G. J. Bunting

Mr. Bunting, who was appointed comptroller of the Illinois Central Railroad Company, with headquarters at Chicago, effective May 15, was born at Portsmouth, Va., July 14, 1881. He entered railway service in 1900 as general accountant of the Cashie & Chowan in North Carolina, a position which he later relinquished to become associated in an accounting capacity consecutively with the Audit Company of New York and Indiana Audit Company, in which service he remained until May, 1909, when he was appointed examiner of accounts for the Interstate Commerce Commission. He re-entered railway service on July 15, 1911, as general accountant of the Chicago, Milwaukee & St. Paul Railway Company, with headquarters at Chicago, a position which he held until March 15, 1913, when he was promoted to assistant general auditor and later to comptroller. He left the service of that road on November 1, 1920, to become assistant director of the Bureau of Finance, Interstate Commerce Commission, in which capacity he was engaged in effecting settlements between the carriers and the government for the guaranty period, until May 15 of the current year, when he resigned to accept the position with the Illinois Central.

Public Opinion Supports Crossing Campaign

Prominent Citizens From Four Points on Illinois Central System Agree Upon Need for Improvement

THE full force of public opinion is solidly behind the "Careful Crossing" campaign of the American Railway Association, in progress from June 1 to September 30, the *Illinois Central Magazine* has reason to believe. This campaign, which was announced in the June issue of this magazine, has the hearty approval and full support of the management and employes of the Illinois Central System.

The leading article in the June issue of the *Illinois Central Magazine* consisted of interviews with twenty-one of the Illinois Central System's locomotive engineers. The interviews gave the opinions of these engineers on the problem of grade-crossing accidents and disclosed several good suggestions to increase safety at the crossings.

In pursuance of this line of thought and to ascertain what public opinion was on the subject, members of the magazine staff took four representative small cities on the Illinois Central System—Clinton, Ill., Fort Dodge, Iowa, Grenada, Miss., and Baton Rouge, La., one on each grand division of the system—and interviewed several prominent citizens in each city on the subject of grade-crossing accidents. The interviews are presented herewith.

These interviews disclose a general demand for a reduction in the number of grade-crossing accidents. The suggestions for their prevention vary, but there is a general agreement that, under existing conditions, the railroads are doing all they can along this line and that something must be done to curb reckless automobile driving and to make drivers "Stop,

From President Harding

Here is what President Harding thinks of the "Careful Crossing" campaign. He wrote the following letter to J. T. Broderick, chairman of the safety section of the American Railway Association:

"My attention has been called to the fact that, under the auspices of the American Railway Association, an intensive campaign is to be waged for eliminating accidents at railway-highway crossings.

"The complete success of such an effort would mean the saving of thousands of lives, the prevention of many more thousands of injuries and incidentally the prevention of a great property loss. Of course, the ideal solution is elimination of grade crossings, to which all possible energy and means should be unceasingly directed. But the extent of our country and its railway mileage make apparent that not for many years of utmost effort could this be effected. There should be constant pressure for elimination of these danger spots, particularly in the more populous areas, pending which there is need for just the kind of preventative effort that your association is planning. Among these measures, the most effective would seem to be to arouse in the minds of drivers a sense of their personal responsibilities. When thoughtlessness is allowed to usurp the place of vigilance, as too often happens, the scene is set for tragedy. Reminders, and still more reminders, of the need for caution at railway crossings are needed.

"Surely, the effort you are undertaking is appealing, and it ought to have the most generous and general support."

Look and Listen" at grade crossings. The suggestions vary from a campaign of educational publicity to the placing of obstructions in the road which will stop the most thoughtless motorist. From the tenor of these interviews—representing a cross-section of what Illinois Central System patrons agree upon—it appears that there would be little difficulty in passing and enforcing laws to cover this matter.

Here are the interviews:

Would Teach School Children

O. F. LAWRENCE, editor, *The Grenada Sentinel*, Grenada, Miss.: The railroads of the country are to be commended and congratulated upon the campaign they are putting on to save reckless automobilists from their own recklessness. The campaign is humanitarian and altruistic.

A failure to *think* is largely responsible for so many people being killed and seriously injured at railway crossings. And the failure to *think*, to measure consequences, is largely responsible for the moral, social and economic uncertainty that disturbs the American people today.

I confess that I am somewhat at a loss to suggest what to do, more than the railroads are now doing, to lessen the number of automobile grade-crossing accidents, but I think if I were confronted with the situation that confronts the railroads I would just continue to use newspaper space—some sage has said that a thing can be written up or down—and, in addition, I believe I would seek, through the state superintendents of public instructions and the school principals, to get the idea out to the public through the school children. This latter might be done by having persons address the schools throughout the country at some particular hour of the same day.

I think people are in too much of a hurry; they may not have any place to go, but they are in a hurry to get there. I want to tell you that an engineer is in a heap bigger hurry than I am when it comes to my crossing the railway tracks.

O. F. Lawrence

A \$50 Fine Might Help

J. H. BROWN, former mayor, Grenada, Miss.: The problem of getting automobile drivers to be more careful in crossing railway tracks is a hard one to solve. It does look as if any sane man would have enough intelligence not to commit suicide simply because he is a free moral agent and can do so if he chooses.

It might help if there were a law passed in each state forcing all drivers of automobiles to stop before attempting to cross a railway track, with a \$50 fine for each offense, one-half of the fine to go to the person reporting the offense to the proper officers. With a law like that, drivers might be persuaded to use reasonable care.

Not long ago I was making a trip in the Delta country, and the negro driver ran his car for a distance parallel to the railway tracks and dodged over ahead of an approaching train. I made him stop the car, and I certainly gave that driver a lecture he'll probably remember as long as he lives. I recall I told him that I would thrash the life out of him if he did it again while I was in the car.

If the railroad were planning an excursion and would announce that the locomotive handling the train would be in charge of an engineer without any more experience than thousands of automobile drivers who are daily menacing their own lives, the lives of those who ride with them and the lives of those who cross their paths, how many passengers do you suppose there would be? I doubt whether there would be any. And that is in spite of the fact that a locomotive, in the hands of an inexperienced engineer, is a whole lot safer than an automobile in the hands of an inexperienced driver, because the locomotive is confined to a definite right-of-way.

Would Enlist Aid of Women

WILLIAM DUBARD, farmer, Grenada, Miss.: I thoroughly sympathize with the object sought to be attained in this national campaign to prevent accidents at railway grade crossings, and I would be very glad to say or do something that might help to make a success of the

J. H. Brown

movement. I doubt my ability to do so, but I give you this thought for what it may be worth:

I am one of those who believe that the future of our country is in the hands of the women, and that their attitude toward public questions will in a large, perhaps in the largest, measure determine the conditions, whether good or bad, in which we must live. Believing this, I suggest that the railroads appeal to the women, through their various patriotic, civic and other organizations, to give aid to this movement. With the help of the women, public opinion may be so educated and aroused as to put the ban on reckless automobile driving. If our women fail us in this crucial period, this and other terrors are on us in full force.

Careless driving is taking its toll in thousands of lives, not only at grade crossings, but upon our highways everywhere. The public must be educated to the great economic loss of this menace of carelessness. I think Mr. Markham was right when he said, in his recent address, that we need to have "teeth" in the laws.

I certainly would not try to ford a stream whose depth I did not know. And I certainly would not drive over a railway track without first satisfying my own mind that it is perfectly safe to do so.

Worth While to Save One Life

W. E. JACKSON, *owner of a printing business, Grenada, Miss.:*

I think each community should exert its best efforts to deal with its own problem of careless automobile driving. I would suggest that automobile clubs institute campaigns to punish reckless drivers by the force of public opinion. They could do this by having charts on which the members could vote on the most reckless driver.

William Dubard

There must be a campaign of education to bring the situation home to the public. If the campaign results in the saving of one human life, it is not without its results.

I think the cards which the Illinois Central System is having its representatives circulate among automobile drivers will do good. Agent E. M. Sherwood had me sign one of the cards yesterday, and last night as I was out driving with my family I stopped at a railway crossing and explained to my wife about the campaign and the card I had signed. We are going to do everything we can to make the campaign a success.

Engineers Do Their Part

DAVE DOGAN, *ex-service man and sheriff, Grenada, Miss.:* I think the railroads are doing everything they can do to prevent accidents at grade crossings. As I was driving into town the other day I noticed how an engineer blew his whistle. Long before I got to the crossing I heard his whistle, when he was still a great distance from the crossing, and after I had crossed over, far ahead of the engine, I stopped my car and watched him come along, with his whistle valve open, all the way.

Dave Dogan

With the railroads and their engineers doing all they can do, it is plainly up to the drivers of the automobiles themselves. They can make the campaign a success if they will do so.

Would Favor Markers and Laws

WILLIAM QUERFELD, *county superintendent of highways, Clinton, Ill.:* By virtue of my position I have to be familiar with the roads of this county and with the railway-highway grade crossings. The situation is pretty well taken care of in DeWitt County as far as the railroads are concerned. Superintendent C. W. Shaw of the Illinois Central has always given valuable co-operation in the matter of improving conditions whenever the railroad can do so.

I saw one place this week where the Illinois Central can help prevent grade-crossing accidents, and I am going to ask Mr. Shaw to fix

W. E. Jackson

it up. By lengthening the planking at a crossing the railroad can make it easier for motor cars to cross and may prevent any accident due to "killing" a motor on that particular crossing.

I have no "complaints to make regarding the attitude of the railroads. Nothing could be more fair.

However, most grade-crossing accidents are the fault of the motor car drivers. We must make them "Stop, Look and Listen." I am not in favor of bumps in the roads near grade crossings, as they may cause more accidents to speeding motorists than they will prevent. A marker in the middle of the road to make the driver turn out and thereby slow down would be the best suggestion, I believe. A law on the matter that could be enforced would do good, too. We must stop hard, fast, reckless automobile driving.

Gets Out and Looks for Trains

J. Q. LEWIS, cashier, *John Warner Bank, Clinton, Ill.*: I am astonished to see the chances that are continually being taken by reckless motor car drivers at grade crossings. In a recent motor car trip which I took to Buffalo, N. Y., I saw numerous instances of narrow escapes at grade crossings, and you can rest assured that I am an advocate of greater care on the part of motor car drivers.

My brother, David Q. Lewis, has been in the employ of the Chicago & North Western Railroad about twenty years and is now assistant general claim agent of that company. Through him I am enabled to learn the railway side of the matter. Not long ago he told me of a grade-crossing accident in which a girl was dragged in front of a train by a frightened horse, but there should be none of that danger when an easily controlled motor car approaches a grade crossing.

You can rely on me to do all I can to further this campaign.

I don't drive a motor car, but I hate to see drivers take chances, particularly when they have their families in the car. On our recent trip east, I made it a point to get out and act

William Querfeld

as flagman for our car at dangerous grade crossings.

Must Stop Such Carelessness

H. H. BURCH, secretary, *Chamber of Commerce, Clinton, Ill.*: I am not sure that I would be in favor of a law forcing motor car drivers to stop at all grade crossings, as that would probably merely increase public hostility to the railroads. We have had too much of this sort of sentiment in the past. I would favor having bumps in the road or some other sort of handicap to force drivers to slow down and to make them realize a grade crossing is near at hand.

Anything that will slow a man down and make him look is good. Of course, if a man is bent on suicide, he will go ahead and do as he pleases.

Where possible, the railroads should be required to improve conditions at the more dangerous crossings.

I am in favor of the "Careful Crossing" campaign because I have observed many such accidents and near-accidents. I was once in newspaper work and frequently had to write reports of such affairs. The average man has no way of judging the speed of a train. Just the other day, while on an interurban, I saw one driver escape by running his motor car into the ditch when he saw he couldn't get across the track. And once I was in an interurban car which ran down a bicycle rider. He had his head down and never looked up to see where he was.

We must stop such carelessness. Most grade-crossing accidents are due to carelessness on the part of those using the highway.

For a Campaign of Education

H. R. BEATTY, hardware dealer and president of the *Illinois Retail Hardware Dealers' Association, Clinton, Ill.*: It seems to me we need a campaign of education among the people who use the roads. The railroads should be complimented on this "Careful Crossing" campaign, and I hope it will succeed in its purpose.

No engineer will deliberately hit an auto-

H. H. Burch

mobile on a crossing. I have had Illinois Central engineers here repeatedly tell me of races to the crossings with motor car drivers, and I have some idea of the worry it causes the engineers. I believe that 99 per cent of the accidents are the fault of the persons hit.

Several things ought to be done. The engineers can sound their crossing signals plainly (although there may be some objections to that within city limits). A campaign can be conducted among the patrons, the consumers, the users of the crossings. Proper signs can be placed in perhaps better locations (but I am afraid bumps in the roads would cause too many law suits). Proper publicity on the matter should be employed at all times.

But, in spite of all these things, we could easily have an accident when two trains are passing a highway on double track. It all reverts to care on the part of the individual concerned.

Educate the people!

Make Drivers Protect Themselves

E. H. PORTER, *editor-manager, Clinton Register, Clinton, Ill.*: My first suggestion would be to remove all protections at grade crossings and let the motor car drivers shift for themselves. Placing the responsibility squarely upon the driver to protect himself might have the desired effect. The railway company is the "goat" in a large percentage of such accidents; so I would use the crossing watchman to protect pedestrians and let the motor car drivers look out for the trains.

There is only one way for the train to go, while there are several ways for the motor car drivers to go and to stop. It is time for the public to equip itself for

H. R. Beatty

safety, since the railroads are now doing all they can.

The point right now is to improve the people, not necessarily the crossings. I have to pass a grade crossing about 7 a. m. every day on my way to the office, and you can bet I have studied out which way the train is coming, so that I can use caution at that crossing. In one case I recall, an electric railroad improved a crossing by moving it out of a cut into the open, and right soon after that some people who had been using the crossing a long time proceeded to get hit.

Since my original suggestion is not likely to be adopted, I would suggest, under present conditions, that all motor car drivers be taught to change gears at grade crossings, so that they will not "kill" their motors when on the track.

A Timely and Necessary Campaign

CHARLES P. MANSHIP, *editor, The State Times, Baton Rouge, La.*: Perhaps the best

statement from Mr. Manship would be to quote the editorial which he wrote for his paper and published June 9. It follows:

C. P. Manship

"The railroads of the country have put on a campaign calling the attention of the American people to the need and necessity for more care in the crossing of railway tracks. Such a campaign is timely

and necessary. It should be heeded. It should save human life.

"There has been an appalling increase in the number of railway grade-crossing accidents; even in Baton Rouge the tragedy and horror of it have been brought home to us all too frequently. Less than a year ago, below the city, three negroes were killed trying to beat a railway train over the crossing, and only two weeks ago, just a few miles north of the city, a little boy was killed and his mother and father seriously injured by careless driving over the crossing of the Y. & M. V. road.

"It takes two to prevent accidents. No matter how many safety devices the railroads have, as long as the railway grade crossings are there accidents are possible.

"The increase we have witnessed has been

E. H. Porter

due to the automobile and the temptation which apparently comes to many with automobile driving to try to beat the train across the track. The records show that during 1920 there were 1,907 people killed and 5,077 injured in grade-crossing accidents. Sixty-seven per cent of the accidents were in automobiles. During the year there were more than 3,000 automobiles struck by trains, making, during every day of the year, eight automobiles hit, four persons killed and 11 persons injured.

"This should be changed. It will be changed if the automobile driver is careful.

"'Stop, Look and Listen' is the slogan the railroads are sending out. It should be followed. If followed the number of accidents will be reduced almost to the vanishing point.

"There is nothing to be gained by beating a railway train over a crossing, and there is everything to be lost, including life, if the attempt is not successful.

"'Stop, Look and Listen' when you reach a railway crossing. A second of care may save your life, and the lives of all in your party."

Would Teach Drivers the Rules

I. M. CAUSEY, retail dealer and president, Kiwanis Club, Baton Rouge, La.: I think it would be helpful if the manufacturers of automobiles would issue booklets giving the dangers of reckless driving, and if these booklets were placed in the hands of all automobile buyers. In that way, the information would come into a man's hand at a time when he is greatly interested in the handling of his car, and it would no doubt make a lasting impression upon him. These booklets could be in the nature of a code of instructions on automobile driving, but in them the peril of reckless driving over railway tracks could be forcibly emphasized.

I think, further, that every automobile driver ought to be required by law to keep in his car a set of traffic regulations and instructions. These also could tell him his plain duty in avoiding accidents at crossings. I believe he

would refer to such a book or pamphlet from time to time and be guided by it.

One way to get at the subject would be to put on a safety campaign in the schools. Children could be taught the danger of recklessness. That might not do so much good in helping the immediate situation directly, but it would be instilling safety habits in the minds of those who will be driving automobiles in a very few years from now.

No Automobile Driver Immune

T. L. SMALL, manager, Baton Rouge Electric Company, and president, Rotary Club, Baton Rouge, La.: I suggest that there is a great need for education on the exercise of caution at railway crossings. The automobilist must be trained out of the habit of thinking: "It happened to the other fellow because he was foolhardy; it will never happen to me." The fact is that it can happen to anyone who does not exercise the greatest caution.

The railroads are able to discipline their employes who grow careless, but there is no way of disciplining the careless automobile driver. Some way of disciplining him must be found.

I think every railway crossing should be as fully protected as possible. Where there are blind crossings, warning signs should be placed back along the street or road at least 100 yards. That is what the railroads can do. But after they have done everything they can do, loss of life will continue to result unless drivers can be forced to exercise caution.

Experienced Drivers Are Needed

ALEX GROUCHY, mayor, Baton Rouge, La.: The loss of life resulting from careless automobile driving is appalling. I have often thought that certain experience

T. L. Small

I. M. Causey

Alex Grouchy

should be required by law of all drivers before they are given charge of automobiles. Inexperienced drivers cause a great deal of the loss and suffering.

Above all, the public must be taught to be eternally vigilant at grade crossings. A grade crossing is never safe; at best, it is highly dangerous. Regardless of what the railroad does in trying to prevent crossing accidents, accidents will continue unless drivers of automobiles do their full share, too.

Safety With the School Children

MISS ANNA A. JOHNSON, county superintendent of schools, Fort Dodge, Iowa: Naturally the grade-crossing problem is of interest to me, since we have seven consolidated schools in the county and close to fifty motor busses operating every school day to carry the pupils to and from these schools. Since there is an average of sixteen young passengers in a bus load, you can figure the damage that could be done by one serious grade-crossing accident. There are six railroads in the county, but we have been fortunate up to the present in having drivers who look out for the trains.

It is my understanding that all of our consolidated school districts require their drivers to sign contracts covering the matter of safety. A violation of a safety rule in transporting these children would make it possible to break the driver's contract.

We absolutely cannot be too careful. I am in favor of teaching the principles of safety in the schools. At present the teachers discourage the children from walking on the tracks, and it ought to be possible to teach them to observe the rules at grade crossings.

The fact that our consolidated school system, with its motor busses, has been in operation

eight years ought to prove that consolidation is a success and that it is possible to handle motor vehicles over grade crossings year after year without accident.

Would Make Driver Responsible

R. O. GREEN, secretary of the Commercial Club, Fort Dodge, Iowa: Compelling every vehicle crossing a railway track to stop absolutely still for a reasonable length of time would eliminate 75 per cent of the grade-crossing accidents, in my opinion. Stating such percentages, however, gives merely an approximation of the idea a man has in regard to the number that could be prevented.

R. O. Green

If the two objects are not permitted to come together, there will be no accident at the crossing. Few seem to realize that a railway train cannot turn out of the way as an automobile can. Running on a track placed along a certain right-of-way, a railway train is required, in order to keep up its schedule, to maintain a certain rate of speed. Drivers of

automobiles are not surrounded by such rules or requirements. Motor vehicle drivers are free agents. When they deliberately run up on railway crossings without making every effort possible to ascertain whether a train is coming, they should be forced to accept the responsibility for the accident which may follow.

If I had the making of the laws, I would make grade crossings safe by placing the responsibility for an accident on the driver of the motor car if it could be shown that he had his vehicle moving at any rate of speed above 10 or 12 miles an hour.

I am not sure that I would make many exceptions to this rule. Even a deaf man generally has his sight and can look to see if a train is coming.

Of course, there are some bad crossings where it is almost impossible to see approaching trains. In such cases I would require the railroad to grade down the embankments so as to improve the view.

One of the worst accidents of the sort I recall, however, happened on a clear track where there was a view of the train for miles. The

Miss Johnson wouldn't break her rule against allowing her photograph to be published, but here, with her regards, is one of the fifty reasons why she favors the "Careful Crossing" campaign.

highway paralleled the track; the driver had his curtains down, and turned to cross the track right in front of the locomotive.

A man, like myself, who does not drive an automobile is often in a better position than the automobile driver to observe what risks are being taken. The general, fatal carelessness of the public is to be seen every day in every city. On most persons the bump of caution seems undeveloped.

I would, if I could, make a law to enforce the "Stop, Look and Listen" rule, and I would make its violation a crime, for the grade-crossing accident is also hazardous to the lives of the passengers on the train. It ties up business and blocks traffic, all of which is reflected back to the public, which has to pay the toll in the increased cost of doing business.

Favors Elimination of Grade Crossings

W. S. KENYON, *judge of the United States Court of Appeals of the Eighth District and former United States Senator from Iowa, Fort Dodge, Iowa*: I certainly wish the railroads success in the campaign to prevent grade-crossing accidents. It all goes back to the question of being careful. Too many are willing to be careless a moment or two and then to regret it a long time. I am glad that the railroads are carrying on this campaign.

I have always been an advocate of the elimination of all grade crossings. The railroads will find it to be a good thing from even a purely financial point of view. It may take a long time and cost a great deal of money, but I believe that it will come eventually.

Be careful—be careful—nothing else; that is nearly a truism, but it is up to every individual to observe it.

Speaking of railroads, I recall that Tom Marshall used to say that the greatest need of the country was a good 5-cent

cigar, but after traveling around a while I am inclined to believe that the country's greatest need is more air in Pullman cars.

Force Them to Slow Down and Look

W. L. TANG, *city clerk, Fort Dodge, Iowa*:

W. L. Tang

The prevention of grade-crossing accidents, reduced to its purely physical aspect, lies in making automobilists slow down when approaching railway tracks. Nearly all grade-crossing accidents are caused by motor car drivers having a chance to go too fast when getting near the track.

If the road made a sharp turn on each side of a grade crossing—preferably a double turn, so that the driver could see the track both ways—then the two objects would be accomplished of slowing down the motor car and allowing the driver to see if the track is clear.

Anything that will slow down an automobile and thus give the driver a chance to look and listen and a better chance to stop will help to reduce grade-crossing accidents.

Fort Dodge has been fortunate in not having many fatal grade-crossing accidents. The railroads have proved willing to co-operate in measures of prevention. Very few accidents have happened on the most dangerous crossings, as everybody is looking out for them; the greatest carelessness and most accidents are noted at the supposedly less dangerous crossings.

A Matter for Proper Publicity

J. FLOYD RICH, *assistant cashier, First National Bank, Fort Dodge, Iowa*: The only advertising poster you will find in our bank is the one announcing the "Careful Crossing" campaign. It has a place of honor where every customer can see it. We are glad to co-operate in the movement, since no one particular railroad is affected more than another and the work is for the good of all, and most of all for the good of the public.

The number of motor cars in the county has increased greatly in recent years, and there is more necessity than ever for such a campaign. It is a fine campaign and should have all the prominence possible. The big thing is to get the idea of safety firmly rooted in the minds of the people. Constant publicity may have the desired effect. It takes a bad accident to make the matter most impressive, but I hope that this campaign will accomplish the same results in a better way.

W. S. Kenyon

Don't Block the Game, Urges H. S. Taylor

*Hustling Chief Clerk to General Superintendent W. S. Williams
Preaches and Practices Ambition*

IF you are not working for advancement, resign now, and get out of the way of the others below you—don't block the game. That's the advice of H. S. ("Hodge") Taylor, chief clerk to General Superintendent W. S. Williams at Waterloo, Iowa.

In Mr. Taylor's opinion, the employe who is absolutely satisfied and contented with his position can never advance into the ranks of the officers. It takes that restless spirit and eagerness to accomplish something that is unlooked-for and yet needed, for a man to gain promotions. He who sits back and does only that which he is told cannot have the initiative that is required in the higher positions.

And "Hodge" Taylor's record exemplifies his statements. His every deed is an example of energy and ability. He has always been on the look-out for new things to do and has done them with a thoroughness that is admirable. A review of his service with the Illinois Central shows that.

He entered the service of the company April 25, 1904, as a yard clerk at Carbondale, Ill., after having attended the public schools and the Southern Illinois State Normal School there. At the time he entered the service he was studying stenography, and he continued in that course while he was at work.

Got a Promotion to Pass Clerk

He had been at work but three months when a position as pass clerk in the superintendent's office became vacant. That position offered more stenographic experience than the one he had, and he was anxious to master the typewriter. He made an application and received the position he desired.

Young Taylor was proud of that new position. It was a small increase in salary for him, but above that he appreciated more the fact that opportunities were broadening for him. Here was a chance for him to exercise his fingers on a typewriter, while at the same time the new position was to teach him more about the railway business.

There was no such thing as a definite quitting time for him. He had much work before

H. S. Taylor

him if he were to accomplish all that he would like to. He realized that the more and better work he did, the more benefit it was to him. He was not selfish in his thinking constantly of his own betterment, for his strenuous efforts to turn out the very best work in his ability proved to be more than beneficial to the company. And it was not long before he was really a better man than the position he held called for.

His Experience in Road Work

Nine months passed, and then the supervisor of bridges and buildings needed a clerk. Mr. Taylor saw immediately that some very valuable information could be obtained in that office. As young as he was, he realized the importance of a knowledge of the road work—the foundation of a railway system. He was given that position, a place in the office with the roadmaster and road supervisor.

The experience he gained in that office was

probably more important to him than the experience in any position he has held, he says. It was there that he gained a general knowledge of maintenance of way work. And he went about learning it in such a way that it stuck with him. Problems come up today, he says, that he could not handle so promptly and thoroughly were it not for the experience he had in the supervisor's office.

His next position, which he accepted nine months later, was as clerk to the chief dispatcher. The coal fields made that division the busiest on the system, and that made the chief dispatcher's office busy. That's why young Taylor wanted to be in that office. He worked hard every week day, every night and Sundays.

Six months later he became the assistant car distributor, and in another year Trainmaster George W. Berry made him his clerk. He had been in this position about a year when Mr. Berry was appointed superintendent of the Iowa division at Fort Dodge. Mr. Berry knew what kind of mettle his clerk at Carbondale had in him. On July 17, 1910, he made Mr. Taylor his assistant chief clerk at Fort Dodge.

Originated a New Report

In December of that year, Mr. Berry was promoted, L. A. Downs was made the superintendent at Fort Dodge, and the chief clerk there was promoted to chief clerk to the general superintendent at Chicago. Mr. Downs made Mr. Taylor his chief clerk.

Mr. Taylor made a lasting impression on every man he worked for. He made himself so valuable that they could scarcely get along without him.

Mr. Downs was transferred to Dubuque July 15, 1913, and by September 1 of the same year he had Mr. Taylor there as his chief clerk.

While in this position, Mr. Taylor originated a piece of work that benefited the entire system. He saw how trying it was on the superintendent to sum up the entire business of his division. It took valuable time and caused many gray hairs.

Mr. Taylor planned a monthly report sheet with every item of business on the division properly tabulated. As reports came in, he entered them on the blank sheet, and when the last one came he totaled the whole thing at the bottom. Then he turned the completed report over to the superintendent. With such a report on his desk, the division officer was

able to tell at a glance exactly what his division was doing and had done in the past.

A copy of the report was sent in to the general manager. He was so impressed with it that he sent it out to all the division officers with the request that they compile similar reports each month. Thus Mr. Taylor's work spread over the entire system.

Became Secretary to President

Such a piece of work was sure to attract the attention of the officials at Chicago. The originator of it was undoubtedly a man who was needed higher up in the organization.

About the middle of February, 1915, Mr. Taylor was surprised by a telephone call from the president's office in Chicago asking him to report there for a conference. On his arrival in Chicago, Mr. Kittle asked him if he would consider a position as secretary to President Markham. He was more or less bewildered, he says, but lost no time in accepting the offer. He reported for duty March 1.

Mr. Taylor says that his days with President Markham were pleasant and indeed valuable. He gained further knowledge in operation by being with Mr. Markham on the road. He also had the good fortune of attending Mr. Markham's conferences with the division officers.

August 1, 1917, the general superintendent's office of the Western Lines was opened at Waterloo, and Mr. Taylor was chosen to be the chief clerk.

He continued to prove himself of value to the company by getting out comparative statements that drew things down to a final figure where the officers could tell at a glance the performance of that division without having to go through detailed statements to compile the desired information. Mr. Taylor's reports again attracted the attention of the entire system.

A Good Worker and a Good Fellow

Mr. Taylor keeps a daily record of all phases of operation. He makes the reports himself, so that he will become acquainted with the figures as they come in. The report blanks contain the figures of a normal business for comparisons.

He places much stress on the correspondence of his office and never lets the sun go down on an unanswered letter. He insists that the office force give even more information in short, snappy and to-the-point sentences than

is asked for, to prevent the disgrace of having a letter come back asking for more information.

In his office, Mr. Taylor is stern. He attends strictly to business, but he never misses an opportunity to praise a piece of work by one of his subordinates when it is worthy of

praise. On the other hand, he is just as free in criticising poor work and uncalled-for errors. He has the highest admiration of every employee in his office.

On the street, Mr. Taylor is a mighty good fellow and a thorough gentleman, as all his acquaintances testify.

BIBLE CLASS HAS ILLINOIS CENTRAL GROUP

Young men's class of the Woodlawn Methodist Episcopal Church, Chicago. Illinois Central men in the picture are, reading from left to right: First row: No. 2, C. S. Clark; No. 3, C. H. Mottier; No. 4, R. S. Criswell; No. 12, C. J. Corliss. Second row: No. 8, C. D. Turley. Third row: No. 9, George Walkup; No. 16, W. S. Morehead. Fourth row: No. 2, W. E. Walkup; No. 3, E. R. Word; No. 8, C. M. Bell. Fifth row: No. 3, A. A. Shillander. Sixth row: No. 7, G. E. Heniken. E. T. Howson, leader of the class, is No. 9 in the second row.

Perhaps no other Bible class in Chicago is attended by so many Illinois Central men as the Young Men's Class of the Woodlawn Methodist Episcopal Church, 64th Street and Woodlawn Avenue. This organization of 150 active members is believed to be the largest men's class in Chicago. It is led by E. T. Howson, editor of the *Railway Maintenance Engineer* and of the western edition of the *Railway Age*. C. H. Mottier, office engineer, Chicago terminal improvement, is song leader, and C. M. Bell, assistant engineer, is pianist. C. D. Turley, assistant engineer, Chicago terminal, is the retiring president; C. S. Clark, assistant engineer, building department, and R. S. Criswell, mechanical department, each head a committee; and C. J. Corliss, chief clerk, valuation department,

and George Walkup, correspondence clerk, general manager's office, are secretaries. Other Illinois Central men who are active in this class are: H. E. Byrum and E. R. Word, engineer auditor's office; C. M. Said, *Illinois Central Magazine* cartoonist, general manager's office; Arthur Howson and A. B. Johnson, Chicago terminal improvement department; A. A. Shillander, chief engineer's office; E. P. Wright, A. L. Leach, W. D. Peeso and W. J. Swisher, bridge department; E. D. Bullard, building department; W. E. Walkup, traffic department; Oscar Shultz, signal department; G. E. Heniken, formerly assistant engineer, valuation department, and L. D. Clark, valuation department. W. S. Morehead, assistant general storekeeper, is in the group above as a guest of the class,

Give Dinner in Honor of Floyd R. Mays

Citizens of Vicksburg, Miss., Praise System and Superintendent for Fighting Recent High Water

THE friendly spirit which for many years has marked the relations between the Illinois Central System and the business men of Vicksburg, Miss., was evidenced in a dinner given by 210 Vicksburg business men the evening of May 30 in honor of Superintendent Floyd R. Mays, the members of his division staff and other officers of the Illinois Central and Yazoo & Mississippi Valley railroads. The dinner was in appreciation of the flood control work carried on at Vicksburg and other points along the Mississippi River by the railroad's forces during the April floods.

Speeches of appreciation, telling of the work performed by the railroad and the materials furnished, describing the devotion to duty displayed by the railway men of every rank and pledging Vicksburg's unending gratitude, were delivered by Mayor J. J. Hayes, Major Alexander Fitz-Hugh and B. W. Griffith. Major Fitz-Hugh is a business man with large interests on the river-front. Mr. Griffith is president of the First National Bank of Vicksburg. He was chairman of the committee which arranged the dinner, and he served as toastmaster. Responses were made by a number of the railway officers present. As a testimonial of their appreciation for the work carried on under his supervision and his part in it, a watch and fob were presented to Mr. Mays by Ben H. Stein, a member of the arrangements committee, on behalf of the business men of the city.

An Unselfish Tribute

Speakers declared that the occasion was especially noteworthy, in that it was the first time, to their knowledge, that the citizens of a community had ever met to pay their unselfish tribute to a railroad and its representatives for an unselfish public service. It was, indeed, a history-making occasion.

Frequent references were made to President C. H. Markham and the spirit of public service which characterizes the organization of which he is the chief executive. Mr. Markham was prevented from attending by a business engagement which could not be deferred. Toastmaster Griffith read the following telegram to the committee, which explained his absence and pledged

Floyd R. Mays

the 100 per cent co-operation of the Illinois Central System:

From President Markham

"Fully conscious of the unusual character of the dinner to be given to Superintendent Mays and other officers of the Yazoo & Mississippi Valley Railroad Company by the business men of Vicksburg, I have been trying my best to shape my plans so that I could be present to meet the business men of Vicksburg and to tell them how deeply appreciative I am of their kindly feelings toward our company and its officers.

"I regret that my plans have not worked out as I hoped they would. I now find that I must be in New York on Wednesday morning to attend a meeting of the board of directors which could not be deferred. However, the Yazoo & Mississippi Valley Railroad Company will be well represented at the dinner by a number of its general officers and local officers. I feel that this occasion will serve further to cement the friendship which has always

existed between our company and the business men of Vicksburg.

"The company's friendship for Vicksburg has been fully demonstrated, not only by the recent fight against high water but also by the large payroll which it has maintained in Vicksburg for many years and by other ways which I will not attempt to enumerate. We are anxious to work with the business interests of Vicksburg for the advancement of your city. We believe that you business men can do a great deal to help Vicksburg and Mississippi by building the right kind of foundation of confidence which will attract and encourage the investment of foreign capital. Any movement for the advancement of Vicksburg and Mississippi which may be made will receive 100 per cent co-operation from us.

"The thought I should like to leave with the business men of Vicksburg is this: Let us not only be good friends in the future, but be more active in promoting one another's best interests."

At the conclusion of the dinner a toast was given Mr. Markham, to which the business men responded heartily.

A Spirit of Good Feeling

The dinner was in the ballroom of the B'Nai Brith Club, which had been handsomely decorated and converted into a banquet hall seating

250 men. At the rear of the speakers' table was the stage; before the dinner began the room was darkened and the drop curtain lifted, disclosing a large American flag and, in electric lights, a sign with the letters, "Y. & M. V. R. R."

Toastmaster Griffith struck the keynote of the dinner when he repeated, as a text for the evening, the phrase, "Know one another and you will love one another."

"The welfare of a community is indissolubly linked with the welfare of its railroads," Mr. Griffith said in his opening remarks. "The railroad and the community have common adversities and common prosperities. What helps one helps both, and what hurts one is hurtful to both. The railroads should have the same fair treatment accorded individuals. The community should ever be alive to promoting the interests of the railroad which serves it with transportation. This community of interests, this interdependence, was remarkably demonstrated by the work performed by the Yazoo & Mississippi Valley Railroad during the flood season, and this dinner was arranged as a testimonial of the appreciation which the business men of Vicksburg have for the unselfish efforts put forth by the railroad and its representatives.

"The spirit thus far advanced should go on.

A view of the banquet hall. At the speaker's table, left to right, first row: W. L. Jaquith, agent, Vicksburg; W. B. Ryan, assistant general freight agent, Memphis; J. F. Porterfield, general superintendent of transportation, Chicago; R. V. Fletcher, general solicitor, Chicago; Toastmaster B. W. Griffith, banker, Vicksburg; L. W. Baldwin, vice-president, Chicago; F. R. Mays, superintendent, Vicksburg; F. L. Thompson, chief engineer, Chicago. Second row: Mayor J. J. Hayes, Vicksburg; J. Morgan, foreman, car department, Vicksburg; F. H. Anderson, trainmaster, Vicksburg; Fred Hattic, general yardmaster, Vicksburg; S. F. Lynch, chief clerk to superintendent, Vicksburg; H. R. Davis, assistant engineer, Vicksburg; H. W. Doyle, claim agent, Vicksburg; E. W. Sprague, assistant general claim agent, Memphis; V. V. Boatner, president, Peoria & Pekin Union Railroad, Peoria, Ill.

The community and the railroad should in the future, as in the past, be zealous for the best interests of the other."

"The officers of the Yazoo & Mississippi Valley Railroad have worked closely with our people for a good many years," Mayor Hayes said in his speech, "and there has always been the finest co-operation between us. When the river threatened us we were powerless, and we called upon the Yazoo & Mississippi Valley Railroad, and it came to our rescue. There was never a time when the railway men—officers and employes alike—did not do everything that could have been asked, more than was expected of them from the standpoint of duty, I am sure. If anything was needed, we had only to say the word. In one instance, I recall, a force of several hundred men was at work on the ground, with all the materials needed, fifteen minutes after I had called up Mr. Mays and advised him of the situation."

Kept Trains Moving

Mayor Hayes told how trains were kept moving throughout the period of high water, on both the Vicksburg and New Orleans divisions. At no time was train service completely abandoned. For several days trains were operated through water which stood several feet over the top of the rail, carrying food, supplies and materials to the stricken territory.

"I tell you," the mayor said, "that men who have the courage to carry on work of that sort deserve anything we can give them."

Mr. Hayes spoke of his observations of the work while it was in progress, of the fact that Superintendent Mays, wearing hip boots and wading through the flood waters, spent eighteen hours a day on the job. Other officers and employes were commended.

"Vicksburg people should stand up for the Yazoo & Mississippi Valley Railroad," he said. "I'm going to do it as long as I have breath in my body."

Major Fitz-Hugh gave a summary of the work done by the railroad and urged that the gratitude of Vicksburg citizens to the railroad be demonstrated in a practical way. The following is his address, in part:

Address by Major Fitz-Hugh

"A levee of sacks four feet high and of sufficient thickness and base to withstand flood water was constructed from Glass Bayou on the north down to the corner of Clay and Levee streets, and from the intersection of Clay and Depot streets down to Kleinston, or the lower landing. After citizens had objected

B. W. Griffith

to the levee adjacent to the passenger station, alleging that they were damaged by seep water, the company opened it up and the street was flooded. When these citizens were convinced that their property could be protected by the levee, and the street kept open for business and railway traffic, the levee was reconstructed and the water pumped out of the street, so that it was dry except for a slight seepage.

Men Displayed Initiative

"The forces of the company were freely given to aid the great lumber interests along the river front, to protect the compress containing a million dollars' worth of cotton, and to aid and assist the wholesale interests in protecting their large stocks. Sacks, lumber and other materials were furnished by the company for this purpose.

"The striking feature of the service of the company was the extent to which the whole force seemed to be impressed with the idea of the duty and of the opportunity to serve the public to the utmost, under trying conditions. When Mr. Mays was asked to do something to help any particular industry, he did not say that he would have to get authority from Colonel Egan. In the midst of his many

official duties, when his chief clerk, Mr. Lynch, was appealed to, he did not say that he would have to get authority from Mr. Mays. When Mr. Brown, the roadmaster, or Mr. Haddic, the yardmaster, or Mr. Roberts, the efficient storekeeper, were asked for help, it was freely given without having to wait for the authority higher up to grant permission. This spirit was strikingly displayed by the yard crew and switchmen, who in rain and water performed services that were often extraordinary and not contemplated in their regular line of duty.

"A fine young man, Jack Penalva—who, by the way, had his first position as a boy in my office—lost a leg in line of duty switching cars in the water at night.

"The policy which Mr. Markham has sought to put into effect on the lines of the Illinois Central System reasonably to decentralize authority and enable the local man on the ground, who is familiar with local conditions, to handle the situation was splendidly demonstrated.

"Next to agriculture, transportation is the most essential industry to mankind. His progress, his pleasures, his happiness, his very existence depend upon transportation. The his-

tory of civilization from the time of the Phoenicians up to our own day is largely the history of transportation—transportation of matter and materials by railroads, ships, motor and air craft, transportation of sound by the telephone, telegraph and radio, and transportation of the great forces of nature through wires that transmit the power of great hydro-electric plants.

Playing Fair With the Railroad

"Let us ask ourselves the question: What is a railroad? A railroad is an institution for the construction and maintenance of which some of the people furnish the money, and which some of the people are employed to manage and operate, in order that a much greater number of the people may be furnished with the great service of transportation.

"What does the Yazoo & Mississippi Valley Railroad mean to Vicksburg? It has 1,100 employes here, including 800 heads of families, and furnishes support to 5,300 persons. To these 1,100 persons are paid \$2,000,000 annually in wages and salaries. The Yazoo & Mississippi Valley Railroad pays over 10 per cent of the total taxes of Warren County, or about \$51,000, and over 5 per cent of the total taxes collected by the city, or about \$17,000. The tax which the county retains for county expenses amounts to about \$33,000, or about sufficient to pay the annual interest on the \$600,000 bonds recently authorized and sold to construct good roads which will partly compete with the railroads.

"This splendid entertainment in this beautiful club in which so large a number of our citizens have joined together to express appreciation to Mr. Mays and to other officials of the company is a fit and proper recognition of what the company and its officers and employes have done. I wish to ask you, however, whether our appreciation should end with this. Should it not go farther, and should we not see to it, so far as our influence goes, that the railroad gets fair treatment from the people and from the institutions of the people?

This Is Practical Appreciation

"What will be our attitude in the future to men seeking public office who try to impose upon the ignorance and prejudice of the masses through unjust, unwarranted and inaccurate statements about the railroads?

"What shall be our attitude toward the lawyer who seeks to prey upon the ignorance

Major Alexander Fitz-Hugh

and prejudice of the juror by making improper, unjust, untrue statements about the railway companies? Are you going to complain about unjust verdicts against the railroads in damage suits and then seek to evade jury duty when you are summoned? In making this statement I do not mean to suggest that I do not believe that a citizen has a perfect right to go to the courts in order to obtain the damages he feels he is justly entitled to, when he is unable to effect settlement with the railway company. I have served on railway cases and have rendered verdicts against the railroad.

"What is going to be the attitude of the laboring man and other employes of the company—and I wish more of them were present to hear what I have to say—when the labor agitator from some far-off city or state, who is unfamiliar with the local conditions and unacquainted with the pleasant relations existing between the company and its employes of such long standing, comes to disturb these pleasant relations and to seek to put into effect working conditions that are uneconomic and onerous to the company? Whatever harms or retards the company harms or retards its employes, who in this community constitute over 30 per cent of the population, and who to that extent are an important part of the public.

One Conscience for All

"We cannot have one conscience for the individual, and another conscience for the railroad. The railroad, although a corporation, is in a sense an association of individuals. It is a fundamental principle of law that the corporation is entitled to enjoy all the rights and privileges of the individual, so long as the acts of the corporation are consistent with the purpose for which it was formed.

"There will be the dawn of a new day in our community, and in our state, if there will be a just and fair treatment of corporations and a recognition of the fact that their best interests and the best interests of the people are mutual. When this comes, I believe the waste places of the state will become fertile, the education and intelligence of the people will be advanced and their happiness and prosperity promoted."

Farmers Express Their Thanks

Representatives of the territory to the north of Vicksburg, on the Vicksburg division, of which T. L. Dubbs is superintendent, were present and told of the appreciation of their communities for the flood control work carried

Kept on the Job

A number of the members of Superintendent Mays' staff were unable to attend the testimonial dinner given in their honor May 30 at Vicksburg. The fill at Big Black, nineteen miles south of Vicksburg, began settling as the water receded, and on May 28 all traffic was halted over that portion of the main line. Crews worked day and night to put the line in shape, and on June 4 traffic was resumed, but on the night of May 30 Roadmaster E. W. Brown, Supervisor J. W. Harper and others were on duty nearly twenty miles from where Vicksburg citizens were praising them for their good work.

The Big Black fill is about 1 mile long, from 10 to 40 feet high, and from 12 feet wide at the top to 150 feet wide at the bottom. The water came to within a few feet of the top, and when the river began falling it fell at the rate of about a foot a day. The fill had been thoroughly soaked by the high water, and with the recession of the flood it began sliding and settling. More than 1,000 cars of dirt were used in reclaiming the embankment.

on. Dr. R. P. Crump of Nitta Yuma, Miss., was to have been on the program, but he could not be present and sent a telegram which was read, praising the work of the railroad and its representatives. Henry Kline of Anguilla, Miss., spoke for his community, and in conclusion declared that he and the other farmers of that section were going to raise all the cotton they could this year for the railroad to haul. The Rev. E. J. O'Neill of Rolling Fork, Miss., substituted on the program for J. B. Sinai of that community, telling of how grateful Rolling Fork citizens were to the railroad for its timely assistance. T. H. Powers of Cary, Miss., chairman of the board of supervisors of Sharkey County, expressed the appreciation of his community.

How Affair Was Organized

In presenting the watch and fob to Mr. Mays, Mr. Stein spoke as follows:

"I do claim considerable responsibility for this affair, and, while I have not had all to do with it, I feel very much honored that it has been the means of our getting together in this beautiful place. To tell you the truth about it, I was standing on the corner, near one of our prominent banks, in the portals of which I am constantly going with requests, and I just remarked that it appeared to me that we ought to get up a little testimonial of appreciation to

Floyd Mays. This remark was made by me to another fellow who loves Vicksburg just as I do, and we began to frame up a little dinner party in our own minds, when along came a couple of other fellows who also love Vicksburg, and we then began to realize that the plans we were talking about were not nearly big enough to indicate what we considered the proper appreciation for the most valuable services we have had rendered us here as a community for many years; so we then began to look farther ahead, and as we worked the idea grew and grew on us until now you see a part of the result.

"We have with us tonight more than 200 of the flower of Vicksburg's business interests; they are gathered here from every line of business known to our community, and they are here with one mind alone—to express by their presence and their words their hearty appreciation for the valuable services rendered to them, to their community and to the people in the overflowed area in their trade territory by the superintendent of the Yazoo & Mississippi Valley Railroad Company—Mr. Floyd R. Mays—his superior officers and the men under him.

A Rather Unusual Situation

"Vicksburg is especially fortunate in many ways. Among its most fortunate happenings is the fact that Floyd R. Mays is a citizen of this town and has its interests at heart the same as you and I have. He has shown it many, many times before, but never has he been put to such a task as he has in handling the complex situation which has confronted everybody during this 1922 high water.

"It is especially gratifying to the committee in charge of this affair that its chairman, Mr. B. W. Griffith, its other members, Mr. Neil Callahan, Mr. Lindsay McGee, Mr. John Hennessey and myself, have had a hand in the making of this evening. Here you will find a bunch of men bent upon the one idea, of giving this corporation something almost unheard of in the annals of the business community. Usually they invite these fellows and get them together for the purpose of asking something of them. We might have had that idea in mind ourselves, but we have felt that we are for the railway company; that they know what Vicksburg means; that they know that Vicksburg needs them; that they need Vicksburg, and that whatever is necessary for the development of their interests and our interests they are going to do, without our having to go to them with appeals of various kinds through

Ben Stein

trade organizations and otherwise in order to get what we rightfully deserve.

"It does me good to be able to honor a man like Floyd Mays. He came to us some twenty-odd years ago, a mere boy working in the shops of the Yazoo & Mississippi Valley Railroad, and he has worked himself up from the very bottom to the very high and important office he now holds, and in which office he is given rein to exercise authority by his superior officers, for they have confidence in his ability as a railway official and honest integrity as a man.

Presented Watch and Fob

"We are especially gratified to have with us so many of the officers of the Illinois Central and Yazoo & Mississippi Valley railroads. We want them to know how we feel toward them and in what esteem their loyal superintendent is held by the citizens of this community. Some of these days, fellows, we are going to hear that our genial friend and wonderful co-worker, Colonel Egan, is going to be made a bigger man than he is today, and so is Floyd Mays; and all we ask is that, when Floyd Mays is made president of a railroad, just as our good friend Vic Boatner has been, they will let him have his office in Vicksburg, for we want to keep him here with us.

"And now, Floyd, I have a word or two to

say to you on the part of this assembled audience which is somewhat personal. When we told them we were going to give a dinner to you and your officials, we also told them we wanted just enough to give you a slight token that you could keep. This token can in no measure express to you the full sentiments that are in our hearts, but we want you to have it, coming from the citizens of your home town, with every bit of love and affection and appreciation that I might express to you, for we realize in you, Floyd, the qualities of the man you are, and I earnestly hope that you will always remember that in the hearts of your community you have an abiding place.

"I take pleasure in presenting to you, on the part of the citizens of Vicksburg, this watch and fob."

Superintendent Mays' Response

When Superintendent Mays arose to express his appreciation of the gift, he was given a rousing cheer. He said:

"Certainly no achievement of mine has merited the honors which you have bestowed upon me this evening. If I have done anything which merits your commendation, believe me, it was only in the line of my duty to the community in which I live.

"To be of service to you is my utmost am-

bition, and I bless the fates which cast my lot among such as you. Words are useless to me on such an occasion as this, and my best response can only be, I thank you."

The representatives of the Illinois Central from out of town who were present at the dinner included: L. W. Baldwin, vice-president; Judge R. V. Fletcher, general solicitor; F. L. Thompson, chief engineer; A. F. Blaess, engineer, maintenance of way; J. F. Porterfield, general superintendent of transportation, and George M. Crowson, editor, *Illinois Central Magazine*, all of Chicago; Colonel A. H. Egan, general superintendent; E. W. Sprague, assistant general claim agent, and W. B. Ryan, assistant general freight agent, all of Memphis.

In addition to Mr. Mays, the following members of the division staff were present: S. F. Lynch, chief clerk; F. H. Anderson, trainmaster; Fred Hattic, general yardmaster; H. R. Davis, assistant engineer; T. C. Carter, general foreman; J. Morgan, foreman, car department; C. S. Roberts, storekeeper; Henry Fletcher, traveling engineer; H. W. Doyle, claim agent, and W. L. Jaquith, freight agent.

Talks were made by Vice-President Baldwin, General Solicitor Fletcher, Colonel Egan and Mr. Crowson.

Vicksburg Division Service During Flood

Residents of the Delta country above Vicksburg, Miss., came to have a new appreciation of what the Illinois Central System means to them when they were threatened with the recent flood waters. Men and materials were furnished for the work of protecting the levees, homeless families were furnished box cars as temporary homes, rapid transportation was furnished for the handling of materials to needed points, and officers and employes generally entered into the spirit of the work in a way which won unstinted praise for the Vicksburg division.

Perhaps the most noteworthy accomplishment of the flood period was that, in spite of the fact that at one time twenty-two miles of main line track on the Cleveland district were under water—with the water thirty-three inches over the top of the rail at the highest point—train service was not discontinued for a single day. Water went over the top of the rail at Smedes and Issaquena, twenty-eight and thirty-four miles above Vicksburg, on April 13. The water

continued to rise until May 5, when twenty-two miles of main line track were under from one to thirty-three inches of flood water. The water fell gradually, and on the morning of May 23 it cleared the top of the rail. Certain trains were discontinued from time to time as track and other conditions required, but throughout the period of high water the Yazoo & Mississippi Valley Railroad continued to operate at least one passenger train and one freight train daily in each direction. These trains carried food, materials and supplies to the stricken district.

During the period of high water the levees were taxed to capacity, and weak places developed from time to time at various points. As a result, the railroad was frequently called upon to perform special train service on from ten to thirty minutes' advance notice. An idea of the volume of this service is shown by the report of Superintendent T. L. Dubbs that the carrying of laborers from one point to another

Flood Scenes on the Vicksburg Division

on the account of the levee board amounted to 381,863 passenger miles.

Several special freight trains were operated from time to time on the Vicksburg and Memphis divisions to handle boats, levee bags, etc. Many shipments of emergency character were transferred from freight cars into baggage cars and handled on passenger trains to expedite their movement.

Newspapers throughout the South commented upon the movement of a special train of twenty-four cars of levee bags from Schenectady, N. Y. to Greenville, Miss., division headquarters, a distance of 1,455 miles, in eighty-nine hours. The train left Schenectady at 2 o'clock on the morning of April 21 and at 7 o'clock on the evening of April 24 it was standing on the team track at Greenville. The sacks were from the army supply base at Schenectady. It is believed that the operation broke the record for the fast handling of a freight train over a similar distance.

Superintendent Dubbs writes that at one time more than 1,600 families were living in box cars furnished by the railroad.

Not all the trouble was encountered on the main line, however. On March 9 the back water from the Yazoo River reached our embankment on the Silver Creek district, and on

March 25 it stood approximately six inches over the top of the rail for a distance of five miles. On March 26 the remaining trains on that district were taken off. On May 29 twelve miles of track were under water, with the water $8\frac{1}{2}$ feet deep in the deepest place. At one time eighteen miles were under water, the greatest depth over the rail being $13\frac{1}{2}$ feet. Train service was not resumed on the Silver Creek district until in June.

Superintendent Dubbs, in a letter to the *Illinois Central Magazine* under date of May 29, said:

"The spirit of co-operation which existed between government officials and employes, levee board officials and employes, railway officers and employes and the general public was one of such complete harmony that it has frequently been said that no better results could have been obtained if all these bodies had been consolidated and operated as one unit."

That the residents of the Delta country, the representatives of the government and the officers of the levee board appreciated the part played by the railroad in the fight against the floods is demonstrated by the numerous letters received by the management. The Vicksburg division can truly be said to have won the thanks of the Delta country.

Movie Show Tried Out on Our Train No. 3

Passenger Department Joins in Experiment to Give New Pleasure to Patrons of the Illinois Central

MOTION pictures on a moving Illinois Central train were demonstrated—purely as an experiment—for the first time on June 7. No. 3, out of Chicago that evening, has the distinction of being that train. The pictures were shown in the diner after all meals had been served.

Few, if any, of the passengers on No. 3 that day knew what a treat was in store for them, but the crew knew, and all the trainmen were more than eager for the performance to begin.

It was nearly 9 p. m. before the last passenger left the diner, and that coach was to be taken off the train about 10 o'clock at Mattoon. That left only one hour to clear the diner of its dishes and tables and to transform it into a theater. Immediately after the last passenger had finished his meal and left the car, the work of transformation began.

J. W. Stevenson, assistant general passenger agent, R. B. Gray, advertising agent, and E. H.

Baker, supervisor of passenger service employes, who were overseeing the demonstration, pitched right into the work with the rest. The waiters carried the dirty dishes to the kitchen, the steward put the soiled linen out of sight, and the others interested in the show took down the tables. The chairs were placed facing forward and four across the car, with a narrow aisle down the center. A small white curtain was hung at the front end, and two portable motion picture machines were set up at the rear. By 9:15 o'clock, the diner really resembled a "movie" house.

The passengers were pleasantly surprised when a porter calmly stepped into their cars and announced: "Harold Lloyd, in a three-reel comedy, 'Now or Never,' is being shown in the diner, at the rear. Admission is free."

There were a lot of "movie" fans on the train that night. Every seat in the diner was taken, and many stood in the aisle.

Before the machines started clicking, the

Making a Theater Out of a Dining Car

diner was given a more complete theatrical atmosphere by shouts of "We want music!" from some of the restless ones. The noisy person who tries to force almost every show to begin by banging his calloused hands together was also there.

Then there was a click, and the diner was in darkness. That brought forth a round of applause. Another click, a whir, a series of many little clicks, and the "movies" were on. The audience was in an uproar, but the picture soon became so interesting that all else was forgotten.

A few minutes before Mattoon was reached, Harold Lloyd had gone through three reels of pleasing antics. When the last click had died away, the audience burst forth in applause. The lights came on as expectedly as in any "movie" house, and the passengers walked leisurely to their berths.

One girl with bobbed hair, painted cheeks and lips, a wad of chewing gum that kept her jaws busy, short skirt, rolled hose and low-

heel shoes (we've often heard the type called "flapper") was heard to remark about the idea of having "movies" on a train: "I think that's cute." And an Illinois Central employe at the other end of the car said: "I've been railroadin' thirty-five years, and I never expected to see 'movies' on a train."

Everyone agreed that the demonstration was a complete success as regards the possibility of showing motion pictures on a moving train. The screen was fastened so that it carried the motion of the car, as were the projection machines. The audience, of course, had the same motion.

The picture was small, about 3 by 4 feet, but very distinct. The light was obtained from the generator of the car.

A report on the experiment has been made to the management for consideration in connection with a proposal to work out a schedule of offering motion picture entertainments regularly to patrons on through passenger trains.

AMERICAN RAILWAY EXPERTS IN ROME, ITALY

An American party at the Ninth Congress of the International Railway Association at Rome, Italy, April 18 to 28. Left to right, front row: Eugene L. Sullivan (Worthington Pump & Machinery Corporation); Samuel O. Dunn (editor of the *Railway Age*); L. A. Downs (vice-president, Central of Georgia); A. S. Baldwin (vice-president, Illinois Central); J. E. Fairbanks (general secretary, A. R. A.); F. K. Vial (American Association of Chilled Wheel Manufacturers); Ernest Lloyd (American Locomotive Company); Miss Pattison; Hugh Pattison (electrical engineer, Illinois Central). Second row, left to right: Count Coruini; Captain Priviteau (Regan Safety Devices Company); Dr. D. Z. Dunott (chemical, medical and surgical section, A. R. A.); D. F. Crawford (delegate of United States State Department); F. A. Poor (president, P. & M. Company); Mrs. Downs; Mrs. Fairbanks; Colonel L. P. Winby (P. & M. Company). Third row, left to right: Mr. Werlich (American Locomotive Company); W. F. Drysdale (Worthington Pump & Machinery Corporation); Miss Tollerton; Mrs. Drysdale; Donald Rose (European traffic manager, Illinois Central). Fourth row, left to right: L. G. Culleton (Worthington Pump & Machinery Corporation); Mrs. Baldwin; Mrs. Dunott; Mrs. Tollerton. Fifth row, left to right: Mrs. Dunn; W. J. Tollerton (chief mechanical superintendent, C. R. I. & P.).—Photograph by courtesy of *The Railway Age*.

Roswell B. Mason, Illinois Central Builder

First Chief Engineer and General Superintendent Was Foremost in His Line in the Early Days

By C. J. CORLISS,

Chief Clerk, Valuation Department, Chicago

COLONEL ROSWELL B. MASON, first chief engineer and general superintendent of the Illinois Central Railroad, and mayor of Chicago at the time of the great fire, was one of the foremost railway builders of the 19th century.

Colonel Mason's earliest ancestor in this country was a member of Cromwell's famous "Dragoons" who emigrated from England and settled in Massachusetts in 1649. His grandfather was a soldier of the American Revolution, and his father was an officer in the War of 1812. Colonel Mason was born on a farm at New Hartford, Oneida County, New York, on September 19, 1805. After leaving the rural district school he attended an academy at New Hartford two winters and studied mathematics and surveying two years at Utica. During his vacation periods he was employed as a rodman on the construction of the Erie Canal.

A Builder of Canals and Railroads

In the spring of 1824 Mason went to Pennsylvania as assistant engineer on the Schuylkill Canal, and later that year ran a survey and prepared maps and estimates for a canal from Lake Champlain to the St. Lawrence River. From 1825 to 1831 he was employed as assistant engineer successively on the Morris Canal, the Delaware and Raritan Canal and the Mauch Chunk Canal. In the spring of 1831 he became principal assistant engineer of the Pennsylvania Canal, and the following year superintendent of a section of the Morris Canal, and then superintendent of the Mauch Chunk Canal, which office he held until the fall of 1836.

The age of railroads was then beginning to dawn, and Colonel Mason turned his attention to this new and promising field of engineering. During the winter of 1836-37 he made a survey for the Housatonic Railroad, and the following spring became chief constructing engineer of that project. The Housatonic road extended from Bridgeport, Conn., to Stockbridge, Mass., and was one of the largest of the early railroads of our country. On the completion of the road he was made general superintendent of operation. He served in that capacity and

Roswell B. Mason

resided at Bridgeport until the spring of 1848, when he was appointed chief engineer of construction of the New York & New Haven Railroad; and when that road was completed in the fall of 1849 he became its general superintendent. During 1847 he was also consulting engineer for the Naugatuck Railroad project, and in 1849-50 he had charge of the construction of the Vermont Valley Railroad.

Building Our Charter Lines

As an engineer and railway executive Colonel Mason then stood in the front rank, and when the great Illinois Central Railroad was projected in the spring of 1851 he was immediately offered the post of chief engineer of construction. This offer was accepted on March 22, 1851, and he entered at once upon the selection of his assistants and the making of preparations for his journey to what was then considered this "far Western country." A corps of seventy young engineers was carefully recruited in New York and New England, and on the 14th of May the chief and his party left New York for Chicago, where they arrived after five days' journey, and the location and construction of "the longest and finest railroad in the world" was soon under way.

The route extended from Cairo to Dunleith, opposite Dubuque, with a branch from near

Centralia to Chicago, a total distance of 705.5 miles. The largest railroad in the country at that time was the New York & Erie, 301 miles in length, and the building of the "Central" was looked upon in that early day of railway development much as we looked a few years ago upon the construction of the Panama Canal or the Trans-Siberian Railway. It was a colossal undertaking, and during the five years which followed Colonel Mason's ability as a railroad builder was tested to the utmost.

How well Colonel Mason fulfilled his great trust the records of the company, the newspaper files of the period and the road itself bear ample evidence. "The substantial, durable and highly satisfactory character of the work under Colonel Mason's direction" was the subject of a special report of Directors Sturgis, Neal, Wiley, Ketchum and Burrall upon the completion of their tour of inspection in the fall of 1853.

The correctness of their observations was confirmed sixty-three years later by Ex-President Stuyvesant Fish, who wrote President Markham in 1916: "It is due to Mr. R. B. Mason and others in the engineering department that I should say to you that I have no recollection of ever having heard of a failure of a bridge on the Illinois Central resulting in the loss of a human life. A good many bridges were in my day carried out by freshets, but I do not think one ever failed under traffic."

Had Almost Complete Authority

With President Schuyler in New York, Colonel Mason was given almost complete authority over the entire project, from the selection of the route to the location of towns and the disbursement of millions of dollars for labor, materials and supplies. And on many occasions, notably before the city councils of Chicago and Galena, he proved a more skillful negotiator than the company's best attorneys. It is due largely to his efforts that the Illinois Central occupies its splendid and unique location on the lake front at Chicago. At Galena he went before a hostile council and amicably adjusted a controversy of long standing after the company's best legal talent had failed. General Solicitor Brayman wrote President Schuyler on that occasion: "That energy of character, tempered with mildness; and thorough knowledge, adorned and half-concealed by unaffected modesty, which so strikingly characterize the acts and intercourse of Colonel Mason, fit him for such a difficult task as this, and he has finished it under cir-

cumstances likely to have defeated most others."

On March 16, 1853, in addition to his other duties, Colonel Mason was made general superintendent of transportation, and in March, 1855, additional executive powers were granted him in Illinois.

An Anecdote of His Career

A characteristic anecdote of the colonel's care and firmness as a railway manager has been preserved. One train had been directed to wait on a side track until another had passed safely by. "How long must I wait?" inquired the impatient conductor. "Wait till your wheels rust off," was the colonel's reply.

On September 27, 1856, the last rail of the charter lines was laid. Colonel Mason tendered his resignation shortly afterward, and it was reluctantly accepted. During the three years which followed he was engaged as a contractor on the construction of the Dubuque & Pacific, the Minneapolis & Cedar Valley and other roads in Iowa and Wisconsin, and in 1860 he became superintendent of the Chicago & Alton and receiver for the Logansport & Peoria Railroad. In the fall of 1861 he returned to the Illinois Central as comptroller of the land department, which office he held until August, 1867, when he became chief engineer on the construction of the Dunleith and

C. J. Corliss

Dubuque bridge. This was completed in December, 1868, and for the next several months he was engaged by the State of Illinois on lowering the summit of the Illinois & Michigan Canal.

In the meantime a political upheaval was taking place in Chicago. Public spirited citizens, aroused over the corruption, extravagance and inefficiency of the city government under the notorious "Hickey Ring," organized the Citizens' Party for Municipal Reforms, and sought as a candidate for mayor "a clean, capable, and courageous business executive who could neither be bought nor sold." They found such a man in Colonel Mason. A strenuous campaign was waged in his behalf, and in the election which followed he received a plurality of 12,000 votes over his principal opponent. On November 2, 1869, he took the oath of office and became thirtieth mayor of Chicago.

A Great Mayor of Chicago

Mayor Mason administered the affairs of the city in a highly efficient manner, enforced the city ordinances without fear or favor, and turned a deaf ear upon every faction or influence which sought to swerve him from his sworn duty. He was truly a mayor of the people and for the people; and, fortunately, his administration occurred at a time when his distinguished ability as an engineer and an executive was most sorely needed. The great fire occurred during the closing days of his term, and it is due to his skillful handling of the situation that portions of the city were saved from destruction and untold suffering and loss of life was prevented. His residence stood for many years at the southwest corner of Michigan Avenue and Twelfth Street, opposite the present Illinois Central station, and for several days following the fire it was a beehive of activity as the temporary headquarters of the city government.

On November 7, 1871, Mayor Mason was succeeded by Joseph Medill, editor and publisher of the Chicago Tribune, and for the first time in his life he decided upon a temporary respite from his labors. That winter he and Mrs. Mason sojourned in Southern California, and the following summer they toured Europe with a party of distinguished Americans. Upon returning to Chicago the colonel established an office as consulting engineer at 94 Washington Street, and that was his headquarters for the balance of his life. His habits were always simple and temperate, and his days were

prolonged with remarkable vigor beyond most of his contemporaries. When past 80 years of age he was active as president of the Chicago South Branch Dock Company, and his opinions on engineering questions were constantly being sought and safely relied upon.

He Was a Noted Churchman

Colonel Mason was for many years an elder in the Fourth Presbyterian Church, and was one of the incorporators and a life-long director of the Presbyterian Theological Seminary of the Northwest. In 1872 he became president of the Western Presbyterian Publishing Company, and from 1873 to 1883 he was one of the trustees of the Illinois Industrial University. He died at his new home at 27 Delaware Place on January 1, 1892, at the age of 86, and his remains now rest in Rosehill Cemetery in this city. One of his sons was killed on the Rock River Bridge at Rockford, Ill., in 1855. Another son, Edward Gay Mason, was a distinguished lawyer and historian and was for many years president of the Chicago Historical Society. Another son, Henry B. Mason, and at least three grandsons are now honored members of the Chicago Bar; and another grandson, Julian Mason, formerly editor of the Chicago *Evening Post*, is now editor of the New York *Tribune*.

HAVE YOU EVER THOUGHT

If nature has given you a little temper, be careful not to lose it.

Life is a burden to those only who have nothing to carry.

Bachelors speak of marriage contemptuously—married men do not mention it.

Failure exists only when it is recognized.

If you wait for things to turn up, you're sure to be turned down.

You don't have to go to the back door if you really have something worth delivering.

Even the stingiest man sometimes gives himself away.

It's better not to jump at a conclusion until you can see it.

The interest on borrowed trouble is generally usurious.

The foolishlest fool is the fool who fools himself into thinking he is fooling others.—V. T.

A MOTTO

The man who will do as much today as he is going to do tomorrow will get things done.

Honored for Good Work in Saving of Fuel

As a reward for unusual interest in fuel-saving during the last year, two enginemen from each of the grand divisions attended the International Railway Fuel Association meeting at Chicago May 22 to 25 at the company's expense. In addition, each one was given free membership in the railway fuel association for the year.

The enginemen who carried on the good work of fuel-saving to their fellow employes on the Northern, Western and Southern lines and the Yazoo & Mississippi Valley are: Northern Lines, Frank Gallagher, engineer, Clinton, Ill.; J. E. Beasley, fireman, Carbondale, Ill. Western Lines, A. G. Haines, engineer, Fort Dodge, Iowa; E. R. Fortsch, fireman, Waterloo, Iowa; Southern Lines, S. J. Rice, engineer, Memphis, Tenn.; O. F. Montgomery, fireman, McComb, Miss.; Y. & M. V., Elmer Lees, engineer, Natchez, Miss.; J. D. Coffey, fireman, Vicksburg, Miss.

Frank Gallagher entered the service as a

fireman August 30, 1890, and was promoted to engineer October 16, 1895.

J. E. Beasley entered the service as a fireman January 24, 1916, and was promoted to engineer January 11, 1921.

A. G. Haines entered the service as a fireman October 7, 1879, and was promoted to engineer October 16 1885.

E. R. Fortsch entered the service as a fireman January 19, 1910.

S. J. Rice entered the service as a fireman December 11, 1902, and was made an engineer November 10, 1906.

O. F. Montgomery entered the service as a fireman November 25, 1915, entered the United States Army May 24, 1918, and returned to the Illinois Central service May 26, 1919.

Elmer Lees entered the service as an engineer November 2, 1893.

J. D. Coffey entered the service as a fireman June 5, 1918, and was promoted to engineer September 4, 1921.

The Dollars and Cents Side of a Home

Ownership Brings a Man Thrift, Good Citizenship, Confidence, Loyalty and Business and Social Standing

By W. L. LARSEN,
Chief Accountant, Master Mechanic's Office,
Waterloo, Iowa

EVER since I was old enough to realize some of the hard battles of life that were ahead of me, my first thought was: When I get married I must have a home. I always figured on giving the girl of my choice, who was to share her life with me, just as good a home and place to live in as I took her from. But when I got married and was ready to settle down, my hopes were not realized.

I entered the service of the Illinois Central in 1914, when I was 21 years old. I worked hard and steadily, saved all the pennies I could and had a nice little nest-egg stored away, when in 1917 the World War came. On April 28 of that year, I enlisted in the service of Uncle Sam and worked for him until May 18, 1918.

After Uncle Sam was through with me, I was again given my old position with the "Old Reliable," the Illinois Central Railroad. I was married in February, 1920, just at the time when prices were at their peak. The little nest-egg I had laid away all went to furnish a 3-room apartment, which was the best I could get at that time.

Hoped to Own a Home

We lived in the apartment for one year, and paid \$38 a month rent. I was getting only \$112.50 a month, but my wife worked for some time after we were married to help us get a start, which helped considerably to keep the wolf from the door and to save a little for the future.

All the time we lived in the apartment our motive and ideal was to have a home of our own. We were not contented with being cooped up inside all the time and saving "rent receipts." We always considered money paid to our landlord and the rent receipts that we received in return as poor expenditures. Our friends were nearly all owners of their own homes, and they always tried to persuade us to invest and own our own home. But the venture on this proposition seemed too much of a responsibility.

The Larsen Home

We stood it as long as we could, and in the spring of 1921 various real estate dealers took us out as prospects for buying a home. The more they took us out, the more we desired to buy, but after we talked the matter over, on all of our return trips from looking at homes, we didn't have the nerve to venture on buying, thinking we couldn't handle a proposition of this kind.

Helped by Building and Loan

Finally we found a place, the bungalow we now live in. This was to be our first home; it suited us in all ways, and badly did we want to buy; but, as I said before, we always thought: How can we get the money and can we make our monthly payments? I got busy and counted my pennies, which we found enough to pay the owner his equity, and the balance we carried in the building and loan association. My total loan from the Waterloo Building and Loan Association is \$2,800. On this I pay \$32.67 a month.

Many employees do not understand the proposition as offered by the building and loan association. In my case, of the \$32.67 that I pay each month, \$18.67 pays interest on the \$2,800, and \$14 goes to apply on the principal. On the money that I pay in on the principal, I get a guaranty of 7 per cent interest compounded semi-annually, but the rate of interest generally amounts to more than 7 per cent, as it is based on the prosperity of the company. My accumulated interest every six months is added to the money I am paying on the principal.

In other words, the building and loan association lent me \$2,800 at the rate of 8 per cent interest, while I, in turn, am lending the building and loan association \$2,800 in payments of \$14 a month at a guaranty of 7 per cent interest. If I desire to make larger payments at any time, I am credited with the additional amount I deposit at the same rate of interest I receive on the principal.

By virtue of this proposition, I give the building and loan association credit for the possibility of my owning my own home.

What a Home Owner Has

"Do you own your own home?" Many times have I been asked this question, and I am proud to be able to answer in the affirmative.

Owning one's own home establishes in a man five things: thrift, good citizenship, confidence, loyalty to his community and credit for himself in the business and social world.

Thrift applies to me in the payments that I make on my house, which I consider as a savings account. The more I can pay in on my home each month, I figure, that much more am I saving. Thrift also applies to the upkeep of my place. The better I can make it

look, that much more of an impression upon the public can I make that I am thrifty. The nicer I can keep my lawn and the more shrubbery I can place in it, that much more does my thrift show itself.

By good citizenship, I mean, more attention do I pay to public administration and to help make my city just a little better than the other one, by helping put into office the clean, conservative officer for the benefit of myself and property. I am led to favor the proper upkeep of public roads and property and a clean administration, both as to social conditions and conservation of public funds, funds to which I contribute by payments of taxes.

Home Owning Gives Confidence

By owning my own home and now being satisfied that I have been able to handle my payments upon it, and keep up the other necessary expenses which are incurred in connection with owning a home, without serious difficulties, I have gained confidence in myself to do other things equally as large.

By loyalty to the community I mean: Do unto your neighbor as you would have him do unto you, and always try to establish friendship and good will with him.

My fifth and last point is credit in the business and social world. Credit by business men is a mighty nice thing to have in your home community, and this can be obtained much more easily if the business man knows you are a resident of the home town and a taxpayer. One's social standing in the various social organizations is rated better when they know you own your own home.

However, there are those who argue that renting is more economical than owning your own home. There is a man of my acquaintance who firmly believes in the former. His arguments are as follows: High taxes, loss of interest on investment and decrease in value of property. As a matter of fact, he has paid rent for about nine years and has nothing to show for it. If he had applied this rent money in payments on a home, he could have had it paid for by now, and the money he is paying in rent at the present time could be applied on improvements on his home and in a savings account.

The Larsen Family

If you have a man working for you who is not fired with enthusiasm and you cannot fire him with enthusiasm, then promptly fire him with enthusiasm.—*Exchange*.

Uses His Head in Jackson, Miss., Yard

R. W. Hardin Finds That System and Efficient Co-Workers Get Results in True Illinois Central Style

WHEN R. W. Hardin, general yardmaster at Jackson, Miss., first went to work for the Illinois Central System in 1899 as a switchman in the yard at Clinton, J. F. Porterfield, now general superintendent of transportation, was trainmaster at that point. Mr. Porterfield has been in close touch ever since with Mr. Hardin's work, and when he was asked for the key to the latter's success as a yardmaster his answer was:

"System. Hardin uses his head. He is a hard worker, and he gets along well with his men, and both of those things contribute to his success, but the principal thing is that he studies his job, maps out his work and the work of his forces, and goes to it. He isn't much of an advertiser of what he does, but he does things."

And so, when a representative of the *Illinois Central Magazine*, assigned to write a story about General Yardmaster Hardin, went to Jackson, he asked him to explain his system.

Gets on the Job Early

"My system of running the yard is to get on the job early and look the situation over so that when the engine foremen report for work I will be in a position to line them up for the forenoon tour," Mr. Hardin said. "Sometimes I don't see the engine foremen again until lunch time, but I keep a line on the work performed through the switch tabs and yard checks."

"I also believe that when an engine foreman or a clerk does a good day's work or makes a good suggestion he should be told about it and patted on the back. Boquets cost nothing and they are worth a lot. On the other hand, if a man fails in his work I tell him about that, too, and not exactly in bouquet language. In my earlier days I was a Sunday school teacher, but there are times when a Sunday school teacher and a yardmaster are two different persons."

The yard operation problem at Jackson is quite different from that of most other Illinois Central System terminals.

"We do not handle so many cars at Jackson as most other terminals in proportion to the number of engine hours worked," Mr. Hardin

General Yardmaster R. W. Hardin, in the uniform of a Knight Templar.

said. "Jackson is largely an industry and interchange yard. We have more than fifty industries, to say nothing of team tracks and house tracks, including five of the largest oil mills in the state."

"Jackson is not such a small place as some of our people may think. Our station earnings for May, exclusive of passenger business, were more than \$600,000."

Ice 70 Cars at One Spotting

Our icing facilities at Jackson, according to Mr. Hardin, are the most up-to-date on the railroad. The Illinois Central has a \$50,000 ice ramp, and seventy cars can be placed for icing at one spotting. Between April 6 and

the first week in June the Jackson forces initially iced more than 1,600 cars and re-iced more than 2,000 cars. About 150,000 tons of ice were used. Jackson is the distributing point for cars to the vegetable producing territory centering about Crystal Springs and Hazlehurst. In addition to our own lines, cars

are iced at Jackson and distributed for loading to points on connecting lines in that territory.

Eight engines are in use in the yard operation at Jackson, two 180-class engines and six of the 400-class, the old "muzzle-loaders." Including a transfer gang of ten men, there are

The day yard clerks and part of the night clerks, Jackson yard. Left to right: L. Agnew, line-up clerk; C. E. Boyington, night interchange clerk; W. P. Cooper, night chief clerk; J. W. Whitley, A. & V. interchange clerk; T. N. Swafford, G. & S. I. interchange clerk; E. E. Hardy, chief clerk; E. J. Weber, day call boy; R. E. Dees, line-up clerk; S. Hester, assistant yardmaster; J. E. Masters, night yardmaster; Mrs. J. Ball, stenographer; R. W. Hardin, general yardmaster.

The day yard men and engine crew, and part of the night crew, Jackson yard. Left to right, standing: R. W. Hardin, general yardmaster; S. Hester, assistant yardmaster; J. E. Masters, night yardmaster; E. A. Fleming, engine foreman; J. R. Foreman, engine foreman; J. E. Henry, engine foreman; L. B. Hill, switchman; W. C. Agnew, engine foreman; Moore, fireman; Frank Duffy, engineer; H. Bowen, engineer; F. Gardner, switchman; D. H. Sims, switchman. Sitting, second row: R. W. McElwee, engine foreman; E. A. Comfort, engineer; M. Berberovich, engine foreman; E. I. Whittington, engineer; L. A. Thompson, engine foreman. Sitting, first row: Arthur Mallett, switchman; Jim Baines, fireman; John Blake, fireman; John Bell, fireman; Simon Stevens, switchman; Aaron Fields, switchman.

Two views of the ice ramp in the yards at Jackson, showing its length and the manner of delivering ice to refrigerator cars.

seventy employes under the jurisdiction of the general yardmaster.

"We have the best night yardmaster, I think, on the railroad," Mr. Hardin said. He is J. E. Masters. "You can see him any time of the night with his hat off and in the game. I always figured Ed Clements at East St. Louis was the best assistant yardmaster of the system, but we have his equal in S. Hester at Jackson."

And again from Mr. Hardin: "Speaking of co-operation between the agent and the yard force, co-operation is the first word in our dic-

tionary. J. L. Morgan and I work together like brothers. Jim is one of the best and biggest agents on the railroad (he weighs about 250 pounds), and he is as much interested in saving engine hours in the yard as he is in saving man hours on the platform."

Has Had Varied Experience

It is told above how Mr. Hardin began his service with the road twenty-three years ago at Clinton, under Trainmaster Porterfield. From switchman he became engine foreman, and then night yardmaster. When Mr. Porterfield was appointed superintendent at Vicks-

How This Story Came to Be Written

Several months ago we published a story about the porter who was found asleep in the wreckage of a train that had been derailed and who said, replying to his astonished questioners: "Yas, boss, I did feel sumpin' kind of jolty; but I t'ought dey was a-puttin' on de dinah at Jackson." General Yardmaster Hardin probably never will hear the last of that story. In a few days he received about fifty copies of that page of the magazine.

But, if anybody thinks the story about the porter applied to Jackson, Miss., he's wrong, for Jackson has been making a wonderful record in handling equipment without damage. Yardmaster Hardin declares that a switch crew hasn't broken a water glass on a diner in many, many months, and as for the entire record of damage to equipment just glimpse the following, which shows damage to equipment in the yards at Jackson since Mr. Hardin has been there, as compiled from the Form No. 1480 reports:

	1918	1919	1920	1921	1922
January		\$369.22	\$189.76	\$12.82	\$25.00
February		225.70	179.11	90.36
March		194.57	88.70
April		113.65	242.95	6.07
May		18.64	210.07	6.75	17.34
June	\$468.38	19.54	300.68	16.44
July	185.81	57.51	73.47
August	492.61	102.69	70.05
September	222.95	55.19	114.63	59.83
October	245.94	16.86	71.19
November	409.65	69.43	8.07
December	497.59	61.21	51.96	6.85

burg, in April, 1905, he took Mr. Hardin with him as night yardmaster at Vicksburg. Two months later Mr. Hardin became general yardmaster at that place. Yardmaster Hardin had a real job to manage at Vicksburg, but he acquitted himself well. He stayed at Vicksburg and at Memphis until November, 1911, and he was appointed night yardmaster at East St. Louis, January 1, 1912, under Superintendent Porterfield, who had been assigned to the St. Louis division. A month later he was made general yardmaster there. In June, 1912, Mr. Hardin left the Illinois Central System and worked for the Terminal Railroad Association as switchman and assistant yardmaster, but in 1915 he returned as night yardmaster at Wallace yard under Superintendent J. F. Dignan. Then he became assistant yardmaster, and in June, 1918, he was appointed to his present position.

"I am well pleased with my last change," Mr. Hardin said. "Jackson is a good town, and we have good people to work with and work for here. I consider that we have the most efficient yard men and yard clerks on the system."

A yardmaster, in Mr. Hardin's opinion, must be, first of all, a student of human nature. He must love men, and love to work with them. Next, he must know the routine of yard work thoroughly.

"A man experienced in yard work can almost always find places to take up lost motion, if he applies himself to the job," Mr. Hardin says. "And that's what it takes to run a yard successfully."

As to whether Mr. Hardin is making a

A yard crew at Jackson, Engine No. 188. Left to right: Jim Baines, fireman; Frank Duffy, engineer; Aaron Fields, switchman; J. E. Henry, helper; W. C. Agnew, engine foreman.

A yard crew at Jackson, Engine No. 507. Left to right: John Blake, fireman; E. I. Whittington, engineer; Simon Stevens, switchman; L. B. Hill, helper; E. A. Fleming, engine foreman.

success of running the Jackson yard, just ask any of our people on the Louisiana division.

NO COMPLAINT

It was noon. The streets were jammed.

At Sixth and Main streets, a man hurrying back to his office observed a well-dressed youth standing on the curb. He was groping his way with a cane. The one in a hurry paused and, observing the other was blind, asked:

"Can I escort you across the street?"

"Thank you," the sightless youth replied.

Midway they were stopped by the traffic.

"It is a beautiful day; the sun is again with us," the escort said.

"Yes, indeed; I have no complaint," the blind boy said.

The other, blessed with two good eyes, left the sightless one safely upon the opposite corner and departed for his work. He had a new vision: "I have no complaint."

Truly, it was a "bracer" that many of us need.—Los Angeles (Cal.) Times.

Watch the Deadline!

Material for the magazine is still being sent in after the 15th of the month, in spite of warnings to the effect that the 15th is the deadline for magazine material. Obviously, material arriving so late will have to hold over a month, maybe longer.

How Our New Mechanical Stokers Work

An Explanation by the Manufacturers and a Paper on Operation by Traveling Engineer J. McIntyre

SINCE our new 2-10-2 locomotives, the 2901 class, came to us equipped with mechanical stokers, considerable interest has been shown over the system in the operation and care of these up-to-date aids to efficient firing. Properly handled, the mechanical stoker is a fuel-saver; but it can also waste coal in an alarming manner, if not properly handled. With these stokers it is possible to feed the fire-box 7,200 pounds of

coal an hour. Each revolution of the elevator puts six pounds of coal into the fire-box, three pounds on each side. The piston which operates the elevator will make twenty strokes a minute, thereby feeding the fire-box 120 pounds of coal a minute.

The Duplex Stoker, with which these locomotives are equipped, prepares its own coal by breaking the lumps to a proper size for economical firing. It is designed to handle all

kinds of coal, including lignite, anthracite mixtures and bituminous slack or lump coal of proper size for hand firing.

Operation of the Duplex Stoker

The accompanying illustration will give some idea of how the stoker operates.

The coal in the tender falls through an opening in the shovel sheet to the conveyor trough (1). The coal is then carried forward by the conveyor screw (2), then through the crushing zone, where it is forced against the crusher (4), and broken into a suitable size for firing.

The coal, having been prepared for firing, then passes into the transfer hopper (9), where it is divided equally or unequally, according to the position of the dividing rib (18), between two elevator screws (11), which elevate the coal and drop it into two distributor tubes (15), fitted into elbows (16 and 17), and extending into the fire-box through holes in the back-head on each side of the fire-door.

The coal thus delivered to the distributor tubes (15) is then carried forward by a constant steam jet pressure which spreads the coal evenly over the grate area.

How Distribution Is Controlled

The distribution of the coal is controlled by varying the steam pressure at the jets and by adjusting the dividing rib in the transfer hopper (9). The amount of coal delivered to the fire-box or the rate of delivery of the coal is controlled by varying the speed of the stoker engine.

The elevator screws are driven by gears which mesh with the driving rack (24), and the conveyor screw is driven by a driving shaft, also meshed into the rack and connected to the conveyor screw through a series of drive shafts (27) and gears (31 and 32) at the rear of the conveyor trough.

Through a system of ratchet wheels and pawls, motion is imparted to the elevator and conveyor screws. By operating the elevator pawl shifters (13) and the conveyor reverse lever (21), one or all of the screws can be started, stopped or reversed, each one independently without affecting the others.

Some General Suggestions

The Locomotive Stoker Company of Pittsburgh, Pa., which manufactures this stoker, gives the following general suggestions:

1. See that the fire is clean and in good condition before leaving the terminal.
2. Build up a good fire with your shovel.

3. Do not feed iron, rocky slate, wood or waste through the conveyor.

4. When the train is standing on sidings, shut steam off the stoker.

5. Close the tank slide openings before taking coal on the tender.

How to Leave the Stoker

The duties of the fireman on arrival at terminals are outlined as follows:

1. Before leaving the stoker engine on the fire track, see that the slides in the tank are closed.

2. When nearing the terminal and after closing the slide plates, the driving engine should be run long enough to remove all coal from the conveyor.

3. Before giving up the engine, place the conveyor reversing lever in center or neutral position and run the vertical screws to empty the elevators of coal.

4. Close all steam valves to the stoker engine.

The following paper on the operation of the stoker was prepared by Traveling Engineer J. McIntyre of the Springfield division. It covers preparing the fire, stoker firing and maintenance, the latter divided as to daily and monthly inspection.

The fireman should always be on his engine at the required or specified time and examine the condition of his fire the first thing. If the fire is not level at the pit, the fireman should loosen his grates sufficiently to break up or crack the coke formation. This will let the air through and burn the fire down to a level bed about two inches thick.

If the fireman takes care of the fire the first thing, the fire will take care of itself while the fireman is doing his other work. If the fire is not level at the pit, the fireman should always loosen the grates and use the shovel in the low or bare spots.

The stoker should not be used when leaving the pit unless the fire-bed is light and level, and then it should be run very slowly in order to insure good distribution. The secret of success with a locomotive stoker is to get away from the pit on the right foot.

How to Oil the Stoker

Do not oil the stoker while it is not running. When the stoker is oiled on the pit, all the screws should be placed in the neutral position and the engine run idly while oiling. This is the most economical way to oil the stoker, because the oil will thoroughly swab or

run over all parts, and it will not do this if the machine is standing. The stoker requires a little oil about every two and one-half or three hours, but it is a gross waste of oil to oil the machine excessively when it is standing at the beginning of a trip and then not to oil it any more during the trip. That is neglecting the machine.

Before leaving the pit or roundhouse track, be sure the slide to the conveyor is open. While going to the yard, run the stoker until the coal appears at the distributor tubes.

Important to Start Right

In stoker firing, a thin, level fire should first be built up with a shovel. In leaving the yard, care should be taken that the fire is not crowded, because this is very easily done with the stoker. The fire should be watched closely the first few miles, and then the fireman will know that his stoker is going and he can make the remainder of his trip in solid comfort. He won't have any trouble, because he has started from the roundhouse right. That is the secret of success in stoker firing—get started right.

If the engine is properly drafted, with units tight, no air leaks around the front end and the grates and grate rigging in good condition, the condition of the fire is up to the will and pleasure of the fireman. The stoker will do all the work except the brain work, and there are even times when a fireman expects it to do part of that.

Watch the fire closely to ascertain if any clinker formation starts; if so, move the grates sufficiently to break up the clinker before it gets heavy, and there will be no further trouble. The stoker fired engine should never be crowded with coal, but this is sometimes done by a poor or careless fireman. One scoopful of coal placed in a fire-box by hand cannot be distributed over six square feet of surface, but half of this amount placed in one of the 2901 class engines by a stoker covers the entire grate area, or eighty-eight square feet.

The fireman should study the engineer's way of handling the engine and run his stoker accordingly.

Stoker Should Run Steadily

The stoker should not be run fast and then shut off, because this causes a variation in boiler pressure. Continuation of such a practice will sooner or later cause side sheet or flue trouble, because letting the fire die down while the engine is worked hard causes a sudden change in temperature in the fire-box.

The stoker should be handled the same as an

injector—that is, to say, it should just supply the boiler requirements and no more. Stoker fired engines should be fired and handled to avoid raining black smoke, and the pop valves should be left seated at all times except in case of an unexpected stop.

Some firemen crowd the fire because the machine puts the coal in so easily, and some engineers bear down on an engine for the simple reason that it is stoker fired. An engineer should run his engine at an economical cut-off regardless of the fact that it is stoker fired.

Must Get Use Out of Coal

The fireman should keep his ash pan shelves clean, so that the free passage of air will not be restricted.

If the fireman will glance at his coal pile once in a while, he may find some foreign matter in the coal and get it before it gets down into the conveyor screw.

When the trip is completed, close all slides in the tank and run all the coal out of the stoker. The slides must be closed in plenty of time before the trip is quite completed; when the engine is entering the yard is a good time. The coal must not be run into the fire-box for the sole purpose of cleaning out the stoker, but must be made to evaporate water into steam advantageously.

The matter of maintenance can be divided into daily and monthly inspections.

A. Daily Inspection

1. See that the conveyor and the elevator are free from coal and that all slide plates over the conveyor are closed.

2. Start up the stoker engine and note the general condition of the machine, paying particular attention to the following:

- A. See that right and left elevator and conveyor drivers will perform their function in neutral, drive and reverse positions.

- B. See that the driving engine will reverse properly, using the operating rod on the back head of the locomotive boiler.

- C. Try both steam gauges.

- D. See that drain valves in the stoker line close properly when steam pressure is turned on.

3. See that distributor tubes are pulled right against the elbow.

4. Inspect oil pipes for broken or loose connections, and see that oil cups are free from dust and dirt.

5. Inspect the stoker engine for steam leaks.

B. Monthly Inspection

1. Examine the distributor tubes; tubes with ends burned off are to be replaced.

2. Examine the steam jets to see if they are plugged or if the bridge between the holes is worn. In renewing jets, care should be taken to see that the holes are $\frac{5}{8}$ inch off the bottom of the distributor tubes.

3. Examine the driving rack and notice if it is receiving sufficient lubrication.

4. All oil pipes should be inspected to see if they are stopped up.

5. Examine piston rod packing.

6. Examine bolts connecting the coupling and the conveyor screw at the rear end of the trough.

7. Examine cotter keys in the conveyor drive shaft to see if they are properly spread so that the pins will not work out.

8. When the stoker is running, if the cylinder gauge shows an excessive amount of steam to run the stoker light, the exhaust line in the smoke box should be examined to see if this is plugged with burned grease.

9. Examine all bolts and nuts around the transfer hopper, particularly where it is bolted to the locomotive frame.

10. Test the limiting valve, which should unseat at 75 pounds.

11. Test the cylinder gaskets under load at 75 pounds pressure.

12. Remove the differential valve and inspect it thoroughly.

13. Remove the operating valve and inspect it for worn, broken or missing rings.

14. Examine the pawl springs in elevator and conveyor pawl casings.

15. At drawbar inspection, examine the grease in the gear casing at the rear of the conveyor trough.

TO HANDLE LEGION MEETING

A pamphlet issued recently by the passenger department announces that plans have been made for the establishment of another Pullman city by the Illinois Central System at New Orleans. This time, it will be for the comfort of those who attend the American Legion convention, October 16 to 20, 1922. The booklet has many beautiful illustrations that point out the places of interest at our Southern terminal, and it describes in detail the facilities of the city on wheels which was established during the triennial conclave of the Grand Commandery, Knights Templar, April 24 to 27, 1922. It is addressed to the members of the American Legion with "Let's Go, Buddy!"

Employees Own 900 Homes at Waterloo

More Than Half Are Out of Renter Class; How One Young Man Does It on a Salary of \$115 a Month

WATERLOO, Iowa, is blessed with a large number of homes of the employees of the Illinois Central System. Probably 60 per cent of the employees there own their own homes, and those houses lend their share toward giving Waterloo its reputation as a city beautiful. There are perhaps 1,500 employees at Waterloo, and that means about 900 homes.

Incidentally, the Illinois Central employees at Waterloo have sound credit. They are respected, trusted and called upon for their opinions in civic matters of importance.

There's food for thought in that. It may be that home-owning has something to do with it.

Probably the most unusual case of thrift at Waterloo is a young man employee who is paying for a \$5,000 home while his salary is only \$115 a month.

Didn't Like Apartment Life

In 1920 this young man had fallen heir to \$2,600, and he was making \$130 a month. He married and rented an apartment for \$35 a month. There was no furniture to buy, for his wife's mother had left her enough to serve their immediate needs. They lived in this apartment for a year and a half. Apparently there was little difficulty in financing the home. A \$200 doctor bill was paid, and a few small pieces of furniture were bought during that time.

But living cooped up in an apartment house soon became boresome, he says. In reality, the apartment was merely a place to sleep. The two spent little of their time at home. They had meals out, and they came to feel that they had to go away from home to have freedom.

Then, too, the young man says, he grew weary of seeing canned fruit on the shelves in his clothes closet and the broom and sweeper behind the bath tub.

It is no surprise that this man and his wife began to figure on the amount of rent they were paying in comparison with the amount of money other young couples were paying each month toward owning their own home. An examination disclosed the fact that the money paid for rent was slightly more than the amount others were paying toward their homes.

Six weeks of home-hunting followed, against the protests of many friends. The young man was advised that he was to receive a cut in wages on July 1, 1921, but he disregarded that sad news in view of what he and his wife thought was the best course.

There were no homes to suit them in Waterloo. The properties shown to them were in poor locations, poor structures or priced too high. So they decided to build.

In a book, "American Homes Beautiful," they found just the home they wanted. It was roomy and looked to be a building that could be constructed within their means.

A contractor estimated the cost of that house to be \$5,000. In April, 1921, a 43-by-100-foot lot was purchased for \$750, and arrangements for building the house were made. The contract called for the payment of \$2,500 within two weeks after excavation had started and the balance when the house was completed and accepted.

The young home builders knew that they did not have enough money to carry out the terms of the contract, and they planned to fall back upon the building and loan association if the contractor made urgent demands.

Went Into Building and Loan Plan

After the lot was purchased, there was only \$1,850 left in the little fortune. Upon a demand for payment, the young man borrowed \$200 from his father, paid the contractor \$2,000 and agreed to go into the building and loan association so that the remainder of the money could be had when the contractor wanted it.

The contractor was in need of money, the same as many other business men at that time, but he was lenient with his young client.

The balance of the money for the payment on the house was obtained from the building and loan association, and the young man agreed to pay the association \$32.66 each month.

Then came the cut in salary to \$115 on July 1, 1921. What was left of the salary after the payment on the home was taken out—\$82.34—was not much to live on, but the wife came forward with a budget system that solved the problem.

She allowed 25 per cent of the money to be

spent for food, 11 per cent for shelter, including coal, light, water, taxes, etc., 12 per cent for clothing, 11.7 per cent for general operation, 32.04 per cent for advancement, including newspapers, magazines, insurance, donations, etc., and 8.26 per cent for miscellaneous items.

Budget System Worked Well

The system could not be followed exactly, but when the expenditures exceeded the limit in one place they were held down below the allowance in another.

The percentage allowed for food was found to be more than sufficient. A fireless cooker helped solve the problem in the kitchen.

The percentage allowed for clothes was far too small for the purchase of the clothes they had been used to. So the wife learned to sew.

As time wore on, the budget system came to be followed more closely. Today the home

makers are meeting all expenses. It is true that they are making great sacrifices, but they are happy—very happy. They sit down together of evenings, plan, figure, decide to economize here and there, and they profit in more ways than one by these business meetings.

When the smoke had cleared from the barrage of advice as to the foolishness of this young couple in buying a home, an intimate friend said, "Well, they are young, and it is the only way for them to get ahead."

Many homes in Waterloo are being bought by the aid of the building and loan association. In fact, it is said that probably more than half of them are paid for in this manner.

How the Loan Feature Works

Payments to the building and loan association are usually about \$33, but, of course, that varies according to the amount borrowed.

Where the payment is about \$33 a month,

DISTINGUISHED M. D.'S USE DAYLIGHT SPECIAL

Judd, Rochester, Minn.; Doctor Adson, Rochester, Minn.; Dr. Jerre Watson, Anniston, Ala.; Dr. H. Helmholtz and Dr. E. Starr Judd, Rochester, Minn.

Homes of employes at Waterloo, Iowa. 9, F. R. Cooley, conductor, 433 Logan; 10, Herman Becker, roundhouse foreman, 223 Logan; 11, H. G. Brown, trainmaster, 346 Vine; 12, A. J. Fairburn, engineer, 627 Lime; 13, C. E. Horsely, assistant roundhouse foreman, 612 Sumner; 14, Henry S. Bunnell, carman helper, 635 Sumner; 15, A. Feisner, boiler foreman, 623 Sumner; 16, C. S. Jackson, switchman, 701 Broadway.

\$14 goes as payment on the principal and the balance as payment of the interest on the principal. The interest charged is 8 per cent. In turn, the association guarantees 7 per cent interest on the money that is paid in to apply on the principal. Often this percentage of interest goes over 7 per cent, but never under. It is regulated by the prosperity of the company. The interest paid by the association is compounded every six months and applied to the principal.

In other words, the building and loan association lends a man the desired money in a lump sum at 8 per cent interest, and the man, in turn, lends the association the same amount of money in monthly payments of \$14 at a fraction less than 8 per cent interest. The man pays only a fraction of 1 per cent interest for the privilege of having the money he desires in a lump sum.

Then there are those in Waterloo who are buying their homes through the real estate dealers. Many are buying their homes on just as easy terms in this manner as others are in the building and loan association. A typ-

ical case is that of T. R. McNeil, a brakeman, who took over payments on a home.

Mr. McNeil married in July, 1920, and rented an apartment at \$35 a month until December 3, 1921. He learned of a friend who had been paying on a home but was about to let it drop. Mr. McNeil got in touch with him and learned that \$466 had been paid on the \$4,500 home. The friend accepted \$250 from Mr. McNeil for the title to the \$466 paid in, and Mr. McNeil took up the payments of \$30 a month on the home.

The total cost of his home, Mr. McNeil says, is not more than \$50 a month. That includes insurance, taxes, etc. When he rented, he paid \$35 a month for a place to sleep. Now he is paying but \$15 a month more and has ample room for a chicken yard, a garden and a place to do as he pleases.

The income from his chickens and the money saved by his garden more than make up the difference between his payment now and the rent he paid. And, at the end of a definite time, he will have his little home all for himself.

Our Rules for the Proper Storage of Coal

The following rules about unloading and caring for storage coal have recently been issued from the office of Vice-President L. W. Baldwin:

1. Ground upon which coal will be stored must be firm, level, clean and properly drained.

2. No drainage should pass through or under storage coal piles.

3. Coal unloaded into storage should not be placed on loose cinders, against wooden posts, wooden trestle bents, hot or warm pipes or flues.

4. Coal unloaded into storage must not be placed in piles to exceed twelve feet in height and thirty-six feet in width at the ground level, limiting piles to 1,500 tons, with clear space of at least five feet between piles.

5. Do not ventilate storage coal piles by artificial methods.

6. When unloading coal of different sizes, place each size in a separate pile.

7. When unloading coal of the same size from different mine fields, coal from each field should be placed in a separate pile.

8. To avoid excessive breakage, coal from

the grab buckets of cranes must not be dropped to exceed three feet when making piles.

9. Do not move coal once placed in storage unless absolutely necessary.

10. The temperature of coal in storage should be taken at least once each week, and oftener if necessary, using either the thermometer or the rod method.

11. Where coal is stored under cover, the structure should be well ventilated to make possible the escape of the gases which are given off.

12. Under no circumstances should water be applied to a heated coal pile. Heated or fired coal should be removed and used or extinguished by well scattering and then applying water.

THE AIM WAS WILD

Judge Priest—Parson, that turkey you sold me yesterday wasn't a tame one, as you claimed it to be, for I found shot in it.

Parson Brown—Judge, dat was a tame bird, just like I sed it was; dem shot was meant for me.—*Judge.*

Our Railroads Are Big

THE railway tracks in the United States would reach very nearly to the moon and return and a locomotive with thirty-five cars behind it could be placed at 7-mile intervals along that whole distance merely by using the equipment now in use on American railroads. Two hundred side tracks extending from New York to Philadelphia would be required to hold the freight cars of this country alone.

Nor is the passenger equipment small. If the 56,000 passenger cars were street cars and started from a given point at the rate of one a minute, forty days would be required to get them all in motion. In 1920 a number of people equal to more than thirty times the population of the entire earth was carried a distance of one mile. The Pennsylvania station in New York City handled 36,000,000 passengers in 1920—very nearly the population of France—one-third as many people as live in the United States. The employees of the railroads number more than two million, which is equivalent to the number of American soldiers sent to France.—HAWTHORNE DANIEL, in the *World's Work* for June.

We'll Confirm

Overheard in the yards:

Mike—Say, Bill, do you know the quickest way to the Illinois Central Hospital?

Bill—Sure, walk between moving cars to pull a pin.—S. M. C.

Old Second Church

Dear Wake: A few days ago your column carried a question regarding the Illinois Central station at 16th Street. I have an old newspaper clipping reading:

The building now used as the Illinois Central station at 16th Street was originally put up to be the Second Presbyterian church. Work was be-

gun on it July 9 and the edifice was dedicated to the worship of God September 1, 1843. The location of the church was on the south side of Randolph Street, eighty feet east of Clark Street.

[Signed.]

Edward L. Bradley.

[With the Second Presbyterian church for more than forty-six years.]

The clipping above was saved because relatives of mine lived in the flat above the station for thirty-one years. My aunt was station agent from 1885 until 1913.—I. C. M., in "The Wake of the News," *Chicago Tribune*.

Letting Him Down Easy

A rich man, lying on his death bed, called his chauffeur, who had been in his service for years, and said:

"Ah, Sykes, I am going on a long and rugged journey, worse than any over which you have driven me."

"Well, sir," consoled the chauffeur. "There's one comfort, it's all downhill."

Life in a Few Words

Uncle Bill Smith read the railway sign:

"STOP, LOOK, LISTEN"

"Those words express the whole scheme of life," he said.

"How so?" asked a friend.

"You see a purty girl; you stop; you look; and, after you marry her, you listen."

Some Small Homes Worth Looking Over

Illinois Central Magazine Will Aid Its Readers to Get Information and Plans for Building

HERE'S a thrift idea and something to talk over with your wife or sweet-heart:

Through the courtesy of the American Wholesale Lumber Association, the *Illinois Central Magazine* is able this month to present to its prospective home-builders the accompanying views and floor-plans of typical, moderately priced, up-to-date American homes. These samples are presented with an idea of encouraging thought on the matter. Those who desire to investigate the matter further may, by taking the matter up through the magazine, obtain from the Southern Pine Association of New Orleans a booklet showing fifty other similar views. A full set of blue prints, drawings and details may be obtained likewise, when the home is finally decided upon, for a few dollars. The American Wholesale Lumber Association offers also to handle the matter with the lumber retailers in the various towns interested so as to obtain estimates of cost, plans for financing and the like. Where enough citizens of any town are interested in the matter, the American Wholesale Lumber

quently praised by employees in these pages. If this feature proves of interest to the readers of the *Illinois Central Magazine*, it will be continued, with new views each month.

A FUEL-SAVING HINT

Here is the Illinois division's Fuel Conservation Bulletin No. 9:

"A local freight train had instructions to unload four carloads of ballast on northward track at a point one and one-half miles south of a station, but, upon arrival at the designated place, there were no section men on hand to unload the ballast, necessitating a back haul of the four cars to the station, where they were held over until the following day. This resulted in a loss of four car days, the consumption of approximately one ton of fuel and one hour overtime to the train crew, all of which could have been avoided by proper co-operation between the track supervisor and train dispatcher.

"A towerman stopped a passenger train to allow a cross line tonnage train to use the crossing, resulting in unnecessary consumption of fuel."

TAKES HUSTLING

The world owes you a living,
As the old saying goes;
But to collect it is a job
That keeps you on your toes.

Association will likewise provide an expert to advise regarding the establishment of a building and loan association, such as has been fre-

New McComb, Miss., Car Shed Completed

Up-to-Date Facilities Are Now Available; Unit Cost Proves Almost Twice That of Nonconnah Construction

By E. W. BULLARD,
Building Inspector

THERE has just been completed at McComb, Miss., in connection with new car repair facilities at that point, a car shed of 100-car capacity, 176 feet wide and 600 feet long, covering eight standard gauge repair tracks and four standard gauge material tracks, with lighting, water and air connections which provide for rapid and economical handling of cars through this terminal. The structure is fireproof throughout. It covers practically $2\frac{1}{2}$ acres of ground and contains 7,200 lineal feet of tracks.

The superstructure is of structural steel, with a saw-tooth roof of twenty panels, supported on concrete footings, which in turn are on piling where the condition of the soil required. The steel columns, 22 feet 6 inches high, are spaced thirty feet apart along the length of the shed and forty-four feet apart across the width. These carry the transverse and saw-tooth trusses which support the roofing material. The saw-tooth trusses are triangular and spaced longitudinally between

columns, with two intermediate trusses in each transverse space of forty-four feet. These intermediate trusses are supported by transverse trusses placed in the plane of the steep side of the saw-tooth. Knee braces in the planes of the columns are provided for all transverse trusses and the inside longitudinal trusses. Structural steel purlins spaced four feet apart brace the saw-tooth trusses transversely at the top and also carry the roofing, which is Continental Cement red tile. In the valleys over the flat cement tile were placed cinder concrete and 5-ply composition roofing, with a necessary fall across the width of the building for drainage. Down spouts on each side of the building carry the water from the roof to the sewer.

Wire-Glass Skylight Installed

A special feature of this roof, which differed from that of the car repair shed at Nonconnah yard, Memphis, built in 1916 and described in the *Illinois Central Magazine* of August, 1917, is the corrugated wire-glass skylight, in the transverse trusses. This skylight is seven feet high and extends across the en-

tire width of the building in the steep side of the saw-tooth of each panel.

The corrugated glass, furnished by David Lupton Sons Company of Philadelphia, is in panes $27\frac{3}{4}$ inches by 84 inches in size. These panes of corrugated glass are supported in structural steel sash built up of Z-bars supported in the transverse trusses. The vertical joints between the several panes of glass are held in position by an aluminum cover cap and an inner strip. The sash is made water tight by means of flashing, asphalt strips and mastic filling, all held in position by means of bent clips and bolts with lead washers.

The sides of the building are open to a height of 15 feet 6 inches above the rail, and the gables and siding are covered with 20-gauge corrugated iron. Inside the building each track has two lines of swinging scaffolds eight feet above the tracks for men working on the cars. This eliminates the old trestles and ladders formerly used in facilities of this kind.

Air lines of large capacity lead to outlets at columns to within thirty-five feet of any point in the building. There are also electric plug outlets installed at each column, and the electric lights are so arranged that the building can be used at night as well as in the day.

Efficient Arrangement Made

The tracks, shed and ground are on a .5 per cent grade descending in a southerly direction,

which will assist in the rapid movement of the repaired cars at this point. The system of standard gauge material tracks, with thirteen turntables of structural steel and concrete pits, provides for the delivery of material to every part of the facility, and the grade of these tracks is such that the movement of the material used in the repairs to and from the car shed is handled with ease and rapidity.

The new car shed is within the city limits of McComb, convenient to the residences of the workmen, east of the main tracks, south of and about one-half mile from the station. The new shed replaces a frame shed destroyed by fire in June, 1921.

Rapid Work in Steel Construction

The clearing of the site, started by the division forces in December, 1921, consisted of moving four frame buildings and adjacent platforms to new locations, rearranging the tracks to agree to the new plan, and at the same time maintaining the local car repair facilities in operation. The division forces drove the 132 creosoted foundation piles. The general contractor started work on the foundation January 12, 1922, and by February 1 had completed the 105 footings, consisting of 230 cubic yards of concrete, and was ready for the erection of the steel to begin.

Splendid progress was made in the erection of the steel. Seven hundred and fifty tons of light steel were fabricated and shipped from Decatur, Ill., by the Decatur Bridge Company

in the allotted time of four weeks. About thirty cars of steel were shipped to the work, and some of the cars made the 647-mile trip from Decatur, Ill., to McComb, Miss., in the quick time of five days. The complete erection of the steel work was done in thirty-five working days. As the structural steel was received on the cars, the transverse and two intermediate trusses of each bay were assembled on the ground and erected as a unit. The steel was handled by derrick cars which traveled on standard gauge tracks which were already in position and suitable for this purpose, and the erection of the steel was so started as to allow the derricks to back away from the structure as the steel was placed.

The different trades started working as fast as the steel erection would permit. The tile, cinder concrete, composition roofing and flashing were started just as soon as the painting was completed. The good weather conditions, along with the splendid co-operation of all departments, made possible the speed obtained in the actual erection of this shed. The general contractor began his work on the foundations January 12, on April 10 the west half of the shed was turned over to the mechanical department for use, and by April 20 the shed was complete.

The division forces did all the track work, driving piles, moving old buildings and clearing the site.

Cost Shows Increase Since 1916

The general contractor, the Ellington Miller Company of Chicago, did all the concrete foundation work and work on the sewer and fire protection water lines. The steel erection was done by the Ferro Construction Company of Chicago, and the tile roof was furnished and placed by the Continental Cement Tile Company of Chicago. The composition roofing and sheet metal work was done by the American Sheet Metal Works of New Orleans, La.

For the Illinois Central, this work was under the supervision of the chief engineer and the engineer of buildings, with the field work in charge of the chief building inspector. The writer was inspector on the work.

In connection with this work, a comparison of the cost of the car repair sheds as built at Nonconnah yard, Memphis, Tenn., in 1916 and the one just completed at McComb proves interesting. While there was very little difference in the cost of the structural steel, the cost of erecting and painting the steel at Mc-

Comb per ton was just double the cost of similar work at Nonconnah. The cost of tile and sheet metal work, with the composition roofing, etc., at McComb shows a slight increase over the cost of similar work at Nonconnah; this was due principally to the increased cost of labor. The total cost of the two jobs on a basis of square foot of car shed was: Nonconnah, \$0.960; McComb, \$1.794. This is an increase in cost per square foot at McComb of 87 per cent over the cost of Nonconnah.

HE TOPS THE LIST

The oldest conductor in service on the Louisiana division is Charles E. Dunbar, who entered the service of the Illinois Central June 1, 1883, at the age of 23, as a brakeman. In February, 1885, he was promoted to conductor. During his first nine years of service, there were two reprimands and ten demerits entered against his record for honoring expired tickets and passes and ten demerits for carrying a blind negro past Bogue Chitto. The last demerits were entered against his record in August, 1904, and since that time his record has been clear. Mr. Dunbar is now in charge of the Panama Limited between New Orleans and Canton.

Making Sure of What We Buy and Use

Illinois Central System's Test Department Safeguards Purchasing and Keeps Quality Uniform

BY J. L. CARVER,
Engineer of Tests, Burnside

THE nucleus about which the test department grew was the position of mechanical inspector, created about 1907 at Burnside Shops, Chicago. The mechanical inspector was the man under whose jurisdiction the air hose, steam, shop air and miscellaneous hose were mounted, journal bearings were relined with babbitt, the rolling mill was operated and the reclamation work on the scrap elevation was carried on.

There was one man in this organization who handled the inspection of bar iron, and who later directed the operation of the locomotive cranes. One chemist was employed working mostly on paints and oils. About 1909 the operation of the paint mill was taken over by the mechanical inspector. The test department, as such, was organized in 1910 under the general superintendent of motive power, with the engineer of tests in charge, two chemists, a chief material inspector and four material inspectors. Two inspectors who were under the jurisdiction of the store department, covering bar iron and wheels, were taken into the organization and also five fuel

inspectors. These latter, however, were divorced from the test department in 1911.

An assistant engineer of tests was appointed in 1911, but this position was abolished in 1914. At this time the department had increased its laboratory force to three chemists and its inspection force to seven. A year later there were four chemists and nine inspectors, and at present there are thirteen inspectors, four chemists, one apprentice chemist, a water inspector, a stenographer and a clerk, a paint mill foreman and eight paint makers. The rolling mill has ceased operation due to the lack of material with which to work.

Makes Tests of Our Purchases

The purchases of a railroad are enormous, varying from 10-penny nails to 200-ton locomotives, from table salt to garden hose. A railroad is a consumer of practically all manufactured products, entailing a separate department to handle purchases and a store department to carry the stocks. It is one of the fundamental duties of the test department to see that the quality as paid for is delivered and to assist, by means of its laboratory and test equipment, in selecting the

Machinery to Test Stretching and Bending

Rolling Mill and Furnace

most suitable and economical material possible consistent with the highest safety.

Steel and iron of all grades and qualities are inspected and tested in the major part of the work. Practically every piece of steel and iron which enters the construction of cars and locomotives has passed under the watchful eyes of an inspector and has been tested and accepted by him. Axles, wheels, plate, structural shapes, bars, springs—all have been examined. It is only by such means the highest standard can be maintained. The varied classes of materials give an inspector familiarity with glass, paint, textile waste for wip-

ing and journal boxes, rubber (mostly hose), brooms, brass and all steel and iron products. Only material of the highest quality is accepted, and it must conform to the rigid specifications upon which it is purchased.

In these times of high priced labor, material which will give long life is a necessity, as in most cases the labor costs of renewal are far greater than the value of the material. When one is familiar with railway problems of operation, especially those causing train delays, he can realize exactly what influence the quality of material has to do with these troubles and that all precautions taken to

eliminate faulty material as the cause are well repaid when checked against the cost of the delay, in time, labor and resultant repairs.

Tests in Stretching and Bending

Steel and iron are tested in a machine which pulls them out like a piece of rubber until they break. A machine of this type is shown in Figure 1. Not only can the metal be stretched out but it can be bent until broken. These tests show exactly what the metal can stand and indicate its quality. Blocks of cement, wood, brick, babbitt, etc., can also be crushed. A smaller machine which can be used to obtain the breaking strength of rope, rubber, wire, thin metal sheets, cloth, duck, etc., and can be adapted to various strength tests is shown in Figure 2.

In the laboratory are analyzed and examined all steel and iron, babbitts, paints, oils, greases, polishes, preserving compounds, boiler scale, boiler compounds, water, coal, soap, cement, and a variety of miscellaneous preparations that are offered to the railroad. The quality and merits of these are passed on, and if they show sufficient merit they are purchased or accepted. Investigations as to economical purchases and the comparative qualities of a great many materials are carried out. Materials which are causing trouble are analyzed and the reason found so that proper corrections can be made.

Considerable work along the development of a proper water supply for boiler purposes

Views of the Paint Mill Machinery

is done by the test department, and a water inspector who devotes his whole time to such problems reports to the test department and works in co-operation with the water service department and the department of maintenance of way. The water inspector visits periodically the softening plants on the system, checking the treatment and recommending proper treatment if the work is not found accurate. Only one who has an appreciation of the losses caused by scaling water and corrosive water can realize what a vast saving is effected by the proper treatment of boiler waters, making this part of the work in the test department vitally interesting and educational.

Material Inspectors Are on the Road

The duties of the material inspectors carry them over practically all of the United States east of the Mississippi River. These men are sent where our material, subject to specification, is purchased. The material is tested to the standard requirements of the Illinois Central System, and that which is not up to standard is eliminated from the shipment. Equipment for such tests and the necessary assistance are furnished free of charge by the manufacturer. By this means it can be realized that an assurance of quality can be assumed and a large market for all materials opened.

Operation of the rolling mill came under the test department. This mill, known as a reducing mill, rolled short lengths of iron or steel, after being heated in an oil furnace, into longer lengths of smaller diameter or section, making the material available for use. The commoner sources of the billets for rerolling were scrap arch bars and truss rods, etc., from dismantled cars. Since this supply was cut off, the rolling mill has been discontinued and dismantled. This little mill paid for itself many times over. Figures 3 and 4 show views of the mill and furnace.

The paint mill is operated under the direction of the test department. Practically all the paste paints used on the railroad are ground and mixed in this mill. These include the purple and black used on coal cars, bridges and other steel structures, maroon freight car paint, refrigerator and station yellow, inside trim, inside body, passenger car roof color, green in oil, steel gray machine, bottle green and outside white. Disinfectant, deodorant, rust preventive, car cleaner and polish are

This Machine Tests Cement

also made in the paint mill. The paint mill foreman handles all the paints and varnishes, brushes, etc., purchased and handled in stock book "K" and takes care of the shipment of these materials from Burnside to points on the line. All materials entering into our paints are examined and checked to specifications originated by the test department. None but the highest quality of paint materials is allowed to enter into any of our paints. Paint brushes and painters' materials are examined and checked to Illinois Central specifications.

Pigments Are Ground and Mixed

Views of the paint mill machinery, which involves a simple operation, are shown in Figures 5 and 6. Pigments are ground in linseed oil by two stones, one rotating against the other. This forms a heavy paste which is shipped out in barrels; the necessary linseed oil, thinners, etc., are added on the job. Pigments which are not ground in our mill are mixed together in various proportions with oils, driers and thinners in large mixers as shown in Figure 5. The average monthly production would total about five hundred barrels of paint, calculated as ready for application.

The testing of cement is done under the jurisdiction of the test department. This is carried out in a practical way by making standard briquettes which may be noted in Figure 7 on the right of the dial on the test machine. The tensile strength of these briquettes is obtained at various ages of the cement, after being made into this form in a mold with a certain amount of standard Ottawa sand.

Figures 8 and 9 show views of the laboratory and pieces of apparatus which are used for determining the composition of various materials. It would be a great pleasure to explain and

Two Views in the Laboratory

demonstrate further any of the equipment or methods in the test department to those who are interested.

ENGINE AN INCUBATOR

According to a story emanating from Groveland, Cal., recently, Tom McKenna, an engineer of the Hetch-Hetchy Railroad, is back in camp with six young chickens hatched from the heat of the locomotive boiler. McKenna, anticipating that he would be away from camp at meal hours, had placed the eggs in the en-

gine cab about twenty-five days before. He forgot the auxiliary provisions until he heard the peeping of new-born chicks as they broke through their shells.

A RECORD MOVEMENT

May 14 there were moved north out of Mounds, Ill., 1,267 loads and 142 empties. This is the largest number of cars handled out of Mounds north since April 18, 1918, when 1,293 loads and 133 empties were moved.

Concrete Bungalows Are Strong and Cozy

Here Are Drawings and Floor Plans of Two Little Homes Laid Out for Comfort and Convenience

ARE you interested in concrete bungalows?

The concrete bungalow shown here-with, which could be placed easily on a 30-foot lot, is a model of compact, comfortable and economical building.

Instead of the large dining room, which is used only for two or three hours a day, the architect has planned a small breakfast nook opening out of the living room and leading through the kitchen. This cozy feature is becoming more and more popular in bungalow and apartment design.

The living room has a good fireplace, and the kitchen, though small, is well planned for convenience of operation. The rear porch has a recess for the ice chest.

Both the bedrooms have cross ventilation and good closets, and a bathroom is easily accessible from all the rooms.

The front porch is a dominating feature in the front elevation. When decorated with flower boxes and planted around with shrub-

bery it will give a home-like and charming appearance to the dwelling.

A cellar, entered beneath the rear porch, is planned for this house, but could be omitted, if desired, at a very large saving of expense.

The working drawings are laid out for concrete block construction covered with portland cement stucco, which will give the most permanent and fire-resisting, maintenance-free construction possible to get for a small outlay. The cost will be found very little in excess of frame construction.

FLOOR PLAN

The owner of the compact and comfortable 5-room home shown herewith will find that he has made the very finest investment he possibly could in selecting concrete block and stucco for his building.

The front porch has concrete floor and steps that will never rot, splinter or decay, and from this we pass through a small lobby into a comfortable living room with a fireplace. This leads into a big dining room with triple window and from thence into a convenient pantry and kitchen.

There are two bedrooms, with bathroom well placed between them. The front bedroom can be entered directly from the front vestibule, which is a great convenience when the room is sub-let to a lodger.

It is designed with a cellar under the whole house, but the cellar is not really necessary, as modern methods of hot-water heat run from a boiler-radiator in the kitchen or dining room will be found sufficient to heat the house at half the cost and also save nearly \$1,000 on construction cost. The cellar can be omitted if desired.

Working drawings and bills of material can be obtained from the Portland Cement Association, 111 West Washington street, Chicago. A booklet showing plans for twenty-five houses may also be obtained for 50 cents.

FLOOR PLAN

The Romance of Yellow Pine on Our Lines

Vast Forests of Southern Mississippi and Louisiana Have Almost Vanished Under the Lumberman's Ax

I think that I shall never see
A poem lovely as a tree;
A tree whose hungry mouth is pressed
Against the earth's sweet flowing breast;
A tree that looks to God all day
And lifts her leafy arms to pray;
A tree that may in summer wear
A nest of robins in her hair;
Upon whose bosom snow has lain;
Who intimately lives with rain.
Poems are made by fools like me,
But only God can make a tree.
—Joyce Kilmer (killed in France).

By W. A. BRADLEY,

Chief Lumber Inspector, McComb, Miss.

TWO of the pioneer yellow pine lumbermen who were responsible for bringing this wonderful product to the attention of the building world happened to be located on the Illinois Central, which was built through miles and miles of the most beautiful virgin yellow pine forest in the world.

History has it that W. J. Van Zant of McComb, Miss., made a determined effort to interest the buying public in 1872, making several trips north over what then was anything but the Illinois Central of today; but people outside of the immediate yellow pine district could not be made to realize the value of this material. Knowing that if he could once obtain the attention of the building public and show it the real beauty and lasting quality of this wood he would have a permanent market for his product, Mr. Van Zant made yet another trip into what was then considered the far north, and after much effort got one of the retail yards to agree to accept and handle for him a few cars subject to approval. He was to pay all expenses, and their part of the bargain was to display his stock and give it an opportunity to speak for itself. From these few cars and the hard work and advertising by pioneer lumbermen has grown the large industry of today, which is one of our largest revenue producers.

J. J. White Built Mill in 1859

Among the very first saw mills located on the Illinois Central Railroad to manufacture southern long leaf yellow pine was the mill of J. J. White, about two miles west of Summit, Miss., built in 1859 and operated on a small scale for local markets until the Civil War. During the war the mill was closed, but

W. J. Van Zant

it reopened immediately after and operated in the same place until 1870. Then it was moved a short distance and later, in 1883, was destroyed by fire. Mr. White then erected a 50,000-foot daily capacity mill at South McComb, Miss., a plant which was one of the most modern in the entire southern pine territory at that time. Additions were made from time to time until, when it was closed down in 1912 on account of lack of available timber, the daily capacity was 75,000 feet. For this mill the second logging locomotive to come south was bought in 1878. The locomotive is now in good condition; it was used as late as 1913 in the brick yard at McComb for light work. This locomotive has been presented by Mr. White's heirs to the public park of McComb, and it will be on exhibition through the years to come in memory of one of our most successful pioneer lumbermen.

In 1859 we had virtually a solid virgin for-

est of southern yellow pine from Canton, Miss., to Hammond, La.—acres and acres of majestic heaven-touching trees, in beauty not even surpassed by the Douglas fir and redwood of the West. The beauty of these forests was such that it would indeed take a wonderful writer to picture them as they really were. Just imagine a level tableland as far as the eye could see with nothing but trees reaching from 75 to 130 feet to the first limb and from 24 to 48 inches and larger in diameter. Music made by the whispering winds as they blew through this expanse of trees was unequaled

A Carload of Logs

by the music of the sea. This scene was witnessed by the early travelers, and this music was heard by those who traveled on the Illinois Central in its early days before this timber was destroyed and cut. A large part of this timber was cut down, as the railroads in those days destroyed many trees for their rights-of-way, and the pioneers, in improving their farms and building old southern plantation homes that can yet be seen in the interior, destroyed thousands and thousands of acres by burning the trees with no profit to themselves.

Mills Much Larger Now

After Mr. Van Zant introduced this matchless wood to the northern markets, little mills sprang up all over the southern pine territory, but these small, crude mills, with daily capacities of 10,000 to 15,000 feet, did not compare with the plants of today, with daily capacities from 50,000 to 600,000 feet, the largest on our lines. You wonder how it could be possible for so much of the timber to disappear and yellow

J. J. White

Yellow Pine Before—

And After Cutting

Getting Out the Logs

A typical lumber mill, with pond in foreground. The pictures on this and the preceding page show the various steps from the standing tree to the manufacture of the lumber. The logs are dumped from cars into the pond shown above, and are then carried up the incline into the mill.

pine lumber to become known to almost all races of men through the efforts of the early mills.

In 1905 between Jackson, Miss., and Hammond, La., there were available and in the hands of timber merchants as many as 3,000,000 acres of timber, in addition to the holdings of the large mills. About 70 per cent of this has since been sold to small operators for manufacture or destroyed by storms. Since 1905 we have had four terrible storms in our immediate district—1907, 1909, 1915 and 1921—which would hit a tract of pine timber and uproot or break off millions of feet, leaving a trail of destruction, as the timber would be twisted, torn and broken until it would be useless for manufacturing into lumber. Winds seem to have a particular fondness for this timber, as long leaf yellow pines grow tall and straight without limbs until at the top there is always a cluster which makes for top-heaviness. They also have a small tap root and are shallow growers.

In 1905 any amount of the 3,000,000 acres of choice virgin long leaf yellow pine could have been purchased for \$3 stumpage; in 1922 what is left in this immediate territory and all other southern yellow pine territories sells for \$12, with taxes twelve times as much as they were in 1905 and annually more per acre than Mr. Blodgett paid for the famous Blodgett tract of timber and land in South Mississippi before the value of the product was known.

Some Mills Still Operating

On the Illinois Central Railroad at that time

A Typical Logging Engine

—1905—were located some of the largest and best yellow pine mills, and some of these mills are operating at this time.

The history of Enochs Brothers, Fernwood, Miss., reaches almost back to that of Mr. Van Zant. They have had for years a large plant with every modern convenience and a standard gauge railroad from Fernwood to Columbia, Miss., on the N. O. & G. N. They have about fifteen years' cut ahead of them if their timber is not destroyed by storms. We never have the destructive forest fires of the north and west.

The Brooks-Scanlon Company, Kentwood, La., also goes back "a long ways," as the Southerner expresses it. This company took over the holdings of the Banner Lumber Company, which had been operating on a smaller scale since 1890. This wonderful plant will

A Squared Log Requiring Two Flat Cars

be idle after this year on account of lack of available timber.

The Hammond Lumber Company, Hammond, La., while not so old in the business as some, has been operating for a number of years and has large holdings of timber which will enable it to operate for something like fifteen years.

Fixed for Fifteen or Twenty Years

The Natalbany Lumber Company, with sales office at Hammond, La., probably has more timber than any other one company on our tracks at this time, as it operates a large mill at Norfield, Miss., known as the Denkman Lumber Company, which has available timber for twenty years, and one at Natalbany with just a few years' cut, as well as the plant at

Canton, Miss., which cuts principally rosemary pine and hardwood.

The small mill has played an important part in the history of this industry. In 1905 we had on our lines and on immediate connecting logging roads about 300 small mills with an average daily capacity of 10,000 feet. Contrast this with the small number operating today, not more than fifteen, and this will help you to realize that the millions and millions of acres of timber through which the Illinois Central was built have been manufactured and moved to distant markets over our tracks. In just a few years the yellow pine industry will be history in the neighborhood of the Illinois Central.

Radio Test Successful on Freight Train

What is probably the first real test of radio receiving on a freight train running 30 miles an hour has been finished by A. A. Freiberger, chief dispatcher; R. P. Shelton, lineman at Memphis; A. E. Stahl and Glen Roach, telephone experts, all in the employ of the Illinois Central System at Memphis.

The experiment was not an official one. It was brought about for the enjoyment of the railway men when Mr. Freiberger and a party were en route to Moon's Lake on a fishing trip.

The party left Memphis on freight train No. 51 at 6:45 o'clock in the evening. They placed their self-constructed wireless outfit in a coach caboose. Wires were stretched over the top of the coach for antennae, and another wire placed under the coach and used as a ground wire.

The bulb set was used for receiving with 2-stage amplification. About 7 o'clock in the evening, when the train was under full headway, signals were picked up from Memphis station, and the entire programs were heard as if the singers were in an adjoining room, says Mr. Freiberger. Indianapolis was picked up clearly and heard distinctly, excepting a few moments when the static became bad, which prevented further hearing.

The test was made on a fast moving freight between Nonconna and Clarksdale, Miss. Mr. Freiberger says signals came just about as

Chief Dispatcher A. A. Freiberger, Memphis, Tenn., with four hours' catch, Moon Lake, June 5, 1922.

clearly when the train was traveling 30 miles an hour as when it stood still at water tanks.

During the concert at Indianapolis two freight trains passed under full headway, one traveling north on a different track. The noise of the passing train had no effect on the clearness of the radio service, and this was the most valuable part of the whole experiment, says Mr. Freiberger, as the members of the crew had agreed among themselves that a passing train would probably bring such an interruption the signals could not be heard.

The party proceeded to Moon's Lake, where they spent a day fishing with fine results, Mr. Freiberger proving himself the champion fisherman of the crowd, landing a number of very fine catches.—Memphis (Tenn.) *Commercial-Appeal*, June 9.

My Country

By Dr. Frank Crane

I AM AN AMERICAN.

I belong to the United States of America, and am proud of it, because my country is great and strong, and its ideas are just and humane.

I love my country because it is a democracy, where the people govern themselves, and there is no hereditary class to rule them.

I love my country because the feeling of the people is against all classes, and what classes we have are constantly mingling and breaking up.

I love my country because it never wishes to conquer any other country, nor to annex any territory that does not belong to it without the consent of the people who live in such territory.

I love my country because the only use it has for an army and navy is to defend itself from unjust attack and to protect its citizens.

I love my country because it is founded on the principle of federation and not of empire.

I love my country because it asks nothing for itself it would not ask for all humanity.

I love my country because it is the land of opportunity; the way to success is open to every person, no matter what his birth or circumstances.

I love my country because every child in it can get an education free in its public schools, and more money is spent on training children here than in any other country.

I love my country because women are respected and honored.

I love my country because here it is considered honorable to work, and those people who do no useful labor are looked upon with disfavor.

I love my country because if any one is dissatisfied with things as they are he can change them if he can induce enough people to agree with him.

I love my country because its people are industrious, energetic, independent, friendly, and have a sense of humor.

I love my country because it gives me full opportunity to live my own life, and I wish so to live that I shall be of service to my country. I will strive to be a good citizen—I will live for my country.

If Need Be I Will Die For It

Editorial

HOW THE PUBLIC CAN HELP

Probably no other subject relating to the railroads has been so extensively written about or so thoroughly agitated as has the subject of accident and injury prevention. Every known method has been utilized to disseminate the message of conservation of life and health. The railroads have spent many millions of dollars in perfecting and adopting safety devices and appliances. Railway workers have been trained in the safe way of conducting themselves on duty, and discipline has been enforced to require workmen to observe the greatest caution in protecting the lives and property placed in their care. The result has been a creditable reduction in the number of accidents occurring on the railroads.

But, while accidents on the whole have decreased, accidents at railway-highway grade crossings have increased. The very fact that the trend in crossing accidents has been counter to the trend of accidents generally seems to indicate that the control of crossing accidents does not lie within the power of the railroads and their employees. That is true. Despite everything that the railroads and their employees can do—and, as one citizen says in an interview in this number of the *Illinois Central Magazine*, they are doing everything they can—the grade-crossing peril will exist so long as automobilists continue to disregard the fundamental law of self-preservation.

We believe that another citizen whose interview is published in this number is right when he says that automobilists must be trained out of the habit of thinking: "It happened to him because he was foolhardy; it will never happen to me." Death at a grade crossing will never overtake the driver who stops his car just before reaching the tracks and makes sure that he is safe in crossing over, but death does lurk at the crossing for the driver who fails to exercise that precaution.

When the railroad has placed signs at its crossings and enginemen are careful to give the required signals of approaching trains, the blame for an accident should be placed by the public upon the automobilist who dashes upon

the tracks, putting his life and the lives of the other occupants of his car in jeopardy, shattering the nerves of the engineer whose hand controls the rapidly moving train and putting the property of the railroad and the lives of railway employes and passengers in danger of destruction. Railway trains have been wrecked not infrequently by the carelessness of automobile drivers. There is a liability of great danger to life and property when a train strikes, for example, a heavily loaded motor truck. There is evidence that the courts and the public are coming to take notice of this feature of the problem, for recently a railroad brought suit at Cleveland, Ohio, against the owner of a truck that had been struck by a train at a grade crossing and recovered the full amount of its claim for damages.

One of the citizens interviewed in this number of the magazine emphasizes the point that the "Careful Crossing" campaign of the railroads this summer is an unselfish, altruistic one and should have the support of every thinking man and woman.

MASS COURTESY

Individual examples of courtesy are pleasant to experience, but when one meets up with an organization of 60,000 individuals every one courteous and obliging, it is an experience which makes a lasting impression. A courteous conductor can make a passenger's ride a pleasant one, but when the conductor is assisted by the ticket agent, the baggageman, the brakeman and the other employes with whom the passenger comes in contact, the ride in a passenger train becomes, in its true sense, a joy-ride.

That's the kind of courtesy in which the Illinois Central System is specializing. There never has been a time when we haven't had thousands of courteous employes—men and women who delight in finding ways to make our patrons feel at home with us—but just now we are intent upon making the courtesy of this railway system a 100 per cent manifestation.

There's no room in our organization for a

discourteous workman. If there is one among us—we hope there is not—who does not delight in transmitting pleasure to others, he owes it to the rest of us to change his ways at once. He queers our game. Perhaps you may know some such individual; we hope you do not, but if you do, why not give him a quiet tip that we are counting on him for teamwork in making the record of the Illinois Central System outstanding as the railroad where courtesy comes first.

Some persons seem to have the idea that courtesy is something for ticket sellers and train service men alone to cultivate. That isn't true. There is just as much reason why every person who interviews a patron, in person, by telephone, or by letter, should be courteous and obliging at all times.

The Illinois Central System right now is in the forefront of the railroads of the country in that respect, but let us never be satisfied, let us always be seeking diligently to improve our record.

SEE; THEN TEACH

The railroads are paying considerable attention to the education of the public on railway subjects. There is a great need for that work. The railroads will continue to progress as servants of the public if they are given the right kind of support by those whom they serve, but if public opinion is not constructive, if those who want to see the railroads break down are permitted to dominate public thought on railway questions, the end of progress will be swift and certain. The desire to have the public fully informed about the railroads is not altogether a selfish one. A breakdown of the railroads would be disastrous to the entire country; every business would suffer; hunger would stalk the streets of our great cities; millions would be thrown out of employment; chaos would reign.

However, we cannot expect the average citizen to take a greater interest in the problems affecting the railroads than railway officers and employes themselves take in them. Among railway men who know their own particular jobs exceedingly well, there are some who have not availed themselves of the opportunities for self-education on the problems which, in the last analysis, have a direct relationship to their own future security.

There is little excuse for this situation. With the opportunities offered railway officers and employes to study railway questions, a person

who fails to avail himself of those opportunities is neglecting an important field of his own development.

That man is a better worker who has the broader vision. The story is told of a man who approached three workmen and asked each what he was doing.

"I am putting stones in place," said one.

"I am working for \$6 a day," said another.

"I am helping to build a great cathedral," said the third.

The first and second workmen may have been as adept at masonry as the third, but it is a safe bet that the third workman was finding more solid contentment in his work and hence was a better workman. He was making a definite contribution to something which would stand for generations as a tribute to his craftsmanship.

The railroads are engaged upon an industrial enterprise which is of the utmost importance. It is said that the railroads perform a service second in importance only to that performed by the farmers, but that comparison reminds us of the late controversy over "who won the war." As a matter of fact, the railroads and the farmers are dependent upon each other; one could not continue in business except for the other. And if the railroads were to cease operations the country would collapse in ruins.

Railway men need to get the vision of the enterprise upon which they are engaged. Too many have defective eyesight; they need glasses. The glasses are offered them in the opportunities which encompass them for self-education about the railroads and the railroads' problems.

Every railway man in the country ought to be an active worker in the task of securing a better understanding of the railroads on the part of the public. But to do that the worker must first educate himself in the fundamentals of what he is to teach.

GET A NEW VIEWPOINT

Before the ink has dried on this page the days will be growing shorter, summer will be on the wane. These seasonal reminders of the flight of time might well be occasions for taking stock of what we have accomplished and for fortifying ourselves for the days which are left us. There is so much to do, it is such a joy to live, and our days are so few and so short. We cannot arrest time in its flight, but by planning we can use our time effectively.

Too many of us are slaves of our timepieces.

The alarm clock brings us out of bed with a rush, we hurry through breakfast at a speed that takes the joy out of eating and disrupts our health, our working hours are a nightmare of tasks that are never ended and we go home at night physically and mentally exhausted, our nerves tingling and our heads throbbing. Our work grows distasteful, and we long to chuck it all and seek relief in some spot never invaded by alarm clocks and typewriters and unanswered letters.

We cannot master our work by forever rushing at it like a maddened bull. Nothing is truer

than the old adage that "Haste makes waste." Our fault is in permitting ourselves to be put on the defensive. The individual who assumes the offensive with respect to his work, and attacks it diligently and confidently, has the tactical advantage.

We cannot muffle our alarm clocks, and the typewriters cannot be stilled. There will be letters to answer so long as we help to carry forward the world's work. But we should master our time—put ourselves on the offensive—attack our work, instead of permitting it to attack us.

BOYS' BAND HAS ILLINOIS CENTRAL LEADERS

The Mattoon Rotary Club Boys' Band. Director Darnell is shown in the center of the back row in the dark uniform. The second from his left hand is Manager Able.

Sixteen boys of Mattoon, Ill., ranging from 11 to 19 years in age, met on March 1 and organized a band, appointing Winston A. Darnell, accountant in the Indiana division office of the Illinois Central, as director and Forrest Able, messenger boy in Superintendent Roth's office, as manager. The boys rented a large garage, and immediately "got busy," meeting at least one night a week, sometimes more frequently, for practice. In the meantime, each individual took outside lessons. Fines were imposed when lessons were omitted and practice nights "skipped." The membership rapidly increased to twenty-three. The boys worked diligently and earnestly. Soon there came to the ears of one of the members of the Mattoon Rotary Club an echo of the splendid work the boys were accomplishing, and he had some of the musical members of the club go out to hear them prac-

tice. These men were so agreeably surprised in what they found that they succeeded in having the boys immediately "adopted" and given the name of "The Mattoon Rotary Club Boys' Band." They made their initial appearance in the Rotary parade at Mattoon, May 27 (less than three months after being organized), at which time their splendid appearance and efficient playing caused much favorable and enthusiastic comment among the onlookers and bystanders and gave their adopted parents, the Rotarians, much cause for just pride. The band has since been in great demand.

THE REAL REASON

Arthur—I know a man, married for thirty years, who stays at home every evening.

Amy (with feeling)—That is love!

Arthur—No! It's rheumatism!

PUBLIC OPINION

What the

World Thinks

MISPLACED SYMPATHY

When a railway train strikes an automobile which has been carelessly driven upon the tracks at a grade crossing, turning the car into a mass of crumpled steel and killing or maiming the occupants, the person most entitled to sympathetic consideration seldom gets it. He is the locomotive engineer. He does everything within his power to prevent injuries and loss of life, and yet, in spite of all he can do, reckless drivers often turn his run into a nightmare.

We have in mind a conversation with a locomotive engineer running out of Carbondale on the Illinois Central, who ran over and killed a man asleep on the track, with a bottle of whisky in his pocket. The train was rounding a curve; the engineer did all in his power to stop; he said he realized that the man was to be killed. He said he suffered untold agony as he fixed his gaze on the man he was to kill, and powerless to prevent it.—Carbondale (Ill.) *Herald*, June 8.

WHO ARE "THE RAILROADS?"

When "the railroads" are discussed for vote-getting purposes, they are always pictured as fat gentlemen with dollar marks on their clothes, and the impression is carefully fostered that only a few men own the roads. If ownership or control can be pinned on one very wealthy and unpopular man, so much the better for political purposes.

A recent statement issued by the Northern Pacific road gives some surprising facts as to ownership. The total number of employees of the road is 35,244, while there are 36,000 stockholders and 30,000 bond owners.

The wages paid in 1920 amounted to \$66,000,000; the dividends paid that year amounted to \$17,000,000; and the interest paid amounted to \$12,000,000.

So, instead of a few fat men with dollar-marked clothing owning this railroad, it has twice as many owners as it has employees.

Much the same conditions exist in regard to other railroads. The Pennsylvania, for example, had 141,921 stockholders on March 1, and the average holding was approximately 70 shares. About 66,000 of the stockholders were

women, presumably a large percentage of these being widows to whom the stock had been willed.

"Big Business" in America is composed largely of small units. Any blow aimed at business prosperity is a blow at only a few big investors, and at the millions of smaller investors as well.—Pittsburgh (Pa.) *Labor World*, May 25.

A DISGRACE TO THE BAR

The growth in recent years and present extent of the practice of soliciting professional legal business is not the least interesting portion of a report on the general subject just made by a special committee of the St. Louis Bar Association. The number of lawyers who resort to the practice is not an important percentage of the total bar members, but the system followed is elaborate and extensive and includes the employment of paid agents to extol the merits of particular lawyers and such comprehensive means of obtaining early information as to accident cases that the term "ambulance-chasing" is by no means always figurative as applied to one phase of the evil. That the representatives of damage-suit lawyers often importune the victims of accident before the surgeons can devote their skill to the injuries at the hospital seems literally true in many instances. To capitalize for certain practitioners the litigious possibilities of personal injuries is, however, not the only object of these censurable activities. The committee says that through means of less crudeness retainers are solicited from corporations having remunerative legal business.

Commercialized activities of such a sort and on such a scale are most unworthy of a learned profession, and their results stamp them as an unquestionable public evil. Time and again, after local courts have returned verdicts in comfortable amount for major accidents having some such distressing outcome as blindness or loss of limbs, it has been discovered that for a brief period of professional effort rapacious lawyers have obtained as much of the total award as remained to indemnify the victim for disabilities lasting throughout his lifetime. Divisions of the judgment so monstrous are generally made under jug-handled contracts ob-

tained while the victim was still suffering from shock or unaware of the seriousness of the injuries.

The special committee recommends a bar rule prohibiting the evil, a standing committee to see to its enforcement, disbarment as a penalty for violation, exclusion of solicitors from hospitals and a special act of the Legislature dealing with the matter. These are vigorous measures. That the legal name for the offense, "barratry," is derived from a word meaning "to barter" or "to deceive" is significant. Deception is almost always a resort of the ambulance-chasers, often a cruel, larcenous deception. From the ethical standpoint lawyers are particularly concerned in suppressing an evil that brings the bar into disrepute, but the public has a grievance of its own against these eaters of ambulance dust and plundering loiterers about the operating room.—St. Louis (Mo.) *Globe-Democrat*, May 10.

WHY RUN FOR A TRAIN?

The man who runs for the train sometimes catches it, and sometimes gets tangled up with the wheels and loses interest in subsequent developments.

It is important to catch a train, but not nearly so important as it is to continue in this life with all one's limbs and features in the condition they were.

It may be gathered from the foregoing that this is an editorial on procrastination, which it is.

Now the gentleman who is running for a train does not look like a procrastinator. Yet if he were not a procrastinator there would be no need for him to run for a train.

Trains start on schedule time, not whenever the conductor notices that he has a load of passengers aboard.

One who contemplates a journey has abundant opportunity to look at the time tables and to make his plans accordingly. No matter how busy he may be, if he really wants to make a particular train he can do it.

If the loss of the three or four hours that will elapse before the next train starts for the same place are important to him, he will do better to be on hand in plenty of time to get himself and his baggage comfortably disposed before starting time.

Otherwise he may slip on the steps, and, although he escapes with his life, do himself more

harm than the loss of that particular train could possibly do.

The catching of trains was chosen as the subject of this article because life is figuratively just one train after another.

A great many years ago, Shakespeare wrote about the tide of affairs of men which taken at the flood leads on to fortune. There were no trains in Shakespeare's time.

Opportunity, which is not so rare a visitor as the proverb would have us believe, is much like a train in that if taken deliberately it is an easy way of going where we want to go. Try to rush it, and it either gets away altogether or leaves the aspirant floundering on the platform as it departs.—JOHN BLAKE, in the *Chicago Daily News*, May 19.

HAS FINE RECORD

The oldest engineer in service on the Louisiana division is John T. Stuart, who was born May 1, 1861, and entered the service of the Illinois Central November 1, 1881, as a fireman. In August, 1883, he was promoted to engineer. Only one reprimand and five demerits have been assessed against his record during his service of forty years. Mr. Stuart is in charge of passenger trains Nos. 321 and 323, operating on the Yazoo district.

Maintenance

Save It

Shovels

**Abuse of shovels, like rust,
Consumes faster than labor wears.**
—Poor Richard III.

During the last four years the Illinois Central and Yazoo & Mississippi Valley railroads used 129,110 shovels of all kinds at a cost of \$143,001.50. Sixty-eight per cent, or 88,266, were track shovels, representing an expense of \$81,102.33, or an annual expenditure of \$20,275.59 for track shovels alone.

An average of seventy-four track shovels were furnished each working day at a daily expense of \$70. Assuming that 50 per cent of the time the track forces used no tools other than shovels, the average life of each shovel was only a little more than two months.

Track shovels will, of course, wear out in time—certainly not in two months. Most of them are discarded on account of damage caused by abuse rather than wear, and no doubt

many are diverted to other than railway use. The proper care and use of track shovels should reduce the purchase of new shovels at least 50 per cent, which represents a saving of more than \$10,000 a year.

Many shovels are broken by nipping up ties with them, and others through being used to pull ties out of the track. Shovels are also damaged by being used to drive stakes and for other purposes requiring a hammer or maul.

Shovels should not be thrown violently from hand or motor cars or in handling, nor should they be thrown promiscuously in a pile with lining bars, jacks and other heavy tools or material likely to damage them. They should be handled in such a manner that they will not be subject to breakage or other damage.

Where shovels are used for handling mud, they should be cleaned after use, and the blades oiled if they are not to be used again for some time.

Value, as Scrap, Nothing; as Shovels, \$1,500

Five of Our Vicksburg Division Veterans

One Agent, Two Engineers and Two Conductors on the List Have Service Records That Total 172 Years

FIVE employes on the Vicksburg division of the Illinois Central System have given commendable service for a total of 172 years. The oldest in service of the five became an employe of the company thirty-eight years ago, and the youngest started work twenty-seven years ago.

G. B. McCaul, agent at Rolling Fork, Miss., opened the first station at Shelby, Miss., thirty-eight years ago. He had never had experience as an agent at that time, but he was successful in his new position. H. J. Lawrence, thirty-eight years in service, has served as conductor for more than twenty-three years without injury to any of his passengers. C. W. McCaul, engineer, thirty-seven years an employe, entered the service of the Louisville, New Orleans & Texas Railroad when the right-of-way was banked by a wilderness that was filled with wild animals. J. W. Leach, engineer, with a record of thirty-two years, has made good use of the hard knocks of his early experience, and has developed into one of the best engineers on the division. A. C. Henry, conductor, twenty-seven years in service, advanced from baggage master and express messenger to conductor in three years.

His Station Antedated a Town

G. B. McCaul, agent at Rolling Fork, Miss., was the first agent at Shelby, Miss. That was thirty-eight years ago, and the Yazoo & Mississippi Valley was then the Louisville, New Orleans & Texas. There was really no Shelby, Miss., at the time. The railway station was the only building there. But Shelby gradually grew into a village.

Mr. McCaul had been an operator for another railroad, and he followed one of his superior officers into the service of the L., N. O. & T. in 1884.

When he was on the way to Shelby, he says, he met the auditor of station accounts. The auditor, a Mr. Cabiness, asked him if he knew anything about station work. Mr. McCaul frankly told Mr. Cabiness that he did not. The auditor told him that he would call at Shelby the last of the month to help make the reports, but when the time came Mr. Cabiness did not appear. Mr. McCaul says that he wor-

ried, perspired, worked and guessed at those reports until he became worn out, and then he sent them in. In a few days, the auditor called at Shelby, and Mr. McCaul asked him why he did not come to help on the reports.

"I saw the reports you sent in," Mr. Cabiness said. "Just keep on sending them in like that."

The reports in those days, Mr. McCaul says, were just one sheet of paper. The daily freight receipts and the ticket sales were entered on a blank; then at the end of the month a statement of the debits and credits was made.

And in those days, if a piece of freight was lost, the agent had to pay for it.

Slept in the Waiting Room

The station at Shelby was a small 2-room building. One room was the office, and the other the waiting room. Mr. McCaul slept in the waiting room.

In the year Mr. McCaul stayed at Shelby, several families moved to the place, and two stores were built. He was then transferred to Hampton, Miss., as agent.

After he had been there about a year, the company opened a station at Glen Allen, two miles from Hampton, and requested Mr. McCaul to take charge of it also. He went from one to the other on a handcar for ten years, and his salary was \$90 a month.

He was then made the agent at Rolling Fork, and after a year was transferred to Friars Point, Miss., where he remained for three years.

About a thousand bales of cotton were handled each year at Friars Point then, Mr. McCaul says, but one man bought all the cotton grown in that section and loaded it himself. The only work left for the agent was to receipt it by carloads. Only twenty-seven bales were loaded in a box car then. They were not double decked as they are now. But with flat cars it was different. Fifty-two bales were often piled upon them. Mr. McCaul remembers one flat car that was loaded with so much cotton it swayed dangerously from side to side. That was while he was at Shelby. He straightened the bales and allowed the train to proceed.

Three years passed while Mr. McCaul was

agent at Friars Point, and he then returned to Rolling Fork, where he remains as agent.

Passenger Conductor 23 Years

H. J. Lawrence, thirty-eight years in the railway business, has been a passenger conductor for more than twenty-three years, and he has served in that capacity without an accident or an injury to any of his passengers.

Conductor Lawrence entered railway service with the C., O. & S. W. Railroad, now the Kentucky division of the Illinois Central, as a telegraph operator, August 1, 1884, at the age of 19, and worked at various stations as agent and operator until December, 1889. On account of ill health, he went west and remained about one year. On his return he entered the service of the L., N. O. & T. Railroad as flagman, February 15, 1891. He was promoted to freight conductor December 20, 1891, and promoted to passenger conductor in February, 1899. His run was between Memphis and Vicksburg, and he continued in this service after the L., N. O. & T. was taken over by the Yazoo & Mississippi Valley.

Conductor Lawrence is typical of the "old school gentlemen," the men whose self-respect and consideration set an example for others to emulate, and he has won a warm place in the hearts of all who know him.

In earlier days the runs covered by Conductor Lawrence from Memphis to Vicksburg embraced only the one division. In 1901, when the Vicksburg division was organized, he chose to remain with it. As a result of this choice he is the oldest conductor in service between Memphis and Vicksburg.

The advancement of Conductor Lawrence is an example of well-deserved promotion. At all times he has had due regard for the interest of the company which he represented and the public that this company served. He is quiet and unassuming, always careful with the women and children under his guardianship, on or off duty.

Prompt Action on Fish Shipment

A fish story in connection with Conductor Lawrence's career most forcibly points to the manner in which he serves the Y. & M. V. and its patrons.

Conductor Lawrence once had orders which read: "Stop at Anguilla for passengers." His train stopped, and while baggage and passengers were being taken aboard he noticed twenty barrels of fresh fish near the track. He walked over, noted the tags on the barrels and saw they were consigned to New York. He asked

the station agent when the fish were to be shipped and was told, "Tomorrow." He glanced at the passengers and pile of baggage and then asked the agent, "Why not put them on my train and save twenty-four hours on the shipment?" The agent said they were not billed; whereupon Conductor Lawrence asked if the billing could be made while the twenty barrels were being loaded in the baggage car. The agent replied that it could be done. Conductor Lawrence said, "We'll do our part of the hustling while you make out the billing." As a result, these twenty barrels of fish were taken to Memphis on that train and sent to New York twenty-four hours ahead of time.

Conductor Lawrence has a brother, B. T. Lawrence, who is a passenger conductor on the New Orleans division.

Motorist Begged His Pardon

C. W. McCaul, engineer on the motor car between Greenville and Rolling Fork, Miss., has had the unusual experience of having a motorist, whose car collided with the railway coach, beg his pardon for the accident.

It was only a short time ago that he noticed an automobile approaching a grade crossing at a furious rate. Mr. McCaul was advancing on the same crossing at about forty miles an hour. His previous experiences warned him to keep his eye on that motorist, for he was going to try to beat the railway car across the crossing instead of stopping on the near side. Mr. McCaul shut off the power on his coach so that he could stop in a short distance. When he was only a few feet from the crossing, the automobile was still dashing forward, although there was not a chance for it to get across first. Mr. McCaul firmly set the brakes and brought his coach to a dead stop at the center of the crossing just as the automobile jammed into the pilot.

"I beg your pardon, Mr. McCaul," the motorist said. "It was all my fault I was going so fast I couldn't stop. Please don't tell anyone that this has happened, for I don't want it known that I was such a fool."

Started Work at \$38 a Month

Mr. McCaul, who is a brother of the G. B. McCaul previously mentioned, is a native of Mississippi. He entered the service of the L., N. O. & T. in 1885 when the right-of-way was banked on each side by wilderness filled with wild animals. His first job was night watchman for a work engine at Shelby, Miss. It was No. 55, an old New York Central en-

G. B. Mc Caul

C W Mc Caul

A.C. Henry

Vicksburg
Division

J. W. Leach

H. J. Lawrence.

gine. He had to clean and wipe it, put out, bank and make fires and call crews—all for \$38 a month. He was there about six months and was transferred to Hampton as night watchman. After another year of the tedious watchman's toil, he was made a fireman out of Hampton on the Lake Washington branch.

When the high water of 1890 destroyed bridges and great stretches of the right-of-way, Mr. McCaul was placed in pile-driver work. In the succeeding high-water periods of 1892 and 1897, he was in the same work. The high water of 1892 probably did more damage than any of the others, he says. The bridges were all washed out, and in some places the track was washed a mile away from the right-of-way.

Proud of His Motor Car

Later Mr. McCaul went to Greenville as hostler at \$60 a month. Soon he was made engineer on a switch engine there. In 1898 he was given the local run between Greenville and Leland, which he held for five years. He then was given a main line run between Vicksburg and Cleveland.

About six years ago the company sent a motor car for service between Rolling Fork and Greenville, and Mr. McCaul was given the position as engineer. He has held that position since.

The motor car is equipped with a 200-horsepower gasoline engine which operates a 600-volt generator. The generated electricity is the power of locomotion.

Mr. McCaul thinks as much of the motor car as one does of a watch. Instead of abandoning his car on a siding when the run is completed, Mr. McCaul can frequently be found going over the engine with greatest care. He is as regular in his work as the days on a calendar, and has never had the motor car out of order.

Mr. McCaul says that the engineers took mighty good care of their engines in the early days of his experience. Hard hammers were never used on bolts; nor were chisels and hammers used on nuts. And the engineers overhauled their engines nearly every Sunday.

Learned Lessons From Experience

J. W. Leach, engineer on the Vicksburg division, has developed into one of the best engineers on that division by turning the hard knocks of his early experience into useful information. What many would term bad luck started with Mr. Leach when he first was made an engineer. His engine broke down when he was but a few hours on the very

first run. And it seemed, he says, that every run after that for some time was hampered by some trouble. He admits that it was discouraging to him, but he says that each mishap made him determined that a like occurrence should not happen again. And in that way his unusual caution was developed.

Mr. Leach entered the service of the L., N. O. & T. as a watchman at the shops at Vicksburg in 1890. After a few days he became a hostler's helper, and in four months he took a position as a fireman on a switch engine in the yards there.

He was not kept at any one job very long at a time, he says. In those days, when an urgent piece of work was to be done, the employe who was capable and available was put on it, no matter what he was doing at the time.

For six years, Mr. Leach fired, hostled and ran a switch engine at almost every point on the division. The division then comprised the present Memphis and Vicksburg divisions.

Bad Luck on First Freight Run

It was in 1896 that he was made an extra freight engineer and given his first run from Memphis to Clarksdale. Everything was working smoothly until he reached Walton, later renamed Moon. At that point the piston rod broke, and the cylinder heads were knocked out.

Mr. Leach was an extra engineer for two or three years and then was given a regular engine for freight service. He ran engine No. 38, with 17-by-24-inch cylinders and a 2,400-gallon tank, a total distance equal to that from here to the moon, he says.

When construction on the Yazoo Delta Railroad was started, Mr. Leach was engineer on a pile-driver. The name, Yazoo Delta, inspired the happy-minded persons of that part of the country to call the new road "Yellow Dog," and, much to the displeasure of the officials, the nickname has stuck.

Mr. Leach's first regular passenger run was between Clarksdale and Yazoo City. He remained there for four or five years, then ran extra out of various points on the division. November 1, 1918, he was given the run between Memphis and Vicksburg. He continues on that run on No. 12 and No. 15 today.

Rose to Conductor in Three Years

A. C. Henry, conductor on the Vicksburg division, was advanced from baggage master and express messenger to conductor in three years. Good conscientious work and an in-

creasing interest in the affairs of the company were the causes of his rapid promotion.

In 1895 he entered the service as baggage master and express messenger on a train between Greenville and Leland, Miss. He had been in that work two years when he accepted a position as flagman. The Vicksburg division was part of the Memphis division then, and Mr. Henry worked as flagman on various runs over the entire division. His ability and willingness for work won for him a promotion to conductor before a year had passed. He was given the Riverside local run between Coahoma and Rolling Fork.

There was no such thing as a 16-hour law or an 8-hour day then, Mr. Henry says, and many times he worked thirty-five hours without rest.

He remained on that run for two and one-half years, and was then made extra passenger conductor. He worked out of various points over the division for two, or three years before he was given a regular run.

Mr. Henry's first regular run was between Greenville and Percy, Miss., and he remained on that for two years. In 1905 he was given the run he now has between Memphis and Vicksburg. He is conductor on Nos. 12, 13, 14 and 15.

Mr. Henry says that his train crashed into a box of Bibles that was too close to the track at Hampton, Miss., one day. The box and contents were demolished. When the run was finished, he says, the porter came to him and said: "Well, Cap'n, we sho' scattahed the word of God this mawnin', didn't we?"

How Floyd Mays, Jr., Whipped a Monkey

The Honorable W. J. Bryan and his anti-Darwin crusaders, to whom the very mention of a monkey is abhorrent, would have been tickled could they have witnessed the victory of little Floyd Mays over an ill-natured and somewhat pugnacious monkey—that is, if Floyd's story is to be believed.*

Floyd, aged 6, who is the son of Superintendent F. R. Mays of the New Orleans division, was taken by his mother to visit a traveling zoo which was exhibiting in Vicksburg. The youngster displayed but passing interest in the various animals on exhibition, but on spying the monkey cage was instantly attracted. He greeted all the simians cordially and offered to shake hands with one that, judging from his grave demeanor, seemed to be a chief among them. Apparently highly incensed with Floyd's familiarity on such short acquaintance, the old monk reached out and made a vicious claw at his face.

Did Floyd fight back? He did—not. He let out a yell that would have made a young Comanche envious. He hid his face in his hands in terror and squalled as only a frightened youngster can. Indeed, he revealed a pair of lusty lungs. It was a good while before his mother and her friends succeeded in quieting him.

Afterward, in recounting the visit to the zoo to his father, Floyd carefully avoided any reference to the monkeys, but was quite glib in his description of the other animals.

"But, Floyd," said Mr. Mays, "were there no monkeys at the show?"

"O, yes, Daddy," replied Floyd, not a bit abashed, "but they're a bad lot; haven't even got any manners."

"Why so, Floyd?" said Mr. Mays.

"Well, I wanted to shake hands with one old fellow, and he just reached out and tried to scratch my face off."

"And then what did you do?"

"Oh, I fixed him mighty quick," said Floyd, assuming an air of superior bravery. "I just stepped back and said 'boo' at him, and it nearly scared that monkey to death."

A Paper on Powder and Paint

Poets have sung the praises of the sunshine of a woman's smile, but none has ventured to eulogize the "shine" on her nose. It would not be safe! A "shiny" nose is considered the bane of feminine existence, as shown by the omnipresent powder puff. The modern woman would as leave venture forth without her hanky as to overlook the bit of magic lamb's wool or velour. It has become a part of her equipment, since her poise depends to a large extent upon knowing that she is good to look at. And who can lay claim to beauty with a shiny nose? Cleopatra herself would have declared it impossible. Of course, the dainty woman always carries a clean powder puff.

Face powder improves the appearance of the skin, and its use is considered indispensable to good grooming. The powder should be applied with care, however, for the use of too much of it is disgusting. To plaster one's face with powder until it resembles the grotesque mask of a circus clown is an obvious badge of bad taste.

The use of rouge at the present time is rather more general than in the days of our mothers' young womanhood. We should bear in mind that artificial tinting is a clumsy substitute, at best, for nature's lovely roseblush. We cannot all possess a "peaches and cream" complexion, more's the pity, and so we resort to artificial means. Rightly used, rouge will improve one's appearance. We cannot deny that it brings out all the sparkly tints in one's eyes, and we should apply it with the artistic result in mind. For the woman who, because of indoor work or natural pallor, has not the least trace of color in her cheeks, the use of rouge is advocated to remove that dead-white look. There is nothing quite so depressing as to have one's friends inquire, "Are you ill, dear?" when one feels quite fit. Invariably, the woman who boasts that she never uses powder or rouge has a sallow complexion and persists in wearing brown! We say to ourselves mentally, upon hearing her brag, "You look it!"

We owe it to ourselves, and to those with whom we are associated, to be as "easy to

look at" as possible. The indiscriminate use of rouge and powder, however, has been associated with an undesirable type of person, and when we use powder and rouge too obviously we not only offend, as we have said, the requirements of good taste but we subject ourselves to unfavorable criticism. We need to avoid the extreme in all things pertaining to our daily lives—to use common sense, in other words—and common sense will guide us aright in the use of cosmetics as in every other phase of the pursuit of happiness.

Those June Brides

Someone has requested us to explain the shortage of June brides on the Illinois Central. We might as well try to answer Mr. Said's conundrum, "Why is a cake eater or a flapper?" From one of the southern divisions, however, comes the suggestion that the failure there must be attributable to one or the other of the two things that are responsible for all the ills in that part of the country: namely, the Mississippi river flood or the boll weevil. We hope that this is true, and that our young women have not taken the pessimistic view of matrimony which is expressed in the following lines, sent in by one of our readers:

TO WED OR NOT TO WED

To wed or not to wed, that is the question;
Whether 'tis better, after all, to marry
And be cajoled and bullied by a husband,
Or to take up stenography or clerking
And slave, alas! for someone else's husband?
To love—to wed—and by a wedding end
The struggles and the thousand petty cares
That "slaves" are heir to—'tis a rare vocation
Devoutly to be wished for! To love—to wed—
To wed—perchance divorce! Aye there's the rub!

For in that dream of bliss what jolts may come
When we have cast aside our little jobs
Must make us wary. There's the sorry thought
That makes so many hesitate:
For who would bear the long eternal grind,
The employer's jokes, the chief clerk's
contumely,
The insolence of office boys, the smoke
Of last week's stogies clinging to the hair,
When she herself might quickly end it all
By getting married? Who would not exchange
A dingy office for a kitchenette—
A keyboard for a stove or for a cradle—
But that the dread of something worse to come
After the honeymoon—that life of chance

From whose dark bourne so many have returned
By way of Reno—fills us with dismay,
And makes us rather bear the jobs we have
Than fly to evils that we know not of?
Thus cowardice makes spinsters of—so many!

Tested Recipes

CUCUMBER AND TOMATO SALAD.—Arrange a wreath of slices of cucumber and tomato, overlapping each other, alternately, around the edge of a salad plate. Fill center with garden cress. Pour over French salad dressing, and serve.

PINEAPPLEADE.—Boil 1 cup sugar and 1 pint water ten minutes; add 1 can grated pineapple and juice of 3 lemons; cool, strain, and add 1 quart of ice water.

SWEET PICKLED PEACHES.—Boil 2 pounds brown sugar, 1 pint vinegar, and 1 ounce stick cinnamon 20 minutes. This will be sufficient for $\frac{1}{2}$ peck peaches. Dip peaches quickly in hot water, rub off the fur with a towel, stick each peach with four cloves, put into syrup and cook until soft, using half the peaches at a time.

CHILI SAUCE.—Peel and slice 12 medium-sized ripe tomatoes, put into a preserving kettle, and add 1 pepper, finely chopped, 1 onion, finely chopped, 2 cups vinegar, 3 tablespoons sugar, $\frac{1}{2}$ tablespoon salt, 2 teaspoons each of ground cloves, cinnamon, allspice, and grated nutmeg. Heat gradually to boiling point, and cook slowly two and one-half hours.

LUNCHEON CAKES.— $\frac{1}{2}$ cup shortening, 1 cup sugar, 1 egg, $\frac{1}{2}$ teaspoon vanilla, $\frac{3}{4}$ cup milk, $1\frac{3}{4}$ cups flour, 4 teaspoons baking powder, 1 teaspoon cinnamon. Cream shortening; add sugar gradually, beating well; add egg yolk, vanilla, and half the milk; then add half the flour sifted with the baking powder and cinnamon; add remainder of milk and flour, and fold in beaten egg white. Bake in greased tins, in moderate oven, about 20 minutes. Serve hot with chocolate or cream sauce.—Miss V. T., *Tennessee Division.*

Some Dining-Car Suggestions

Chef-Cook J. E. Crawford, whose picture appears on this page, tickles the palates of patrons of the Seminole Limited. Here are some of his favorite recipes:

CANAPÉ LORENZO.—Put into a saucepan 1 tablespoon of butter and fry in it one slice of onion chopped fine, but do not brown; add 1 tablespoon of flour and cook without browning. Stir in 1 tablespoon of milk and $2\frac{1}{2}$ tablespoons each of parmesan and swiss cheese. Cook just long enough to soften the cheese. Remove from the fire and let cool; then form into balls. Put

J. E. Crawford

into a saucepan 1 tablespoon of butter, stir in 1 tablespoon of flour, 1 cupful of stock, and 1 cupful of crabmeat. Cook until slightly thick. Season with salt and cayenne pepper. Have ready circles of toasted bread (or bread fried brown in butter), cover them with a layer of the crab mixture, and in the center of each piece place a ball

of cheese. Put in oven for five minutes. Serve with watercress. Lobster, fish, or chicken may be substituted for the crabmeat.

ATHENS PARFAIT.—Beat yolks of 8 eggs until light, add 1 cupful of syrup, place mixture on slow fire and stir constantly until the eggs have thickened sufficiently to coat the spoon. Turn into a bowl, add 1 teaspoon of vanilla extract, and beat with a whip until cold. It will then be very light. Add a pint of cream whipped stiff, being careful to drain off all the liquid from the cream. Stir lightly together, turn into a 3-pint mold, and pack in ice and salt for 4 hours. This cream may be varied by using two ounces of chocolate melted and smoothed, or other flavorings, instead of vanilla.

CHICKEN HACIENDERA.—Take a broiler or a spring chicken, disjoint, wash, and season. Roll in cream, then in flour. Have a frying pan ready with hot fat about an inch deep. Drop chicken into hot fat and fry until golden brown, remove from pan and place on napkin to drain. Make a gravy of 1 teaspoon butter, 1 teaspoon flour, 1 gill of cream, and 1 gill of milk. Place a circle of rice and mushrooms on a hot platter, add the chicken, cover with gravy, and serve immediately.

Household Hints for Home Makers

MRS. HOUSEWIFE: Why not paint that dingy mop handle, that dustpan you keep in the pantry or broom closet, the coal scuttle in the kitchen, the kindling bin, or any of those useful articles that you look at, pick up, and use every day in the year? If you paint the coal scuttle and dustpan a bright black, with a pin-stripe of yellow or jade green around the edge, you will find it a real joy to use them, instead

of sighing each time you put coal in the kitchen stove or sweep up dust on the back porch. "A little bit of planning, a little bit of paint, will make one's kitchen equipment look like what it ain't."—Miss VERNITA TRIBBLE, *Tennessee Division*.

A weak solution of ammonia water, applied with a cloth, will brighten old carpets.

Tie strands of a new broom closely together, place in a pan of boiling water, and let it soak for two hours. Dry thoroughly before using.

Rub creaking doors with hard soap.

To remove white spots from the dining room table, rub with camphorated oil.

OUR BABIES

"Here we are, folks—just a few of us, though! We made Aunt Nan sit up and take

notice when we trooped in from all over the system in bunches of forty and fifty at a time. You will find another group of us in the August magazine. Watch for the twins!"

NOTE.—The enthusiastic response to our request for pictures of Illinois Central babies so far exceeded our most sanguine expectations that we are obliged to distribute them through several issues. We are proud of our babies and regret that space will not permit showing all of them at one time.

Baby

Fashioned of sunshine, of flowers and dew,
Eyes of the starshine, tender and true,

Tip-tilted nose,

Tiny pink toes,

Soft dimpled chin, 'neath a mouth like the rose.
Dear loving arms, holding up for caress,
Gold, tousled head, pressing close to my breast,
Warm fragrant lips, clinging sweetly to mine,
God-given, soul-riven, baby divine.

Low cooing voice, like the note of a dove,
Whispering to Mother, soft words of love,

Two drooping eyes,

Fluttering sighs,

Wafted to Dreamland on Love's lullabies.
Closer I hold thee, tight in my arms,
May God keep and guard thee, safe from
alarms,

Watch o'er thee kindly, His hand in thine,
Heart of me, part of me, baby divine.

—ANNE ROSE SWEENEY, *Kentucky Division Correspondent.*

Our Younger Generation

Patriotic Citizenship Badly Needed Now

W. G. Arn Calls Attention to the Opportunities and the Need for More Business Men in Politics

Patriotic citizenship is as much needed now as during the war, according to Lieutenant-Colonel W. G. Arn of the Engineer Officers Reserve Corps, assistant engineer, maintenance of way, Illinois Central System. Colonel Arn, as a graduate of the Rose Polytechnic Institute, Terre Haute, Ind., delivered the alumni address at the commencement exercises of that institution, which were held on June 8. His subject was "Citizenship." In the belief that an employe cannot be loyal to the Illinois Central System unless he is loyal also to his duties as a citizen, some excerpts from Colonel Arn's address are presented herewith.

MY subject is "Citizenship." One or two of you were in military service during the World War. Most of you others, probably all, wished then that you were old enough to serve and still regret that you were not. You, however, have fully as important a duty, and one probably harder for the average man to fulfill, in performing the full duty of citizenship. You have fully as much chance as the soldier, sailor or marine for serving your country, and at the same time your own people and yourself, and generally without so great a risk of life or limb.

Your country today, young gentlemen, has no greater need than its need for honest, patriotic citizenship. By honest citizenship, I mean a citizenship that shirks none of its duties, but performs the duties of citizens as thoroughly, honestly and efficiently as are performed the business and professional duties for which pay is received in money.

Citizens Responsible for Conditions

If citizens, through their failure to do their duty in politics and at the polls, permit those to get in control who are dishonest or even merely incompetent, they are not good citizens and are themselves responsible in part for the graft and waste which result.

By patriotic citizenship I mean not merely that the citizen shall serve his country at a sacrifice of time and money and possibly of health and even life in time of war, when everybody is wrought up to a self-sacrificing fervor, but that he shall serve it at a sacri-

W. G. Arn

fice in time of peace as a citizen-soldier to be prepared for war and more especially serve it politically or civically. He must not merely make a sacrifice of money but make a sacrifice of time, in conventions, in party councils, at the polls, and between times in the work of training the foreign born in Americanism and instilling into that class a proper sense of duty. He must also be willing to serve in office at a financial sacrifice. With the duty of citizenship fully realized by the great middle class, it will, I hope, ultimately be the case that all public officers and employes will be so well paid that it will not be a financial sacrifice for those to accept public office who should as a matter of fact be our public servants (and not our bosses, as is usually the case).

The time to get interested in politics and take an active part is as soon as you leave here. If you do not take this active part then, you probably never will. No matter where you settle, there is room for improvement in the politics and local self-government

of your neighborhood. Learn the location of your polling place; register at the first opportunity; vote at every election, both primary and final; and take part in the local political meetings and conventions.

The greatest good can probably be obtained by affiliating with one of the parties, but this does not mean that you should become a party man of the "yellow dog" type—that is, vote for the nominee of your party, no matter how unworthy he may be, when the other party may have a real man for its nominee.

Study the local political situation, become acquainted with precinct and ward leaders, become acquainted with all grades and classes of citizens in your precinct and ward, particularly those of the party of your choice. You cannot influence your fellow-voter unless he is convinced that you do not think yourself above him and if he does not believe that you have or have had better opportunities for information.

At the last election held in Chicago—the April primary—it is estimated that one hundred thousand voters remained away from the polls because it rained—this where sidewalks are paved and nobody lives far from his polling place. Inasmuch as the primary practically decides who will hold most of the offices, this is a sad commentary on our so-called representative, or republican, form of government. And who stayed away from the polls? Not the ignorant and vicious, and the great bulk of foreign born who are controlled by the politicians (I use this word in its lowest sense), and bosses, and the politicians and bosses themselves, big and little—no, not at all; they go to the polls at any cost, rain or shine! It is the so-called "middle class," the class which includes the business and professional class, the bulk of the American born, the class corresponding to the *bourgeoisie* of France and Europe, the class which is practically absent in Mexico, in consequence of which Mexico is in the terrible state it is and has been for the past ten years. Chicago is but typical of the whole country in this neglect of civic duty.

No Governing Class Here

In Great Britain and many of the other countries of the world there is a kind of governing class which is expected to govern, usually at a financial sacrifice. These are of necessity the people of wealth, or at least they must be well to do, and they feel and accept the responsibility. In this country most of the members of the corresponding class do not

feel and accept this responsibility, and I do not know that we want them or any other class to wield the power that would result from such an arrangement. In this country every class should carry its proper share of the responsibility of government, and no class in our country shirks this responsibility so much as does the great middle class. To this extent the republican form of government—that is, representative government—in our country lacks very much, indeed, of being the complete success that it might and should be. In fact, the failure of the average good citizen to do his full civic duty is the reason why representative government seems at times almost a failure in this country.

It is a good kind of government, and we have a great and glorious country, but how much better the government, national, state, county and city, and how much greater and glorious our country would be if every citizen did his full civic duty, and the crook, grafter, pork-barrel roller, boss, affable nonentity and well-intentioned but misguided reformer were all eliminated from office and were replaced by substantial business and professional men, who cannot and will not refuse this duty when given to them. There is much in the old motto: "Let the office seek the man, and not the man the office."

Public Office Should Pay Well

We should get away from the idea that public offices should pay less than positions in commercial and professional life which are filled with men of the caliber that we should have, but as a rule do not have, in the public offices, and that the honor of the position makes up the lack in compensation. They should have the honor, it is true, but they should also have the compensation so that they must not sacrifice themselves and their families to serve. As an example of the injustice, I know of a man who gave up a well-paying position in commercial life to enter government service at a considerably smaller salary. This required a tightening-up on expenditures. One of the easiest ways, apparently, to do this was to drop some life insurance, as he was young and with a good, long expectancy before him. But what was the result? He was killed in an accident, and his family was left an estate very limited indeed—as much martyrs to their country as if the husband and father had been killed in military service in France, where he served with distinction.

There are two simple rules of civic duty,

which, when followed by every citizen, will eliminate our civic troubles. They are: "Vote always and as your conscience dictates," and "Obey and uphold every law, even those with which you may not be in sympathy."

Did the war cease too soon for our own good? Some of the aftermath makes it appear that such is the case. We did not practice self-sacrifice and co-operation long enough for it to become a habit. With the realization that the war was over, almost everybody, after a brief breathing spell following the armistice, became money-seeking-mad, wildly extravagant, and pleasure-seeking-wild, and it has taken the recent spell of hard times, almost a panic, to sober us. We were so eager to make money, questionably and even dishonestly, that the returning soldier was so gouged that he forgot he had ever sworn at the plucking given him by the thrifty French peasant or shop and cafe-keeper.

The war did more to Americanize the foreign born than all that had taken place in the preceding quarter century, but it did not complete that job. Much, very much, is yet left to be done in that line. The war and its aftermath have finally opened our eyes to the necessity of restricting immigration to a marked degree, but the lesson seems not to have been severe enough to make us bold enough to control it as we should. It melted some of the hyphens, but did not last long enough to rid us of them all.

No Place for the Hyphen

Patrick Henry, in a speech after the Revolution and following the adoption of the Constitution and the welding of the colonies into one government, said: "We are no longer Pennsylvanians, Rhode Islanders, or Virginians—but Americans." The war should have left us no longer Irish-Americans, German-Americans, Greco-Americans, but plain, honest-to-God Americans; but it seems not to have lasted long enough to accomplish that.

This incompleting task must be taken up and carried to completion by you younger men. Immigration must be closely controlled and carefully regulated, if not stopped entirely for a period. The irresponsible foreign red, I. W. W. and Bolshevik must be deported or absolutely controlled.

There are many plans and means for the Americanization of foreigners. Assist them through some organization for that purpose or through your fraternal organization or individually.

At a recent celebration in a good-sized town in the southern Illinois coal fields where the foreign born are numerous but where there is a considerable percentage of Americans by birth, Old Glory was carried in the parade. But with what result? Not one in twenty-five, not even the American born, paid it the respect of taking off their hats in salute. Three years ago such neglect and disrespect to our honored emblem would have caused a riot. (Apparently the war did not last long enough or was too far away.) Such an event could not happen today in France or England, even in their unsettled state, or even in some of the less stable countries of Europe.

The engineer is not given proper recognition in our government by his fellow citizens. By "proper" I mean that to which he is entitled and which he has really earned by his training and experience. Who is to blame? The engineer himself. Why? Because he does not take the part he should as a citizen and public worker. Compared with men of other professions, he is not accorded the respect due him for his knowledge and worth. Without disparaging the lawyers, for instance, I would say that engineers ought to have a more prominent place in government than they have now. We now have too many laws made by lawyers and from their point of view. They lay too much stress on precedent and not enough on fact, worth, and common sense, which, after all, are the bases of all engineering.

One of the things you can help to do—and mere voting will do little to accomplish it—is to see that the right kind of citizens are candidates for, and are elected to, office. We sadly fail in the selection of our law makers and law executors. We select too many political bosses or tools of bosses; too many who cannot make a success of anything else and make politics a business merely for the living it yields; too many affable, speech-gifted fellows who have no worthy qualifications except good-fellowship; too many possibly good men in some places, but without qualifications for the place they seek.

Too many criminals, both great and small, are released on account of political influence, and too many labor unions, instead of being run by honest artisans, are run by crooks and criminals who are able to control solely through dishonest politics.

Crooked politics, which each of you is under

obligation to work against and eliminate, is not confined to the large cities (as bad as conditions are there), but is a general affliction. It has been an underlying cause of race riots in cities large and small. It has been found in rural districts and in towns and villages in all parts of the country. Wherever you may settle, there is work for you to do to improve conditions.

Good Jury Service Important

Respect for law must be increased in all of us, and it must be inculcated in those in our country who now have none. Your part in this matter is to serve as jurors when called upon. This is as much your duty as it is to pay taxes or to testify as a witness. The success of a jury system is impossible among a people who are not, on an average, intelligent and honest; hence, it will be more or less a failure, accordingly as the honest and intelligent men of the community evade this service. Do not be a jury dodger.

Jury service is another of the places where

financial reform is needed. A juror should be adequately paid for his service, but, regardless of how soon this reform is effected or whether it ever be, you should do your full duty in this service. Many, many laws are not enforced mainly because those who should compose our juries dodge that service, and as a result murderers and gunmen are unhung and highwaymen, burglars and thieves are out of the penitentiary. Chief Justice Taft has well said: "The emotional and untrue doctrine that it is better that ninety-nine guilty men should escape than that one innocent man should be punished has done much to make our criminal trials a farce."

Don't think from what I have said that our representative form of government is a failure. It is not. It is the best form of government, and the one that will ultimately prevail throughout the earth, but to an appalling extent it is not the success it can be made by your persistent efforts.

NEW ORLEANS GROUP USING PANAMA LIMITED

New Orleans delegation leaving on the Panama Limited June 3 for Indianapolis to attend the convention of the National Association of Wholesale Credit men, June 5. Among the delegates were: Mr. and Mrs. J. A. Badger, Woodward Wright & Company; S. G. Steiner, Parke Davis & Company, president of the New Orleans Association; C. H. Hamilton, Merchants Coffee Company, vice-president, and Mrs. Hamilton; A. J. Marion, Nicholas Burke Company; C. H. Kammer, Aug. H. Flaspoller Company, chairman of the New Orleans executive committee; G. L. Wolley, Hibernia Bank & Trust Company; L. A. Weil, Kohn, Weil & Simon, Inc.; George Grundmann, Albert Mackie Company; T. J. Barlette, secretary-treasurer; T. L. Ensley, Brown Roberts Hardware & Supply Company; Mr. and Mrs. E. Pilsbury, B. Rosenberg & Sons, Inc.; Mr. and Mrs. F. V. Moise, Whitney Central National Bank; T. F. Regan, Citizens Bank & Trust Company; M. G. Adams, Schwartz Brothers Company; J. M. Klopff, Canal Commercial Bank & Trust Company; W. P. Simpson, C. T. Patterson Company, national director, and Mrs. Patterson.

Where Switching Is Down to a Fine Art

Intricacy of Operation at Randolph Street, Chicago, Is Eye-Opener to the Average Railway Man

By FRED T. COLLAR,
Chief Clerk to Superintendent,
Suburban Passenger Service

THE average employe in other branches of the service has small conception of what is involved, for example, in operating our Chicago suburban passenger trains day in and day out with their clock-like regularity. We are at present running 370 trains, handling an average of about 75,000 passengers a day. These trains are operated nearly 100 per cent on time, as is shown by the following statement showing the percentage of suburban trains on time for the twelve months from March, 1921, to February, 1922, inclusive:

March	99.7	September	99.4
April	99.8	October	99.6
May	99.9	November	99.6
June	99.9	December	99.3
July	99.8	January	99.0
August	99.8	February	99.4

Of our 75,000 daily passengers, approximately 60,000 are handled during the morning and evening rush periods, when our patrons are going to and returning from work. The peak periods are from 7:30 to 9 o'clock in the morning and 4:30 to 6 o'clock in the evening. To handle this volume of traffic during these hours necessitates operating trains at very short intervals. During the peak, trains are scheduled into the Randolph Street terminal at intervals of one and two minutes.

Hard to Keep Terminal Clear

Our terminal facilities at Randolph Street are limited. For a short distance entering the

yard we operate over a single track. We have no turntable at Randolph Street; therefore, trains and engines coming into this terminal station, consisting of six tracks and three platforms, move over this single track. Equipment must be immediately removed from the depot yard tracks by being kicked through a system of hand switches into a storage yard consisting of two tracks, which parallel the incoming track, before the trains following can be accommodated. It can be readily seen that this involves a large number of switch moves, which must be made during the rush period while southward trains in the morning and northward trains in the evening are being prepared and operated in and out of the terminal. This, of course, necessitates the coaling and watering of engines, which are handled at the north end of the Randolph Street yard.

The total number of cars handled each day at Randolph Street on train movements is 1,736, of which about 80 per cent are handled in the rush periods. In addition to this, there are about 150 switch moves involved, and all of these are handled through the "neck of the bottle"—the stretch of single track referred to. Anyone who doubts that this is strenuous operation is cordially invited to visit Randolph Street terminal any morning or evening and watch the wheels go 'round.

The fact that we are able to handle such a volume of traffic with our limited terminal facilities is due largely to the constant study

Where the Complicated Switching Comes In

All Set to Go at Randolph Street

and attention given this problem by Assistant General Yardmaster W. H. Ortel and his force. These men work under high pressure and must of necessity make every second count to its utmost if they are to keep the trains moving on schedule.

A number of things, none of which can be justly charged to man-failure, militate against on-time operation of our trains. For example, adverse weather conditions, delays at cross-line railway crossings and other causes over which we have no control disarrange the schedules to some extent. It requires quick action in such emergencies, on the part of the supervising staff as well as the force, to prevent demoralization of the service and the consequent congestion of passengers on station platforms and trains.

Service Has Limitations

Our suburban traffic continues to show a steady increase in volume. We are, however, restricted as to the number of trains we can handle during the rush period in and out of Randolph Street. We are also limited as to the number of cars per train, both by the length of the station platforms on the line and by the length of tracks and platforms at Randolph Street. We have about reached the limit, with our present facilities, both as to the number of trains and cars, and it is therefore due only to the unusual degree of efficiency prevailing in our suburban force in general that our reputation of having the "best steam suburban service in the world" is maintained. To this must be added the desire of the force to serve our patrons to the best of our ability—and courteously, always and under any circumstances.

Just one little instance is cited as an evi-

dence that this matter of courtesy is always uppermost in the thoughts of our employees.

Appreciation From a Patron

At Randolph Street station we load approximately 15,000 passengers during the evening rush. Each passenger's ticket is canceled or perforated by one of the gatemen before the passenger boards the train. It is sometimes difficult to handle this crowd, as everyone is in a hurry. One of the gatemen at this station recently received a small present from a woman who regularly passes through his gate every evening. The gift was accompanied by the following note: "Dear Sir: Accept this small token of regard for your kind attention in seeing that a young lady of 75 years always gets the right train to Brookdale." It might be pointed out that such attention to passengers on the part of our gatemen or gatemen is the rule and not the exception.

Traversing, as we do, one of the best residential sections of Chicago, we draw our patronage from those who expect and demand nothing less than the best possible service. In handling such a large volume of traffic, it is to be expected, we receive some complaints and criticisms regarding our service. These are, however, remarkably few in number, and the employe involved invariably considers a complaint of any nature as a personal matter and takes immediate steps to remove the cause. From Conductor "Bob" Rinearson, with his forty years of continuous service, to the newest extra trainman on the list, our conductors, collectors and flagmen are on the alert to collect proper transportation from passengers, to assist in loading and unloading passengers, to prevent personal injuries and to carry out the

Mrs. Belle Stansell

fuel and in safeguarding the welfare of the passengers on their trains.

A Ticket Seller Thirty-Five Years

The oldest ticket agent in service on the Chicago terminal is Mrs. Belle Stansell, who has sold tickets for thirty-five years. She, as well as all of our ticket sellers down to the latest ticket clerk employed, is interested in seeing that our patrons are given proper attention at the ticket window.

Our switch tenders are an important cog in the wheel of suburban operation, as a great deal of responsibility rests on their shoulders in handling the numerous movements of trains and engines properly. The roundhouse forces at 27th Street and the car cleaning forces at Randolph Street and Weldon keep our suburban engines and equipment in good condition, and the co-operation of the mechanical department in this respect is of valuable assistance. Even our station cleaning force, under the able direction of Station Inspector J. E. Carroll, is to be commended for the excellent condition in which are kept our fifty-seven suburban stations.

many other duties of their positions. From Engineer J. C. Glover, who has been running an engine forty-three years, to the newest fireman, our enginemen are concerned in maintaining the schedule of their trains, in conserving

The fact of the matter is that the entire force is instilled with the "give your best" spirit, and it is our humble opinion that a finer body of employes cannot be found on this or any other railroad.

Our Monthly Roll of Honor

Below is a list of employes retired at the meeting of the Board of Pensions May 29:

Name	Occupation	Years of Service	Date of Retirement
John Feulner	Signal Helper, Chicago, Ill.....	25	12/31/21
Oscar B. Hill.....	Engineman, Centralia, Ill.....	33	1/31/22
John H. Wells.....	Operator, East Cabin, Ill.....	29	2/28/22
Frank Brown (Col.).....	Engine Watchman, Canton, Miss.....	40	2/28/22
Samuel M. Bishop.....	Foreman, Machinery Dept., Cecilia, Ky.....	21	4/30/22
James Prendergast	Watchman, Chief Special Agent's Dept.....	28	4/30/22
John O'Connor	Section Foreman, Chicago, Ill.....	41	4/30/22
Wencil D. Melsa	Hostler, Cedar Rapids, Iowa.....	20	11/30/21

The following deaths of pensioners were reported at the same meeting:

Name	Last Employment	Date of Death	Term as Pensioner
Oliver A. Harrison.....	Conductor, Mississippi Division.....	4/28/22	1 year
George J. Smith.....	Molder, Louisiana Division.....	4/22/22	2 years
August F. Marx.....	Laborer, Minnesota Division.....	4/29/22	3 years
Perry McGlothter (Col.).....	Section Laborer, Tennessee Division.....	5/ 3/22	5 years
John Richardson	Clerk, Accounting Department.....	5/14/22	12 years
Fred C. Norman.....	Agent, Minnesota Division.....	5/18/22	2 years

ACCIDENT AND

INJURY PREVENTION

Nine Employees End a Course in Safety

AT a graduation dinner of the Chicago Safety Council at the Morrison Hotel, Chicago, June 6, nine employees of the Illinois Central were graduated as safety supervisors and awarded diplomas.

The Chicago Safety Council, organized by the Chicago Association of Commerce, conducted a school of instruction in safety principles and practices, known as "The School for Safety Supervisors," holding bi-weekly evening meetings, beginning February 14. The attendance at nine or more meetings of the fourteen entitled one to a diploma certifying that he had satisfactorily completed the course of instruction. The meetings were held at the Central Y. M. C. A. and were largely attended by all classes of employees, and also by employers. More than 800 persons attended the graduation dinner, and 504 employees of various railroads and industries were awarded diplomas. President Samuel M. Felton of the Chicago Great Western Railroad, President Herman H. Hettler of the Illinois Manufacturers' Association, and Vice-President Homer E. Niesz of the Chicago Safety Council gave interesting talks on the safety problem.

The following named Illinois Central employees were awarded diplomas:

SAMUEL M. COPP, assistant general claim agent, is an ardent worker in the cause of accident and injury prevention. He began his railway career twenty years ago as a stenographer at New Orleans, his home town, but for the last thirteen years he has been in the claims department of the Illinois Central System. Beginning as a stock claim agent at Memphis, he has been

S. M. Copp

promoted through successive grades of the service, and since October 1, 1919, has been assistant general claim agent, Northern and Western lines, with headquarters at Chicago. While with the Illinois Central System he has been located at Memphis, Yazoo City, Grenada, Freeport and Fort Dodge.

E. W. Jansen

Mr. Copp believes in the effectiveness of promoting accident and injury prevention through the *Illinois Central Magazine*. For some time he has had charge of the department of the magazine in which this article is published. He believes in giving credit where it is due, and the photographs and records of the men who have been achieving splendid records in preventing accidents and

injuries which have appeared in this department month by month attest his interest in and enthusiasm for this important branch of railway work. Mr. Copp says that every member of the claims department takes a keen and active interest in "selling safety" to the employees and in calling attention to hazardous conditions on the railroad which should be remedied.

E. W. JANSEN, electrical engineer, member of the general safety committee, entered the service of the Illinois Central System as an electrician, Central Station plant, July, 1896. He organized the electrical department on the Chicago terminal in January, 1901, and on the system in November, 1904. At present there are 203 electricians and apprentices, including division electrical foremen, on the system, and no fatal injuries have occurred since December, 1919. Mr. Jansen has taken an active in-

terest in safety work, and considering the hazardous work in connection with the electrical department few accidents have occurred to employees. The electrical department employees on one terminal have a record of 100 per cent. The electrical department also won the terminal safety silver cup during the system's "Safety First" drive in the fall of 1920.

F. W. ARMISTEAD, assistant engineer, entered the service of the Illinois Central System as a chainman in 1905. He received various promotions in the engineering department, holding the positions of rodman, masonry inspector, instrument man and resident engineer. He was appointed assistant engineer in the office of the engineer, maintenance of way, August 15, 1921. Mr. Armistead has been much interested in accident and injury prevention work and has never had occasion during the time that he occupied the various positions mentioned to make out a personal injury report covering an injury to himself or to any of his men.

F. W. Armistead

WILLIAM J. S. WILLS entered the service of the Illinois Central System during 1915 as a painter and varnisher at Burnside. He has been a member of the safety committee for six years. Mr. Wills was a constant attendant at the safety supervisors' school, and he is a booster for safety work. To use his own words, he says: "I believe if each and every employee would put his shoulder to the wheel and make himself an individual safety man, look out for his neighbor's welfare and warn him against any unsafe or dangerous practices, the number of accidents could be materially reduced."

W. J. S. Willis

EDMUND JERGENS has been in the service of the Illinois Central since 1914, employed in the machine shop at Burnside. He has served as a member of the safety committee for the past two years. Mr. Jergens says that the safety movement has been a great help to humanity in general, that it has developed guards and protective devices on machines which before were dangerous to industrial workers. The safety movement has also caused employees to give more thought to unsafe practices, thereby benefiting themselves and their employers. Mr. Jergen is also a booster for safety work, and says that the work of their safety committee has produced beneficial results.

Edmund Jergens

MARK ETHELL has been in the service of the Illinois Central since July, 1912, employed as a blacksmith at Burnside shops, Chicago. He has been a member of the shopcrafts safety committee during the past five years. Mr. Ethell says: "The safety work has always been of great interest to me, and I hope to continue it for the benefit and protection of my fellow workmen and myself in the future as I have done in the past."

Mark Ethell

RUFUS T. NEWBERRY entered the

R. T. Newberry

service of the Illinois Central, September 10, 1910, as a tool dresser at Burnside shops, Chicago. He was appointed a member of the safety committee in March, 1912, and was made chairman of the safety committee in 1920, which position he now occupies. Mr. Newberry was graduated as safety supervisor in 1921. In commenting on safety work he says: "It has been my ambition, as well as the ambition of the safety committee and the other officers, to overcome all dangerous hazards, whereby accidents could be reduced. I have come to the conclusion that our plant is the best equipped plant in this part of the country in regard to safety appliances and sanitary conditions. This being true, it is up to the men to develop the safety habit and to be on the alert and look out for the other fellow as well as themselves. This has been my policy and I thus far have been fortunate enough to prevent injury to myself and to my fellow employees."

C. H. Leyerle

CHARLES H. LEYERLE entered the service of the Illinois Central during 1901 as section foreman on the St. Louis division. He has been continuously employed in the maintenance of way department since that time with the exception of about two months. He is now employed as section foreman at Fordham yard, Chicago. Mr. Leyerle says that after attending one of the safety supervisors' classes he became much interested in the instructions and continued to attend the meetings until he had completed the course. During his entire service with the company he has never had but one employee working under him sustain an injury.

EMIL SAPPER, section man, worked under

Section Foreman Charles H. Leyerle at Fordham for the past year. He is now employed as a car repairer helper at Fordham. On being questioned as to how he became interested in accident and injury prevention work, he replied that after attending one of the meetings with Section Foreman Leyerle he became very much interested and decided to complete the course.

COMMUNICATIONS

More About Spark Plugs

The following letter to J. L. Downs, roadmaster of the Illinois division, has been passed on to the magazine:

After reading your letter of May 12, in which you quoted a letter from the general storekeeper in regard to excessive use of spark plugs, we asked every man using spark plugs to advise how many plugs he had used in the past year, and we received the following surprising information:

Maintainer Garard at DeWitt reports he has been there for the past seven years and has been furnished only one plug in that time, but that he has two Splittorf green porcelain plugs that he has used alternately for the past six years.

Maintainer Followell at Edgewood is using the original plug furnished with the car, and he has been using the car for more than three years.

Maintainer Alexander at Kinmundy was furnished a Stitt plug for a test about two years ago, and it has been in continuous service ever since, and he says that it is good for at least five more years unless it is accidentally broken.

Maintainer H. Hyde at Paxton reports that the plug he is now using has been in continuous service for more than two years, but he says he has had plugs that would fail within a week.

Maintainer Simpson at Tuscola reports he still has a plug that was furnished with the car, about four years ago, and it is still in serviceable condition, and he is using it alternately with plugs discarded by a garage.

Maintainer Evans at Champaign reports that he has not received a plug for more than three years, but has been using plugs found on the track that were lost or discarded.

Foreman Fox reports he received three plugs during March, and still has them, for he has been using discarded plugs given to one of his men by a garage. Mr. Fox has five plugs in use at all times.

Under the heading, "Material Means Money," in the April magazine, spark plugs were the subject. It was pointed out in this article that the present average life of a spark plug was eighty-seven days, and that one section foreman had a plug in service for fifteen months; so it seems that some of the signalmen have surpassed the best known records.—S. C. HOFFMANN, Supervisor of Signals, Illinois Division.

Emil Sapper

Some Aspects of a Roadmaster's Work

He Talks It Over With the Trainmaster, and Both Get New Ideas of Proper Railway Co-operation

By G. M. O'ROURKE,

Roadmaster, Indiana Division

THE extra north had passed, and the trainmaster and roadmaster were proceeding on their motor car inspection trip of the district. While waiting for the train they had been talking "shop," each outlining the work required of him in his department, and as they sped along they were turning over in their minds the benefit to be derived through an exchange of ideas and information. Suddenly, without warning, the motor stopped.

The weather was beastly hot, and after working over the motor a while they decided to push the car to a siding a short distance away, where there was some shade. Fairly worn out, they reached the shade of some warehouses and experienced a delightful feeling of comfort, like the surprising experience of cold which one feels in the early morning in the South. At the slightest exertion, however, their clothes became wringing wet, and the trainmaster's glasses were continually covered with moisture.

The Life of a Motor Car Man

"How motor engineering ever attracts adherents is beyond my understanding," exclaimed the roadmaster as he worked over the engine. "Men have become lunatics, and others bear the marks of having tried it—finger nails which yield only to a shovel or trimming to the quick; clothes, hands and faces smeared with grime, knitted brows and heart-rending expressions. I refuse to face such a fate. After a sincere effort for an hour to get an explosion from this atrocity, I leave it for other hands."

"We all have our dreams," the trainmaster remarked. "The motor engineer and mechanic, no doubt, dream of improvements and inventions which will bring them fame and riches. Without such dreams we should be clods. It is in our dreams we accomplish the impossible; the rich man dumps his load of responsibility and lives in a log shack on a mountain top; the poor man becomes rich; the stay-at-home travels; the wanderer finds a home. In our dreams, yours and mine, we become great railway men."

"Something more than dreams, however, is

required to make us great railway men," growled the roadmaster, looking up from his distasteful task. "Work and supervision, planning and results are demanded. Too often we lack the push and grasp which a general officer must have. Our supervision is of a retrospective rather than an introspective character. Too many division officers approach the matter of effecting improvements and savings in a negative manner by referring to present and past practices resulting unsatisfactorily, instead of applying the remedy and following it up to see that instructions are carried out. No doubt reference to past and present bad practices is beneficial, but better results can be obtained by requiring our men to do certain things in addition to bringing to their attention present practices and results. The remarkable results of the various drives during the past three years illustrate what I mean, and we in the maintenance of way department are giving thought and attention to some form of 'measuring stick,' so called by our vice-president, that we may follow the progress of our work.

"In arriving at a 'measuring stick' of work done in maintenance of way and reconstruction work we must make more use of the so-called E. D. and D. V. reports which are prepared on the conclusion of all work covered by an authority for expenditure," continued the roadmaster. "From them we find the work accomplished per man hour in lineal feet of track ballasted, lineal feet of rail laid in main and side tracks, rods of fences built, panels of ballast deck and open deck trestles constructed, cubic yards of concrete poured, and so forth. Annual tie statements and other reports prepared in the office of the roadmaster and division accountant are not used to the extent they should be in fixing the work which is to be accomplished per man hour.

Planning a Roadmaster's Work

"With freezing weather comes the end and beginning of a roadmaster's work," he said. "It is then he renders reports of results accomplished during the working season and submits his plans and recommendations for the coming year. He brings to the attention of his supervisors the results compared with previous years

and should lay out what is expected of each in the coming season. These plans he should keep before him during the year and compare them frequently to establish the relative efficiency of supervisors and to watch the progress of each class of work. Graphical charts will be found a great aid in readily following the progress of plans and for comparison with past performances.

"To follow up these plans personally means work. The outline or program should be carefully made with a consideration of the force, material supply and other controlling factors. Caution should be exercised to avoid being like the Sangamon River steamboat with the 3-foot boiler and the 5-foot whistle; every time the whistle was blown the boat stopped until steam was made again. A roadmaster is expected to demand of his men just as much as he himself puts into the work, and he is selected as a pace-setter. The man who has no ideals and no desire to progress and make a stand against his own weaknesses can't be much of a railway man. If he is looking for an easy berth he seldom finds it—or has any satisfaction of it if it does come to him. Men of normal, healthy standards enjoy the struggle and refuse to become the slaves of routine.

Days Set for Special Work

"The old saying, 'Take care of the little things and the big things will take care of themselves,' must have been intended especially for maintenance of way officers, because it is truly applicable in our work. Do you know there are more than forty parts of a turn-out that are inspected by the road supervisor each month; that the first Tuesday of each month is set aside on this great system for tightening track bolts, and on our division the second Tuesday is 'Bridge and Culvert Day'? On the first Tuesday all track bolts are tightened because loose bolts result in bent bars, bent and battered rail, cut ties, churning ballast, low joints and rough track. By concentrating all efforts on bridges and culverts on the second Tuesday of each month we are rapidly getting all bridges tie plated, the embankment at the bulkheads widened and strengthened and culverts kept free of obstructions. We are eliminating the low places in the track at the ends of bridges where the track hung swinging because of insufficient embankment. These are tasks or 'drives' that are bringing good results.

"I wonder if you know how the tie renewals are carried on; that the section foreman in the fall of the year actually closely inspects and

counts the ties that are to come out next year, and that this is checked by the supervisor and roadmaster and tabulated by miles and side tracks before sending to headquarters. And when the renewals are made the ends are all lined up on one side and the spiking is done according to a rule. Speaking of rules, I would like to know how many men in the transportation department know as much about maintenance of way rules as the average section foreman knows of transportation rules."

Appeal to Men Is Successful

"Yes," replied the trainmaster, "I am aware all section foremen are required to pass examinations on both books of rules, and I am sure all trainmen and enginemen would find a study of maintenance of way rules profitable reading. I enjoyed the pleasure of attending the last 'spelling bee' on rules and standards held between the section foremen of two districts and learned more of maintenance matters than I had picked up in years. The enthusiastic and friendly rivalry of the contestants was refreshing.

"More psychology injected into our business will bring results. Appeal to personal pride and manhood has enabled me to break up many bad practices, among them the dangerous act of jerking off and throwing away switch locks at ground throw switches entering yards. A trainmaster must take up with the rank and file dangerous practices and make examples. It is a fine act on the part of a trainman or switchman who acknowledges his negligence in running through a switch but takes immediate steps to prevent the creation of a trap. Diametrically opposite is he in manliness who actually sets a dangerous trap for his companions through exercising a nasty disposition in throwing away a switch lock. A trainmaster must come in personal contact with his men in an appeal to their professional pride to stop bad practices resulting in waste and injury."

Possibilities in Saving Material

"I am glad to hear that you are interesting your men in avoiding waste," the roadmaster remarked, "because there are great many possibilities in saving material found along the waylands. Several types of castings used at interlocking plants may be reclaimed, worked over and used again; pipe compensators can have the cored holes, in which the crank pin sets, bored out a trifle larger, after which, with the insertion of a thin metal bushing, they will serve for another period. Spikes relieved when main track rail is relaid are sorted over

and all usable spikes placed aside for redriving in side tracks and yards. Worn switch points and frogs are sent to welding plants at several places on the system where they are rebuilt and made good for use in back track switches. In the same manner battered and bent bolts are straightened and rethreaded; guard rails are made from short pieces of rail; spike mauls, chisels, picks and shovels are being sent to the shops for repairs. Water department valves having good bodies are re-seated, and all other fittings are carefully considered for further use before getting into the scrap. If the unit costs of tools and material can be placed before our employes in an interesting manner, they will have a desire to help us save.

"As long as the uninformed do not think or are of the opinion that supplies are cheap or that the railroad can afford the loss, we shall find waste, but if they know the cost our conservative men are not going to tolerate negligence in their companions. All of our men do not believe in the gospel that they are selling to the railroad their time, not their services. This doctrine of elapsed time, not work performed, simply ruins men for becoming efficient workers, and we should be happy that such characteristics do not exist in each individual equally, nor will every single man be inoculated with them.

Dickens' Golden Rule

"I remember reading somewhere Charles Dickens' Golden Rule, which was like this: 'I never could have done what I have done without the habits of punctuality, order and diligence—without the determination to concentrate myself on one subject at a time, no matter how quickly its successor should come upon its heels. Whatever I have tried to do in life, I have tried with all my heart to do well; whatever I have devoted myself to, I have devoted myself to completely; in great aims and in small I have always been thoroughly in earnest. I have never believed it possible that any natural or im-

proved ability can obtain immunity from the companionship of the steady, plain, hard-working qualities, and hope to gain its end.'

"Efficient and economical maintenance and operation will follow only on the application by each individual employe of such a rule.

"Just now, however, the business in hand is to get this motor to respond. Crank her, and let's see if we can't get a snort from her."

After a few turns of the crank, the motor started with a roar, and they went on to the next station to tie up for the night.

PREACHING

A Scotch preacher had been abroad, and when he came back he was preaching to his congregation on the marvels he had seen.

He wound up with this: "And the same Creator who made the vast ocean made the dewdrop. The Creator who made the mountain made the pebble. Yes, and that same Creator who made me made a daisy!"

FITTING EPITAH THIS SUMMER

Sports Over the System

Memphis Employees Strong for Baseball

By WILLIAM GERBER,
Memphis Terminal Correspondent

After a lapse of several years in athletic enthusiasm, the Illinois Central at Memphis has once again come to the front with a league of baseball clubs, one of which threatens to capture the city championship. There are about twenty leagues under the jurisdiction of the Memphis Associated Amateurs, and it is indeed gratifying to say that the Illinois Central League is composed of some of the best ball swatters in the entire circuit. By comparing the brand of ball being

played by the Illinois Central teams with that played by other ball clubs, one can have every reason to believe that one of the Illinois Central clubs will win the city championship.

At this writing (the middle of June), the Outbound team is playing a splendid game of baseball. Out of eight games played, this team has won six and lost two. A great deal of credit for the pep and winning ability of the Outbound team is due to the wise and brainy managing of W. E. Duncan. Duncan has exhibited that he knows how to handle a ball club in order to make it win, he has gained the confidence of his men and has instilled a fighting heart into them that is proving successful.

It might at this time be pointed out that the Outbound team, after winning six straight games, has lost two in a row. This is due to the other clubs' realizing the necessity of removing certain players who were not demon-

GOLF—THAT SLOW FOURSOME JUST AHEAD

strating their ability to play the class of ball necessary in this league. All of the pitchers are now coming around. With many of the players gaining their batting eyes, it looks as if all of the clubs are going to make one another hustle for the pennant.

It is also gratifying to note that the employees of the Illinois Central System at Memphis are taking much interest in the pennant race, and all games are being attended by a great majority of the officers as well as by the employees.

Golf Club Going Well

In the June issue of this magazine announcement was made of the organization of the Illinois Central Golf Club at Chicago. The number of members has increased to sixty active "golf bugs," and the regular routine of the club is going full blast. No cash prizes are offered, but the money designated for each winning position is converted into golf accessories, such as clubs, balls and various other trophies of use to the golfer.

The prize winners for the week ended Friday, May 19, were:

Name	Gross	Handicap	Net	Prize
A. B. Johnson.....	93	32	61	1st
M. B. Hamilton.....	87	28	59	2nd
J. M. Dorsey.....	93	27	66	3rd
E. F. Barnes, Jr.....	128	36	92	Consolation

The prize winners for the week ended Friday, May 26, were:

Name	Gross	Handicap	Net	Prize
A. H. Coates.....	90	23	67	1st
J. M. Dorsey.....	95	27	68	2nd
F. I. Lucius.....	98	30	68	3rd
E. A. Courtney.....	91	22	69	Consolation
A. F. Cox.....	149	49	100	

The "gang," as the members term the organization, is enthusiastic over the prizes awarded, and each week finds the winners turning in different scores. The handicap committee is kept pretty busy determining the net scores of the members, as some have as much as a 35-stroke handicap—one, A. F. Cox, rides with a 49 handicap, and it is seen by the list of winners for the week ended May 26 that Cox came in for a prize. This goes to show that the beginner has an equal chance with the old-timer.

Excellent weather has made it possible to play good golf and for the beginner to improve his game. Practically all the members find it easy to play the best part of the game before going to work in the morning.

A question has arisen as to the probability

of other golf clubs of Illinois Central employees being in existence on the system. If there are any clubs managed by and exclusively for Illinois Central employees that would entertain the idea of a tournament before the season is over, they should communicate with F. I. Lucius, secretary, Illinois Central Golf Club, Room 701, Central Station, Chicago.

Local Freight Office, Louisville

To the score of 28 to 1, the front office boys trounced those from the back office in a loosely played game on the part of the boys from the back. This is an annual affair on Decoration Day to decide the supremacy of the two offices. The following clerks composed the two teams.

Front Office

Allen	P.....	Nickles
Buchhold	C.....	Shacklette
Sheehan	S.S.....	Grossman
Shaughnessy	1-B.....	Sage
Albrecht	2-B.....	Berger
Whitlock	3-B.....	Cassell
Dudderar	R.F.....	Morton
Higgins	L.F.....	Grubbs
Daniles	C.F.....	Crawley

Back Office

Auditor of Freight Receipts, Chicago

McCarthy's 1922 ball team engaged in a conflict with the Illinois Central suburban trainmen, Sunday, June 11, resulting in a victory for the latter by a score of 2 to 1. The score is representative of the game. The two scores made by the Suburbanites were on a hit to the bushes in left field and an error on a fly to right. McCarthy's team registered its run when Rowe knocked a homer to right field. Airtight pitching by Walthers for the A. F. R. athletes and by Davin for the Suburbanites characterized the game, with excellent support in the field for both teams. For future engagements call E. A. McCarthy, A. F. R. Office, 63rd street, telephone Local 8.

A Suburban Service Ball Team

The suburban trainmen at Chicago have organized a baseball team for the season of 1922. Sunday, May 28, they played the transportation department team at Washington Park, winning by a score of 26 to 4. The team is desirous of meeting other Illinois Central teams. Arrangements should be made with E. A. Smittle, manager, Randolph Street Station, Chicago, Ill.

Traffic Department

Our Part to Play in Foreign Trade

By W. M. RHETT,
General Foreign Agent

SINCE the termination of the World War there has come to all business men a better appreciation of the value of foreign trade, and we are beginning to realize that as we are willingly or unwillingly more or less bound up with the rest of the world, politically and economically, we must either take a leading part in world trade or else fall behind commercially, which also means loss of advantage and prestige in all other respects. Our present preeminent position is based on our prosperity and wealth as compared with those of others, but as they resume industry and business activity this condition will be equalized unless we in turn redouble our efforts abroad as well as at home and keep the lead. We find, in our contact with merchants and manufacturers, more intelligent interest in this question than formerly, especially as an increasing number of them have reached the point of development where it is necessary to find foreign markets for their surplus, thus keeping down the overhead expense.

Imports Are Important, Too

Unfortunately the growing popularity of exports does not extend to imports. On the contrary, there is a strong tendency to view with suspicion every effort to increase our imports, and we seem to be haunted by the fear that unless we exclude the foreigners' goods we will injure ourselves. We go to extremes in protecting our toes from foreign pressure, but at the same time are striving to sell our goods to the other fellow in competition with his own products or his ability to obtain a supply from more friendly neighbors. With other countries pursuing a reciprocal policy, how can we succeed along these lines, especially as the foreigner has little money with which to buy and even that is depreciated, and we deprive him to a great extent of the ability to exchange his goods for ours? In many cases exchange is his only means of purchase. The answer to exports is inevitably imports. A valve working only one way will not accomplish the re-

sult. Pursuance of this policy will always operate as a handicap, and no doubt a full appreciation of this truth will come to us in the course of time.

These matters are vital to us of the Illinois Central. We have always been pioneers and leaders in policies affecting foreign traffic, especially through the port of New Orleans, now the second port in the United States and still growing and gaining on the others. Just how much we are interested will be better realized if we consider our foreign tonnage somewhat in detail.

Price Abroad Fixes Return

In the matter of exports, consider the enormous volume of grain and grain products. In this case the price paid abroad practically fixes the return to our farmer for his entire crop, whether consumed at home or abroad. This is also true to a lesser extent of cotton, a large proportion of which crop is exported. Cotton seed products, forest products and packing house products, together with iron and steel and manufactures thereof and petroleum products, constitute a large part of our business, to say nothing of the exports of general merchandise.

In the line of imports there is a great volume of bananas from Central America; coffee from Brazil; sugar from Cuba and Porto Rico, refined at the seaboard and reshipped to the interior; sisal and petroleum from Mexico; pineapples and vegetables from Cuba; nitrate of soda from Chile; bones from the Argentine; mahogany logs from Europe, Africa, Central America and Mexico; ferro manganese, salt and fullers earth from England; glass, apollinaris water and rags from Belgium; potash from France and Germany; magnesite, marble and lemons from Italy; olive oil and olives from Spain, Italy and France; paper from Norway and Sweden; burlaps and bagging from Calcutta, India; silk, matting and tea from China.

A study of these things is exceedingly interesting, and an appreciation of what it means to us is inspiring and will incite us to use every

effort to further the development of this traffic with which we are so closely identified and which is so important to our welfare. Our company maintains a strong traffic organization in London, with sub-agencies in the important European ports, to serve our patrons in the way of obtaining more frequent and efficient steamship service and lower ocean rates to the ports of New Orleans and Savannah from all of Europe, and to bring in closer contact the sellers of Europe and our buyers, thus facilitating the exchange of goods. This service is co-ordin-

ated with our general foreign traffic department at home, which enables us to be prepared at all times to furnish prompt and reliable information as to sources of supply, costs of transportation, customs duties and other useful information. We are also prepared to quote rates, advise as to sailings and issue through export bills of lading via any American port to all parts of the world. We can be of service to our patrons by calling their attention to these facts and by offering freely the use of our facilities and information.

Illinois Central Loads Mexican Wagons

During the past month the Illinois Central has been engaged in originating the shipment of 5,000 army escort wagons which were recently sold to the Mexican government, through the American Sales Corporation of Galveston, Texas, by the United States government. The wagons were loaded at our Hawthorne yard, near Chicago, and moved out at the rate of a trainload a day, each train consisting of from twenty to thirty cars. The entire shipment amounted to 300 carloads. The Illinois Central handled the business between Hawthorne and Cairo, where it was turned over to the Mississippi Barge Line for shipment to New Orleans.

The wagons will be used by Mexican farmers. The Mexican government has arranged to sell the wagons to the farmers in that country on the partial payment plan.

For more than a year the Illinois Central has been interested in obtaining this business. J. B. Convery, our commercial agent at Houston, Texas, heard a year ago that the Mexican government was arranging to buy a large number of farm wagons which were stored at a government warehouse in Chicago, and he wired J. W. Rhodes, foreign freight agent at Chicago, to that effect, advising Mr. Rhodes that E. A. Morris, vice-president of the Ameri-

Reading from left to right: C. D. Anderson, general yardmaster, Hawthorne; J. B. Hamilton, trainmaster; R. A. Castillo, representative, Mexican government; G. O. Shotwell, city freight agent, foreign freight department; J. F. Ellis, agent, Hawthorne.

can Sales Corporation at Galveston, Texas, which was serving as an agent in the transaction, was in Chicago at that time. An appointment was arranged, and Mr. Rhodes met Mr. Morris and gave him full information as to rates, routing, service, etc. Final arrangements were completed on June 3 of this year.

A Good Word for Mexico

George O. Shotwell, city freight agent, foreign department, met with Mr. Morris and Trainmaster J. B. Hamilton and made the arrangements for handling the shipment. The

Line-up of Cars Ready for Shipment

Hawthorne station and some of its employees. Left to right, standing: E. Herring, yard clerk; R. Hammer, yard clerk; E. M. Hayes, reconsigning clerk; M. Vollameder, cashier; J. Pittman, dispatcher; R. A. Castillo, Mexican representative; J. Geiger, rate clerk; C. D. Anderson, general yardmaster; J. B. Hamilton, trainmaster; J. F. Ellis, agent; Ed Kusabaski; G. O. Shotwell, city freight agent. In front, W. J. Marsh, switchman; J. E. Stipek, switchman.

movement was supervised at Hawthorne by J. F. Ellis, agent, and C. D. Anderson, general yardmaster.

Rafael A. Castillo of Mexico City, representing the department of publicity of the Mexican government, inspected the shipment and otherwise looked after the interests of his government.

The following is a statement which Mr. Castillo made for the *Illinois Central Magazine* in reference to conditions in Old Mexico:

"It indeed surprises me that every American whom I have had the honor of meeting asks: 'How are things over there?' 'Is not the life of a man in risk in your country?' and I, of course, have been compelled to answer that perhaps the human life in Mexico is safer than in the United States, because there the people do not disappear mysteriously and so often as it happens here. I say that I was surprised because the peace that prevails in

Mexico is known all through Central and South America as well as in the old continents, and, of course, it is surprising for me to learn that the peace and well-being prevailing beyond the Rio Grande are not better known in the United States.

• Proof of Complete Tranquility

"The best proof that there is complete tranquility throughout that country is the fact that General Obregon, president of the Mexican republic, has formed an investigating board to revise the records of the military men, which results in many being discontented among that class, whom he does not fear. He has reduced the number of soldiers to 50 per cent of what other governments require for their protection, which shows evidently that he holds control of the country, not by force, but by the confidence which his fellow countrymen have in him. Naturally, as a result of this, a great deal of saving was accomplished in the war de-

Be Exported to Mexico

Horsemen's headquarters when Hawthorne was used as a racetrack. It is rumored it will be used again as such in September, 1922.

partment, and part of the savings has been applied to establishing agricultural schools in the country. A commercial department has been established in the office of public improvements in Mexico City, with seven branches in the rest of the republic, in order to afford more facilities to the farmer. One of the services of the department is the importation of all kinds of machinery and farm implements to be sold at cost, allowing the best possible terms for payment, in four installments: part cash, and installments of four, eight and twelve months. When selling the machinery, the department furnishes experts to teach the buyer the right way of handling the machine or implement, without any extra charge for this service. The propaganda department keeps in direct touch with the farmers of the country, which according to the last census are more than 100,000 in number.

"This year, in addition to the capital that was on hand, a million and half pesos (about \$750,000) was contributed for the purpose of buying machinery and farm implements. Part

of that money was invested in 5,000 wagons for farmers. That is the reason why I am here at the present time.

"The office of agriculture and public improvements has given concessions to foreign and national firms for the irrigation of dry lands.

An Improvement in Education

"As far as education is concerned, many schools have been opened that never existed before, so that they are not only taught how to get the best results from their lands, but are educated mentally as well.

"The foreign department establishes embassies, names ministers, consuls, and financial agents in our brother countries. The office of industry and commerce gives a guaranty to all those wishing to establish themselves in business. If, after reading the reasons given above, they are not found sufficient to show the stability and efficiency of General Obregon's system, then there is no country in the world that has a right to be called a prosperous and peaceful country."

50th Anniversary of Railway Y. M. C. A.

The railway department of the Young Men's Christian Association celebrated its fiftieth anniversary June 11. Its first work was started in the Union Station at Cleveland, Ohio, June 11, 1872.

In 1872 there were only ten railway Y. M. C. A.'s, while in 1921 there were 269. In that same length of time, the total membership grew from 790 to 125,047. The total value of buildings and equipment has grown to more than \$8,627,500.

In connection with the semi-centennial celebration, two booklets were published. One gives a complete history of the organization, and the other is devoted entirely to testimonials from railway men.

President Markham has said the following about the railway Y. M. C. A.:

"Fifty years of activity devoted to service to railroads and their employes is a record to be proud of. It is entirely fitting that there be proper observance of the fiftieth anniversary and undoubtedly it will not only be the occasion for reviewing the past, but for considering the future and facing it with a determination to do even more and better work.

"You are assured of our fullest co-operation."

G. E. Chance, a telegraph operator for the Illinois Central System, gave the following testimonial in the booklet:

"The railway Y. M. C. A. is a haven of rest for the weary railway man. It is a convalescing and recuperating institution along moral lines and edifying environments. It is a Christian refilling station catering to a million big, hard-working and honest men."

CLAIMS DEPARTMENT

Railroad Wins Cotton Fire Suit

At the March term of court in Sunflower County, Mississippi, the jury returned a verdict in favor of the Yazoo & Mississippi Valley in a suit brought by the Doddsville Land & Mercantile Company of Doddsville, Miss., for alleged damage or destruction by fire of nineteen bales of cotton. The amount sued for was \$3,951. The petition filed by the plaintiff alleged that the fire was set out by a train passing the place about 6 p. m., although the fire was not discovered until after 3 o'clock the next morning. The idea was advanced that sparks had smoldered in the cotton for nine hours before breaking out.

The manager of this plantation had had experience in suing the railroad in the past. Several years ago he filed a suit for the burning of a barn which was discovered on fire after midnight. He produced a witness or two who testified that a freight train passed the place between 11 and 12 o'clock that night. The railroad showed by the time card, train registers at both ends of the district, all the train employes who worked on the district, together with all the pay checks issued, trip reports and other documentary evidence which could be thought of, as well as the testimony of the train dispatcher and other division officials, that there was no train run on the district after 6 p. m. Notwithstanding such proof, after three trials recovery was obtained against the railroad.

A few years before that, this same man had a suit for alleged personal injury on an Illinois Central train. The case, which was tried at Winona, resulted in a jury verdict for the railroad.—E. W. S.

Couldn't Beat a Statute

While driving a truck for the Standard Oil Company, Harry Lentz was struck by a locomotive on an Illinois Central crossing near Forreton, Ill., in August, 1920. Under the terms of the Illinois Compensation Act, his employer has ever since paid him the weekly compensation provided for.

While not obliged to do so, the railroad also

had incurred a large expense in doctor's and hospital bills in its desire to have the injured man recover.

Evidently Mr. Lentz could not understand why, in addition to the benefits he had received from his employer and from the railroad, he could not obtain a handsome sum in damages for the accident. Accordingly, the services of lawyers from Chicago were obtained, and suit was instituted for \$50,000 against the Illinois Central.

Several days' time of the court and jury were consumed in hearing the plaintiff's side of the matter. At the conclusion of this, it was not necessary for the defendant to introduce any evidence, for the court observed that his remedy was not against the railroad but was compensation as fixed by the Illinois statute to be paid by the employer. This he had already received. In commenting on their defeat his attorneys remarked they could not beat a statute, the only answer to which doubtless was that they should not have tried.

—B. H. H.

Lost His Suit in Mississippi

About the middle of May, 1921, a dental convention was held at Baton Rouge, La. A short time thereafter Dr. J. Rollo Knapp, a New Orleans dentist, claimed he had been injured alighting from train No. 12 at Baton Rouge. At first he was unable to recall whether he was a passenger in a day coach or in one of the Pullmans, but later decided he was in one of the latter; that while getting off this car his foot caught in the rubber mat on one of the steps; that he fell, bruising his shin; that the wound became infected; that he had to have several operations; that he could not stand on his feet to do dental surgery for several months; that he suffered great pain and incurred large expenses.

A careful investigation failed to develop testimony to substantiate the doctor's claim, except that after his return to New Orleans he did have a little trouble with one of his legs and had a few treatments by a doctor.

Inquiry was made among the dentists at-

tending the convention. While several remembered seeing Doctor Knapp at the station after the arrival of the train and at frequent intervals during the convention and others had walked and talked with him, none of them had heard him mention the accident or injury. Several also remembered that he attended the dance which was given the last night of the convention and that his performance there did not indicate he was suffering from any injury.

The doctor's demands were large, and no serious effort was made to settle with him; so he filed suit against the Yazoo & Mississippi Valley and the Pullman Company at Canton, Miss., 206 miles north of New Orleans, where he lives, and practices his profession. Living in New Orleans, having been injured at Baton Rouge and filing suit away up in Mississippi looked queer; but in Louisiana law suits are usually tried before a judge without a jury, and the doctor and his advisers probably expected more from Mississippi in damage suit litigation.

The suit was tried at the May term in Canton, but the doctor's expectations were not realized, as the jury returned a verdict for the defendants.

The atmosphere of the case was not very good. It did not require a suspicious person to notice the willingness of the doctor to magnify various features of the case. Among other things, he testified that his doctor bills amounted to more than \$700, although he introduced a deposition from his physician in which the latter stated he had attended Doctor Knapp seven or eight times only and that the treatment was simply to prescribe some local applications.—E. W. S.

Supreme Court Closes Iowa Case

An echo of the disastrous railway wreck on the Illinois Central near Aplington, Iowa, which darkened many Dubuque homes on Memorial Day in 1918, came today when announcement was received from Washington to the effect that the test suit brought by attorneys for Arthur J. Dahn, one of the injured, finally had been disposed by the United States supreme court.

The decision, according to the Associated Press dispatch, sustained the circuit court of appeals, which had reversed the findings of the United States court for the northern district of Iowa. The Washington dispatch follows:

"Washington, April 10.—Federal employees are restricted to one avenue of governmental

relief for injuries received by them in the official discharge of their duties, the supreme court today held in a case brought by Arthur J. Dahn, a railway mail clerk, against the director general of railroads.

"The United States district court for northern Iowa held that Dahn could sue the railroad upon which he was injured and which was under government operation as well as accept benefits under the federal employes compensation act, but the circuit court of appeals decided that having accepted the latter relief he was precluded from further governmental assistance. The supreme court upheld the decision of the appellate court."

Seven persons, three of them Dubuquers, were killed outright in the wreck and a great number were injured. The Dubuquers killed were James J. Rae, mail clerk; Albert C. Weidenmeyer, mail clerk, and Frank Higley, baggage-man. Besides Dahn, C. W. Cleaves and Glenn L. Dewey, both mail clerks, were injured.

The fatal train left Dubuque at 11 p. m. on the night of May 29, 1918. At about 3 o'clock in the morning the train neared Aplington. The entire countryside in that section was under water, due to heavy rains and a cloudburst, which came that night. A concrete bridge spanned Beaver Creek, swollen beyond its banks by floods. The train crew decided to attempt to cross the swollen creek on the bridge, and proceeded cautiously. When the full weight of the train came upon the bridge, it gave way, precipitating the engine, baggage and mail car and several coaches into the waters.

The appellate court's ruling having been sustained by the highest tribunal, the test case becomes history and the controversy reverts to *status quo*. Other federal employees injured in the wreck were anxiously awaiting the outcome of the test case.—Dubuque (Iowa) *Telegraph Herald*, April 10.

Two More State Commissions Act

Realizing that the entire responsibility for care at highway and railway crossings cannot be assumed by the railroads, the public service commissions of the Pennsylvania and New York have issued orders requiring commercial automobiles transporting either freight or passengers as common carriers to come to a full stop before crossing the tracks of any steam or electric interurban railroad.

Here is the Pennsylvania order, which is the same in all intents as New York's:

"It is hereby ordered that all common car-

riers of passengers or property by automobiles be and they are hereby required to stop each and every such vehicle before crossing the tracks of any steam railroad or electric inter-urban railroad, such stops to be made not more than seventy-five feet from the nearest rail of the crossing and at points where the clearest view of approaching trains or cars can be had.

"After making the stops hereby required, the driver or operator of the automobile shall carefully look in each direction for approaching cars or trains and shall not proceed until it be ascertained that none is approaching and

that the crossing of the tracks may be accomplished with safety.

"The foregoing order shall not apply to common carrier automobiles within cities and boroughs of the commonwealth insofar as regards operation over the tracks of electric street railways.

"Failure to observe this order may be considered by the commission sufficient ground to revoke certificate of public convenience issued to such offending common carriers, and for the further imposition of such penalties as may be authorized by the Public Service Company Law for violating this commission's orders."

A Man's Work Is His Best Expression

By W. WARD,
Agent, Indianapolis, Ind.

There is no substitute for work in the making of a man or in fixing his power of achievement. Hence, what we do today determines what we may do best and are most likely to do tomorrow. It is through our work that our habits are formed and our character determined. Every act has its inward as well as its outward effect, and therefore one's character is the direct answer to his life of actions and conduct.

Physiologists tell us that in our hours of rest the nervous system is rebuilt along the lines of preceding activity. We often treat our work in our profession as something to be ashamed of or to be got rid of. But, as the mother might try in vain to erase from her face the lines that years of anxious care and loving tenderness have written there, one's trade or profession settles down upon him, so that the marks of his calling are inevitable.

There is a belief common among us that man must seek richness and fullness of life outside of occupation, in travel, music, art, literature or studies, quite aside from his active pursuits. The life of leisure, some say, is the ideal life, and work is part of the primeval curse laid upon Adam when he was banished from the Garden of Eden. On the contrary, however, man realizes himself with his work and through his work, and everybody lives by consuming the products of labor. The man who does not render equal personal service in return is a pauper, a parasite upon society; inherited wealth or a thrifty marriage cannot free one from this obligation.

What gives nobility and dignity to life is the consistent and resolute pursuit of a calling which renders a real service to mankind. To be diligent in work implies a love for it. Carlyle says: "Blessed is the man who has found his work; let him ask no other blessing." The man who loves and idealizes his work is an artist. It is not necessary that one must write or sing or paint or carve to be an artist, for a man in the meanest occupation who is inspired by an ideal of thoroughness and completeness is an artist.

Too many workers often count the hours until they are released. They want to "have a good time." Relaxation, recreation, sports and games and social gatherings are needed as well as sleep, but there is something wrong, either with the worker or with his working conditions, if he does not get his greatest pleasure out of his work. Our greatest happiness must always come from the exercise and full development of the best thing in us.

Obstacles and difficulties seem to be a part of the Divine plan to make men of us. It does not follow that there will not be long hours of work when the flesh grows weary and when only strength of purpose and firm resolution will hold one to his task. There are no great responsibilities without great labor; likewise no mountain peak was ever gained without toil in the ascent.

Man is naturally a fighter. He delights in conflict, although not necessarily of the bloody sort. A man's work is the best expression of himself, for a man is as large as the thing he does and no larger. Every evil in society is a challenge to our manhood.

What Patrons Say of Our Service

No Train Like the Panama

The following letter was addressed to J. R. Marler, ticket agent at Freeport, Ill., by E. R. Shaw, an attorney with offices at 115 Stephenson street, Freeport:

"Some little time ago you secured tickets for myself and wife for a round trip to New Orleans, at the same time getting reservations for compartment, etc.

"At the time I much appreciated the very accommodating and courteous manner in which you took care of the order, and I thought you might be interested to know that the train service was more than up to my expectations.

"I found your Panama Limited to be a better train than I expected. I have made the New York trip a number of times on the Century and have had some experience of other fine trains, but I never found one that was quite the equal of your Panama Limited. Not only that, but all of the officials were exceedingly courteous, the dining car service was excellent, and the fast-running schedule was maintained absolutely at all times. I consider the Panama the best train I ever traveled on, and my wife and I enjoyed the trip very much, both going and coming.

"I thank you for the careful way in which you arranged my reservations."

Thanks for Holding a Train

The Illinois Central recently accommodated the Cullom Electric Company of Cullom, Ill., by holding local freight train No. 392 in handling an automobile car on the main track just north of Cullom to permit that company to load a heavy, oil-burning engine for Belleflower, Ill. As a result, the following letter of appreciation was recently addressed to Trainmaster J. T. Stanford of Champaign, Illinois division, by A. G. Walter, secretary of the electric company:

"With reference to the letter written to you on March 17, 1922, by your local agent here, Mr. Taylor, concerning the holding of your local freight No. 392 for the purpose of loading the large engine for Belleflower, we wish to state that we cannot dismiss this matter from our mind, even after paying your treasurer the required charges, without at least writing you of our appreciation of the service done us in this matter.

"You may be too busy to waste your time in reading such a letter as this, but we think we ought to thank you personally for your services in allowing us the privilege of holding your regular train, which we understand is not customary.

"We were advised by several (whose general opinion of the railway company is 'highway robbery, hogs, independence, etc.') that there would be no use even to ask your company to hold a freight an hour or two, as they would be too selfish or strict to grant any such favor.

"We for one stated (and we are positive of what we state, considering previous dealings) that we have never asked anything from the Illinois Central Railroad Company but what it was given a strictly business decision, as was the result in this case.

"We also wish to state that your train crew was very courteous and patient and that also you saved us some \$30 or \$40, besides lessening the danger to several lives, by allowing us to load the engine at the point suggested. Your charge of \$18.20 was very reasonable and much lower than we expected, and our object in writing this is to let you know that there are a few concerns who think differently of the railway company than the majority of the public does."

Service to a Funeral Party

The following letter to Vice-President C. M. Kittle is from Charles V. Essroger, vice-president of the First National Bank of Chicago:

"Occasionally it happens that I am able to give you some business by routing some of my friends over the Illinois Central.

"A week before last I sent a small party out over the Panama, and today I am sending a party of six over your road to St. Louis. I am glad to do this, not only on account of the excellent service that your road gives, but also because I get such prompt and courteous service out of your depot agent, Mr. Nolan. The party going out today is routed for Galveston; the children are taking along with them the body of their mother, who died last evening. Mr. Nolan was simply indefatigable in his efforts to secure the proper accommodation for them, and as I know you railway men

are always glad to hear of efficient service rendered by your personnel, I am glad to say these few words in Mr. Nolan's behalf."

A Timely Example of Service

The following letter to President C. H. Markham is from H. C. Yelton, president of the Inland Supply Company, 4630-46 West Augusta Street, Chicago:

"Late Saturday afternoon I read your article in the June issue of the *System* magazine, and was reminded that during the forenoon one of your employes, who I learned to be Charles W. Blake of 4501 South Wabash Avenue, Chicago, called me on the telephone and said that he had found in one of the Illinois Central coaches one of our checks, amounting to \$47.29, which, no doubt, had been lost by one of our Iowa salesmen while riding in the car.

"The check perhaps would have been of no value to Mr. Blake or any one else, but I thought it well to call your attention to it, as it illustrates to me the interest shown by some of your employes in satisfying the public, which in this case is much appreciated."

Thanks From a Board of Trade

The following letter to T. E. Hill, superintendent of the Kentucky division, from W. E. Morrow, secretary of the Louisville, Ky., Board of Trade, refers to the recent spring trade extension trip taken by members of the board:

"It was a pleasure to have you with us on our recent trade trip, and this letter is just to thank you for the interest shown and to apprise you of the fact that in resolutions adopted by members of the party your presence and participation were mentioned as factors that had contributed to making this the most successful excursion of the kind the Board of Trade has ever made.

"We also went to thank you for the service rendered by yourself and other Illinois Central officials in handling our train and in providing for the comfort and convenience of members of our party.

"We are, indeed, grateful to all of you."

All That Could Be Desired

The following letter to C. B. Dugan, superintendent, dining service, is from Isaac W. Jones, secretary of the Preferred Risk Fire In-

surance Company, 701 Jackson Street, Topeka, Kan.:

"Believing that good service is worthy of commendation just as much as poor service is worthy of condemnation, I take this means of calling your attention to the fact that I had the pleasure of partaking of the meals on your diner Sunday, May 14, between New Orleans and Memphis. The service was all that could be desired, and especially so under the stewardship of R. W. Burton, who was in charge on that date. Mr. Burton was especially interested in seeing that the patrons of the diner received all possible attention."

All Were High in Praise

The following letter to Master Mechanic L. Grimes at Jackson, Tenn., is from Prof. J. W. Lane of Lane College for negro students at Jackson. Professor Lane is a son of Bishop Lane, one of the leaders among his race in the South.

"I wish to thank, through you, your company in the splendid accommodations afforded our people of the delegation to the C. M. E. General Conference at St. Louis, Mo., last week.

"I went down to the station to ascertain just how the large delegation felt toward the accommodation, and all were high in their praise of the Illinois Central.

"If at any time that I can be of any service to you in bringing business to your company, inform me, and I will take pleasure in rendering whatever assistance that I can to help you carry out the program that you desire."

Our Friends in Vaudeville

The following letter to President C. H. Markham is from E. F. Albee, president of the B. F. Keith circuit of theaters, 1564 Broadway, New York City:

"Enclosed please find a copy of a letter from one of our vaudeville artists, which I think will be of interest to you.

"The splendid co-operation which you have given in assisting to have the baggage of the vaudeville artists delivered on time for their entertainments is most commendable, and these little notes from the artists are very gratifying from the standpoint that they are very appreciative of what is being done.

"I have sent a similar letter to the general passenger agent at Memphis.

"Please accept my sincere thanks for your many acts of kindness."

Jack Fulton of Fulton & Burt, the vaude-

ville artist referred to, had written to Mr. Albee from the Regent Theater, Detroit, Mich., as follows:

"Knowing you appreciate being advised when your efforts are not in vain, particularly in a railway and baggage case, I wish to acquaint you with the extreme courtesy shown Pantages performers leaving Memphis. The Illinois Central lines, through their general passenger agent, make it possible for acts to open Sunday in Chicago or northern points by holding the Panama Limited, their crack Chicago and New Orleans express, for thirty and even forty minutes every Saturday night, to enable the Pantages performers to catch the train. They also run without baggage from New Orleans to Memphis in order to carry the show baggage (since this is a fast train, baggage space is limited).

"Instances of courtesy such as this certainly command attention and thanks. All the members of our show have written the general passenger agent commending his action on our behalf.

"Feeling sure you enjoy knowing such courtesies are being shown the profession at large after a bitter struggle, I take this liberty of writing you."

Mr. Albee wrote to Mr. Fulton as follows:

"I have yours of May 10. Your letter indicates that there is a great improvement in the handling of baggage and in the courteous consideration shown by the railroads throughout the United States and Canada, as far as the vaudevillians are concerned. This emanates from the presidents and is carried out by the officials and employees of the different roads. When I decided to endeavor to improve the baggage conditions, so that there would be less occasion for complaint on account of the non-arrival of baggage at the theaters, also the artists on Monday morning (the artists lose one or two shows, and the manager is inconvenienced and the public disappointed), I wrote to the president of every road in the United States and Canada, and they courteously replied, pledging their efforts to bring about more tenable conditions. The complaints prior to taking this matter up were frequent and from all over the country. Today we scarcely hear of any dissatisfaction, and there are few cases of the non-arrival of baggage in time for the Monday performance.

"I feel that this is entirely due to the great interest which the railway people have taken, particularly the president of each road, who

gives the greatest interest to every case reported to him. There is no delay; he immediately sends it down the line for action, and the results have been most satisfactory.

"The artists can do much good by being careful to make the proper arrangements during the week for their travel, on Thursday, Saturday or Sunday night, as the condition of their contract calls for. I feel that courteous treatment to the railway people, baggage men, transfer men and everyone connected with the transportation of yourselves and your baggage would be a just return for the great interest that they are taking in the artists' affairs. Always keep in mind that courtesy, gentleness and consideration for others generally bring a return of the same; so what you expect from others you must first advance yourself. We are making great headway toward better conditions in every branch of the vaudeville business, and we want to carry on the good work.

"Thanks for your letter. I have sent a copy of it to President Markham, together with a copy of my reply. It will also be published in *The Vaudeville News*, so that other managers and artists and any railway men who may run across this little paper may know of our appreciation of their excellent interest and consideration in our behalf."

TO CONDUCT A TOUR

G. W. Schelk, ticket stock custodian of the passenger department, Chicago, will conduct a vacationists' tour through Yellowstone National Park and Colorado this summer. The trip, which is the tenth he has had charge of, will begin August 13.

He routes the party over the Illinois Central to Omaha, and over the Union Pacific to Yellowstone. Through Pullman service is given.

A single charge includes: Round trip railway transportation, round trip Pullman accommodation, meals, lodging, surcharge, scenic side trip to Ogden Canyon, complete tour of Yellowstone National Park, side trip from Canyon Camp to Canyon Hotel and return, sight-seeing trip Salt Lake City, organ recital at the Mormon Tabernacle, open-top observation car through Royal Gorge, automobile drive through the Garden of the Gods, Williams and South Cheyenne canyon and Denver.

Mr. Schelk was formerly traveling passenger agent at Evansville, Ind., and has been in the service of the company for about twenty years.

THE Fairhill War Heroes' Memorial was six months old when Private Stanton Martin came home from overseas. That is, it was six months old as an objective, not an attainment. It had some of the attributes of a chick pigeon, that memorial project: 'twas larger at birth than it was subsequently. The women of the town planned and launched the movement—mothers, wives, sisters, sweethearts of men who served. The plan was modest enough: simply to raise \$1,500 to buy and install a clock in the courthouse tower for a visible manifestation of gratitude and honor to the boys; but it had turned out an up-hill undertaking.

Private Martin's gentle and unassuming little mother was one of the main workers in behalf of the memorial. She had had two sons in the A. E. F. One, Roy, the elder, slept under a wooden cross somewhere in France. But the other, Stanton (every one except his mother called him "Stunt"), had survived the Meuse-Argonne inferno and six months of peaceful occupation along the Rhine, to return home, seemingly inches taller and pounds heavier and shades browner, but with his boyish smile the same. There were moments when mysterious shadows brooded in the depths of his eyes, not often, only when he remembered and fancied himself unobserved. Of those shadows he never spoke.

Stunt Martin was freckled and habitually genial. When he smiled a certain kind of smile, the beholder thereof were wise to arm his heart with strength. It was an icicle-melter, that smile.

"I hear talk about a clock for the courthouse steeple, down town, Mommy," he remarked one day. "'Most everybody seems to think it's a joke. What is the idea, anyway? Didn't they go at it right, or what?"

His mother sighed.

"I've wondered what made us fail in that," she said. "And I guess it's because everybody's tired of giving. While the war was going on it was different, although some of them didn't

give much, even then. But Fairhill isn't a wealthy community."

"Isn't it? What about all those old codgers up on Bon Ton Avenue? Mark Burridge and George Sapp and Henry Pickard. Any one of 'em could give the price of a town clock and never miss it. Who went after 'em to get 'em to subscribe?"

"Well, we divided up the work of soliciting among all the women. Each solicitor saw certain ones. Mr. Sapp gave \$5. Mr. Burridge didn't give anything. We tried everything we could think of to raise the money. We gave a chicken dinner, but it rained all day that day, and very few persons came to town. And we had several entertainments—but nobody came to speak of. And we had a tag day. All told, we've made up something more than a hundred dollars. Mr. Tufts, who edits the *Weekly Herald*, has been mighty nice. He's boosted for the memorial in the paper as hard as he could."

"I have a pretty good idea of what happened," he laughed. "You held meetings and appointed committees, and Ewing Tufts made a speech, and everybody applauded, and you had a regular love-feast. Everybody patted everybody else on the back and was for it tooth and toe—

"I hear talk about a clock for the courthouse steeple, down town, mommy," he remarked one day. "'Most everybody seems to think it's a joke. What's the idea, anyway? Didn't they go at it right, or what?"

nail. It locked like a cinch. The trouble was you didn't have any of the opposition present—the guys you were depending on for the coin. When you got out and bumped up against the airtight outfit, you found that they'd gone in their holes and stopped up the entrances. You didn't go at it right, Mommy."

"Stanton, my dear boy, we did the very best we could. You can't force people to contribute to something they aren't interested in, can you?"

"Oh, can't you?" Stunt smiled his disarming smile. "It's all a matter of tactics, I'm thinking. You can catch flies with molasses, but not cinnamon bears. You have to run your bear into a hole and then smoke him out."

She shook her head a little sadly.

"People have already forgotten the war with its horrors and its sacrifices," she said. "At least, those have who weren't intimately touched. Those who sat safe and comfortable at home, while others fought and died to keep them safe, can find it easy to forget. And the farther away it gets, the less they'll think about it—."

"Did you all want that memorial so very much, Mommy?"

"Why, of course, my son. We had our hearts set on it. It's a bitter disappointment to every true woman in Fairhill to think we failed—."

"All right then, Mommy; just you rest easy. Maybe something can be done yet."

"Do you mean you have a better plan, Stanton?"

Stunt Martin smiled his sunniest smile. "Shake, Mommy," he said with an air of affectionate raillery. "I believe I'll tackle the job just for fun. You watch my smoke—."

Stunt's first move in the game he was about to play was to pay certain unostentatious visits to the office of the sheriff and county prosecuting attorney, where he talked for some little time and left in the best of humor, to judge by the laughter which sounded in his wake. In passing, he also spent some minutes in earnest confab with the city marshal and his able-bodied coadjutant, the night policeman, who watched over the peace and order of Fairhill. These, too, were rather merry when he left them. But then, all of the officials in question had known Stunt Martin from the time he could toddle. The young man returned to his mother and asked for and obtained a dozen or so of the white satin ribbon insignia worn by the whilom sirens whose charms had

failed to charm. After that Stunt seemed to fade out of the picture.

Along in the gray gloom which transiently intervenes between twilight and pitch darkness during the wane of the moon, he reappeared as a spectral horseman, riding on some queer errand through the dim, deserted thoroughfares of the residence section of Fairhill. The motive behind this silent traverse was not exactly apparent; he rode circumspectly up one street and then down another, following an involved and intricate course which was doubtless in conformity with a considered plan. A keen-eyed observer of his furtive movements might have noticed that he trailed some obscure, small object behind his mount, attached to a long string.

It was well toward midnight when, faint and far off, like the "horns of elfland faintly blowing," sounded a long-drawn chorus. Nearer and nearer it drew, swelling steadily in volume, until none could mistake its significance. It was the long-drawn, deep-mouthed baying of a pack of 'coon hounds in full cry. Almost everybody in Fairhill knew that particular pack of dogs; it belonged to a be-whiskered old-timer, half hermit, half patriarch, commonly called Old Man Bowman, who lived in a sort of cabin dugout down along the creek bluffs. There were ten dogs in his pack.

They presently entered the confines of the town, and wondering burghers, roused from blissful dreams, marked their riotous course through the heart of the city. They left a shattered welkin in their wake. Ten lusty and eager 'coon hounds belling together along the quiet streets of a sleeping country town in the dead of night are cause sufficient for disturbed dreams. The pack circled and zig-zagged in and out, up and down, forward and back through the district where retired capital had reared its lares and penates. Pandemonium reigned for something like an hour. With a final, clangorous, throbbing burst of acclaim under the windows of Marcus Burridge, the dogs trailed off in widening circlings, in a persistent but futile attempt to pick up the lost scent.

Stunt Martin, broadly a-grin, was down town early. Friends facetiously inquired, "Was that you out hunting last night, Stunt?" and he grinned yet more broadly. "That was a still hunt to what's going to happen," he averred to one or two.

All that day Private Stanton Martin was busy surreptitiously consulting with young men

at their various places of employment. These consultations were darkly confidential. There were a great many warning admonitions and occasional explosions of hilarity. Stunt improvised a sort of temporary headquarters at Ben. Carter's O. K. Garage, where his trusted co-conspirators could find him during the afternoon.

Late that night, after the picture show had ceased to function and the proprietor of the Owl Meat Market, who took pride in living up to his trademark, had padlocked his front door, a small motor car of a familiar brand, having a truck body behind, might have been seen to scuttle out of the O. K. Garage. Stunt Martin was at the wheel. He drove swiftly to various apparently predetermined trysting spots, augmenting his whispering company of passengers by one or more shadowy figures whenever he stopped. Presently a dozen youth clung by precarious handholds and footholds to the little car, which carried in addition to its living cargo a weird assortment of paraphernalia—battered galvanized tubs, tin dishpans, pieces of sheet iron, circular saws, and a formidable array of shotguns and revolvers. Each young man wore a white ribbon badge.

"The first mud-turtle on our list," Martin said after he had picked up the last recruit, "is our old conservative friend, Hen Pickard. We'll touch him up for half an hour or so until he gets the wool out of his eyes, and then I'll put a bug in his ear. I've got him down for three hundred plunks. But if he gets up-pish we'll make it four, see."

"Make it four," a deep voice droned in the darkness like a sepulchral echo.

The car halted in front of a darkened domicile. There was a bustle of unloading cargo, a stealthy movement of dusky figures toward the house. Then—a sudden tremendous cat-clysm of sound split the quiet night like the crackle of Doom. A clanging clash of metal mingled with the thunderous rumble of crashing gongs, the boom of shotguns, the staccato blasts of small arms, the clanking and jingling of bells, the yelling of maddened savages. Fair-hill, and more particularly the household of Henry Pickard, awoke with throbbing eardrums. Most of those who heard the barbaric rhythm understood its discordant significance.

It was the tumult of the almost obsolete but well-remembered "shivaree."

The din increased in volume and violence. It was like the crashing of Thor's hammer

on the anvil of the gods. Then, abruptly, the uproar rippled and thundered away over the echoing hills and valleys and ceased. Pickard had raised an upstairs window.

"What's the meaning of this devilish racket?" he demanded. "Who's doing it?"

"We're soliciting subscriptions for the Soldiers' and Sailors' Memorial," replied a pleasant voice from the shadows—the genial accents of Stanton Martin.

"Get out!" roared Pickard. "One more yelp out of your gang, and I'll have the lot of you arrested!"

The window came down with a bang. The sleep-annihilating serenade again rent the dulcet night. This time it was no transient disturbance; it kept on, and on. It is to be assumed that Pickard telephoned the officers whose province it was to arrest peace disturbers. No guardians of the law appeared. The beleaguering continued without interruption. It was a long siege at Pickard's. He had a horror of parting with money. But he dipped his flag a little after 1 o'clock.

"I—I'll subscribe fifty dollars," he told them.

"Company, attention!" barked Stunt Martin. "Resume action! Hit 'em hard!"

"I'll—I'll make it a hundred dollars," squeaked the retired capitalist.

"Company, at ease!" ordered Stunt. "The enemy is slipping."

Further parley ensued, and at least one volley from the heavy field guns. Henry Pickard shakily signed a check for \$350 in the end. The difference between the \$400 demanded and the \$300 offered was divided by common consent.

The canvassing committee carried its equipment across one intervening vacant lot to the home of George Sapp. The engagement there was rather brief. Sapp had been just the same as under bombardment for several hours. He capitulated to the tune of an even \$200 at 2 o'clock. The little car was loaded and driven to the next block. The unit was getting into its stride now. The committee garnered checks amounting to \$425 in that sector. These were in smaller individual contributions. One comparatively indigent capitalist was absolved for \$125. Stunt didn't want to impoverish anybody. "Remember," he grimly warned each victim, "If you stop payment on this check, we have

the sheriff's permission to use our own judgment about tar and feathers."

The canvassers wound up their busy night at Colonel—by courtesy—Hooker's feudal castle. The Colonel, with a little grilling, disinterred buried treasure to the extent of \$250. The committee knocked off work for the night with that.

The news of Stunt Martin's summary methods as a subscription-solicitor spread to the four corners of Fairhill. The town cackled with enjoyment. It was a new and novel means of promoting public spirit. And it was quite characteristic of Stunt Martin.

"Mark Burridge is the richest old tightwad in town," Stunt reminded his devoted clansmen when they mobilized for duty that night. "I've turned on the full capacity of my 3-candle-power brain today to think up something suitable for his benefit. And I've got it. Listen to me a second—"

They loaded a mysterious contrivance on the little truck and drove to a blacksmith's shop, where Stunt produced a key and they proceeded to add two anvils, a long iron rod and a blow-torch to their equipment. The party was augmented by one new member, a non-resident of Fairhill who answered to the tribal name of O'Sullivan; he was one of several steel-workers engaged in setting up the girders and beams of the new high school annex, and he had charge of the mysterious contrivance.

The earlier endeavors of the committee that evening had to do with three or four lesser lights in the financial firmament. These contributed their allotted quota without much reluctance. The car was loaded again and driven to the semi-suburban abode of plutocrat Burridge. Stunt drove right up the driveway and stopped close by the house. While equipment was being unloaded by the main body, one man mounted on the shoulders of a comrade removed the frosted globe and light bulb from the electric porch lamp. Stunt rang the doorbell. Marcus Burridge personally answered the summons. The young man stepped briskly into the hall and stood against the porch-light switch.

"Happy greetings, Mr. Burridge," he said with his most dangerous smile. "Excuse me for coming in, but we want to use your porch socket for a little while, and I'm the hero who's supposed to guard the switch. We're going to give you a little sample of the real thing before we start talking business."

Marcus Burridge was a small, egg-shaped man who talked in a series of grunts. He had chin whiskers and a short bristling mustache, horizon gray in color.

"I've heard about you and your rowdy gang, Martin," he said jerkily. "I expected you'd come here. Go right ahead. We'll see who's the most surprised in the end."

A figure appeared at the door. It was O'Sullivan.

"All set, General," he said. "Ready for orders."

"Battalion, attention!" bellowed Stunt. "Engage the enemy!"

Six shotguns, both barrels set off nearly simultaneously, roared at the word.

"Our battery of 75's," Stunt remarked as Burridge grimaced. "The machine-guns will join in in a minute—"

There was a sound as if earth and sky were being ripped asunder. It was ear-splitting, nerve-shattering, terrific. It drummed on the very auditory sense-center of the soul—a veritable rat-tat-tat of all the imps in a Dantean Inferno. The windows rattled; the walls vibrated with it. Abruptly it ceased.

"Over in France the natives used to call machine-gun fire something that sounded like 'ranh-tanh-tanh,'" observed Stunt. "They had some little dolls they called 'Neenette' and 'Ranh-tanh-tanh.' Supposed to protect the fellow that wore 'em from harm. But not always, I noticed. You never heard the bullets buzz past your ears, did you, Mr. Burridge? And I'd like to ask, have you ever had—cooties?"

The old gentleman grunted negatively.

"You've had it pretty soft," murmured Stunt Martin. "Nothing to do but rake in the chink. Battalion, attention!" he rapped out. "Over the top, first wave! Open order! Let's go!"

Somebody set off a photographer's flash cartridge, which glowed with a ghostly light. O'Sullivan and his electric riveter went into action again. The shotguns roared. Pistols and rifles crackled. But filling in the interstices of other sounds was a horrible, ripping, rattling, galloping noise like that made by some giant hand raking a stick along a colossal picket fence. This ended in a frightful explosion which almost knocked Burridge off his feet. Silence fell—a silence like the hush of a tomb.

"That was one of the enemy's big shells," quoth Stunt. "Must've hit pretty close. I've seen a dozen men simply blown into red rags where one of them babies struck. You know you can hear 'em coming for quite a while.

"You never heard the bullets buzz past your ears, did you, Mr. Burrige? And I'd like to ask you, have you ever had—cooties?"

And then—blooie! Like that, all night long. Division, attention! Barrage! Machine-guns! Give 'em the works!"

Then the real pandemonium of the night thundered into actuality. What had gone before was mild. Blasts that shook the house resounded. The heavens rocked with the thunder of gun-fire. Ten—twenty minutes passed; the uproar did not slacken.

Marcus Burrige covered his ears with his hands. He motioned to the young man against the wall, at last, as if asking for a chance to speak. Stunt clicked off the electric switch. The bombardment stopped almost instantly.

"I've had enough," the old man said weakly. "I begin to see just a little bit what you boys had to endure over there. Now we'll get down to business. Jumping Jehosaphat! My ears are ringing till I can't hear myself think."

"Army, attention!" shouted Stunt. "Cease firing! At ease!"

"This memorial thing," continued Burrige. "I haven't been in favor of a clock to honor the soldier boys with—."

"You understand, sir," the young man said quietly, "we're not raising this money just because we were in the war ourselves and because we want to be honored. We don't really give a whoop about having a memorial. But the women folks want the darned thing, and that's enough for us. They were the ones that suffered the most, if you'll stop to think about it.

And I guess they haven't forgotten the fellows that didn't come back—those are the ones this memorial is meant for—."

"Yes, I reckon I understand," the other grunted a little gruffly. "I haven't never exactly favored this piddling clock as a proper memorial to our soldiers and sailors. That blabber-mouthed Ewing Tufts and some of the others have been yelping around for a clock mainly for lack of sense. And a body would only get themselves sneered at if they'd suggested something else. Tufts thinks he knows it all. But—well, how much money do you lack of enough to buy the clock?"

"Why—er," Stunt was never quick in mathematics, "I think we're short about five hundred plunks yet, Mr. Burrige—."

"Very well, I'll write you a check for it. And, while we're discussing the matter, there's something else I want to mention. I've been planning all along to do something in honor of you young fellows who went through hell for the rest of us, but I wasn't in any particular hurry about it. I just wanted to see how many other folks would let the subject slip from their minds as time passed. I've got a deed already drawn up here in my desk; it conveys that 40-acre tract of land of mine over here in the east part of town to the city of Fairhill as trustee for the establishment of a park dedicated to the memory of those who fought in the great war. And I am further going to see that a suitable granite shaft is

erected on it in honor of—of the fellows who didn't come back."

"Yes, sir," murmured Private Stanton Martin, very humbly. "I—I guess I—we ought to thank you—but words are sort of— of—."

"Words are nothing but audible whiffs of air, my boy," snorted Marcus Burridge. "It is the thought behind them that counts."

"Yes, sir," said the young man, lifting his hand in salute.

Has Motorists Sign a Pledge for Safety

In an effort to gain the best results possible during the "Careful Crossing" campaign, W. H. Petty, trainmaster on the Mississippi division, originated the idea of having printed-pledge cards for motorists to sign, promising they will stop their automobiles before driving on a railway track.

The cards tell the number of persons killed and injured at railway crossings during 1920, then announce the date of the "Careful Crossing" campaign, which all the railroads in the United States are waging. At the bottom of the card is a place for signature, address and occupation of the signing motorist, and a request that a 1-cent stamp be placed on it and the card mailed to the person addressed on the reverse side. Three sets of cards were printed; one set was addressed to Mr. Petty, another to Trainmaster N. W. Spangler and a third to Superintendent A. D. Caulfield.

Employees of the Mississippi division take the cards out with them on their runs and place them in the hands of motorists. One engineer, C. J. Barnett, handed out fifty-six cards, which were returned properly signed, and asked for the privilege of distributing 500 more. Another engineer, S. A. Law, obtains used copies of the June issue of the *Illinois Central Magazine*, attaches to the magazine one of the cards and a letter, wraps the three in a neat little bundle and throws or hands the packages to automobile owners along the right-of-way. The letter Mr. Law attaches is as follows:

"Dear Friend: I am throwing you off one of our monthly magazines. Please note the picture on the cover. I would be glad if you would look over the magazine, turn to page 131 and read carefully, noting the great number of accidents that happened on road crossings last year.

"Won't you help us to eliminate accidents on our railroad by stopping, looking and listening before crossing?

"Just think how an engineer feels when he sees he is going to strike an automobile and

probably injure or kill a lot of people! I have been running an engine on this division nearly twenty-five years, and so far I have not struck anyone on a crossing; but, when I see the desperate chances that our people are taking day after day, I am in mortal fear of striking someone at almost any crossing.

"We blow the whistle, ring the bell and do everything in our power to avoid these accidents, and we are just asking you as our friend to assist us."

The cards that have been returned to Mr. Petty contain the signatures of the mayor of Memphis, secretary to the mayor of Memphis, city commissioners, sheriffs, insurance agents, physicians, bankers, lawyers, manufacturers and wholesale and retail merchants.

Mr. Petty has already obtained the signatures of persons from every station on the Grenada and Aberdeen districts. His object is to gain the co-operation of several representative persons in each of the towns on the division. By stopping before they cross a railway track, these persons will serve as examples to others.

Engineer Barnett wrote the following letter to Mr. Petty:

"Everyone I ask thinks this move is a fine one, and you can't make a mistake by pushing it. I wish you would hand me, on No. 8, five hundreds more of your cards, and I shall have them signed and returned to you.

"It is a good work. Keep it up.

"The bigger the man, the more anxious he is to sign. I wish you would take time and look over the signatures of the inclosed cards."

APPOINTED IN UTAH

Effective June 15, J. C. Barr was appointed traveling freight and passenger agent of the Illinois Central System, with headquarters at Salt Lake City, Utah. His offices are at 205 Judge Building.

NEWS OF THE DIVISIONS

AROUND CHICAGO Foreign Department

Morris Freehling, city freight agent, foreign department, Chicago, has been granted a six months' leave of absence on account of his health. He is spending his leave in Denver. Mr. Freehling has been connected with the railroad twenty-two years.

Welghing and Inspection and Demurrage and Storage Departments

Miss Myrtle Bjurstrom announces her engagement to Elmer George. Both are of the demurrage and storage department. Myrtle has been with the Illinois Central the last four years and is now secretary to Supervisor Tinning. Elmer has been with the Illinois Central the last two years as demurrage inspector.

J. A. Prendergast of the weighing department is the proud parent of a baby girl, born May 23. This is the fifth baby in the demurrage and weighing departments the past year. James H. O'Keefe, chief clerk, Paul M. Lea, assistant chief clerk, W. J. Leahy, demurrage inspector, H. A. Simmons, weighing inspector, and Mr. Prendergast are the proud fathers.

General Freight Department

Announcement is made of the marriage of Carl F. Stephansen of Chicago and Miss Edna Miller, which took place in New Orleans, Tuesday, April 25, during the Triennial Conclave of the Knights Templar. The wedding was the culmination of a romance started during the war, when Mr. Stephansen was stationed at Camp Logan as secretary to General Henry, after which he spent one year in the Philippines. He is now connected with the Illinois Central as secretary to W. Haywood, general freight agent. The bride is the daughter of Mr. and Mrs. June P. Miller of Houston, Texas.

Auditor of Freight Receipts

On Decoration Day the little daughter of R. G. Wall met with what appeared to be a fatal accident when hit by an automobile. Following a successful operation at the Illinois Central Hospital, however, she is rapidly recovering.

Miss Jessie Miller was married to George Madsen of the freight claim department on June 3. Miss Miller was given a suitable present by her many friends.

Burnside Roundhouse

Engineer L. E. Quyle, who was granted a leave of absence to overcome an illness, has gone out West to live in the mountainous region for a while.

Fireman Patrick McGovern has started on a trip to Ireland to visit his folks.

Engineer and Mrs. W. W. Huggans have been visiting friends in Toronto, Canada, making a stop-over at Niagara Falls.

Machinist Frank Plevo was off several days on account of his mother's death.

Engineers James D. Kelly and John McElree have been granted leaves of absence to try their luck on their farms in Montana and Indiana.

Fireman C. Nolan is the proud father of a baby girl, born recently.

Suburban Passenger Service

Mrs. Lillian Schafer's infant son died March 31.

Miss Eileen Sullivan was recently married to Dennis Keating.

Mrs. Laura Smith's husband passed away suddenly May 26.

Mrs. Laura Goodman has been visiting relatives at Bloom, Kan.

Mrs. Grace Rinearson's son had a successful operation recently.

ILLINOIS DIVISION Superintendent's Office

The marriage of Miss Blanche P. Lawson of Chicago to Wayne A. Johnston of Champaign was solemnized at 4:30 p. m., Saturday, June 17, at the home of the bride's parents, 6514 Kimbark Avenue, Chicago. Mrs. Johnston is the daughter of Mr. and Mrs. L. ("Pokey") Burns, and Mr. Johnston is the son of Mrs. DeEtta Johnston, 604 South Third Street, Champaign.

Mrs. Johnston entered the service of the Illinois Central May 22, 1917, in the superintendent's office at Chicago as comptometer operator. She was later transferred to Champaign when the division offices were moved to that point in October, 1918. This position she held until June 10, this year, when she resigned.

Mr. Johnston entered the service of the Illinois Central as an accountant in the superintendent's office at Champaign, September 23, 1918; was promoted to chief accountant, February 16, 1920; was promoted to chief clerk to superintendent September 1, 1920, and was transferred to be assistant chief clerk to the general superintendent, Chicago, September 28, 1921. This position he now holds.

The bride and groom spent their honeymoon in Chattanooga, Tenn. They have been at home since July 1 at 6032 Stony Island avenue, Chicago.

Miss Kathryn Kelligar, stenographer for Trainmaster J. T. Stanford, has returned to

The Johnstons

the office, having recovered from a recent operation for appendicitis.

Miss Fairy Wand entertained at a vanity shower at her home, 402 East Green Street, Champaign, Tuesday evening, June 6, in honor of Miss Blanche Lawson, who on June 17 became the bride of Wayne A. Johnston. Those present were: Misses Zoe and Billie Friend, Mrs. Paul Somers (formerly Helen Sullivan), Miss Bernice Sullivan, Misses Pauline and Margaret Mallman, Miss Ethel Baker, Mrs. Otis A. Barnes, Misses Viola and Mildred Monahan and Misses Lona and Blanche Lawson. Light refreshments were served.

Kankakee Roundhouse

Herman Miller, blacksmith, was called to Junction City, Wis., recently by the death of an uncle.

Mr. and Mrs. F. R. Shapland are the proud parents of a new daughter. Mr. Shapland is an engineer.

Conductor Ed Ehrich is off duty on account of illness.

Mr. and Mrs. H. A. Kunde are the parents of a baby girl. Mr. Kunde is an engineer.

Switchman W. F. Hardgrove of Kankakee, Ill., was pensioned May 1. Mr. Hardgrove entered the service of the Illinois Central, Friday, September 13, 1900, and had been in continuous service since. He began as a brakeman on the Bloomington district and was later transferred to the Kankakee yard as switchman.

W. F. Hardgrove

SPRINGFIELD DIVISION Decatur, Ill.

The regular monthly meeting and luncheon of the Transportation Club of Decatur was held Thursday evening, June 8, at the Y. M. C. A. William Haywood, general freight agent, Illinois Central, Chicago, was the speaker of the evening. His subject was "Service as Applied to the Modern Railroad." More members attended this meeting than have been present at any meeting since the organization of the Transportation Club.

Clinton, Ill.

With the return of the second local between Clinton and Pana, June 12, Conductor Kapelsky has moved to Clinton to take the Sunday lay-over at Clinton. Conductor Bennett falls heir to the position on the local between Pana and Centralia vacated by Conductor Kapelsky.

Everyone is glad to see Conductor O. R. McClelland back in service after an absence of several weeks on account of serious illness.

Dispatcher John R. Fleming has been transferred temporarily to the Indiana division at Mattoon on account of increased business at that point.

Dispatcher H. S. Macon enjoyed a 10-day vacation trip with Mr. Dodge and Mr. Lindrew of the fuel committee, taking an active part in the fuel campaign on the Southern Lines.

The Centralia-Peoria business has been heavy since May 15. There are now four crews assigned to these runs.

From May 27 to June 1, the Illinois Central handled seventy-three Clover Leaf trains between Ramsey and Vandalla, which were detoured on account of repairs being made to a bridge on the Clover Leaf one mile west of Ramsey.

Effective May 1, an Illinois Central agency was opened at Havana, Ill. T. R. Beach has been assigned to be permanent agent at that point.

Dispatcher J. A. Vallow has resumed his duties at Clinton after six months in California. The trip has greatly benefited his health.

F. J. Stuber has been assigned as permanent agent at Chestnut, vice T. R. Beach.

Mr. and Mrs. R. C. Fortman of Springfield are the proud parents of a baby boy, born June 8. Mr. Fortman is third trick operator at East Grand Avenue.

Hard road work on the Meridian Trail between Pana and Centralia is rapidly progressing. This temporarily makes business good for agents at stations in this territory, as the Meridian Trail parallels the Illinois Central on this district.

Yardmaster and Mrs. N. B. Clark of Springfield departed June 1 for points in Colorado, Washington and Oregon. They expect to be gone about six weeks. During Mr. Clark's absence, Night Yardmaster C. M. Ruddle will act as day yardmaster.

Division Superintendent and Mrs. C. W. Shaw, District Surgeon and Mrs. George S. Edmonson and son Kenneth departed June 1 for Los Angeles, Cal., to attend the Rotary Club meeting. While in California they expect to visit many other points of interest.

Yard Clerk Ellis Reddick and Miss Nelle Surdam were married in Springfield Tuesday, June 5. They went to New Orleans on their wedding trip.

Conductor M. J. Kenney is again out of service on account of sickness, being relieved by Conductor Burkhardt.

There was a severe storm at Springfield on the morning of June 13, damaging considerable property and blowing down some of the Illinois Traction System poles and wires, making it necessary for the I. T. S. to call on the Illinois Central for assistance. We furnished a switch engine and crew to distribute poles along the I. T. S. track and handled some of their passenger cars between Springfield and Riverton.

Switchman George Brown has been granted thirty days' leave of absence to accompany his father and mother to Denver, Colo. They expect to drive from Clinton to Padosa Springs by auto.

Switchman Hugh Magill returned Saturday, June 10, from Toronto, where he attended the trainmen's convention. Mr. Magill was a representative from the B. of R. T. of Clinton.

Local Attorney D. R. Kinder died at his home at Litchfield, June 6. Funeral services were held June 8.

Operator C. E. Ritchie has returned to Clinton after a trip to Fayetteville, Ark., to see his father, who has been very ill, but is much improved.

Road Department

Marion McClelland, who has been attending

“Twenty years I’ve carried this watch”

ENGINEER Charles Monk, of the Erie Railroad, is proud of his Hamilton. Twenty year companions they’ve been, and the Hamilton has been a faithful, reliable comrade.

Even Engineer Monk wouldn’t estimate the enormous number of trains he has brought in “on time.”

He does say that in the ordinary day’s work he must consult his Hamilton dozens of times.

Dozens of times a day, multiplied by three hundred odd days a year and by twenty years—that would make a figure which in itself spells “service.” Through it all his Hamilton has given accurate time.

This experience of Engineer Monk is but the echo of the experience of thousands of other railroad men who own Hamilton Watches. And these men know that for time inspection service the Hamilton 16-size, 21 Jewel, No. 992, is the most popular watch on American railroads.

HAMILTON WATCH COMPANY
Lancaster, Penna., U. S. A.

Hamilton Watches range in price from \$40 to \$200; movement alone, \$22 (in Canada, \$25) and up. Send for “The Timekeeper,” an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated and prices given.

Hamilton Watch

“The Railroad Timekeeper of America”

the University of Illinois, has accepted a position as rodman on the Springfield division.

Miss Geraldine Reynolds, stenographer in the roadmaster's office, has been granted a two month's leave of absence and will leave July 3, together with Miss Julia Coffey of the accounting department, for Los Angeles, Cal.

Harry Miller, clerk in the roadmaster's office, has been transferred to the store department to accept a position as assistant accountant in the office of Division Storekeeper Downing.

New station facilities have been installed at Hedrick, Ind. Our station there was destroyed some time ago by a cyclone.

Frank G. Kelley died at Huber Memorial Hospital in Pana Tuesday, May 9. Mr. Kelley was a clerk in the freight department at Pana and had been in the service of this company for the past six or seven years. Funeral services were held at Vandalia Friday, May 12.

Mechanical Department

The third annual fish fry given by the supervisory forces of Clinton shops was held Wednesday, June 14, at Weldon Springs, beginning at 4 p. m. All the foremen and several guests who were present report a fine time. The menu consisted of the following:

More Fish	Fish	Bass
Olives	Catfish	
Bread	Butter	Pickles
	Lemonade	Coffee

The committees were organized as follows: Refreshments, F. S. Bogan, chairman, E. B. Barlow, Fred Howard, M. G. Taylor; transportation, H. L. Needham, chairman, R. J. Gable, F. W. Menefee. Jacob Krehl was chef.

ST. LOUIS DIVISION

L. L. Heileg, chief clerk to Roadmaster J. W. Kern, was in the hospital at Carbondale a few days recently as the result of a snake bite.

Carpenters have finished work on the extension to the division office, and the painters are expected to finish up soon. There have been many changes in the arrangement of the offices. We now have a real office building and one that all are equally proud of.

Freddie Nolting, switchman, Centralia, Ill., died May 25.

Joe Hewitt was married June 3 to Miss Marie Gordon, Anna, Ill. Mr. Hewitt is record writer in the mechanical department, Carbondale. They will make their home in Carbondale.

There were more gross ton miles (333,293,000) handled on the St. Louis division during May than since January 1, 1921, at which time the daily freight train performance report was started.

Bart Baker, who is in the cavalry at Fort Riley, Kan., is visiting his sister, Mrs. Ed Clayton, Carbondale. Mr. Clayton is clerk for Trainmaster F. E. Hatch.

Mrs. Lloyd Oliver died in Holden Hospital, Carbondale, June 13. Mr. Oliver is night roundhouse clerk at Carbondale.

L. C. Brown, fireman, engine No. 1756, south, June 10, saw a brake shoe lying on the west rail of the northbound track and took the necessary steps in reporting this and having it removed.

A DeMolay lodge (junior Masonic fraternity) has been organized at Carbondale, with several

Illinois Central employees and sons of Illinois Central employees becoming members.

Conductor William Walker attended the O. R. C. convention at Cleveland, Ohio.

E. J. Conners

Life is just one thing after another, and the latest thing for the genial general foreman at Centralia, E. J. Conners, is his new motor car. One glance at his smiling countenance will convince the most skeptical that "Rip" believes in making life pleasant. Always a favorite with the fair sex, Rip's popularity has certainly not been impaired with the advent of the new buzz wagon.

INDIANA DIVISION Superintendent's Office

"No Exception" campaign! Have you been watching the daily bulletins issued by the supervising agent's office, showing the antics of "O! Exceptions," Newt's difficulties, and the advice of the observer from the window? Also the new character "Lil' Cancellations?" Keep up with 'em—they're interesting!

M. E. Kemper has been appointed chief clerk to Superintendent Roth. L. H. Petri has been appointed assistant chief clerk to Superintendent Roth.

Our accounting department seems to be matrimonially inclined these days. On Saturday, June 10, at the parsonage of the Church of the Immaculate Conception, George Lahey (accountant, superintendent's office, Mattoon) and Miss Margurite Smith of the same office were married. They are spending their honeymoon in Chicago and Indianapolis. The next day Sunday, June 11, at the parsonage of the Methodist Church in Danville, Ill., Hugh Whisenann (accountant, superintendent's office) and Miss Stella Elliott of Mattoon were married.

April 28 a baby girl was born to Mr. and Mrs. Walter J. McDonnell—Frances Joan. "Mac" is electrician on the Indiana division.

One evening in May, Miss Lucille Yount of the superintendent's office entertained the young women of the division office at her home, displaying her usual artistic ability in house and table decorations. The color scheme was yellow, the luncheon table being unusually pretty, with yellow birds perched on tumblers carrying the place cards in their mouths, yellow nut baskets and the center piece a real work of art—it represented a Japanese garden, built on a tray. Real grass was growing; there was real shrubbery (tiny ferns and grasses); small pine cones, which had been dipped in green paint, were used to represent small trees. Around the edge of the tray was a wall made of small pebbles and real cement, and a small path made of white sand wound in and out among the shrubbery from one entrance to the other. At one end of the garden was a small lake, on which serenely floated a small white swan, while tiny fish, a frog and a turtle played around on the sandy bottom. Some cosmos and other taller grasses were planted around the lake to afford some nice shade for

the little chicks and ducks which were scratching in the grass nearby. Over an arbor made of small twigs tied together were twined little yellow rosebuds, while a small white cupid made an impressive piece of statuary; between the trees and shrubbery could be seen a little rustic bridge.

Chief Dispatcher's Office

J. E. Cullum, agent, Helmsburg, Ind., who broke his leg recently playing ball, is improving nicely and expects to be back at work soon.

Agent H. A. Douglas, Dundas, Ill., bld in first trick at "MY," Mattoon yard office, and at present is filling in at "Q," dispatcher's office, due to extremely heavy business on the division.

OUR CORRESPONDENTS

No. 2

MISS FLORENCE McSHANE, secretary to Superintendent H. J. Roth of the Indiana division at Mattoon, Ill., has made the arrival of the Indiana division notes in the magazine office an event of gladness to the hearts of the editorial staff. She nearly always has at least one good story for the magazine, in addition to the usual notes. Miss McShane has been secretary to the superintendent for eleven years.

During May the Indiana division moved 7,692 loads out of Evansville, Ind. This was the heaviest movement ever handled out of Evansville in one month, making it necessary to put on three additional dispatchers at Mattoon.

Dispatcher J. L. Fleming from Clinton, Ill., is working as second trick dispatcher on the Indianapolis district. Dispatcher Bosley is taking the first trick of the new jobs.

Operators in "Q" office, Mattoon, are feeling the effect of Supervising Agent Walker's "No Exception" campaign on account of the increasing telegraph work.

The vegetable and banana movement from

the South continues to increase, averaging from sixty to one hundred cars daily out of Effingham for eastern points through the Indianapolis gateway.

Sunday, June 4, the large "Mikado" engines were run over the Wabash River bridge at Grayville for the first time. Now all trains out of Evansville handle about ten more cars.

Master Mechanic's Office

Mr. and Mrs. P. B. Myers are the proud parents of twin girls, born May 24. Mr. Myers is a clerk in the office of Master Mechanic Bell.

Miss Mildred Bell, daughter of the master mechanic, is home from Breneau College, Ga., for her summer vacation.

Vacation season has started. Local Chairman of Engineers and Mrs. T. L. Conner have departed for California to attend the Shrine convention; Engineer and Mrs. William Eaton and daughter have also left for San Francisco to attend this convention. Chief Accountant and Mrs. C. R. Plummer left June 11 for Tacoma, Wash., to visit relatives. Norton Parks, clerk, is vacationing in Springfield, Ill. Machinist and Mrs. M. Cleveland are leaving for Abilene, Texas; Machinist Helper C. Jeffries, for Garneill, Mont.

WISCONSIN DIVISION

The Acme Manufacturing Company, of Wheaton, Ill., which recently lost its plant by fire, has located temporarily at Dixon, Ill., making use of one section of the old Dixon College buildings, known as the Dixon Cereal and Feed Company. The Acme Manufacturing Company is engaged in the manufacture of animal food.

A move is now on foot in Dixon to have Dixon named as the site for the building of the children's home of the Brotherhood of American Yeomen, an institution which will occupy 2.6 acres of ground and will call for an expenditure of ten million dollars. The home site committee, including H. W. Meyers, state manager of the Yeomen of Illinois, was

in Dixon June 19, going over the situation and viewing the proposed site.

There is no slump in business with the Illinois Central at Dixon. Earnings up to date for June are far exceeding those of June, 1921, and the local yard engine is handling a great many more cars a day.

The bathing season, having opened in this city, finds the evenings well spent at Lowell Park, with the Illinois Central represented among the throng by some members of the local force enjoying the splash.

M. J. Reilly, engine foreman, laid off for rest and recreation the first ten days of June, his place being filled by Switchman D. S. McIntyre.

Agent and Mrs. C. G. Shepherd of Dixon recently gave a week-end party for the entertainment and pleasure of Chicago friends, who motored to Dixon via the Lincoln Highway. The party consisted of Mr. and Mrs. Otto Belch and two sons (Mr. Belch is Chicago manager of Paul F. Belch Candy Company); Mr. and Mrs. Walter Stein (Mr. Stein is president of the State Commercial and Savings Bank, Chicago); Mr. and Mrs. Arthur Ross, son and daughter (Mr. Ross is department superintendent, R. R. Donnelly Publishing Company); Mr. and Mrs. C. George Shepherd and son Dick, manager art department, R. R. Donnelly Company. Mr. Shepherd is maker of all the magazine covers used on the Rock Island Magazine. Others were Mrs. W. Holmes of Boston, Miss Pauline Scott, special school instructor, Chicago, Mr. and Mrs. F. J. Patterson, Mendota, Ill., Mr. and Mrs. A. Tesche, Mendota. The Illinois Central employes made sure that all points of interest were taken in, including a trip to Blackhawk Monument, near Oregon, Castle Rock, Lowden Park, Lowell Park, a trip over the Blackhawk Trail, dinner at the Old Colonial Hotel, Grand Detour and many other points of interest too numerous to mention. Mr. Stein says in recent letter: "I never before realized what wonderful country we really have in Illinois. When Otto Belch described the Rock River country to me, I thought he was exaggerating, but my visit exceeded my fullest expectations."

Sympathy is extended to D. & V. Accountant

This picture shows a portion of a temporary bridge constructed on May 13 over the Sioux River on the Iowa division. On this date this bridge, consisting of seventeen 5-pile bents, with an average height of 18 feet and a length of 225 feet, was entirely destroyed by fire. Men were assembled and material loaded and moved to the location in record time, with the result that not a passenger train was delayed—the Iowa division still maintains its usual record of "passenger trains 100 per cent on time."

Paul Donahue and Record Clerk Florence Donahue, whose mother died suddenly Sunday, June 11.

MINNESOTA DIVISION

A meeting of the Minnesota, Iowa and Wisconsin division supervising agents and agents was held in Dubuque, June 9, with a view to reducing exceptions during the June "No Exception" campaign.

Claude Crandall of the revising bureau was called to Decatur, Ill., recently by the death of his mother.

A number of the freight office clerks at Dubuque participated in an enjoyable picnic held at "Dominic's Pool," about twelve miles outside of the city. They report a fine time and that they also were entertained by some of the farmers for several hours while waiting for the truck to bring them back to the city.

Gloom was cast over the employees on the Minnesota division when they were informed of the death of Charles Coffey, second trick operator, "KB," Dubuque. Mr. Coffey was born in Dixon, Ill., thirty-seven years ago. He entered the service seventeen years ago as an operator and was employed in that capacity until eight months ago, when he was taken ill and was confined to his home up until the time of his death, which occurred May 30. Funeral services were held June 2 from his residence, 22 Locust street, Dubuque, to St. Raphael's Cathedral. Burial was made in Mount Olivet Cemetery. He is survived by his wife and three children.

Superintendent and Mrs. L. E. McCabe are spending their vacation at Banff and Lake Louise, Canada. They will also visit in California.

"Bob" White, yard clerk, Waterloo, had the misfortune to fall and break his knee cap while playing ball at Waterloo recently. Mr. White is now at the Illinois Central Hospital in Chicago.

L. E. Strouse, trainmaster at Dubuque, has purchased a new motor car.

KENTUCKY DIVISION

G. E. French, station helper at Dawson Springs, Ky., and Miss Ethel Majors of that city were married on June 1.

D. B. Osborne, conductor, Princeton, Ky., has been called to Roanoke, Va., by the serious illness of his father.

Signal Department

The signal department educational meeting for May was held at Louisville, Ky., on May 29, with an attendance of forty. The subject was "Insulated Joints." H. S. Scott, supervisor of signals of the Louisiana division, was a visitor at this meeting.

The regular monthly educational meeting for June was held at Leitchfield, Ky., on June 19. The subject was "Track Relays."

Employees of the signal department held their annual outing at Grayson Springs, Ky., on June 17. A large attendance was present, and the basket lunch was enjoyed by all.

The signal department has two representatives on the Illinois Central baseball team. S. W. Overstreet, signal helper, Signal Gang No. 1, is the catcher, and J. A. Sauer, signal testman, plays third base.

H. S. Scott, supervisor of signals, Louisiana division, visited his old home at Lexington, Ky., on May 29, passing through Louisville en route.

The automatic block system between Paducah and Ilsey has been extended from Ilsey to Fox Run. The new signals in this block section were placed in service on May 24. The installation of these signals was carried out by Signal Gang No. 1, under the direction of Signal Foreman C. C. Sauer and Signal Supervisor J. P. Price. Operation and circuit tests were made by Signal Supervisor Price, Signal Inspector Partidge and Signal Testman J. A. Sauer. The signals are the Hall Switch & Signal Company's Style L, 3-position, upper quadrant, semaphore type. Relays were furnished by the Union Switch & Signal Company. The switch boxes were the Union Switch & Signal Company's Model U-2, used in connection with the RSA standard ball-and-socket switch box rod and switch point lugs. The approach lighting system was used for the operation of the electric lights. Lamps were furnished by the Aldon Engineer Company, and were equipped with $3\frac{1}{2}$ -volt, concentrated filament lamps operated from five cells of primary battery. Cable connections were made according to SD-2037, using strain insulators.

The entire main line of the Kentucky division between Louisville and Paducah is now protected by automatic block signals, with the exception of fifteen miles between Graham and Fox Run. The installation of block signals in this section is being held up on account of contemplated grade reduction work.

The Kentucky division now has 8 interlocking plants, 430 automatic signals, 44 crossing bells and 1 color light signal in service for the protection of traffic movements.

T. L. Davis, supervisor of signals, has returned from Arizona and is now at his home at Martinsville, Va.

The signal department educational meeting for July will be held at Princeton, Ky., on Sunday, July 23. The subject will be "Maintenance of Oil Lamps."

Signal operations on the Kentucky division for May were 739,269, compared with 582,561 in April, an increase of 156,708. This increase in the number of signal operations was due to the increase in the number of train movements.

Local Freight Office, Louisville

Andrew Thomas, after a brief honeymoon spent in the Windy City, where he was extensively entertained, has returned to the office to resume his daily routine.

Mark Sheehan is seriously contemplating taking a trip to "Old Erin." During the time that he is there it is his intention to get as much information as possible relative to his ancestral tree. So far he has traced six generations.

MISSISSIPPI DIVISION

Frank Cooper, employed as car inspector, Water Valley shop, died suddenly at his home in Water Valley of heart disease Sunday, June 4. Mr. Cooper leaves a wife and several children. Funeral services were conducted by the Rev. Wayne Alliston, pastor of the Baptist Church, assisted by the Masons.

John T. Nason, passenger conductor on the Mississippi division, died in the Illinois Central Hospital at New Orleans, May 30, after an illness of two months. Mr. Nason had been in the service for thirty-two years. He was employed as a flagman out of Water Valley, Miss., August 7, 1890, and was promoted to conductor December 11, 1893. He was an affable and

RAILROAD-LUBRICATION

Good Railroading

A CONFEDERATE Colonel, who was distinguished for his strategy if not for his book learning, was asked to outline the reasons for his military successes.

He said that it consisted of "getting the mostest men there firstest."

We quote this because it suggests so well the cardinal principle of good railroading, which is

***Moving the greatest tonnage
in the shortest time***

Necessarily the attainment of this ideal demands watchful supervision, careful dispatching and proper mechanical conditions.

Proper mechanical conditions mean efficiency of locomotives and freedom from hot boxes or bearing troubles on cars.

Railroads use large quantities of lubricating oils, therefore they must buy economically.

Not only must railroads guard against stoppage of traffic, but they must be on the lookout against frictional losses which

cause waste of fuel. Therefore, the efficiency of the lubricants they use and their correct application are important essentials to good railroading.

We consider the increasing sale of Texaco railroad oils a glowing tribute to our refining skill and the efficiency of our delivery service.

It is our privilege to render, through our Lubrication Engineers, a valuable service in the handling, storage and application of the Texaco Lubricants.

We have on our books many of the large railroads in this country, including the Illinois Central. The list of Texaco products they use includes lubricating oils for locomotives, rolling stock, shop machinery and power plants, illuminating oils for signals, headlights, road oils, roofing, etc.

The use of the whole Texaco line by these railroads conclusively proves our statements regarding the high quality of every product sold under the Texaco Red Star and Green T trademark.

THERE IS A TEXACO LUBRICANT FOR EVERY PURPOSE

agreeable gentleman, and was highly esteemed by the railway employees and the public in general. He was buried in his home town, Starkville, Miss., with Masonic honors, having been a member of the Valley City Lodge No. 402, McConnico Chapter No. 96, and St. Cyr Commandery No. 6, all at Water Valley, the Wahabi Temple Shrine, Jackson, Miss., and the Water Valley Elks Lodge No. 459.

Miss Audley Kennedy and Earl Fly were married Sunday, June 4. Miss Kennedy is the daughter of Engineman I. P. Kennedy. Mr. Fly is a valued employee of the postoffice force at Water Valley.

Another wedding was that of J. W. Gooch, machinist, Water Valley shop, to Miss Marie Simms, Sunday, May 28, at the home of the bride in Water Valley. After a short bridal trip, they are receiving congratulations at their new home in the southern part of the city.

Conductor J. H. Stewart has returned to service after receiving treatment at the company hospital at New Orleans.

Flagman Gabe M. Jones, ex-service man, is receiving treatment at the government hospital in New Orleans.

Engineman A. T. Smith and Conductor A. G. Perry are in the hospital at Chicago for expert medical attention.

Paint Foreman J. A. Kettle has gone to the hospital at New Orleans for treatment.

We are glad to report that Mrs. A. D. Caulfield, wife of the superintendent, has recovered sufficiently to be able to return home, after a month's treatment in the Baptist hospital at Memphis.

Section Foreman W. M. Taylor, McCool, Miss., had one of his legs fractured when struck by an angle bar from a rail which he was endeavoring to loosen on account of expansion. He was carried to the Illinois Central hospital at New Orleans, where he is reported as doing nicely.

J. L. Stallings, machinist, Water Valley shop, had his right leg broken in two places June 1, when a bell cord with which an engine driving spring was being loaded broke, permitting the spring to fall, striking him. He was carried to the Illinois Central Hospital at New Orleans.

Section Foreman Frank Olson, Holly Springs, Miss., has been commended for interest displayed in discovering a brake beam down under St. L. & S. F. car 11639, in train 98, three miles north of Holly Springs, June 1.

Assistant Engineer and Mrs. J. T. Westbrook attended the commencement exercises of the Columbia Military Academy, Columbia, Tenn., where their son, John Junior, was graduated this year with high honors.

On May 20, poultry raisers of Yalobusha County, Miss., organized an association to promote the raising of purebred birds of standard breeds and increase the amount of poultry produced. M. L. Woods, chief clerk of the road department at Water Valley, was elected sec-

J. T. Nason

retary, and S. N. Berryhill, who is connected with the Water Valley Bank, was elected president.

W. F. Woolard has taken a position as rodman with the engineering force of this division. Mr. Woolard has just been graduated from the University of Mississippi. He will be remembered as the son of W. W. Woolard, formerly pastor of the Methodist Church at Water Valley.

Mrs. Gladys Walker is off on a three months' leave of absence. Her place at the tonnage desk is being filled by Miss Annie Bell Anderson. Extra Clerk Corinne Ederington is filling Miss Anderson's position as stenographer to the accountants.

LOUISIANA DIVISION

Miss Una Holmes, tonnage clerk, was slightly injured in an automobile accident near Tangipahoa, La., recently. The car in which she was riding went through an old bridge. Miss Holmes is better and has returned to work.

Division Storekeeper Sauls advises that the \$43,000 storehouse now under construction will be ready for occupancy about September 1. Severn & Murphy are in charge of the work.

Mrs. William E. Berry, wife of the operator at Summit, Miss., and formerly employed as chief performance clerk in the superintendent's office, was a welcomed visitor last month.

Charles Gray, employed in the boiler shop at McComb, and Miss Saide Catchings, daughter of W. L. Catchings, foreman, tin shop, McComb, were married in Centenary Methodist Church by the Rev. P. H. Thompson, Thursday evening,

Here is Carolyn Kelly Buck, 18 months old, daughter of Chief Yard Clerk H. K. Buck of Gwin, Miss. Carolyn likes the automobile as a plaything, but she prefers the "choo-choo train" for real traveling.

June 1. Among her attendants were: maid of honor, Miss Elaine Moore, daughter of T. L. Moore, engineer; bridesmaids, Miss May D. McMichael, clerk to chief dispatcher; Miss Roberta Darville, clerk to supervisors; Miss Heloise Dunn, daughter of Conductor W. S. Dunn; Miss Maude Elma McInturff, daughter of Conductor R. E. McInturff.

W. T. McGuire, chief clerk to the superintendent, has started a poultry farm.

Instrument Man R. E. Bundy's bungalow will soon be ready for occupancy. Accountant I. F. Tullis' house is also under construction.

The vegetable business on the division has increased 100 per cent this year over last, the territory extending from Brookhaven to Terry, Miss., including connections at the former point.

The sum of \$30,000 has been appropriated by McComb for an amusement park on the west side of the city which covers about thirty acres.

Jackson, Miss.

Two weddings of interest took place during May: L. E. Bonner, clerk, and Miss Doris Puffer were married on May 21 and made a honeymoon trip to Kansas. T. E. Lard, clerk, and Miss Joan Bridges were married on May 19 and visited Memphis. Both couples will reside in Jackson.

Mrs. J. P. Martin is back after an illness of several months.

Mrs. Douglas McNair is the new stenographer in the agent's office.

Gwin, Miss.

J. T. McMaster has been appointed general yardmaster, in place of W. Wicker, promoted to acting trainmaster of the Mounds-Cairo terminals. T. I. Grafton has been appointed to succeed Mr. McMaster as night yardmaster.

Our night chief clerk and family have moved into their new residence at Gwin. This makes a total of three new residences and one mercantile building put up lately. Plans have been received for our new hotel, and work will soon begin. This will be a great addition to our town.

The coal chute at Gwin has been rebuilt and is now being operated with 100 per cent efficiency.

Icing Clerk T. B. Robertson has been on sick leave at his home at McKinzie, Tenn.

Icing Clerk L. L. Fatheree has been enjoying a visit in the West, also attending the B. of R. C. convention at Dallas, Texas.

NEW ORLEANS TERMINAL

The terminal was recently visited by two of our Northern sisters—Miss Margaret Walsh of Waterloo, Iowa, and Miss Grace McDonald of Dubuque, Iowa. The young women were escorted about New Orleans by several of the terminal employees, and the only regret was that their stay was so short.

Another charming visitor to the terminal recently was Mrs. D. I. Taylor of Barnhart, Texas. Mrs. Taylor before her marriage was Miss Cora Ellsworth, and she spent several years in the employ of the agent at Poydras

MEE'S ELECTRIC LANTERN

Especially constructed for railroad service. It is a wireless construction, no wires to break, ground, short circuit or cause a leak in the batteries. The only Lantern on the market that can be operated with one hand satisfactorily. The body of our Lantern is made of 22 gauge tempered brass and heavily nickel plated, guaranteed not to peel off.

Our Price Direct to Consumer Complete With Battery and Two Bulbs, \$3.75

Parcel Post C. O. D. only. Don't fail to mention whether drop or stiff bail wanted. Our batteries are the standard size and will fit any Electric Lantern. The price of one battery is 75c, or in lots of three or more, 65c each. Mazda bulbs, 15c each in lots of three or more. Nitrogen bulbs 40c each or three for \$1.00. Your name will be neatly engraved on your lantern if instructed.

Continental Casualty Company H. G. B. ALEXANDER President Chicago

freight office. Of course, like all Illinois Central employees, she could not visit New Orleans again without paying all her former co-workers a visit, and everyone welcomed her back royally.

It is with deep regret we write of the death of Mrs. Lelia Harvey Scaife, wife of the late Charner T. Scaife, who was at one time freight agent and later chief claim agent for this company at Chicago. At the time of her death, she was visiting her brother, C. Y. Harvey, 1403 Webster Street, New Orleans, where the funeral services were held. The body was taken to Memphis for burial. Mrs. Scaife was well known in New Orleans, Memphis and Chicago for her many charitable deeds.

The services and preaching held every Thursday at noon time in the warehouse at Stuyvesant docks by members of the Baptist Bible Institute are being well attended.

Caroline, an old New Orleans negro mammy, formerly in the employ of Agent Scaife's family,

In City Park, New Orleans

The New Orleans Terminal yard department presents herewith its two yard employees with longest service records. At the left is Dan Fletcher, who entered service as weighmaster, taking charge of a scale at Government yard, assigned to the weighing of bananas exclusively. He was later transferred to Harahan yard, taking over the automatic scales, a new device for weighing cars while in motion, and he is still in charge of all weighing at Harahan. Ben Werling, at the right, entered service forty-six years ago as loading clerk on the river front under Agent Cousins and later was transferred to yard service as Belt clerk. At present he is car tracer and paymaster at Harahan yard. Photograph taken at entrance to Harahan yard office.

witnessed the Knight Templar parade recently held in this city. She mentioned that she heard the Millionaire Band from Chicago and said: "Dem horns sho ain't gold." No argument could induce her to believe the instruments were of gold. On being asked why she thought they were not gold, she replied: "Cos if dey was gold, dem men's never would get out of New Orleans wid 'em."

F. U. Rogan, section foreman, became the proud father of a 11½-pound girl, May 5.

J. H. Mears, section foreman, recently gave the hand of his daughter, Mary, in marriage to Lewis Holmes of Galveston, Texas. The couple will make their home in New Orleans.

Thanks and praise are due F. C. Nodier, yardmaster at Harahan, in appreciation of the excellent service rendered by him. Mr. Nodier's efficiency and co-operation are such that all employees on the terminal have unanimously termed him "the right man in the right place." His foremost thought at all times is service, in every sense, of the word, and he not only strives to be 100 per cent capacity as yardmaster, but always has an eye to improvement and saving. The road department has taken particular note of his careful method of re-railing derailed equipment without damage to track. It is said in such instances all Mr. Nodier needs is an angle bar and an oak wedge to do the job. He also specializes in placing company material promptly to release equipment.

MEMPHIS TERMINAL DIVISION

A great deal of interest is being manifested on the Memphis Terminal in the "Careful Crossing" campaign, which began June 1 and extends to September 30. Terminal Superintendent E. Bodamer has been active along this line and is impressing employees daily with the necessity for doing all possible to eliminate crossing accidents during this period. Various advertisements, posters and other material are being distributed upon this subject, and the citizens of this city are awakening to the spirit necessary to make this campaign a success. Mr. Bodamer is conducting a regular political campaign upon the Memphis terminal, shaking hands with all trainmen and other employees, explaining to them individually the real necessity of making this campaign a success on the Illinois Central System.

Passenger Conductor Wesson, running between Memphis and Fulton, Ky., was instrumental recently in bringing about the conviction of a negro on the Memphis terminal for the misuse of a pass. Federal Judge Ross sentenced the

Look for this stamp on the watch you buy

negro to thirty days in jail and to pay a fine of \$300 after the negro had pleaded guilty to the charge. Conductor Wesson, the special agent's department and the roadmaster's office are commended for the manner in which this case was handled. This is only one of the several cases in which Conductor Wesson has discovered persons guilty of misusing Illinois Central passes.

George Simmons has been granted a leave of absence in order that he might construct his home. Several of the carpenters in the bridge and building department on the Memphis terminal have recently built their own homes.

The Illinois Central is receiving its share of the glory for the building of the McLemore Avenue viaduct. Colonel A. H. Egan, general superintendent, made a speech on one of the days of the celebration.

John Burns, chief clerk to Superintendent Bodamer, has developed into a first-class fisherman. Mr. Burns is well equipped with the necessary paraphernalia, and his recent trips have netted many good catches.

Pat McHugh, son of Peter McHugh, special agent at Memphis, sprained his leg while playing baseball with the Outbound team at Osceola, Ark., on Decoration Day. Pat is now confined to St. Joseph's Hospital.

Mechanical Department

(W. A. Frost)

J. C. Miller, machinist apprentice, who sustained a painful injury when a large piece of iron fell on his fingers, cutting them severely, has resumed work.

The yard office of the Illinois Central is receiving its annual coat of yellow paint, which greatly improves its appearance.

Miss Anna Dixon, file clerk in the master mechanic's office and one of the best-known violinists in Memphis, was given an ovation when she appeared at the banquet of the Retail Credit Men's Association at the Hotel Chisca, where she gave a number of solos.

E. D. Crouch, 1050 Patton Avenue, has returned from Chicago, where he has been under treatment at the Illinois Central Hospital for the last month.

George Utz, machinist apprentice, who was severely bitten by a stray dog thought to be affected with rabies and who was placed under observation, has entirely recovered and returned to work.

William Kelley, machinist, who has been on the sick roster for a week, has resumed work.

The Outbound baseball team (Illinois Central League) defeated the strong Osceola, Ark., team at Osceola on Decoration Day by a score of 5 to 2.

J. E. Elliot, machine shop foreman, who has been in St. Joseph's Hospital, where he underwent an operation for the removal of his tonsils, has recovered sufficiently to resume work.

Leonard Clark, machinist, who has been confined at St. Joseph's Hospital with appendicitis, has so far recovered as to be removed to his home.

C. M. Leonard, machinist, has returned home from Fairmount, Va., where he was called by the death of his sister.

Conductor A. M. Mitchell, Tennessee division, has returned to work after being on the sick list for a week.

J. H. Stallings, boilermaker foreman, has returned home from Chicago, where he attended the boilermakers' convention.

O. F. McHugh, machinist apprentice, who has been on the sick list for a week, has reported for duty.

T. H. Griffin of the Illinois Central forces has gone to Chicago, where he will undergo an operation for appendicitis at the Illinois Central Hospital.

W. A. Smith, tool checker in the boiler shop, has returned to work after being on the sick list for two weeks.

Conductor Will George of the Tennessee division, who has been on the sick list for a short period, has resumed his duties.

Roy Smith, night hostler, who has been confined at St. Joseph's Hospital, where he underwent an operation for tonsillitis, has so far improved as to resume work.

The Illinois Central storekeeper's department has received a new 1½-ton truck to be used in transporting stock from the Central Station to the Memphis shops.

Carl Jones, who has lately been connected with the Valley Investment Company, has resigned to take up an apprentice course in the Illinois Central shops.

Harry McAdams, electrician, has purchased the property at 688 Edith avenue, where he will make his future home.

J. H. McCloi of the Illinois Central forces has moved into his new bungalow at Wellington and Lucy avenues.

T. A. Ponnery, conductor, Memphis division, who has been on the sick list for a week, has resumed work.

W. B. Ham, conductor, Memphis division, has resumed work after being on the sick list for a week.

Conductor J. M. Northcott, Tennessee division, who has been on a furlough for the last two months, has resumed work.

M. E. Hawkins, former call boy for the Illinois Central, and R. G. Williams, switchman, have returned to Memphis after being mustered out of the navy.

J. E. Elliot, machine shop foreman, who was in Atlantic City for a week, attending the air brake men's convention, has returned home.

B. J. Feeney, traveling engineer, has returned from Atlantic City, where he attended the air brake men's convention.

G. H. Hopkins, machinist, has returned from Jackson, Tenn., where he was called by the death of a relative.

George Newhall, Illinois Central employe, is erecting a beautiful veneered brick bungalow at 270 Edith Place, which he will occupy as his home.

A wedding of local interest took place at Champaign, Ill., when J. E. Crews of this city, conductor on the Y. & M. V., was married to Miss Machin White of that city. After spending several days in Chicago, they returned to this city, where they will be at home to their many friends at 337 McLemore Avenue.

Charles Schubert, machinist apprentice, who has been on the sick list for a few days, has resumed work.

R. H. Myers, blacksmith, who has been on a 30-day furlough, has reported for duty.

The shop team of the Illinois Central League, in an exhibition game, defeated the strong Memphis packing-house team recently by a score of 4 to 3.

The Memphis shop team of the Illinois Central League will go to Paragould, Ark., on the

Fourth of July to cross bats with the home team of that town.

Nonconnah Car Shop (C. R. Creedon)

General Car Foreman Arnold has had added to his already efficient staff a 9-pound grandson, born May 29.

Car Foreman G. L. O'Connor has returned from Cleveland, Ohio, where he was called by the death of his father on June 1.

Steel Foreman R. W. Gilliam is the owner of a brand new sports model car.

Since the announcement of her arrival in the April issue little Miss Patricia Hollahan has been making "record time." She recently claimed first honors in the St. John's baby clinic. "Pat" is the daughter of Foreman and Mrs. E. J. Hollahan. The latter was formerly Miss Bernice Murphy, chief operator at Memphis, before her marriage.

Since re-organization, the Nonconnah baseball club, under the efficient captaincy of J. F. Guy, is winning unusual distinction among the South Side athletic clubs.

Miss Catherine Bunting, daughter of Mill Foreman Bunting, is spending the summer months in Nashville and Chattanooga, Tenn.

Inspector Foreman Henry Honea and family are spending the summer on their farm in McComb, Miss.

Miss Hazel Hughes, daughter of Car Carpenter G. H. Hughes, and Thomas Fauver of the transportation department were married on June 12.

Inspector Pete Balestrino and Miss Gaia were married on June 6 and left immediately for New York, where they boarded a steamer for Europe and "honeymoon land."

The shortage of June brides didn't mean anything to V. Alexander.

The Alexanders

for the home of the bride's mother in Chattanooga. Mr. Alexander came to Memphis four years ago from Kentucky.

Across from Friars Point, Miss., securing the Trotters Point incline, which was swept away by the high water the first of April.

proved, but is not able to return to work. She is now on a leave of absence. She left June 11 for Chicago, where she expects to spend the summer in an attempt to regain her health.

Elliott Rose visited his friends in the superintendent's office for a few minutes May 29. Mr. Rose, who was file clerk in this office for some time, is now working in the treasurer's office of the Peoria & Pekin Union Railroad at Peoria, Ill. Mr. Rose was accompanied by his wife, who was formerly Miss Grace Roberts of Memphis.

A well-attended safety meeting was held at Memphis, May 16. S. S. Morris, chairman of the general safety committee, was a visitor at the meeting and made an interesting talk in connection with the "Careful Crossing" campaign.

The work of rebuilding the incline at Trotters Point, which was washed away by the high water the first of April, was started May 22, and regular service between Helena and Trotters Point was resumed May 29. The force at Trotters Point worked day and night on the incline, and the construction was rushed to completion on record time.

D. T. Monroe, clerk at Tutwiler, and Agent and Mrs. G. L. Edwards of Tutwiler spent May 30, Decoration Day, at Moon Lake, fishing with a party of Tutwiler people. They reported a catch of nearly two hundred fine white perch, which they maintain is not a "fish" story. Fishing at Moon Lake seems to be good this year, as F. T. Theobald, superintendent's chief clerk, and A. A. Freiburger, chief dispatcher at Memphis, report a catch of ninety-three fine fish in a few hours on June 5.

F. A. Scarsbrook, operator at Lake Cormorant, Miss., discovered a brake beam down in train No. 54, passing his station June 3. He notified the conductor, the train was stopped and the brake beam removed.

On March 27, as passenger train No. 335 was leaving Whaley, Miss., Whole Line Foreman P. Perry noticed a brake beam down on the negro smoker. He attracted the attention of the train crew and had the train stopped. Foreman W. R. Witherington and Foreman Perry assisted the train crew in making temporary repairs to the brake beam, tying it up with wire sufficiently for the train to make Greenwood, where a new brake hanger was provided.

NEW ORLEANS DIVISION

W. F. McDuff of the forces of the superintendent and Miss Laura Roberts were married at

the home of the bride's parents at Signal, Miss., on June 7. The wedding was a beautifully arranged affair and largely attended. Mr. and Mrs. McDuff departed after the ceremony for a tour of points in the Southwest.

Traveling Engineer Jerry Cronin, who has been under treatment in the Chicago hospital, is back on the job, much improved in health.

G. C. Christy, our master mechanic, is at present in the hospital undergoing treatment.

Miss Edna Mahin, who has been on the sick list for some time, is now fully recovered and able to resume her duties in the superintendent's office.

Miss Margaret Walsh, soliciting freight agent, Waterloo, Iowa, formerly of the superintendent's office at Dubuque, Iowa, and Miss Grace McDonald of the superintendent's office, Dubuque, were guests of Superintendent Mays' forces at Vicksburg recently, and everyone was eager to assist in giving them an enjoyable time. This is the young women's first trip to the Sunny South, and they were profuse in their compliments to the traditional Southern hospitality. While at Vicksburg they took in the National Park, one of the wonder attractions of the country.

How force of habit clings to some perverse persons is astonishing. Crossing watchmen complain that, during the recent high water, men in skiffs tried to beat the engine across, just as automobilists do in dryer times.

Governor John M. Parker of Louisiana turning the first shovelful of dirt for the construction of the first building on the new site of the Louisiana State University at Baton Rouge. The building is to be a dairy barn for the accommodation of 100 cows for the College of Agriculture farm.

Panama Limited Sets an "On-Time" Record

Illinois Central System's Best-Known Train Missed the Mark Only Four Days in a Year

THE Panama Limited, the Illinois Central's "crack" passenger train between Chicago and New Orleans, has just completed a most remarkable record. During the twelve months ending May 31 the northbound train, No. 8, has arrived in Chicago on time every day, and the southbound train, No. 7, has arrived in New Orleans on time 361 days out of the year. The southbound train was late at New Orleans twice in August, 1921, once in December, 1921, and once in February, 1922.

The distance between Chicago and New Orleans over the route traversed by the Panama Limited is 921.2 miles. During the twelve months these two trains have traveled 672,476 miles—a distance equivalent to approximately twenty-six times around the earth at the equator.

The trains are handled by Pacific type locomotives, which are manned by the following named engineers: between Chicago and Champaign—George Wohn and L. Burns; between Champaign and Centralia—H. Howard and William Fluck; between Centralia and Cairo—E. Cookerow and J. Heyduck; between Cairo and Memphis—J. W. McNamara and C. P. Chandler; between Memphis and Canton—C. J. Barnett and C. H. Hammond; between Canton and New Orleans—C. A. Gilmore, J. D. Ellsworth and C. W. Harrell.

Between Chicago and Cairo there are no regular conductors assigned to the Panama Limited. The passenger train runs are pooled, so that each conductor takes his turn. However, between Cairo and New Orleans the fol-

Panama Limited, Engine No. 1148, Central Station, Chicago, July 19, all set for the trip toward New Orleans. Engineer G. Wohn and Fireman J. B. Graham are shown in the lower view. The upper view also shows Conductor Fred Englet.

Panama Limited, Engine No. 1117, Union Station, New Orleans, April 6, all set for the trip toward Chicago. Engineer Traxler, Fireman L. Ford and Brakeman E. J. Powers are shown. The photographs were taken by E. Thurman of the general freight department at New Orleans.

lowing named conductors regularly have charge of the Panama Limited: between Cairo and Memphis—W. D. Thompson and J. M. Northcott; between Memphis and Canton—J. C. Turner and N. S. McLean; between Canton and New Orleans—C. E. Dunbar and W. E. McMaster.

The Panama Limited is an all-steel train, carrying no coaches. Its equipment includes sleeping cars, diner, buffet car and composite observation car. In addition to the most up-to-date features of the usual "crack" passenger train, the Panama Limited gives a telephone service before leaving the stations at Chicago and New Orleans, carries an expert ladies' maid on the train for the service of passengers and

has a barber shop compartment, in connection with which a shower bath also is operated and valet service is offered passengers.

Carelessness?

C. D. Cary, claim agent for the Illinois Central Railroad, handed the *Kankakee Republican* this story recently and vouches for the truth of it because it was given to him by Engineer George Dix, one of the most reliable and trusted employes of the road.

For pure carelessness, amounting almost to deliberate suicide, it beats almost anything the writer ever heard of.

Dix is engineer of train No. 25 and train No. 10. The incident he speaks of occurred between Loda and Buckley as he was pulling train No. 10 northbound, due in Kankakee about 7 a. m.

Just out of Loda, Dix saw an automobile standing on the railway crossing, presumably stalled. He blew the whistle. No movement of the auto. He was running between 55 and 60 miles an hour, down grade. He blew the danger signal the second time. Again no movement. He quickly shut off steam, applied the air and brought his train to an abrupt standstill within a few yards of the crossing.

Dix got off his engine and went to the car to investigate. The auto had side curtains on. On the opposite side of the machine was a man standing on the ground. In the machine was another man. They were visiting with each other—talking about crops or something. When hailed by the engineer, both looked up in surprise. They had not heard the approach of the train.

Can you beat that?—Maroa (Ill.) *News-Times*, June 1.

Our station at Decatur, Ill., recently featured on the cover design of The Station Agent magazine.

Good Work Seen in "No Exception" Drive

Campaign of June, This Year, Betters the Record Set a Year Ago; Memphis Division Leads

By C. G. RICHMOND,

Superintendent, Stations and Transfers

JUNE 30 marked the close of the most successful "No Exception" campaign ever conducted on the Illinois Central and Yazoo & Mississippi Valley railroads.

The "No Exception" campaign conducted during June last year resulted in a substantial reduction in the number of exceptions due to improper handling of less-than-carload shipments, with a corresponding reduction in claim payments. With a view further to increase the efficiency in the handling of less-than-carload and carload shipments, a similar campaign was made in June this year, the slogan of which was "Beat Last Year's Record." While the record made last year was an excellent one, each division made a better record this year by having a smaller number of exceptions charged.

The "No Exception" campaign of last year covered only less-than-carload shipments. However, as approximately 70 per cent of the total claim payments for 1921 were chargeable to carload shipments, it was decided to include both carload and less-than-carload shipments in this year's campaign.

Only 1,485 LCL exceptions were charged all stations on the Illinois Central and Yazoo & Mississippi Valley railroads in June, 1922, as compared with 1,933 in June, 1921, a decrease of 448, or 23.1 per cent. There were 150 carload exceptions charged to all stations during June, 1922, compared with 374 in July, 1921, a decrease of 224, or 59.8 per cent. (Figures for June, 1921, are not available.)

The following shows the total number of less-than-carload exceptions charged in June, 1922, tabulated as to classes and grand divisions, compared with the totals of June, 1921:

	Northern Lines
Shorts	158
Bad Orders	434
Pilferages	34
Overs	285
Astrays	166
Total June, 1922.....	1,077
Total June, 1921.....	1,189

C. G. Richmond

The rank of grand divisions, based on the number of LCL exceptions charged, is as follows:

Grand Division	Rank	LCL Exceptions
Western Lines	1	47
Southern Lines	2	156
Y. & M. V. Lines.....	3	205
Northern Lines	4	1,077

The rank of the various divisions, based on the number of LCL exception reports charged, is as follows:

Divisions	Rank	LCL Exceptions
Memphis	1	5
Tennessee	2	7

Western Lines	Southern Lines	Y. & M. V. Lines	Grand Total
6	11	21	196
29	80	94	637
4	3	10	51
4	34	34	357
4	28	46	244
47	156	205	1,485
92	259	393	1,933

Mississippi	3	11
Vicksburg	4	11
Minnesota	5	12
Louisiana	6	13
New Orleans	7	15
Wisconsin	8	15
Iowa	9	20
Springfield	10	26
Illinois	11	28
New Orleans Terminal	12	59
Kentucky	13	66
Indiana	14	93
St. Louis	15	105
East St. Louis Terminal	16	159
Memphis Terminal	17	174
Chicago Terminal	18	666

The following shows the rank of grand divisions, based on the number of carload exceptions reports charged in June, 1922:

Grand Divisions	Rank	Exceptions
Southern Lines	1	25
Western Lines	2	37
Northern Lines	3	39
Y. & M. V. Lines.....	4	49

The rank of the various divisions, based on the number of carload exceptions charged in June, 1922, is as follows:

Divisions	Rank	Exceptions
Mississippi	1	0
Vicksburg	2	0
Memphis	3	1
Tennessee	4	1
Minnesota	5	1
Louisiana	6	2
Chicago Terminal	7	2
Illinois	8	3
Springfield	9	3
East St. Louis Terminal.....	10	6
St. Louis	11	10
New Orleans Terminal.....	12	10
Kentucky	13	12
Iowa	14	12
Memphis Terminal	15	14
Indiana	16	15
Wisconsin	17	24
New Orleans	18	34

The campaign started on June 1 with a great deal of enthusiasm and interest on the part of officers and employees. The number of exceptions charged each day and the standing of each division as compared with last year were telegraphed to general and division superintendents, who in turn transmitted this information to employees of their respective divisions through the medium of bulletins and on some divisions by interesting and forceful cartoons which created an intense but friendly rivalry as between divisions and grand divisions. Employees eagerly looked forward to the issue of these bulletins and cartoons in order to keep posted on how the race was progressing. Each division set out to beat its own record of last year, also striving to beat the record of other divisions.

Same General Plan Repeated

The same general plan of action used in last year's campaign was followed this year: Superintendents, supervising agents, trainmasters, master mechanics, yardmasters and agents actively campaigned with the employees of all departments for the elimination of freight claim causes. The employees of all departments were daily impressed by supervising officers and department heads with the importance of prompt and proper handling of all freight shipments and that the final result desired was not only the conservation of foodstuffs and materials but the elimination of causes responsible for payment of claims amounting to thousands of dollars.

A special effort was made by platform forces to see that packages were properly marked, packed and in containers of sufficient strength to insure against damage while in transit; also

Causes of exceptions. At left, a car with no bulkhead after a heavy impact. At right, a heavy box loaded on top of a light one.

to see that shipments were correctly loaded and that a waybill accompanied each and every shipment to insure proper handling en route and prompt delivery at destination.

A remarkable reduction was made in the number of bad order reports charged against less-than-carload shipments, the total for June, 1922, being 637, as compared with 935 in June, 1921, a decrease of 298, or 32 per cent. This reduction was largely accomplished by closer attention being given to the loading, stowing and bracing of less-than-carload shipments and also the increased use of bulkheads in through destination cars at the larger platforms.

How Bulkheading Cuts Exceptions

The following statement shows the efficiency in the handling of less-than-carload shipments based on the number of tons handled per exception, also the number of cars bulkheaded and exceptions charged to bulkheaded cars forwarded from the larger stations during June, 1922:

Stations	Total Number Tons Outbound Mdse. Loaded	Total Number Exceptions Charged	Tons Handled Per Exception	Number Cars Bulk- Headed	Number B/O Reports Recd. on Bulk- Headed Cars	Number Bulk- Headed Cars Loaded Per Exception
Birmingham	3,251	6	541	55	0	55
Mounds	4,217	10	421	59	0	59
Jackson, Miss.	4,572	11	416	131	1	131
Paducah	5,118	17	301	50	0	50
Louisville	7,375	43	172	37	1	37
New Orleans	8,246	59	140	202	12	17
Memphis	18,850	174	108	220	26	8
E. St. Louis	15,914	159	100	412	24	17
Chicago	39,558	665	59	556	12	46
Totals	107,101	1,144	Av. 93	1,722	76	Av. 23

The statement above reflects a high degree of efficiency at the stations named and also shows conclusively that the use of bulkheads in through destination merchandise cars is effective in overcoming causes for bad order exceptions.

The intense interest and spirit of co-operation manifested by every employe during this campaign were even greater than those displayed last year. An instance cited by Agent F. B. Wilkinson of Jackson, Tenn., concerning a negro stowman, Alf Bolin, who thought of a better way to stow a piece of freight and returned to the freight house at 10 p. m. to rearrange the loading, is typical of the personal interest displayed by employes.

Novel Features in Campaign

A novel feature introduced

Proper Bulkheading in the Test Car

in this year's campaign was the showing of motion pictures visualizing the proper and improper methods of handling freight and the results of improper handling. In addition, these pictures featured an interesting test showing at what

rates of speed merchandise is damaged while being switched in the train and yard service.

This test was made with a specially constructed box car with one side and roof removed. A wire screen of large mesh was placed on the open side of the car to prevent freight from falling out while the tests were being made and to permit the taking of mo-

Special Car Used in Making Tests of Rough Handling

tion pictures showing what actually occurred to the contents while the car was being switched and subjected to various impact shocks. Tests were made with merchandise properly trimmed down and also bulkheaded. In the making of these tests, a shock impact recording device was placed in the car to indicate the degree of impact shock at various rates of speed ranging from 3 to 20 miles an hour.

The remarkable result of this campaign, which was made possible by the interest and united effort of all employees, is an accomplish-

ment of which all may well feel proud and one which is highly appreciated by the management. It is earnestly hoped that the same efforts will be continued during months to come with a view of making equally as good a showing or a better one.

The Results by Stations

Following is a statement showing the total number of less-than-carload exceptions charged to individual stations and divisions during the June, 1922, campaign, compared with June, 1921:

Salvaged a Carload of Dampened Freight

Accidents may happen to freight we are carrying, but that is no reason delivery should be made before everything possible has been done to repair the damage and to prevent exceptions. Witness the case of G. L. Edwards, agent at Tutwiler, Miss., who took a carload of twenty-seven mixed shipments that had been rained on, dried off the canned goods, polished a piano and in other ways repaired the damage, and then delivered the shipments with only two exceptions charged against them—a loss of only \$4.66 that might easily have gone into the hundreds of dollars.

"With a view of eliminating exceptions, it is necessary that freight be delivered in good condition; if it is received at the station in bad order, it should be put in good condition

before being offered to the consignee," Mr. Edwards declares.

"A car loaded at Memphis recently arrived at Tutwiler with the contents damaged. While the car was en route the tin roof was blown off, and a heavy rain drenched the shipments, except in one corner.

"Noting the condition of the contents, my first action was to unload the car. With the assistance of my porters and clerk, each article was examined; the water was wiped off all the boxes, and they were spread out to dry, after which immediate delivery was made by having the merchants call for their shipments. Canned goods were unpacked at once, in order to dry the labels and thus to prevent them from slipping off and to avoid having rust form on the

G. L. Edwards

cans. Where immediate delivery could not be made, boxes were opened and unpacked, each

can or package dried and aired well, and then replaced in the original package. Delivery of these packages was effected without exception. Shipments of sugar, coffee, beans, etc., were unloaded, the packages turned every hour and dried on all sides.

"All the paper covering was taken off one piano, which was very wet. I dried it thoroughly with a soft cloth, aired it for twenty-four hours, and then wiped it off with a high-grade furniture polish. The piano was then repacked and delivered without exception.

"Among the shipments in the car that were damaged by water were the following: Sixteen sacks of corn meal, thirteen cases of spices, twelve sacks of roasted coffee, ten cases of shredded cocoanut, ten cases of syrup in fiber board containers, nine cases of coffee, six cases of peanut butter, nine bundles of paper bags, five sacks of sugar, two cases of dried fruit, two cases of corn, one carton of cigars, one carton of smoking tobacco, one sack of beans, one sack of peas, one case of drugs, one piano and stool.

"There were only two exceptions against the entire load of twenty-seven shipments, the claims amounting to \$4.66."

AT THE FINISH, JUNE "NO EXCEPTION" CAMPAIGN

The cartoon above was inspired by W. J. Laffey, inspector of stations and transfers, and executed by J. P. Alley, Memphis Commercial Appeal cartoonist and creator of the philosophical Hambone. The standing in the race shows how the various operating divisions of the Illinois Central System finished in the recent "No Exception" campaign.

Vice-President A. S. Baldwin Dies on Train

Popular Official Stricken While on Way Home from Recent Trip of Inspection in Europe

A. STUART BALDWIN, vice-president of the Illinois Central System, died suddenly on a Michigan Central train at 11:50 p. m., June 26, near Detroit, Mich. Heart trouble caused his death. He was nearly 61 years old.

Funeral services were held at his home in Chicago, June 29, with C. H. Mottier, C. I. Anderson, W. G. Nusz, W. T. Kelly, T. H. Robertson and W. E. Colladay (all of his own office) as active pall-bearers and more than one hundred honorary pall-bearers. Burial was at Staunton, Va.

Mr. Baldwin had just returned from Europe, where he had spent three months studying electrified railroads in England, France and Italy in preparation for the work of electrification of the Illinois Central's Chicago terminals. His wife and daughter had accompanied him on the trip and were with him at the time of his death. Hugh Pattison, electrical engineer in the Chicago terminal improvement department of the Illinois Central, also was a member of the party. D. J. Brumley, chief engineer of the Chicago terminal improvement, had gone to New York to meet Mr. Baldwin, his family and Mr. Pattison, and was accompanying them back to Chicago.

Only a few minutes after he retired, Mr. Baldwin arose from his berth, and complained that he could not get his breath. Aid was summoned immediately, but he died within a short time. The body was brought to Chicago on that train.

A Great Loss to Our System

"Mr. Baldwin's death is an immense loss to the Illinois Central System and the railway industry in general," said President C. H. Markham. "It also is a blow to our plans for electrification. Of course the work will go ahead, but he has been an invaluable aid. He was very enthusiastic about the project and understood it thoroughly."

Mr. Baldwin was born in Winchester, Va., September 28, 1861, and was educated in private schools in the Shenandoah Valley and at Staunton Military Academy.

After teaching school one year, he entered railway service in 1879 as a rodman on the

A. Stuart Baldwin

Richmond & Allegheny Railroad, now part of the Chesapeake & Ohio. From 1881 to 1883 he was employed as assistant engineer of the Iron & Steel Works Association of Virginia in railway and blast furnace construction and development of ore mines.

In 1884 he re-entered railway service as assistant engineer on the Philadelphia extension of the Baltimore & Ohio Railroad. He was placed in charge of construction of bulkheads and docks on the Schuylkill River.

In 1885 he accepted a position with the Chicago, Milwaukee & St. Paul as principal assistant engineer and was placed in charge of construction of its bridge across the Missouri River at Kansas City. He was afterward resident engineer on the construction of the St. Louis & Texas Railroad, now part of the Louisville, Henderson & St. Louis.

Mr. Baldwin entered the service of the Louisville & Nashville Railroad in the fall of

1887 as assistant engineer on development of the mineral district around Birmingham, Ala. He was advanced to principal assistant engineer, and later promoted to roadmaster, remaining in the service of that company until September, 1901.

Joined Illinois Central System in 1901

On September 1, 1901, he was appointed principal assistant engineer of the Illinois Central System. He was advanced to engineer of construction, May 1, 1903, and was promoted to chief engineer in charge of maintenance and construction, March 20, 1905.

During his service as engineer of construction and chief engineer, the Illinois Central System went through a period of great development in both maintenance and construction work; many branches and auxiliary lines were built; on many portions of the line grades were reduced, alignment was improved and second track was built. Many large yards were constructed, as were large terminal facilities in Memphis, New Orleans, Centralia, and other places, and the general condition of the road was improved.

The more important works of construction made under Mr. Baldwin's supervision were:

Indianapolis Southern Railway, extending from Switz City to Indianapolis, a distance of ninety miles. An interesting feature in the construction of this line is Richland Creek viaduct, a steel structure, 2,215 feet long and 134 feet high.

The Birmingham line, extending from Corinth, Miss., to Haleyville, Ala., a distance of eighty miles, and the Illinois Central terminals at Birmingham. Involved in this work was the construction of a viaduct over Bush Creek, a steel structure 1,230 feet long and 175 feet high.

Kensington & Eastern Railway, extending from Kensington to the Illinois-Indiana state line, a distance of seven miles, a double track electrified railroad.

Batesville Southwestern Railroad, sixteen miles.

A cut-off between Wickliffe, Ky., and Fort Jefferson, Ky., three miles, made necessary by encroachment of the Mississippi River.

New line from East Cairo to Paducah, Ky., thirty-two miles, developing a new section of the country and reducing distance between Cairo and Louisville.

Memphis & State Line Railroad, double track railroad, twenty miles long, forming belt line around Memphis for handling freight traffic.

Herrin & Zeigler Railroad, eight miles.

Johnston City Southern Railroad, four miles.

Line from Silver City, Miss., to Kelso, Miss., forty-one miles.

Line from Lambert, Miss., to Swan Lake, Miss., twenty-two miles.

Line from Belzoni, Miss., to Yazoo City, Miss., twenty-three miles.

Line from Phillip, Miss., to Charleston, Miss., twenty-seven miles.

Grades were reduced between Fulton and Memphis; Canton and New Orleans; Princeton and Paducah; Waterloo and Fort Dodge; Clinton and Springfield; Belleville and Groves, Ill.

Second track was constructed between Fulton and Memphis; Canton and New Orleans; Chicago and Parkway; Lakeview and Lake Cormorant, Miss.

Track elevation in Chicago, begun prior to World's Fair north of 53d Street, was carried forward and the main line was elevated from 63d Street to 83d Street and from Burnside to Kensington.

Stuyvesant Docks at New Orleans, almost entirely destroyed by fire in March, 1905, were rebuilt in record time.

New and enlarged mechanical facilities were constructed at many points along the line, notably at Champaign, Centralia, East St. Louis, Waterloo and Memphis.

A new bridge was built over the Tennessee River at Gilbertsville, Ky.

New passenger station facilities, including track elevation, were constructed at Memphis.

Elected Vice-President in 1918

On August 1, 1918, Mr. Baldwin was elected vice-president of the corporation while the railroads were under federal control, serving in this capacity until relinquishment of the roads by the government, March 1, 1920, when he was elected vice-president in charge of the improvement and electrification of the Chicago terminals and valuation of the system, a position he was occupying at the time of his sudden death.

The Chicago terminal improvement, covering the reconstruction of the entire terminal north of 51st Street and including the construction of a new passenger station at Roosevelt Road, a new suburban terminal north of Randolph Street and the rebuilding of the South Water Street freight terminals, is covered by a contract ordinance among the city, the South Park Commissioners and the Illinois Central. The ordinance also provides for a park east of the railroad extending from Roosevelt Road to Jackson Park, with adequate viaducts and subways crossing the railroad tracks. Streets are to be widened and extended, and Grant Park west of the tracks is to be enlarged. It further provides for the electrification of the main line from the Chicago River on the north to Matteson, Ill., on the south, a distance of twenty-eight miles, and of the South Chicago and Blue Island branches. This ordinance, negotiations for which were begun in 1912, was, in the main, handled by Mr. Baldwin from the time of its inception to its final passage by the City Council, July 20, 1919.

Member of Several Organizations

Mr. Baldwin was affiliated with many technical societies and many clubs, a list of which

follows: Society of Cincinnati of the State of Virginia; American Society of Civil Engineers; past president, American Railway Engineering Association; past president, Western Society of Engineers; American Railway Association; American Railway Guild; Advisory Committee, Federal Board of Surveys and Maps; Franklin Institute, State of Pennsylvania; Chicago Engineers Club; Flossmoor Country Club; honorary member, Tau Beta Pi, University of Illinois.

Mr. Baldwin was the official reporter on "Terminal Stations for Passengers" to the Ninth Congress of the International Railway Association, which convened at Rome on April

18, 1922, and was also a delegate from the Illinois Central System to the Congress. In addition to attending the Congress, his mission abroad had to do with investigations of railway terminals and electrifications in foreign countries.

December 19, 1883, Mr. Baldwin was married to Miss Martha Frazier of Staunton, Va., who, with one daughter, Katherine M. of Chicago, and three sons, Robert F. and Howard F. of Chicago and W. Frazier of Savannah, survives him. He is also survived by two sisters, Mrs. Hugh C. Preston and Mrs. Barton Myers, and three brothers, Robert Frederick, William Barton and John M., of Norfolk, Va.

Vice-President Baldwin's Trip to Europe

Following is a brief account of Vice-President A. S. Baldwin's trip abroad. The author is Hugh Pattison, electrical engineer, Chicago terminal improvement department, who accompanied Mr. Baldwin.

Mr. Baldwin's party, consisting of himself, Mrs. Baldwin and daughter Katherine, Miss Mary Pattison and the writer, left New York on the steamship "Colombo" April 1, arriving at Genoa April 13, where Mr. Baldwin was met by Donald Rose, European traffic manager of the Illinois Central, also a delegate to the Congress, and Mrs. Rose. That afternoon the ship continued on the way to Naples, arriving April 14. The weather was clear, and the entrance into the beautiful Bay of Naples was equal to the most extravagant descriptions of this famous spot. The party remained at Naples until April 17, during which time a visit was made to the ruins of Pompeii, where Mr. Baldwin was much interested in the types of construction and the lasting qualities of the materials.

Arriving at Rome on April 17, Mr. Baldwin attended the formal opening of the International Railway Congress on the 18th. Immediately upon the organization of his section, he participated actively in the consideration of all of the papers and discussions presented, in addition to his own paper, making many friends whose assistance later on proved of value to him in securing cordial receptions when examining railway terminals and electrifications.

The party left Rome on April 28 for Genoa, examining the arrangement of the passenger station at the latter point, looking over the electric construction in the freight yards and

observing the operation of electric locomotives.

Leaving Genoa on May 2, the party proceeded to Switzerland via the famous St. Gothard route of the Swiss Federal Railways, which is electrified from near the Italian frontier through the St. Gothard tunnel and on up nearly to Zurich, in the north of Switzerland. The following morning the party went to Florence. After a few days there the members went to Venice on May 9. As an engineer, Mr. Baldwin was particularly interested in the construction of the buildings along the canals. From Venice the party went through Switzerland to Zurich and, after a short stay there, continued on through Basle, arriving at Paris May 17.

At Paris Mr. Baldwin inspected a number of large stations, of interest because of the heavy suburban traffic, and had opportunity for discussion with officials of those French roads which are now actively proceeding with electrification. He went to the top of the Eiffel Tower and was greatly interested in the details of construction of this remarkable structure.

On May 27 the party left Paris for London, by way of Calais and Dover. Between Paris and Calais were seen some of the cemeteries of those lost in the war. This was probably the nearest point to the war zone that was reached on the trip. Between Dover and London the trip was made in a Pullman, which, though different in arrangement from those in the United States, nevertheless reminded us of home, because it really was a Pullman car.

In London, as in Paris, Mr. Baldwin was in conference with engineers and railway of-

ficials and inspected passenger terminals and suburban electrifications. He was cordially received and had the opportunity again of meeting acquaintances made at the Congress in Rome.

On June 9 a trip was made over the Manchester Bury electrified section of the Lancashire & Yorkshire Railroad, and the electric repair shops as well as the principal local shops were visited. Not only is this an interesting electric service, but all-metal cars are operated, in which, to obtain lightness, aluminum has been used to a considerable extent. While at Manchester Mr. Baldwin had opportunity for a short inspection of the famous Manchester ship canal.

On June 13 the party left London for Edinburgh, and on the following day Mr. Baldwin went over the famous Firth of Forth Bridge. Mr. Rose and the writer accompanied him, and an engineer of the road was assigned to conduct the party and explain the features of the bridge. Mr. Baldwin examined the bridge thoroughly, going through the trap doors so as to see the underside of the structure, and climbed to the top chords for a more general view.

On June 16 the party went to Liverpool, and the following day sailed for home on the "Celtic," reaching New York on the morning of the 26th, leaving for Chicago via the Michigan Central almost immediately. Mr. Baldwin died that night.

Arthur C. Snow, Contract Attorney, Is Dead

Arthur C. Snow, the contract attorney in the office of the vice-president, operating department, died the morning of Wednesday, July 19, at the Illinois Central Hospital in Chicago. He had been ill since the first of the month.

Mr. Snow was born forty-three years ago at Ottawa, Ill., where his father, David B. Snow, is still a distinguished attorney. Upon coming to Chicago he entered a law office and attended the Chicago College of Law, from which he was graduated in 1902. Vernon W. Foster, now local attorney at Chicago, was a member of his graduating class. About the time of finishing law school he entered railway service as secretary to George R. Peck, general counsel of the Chicago, Milwaukee & St. Paul, and in 1904 he came to the Illinois Central as secretary to Judge J. M. Dickinson, general counsel. After a few years with Judge Dickinson, he became one of the principal clerks in the general office of the law department, remaining there until 1907, when he accepted the post of contract attorney in the operating department.

For a number of years Mr. Snow had made his home in Stewart Ridge, a Chicago suburban district, where he was prominently identified with community activities. His wife and son survive him.

Mr. Snow lived an unusually well-rounded life. He was noted among his associates as a thorough student, and he was an accomplished musician and was successful in a wide range of sports. As a baseball

Arthur C. Snow

player he was able to fill any position on the team. During the last few years he had given up golf, a game which he formerly played with much success. It was as a tennis player, however, that he achieved the most fame, winning the Illinois state tennis championship in one season and

being runner-up in the western play another.

He was a musician of unusual talent, playing a number of instruments well. He was director of the West Pullman Men's Club Orchestra, a community organization in Stewart Ridge. He was prominent in Masonic circles and played the piccolo in the Woodlawn Commandery Knights Templar Band. The Woodlawn Commandery

numbers many Illinois Central officers and employes in its membership.

"It is with deepest regret that I heard of the death of Mr. Snow this morning," said Vice-President L. W. Baldwin. "Mr. Snow was a valuable member of our organization. Personally, I held the greatest admiration for him, and I am grieved that his untimely death has removed him from us."

Saw 15 Months of European Relief Work

Fifteen months' medical work in the Baltic provinces of western Russia has been the experience of Dr. Claude S. Mumma, son of S. W. Mumma, agent at Forreton, Ill. Doctor Mumma enlisted in the Eleventh Regiment, Illinois Infantry, in 1917 and was made quartermaster sergeant in the medical corps of the regiment September 4, 1917. This position he held until his enlistment in the Navy, December 7, 1917.

S. W. Mumma

Doctor Mumma was commissioned as captain with the American Red Cross March 6, 1920, and was assigned to the Baltic provinces of western Russia. He served throughout Lithuania, Latvia and Esthonia, with headquarters at Riga and with work extending to Viborg, Finland. After engaging in sanitary work, including a study of typhus, he was assigned to the Latvian government army hospital for six months in child welfare work.

He served in western Russia for fifteen months, until the commission was discontinued. He then went to Vienna, Austria, entered a medical school and specialized on some branches. He returned to America in October, 1921, and is now practicing medicine in Chicago, where he also holds a position with the government in the Veterans' Welfare Bureau.

Samuel W. Mumma, his father, entered the service of the Illinois Central System at Forreton, Ill., June 15, 1882, on the extra list. He served at various times for a term of four years, working nights as baggage man and caller

Dr. C. S. Mumma

and doing clerical work.

January 1, 1886, he was given a clerkship in the freight office at Forreton and was assigned the Chicago & Iowa Railroad part of the work. He held this position until January 1, 1891, when he was appointed joint agent for the Illinois Central and the Chicago & Iowa railroads. He has now put in more than thirty-six years of continuous service at Forreton.

Miles N. Pritchard was agent when Mr. Mumma entered the service; John C. Jacobs, superintendent; A. J. Poland, trainmaster; Fred Doty, roadmaster; Horace Tucker, general freight agent; W. E. Keepers, assistant general freight agent. Division offices were then at Amboy, as were the machine shops.

Mr. Mumma worked under Agents Pritchard, Baldwin and Riley, all of whom are now dead. As far as he knows, he is the only surviving regular agent who ever had Forreton station, as well as being the oldest exclusive agent on the Wisconsin division and ranking No. 4 on the telegraphers' seniority list.

Mr. Mumma says that many of his old friends on the Wisconsin division are gone. He recalls Conductor John Quinlan, who used to make Forreton and who is still in line of duty out of Dubuque. Mr. Mumma's years of service have been pleasant ones.

Firemen Tell How to Make Crossings Safe

All Are on Alert to Do Their Part by Helping Engineers Keep Watch for the Indifferent Motorists

THE views of some of our locomotive engineers regarding grade-crossing accidents appeared in the June number of the *Illinois Central Magazine*. No railway employes have had more experience with the dangers of grade-crossing carelessness than enginemen. Locomotive firemen also are confronted with this problem, and with that in mind the *Illinois Central Magazine* has asked a number of locomotive firemen for short statements setting forth their views of how the grade-crossing problem should be met. Twelve firemen have complied, and their statements are given herewith:

Would Ask Friends to Co-operate

J. E. SHELTON, *Paducah, Ky.*: I think we should have a talk with our friends—giving warning of the many chances they take trying to beat us to the crossings, asking them to co-operate with us. Let it be known throughout the country that we as enginemen are doing all in our power to prevent accidents that happen at grade crossings. Ask them to talk with their friends, warning them of the danger, and caution their children of the many accidents that occur at railway crossings, telling them always to stop, look and listen for approaching trains.

At some of our smaller towns we have speed restrictions of ten or fifteen miles an hour. I do not think this is right and just to our railway company, nor to the public, as it only invites the people to go on, thinking they have plenty of time to get across the track. It also invites boys as well as men to catch the trains, many times causing them to lose an arm or leg, thus adding to the list of cripples.

I think it would be time well spent if we could have some cards printed on the same order as our cards for soliciting business for our railroad, and ask that each man in engine

and train service send a few cards to his friends to let them know that we are interested in trying to prevent accidents.

I think all firemen should so arrange their work that they can watch carefully at grade crossings, and more especially on "blind" curves and at the small towns we pass through. We can very easily arrange our work so we can ring the bell and call the attention of the engineer to any danger that might occur at these points.

Blames Carelessness and Ignorance

J. D. COFFEY, *Vicksburg, Miss.*: For the sake of humanity, the railroads, and the peace of mind of enginemen, it is obvious that more progress must be made in the way of preventing grade-crossing accidents.

The locomotive fireman is an important factor in assisting engineers to prevent accidents at crossings. He should ever be on the alert and remember always that "safety is of first importance in the discharge of duty."

I endeavor to arrange my firing so that I can keep on the look-out at every roadway and street crossing, so that I may warn the engineer of approaching vehicles, especially automobiles, from my side and cause him to sound additional blasts of the whistle and reduce the speed of the train, if necessary. It is important that a fireman should maintain a vigilant watch at crossings, as on the larger locomotives now in use the engineer cannot see the approach to the crossing on the left-hand side at close range.

I am as conscientious in seeing that the bell is rung at the proper time as I am that the engine has the required steam pressure. When engines are equipped with air bell-ringers, I think that the ringing valve should be placed within convenient reach of the fireman instead of on the right-hand side of the cab. Firemen

J. E. Shelton

J. D. Coffey

should see that the bell-cord and bell-ringer are in good condition and working properly at the beginning of each trip.

It is my opinion that more crossing accidents are due to carelessness and ignorance of the danger on the part of the driver than to wanton recklessness. However, there are some "dare-devils" who will always take a delight in trying to beat the train. The latter named class the Lord will take care of to a large extent. The former must be educated as to the danger.

The managements of the railroads are doing their best in this line, but every employe should make it his business to talk to every automobilist and tell him of the importance of obeying "Stop, Look and Listen" signs and of the grave danger of paying no attention to them. I never approach a railway crossing while riding in an automobile that I do not caution the driver to stop, look and listen.

A national law should be passed compelling autoists to stop before crossing railway tracks.

How Trainmen Can Help Campaign

R. T. LORDAN, *Springfield, Ill.*: We must be on the look-out at all times, sound the whistle and ring the bell at every road crossing. In this way we may overcome our part of the accidents.

Trainmen can help just as much as the engineer and fireman. When they leave cars on sidings, the cars should not only clear the crossing but be put at least sixty feet away from it when possible. It will take but little time to do this and may save many lives. Also it gives the engineer and driver a clear view.

Crossings should be in good condition at all times, as many accidents are due to drivers' looking to see what kind of crossings they are going to hit and not looking for trains. In many cases they get a bump, not caused by a bad crossing, but by a locomotive.

Let us all get together with "Stop, Look and Listen." If the car driver will stop to listen he will hear the wonderful sound, "L-O-O-K O-U-T, THANK YOU," which is the familiar crossing signal, two long and two short blasts of the whistle.

R. T. Lordan

Must Get Help of the Public

VAN L. STEWART, *Vicksburg, Miss.*: I think that this is one of the most important drives that the company could have put on, and I like the way it is being handled, for crossing accidents cannot be stopped until we get the help of the public. We all know an engineer would not hit an automobile if it were in his power to prevent it.

V. L. Stewart

It is a strange thing to me that some people are always growling about slow train service, and still they expect us to stop at

every crossing and let the automobile pass first. Everyone knows there is only one way for a train to run, and that is on the rails. It is impossible for the engineer to dodge an automobile except by trying to stop, as the engine has no steering wheel; so it seems to me that if a person would only stop to think he would know that if he gets on the track ahead of the train he is going to get hit. The average automobile driver does not look to see the speed of a train, as he is only watching his own speed. If he can run ahead of us while starting from a station he never looks back to see if the train is gaining on him before starting across a crossing.

I sometimes wonder what it is about an automobile that causes some people to lose their minds. Most drivers seem to think they have the right of way over the world or that they are in a land where there is no danger. I think the best way to stop crossing accidents is to start a campaign with the public and to get the public's co-operation. I think the posters the company has had tacked up around the depots and at other public places will help to remind drivers that the trains are still running; and I believe that if any sane person would stop to think he would not take the chances he does take on railway crossings. Nine out of every ten accidents are caused the carelessness of the drivers.

Every day I see automobiles dash across the track ahead of our train and stop while the driver turns and gives us a signal to come on or gives us the laugh; and every day I see in

the newspapers that an automobile has been struck by a train.

There are few persons who realize what it is to sit on an engine and plow into an automobile full of people, and see the automobile go into one direction and its passengers thrown into the air and under the engine and mangled. If they could only see it once, they would have a picture in their minds that would last a lifetime.

However, reckless as automobile drivers may be, I believe a fireman can help to prevent crossing accidents. I am always talking it. I talk it at the boarding houses, on the streets, and to my brother fireman, and ask him to talk it. I want the public to know that we are trying our best, and I ask my friends to help. I like to keep in their minds to "Stop, Look and Listen" before starting across a railway track while driving. I have fired for some mighty careful engineers, and they have taught me always to be on the look-out. By constantly calling my attention to crossings, they soon had me acquainted with the road, and I could tell at all times where we were, and I soon learned to space my firing so that I could be on the seat-box looking out at all crossings through towns and around curves.

When I first went into the passenger service I was firing for a man who would make me start the bell before he would start the air-ringer to work; so I soon got into the habit of starting the bell with the rope, and now I always know the bell is ringing while approaching and passing over railway crossings. It calls the attention to the engineer to blow the whistle, as sometimes he might be busy working on his side of the engine. If I see an automobile running alongside the train or approaching the crossing, I call the attention of the engineer, so that he may give an extra alarm while approaching the crossing. I have even given auto drivers a sign that they had a flat tire or that there was something wrong on the rear end of their cars, so they would have to stop and we could get rid of them.

I know the firemen on the Y. & M. V. are doing as much as anyone to stop automobile accidents, as we appreciate what the company has done for us in giving us a chance to be on our seat-box once in a while. The company has all the lumpy coal broken at coal chutes and also has water sprinklers on all coal chutes north of Rolling Fork, and this gives us plenty of time to be on the look-out.

I do hope the public will take just half as much interest in this campaign as the railway employees. Then, I am sure there will be fewer accidents.

Keeps on Look-Out for Crossings

J. E. CALDWELL, *Memphis, Tenn.*: Carelessness has brought more sorrow to people than any other one thing, and I think each fireman should practice "Safety First" at all times to help prevent accidents. At all crossings around depots and public places we should be on the look-out. I prepare my fire to carry me by such places, so I can be on the watch to notify the engineer to repeat the second

J. E. Caldwell

warning signal or stop, if necessary. I always have the bell in good shape, so it will not fail to ring, and my hand on the cord making a sound so that everybody can hear it and know a train is coming. I always mention to the engineer that the crossing is clear on my side. Let us all get busy and help to make this world a better and safer place to live in.

R. S. Peck

Would Hold Motorist Responsible

R. S. PECK, *Vicksburg, Miss.*: I always ring the bell at every crossing and call attention to the engineer to sound the whistle. Even after the crossing signal has been blown, I make it my duty to avoid any accident, if my close attention will avoid one. I would suggest that a law be passed

to reverse the responsibilities, making the motorists responsible. The "Stop, Look and Listen" sign is disregarded, I am sorry to say, but until there is a law to make careless people do their duty we will have accidents.

Would Enlist Motion Pictures

H. J. BUCKLEY, *Dubuque, Iowa*: An auto-

mobile driven by a railway man and struck at a grade crossing is an accident that one seldom if ever hears of. Railway men know the danger of crossing a track without knowing that the way is absolutely clear. They not only use every precaution while driving a car, but while operating their trains they are constantly on the look-out for some careless motorists trying to cross the tracks before them.

All engineers, firemen and trainmen on the Minnesota division co-operate to try to prevent such accidents. Firemen arrange their work so as to be on the look-out over crossings, especially through town and cities. While trains are on passing tracks with one or more crossings cut, the trainmen arrange their work so that they may be standing on the crossings to warn a motorist or couple the crossings just before trains pass on the other track.

I am sure that if motorists would co-operate with railway men in trying to prevent accidents the number of accidents would be reduced considerably. Motion pictures showing accidents of this kind at grade crossings, auto traffic violations on city streets, street car accidents, etc., and talks from enginemen who have had such accidents would bring about co-operation from motorists.

Any move to bring about a little more interest on the part of the public toward this subject would please all of us who are concerned in the operation of trains.

Enginemen are doing their best. Will automobile drivers please help?

Never Had a Crossing Accident

ROBERT MCGREGOR, Paducah, Ky.: I am proud to say that I have never had or been in a crossing accident of any kind. I have always tried, with the best of co-operation with my en-

H. J. Buckley

R. McGregor

ginemen, to use every precaution possible to prevent any kind of accident whatever.

The Menace of the Careless Driver

LOUIS R. ERNST, *New Orleans, La.*: Automobile drivers take into consideration the dangers of railway grade crossings only when they see a human being jump in front of their car with a red lamp or a stop signal or when the crossing gates have torn away half of their car tops.

Let us take this reckless class of automobile drivers into consideration, who violate the motor vehicle ordinances of our large cities, who speed up to railway crossings in the heart of a big city, tear down the gates, get caught with the gates on the top of the cars, and the crossing watchman has to flee from his post to get out of their way. Let us try to imagine what these speed demons of the cities are going to do when they hit the highway in the rural section of the states. Those who violate traffic and crossing laws in the heart of the city, where the law stands with a pad writing down license numbers, are not going to take their feet off the accelerators making a rural crossing.

The novice will pick the open roads of the country to learn to drive a car; he is not familiar with the grades of the crossings and is not taking into consideration what his car can or cannot do, and he tries to make the crossing without using his intermediate gears and stalls in the middle of the track.

Engineers and firemen must be given a large open area so that they can scrutinize the crossings on both sides. A fine should be imposed upon every driver of an automobile who does not come to a dead stop before making a grade crossing.

Urges Observance of the Rules

JOHN V. MALONEY, *New Orleans, La.*: While on an engine the fireman has to watch his water and fire; he also has to keep a look-out on the left side of the engine for danger ahead. I have often seen automobile drivers speed up and rush under crossing gates before they are fully down, and then look around and laugh. Suppose the automobile engine were to die on the crossing; the driver might possibly have time to get out of the way himself, but does he know the feelings of the two men on the engine? Does he know that their hearts are in their mouths? They do not know whether they will be able to stop the train before striking the automobile with its occupants. I also have noticed, where there are no gates but

the flagman is out with his warning flag, the driver run around him in the very face of danger.

Only recently at one of our crossings, on a prominent avenue of our city, there were repairs being made, the street torn up, rock, earth, etc., piled up on both sides of the crossing and a barricade across the street with a red lantern and a red flag fifty feet away and a stop sign 100 feet away. An automobile came down the street, dashed through the trench and half way up the other side of the crossing, after having dashed through barricade and over rocks, etc. Luckily there was no train due at the moment.

If the drivers would only "Stop, Look and Listen" for a few moments there would be no accidents at crossings. I notice in the newspapers where hundred of motorists ignore the summons of our traffic court. If they ignore the summons of the court, what may we expect of them when they come to the crossings? The warning bell is the summons for them to look out, but instead they open up and rush across the tracks—and possibly into the open arms of

death. In *The Times-Picayune* I notice where forty-two drivers were summoned to court for speeding and reckless driving. If they are so reckless in a big city, where they are under the very eye of the law, what may we expect of them where there is no watchful eye, on a country road?

I have run an engine in France, where no one would dare, after the locomotive whistle had sounded, to attempt to open gates or cross tracks—and in France you never hear of accidents at crossings. So let us work together, like good citizens, and make this drive 100 per cent free from accidents. It can be done, and it must be done.

Helps Engineer Keep Watch

I. E. JENNINGS, *Brookport, Ill.*: I have often called the engineer's attention to an automobile approaching from my side of the engine and the engineer's side when I could see both ways, and I make it a practice to give the proper alarm whenever the engineer is absorbed in his work and has failed to notice approaching a crossing. In some cases I have done this on the right of way where I have seen stock or

HOW WE CAN AVERT ONE "RAILROAD STRIKE"

By Courtesy Chicago Daily Drivers' Journal

WILLIAM
FERGUSON
22

persons on the track. I have always tried to watch out for the safety of persons, such as fellow employes, other persons, and the company property as well as my own personal safety.

Racing the Train

J. W. WHELCHER,
Fort Dodge, Iowa:
Locomotive firemen can do much in preventing crossing accidents. I try to have my work done when

J. W. Whelcher

approaching crossings or while passing through station grounds, so I can be on the look-out for

automobiles approaching. If I see one coming, after the regular crossing whistle has been sounded, I notify the engineer, so that he can sound an additional warning. If the bell isn't operated by an automatic bell ringer, the fireman should be ready to ring the bell at all grade crossings and station grounds. I try to make that a practice, and I think the rest of the firemen on the Iowa division try to do the same.

I have seen motorists, where there are diagonal crossings with the train in clear view, race side by side trying to beat the train to the crossing. They don't pay any attention to the whistle or the bell ringing—they just keep going. They just get by when we cross the crossing. This occurs often, with the people in the automobile grinning at you while racing to get by.

What Sane Co-operation Can Accomplish

By RUFUS KEMP, JR.,

Secretary to Roadmaster, Fulton, Ky.

What is a molecule? Webster says it is the smallest quantity of an element or compound which can exist separately. Then a molecule has comparatively no strength whatever, alone. Everything which exists under the high Heaven today is made up of molecules; and we know that there are thousands of things that have power, energy, resistance and strength. Then it must follow that this strength is secured through the union of thousands of small molecules which have no strength in themselves but which, when united, form the strongest and most powerful machines we have.

A drop of water is a harmless thing within itself, but when thousands and millions of them are united, they are rivaled by fire alone in the amount of destruction they produce with their strength, even defying the most powerful resistance which the human mind is able to conceive or the human hand erect. Still, they are mere drops of water.

In the same way, man himself is made of many molecules; but the molecules of which man is composed, when united, form the most powerful animate being, and give him the mind and body to dominate the majority of all other molecular bodies regardless of their enormity.

Then, man takes the different molecules of pig iron, carbon, alloy, etc., and forms machinery and weapons which he can command, to enable him to resist the onslaught of the destructive molecular bodies.

Now, let's make a little equation in comparison. A molecule is to man the same as man is to (?). Can you answer it? If thousands of molecules unite themselves and make one man (the most powerful animate being on earth), then what must the result be when thousands and millions of men unite themselves and make one body? The result should be an irresistible force, the most powerful piece of machinery and the highest factor in productivity.

But in order to make this machine function properly and obtain the desired effect, we must follow the example of the molecules of which man himself is made, and mold ourselves into the most nearly perfect form of machinery. We must model ourselves from the most powerful animate machine, man. We must have a head; some broad shoulders for it to rest upon; a body to assimilate the necessary food and give us the strength to carry on the work; and the limbs to stand upon and protect ourselves from those who would harm us.

Now when we have completed this machine,

we have the power and strength to perform any undertaking; but there's the rub—in order that no single part of our body may suffer an injury we must avoid the "weapon warfare"—we must make our purpose clear, aspiring to produce, rather than destroy; do good and not an evil; lift up instead of crush; love and never hate. Then, and only then, will God permit our unity to live or be justified.

The Illinois Central System is a vast and powerful machine established and operated to serve the public; it consists of many molecules,

of which you are one. It can do nothing without the close and efficient co-operation of each molecular part, and no single part can accomplish anything without the co-operation of the whole. The whole must accomplish its purpose before any one part can realize or derive any benefit therefrom; and in the proportion in which our purpose is accomplished, each will realize his proportionate share of the benefit. Therefore, it is up to us, as molecules of one body, to co-operate, work and strive to attain the purpose for which we were organized.

Big Increase in Tennessee Strawberries

The thousands who sat down to their morning meals this spring and began the day with the taste of the delicious strawberry on their palates little realized the extent of work and trouble needed to bring this wholesome berry to their breakfast tables or the immense amount of tariff these little berries had brought to the transportation systems of our country, thus permitting them to restore men to work who otherwise might have gone hungry.

On the Tennessee division alone, approximately ten thousand acres of these berries were cultivated, and 25 per cent were left to rot on the vines on account of excessive rains which ripened the berries too fast to permit the own-

ers to pick them. The pickers also were handicapped by the wet condition of the ground.

Regardless of this loss, approximately 546,000 crates of berries were shipped to the market from the Tennessee division, an increase of almost 200 per cent over last year's crop.

An acre of ground is estimated to bear seventy-five crates of berries. With the expected increase in acreage on this division next year, it is estimated that 800,000 crates of berries will be shipped next year, if the weather conditions are favorable.

The following figures are actual comparisons in cars shipped from the Tennessee division in 1921 and 1922:

Station	1922			1921			Total Increase
	Express	Freight	Total	Express	Freight	Total	
Fulton	4	1	5	0	0	0	5
Martin	9	5	14	0	0	0	14
Sharon	23	65	88	14	10	24	64
Greenfield	20	22	42	8	0	8	34
Bradford	16	18	34	8	0	8	26
Idlewild	2	2	4	0	0	0	4

Proves a Factor in Our Public Relations

G. T. Roach, Chief Clerk to Colonel A. H. Egan, Originates Plans to Make System Better Known

THE railroads must make themselves better known to the public, and to this end they must cultivate the friendship of the newspapers. Such is the belief of G. T. Roach, chief clerk to Colonel A. H. Egan, general superintendent of the Yazoo & Mississippi Valley.

"It doesn't pay to cover up news and to try to keep it away from the newspaper men," he says. "Nine times out of ten they will get it, anyway, and then your standing with them and the public they represent will go down to zero. If there is a wreck or an accident, the best plan is to talk frankly with the newspaper representatives about it, and you can rely upon them to guard any secrets you may give them.

"And then, on the other hand, when you want to spread constructive information about the railroads, you can rely upon your friends among the newspaper men to see that the news is spread. The Yazoo & Mississippi Valley, in common with other grand divisions of the Illinois Central System, has been complimented for its efforts to keep the public informed regarding its doings.

"Whenever there is news, we try to see that the newspapers get it. Every so often we send out the reports regarding maintenance of passenger schedules, and the newspapers print them, with the result that the record of the Illinois Central System for on-time passenger trains is a by-word among our patrons. If anything is to be built, if a schedule is to be changed, if there are unusual shipments or if an interview on the crop situation is timely, we see that the information is placed where it will do the most good. Occasionally railway publications provide good tips for stories. And when newspaper men call upon us for co-operation, as they have learned to do, you can be sure that we give them the best we have."

A Believer in Good Public Relations

All of which goes to show that Mr. Roach, in compliance with the wishes of Colonel Egan, is making the Yazoo & Mississippi Valley headquarters a leader in the public relations work to which the Illinois Central System is committed. It comes natural to Mr. Roach to

make a success of this work. While of a somewhat retiring nature personally, he is a thorough gentleman—as any of his friends will tell you—and he believes in courtesy and in thorough, conscientious service to the company which employs him; and it would be ungentlemanly, discourteous and subversive of the best interests of the Illinois Central System to deny newspaper men that upon which they make their living—news.

Besides following the more stereotyped forms of spreading information regarding our system, Mr. Roach has evolved some new and effective ones of his own. The cards which were reproduced on pages 126, 128, 129 and 130 of the June issue of the *Illinois Central Magazine* were originated by Mr. Roach. These business solicitation cards for employes in Mississippi, and for Memphis, Tenn., Vicksburg, Miss., and Baton Rouge, La., in particular, it will be recalled, detailed information regarding the contribution the Illinois Central System was mak-

Courthouse at Clinton, Ill.

ing to the welfare of these communities, listing the number of employes, the number of employes who were heads of families, the number of persons receiving their livelihood from the Illinois Central System, the amounts of monthly and yearly wages and the amounts of materials and supplies purchased and taxes paid. The information on these cards was compiled under Mr. Roach's direction. After the project had been approved by the management, the cards were distributed to employes in the localities involved. As there was a place on each card for the signature of the employe presenting it, the general information was thus linked up with the individual.

Cards Have Done Much Good

These cards have done much to cause citizens of Mississippi, of Memphis and of Baton Rouge to appreciate what the Illinois Central System means to them. Many compliments have been passed upon the idea, and it is certain that the cards have improved the relations between the Illinois Central System and the public it serves.

Mr. Roach's individual efforts are constantly directed toward improving the friendship of our patrons for our line, as any of his friends will tell you. It is said of him that he makes a practice of hunting out complaints that have been made, straightening up the matters and then taking steps to see that the causes for dissatisfaction are removed.

Mr. Roach's personal readiness to do whatever he can for the good of the company is illustrated by one event of his life about which he is particularly reticent—and that is because it would make him appear a hero. March 11, 1909, when he was chief clerk to Colonel Egan, at that time superintendent of the Kentucky division, fire broke out in the offices at Louisville. Mr. Roach remained so long in the office, putting away valuable records in the safe, that the fire cut off his escape by the usual avenues, and he fell and was seriously injured while getting out. He was out of service for three months, and it is said that he still carries the scars caused by his devotion to duty.

Entered Railway Work in 1892

Mr. Roach is a native of Champaign, Ill. He has been in railway work thirty years. His first employment was in the locomotive and car shop of the Illinois Central at Champaign in 1892. A year later he became clerk at that point, and in 1894 he went into the freight

office as a general clerk. In 1895 he went into the employ of the Big Four Railroad at Urbana, Ill., as a general clerk to the master mechanic, after which he was promoted to assistant storekeeper.

But Mr. Roach was destined to work for the Illinois Central, and he returned to our employ in 1898 as chief clerk to the trainmaster of the Illinois division at Champaign. Illinois division headquarters at that time were in Chicago, and Colonel Egan was superintendent. In 1902 Mr. Roach was made assistant chief clerk to the superintendent. A year later he was chief clerk to the roadmaster of the same division. Colonel Egan called Mr. Roach to the Kentucky division in 1904 to be his chief clerk.

In April, 1913, Mr. Roach went to Memphis as chief clerk to the general superintendent, at the time Colonel Egan was promoted to that position.

For several months in 1916 Mr. Roach served as trainmaster on the Memphis division. In October, 1919, he was named as vice-chairman and secretary of the Memphis district operating committee. Then for several months in 1920 he served as a transportation inspector, after which (in September, 1920) he resumed his duties as chief clerk.

Score Card Used at South Water Street

Tabulation of Errors Shows Almost 100 Per Cent Efficiency at Our Great Chicago Freight Station

R. O. WELLS, our agent at South Water Street, Chicago, was asked how he handled such a large volume of freight with so few mistakes. Here is his reply:

"We load through this plant daily forty-five thousand packages of merchandise of all descriptions imaginable, packages weighing from five pounds to five thousand pounds, aggregating from sixteen hundred to eighteen hundred tons. This freight comes to us by horse-drawn vehicles, motor trucks, transfer cars, boats, and from underneath the ground by electric tunnel cars, and we expect any day to see it coming to us by airplane. No combination local and transfer house in the world handles the large volume of less-than-carload traffic that moves through this plant.

"In March we loaded 1,215,000 packages into

6,945 cars, and only 204 of them were misloaded. From these figures you will understand how close to the 100 per cent mark we came—to be exact, 99.999 per cent correctly loaded. The few packages which are incorrectly loaded are of course forwarded to destinations as shown by the marks on them.

"As to how it is done, put it down this way: First, system; second, supervision; both of which mean, among other things, that every employe must 'stand up and be measured' every day.

"First in the organization are the general foreman and his assistant. They are measured by the general results obtained. Next come his assistant foremen, who are measured by the number of packages misloaded (as developed by the over reports received) in the cars loaded under their jurisdiction, likewise

Handling Freight

Inbound

the number of bad order reports issued against their cars. The stowmen working under these assistant foremen are measured in a like manner.

"Next come the receiving and check clerks, all measured by the number of errors for which they are responsible.

Results Posted Regularly

"All reports indicating errors are checked up, and the employes responsible are notified of the particulars daily. Twice each month a list of the employes in each class, showing the number of mistakes chargeable to each as compared with the two previous weeks' operation, is placed on the bulletin board; thus each employe knows just how he has been measured. Employes whose efficiency falls below the average are required to state their reasons, and all reasonable assistance and encouragement are given them to help make a better showing."

Many employes of our great system may not be aware that the South Water Street station outbound house of the Illinois Central—under the supervision of Agent R. O. Wells at the foot of South Water Street, in the heart of the business district of Chicago—is probably the largest combination originating and transfer outbound LCL freight house in the United States. The Illinois Central in this house handles its own business and that of the Big Four and the Chicago, Lake Shore & South Bend railroads.

This freight house, which is more than 1,800 feet long, is served by seven loading tracks, which extend the entire length of the house with a capacity of three hundred cars at one setting, and by four transfer car tracks with a capacity of seventy-six cars.

Freight Received in Many Ways

The tonnage on this platform is handled by electric motors and 4-wheel trucks, there being nine motors and approximately seven hundred 4-wheel trucks used in the operation.

LCL freight is received for outbound movement at South Water Street as follows:

1. By wagons and auto trucks.
2. By underground tunnel cars of the Chicago Warehouse & Terminal Company.

One Way the Freight Arrives

3. By trap cars originating in the Chicago Switching District.

4. By cars from connecting lines, including the Chicago Junction Railway, B. & O. C. T., etc.

5. By line cars originating at stations on the Illinois Central and Big Four.

6. By boat via the Merchants' Lighterage Company.

About 150 tunnel cars and 650 wagons and motor trucks are handled at this house daily.

On the Alert to Improve Service

All through destination merchandise cars are forwarded in manifest trains, and their movement is closely followed to prevent delay en route. The unloading of these cars at destination is also checked daily to insure prompt handling. In addition, the tonnage of each car is policed daily; when tonnage offered for any one destination or territory is sufficient to justify a regular schedule, new classifications are immediately established to accommodate such tonnage and expedite the movement.

During the winter months seventy-nine regularly scheduled heated cars are operated each week to points in the freezing zone in order to afford protection to perishable freight and other freight liable to damage from low temperature. During the spring and summer months 120 iced refrigerator cars are operated each week on regular schedules, affording protection to perishable freight.

During 1921 the out-freight house handled 464,897 tons of freight, an average of 38,741 tons a month or 1,490 tons a day. This tonnage was forwarded in 76,513 cars, which is an average of 6,376 cars a month or 245 cars

Loading. View at left is through several cars.

a day. The loading of each car averaged six tons.

More Than 50,000 Packages a Day

Perhaps a better understanding of the vast volume of freight handled at this house can be gained from the fact that, at the maximum, 52,000 packages are loaded daily, or a total of 1,352,000 packages a month.

The efficiency in the handling of these 1,352,-

000 packages is remarkable, as, on an average, only 124 packages a month were erroneously loaded. This efficiency is further reflected in the decrease of 20,384, or 58.4 per cent, in total exceptions charged to this loading in 1921 as compared with 1920. During 1921 an average of 32 tons was handled for each exception report received, compared with 13.2 tons in 1920, an increase of 18.8, or 142.4 per cent.

Special attention is given the loading and

Line-Up of Cars at South Water Street

Special Loading Equipment at South Water Street

stowing of this large tonnage in order that shipments may reach their destination in good order, thereby eliminating freight claims and annoyance to consignees.

Bulkheading Prevents Exceptions

To insure the safe carriage of freight loaded in through destination cars, such cars are bulkheaded before going forward.

During January, 1922, 604 cars were bulkheaded. The total number of bad order reports received against these cars was only 44; this is an average of 13.7 cars for each exception. Of the 604 cars bulkheaded, 77 were destined to New Orleans; against these only 12 bad order reports were received.

The close attention given the loading and stowing of LCL freight at Chicago resulted in a large decrease in the number of bad order exception reports charged against the outbound

loading during 1921 as compared with 1920. The total bad order reports received in 1921 were 6,416, compared with 12,273 in 1920, a decrease of 5,857 or 47.7 per cent; during the same period the tonnage decreased only 22 per cent, which shows an increased efficiency of 25.7 per cent.

The team tracks at South Water Street accommodate a large volume of carload traffic, an average of 7,177 cars a month, or 281 a day, being handled on team and industry tracks in South Water Street territory.

Chicago station is the largest revenue producing station on the Illinois Central. During 1921, the total freight revenue was \$31,514,625, as compared with \$29,779,753 in 1920, an increase of \$1,734,872, or 5.8 per cent. October, 1921, was the largest single month in the history of the station, with a revenue of \$3,432,133.

Train No. 706, Engineer George W. Simpson, at White Heath, Ill., July 1.

Judge Lovett Refutes Charge About Clique

Illinois Central Director Denies That "Inner Group" of Financiers Dominates Railroads of U. S.

CHARGES that an "inner group of New York bankers and financiers" dominates the railroads, dictates their purchases of fuel, equipment and supplies, and controls their labor policies were emphatically denied by Judge Robert S. Lovett in a statement before the Committee on Interstate Commerce of the Senate June 1. The charges had been made by W. Jett Lauck, a statistician employed by the labor unions, who had presented to the Senate committee a lengthy statement, supplemented with charts and diagrams, concerning the interlocking directorates of the railroads, banking concerns, and steel, coal and railway equipment firms.

Judge Lovett, who is chairman of the finance committee of the Illinois Central System, declared that Mr. Lauck's statement, "so far as it relates to matters within my knowledge, is the most misleading and deceitful narrative I ever have read." Among the twenty-five directors through whom Mr. Lauck had charged that the control of 82 per cent of the country's railroads is exercised by a group of New York bankers and financiers, Judge Lovett's name was placed first. Judge Lovett said:

Holds Lauck Statement Untrue

"So far as it relates to me, and, so far as I know and believe, to others, Mr. Lauck's statement with reference to this control by such group, or any group, of New York bankers and financiers and his carefully and ingeniously worked out diagrams and charts and all they are intended to convey are, from beginning to end, an invention and fabrication without any foundation in fact."

For more than eighteen years Judge Lovett has been a director of the railroads comprising the Union Pacific System. He said:

"During all this period I have known the directors and know who has controlled and directed the policy, business and affairs of these railway companies. Not one of the fifteen banking and financial institutions mentioned by Mr. Lauck has ever exerted or sought to exert the slightest influence upon them with respect to their purchases of equipment or supplies or in the wages they pay or the policy they pursue or in any other respect whatsoever. In-

deed, the first named in the group and the leading object of attack has never manifested the slightest interest in our affairs. Eleven of the fifteen named do not, according to our record of stockholders and to the best of my knowledge and belief, own a single share of the stock of any of these railway companies, and the remaining four own altogether \$1,618,200 par value of the preferred and \$61,900 of the common stock out of a total aggregate outstanding of \$321,836,600, though I believe and hope that the life insurance companies and the others acting as trustees own large amounts of our bonds. The stock of the Union Pacific is widely scattered and is held by more than 50,000 different owners. No one person, firm, corporation or institution owns as much as 2 per cent of our capital stock."

His Interest in the Illinois Central

In addition to being a common carrier, the Union Pacific Railroad Company, by its charter, is a holding and investing company in railway securities. Through one of its subsidiaries, it came into possession of \$80,000,000 of the stock of the Northern Securities Company, and, following the Supreme Court decision dissolving the relations of the Southern Pacific and the Union Pacific, the latter had about \$125,000,000 par value of the capital stock of the Southern Pacific which it was required to dispose of. The reinvestment of the proceeds from the sales of these stocks and bonds of other railway companies has been the cause, Judge Lovett stated, of his becoming and remaining a director in such other companies. With reference to his relation to the Illinois Central System, he said:

"Through the reinvestments by Mr. Harri-man above mentioned the Union Pacific directly and through subsidiaries owns \$31,700,000 par value out of a total of \$109,295,966.67 outstanding of the capital stock of the Illinois Central Railroad Company—that is, about 30 per cent—and also owns upward of \$5,000,000 of its bonds and equipment trust notes. For that reason and to represent that interest I am and have been for many years (except for about a year during the war) a director and member of the executive committee of the Illi-

nois Central Railroad Company and of the Yazoo & Mississippi Valley Railroad Company and the Central of Georgia Railway Company and Ocean Steamship Company of Savannah, subsidiaries of the Illinois Central."

Judge Lovett was a director of the National City Bank of New York from November, 1912, until February, 1921. On the latter date, he said, he resigned because of an opinion of some lawyers, which he did not at all share, that the borrowing of money by a railway company from a bank with bonds as collateral was "dealing in securities" within the meaning of Section 10 of the Clayton Law. He continued:

Not a Director of a Bank

"I am not now and have not been for a number of years a director of any other bank or banking institution. I am not a director of and have never had a dollar's interest in any of the equipment or manufacturing companies or any of the coal companies mentioned by Mr. Lauck or shown on the exhibits he introduced. I have never been a director or officer of any such company except the Union Pacific Coal Company and its subsidiaries, every dollar of the stock of which is owned by the Union Pacific Railroad Company and which mines coal from lands granted by the government in aid of the original construction of the Union Pacific Railroad and which does not sell and has not for many years sold coal to the public, since the Union Pacific System requires the entire production for its own use as fuel. But upon Section 10 of the Clayton Law becoming effective, I retired from the board of the coal company, although it is owned exclusively by the railway company of which I am chief executive."

After outlining his connection with the railway companies named, Judge Lovett continued:

"Such are my relations to the railroads and the financial institutions referred to by Mr. Lauck with the reasons for such relationship. I state now and as broadly and as emphatically as I can that, during all the years I have been a director and officer of the railway companies named, the management and policies of each system have been in its own interest alone, as distinct from the other systems, and have been as separate in all respects as if there had been no common directors; that there has been no combination or common control or

direction of them; that none of the banks or financial institutions mentioned by Mr. Lauck or shown on his exhibits and no other bank, banker or financial institution or groups of such have controlled or sought to control them or had anything to do with the policies or management or with the business or affairs of any of said railway companies so far as I know or believe, except in lending them money or buying their securities.

Bankers as Railway Directors

"Where bankers were on the boards they were there as individuals, the same as other directors and with no more influence except perhaps as to when and how best to raise new capital, as to which they were, of course, experts, and their expressed opinions were heard with interest but not always accepted. Not one of said banking houses or financial institutions and no other banking house or banking institution nor any banker member of any board of directors on which I served ever exercised or sought to exercise the slightest influence with or upon any of said railway boards with respect to wages of the employees or the purchase of equipment or supplies of the railway company.

"I am unable to find in the report of Mr. Lauck's testimony before this committee or in the charts and diagrams he introduced any facts or evidence to support his unqualified and sweeping charges that a 'New York bank combine' through a 'spread of control of twenty-five railway directors links together ninety-nine Class I railroads operating 211,280 miles, or 82 per cent, of the country's steam transportation systems' and dictates the policy of the management of such railroads with respect to labor and the purchase of equipment, coal, and so forth. I am, however, not surprised at such lack of evidence, for I know the charge is absolutely untrue and consequently there is no real evidence to support it. Apparently Mr. Lauck bases his charge wholly upon the fact that some individuals who are among the directors of one company are also directors of others.

"The witness fails utterly to distinguish between association and combination. Nobody supposes for a moment that because men belong to the same church or the same club or play golf together or reside in the same community or commute on the same train or otherwise associate together they are in a common conspiracy against somebody and that

all their separate interests are brought into the combination. No one supposes when a merchant becomes a director of the local bank that the store and the bank are combined or that his farm, if he has one, is brought into the combination. If two rival and competing merchants or bankers happen to have an interest in some other enterprise—a street car line or a light and power plant, for example—and are elected directors of it to represent their interest, no one supposes that their separately owned stores or banks are thereupon combined or cease to compete.

Co-operation Is Not Conspiracy

"Not merely those engaged in different enterprises, but millions of men engaged in identical and often competing lines of business, are meeting every day not only socially and in the ordinary intercourse of life but even for consultation or co-operation and action with respect to another enterprise or something in which they are each interested without any suspicion anywhere that they are bringing in their other separate businesses and interests or dealing with any except the joint business or matter in hand for the time being. The wheels of progress in great enterprises would revolve slower still if men of recognized ability and commanding the confidence of others, already identified with one great enterprise, could not join others similarly situated in directing other wholly independent enterprises without commingling and combining the whole. Yet it is upon such basis as this alone that Mr. Lauck's charge seems to rest.

"As a director of one of these companies I deal with the business of that company from the standpoint of my duty to it—as a trustee for its security holders, its employees and the public at large. In that way I can best promote the interest of the Union Pacific as a stockholder in such company. While I speak of myself, I do so only for convenience in expression because, of course, every other right-minded director is governed by the same motives.

"No banker on any board of directors or committee or in other circumstances or at any time or place has ever given me any advice or sought in any way to influence me as to the 'deflation of wages' of railway labor or as to what wages should be paid to, or what working rules and regulations should be established for, or what if any contracts should be made with, railway labor, or had anything whatever to do with the policy of railway

management with respect to railway labor. All the bankers with whom I have had anything to do or with whom I have come in contact on or off railway boards or in railway management have shown a friendly attitude toward labor, and union labor at that, so far as I ever heard any expression from them on the subject.

Why Bankers Buy Stocks and Bonds

"The fact is that the bankers are no more concerned about railway labor than are other wide-awake citizens and manifest no more interest in the subject. The larger private banking firms in New York at which much of the denunciation has been leveled and other investment bankers own little if any railway stocks. I might add that the schedule of the estate of the late Jacob H. Schiff, one of the largest bankers in New York, which was published widely in the New York papers, showed that he did not own any stock of the railroads.

"These bankers do not buy stocks to keep, but to sell, just as the merchant buys goods not to keep, but to sell. If even the largest of such firms in this country were to keep the railway stocks and bonds they buy, they would have to close up shop in a month, for their capital would all be invested. They sell as quickly as possible after they buy in order to buy again, for their profit is in the turnover, and while waiting for new business their money is either in the bank or on call loans or invested in municipal or other government tax exempt bonds or other short term bonds not likely to fluctuate, so that all or any part can readily be converted into cash when needed to turn over another issue of stock or bonds. What interest have they, therefore, in the railway wage question more than any other citizen? It is the stockholder and, on weak roads, sometimes the bondholder who are interested in wages and working rules and conditions, because, as they have been going in recent years, these expenses may mean the loss of their property.

Boards Do Not Deal With Labor

"Neither do the directors or any of the boards or committees of the boards on which I have served attempt to interfere with the presidents or other executive or administrative officers of the railroads in dealing with wages or working rules and regulations or in the policies to be pursued by them with respect to the employees. Although I have served for a number of years on many boards of directors and executive committees and finance

committees of a number of railway companies, I have never been present or known of an instance when a board of directors or committee of a board of a railway company by resolution or otherwise has given any directions or instructions to the president, or interfered with him or has taken any action whatever with respect to wages to be paid, hours to be worked, rules and regulations to govern, contracts to be made or the policy to be pursued with respect to employes engaged in the maintenance and operation of the railroad. They have realized, apparently, at least during the period covered by my experience, that all these matters were pretty well standardized over the whole country or in the various districts and territories and settled by agreements which could be changed from time to time only by negotiation between the operating officers and committees of the various organizations representing the employes or by strike. This situation grew until it became nation-wide at the time of federal control, and when the railroads were released from federal control it had merged into law and practically could be changed only by the Railroad Labor Board.

"It seems little short of silly, therefore, to charge that the bankers are not only dictating a labor policy to the boards of directors but are dictating it to the presidents and operating officers themselves. I have never yet known a railway president or other executive who has grown up on the line in superintending and working with the mass of employes confess any need or show any desire for the advice or instructions of a board of directors, generally without such experience, as to the rates of wages he should pay or the rules and regulations he should establish or how he should deal with such employes and, as said before, I have never been on a board foolish enough to offer such advice or give such instructions.

No Graft in Railway Purchases

"With reference to Mr. Lauck's charge that this alleged 'inner group of New York bankers and financiers' has combined, through control of directorships, the coal industry, the railway equipment industry and other industries so that the railroads pay without protest exorbitant prices for such materials, I will state that, so far as it refers to any company of which I am a director and, as I believe, to any others, it is absolutely untrue. We have

paid exorbitant prices in recent years, as has every individual who has bought anything, but only because we could not avoid it. Some of our directors, I think not more than three, prior to the effective date of the Clayton Law were directors of manufacturing concerns among the many from which we sometimes buy materials, and I know, because of the questionnaire sent out by us when that law became effective, that two are still directors and are interested in such concerns, but in one such case we buy upon public bidding under the act, and as to the other, we discontinued buying because I was anxious for the director to remain on our board, and the articles were of a character that we could buy from many others and thought we could do so by private negotiation on better terms than by public bids.

"No director of the Union Pacific or any of its subsidiaries, since my connection with it, has ever influenced or sought to influence, as director or otherwise, the purchase of any of our equipment or rails or materials and supplies of any kind. I believe the same is true of every other railway company with which I am connected, but I speak thus definitely about the Union Pacific because I am, under the by-laws, the only medium of communication between the directors and the subordinate officers, and directors would quite naturally communicate, anyway, with me as chairman if they had any such request.

President Manages the Railroad

"As a matter of fact, railway directors as a rule do not know when or from whom or how railway purchases are made except in some cases such as the purchase of engines and cars. I never knew to be presented or discussed in any board of directors of which I am a member or any executive or other committee of such board the names of those from whom any purchases were to be made or any directions given or suggestions made by any such board or committee as to the selection of suppliers. If there is any exception to be made to this statement, it is with respect to equipment. It is customary in the companies with which I am connected for the purchasing department, under direction of the president, to invite tenders from the various equipment manufacturers, and when they are received the president sometimes sends on, for the information of the board, a list of the bids, but this is very rare. Usually the board or executive

committee authorizes the president to purchase certain equipment which he recommends, and that is the end of it so far as the board or committee is concerned, except to provide for financing the purchase. All other purchases are made by the purchasing department under the supervision and direction of the president or chief operating officer under the general authority of such executive to maintain and operate the property, and the directors have no knowledge whatever as to when or from whom such purchases are made, unless there should be occasion for some special inquiry.

"No board of directors nor banking firm or group of financiers in New York can manage a large railway system. Only disaster would follow such an effort. No board of directors on which I have served has tried. In no business is organization more important or necessary. The board of directors selects a president or other chief executive officer and puts him in charge, and all others on the line are subordinate to him, and they are selected or are removable by him, though ratification or veto power is held by the board, but rarely,

if ever, exercised. Of course, by law, supreme power is vested in the board, but the executive power the board may and must delegate to individual executives, for there must be decision and action promptly and sometimes instantly. The only function the board ever exercises, within my experience, with respect to compensation or wages, is to require its approval of salaries in excess, usually, of \$400 or \$500 per month, and exceptions are made even as to this in the case of train service employes, some of whom on our line make more than \$500 per month.

"Directors, in my experience, confine themselves largely to determine whether or not new enterprises, construction of extensions, additions and betterments and other projects calling for more capital shall be undertaken and the ways and means of raising such capital; passing upon contracts to see that through inadvantage or otherwise the company is not unwisely committed or bound for long periods and large amounts, and to other matters which legally require board action."

His 48-Year Record Was One of Safety

James J. O'Rourke, retired December 31, was forty-eight years in locomotive service on the Illinois Central System, and in all that time he never killed or injured an employe of the company, he was never injured himself and the trains he operated never met with any serious accident.

Mr. O'Rourke was first employed by this company as a machinist helper at Jackson, Tenn., in August, 1873. The railroad was then called the Chicago, St. Louis & New Orleans Railroad Company. John S. McKay and Ed Anderson were then master mechanics at that point. In April, 1876, Mr. O'Rourke was transferred from Jackson to Water Valley, Miss., as a machinist apprentice, and he continued in service there until 1879, when he took up locomotive firing between Jackson, Tenn., and Canton, Miss. He was promoted to locomotive engineer in the fall of 1879 and continued service as locomotive engineer until he was promoted to be general foreman at the Water Valley shops in 1883. J. F. White was master mechanic at that time.

Mr. O'Rourke remained as general foreman until he was appointed master mechanic at the Water Valley shops. In November, 1890, he was transferred to the Memphis shops as mas-

ter mechanic. He remained in that position until May, 1898, when he gave up this position and returned to locomotive service as engineer on the Grenada district of the Mississippi division, running between Memphis, Tenn., and Canton, Miss. He remained in that branch of the service until he retired on pension, December 31, 1921.

The O'Rourkes live at 524 LaCleda Avenue, Memphis. Mr. O'Rourke owns his own home and is the father of five children, James Edward, Walter Thomas, Mary, Emma and Minnie. Both of Mr. O'Rourke's sons, James and Walter,

served their apprenticeships as machinists with the Illinois Central at Memphis. At present James is general foreman of the Santa Fe Railroad at Beaumont, Texas, and Walter is a locomotive engineer out of Memphis on the Y. & M. V.

Mr. O'Rourke moved from Missouri to Tennessee with his parents in 1868 and has lived in Memphis since 1890. His father was born at Baton Rouge, La., and his mother was from Galway, Ireland. His father was a veteran of the Mexican War.

Mr. O'Rourke has seen the great progress that has been made since the Civil War in locomotive development. While he was general foreman at Water Valley and master mechanic at Memphis he employed practically all of the locomotive engineers at present in passenger service out of Memphis and Water Valley on the Illinois Central System. Locomotives in the early days weighed about twenty-five tons compared with the 200-ton locomotives of today.

During the yellow fever epidemic, Mr. O'Rourke had many trials and tribulations, as

many of his engineers and firemen were stricken. Although it was a difficult task, yet he managed to keep all locomotives in service during this epidemic.

While an apprentice at Water Valley Mr. O'Rourke helped erect and build the first locomotive that was ever built in Mississippi. This was engine No. 71, named "John E. Becton" after the master mechanic at Water Valley at that time. Afterward this engine ran between Jackson, Tenn., and Canton, Miss. At that time engines were always named for some prominent person connected with the road.

Mr. O'Rourke tells many stories of the troubles of the railroads in the early days. He says that at one time the railway company was six months behind in paying the wages of the employees and that it frequently paid in script. This script was accepted by all the business houses, but was discounted.

When he retired from the service on a pension, he received many complimentary letters from the general officers of the company expressing their appreciation of his forty-eight years spent in the service.

Frank A. Montgomery, Local Attorney, Dies

Frank A. Montgomery, for twenty-five years a local attorney of the Yazoo & Mississippi Valley Railroad Company for Tunica County, Mississippi, and for many years also attorney for the Illinois Central Railroad Company and the Yazoo & Mississippi Valley Railroad Company for DeSoto County, Mississippi, died at his home in Tunica, Miss., June 12.

Mr. Montgomery was a lawyer of high standing and character and was known as such throughout Mississippi. He enjoyed a large and lucrative practice. He represented the Illinois Central System in many important cases and was remarkably successful. He gave most careful and painstaking attention to litigation intrusted to him. As he believed thoroughly that litigation was won or lost in its preparation, he always went into court thoroughly fortified on every point which might arise.

He showed the greatest industry and zeal in behalf of his clients, and his opinion on questions of law, in Tunica County particularly, was so much respected that persons having claims against the railway company would frequently come to him and lay their claims before him without bringing suit. His fairness and impartiality were so well known that his opin-

ions were generally accepted, with the result that after he took charge in Tunica County it was rare that any meritorious claim ever went into litigation.

In addition to serving the two railway companies in Tunica and DeSoto counties, he was frequently called upon to try cases in adjoining counties and at Helena, Ark. He possessed the confidence and esteem of all of the officers of the two companies. His death is a distinct loss to the two railway companies and his other clients. The people of Tunica County consulted him on every matter of importance which arose, and he molded in Tunica County a just and enlightened public sentiment.

His son, Roger Montgomery, was educated as a lawyer and had been admitted to partnership with his father. Roger Montgomery, at the outbreak of the war, enlisted in the aviation service, but was killed in an airplane accident at Ellington Field, Texas, in June, 1918.

Mr. Montgomery is survived by his widow and two daughters, Mrs. Ione Adams and Miss Frank Montgomery. Mr. Montgomery was born at Rosedale, Miss., September 23, 1858. His father was a well-known lawyer and judge before him.

HOUSE PLANS FOR OUR READERS

Southern Pine

An encouraging response has been received to the offer made last month by the Southern Pine Association, through the *Illinois Central Magazine*, to distribute free of charge to those interested a booklet of fifty photographs and floor plans of medium priced homes. This booklet is a dandy, and those who, have been so fortunate as to receive a copy after application to the magazine have found the suggestions contained therein of great value in selecting the kind of homes they hope to build.

Another home plan is shown herewith. Additional plans will be shown from month to month. These printed in the magazine are merely samples of the fifty shown in the booklet.

Most of those who inquired for the booklet last month have their lots bought and are now trying to decide upon the best type of house to build. As explained last month, if any of these fifty plans is decided upon, a full set of blue prints can be obtained from the Southern Pine Association, New Orleans, for a few dollars. The American Wholesale Lumber Association will arrange for the co-operation of

the local lumber dealer. Where a group of employees is interested in building homes, the same association will arrange the details for forming a building and loan association to finance the projects.

He Is the Champion Hunter of Birds' Eggs

R. Magoon Barnes, Illinois Central Local Attorney at Lacon, Ill., Enjoys National Reputation as Oologist

BIRDS' eggs are of such infinite variety in size, shape, color and markings and of such proverbial beauty that the temptation to have and to hold them is overpowering. Almost every boy has made a collection of them.

It is true that these collections are usually shortlived, as a few seasons ordinarily suffice to use up the enthusiasm, but there are many men bent and gray who today look back to their egg-collecting days as among the most pleasant of their lives. Many were the rare specimens obtained. The pewee's and the robin's eggs vied with those of the "knot bird" and the "henhawk" for first place. Pins were used to punch holes in each end of the eggs, so that the contents could be blown out; then the eggs were placed on a string. The end of the collection was often brought about by the mice.

But boys are not the only ones who collect birds' eggs. There are men who find it intensely interesting. These men are oologists, and they go about collecting birds' eggs in a definite and scientific manner.

R. Magoon Barnes, local attorney for the Illinois Central at Lacon, Ill., since 1887, is an oologist of national reputation. He has one of the most nearly complete and largest private collections of North American birds' eggs in the world.

Local Attorney an Expert Oologist

Mr. Barnes has been a student of nature for more than forty-seven years. During that time he has traveled extensively throughout North America collecting skins of animals and birds, nests and birds' eggs. He now has hundreds of mounted skins, nests and eggs in his museum at Lacon. The building is 50 by 32 feet, two stories high, and has an 8-foot basement. It is thoroughly modern in construction and equipment. Its location is at the rear of his home.

The collection was formerly kept in the Barnes home, but in 1920 Mrs. Barnes issued a proclamation that the trophies must go. The museum was built that year.

Mr. Barnes' prominence as an oologist has won for him the appointment as assistant curator in charge of the department of oology

Front view of R. Magoon Barnes' museum of oology at Lacon, Ill.

of the Field Museum at Chicago. This department covers the entire collection of eggs from all parts of the world. He is an authority on birds' eggs and is often called upon to solve puzzling problems for his brother oologists. He publishes a monthly magazine, *The Oologist*, which has a wide circulation. It is the only publication in the western hemisphere devoted to oology and the interests of oologists.

His Collections to Field Museum

Mr. Barnes has arranged to place each completed series of eggs of his collection in the Field Museum. He has many complete sets now that cannot be duplicated, and he intends to move them to the Chicago museum soon. After his death, he wishes the eggs to pass into the permanent possession of the Field Museum, he says.

The idea of making a collection of birds' eggs came to Mr. Barnes as a suggestion, he says, away back in 1875, when he was a small boy. He was sitting under a shady tree on the lawn at his home in Lacon with his father and a cousin when a robin flitted past and went into a small tree near by. The cousin was interested in birds and went over to the tree where the robin had gone. When he returned, he told his companions of the little nest, eggs and the protesting mother bird. Young Barnes was thrilled by this conversation. He had seen hundreds of birds about his home every day, but had paid little attention to them. Perhaps he might cast a stone at one that looked to be a good mark. But Magoon admired this cousin. The cousin was a college student, and

what he found to be of interest Magoon accepted also. The cousin told the two of oologists' collections he had seen and of his own collection, and then asked young Barnes if he had ever collected birds' eggs.

That was enough. The suggestion took root, and that very night Magoon planned an egg-hunting expedition. Early the next morning he assembled his gang and started out. Since that day his interest in collecting birds' eggs has grown with increasing intensity.

To prove that he is conscientious and has a definite purpose in view, the collector of birds' eggs must procure a state and national license, Mr. Barnes says. And when eggs are to be hunted in another country, the license of that country also must be obtained.

Mr. and Mrs. Barnes by a Queen Cactus with twenty-four blooms at their home in Lacon, Ill.

Let us go on an imaginary egg-hunting expedition with Mr. Barnes and learn how he goes about it.

How an Egg Hunt Is Conducted

With a collector's box full of cotton slung over our shoulder and our notebook in our pocket we start out, full of anticipation.

We know that woodpeckers nest in holes and meadow-larks on the ground, while robins nest in trees and indigo buntings in bushes.

Suppose we find a robin's nest in an apple

The arrangement of a series of birds' eggs in a large collection. Each row is a different variety.

tree. Here is what we do, or should do. First, we make absolutely sure it is a robin, because later we may find some nests where we do not know the birds. Then we climb up and peep into the nest. Only two eggs! An incomplete set, so we leave them and pass on.

Next we find a bluebird's nest in an abandoned woodpecker's hole in a small dead limb of an apple tree. Five fresh eggs! Good! The first specimens for our collection. How shall we get them out? Our hand is too large to get into the hole. It is not so very far to the house, and we go back and borrow a saw. Slowly and very carefully we saw the small limb off below the nest and lower it to the ground, turn it slightly over, take a spoon out of our pocket and lift out the beautiful blue eggs one at a time. These we roll separately in cotton and place in our cigar box. Then we take our note-book out and sit down and enter the following:

Making Record of the Eggs

"(1) 766 A-5 or a/5. Nest seven feet up in an abandoned woodpecker's hole in dead limb of an apple tree in an orchard. Birds seen, eggs fresh, nest saved. Remarks: This nest was on the south side of the tree, and the opening was toward the southeast. The cavity was nine inches deep and the openings two and one-quarter inches across. Nest typical, of fine grasses, weeds and feathers."

Then we replace the note-book in our pocket, place the figure (1) on the nest stub, stand it up against the foot of the tree where we can get it when we return home and pass on.

Next we find a phoebe's nest under a bridge across the road, stuck on one of the projecting rocks of the retaining wall. The bird is gone like a flash, but we know her. The nest contains six eggs, a very unusual number. They show signs of incubation, but, deciding to chance it, we carefully remove the eggs, roll each one carefully in cotton and place them in our collecting box. Then, after removing the nest and wrapping it in a newspaper cornucopia and marking it (2), we enter in our note-book:

"(2) 456 A-6 or a/6. Nest stuck on a projecting stone of a retaining wall of a bridge across the Lacon and Henry road, five miles north of Lacon, seven feet above the creek bed and three feet from bridge floor. Birds seen. Nest of rootlets, moss, fine grass and mud, lined with hair and feathers. Eggs, six, an unusually large number; incubation commenced. Nest saved."

Then we start home. Across the fields we travel, when suddenly from under foot flutters a mass of feathers. Finally it rises awing, and floats away. A meadow lark! Looking down we see a tuft of grass with a small opening in the side. Peering in, we see five fresh eggs; they are transferred, cotton-wrapped, to our collecting box. Then we sit down beside the nest and enter in our note-book:

"501 A/5. Nest on the ground in a pasture, partly sunk in the ground, in the middle of a tuft of last year's grass, arched over and lined with finer grasses. Eggs fresh. Female flushed from nest. Nest saved."

Nest saved! Yes. But how? As we are not far from our own home we go there, get a spade and a small box 8 by 10 inches and 3 inches deep. We carefully cut the sod around the nest and under it to the same size and depth as the box, being careful at all times not to disturb the nest or the grasses about it, and slip the spade under it, setting the sod with the nest into the box. If this is properly and carefully done, we have preserved one of the very hardest kind of specimens to get, a ground-sunken nest amid vegetation.

We then go home for the day with three nests and three sets of eggs.

Mr. Barnes' advice from then on is as follows:

The first thing to do is to lay aside each set of eggs separately on a cloth or layer of cotton batting, something that will prevent them from rolling; then procure a basin of water, a tumbler filled with water, and blow pipes and egg-drills. Sit down at a low table, or on a door-step or some similar place, so as to bring the basin above the object you sit upon.

How to Prepare Birds' Eggs

Now comes the preparation of the set of bluebird's eggs. Pick up one of the specimens and look it over carefully to see if there are any stains or any foreign matter on it which cannot be removed. If there is, that is the side we shall blow it on. First pierce the shell with a finely pointed pin or needle; then select the smallest of the blow-pipes, which should be No. 0; carefully insert the point of the drill in the hole left by the needle. Hold the egg between the thumb and finger of the left hand, with the larger end away from you and the second finger under the smaller end of the egg. Slowly twirl the drill back and forth with the thumb and finger of the right hand, gradually enlarging the orifice until you have

drilled clear into the egg. If you have the right kind of drill, the rear end of the burr part of the drill will cut the lining as it enters the egg. If it does not do this, it will be necessary to draw the drill back until the rear of the burr comes in contact with the inner surface of the shell at the hole made by the drill. A few more twirls will then cut the lining.

Then withdraw the drill; turn the egg over, still holding it between the thumb and finger of the left hand; take a small blow pipe. Hold the point of the blow pipe near the orifice of the egg, turning the egg upside down over the basin of water. Then blow through the blow pipe, and the air will gradually enter the egg and force the contents out of the same hole.

After the contents of the egg have been blown out in this way, take some water in the mouth from the tumbler of water standing nearby and blow the water through the blow pipe into the egg. Do this with some force, but not enough to destroy the eggshell. After the egg has been blown full of water, blow the water out of the egg. Repeat this two or

three times until the contents of the egg are thoroughly cleaned out, for any foreign matter or any of the contents of the egg that may be left will surely stain the shell and ultimately destroy the specimen.

Eggs Should Be Dried Out

After this has been done and you are sure that the contents of the egg are entirely out and the inner surface of the shell thoroughly cleaned, lay the egg upside down, with the hole resting on a small piece of blotting paper. Continue the same process with each one of the eggs in this set, laying them side by side on the blotter when the blowing is completed. They should be left in this position until they are thoroughly dry. All the other eggs taken should be drilled and blown in exactly the same manner, using care to see to it that the sets do not become mixed.

The foregoing is the proceeding for blowing all eggs which are fresh. It makes no difference whether they are the size of a goose egg or the size of a humming-bird's egg.

The marking of specimens is one of the most

Tray arrangement of a collection of nests and eggs of North American warblers.

important steps in their preparation. Care should be taken to mark each set neatly, legibly and according to the system used by oologists. They should be marked with a soft, pointed lead pencil unless you are a high class expert with india ink.

Marking Eggs for a Collection

The set of bluebird's eggs should be marked as follows: Above the blow hole on the larger end of the egg and near the blow hole

will indicate the number of eggs in the set. Beneath the blow hole should be placed numbers designating the year in which the set was taken.

After marking all of the eggs taken, the next important thing is to make out a data card for each set. This should be on a standard data blank, and all the salient facts regarding the set shown in your note-book should be given. After this has been done, place the eggs in a dark cabinet of some kind

The proper way to mark eggs for the cabinet.

should be placed neatly the number 766, which is the number of the bluebird in the American Ornithologists' Union ("A. O. U.") *Check List of North American Birds*. To the right of the blow hole should be placed a short straight line, as near as may be opposite the center of the blow hole. Above this line should be placed the letter "a" or "A" and beneath the line the figure "5." The letter "a" indicates the fact that this was the first set of bluebird's eggs taken this year. Any subsequent sets should be indicated by the letters b, c, d, etc. The figure "5" beneath this line

with closely fitting drawers that will exclude both the dust and light. The light will cause many specimens to fade; in fact, nearly all. Dust, if it settles upon the eggs and the atmosphere then gets damp, will set up a peculiar character of fungus growth on the shell that will ultimately disfigure the eggs for all time, particularly those having a solid color.

You will discover that your standing and rank as an oologist will depend largely upon the character of your work in preparing your specimens. Accuracy, neatness and cleanliness above all things should be your motto.

HOUSE PLANS FOR OUR READERS

Concrete

Here is plenty of room for two and the baby. Modern domestic science is showing the way to minimize housework in every direction and in this plan will be found all the conveniences of the up-to-date apartment in a delightfully cozy individual home.

The planning is so compact that it has been possible to omit the cellar. By installing a modern type heater in the kitchen, hot water heating for the whole house is easily provided with a desirable economy in fuel.

The small family will appreciate the convenience of the dining alcove. It is so close to the kitchen as to be almost a part of it, and yet is entirely shut off from both kitchen and living room. The double doors between kitchen and living room prevent cooking odors from getting into the front of the house.

A sink and two laundry tubs are placed in the kitchen, and there is plenty of room along the side wall for such modern contrivances as an electric dish washer or laundry machine.

The living room is large, spacious and well lighted. It has a delightful open fireplace and two convenient closets for overcoats, wraps, golf clubs and the like. A splendid porch runs across the front of the house. It can be screened in or glazed if desired. One large bedroom and one smaller guest room are at the rear of the house.

There is room enough in the attic for one or two bedrooms if desired, and a stairway to them could be easily arranged on the end wall of the living room.

This house is designed for concrete block construction covered with portland cement stucco. In selecting firesafe roofing the builder can choose from a number of materials, the best known being roofing tile, cement, asbestos, or asphalt shingles and slate. Of course there will always be people who will prefer frame or brick construction, and this design is easily adaptable to these materials.

Those desiring other house plans should communicate with the Portland Cement Association, 111 West Washington Street, Chicago, Ill.

Calls Demagogue Greatest National Peril

W. R. Boyd of Cedar Rapids, Iowa, Rises to Defend the Railroads; Would Awaken Public

The following remarks about the railroads were included in an address delivered before the Kiwanis Club of Cedar Rapids, Iowa, June 28 by W. R. Boyd, president of the Perpetual Building & Loan Association of that city. Mr. Boyd formerly was editorial writer on the Cedar Rapids Republican and Times. He displays a knowledge of the railway situation which makes his address, we believe, worth reading.

ON or shortly after New Year's day or the first of July, as the case may be, statisticians tell us, with as much accuracy as possible, what various destructive agencies cost the nation in dollars and cents—the losses occasioned by fire, floods and tornadoes; how much the rats ate and the boll weevil destroyed. The toll of human life occasioned by accident of one type and another is also set out. Many of the items in this summing-up of the ravages of the forces of destruction are startling, and the sum total is appalling.

Consider the Demagogue

I have often wondered what would be our feeling if someone would tell us, with reasonable accuracy, what the demagogue costs us annually in dollars and cents—yes, and in human life from time to time. And then if we could know what he costs us in wasted time and effort and in long delays in the settlement of questions which finally can be settled in but one way. If this could be done, we would stand absolutely aghast. Fire, flood, tornado, the rat, the boll weevil, and all other tangible forces of destruction are pikers as compared with the demagogue. The demagogue is the subtlest and the most dangerous and the most destructive enemy of popular government. He muddles every stream of political and economic thought. He obscures every political and economic issue. He is usually plausible and attractive. His speech is honeyed. "Between his lips, words bud and blossom." He is nearly always master of the worst kind of lie—the half truth—and he is often able to deceive the very elect.

With the blind optimism characteristic of America, we are careless toward all destruc-

tive agencies. Seldom do we fight any of them effectively, and never do we wage war to the death against any of them. We have "fire-prevention" weeks and "anti-rat" days and other spasmodic efforts duly heralded by executive proclamations and newspaper headlines, and that is about all there is to it. The demagogue we not only endure, but we embrace him. We take him to our hearts and reward him.

It is, of course, impossible to set out in terms of dollars and cents or in any other terms what the demagogue costs a theoretically free people. We may get some idea by fixing our attention for just a moment on a few high spots.

A generation ago, confronted by the fact that the railroads of the country threatened to become Franksteins, we undertook their regulation and control. No one questions the necessity of such action. That the railroads had abused their power, as most human agencies do if not restrained, and that they deserved to be controlled, if not punished, goes without saying.

Playing Football With the Railroads

Now, statesmen could have settled this problem, intricate as it was, with approximate justice to everybody; but the demagogue made the railway question a political football in every state in the Union and in congress. Statesmen there were, always, who tried to do their best; but their efforts were blocked. What is the result? Our railway facilities today are wholly inadequate for the maximum needs of the country. Railway credit has well-nigh reached the vanishing point; and, unless statesmanship shall speedily find a way out, the country will be face to face with the dilemma of general railway bankruptcy or government ownership; and this despite the fact that carrying charges for both freight and passengers are higher than they have been within the memory of any man now living.

The pitiful thing about all this is that those who have suffered most, and who will suffer to the uttermost if things along this line get worse, are the very ones the demagogue professes to love and serve and who perpetuate

him in power. The strong can, and usually do, protect themselves.

The announcement that a railroad or a traction company or a gas company has defaulted on its bonds and that a receivership is impending causes the casual reader little anxiety unless he happens actually to hold a bond of that particular concern. He may, if he thinks about it at all, say: "Oh, well, they can afford to lose, and perhaps they deserve to lose." But who loses? The great financial concerns that put out the securities of railroads, public utility companies and industrial concerns no more keep those issues in their vaults than the merchant keeps the goods he buys from time to time on his shelves. They are bought to be sold to the general public, and they are sold to the general public. Bond salesmen make Cedar Rapids as regularly as grocery salesmen or drygoods salesmen or hardware salesmen, and they miss no chances. The other day the release of a small mortgage by a woman whose little financial affairs I happen to look after was reported from the recorder's office. Before night two bond salesmen called on that woman to get her to put the proceeds of that little mortgage into a bond.

Who Owns the Railroads

A majority of the bonds of railroads, public utility companies and industrial concerns are owned, directly or indirectly, by the public. They are owned by individuals, by banks, trust companies, insurance companies (life, fire and casualty) and by endowed institutions of all kinds. None of these financial institutions invests much of its capital in such securities. They are purchased with their deposits in order that they may be able to pay depositors interest. If these companies fail, banks fail; insurance companies fail; colleges, hospitals and all manner of charitable institutions are embarrassed. I wish all men and women who carry life insurance would take time to study the financial statements put out by the companies in which they are interested. They would then find that they had an interest in nearly all the important railroads and public utility companies in America, and in many of which they had never heard.

If this fact—namely, that the ownership of securities is not concentrated in a few hands, as demagogues constantly declare, but is widely distributed—could be generally known, the average person would appreciate that he has a vital personal interest in the solvency of more than one concern he had been taught by dema-

gogues to look upon with suspicion, if not to hate. Some years ago, when *Harper's Weekly* was still in the land of the living and, approximately at least, measured up to its claim that it was a "journal of civilization," there appeared at the head of its editorial columns this gem, which I clipped and to which I have referred so often that I almost know it by heart:

A Call to Statesmanship

"There is nothing intrinsically sacred about the people, except that they are the great embodiment of human life, for which and in which lies the chief work of man on earth. The people may be right or wrong, and are apt to be wrong. He helps them who leads them when they are right and stems them when they are wrong. But they are not sacred to be obeyed willy nilly. Neither are constitutions sacred, to be bowed down to. What is sacred is Truth. Who can find it and follow it—he is the enviable man; he is the true leader; admirable, not for himself, but for the truth that is in him. The people are nobody's God; not even their own. We are the people.

"Come now, do we revere ourselves so vastly? These gentlemen that stand on stumps and tell us we are all there is—do we bring away so profound an opinion of their wisdom? More likely we say: 'Come, come, stop fooling with us and give us your best. Wherein you know better than we do, let us know what you know. We are nothing if not teachable. Wherein we seem to want what is not right, teach us wherein it is not right. To want what is right and get it is all our hope. To want what is wrong and get it is destruction. Better, far better, to want what is right and struggle toward it, even if it is denied to us. Tell us, not what we want, but what we ought to want. That is true service. That is what we need to know.'"

Perhaps the writer of the editorial gave the people more than their due. So many of them seem to like to follow off after every advocate of quackery that comes along. But I am not so sure. Only a small percentage of men and women are innately dishonest or vicious or mean. If we can get to them with the truth in a way they can understand it, they will yield to it; at least, a majority of them will. Courage of a high order in public life is a rare virtue. It is easy to swim the current, but difficult to stem it. Uncle Joe Cannon once said that the average congressman would sell his immortal soul for another term. I do not believe any such sacrifice necessary to get an-

other term. I believe that in a majority of instances an honest presentation of well-founded truth will defeat error in the public forum. If I were just a fair platform man and coveted public office, I would not be afraid to go before the people of this state as the enemy of every one of the political and economic heresies now seemingly so popular. The trouble is we have been thinking about public questions as individuals or in groups, from the standpoint of what would seem to be our personal interest, and without a thought of fundamentals or the general welfare. We have not made an effort to get at the facts.

War as a Destroyer

Here in Iowa, for example, it has been taken for granted that agriculture was the only thing hurt by post-war reaction, that nothing else had been hit at all, and that many of our woes were due to a certain banking system and to high freight rates, and that we could pull ourselves out of the depths by striking someone else down.

Now, the fact is that war is a wholly destructive process. It stimulates certain industries while it is in progress. A few who are wise enough and fortunate enough to quit the frenzied game in time keep their winnings. But few can do this, and when the fever passes there is general prostration, and the riches gained during the cataclysm for the most part take wings.

Suppose that, for just a few moments now, we consider the other fellow, and see how he fared. We know what happened to us in agricultural Iowa. We know that corn which sold for \$1.90 two years ago sold as low as 35 cents. We know that hogs which sold for \$20 plus per hundred weight were for a time below \$10. We know that land which sold for \$400 an acre can now be bought for \$250, and that not a few who bought land at \$400 an acre and mortgaged it for \$250 an acre lost their all. And we know that renters who leased land which called for an annual rental of from \$10 to \$15 per acre could not pay last year's rent, and many lost the savings of a lifetime. It was very bad—in many cases it was pitiful. But farmers were not alone in this. Let us consider, for a moment, some other classes.

Investigation will show that many classes have been practically as hard hit as the farmer by the events of the past few years centering around the decline in prices. A point most often overlooked is that the person whose income has been derived from permanent investment in

bonds or stocks has been terribly hit, and that it happened to these people a long time before the farmer was affected. When prices went up at the outbreak of the war, and continued to climb higher and higher, the amount of the necessities of life that could be purchased with the income from a bond became smaller and smaller, so that many persons who thought themselves well fixed for life in 1914 found in two years that they had difficulty in buying the necessities of life. This was especially true of such classes as retired farmers, people beyond middle age who had turned their savings into farm mortgages or low interest bearing bonds. The effect on people whose savings were invested in corporate investments was especially unhappy in the eastern states and in New England where that form of investment was better and more favorably known than the farm mortgage so popular here. Nearly every great industrial concern was compelled last year to charge off huge inventory losses and to suspend dividends.

I venture the guess that there is not a merchant in this room today who has not had to take losses and forego profits.

Effect Upon Railway Investors

Here are a few facts relative to what has happened to the railroads. Of the forty-seven railroads listed on the New York Stock Exchange as reported in the New York *Herald* of June 11, thirty-two were paying no dividends on their common stock, and of these twenty were paying nothing on their preferred stock. The dividends on these railroads were \$102,686,106 less in 1921 than they were in 1914. The amount of defaulted interest on railway bonds from 1914 to the present time is approximately 70 million dollars. A study of stock market statistics would be an instructive pastime for anyone who thinks he is the only fellow who has suffered.

Let us suppose that an Iowa farmer who had for years been hearing from chautauqua platforms and stumps, and perhaps now and then from a pulpit, and who had read in various publications, how he was constantly being made the victim of some rich railroad and industrial concern, had decided to sell out and invest his money in a few of these securities. Suppose he owned 160 acres and sold his farm for \$250 an acre, \$40,000; and that his closing out sale netted him \$10,000 in addition, making a total of \$50,000 and suppose he had reasoned something after this fashion:

(Continued on Page 108)

Mix Play With Your Work and Be Happy

Best of All, Take Into Your Daily Toil the Same Spirit You Show When You Seek Recreation

The following article by Edwin B. Parker, general counsel of the Texas Company, New York, has been a source of inspiration to us, and we take pleasure in passing it on, with Mr. Parker's permission, to our readers:

DID it ever occur to you that the line of demarcation between work and play is, at best, shadowy?

Both play and work are states of mind, not tangible things. Both are psychic, not physical, in concept. The confusion arises through labeling certain forms of activity work, and other forms of activity play. A moment's reflection will suffice to demonstrate that one form of activity to a certain person under certain conditions is play, while to the same or another person under different conditions it is work. Instance, the boy who, risking dire punishment, harkens to the seductive call of the baseball diamond and plays hookey that he may emulate the example of his batting hero and make a home run. His whole body and mind and heart are filled with the buoyant spirit of the game—and this is called play. This same boy, grown to manhood's estate, takes his place on a professional baseball team and again stands at the home base intent on seeing and accurately measuring the pitcher's curves—but this is called work.

The little girl in her nursery playhouse dresses her dolls, prepares their meals, sweeps her floors, and puts her house in order, going about her tasks seriously, earnestly, and conscientiously—and this is called play. This same little girl, now become a woman, dresses her children, prepares their and her husband's meals, and performs her other household duties with the same conscientious care she gave to her nursery tasks—but this is called work.

Proper State of Mind Needed

The difference lies in the state of mind, not in the nature of the undertaking, nor in the purpose to be attained save as the purpose reacts upon the state of mind.

The problem of each individual is how to create a state of mind which to him spells play, and to carry that state of mind with him into the tasks which to the world spell work. When he has done this, he has transfigured his work

Edwin B. Parker

into joy-giving play. And this can be done through the exertion of will power by any strong, wholesome, clear-minded man or woman.

The man who has contributed toward solving a troublesome problem in science, commerce, banking, industry, law, or social or international relations derives therefrom a more poignant and enduring pleasure than he who kills big game in Africa, or is crowned victor in international athletic games, or is the winner of a golf tournament. I do not mean to condemn or belittle these forms of recreation. On the contrary, I am convinced that when pursued with temperance they serve a useful purpose and deserve to be encouraged and stimulated. The thought that I would convey is that the atmosphere of the contest—the thrill in the exercise of the power to conquer which carries the hunter into the wilds of the forest to track down and kill the powerful beast—

can readily be diverted into other channels where the obstacles to overcome and master appeal quite as strongly to the imagination if not to the spirit of adventure, but where the results tend to add to the total of world values and increase the sum of human happiness, and are of a creative and re-creative nature rather than mere recreation.

The Joy in One's Own Work

There is no game more inspiring or more stimulating to the wholesome mind than the mastering of one's job—be it big or little, so long as it is one's job. No more alluring exploration was ever planned than the journey into that undiscovered land—one's own life. There is no satisfaction more exquisite than the pursuing of one's life plan, step by step, day by day, and seeing the creature of one's imagination mature into a vital and fertile reality.

There is implanted deep in the breast of every healthy red-blooded man a lust for power, in some form, which should be stimulated rather than stifled, provided it be directed into constructive channels and exerted to promote the progress of the world. The impulse to lead, to direct, to win, to master, may find expression in athletics or other sports, or in the larger games of commerce, of industry, of finance, of science, of law, where the stakes are higher, the consequences more far reaching.

The form which the expression of such impulses takes is frequently determined largely by the fortuitous influences of environment, and not by conscious volition on the part of the individual. But the individual can, if he will, direct such impulses into whatsoever channels he pleases. He can form the habit of giving them expression either in activities called work or activities called play. Whatever the character of the outward manifestation of such activities, the quality of the impulses and the spirit which permeates them will determine their true nature.

Must Join in Reconstruction

During the war the people of America responded—and wholeheartedly responded—to the Nation's call. The occasional slacker was branded as an unclean thing, to be shunned and treated with contempt. The fighting spirit of the Nation, aroused and diverted into the narrow channel of subordinating all else to winning the war, swept forward with irresistible momentum. The great stakes justified the immeasurable destruction in every form

which the game entailed. Now that has passed and has left us in its wake problems of peace quite as important and in some respects more difficult than those of war. The world does not need any reapers who do not sow. The slacker of today is no less a slacker because the armistice has been signed; the war is not yet over—that is, in certain quarters the spirit of the war still lives. The survival of this war spirit emphasizes the duty of every strong right-thinking man to put forth the best there is in him toward helping quietly and unostentatiously, but surely and effectively helping, the world to recover its equilibrium. The orgy of destruction renders more imperative than ever before constructive and collective effort. The peoples of every nation and of every community of each nation are coming day by day to a fuller realization of the fact that the salvation of the world lies in work—well-directed, co-operative work—into which is unreservedly thrown the whole energy of the heart and mind and body. Work which rejoices in the zest of the contest, in triumphing over obstacles, in creating, in producing, in progressing, in achieving. Work, whatever may be its nature or importance as measured by the ordinary standards, which is clean and honest and useful, which is regulated by rules of fairness and good sportsmanship, and which is permeated by the exuberant spirit which the world calls play. Such work is freighted with peace and plenty and joy and happiness for the worker and all about him. Such work, godlike in its creative attribute, is included in and partakes of the nature of recreation.

Switch engine No. 3509, "pride of East St. Louis." Yard crew, left to right: A. A. Bloomer, engineer; H. Hamblin, switchman; R. R. Fitzgerald, engine foreman; E. M. Albee, switchman. "No yard damage with this bunch this month," wrote Trainmaster J. D. White at the end of May.

Signed Up With Illinois Central in 1858

George Althouse, Early Engineer on Our Line, Was a Keen Student of Locomotive Development

Signing himself "A Dutchess County Friend," a New York contributor sends us the following interesting account of the life work and observations of a former Illinois Central locomotive engineer who studied the development of locomotives from about 1845 until his death last year.

ON THE 9th of June, 1921, George Althouse was laid at rest in the beautiful Fishkill Rural Cemetery, Dutchess County, New York. His observation of railway development began in boyhood, while the Iron Steed of the early period was to be seen in service, and, close at hand, he watched the evolution of the enormous locomotive which today is the feature of the American railroad. He was thoroughly familiar with the little single driver which still was working when he began railroading and in succession ran all the types which appeared prior to 1885, when he withdrew from railway work.

Mr. Althouse was born at Millerton, N. Y., July 10, 1832. About 1834 the family moved to the vicinity of Salisbury, Conn., where in due time George attended school and acquired a good education.

A Student of Locomotives

Like most boys, he had a lively interest in railway operations, and he remembered the arrival of the first train of the Housatonic road when the rails reached Falls Village. The locomotive was named "Pequannock" and was a single driver weighing about eleven tons. Successively he saw the advent of the other equipment of the Housatonic, and gave the order as follows:

Pequannock, Baldwin, single driver, outside connection;

Bridgeport, Baldwin, single driver, outside connection;

Albany, Rogers, four drivers, outside back axle connection;

Stockbridge, Rogers, single driver with trail wheel, outside connection;

New York, Rogers, single driver with trail wheel, outside connection;

Berkshire, Rogers, four drivers, like Albany, but heavier;

Massachusetts, Rogers, 4-4-0 type, 18 tons;

Connecticut, Rogers, 4-4-0 type, 19 tons;

Fairfield, Rogers, 4-4-0 type, 20 tons;

Litchfield, Rogers, 4-4-0 type, 20 tons;

Housatonic, Rogers, 4-4-0 type, 20 tons;

Reindeer, Rogers, 4-4-0 type, 22 tons;

George Althouse, About 1860

Pittsfield, Amoskeag, 4-4-0 type, 24 tons;
Taghonic, Amoskeag, 4-4-0 type, 24 tons.

The "Taghonic" was sold to the Hudson & Berkshire Railroad and renamed "Henry Waterman." Except as stated above, all were inside connected and equipped with V-hook and were wood-burners. This roster is down to 1852, when he ceased to be on the Housatonic. He related that an artist living at New Milford painted a picture of each locomotive with accuracy and gave the paintings to the respective engineers. How interesting it would be if those paintings could be found! Alas! the name of the artist is lost and presumably the paintings have been discarded by the descendants of these engineers.

Joined Illinois Central in 1858

After working on several railroads in the East, Mr. Althouse in 1858 was induced to go on the Illinois Central. His home was at Amboy, in the northern part of the state, and he ran usually on the North division, which at that time was supervised by E. P. Noyes as assistant master mechanic. Mr. Noyes had

Figures From 1861

Among Mr. Althouse's treasured possessions was a copy of the monthly statement of the superintendent of machinery for the Illinois Central for December, 1861. Samuel J. Hayes was superintendent of machinery at that time; William T. Morrow, master mechanic of the Chicago branch, which had a mileage of 252½; David Oxley, master mechanic of the South division, which totaled 230¾ miles; E. P. Noyes, master mechanic of the North division, which boasted 225 miles.

A complete account was given of the performance and expenses of the 113 locomotives at that time owned by the company. The total number of miles traveled by all the engines that month was 189,348. The total maintenance cost, including salaries (few of which ran over \$100), was \$31,199.88. The cost per mile traveled averaged 16.47 cents. A pint of oil was used every 15.42 miles; a cord of wood, every 40.26 miles; a ton of coal, every 38.60 miles. The locomotives, it should be explained, were almost equally divided between wood-burners and coal-burners. Thirteen of the engines were undergoing repairs or being altered to coal-burners, according to the notations.

Additional notes explained that the oil included that used in the headlights and the engineers' lamps; wood was rated at \$3.50 a cord and coal at \$1.75 a ton, loaded on tenders; two empty cars were rated as one loaded in computing the average number of cars hauled per trip of 100 miles, the average of which was 11.92. Notes also pointed out that the average cost per mile of passenger engines was 14.30 cents; of freight engines, 18.67 cents; of construction engines, 13.97 cents; of switching engines, 12 cents. The average cost per mile of freight engines using wood for fuel was 26.18 cents; of freight engines using coal for fuel, 15.69 cents.

come to the Illinois Central from the Fairbanks Works, and Mr. Althouse held him in high regard. Samuel J. Hayes, from the Baltimore & Ohio, was general master mechanic. The equipment was to a great extent Rogers. Only two carried names, and these were the "Cairo," on the South division, and the "Rogers," on the North.

Mr. Althouse noted the engines on the adjoining railroads. He liked those of the Galena & Chicago Union best and instanced a very beautiful locomotive of that road named "Como." This was one of the few built by

the Chicago Locomotive Company during its brief existence. The Burlington had dropped names for the most part, and likewise the Rock Island. A few on the Toledo, Wabash & Western carried names. What is now the Alton was insolvent and, he had the impression, did not name the engines but designated them by road numbers. In the days when the company was operating under the title of Chicago & Mississippi Railroad there are some reasons for assuming that it named its locomotives and that in the equipment were several very old ones which were of types antedating the building of the Alton & Sangamon Railroad, which the Chicago & Mississippi succeeded in 1854. Unfortunately, the motive power records prior to 1871 were destroyed in the Chicago fire, and data prior thereto is not accessible.

Mr. Althouse's train used to cross the line of the Peoria & Oquawka Eastern Extension Railroad at El Paso, Ill. He used to see the "W. H. Cruger" and its engineer at this crossing. Now that engineer in 1859 and 1860 was James C. Nash, and it is a singular fact that as an apprentice in 1854 he helped in the construction of this locomotive at White River Junction, Vt. He became an engineer and went to Illinois. In 1859 he was directed to go to Peoria and take the "Cruger." He was greatly surprised to find it was the very one which he had built. A marked character about the machine caught Mr. Althouse's attention, and he always greeted the engineer as his train rolled over the crossing. Many years passed, and then in 1916, through an allusion in a letter written to a friend of Mr. Althouse, the latter recalled the crossings of 1859 and sent a message to the "Cruger's" old engineer. The two exchanged photographs and kept up communication until 1920, when the former died.

Made Engine a Pile Driver

In the interchange of reminiscence, among other topics occurred mention of a singular locomotive belonging in 1859 to the Burlington; it then carried the name "Pigeon" and was well remembered by Mr. Althouse. It had been constructed in 1837 by Baldwin upon the order of the state of Michigan and ran on the state's railroad, then called the Central Michigan Railroad. The engine carried the name "Ann Arbor" and was a single driver. Its engineer was Charles F. Jauriet, a Frenchman of decided mechanical ability who became one of the prominent master machinists of the West.

When the Chicago and Aurora branch took the present name of Chicago, Burlington &

Quincy Railroad, Mr. Jauriet was called as master mechanic. He brought with him the "Ann Arbor," which meanwhile had become the "Pigeon" when in 1846 the state sold the Central Railroad to the Michigan Central Railroad Company. Mr. Jauriet remodeled the "Pigeon" and made it a pile driver. A letter received by Mr. Althouse on this point was as follows:

The construction of the "Pigeon" was somewhat different from the "Pioneer," as the one set of drivers was located in front of the fire-box and had a trailing pair of 30-inch car wheels behind.

Now the change to pile driver was this. A bevel gear was put on the axle and a shaft with a bevel gear on the end which worked in the gear on the axle. Then the shaft went to the front end of the engine under the smoke box connected to a drum on which the rope went around and connected with the iron hammer. A large spring was set at either end of the springs on the boxes of the trailing wheels and 3-inch square thread ran through the deck of the engine with a nut bolted to the deck. The bottom end of the screw rested on the spring board; the top end projected through the deck squared for a wrench. To use the engine as a pile driver, they screwed down on the screw, thus raising the drivers clear of the rails; then blocked the trailing wheels so the engine could not move. Now you see the engine was in condition to drive piles. This engine would haul all material used for pile driving. In other respects she was like the "Pioneer."

The "Pioneer," to which this alluded, was the historic engine which came to Chicago to open the Galena Union in 1848. It was built by Baldwin in 1836.

Mr. Althouse often spoke of the emulation

existing among the engineers of the Illinois Central in the management of their locomotives. Each tried his best to get the utmost number of miles from the fuel, oil and waste furnished to keep down repairs. Every month a great sheet was posted in the roundhouses where all could read it, giving the performance of each locomotive and its engineer, and the posting of these monthly statements aroused keen attention. He regarded these Illinois Central engineers as constituting a very fine type of man. The locomotives were standardized; they presented little difference in outward appearance and, not bearing names but being distinguished merely by road numbers, did not readily recall themselves. The one which he remembered best was No. 97. He recalled it as a reliable machine, but, of course, it did not present the individuality held by the "Schuyler" or "Island Belle," for example, thus showing how greatly that feature is increased by cognomen and how it is diminished by numerical designation. If the Pilgrims had come to Plymouth Rock on No. 838, instead of the "Mayflower," the vessel would be recalled by very few. However, names for locomotives were called for by a period of men, conditions and methods which long ago passed.

Mr. Althouse came into Illinois while political activity was intense. He was a Republican, having cast his first vote for the Fremont and Dayton ticket, and took great interest in the

George Althouse, at right, explaining to a friend about a locomotive he once knew. Picture taken a few years ago.

joint debates of Douglas and Lincoln. He attended one of these at Freeport and in 1860 cast his vote for the Lincoln and Hamlin electors.

Knew General U. S. Grant

He was assigned to a run which terminated at Galena, and in the evening, to while away the time, often visited a large store where many citizens of the town were wont to congregate for sociability. Here he occasionally exchanged greetings with Ulysses S. Grant. Grant at this period dressed coarsely and looked rough, as he wore a flannel shirt and tucked his trousers into cowhide boots. Indeed, Mr. Althouse hardly would have remembered him if it had not been that within a year or two Grant became exceedingly prominent. Had it not been for this burst into prominence, there is little doubt that the recollection of these casual meetings would not have revived, and Grant would have passed out of Mr. Althouse's memory together with many a similar figure in the motley throng of that Galena store.

George B. McClellan and Ambrose E. Burnside, superintendent and assistant superintendent, also came under his observation, and he remarked that he little dreamed these three individuals were destined to occupy the exalted positions in history which the Civil War brought to each.

During the war he was assigned on several occasions to locomotives drawing troop trains. At the close of hostilities he tried the New Orleans & Jackson and the Mississippi Central roads. Conditions were distasteful there, and he went out on the Union Pacific, then under construction. The lawlessness of the plains impressed him unfavorably, and he came back to Illinois, where he stayed several years.

Tamed a Balky Engine

The year 1869 found him on the Central of New Jersey. His fine qualities soon caught the attention of Superintendent R. E. Ricker. Perhaps the particular incident which won Mr. Ricker's appreciation was this. A locomotive had come from the Grant works and proved "cranky." So much difficulty was experienced that the engineers, one after another, declined to have anything to do with the machine.

Mr. Althouse asked leave to study its peculiarities and finally located the trouble. Thereafter, it was perfectly tractable, and Mr. Ricker, who had debated whether or not to dispose of it, was delighted when Mr. Althouse drew an excursion train of seventeen cars to Plain-

field and return on schedule time. He let Mr. Althouse have the little "Flemington"—the last of the wood-burners. The latter could depend on this fine Baldwin, which had the run to Somerville as a local, for it came quickly to full speed between stations. He considered this engine one of the easiest locomotives to manage that had fallen to his lot, and it was, with the possible exception of the "Island Belle," the one which gave him the greatest satisfaction to recall. While he was aware, of course, that the day of wood-burners had closed, nevertheless he maintained

Engineers in 1861

The engineers employed by the Illinois Central in December, 1861 (according to the monthly statement of the superintendent of machinery which was in the possession of Mr. Althouse), together with the numbers or names of their engines, were:

Chicago Branch

Nos. 1, C. J. Sabin and others; 6, N. Smith; 12, J. Granger; 21, L. Hancock; 24, N. Nellis; 25, H. Bailey; 33 and 42, E. Quinlan; 43, Wilson and Hancock; 46, T. Rackham; 47, C. N. Gilmore; 48, O. F. Carlton; 50, J. Hammill and others; 53, C. Lawrence; 59, J. Lester; 60, C. P. Noble; 70, L. Wilson; 71, S. P. Brown; 72, C. N. Gilmore; 73, F. Ongley; 76, R. Willis; 77, C. Draper; 80, S. Brown; 82, J. Wright and others; 83, M. Hackett; 86, F. Peugeot; 89, N. Smith; 90, E. Vaughan; 95, G. Klyber; 96, W. H. Wild; 100, W. Dempster; 103, J. Enwright; 104, John Gillan; 106, E. Morris; 107, J. Wright; 108, P. Sendt; 109, H. P. Rogers; 125, H. Smith; 126, George Jackson; the "Rogers," Allen and Luddington.

South Division

Nos. 5, A. McWilliams; 7, J. Eastman; 9, P. Battles; 11, B. C. Howard; 14, Samuel Lane; 16, P. B. Bryant; 17, A. J. Wimple; 22, George C. Conover; 29, J. Shandorf; 34, W. Dibble; 38, Samuel Lane; 39, C. S. Bayley; 40, G. R. Clark; 56, G. Harrington; 58, A. J. Van Patten; 61, H. Filkins; 62, E. P. Phelps; 68, W. H. Ledgerwood; 74, Alonzo George; 78, F. Pratt; 81, C. H. Lawrence; 84, Alex Moore; 87, A. R. Clements; the "Cairo," A. McWilliams.

North Division

Nos. 18, George Snow; 20, F. Dunning; 23, William Rolph; 26, John Doyle; 27, J. M. Cook; 28, H. McGraw and others; 30, W. C. Wellington; 35, C. Putnam; 36, J. Purington; 37, J. Hathaway; 41, F. Westcott; 51, I. R. Patterson; 52, H. Graves; 54, H. D. Clark; 65, D. Reynolds; 67, L. H. Stay; 69, N. F. De Groodt; 75, D. Reynolds; 79, H. McGraw and Graves; 85, H. Graves; 88, J. Howe and others; 91, John Spalding; 98, H. P. Cook; 99, A. L. Beach; 101, John Carter; 105, William Trude.

that they were far pleasanter to manage than coalers.

From the Central he went to the Rondout & Oswego, and thence to the Rhinebeck & Connecticut, running from the Hudson to Hartford. This road had a large but unremunerative traffic, went into insolvency and has lost its identity, becoming merely a local branch line. Mr. Althouse in 1885 retired from locomotive engineering and thereafter lived at Groveville. He filled the position of engineer in the Matteawan Manufacturing Company for a long time, but finally withdrew as infirmity of age came on, and took his leisure.

A Man of Remarkable Memory

He was a man of thoughtful mind, modest and unassuming. It was a pleasure to converse with him, for he expressed his ideas clearly and logically in well-chosen phraseology and never rambled. His retentive memory and active mentality endured to the last, and when he laid down the daily newspaper and opened conversation with a companion his talk was sure to be interesting, whether it bore on social topics or on railway affairs.

Another characteristic was the memory which he held of locomotives—not merely a memory of the ones which he managed during his thirty-six years of engineering, but of the very large number which came under his observation. He seemed to carry a distinct picture of these locomotives. He usually would state the make; then whether or not it was a wood-burner; then, whether inside connected; whether the name was paneled on the boiler or on the cab. Regarding the make, he very seldom failed to recall it correctly—indeed, but

one instance occurred where memory in this respect proved treacherous, and that, oddly enough, was in the case of the first locomotive which he ever saw—the “Pequannock.” He declared it was a Rogers, while in reality it was built by Baldwin in 1839. Possibly some bystander erroneously pronounced it a Rogers, and this first impression quite likely remained paramount whenever he happened to think of the “Pequannock” after a long lapse of years. His offhand statement of the make of an engine which he had seen, perhaps casually, years before was time and again confirmed by reference to the official roster of the master mechanic. He had a real love for a locomotive and regarded it as a “breathing being almost.”

Mr. Althouse was a true representative of the type of engineer which characterized the middle period of our locomotive engines. He took a deep interest in his work and performed it as intelligently and conscientiously as if the locomotive were his own property. He did not spend much thought on the question whether or not the pay was what his services were worth. He had no need for thought of this kind, since superintendents always gave him the highest rate, for they recognized his ability.

AN IDEA; PASS IT ON

Agent J. W. Sayre of Rockwell City, Iowa, writes that for some time he has placed a copy of the *Illinois Central Magazine* in the Rockwell City Free Public Library. The manager tells him that the magazine is frequently called for. Perhaps this will contain a suggestion for some of our other readers.

Our Monthly Roll of Honor

Below is a list of employees retired at the meeting of the Board of Pensions June 29:

Name	Occupation	Years of Service	Date of Retirement
Peter J. Betz.....	Laborer, Dubuque, Iowa	23	4/30/22
Rex M. Ickes.....	Conductor, Minnesota Division.....	15	4/30/22
Andrew Allen	Switchman, New Orleans, La.....	23	5/31/22
John J. Ryan.....	Engineman, Chicago Terminal.....	35	6/30/22
John Goetz.....	Carpenter, Burnside Shops.....	40	6/30/22
Edward T. Shergold.....	Clerk, Chicago Terminal.....	33	6/30/22
Frank M. Williams (Deceased).....	Conductor, Illinois Division.....	27	4/30/22
Y. & M. V.			
Cornelius Walker (Col.).....	Locomotive Fireman, Memphis Terminal.....	35	3/31/22

The following deaths of pensioners were reported at the same meeting:

Name	Last Employment	Date of Death	Term as Pensioner
James Prendergast	Watchman, Chicago;		
	Chief Special Agent's Dept.....	5/30/22	1 month
Daniel J. Donovan.....	Boilermaker, Minnesota Division.....	6/12/22	2 years

57 cars of bananas going into Centralia Yard.

No. 21 rounding the curve into Makanda.

Waiting to follow No. 1 from Centralia Yards.

Going to work at one of the mines.

Waiting for No. 5 at Anna.

Women cleaning up yards at Mounds during World War.

Three pictures at once.

Some thoroughbred bulls lent to Centralia farmers by I.C.R.R.

At large with a kodak. Snapshots taken here and there in the last few years by E. B. James, 404 South Pine Street, Centralia, Ill., a conductor on the Centralia district of the St. Louis division. Conductor James pleads guilty to being a "kodak fiend." Are there others like him on the system? The magazine is always glad to get interesting pictures, particularly those having to do with railroading.

Our Program of Locomotive Superheating

Work Involves Changes in Equipment of Engines to Make All Parts Correspond in Strength

By W. O. MOODY,
Mechanical Engineer

THE original program of superheating locomotives was extended to include other necessary improvements, so that the engine as a unit would be in harmony, as to strength, with its increased boiler efficiency and the economy for which the superheating equipment is responsible.

When well-designed saturated steam power, through the application of modern economical devices representing well-established practice, has had its capacity or efficiency or both increased, it may be considered as having been, to a certain degree, modernized, for it is now on a fairly comparable basis with the most improved modern designs. The advantages de-

rived from modernizing well-designed old power have been demonstrated by repeated road and laboratory tests throughout the country, so that a reasonable return in fuel and water economies can be assured on the investment.

Factors to Be Considered

When such a program involves a large number of locomotives, it necessarily follows that the work must extend over even several years, and this time may have to be extended due to unfavorable market conditions.

The quality of water and fuel in different localities may be the governing factors in determining upon the policy of reconstruction, since that which would answer all requirements for a class of power in one section would not guarantee equally favorable results elsewhere.

To do this work under a well-prepared pro-

Engine No. 1000 Before and After

Alterations Made on Engine No. 1026

gram on any extensive scale demands increased shop facilities, either in space or in having obsolete tools replaced by modern of greater output capacity, so that the old shop is also modernized and its output increased to be in harmony with its modernized output.

Some Parts Can Be Purchased

By the purchase, on the open market, of certain of these modern devices, machined and assembled, the back-shop may be relieved of a percentage of the burden of manufacture. Outside valve gears, for example, can be purchased and applied without any very great increase in shop work or costs over a link motion gear which may require a large amount of renewal of parts and is not satisfactory on large engines.

Before such work is begun, each class of available locomotive is given serious study to determine to what extent it is advisable to increase its capacity or efficiency and the reason for each class of improvement based upon expected results in increased efficiency.

With a well-considered program prepared, it becomes necessary to compile careful estimates to determine the interest returns on the in-

vestment in tools and improvements to power. Although we may have a satisfactory foundation upon which to reconstruct our modernized engine, it often becomes necessary to renew many small details that would be over-stressed—as, for example, crank pins, main axles or portions of the frame—and this may represent a respectable proportion of the total investment involved.

A Move Toward Standardization

We also have another factor which exerts its influence in determining the reconstruction program. A road may operate a satisfactory class of engine which on later orders has been redesigned to accommodate superheaters with larger cylinders and reduced steam pressure, so that it is a wise policy to have the superheated types serve as models when reconstructing the saturated ones, and thus reduce the number of classes, including the storehouse stock and patterns.

As an example of this, when Pacific type engines Nos. 1031-1048 and 1054-1068 were superheated they were also equipped with Walschaert valve gears, larger cylinders and

No. 673 Superheated and With Universal Valve Chest

main axles, so that they are now duplicates of engines Nos. 1069-1138.

Also, Pacific type engine No. 1000, with some change in boiler and with cylinders bored to 25 inches in diameter, will be in the same class as engines Nos. 1069-1138.

Disadvantages of the Slide Valve

Engine No. 1031 was the first engine that

was superheated according to the program. Like the other Pacific types in this class, it was originally fitted with piston valves and link motion valve gear.

The engines in series No. 541, No. 651 and No. 2001, however, have the ordinary slide valve, which does not operate well under superheated steam for the reason that the cast iron

No. 1031—Ancient and Modern

of which the valve is made warps under the great difference in temperature. In addition, its large flat area does not lubricate well. Some roads have experimented with brass slide valves, with indifferent success, and have finally had to adopt an outside steam pipe connected to a special design of steam chest fitted with a piston valve having outside admission. Another disadvantage of the slide valve is the fact that the original steam passage in the cylinder saddle must be used, and this results in cracked cylinders.

A Saving in Coal and Water

The range of temperature for an engine operating with saturated steam is from, say, 60 degrees Fahrenheit for a cold engine to 388 degrees Fahrenheit under steam at 200 pounds per square inch, while this latter temperature may be as high as 600 degrees with superheated steam. Cast iron in certain forms is

liable to fracture when subjected to the high temperature range which is obtained with superheated steam.

The reason for superheating locomotives is that the saving in coal and water is sufficiently great to warrant the cost of application and the increased maintenance cost of an additional appurtenance as represented by the superheater. A conservative saving in coal is about 20 per cent and in water 25 per cent, as compared with the same engine operating on saturated steam. In general, the lower the steam pressure, the greater the economy resulting from superheating.

Here Is Our Superheating Program

Our superheating program will be readily understood by the data in the table below, which also indicates some of the results obtained by modernizing other details, as valve gear, valves, etc.

Engines By Class	Engine Numbers	Number of Engines In Super-		Cylinder		Steam Pressure		Tractive Effort, Lbs.		Remarks
		Class	heated	Before	After	Before	After	Before	After	
Mogul	541- 598	58	22	20x28"	same	200 lb.	same	30,222	same	Had slide valve Changed to inside admission

How We Picked Up \$11,000 Extra in April

By R. B. GOE,

Supervisor of Weighing and Inspection

Reweighing and inspection on the Illinois Central System in April increased freight revenues \$11,610.23. Of the total LCL tonnage reweighed, 11.6 per cent increased revenue \$3,860.11, while of the 31,729 shipments inspected 2,777—or about 9 per cent—were found misdescribed and revenues were increased \$7,750.12.

In order to assess transportation charges correctly as required by law and to apply lawfully published classification and tariff provisions, it is highly important that all freight offered for transportation be correctly weighed and described.

Description means the kind of commodity, how packed, crated, knocked down, set up, etc. Misdescription of freight is a misrepresentation of facts which permits, in many instances, transportation of freight at less than tariff

rates, increases liability of the carrier and promotes undue advantage to the shipper.

Recent observation indicates the tendency toward misdescription is greater at this time than for a number of years past, and there is a greater necessity for close inspection of all freight at forwarding stations where such inspection should be made; however, the fact that inspection should be made before freight is received does not relieve the delivering agent of the responsibility to collect transportation charges on the correct description when the shipment is found improperly described.

Practically all the railroads are members of one or more of the various weighing and inspection bureaus, whose functions are to supervise, instruct and enforce uniformity, but in no way to relieve the carrier of the responsibility in the enforcement of classification and tariff provisions.

These bureaus, while not responsible for fail-

ure at receiving stations to weigh and describe freight correctly, are a part of the railroad—are employees of the railroads—and as such should have a large part in the education of station employees in these features. Agents and station employees should not hesitate to call upon them at any time for assistance in the enforcement of classification and tariff provisions.

We have been endeavoring through these agencies and by instruction of station employees to increase efficiency in this direction, and while some progress has been made, as shown by the following tabulation for April by divisions, there is every indication that these important features are not receiving all the attention necessary to insure full protection of our interests:

Divisions	—REWEIGHING—		—INSPECTION—			
	Per Cent of Tonnage Reweighed	Revenue Increase	Number of Shipments Inspected	Number Found Mis- described	Revenue Increase	Total Revenue Increase
Chicago Terminal	10.9	\$ 322.95	274	144	\$ 144.51	\$ 467.46
Illinois	31.	168.30	557	4	21.86	190.16
St. Louis	15.6	485.83	671	58	15.80	501.63
Springfield	3.9	115.28	2,339	78	320.94	436.22
Indiana	14.3	452.06	4,433	286	878.46	1,330.52
Wisconsin	8.5	40.46	786	52	33.69	74.15
Minnesota	8.5	118.79	990	58	95.64	214.43
Iowa9	129.90	1,408	57	407.62	537.52
Kentucky	4.1	539.88	5,474	486	793.26	1,333.14
Tennessee	6.4	266.06	1,803	22	160.41	426.47
Mississippi	5.6	97.21	202	4	7.95	105.16
Louisiana	33.4	278.87	2,558	81	203.01	481.88
New Orleans Terminal..	2.1	344.34	3,846	1,282	2,209.12	2,553.46
Memphis Terminal1	228.42	446	82	2,175.63	2,404.05
Memphis	28.2	111.43	2,635	39	207.68	319.11
Vicksburg	32.9	63.82	2,430	38	57.59	121.41
New Orleans	3.9	96.51	877	20	16.95	113.46
Total	Av. 11.6	\$3,860.11	31,729	2,777	\$7,750.12	\$11,610.23

It is hoped that station employees will continue their efforts and that these important features will be watched so closely that in time

it will be impossible to find a misdescribed or underbilled shipment that originated on our lines.

Makes Him Feel Good to See Our Engines

A loyal and faithful employee, now retired, is W. D. Melsa, who was pensioned December 1, 1921, after nineteen years of service as a hostler at Cedar Rapids, Iowa. Mr. Melsa was employed as a hostler at Cedar Rapids May 2, 1902, and continued in the work at that place until October 31, 1921, when a general breakdown in health necessitated his retirement.

"He was a faithful employe and always willing to do all the work that there was to be done," writes his former chief, N. Bell, master mechanic at Waterloo.

Mr. Melsa was born in Bohemia in 1860 and came to the United States with his parents when he was 8 years old. From 1880 to 1902 he was employed at Cedar Rapids as engine inspector and stationary engineer for the B., C. R. & N., now the Rock Island. Then he entered the employ of the Illinois Central.

"I can remember well when the Illinois Cen-

W. D. Melsa

tral had only three engines at Cedar Rapids," writes W. Mueller concerning his friend, "and Mr. Melsa was the whole force. He was interested in his work and desired everything to be right and safe. The engineers admired him greatly, and he still has many friends among the employees.

"Mr. Melsa is suffering from rheumatism, which makes him unable to work, but he comes every week to see our engines. He claims it makes him feel good when he sees our engines."

This Section Home Is Surrounded by a Park

Travelers Admire Attractive 5-Acre Plot of Ground at Ripley, Tenn., Which Company Had to Buy

MANY travelers on the Illinois Central have probably admired the park along the right-of-way at Ripley, Tenn., and have wondered why such a large tract of land should be converted into a beautiful garden. There are about five acres in the park, extending a considerable distance along the east side of the tracks at Ripley.

Looking from the east side of a coach at Ripley, one sees a pretty little section home high on a hill, with a lawn extending gracefully down the slope to the base of the tracks. It is indeed a wonderful setting for a house. The entire hillside has been handled with greatest care. The grass is so thick the blades rub together, and it is kept mowed close to the ground. This rich, green, velvet carpet is dotted here and there with small trees, shrubs and hedge that are trimmed into artistic shapes.

H. L. Ferguson, section foreman, who lives on the property at Ripley, tells the following story concerning the park and land there.

A Mr. Pierson, he says, owned forty acres of land adjoining the Illinois Central right-of-way at Ripley eighteen years ago. When the road was built, a cut through a large hill separated Mr. Pierson's farm from the city. He vigorously protested, but an overhead bridge just for his convenience was too expensive a project for the company to undertake.

H. L. Ferguson and Family

There came a time when Mr. Pierson was elected to a prominent office in the administration of Ripley, and he lost no time in making arrangements to use his office to force the Illinois Central to build an overhead bridge from his land over the tracks to one of the streets of Ripley.

Realizing the expense of such a structure and the probability of being forced to construct it, the Illinois Central purchased the

The Section Home of H. L. Ferguson

Another View of Our Park at Ripley, Tenn.

farm from Mr. Pierson. The price paid for the land was undoubtedly much less than the bridge would have cost, Mr. Ferguson says.

The old Pierson home served as a section house until 1914, when Mr. Ferguson became the section foreman at Ripley. The house was a poor shelter and was at an inconvenient place on the land. After living in it two weeks, he persuaded the company to build the present section home on the most desirable site.

Mr. Ferguson does not allow the thirty-five acres that are not in the tract to lie idle. He cultivates eighteen acres and uses the remainder as pasture for his stock.

There is a strawberry patch of six acres, and this year it produced 221 crates of the berries for the market. Twelve acres planted in cotton last year produced eight bales. Last year the land produced sixty bushels of potatoes.

In the pastures, Mr. Ferguson has two mules, one horse, three milk cows, one heifer, one calf and six hogs.

Mr. Ferguson does not have the time to cultivate much of the land himself. After he finishes his section work, he does not have more than enough time to attend to his little garden. He hires negroes to work for him. The old Pierson home serves as their shelter.

When the company built the new section house, plans were made to tear down the old

Pierson home, but Mr. Ferguson asked permission to keep it in repair to be used by his help. The negroes paid him \$5 a month rent, and he used that money to keep the building in good repair.

Plans are under consideration, Mr. Ferguson says, to make the park even larger than it is now.

FOUND A LOST HAT

A woman's hat blew out of the window of a coach on No. 14 as it was approaching Iowa Falls, Iowa, June 23. Road Supervisor H. Huffstutter, who was on the train, informed the owner of the hat that a special effort would be made to recover it for her. She gave him her address as Farley, Iowa. When No. 14 arrived at Iowa Falls, Mr. Huffstutter enlisted the services of Sam Craiglow, engineer on a local freight, and George Hutchinson, station baggageman. The three started walking west on the right-of-way in search of the elusive headpiece. Near the 2-mile post, the search came to an abrupt end. There was the hat, and it was only slightly damaged. It was forwarded on No. 28 the next morning to the given address. The owner valued the hat at \$17.50. General Superintendent W. S. Williams wrote a letter of commendation to the employes concerned, praising them for the special effort put forth in this case.

Railroading as Enjoyed by Soviet Russia

Primitive Methods and Worn-Out Equipment Are Common; Delays Are the Rule, Not the Exception

American railway employees who occasionally have the so-called advantages of soviet government in Russia pointed out to them ought to be interested in the following dispatch concerning soviet railway conditions which F. A. Mackenzie, special correspondent, sent to the Chicago Daily News.

ONE afternoon in central Siberia the train on which I was traveling broke down. There was nothing unusual in this. I stepped out of my compartment to discover what fresh thing had gone wrong. What I saw was typical of railway conditions in outer Russia today.

The train had been climbing a moderate gradient, and one of the pins fastening the outer coupling rod had snapped under the strain. The driver was striving vainly to knock the other pin out, but he had no hammer. One of his assistants was trying to cut a beam of wood to fit the place, with some strange idea of using it as a rod. But he had neither knife nor chisel nor saw, and was endeavoring to cut the wood with a cold chisel. He could have done it better with his teeth.

Finally the driver demanded some rope. A length of cord was found. He tied up the broken parts with this, poured oil over it and set out. The cord held until we reached the next divisional point, eight or ten miles away.

While he was making his repairs, I examined his locomotive. It was unspeakably dirty. The painted parts had seen no fresh paint for many years. The machinery may have had lubricating oil some time back, but I could find no trace of it. The thing was a wreck, and yet, wreck that it was, it was hauling the main train on the trans-Siberian railroad.

Railway System Near Collapse

Eight years ago the Siberian railroads were among the most comfortable and luxurious in the world. I traveled on them many times and never desire easier journeys. Today the entire system has almost collapsed. To travel as a passenger you have to obtain special permission from the authorities. The trans-Siberian express now goes only as far as Novo-

Nikolaievsk, about half way. Beyond that, there are supposed to be three trains a week, as far as Irkutsk. Usually there are only two. From Irkutsk to Chita there is one train a week.

After you have obtained permission to travel, you cannot be certain when your train will arrive, or whether there will be room in it for you. You may—unless you are a person of unusual importance—wait for two or three weeks before you find a place.

There are constant delays. The train may be left for one, two or three days in a small station waiting for a locomotive. Once my train was held up for thirty hours at a village where no food was to be had. You may stop all night—as once happened to me—because the engine driver and his crew have finished their day's work and gone away for a rest, food and bed. Then there are breakdowns innumerable. Sometimes you have to wait for coal. Three expresses were waiting at the same time in Omsk station in mid-December for lack of fuel. One of them had waited for a week.

In my journey from Moscow to Irkutsk and back, I covered more than 10,000 versts (6,600 miles), apart from side trips. Our trains rarely exceeded twelve miles an hour. From Novo-Nikolaievsk to Irkutsk, a distance of a little over 1,700 versts (about 1,020 miles), took nearly seven days, or an average, including stops, of less than seven miles an hour.

Coaches Dilapidated and Cold

Many of the first-class cars are old International Wagons-Lits. Their outer paint has all worn off, curtains, blinds and carpets have disappeared, the lavatory basins are broken and unusable, the electric light apparatus is wrecked, the bells do not ring, and some of the windows are broken and have been partly replaced by wood. Worst of all, the heating apparatus is worn out. I have traveled for days with the thermometer in the compartment registering several degrees of frost. The old Russian cars are much better in this respect. They are at least warm.

You take your own bed, light and food with you. I found a Primus stove a boon. This is the kind used by every experienced Russian

traveler. You cook your meals in your compartment. Some food, mostly bread and sausages, can be had at many villages.

In central Siberia the peasants will not accept soviet money. They demand matches, salt or cloth in exchange for food. Hot water can be had at most stations. There were a few railway restaurants open when I crossed eastward. Most of them had closed when I returned.

I saw much of the railway men on my journey and traveled for some distance in a railwaymen's car, an old third-class compartment, where we were packed like herrings in three tiers of wooden benches, one atop of another. The compartment was dark even in daylight, for there was nearly an inch of ice inside the double windows. The men talked freely about their lives and ways. They are anything but contented, and do not hesitate to say so.

Slow Pay for Railway Men

The railway services in the Russian republic are today semi-militarized. The men are not allowed to leave their employment. They are paid, or are supposed to be paid, by the state. They are subject to special discipline, with a special branch of the cheka (the much feared political police) to watch them, and a special traveling judiciary to try and sentence them.

Last November, when soviet money began to approach the exchange rate of 250,000 rubles to the dollar—it was over 500,000 rubles to the dollar before I left—the government announced an increased scale of railway wages and allowances. The men were to be paid at a rate averaging about 200,000 rubles a month in money, fifty pounds of flour and other rations of food.

A special advance payment of 100,000 rubles per head (about 25 cents) was made right away. Then came a long wait. When I last inquired, late in January, no more wages had been received, and part of the November food ration was just being issued.

"The worst of it is that we are not allowed to leave and find other employment," one man told me. "A number of the young fellows have done a bunk and got away. If they are found, they are brought back and imprisoned as deserters. But we married men cannot do that. I would be off to a flour mill at once if I could. You can always take enough grain away from there for the children's food."

"How do you live, if you are not paid your wages?" I demanded.

"I do like many others. I buy goods, usually government monopoly goods, for they are scarce and dear, in the town, and take them to the country. I exchange them with the peasants for food. I take that back to town and sell it at a profit."

This plan, I found, is general among the railway men. One guard on a through express showed me his stock. He took his wife with him, the two occupying a big compartment, although a number of passengers had been left behind for lack of room. The lavatory attached to the compartment was stocked up. Salt was this guard's medium of exchange. The country people are clamorous for salt. The wife did the bargaining with the peasants, so many pounds of salt for a goose, so many for a sucking pig, and so on.

Bribery for Train Compartments

Another way in which the railway men live is by extortion. If you wish to make sure of a place in the train and are not a high official, you first see the station master, the booking clerk and the conductor, and some money changes hands. The man who gives the bribe is liable to heavy punishment. But the man who does not is very often left behind. A greedy guard will fill the corridors of first-class compartments.

The government attempts to improve the service by harshly punishing the men. What is really wanted is the payment of their wages, better organization and supervision and an increase in the skilled staff. Big sums are being spent on new locomotives from Germany, while there are hundreds of locomotives going to wrack and ruin in sidings at the main stations that could be restored to good service were there skilled men and machinery to repair them. Something, I admit, is being done in the way of repairs. At the present rate of progress it will take four and a half years to mend the engines now disabled.

The punishments of the men are severe and would produce immediate rebellion on any American road. I came across two sets of cases in one week. A mail train was held up for three days at Novo-Nikolaievsk, waiting for a locomotive. The temperature was about 20 degrees below zero and the cars froze so solidly to the rails that it was found difficult to get them away. The assistant station master and one of his subordinates were held to blame for this. He received a month's imprisonment, and the subordinate ten days.

One of the repairing shops at Omsk caught

fire. When the fire extinguishing apparatus was brought out it was found that the pipes were rotten and the engines worthless. The fire was accidental, but the man held responsible for it received a sentence of five years' imprisonment. The head of the fire department was sent to prison for a year, and some of his helpers for lesser terms.

Cheka's Spies Abound

Spies of the cheka are sent among the railway men to obtain evidence of corruption. One woman spy told me that she procured evidence that resulted in death sentences for five railway men on a specially corrupt branch line. Her only regret seemed to be that fifty-five had not been convicted.

At Omsk I did not see the station master myself but sent some one for my tickets while I personally guarded my luggage. The station master was so careless that he neglected even to read my official authorization,

or he would have realized that it was not safe to hold me up. His clerk raised some minor objection about the signature on my papers and would not issue the tickets. A few hundred thousand rubles no doubt would have settled the matter, but I was not there to give them. The train went off without me.

Immediately the higher authorities heard of this, orders were issued for the station master's arrest. Other charges against him quickly transpired, and he was brought to trial. It was proved that he had accepted two bribes, the equivalent of about \$20 altogether. The government prosecutor demanded a death sentence; he received a sentence of five years' imprisonment.

The Moscow government has just appointed a new chief of the Russian railroads, the man who up to last December was supreme organizer of the cheka, the most dreaded and merciless man in Russia.

Our Yards Are Kept Busy at Mounds, Ill.

By W. WICKER,

Acting Trainmaster, Mounds, Ill.

O. O. McIntyre, the New York human nature writer, remarked that on his late Western trip he was unable to see some of the Western towns on account of their being hidden behind a box car. Had he passed through Mounds any day in May he would have experienced the same difficulty, since that town was hidden by several thousand cars of every description.

About thirty-two years ago a few tracks were laid out in Mounds and facilities begun which were thought to be adequate. This was at a time when cars between the North and South were transferred in boats across the Ohio to East Cairo and across the Mississippi to Bird's Point, Mo. The Cairo bridge, later completed by the Illinois Central for a single track, has been taxed to its capacity for many years past, and now double tracking has become necessary and is in immediate prospect.

These yards have been expanded year by year, until at present they extend from Villa Ridge to one mile south of Mounds, or a distance of approximately four miles. Part of this distance has a complicated network of thirty-two tracks side by side, with new round-houses, shops, coal chutes and offices enlarged and rebuilt from time to time in an effort to keep abreast of the steadily increasing volume of business between the North and South.

Figures are not uninteresting when they prove something; therefore, the following are submitted for May, 1922:

Mounds used 7,858 tons of ice, icing 5,474 cars. In May, 1921, Mounds used 4,098 tons, icing 3,675 cars.

The transfer shed handled 4,329 tons of merchandise, 670 cars, in May, 1922, compared with 3,571 tons, 586 cars, in May, 1921.

One old negro employe said: "I'se gwine vestigate my money in a piece of land. Hain't no use for me to work for old man I. C. no more. I'se been working hard for him comin' on eight years, and he ain't never ketched up yit."

His version of activities is not far wrong when you consider the following:

Total number of cars handled, May, 1922, 162,304; May, 1921, 104,237; increase, 58,067.

Total number of trains run, May, 1922, 1,485; May, 1921, 921; increase, 564.

A large number of these loads were southern vegetables requiring re-icing and re-consignments. This complicated the movement and necessitated a small increase in the yard and station force. There was considerable new coal business moving north from the Kentucky mines on account of the miners' strike, and the East Cairo district was taxed to its limit during this time. The movement is still in progress.

The following telegram from Superintendent

C. R. Young, dated June 12, is self-explanatory:

"Presume you noticed movement into Mounds, total 976 cars, which has been exceeded only five times since 1911, and the movement out of Mounds-Cairo district, 1,173, which has been exceeded only once since 1911. Peak movement into Mounds last 11 years was 1,191 cars, April 6, 1916. The peak movement out of Mounds was 1,249 cars, June 23, 1917."

It develops, by reliable information, that on

our lines in Louisiana and along lines of our connections in Texas and the Gulf states there is a growth in the vegetable and fruit industry that promises an even greater bulk of high class business in the future.

During the high water, Mounds handled both passenger and freight business in solid trains for roads less fortunate than ours, some of which were forced to use our rails for as long as two weeks at a time.

The strawberry and vegetable express movement was unusually heavy this year.

Something Up-to-Date in Circus Trains

Here are views of a modern all-steel circus train recently built for the Sells-Floto Circus Company by the Keith Railway Equipment Company of Chicago, whose shops are at Hammond, Ind. All the cars are enameled in white and lettered in turkey red, with black shading.

They are 70 feet long, 8 feet 11 inches wide and have a capacity of 80,000 pounds. They are equipped with American automatic hose connectors.

The flat cars, capable of carrying five loaded circus wagons, are equipped with Klasing hand

brakes and possum bellies for handling ropes and tools.

The stock cars, 13 feet $3\frac{1}{4}$ inches high at the eaves, are equipped with stalls, collar carriers and automatic feed troughs to accommodate thirty-four horses; one car is equipped with a partition and double deck twelve feet from the end to accommodate nineteen ponies in addition to twenty-eight horses.

The elephant cars, 14 feet 2 inches high at the eaves, are decked at one end to accommodate ten ponies and also divided into two spaces by a partition to carry four camels and eight elephants. Each car has ten windows on each side barred and screened for ventilating. They are equipped with steam line, air signal line conductors valve and rolled steel wheels for passenger service.

No class of freight is so hard on railway equipment as circuses. For instance, all circus flat cars, in addition to the regular flooring, are lined with 3-inch oak plank, upon which the wagons are run. So heavy are these loaded wagons that this oak lining seldom lasts more than six weeks, when it must be replaced. Even the heavy steel plates laid between the flat cars, over which the heavy loaded wagons are run, have been known to bend and give way under the weight of these wagons. Not only are the loads hard on circus cars, but the train, being a combination train generally of flats, stock and coaches, requires skillful handling. Some shows have been known to shorten the season on account of the deterioration of their railway equipment.

Editorial

A CREED OF COURTESY

In every room of a downtown Chicago bank there hangs a sign which reads:

"Our creed: To be obliging to our customers; to render full service to every patron; to remember that gentleness and kindness will win the respect of those with whom we come in contact; never to forget that our customers are responsible for our business."

We believe that is an excellent definition of the spirit which should guide the officers and employes of a railway system, and we offer it, without further comment, to our readers.

PUBLIC OPINION

"Public opinion is often like a fire department. Some one must turn in the alarm, or it will come too late. Some one must arouse it; some one must keep it awake; some one must interpret it. . . . Otherwise, public opinion would be helpless."

The foregoing, from an editorial in the *Chicago Herald and Examiner* of July 6, brings to mind the obligation we as railway men have for arousing public opinion in behalf of measures which will strengthen the railroads and make them better able to serve the public with transportation. The writer of the editorial declares that there is a popular fallacy that public opinion is always self acting, incapable of error, certain of result. Perhaps we often fall into the error of sharing this view.

Public opinion might be compared to a fire, which will soon die out if we do not add fuel to it. We are the tenders of the fire, so far as public opinion about the railroads is concerned. We are in touch with railway problems; we meet these problems every day in our routine of work; to us belongs the duty of keeping the public advised about them. The public is ready to listen to us, as railway men, when we speak of the problems of transportation.

The one thing which the railroads of the country most greatly need is the friendship of the public. We can help to bring about that condition, not only because we are part of the public, but because the other people who help to mold public opinion are the people who

ride on our trains, who ship, or receive freight shipped, over our lines. We meet and deal with them every day.

OUR PENSION SYSTEM

The attention of our readers is directed to the statement on our pension system by President Markham published on page 131 of this number. Our pension department recently passed its twenty-first birthday. Up to date it has paid out to retired employes nearly two and one-half million dollars.

The money paid out in support of our pension system is a good investment for the railroad. It is right to reward faithfulness and loyalty of employes who by their continuous service eliminate the wastefulness which results from constantly training new men for the various positions.

President Markham has said, upon numerous occasions, that he is proud of the asset which the Illinois Central System has in its loyal employes who have been long in the service of the railroad. We are a big family, gathered together to do an important work, and we should promote the interests of one another in every way that we can consistently.

We believe the employes of the Illinois Central System, especially those whose pension rights, as a result of long and continuous service, are of considerable cumulative value, deeply appreciate the pension system. It has been a comfort to many employes who face old age or who have become incapacitated. All of us who have a number of years' service to our credit value our pension rights highly.

CONSTRUCTIVE REGULATION

Transportation is so vital to the public welfare that the business of performing transportation service should be supervised by governmental agencies. Railway men do not object to that. Their objection is to the one-sided tendency which regulation has assumed in the past. To safeguard the public's interest, it is important that the railroads should be permitted and assisted to function without unnecessary restrictions and to finance extensions to and improvements in their plants.

PUBLIC OPINION

What the

World Thinks

WATER COMPETITION

On every hand, even from quarters where there should be deeper thought and fuller information, we hear the plea for increased facilities for water transportation because "carriage by water is so much cheaper than by rail" and because "the railroads, when the great volume of traffic comes with revived business, will not be able to handle it adequately, because of the condition of their equipment." This, of course, is not the only argument made in favor of this or that waterway improvement, but it is, at least, one of the principal arguments. One hears it in connection with the proposed St. Lawrence Canal, with the proposed deep waterway from the Great Lakes to the Gulf, with the government barge line on the Mississippi and Warrior rivers, and with other similar, though less important, projects.

We hold no brief for the railroads nor for rail transportation as against water transportation, except as water transportation, or any other form of competition, may be aided by government at the expense of the taxpayers. But we are interested in transportation. We say that, no matter what waterways are created or improved, the principal mode of transportation in this country must always be by rail. We would not suppress all water competition in order that the railroads might thrive, but we would have those interested in the subject stop and ask how rail transportation—on which they must always chiefly depend—is to become cheaper if we use the high rail rates simply as an argument for building up water competition that can only make rail rates higher, if the railroads are to live. And we would have them ask themselves what it is that causes the shortage and bad condition of railway equipment that occasions their worry as to the ability of the railroads to function adequately when business reaches the peak. It is a fact, is it not, that the railroads have not been and are not now being allowed earnings sufficient to replace worn out equipment or keep it in proper repair? Shall we remedy that condition merely by pointing it out, and fostering competition by water and motor truck?

We think even many men who follow trans-

portation as a business do not think deeply along this line. We have seen them applaud speeches of the kind to which we have been referring and heard them speak with approval of this or that water project merely because it meant lower rates. And as for the public—the public uneducated in transportation science—it swallows that sort of thing with avidity, as why should it not? It is for persons who are capable of analyzing the situation and considering it fairly to present the correct view. Let there be water transportation, by all means, wherever there is a real commercial demand and necessity for it; but let us not forget that the failure of our rail lines to function adequately is a thing to be feared, and that our safety lies in adopting measures that will enable them to make a fair profit and thus continue to serve us.—*The Traffic World* (Chicago), June 24.

SPEAKING OF FLOODS

The Y. & M. V. Railroad traverses this country where back water invades its coaches, and the pilots' union kicks like a mule because locomotive engineers are permitted to navigate tributaries of the Mississippi River without a pilot's license.

An adventurous traveler observed a section foreman climb into the train and hitch his skiff behind. The traveler got into the skiff alone, and enjoyed the novelty of being towed by a northbound express—until they reached a higher stretch of track, and his skiff went bumping over cross ties.

Throughout this fight our railroads have rendered notable service. For example: The government had four million sacks stored in a warehouse at Schenectady, N. Y., doing nobody a particle of good. So a trainload was shot along its route to Greenville, Miss., fourteen hundred and fifty miles away. Limited specials sulked on the sidings, and millionaires waited while the humble sacks went by, the shipment reaching our levees in eighty-nine hours—a world's record for the movement of freight. Hard-headed jurors who used to soak the soulless corporations are now holding love feasts and passing flowery resolutions; while

cynics wonder if their Damon-and-Pythias performance will last until the next term of court.—Harris Dickson of Vicksburg, Miss., in the *Saturday Evening Post*, July 15.

TRUCKS AND HIGHWAYS

In the *Illinois Central Magazine* for June, pages 74-75, there was published an excerpt from the decision of the Colorado Commerce Commission in the case of an application for a certificate for the operation of an automobile freight and passenger line in that state. The following is an excerpt from a decision of the Pennsylvania Commission on a similar subject:

"The applicant seeks a certificate of public convenience for transporting property in common carriage, by means of auto trucks, between Huntingdon, in the County of Huntingdon, and Saxton, in the County of Bedford, a distance of about twenty-five miles. The proposed route practically parallels the Huntingdon & Broad Top Mountain Railroad, which conducts a passenger and freight service over its lines between the points stated. The railway company protests this application on the grounds that it is not necessary for the public accommodation, and if granted would only operate to divert greatly needed revenues from the railway company, which would seriously affect its service, since the company is largely dependent upon its local freight revenues for the maintenance of its operations.

"The protestant is a short line railroad having approximately 70 miles of trackage, including its branches, and connects at its northern and southern termini with the Pennsylvania Railroad. It has been furnishing adequate and satisfactory freight service between Huntingdon and Saxton, the terminal points of the proposed auto-truck service, as evidenced by the fact that a number of those vitally interested in such transportation, who in the first instance approved of this application, have since withdrawn that approval.

"It has not been the policy of the commission, nor does it appear just or reasonable, that the commission should sanction or permit either destructive auto-bus or auto-truck competition with trolley or short line railroads, which have large capital investments, and which for years have been furnishing reasonably regular and adequate service to the public. Such competition would certainly curtail and lessen the efficiency and adequacy of the service rendered

to the public by the existing steam and electric carriers, and in many instances would probably result in the abandonment of their operations. It is obvious that the public interest would thereby immeasurably suffer.

"Both the auto-bus and auto-truck service are in an experimental stage of operation, and as a general rule neither has proved to be a satisfactory all-year-round service. The argument so frequently advanced, and earnestly urged in this case, that the permanent manner in which the highways of the commonwealth are being constructed is a recognition of the fact that they are to be subjected to severe usage by the heavy freight carrying trucks is a fallacious one.

"These improved highways are a costly investment, and, if the general public is to get the benefit of them to which it is entitled, the 'heavy freight carrying truck' will have to be operated within statutory prescribed limits and regulations. No method of highway construction has yet been devised that will protect and secure the highway against the destructive ravages of the heavy truck usage.

"The evidence in this case clearly indicates that the public which the proposed truck operations are intended to serve is now adequately served by the protestant, and that the granting of this application would operate injuriously to that service and ultimately result in a less efficient service to the public, and therefore the application will be refused."

CROSSING CAMPAIGN ON

The safety section of the American Railway Association has announced its "Careful Crossing Campaign," which commenced June 1 and will continue until September 1. An intensive campaign in advertising of all kinds in an effort to reduce accidents at railway crossings is to be carried on.

Omaha business men will realize the importance of this campaign by the following figures. The number of motor vehicles registered in the United States was 10,449,785 in 1921 and increasing in 1922—one motor vehicle for every ten persons. There are 252,000 grade crossings in the United States. It would cost \$12,600,000,000 to eliminate them. During 1920 there were 3,012 automobiles struck on grade crossings. In these accidents 1,273 persons were killed and 3,977 were injured. The "stop, look and listen" sign, if carefully scrutinized before crossing a rail-

way track, will decrease the number of accidents. C. H. Markham, president of the Illinois Central Railroad, is using all his influence as head of a great system to make the campaign a success.—Omaha (Neb.) *Chamber of Commerce Journal*, June 10.

COMMENTS OF A RAILROAD MAN

I have been railroading since 1879;

I have pleased and displeased people ever since;

I have been cussed, discussed, boycotted, talked about, lied about, lied to, hung up, held up and helped up.

The only reason why I continue in the "profession" is to see what the hell is going to happen next.—*Exchange*.

HOW RAILROADS PROFITEER

The only reason why the Federal Reserve Bank System isn't squeezing the life out of us is because the railroads have already squeezed it out. If that isn't true, neither are a lot of other things you can hear these days from persons who ought to know better. An illustration of how railroads have been profiteering upon the helpless public is shown in a recent report of the Illinois Central. The report shows that last year that road paid 23 per cent more taxes than it did dividends.

But it did pay dividends. There were some railroads that didn't pay any last year. But the Illinois Central paid to its stockholders 4.48 per cent of its income for dividends and 5.54 per cent for taxes. The taxes were more than twenty-nine times the salaries paid the general officers of the road. These officers got only .19 per cent of the income of the road—less than one-fifth of 1 per cent.

There were some other startling features in the report. It will be a strain on the credulity of some that the dining-car service cost the road .62c out of every dollar of expenditure to run, and brought in but .58c per dollar of revenue. In short, the railroad lost money on the service.

According to the report 93 per cent of operating cost goes for wages. In maintenance of equipment 66⅔ per cent goes for wages, while in maintenance of roadbed, buildings and bridges 54.7 per cent of the outlay went for wages. Over 70 per cent of the income came from freight service.—Dallas (Texas) *Morning News*, July 15.

A CONSTRUCTIVE POLICY NEEDED

Intelligent Americans in all walks of life would do well to do some open minded thinking on the situation of the railroads.

All railroads are not in the same condition, but all are affected and gravely affected by conditions which public opinion and public action have subjected them to. If these conditions are conducive to the public welfare, the railroads will have to submit to them, regardless of their fate as private enterprises. But if they are not conducive to the public welfare it is to the public interest that they be corrected or abolished.

It is certain that a marked deterioration of the railroads, the American system of transportation, would affect seriously, if not fatally, the prosperity of the whole American people. Railroads are the arteries of commerce and we can no more have prosperity if our railroads are inadequate and inefficient than the human body can enjoy health with its arteries in bad order. If we lived in a primitive agricultural state, such as existed in ancient times and persists in remote parts of the world today, we, or a part of our population, could subsist without transportation by each raising his own and his dependents' food and providing his own and his family's clothing and shelter. But we do not live in such a backward stage of human evolution. Not only the city dweller but the farmer himself depends upon transportation for what have become necessities. As soon as transportation is touched, every man, woman, and child feels it, the farmer, the mechanic, the clerk, the business man, the professional man. The producer cannot sell his produce, the consumer cannot obtain what he needs and does not produce. An inadequate system of transportation means deprivation for every individual in the country and a general slowing down of all the activities which give us prosperity.

This obvious and basic fact has been pretty well ignored during the last generation. The railroads have been looked upon simply as private money making enterprises and there has been a persistent effort to restrict their freedom of action and reduce their earnings and profits to a minimum. The farmers have attacked them; business men as shippers have attacked them; labor has attacked them. A generation ago a system of government regulation was set

up under which the income of railroads was restricted through the fixing of freight and passenger rates. In 1916 a law was passed regulating the payment of wages under the guise of establishing an eight hour basic day. Finally a railway act now limits the rate of earnings.

It is true that evils grew up while railroads operated without regulation, such as the rebate evil and forms of bad financing and manipulation of stock issues. It is true that railroads partake of the nature of monopolies and that some measure of government regulation of their activities is necessary to prevent the imposition of exorbitant charges on the public, the absorption of undue profits, the neglect of public service. But it is as essential to the public interest that the railroads should be permitted and assisted to function properly, to keep efficient as common carriers, to have rolling stock and equipment enough to serve our needs, and to extend their lines when required, as it is to prevent them from overcharging us or putting too much money into private pockets at the expense of their proper development as public agencies.

Our fault has been that we have not studied the problem of the railroads from both sides, or rather from all sides. We have not seen it in the round, as a unit, which it is. Our policy has been restrictive instead of constructive, to check but never to assist. Politicians have ridden into office on movements for restrictive laws, never by proposing laws or policies which, while preventing railroads from exploiting the public, assisted them to serve the public.

As a consequence of this one sided course of action pursued for many years, there is no doubt that the American railroads, which once were without rivals in the world, both for efficiency of service and moderateness of charge, have been retrograding and are still retrograding. They are between two millstones. On the one hand a government agency with full power to restrict income has followed a policy which has kept income restricted to a minimum. Furthermore congress has now passed an act which sets a limit of $5\frac{1}{2}$ and 6 per cent return upon railroad investment, while other securities of the solidest variety in public and private enterprise yield as high as 8 per cent, and more speculative but attractive forms of investment do even better. On the other hand, the railway act does not provide equally mandatory

safeguards against undue pressure upon the railroads. It provides a method of peaceful adjudication of wage disputes, but the findings of such adjudication may be ignored and are being ignored at this time. It leaves one agency, the Interstate Commerce Commission, to fix income, and another, the Labor Board, to suggest but not impose wages, and while the former body is assumed to take into account expenditures, the disparate treatment of what is one problem is not likely to produce satisfactory results. In other words, the government restricts income, but not outgo, and has no constructive policy which it is ready to enforce to assist the efficiency and expansion of our transportation system.

Advocates of public ownership may watch the operation of this one sided policy with satisfaction, but the result will be to make private ownership impossible. That is a very wasteful, unjust, and demoralizing method of adopting public ownership. It will not only cheat legitimate investors in railroads, but it will cost the whole country heavily through the effect upon all production of a gradual deterioration of transportation facilities. If we wish to try the experiment of national railroads, in spite of what we know of the inferiority of nationalized transportation in other countries and what we ought to foresee of the evils of an enormous bureaucracy, let us establish that system at once by appropriate legislation. That would be fairer and cheaper in the long run.

But certainly, if we are to have private ownership and operation, we must adopt a policy under which railroads can attract capital seeking conservative investment, and in an amount sufficient to provide means for expansion in proportion to our growing needs. Capital will not go into railroads if profits are limited and losses unlimited. The Esch-Cummins law, if enforced, will be a long step toward balanced policy. But it will not work unless the business community and the powerful organizations of farmers and wage earners see the railway situation and railway policy as a whole.

There is, however, another phase of the railway problem under private ownership which is fundamental. So long as employees have only a wage interest in railway earnings, they must and will engage in persistent struggle from that point of view. That is natural. It cannot be avoided except by a policy which shall give to employees the point of view, not only of wages, but of profits; that is, by making them part

owners. As wage earners, merely, they have an interest in gross earnings, an interest not always clear because overshadowed by the struggle for immediate advantages in the form of wages. But their interest in net profits, though it exists, since profit to capital is essential to the success of an enterprise and therefore to its continuance—and to its ability to pay good wages, yet this is indirect and likely to be ignored by most employees.

But if employees could be brought in as part owners they would see more clearly their stake in successful operation and even in the adjustment of the wage factor to the economic necessities of the whole enterprise.

How to bring in the employee is not an easy problem, but it is a crucial one and, we believe, possible of solution if a serious attempt is made to solve it.—*Chicago Daily Tribune*, July 20.

SUGGESTS A REMEDY

I believe the real railway problem that confronts you today is: How are you going to put the railroads in such shape that they can

furnish to the country the transportation which you will need?

The railroads in the United States were paid for by private capital, and were built up and developed by the hard work and enterprise of their managements and employes. They are rapidly coming back to that old-time efficiency through the efforts of these same men; but unless the railroads are relieved from hostile and restrictive legislation by which they are now hampered, with the assumption of authority without responsibility by governmental bodies, you are not going to have an efficient machine to call upon.

Let the managers manage, and hold them responsible. This means restoring to the directors and officers of the various railway companies the administrative and managerial powers measuring up to the responsibilities that are placed upon them. If we can get that I know we can win out and save this country from the calamity of government ownership.—*From address by Colonel James A. McCrea, vice-president, Central Region, Pennsylvania System, to the Chamber of Commerce, Pittsburgh, Pa.*

A FEW FACTS ABOUT FLIES.

Accepting the conservative statement that one fly lays 100 eggs at a time, and that this brood of new flies produces another brood in three weeks, that fly might have 5,104,863,552,000,000,000 descendants from one batch of eggs alone.

But the fly will lay many more batches of 100 eggs at a time during the season, and the total must be multiplied by those scores.

If all the flies in the world bred unchecked for a summer, they would exceed the world in bulk.

The fly is responsible for spreading typhoid fever, tuberculosis, cholera, summer diarrhoea, summer dysentery, cholera, morbis, infantile paralysis and many other diseases.

Experiments by the Agricultural Experiment Station at Storrs, Connecticut, show that one fly carries 5,000,000 bacteria at once.

A total of 170,000,000 flies are lost every generation through diseases spread by the fly.

THE FLY

Dysentery	1924	355
Polagra	15831	1535
Tuberculosis	8089	2706
Diphtheria	1152	152
Small-Pox	2468	9
TOTAL DEATHS FROM PREVENTABLE DISEASES		6878

"WILL YOU WALK OUT OF MY PARLOR?"
SAID THE SPIDER TO THE FLY
YOUR FEET ARE FULL OF TYPHOID.
AND I DO NOT WISH TO DIE."

The danger from flies is well illustrated in the drawing shown above, which is prominently displayed in the white waiting room of the Greenville, Miss., passenger station of the Y. & M. V. The drawing was worked up by Dr. A. J. Ware, health officer of Washington County. It measures 48 by 68 inches. While the date of the picture is 1915, the conditions have not changed materially in many places.

Maintenance
of Way
Department
Material Means Money
Save It

Cross Ties

**Nature has worked years to produce
the tie destroyed in minutes.**

—Poor Richard III.

The cost in place of all ties used on the Illinois Central and Yazoo & Mississippi Valley railroads in 1921 represented more than 22 per cent of all expenditures chargeable to maintenance of way and structures.

The total cost of cross ties, exclusive of switch and bridge ties and not including the cost of applying them to track, was \$3,179,-222.27 on the Illinois Central and \$892,068.10 on the Yazoo & Mississippi Valley, a total expense to both roads of \$4,071,290.37, the average cost per tie being \$1.55.

On an average, six cross ties were used each minute twenty-four hours a day for 300 working days a year, while the total expense for all ties, including switch and bridge ties, was more than \$20,000 a day, or 11½ cents every time the clock ticked. If the 2,629,050 cross ties purchased in 1921 were placed end to end they would make a line nearly 4,000 miles long, or more than four times the distance from Chicago to New Orleans.

Possibly no feature of railway maintenance

will permit of greater economy than the use of cross ties, as carelessness or neglect in handling ties results in abuses which tend either to destroy the ties or greatly shorten their useful life. Some of the commonest forms of abuse of ties are as follows:

Driving picks into ties when handling or placing them in track.

Failing to apply plugs to spike holes in ties.

Pounding ties in line with a maul when they are not square with track.

The use of ties as bumping posts in stub tracks.

The use of ties for blocking material on cars.

Piling ties on low ground, where they are washed away.

Leaving ties in weeds on right of way, where they are destroyed by fire.

In addition, extreme care should be exercised to see that no ties are removed from the track before full service has been obtained from them. Also, every effort should be put forth to avoid respiking ties, as in the case of laying rail before tie plates are applied, which often necessitates pulling spikes later on when plates are applied.

A material saving in the cost of ties will be accomplished by careful observance of the suggestions above as well as the instructions given in the Book of Rules.

A Day's Supply of Cross Ties

Sports Over the System

Members of the Power House Team, Illinois Central System League, Memphis, Tenn.: Standing, left to right—R. E. Hair, 3b, yard clerk; C. J. A Winner at New Orleans

The Illinois Central baseball team of the local freight office at New Orleans is maintaining its reputation gained last year while champion of the Transportation League. Out of twelve games played this season, the freight office players have won nine, lost two, and tied one. They recently defeated the Y. M. H. A. baseball team, being awarded a handsome loving cup. On Sunday, June 25, they defeated the strong Knights of Columbus team at their annual festival, by a score of 17 to 1.

Speaking of Vacations

R OSENCRANTZ, a bookkeeper, asked Guildenstern for a raise. Guildenstern was sitting at his desk at the time; he frowned and muttered to himself a minute; then he began to make figures on his blotter with a pencil. "How long ye been with me, Rosey?" he said at last.

"One year, boss," said Rosencrantz, the bookkeeper.

"That's 365 days, ain't it?"

"Sure."

"But ye only work eight hours a day, don't ye?"

"That's right, boss."

"So the Gospel truth is that ye only work one-third of a year." Guildenstern figured on his blotter. "That's 122 days, ain't it?"

"Why, yes, if——"

"If nothing. Work on Sundays?"

"No."

"Then I take 52 days from 122 leavin' 70 days what ye worked last year for me. Am I right, Rosey?"

"Why, er——"

"We're a Jewish firm here, so naturally we don't work on Saturdays. Lemme see—52 from 70—that leaves 18, don't it?"

"Aw, say——"

"How long a vacation did I give ye with pay last summer?"

"Two weeks."

"Two weeks—14 days, 14 from 18 leaves four workin' days to yer credit."

"Aw——"

"How many holidays did I give ye? Christmas, New Year's, Thanksgiving and Fourth of July—that's four, ain't it?"

"Aw——"

"And four from four leaves nothin'. Why, Rosey, ye bluffer, ye don't actually work for me at all, and ye got the noyve to come and ast me for a raise. Get out o' here, darn ye,

before I sue ye for the last year's salary what I paid ye for bummin'!"—SELECTED (by E. F. McP.).

What a Life!

The idea of a man in Chicago having a wonderful time:

He is late for dinner and is bawled out.

He waits for his wife to finish her toilet.

He starts for the theater thirty minutes late.

He gets caught in a suburban train jam and loses fifteen minutes more.

He gets to the show and finds they have saved the wrong seats.

He doesn't like the show and argues with his wife.

He goes to a jazz joint and gets a punk table.

He waits one hour for \$1 worth of food, which costs \$10.

He loses his hat check and has to identify himself at the office.

He gets put out just as he is beginning to enjoy himself.

He gets on the street and finds the lights are all out.

He starts for a suburban train and finds they are tied up.

He starts for an elevated and finds they are also tied up.

He starts for a surface line, and the power is off.

He gets a taxi and starts for home.

He gets home and finds all he has is street car fare.

He wakes up his neighbor and borrows \$15 to pay the taxi man.

He slips on the ice and falls in the snow, cutting his hand.

He goes into his apartment and finds the steam off.

He wakes up in the morning with a dark brown taste.

He finds the maid has drunk the last remaining lick.

He says: Never again!

He goes out the next night and does the same thing over, and that is his idea of a wonderful time.

She Answered

An austere woman was lecturing a body of high school girls in a Hoosier town recently on the uselessness and wickedness of the flapper. After she had said that they were not fit to become the mothers of the next gen-

eration, she looked at a bobbed-haired little girl who had rouged and powdered her face rather heavily and demanded, "Young lady, what do you know about babies?"

For a minute the little flapper looked startled. Then she blushed a fiery red. "Well, lady," she stammered, "I've stopped believing in the stork."—*Indianapolis News*.

His Favorite Dish

J. J. McL. liked this so well he passed it on to the magazine.

Young Gibbs of Smalltown, Kan., decided to travel. Arriving in Chicago, he made up his mind to eat at least one meal in a fashionable hotel. He was getting on famously with the array of silverware, and appeared to feel satisfied that he was passing for a man of the world, when Jackson, the negro waiter, became communicative.

"Been in town long, sah?"

"Just came in from New Orleans," said the young adventurer.

"Dat so? Ah used to live in New Orleans. How's de Mardi Gras?"

"Fine! It's the best I've ever eaten."

—*Harper's Magazine*.

STEADY ON HIS JOB

J. T. Kyle

INKID SAYS—

What appears to be a record for continuous service was established up to June 27, 1922, by J. T. Kyle, engine foreman, on the Memphis terminal, according to William Gerber, our Memphis terminal correspondent. Mr. Kyle has reported and worked every day for three consecutive years without being absent from duty a single day. It is considered an extraordinary occurrence, in view of the fact that Mr. Kyle worked 365 days in each of the three years (366 in 1920), without being off duty on any holiday, Sunday, or due to any sickness. Mr. Kyle, who is known to all of the employees at Memphis as "Daddy" Kyle, has been in the service of this company for twenty-seven years, during which time he has served in every capacity from switchman to general yardmaster. He is conscientious in his work and a constant advocate of "Safety First" principles. The records show that on August 27, 1912, he received favorable mention for discovering a broken flange under the wheels of a car that was being handled into Nonconnah, thereby averting a possible derailment and considerable damage to equipment. On July 27, "Daddy" Kyle started a vacation, the first time in many days that he has been away from his job.

These Veterans Average 46 Years' Service

Five Illinois Division Old-Timers Include One Section Foreman, One Agent and Three Engineers

MICHAEL DOLAN, M. H. Kempton, E. J. Wolfe, P. L. Hayes and H. D. Howard are five of the oldest men in point of service on the Illinois division. These five men have drawn pay checks from the company for 233 years of service, an average of more than 46 years each.

Mr. Dolan, section foreman at Roberts, Ill., has been in continuous service, with the exception of eighteen months, for fifty years. Mr. Kempton, engineer, will soon round out his fiftieth year. Mr. Wolfe, agent at Clifton, Ill., has been in the employ more than forty-six years. Engineer Hayes has forty-four years to his credit. Engineer Howard has served the company for forty-three years.

Hard Winters in 1881 and 1882

With the exception of eighteen months, Michael Dolan, section foreman at Roberts, Ill., has been continuously in the service of the company for fifty years. He entered the service in March, 1872, as a section laborer at Farmer City, Ill., and remained there until March, 1877, when he became ill. He was out of the service until September, 1878, when he returned to his former position.

On August 1, 1881, Mr. Dolan was made the foreman of the section at Roberts, where he has since remained. There was no ballast in those days, and the rails were iron; but his careful watch over the section prevented accidents. There has never been a wheel off on his section, he says, nor has he been seriously injured while in service.

The most severe times of all his years of experience, Mr. Dolan says, were during the winters of 1881 and 1882. The heavy snows caused the section men untold labors then. There were no plows; the snow had to be scooped off the right-of-way by the men. He has worked as many as three days and nights without sleep.

About three years ago, bandits entered the bank at Roberts and were leaving with about \$30,000 when Mr. Dolan opened fire on them from the roof of a hardware store. He held them at bay for a short time, but they escaped in an automobile. Mr. Dolan was praised for his bravery.

His service with the company has been ad-

Home of P. L. Hayes at Champaign, Ill.

mirable, and he has won the respect of those with whom he has come in contact. He is whole-hearted, generous and takes a great interest in the welfare of the Illinois Central System.

Made an Engineer in 1880

On December 9, 1922, M. H. Kempton, engineer, will round out his fiftieth year of service with the Illinois Central System. And he has been on the job all the time.

Few men now in the service remember such employes as Engineer Frank Rugg, Captain J. J. Delacy and A. Fortin. The latter was known as the "Wild Frenchman" on account of his extreme recklessness. These men were all close friends of Mr. Kempton in his early days of railway service.

Mr. Kempton entered the service as a machinist and drafting apprentice in the shops at Weldon on December 9, 1872. He served four years and came out with a record that any young man should be proud of. He was given a position as fireman in freight service, and was soon firing on extra passenger trains. He was chosen to make tests when new mechanical devices were introduced.

January 5, 1880, he passed the engineers' examination and was placed in freight service. He was engineer on inspection tours and on pay trains all over the system at various times.

In 1891 he was offered a passenger run, but at that time he had a good freight run and did not care to give it up. He was granted the privilege of remaining on that run until

Division

P.L. Hayes

H.D. Howard

a more desirable passenger run was open. What is now No. 21 between Chicago and Champaign was his first passenger run. It was known then as No. 3.

Mr. Kempton is now engineer on Nos. 1 and 2 between Chicago and Champaign.

Started as Man of All Work

E. J. Wolfe, agent at Clifton, Ill., has been in the service of the Illinois Central for a little more than forty-six years. He entered the service as agent's helper at Hudson, Ill., January 7, 1876. In those days, besides learning to be a telegraph operator, the agent's helper had clerical work and was expected to keep the depot clean.

Mr. Wolfe was a bright young man, and at the end of five months he became an extra agent and operator. He worked at various stations for about a year and was then sent to Eldena, Ill., as regular agent and operator. Eldena was on what was then known as the North division, and Amboy was division headquarters. There was no station at Eldena for six months after Mr. Wolfe became the agent there. He had his office in a grain office near the track.

After he had been at Eldena for a year and a half, he went to Clinton as operator. Three or four months later, he became the operator in the dispatcher's office at Centralia. After a few weeks, he decided that the work there was too hard, and so he accepted a position as day operator at Effingham. He was made agent and operator at Cobden six months later. He was there only a short time when he was transferred to Monee. A year and a half later, he was transferred to Gilman as day operator. He remained there two years.

Defended an Engineer in Court

In 1884, Mr. Wolfe became the agent at Loda, where he remained about eleven years. It was while he was agent there that Engineer Kempton was summoned to appear before the court at Loda for driving his train through that city at a speed in excess of ten miles an hour. On the day set for the trial, Mr. Kempton came to Loda, but brought no lawyer with him. Mr. Wolfe says that he went to the judge with Mr. Kempton and asked to be allowed to plead the case for the engineer. The request was granted, and he came near winning the case. The city ordinance made exceeding the speed limit an act subject to a \$25 fine, while Engineer Kemp-

ton was fined only \$1 and costs. For a long time after that, Mr. Kempton prefixed "Lawyer" to Mr. Wolfe's name when he saluted him from the cab.

In 1895, Mr. Wolfe again went on the extra list. He worked at Champaign, Burnside, Pullman, Ashkum and Kempton. He was made the agent at Clifton in April, 1901, and he has remained there since.

Worked Before Day of Air Brake

P. L. Hayes, engineer, was in the service of the company when the brakemen stopped the trains with clubs used as brakes. There were no air brakes then, and it was seldom that a train was able to stop at the station platform. The brakemen were given strict orders not to use clubs in stopping the trains, but the method was effective, Mr. Hayes says, and the orders were often disregarded in face of the danger involved.

Mr. Hayes entered the service as a fireman on switch engine No. 9 in the yards at Champaign on July 5, 1878. After a year had passed, he was made fireman on engine No. 58 in freight service. Twenty 10-ton cars made up a heavy train in those days, he says.

In another year, he was fireman on passenger engine No. 33. For four and one-half years he fired between Champaign and Centralia for Engineer Ed Vaughn. At each end of the run, he had to wipe, clean and shine the brass on the engine.

February 13, 1883, was spent in taking the engineers' examination. It required the entire day, and Mr. Hayes passed it by a wide margin. He was then given the switch engine in the yards at Champaign. He worked at three-fourths pay for one year, and then was placed in freight service, where he remained for five or six years.

During the World's Fair at Chicago, he was placed in extra passenger service, and in 1901 he was given a regular passenger run between Champaign and Centralia. He was on Nos. 3 and 4 for seven years, and Nos. 5 and 2 for five years. In 1919, Mr. Hayes became the engineer on the suburban train at Champaign between the depot and the shops. He continues in that service today.

Has Relics of Early Service

Mr. Hayes has never been seriously injured in the forty-four years of his service.

He has four relics of his early days of railroading that neither love nor money could buy. Two brass torches made from the flagstaffs on

1. An old screw lock that was in use on the system between forty-five and fifty years ago. 2. Two brass torches that Mr. Hayes prizes highly. 3. Mr. Hayes' first switch key, No. 132.

the headlights of the early engines head the list, in his estimation. They were made by L. L. Dawson and W. H. Donley, both of whom learned their trade in the shops at Champaign.

His first switch key, No. 132, ranks next. Numbers on switch keys have now grown to over 55,000, he says.

Then there is one of the old screw switch locks which were in use over the system about fifty years ago.

Engineer on the Panama Limited

H. D. Howard, engineer on the "finest train in the world," the Panama Limited, entered the service of the Illinois Central in the roundhouse at Champaign, July 11, 1879. He was a student in mechanical engineering at the University of Illinois at the time, and had three years of shop experience.

At the close of the first ten days of his work, he had learned the signals and was given a position as fireman on engine No. 53 in freight service. Mr. Howard fired a freight engine a little more than three years, and was then placed in passenger service. On February 13, 1883, he passed the examination for engineers and was given the switch engine in the yards at Champaign.

Mr. Howard had been on the switch engine but a short time when he was placed in freight service on the main line. In February, 1884, he was transferred to the Chicago district, where he was placed in suburban service.

At that time, there were only eight suburban engines, he says. The service extended from Chicago to Pullman. From Hyde Park on out to the end of the suburban lines, there were few buildings, and at 63d Street the line ran through an oak forest.

During the World's Fair in Chicago, Mr. Howard was in the suburban service.

Handled Engine on Inspection Trip

After this, he was in freight service for several years and then in passenger service for two or three years. In 1900, he was made the general foreman of the roundhouse at Champaign. He remained in that position until 1907. He was then returned to passenger service.

Mr. Howard ran Nos. 1 and 22 between Champaign and Centralia until the Panama Limited was installed. He was then made engineer on the first Panama Limited.

Mr. Howard's value as an engineer has always been appreciated by the officials of the company. President J. T. Harahan selected him to be the engineer on an inspection tour of the system. He was given engine No. 1127 to make a 5,000-mile trip in thirty days and was instructed to maintain a speed of twenty-eight miles an hour. Mr. Howard says that he was relieved at night. The return to Chicago was twelve hours ahead of schedule, he says.

His train had the right-of-way on the entire tour. The inspectors sat side by side in the observation end of the train, with Mr. Harahan in the center. Each man had a certain thing to watch, and made a report of the general condition of it at the end of each mile. The chief engineer stood by to call the miles. When the tour was completed, they had a record of the general condition of every mile of right-of-way of the system.

Mr. Howard has served fourteen terms as alderman of Champaign and is at present on the school board there.

Hospital Department

The Story of "Scoop" Hawkins, Fireman

UNDERSTAND I don't make no pretense of being a writer, but when I have got something to say it's no trouble for me to talk it, and I got Benny Williams to write this down for me just as it happened, so that the rest of you fellows could all read it.

I was doin' a job of paintin' on my house two years ago, just before I went firin' for Ol' Man Sanders regular and before I got wise to the fact that a fellow's outside is no indication as to what's inside of him—why that ol' chap is the finest ever when you get next, and I used to think that he was the worst old grouch that ever eased a throttle open.

Well, I had my house nearly painted, and one fine afternoon, havin' only the west side to finish up, I gets out the old ladder and goes up to see how near through I could get before the caller came for me. I'll admit I was hurryin' considerable, but that was no excuse for what happened, because I just naturally put down my foot where there wasn't no ladder and did a high dive quicker than lightnin'.

You won't believe it, but I didn't cuss a bit—I couldn't, the breath being knocked clean out of me. The old lady comes runnin' out and asks me did I fall, and by that time my breath comin' back again, I told her—and she runs back in the house, never likin' to hear me cuss.

Just then it happened, for in getting back onto my feet, I cut my thumb on a piece of glass, and it started that cussin' streak all over again. The caller came around the corner of the house just then and thought I was bawlin' him out—and he yelled that he couldn't help it because he had to call and would I hurry right down for No. 10.

I put the paint, what was left of it, back in the shed, kicked the blamed ol' ladder and hustled down to the roundhouse, havin' wrapped my handkerchief around my thumb. Of course, it was a hard run, me putting forty or fifty ton of coal into that fire-box before we got to the end of it. The handkerchief being needed to keep the dust out of my neck, you bet it didn't stay around that thumb long, and long before the end of the run I forgets about it.

That night I met up with two or three old pals of mine, and we sets up playin' cards until about about four or five in the morning. It being too short a time to get any sleep, I just beats it for the roundhouse and puts in the time goin' over the ol' 94, which sure don't do any harm and maybe makes her run some better.

When I gets home I turns in and sleeps like a baby, which I figures I got comin' to me 'count of being such a fool as to stay up the night before. All this time, mind you, that thumb don't hurt a bit, making me figure that it was all well. This goes on for a couple of days more, and then the music begun, because right in the middle of the run and while everything was goin' lovely I begins to shiver and shake, and the sweat just dried up on me completely.

At first I didn't pay no attention, because I had just been out on top and took water, standin' there in the breeze for ten or fifteen minutes and sort o' got chilled, but when it started all over again and I began to feel weak and sick, it got me scared.

Ol' Man Sanders had been watchin' me, unbeknownst like, and presently he calls down was I sick or was it home brew, or both. I never felt less like jokin' in my life, but I laughed and started firin' again and presently got to feelin' some better.

Well, I had three of them durned chills before we got in, and the last one was while I was changin' my clothes; I felt so rotten I just laid down on the bench and groaned, and the foreman got scared and sent for the Doc', and he took one good look at me and sent for the ambulance to take me to the Company Hospital. I didn't feel like arguin' with him, having just discovered a sore spot 'way up under my arm which hurt like blazes.

I ain't sayin' all they did to me at the hospital, 'cause some young fellow with a white nightshirt on gave me something to smell, and I sure forgot my troubles for a time. When I got so I could notice things, I found myself in a nice white iron bed with the cleanest cov-

erin's I ever saw and some good lookin' young gal puttin' a towel across my chest. I had a funny smell in my nose, my arm was all wrapped up and when I tried to raise my head to look around this good lookin' gal put her hand on my forehead and pushed it down. I was sick all right, but not too sick to try this trick again, but it didn't work that time 'count of someone callin' her away, and then I sort of realized the fact that I was in a hospital.

I just can't tell you what a swell place it was and all the nice things they did for me, because I was so old and tough that I began to get better right away, and in a week's time was settin' up and figurin' on getting back home. The only bad thing about the place

was the dressin' of that hand and arm, but when I found out that the Doc' didn't get sore if I held the nurse's hand while he was hurtin' me, I got along first rate.

Well, that's about all of it, except for me worryin' about the pay for the hospital, 'count of me bein' hurt while off duty and findin' that I had been payin' a measly six bits every month and never had missed it, which was the regular thing for all company men and took care of 'em when they were sick or hurt off duty.

Railroadin' ain't such a bad job after all, and I just told Benny Williams that I certainly was glad that I belonged to the Hospital Department.

A New Project on Our Line at Evansville

The Dade Park race course which is being constructed on our line near Evansville, Ind., at the incline on the banks of the Ohio River,

is expected to rank with Latonia at Cincinnati, Churchill Downs at Louisville, the courses at Lexington and all others in the country. The

location is a mile from the river on the Indiana side, but it is a strip of land controlled by Kentucky. Racing will be under the Kentucky racing commission's jurisdiction.

The course will be one and one-eighth miles long. It will be on the Grand Circuit for harness races, and will have dates for running races between the dates of the other good courses of the country.

Agent C. C. Kunz of the Illinois Central is

taking an active interest in the construction of the new course. He is shown on the left in the photograph, in conference with E. F. Bohne (at right) of the Green River Jockey Club.

These photographs were sent to the *Illinois Central Magazine* by K. K. Knecht, cartoonist, who served as an employee of the Illinois Central System from 1901 to 1906, before entering an art school. The pictures originally appeared in the *Evansville Courier* of July 2.

Sees Value of Station Staff Meeting

The following article by J. H. Wooldriege, perishable and team track clerk in the local freight office at Cairo, Ill., is born of long experience, as Mr. Wooldriege has been in service fifty-four years. He was one of the St. Louis division veterans described in the October issue of this magazine. The article was originally read at one of the staff meetings of the Cairo office.

To my mind, a station staff meeting is one of the most beneficial things for a station. It brings all the employes together with their superior officers, where are brought up various subjects appertaining to the station operation and efficiency. It gives an employe an opportunity to express himself or herself along various lines of daily work, bringing forth suggestions and methods which help to overcome unnecessary labor, improvements over old methods. Station staff meetings make the employe feel his importance as a cog of the machinery that makes for the success of the company; it makes for realization of fellowship and co-operation in the daily performances of duties required; it aids in the clerks' having a better knowledge of what is required of them by being given a broader understanding of the various workings of the positions of each employe, as the topics appear before the meeting, all being reflected in the standard of efficiency maintained at the station. There is nothing of more value than the getting together of employes for discussions which are first in the hearts and minds, to give all the service possible for the time paid.

The most important subject discussed at the present time is "perfect package shipments." This is a question of vital concern not only to the company but to the shippers as well. If the packages are brought to the freight warehouse in good condition, it saves the railroad

a great deal of time in the prompt unloading of wagons and storing into cars. Bills of lading made out properly insure correct billing and avoid errors that are likely to occur from illegible bills of lading and wrong billing. If old marks are erased from packages, it saves both the time of the driver and the receiving clerks in having to do the work after shipments have been offered for transportation. If the shippers co-operate with the railroads in the "perfect package" movement throughout every day in the year, a great deal of saving can be had in the way of decrease in claims paid for loss or damage to freight or irregular billing. Clerks also should put forth their best efforts in helping the company to reach the goal for which it is striving.

There is another factor which enters into the life of the railroads, and one which will, eventually, work much damage in the way of decreased earnings, and that is the inroads the wholesale jobbers and others are making on the railroads by running truck line service to various stations up and down the divisions. Representatives of an airship line have also been in Cairo endeavoring to work up enough freight and passenger trade to form a schedule for the carrying of passengers and freight.

At present Cairo is "on the map" in the agitation for improvements which will expedite the movement of freight from the North to points south on the river. The Illinois Central is intending double-tracking its lines from Minnesota to the Gulf, which will include the recently proposed improvements on the Cairo Bridge. This will make the Illinois Central on a parity with other fast freight lines in the movement of freight from point of origin to destination and a probable realization of its ideal, that of making deliveries the same day freight is loaded, to prevent complaints that

are now being received from shippers and consignees about delay in transit to their freight shipments.

Various highway associations are seeking support from other organizations and the public which will permit them to request the government to grant them a portion of the allowance Congress will make for the improvement of highways throughout the country, and thus assist them in erecting a \$20,000,000 "Y" bridge extending from Illinois into Missouri and Illinois into Kentucky, centering at Cairo (the logical head of navigation by water the year around), which will result in uninterrupted automobile and truck travel from the North to the South.

Also the Mississippi-Warrior barge line is located with the Illinois Central at Cairo, with which the barge line has made a contract for use of the incline to extend twenty-five years from 1921. These people handle a large tonnage from the South to Cairo by barge and thence over rail lines north, southbound traffic moving over our rail lines to Cairo and thence via barge to New Orleans. All these means of transportation have a tendency to draw away from the railroad tonnage and freight revenue that were formerly enjoyed through long-haul business.

With problems such as these confronting us at Cairo station, it behooves each of us to "put

his shoulder to the wheel" and endeavor to throw all freight possible to our line. One of the surest means of securing an increased tonnage is to be courteous to the public in every way possible; give all the information patrons may ask for and otherwise assist patrons in their many demands upon us as employees. By exercising our good influences we can make such a favorable impression upon them that they will cheerfully turn most of their traffic our way.

Another point at issue with the railroad, not only at Cairo but over the entire country, is some way or means by which overhead expenses may be reduced to the minimum, some economical basis to be reached whereby all leaks and waste can be overcome. This cannot be accomplished without the efforts of all employees to conserve stationery, to see that water is not allowed to run or lights burn unless for some specific purpose, that supplies furnished are used with the utmost care. In other words, all employees should be on the look-out to prevent waste wherever it may come to their notice, and thus bring about a material saving.

The company has some perplexing situations to contend with at this time, and all employees should do what lies in their power to render the very best service possible and have the interest of the corporation for which they work at heart at all times.

Railway Y. M. C. A. at Mounds Celebrates

May was the greatest month in the nineteen years' history of the Mounds, Ill., Railway Y. M. C. A. The dormitories were inadequate to accommodate the men, and eighteen beds were placed in the assembly room and two sleeping cars were backed in on tracks made for the purpose near the Y. M. C. A., which now gives a sleeping capacity of eighty-five.

The eight showers and three tubs were insufficient for the men. There were as many as 201 baths taken in one day, the average being 101. The number of men given beds during the month was 3,286, an average of 106 a day. These were 620 men more than ever slept in this "Y" in any month previous to this time. The members of the association are grateful to the company for sending these cars to relieve the crowded condition of the dormitories. The membership for the month numbered 771. This does not include a great many men who have membership in other associations

but who are accommodated with beds and bath at Mounds.

This association on Sunday, June 11, celebrated the fiftieth anniversary of the railway department of the Y. M. C. A. The program at the Y. M. C. A. park was preceded by a concert given by Drabing's saxophone band. This band, made up of Illinois Central boys principally, has been organized only a little more than a year, but it is rendering some good music. Every Wednesday evening this band gives an open air concert in the "Y" park.

The program opened with a song service, followed by prayer by T. A. Shafer, clerk in the transportation department. Short talks were given by W. H. Randall, engineer, and W. D. Cratzner, fireman, of Centralia. These men spoke of their appreciation of the "Y" as a place to clean up, sleep and spend their leisure time. Next, Henry ("Dutch") Nordman spoke of conditions that existed at Mounds be-

fore the "Y" came and of the suspicion of some of the men in regard to the "Y." They thought if they joined the "Y" they would be expected to sit and read the Bible all the time. He spoke also of the transformation that has come into the lives of the men, and especially his own life, because of the "Y." The next speaker was Luther Hodge, agent, who spoke of the uplifting influence of the association on the community. He spoke of the co-operation of the company with the association with great appreciation. He also referred to the interest that the company had in

the welfare of its men. J. E. Keele, engineer, spoke of the great benefits to be derived by having a Y. M. C. A. membership card. He said a man always has a home where there is a Y. M. C. A. if he carries his card. Mayor G. E. Chance, chief operator and president of the association, spoke in general on the work of the association and expressed a strong desire, as did all the other speakers, for a new building adequate to meet the demands. J. C. Mench, general secretary, gave a brief historical account of the association's "fifty years with railway men."

He Served as Ticket Agent for 44 Years

The Halliday House is as much an institution at Cairo, Ill., as the Illinois Central Railroad is, and one of the institutions at the Halliday House is J. H. Jones, pensioned ticket agent of the Illinois Central at Cairo, who served the company forty-four years at that one place in that one position.

J. H. Jones

Mr. Jones was retired November 1, 1916, and he and Mrs. Jones have lived at the Halliday House since. It is said that his residence there is a result of his close friendship with the late Captain W. P. Halliday, Cairo magnate and hotel owner. Members of the Halliday family were responsible for Mr. Jones' moving from New York, the state of his nativity, to Cairo while he was still a young man. He came in contact with Captain Halliday's brother when the latter was on business trips in the East, and the description of western life he received at the time led him to cast his fortunes in the newer country.

Mr. Jones' arrival at Cairo was shortly after the close of the Civil War, long before there was any bridge over the Ohio River at that point. For six years he worked on a transfer boat that carried passengers between the Illinois Central terminal at Cairo and the terminal of the Mobile & Ohio at Columbus, Ky., twenty-

five miles down the Mississippi River. For a short time after that he worked as a construction agent for the Mobile & Ohio, and then he entered the service of the Illinois Central at the Cairo station in 1872, at a time when W. P. Johnson, general passenger agent, and A. Mitchell, superintendent, were making a shake-up in the office force.

For forty-four years thereafter Mr. Jones served the Illinois Central faithfully and steadily as ticket agent.

When Mr. Jones first arrived in Cairo, river traffic was much more important than railway traffic at that point. There would be as many as twenty-five boats a day in and out of the port and only two Illinois Central trains. He saw the number of boats dwindle greatly and the number of trains increase to forty-four before he retired from service five and one-half years ago.

Mr. Jones saw the Mississippi Central (now the Illinois Central) build up to Cairo from the south in the early 70's, and he saw the increased efficiency in operation that came with the erection of the Illinois Central bridge almost twenty years later. He served with four agents at Cairo station, the last of them the late John D. Ladd, whose death has been recorded in these pages.

One of Mr. Jones' most prized possessions is the friendship of the Illinois Central officials under whom he has worked. He does not recall that he ever had trouble with any of them, and he ascribes the cordial relations between officers and employees to the fact that the officers themselves have worked up from the ranks. While working at the station he always took occasion to inculcate lessons of safety in

those working under him. He says that the results he thus obtained have always been a source of satisfaction to him. He never drank. and he would not tolerate employes who did. He never had a relative employed in the office, as he believed the policy of employing them was subversive of morale and he discouraged other employes who sought to get relatives on the office payroll.

Mr. Jones is hearty and in good health, although he is more than 70 years old. He ascribes his good condition to the fact that he takes long walks every day. He declares, with a smile, that he came out of the company's service poorer than he went in, and that, consequently, in spite of his pension, he still has to work for a living. He has a real estate and insurance office downtown in Cairo, and he finds time to apply himself pretty closely to the job. He can talk the good points of Cairo to a prospective buyer with all the enthusiasm of an agent fifty years younger.

Although a Northerner by birth and early training, Mr. Jones married a daughter of Kentucky. Mr. and Mrs. Jones have six children, three boys and three girls, grown up and now living in various parts of the country.

STILL AT WORK AT 64

Sixty-four years old and forty-four years continuously in the service of the Illinois Central Railroad Company at one place is a record that any man may well be proud of.

P. M. Whitehead, blacksmith, now employed in the shops at Water Valley, Miss., is the proud possessor of that record. He is expecting to make it fifty years of service before he retires. As he is robust and has a

EVER HAVE THIS FEELING?

The alluring waters and attractive scenery around Lake Pontchartrain are irresistible, and above is a conception of a railway clerk's thoughts as he sits at his desk on a hot day down in New Orleans. This is from the pen of Vic Olivier, clerk, superintendent's office, New Orleans terminal, who is an adept at paper and pencil drawings. Olivier is at present giving his spare moments to a course in cartooning and caricaturing and shows rapid progress.

good, sunshiny disposition toward all, he will be a "young man" still after fifty years' continuous service.

Mr. Whitehead was born in North Carolina, December 20, 1857, and was 3 years old when his parents moved to Mississippi.

In 1878 (the year of the yellow fever epidemic), he entered the service of the company. He was on the job through the epidemic and has been continuously since. During Mr. Whitehead's service, he has worked under fifteen master mechanics, from John Becton to S. R. Mauldin, present master mechanic. During all this time, however, he has worked under only two blacksmith foremen: John King (de-

P. M. Whitehead

ceased) and his son, W. J. King, present blacksmith foreman.

Mr. Whitehead, in his younger days, was a fox hunter and a lover of game chickens. At present he has a yard full of game chickens, and he is fond of talking of his hunting days, when foxes were plentiful.

Mr. Whitehead has accumulated considerable property, including the home that he and his good wife have lived in thirty-three years, where all the children, three boys and two girls, were reared.

At no time during his service has Mr. Whitehead been suspended for any reason, and his service is truly continuous.

SAFE RAILWAY TRAVEL

Thirty years ago the average American took eight annual railway journeys, and now he takes twelve. Then he rode 24 miles each trip, and now he goes 38 miles. Notwithstanding he rides half as many more times now, half again farther each trip and doubtless spends half as much more time in railway travel, yet the danger to his life is less than half as great as it used to be. If he has ridden once in the last 33 years, his chances of being killed were one in 91,000,000. Or, if

he has taken one trip each year during that period, he came as near losing his life as one is near to 2,760,000. One ride taken last year imposed a hazard on his life of only one in 5,673,000, and on his twelve customary journeys he was as far from jeopardy as 473,000 is greater than one. Altogether, the railroads of the United States carried in 1920 about 1,300,000,000 passengers, with one killed for each group of 5,673,000 carried, while in a total of 472,000,000 persons carried in 1889 the death rate was one in 1,523,000. The danger to life of railway travelers in 1920 was, therefore, less than one-third of what it was in 1889, most of the reduction accruing since 1907. To be sure, there have been very bad years, and exceptionally good years, but the general trend throughout the whole period has been decidedly toward the increasing safety of the traveling public. The foregoing figures are the result of statistics compiled and issued by the Interstate Commerce Commission.—*Atlantic Coast Line News.*

THOMAS S. MILLER DIES

T. S. Miller

The Illinois Central System lost one of its most loyal employes when Thomas S. Miller, general timber inspector, died suddenly at Magnolia, Miss., early Tuesday morning, May 24.

Mr. Miller was born at Magnolia, June 22, 1869, and was educated in the public schools and a commercial college. He was a member of the Knights of Pythias.

He had to start to work early in life to help take care of his widowed mother and two sisters, and he never married. He was living in the old family home with the only remaining members of his family, his brother and sister, at the time of his death. In February, 1897, he went to work for the Illinois Central as timber inspector for the supervisor of buildings and bridges. He was transferred to the timber department at the time it was opened and served there until his death.

Mr. Miller had friends all over the Illinois Central System and throughout the entire southern pine territory who loved and admired him on account of his excellence of character and kind disposition.

The Home Division

Edited by

Nan Carter

For the Canning Season

From the Tennessee division come some suggestions for canning fruit which are so practicable and seasonable that we print them below for the information of our readers.

COLD PACK CANNING

1. Sterilize jars and rubbers.
2. Prepare fruit.
3. Heat sugar and water to boiling point.
4. Pack fruit in sterilized jars.
5. Pour syrup (sugar and water) over fruit.
6. Place rubbers on jars.
7. Place covers on jars—not tight.
8. Place jars in hot water bath, and sterilize required length of time (see table below). Count time when water begins to boil.
9. Remove from bath, screw cover down tight, invert on table to cool. Be sure that jars do not leak.
10. Store in dark place, as light fades color of the fruit.

Table for Canning

5 lbs. fruit	Sugar (cups)	Water (cups)	Cold Pack time of boiling (min.)
Apples—sour.....	2 $\frac{3}{4}$	6	20
Apricots.....	2 $\frac{3}{4}$	2	15
Berries.....	2 $\frac{3}{4}$	1	15
Cherries—sour.....	4 $\frac{1}{2}$	3	15
Cherries—sweet.....	2 $\frac{3}{4}$	3	15
Currants.....	6	2	15
Peaches.....	2	2	15
Pears.....	2	3	15
Pineapple.....	2	3	20
Prunes.....	2 $\frac{3}{4}$	2	20
Quinces.....	2 $\frac{3}{4}$	6	30

OPEN KETTLE METHOD

1. Sterilize jars and rubbers.
2. Prepare fruit.
3. Heat sugar (corn syrup) and water until sugar is dissolved. If equal parts of sugar and corn syrup are used, fruit will not crystalize.
4. Add fruit and cook until tender.
5. Pack in sterilized jars, inserting a silver fork between fruit and jar to break up any air bubbles.
6. Wipe top carefully, fit rubbers, put on covers and seal at once.
7. Invert jar on table to cool. Be sure jar does not leak.
8. Store in cool, dark place.

New rubbers should be used each season, and care must be taken that the covers are perfect, as the jars cannot be made air-tight if the covers are bent.

To sterilize jars, wash and fill with cold water. Set in a kettle on a rack, surround with cold water, heat gradually to boiling point, remove from water, and empty. Let covers stand in hot water for five minutes. Dip rubbers in hot water and remove them immediately.

Health Hints

Perspiring feet should be bathed in tepid or cold water; avoid hot bathing. It will be found helpful to powder the insides of the shoes each day with boric-acid powder.

Here are some simple rules for hot weather comfort:

- Drink plenty of cool, not iced, water.
- Bathe frequently.
- Wear light clothing.
- Don't fume, fret, or swear.
- Avoid rush, and make haste slowly.
- Eat less, particularly less meat.
- Keep cheerful.
- Forget about the weather.

Household Hints for Home Makers

Salt will curdle new milk; in preparing gravies, etc., salt should not be added until the dish is prepared.

To remove mildew from cloth, put a teaspoonful of chloride of lime into a quart of water, strain it twice, then dip the mildewed spots in this solution, and lay in the sun. Repeat, if necessary.

To remove egg stains from silverware, rub with common salt.

Gilt frames may be brightened by rubbing with a sponge moistened with turpentine.

Hot water, ammonia, and a little washing powder will clean an oil mop successfully.

Tested Recipes

O'BRIEN POTATOES.—Fry three cups potato cubes or balls in deep fat, drain on brown pa-

per, and sprinkle with salt. Cook one slice of onion in one and one-half tablespoons butter three minutes, remove onion, and add to the butter three canned pimientos cut in small pieces. When thoroughly heated, add the potatoes, stir until well mixed, and serve sprinkled with finely chopped parsley.

FRUIT SALAD.—2 oranges, 3 bananas, ½ pound Malaga grapes, 12 walnut meats, 1 head lettuce, French dressing. Peel oranges, and remove pulp from each section. Peel bananas, and cut in slices about ¼ inch thick. Remove skins and seeds from grapes. Break nut meats in pieces. Mix prepared ingredients and arrange on lettuce leaves. Serve with French dressing.

PEACH DELIGHT.—Make a sponge cake as follows: Beat 2 whole eggs or 4 yolks (adding pinch salt) together until very light. Add 1 cup sugar and stir several minutes. Add 1 cup flour with 1 rounded teaspoonful baking powder; then add slowly ½ cup boiling water, and flavoring to taste. Batter will be very thin. Bake in moderate oven. Just before using, spread with fresh peaches, sliced and sweetened, and then cover the whole with whipped cream.

CHERRY SALAD.—1 cup canned cherries, ½ cup chopped apple, ¼ cup chopped pineapple, 3 tablespoons lemon juice, 1 teaspoon sugar, ½ cup mayonnaise, ¼ cup French dressing, 1 cup whipped cream. Toss apple and pineapple through French dressing, add lemon juice, sugar and mayonnaise, and arrange on crisp lettuce leaves; cover with cherries and put whipped cream on top.—Miss V. T., *Tennessee division.*

POPOVERS.—The following recipe was given us by a mere man, an employe of the Illinois Central at Chicago. He claims to be an expert at making popovers, and this is how he does it:

Light the oven. Put empty iron gem pans into the oven. Oven and pans must be piping hot. To test heat of pan, drop a bit of butter into it; if the butter hisses, the pan is ready for the batter, which is made as follows: Mix 1 cup of flour with ¼ teaspoon salt and add a cup of milk. Break 2 eggs into a bowl and beat until light. Fold the eggs into the first mixture, and beat with Dover egg beater until bubbles form on the surface (about 2 minutes). Add ½ teaspoon melted butter, and beat again. Remove pans from the oven, grease with butter, and fill with batter. Bake in hot oven 30 to 35 minutes.

W. E. Clark

Dining Car Recipes

"Service second to none" is the slogan of W. E. Clark, chef-cook on dining car No. 3996. Chef-Cook Clark, whose picture appears herewith, has furnished us some of his best recipes. Here they are:

CHICKEN A LA KING.

—Saute 1 tablespoon minced onion and 6 fresh mushrooms (broken in pieces) in

2 tablespoons of butter, add 2 tablespoons chopped pimientos, and cook ten minutes. Add 1 cup of cream and the yolks of 2 eggs; slightly beaten, and stir constantly until thick; then add 3 cups of diced cooked chicken. Season with salt, pepper, paprika, and a few drops of lemon juice. Serve hot on toast.

APPLE SPRING VEGETABLE SALAD.—Take 1 cup of cold cooked vegetables (chopped), 1 cup of diced raw apple, ½ cup of tender celery, cut in small pieces. Mix with mayonnaise dressing and serve on lettuce leaves.

THOUSAND ISLAND DRESSING.—Mix together 1 tablespoon each of minced onion, dill pickle, beet, parsley, pimientos, capers, 2 tablespoons minced hard-boiled egg, 2 tablespoons chili sauce, ½ teaspoon Worcestershire sauce, 4 drops Tabasco sauce, and 1 cup mayonnaise dressing.

OUR BABIES

We think nine pairs of twins make a pretty fair showing. There seems to be plenty of material in our group of babies for future railway men and women. A grave responsibility is ours to see that they are properly nurtured and trained to make good citizens and loyal members of the railway family.

No. 1.—Blanche and Billy, 4 months old, daughters of Conductor B. F. Fortner, McComb, Miss.

No. 2.—Oliver and Alvin, 9 months old, sons of John G. Dulle, blacksmith, East St. Louis.

No. 3.—Mary Margaret and William Robert, Jr., 3½ years old, daughter and son of William Robert Gore, clerk, signal engineer's office, Chicago, Ill.

No. 4.—Louise and Elouise, 3½ years old, daughters of J. Nelson Huntington, roundhouse foreman, Centralia, Ill.

No. 5.—Dorothy Jean and Elizabeth Jane, 6

Some

Twins

months old, daughters of P. J. Phalen, clerk, Dixon, Ill.

No. 6.—Dorothy and Mildred, 3 weeks old, daughters of Paul B. Myers, report clerk, master mechanic's office, Mattoon, Ill.

No. 7.—Margaret and Elizabeth, 3½ months old, daughters of First Assistant Accountant Pickering, superintendent's office, Fulton, Ky.

No. 8.—Tom and Jim, twins, 2 years old, also Marian, 5 years old, children of Chief Clerk Martin, freight office, Waterloo, Iowa.

No. 9.—Henry Joseph and Helen Margaret, 6 months old, son and daughter of Car Inspector Ed Blehinger, Wallace yard, Freeport, Ill.

No. 10.—Miriam Beth, 1 year old, daughter of Clarence Wallace, machinist, Waterloo, Iowa.

No. 11.—Frederick, 3 years old, son of R. L. Guensler, chief clerk to superintendent, Dubuque, Iowa.

No. 12.—Richard Hugh, Jr., 1 year old, son of R. H. Carter, engineering department, Vicksburg, Miss.

No. 13.—P. H., Jr., 3 years old, son of Section Foreman P. H. Schneckenger, Harahan, La.

No. 14.—Joe, 1 year old, son of A. P. Cunningham, instrument man, Champaign, Ill.

No. 15.—Wauneta, 4 months old, daughter of W. P. Wall, agent and operator, Steen, Minn.

No. 16.—Marjorie Lee, 2½ years old, daughter of M. D. Jones, Vicksburg division. Marjorie Lee won a prize in the beauty contest at Greenville, Miss., May 27.

ALMOST TOO LATE

This picture arrived in the office a little too late to be included in the page lay-out of Illinois Central System twins shown herewith. The youngsters shown above are, left to right, Kenneth and Fred Warren George, 3-year-old twin sons of G. C. Schindler of the engineer auditor's office, Chicago. Mr. Schindler was formerly employed as a draftsman in the office of the signal engineer.

No. 17.—John William, 6 months old, son of Section Foreman J. S. Foley, Anthon, Iowa.

No. 18.—Betty, 4 years old, daughter of C. J. Carney, assistant engineer, Louisville, Ky. No. 22 is Betty's sister, Mary Jane, 6 years old.

No. 19.—William J., Jr., 1 year old, son of William J. Garrity, chief clerk, bridge and building department, Chicago, Ill. No. 21 is Junior's sister, Jeanne Louise, 4 years old.

No. 20 shows the children of Roadmaster W. E. Russell of the Springfield division, Clinton, Ill.: Hunter, 10 years old, Albert, 8, Robert, 6, Howard, 4, and Eleanor, 2.

No. 21.—See No. 19 above.

No. 22.—See No. 18 above.

No. 23.—Ruth, 3 years 7 months old, daughter of Chief Dispatcher L. S. Houston, Water Valley, Miss.

No. 24.—Davle Ruth, 3 years old, William H., 1 year old, and Jack T., Jr., 5 years old, children of Accountant J. T. Walker, superintendent's office, Memphis, Tenn.

No. 25.—Helen Rose, 3 years 2 months old, and Virginia 6 months old, daughters of S. L. Shelton, ticket agent, Leland, Miss.

Baby

An hundred kings may come and go, and empires rise and fall,

But Baby with his smiles and curls is Monarch of us all.

The roses gave him finger tips, the bright stars gave him eyes,

The sweetest music of the world within his laughter lies;

And so his willing slaves make haste to do his least command,

An Autocrat of Love, he rules supreme in Cradle-Land.—*Woman's Home Companion*, July, 1922.

The Lord Loveth a Cheerful Worker

The other day a girl typist asked me to help her obtain a position. There was a vacancy, but the work was tedious and required accurate typing of many columns of figures. I knew nothing about her ability, and her meager experience made me hesitate to recommend her, until she said something that turned the trick in her favor. What do you suppose it was? When I explained in detail the character of the position, she responded promptly and sincerely, "I love that kind of work!" She made good. I knew that she would. Most of us "hate" to do this or that kind of task. We regard our work as a bitter pill, and, since circumstances compel us to swallow it, we demand a thick sugar-coating. It is refreshing to hear a worker say that she "loves" to work; when that is her mental attitude, invariably she justifies our confidence in her ability to make good.

What We're Working For

Why Not Regard Material as Money?

By E. R. BARSTOW,
Supply Department, Burnside

WHEN entering a bank or large commercial establishment we notice the care with which the cash and collateral are handled. Vaults of the best known construction are provided; elaborate accounting systems are maintained, and careful checks are made from time to time to insure that employees engaged in the handling of cash or securities are made accountable for every penny.

There has never been any doubt that such precautions were necessary; in fact, a business which did not maintain such safeguards was considered unsafe, and its financial rating suffered through this neglect.

It was also noticeable, however, that when this money was turned into manufactured materials the elaborate care which was taken of it was no longer considered necessary. Materials were stored in any out-of-the-way place available, and much of the stock on hand was maintained by mechanics whose principal concern was to have plenty of it on hand when required. A condition such as this always develops waste, due not only to excessive ordering of materials but also to many duplications of orders and inadequate storage facilities.

This was particularly true of large corporations on account of the scattered stocks which it was necessary to maintain and the immense variety of articles required. It has been the aim of all departments to correct such waste, and many of the best results have been obtained within the average man's recollection.

It is no longer considered advisable to store quantities of materials in out-of-the-way corners, in shops and other buildings where it is necessary to rely on the memory of a few men to replenish them when required. Storehouses have been constructed, with standard bins labeled and catalogued in stock books, so that the stockkeeper in charge may not only keep his material in an orderly condition but also,

by referring to the movement of his stock as reflected by his stock book, order his requirements economically. By reference to the stock books maintained, it is now possible to locate surplus stocks and move them to points where they are required, instead of making additional purchases. This naturally reduces the investment in materials and supplies.

An addition to the economies effected through careful ordering of materials has been the campaign to instill in the minds of those using materials the value of the articles used—that the material is the equivalent of cash and should be equally as well taken care of.

A large proportion of the stock is of necessity stored in section tool-houses under the care of section foremen, and these men are being continually reminded by material checkers of the value of the various items under their care and the importance of taking care of them. They are urged that, whenever possible, second-hand or reclaimed material be used to avoid the purchase of new.

Circulars have been sent out by roadmasters and supervisors giving the average price of the smaller articles, such as spikes, bolts, tie plates, rail anchors, etc., and these circulars are posted in tool-houses for the information of all persons who use material.

All of this agitation will bear fruit in time, and savings will be effected in proportion to the understanding that employees have that material is the equivalent of cash and should be cared for and expended as judiciously as the money itself.

Watch the Deadline!

Material for the magazine is still being sent in after the 15th of the month, in spite of warnings to the effect that the 15th is the deadline for magazine material. Obviously, material arriving so late will have to hold over a month, maybe longer.

Traffic Department

How We Aid Wisconsin Cheese Industry

By H. B. WAGNER,

Commercial Agent, Milwaukee, Wis.

ON the crossroads throughout Wisconsin are scattered in excess of 2,800 cheese factories, producing 77 per cent of all the American cheese produced in the United States and 64 per cent of all the so-called foreign brands, such as limburger and Swiss. And this in view of the fact that at the close of the Civil War Wisconsin was known as a wheat and lumber state, ranking third in that production!

Much of the lumber has been cut, and wheat growing "played out." Our rivers and waterfalls, which aided our lumber cut, are now operating our great paper mill industry. Diversification of crops was necessary.

The dairy business was found to be the most satisfactory because of the natural fertilization furnished by cattle and the variety of the crops necessary to sustain them. "Substitute the cow for the plow" became the cry. The state took hold of dairying, and the department of agriculture at Madison became a great spirit, full of advice and enthusiasm in fostering this great dairy industry to be. A college of agriculture, rated as the greatest in the country, exists at Madison, aiding the dairy and agricultural interests. Herds of the finest stock, machinery of the latest type, newly developed modern practices and professors of renown and enthusiasm are there. There is the short course or the long course—anything to suit the convenience of the farmer and to aid him advance his production and quality.

Laws Regulate Cheese Industry

The legislature passed laws which at the time were called stringent but which proved most helpful in the proper upbuilding of the dairy industry. There is a law compelling cleanliness of dairy barns and factories, the inspection law, the license law, the marketing law, the infection law, and now we have the grading law. Cheese must now be marked under the paraffine with its grade and sold at

that grade. The new law is said to have temporarily affected our sales adversely, but in the end it will standardize our quality and brands throughout the world.

All these influences have meant to the Wisconsin dairy industry what the cotton gin meant to the South. Climatic conditions, quality of the soil and water aided development, as did the character of the settlers.

Cheese is distributed by dealers who own cold storage plants in the larger towns or by mutual or co-operative makers' associations. The product is brought into these distributing houses on a system of concentration freight rates. The price paid to the maker is determined by the Call Board at Plymouth, Wis. Cheese is made in a variety of shapes or styles, which, however, have nothing to do with quality. The most common styles are the "single daisy" and the "long horn."

Shippers Trust Illinois Central

Wisconsin's production of cheese in 1920 was 307,365,073 pounds, and its value was \$100,000,000. Cheese is a high-class commodity for railroads, requiring special handling and special facilities and equipment. The Illinois Central has specialized as a perishable freight carrier. The largest cheese shipper once told me that he felt safe when his goods reached our road. We have the power, the icing stations, the coolers, the refrigerator cars, the schedules and the trained men. The perishable freight shippers know that. Our efficiency and foresighted policy have brought tonnage. Very few complaints or claims are placed against us on perishables.

Our agent at Chicago, R. O. Wells, advises me that in March, 1922, he received from the three big Wisconsin lines (exclusive of our own Wisconsin line) 2,534,835 pounds of less-than-carload cheese. The carload tonnage would approximate the same. He loaded out from Chicago in that month 828 scheduled refrigerator cars. We operate from Chicago a more extensive system of refrigerator cars than any other line. Today shippers can get

the benefit of through refrigerator car service on their less-than-carload perishables from Chicago to any fair-sized city in the South.

Cheese is still called a luxury by many persons. That is not a fact, however. Health departments, chemists and physicians say that cheese is a highly nutritious and moderately priced food. There is no cooking or waste. Six ounces of cheese and twenty-four ounces of bread will sustain the average hard-working man each twenty-four hours. We are not, however, a cheese-eating nation. We consume one pound per capita per year to England's five pounds. It formerly was less than that.

Wisconsin will advertise and improve the quality more in the future. It is predicted that in four or five years the consumption in this country will be equal to that of England. That means five times the present cheese tonnage throughout the United States. Estimate therefore the demands to be placed upon the carriers for icing facilities and refrigerator cars. Our road has come along with this rapid increase in all perishable movements; it is now possessed of one of the largest complements of refrigerator cars and is constantly adding to that number.

A Well-Known Western Lines Conductor

M. R. White, conductor on the Wisconsin division, has been in the service of the Illinois Central System for thirty-four years, and has been a railway man for forty-six years. He was born January 27, 1857, at Canton, Ohio, moved to Illinois when he was 3 years old, was forced to leave school when he was 13 years old, worked as a farm hand six years and started his railway career in 1876 as brakeman on the old Western Union Railroad, which later became the C., M. & St. P.

Mr. White relates many and varied experiences during his early railway work. He was a brakeman during the time when there was no such thing as air brakes. All the stops of the freight and passenger trains had to be made by hand. And in the winter the tops and platforms of the cars were covered with ice and snow. Often, he says, the brakemen had to carry hammers on the top of the cars to clear away the ice so that the brakes could be set. It was dangerous work in those days, he says, as the tops of the cars were slippery.

Mr. White's service with the Western Union Railroad came to an abrupt end when he refused to be suspended for ten days. He had a controversy with the superintendent of the division on which he was working because he had used waste to build a fire. As a result of the misunderstanding, Mr. White asked for his salary and resigned his position.

He was not out of the railway work long. He resigned at Freeport, Ill., left the station and met a conductor of the C. & N. W. R. R. He related his recent experience, and was im-

M. R. White

mediately offered a position on the C. & N. W. R. R. as brakeman. Conductors and agents had the authority to hire men in those days, Mr. White says. He accepted the position, started to work that day and remained with that road for ten years. During this time he was brakeman, conductor and yardmaster.

In 1888 Mr. White resigned to accept a position as conductor on what was called a supply train of the Illinois Central Railroad. This

train carried company material and provisions to the construction camps along the line.

Mr. White was freight and extra passenger conductor for the Illinois Central until April 7, 1892, when he was promoted to passenger conductor and was given a regular run between Chicago and Addison, Ill. He has continued as passenger conductor since.

At present Mr. White is conductor on what he terms the Rockford Milk Train. He runs into Chicago every day, and makes his home in Rockford. Mr. White has one son and two daughters, all married. Another son, James W., died at Atlanta, Ga., while in service during the war.

He says that he has always been glad that the controversy arose while he was employed with the Western Union, because it was the beginning of his advancement in the railway business. He declares that he is now employed by the best railroad in the country.

GUARDS THE TIME

W. F. Hayes

W. F. Hayes, who was appointed general time inspector of the Official Bureau of Railroad Time Service to succeed Webb C. Ball, deceased, is well known on the Illinois Central System. Mr. Hayes was born on a

farm near Palmyra, Wis., served his apprenticeship as a watch-maker and worked at that trade for fifteen years. After several years in the jewelry business at Janesville, Wis., where he was local watch inspector for the Chicago & North Western and the Chicago, Milwaukee & St. Paul, he became associated with Mr. Ball in 1903, having jurisdiction over the Chicago, San Francisco, Houston and Winnipeg offices.

A TRUE SOUTHERNER

Miss Martha Lucie Mackey

Miss Martha Lucie Mackey, daughter of Claim Agent and Mrs. H. G. Mackey, Jackson, Miss., was maid of honor on the staff of Major-General William Wroten, commanding the Mississippi Division of the United Confederate Veterans at their recent reunion at Richmond, Va. Both of her paternal and maternal grandfathers were soldiers in the "Lost Cause," and she takes great interest in the activities of the old soldiers, being a frequent visitor to the Confederate Veterans' Home at Beauvoir, Miss. She was graduated from the high school at Jackson, Miss., in June and will enter college in the fall. Miss Mackey accompanied some of the veterans to Washington, where they were received by President and Mrs. Harding and were shown many courtesies by the Mississippi representatives in Congress.

ACCIDENT AND

INJURY PREVENTION

Our Investment in Safety Figured Out

By C. O. SHUNK,
Engineer, Freeport, Ill.

IT is evident that, if grade-crossing accidents are to be avoided, some one must stop. The railroads have done and are doing everything possible to protect the autoist, except stopping the trains at grade crossings.

In order to ascertain just what the Illinois Central has done on the Freeport district, I have taken a check on the amount of money spent from Freeport to Parkway—105 miles—for crossing gates, bells, signs, and so forth, and for the wages of gatemen and upkeep of gates. I find that up to January 1, 1921, there had been spent \$45,130 for installation and that during 1921 there was spent \$3,470 for upkeep and \$26,200 for the salaries of gatemen and crossing flagmen. This makes a total of \$74,800, or \$712 a mile, or \$870 for each grade crossing. Yet the Illinois Central has derived little benefit for the investment of \$74,800.

One would think that the expenditure of this amount would furnish ample protection, and yet, on this district in 1921, there were eight grade-crossing accidents. In each instance the crossing was equipped with a crossing bell. In six of the cases, locomotives struck the automobiles and in the two others the automobiles were driven into the train. In all but one case damages were claimed. For these the company paid \$563, not because it was at fault but to avoid lawsuits, which would have been more expensive. Fortunately no one was killed, but six persons were injured.

What Whistle Signals Mean

I understand that, in case of violation of the traffic rules in a city, if an accident occurs, the motorist violating the rules is liable to a fine and also to damages. But, in the case of a grade-crossing accident, which is always caused by the motorist's failure to observe the rules, the railroad is usually blamed for the accident. It is seldom that the automobile driver will admit that he is at fault.

C. O. Shunk, freight engineer between Freeport and Chicago, will complete his twenty-third year of service in September. He entered the service as a fireman in September, 1899, at Freeport. On January 30, 1903, he was promoted to engineer. The greater part of his work has been between Freeport and Chicago.

Enginemen have a code of whistle signals, most of which are used in the operation of trains, but there are two that are for the benefit of the people. One long blast of the whistle is sounded when approaching a station, and two long and two short blasts when the train is approaching a crossing. An engineman neglecting to sound the whistle at each whistling post is liable to a fine. There is no one, perhaps, who doesn't know the regulation crossing signal. There is another signal, not used in the operation of trains, a series of short blasts of the whistle, which is known as the stock signal; it is used to frighten stock which may be on the track,

and it is usually effective. Often, when an engineman has sounded the regulation crossing signal and sees an automobile approaching the crossing whose driver will not heed the warning, the engineer gives the stock signal, which will sometimes stop the driver of the car.

It is my opinion that the one great mistake is that the automobile drivers have been taught that the railroad will protect them, instead of being taught to protect themselves. The laws and city ordinances compelling the railroads to install gates, bells and so forth have only tended to make the autoist careless.

Gates and bells are mechanical and are liable to failure. Should such a failure occur when a train is approaching a crossing, it would be very dangerous, for those who use such a crossing will make no attempt to stop if gates are not down or the bell is not ringing. The best protection, then, for the automobile driver would be a law compelling everyone to stop for every railway crossing. The penalty for the violation of such a law would have to be severe. No doubt safety islands, such as are used in Chicago at street intersections, could be used on both sides of each crossing. They would compel the motorists to slow down and would reduce grade-crossing accidents.

It is the duty of the motorist for his *own* safety to "Stop, Look and Listen." If he will not, the trains will have to—and it is certain that on one wants either passenger or freight service so encumbered.

Would Label Safest Section

B. J. McAboy, division motor car repairman at Clinton, Ill., who has been active in

B. J. McAboy

operation of a motor car with a white sign on which in blue lettering are painted the words "Safety First 100%." The white background and the blue letters make a conspicuous sign and would designate the standing of the foreman and his gang. This sign would be furnished only to foremen who had no accidents or injuries during the year. Any ambitious foreman realizing this fact naturally would be much interested in keeping his motor car equipped with a "100%" sign.

The idea submitted by Mr. McAboy seems to be a good one and, if such a plan is adopted, ought to assist in preventing accidents and injuries in the operation of motor cars. At the same time, it will recognize the foreman who has had a clear record.—S. M. C.

Teach Children Safety

In connection with the "Careful Crossing" campaign, the Chicago Safety Council recently issued a pamphlet appealing to the school children of Chicago for their support in making the campaign a greater success. The booklet was distributed with the request that it be read in each room of all Chicago schools either by the teacher or by an older boy. It contained statistics of the number of persons killed and injured at railways crossings in recent years and many "don'ts" for the children to bear in mind. The pamphlet also made the request that the attention of the children be drawn to the "Cross Crossings Cautiously" posters which have been displayed.

Proper Lubrication an Aid in Saving Money

Engineer Can Serve Company by Preventing Waste of Oil as Well as Avoiding Use of Too Much Fuel

By C. L. ZANEIS,

Traveling Engineer, Springfield Division

Mr. Zaneis has recently been acting as lubricating engineer, working under the direction of R. W. Bell, general superintendent of motive power.

ARTICLES have appeared in this magazine from time to time giving facts and figures as to the result of united effort when put forth to accomplish a particular thing. All effort put forth by those held responsible for efficient, economical and satisfactory railway service must be accompanied by the full and whole-hearted co-operation of the man on the ground if the desired results are to be obtained.

Importance of the Engineer

There are but two classes of employes on the railroad: one which disburses money for labor and supplies, and one which makes and saves material. It may be that I am partial to some extent, but I feel that the locomotive engineer is in a position to make and save more for the railroad than any other employe. The proper handling of trains in both freight and passenger service, good judgment in switching cars, avoiding rough handling and providing on-time service are advertising features that win and hold business, and these are largely under the control of the locomotive engineer. In other words, the engineer delivers the finished product.

We hear much of the saving that has been made in fuel the past two or three years. This wonderful saving has been brought about through the united effort of employes in every department, but the final result had to be shown on the locomotive. Many methods of fuel conservation have been tried, but the most effective method proved to be the one based on education and co-operation. With these two principles foremost, many employes found that they had never realized the great waste of fuel and material, because there had been no organized effort to save.

Education in Safety Needed

Many devices have been installed on the rail-

roads the last few years to guard the safety of passengers and employes. A disregard of the intent and principle of these devices not only is a loss to the railroad but often results in injury or loss of life to passengers or employes. Often the misuse of a safety appliance is caused by ignorance, and it is the duty of those who are informed as to their correct use to instruct their fellow employes. By this kind of co-operation, we will obtain results that make for better railroading.

The last ten years have seen decided changes in the design and construction of locomotives. Numerous devices have been installed to lessen the labor of the enginemen, enabling them to give greater attention to the operation of the machine. With the advent of new power and improved conditions on the locomotive, it has been necessary for the engineers also to adopt new ideas and methods or become back numbers, and with but few exceptions they have adapted themselves to the new conditions almost 100 per cent.

Lubrication on Superheated Engines

One of the greatest changes effected in power has been the introduction of the superheated engine. The installation of this device has made it possible to have larger engines with greater tractive effort.

This change has reversed the lubricating system practiced on saturated engines, inasmuch as it is now necessary to lubricate the cylinder as well as the valves. It is not necessary to go into detail as to the construction and operation of the superheated engine, except from a lubricating standpoint. In the saturated engine we oiled the valves only, and as a rule with almost any kind of lubricating oil; but owing to the increased temperature in both valves and cylinders, especially prepared oil must now be used to lubricate the engine properly.

The successful lubrication of a superheated locomotive is not difficult if all the accessories to the lubricator are in proper condition. The chokes in the tallow pipes should not extend more than half way into the steam pipe, opening down, so that the oil may mix properly with the steam. The tallow or oil pipes should

have no pockets in them. The steam pipe to the lubricator should be wide open, and with a properly working lubricator the engine will lubricate successfully.

What Causes Carbonization of Oils

Carbonization of oils in the steam ways and cylinders is caused by the admission of air when the cylinders are at a temperature above the flash point of the oil and by unconsumed gases drawn into the valve chambers and cylinders through the exhaust. The use of a drifting throttle should always be practiced.

Tests and experience have proved that admission of oil to the valves only does not provide the necessary lubrication for the cylinders as satisfactorily as when oil is fed directly into them. This method of lubricating does not require additional oil, as the valves receive part benefit of the cylinder lubrication as it passes through the exhaust rings.

The cost of lubricating oil on this system is almost \$500,000 a year, and the wasteful and improper use of oil is a big item. The extravagant use of oil on driving box wedges and shoes and on valve motion can be eliminated if the engineer will only realize that a very small amount of oil applied properly and at the proper time will give any bearing suffi-

cient lubrication. As an example of the free distribution of oil, a small spoonful of oil placed in a tub of water will completely cover the surface.

Oil can be saved by closing the lubricator feeds before stopping on pit tracks, as many times engines will drain enough oil out of the cylinder cocks on the roundhouse floor to lubricate them for twenty-five to fifty miles had it been applied properly through the lubricator instead of being allowed to waste on the floor.

Related to Fuel Conservation

The same rule applies to guide cups, should they be left open. Packing in engine trucks, trailers and tank boxes should be inspected, and reported only when needed. A great loss of oil is often caused by extravagant use on these appliances, and it should be watched carefully.

Proper lubrication is closely related to fuel conservation, and the engineer has both under his control and supervision. In the light of conservation, oil wasted is beyond use for any purpose. Coal may be reclaimed in some measure. The engineer has within his power the means of effecting a great saving in both oil and coal, and this saving means greater efficiency both on the part of the engineer and in the service the railroad renders the public.

Our Annual Fire Loss 57 Cents a Minute

By G. R. HURD,

Supervisor of Fire Protection

The fire losses on this railroad for the last year amounted to 57 cents a minute, and most of the fire losses were preventable. Each employe should consider himself a fire inspector or warden, as far as his particular duties are concerned and insofar as any dangerous condition may come to his notice; each one should have in mind constantly that through no act of his or through no lack of action on his part will he create a fire hazard or allow one to pass unnoticed.

If you know of or see a fire danger or hazard, report it at once to the person in charge of your department, so that the danger may be corrected at the earliest possible time.

I have often heard the following remark: "We have never had a fire, and I have been here so many years."

The answer is that the mere fact that you never have had a fire is no reason that you may not have one. You are perhaps that much

nearer a fire. Fires, like accidents, happen at unexpected times. Fire is the demon that never sleeps. An ounce of prevention is worth more than tons of water after the fire has a good start.

Keep in mind constantly that the first requisite in the prevention of fire waste is good housekeeping—meaning cleanliness. Every fire in railway property should be made the personal responsibility of some employe. It must be remembered that the majority of fire losses are preventable, that they are largely a matter of lack of cleanliness and carefulness, and that the great study of prevention must be along these lines.

Remove accumulations of rubbish and waste and guard inflammable property and materials from all sources of danger by fire. Guard against not only physical defects but also neglects brought about through carelessness, indifference, ignorance or willfulness on the part of any person.

Smoking is a general habit. Guard carefully

against hazards and careless practices incident to it. Do not smoke wherever you see the "No Smoking" sign.

The acceptance of individual responsibility will prevent not only large waste of property, which cannot be replaced immediately, but temporary loss of employment through the destruction of facilities and serious interference with operation.

Most fire losses are caused by carelessness, and carelessness means not having your mind on what you are doing.

All officers and employees should be on guard at all times to prevent a fire. Show your loyalty and co-operation, and, thorough earnest efforts and constant vigilance, accept your responsibility toward the prevention of the unnecessary fire losses.

Are you doing your part to prevent a fire and to help make this the safest and best railroad in the world?

Remember that it is easier to prevent a fire than it is to extinguish one. Think before you take another chance.

What Rough Handling of Cars Can Cost

By G. S. HARTMAN,
Trainmaster, Fordham, Ill.

Records show that rough handling of equipment is responsible for about 25 per cent of loss and damage claim payments. In addition, this means a great expense (and a large portion of it unnecessary) due to the damage to equipment and also to loss of time of train and engine crews re-railing cars and engines or chaining up cars. In many cases, there is the expense incident to requiring a steam derrick, the use of which is expensive, to say the least.

If engine and trainmen would stop to consider what pulling out one drawbar means, it is safe to say each one would redouble his efforts to avoid this damage.

To illustrate, if it requires thirty minutes to switch a bad order car on the repair track and thirty minutes more to switch it off the repair track and classify on the proper track, the cost for switching the car alone will amount to approximately \$15, including fuel, supplies and supervision, and only one drawbar pulled out each day for one year will cost \$5,475 for switching the car to and from the repair track. Considering this service can be accomplished in one hour, the amount for switching the car alone is equal to the interest on more than \$90,000 for one year at 6 per cent, and does not include the cost of labor or material in making repairs to the car. On every car that is damaged sufficiently to require being placed on the repair track, where the switching operation requires as much as one hour, the interest on more than \$90,000 for one year at 6 per cent is simply thrown away. How many enginemen, trainmen or yardmen stop to think of this extravagant waste in handling their trains or switching cars in yards? A little

earnest effort on their part will soon eliminate this large and practically unnecessary item of expense and will serve greatly to reduce loss and damage freight claim payments.

Safe practices, co-operation among all employees and a feeling of good fellowship are absolutely necessary to the proper operation of the railroad. Where these three attributes are apparent, the major portion of loss due to rough handling will soon be eliminated. Yardmasters can do a great deal of good in the elimination of rough handling by keeping a close supervision on the work in their yards and the proper placing of their men, especially of engine foremen, and by talking frequently with them, as well as the helpers and enginemen, on their daily rounds through their yards, correcting any irregular practices that may come to their notice. New men are usually assigned to night work and, not being entirely familiar with conditions, might possibly handle cars too fast or in some other manner that might cause damage. The yardmaster, if alert, will soon educate the new man by talking with him before the damage is done.

The rough handling of equipment, about which so much has been said, is in most cases the result of carelessness or lack of good judgment. It can be eliminated when safe practices and co-operation are pursued among employees.

APPOINTED IN CALIFORNIA

A. A. Zastrow was appointed traveling freight and passenger agent at Los Angeles, Cal., July 1. His office is 370 Pacific Electric Building. Mr. Zastrow takes the place of J. R. Gager, who has been promoted.

Bottom picture—First roundhouse at Centralia in 1854. Photographs by courtesy of R. H. Horn, now on the pension list.

CLAIMS DEPARTMENT

Damage Suit Yields \$25 Verdict

Miss Emma Taussig, an Austrian citizen, sued the Yazoo & Mississippi Valley Railroad in Claiborne County, Mississippi, for damage by fire alleged to have been set out by a passenger train near Insmore, Miss., in November, 1920. In the petition she claimed that an area of thirty-five acres had burned over, destroying 164 bushels of lespedeza seed valued at \$5 a bushel and sixty-four tons of lespedeza hay valued at \$15 a ton, or a total of \$1,780.

C. C. Smith had been running the place in previous years and owned and worked other land in the locality. Smith has been a frequent litigant against the railroad. He induced Miss Taussig to let him file this suit in her name. The case was tried at Port Gibson, Miss., in June. While the trial court gave the jury a peremptory instruction to find the railway company liable, the jury was so little impressed with the fact that any material damage had been sustained that it returned a verdict for only \$25, about 1.4 per cent of the amount sued for.

When the expenses are paid, Miss Taussig will probably regret that Smith did not arrange to share in the losses as well as in the profits.

It is an adage that when a train strikes a scrub cow or a razorback hog, a Jersey or Duroc animal is the one found dead. It is also said that usually when fire burns over an old weed patch or sage field near the track immediately the field proves to have had the best stand of hay and seed ever grown in the country. Too frequently the plaintiff gets away, in part, with such a contention, but this was evidently too clear a case for that particular jury. Possibly the jurors thought the railroad had been so nearly drowned out in the recent floods that it ought not now be scorched with a fire suit.—E. W. S.

Speed of Train Didn't Count

George D. Clark, a 13-year-old youth living at Jackson, Miss., attempted to board a moving freight train on March 22, 1921, while it

was passing over one of the street crossings of that city. He is minus his right foot as a result of his folly.

A lawyer thought that he could recover damages by invoking in this case the statute prohibiting trains from exceeding a speed of six miles an hour through the corporate limits of a municipality. He therefore filed suit in Hinds County. When a leading paper of Jackson commented editorially on the gross injustice of the suit, he dismissed his suit and filed it in Lincoln County, far removed from the scene of the accident as well as the home of the youth.

The railroad removed the case to the federal court, at Jackson, where a trial was held in December, 1921, before Judge Sheppard of Florida, sitting as a special judge in Mississippi. Being unfamiliar with the Mississippi laws Judge Sheppard permitted the case to go to the jury, and a sympathetic verdict of \$3,000 was returned, which Judge Sheppard, as soon as he had thoroughly examined the Mississippi law, set aside. He granted the railroad a new trial.

The case was recently tried before Judge E. R. Holmes, the regular federal judge, who, upon hearing the plaintiff's testimony, held that the boy's injury was the result of his own grossly negligent act, and the jury was instructed to return a verdict for the railroad.

We believe that this is the first time a plaintiff has charged in his declaration that, while the injured person was engaged in the unlawful and extremely hazardous act of jumping on a train, his injuries were solely caused by the fact the train was running faster than the statute permitted. It only goes to show the extremes to which some lawyers will go in order to "trim" the railroad. Both trials consumed four days and cost the taxpayers and the railroad a considerable sum of money.—H. G. M.

The Passing of John Williams

Away back yonder in the spring of 1913, before Volstead became famous, there was employed by this railroad a negro named John Williams—a member of Bernreuter's bridge

gang—whose home was at West Point, Miss. John was the head of a large family of children, ranging from infants to adults, and it was his custom to run in home Saturday nights when the camps were located sufficiently near to warrant the trip.

The evening of May 18, 1913, having tanked up on a beverage that is now extinct and having ascertained that the boss was away with his tricycle left unguarded, John secretly took possession of the "speeder" and started down the track in the direction of his home, about ten miles distant. There was a dip in the track at about the half-way point, and locomotion was easy until he got that far. However, like Lazy Ned, he did not fancy the up-hill pull, and, being filled with liquor akin to "white mule," very naturally fell asleep when his machine finally stopped at the lowest point.

This was about sun-set, and No. 234 was due, but John was enjoying sweet dreams of childhood and was not annoyed by train sched-

ules, either freight or passenger. After rounding a stiff curve, Engineer Blankenship discovered the object in the track only a short distance ahead and made a desperate effort to stop, but that was impossible. Repeated blasts of the whistle failed to arouse the man, and the engineer then realized he was asleep, sitting there on the tricycle in an upright position.

The negro did not live to make a report of the accident, but after a long number of years the heirs-at-law found attorneys who were willing to try their luck at recovery. Then followed a suit at Aberdeen and a trial October 27, 1921, which resulted in a jury verdict in favor of the railroad. The supreme court has just now affirmed the decision of the trial jury, and the case is therefore finally closed.

The heirs, having taken advantage of the pauper's oath, threw the heavy costs upon the railroad, besides which the employe witnesses were compelled to lose many days from their regular work.—J. L. S.

His Watchfulness Saved a Child's Life

Engineer William ("Buster") Carney, a veteran engineer on the Memphis division, saved the life of a child while on train No. 13, March 30, by his watchfulness and quick judgment.

After leaving Coahoma, running at the usual rate of speed, Mr. Carney saw a white object in the distance on the track. He whistled and immediately applied the brakes in emergency. As he was stopping he discovered the object was a little child. There was a moment of dreadful suspense, when Mr. Carney feared being unable to stop. He used all the appliances at his command, bringing his train to a stop within six feet of the child. Mr. Carney got off his engine, lifted the child from the track, and delivered her to the older children, who had by that time reached the track.

The child is the 21-months-old daughter of I. J. Morris, a planter near Coahoma, Miss. Mr. Morris advises that he continually warns his children of the danger of going upon the railway property and does everything possible to keep them away from the track. In this instance, the child was in the yard with the other children only a few minutes before the occurrence, but in some way escaped their notice and wandered on to the track at a point opposite Mr. Morris' residence.

Mr. Carney has been an engineer in the

William Carney

Memphis division for thirty-one years, and his service has always been of the character manifested in this instance.

What Patrons Say of Our Service

Special Service on Medicine

J. E. Rudolph, assistant manager of the Van Vleet-Mansfield Drug Company, Memphis, Tenn., recently wrote as follows to F. J. Theobald, chief clerk to Superintendent J. M. Walsh of the Memphis division:

"On behalf of our customer, Dr. J. W. Gray, Clarksdale, Miss., and his patient, we want to thank you for the accommodation which you so kindly extended us Saturday evening in permitting us to place a package of Antirabic Serum on an early freight train leaving for that point.

"This was a favor that of course could not be extended promiscuously, but on serious occasions like this we certainly appreciate co-operation from disinterested parties in assisting us in effecting immediate delivery of vital medicines."

The call came to Mr. Theobald at 6 o'clock one Saturday evening. Doctor Gray had a patient, a child who had been bitten by a mad dog, and the drug company wanted to know if it would be possible to speed the package from Memphis to Clarksdale on a freight, the only train running at that time in the evening. Mr. Theobald found that a dirt train was listed for 7 p. m. He had the package delivered to the chief caller at South yard, who delivered it to the conductor boarding the 6:30 p. m. employees' train, and the conductor in turn delivered it safely to the ticket agent at Clarksdale.

At the Funeral of Mrs. Small

The Illinois Central served many of those who attended the recent funeral of Mrs. Len Small, wife of the governor of Illinois. The following letter to J. H. Lord, district passenger agent at Springfield, Ill., is from C. E. Black, adjutant general of Illinois, with headquarters at Springfield:

"I wish to express to you and, through you, to the many officials of the Illinois Central Railroad who co-operated with you in the furnishing of the special train to Kankakee and return on the 28th my appreciation of the excellence of the service and the great attention paid to the comfort of the passengers aboard the train.

"I made many inquiries of the passengers regarding their comfort, and their expressions

were unanimous that everything was being done to make their journey a comfortable one. While I did not get to talk to every passenger individually, I am sure the expressions above represented their unanimous opinions.

"Many remarks I overheard to the effect that this was the finest funeral train that ever was sent out from Springfield, and I believe you and your officials should know that we appreciate that everything was done that could be done by you and, from the standpoint of the railway train, your work was a great success."

Enjoyed Trip of Illinois Bankers

The following letter to C. B. Dugan, superintendent of our dining service, is from Carl H. Weber, assistant chief bank examiner, office of auditor of public accounts, Springfield, Ill.:

"I had the pleasure of being a member of the party of bankers which toured the state in connection with the group meetings of the Illinois Bankers' Association, and I desire to take this occasion to compliment your department for the excellent service rendered en route. C. A. Castle and his assistants were unusually capable and courteous and were very solicitous for the welfare of the entire party."

Finds Good Service on a Diner

The following letter, addressed to C. B. Dugan, superintendent of our dining service, is from Leo K. Steiner of the investment firm of Steiner Brothers, 55 Liberty Street, New York City:

"I feel that efficient service should be commended, just as inefficient service would be reported.

"It has been my pleasure as well as the good fortune of my family to travel on a great many occasions on your trains between Birmingham and Chicago, and during these travels, on a number of occasions, we were served in your diner by L. B. Frame.

"It is a pleasure to travel with him, as I consider him one of the most efficient men that I have come in contact with, and my travels have been extensive."

Perfect Service to the Bankers

The following letter, addressed to J. V. Lanigan, general passenger agent, and C. B.

Dugan, superintendent of our dining service, is from John A. Cathcart, president of the First National Bank, Sidell, Ill., who was in charge of the trip to which he refers:

"I wish to take this occasion to thank you for the manner in which you arranged for our comfort and prompt handling of our cars on the recent tour of the state on the Illinois Bankers' Association Special. From the time that we left Chicago until our return, not one incident occurred to mar the trip. I want to congratulate you on having in your employ such men as your Mr. Wheelan, Mr. Castle and Mr. Simmons. These gentlemen used every means possible to make our trip a pleasant one, and it was the consensus of opinion that it was the best trip the group has ever had.

"Your Mr. Castle deserves special mention for the manner in which he handled the dining car service, which was excellent, and the meals will long be remembered by the party.

"Mr. Harvell, who had charge of the Pullman work, is also a past master in his line, and we appreciate his many courtesies.

"I trust that you will feel at liberty to call upon us should you desire a good recommendation for the service of your good road."

Handled a Crowd in a Hurry

The following letter to President C. H. Markham is from W. H. Brizendine, mayor of Mayfield, Ky.:

"Recently it became necessary or advisable for a party of forty-four of our leading business and professional men to appear in Louisville before the Kentucky Normal School Commission, which is considering claims submitted by various western Kentucky towns for the location of the Western Normal School. Our party was suggested and the trip planned so hastily that we found the hearty co-operation of your local agent, M. H. Robertson, and the superintendent, C. R. Young, so nearly perfect that it greatly aided our party in its object and added wonderfully to our comfort. I therefore take great pleasure in making the facts known to you.

"Our trip was planned on Sunday afternoon, May 28, to leave Mayfield at 10:45 a. m., May 30. I conferred with your local agent, who advised that I call Mr. Young over long distance telephone. I told him that I thought it would be necessary for him to put an extra car on the regular train and make extra provisions for the dining car service; although the time was very short, he gave evidence of work-

ing over-time to make preparations, called me several times over long distance, and really did more for us than we could have reasonably expected of him. Our trip to Louisville was enjoyed by all; your train crew, and especially those in charge of the dining car service, showed us every courtesy and attention that we could have expected.

"Mr. Fowler met our train in Louisville and not only gave us assurance but relieved us of any trouble or worry with reference to Pullman service out of Louisville on the evening of May 31. He offered his services otherwise in any way we could use him, making it all in all a very enjoyable trip and one highly appreciated by every member of the party."

Appreciated the Bankers' Special

The following letter is from Paul R. Walters of Atkinson, Ill., president of the Illinois State Chapter of the American Institute of Banking:

"The writer has a very pleasant duty to himself to discharge in acknowledging the splendid service rendered on the recent tours of the state of Illinois by the Illinois Bankers Association Special.

"Every attention and courtesy was afforded us. Mr. Castle and Mr. Simmons were always on the job to make things pleasant and comfortable, and the only complaint we could possibly make was they overdid the matter and fed us too well.

"The chef and waiters should be mentioned also. Their perfect service was needed to make the thing complete.

"Real hospitality prevailed, and it is with the utmost pleasure I send in this word of my appreciation as one of the party which was treated so royally."

Milliken University, Decatur, Ill.

The Demagogue a Peril

(Continued From Page 46)

"I am going to have a share in some of these enormous earnings, but I am going to play safe. I will buy only the very best. I will start in with some railroads. There is the Pennsylvania. They tell me it is the standard railroad of the world. It has 60,000 women stockholders. It has paid dividends since 1854. I can buy its stock now at about par, I will put one-fifth of my money in that. It will earn me \$600 per year for life. Then, there is that Chicago, Milwaukee & St. Paul, which runs from Chicago to Seattle, and covers Wisconsin, northern Iowa, southern Minnesota and the Dakotas like a devil fish. Its preferred stock was sold outright to stockholders for \$100 per share cash. It has been above par, and now I can get it where the stockholders got theirs. I will put \$10,000 in Chicago, Milwaukee & St. Paul preferred—\$700 a year for me as long as I live from that source. No taxes; the railway company pays the taxes.

"Boys, I am getting somewhere now. And here is that sugar monopoly. Its stock was selling at \$140 not long ago. I can get that at par, too. So here goes—\$10,000 for sugar. Seven hundred dollars more assured for life—no taxes. And, say look at that Sears Roebuck stuff! I can get that at about par. I have paid that concern a lot of money. I am going to be in it myself, and I will get my little 7 per cent regularly—\$700 more annually. Great Caesar! I thought I was done with railroads, but here is that old reliable North Western selling at \$99 a share. I did think I would put the last \$10,000 in the bank or loan it on a mortgage, but I might have to pay taxes on the mortgage. I will put this last \$10,000 in North Western—\$700 more per year for life. My \$50,000 is going to give me a total income of \$3,400—no taxes, no repairs. The money will come to me by mail."

How Would It Turn Out?

I submit that any banker would have told anyone who came to him with such a program a few years ago about this: "If you are going to invest in stocks, which I do not advise, you have about as conservative a list as you could pick out."

But how would it fare with anyone who had done this? His income would not be \$3,400 per year. It would be \$900. The Pennsylvania's dividend has been reduced to 4 per cent,

and the North Western's to 5 per cent. They are the only two concerns on the list that are paying anything, and the North Western's dividend was not earned last year. How about his capital account? His 100 shares of American Sugar would be worth \$7,800; Sears Roebuck the same; North Western \$7,400; Milwaukee preferred \$4,000, and the Pennsylvania \$8,200; total \$35,200, being a loss of \$14,800. It would have been very easy to have made out a list of stocks considered gilt edged two or three years ago which are today paying nothing at all and can be bought for a song. None of the stocks of the great sugar companies are paying a cent of dividends. Of the well-known mining stocks, only the Utah Company is paying a cent, and that only \$2 per share. The dividends on automobile stocks have reached the vanishing point. The chemical stocks which paid from \$6 to \$32 a share prior to two or three years ago have all passed their dividends except two, and they are on a 4 per cent basis. Of the rubber-tire companies, all dividends have been passed except in two cases. One is paying \$3 a share and the other \$2. Only the tobacco stocks seem to have held their own.

Every business man, big and little, has had to take a dose of bitter medicine. Many of the war profits were on paper only, but on those paper profits income and other taxes had to be paid in real money.

Poorer Because of the War

A few individuals may be richer because of the war, but not nearly so many as we have been led to believe. The world, as a whole, is infinitely poorer. It has lost, numerically, financially, morally and spiritually. Its loss in man power—the very flower of its manhood—cannot be regained in many generations. Its loss in property can only be made good by work, and then more work, and through thrift. The moral and spiritual lapse can only be overcome by a new birth from within. It cannot be superimposed from without. We shall, in the end, stand or fall together. Recovery will be a gradual process at best.

The business men of any country, if united, are generally invincible. We need to give more attention to the all-important questions of government than we have been accustomed to give.

How much longer can the business men of this country afford to have the railway question the sport of demagogues who would be out of a job if this great issue were settled right? It is no longer profitable to dwell on the sins of the railroads in days gone by. If

they sinned, and they did sin, have they not been punished—yes, beaten with many stripes? Without them, this country would be undeveloped. Iowa, our own Iowa—today a garden—would be a beautiful wilderness, and nothing more. And unless railway development keeps pace not only with but in advance of the growth of the country stagnation will result.

Herbert Hoover is on record as saying that no other factor or combination of factors would bring a return of prosperity as quickly as would a policy which would re-establish railway credits and permit the railroads to re-equip and extend themselves to meet the transportation needs of the nation—and he is right.

A Half-Truth Is a Lie

The Cummins-Esch Bill is criticised and its repeal demanded because of an alleged guaranty provision guaranteeing to the railroads a net income of $5\frac{1}{2}$ per cent on ascertained valuation. I know of no more striking example of how hard it is to kill off a lie or a half-truth than this. There never was any guaranty. Last year the railroads earned less than 4.2 per cent. (Their net operating income was 3.3 per cent upon tentative valuation—Editor.) Has anyone heard of this deficiency being made up to them?

For myself, I am bold enough to say that there ought to be a guaranty in the case of the railroads, since we have so regulated them that they have no control over their own business. Let me bring this home to every one of you. Suppose the government should establish two boards to control your business, giving to one the power to say what you should charge for the goods you had to sell or the service you rendered and to another board the power to say what wages you should pay your help, how many hours they should work, and under what conditions, down to the minutest detail. Do you think you could borrow money at low rates under those conditions? Do you think you could sell stock to raise money for extensions and betterments? The railroads are in just this condition. Truly the road back to normalcy for them is a rocky road.

In my opinion, these things would help:

First, to get back to fundamental principles in government. We have not been exactly "fiddling while Rome burned," but we have been engrossed in business, in golf, in joy-riding, and in an all-around effort to have a good time, while the very foundation principles on which this government rests have been subtly undermined. We need to get back to a repre-

sentative government. This nation cannot endure as a social democracy any more than Russia can. We need to choose the very best men possible for legislative duty, and, having chosen them, trust them—keep them in office long enough to master governmental principles, and then keep them in because they have mastered them.

Do Away With Class Thinking

Second, quit thinking of public questions solely from the individual standpoint. This country, with its diversified interests, often in conflict, can not get anywhere by the bloc method, now seemingly popular. There is more class consciousness in America today than there ever has been before. Class distinction is as far removed from the true spirit of America as Prussianism is. In a message to Congress toward the close of his administration, President Roosevelt said:

"The vital lines of cleavage among our people do not correspond and indeed run at right angles to the lines of cleavage which divide occupation from occupation, which divide wage earners from capitalists, farmers from bankers, men of small means from men of large means, men who live in towns from men who live in the country; for the vital line of cleavage is the line which divides the honest man, who tries to do well by his neighbor, from the dishonest man, who does ill by his neighbor.

"It is the man's moral quality, his attitude toward the great questions which concern all humanity, his cleanliness of life, his power to do his duty toward himself and toward others which really count; and if we substitute for the standard of personal judgment which treats each man according to his merits another standard in accordance with which men of one class are favored and men of another class discriminated against, we shall do irreparable damage to the body politic.

"I believe our people are too sane, too self-respecting, too fit for self-government ever to adopt such an attitude. This government is not and never shall be governed by a plutocracy. This government is not and never shall be governed by a mob."

I wonder if Mr. Roosevelt, if he were living, could express himself with equal confidence as to America's attitude today? I fear not. But that does not matter, so far as the truth of what is said is concerned.

There is no place in America for any kind of a bloc. If we replace the party system with

a group system, the day of our degradation and disintegration will be at hand. We must seek to do justice rather than to take or gain advantage; to rely upon ourselves rather than upon the government; to discriminate between liberty and license everywhere. We must recognize the fact that statesmanship is an art; that it can no more be mastered over night than law or medicine or engineering; and that people can no more legislate directly than they can build bridges directly. There is no alchemy whereby mass ignorance can be transmuted

into intelligence. We must get away from littleness. Always we must have in view the larger ends to be attained and served. Just now we are in danger of predicating our action on great governmental policies of far reaching import on some prejudice—some inconsequential thing. We have got to quit this. We must shun the demagogue and exalt the statesman, or we shall "meanly lose the last best hope of earth"—a government founded on equality before the law and justice under the law.

Son of Pensioner Becomes a Noted Singer

Back in the eighties and early nineties, one of the most popular of the Illinois Central's pioneer engineers on the Amboy-Dubuque division was William A. ("Bill") Ropps, who, with his modest but equally popular wife, reared a family of three stalwart sons and one daughter in the little village of East Dubuque.

W. A. Ropps

The eldest of the sons, William Ashley, Jr., early manifested a desire to become a singer. Upon completion of a high school course in the local school, he joined the vested choir of St. Luke's Methodist Episcopal Church, Dubuque, as a chorister, at the same time taking up the study of voice with the director, William H. Pontius.

The singer's gradual rise in the realm of musical art is pointed to with a degree of pride by his parents (who for a time opposed such a course), and they have lived not only to have his beautiful voice ever with them through phonographic records but also to have seen him achieve high rank among the foremost concert and oratorio singers in this country. Mr. Ropps is also a distinguished vocal teacher, having produced several singers now in the active musical field in New York City, where he conducts studios both in the Apollo Building, Brooklyn, and in Carnegie Hall, New York City proper.

Ashley Ropps

Ashley Ropps, as he is known professionally, is entirely a self-made man, having worked his way by devious routes from the little hamlet to the greatest musical center on earth, where, without assistance and entirely unknown, he won a scholarship contract to study with a celebrated master. In addition to having sung with some of the most representative choral bodies and many world-famous artists, he has toured extensively.

The barytone's most recent appearance in the vicinity of his home town, Freeport, Ill., was on December 27 last, when he was the leading soloist at the annual production of "The Messiah" in St. Luke's Church, Dubuque, Iowa, under the direction of Dr. Hugh D. Atchison before an audience estimated at twelve hundred. This was the same church where he began as a choir boy.

His father, who was retired on pension January 1, 1909, after more than forty years of service with the Illinois Central, now lives at Freeport. The elder Mr. Ropps was employed by this company as a fireman in September, 1867, was promoted to engineer in August, 1873, and was employed as engine inspector from April, 1893, until pensioned.

I'VE always resented being harassed by rules and regulations imposed by somebody else. From the time I was 2 or 3 years old, I've always wanted to do as I myself chose, not according to the arbitrary dictation of another. As soon as I learned how to decipher the English language as printed in books, I found out that the feeling of being untrammelled is a fundamental idea of the American people. They had it right at the start. The first colonists brought it along among the old furniture in the Mayflower and the fine old Virginia traditions of Jamestown. Those Jamestowners, so far as I could learn, had individual rights down to a science. They were the original promoters of the principle that a man has a divine right not to work unless he wants to and were willing to starve to death to prove it. In fact, some of them did starve to death proving it.

So I lined up with the contenders that man is a free agent with the right to do as he pleases. Anybody who restricts him in his freedom of thought and action just because of a transient power to do so is a tryant and an oppressor. But the world is full of these self-appointed dictators, I've found. My parents hedged me round with rules and regulations. They oppressed me with an iron regime of disciplinary "do this's" and "don't do that's." When I finally succeeded in oozing out from under a stern parental yoke, I only got out of the frying pan to fall into the fire, so to speak. I discovered that there are a million laws and ordinances enjoining a person to do this or forbidding him to do that. Every other individual you meet is an arbiter of some sort. Half the population is busying itself making laws or enforcing laws or winking at law violations which ought to be enforced. There's very little real freedom anywhere, it seems.

If it isn't a legal statute that confronts one, it is a decree of public opinion or established custom. People are like sheep; they follow anybody who takes it on himself to be a bell-

wether. For example: Every inconsequential act of one's daily life is mapped out for one. A jangling alarm clock or a bellowing whistle rouses one up at an unearthly hour in the morning, when one most desires to remain blissfully asleep. One is forced to get up, under protest from every liberty-loving instinct of his soul, but get up, anyway. He is instantly confronted by all sorts of cut-and-dried rules of procedure. He must put on his pants. He must wash his face, comb his hair, shave, brush his teeth. He must not appear in public without a shirt or even a collar and tie, the latter properly tied. At breakfast he must eat, not necessarily what he wants to eat, but what's on the table—if anything's on the table. Then he must hike, willy-nilly, to his work. On the street car he's expected to hop up and give any strange woman his seat, and if the sardine-packer at the rear yells "Step forward, please!" he must step forward docilely. If he steps on somebody's big feet while doing it, he must say "Beg pardon!" politely. Arrived at his place of toil, he must buckle down to whatever task the man higher up has set for him. And there's always some man higher up

A jangling alarm clock or a bellowing whistle rouses one up at an unearthly hour.

if you have to go to the United States Supreme Court to find him.

In short our personal liberties are constricted and curtailed on every side.

I'd been handicapped by these irritations for a good many years. I'd take off my hat when a woman entered the elevator. I never went around with more than a three days' harvest of heather on my chin. I kept my coat collar fairly free from dandruff. I never grabbed for the best piece of anything on the dish. I'd laugh loudly at any stale joke a friend would tell me. A gentleman can do no less than that, and an angel can do no more. Not that I was glad to do these things. Inwardly I rebelled, but my fetters were too strong for me. I knew myself to be a spineless creature of conventions, a thrall to the rules and regulations made by others, and secretly I despised myself. I would have liked to be a man of initiative, captain of my own soul, and all that sort of thing, but I was a victim of circumstances.

And then one day a rich aunt of mine donned the robes of immortality, and, having a lot of worldly and material impedimenta she couldn't take along with her, she very sensibly left it behind. I, being the nearest of kin, became duly seized of money and chattels approximating a total of \$20,000 in spendable specie. It was quite flustering to think of, at first.

Here I was, in the heyday of my career, suddenly emancipated and cut loose from the shackles of arduous industry. I could twiddle my fingers if I liked at Fate, Fortune and Dame Fashion. Constituted authority had no further strings on me. I felt like a fish in his own private ocean. Think of it! To be able to come, go, stay, or refuse to do any one of the three, as fancy might move you; to eat when and where and what you like; to sleep if you choose; to wear or not to wear what you please—oy, oy! 'Twas fine business.

The first thing I did was quit my job. The boss was right solicitous about me. He suggested that I invest my twenty thou' in sound securities and lay a foundation for a cozy old age. He wanted to place his wider experience at my disposal and give me the best advice he had in stock, gratis. I sniffed inwardly.

"You're a young man of ability and good sense," he said admiringly. "If you decide to stay on with us here, there's a promising future before you. You're already in line for

promotion soon. Don't lose your head, and you have the world by the tail."

I dissented, courteously but firmly.

"I've got my plans all made," I told him. "Thank you and good-by."

"Well, let me know if you should reconsider," he laughed as I left.

It was a great sensation, being free as the air at a filling station. I began to enjoy my liberty at once, without delay. Going back to my boarding house I froze to the end seat on the street car and made everybody scramble over me. I let 'em know they couldn't infringe upon my comfort in any particular. A fat woman with some babies and a lot of bundles got in my way at a street crossing after I left the car. You know, one of those weird people can get in the middle of a sidewalk and block the whole confounded street. It's a knack they have. I jostled her to one side, and she dropped part of her burden—several bundles and maybe a baby or two. It was very evident that she expected me to hustle and pick everything up. But I didn't. I merely kicked the nearest package into the gutter and went on my way rejoicing. I was through being at the beck of any human creature. Through with conventions and irritating restrictions.

Next morning the leather-lunged factory whistle that usually woke me up prematurely performed its office as usual. I rolled out of bed and dressed like a meek sheep from force of habit. Then I remembered that I wasn't a poor fish in a bowl any longer. With a snort of disgust, I undressed and went back to bed. But I couldn't sleep. The other boarders were rearing around in adjoining rooms and clacking up and down the halls. When things sort of quieted down, the landlady came and rattled the door-knob.

"Last call for breakfast," she cackled like a persistent old hen. "Are you sick or anything this morning?"

"No, I'm not sick!" I roared. "I'm taking my much-needed rest. Scat away from there, will you!" She scatted.

Later on I ambled downstairs. The breakfast table was cluttered with leavings. Tilda, the flat-faced Scandinavian serving maid, greeted me with her usual exasperating affability. The stench of fried potatoes sickened me.

"I'm going out somewhere where I can get food fit for a dog to cat!" I exploded and rushed from the room.

In the front hall I found the landlady paw-

In the front hall I found the landlady pawing over the morning mail. She had a letter addressed to me in her hand when I caught her. I snatched it.

ing over the morning mail. She had a letter addressed to me in her hand when I caught her. I snatched it.

"What the deuce are you prying into my affairs for?" I snarled at her. "What's the idea? I'm sick of people snooping around all the time."

"My stars!" she ejaculated. "I didn't know you were up yet, Mr. Horace. I was just about to fetch your mail up to your room—"

"Bah!" I sneered and flung out.

In the restaurant was where I met my friend Bellows. He was a little, fussy man with a beet-colored nose. He was having an altercation with a waiter. The row presently spread to the proprietor. It was all about whether a patron had a right to eat with his hat on at a table. There's an unwritten law, it seems, that permits people to eat at a long counter while perched on a stool and keep their hats on. But if you sit down at a table anywhere else in the same room, you're supposed to take your hat off—if you happen to be of the male persuasion. Another silly, tyrannical, arbitrary restriction. Bellows, it appeared, was an advocate of the inalienable rights of a man to do as he pleases. But when they threatened to throw him out, he compromised by taking off his hat and placing it on the table. He said he'd had a good hat exchanged for one a horse would refuse to wear, without his consent, in a restaurant once and refused to take chances. I saw that he and

I were birds of a feather. He was a proponent of personal liberty after my own heart. We became bosom cronies.

Mr. Bellows was possessed of more or less independent means. He also owned a kind of automobile—a 1-seated affair of the well-known tintinnabulator brand. We spent several care-free and emancipated days in each other's company. He was loud and unsparing in his denunciations of what he called the fanatical zeal of meddling zealots all over the country to interfere with other people's rights and privileges. He denounced the "blue laws" which more recently have contrived to take all the zip and zest out of life in these United States, particularly the Eighteenth Constitutional Amendment.

"Freedom certainly yelped when that man Volstead was born," he assured me. "No more foul and underhand blow was ever struck at the liberties of a great nation than this here prohibition law. It's preposterous and ridiculous to think that a small minority of the population could undermine the whole basic fabric of freedom that way, but they did it. A pussy-footed group of rag-tag reformers working slyly in the dark—"

"But," I argued, mainly for the sake of argument, "didn't all the states ratify the amendment you refer to? Wouldn't you call that a majority of opinion?"

"They did it unthoughtedly, under a misconception. Half of 'em didn't realize what they were doing, and the other half were bulldozed into doing what they did. Czarism, tyrannical radicalism, that's what we're up against. The will of a ruthless few thrust upon the many. And besides, prohibition doesn't prohibit at all."

"Very well, then," I said. "If it doesn't prohibit, there's no harm done. If the law is a dud, so much the better. Our liberties are still unassailed."

"But it's the general principle of the thing I'm opposed to," he insisted.

The term "general principles" covers a lot of things. People say a man ought to be hanged on general principles or a public service corporation ought to be stuck for big damages on general principles. I wonder sometimes just what these general principles mean exactly. Is their application universal or specific? I like to know for sure, just on general principles—but to get on.

My friend Bellows demonstrated his death-

less heritage of personal liberty once by purchasing for \$5 and imbibing unassisted a pint of alleged bottled-in-bond and aged-in-the-wood Old Taylor whisky. The stuff turned out to be a combination of henbane, radiator anti-freeze, deadly nightshade and mandragora, with a dash of fusel oil to season it. We saved him with quick measures and three doctors.

The two of us embarked upon a delightful campaign of liberated individualism. We went around daring other people to infringe upon our heaven-born rights to do as we jolly well pleased. A great many of those we bumped up against refused to take a dare, and all kinds of complications ensued. We discovered a world full of adventures on all sides. When somebody trespassed upon our personal liberty who was vocally or physically inferior, we made him hard to catch. If he or she chanced to be six or seven feet tall and muscularly developed with it, of course we used our own judgment. Nobody profits by arguing with a peeved elephant, and the best way to treat a steam roller is to stand aside. We had a few differences with traffic cops. They're another grave menace to the free exercise of personal liberty in the land of the emancipated and home of the so-called brave. A case of might opposed to right, with the whole insensate machinery of a smoothly-working autocratic system behind 'em. The way they have of giving you yours is not a particle of trouble to 'em.

We explained our theories to the judge on several occasions, but his acquaintance with even the rudiments of logic was slight. He wasn't impressed. I remember one statement he made after assessing our fines.

"You nuts with your ideas of personal liberty," he barked, "ought to be reasoned with with a club. Society is like one of these jigsaw puzzle maps. All the individual pieces fit in and dovetail into their places fine and dandy if they adjust themselves to the curves and angles of one another. But you let a piece get crossways and crooked or a little bit warped, and it won't fit anywhere. A man is merely one little essential part of the whole immense proposition. If he fits in he may not be noticed, but he has the satisfaction of knowing he's helping to make the map a perfect thing of beauty and utility. If he doesn't fit, he's no good. Society is an interlocking, interwoven affair, see? It is made up of millions of associated units supporting and accommodating themselves to one another. No one can go it alone. A man must conform himself

to the pattern of the big scheme. He's not the whole thing; he's just a small part of it. He must give and take and help bolster up the other fellow as well as let the other fellow back him up in the pinches. Get out of here and get in the game like true sports."

He was a funny-idea-ed guy, that judge. I thought at the time he would like to have us all hooked up to a ball and chain. The idea of making all men servants to and dependent upon one another like that! The thing contradicted itself. One couldn't be master and servant simultaneously. Bunk!

Bellows and I continued to do as we pleased. It was a great life. We spent our days in riotous freedom. We repudiated all existing forms of interference. We declared ourselves free and independent citizens of the new world democracy. Not only declared it but demonstrated it. We were willing to suffer martyrdom for our convictions. In fact, we did suffer martyrdom finally.

We were out in Bellows' lizette one bright summer day, bowling along the pleasant country lanes, ranting as we went and reveling in the heritage of liberty which was ours and which we meant to transmit to shackled millions yet unborn. I have a hazy recollection of our coming to a railway grade crossing while traversing a nice open stretch of level road. There was an insulting signboard stuck up at the side of the road reading "Stop! Look! Listen! Take no chances!" and a lot of other bumptious advice like that. Bellows bristled at the sight of it. It was a challenge to his unconquerable spirit. Off a little ways we could see a train coming, too. It was coming at a terrific pace, seemingly heedless of anybody else's rights or privileges on earth. The man who was driving the locomotive blew several raucous blasts on his whistle, apparently in deliberate defiance of our rights as freeborn men to pursue our course in our own way.

"Get that, will you!" shouted Bellows in righteous anger. "He's ordering us to stop and wait until he's gone by. Why shouldn't he stop and wait until we've gone by, hey? Why, because it's a silly custom in this country for right to give way to might. I'm here to tell you I don't intend to be browbeaten in any such fashion."

He manipulated some jigger or other on the machine, and the little car flung itself forward with a loud chattering sound like the gnashing of metallic teeth.

"Can you beat him across the crossing?" I inquired interestedly and rather loudly.

"I'll take a shot at it, anyway," he yelled. "He can't bluff me by tooting his infernal whistle. I've got as good a right on earth as he has—."

It was a short but exciting race. My impression was that we had won the heat and forever demonstrated our contempt for anything or anybody that sought to deter us, when, at the last instant, something interposed. What happened was very much as if that immediate part of the state had abruptly blown up. I saw a streak of fire studded with stars which split the firmament and heard a succession of rending, crackling noises which might be compared to the famous chariot race in Ben Hur held on a tin roof. I was aware of doing a succession of pin-wheels and dizzy triple somersaults in mid-air and then, a while afterward, I soared down and gave an imitation of one of these nigger-chasers while poised on my left ear with legs flapping the ambient air above a plowed field. Bellows alighted nearby a minute or so afterward and went through an intricate series of acrobatic stunts. The flivver would never tink-tink again. Part of it was draped over the headlight of the engine and part of it entwined around the fence.

The train was stopped and backed up, and they loaded us into the baggage car and took us to a hospital. It seemed that neither of us was very badly hurt owing to the fortunate circumstance of our landing on our heads. I heard afterward that the engineer said our actions proved what our heads were composed of long before he hit us.

Bellows and I, in our little white beds in the hospital, held lengthy post-mortem al-

tercations. My solid osseous cranial structure, as the engineer described it, had been cracked open somehow enough to let a little light penetrate. This personal liberty proposition had a lot of different facets to it, I discovered. For instance, there's the standpoint of the other fellow. Has a man, seeking his own private ends or comfort, the right to infringe on the private interests or pursuits of the other guy? And was that beetle-browed police judge altogether wrong when he said one man sort of leaned on one person here and braced another one there and dovetailed into the whole jigsaw puzzle if he properly performed his part—.

In a week or two, when I was discharged from the hospital, I went back to my boarding house filled with a kind of inner elation. I was actually glad to see the landlady and Tilda and everybody, and the odor of fried potatoes was like some divine fragrance.

Then I limped around to the office early one Monday morning.

"I guess I'm ready to start to work," I told the boss. "I'm tired of loafing around. And some time when it's convenient I wish you'd advise me about those investments you spoke about—."

"I'll be very glad to," he said genially. "Did your other plans fail to work out, my boy? I hope you didn't get trimmed—."

"I've still got my roll, if that's what you mean," I said. "And my plans worked out perfectly. There ain't a thing to 'em," I declared cryptically. "The judge was absolutely right. If you don't fit into the puzzle, you're no good. I want to be a part of the picture, see?"

"I don't see," the boss laughed, "but I'll take your word for it."

I was aware of doing a succession of pin-wheels and dizzy triple somersaults in mid-air. . . . Bellows alighted nearby a minute or so afterward.

NEWS OF THE DIVISIONS

AROUND CHICAGO

Auditor of Freight Receipts

The girls of the station accounts and local abstract divisions presented Miss La Vina Bringe with a beautiful floor lamp at a shower given in her honor at Grand Crossing Park field house June 24. The bride-to-be was blindfolded and given a bouquet of several kitchen utensils strung on a carpet beater, with a shower of clothes pins. She was then decorated with a train of clothes pins, with a rolling pin attached. Then came the grand march, which ended under the lamp. The blindfold was removed, and, while Miss Bringe was admiring the bouquet, her train and her lamp, her friends sang "Hail, Hail, the Gang's All Here" in a most convincing manner. Refreshments were served. Dancing and songs by Misses Kralek and Verwer constituted the entertainment. Misses Brill and Kralek furnished plenty of excitement by performing aerial stunts on the trapeze.

Mrs. Pearl McKenna left the service July 1, after about ten years in the office of the auditor

of freight receipts. The girls of the station accounts and local abstract divisions gave her a surprise farewell dinner party at the "Submarine Restaurant" and afterward visited the Tivoli Theater, seeing Jackie Coogan playing in "Trouble." The dinner was not only delicious but was served with careful attention, even to "crackers a la mode." At the Tivoli the orchestra played the fraternal anthem of the station accounts and local abstract divisions—"Hail, Hail, the Gang's All Here"—and the gang was all there. Good luck and best wishes to Mr. and Mrs. McKenna were extended at the close of a perfect evening.

The comptometer-Elliot Fisher department enjoys the distinction of having five June brides: Miss Anna Murphy was married to Jack Cunningham, June 1; Miss Bessie Higgenbotham married Bert Mount, May 27; Miss Gladys Stewart became Mrs. Hy Doyle, June 17; Miss Hazel Johnson married Clifford Bessett, July 1, and Miss Mabel Baker was married to George Stevenson, June 10. These young people were given showers and presented with valuable gifts of silver and linen.

Baggage and Mail Traffic Department

Miss Vesta A. Shoesmith, claim clerk in the baggage and mail traffic department, sailed on the White Star Line steamship "Canada" from Montreal July 1 to land at Liverpool. She expects to visit England, France, Switzerland, Belgium and Holland, also the land of the mid-night sun, returning the latter part of August on the steamship "Regina."

Fred W. Laenhardt has again taken up his former duties as chief mail clerk in the Central Station mail room.

Suburban Passenger Service

Assistant General Yardmaster Kimble on July 8 wrote to A. Bernard, superintendent of the suburban passenger service, as follows: "On July 3, at 11:30 p. m., Crossing Flagman Ed Love at Parkside, on the way to the platform to catch a train, noted a woman staggering along the hand railing as if sick or intoxicated. At the end of the hand railing, she reeled on the track in front of the train, which was approaching the platform. He grabbed her just in time to keep the train from striking her. This information was given me by Engineer A. B. Frost, who witnessed this from the platform at Parkside."

A. Bernard, superintendent of the suburban passenger service, recently wrote to Fireman F. A. Kemp as follows: "My attention has been called to the fact that, while running on train No. 3, June 29, you were instrumental in preventing what might have been a very serious accident by observing an obstruction on track No. 4 which, it developed, was a large piece of wood which had fallen from a bad order car, and you took the necessary steps to notify the engine crew of a train operating on that track. Your watchfulness in this instance is greatly appreciated, and you are to be highly commended for your interest in the company's welfare."

Hamilton Watches range in price from \$40 to \$200; movements alone, \$20 (in Canada, \$23) and up. Send for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated and prices given.

A Mile-a-Minute Schedule on Hamilton Time

CONDUCTOR Nicholas Laycock of the Philadelphia and Reading Railway "Rocket" to Atlantic City times his fast train with a HAMILTON WATCH. This train regularly travels the fifty-six and a half miles between Camden and Atlantic City in fifty-five minutes, equaling the record of the "Boardwalk Flyer," which is known as the fastest regularly scheduled train in the world. When Conductor Laycock chose a watch that would time his train with consistent accuracy, his choice was naturally the HAMILTON—"The Railroad Timekeeper of America."

It will pay you to own a watch with a service record

The Hamilton Watch is the choice of most American Railroad men—a highly significant fact, for Railroad men MUST have accurate timepieces. A great many of them choose the Hamilton 21 Jewel, No. 992—and if you want true time all the time follow Conductor Laycock's example and purchase a watch with a real record for service, where service counts.

HAMILTON WATCH COMPANY, Lancaster, Penna., U. S. A.

Hamilton Watch

"The Railroad Timekeeper of America"

accounting department, has been granted a 90-day leave of absence, effective July 1.

R. J. Berry has accepted a position as accountant.

H. D. Drothit of Decatur, Ill., has accepted a position in the accounting department as comptometer operator.

Chief Accountant E. F. Kremer has returned from a two weeks' fishing trip spent in the North.

Kankakee Freight House and Roundhouse

Melzer Thompson, who has been yard foreman in Kankakee yards more than twenty-two

years, has been placed at Station Street as crossing flagman. Mr. Thompson suffered a slight paralytic stroke some time ago and has taken this position temporarily until he will be able to resume his yard duties again.

Pete Smith, who has been employed as station baggageman at Kankakee, left June 1 to accept a position in the special agent's department at Chicago.

Engineer O. A. Johnson has gone to Sheldon, Iowa, for two months.

Engineer W. H. Schlenz and family are spending a few weeks in Denver, Colo.

Conductor E. D. Ehrich of Kankakee, Ill., who

The Illinois division offices at Champaign won't yield to any headquarters on the system as regards the efficiency and good looks of their telephone operators. Here we have the whole staff. No. 1 is Miss Helen Brown, second trick operator, in the service since June 1, 1920. No. 2 is Miss Mabel Slingman, third trick operator, who has been employed by the company since January 13, this year. No. 3 is Miss Marie Capps, pass clerk, who also doubles as a relief operator. Miss Capps entered the service of the Illinois Central, October 4, 1918, when the Illinois division offices were moved to Champaign, and was the first telephone operator employed. She worked in that capacity as first trick operator until May 25, 1920, when she was promoted to pass clerk. No. 4 is Mrs. Inez Roney, relief operator, an employee since May 10, 1920. No. 5 is Miss Lucinda Sullivan, first trick operator, who entered the service January 26, 1920.

had been ill for some time, died June 24. Mr. Ehrich entered the service of this company August 4, 1906, as freight brakeman on the B. P. & T. district, and was promoted to conductor November 27, 1912.

Passenger Conductor F. M. Williams, 643 East 88th Place, Chicago, who had been ill in the Illinois Central Hospital for several weeks, died June 17. Mr. Williams entered the service July 11, 1895, as brakeman and was promoted to conductor July 27, 1897. Mr. Williams was pensioned April 30, 1922. Surviving him are his widow, two sons and four daughters.

Night Yardmaster C. T. Ferguson, 302 South Neil Street, Champaign, passed away at his family home July 1, after a lingering illness due to the effects of influenza. Mr. Ferguson was born at Crawfordsville, Ind., November 6, 1870, and had lived in Champaign for several years. He entered the service of the Illinois Central May 10, 1903. He is survived by his wife and two children, Miss Grace Ferguson and Robert Hugh Ferguson.

Helen Kunde, 14 years old, daughter of Switchman Fred Kunde, Kankakee, Ill., died July 7.

Signal Department

The signal Employees educational meeting for June was held at Champaign, Wednesday, June 14. Standards and field specifications were discussed, and the meeting was especially successful because several misunderstandings of the standards and specifications were corrected. The July meeting was held at Champaign, Sunday, the 16th, at which time a representative of the Western Electric Company showed motion pictures of the preparing for use of poles and cross-arms used in constructing pole lines.

The signal work in connection with the new third main track, Kankakee to Matteson, is progressing nicely. When it is completed, we shall have four track bridges for the placing of the signals, which will be the color light signals.

Three conductors on the Centralia district of the St. Louis division. Left to right: E. E. Farris, H. Nolte, H. A. Love.

A. P. Cunningham, instrument man accountant, has been given a transfer from his present place at Champaign to the Kentucky division, where he will be engaged in location work.

Work on our new brick and concrete depot at Gilman has been started, and it is hoped that construction will be complete within the next two months. The new building is to replace the frame depot destroyed by fire several years ago. It will be an up-to-the-minute structure.

Newell Pharmacal Co., Dept. 927 St. Louis, Mo.

in our waylands from the city to the shops north of Champaign is well under way. This new line will eliminate the use of the train which operated between down town and the shops every half hour for the use of employes going to and from their work.

Superintendent J. W. Hevron recently address the following letter to Engineer T. F. Murphy:

"I understand that, while on train No. 8 the morning of June 21, you observed a woman lying on the sidewalk near the Catholic Church at Manteno and wired back from Peotone for the agent to look after her.

"For your information: Upon receipt of your wire our agent went to the point in question and found the woman lying on the village street crossing with a broken hip, having fallen when she stepped on some oil that had been sprinkled thereon. She was immediately removed to her home and received medical attention.

"Your watchfulness and action in this case are certainly commendable, and I want you to know that they are greatly appreciated."

INDIANA DIVISION

Miss Bea Crimmins is a new clerk in the office of Superintendent Roth.

Miss Florence McShane of the superintendent's office entertained the girls of the office at a lawn party at her home one evening the early part of July.

Miss Cora Burch, who was employed in Agent Pemberton's office, Bloomington, Ind., has accepted a position in the accountants' office, Mattoon.

Miss Lucille Yount is resigning August 1. Miss Yount will make her home in Kansas City, where she can continue the study of dancing, which she began out there several months ago. Those who have been fortunate enough to be present on the several occasions when Miss Yount has performed in Mattoon prophesy big things in store for her.

Parker Courtney is a new clerk in Supervisor J. C. Crane's office, Mattoon.

Mattoon Shops

C. T. Miller, pensioned blacksmith foreman, and Mrs. Miller are visiting in Detroit, Mich.

Miss Harriett Bledsoe, stenographer in the office of Master Mechanic Bell, left July 15 for Wichita, Kan., and several points of interest in Colorado.

Born to Machinist and Mrs. Fred Mobley, a baby boy.

Pensioner Willis A. Walkup passed away after a short illness, on June 16, at his home

W. A. Walkup

in Indianapolis. Mr. Walkup was 86 years old. He was born January 19, 1836, in Marion County, Kentucky, where his parents had settled in 1820 after moving from Virginia. His mother was a relative of President Hayes. In 1863 Mr. Walkup moved to Illinois, taking employment at the Illinois Central shops as a carpenter when that industry first came to this city. He married Susan B. Fudge in 1865. Mr. Walkup was steadily employed with the Illinois Central until he became 70 years of

age, when he was pensioned, at which time he went to Indianapolis to make his home. His wife died nine years ago, on the occasion of their fiftieth wedding anniversary. Surviving are Mrs. J. W. Justis and Mrs. Walter Eichholtz, daughters residing at Indianapolis, and Thomas Walkup, an engineer on the Indiana division of the Illinois Central. Mr. Walkup was a lifelong member of the Odd Fellows and an active member of the Presbyterian Church. Funeral services were held at the Presbyterian Church of Mattoon, the Rev. Marion Hull officiating, and burial was in Dodge Grove Cemetery.

Chief Dispatcher's Office

Mrs. Lou Morris is relieving Miss Vic Gustafson, clerk to the chief dispatcher, who is on a month's leave of absence.

W. A. McClure, agent at Bone Gap, Ill., is on thirty days' leave, relieved by Operator Harry Feldman.

The telegraph office at Harwood yards, Evansville, has been discontinued, and all telegraph work is now handled by the Big Four operators in the tower at Harwood.

The melon crop from Posey County is just starting to move. A big crop is reported, which will increase the already heavy business between Evansville and Mattoon.

The coal movement north out of Evansville still continues heavy, the Indiana division having moved 7,435 loads during June.

Operator W. C. Scott, "Q" office, Mattoon, recently purchased a motor car. Dispatcher Earl Smith has done the same.

Operator and Mrs. M. S. Hacker, who were

Day Roundhouse Force at Carbondale, Ill., Taken June 1

"There is but one correct method of measuring the value of lubricants."

"It is not oil, but *lubrication*—the service obtained from the oil—that we are using on our road. It is the *cost of lubrication*, not the *cost of oils*, in which we are interested."

EXPERIENCE, the most practical of all teachers, has convinced operating officials of railroads that a saving made in first cost of oils is far from being an indication of economy in lubrication costs. On the contrary, experience shows that cheap oils have always claimed a toll in other maintenance expenses that amounts to many times this item, without consideration of the inferior service they give.

Every hour of time lost, every dollar spent for repairs and replacements of equipment, and every excess ton of coal consumed—from causes that can plainly be traced to defective lubrication, are as truly a part of the cost of lubrication as the oils themselves.

Efficient lubrication cannot be bought at the bargain counter—there has never been an instance of where low prices have not resulted in poor service—and *service* must be the criterion that establishes lubricating value.

The cost of lubrication on railroads using GALENA OILS shows the ultimate economy of these peerless products. Not only in the mileage delivered, but in reduction of fuel costs, hot boxes, repairs, repacking of journals and cylinders, time losses and other annoying troubles peculiar to railroad lubrication, the feature of Galena economy has been clearly established. The efficiency of Galena Service has, of course, never been questioned, as the splendid showing on representative railroads under Galena lubrication places it in a class by itself.

*"More miles to the pint—
Better service to the mile!"*

Galena-Signal Oil Company

Tag worn by all employes in our East St. Louis yards, according to Trainmaster J. D. White.

recently married, have been assigned to the Rose Hill agency. They report they are nicely settled in their new home.

ST. LOUIS DIVISION

Morton Wilhoit, lineman at Carbondale, who has been in the hospital at Chicago for some time, has returned home much improved in health.

The work of ditching the lowlands around the roundhouse at Carbondale is now in progress. This is in connection with the campaign which is being carried on in Carbondale against the mosquito. The Illinois Central is expending considerable money in this campaign and is working in close co-operation with state officials.

O. C. Richardson of the division accountant's office and Miss Norma Van Buskirk, stenographer in the roadmaster's office, quietly left Carbondale and were married at Bonne Terre, Mo., on July 3. The entire division office force was treated to candy and cigars as result of this incident. They will make their home in Carbondale.

Marcus Vitt, father of Switchman A. A. Vitt, Carbondale, died of heart disease at his home at Cobden, Ill., July 8, and was buried July 10. Mr. Vitt was a retired baker, having lived at Cobden for many years.

W. G. Baggett, clerk in the freight office at Carbondale, who was in Holden Hospital, Carbondale, for many days with a severe attack of blood poisoning, is able to resume his duties.

E. D. Barnes, caller, has been working in the office of Special Agent J. H. Miskell for some time.

St. Louis District Dispatcher S. A. Snider just recently returned from a system dispatchers' inspection trip.

Glenn Douglas, son of Conductor J. H. Douglas, has been working as a caller.

Harry E. Goetz, assistant accountant, is on a short leave of absence, making a tour of the northern states with an orchestra. Harry is an accomplished musician.

Charles Wolf, clerk in the freight office at Carbondale, has just returned from the Chicago Hospital. One of his eyes was injured recently.

Frank McNier, fireman, St. Louis division, son of Engineer A. C. McNier, and Miss Mildred Mayhew, daughter of R. G. Mayhew of Murphysboro, Ill., were married at Jonesboro, Ill., Sunday, July 9. They will make their home

A yard crew that is helping to "stop the leaks" in our East St. Louis yards. Left to right, sitting: H. Foster, fireman; R. R. Fitzgerald, engine foreman. Standing, left to right: H. Dinkleman, engineer; William Compton, switchman; W. E. Swancutt, switchman.

In Carbondale, where their many friends will be welcomed.

L. Minton, son of Road Supervisor S. Minton, Christopher, Ill., has accepted a position as road supervisor's clerk at Carbondale.

Miss Edith Cromeenes has accepted a position as stenographer in Superintendent Atwill's office. Her home is in Marion, Ill., but for the past several months she has been doing stenographic work in Carbondale.

The daughter of Road Supervisor Sutliff died at Pinckneyville, Ill., June 27 and was buried June 29.

WISCONSIN DIVISION

John Halburg, who served as a section laborer on the Wisconsin division for the past thirty years, was retired on pension May 1. Mr. Halburg entered the service on April 2, 1892, and has been a faithful and efficient employee. For the past seventeen years he has done all

the track walking on Cloverdale section. He also took care of the switch lamps, which were said to be the best on the Freeport district, and he looked after the company's interests at all times.

Miss Mae Eleanor White, popular Ottawa girl, and William F. Confrey, well known La Salle young man, were married by Dean T. E. Madden at a 7 o'clock mass at St. Columba Church, Ottawa, Ill., June 7. Mr. and Mrs. Confrey went to New York for a two weeks' honeymoon.

John Halburg

They will reside in La Salle. The bride has taught in the Marseilles public schools for the past three years. She is the daughter of Mrs. Mary L. White, 1027 Clinton Street, Ottawa. The groom is a son of Mr. and Mrs. Thomas Confrey of Campbell Street, La Salle, and received his education in the La Salle schools. He is a member of one of the oldest and best known La Salle families and is employed as chief clerk in the La Salle freight office of the Illinois Central.

MINNESOTA DIVISION

Sherman T. Mayne Jr., 12 years old, son of S. T. Mayne, third trick operator at East Cabin, died at the family residence in East Dubuque, Wednesday, July 5. Death was due to tubercular meningitis. Funeral services took place Friday, July 7. Burial was made in East Dubuque.

E. A. Barton, representative of the department of stations and transfers, displayed motion pictures at Waterloo and Dubuque, June 29 and 30, on proper handling of freight and switching of cars. The pictures showed actual examples of damage done by improper handling and showed the wrong and right way of handling freight shipments. There was a good attendance at both meetings, not only of Illinois Central employes but of employes of neighboring lines as well. Those attending displayed enthusiasm and interest.

F. Belscamper has accepted a position as second trick operator at "KB," Dubuque. This vacancy was occasioned by the death of Operator C. T. Coffey.

J. W. Benda, agent at Council Hill, is off duty on account of illness. Operator J. W. McGraw

of East Cabin is also confined to his home on account of illness.

Miss Gertrude McCaffrey has accepted a position as telephone operator at Dubuque.

Engineer G. A. Wheeler has entered the Illinois Central hospital at Chicago for treatment. J. A. Harrington, conductor between Dubuque

and Chicago, has returned to work after an extended automobile trip through Wisconsin and Illinois.

C. H. McCarthy, conductor between Dubuque and Fort Dodge, has returned to work after a trip motoring through Iowa.

The employees of the division offices were much surprised to hear of the marriage of Miss Martha Wunderlich, first trick telephone operator at Dubuque, to George Miller of this city. The marriage was solemnized in Minneapolis, June 3, where Miss Wunderlich was spending a month's leave of absence.

Office of Division Passenger Agent

E. J. Meade, traveling passenger agent with headquarters at Milwaukee, Wis., formerly of the Minnesota division, and Miss Norena Schauers were married in St. Mary's Church, East Dubuque, Ill., June 27. They spent their honeymoon in Los Angeles, Cal.

Alvin C. Burdt, stenographer to the division passenger agent at Dubuque, and Miss Rhenoah McAleece were married at the Sacred Heart Church, Dubuque, Iowa, June 20. After their return from their honeymoon, which is being spent in the West, they will reside on Garfield Avenue, Dubuque.

Dubuque Freight Office

Vernon E. Allison, son of Freight Agent J. E. Allison, has accepted a position as traffic manager with the Carr, Ryder & Adams Co., Dubuque, Iowa.

The members of the freight office force enjoyed their annual "get together" picnic at Union Park, July 11. A most enjoyable time was reported.

We have received cards announcing the marriage of Thomas J. Ahern and Miss Esther McLaughlin at Denver, Colo. Mr. Ahern was at one time accountant and Miss McLaughlin trainmaster's clerk. They will reside at Wichita Falls, Texas, where the groom is a successful broker.

IOWA DIVISION

C. C. Simpson, section foreman at Merrill, Iowa, died of inflammatory rheumatism June 20 after an illness of several weeks. He had been in the service for eighteen years, and was section foreman at Merrill the last twelve years. The section foremen of Sioux City and Fort Dodge were pall-bearers. Burial was in the Assumption Catholic Church cemetery June 23.

E. N. Shirley, agent at Oto, Iowa, is on leave of absence to visit his people in the South.

C. H. Smith, agent at Merrill, Iowa, is on leave of absence for six weeks.

F. J. Spinharney, agent at Barnum, Iowa, has found it necessary to have his leave of absence extended on account of the sickness of Mrs. Spinharney. However, we are glad to learn that her condition is improving.

J. J. Little, agent at Primghar, Iowa, is making a trip through the East and expects to be gone approximately three months.

KENTUCKY DIVISION

Water Works Foreman J. S. Stinebaugh, who has been sick for several weeks, is slowly recovering.

J. P. Price of Louisville has been at Princeton during the illness of Mr. Stinebaugh.

Mrs. W. C. Wagner, daughter Gladys and son Cole have returned from Rochester, Minn., where Miss Gladys has been under treatment by Mayo Brothers.

Dispatcher L. R. Sutton has been on the sick list.

Conductor J. P. Perry, whose foot was crushed in March, is improving nicely and will soon be O K again.

Conductor J. W. Griffith, who has been in the hospital for two weeks, is out and will soon be back at work.

Engineer A. Kuykendall, who was operated on at the hospital at Paducah recently for appendicitis, is improving nicely.

Miss Lola Klement of Hillsboro, Wis., and Jesse C. Hessian were quietly married at the Buena Memorial Presbyterian Church, Chicago, Saturday, June 24. Miss Klement has many friends to welcome her return to the city, having taught in Paducah High School two years. Mr. Hessian is a clerk to Trainmaster Thomas at Paducah. He served six months in France during the world war. Immediately after the wedding, the couple left for Detroit, Niagara Falls, New York, Atlantic City and Washington.

Freight House, Louisville, Ky.

Leonard B. Bartlett, en route from Lowell, Mass., to Rockford, Ill., enjoyed a few days with his parents, Mr. and Mrs. W. H. Bartlett, recently. Young Bartlett has been attending school at Lowell, where he has been learning the manufacturing of textiles. He was transferred to Rockford to complete his studies.

Our co-worker, Miss Josephine Jecker, lost her father on June 27.

Henry Wilkerson and family are enjoying a trip to Los Angeles. Mr. Wilkerson was granted a thirty days' leave of absence.

John Shacklette has been promoted from mail clerk to night expense clerk. Albert Crowder succeeded Mr. Shacklette as mail clerk, being promoted from messenger. Richard Queen has been reinstated on the office roster, after being dismissed on account of a reduction in force. He succeeds Mr. Crowder as messenger. Robert E. Grubbs has severed connection with this office, having accepted another position with the Louisville & Nashville. He was formerly night expense clerk and is succeeded by Mr. Shacklette.

TENNESSEE DIVISION

Carl C. Croft, valuation clerk, and Miss Neva Jordan of Brown's Grove, Ky., but formerly of Fulton, were married Saturday, July 8, at Mayfield, Ky., the Rev. A. L. Wilson performing the ceremony. Immediately after the ceremony, the happy couple left for a honeymoon trip to Chicago. They will be at home at the residence

ILLINOIS WATCH COMPANY
SPRINGFIELD

Master mechanic's office force at Paducah, Ky. Standing left to right: R. Puryear, accountant; R. L. Long, chief accountant; D. O. Hammock, clerk; O. Johnson, clerk; J. B. Rouse, clerk; L. Houser, clerk; S. E. Denker, stenographer; L. R. Gleaves, chief clerk; W. L. Phillips, clerk; E. Schumaker, chief timekeeper. Sitting left to right: R. L. Gilbert, clerk; P. Dismukes, clerk; G. C. Barnes, stenographer; E. Marshall, clerk.

of Mr. and Mrs. J. A. Colley, Vine Street, Fulton, after their return. The bride is the daughter of Mr. and Mrs. C. L. Jordan and has been a teacher in the Fulton schools for the last three years. Mr. Croft has recently been appointed assistant adjutant general of the Southern Confederacy. He is a grandson of W. C. Croft.

A co-operation meeting was held in the office of Supervising Agent T. D. Clark, June 26, attended by Paul Echols, traveling freight and passenger agent; W. P. Luttrell, demurrage and storage inspector; J. E. Boone, agent, Fulton; K. A. Carney, perishable freight service agent; H. M. Robertson, agent, Mayfield, Ky. This is the kind of "stuff" that put the Tennessee division at the head of the Southern Lines in the "No Exception" campaign in June and second on the system.

Randall Luten, a former employe of the Tennessee division and only son of District Surgeon H. Luten, Fulton, Ky., who is attending school at the University of Louisville, and Miss Dora Hafendorfer of Louisville were married July 8 at the Highland Methodist Church in Louisville, leaving immediately for Fulton, where they will remain for the summer, until young Luten returns for the final year in college. R. P. Witty, clerk in the superintendent's office and lifelong chum of the groom, acted as best man.

James T. Perry, who has been clerk to the supervising agent at Fulton for almost two years, resigned his position and left July 14 for Peoria, Ill., to accept a position with Allen Robinson, formerly supervising agent at Fulton.

Many employes were somewhat surprised when they received announcements to the effect that W. A. Love, foreman of water service, Fulton, Ky., and Mrs. L. Castleberry, clerk in the superintendent's office at Fulton, were married in the First Christian Church at Fulton, May 18, leaving immediately on train No. 1 for New Orleans, where they embarked on the steamship Chalmette for the wonderful island of Cuba, where they spent a week honeymooning and sight-seeing. Both bride and groom report a

lovely trip, saying that the only handicap they had was the narrowness of the streets in Cuba, where they had to go single file. The newly-weds returned to Fulton, May 30, where they are making their home.

Train Porter Ed McCullar, on the Seminole Limited, May 13, has been commended for his honesty, when he found a check for \$980, drawn by N. U. Stryker and Co., in favor of H. E. Echols, and turned it over to the conductor for delivery to its owner.

Conductor John Danaher has been commended for the interest displayed when his train broke in two, two miles south of Water Valley, May 29, and he got in touch with the operator over a rural telephone and avoided delaying train No. 102 more than thirty-six minutes.

MISSISSIPPI DIVISION

Joe McMillan, an employe of the mechanical department at Water Valley shop, and Miss Carrie Vaughan, residing near Water Valley, were married June 14.

Kendrick Reynolds, son of Engineman L. C. Reynolds and recent graduate of the Water Valley High School, has received notice of his appointment to the Naval Academy at Annapolis.

Miss Maxine Mauldin, daughter of Master Mechanic S. R. Mauldin, has returned from the Cincinnati Conservatory of Music, where she has been a student. Miss Mauldin is a musician of unusual talent.

Mrs. John Unger, who will be remembered as Miss Hortense Baker, clerk in the chief dispatcher's office, now living at Jonesboro, Ark., has been visiting her sister, Miss Maude Baker, timekeeper in the superintendent's office.

The twelfth annual memorial service of the B. of L. E. was held at the Baptist Church in Water Valley, Sunday, June 11. A beautiful and impressive program was rendered. An honored guest at this service was Assistant Grand Chief Engineer M. E. Montgomery of San Jose, Cal.

Conductor and Mrs. C. L. Avent are on an extended visit to relatives in Newport, R. I. Before returning home they will visit New York, Washington and Asheville, N. C.

Engine Foreman L. L. Spencer, past exalted ruler of Elks Lodge No. 459, has been attending the annual convention of the Elks at Atlantic City.

Conductor J. W. Cathey has returned from the hospital in Chicago much improved in health.

Instrument Man Accountant George Lord has been confined to his bed for a week or ten days with a severe attack of erysipelas.

Roadmaster and Mrs. T. M. Pittman are receiving congratulations over the arrival of a fine son, Edward Pascal.

The work of remodeling the depot and other station facilities at Batesville, Miss., is nearing completion. The company has expended something like \$20,000 on these improvements. When the work is completed, Batesville will have one

of the most up-to-date depot buildings on the division.

NEW ORLEANS TERMINAL

C. T. Seiler, agent, Poydras freight station, attended the second annual session of the American Railway Association, Freight Station Section, held in Philadelphia June 20. He reports an interesting meeting and a large attendance.

J. P. Guillot of the local office recently celebrated his twenty-fifth wedding anniversary with an auto ride and fishing party to Lake Salvador. Mr. Guillot does not mind telling anyone he is married twenty-five years, as he still feels like a young man.

Miss Louise Lang, stenographer in the car department, obtained a leave of absence and left July 1 for Los Angeles, Cal.

John Gilliard, per diem clerk, local office, expects to spend his vacation aboard his staunch little yacht, the "Sarah G," cruising in southern waters.

A. P. Babin, baggage department, ran across the following some time ago, which is an excellent example of whole-hearted efficiency, and we desire to pass it on:

A negro working in a saw mill handling a truck ran into several objects along his route. The proprietor, seeing this, told the negro to go to the office, get his time and go home. The negro inquired who he was, and the proprietor answered that he was Mr. Smith, owner of the mill.

The negro replied: "Look here, Mr. Smith, you go home yourself. I've got no time to go home or to the office for my money. They's too much work around here for me to leave this place."

His pay was raised.

Mechanical Department

The friends of George Dwelle offer their sincere sympathy in his hour of sorrow due to the death of his mother.

An enjoyable affair in which railway employees were interested was the performance of the pupils of Miss Alice M. Cobb, teacher of dramatic art, New Orleans. Three of our employees participated in a presentation of "The Duke of Mantua" and acquitted themselves creditably. Stenographer Joseph E. Hodges and Storekeeper's Clerk Joseph Sterbenz were cast in leading parts, Coal Clerk T. J. Murphy, while having a small part, being one of the junior

Continental Casualty Company H.G.B. ALEXANDER President **Chicago**

pupils, handled in excellent manner the lines in the Court Scene, which was the "piece de resistance" of the play.

Hostler Charles Steitz has been earnestly studying the Chicago Joint Agreement of late and is now prepared to answer all questions of the uninformed.

Engineer George Gumpert left New Orleans on June 6 to attend the Shriners' convention. He has not yet returned.

W. P. Powell, engine foreman, was commended for his alertness in discovering the condition of a wheel on A.R.L. 8452, lard for Armour & Company, June 11. It was necessary for Powell to "nurse" the car from Levee yard to the plant of the consignees in order to avoid serious accident.

Meritorious entry has been made on the efficiency records of Engine Foreman P. Demesia. Engineer H. H. Burns, Fireman Ed Babin and Switchmen J. J. Weis and W. D. Burke for their action in extinguishing G.R.C.X. 1500, an empty tank, afire from the ignition of drippings of gasoline. It is regretted that Engine Foreman Demesia received a painful burn on his right hand while smothering flames around the discharge valve of this tank. We are glad to know that at this time he has completely recovered and resumed work.

Station Master's Department

A bulletin board has been placed on the milk platform at Union Station showing all the cans reported lost. This is a suggestion of Baggage Agent J. J. Cardno and has proved a great help in locating lost cans and preventing claims.

E. J. Ray, in charge of the handling of the milk at Union Station, has greatly improved the service on the New Orleans terminal. His interest and enthusiasm in specializing in the prompt and efficient handling of milk have won for him the praise of many officials, as well as the thanks and appreciation of shippers. He has as an able assistant Checkman George Barrios.

A comparative statement of milk handled for the first six months of 1922 compared with 1921 shows an increase of 6,914 cans.

On account of the heavy passenger travel during the past month, it was necessary to furnish Gateman W. G. Murphy with a new

Thomas J., Jr., son of Thomas J. Lee, clerk, superintendent's office, New Orleans terminal, receiving pugilistic lessons in the briny waters of the Gulf Coast from J. L. Beven, son of Trainmaster C. T. Beven and nephew of J. L. Beven, assistant to the senior vice-president.

"Kitty" McLean

punch to replace the old one, which completely wore out.

MEMPHIS TERMINAL

Adelaide Elizabeth ("Kitty") McLean, daughter of Boiler Maker Foreman R. J. McLean of the Nonconah shops at Memphis, is just 2½ years old. She often runs off to the shop gate to meet her daddy when he has finished work. Every employe at the Nonconah shops knows and loves her.

MEMPHIS DIVISION

B. C. Neal, agent at Crenshaw, Miss., who was in the Illinois Central Hospital in Chicago during June, has now resumed duty at his station.

H. E. Frederick, Memphis division conductor, and Mrs. Frederick, tonnage clerk in the superintendent's office, have been granted a leave of absence on account of Mr. Frederick's ill health. They have departed for a northern climate, where it is thought Mr. Frederick will improve.

F. B. Bell had his tonsils removed in the Illinois Central Hospital in Chicago in June. Mr. Bell is a conductor on the Memphis division and has returned to his regular run, much improved in health.

D. C. Gilmer, flagman on the Memphis division, was killed in the Memphis terminal, Sunday, July 9. He had just come in from Cleveland and was waiting for the employees' train. He crossed over in front of a moving cut of cars, was struck and both of his legs were cut off. Mr. Gilmer died before the ambulance reached the hospital. He was 27 years old and had been working on the Memphis division six years.

E. B. Huffman, conductor on the Memphis division, has just returned from a trip to Canada, Oregon, Washington and other points in the Northwest.

Conductor V. R. Byrd, who has been ill for several months, has returned from the Illinois Central Hospital in Chicago and has resumed duty.

B. O. Crutchfield, file clerk in the superintendent's office, left his position July 1 to play on the Jackson, Miss., baseball team. His position was filled by Wyatt Sherron, who was assistant file clerk.

Conductor S. W. Helms has returned from Rochester, Minn., where he took his daughter, Marye, for consultation with Mayo Brothers.

Engineer F. F. Wright reports that while on train No. 172, north, July 10, with a tank of slack coal and a very heavy train, when his fireman gave out at Crenshaw, Miss., a negro brakeman, George Phillips, fired his engine to Nonconah without any delay.

Dispatcher G. L. McAlister, relief man, has been doing relief work at McComb, Miss., on the Louisiana division for the past two months.

Dispatcher L. F. Smith, who has been on an extended sick leave, is reported improving in health and expects to return to work shortly.

Extra Dispatcher Claypool, temporarily filling

RAILROAD LUBRICATION

Good Railroading

A CONFEDERATE Colonel, who was distinguished for his strategy if not for his book learning, was asked to outline the reasons for his military successes.

He said that it consisted of "getting the mostest men there firstest."

We quote this because it suggests so well the cardinal principle of good railroading, which is

***Moving the greatest tonnage
in the shortest time***

Necessarily the attainment of this ideal demands watchful supervision, careful dispatching and proper mechanical conditions.

Proper mechanical conditions mean efficiency of locomotives and freedom from hot boxes or bearing troubles on cars.

Railroads use large quantities of lubricating oils, therefore they must buy economically.

Not only must railroads guard against stoppage of traffic, but they must be on the lookout against frictional losses which

cause waste of fuel. Therefore, the efficiency of the lubricants they use and their correct application are important essentials to good railroading.

We consider the increasing sale of Texaco railroad oils a glowing tribute to our refining skill and the efficiency of our delivery service.

It is our privilege to render, through our Lubrication Engineers, a valuable service in the handling, storage and application of the Texaco Lubricants.

We have on our books many of the large railroads in this country, including the Illinois Central. The list of Texaco products they use includes lubricating oils for locomotives, rolling stock, shop machinery and power plants, illuminating oils for signals, headlights, road oils, roofing, etc.

The use of the whole Texaco line by these railroads conclusively proves our statements regarding the high quality of every product sold under the Texaco Red Star and Green T trademark.

the car desk, reports log and lumber loading picking up.

During June we handled seventy-eight banana trains, with a total of 3,708 cars of bananas, all of which maintained schedule or better, with the exception of two trains, unavoidably delayed.

We also handled eleven trains of Casper-Baton oil, all of which made better than schedule, a total of 650 cars of oil. Since this movement began last December, seventy-two trains of sixty cars each have been handled, a total of 4,320 cars, or about one-third of the total shipment of 13,000 cars. This oil is being handled from Casper, Wyo., to Baton Rouge, La., in connection with the Burlington, through Centralia, Memphis and Gwin, on special schedule, empty tanks being returned in the same manner.

During June sixty-two trains of Louisiana fresh vegetables and fruit were handled, a total of 3,551 cars, all of which maintained schedule or better.

VICKSBURG DIVISION

The service and kindness of the Illinois Central System for those living on its lines was illustrated again recently when T. L. Dubbs, superintendent of the Vicksburg division of the Y. & M. V., ordered two carloads of gravel placed free of charge at a bad place in the street before the negro King's Daughters' Hospital at Greenville, Miss. The officers of the organization sent a letter of appreciation to Superintendent Dubbs. Mr. Dubbs had the following to say about the incident, as quoted in the Greenville Democrat-Times:

"Dr. A. G. Payne and Dr. H. A. Gamble called my attention to the fact that the street in front of the colored King's Daughters was in an impassable condition during inclement weather, making it necessary to carry patients on cots a considerable distance through the mud, and making it impossible for the doctors to go to and come from this hospital except on foot, necessitating the transportation of supplies to the hospital on foot also during such periods; and requested that, if possible, some suitable material be furnished to pave the street.

"Through my friend, Mr. Maddox of Brookhaven, I secured the donation of a special type of gravel for street building purposes. The Y. & M. V. Railroad transported this gravel from Brookhaven to Greenville without charge. Our friend, Mayor Hunt, placed the gravel on the street. It is now in good condition and the difficulties and objectionable features heretofore encountered have been eliminated.

"We were very glad, indeed, to be able to be the means of overcoming the troublesome situation referred to."

The Democrat - Times complimented the Illinois Central System and Mr. Dubbs highly for the act when it told its readers that, although some would not consider placing the gravel a big thing, yet it proved after all that some railway corporations have souls most sympathetically expressed in real service through the big souled men who direct their operation.

NEW ORLEANS DIVISION

Some days ago Conductor W. W. Cunningham was forced to eject an obstreperous and desperate negro from his train, and the man went away threatening vengeance. A few days after, at Allen, Miss., his opportunity came, and the desperado opened fire on Mr. Cunningham at sight, inflicting two dangerous wounds. Mr.

Cunningham, notwithstanding the shock of the attack, was able to return the fire, whereupon the negro took to his heels, pursued by a crowd of citizens of Allen. As the negro ignored all commands to halt and showed further fight in his flight, the posse of citizens opened fire, resulting in the death of the assassin. Mr. Cunningham was rushed to Vicksburg, where his wounds were treated. He is now on a fair road to recovery.

Already plans are being considered for the protection of the company's properties in Vicksburg and vicinity from future Mississippi floods. A wall to protect the most vulnerable spots is being discussed by the city and the engineers connected with the company, and several of the higher officials of the road have been in consultation with the various commercial bodies of the city. As yet nothing definite has been announced, but the assurance is given that the city and company will arrive soon at some practicable method of arresting these dangerous and costly inundations.

Switchman O. W. Penalver, one of the few who sustained serious injuries through accidents in the recent flood, is able to be out. Mr. Penalver suffered the loss of a leg.

Listen to the bells! Wedding bells! Their ringing has become familiar around the superintendent's office at Vicksburg. This time the bells ring merrily for Chief Accountant George M. Schaffer, who on June 23 at Greenville, Miss., led to the altar Miss Lucie Beatrice Cason of Hollandale, Miss. After a short bridal tour, Mr. and Mrs. Schaffer returned to Vicksburg, where they are now at home to their friends.

OFFICE OF G. F. A., NEW ORLEANS

St. John's Catholic Church, New Orleans, La., was the scene of a pretty wedding Thursday, June 29, when Miss Frances Cecelia Kuntz became the bride of J. Jefferson Ray. Both are prominent members of the younger social set of New Orleans. Mr. Ray is trace clerk in the office of the commercial agent of the Illinois Central System. After the ceremony a reception was held for the bridal party at 2124 Tersichore Street, where the many presents were displayed. The bridal couple left on Illinois Central train No. 2, the same evening, for Chicago, New York, Washington and other eastern points of interest.

Here is our commercial office force at New Orleans. Bottom row, left to right: E. V. Verlander, city freight agent; F. A. Shaw, commercial agent; E. G. Burke, city freight agent. Top row, left to right: H. C. Selle, messenger; W. G. Yung, chief clerk; E. A. Schindler, stenographer; J. J. Ray, clerk; L. A. Mailhes, city freight agent.

Pudding Pan. Used like this for puddings, cakes, bread. Also milk dish. Two and one-half quarts.

Used as Colander. Handy to strain berries. Also used as Strainer.

Used as a Double Boiler cooks cereals, no scorching. Steams vegetables in top. Kettle Cover made of thick aluminum.

Combination Cooker. Used this way for general purposes not so well filled by any other utensil. Ears of kettle hold bail upright or lowered position.

Self-Basting Roaster. When used this way makes juicy, well browned roasts. A perfect self-baster. Steam condenses on cover and drips back.

Used this way as Steamer Set. For steaming potatoes or corn on cob. Perforated bottom makes uniform cooking.

Used this way for Tubed Cake Pan. Removable tube. Cakes taken out easily without breaking.

A complete cooking set in this wonderful combination. Send only the coupon and we ship the set, all charges prepaid. Try it 30 days on free trial, and then if not just what you want, pay nothing and send it back and we'll pay the return postage charges. If you keep it, pay bargain price at end of 30 days' free trial. Send the coupon.

G. G. Truesdale

Mr. Truesdale, whose appointment as assistant general passenger agent in charge of solicitation took effect December 15, 1921, entered the service of the Illinois Central in July, 1901, as an office messenger in the transportation department. In 1902 he became a file clerk in the passenger department. Then he served as secretary to the assistant general passenger agent. In May, 1906, he was appointed traveling passenger agent, with headquarters at Cincinnati, Ohio. January 1, 1908, he was transferred to Chicago as city passenger agent. He became district passenger agent at Pittsburgh, Pa., in October, 1911. Then in July, 1917, he was transferred to New York City as commercial agent. His next move in the service was to his present position.

With the Fruit Growers at Cobden, Ill.

Remarkable Development of Industry Marks Southern Illinois Orchards as Leaders of the United States

By A. N. EHRHARD,

Relief Agent, Cobden, Ill.

SPEND a day with me in Cobden, Ill. It is peach time. Twenty-five or thirty big, yellow, iced refrigerator cars are standing mutely on the siding. Plump, red-checked Elbertas, carefully packed in fancy baskets, are bidding adieu to their native land at the rate of a thousand bushels an hour or ten to twelve thousand a day.

See the never-ending line of grunting trucks and creaking wagons, stacked high with Nature's best fruit, awaiting their turn to be freed from their precious burden, and look at the dusty drivers, bent forward, as they race back over hill and hollow for another load just as big and just as valuable. Watch the hustling commission agents pace up and down the long loading track, buying or selling as the market swings. Listen to the sharp click of the telegraph instrument as it continually chirps out the latest quotations from anxious bidders.

Everywhere there is activity. Men are hurrying this way and that. Boys are running. A locomotive is switching, picking up some loaded cars bound for Chicago, Milwaukee, St. Paul, Detroit, Cleveland, Cincinnati, Buffalo or some other large city the consignor has selected for marketing his delicious fruit.

Soil Well Adapted to Fruit

Cobden is in the heart of the Ozark region of Southern Illinois and may be called the mecca for orchardists. It is on the main line

Southern Illinois peaches.

of the Illinois Central, and no doubt the fast freight service of this carrier has been a big factor in developing the orchard lands of this section.

However, the soil is said to be especially adapted to apples and peaches. It is mostly a yellow clay, underlaid by deposits of limestone. The countryside is high and rolling and somewhat broken by rocky upheavals, but it affords the best of air drainage, so important for the protection of trees when late freezes occur. Cobden is the highest town on the Illinois Central between Chicago and New Orleans, being approximately 600 feet above sea level. Bald Knob, a bare towering mountaineer five miles west, is only fifteen feet lower than the Bald Knob in Joe Davis

This apple came from Cobden.

County which is said to be the highest point in the state.

Suppose we see H. H. Lamar, district manager, American Fruit Growers, Inc., Southern Illinois territory. Needless to say, Mr. Lamar is the busiest mortal in Cobden when peaches are on. It doesn't take us long to realize why America's greatest fruit combine chose

our host to manage one of its most important properties.

"This is the best winesap apple district in the United States," Mr. Lamar says, "and the flavor and keeping qualities are better than the Virginia grown. Four years ago the American Fruit Growers began to get orchards and fruit lands in Union County, paying as much as a thousand dollars an acre for some of their holdings. The company now owns 1,100 acres, mostly bearing peach and apple acreage, and is adding more from time to time. We are setting fifty to eighty acres in young trees annually.

Good Money in Early Apples

"Early apples are very profitable here. We shipped about sixty cars of Transparents, Dutchess and Benonis this season. From \$2 to \$2.75 a bushel was the prevailing market. So far, seventy cars of peaches have been loaded by us. Union County will produce 600 cars of peaches this year, of which 350 will be shipped from Cobden.

"There are probably 2,500 acres of peach orchards in Union County today, and the apple area is not much less. The abundance of limestone under a loose clay sub-soil gives our fruit color and flavor that are unexcelled.

A typical apple-picking scene.

This explains why Cobden fruits are favorably known in all the great markets of this country and even in London, England, where a car of choice Elbertas was sent some years ago.

"Apples are good for four crops in five years here, and peaches seven in ten. Well-kept fruit land is easily worth \$300 to \$500, according to location.

"The American Fruit Growers, Inc., are in the fruit and vegetable business on a gigantic scale. We produce and distribute fruits of all kinds. Our activities cover the entire country from Florida to California—Nature is our limit. Last year we handled 41,000 cars of fruit and produce, much of this volume being distributed for various fruit associations and state exchanges. Our investment in Southern Illinois is now around \$300,000. The general office is in Pittsburgh, Pa.

"Right now we are planning an immense central packing shed that is to be built in Cobden this coming winter. All our grading, sizing and packing will be done here with modern equipment and under the supervision of experts."

How thick the peaches grow.

Lindorf Walker, cashier of the First National Bank, is a Cobden booster.

"Cobden," he says, "is a clean, white town. Its citizens are peaceful and law-abiding; arrests are few and disturbances rare. The people here are contented.

How Poor Settlers Became Rich

"The earliest settlers came from New York and the New England states in the '70s. Later

Picking peaches at Cobden.

a number of German families located here. The population of this section, made up mostly of descendants of these sturdy immigrants, is happy and prosperous."

Here he mentions several instances of poor settlers who drifted into this country some years ago. He relates how this one is now worth probably \$300,000; that one has raised a large family and accumulated a fortune in peaches; another had only a team, a wagon and a wife, and now is the proud owner of a valuable fruit farm; the fourth had arrived in a forlorn condition, but today is retired, living on his income; and so on.

Speaking of the fruit industry, he asserts that \$1,000,000 comes to Cobden annually from this source and that the yearly deposits of the two banks exceed \$600,000. "Our vegetable production is immense," he adds. "The splendid railway service to Chicago and other important markets has been the greatest boon to the producers." Mr. Walker is a strong advocate of asparagus culture. He declares that an acre, after being set four or five years, is easily worth a thousand dollars of any man's money.

Has Fifty Years of Experience

James N. Fitch, president of the People's Fruit and Vegetable Shipping Association, is probably 70 years old. His connection with the shipping end of the game started fifty years ago, when the organization was first formed.

Tested by Taste

The *Illinois Central Magazine* can vouch for the size and flavor of Southern Illinois peaches. Ferdinand Kohl of Centralia, Ill., well-known Southern Illinois booster, recently sent a basket of peaches to H. B. Hull, assistant to the president, for distribution in the office.

"These are some of 'Egypt's' best," wrote Mr. Kohl. "They were grown in Walter White's orchard. Mr. White has more than one hundred acres close to Centralia and is planting more trees. If you do not agree with us that our Southern Illinois fruit has Southern California backed off the boards, then we must say that you are not good boosters for Illinois Central territory. You will some day be surprised at the volume of the fruit business which will be developed in this garden spot of Illinois."

After numerous tests by members of its office force, the magazine is prepared to back Mr. Kohl in all he says.

The fruit raised in Union County is ahead of California by far, he declares. "The color and taste can't be beaten," our worthy speaker continues, "and we produce more and better vegetables than any other section of the state.

"Our loading last spring ran to fifty cars of asparagus. We have sent ten cars of tomatoes from Cobden in one day. In past years beans, onions, and cucumbers have been extensively grown. Sweet potatoes are shipped

View of Southern Illinois orchard.

Packing peaches for the market.

out in carlots, and the acreage is usually great," he continues.

M. Caraker, loading manager of the People's Fruit and Vegetable Shipping Association, has been with the association ten years.

"Our shipping arrangements work perfectly, provided the railway company can furnish us with sufficient cars," he explains. "We have a man in Chicago to whom all of our cars are billed. He does the unloading and supervises the sales. Each shipper marks his products to the commission firm of his choice, but everything is loaded in carlots, thus obtaining the very lowest freight rate. Three-fourths of our marketing is done in Chicago.

"We have handled possibly 400 cars from Cobden this year, of which 100 were early apples, 50 vegetables, and the remaining 250 peaches, with Elbertas far in the lead."

Many Baskets and Boxes Needed

R. L. Lawrence, president of the largest box and package factory, is next on our list. "We have been rushed to the limit of our capacity for some time," he reports. "We have made more than 700,000 bushel baskets this season. Our copyrighted blue hop bushel baskets are shipped to many states. This plant has a capacity of 8,000 a day, and we are compelled to work day and night to supply the ever-increasing demand.

"We manufacture all kinds of fruit and vegetable containers—baskets, hampers, boxes, crates, barrels, etc. We have eighty-seven employees on our pay-rolls."

Now for a hike. We climb Bell Hill, just at the outskirts of town, for a view of the landscape. Bald Knob, already mentioned, stands out boldly to the west; to the south and southwest, Union County unfolds itself,

and we see a thousand verdant homesteads, until the azure sky blocks the way.

But take a minute longer to scrutinize the undulating scenery and count the rows in you apple orchard, only five miles away. Now look below you, and behold that cluster of houses and half a dozen spires, wrapped in a mantle of oaks and maples, nestled snugly in the sleeping hills—green and picturesque. This is Cobden.

With feelings of regret, our good-by is given to this fairest daughter of "Egypt," but inwardly we promise ourselves another jaunt—

Down where the cucumber "cukes,"

And the cantaloupe "cants" at the bean,

The June apple trees are as red as you please,

And the Elberta peach is a queen.

Get Married; Then Plan to Own Your Home

That Is the Advice of One Who Waited Until After His Family Was Pretty Well Growing Up

By H. BATTENBURG,
Freight Checker, Chicago

OWNING our own home was one thing we had been looking forward to ever since our marriage a good many years ago. It may be easy to build castles in the air or in your dreams, but it is quite another thing to realize those dreams.

As is the case in most marriages, our family started to increase from year to year. We had all we could do to make both ends meet, and, of course, saving a little for a rainy day could not be thought of. Our family increased from two to eight persons. We have five healthy boys ranging from 7 to 16 years of age and one girl 18 years of age, now working as a stenographer and helping us along in the education of her brothers.

During all these years past, we had to figure out everything to the last cent to clothe them decently, feed them properly and give them as good an education as we possibly could afford. By hard work and perseverance and by co-operation in family affairs we succeeded.

Started Payments on Lot in Harvey

But now about a home. About seven years ago we somehow managed to get together about \$30. Seeing an ad in the paper about lots in Harvey to be sold for bargain prices, we invested our \$30 in three lots, a 75-foot frontage on 147th Street and Robey. The rest was to be paid for in \$5 monthly installments.

We hoped all the time to be able to keep this up and eventually have a little to start out with toward a home, as we were getting tired of moving around town, running after flats, interviewing landlords or agents. Very few of these seemed to have any use for children around their premises, and all the time it was getting more difficult to rent rooms.

Then the war came, and everything went up, as we all know, and renting rooms for a big family was next to impossible. Up until September, 1919, we had good rooms for a fair price on the South Side, when we all of a sudden got notice to vacate in thirty days. Now what to do? Renting something was almost impossible, however hard we tried, but finally

The Battenburg family.

we found a 6-room cottage with attic rooms to be vacated in two weeks. The landlord told me that he was willing to sell, but would not rent to anybody, for he was leaving town, going back to his farm in Florida.

Payments on Home Are \$25 a Month

Now here is where our little investment in Harvey came in to our advantage. Although it was not paid in full at that time, we managed to get a small loan from a good friend and got title to those lots, whereupon we sold them again at a sacrifice in order to realize enough money for the first payment on our home.

For this home we are paying now at the rate of \$25 a month, or more if we desire to do so, which is no more than some and less than most people have to pay for rent who have at the end of each year nothing to show but worthless rent receipts. Of course, we have no janitor service, and if we want heat in winter we have to go down cellar and feed the old furnace ourselves; but then I think it is worth a little trouble. Living out here on the South Side, with plenty of elbow-room on a 58-foot lot, is more to our liking and better for the

children than being cooped up in a 2-by-4 flat with a little porch in back for exercise.

Advises Buying Early

Taxes for our \$3,000 home in 1921 were about \$38; there are no special assessments for this year; water taxes for the entire year are from \$8 to \$12; painting and small repairs, which I attend to myself, do not amount to much; for exterior painting every three years the cost is about \$40, ours being a frame cottage; then, of course, there are the insurance and first mortgage to take care of, but all those things almost take care of themselves.

We managed to pull through with a family; why cannot any young couple do the same? I would advise them to start right at the beginning of their married life to invest a little of their money in a home. By doing this they will have it almost paid for by the time their children grow up—if they are so fortunate to have any—and it takes more to feed and clothe big ones than it does for little ones.

Now someone will probably say: Why did not *you* start out like this at the beginning of your married life? Well, for one thing, I

The Battenburg home.

will say that in those times it was easy to rent rooms anywhere for a little money, which, of course, is not the case now and will not be for a long time. As long as we could have rooms for a small price, we did not wish to be troubled with all those things as taxes, insurance, and the like. But when one grows older he begins to look upon those things in a different way. So my advice to all young married couples is: Start early and get something for yourselves that you can call a real home. You are bound to grow older, the same as we did, and then you will appreciate having a place you can call your own.

Aitchison of Oregon and Mark W. Potter of New York.

Now 103, He Helped Build Illinois Central

John J. Smith, Still an Active Texas Rancher, Recalls Adventures of the Early Track-Laying Days

JOHN J. SMITH, a pioneer citizen of Kimble County, Texas, was born at Plumb Hill Spring, near Cairo, Ill., April 23, 1819. On April 23, 1922, he was 103 years old, and hale and hearty. Besides being a pioneer Texan and an Indian fighter of the old-time sort, Mr. Smith bears the distinction of having helped build the first railroad of any consequence ever built in the United States—the Illinois Central.

In 1823, four years after Smith was born, the first charter for a railroad in America was granted in New York. It provided for a line sixteen miles long. When Smith was 14 years old, there were fewer than 200 miles of railroad, all told, in the United States. This included a short line running out of Baltimore, said to have been the first in America, two or three short tramroads in New York, and the first railroad built in New England.

Smith was just budding into manhood when certain valiant spirits conceived the Illinois Central Railroad. It was the first real railroad, with open country in which to build, that was constructed in America. The comparatively level country between Cairo and Chicago, a distance of approximately four hundred miles, made possible a grade that the small locomotives of that day could negotiate with some degree of success.

John J. Smith is a giant. He stands 6 feet 3—and has never, since youth, weighed less than 236 pounds, until the last few years. He now weighs 228.

Had Reputation as a Fighter

It was while helping to build the Cairo end of the Illinois Central that Smith acquired a considerable reputation as a fighter. He insists that all along through a checkered career this reputation has been thrust upon him. In recounting the beginning of his career as a "holy terror" on the old Illinois Central, Smith said:

"Looking back at the matter now, it seems to me that I just about had all that notoriety thrust upon me. When the Illinois Central was built, there were no scrapers, steam shovels and other grading machinery. The grade was

John J. Smith

built by the pick, shovel and wheelbarrow system. Men with skill, at handling these tools were imported from the peat bogs of Ireland. If you know anything about Irish railway builders, you know a man couldn't stay among them long without having a fight. I had several, and had the luck to win them. Then it dawned on the Irishmen that I was so big that no one man could lick all of me at one time.

"My duties took me back and forth along the grade. About every mile there was a grog shop, and I could safely count on at least one fight at each saloon. One day, at one of these joints, a gang of Irishmen decided that I had a licking coming to me. They were probably right. At any rate, as many as could get at me jumped me at once, and they licked me—but they didn't find it out. They knocked me down so often, with everything from their fists to a cross tie, that I decided there was no use getting up any more. Then they crawled on me. I managed to get out my old, pewter-bladed knife, reach over and draw it across their backs. I don't think there was much damage

done, for the blade was bent when I looked at it, but it stopped the fight, and word went up and down the line that I had licked the whole outfit. As a matter of fact, they had me licked, and didn't know it. After that I had a reputation to live up to, and, like many another reputation, it was doubtless responsible for a lot of cracked skulls and smashed noses.

Never Admit You Are Licked

"That was the first time I ever knew that a man is never licked until he admits it. Often, if he can just hang on a little longer, the other fellow will admit it. I got a great name as a fighter, just because I fought when I had to and didn't mention it when I was licked. That reputation followed me on through my days as a Texas Ranger, as a private in the Confederate army, and as a frontiersman as long as there were Indians and outlaws to fight in Texas."

When the Illinois Central was completed, Smith was for some time a brakeman on the South division; between Cairo and Ashley. His memory for dates is not good, and he doesn't remember the exact year that he quit the Illinois Central, but does remember that he made a crop in Fannin County, Texas, in 1859. In 1860 he was a ranger under Captain Woods and fought Indians in West Texas. He tells

many thrilling yarns of his experience in that capacity. In 1861 he enlisted as a private in the Confederate army. He served four years.

For two years after the Civil War Mr. Smith was city marshal of Greenville, Texas. During that time he never let a violator of the law get away, was never injured, and never killed a man, in spite of the fact the country was filled with the worst of bad men.

Handles a Horse Well at 103

In the early 70's Mr. Smith went to Kimble County. He settled on the banks of the Llano River, where he thought he would never be crowded. The country has settled up, but "Uncle John," as this remarkable old centenarian is familiarly known for half a dozen counties around, still lives in his old ranch house, in the middle of his large holdings, within a few yards of where he made his first camp.

One of the pictures herewith shows Mr. Smith, mounted on Old Bill, his favorite saddle horse. He didn't get up in a chair and climb on Bill for the purpose of having his picture taken, either. This picture was made the day the writer obtained this information at first hand, a few months ago. "Uncle John" forked Old Bill and, laying the leather to Bill's black hide, rode him around a refractory

Active on horseback at age of 103.

yearling in a manner that would have been a credit to any puncher on the ranch.

When the matter of fighting is mentioned, "Uncle John" usually says, "Oh, I reck'n I've quit," but there are plenty of men half his age who would hesitate yet to push him beyond reason in an argument. A few years ago he caught a man stealing some of his

stock. He made the man bring the animal home. Then he thrashed the kidnapper of his baby beef, and afterward made the man shake hands and come in and eat with him.

There are scores of true stories about Uncle John's peculiarities, but they have not prevented him from having as many and as true friends as any man in West Texas.

Daughter of Conductor Stars as a Dancer

Miss Holland Fitch, 14-year-old daughter of Harry C. Fitch, passenger conductor on the Indiana division, is a *premiere danseuse* of exceptional talent. Although she is just a step into her teens, she has been graduated from a college of music and fine art and the Hester Brady Dancing School. She also has a Y. W. C. A. swimming record.

H. C. Fitch

Newspaper reports say Miss Fitch pleased a large audience with her dancing June 20 at a B. & O. Railroad chautauqua in Fairmont, W. Va. She was on the program with several noted singers and entertainers, and the newspapers of Fairmont devoted much space the next day to praising Miss Fitch's ability.

Her first dance at that entertainment was a presentation of "The Last Rose of Summer." As the curtain went up, she was posed on her toes by a rose trellis. When the sweet notes of the old familiar song floated upon the evening air, Miss Fitch danced away from the trellis. She resembled a great pink rose in her billowy ballet gown of pink tulle. At the close of the dance, she returned to the trellis and crumpled.

Miss Fitch's father has been in the service of the company for twenty-one years. He entered the service as a freight brakeman at Mattoon, Ill., October 9, 1901, and was promoted to conductor in 1904. Later he was transferred to the Indianapolis Southern at Indianapolis, which was then under construction. His route to this line was: Mattoon to Indianapolis via Big Four; Indianapolis to Franklin, Big Four; Franklin to Morgantown, Big Four,

with caboose and engine. When he arrived in Morgantown he found a water tank and about one-fourth mile of track each way had been built. He was stationed there about three years handling a track-laying machine and doing other work train service.

When the road was completed, he was placed on through manifest runs, Nos. 352-351, between Indianapolis and Effingham. He was on these runs about five years and later was on our local freight between Indianapolis and Bloomfield. About three years ago, when E. N. Vane was made trainmaster, Mr. Fitch was placed on his runs, then Nos. 303 and 324, between Indianapolis and Effingham.

Miss Holland Fitch

LABOR DAY—By Chester M. Wright

Copyright, Collins Industrial Council.

LABOR DAY, falling each year upon the first Monday in September, is a national legal holiday set apart for recognition of the service rendered by the men and women of toil to the community.

The observance of this holiday is a tribute to the basic social service of labor.

The law fixing Labor Day as a national holiday was signed by President Grover Cleveland on June 29, 1894, and this year will mark the twenty-eighth anniversary of its observance.

The history of Labor Day is interesting. The holiday came into being as the direct result of agitation by the American Federation of Labor.

At a meeting of the New York Central Labor Union held on May 8, 1882, P. J. McGuire, then one of the leading figures in the trade union movement, urged the propriety of setting aside a day each year as a general holiday for working people and suggested that this day be called Labor Day.

The Central Labor Union approved the idea and held a Labor Day parade and festival on the first Monday in September, 1882—the same year in which the idea of such a day was first suggested.

Two years later, in its annual convention, the American Federation of Labor indorsed the proposal by the adoption of a resolution introduced by A. C. Cameron, delegate from the Chicago Trades and Labor Alliance, an organization no longer existing. Mr. Cameron's resolution read:

Resolved, That the first Monday in September of each year be set apart as a laborers' national holiday, and that we recommend its observance by all wage earners, irrespective of sex, calling, or nationality.

State federations of labor and city central

Mr. Wright is secretary of the Pan-American Federation of Labor and Director of the American Federation of Labor, Board of Information and Publicity, Washington, D. C.

labor unions took up the matter, and as a result numerous city councils and state legislatures made the first Monday in September a holiday.

Oregon was the first state to fall in line, making Labor Day a holiday through a bill signed by the governor on February 21, 1887. At later dates in the same year Colorado, Massachusetts, New Jersey and New York followed Oregon's example.

Twenty-three additional states set aside Labor Day as a holiday between 1887 and 1893.

It was ten years from the passage of the first resolution in the 1884 American Federation of Labor convention that Labor Day finally became a national holiday by congressional action. The pen with which President Cleveland signed the measure was presented to Samuel Gompers, president of the American Federation of Labor, and is today one of Mr. Gompers' prized possessions.

Observance of Labor Day up to this time has been mostly by way of picnics, parades and speech-making. It is probable that the sole knowledge of many persons concerning the organized labor movement has been gained through watching Labor Day parades; and of course Labor Day parades have been held partly with that end in view.

In more recent years there has been in some cities a tendency to forsake the parade feature, but an effort is being made this year to revive the idea because of its inspirational value.

Probably the majority of those who think

about Labor Day at all in terms other than those of a purely vacation time think about it as a day marking the growing popular recognition of the place which labor holds in our social scheme, in our system of civilization. It is a day upon which we contemplate the fundamental importance of creative endeavor.

It will be noted that we have set apart no holiday to mark the esteem and honor in which we hold business, diplomacy, or the professions, such as the law. But if we examine the thought underlying Labor Day we shall be driven to the conclusion that properly observed Labor Day is a marker of our honor and esteem for every kind of effort that is given in honest service to the common good, every kind of creative effort of thought or brawn that contributes to the sum total of effort that goes to the satisfying of the needs of the race.

If we can get that view of Labor Day we see the day as one on which we pay tribute to the effort that is given by all who give. Obviously there would be no propriety in observing a day devoted to extolling the virtues of those who take. It is therefore proper for all who are engaged in honest effort to serve humanity, in whatever high or humble capacity, to indulge in the observance of Labor Day, in the contemplation of its meaning, and in feeling the response of the millions given in recognition of honest service. It is the proper province of all these to join to the full in the spirit of Labor Day.

The day was won by the organized workers—but it was not won for them alone, nor was that their intent. It was won for all, and surely in its deeper, finer meaning it was won and established, not as a tribute to any particular man or body of men, but as a tribute to the thing itself—creative effort—the great sum total of all creative effort. It is a day for Labor, not especially for laborers.

There is about the idea of Labor Day something of an exalted nature, something of an adulation for humanity's effort to raise itself to ever increasing heights, for that, after all, is what the great contribution of daily toil and thought amounts to. We work and study and think; we give of mind and soul and body, not that we may remain as we are, but that we may advance to better things; that we may go on to higher, nobler concepts, to greater freedom and to broader, deeper life, developing the ethical as well as the material.

No other kind of life thus pays tribute to its own aspiration, to the dignity and purpose of

its own effort. In all life, save human life, there is no purpose of which that life is conscious except the maintenance of the life that is and as it is.

It is the ambition, the imagination, the constant urge in human souls to create by honest, enlightened endeavor a better world, a better environment, a better life in all of its phases, that moves us in observing Labor Day.

And that which moves us to pay honor is, curiously enough, at the same time the thing to which we pay honor, in the last analysis. We pay tribute to a thought, to a concept, to something that is in the mind, to an ideal that is in our brain.

VETERAN OF KEY

W. P. Bonds.

The oldest dispatcher on the Louisiana division is W. P. Bonds, who was born December 13, 1857, and who entered the service of N. O., J. & G. N., now the Louisiana division of the Illinois Central, as operator, September 4, 1874. On February 1, 1885, he was transferred to the L., N. O. & T., now the Y. & M. V., where he worked until November, 1888. Then he was employed by the Texas & Pacific as train dispatcher. In September, 1899, he returned to the service of the Illinois Central at McComb, Miss., as dispatcher. He has been in continuous service since then.

How Suburban Service Met an Emergency

Traffic More Than Doubled When Surface Lines and Elevated Ceased Running During Recent 6-Day Strike

By A. BERNARD,

Superintendent, Suburban Passenger Service

THE flexibility of the Chicago suburban passenger service was demonstrated from August 1 to August 6, inclusive, when it was called upon to handle a great excess over its usual traffic thrown upon it by the strike of the street car and elevated railway employees of the city.

The number of passengers carried on those six days was 807,838, as compared with a normal traffic in the same period of 389,755, an increase of 418,083, or more than 100 per cent. The largest number of passengers handled in any one day was 157,517, as compared with a previous daily average of 72,806.

Naturally this called for a speeding-up of the usual service. The largest number of trains run in one day was 616. During the rush periods, morning and evening, trains were run with a headway of less than one minute.

The large increase in service was taken care of by the regular locomotives and cars assigned to the suburban service, augmented by four additional locomotives and thirteen additional cars. Relay locomotives were kept ready for immediate service at Randolph Street, South Chicago, Kensington and 67th Street (both express and local).

Less Than a Minute at Terminals

This materially speeded up the service, as relay engines were coupled on trains while the engines handling the trains inbound were being cut off. This reduced the standing time of trains at terminals to a minimum. Checks developed, in some instances, that trains were again moving on another trip within forty-five seconds after arriving at the terminals.

The Chicago terminal supervising staff, the suburban trainmen, enginemen, switchmen, switchtenders, interlocking signalmen, agents and other station attendants, maintenance of way employees, mechanical and car forces and volunteers from other departments rendered the suburbanites a service 100 per cent efficient.

The train service was covered by the regular force of train and engine employees by working extra trips and extra hours, and, although

working under this unusual strain, all maintained their usual patience and courtesy while performing this excellent service. The performance was a splendid demonstration of what can be accomplished by a well organized, loyal set of men working in harmony.

Co-operation Handled the Traffic

Volunteers from the accounting departments, headed by Mr. Bristol, and forces of the superintendent of stations and transfers, general superintendent of transportation, auditor of station accounts, chief special agent and passenger traffic department assisted in the sale and punching of tickets, directing of traffic at heavy stations and keeping record of ticket sales and accounts. They are entitled to a great deal of credit.

There were numerous instances of extraordinary performances on the part of individual employees, but lack of time and space will not permit of going into this in detail. All have our warm appreciation.

The special train service was of the same high order as we provide for our regular patrons in our regularly scheduled service, and praises and compliments by the hundred were heard from all sides.

New Business Being Retained

Even since the surface and elevated cars began operation following the strike, the number of passengers carried by our suburban service has been largely in excess of normal. We are therefore led to believe that many who availed themselves of our service during the crisis were so favorably impressed that they have decided to continue riding with us. Our effort will be to hold these new patrons permanently. If efficiency and courteous attention to patrons will serve to retain this new business, our terminal employees may be depended upon to do their full share. They are proud of the fine reputation they have helped to build for the Illinois Central suburban service, and they have a right to be, for it reflects most creditably upon them.

A Chicagoan made this remark to one of our officers: "I have been living within easy access of Illinois Central suburban trains for

many years, but I have always used the street cars. I therefore never knew the attractiveness of the Illinois Central's wonderful service until I tried it during the street car strike. It was a revelation to me. The trainmen, ticket punchers—in fact every employe—seemed to be 100 per cent efficient, and all specialized on the greatest of all selling features—extreme courtesy to passengers."

What this patron had to say is similar to what many of our new customers have said about our suburban service.

Favorable comments also appeared in the daily papers of Chicago, copies of a few of which are submitted herewith. They are typical of the expressions from both the public and the press.

Made Effective Rally

The *Chicago Daily News* of August 1 said: "The Illinois Central, with a huge reserve of its light suburban equipment, made the most effective rally. The little 'tea kettle trains' of the I. C. rendered almost three times as much service as usual and handled the bulk of South Side traffic in good shape."

Prepared to Handle 200,000

The *Chicago Tribune* of August 2 gave our report as follows:

"ILLINOIS CENTRAL—Prepared for anything. 'We can handle 200,000 passengers in and out of the loop if we have to,' was their statement."

On Schedules of Minute and a Half

The *Chicago Daily Journal* of August 2 had the following to say:

"The steam roads were swamped, but rose to the emergency. The Illinois Central and North Western carried the heaviest loads. The Illinois Central took care of almost 200,000 people, it was estimated, running trains of ten and twelve coaches on one and one-half minute schedules between Sixty-seventh and Randolph streets."

Service at Maximum Efficiency

The *Chicago Herald & Examiner* of August 3 said:

"The railroads did an increased business yesterday in carrying commuters from the residence sections to the loop and home again. The steam lines, which are able to maintain an intra-city schedule, report their suburban service now is at maximum efficiency.

"The Illinois Central Railroad continues to

operate during the rush hour with trains at one and one-half minute intervals. Business of handling ticket sales, collections and clerical work has been divided among workers temporarily assigned from other branches of the organization."

Praised in an Editorial

Here are excerpts from an editorial in the *Chicago Evening American* of August 5 headed "Chicago Discovers Its Railroads; Traction Tie-Up Shows City Something in Courtesy to the Public":

"Chicago's electric transportation tieup has led many of Chicago's citizens to an important discovery—that steam railroads are useful for something aside from freight and long distance passenger service.

"Of course, several thousand Chicagoans, and suburban residents employed or in business in the city, needed no introduction nor guide to the railroads. Not so with other thousands who turned to the steam roads when the electric lines ceased to function.

"What did these new commuters find? Take the Illinois Central, for instance:

"They found comfortable cars at frequent intervals.

"They found courteous guides and guards at every station, EAGER TO SERVE THE PUBLIC.

"They were greeted with a smile and not with a frown. It seemed, almost, as though an order had been issued that 'The passenger is ALWAYS right.'"

"And, finally, they found they were advised to buy ten-ride tickets at a saving in many cases which brought the fare below that of the surface and 'L' lines.

"There was no effort to profiteer, but every effort to provide adequate service—to SELL the service FOR THE FUTURE."

Illinois Central Efficiency

Rig, who conducts the "From Pillar to Post" column in the *Chicago Evening Post*, had the following to say on August 3:

"With all its cinders, we love the I. C. still; despite its extra strike traffic, it rises to the emergency in so smooth and effortless a manner that one is tempted to ask, as the DeKalb Independent did yesterday in a front page story, 'Will miracles ever cease?' . . . It is from this same favorite daily that we glean another instance of this road's efficiency. A

farmer going through an Iowa field was attacked by an infuriated bull. The crew on a

passing I. C. freight saw his predicament, stopped the train and drove the bull away."

How to Set Valve Gear Eccentric Cranks

By W. C. DICK,
General Foreman, Freeport Shops

About the time the Walschaert valve gear came into use on the Illinois Central, the writer was doing the valve setting at Freeport shops. We had occasion to renew a main crank pin on a Mikado class engine, and I had the interesting little job of figuring out how to lay out the eccentric crank keyway without first going through the formality of running the valves over.

I decided on the following method, which I found to be accurate and which is submitted for the benefit of shopmen who may not have had any practical experience on this class of work:

First, check the blueprint for the eccentric crank throw and the length of crank and also for the stroke of the piston. Then, on a sheet of tin, draw the line (a) and on the line (a) locate the points (b) and (c), which represent

the axle and crank pin centers respectively. Then from the point (b), with a pair of compasses, draw the arc (d), which represents the crank throw; from the point (c) draw the arc (e). Then draw the line (f) from the point (c) to where the arcs (d) and (e) intersect. Then draw the circle (g), which must be the exact size of the end of the crank pin. The distance between the lines (a) and (f) on the circle (g) is the distance which the center line drawn on the face of the eccentric crank should be from the center line drawn across the face of the crank pin on line with the axle center.

The general practice is to machine keyseats in crank pins before pressing them into the wheel, drawing a line from the keyway to the opposite end of the pin, matching this line with one drawn on the hub face of the wheel; but this practice frequently necessitates applying offset keys, due to the fact that the crank pin turns slightly while being pressed in.

Director Gives Example of Perseverance

John G. Shedd, on Illinois Central Board, Celebrates Fiftieth Year With Company He Now Heads

JOHN GRAVES SHEDD, president of Marshall Field & Company, Chicago, and an Illinois Central director, was once a \$10-a-week stockboy for the company of which he now is president. With thirty-three others who were polishing brass or sweeping floors or selling calico for "the big store" back in 1872 he celebrated on August 7 the completion of half a century in the Marshall Field organization.

The stockboy gave the party, because he is the newest member of the half-century club. Just as in 1872, when Marshall Field sent him, a frightened farmer boy, out into the stockroom to go to work, John Shedd was the "greenie" of the party. To others of the Field organization he might be Mr. John G. Shedd, president of the company, but his companions preceded him on the pay-roll, and to them he was once "Hey, boy!"

There was John Devlin, for example; and "Tony" Mulligan and "Bill" Ryan and Joe Collosky—all more or less firmly established in the store when the new stockboy was taken on, back in the days just after the war, when Chicago was still something of a backwoods town, and Lake Street was the center of things, with crowded wooden sidewalks and hitching posts hard to get.

Presented With Gold Medal

These oldsters, gathering at the Shedd home in Lake Forest, welcomed the new half-century man into the group with a ceremony which the stockboy-president himself devised some years ago. They presented him with one of the diamond-studded gold medals which the store confers upon its 50-year men. Each of them in turn, and seven veterans no longer living, had received one of the medals from Mr. Shedd. This time James Simpson, vice-president of the company, reversed the procedure.

"I am going to keep busy always," declared Mr. Shedd in acknowledging the presentation. "My philosophy is that leisure hurts more men and idleness causes more mental stagnation than anything else."

In paying a tribute to the thirty-three "young

John G. Shedd.

men" who were his guests, Mr. Shedd gave credit for their happiness and youth to their spirit of co-operation with and loyalty to the policies of the firm.

A Lesson to the Ambitious

"You and I," he continued, "have seen Chicago grow from a sprawling town to its present gigantic size. While single minds may have directed, the composite activities of many of you have been the real foundation of our success. Being fifty years at Field's means something.

"Today we have a picture of the result achieved by our house. It is a lesson to the ambitious young. It shows that patience, perseverance, and integrity have their sure reward. Every high official in the organization today began here in some humble capacity and worked his way up."

As they listened, his comrades reviewed the

history of their host. Born seventy-two years ago on a small farm in New Hampshire, Mr. Shedd, as a lad of 17, chose to work in a general store. For doing "almost everything" he received \$75 a month. At the age of 22 he made his way west and entered the employ of Marshall Field's.

In 1906, at the death of Marshall Field, the ex-stockkeeper, who wants to "keep busy always," became president of the loop department store doing a \$200,000,000 business annually.

They Stayed

Learn a lesson, young gentlemen, from John G. Shedd, who has celebrated the fiftieth anniversary of his connection with Marshall Field & Co. What is true of him is true equally of his associate, James Simpson. They began young with Marshall Field, realized that they were with a big man and a very big concern—with all the opportunity that ability could ask.

They did not wander around, or wonder why no one appreciated them. They worked and stayed. Now they control the business.—ARTHUR BRISBANE, in the *Chicago Herald and Examiner*, August 8.

C. M. McRoberts, general claim agent of the Los Angeles Railway, Los Angeles, Cal., who was recently elected president of the Pacific Claim Agents' Association. Mr. McRoberts is well known on the Illinois Central System.

Y. M. C. A. at Canton, Miss., 21 Years Old

Apropos the Illinois Central Bible class at the railway Y. M. C. A. at Canton, Miss. According to C. J. Barnett, Illinois Central engineer and chairman of the board of directors of the Canton Y. M. C. A., Agent H. A. Comfort of Canton has consented for the employees to attend Bible study for forty minutes Sunday mornings, beginning at 10 o'clock. Mr. Comfort is an enthusiastic worker for the class, according to Mr. Barnett, and the members show their appreciation of the privilege by their interest.

The Y. M. C. A. at Canton was opened in February, 1901, and it has not been closed since then. The "Y" has served 210,000 baths, 175,000 beds and many other physical comforts. Many thousand papers, books and magazines have been read in its rooms by the members. Many Illinois Central employes have been trained in its educational classes. Gospel meetings and Bible classes are conducted each week.

During the twenty-one years of this Y.

M. C. A.'s work, about 6,300 membership cards have been written for railway men.

D. G. McLaurin, the present general secretary, after completing a college course at Millsaps College, Jackson, Miss., and a 2-year course in the Y. M. C. A. Training School in Chicago, opened the work at Canton in 1901, during President Fish's administration, when Mr. Harahan was general manager. Both took an active interest in the Y. M. C. A. President Fish's traveling party visited the association in 1901. In the party were President Fish, John Jacob Astor, Mr. Harahan and Chief Engineer Wallace.

"The officials of the Illinois Central have had the best interest of the employes at heart all the while, which is shown by the money spent for welfare work through the Y. M. C. A.'s on their lines," says Mr. McLaurin.

The building for the Y. M. C. A. at Canton was the first one this company put up.

How We Invited the Missouri to Move

System of Current Retards, Built With New Piling, Successful in Protecting Track and Bridge

By C. CHANDLER,
Assistant Engineer of Bridges

THE Illinois Central System for years has experienced considerable difficulty in protecting the banks of the Missouri River against erosion which might endanger its tracks at the Narrows, near Council Bluffs, Iowa.

In 1921 it was decided to install retards at this point, as well as at the west bank of the bridge. The location and extent of this work are shown in Figure 1.

The work at the bridge consists of three retards spaced about 750 feet apart on the west bank, directly north of the bridge, where the river threatened to cut a channel under the bridge approach; the other work covered a stretch about two miles long on the east bank at a bend in the river known as the Narrows, this work beginning about three miles above the bridge, the location and spacing of the retards being shown on this map.

Figure 2 shows a cross section and plan of the retards.

Pile Sinks by Its Own Weight

These retards vary in length from 80 to 170 feet. In the construction of a retard, the first step is to sink from two to four concrete piles of the Bignell type, shown in Figure 3. The Bignell pile is a patented pile having bottom and side outlets for water jets. The piles are 14 by 14 inches, 20 feet long and weigh about 5,000 pounds. They were shipped to the work on barges from Omaha. By use of a water jet, the piles are easily sunk, as the pressure of water through the bottom and side outlets enables the pile to be sunk without any driving, the weight of the pile giving sufficient pressure.

These piles have a minimum penetration of 60 feet. The deepest penetration on the Narrows work was 96 feet, pile heads being from 30 feet to 70 feet below the river bed. The piles serve as anchors for a 1-inch to 1½-inch cable which holds a floating retard in place at a distance of about 100 feet from the pile. Each pile has from six to ten cables run through holes near the heads, the piles being spaced about 38 feet, center to center, the first

Fig. 1. Current Retards on Missouri River

pile being 20 feet from the shore line and the outer piles in water varying from 10 feet to 30 feet in depth.

The trees used in this work varied in length from 40 feet to 90 feet, the butts being from 10 to 36 inches in diameter. The trees were cut along the river bank, loaded on barges and towed to the site of the work by steamboat. The boat and barges are shown in Figure 4.

How the Matting Is Constructed

When the barge is moored in position for the construction of a retard, the butts of a group of from fifteen to twenty-five trees are stapled to a ¾-inch cable, and then these

groups are attached to anchor cables and hauled off the barge. The steamboat used on this work was about 112 feet long, equipped with a 35-foot "A" frame, or derrick, at the bow to handle the piling. This boat, with a crew of fourteen men, could sink ten piles to a 90-foot depth in a 10-hour working day. In addition to this crew, a gang of from ten to twenty men was cutting trees and hauling them to the barge, while another gang of eight men, with a hoist, was building the trees into rafts on one barge, while the steamboat was towing the second barge to the work. Part of the time two steamboats were used.

After these retards are constructed, the water flows through the trees in a slower current, causing the silt to deposit. Silting above the retards is slow, particularly during the first eight or ten months. Below the retard, however, the silting is rapid, varying with the amount of sand the river is carrying at the time. In a week after the completion of a retard there was often a fill averaging 10 feet deep, 100 feet wide and 800 feet long deposited where prior to the construction of a

Fig. 2. Construction of Pile and Tree Retard

Fig. 3. Bignell piling.

retard the channel was twenty to thirty feet deep. A retard 150 feet in length can be built in about two weeks.

It was the intention when this work was started to construct ten retards at the Narrows

Fig. 4. Boat and barges used in the work.

Fig. 5. How the completed job looks.

but after the construction of retard No. 1 the filling-in was so rapid that it was impossible to construct proposed retards No. 2 and No. 3, and the next retard constructed was No. 4.

Permanency of the Retards

After these retards had been constructed, the work was transferred to the three retards at the bridge, and after this work was completed it was decided to build two additional retards, No. 14 and No. 15, at the Narrows as a further protection against erosion of the bank.

No longitudinal protection is placed between the outer ends of the retards, but the silting extends far beyond them, sometimes forming

a bar 800 to 1,000 feet wide. During the high water stages part of the bar thus formed beyond the retards may be washed away, but as the fill between them is deposited at such stages it is not considered probable that it will be affected by future high water.

This bank protection, a portion of which is shown in Figure 5, was built between May 4 and August 23, 1921, by the Woods Brothers Construction Company of Lincoln, Neb., who own the patents on the Bignell pile previously referred to and on this "standard" system of retard construction.

Wayne Pringle, chief engineer of that company, was in charge of the work.

How a Fire-Door Failure Was Prevented

The fact that fire-door failures on occasion have caused trains to be given up reminds E. Von Bergen, traveling engineer of Memphis, Tenn., of the case of Fireman M. D. Carter of the Mississippi division, who once solved such a difficulty in a way that ought to be of inspiration to other firemen. According to a letter of commendation written to Fireman Carter by O. A. Garber, master mechanic at Memphis, a fulcrum stud broke in the fire-door when Mr. Carter was firing engine No. 1100 on train No. 7—the Panama Limited—through Nonconnah. This made it necessary for the fireman to operate the left door by hand, which gave him only half of the fire-door space to dis-

M. D. Carter.

tribute the coal, in spite of which he did his work — although with a great deal of extra effort—and prevented an engine failure. "In this case," writes Mr. Von Bergen, "Fireman Carter used a monkey wrench as a handle on one side of the door and the regular handle on the other half. This prevented a delay."

Isle of Pines, Health and Winter Resort

Equable Temperature and Fertile Soil Make It Desirable for Americans—Of Course, Via Illinois Central

HOW much do you know about the Isle of Pines?

This little isle, about the size of an average county in the United States, is just now attracting much attention as a health and a winter resort for tourists and also as a desirable location for those who wish to engage in the growing of grapefruit, oranges, pineapples, winter vegetables and other products which are produced on the isle under unusually favorable conditions.

The Isle of Pines is ninety miles south of Havana, Cuba, about seven hundred miles from New Orleans. The United States government report says that malaria, yellow fever and typhoid fever have never existed on the isle, that the soil is fertile and that, strange as it may seem, there are no poisonous snakes or insects to be found there.

Shortly before the war the United Fruit Company made the Isle of Pines a port of call for its New Orleans ships, but the service was discontinued during the war. Undoubtedly this service will be resumed in the

near future, as the isle is being developed rapidly by Americans, most of whom, by the way, are from Illinois, Iowa, Wisconsin and Minnesota. They own practically all the land.

The isle is now reached by the way of Havana, Cuba, to which the Illinois Central System is prepared to handle passengers by both the New Orleans and Florida gateways. From Havana the traveler goes thirty-five miles south by rail to Batabano, where connections are made with the Isle of Pines steamship line, which makes the run of sixty-five miles to the isle, maintaining a regular service. An auxiliary power schooner line, rendering a good heavy freight service and carrying some passengers, is maintained between Tampa, Fla., and the Isle of Pines.

Temperature From 60 to 90 Degrees

The topography of the isle is unusual, in that, although so small in area, it has some "mountains" with an altitude of about eighteen hundred feet above sea level, and, except along the coast, all of the land lies high above sea level, giving it a good natural drainage. This

Fourth of July Celebration, Isle of Pines

Street Scene, Nueva Gerona, Isle of Pines.

altitude undoubtedly accounts for its wonderfully equable climate, the temperature throughout the year running from 60 to 90 degrees. It is only about ten degrees warmer in the summer than in the winter. For this reason the isle was, for fifty years before Cuba was lost to Spain, a fashionable summer resort for the wealthy Spanish aristocrats of Havana, who would go to the town of Santa Fe (the great resort and residential town of the isle) to spend a part of the summer season, much cooler than in Havana, taking the thermal baths and drinking the various mineral waters, all famous for their beneficial qualities for many ailments. There are still standing in Santa Fe five buildings that were resort hotels of those days. Americans have erected at Santa Fe two modern hotels that now accommodate the tourist business of the isle.

A peculiar and interesting question is that of the sovereignty of the isle. Who owns the Isle of Pines—Cuba or the United States—has never been settled, although at the present time Cuba is permitted to govern it. President McKinley officially declared the isle United States territory, and it was this decision that caused Americans to go there immediately after the Spanish-American War and to buy up all the land of the Spanish owners, who were afraid of the coming Cuban

rule and desired to sell out at any price and return to Spain.

During the Roosevelt administration the Cuban government advanced a claim to the isle, and a treaty was negotiated ceding the Isle of Pines to Cuba—in consideration of two coaling stations in Cuba that had already been bought and paid for in cash by the United States! This treaty never has been ratified by the United States Senate—and may never be.

American Residents Satisfied

The several thousand Americans on the isle are all well satisfied with present conditions. They are making money. Cuba is giving the isle a good government, spending considerable money there in the way of public improvements—a quarter of a million dollars alone has been spent by the government building "calzadas," or boulevard roads, the delight of the automobilist, although one can go almost anywhere over the isle in a "flivver," regardless of roads.

Havana, a city of half a million, is a wonderful market for all the oranges, poultry, eggs, potatoes and other vegetables and fruits produced on the Isle of Pines, with the exceptions of peppers, eggplant and grapefruit, which are shipped to the United States at such seasons as to bring high prices.

Pepper Field, Isle of Pines

Living conditions are so agreeable and cheap on the isle that many with fixed moderate incomes or pensions are being attracted there. The town of Santa Fe is equipped with an electric light plant and artificial ice plants, has churches of various denominations, a Masonic temple, a woman's club, a public

library, good schools, exposition buildings, fairgrounds, movies and a newspaper. In fact, everything found in a thriving community is to be found in Santa Fé and throughout the isle.

The isle has a service flag of more than two hundred stars—young American boys who en-

Pineapple Field, Isle of Pines

Isle of Pines Grapefruit

tered the war from the isle. More money was raised on the isle for the American Red Cross than was obtained from all the Americans in Cuba.

The Isle of Pines National Bank & Trust Company was the only bank in all Cuba that took no advantage of the government moratorium, functioning in all of its departments.

The average rainfall is sixty inches a year, scattered throughout the year, irrigation being unnecessary and fertilization a much smaller item of expense than in California or Florida.

An Isle of Pines commercial bureau has been opened in Chicago at 53 West Jackson Boulevard, in charge of Clement J. Wall.

LOCATED OLD FRIEND

The *Illinois Central Magazine* has frequently been the means of putting old friends in touch with each other. A case just called to our attention is that of W. O. Wood, formerly trainmaster at Water Valley, now president of the New York & Queen's County Railroad Company, Long Island, New York, and C. H. Hammond, engineer on the Panama Limited between Memphis, Tenn., and Canton, Miss. On page 5 of the August issue was a story

regarding the "on-time" record of the Panama Limited, and in this story Engineer Hammond's name was mentioned. Mr. Wood read the article, tore out the sheet and wrote on it to Engineer Hammond as follows: "Congratulations—I hope the track is better than in the days when old Big Black used to wash out—good luck to you all."

SOME GOLF CLUB NEWS

The Illinois Central Golf Club, composed of a number of the general office men at Chicago, is going along nicely. The match play event, started in June and July, resulted in a victory for Fred Collar. Fred Lucius was runner-up. The club is unfortunate enough to lose Mr. Collar, who will locate in New Orleans as local sales manager for the Dalton Adding Machine Company. A match play handicap event was staged during August. C. C. Haire was put out by A. H. Coates, who in turn was "bumped off" by C. L. Combs, who shot a flawless 82. Bob Anderson, Fred Lucius, W. P. Enright, N. A. Howell, and J. Lessel were others prominent in the running. The club is endeavoring to arrange a tournament with the 63rd Street office shooters.

He Saw America Seventh, Instead of First Pensioner, After Six Trips to England, Found Wonders in This Country Enough to Satisfy Him

By W. H. WASHINGTON,

Pensioned Engineer, Louisiana Division

HAVING taken six trips to England in the last thirty years, I decided it was time for me, as an American citizen, to see America. Accordingly, at 10:30 a. m., June 7, I left Duluth, Minn., via the Northern Pacific, for San Francisco to attend the Shriners' convention, and, incidentally, to see something of the greatest and best country on earth. The ice had been gone off Lake Superior only three or four weeks, but it was 75 degrees in the shade at Duluth and about the same temperature all the way to Seattle.

I saw nothing that most travelers do not see until we reached the North Dakota Bad Lands. They are rightly named: several hundred hills of every conceivable shape and size and most of them absolutely devoid of vegetation. Except in that location the wheat, oats, and other crops looked to me to be healthy and promising everywhere, though I was told that North Dakota needed rain badly.

At Wibaux, the first station in Montana, fully a mile from any house or public road and about 250 feet from the track stands a statue erected to Pierre Wibaux, Montana pioneer. At Big Timber, Mont., the Crazy Mountains came in sight, their tops covered with snow, apparently only about two miles away. At Livingstone, the snow-capped mountains looked to me to be about one mile away, but the conductor told me that they were sixteen. A resident of Livingstone assured me that they were fully that distance.

Country Explored by Lewis and Clark

At 5 p. m., June 8, we passed through the Bozeman tunnel, at the west end of which a sign announced that "Captain Clark, of Lewis and Clark, crossed this pass in 1806." Up into the mountains and down again, out on the prairie, and we passed the Trident, three forks of a stream which unite, forming the starting point of the Missouri River.

On June 9 the brakeman woke me up announcing "Hope," which is on the bank of Lake Pond de Dreille, extending sixteen miles into Idaho. This lake is really a wide place in the

W. H. Washington served the company as a locomotive engineer for twenty years prior to being pensioned January 1, 1918. He was born in England in 1852, began his railway service as a call-boy twelve years later, in 1864, became a fireman in 1869 and an engineer in 1874. He came to the United States in 1881 and entered the service of the Illinois Central, on the New Orleans terminal, in 1897.

Clark's Fork River, which flows into the Columbia. In 1804 Lewis and Clark passed through this river and lake with an Indian girl as pilot.

We reached Spokane, Wash., at 8 o'clock. At Pasco we crossed the great Columbia River, and ninety miles farther on, at Yakima, we entered the Yakima River Canyon and followed the meanderings of the river more than thirty miles. In that distance we were headed many times toward every point of the compass. Sometimes it looked as if we were heading

right into the rock at the end of the canyon; then suddenly we would round a curve and see the canyon ahead of us again. A 2-mile tunnel put us in the open.

At Ellensburg, I wired my nephew at Seattle, and he met me there at 10:30 p. m. Next day, he showed me around the city and through the Farmers' Market, which is a close rival of the famous French Market in New Orleans. In Union Lake, which is connected by a canal with Puget Sound, I saw several of the wooden ships built by the United States government during the war which my nephew told me were for sale. I saw three ships in this lake from Manchester, England.

"The Most Beautiful Scenery on Earth"

I left Seattle at 11:45 p. m., June 11, arriving at Portland, where I connected with the Southern Pacific for Frisco. By 6 a. m., we were passing through some of the most beautiful scenery on earth. Next morning at daylight Mount Shasta came into view, the top part of it covered with snow. At Shasta Springs everyone got off and drank Shasta Springs water. It is a good deal like seltzer water, and there is plenty of poorer stuff sold at soda fountains. We had Mount Shasta in sight, 14,444 feet high, first on one side, then on the other, for a distance of 138 miles.

We ran along the upper edge of the Sacramento River Canyon seven or eight miles with a railroad in sight at the bottom. Then we passed through a tunnel and around a horse-shoe curve, and we were at the bottom and could see the track that we had just passed over. We followed the meanderings of the Sacramento River into the greatest fruit country in the world. Emerging from the canyon we passed through miles of apples, pears, cherries, figs, prunes, oranges, olives, lemons, hops, and here and there a big field of oats, much of which was already cut.

At 4:35 p. m., June 12, we reached Benicia and crossed over Carquinez Strait to Port Costa on a ferry boat that carried our entire train of nine coaches and a large engine and at the same time another train of seven coaches and engine. I got off at Oakland on advice from the engineer, who said that the hotels in San Francisco were full.

Next morning I went over to Frisco, six miles across the bay. It would be useless for me to attempt to describe the decorations all over the city. They were immense, as was also the western hospitality extended to the

visiting Shriners. The Shriners had many street cars chartered for the three days of the convention for the visitors, to ride in, also automobiles running the whole time carrying them wherever they desired to go.

Met Illinois Central Shriners

On Market Street I met Noble W. E. Pleasants, ticket agent at Jackson, Miss., and at the convention hall I met Noble T. A. Moore, passenger conductor, Louisiana division. Both seemed to be having a good time.

I rode out to Golden Gate Park, where there are a number of animals. In the greenhouses are flowers and ferns from Peru, Chile, Brazil, Mexico, Jamaica, the West Indies, the Canary Islands and Australia. Out at the west end of the park and at Cliff House I got my first view of the great Pacific Ocean. I also noted the seal rocks, about 300 feet from shore. I was informed that these rocks are sometimes almost covered with seals, but they were not at home while I was there, and I did not see a single seal. Near Cliff House, there is a large military reservation, and guarding the Golden Gate entrance to San Francisco Bay stand two 16-inch guns. I was informed that there are others so located as to be able to sink any vessel approaching without authority.

After the convention was closed, I spent one day in Oakland. There the red fez was good for a free ride on any street car or automobile. I had a 4½-hour ride over the city and through the neighboring cities of Alameda, Berkeley, Emeryville and several others. I never saw elsewhere such a display of flowers as I saw on this trip. In gardens and in the strips between the sidewalks and the curbstones are every kind and color of flowers, and I saw gardens surrounded with hedges of geraniums seven feet high.

Thirty-Four Tunnels in a Row

On the morning of June 17 I left for Reno, Nev. We traveled through the Sacramento Valley and miles of orchards and vineyards to Auburn at an elevation of 1,360 feet. Then we left the fruit district and cultivated lands and passed through a series of tunnels. I did not count them, but they were numbered, and the last one was No. 34. At American, the elevation is 4,018 feet, and the mountains all around are covered with snow. Here the train stopped five minutes to allow the passengers to get off and view the American River at the bottom of a canyon 2,000 feet deep.

Here began snow sheds, practically tunnels,

but open part of the way on the canyon side and extending thirty-two miles. At Emigrant Gap the elevation was 5,219 feet, and snow was everywhere; it was really cold, and we were still climbing. We passed Cisco, 5,933 feet, Summit, 7,018 feet, with snow ten inches on the level and sixteen inches in drifts. We began to drop down on the other side of the Sierra Nevadas. At Truckee, 5,810 feet, we stopped for supper and could see snow only on distant peaks.

At 8 p. m. we arrived at Reno, the city of divorces. Reno is a city of about 20,000. I saw the entire city, including the famous courthouse, and mailed several postcards of that courthouse before I retired.

At 6:35 o'clock the following morning, I left for Sacramento. About 9 a. m. we passed the great Yuba Dam. It was not favorably situated for a good view from the train, and I could only see the top of it. The conductor told me that it was 250 feet wide at the base, 250 feet high, and reinforced with steel rails, circling inward so as to stand the pressure of the water above.

I arrived at Sacramento at 2:38 p. m. Sunday, walked all over the city and through the capital and left at 12:30 a. m. for Portland, Ore. Again I saw Mount Shasta, first on one side and then on another, for 138 miles. Then I left it behind, as I supposed, for good; but after running fifty-seven miles farther, a few miles from Portland, here was Mount Shasta almost ahead of the engine. We entered a tunnel and saw it no more.

Spent Five Days in Seattle

I arrived at Portland at 9:15 a. m., Monday, the 20th. I went up to Council Crest and the Oaks Parks, had a good look around the city, and left at 8:05 a. m., June 21. I arrived at Seattle at 2:55 p. m. and stayed with friends there five days. I had a good look around the city, saw the big totem pole, and visited Alki Beach and the Woodland, Ravena, and Volunteer parks. At the latter I climbed to the top of the water tower, from where I could see Mount Rainier, sixty miles away, with its cap of snow.

After leaving at 7 p. m., June 25, I arrived at Spokane at 7:50 a. m., stayed all night with a friend at Whitworth College, and, after seeing the city, left at 8:15 a. m. on the 27th.

I arrived at Austin, Mont., at 9:40 p. m. and the next day went to Blossburg, where there is a pile of rocks about four feet wide

at the base and six feet high marking the Rocky Mountain continental divide. From one side of that pile water will run to the Atlantic Ocean, and from the other side to the Pacific.

My friend, Mr. Conway, whom I had known in Duluth, pointed out an abandoned gold mine near the top of a mountain, and while he was at work I climbed up to explore it. I went down a slanting hole leading to a tunnel, into which I went until it was as dark as blackest night. I stepped on something softer than the rock, and on striking a match I saw traces of some large animal, apparently a horse, but a moment's reflection showed me that no horse could get in there. I at once decided that it was a bear and that if he happened to be at home he would probably regard me as a trespasser; so I laid my dignity aside and went out of that hole and down that mountain like a fellow who had urgent business at the bottom.

Mr. Conway told me of a friend of his who worked a gold mine for several years and went more than sixty feet into the mountain side without making enough to live on and, becoming disheartened, sold his mine for \$200. The man who bought it went two feet farther and took out \$50,000.

Entering the Yellowstone Park

The next day Mr. Conway took me to Helena on his car, and we went all over the city and through the capital. I left Helena at 9:25 p. m., arrived at Livingstone at 3 a. m. and reached Gardiner, the northern entrance to the Yellowstone National Park, at 12 noon. About a dozen sightseeing automobiles met the train at Gardiner to carry park visitors to Mammoth Hot Springs Camp, where we arrived at 12:45 p. m. for lunch. To describe the beautiful and wonderful sights in this park would require a much larger book than a magazine, but I want to assure anyone who has not seen them that he will never see anything more worth while than the beauties and wonders of the Yellowstone National Park.

At Mammoth Hot Springs there is a white terraced hill, probably 150 feet high and flat on the top, formed entirely by the sediment from the hot springs on top of it. This hill, our guide informed us, grows several inches every year. There are a number of hot springs on the top from which water flows at 180 degrees. It is remarkably clear and gives off a strong odor of sulphur. The largest spring

jects about fifteen gallons a minute. Near by is a hole about forty feet deep, seventy-five feet long and six feet wide called the Devil's Kitchen, to which access is gained by a ladder. I went down and found it very hot with a strong smell of sulphur, but his majesty was not at home.

At the foot of this hill, we passed several deer, which paid us no attention, but went on eating grass while some women in the party took kodak pictures of them. Here is a circle of rock about six feet in diameter and about two feet high in the center, with a pool of hot water four feet wide, close to the Firehole River. You can catch a fish in the river and drop it into this pool, and it will cook. Another pool about the same size is called the Handkerchief Pool. A handkerchief dropped into this pool goes slowly down to the bottom, through a hole in the center, and is out of sight two or three minutes; then it slowly comes up again clean, but it has to be lifted out with a small iron bar and swung around until it gets cool before it can be handled.

Some Attractions at Yellowstone

We left Mammoth Camp at 8 a. m., July 1, and stopped at Apollonaris Spring, ten miles away, to allow everyone to drink the water, cold as ice. Five miles farther on we passed the Twin Lakes, each about 150 feet across, with about an 8-foot partition between. Both lakes are hot water. One is a deep blue; the other, deep green. Everybody got off the cars five miles farther on and walked a quarter of a mile through Norris Geyser Basin, where are a number of geysers and perhaps twenty holes from twenty to fifty feet wide and from twenty to forty feet deep and full of hot water. Some blue, some green, some colorless and all unbelievably clear. Here also is the Growler, a hole about two feet in diameter, in the side of a rock, which growls constantly with steam pressure from the inside. Six miles farther on we stopped to view the Firehole Cascades, where the Firehole River falls eighty feet.

Our next stop was Mammoth Paint Pots, several pools of boiling mud of different colors, which look like paint. We arrived at Old Faithful Camp for lunch at 12:30 p. m. Old Faithful is a geyser which erupts every sixty-five minutes and sends a stream of hot water 180 feet in the air for ten minutes. Nearby is the Giant geyser, which shoots 250 feet for an hour every 6 to 14 days, which I was fortunate enough to see. The Giantess geyser shoots 200

feet at irregular times, but did not shoot while I was there.

We left at 2 p. m., July 2, and stopped to view the Kepler Cascades, where the Firehole River goes over three falls in a space of about 150 feet, aggregating 100 feet in the three falls. Four miles farther, and we crossed the continental divide at an altitude of 8,240 feet. Here is Isa Lake, from one end of which water runs to the Atlantic and from the other end of which water runs to the Pacific. Seven miles farther, and we crossed the divide again, at 8,345 feet. We arrived at Yellowstone Lake camp at 5 p. m. Yellowstone Lake is thirty-seven miles long and twenty-four miles wide and averages thirty feet deep. The elevation is 7,840 feet.

Where the Fish Are Hungry

The lake abounds with fish, and they will bite! One man I saw fishing said he was compelled to hide behind a tree to bait his hook, or the fish would have the bait before he got the hook into it. I cannot vouch for the correctness of that statement, but I know that fishing is good there. We left at 10 a. m., July 3. We stopped several times along the road to view mud volcanoes, called the Dragon's Mouth, and the Northern Pacific trade-mark. This is a stream that winds around and forms the well-known N. P. trade-mark as perfectly as it could possibly be made. From this, our guide informed us, "Jim" Hill got the idea and adopted it as a trade-mark.

We stopped again at Artist's Point, from where we had an excellent view of the Grand Canyon, and at Inspiration Point for another view. From here we saw three eagles' nests in the canyon, one of them with young ones, too far away to be counted. We also saw a number of ospreys' nests. Here a big black bear with two cubs strolled out of the woods into the road just ahead of us. We stopped, and everybody got out of the car; while the cubs were climbing a tree, several women took kodak pictures of both the bear and the cubs. The bear seemed to regard us all as friends. We were all around her, and she would point her nose first toward one, then another, as if begging for something to eat. There wasn't anything on the car, however. As we drove off, another car came along and stopped, and the occupants, too, got off with kodaks for a visit with Bruin.

We arrived at Grand Canyon Camp at 12:15 p. m. for lunch. The canyon is 1,200 feet

deep at the bottom of the upper falls, where the Yellowstone River, seventy feet wide and four feet deep, flows over a rock and falls 112 feet. Then it flows nearly half a mile and over the lower falls drops 310 feet. Here the canyon is 1,500 feet deep. I went to the foot of the upper falls alone, and two hours later I went with a party of about twenty-five, accompanied by a guide, down Uncle Tom's trail to the foot of the lower falls.

Ice Water on Burning Sand

This was about 10:30 a. m., July 4. Arriving at a little plateau or level spot about 1,000 feet down, we found a big patch of snow about eighteen inches deep, and the entire party indulged in a good natured snow-ball fight for a few minutes. At the bottom the guide showed us a stone about two feet from the edge of the river and said, "Step on that stone and put your fingers into the sand at the bottom of the river beyond it." I did as he said. The water was eight inches deep at that spot and almost as cold as ice. The sand underneath

was so hot I couldn't hold my fingers in it. There are a great many woodchucks and gophers all around this camp, and they will come and eat out of your hand any time you offer to feed them. We left at 1:15 p. m. for Mammoth Camp, where we had dinner and left at 6:30 p. m. for Gardiner and home.

We saw two coyotes on the way, running away from the cars, and we passed a beaver dam and hut, but only the party on the first car saw the beavers.

We left Gardiner at 7:30 p. m. and arrived at Livingstone at 9:45 p. m., just in time to see a beautiful display of fireworks set off by the city on an adjacent mountain. I left at 2:05 a. m. and arrived at Duluth, Minn., at 9 a. m., July 7, after a most enjoyable trip and with a heart full of gratitude for the Illinois Central System, which made such a wonderful trip possible. For the benefit of those who contemplate a sightseeing trip, I advise them not to go to Switzerland or anywhere else until they have seen America.

Won Class Honors in Louisville Academy

Here is Miss Margaret Glynn Mackin of 626 Floral Terrace, Louisville, Ky., grand-niece of Roadmaster P. Glynn of the Kentucky division. Miss Mackin is a recent graduate of the Holy Rosary Academy, 1333 Fourth Avenue, Louisville, where she won class honors and was awarded the gold "Times" medal for excellency.

Her graduation essay, which was widely praised, was entitled "Woman of Faith."

"Endowed with the highest of ideals," Miss Mackin wrote, "animated by the purest of intentions and infused with the noblest of aspirations, who is more fitted to conscientiously curb the evils of today than the pure, angelic woman who possesses God's gift of faith? . . . The power of the woman of faith is untold. In fact, she is endowed with the ability to change from evil to better the very conditions of the entire world. Through her elevating influence, indirectly but affluently, the change will gradually take place. How vital it is that she now realize her duty to grasp the situation and answer God's holy call for help. In one little prayer, one little act of kindness or self-denial, there is the power to convert many."

Miss Margaret Glynn Mackin.

With Our Home Owners at Louisville, Ky.

Employees Find Pleasure, and Profit in Buying or Building; Start Early, Is Advice They Give

IF the home is bought while the children are young, the family pocketbook can stand the strain when school days start. Thus Mrs. Charles Schnell persuaded her husband, assistant foreman at the Illinois Central freight house in Louisville, Ky., to stop paying rent and start payments on a home of his own.

Mrs. Schnell could see the demand the children were to make on their father's income, and the result she feared was seeing her children without a home. She brought the facts squarely before her husband, and it did not take him long to see as she saw.

Mr. and Mrs. Schnell were married in November, 1916, rented a house for \$9.50 a month and lived in it for four years. At the end of that time, the owner of the house informed them that the rent would be increased to \$18 a month. It is true that Mr. Schnell's salary had increased from \$49.50 a month, when he was first married, to \$132.04 a month, but the proposed increase in the rent of the house in which they were living loomed mighty big to

the young couple. Their fondest dream was of a home of their own, but up until that time they had considered the purchase of a home too much of a burden. They had been saving all the money they could; every extra nickel went into the coffer, for they wanted to make a substantial payment on a home when it was decided to make that step.

Paying Out at \$4.02 a Week

In 1920 there were two children—one 3 years old and the other 1 year old. Those were two reasons why a home was needed, and the increase in rent made the fact even more apparent. There was \$1,000 in the bank then, too. That would be plenty for the first payment, they concluded.

So Mr. and Mrs. Schnell went on a home hunt that lasted three months. They found a house valued at \$2,750, talked to the owner and made arrangements for the purchase. The initial payment of \$1,000 cut their obligations down to \$1,750, and liberal terms were extended for the payment of that. The agreement

A train in Borneo, East Indies. Many of the natives of Borneo are of pygmy stature, and this train seems to be built to fit them. The open-air arrangement suits the temperature of Borneo, but the white men who are shown as passengers here seem out of luck if smoke and cinders are flying. This railroad runs through gorgeous tropical scenery, and the passengers shown here are writers, artists and photographers who intend to enjoy and report it. Photograph by the Williams Service, New York.

Fisher, engine foreman, 2229 West Broadway; 5, T. E. Hill, superintendent, 1228 Cherokee Drive; 6, A. Beninger, engine foreman, 1833 Tyler Parkway; 7, D. H. Pearl, conductor, 1823 Eastern Parkway; 8, J. J. Millett, traveling engineer, 2119 Osage Avenue.

was that \$4.02 to be paid each week would pay interest on the \$1,750 and a small amount on the principal. Further arrangement was made whereby Mr. Schnell could pay \$100 at any time he was able and thus reduce his weekly payment by 23 cents. To date Mr. Schnell has made such advance payments to the amount of \$650. He expects to have his home entirely paid for by May, 1923.

There are many such home owners among 350 employes of the Illinois Central at Louisville.

Started Buying on a \$50 Salary

E. S. Stout, assistant foreman of the inbound freight house, started paying for his home in 1890, when his salary was \$50 a month. And he had two children then.

Mr. Stout was married in 1884 and lived for six years without a home of his own. When he decided to buy a house, he had saved about \$200, and he gave that as his first payment on an old house valued at \$1,100. He then made arrangements to pay \$20 a month until the balance was paid.

He lived in the old house about ten years and saved money to build a new one on the same site. When he had accumulated \$600, he

decided to build a \$1,400 home. He borrowed \$800 from a bank and gave two notes for \$400 each, falling due six months apart. The notes bore 6 per cent interest.

Mr. Stout says that the banker would renew the notes each time the interest was paid, and there was no urgent demand that the principal be reduced.

In 1904 Mr. Stout made the last payment on his home. He regards the splendid health of his family and the scarcity of doctor bills as great aids in his success in owning his home.

Bought After 19 Years' Renting

Michael Brown, trucker at the freight house, was a renter for nineteen years before he decided to buy a home. When he married, in 1892, he rented two rooms and bought the furniture for them. In 1911 he had saved \$250, and his wife's mother had left them \$400. He decided to buy a home that year and found a suitable house that was valued at \$850. He borrowed \$200 and made the purchase.

A. Buchhold had visions of a happy life in a home of his own long before he was married, June 15, 1921. It was firmly fixed in his mind that he was to have a home, and he was willing to wait until he had saved the necessary

Summer scenes at the University of Illinois, Champaign. No. 1 is the east entrance to the Woman's Building, with the Commerce Building in the background. No. 2 is the entrance to Smith Memorial Music Building, recently completed.

Employees' homes at Louisville, Ky.: 9, Thomas Barry, engine foreman, 637 South 41st Street; 10, E. S. Stout, assistant foreman, 1915 Portland Avenue; 11, Charles Reavy, crossing flagman, 2121 High Street; 12, D. H. Beuchele, assistant foreman, 2617 Madison Street; 13, Thomas Lynch, foreman, 1113 Seventh Street; 14, A. H. Morton, chief clerk, revising bureau, 351 North 26th Street; 15, C. V. Dudderar, accountant, 526 North 24th Street; 16, Michael Brown, laborer, 1849 Lytle Street.

funds. He rented two furnished rooms at first, and paid \$22.50 rent each month.

But Mr. Buchhold's dream was not so far in the future as he had thought. He had been married but a month and a half when he heard of a house for sale at a bargain. He and his wife went to look at the house, and found it to be just about what they wanted; but both realized that it was not to be theirs for awhile.

How a \$3,500 Home Was Bought

Then a friend came to the rescue and offered to lend the young couple the money to pay cash for the home. They eagerly accepted his proposition and made arrangements for the purchase of the \$3,500 home. Mr. Buchhold agreed to pay the friend \$50 a month and keep the taxes on the property paid until the debt had been erased. At the end of each four months, his monthly payment drops 50 cents. The taxes on the property amount to about \$54 a year, but Mr. Buchhold says that he is having little difficulty in making all of his payments. There is less theater going and perhaps less money for clothes now, he says, but there is the satisfaction behind it all that there is no rent to be raised and no moving to be done.

Mr. Buchhold has been offered \$4,000 for his home.

Thomas Lynch, foreman of the freight house, married in 1884 and rented for ten years, but during all that time he was planning to own a home. He saved his money, and in 1892 he had enough to purchase an \$875 lot. Two years later a \$2,700 house was erected on that site. He borrowed the money to build, and inside of three years he had cleared the debt.

I WILL TRY

I will try to be a lifter, not a leaner; to encourage, never discourage; lighten the sorrow of others; make the world a little sweeter place in which to live, keeping in mind the will of God; make sunshine in life's shady places; look on the bright side of everything; be clean in body and mind, working industriously and honestly for a living and a spotless character so I can look up—not down—and meet Death's coming with a fearless smile; rejoice in life; have hope and faith in everybody until they themselves destroy it; try to live without hate, jealousy, or envy; avoid speaking critically and bitterly; repeat only the good I hear; love because of the enjoyment it brings; do good for the joy of it; be cheerful in disappointments; charitable toward the erring and the fallen; smile more—frown less; follow the Golden Rule.—*Kiwanis Magazine*.

Fireman Rescues Farmer From Mad Bull

*Jesse Bandfield Hero of Encounter Near Manchester, Iowa,
When Train Stops to Save a Life*

JESSE BANDFIELD, fireman on the Minnesota division, fought an infuriated bull that was attacking Fred Bartledd about 5:15 a. m., July 29, in a field about a mile west of Manchester, Iowa, and probably saved the young farmer's life.

Extra freight No. 1879 with J. Hurley, conductor, John Dewhurst, engineer, Jesse Bandfield, fireman, Brakeman Heathershaw, and John Joyce, flagman, had left Manchester an hour and twenty minutes ahead of No. 13. When the freight train reached the west mile-board, Bandfield noticed about thirty head of cattle standing close together with their heads down and tails sticking straight out. They were in a field on his side of the right-of-way, and were showing so much excitement that he called Dewhurst's attention to them.

"Do you want to see a stampede?" he yelled. "Some cattle in this field over here are going to cut up some capers shortly."

As Dewhurst looked, the cattle parted and disclosed a huge bull down on his knees with his head boring toward the ground.

"Look! A man is down!" Bandfield cried.

Bull in Deadly Attack

With that, Dewhurst applied the air and brought the train to a dead stop. Bandfield grabbed his coal pick, leaped from the cab, hurdled a fence and ran to the aid of the man.

Bartledd had his arms locked about the bull's head to keep from being fatally gored. As the animal raised his head, Bartledd was lifted from the ground. The beast ran, clawed Bartledd with a sharp hoof at every step; then stopped, sank to his knees, twisted and shook furiously to loosen his victim and pinned the man to the ground with his head. Bartledd's clothes were in shreds, and blood was streaming from his mouth and nose. His strength was growing weaker.

When Bandfield arrived at the wounded man's side the bull stopped his attack and looked at the newcomer. The beast had become so enraged that his eyes were purple.

"Shall I kill him?" Bandfield asked, taking advantage of the pause.

"Yes," the almost exhausted man replied.

Jesse Bandfield

Fought Bull With Coal Pick

Bandfield struck the bull between the eyes with the coal pick. Bartledd loosened his grip, and the animal backed off a short distance, where he sank to his knees. Bandfield picked up the injured man and started toward the fence. He had gone only a few steps when the bull charged again. Bandfield turned and stopped the attack with a heavy blow across the animal's nose.

Bartledd was taken to the side of the engine, where his injuries were examined. Several ribs were broken, but at his request he was left by the track. He told the crew that he had been fighting against the attack of the

bull for thirty minutes and could not have lasted more than five minutes longer.

Extra No. 1879 proceeded on its journey after being delayed five minutes by the incident.

Bartledd, who is about 35 years old, is employed on the farm of his father-in-law, Henry Veasy, near Manchester. According to the latest report, he is recovering from his injuries.

Employees at Play, Jackson Park, Chicago.

This picture of Northeast Mississippi boosters was taken August 13 in Chicago, near the team track in our yards at Fourteenth Street. There were about one hundred in the party that left Columbus, Miss., August 10 for a 10-day tour through Illinois, Indiana, Iowa, Wisconsin and Missouri. The following dairying and agricultural centers were visited: Racine, Milwaukee, Waukesha, Fort Atkinson, Jefferson, Lake Mills, Madison, Monroe, Wis.; Waterloo, Marshalltown, Ames, Des Moines, Iowa; St. Louis, Mo., and Humboldt, Tenn. The party made use of four 12-section drawing-room sleepers and one baggage car. This equipment was delivered to our line August 11 at Cairo Junction by the Mobile & Ohio. We delivered it to the Chicago & North Western August 14 at Chicago, and it was returned to our line August 15 at Madison, Wis. At Cedar Rapids, Iowa, August 16, the equipment was again delivered to the Chicago & North Western.

Playground Is an Asset to Martin, Tenn.

Park on Illinois Central Land Draws Crowds From Other Towns, and Children Seek to Have Parents Move

ONE of the most completely equipped playground parks on the Illinois Central System is at Martin, Tenn. The residents of that little city firmly believe that all work and no play makes Jack a dull boy. They have spent thousands of dollars on equipment for the park. The result is that there is apparatus there for the recreation of everyone from 2 to 60 years old, and it is all being used daily.

When the Mississippi Central Railroad, predecessor of the Illinois Central, was building its line through that part of Tennessee, there was no town named Martin. But G. W. Martin owned a large tract of land in that locality. He heard of the construction of the railroad, investigated and learned that the right-of-way was to go to one side of his property. He went to the engineer in charge of the surveying and offered the company the title to a part of his land if the track was laid through it. His offer was accepted, and Martin, Tenn., was born.

That's the story told of how there happened

to be land available at Martin for the building of the park. But making a reality out of the dream of a worth-while playground on that land is quite a different story.

Company Gave Use of Land

The company had no immediate need for the land, and weeds were allowed to grow. It became an eye-sore to the residents, but they realized what an expense it would be to the company to maintain the place merely as a beauty spot.

Then a "bomb" was dropped. R. L. Whitcomb, then manager of a garage and now editor of the *Weakley County Press*, sounded the keynote for a playground. It was not long until the entire city was enthusiastic about it, and as the days wore on the excitement grew. Everyone was behind the idea and determined that it should be realized. In 1920 the matter was taken up with Superintendent J. W. Hevron at Fulton, Ky., and an agreement was reached whereby the city was granted permission to install a playground on the company's land.

View of playground at Martin, Tenn.

Some of the playground equipment.

Then the work of construction began. Young and old worked side by side. A subscription totaled \$2,303.93, the land was cleared, and a carnival of local talent netted \$1,410.34. The first equipment for the playground cost \$2,324.11. The merchants of Martin purchased

it for the park and charged no profit on the transaction.

A commission consisting of three members was appointed to have complete charge of the park. Each member was given police power to enforce the regulations and impose fines

The crowds certainly like the park.

upon violators. The commission was given charge of the installation of new equipment.

Complete Playground Equipment

At present the playground apparatus consists of a $\frac{1}{8}$ -mile race track, a 50-foot wading pool, sand pits, a vaulting horse, a vaulting buck, traveling rings, parallel bars, a horizontal ladder, a set of six large swings, a set of eight small swings, a set of four seesaws, one baby slide, one medium slide, one large slide, one giant stride, vaulting posts, jumping posts, horizontal bars, a flexible ladder, a flexible rope, a sliding pole, sliding rails, acting rings, a trapeze, a flag pole, a band stand, two tennis courts, a basketball court, a volley ball court, a baseball diamond, fifty park seats, and a zoo with several cages of hawks, 'possums, squirrels, pea fowls, ground hogs, monkeys, etc. Some of the animals for the zoo were donated, and some were purchased. General Superintendent J. M. Egan donated two 18-inch alligators in the fall of 1920. They are now three feet long.

The residents of adjacent towns share the pleasures of the park with the residents of Martin. Sunday school picnics by the various

churches of Fulton, Union City, Paris and many other places are held there. There is no charge made for the use of the park on such occasions, and a cordial invitation is extended to other towns to take advantage of its facilities. The commission members say they have been told that, after a visit to the park, children of other towns beseech their parents to move to Martin.

It has been estimated that 300,000 persons visit the park each year. During the celebration from the last day of June through the first five days of July in 1920, about fifteen hundred round-trip tickets to Martin were sold on the Illinois Central at six neighboring towns.

Benefits are held in the park each year. The money goes for upkeep and new apparatus. Plans are now being made for an attractive fence about the grounds. Seven brick gateways with a light at each side have been installed. Each show that visits Martin is taxed a percentage of its receipts for the benefit of the park.

The Illinois Central community park at Martin is a splendid example of what the residents of a city can attain by co-operation.

John Holly's Grade-Crossing Adventures

The magazine last month carried a story from Claim Agent C. D. Cary of the Illinois division regarding a "careful crossing" experience of Engineer George Dix. Comes now John Holly, engineer of the first magnitude of the Illinois division.

John says—as Mr. Cary reports—that recently, just after he sounded the road crossing whistle on No. 4 south of Buckley, a small boy came along on a pony. The boy was on the southbound track when he heard the whistle. Instead of proceeding, the boy got off, took hold of the bridle and led the animal off. Near the crossing John blew the station whistle. The pony broke loose and ran away. John says he watched for that boy on several subsequent mornings, but never again did he see the boy on the pony.

Next morning at the very same crossing as John sounded the station whistle he observed a "careful driver" stop his automobile directly in the center of the track on the very next crossing ahead. John applied the brakes in emergency without stopping to guess what

the man would do. He had his train about stopped when some men came along and pushed this car off the tracks. John says that he could have stopped, if need be, within 100 feet of the car and not have struck it. For his good judgment, excellent control of affairs and splendid handling of the train he received a complimentary letter from the superintendent.

About May 7, while on No. 3 near Manteno, John observed an automobile come within the powerful rays of the headlight on No. 1194 and stop upon the track. He brought his train to a stop, and the "careful driver" obtained some assistance and pushed his car off the track.

About three weeks ago, on train No. 3 near Matteson, after passing Riverdale, John noticed a man coming from the west. This driver (careful, of course) had two auto busses, coupled. This was a double header, and a new one on John. John figured that if this fellow kept on and the train kept on, too, the leading bus might escape. But John had it figured out that the good brother would have nothing to tow after he passed over that crossing. Mr. Holly

again applied that over-used emergency brake of his, and the driver stopped with the front of his car directly on the track. Having reduced speed and acted with great discretion, John gave the man a chance to back off and prevent an accident.

Recently at Del Rey, while on train No. 4, John saw a motor car coming from the west. The driver had a young woman in the car. He kept right on coming. She opened the door of the car and jumped out, while the "careful driver" proceeded onward, missing the train by about two feet. John says that after he saw the young woman was safe, made so by her rare good judgment in abandoning the ship, he concluded that about all of any value in the car was safe, and so he proceeded on his way.

John Holly, engineer, was born in Chicago about sixty-one years ago. When he was a child, the family moved to Ludlow, Ill.

Mr. Holly entered the service of the City Railway Company of Chicago when he was 18 years old, but he soon became dissatisfied with that work. On May 9, 1881, he accepted a position as a fireman on a switch engine for the Illinois Central. Soon afterward he was placed in the suburban service at a salary of \$50 a month. In addition, he was given \$5 a month for watching the engine at night. William Leach was his engineer then.

Day and night work was trying on Mr. Holly, and before long he asked for a vacation. He was given one. When he had been gone but a week, the engine exploded.

When he returned from his vacation, Mr. Holly was placed in freight service with Engineer James McSweeney on the old engine No. 176. Later he was transferred to engine No. 300 with William Clayton. He then fired

John Holly.

for Engineer Richard Ormsby between Centuria and Cairo. Mr. Holly speaks of these days as "the good old days of blessed memory, when twelve hours late was not unusual and the farther one went the later he became."

After firing three and one-half years, Mr. Holly passed the examination to become an engineer. He was in the yard service for a year, in suburban service for seven years and then he entered upon his enviable record of twenty-two years in the passenger service. Most of that time, he has been on trains Nos. 3 and 4.

Glenn E. Plumb, Critic of Railroads, Dies

Glenn E. Plumb, long a Chicago attorney, counsel for the sixteen larger railway labor organizations and author of the celebrated "Plumb plan" of railway operation and ownership, died at Washington, D. C., August 1. Death was due to an affection of the heart, from which he had suffered for several months. Burial took place August 4 at Forest Park, near Chicago, after services at the First Presbyterian Church, River Forest.

Mr. Plumb was born at Clay, Iowa, Septem-

ber 30, 1866. He attended the public schools and in 1885 was graduated from the Streator High School at Streator, Ill. He then entered Oberlin College. Later he attended Harvard University, after which he entered the Northwestern University law school.

Mr. Plumb settled in Chicago in September, 1892, and married Grace Edith Clarke three years later. He obtained employment with the law firm of Miller & Starr. He continued with them and their successors, Peck, Miller

& Starr, until July, 1897, when he left to become attorney for the Chicago General Railway Company. In 1903 he took charge of the company as general manager for the reorganizing of bondholders. He was elected president of the company in November, 1904. At one time he represented the late Charles T. Yerkes.

Mr. Plumb was traction counsel for the city of Chicago in 1905. A year later he was appointed general manager of the Southern Street Railway Company, which position he left two years later to become president of the Calumet & South Chicago Railway Company.

In 1919 he obtained national note by advancing the Plumb plan.

Mr. Plumb appeared before the Interstate Commerce Commission on August 8, 1919, to explain his plan. "Organized labor is not willing to have the government operate the railroads because it does not believe so great an industry can be conducted by political autocracy," he was quoted as saying at the time.

Glenn E. Plumb.

The old way of lining track.

New Device Makes Track Lining Easier

The need for labor-saving devices becomes more apparent each day, especially in the maintenance of way department, which is called upon to do extremely heavy work, where a great quantity of labor is necessary.

One of the large features which is to be taken into consideration is the work in surfacing and lining track. Until the present there has been little progress made in devising ways and means to overcome the heavy labor usage in this class of work. It has been necessary to perform this operation by main strength.

A new track liner designed by F. Hackman and being tried out by the Illinois Central System brings about a decrease in the amount of labor necessary to line the most irregular track. This device is in the form of a lining bar, which fits securely against the base of the rail and is placed at such an angle that it permits a lateral strain without raising the track from its bed. On work which requires

as many as seven men, using the ordinary lining bar, to move track to its proper location, three men, by using this device, perform the same amount of work. It is not necessary to bring about a heavy strain on the employe in using this track-lining device.

Tests have proved that six or seven men, using this new device, can perform work which could not be done by eighteen to twenty men in the old way. The ordinary turn-out can be lined by six men using these jacks, while with the old way twelve men were necessary.

This device is especially adaptable to the lining of frogs and switches, as well as to regular track lining work. It is giving exceptionally good service in lining behind surfacing gangs. Where the ordinary requirement would be eight or nine men, three men perform the work. There is no delay or inconvenience in placing these jacks in position to line the track properly. It greatly expedites the lining with the ordinary lining bar.

Three men do the same work with new device.

Here's the Sweetest Part of Our System

New Orleans Division Produces Large Percentage of the Sugar Cane Grown in the United States

By W. W. ALLAIRE,

Office of Auditor of Freight Receipts

LITTLE mention has been made in our magazine of a thriving industry existing along the New Orleans division of the Yazoo & Mississippi Valley. Doubtless many readers of this magazine are unaware of the fact that a great percentage of the sugar cane used in this country is grown and manufactured in a district of Louisiana adjacent to the Y. & M. V.

The sugar cane season in Louisiana each year is from October to January, and during that period there are from two to five 45-car trains in daily operation devoted exclusively to the handling of cane between the various plantations and sugar refineries along the line between Baton Rouge and Reserve, La. In this district there are eleven large, up-to-date refineries, nine of which operate only during the local grinding season. The two others, which are at Gramercy and Reserve, La., operate the year around, handling the home crop during the harvesting season; the rest of year they are operated to refine raw sugar shipped to this country from Cuba.

The largest of these refineries, at Reserve, La., is owned by the Godchaux Company of New Orleans, one of the largest sugar producers in the world. This mill has a capacity to grind fifty cars of sugar cane daily, which is equivalent to about 1,200 tons. An average

Handling the sugar cane traffic at Convent, La. Left to right, O. Duhon, veteran agent; W. W. Allaire, office of auditor of freight receipts, Chicago; Miss Duhon; T. A. Appleby.

ton of sugar cane will produce from 140 to 180 pounds of granulated sugar.

Sugar cane is a plant from which about two-fifths of the sugar of commerce is obtained. In general appearance it somewhat resembles maize or Indian corn. It grows to a height of from eight to ten feet, but it varies in growth according to the situation, the season and the weather.

It is cultivated in all of the warm parts of the world, such as the West Indies, Brazil, Cuba and southern Louisiana. In tropical countries the sugar cane flowers only after the lapse of one year, and a planting will last from six to ten years. However, in Louisiana, owing to climatic conditions, it is usually necessary to replant at least every two or three years.

The juice of the cane is palatable and nutritive. During the harvesting season every creature which partakes freely of it appears to derive health and vigor from its use.

SOMETHING LARGER

Sad is the day for any man when he becomes absolutely satisfied with the life he is living, the thoughts that he is thinking and the deeds that he is doing; when there ceases to be forever beating at the doors of his soul a desire to do something larger which he feels and knows he was meant and intended to do.—*Phillips Brooks.*

Crystal Springs Ships 2,699 Cars of Truck

Mississippi Vegetable Center Reports Increase of 774 Loads Over Business of Last Six Weeks' Season

By R. S. BRENT,

Agent, Crystal Springs, Miss.

CRYSTAL SPRINGS, in the center of the Mississippi trucking belt on the Illinois Central main line, has long been noted for its heavy shipments of fruits and vegetables. The farmers in this belt raise vegetables, hay, corn, sweet potatoes and sugar cane almost exclusively, there being but little cotton planted.

The vegetable business is growing rapidly, and within a few years Crystal Springs is destined to be the largest vegetable shipping point in the South. Tomatoes and cabbage are now being grown twenty miles from town and are brought in to the shipping point in trucks over a fine system of graveled roads.

Here is how the business is increasing:

Crystal Springs in 1919 shipped 1,341 cars of vegetables; in 1920, 1,555 cars; in 1921, 1,925 cars; in 1922, the season just ended, 2,699 cars. We loaded in these 2,699 cars this season 4,298 hampers of turnips, 34,367 hampers of beets, 56,940 hampers of beans, 124,799 hampers of peas, 172,208 hampers of carrots, 185,868 crates of cabbage, and 1,242,015 crates of tomatoes. These vegetables brought to the shippers around \$2,000,000 gross.

Our Revenue More Than \$700,000

This business produces a splendid revenue for the Illinois Central. The earnings for Crystal Springs station for April, May and June, 1922, amounted to \$703,169.98. The bulk of this enormous movement is handled in six weeks. The car movement this season amounted to as high as ninety-two cars in one day, and for

Experts in handling vegetables. Our station force at Crystal Springs, Miss. Standing on the side of the engine is Mrs. C. R. Henington, bill clerk. Those standing from left to right, are: Jim Davis, laborer; Bob Johnson, trucker; Arthur Red, porter; E. P. Wood, flagman; L. K. Ramsey, diverting clerk; K. A. Carney, icing inspector; Lee Tyler, cashier; R. C. Lewis, second trick operator; M. E. Oliver, third trick operator; H. S. Holt, first trick operator; H. P. Campbell, trainmaster; R. S. Brent, agent; E. V. Price, fireman of the switch engine; D. Birdsong, engineer of the switch engine; Harry Schroeder, brakeman with the switch engine; T. H. Hart, conductor with the switch engine; John Rodgers, brakeman with the switch engine. Sitting, left to right: Henry Mitchell, coal handler; C. G. Boudousquie, warehouse clerk; J. F. Holt, utility clerk; W. H. Hodges, yard clerk; F. D. Porter, rate clerk; J. A. Ballard, loading inspector; J. W. Kennedy, ventilator clerk.

more than a week running from eighty-five to ninety cars a day.

Our vegetable train is scheduled to leave Crystal Springs at 10 p. m. daily, and in order to get everything ready we require all bills of lading to be in at 7:30 p. m. Very few are given in before this time.

It is then that the station force gets busy. The icing inspector must inspect each car in order to make a record of how much ice is in the bunkers when the cars are ready to move. The loading inspector must inspect the loading and see that all cars are properly braced. Many times we find that cars have to be re-braced before moving. The ventilator clerk must check over each bill of lading, make a record of the ventilating instructions and go over the yard to adjust every ventilator as per the bill of lading instructions. The seal clerk must see that every car is properly sealed and that the seals are recorded. The rate and bill clerks must see that every shipment is rated, billed and manifested. The demurrage clerk must check each bill of lading against demurrage records to see whether any detention or demurrage charge has accrued to be billed against the shipment. The yard clerk must make cards from the bills of lading for every car and see that they are properly carded, must make a switch list and check all waybills against his list for possible errors in car numbers before handing it to the switch engine crew. This crew, in turn, must get the train lined up and ready for movement at 10 o'clock. With but two or three exceptions, this train was always ready to move on schedule.

An Efficient Station Force

Perishable freight cannot be delayed. Delays cost money. In order to handle this business without delay and loss, our station force was keyed to a high pitch of efficiency, team work and enthusiasm. There is a man for each line of work, and he must be an expert in that line. We do not believe that there is a more efficient or enthusiastic force of clerks anywhere than the one we have at Crystal Springs, and it is to this efficiency and team work that we attribute our success in handling

Home of Agent R. S. Brent at Crystal Springs, Miss. Mr. Brent's three sons are shown. The largest is Robert; the next, William; and the next, Edwin.

the heavy movement this year without a dollar's loss or a claim so far as our handling is concerned.

Naturally there are hundred of diversions made in handling perishables, and it is necessary that we have an expert reconsigning clerk whose duty it is to see that reconsignments, changes in icing or ventilation instructions and requests for disposition of refused cars are handled without a minute's delay, for sometimes even a small delay in handling a diversion will cost the carrier a heavy claim. This station made 1,700 diversions this season.

McCOMB IMPROVEMENTS

Master Mechanic Roddie of the Illinois Central Railroad advised a representative of the *Enterprise* during the present week that he has received authority to install machinery in the locomotive department of the local shops to a total value of \$47,700. The improvements will be made as soon as the new machinery may be ordered, received and installed. These improvements are in line with the program of the Illinois Central for remodeling and enlarging the local shops. In the car department there was recently built a new steel car shed at a cost of \$196,000, and the work of building a new roadway and mechanical store room and wheel shop is just about completed, the expenditure for this work being \$43,000, making a total of approximately \$300,000 within a period of less than a year.—McComb (Miss.) *Enterprise*.

Utica, Miss.; Finds Profit in Vegetables

Truck-Growing Wins Permanent Favor as Successor to Cotton-Raising; 557 Cars Shipped This Year

By H. J. SCHWIETERT,
General Development Agent

PROGRESS and advancement are frequently due to some adversity, which usually is the forerunner of development in any community. This is particularly true of the little town of Utica, Miss., on the Yazoo & Mississippi Valley Railroad, west of Jackson, in Hinds County.

Back in 1917 the boll weevil was so prevalent that cotton, which had been the dominating crop prior to that time, could not be raised profitably or with any degree of certainty. Low prices prevailed, and production per acre was far below the point of diminishing returns. Farmers and planters were discouraged. Debts piled up, and it was exceedingly difficult to obtain credit. The farmers, business men and the development bureau of the Illinois Central System realized that something must be done for the good of all concerned. After careful study of every phase of the situation, it was decided that the growing of vegetables for the early Northern markets would be the best course to pursue. In every great crisis, the people rise to the occasion; so they did at Utica, and a new era was begun.

In every great undertaking there must be leadership; there must be someone with a vision as to the future, someone with unshaken faith and confidence in the ultimate outcome of the project; so there was found a leader at Utica. It required the co-operation of men like D. C. Simmons, banker, merchant and planter, and his associates, as well as the Illinois Central System, to insure the success of the development of the vegetable industry.

Local Sales Agencies Found

Through Mr. Simmons and E. H. Currie & Brother, all vegetables grown in that vicinity find a ready market. These gentlemen act as local sales agencies, which are absolutely necessary if the farmer is to succeed.

In the treatment of the growing crop, by showing methods of cultivation and proper fertilization, and also by demonstrating proper packing and culling when the crop was ready for market, as well as furnishing equipment,

Tomatoes, Utica, Miss.

the Illinois Central System left nothing undone to insure success.

Mr. Simmons reports he shipped 409 carloads of vegetables this season, and Currie Brothers say they shipped 148 carloads. This gives a grand total by these two firms of 557 carloads, which is an increase of nearly 150 per cent over 1921.

The following table will give an idea of how the industry has grown since its inception:

	Carloads
1917	168
1918	148
1919	101
1920	160
1921	225
1922	557

Every effort will be made to have an increased acreage in 1923. From present indications the increase will be about 25 per cent.

Most of the growers are well pleased with the season's crop and the returns from the products sold. C. K. Leighton, who is one of the most progressive farmers, says that he shipped 1,450 hampers of carrots off five acres and that he received an average of \$1 a hamper. The money received from the carrots, he claims, paid for all the fertilizer and other running expenses of the farm, and the balance of his truck crop was net. He shipped 500 crates of cabbage, which brought him \$750. This was from five acres. Although the yield was only fair and the price low, the returns were better than he could have got from twice the acreage

in cotton, provided the latter crop had been good. Mr. Leighton also had twelve acres of tomatoes, for which he received approximately \$2,250. On the twenty-two acres he had in vegetables, he received a return of \$202.27 an acre.

Local Editor a Tomato Grower

O. W. Sarrett, editor of the *Utica Leader*, raised 525 crates of tomatoes in a back lot adjoining his home, with the help of one negro. Due to the unusually wet season and the lateness in getting the tomatoes planted, he fell short about 300 crates of maximum production. Extremes of heat and rain also caused considerable loss through sun blister and cracking.

The prospects early in the season were for 400 crates an acre, but due to unfavorable conditions the average yield for the whole section this year was about 300 crates.

The development of this industry was a blessing to Utica and the entire community. It helped the farmers pay off their indebtedness to the merchants. It has brought happiness and freedom from debt. It has brought to Utica this year approximately half a million dollars.

Agricultural Agents E. G. Wade and Ben Colman of the development bureau, who are

devoting most of their time to the development of the vegetable and fruit industry, have taken an active part in the work at Utica and have rendered valuable service by personal calls and advising growers on fertilization, building of cold frames and hot beds, transplanting, spraying, culling, packing, etc.

Thus, through the united efforts of the farmers and merchants of the community and the development men of the railroad, a great business is operating, and agriculture in the vicinity of Utica has been placed on a more permanent basis.

WORK AGAIN

Everybody seems to think work is an outrage. It isn't; the world over, men probably get more enjoyment out of their work than they get out of anything else. A mechanic I know has more contracts than any other in town. And his contracts are usually big ones; those requiring the most skill, the most intelligent attention. Don't you suppose this man finds a good deal of comfort in the reputation the papers and the people are giving him?

Poor work is disgusting, but good work is a source of pleasure and satisfaction to the man credited with it.—*Ed Howe.*

Where Our Supply of Lumber Is Bought

Mills on Lines South of Memphis Still Patronized, but We Have to Extend Purchases East and West

By W. A. BRADLEY,

Chief Lumber Inspector, McComb, Miss.

JUST a few years ago all of the millions of feet of yellow pine used each year by the Illinois Central System were purchased on our lines south of Memphis. Today we confine our purchases to mills located nearest our lines, but when our requirements are heavy we have to go west of the Mississippi River and as far as Alabama and Georgia on the east.

Some of the largest mills in South Mississippi operating in virgin southern yellow pine are owned by companies composed of men who played a large part in the development of this industry on our immediate lines. Among these are the J. J. White Lumber Company, the Helen White Lumber Company, the Rosa Lumber Company and the C. A. Goodyear Lumber Company.

On the New Orleans Great Northern there is not only the largest saw mill in the world, with a daily capacity of 1,000,000 feet, but one of the most thorough operations. They are utilizing the refuse for making paper and the stumps and roots for manufacturing various chemicals. This mill, known as the Great Southern Lumber Company, is at Bogalusa, La. These people are also doing much in the way of experimenting on the conservation of timber and have attracted the attention of forestry experts in this and other countries through some of the results achieved.

Some typical lumbering track.

At D'Lo, Miss., on the Gulf & Ship Island, is the first electrified saw mill built in the southern pine territory. It is operated by the Finkbine Lumber Company, with a daily capacity of 250,000 feet. This company owns enough timber to last for eight years of steady operations. The Finkbine Lumber Company also operates a mill at Wiggins, Miss., on the G. & S. I. with a daily capacity of 125,000 feet and eight years' cut. The two mills employ about 1,200 workmen.

Modern Mills Use Electricity

The Edward Hines yellow pine trustees erected at Lumberton, Miss., on the G. & S. I. and New Orleans & Northeastern, about two years ago a mill with a daily capacity of 250,000 feet employing 600 men and with timber to last twenty-five years running to capacity. This company has an electric trolley system for handling the lumber from the time it leaves the saw until it is loaded in the car or stacked which has created a great amount of interest among saw-mill owners. Most mills are now using an electric system, instead of the horses used up to just a few years ago.

The Jordan River Lumber Company, Kiln, Miss., in direct connection by a logging road with the N. O. & N. E.,

Track-laying machine used in timber.

Loading derrick has track on tops of cars.

has a daily capacity of 250,000 feet, employs 600 men and has timber holdings sufficient to last twenty-five years. This company is also directly connected with the Mississippi Sound by the Jordan River.

The J. J. White Lumber Company, Columbia, Miss., on the G. & S. I. and N. O. G. N., with a daily capacity of 100,000 feet, and the Helen White Lumber Company, Clyde, Miss., on the Mississippi Central, with a daily capacity of 250,000 feet

A trainload of logs coming out.

Pond at a lumber mill, into which logs are dumped from train.

Logs in pond ready to enter mill via chute in foreground.

and timber to last seven years, are owned and operated by the heirs of J. J. White, McComb, Miss., pioneer lumberman, and L. B. Sedgwick, secretary and treasurer, who was with Mr. White from 1896 until 1912, when they closed down at McComb on account of lack of available timber.

At Picayune, Miss., on the N. O. & N. E., one of our old connections has two large

saw mills that are among the most modern in the country—the Rosa Lumber Company and the C. A. Goodyear Lumber Company, with a daily capacity of 275,000 feet and employing 1,000 men. The timber owned by these two mills is among the finest tracts left in the South. Several smaller mills are operated by the C. & R. Lumber Company at Blodgett, Miss., on the Gulf, Mobile & Northern.

Stacking lumber by machinery.

Y. & M. V. Station, Stephenson, Miss.

The J. J. Newman Lumber Company, with sales office at Brookhaven, Miss., one of the largest operators in the entire southern pine territory, owns three large mills, at Hattiesburg, Sumrall and Bude, Miss., on the Mississippi Central Railroad. They have timber for regular operation to last twenty years.

Among our oldest connections off our lines is the Eastman-Gardiner Lumber Company, Laurel, Miss. This company has been operating since the early 70's. Laurel is the largest saw mill center in South Mississippi. Four large saw mills are located in this little city—the Eastman-Gardiner Lumber Company, the Wausau Southern Lumber Company, the Gilchrist-Fordney Lumber Company, the Marathon Lumber Company—and several smaller operators.

Another old connection of ours is the Ingram-Day Lumber Company, Lyman, Miss., on the G. & S. I. We have been using lumber shipped by these people in our cars and bridges for many years.

On the Yazoo & Mississippi Valley we have two mills that represent a large acreage in yellow pine—the Foster Creek Lumber & Manufacturing Company, Stephenson, Miss., and the Gloster Lumber Company, Gloster, Miss. The Foster Creek Lumber & Manufacturing Company owns one of the largest tracts of timber in the pine district and a modern plant and equipment. The Gloster Lumber Company has

been with us for years. While it does not represent such a large operation, it is modern in every respect.

E. B. Sauls of Brookhaven, Miss., while he has no large mill, has furnished and shipped a large amount of lumber to and over our lines from his several small mills located on connecting lines.

These firms represent men who had the vision to see and the courage to act years ago, when long leaf yellow pine was not known beyond its own territory. They were men who saw the virtue and beauty in the wood which grew so abundantly and so beautifully in the whole southland, but nowhere so superbly as in South Mississippi and Louisiana.

HE DECIDED TO WAIT

Albert McLaurine, 6-year-old son of Trainmaster E. L. McLaurine of the Louisiana division, had just started to school. He be-

Albert McLaurine.

came interested in a little miss of 5 years and was very attentive on all occasions. At school one day another boy appropriated the young lady's pencil. Albert was indignant, went over to the desk and took the pencil away from him.

After school he was telling his older brother about the schoolmate who infringed on his rights and remarked, "I am going to whip him Friday."

"Why Friday?" asked his brother.

"Well, 'cause the teacher will forget all about it by Monday," was the reply.

WHAT CONSTITUTES SUCCESS

That man is a success who has lived well, laughed often and loved much; who has gained the respect of intelligent men and the love of little children; who has filled his niche and accomplished his task; who has left the world better than he found it, whether by an improved poppy, a perfect poem or a rescued soul; who never lacked appreciation of earth's beauty or failed to express it; who has always looked for the best in others and given the best he had; whose memory is a benediction.—

Robert Louis Stevenson.

Lumberman's home, Stephenson, Miss.

The Milk Goat, a Recruit for the Dairy

Authorities Agree on Healthfulness of the Product; Animal is Particularly Adaptable to Small Farms

By A. W. LARGE,

Agricultural Agent, Rock Island Lines

Reprinted, by permission, from the August issue of the Rock Island Magazine.

FOR centuries the milk goat has been an important and respected factor in the domestic economy of Europe, Northern Africa and Asia, and frequent reference to it is made in the literature of those countries as the "poor man's cow," "the little friend of humanity" and other phrases of similar import. The merits of the milk goat have always been known to a few in America, but it has only been in recent years that it has attracted national attention. Travel is a great educator, and it is due in large part to the observations of travelers of the high esteem in which the milk goat was held abroad that this new industry is becoming firmly planted in the United States.

The early Spanish settlers brought the milk goat with them to Mexico and southern California, then under the sovereignty of Spain, and these multiplied rapidly, but retrograded rather than improved in quality. In 1904-05 there was a considerable importation of Swiss milk goats by F. S. Peer and R. N. Riddle of New Jersey and Doctor Gregg of California. These importations included splendid specimens of Toggenburgs, Saanens and Nubians and opened the eyes of the American people to the very desirable economic possibilities of this new industry.

Interest was growing all the time throughout the country, but immediately one barrier after another arose to prevent the obtaining in any considerable number of blooded and high grade European foundation stock for establishing American herds. There was the foot and mouth disease, the great war, interminable European governmental restrictions, then again the foot and mouth disease. So that ever since there have been almost insuperable difficulties in the way of the importer. Consequently the only way to develop an American milk goat was to grade up by using

Rosemont's Crown Prince, one of the most famous Toggenburg bucks on the Pacific Coast, owned by David Whitcomb of Seattle, Wash.

the imported sires with the native stock, and here the work of the early Spanish importers merged with twentieth century ones because these Spanish or Mexican goats were not only more numerous, but still retained in a more or less dormant fashion many of the qualities of the genuine milk goat. This was one of the chief reasons for the rapid development of the milk goat in Southern California, but there are others advanced by Professor Edwin C. Voorhees of the University of California.

Small Farms Call for Goats

"Fortunately," says Professor Voorhees, on the milk goats in California, "I think we can explain the reasons why the milk goat has had its greatest development in the United States here in Southern California. You will readily realize that the greatest development has occurred in the vicinity of Los Angeles, where we have many small farmers and suburbanites. For example, out of the thirteen thousand farms in Los Angeles County, over seventy-five hundred are less than thirty-seven acres in area. The milk goat fits in in such an environment."

Travel again entered into the development of the milk goat, as among the many wealthy, influential and prominent Americans sojourning intermittently in America's

Riviera were two Rock Island directors, John G. Shedd [also an Illinois Central director] and James A. Patten. They became intensely interested from a humanitarian standpoint, and out of this grew the splendid herd of registered Toggenburg milk goats at the Cook County Farm at Oak Forest, on the Rock Island Lines. This is the largest herd of registered milk goats in the United States outside of the rich suburban districts around New York and the Pacific Coast. To Mr. Patten and his wife, in whom he found a sincere and enthusiastic co-operator, belongs the chief credit for this great philanthropic undertaking, which has not only done so much to popularize the milk goat, but forms the basis of the great scientific work being carried on there that will settle definitely and conclusively establish the reliability of many of the claims made for the milk goat.

The Great Stevens' Sale

Travel again marks the next great milestone in the history of the milk goat in America, when Charles A. Stevens, Chicago's merchant prince, journeyed to California and brought back with him two carloads of the choicest specimens of the Toggenburg breed and sold them at a public auction at his Agawam goat ranch, Lake Delavan, Wis. Mr. Stevens is entitled to high commendation for the very careful and systematic manner in which he organized and carried out this sale so as to interest and educate the public to the value of the milk goat. The total sales amounted to \$24,580; the registered animals averaged

Doe and twin kids.

\$472 each, the grades \$163, with an average price for all animals of \$348 each. The highest price paid was \$1,600 by A. L. Farwell for Rosemont's Polly Alpha No. 7747. Among the many prominent persons present at this sale were Mr. and Mrs. Patten, A. L. and F. C. Farwell, Otto W. Lehmann, A. Watson Armour, William J. Wrigley, General Otto H. Falk, Milwaukee; W. O. Washburn and Howard Kahn, St. Paul; David Whitcomb, Seattle, and many others.

There are three leading breeds in this country, the Toggenburg, the Saanen and the Anglo-Nubian, of which the Toggenburgs are the most numerous. They have an official breed association known as the American Milk Goat Record Association, with Charles A. Stevens, 19 South State street, Chicago, Ill., president, and Will L. TeWalt, Vincennes, Ind., secretary, who in a recent letter states: "We registered almost as many last year (1921) as during the prior ten years combined. The demand is increasing so rapidly that we can hardly meet it. I predict a great future for the industry." About two years ago the Anglo-Nubian breeders organized an association known as the International Nubian Milk Goat Breeders' Association, of which Archie C. Talboy, LaJolla, Cal., is secretary.

What Rock Island Has Done

Through the courtesy of Medill McCormick, United States senator from Illinois, we were enabled to secure 10,000 copies of the United States Department of Agricul-

One of the prize winners.

This shows development of udder.

ture's pamphlet No. 920, entitled "Milk Goats," by Edward L. Shaw, and distributed these widely throughout our local territory. That this was not without great results is conclusively attested by the many milk goat colonies now located along our lines, among which might be mentioned Wichita, Dodge City, Hutchinson, Topeka, Liberal, Fowler, Woodbine, Arkalon, Sabetha, Salina and Manhattan, Kan.; Tucumcari, N. M.; Memphis, Tenn.; Little Rock and Hot Springs, Ark.; Des Moines, Cedar Rapids, Grinnell, Ottumwa, Council Bluffs, Vinton and Clio, Iowa; Omaha, Lincoln, Fairbury, Richfield and Hebron, Neb.; Minneapolis and St. Paul, Minn.; Joliet, Rock Island, Utica, Peoria, and the suburbs of Chicago in Illinois; St. Joseph and Kansas City, Mo.; Ringwood and Oklahoma City, Okla., and Dallas, Texas.

Merits Claimed for Milk Goat

For babies: Dr. Richard M. Smith of Boston, Mass., says, and his statement has the approval of and is circulated by the United States Department of Agriculture: "In general, tuberculosis of bovine origin represents about 25 per cent of all cases of tuberculosis in children under 5 years of age. In certain types of the disease it is very much more, as I shall indicate, but taking the cases by and large about one case in four of every child under 5 years of age who acquires tuberculosis acquires it from cattle. It is estimated that in New York City, for instance, between 6 and 10 per cent of the children who die in the hospitals each year of tuberculosis die of bovine tuberculosis. After the disease goes beyond the primary stage—that is, the

stage in which it is localized in glands and bones—it shows practically no further tendency to localization, as that if we get a type of tuberculosis outside of the glands or outside of the bones it almost invariably is a fatal disease; that is, it takes the form of a meningitis or a general tuberculosis, so-called miliary tuberculosis. Taking a series of cases, sixty-seven that were investigated, 70 per cent were of bovine origin and all the cases under 1 year were of bovine origin."

The Research Laboratory Department of Health, New York City: "In children the bovine type of tubercle bacilli causes a marked percentage of the cases of cervical adonitis leading to operations, temporary disablement, discomfort and disfigurement. It causes a large percentage of the rarer types of alimentary tuberculosis requiring operative interference or causing the death of the child directly or as a contributing cause in other diseases. In young children it becomes a menace to life and causes from 6 1/3 to 10 per cent of the total fatalities from this disease."

Rosenau made an analysis of a very large number of tuberculosis cases reported by medical authorities with the following result:

Sixteen years and over, 686 cases, 9 bovine tuberculosis, 1.3 per cent.

Between 5 and 16 years, 132 cases, 33 bovine tuberculosis, 25 per cent.

Under 5 years, 120 cases, 59 bovine tuberculosis, 49 per cent.

Now, it has always been claimed for the goat that it was immune to tuberculosis and could not transmit its germs through milk to the human being. If this

These goats are valued at \$1,500 each.

condition is established, its importance needs no emphasis in the light of the statements above. All of the authorities that we have been able to consult strongly stress this point and rightly so. However, it appears that the goat is not immune to tuberculosis, but practically so, and there seems to be no record of any case where a goat has transmitted tuberculosis to a human being. Note these great authorities: "Out of over 130,000 goats and kids that have been brought to Paris for slaughter in the shambles of LaVillette every year, the meat inspectors have failed to discover a single case of phthisis."—Professor Nacard.

Goats Healthier Than Cows

"While the statement is not entirely true that goats are absolutely immune from tuberculosis, yet of 1,500 goats publicly slaughtered in one year only 0.6 per cent were affected. This bears no comparison to the prevalence of, tuberculosis among cattle. For example, at the slaughter house at Kiel, Germany, in 1896, 41.03 per cent of all slaughtered cattle and 45.82 per cent of all cows were found to be tubercular."—Professor Hoffman.

"In the Kingdom of Saxony in 1894 out of 1,562 goats slaughtered only 10, or 0.84 per cent, were found infected, of which two were destroyed, one was kept under observation and seven were found salable. In Prussia in 1899 in 381 slaughter houses 47,705 goats were killed. Of this number only 148 head, or 0.41 per cent, were infected, either generally or locally. This result must be the most astonishing because the goats with only a few exceptions were kept under conditions eminently favorable to the spread of tuberculosis."—Dettweiler.

One of the most careful and scientific studies of the milk goat that has been made in America was conducted by the New York State Agricultural College, Geneva, N. Y., in co-operation with Doctors Sherman and Lohnes of Buffalo. They say:

"Goats' milk was supplied to eighteen cases of children that were not thriving on any

How goats are milked.

other food that had been tried. In seventeen cases a satisfactory state of nutrition was established through the use of goat's milk, the beneficent results in some instances being very marked. With certain of these children their situation was regarded as serious, and their restoration to a satisfactory nutritional condition was evidence that goat's milk is often a very desirable resort for infant feeding."

"I might go on enumerating various types of cases in which I have had pleasing results, but this is sufficient to show you the important part the goat plays from a social standpoint, not considering the unusual advantage of goat milk as a food and tonic for the weak and debilitated, as those suffering with stomach disorders and tuberculosis, also a paramount food for infants.

"The reason of its particular advantage in infant and invalid feeding is the fact of the oil globules' being one-fifth the size of those in cow's milk, hence easier of digestion. The curds are very small and flocculent, thus more easily attacked by the digestive fluids. It is alkaline in reaction, the same as mother's milk, and in chemical composition the nearest to mother's milk. Furthermore, coming from a healthy animal practically immune from tuberculosis gives it a more stable and uniform consistency. I know of no more appropriate way of expressing my appreciation of the goat than

a photograph which I have taken simulating a statue of a milk goat, entitled 'The Salvation of Our Invalids and Children.'—Dr. Carl G. Wilson, Palo Alto, Cal.

"Goat's milk is nearly always pure white in color. The small size of the fat globules is one of its chief characteristics. The cream rises very slowly and never as thoroughly as in the case of cow's milk."—United States Department of Agriculture.

Little Cream in Goat's Milk

"Do not look for cream on goat's milk. Owing to the smallness of the fat globules it takes from thirty-six to seventy-two hours to rise. The medicinal value lies in this fact, as it is more readily assimilated by the stomach."—M. P. Eggers, President, Northwestern Milk Goat Association.

"The goat's milk produced here is used principally among the children at our tuberculosis hospital and has proved specially beneficial to them. Since using it the children have been singularly free from gastral intestinal trouble so common to them in the summer time."—Henry L. Bailey, Superintendent, Cook County Tuberculosis Hospital.

There is abundant evidence that goat's milk is beneficial and lessens the sufferings of those having advanced cases of tuberculosis and certain forms of cancer. Humanity owes it to those of its members whose sufferings can only be relieved by death to make their lot as comfortable as possible, and it seems without doubt that goat's milk is one of the ways of doing that.

"The goat's milk is used by cancer patients and in advanced cases of tuberculosis among

adults. Medical authorities maintain that the goat's milk is more easily assimilated than cow's milk and usable where the cow's milk is not tolerated by the patients. This is especially true in advanced cases of tuberculosis, and in cancer cases where the system has been undermined by the ravages of the disease."—Henry L. Bailey, Superintendent, Cook County Tuberculosis Hospital.

We should all rejoice and be glad that largely through the warm-heartedness and practical philanthropy of Mr. and Mrs. Patten those who are sick, homeless and friendless in Cook County are being befriended and benefited by the milk goat, the little friend of all the world.

Where to Find Further Information

"Modern Milk Goats." By Irmagarde Richards, Lippincott Company; \$3. Thoroughly modern work by a successful young California woman breeder.

"The Book of the Goat." By H. S. Holmes Pegler; \$3. The Goat World, Los Angeles, Cal. This is the standard work on the milk goat and is by an English author.

"Goat's Milk for Infant Feeding." Free. New York State Agricultural College, Geneva, N. Y.

"Milk Goats," Farmers' Bulletin 920. By Edward L. Shaw. Free. United States Department of Agriculture, Washington, D. C.

"Angora Goat Raising and Milk Goats." By George Fayette Thompson. \$1. The American Sheep Breeder Company, U. S. Yards, Chicago, Ill.

The Goat World, 145 South Broadway, Los Angeles, Cal. \$1 per year.

- (3) To assist in establishing a new industry.

LOOKING FOR A BOOK

Albert N. Harbert of Iowa City, Iowa, is anxious to purchase a book that gives the origin of the names of the stations along the lines of the Illinois Central, with a historical sketch of each. William K. Ackerman was the author of the book he has in mind, which was published in Chicago in 1883. If any employe has such a copy, Mr. Harbert would like to communicate with him.

A pedigree Angora.

What Churches Can Learn From the War

British Prime Minister, Eight Years After Inception, Sees Danger Unless Hearts Are Changed

A little more than eight years ago the war began. Upon the anniversary of its beginning, late in July this year, David Lloyd George, the British prime minister, addressed the following sentiments to a meeting of the Non-Conformist clergy in England:

I SPEAK as one who has had something to do with war and had to make a close study of it. During the war the cry was "Never again!" There is a growing assumption that a conflict is coming again sooner or later. That is the business of the churches.

What do I mean by that? Nations are building up armaments—I will not say nations that did not exist, but nations that have been submerged, buried—are building up new armaments. You have national animosities, national fears, suspicions, dislikes, ambitions, and exaggerated.

You have more than that. Keep your eye on what is happening. They are constructing more terrible machines than even the late war ever saw. What for? Not for peace. What are they for? They are not even to disperse armies. They are to attack cities unarmed, where you have defenseless populations, to kill, to maim, to poison, to mutilate, to burn helpless women and children.

If the churches of Christ throughout Europe and America allow that to fructify they had better close their doors. The next war, if it ever comes, will be a war on civilization itself.

We have reduced our armaments, army, navy and air. In that respect our example is one. We have reduced them beyond what they were before the war, and if all the nations on earth did the same there would be no peril to peace. But it is difficult for one nation to remain defenseless when others construct machinery which may be used for its destruction.

Everything depends on the temper, the spirit which is created throughout the world, and it would be a sad thing, a sad danger, to the people if the world came to the conclusion that Christianity, despite all its principles, in spite

David Lloyd George.

of all its ideals, was perfectly impotent to prevent mischief of that kind.

(Mr. Lloyd George then dwelt on the difficulty of speaking frankly on foreign relations.)

It is difficult, very difficult. You speak with a restraint and often a suppression which you certainly would not exercise in matters affecting the political issues of your own country. Public opinion there is not amenable to public opinion here. The result is that conflict comes very suddenly.

How many men were there in July eight

years ago this week who thought that the most terrible war in the world was just about to start? How many men who were supposed to be in the know thought so? Just read the books that have been written even in Germany on that subject. Men supremely responsible thought a day or two before war was declared that the whole trouble was over. It comes with a suddenness which is appalling, perfectly appalling.

Well, it is too late then to work any elaborate machine. The war germ is just like any other germ. You really do not know that it has got you until you are stricken down. It is of no use arguing with an epileptic when the fit is on him.

It is fear that is the most dangerous of all. There is distrust. There is one nation that will not believe anything that is said by another nation. They say: "What are they up to? There is some deception behind it." They may be telling the truth, at least most of the truth. They might even tell the whole truth, and the more they tell the less it is believed. There is that atmosphere in the world, and it is all explosive material littered all over Europe. When the match has been dropped into the explosives it is no good brandishing the Covenant of the League of Nations in the face of the explosion.

(Mr. Lloyd George then pointed out that already a new generation was arising that knew not the hideousness and remorselessness of war.)

These horrors are always forgotten. I had to read up for the purpose of some debate or other the other day the history of the post-war period of 1815-1816-1817-1818-1819-1820-1821, when there were millions starving to death after Waterloo. You see pictures of it, gorgeous pictures of it, thrilling pictures, ennobling pictures of it, pictures that make you feel as if you could grasp the sword and dash along with those horsemen.

What followed Waterloo? Nobody reads about it, nobody knows and they forget. The disorganization of trade and of industry, the difficulty of getting your daily bread, hundreds and thousands tramping the streets to find some opportunity of earning a living for themselves and for their children, and tramping in the vain despair that filled the land, high taxation, high prices—all that will have gone, but

the glory of war will always be blazoned forth. That is the generation that will be judging the issue when the time comes. They will forget what happened in Europe.

And Russia. No way out of the pit, and sinking deeper into it with every convulsive effort. Germany clinging desperately to the rotten branch of debased currency, and when that gives way, God help Germany. That is forgotten.

It is the business of the Church of Christ to keep that before the eyes of the people.

What was one of the great lessons of the war? I will tell you one. There was a nation with the most perfect army in the world. It was beaten because it had a bad cause. There were nations with illy equipped armies. They won. Why? They had righteousness on their side.

I remember Marshal Foch telling me that the German army that marched into France was the most perfect military machine that ever had been put together. Scattered, destroyed. It is only now just a bare police force, barely adequate to keep order in its own land without being a menace to any other country. Why? The consciousness of the world destroyed it because it fought for an unrighteous cause. That is one of the lessons of the war: Trust not in force.

I am glad that at the head of the greatest church in Christendom at the present moment is a man who is a profound believer in peace. He exercises a great sway on the consciences of millions in many lands in the cause of peace, and I rejoice in that fact.

I have had some experience of the war. It was not my will. I was just like millions of others, caught by the cogwheels of war and drawn into its horrible machinery. How I got there, why I got there, is not for me to say. I simply did my duty. But what I saw of it for years filled me with horror.

There is no more horrible alternative than between devious machinery of slaughter and abandoning on the other hand the cause of right, liberty and humanity, but what I saw of it day by day makes me vow that I will consecrate what is left of my energies to make it impossible that humanity shall in future have to pass through the fire, the torment, the sacrilege, the horror and the squalor of war.

Editorial

GOOD SALESMANSHIP

Two factors are of first importance in successful salesmanship—courtesy and a thorough knowledge of the product. We enjoy making a purchase from a salesman who knows thoroughly the product he is selling, and who tells us by his manner that he is truly pleased to be of service to us.

It is well said that a satisfied customer is the best advertisement. Since successful salesmen make satisfied customers, salesmanship is an important adjunct of advertising. Poor salesmanship can nullify the good results obtained by the expenditure of large amounts for advertising purposes; good salesmanship can enhance the results of meager advertising.

We are all salesmen of the railroad for which we are working. We may not be engaged directly in the business of going out after customers and bringing them in; we may not be behind the ticket window or in the cashier's cage; but we are salesmen. We are meeting people every day who form their opinions of the railroad by their opinions of us. If we sell our personalities to them, we sell the railroad to them. They will patronize the railroad which has an army of men and women working for it who know their jobs thoroughly, who know the railroad and the service it is giving, and who are pleased to be of service to the railroad's customers.

We can well afford to pay a great deal of attention to the two factors which make for successful salesmanship. It does not matter which comes first, for both are of great importance. We should not be satisfied with either one of the two talents, but should strive both to know thoroughly the railroad and its service and to show our eagerness to be of service to our patrons.

ARBITRATION

An experiment which will be made in New York City this fall with a tribunal of justice for the speedy and inexpensive determination of controversies and differences by arbitration will be watched with interest by thinking people throughout the country. The project

is sponsored by the Arbitration Society of America, an organization started in May of this year which includes on its board of governors the deans of the law schools of Columbia and New York universities and a number of business and professional men of international reputation. Its aim is to reduce the volume of litigation, to relieve court congestions, and to insure a speedy administration of justice with the expenditure of a minimum of time, money and worry.

Disputants applying to the proposed tribunal will only agree to a settlement of their controversy by one or more arbitrators selected by themselves or by the society if they so request. All arrangements will be made for them. Hearings involving confidential matters will be treated confidentially, with no publicity except the formal entering of the arbitrator's award upon the records of the court, and even that will not be done in cases where the disputants acquiesce in the award, which the society will encourage them to do.

No technicalities whatever will be followed in the proposed tribunal of justice, and the procedure will be simple and direct. There will be no rules governing the relevancy or competency of testimony, but the arbitrator will use his own sense of common justice to determine what bears upon the question in dispute. Lawyers will be admitted, of course, but there will be no legal requirements whatever.

There will be a small charge to disputants who bring their cases before the tribunal, but the cost, it is declared in the pamphlet we have received from the society, will be trivial in comparison with the cost of litigation. None of the members or representatives of the society can profit through the tribunal, but money received will be applied to the upkeep of the tribunal and to the extension of the work throughout the country—for if it proves successful in New York City the society will undertake to establish similar tribunals in other large cities.

Some excerpts from the society's pamphlet will be of interest:

A complete list of available arbitrators, willing to serve without compensation, will be

made public by the society at any early date. No difficulty is being experienced in recruiting representative members of all the professions and trades for this important public service. It is the almost universal feeling among men of affairs that no other function in life holds more of usefulness, dignity and honor than that of acting as an impartial judge between men in their honest differences.

This tribunal will simply be so much machinery for the effective operation of the Arbitration Law of this state, as amended in 1920.

This law gives legal and binding effectiveness to the settlement by arbitration of nearly all disputes and controversies upon which an action could be brought in a court of law. In all essential respects this law endows an arbitrator with the power of a judge to subpoena witnesses, to compel the production of essential documents and books, and to exert the authority with which a judge is vested in the conduct of a case at law. The law provides further that the award of an arbitrator is confirmed by the court, and is then enforceable precisely as if it were—and, indeed, as it then becomes—a judgment of that court.

There is one other important provision in that law which adds stability to the whole. It is that an agreement to arbitrate is irrevocable. This means that where two men agree to arbitrate a difference neither of them can withdraw from the arrangement.

Men of intelligence in every walk of life are beginning to realize the folly of long, wearisome and expensive litigation over ordinary differences arising between them, and there is sound basis for the belief that a very large number of controversies now carried to the courts will be settled by arbitration—speedily, inexpensively and fairly—in the tribunal.

The tribunal will be open to all classes or controversies, except criminal and divorce cases.

We cannot refrain from commending the public spirit which prompts the founders of this worthy movement. It is a worth while effort to humanize the settlement of the differences which arise in the association of men. We shall await with some eagerness the news of the experiment's progress.

Those who may be interested in this movement may obtain any information they desire concerning it by writing to the Arbitration Society of America, 115 Broadway, New York. J. W. Slaght is the executive secretary.

FOR SERVICE, NOT FOR GAIN

Railway officials have frequently been maligned by those who seek to stir up discontent by pointing out the "princely" salaries drawn by those who direct the destinies of our railroads. The impression is given that high railway officials pay more attention to gaining riches than to rendering service; even the employes of any one railroad, who know better

regarding their own officials, may be inclined to believe that such a condition exists on other lines.

As a matter of fact, the largest railway salaries compare unfavorably with the largest salaries in other fields of endeavor, where the responsibility involved is not comparable to that of any busy railway executive. And, what is more, the men drawing the biggest money in railroading in most cases are the men who have done and are doing the hardest work. The great majority of railway officials are in the work for the service they can render, and only a few worry about the amount of money they get.

In this connection it is refreshing to note the following appreciation of the unselfish service of our own vice-president, A. S. Baldwin, whose death was recorded in the August issue of this magazine. The letter was written by Robert L. Busch of Chicago, and appeared in the *Chicago Tribune* of July 30:

"Is not the announcement that Mr. A. S. Baldwin, eminent engineer and railway official, left an estate of only \$32,000 of more than passing interest?

"It gives us an insight into the lives of the men who conduct the country's great industries, showing that they are not engaged in building personal fortunes, but are spending their energies and dedicating their talents to a faithful performance of the trust committed to them.

"The salaries of such men, when the heavy calls that are made on them and the style of life they must maintain are considered, is barely more than enough to meet the current expenses of every day life.

"That they have opportunities frequently to make fortunes through the advance information they receive in the closing of large contracts and refuse to cloud their integrity by taking advantage of the opportunities gives us a finer opinion of human nature generally and is an inspiration to all who toil and struggle."

THIS DAY

Finish every day and be done with it. You have done what you could. Some blunders and absurdities, no doubt, crept in; forget them as soon as you can. Tomorrow is a new day; begin it well and serenely and with too high a spirit to be cumbered with your old nonsense. This day is all that is good and fair. It is too dear, with its hopes and invitations, to waste a moment on the yesterdays.—Emerson.

PUBLIC OPINION

What the

World Thinks

WHAT REVOLUTION CAN DO

Two sentences in a survey of Russian conditions by *The Tribune* correspondent at Riga tell volumes. A census made last winter gives the population of Petrograd at 770,000. In 1917 it was 2,420,000.

Four years of bolshevism have done that for one of the world's great cities.

How would we like a taste of communism? Chicago, according to the census of 1920, numbered 2,701,705. By taking a good dose of "social revolution" we probably could reduce it in four years to 800,000. That is, if we did as well as the Russian Reds, we could put ourselves back by 1926 to the Chicago of 1886, or retreat forty years in four years.

But this shrinking of a great city, like some wretched being wasted with deadly fever, is only a hint of what a Red revolution would do for us. Imagine our food and fuel reserves gone for lack of working and of planting, followed by a great drought. Imagine Red bands combing the farms for hidden stores. Imagine the railroads gone and the factories shut and no money and no credit. Imagine a million Illinoisians starving. Think of cannibalism in the remote counties and epidemics and little children with emaciated, distended bodies, motherless and homeless, living in burrows like wild animals, and dying in the streets.

It is impossible for us to take such a picture of Illinois seriously. But revolution could make it a tragic reality. Russia is a country as rich in resources as Illinois. It had in fact less to lose by revolutionary destruction than we have. Much of Russia was comparatively primitive, whereas the people of Illinois largely rely upon a highly organized system of production, transportation, and exchange. A larger proportion of our people are in cities and towns and are dependent upon the machinery of surplus production, of transportation, and of finance and credit which the communists propose to destroy. Their fate would be ghastly. But the farmer and his family would fare little better. He might not

starve, though in Russia millions of peasants are starving. But he would exist on the border of famine, and one crop failure would leave him facing starvation like the people of the towns.

Russia seems far away. We think its fate could not befall us. It is not likely to, but it is worth while translating the language of our radicals into concrete consequences. What radicalism has done to the Russian people, it could do to the people even of this fat and sunny land of Illinois.—Chicago (Ill.) *Tribune*, August 11.

CO-OPERATION

Few words have been more used or abused than the one which forms the caption of this article, yet what better term can we apply in suggesting that harmony of thought and endeavor which should always govern the actions and efforts of railway employees.

By reason of the peculiarities of railway operation, the work of one man in service connects with the work of another. Everything lends itself to the movement of trains—all efforts are subordinated or made necessary because of this fact and the line of communication must be unbroken if train operation be maintained successfully.

Just where the effort starts is immaterial. A bolt for a spring hanger, draw bar or track joint is as much a fundamental as the proper alignment of an oil nozzle, or the adjustment of a reverse lever quadrant; the elevation of a curve facilitates traffic possibly to the same extent as the synchronizing of the steam valves on all engines; the proper calipering of a piston rod is no more potent than the correct description of a freight car by a yard clerk. Nor is the factor of safety in a trestle any more important than the integrity of a switch point, or the position of a derail, when life and limb is considered. The lug screw on a grab iron, dope in a journal box, a back-up signal, all equal in their potential possibilities the functioning of the dispatcher or a false clear signal of the automatic block.

Thus we are forced to the additional contemplation of "co-operation," and this again sug-

gests the human element which, in the ultimate analysis, is the governing element in practically all things earthly. Where co-operation obtains, there shall we discover efficiency really efficient. Where it is absent, there will we find demoralization.

In no industry is a community of interest and effort more strongly indicated or necessary than in this railway service of ours, and from call boy to superintendent; shop apprentice to the chief of motive power; section foreman to chief engineer; agent to traffic manager, the burden of service is the responsibility of all, for even as a stiff triple will mar the brake service of the Limited and provide food for criticism, so will a grouchy answer over the telephone divert business to a competitor.—*Southern Pacific Bulletin, Texas and Louisiana, August, 1922.*

This magazine is not responsible for opinions printed under this heading. Initials or pen names will be permitted only when correct name and address of the writer are known to the editor.

A. C. Snow—A Tribute

TO THE EDITOR: The August number of the magazine contained a timely and sympathetic notice of the death of Arthur C. Snow, for many years contract attorney of the Illinois Central, reporting to the operating vice-president.

Mr. Snow's duties brought him into constant and intimate contact with the members of the law department, by whom his work was regularly reviewed. Indeed, so closely was he associated with this department that every member rests under a sense of great personal loss.

The clergyman who officiated at his funeral service, Doctor Ames, aptly referred to one of Mr. Snow's outstanding qualities—his unusual ability to meet all classes and conditions of men upon a plane of perfect ease and naturalness. This useful trait was the outgrowth of his rare simplicity of life and character. He was never self-conscious, because he was never thinking about himself. He was concerned only with the task before him—with his obligation to get it done thoroughly, carefully and properly. He had no desire to exploit himself in anything. He welcomed suggestions from whatever source. He han-

dled intricate and important matters quietly and efficiently, because he had the gift of resolving any problem into its elements and stating his conclusions in simple terms. He had the quiet dignity of the true gentleman—that dignity that grows out of kindness, purity of thought and language, and the absence of all disingenuousness. He was not a sensitive man in the sense that he was always looking for opportunities to take offense—a form of sensitiveness that is, in reality, based on selfishness and ignorance. He had the saving grace of a sense of humor, not of the kind to make his manner boisterous, but such as lurks in the deep recesses of the mind and heart, ready always to bubble up whenever things do not appear in true proportion. His contact with his fellows showed no trace of envy—that most despicable of traits. The writer cannot recall, in many years of close association, one single unkind word that he ever spoke of anyone. He seemed incapable of harboring an evil or malicious thought.

A patient, serene, gentle, beauty loving, transparent, unselfish soul has passed into the land of true perspective where the standards of judgment are infallible.—R. V. F.

For More Mechanical Reading

TO THE EDITOR: As I have been a close reader of the *Illinois Central Magazine* ever since it has been published, I wish to call your attention to the fact that very little is said about the locomotive department or about the improvement on the locomotive of the present day. That would be of interest to the shop men, especially to the young men and apprentices. I think a good thing would be a page or two devoted to mathematics—commencing with seventh or eighth grade work, answers to be sent to you for correction—also a page devoted to mechanical drawing, and then the readers could give their ideas for making useful tools that will help production and efficiency.

Education is the greatest factor for a mechanic to insure advancement and promotion in mechanical work of all kinds. Instead of fiction, publish something about great inventions and inventors, such men as Edison, for example. Take up first George Stephenson, who built the famous Rocket. Get his history by Samuel Smiles

and "Self-Helps" by the same author, two of the best books ever put in the hands of young men or boys. These books will tell the young generation what loyalty, perseverance and efficiency will do for them in their lives.

I would like to see the boys in the shop not figure so much on the wages, but what will fit them for a better position in life by loyalty, efficiency and education. It is always the best educated who get to the front. I would like to see every boy and every man, young or old, devote at least three nights a week to study, not only in mathematics, but in reading mechanical books on the manufacture of iron and steel and metals and educating themselves on technical points.

And in conclusion, I would say to all Illinois Central employees: Study, work hard and you will be the victor. As some of your contributors are quoting Scripture, I will do the same. Read Proverbs XXII, verse 29: "Seest thou a man diligent in his business? He shall stand before kings; he shall not stand before mean men." That is, he shall stand before men of high degree.—S. DAVIES, *Pensioned Foreman, Burnside Shops, now living at Peotone, Ill.*

The Passing of A. S. Baldwin

TO THE EDITOR: Only a few days ago, in a place of subdued light and quiet—so near and yet so unlike the stretch of never idle tracks with which, for months, his valued thought had been so closely interwoven—the friends, the associates, the admirers of A. S. Baldwin, vice-president of the Illinois Central, deeply moved, were congregated at a simple service to his memory.

The purpose of the occasion was well established, the object of their meeting plain—A. S. Baldwin was dead—his frail housing even then, as it were, remaining in their presence before retiring to its final resting place, only to make easier the realization of the truth, so difficult to grasp, that this man would no longer visit their counsels.

That was an hour clothed with a deep significance for those present or not present, inviting therefore more than passing notice. Departing suddenly, most unexpectedly, in the midst of his prime—even, indeed, when the stage was completely set and the curtain actually rising upon the crowning feature of his

career—well did many of that distinguished assemblage, of whom numbers bore the marks of years, perceive how uncertain were their own lives, how close, perhaps, the moment when they too would pass their earthly offices down to others and, themselves, join "the innumerable caravan, that moves to that mysterious realm, where each shall take his chamber in the silent halls of death."

But of more significance than this, if not more impressive, and especially significant during strenuous days like these—when the tendency is again toward turmoil in railway operation, when patience and tempers of men are stretched to the breaking point, when bitterness is rampant and distrust not easy to dispel—that hour, that service, that life bear further testimony to uphold the truth, so well established and yet so often disregarded (and whose existence suggests a rule of conduct, so salutary and yet so often unapplied), first, that in railway service one can attain position and still remain man; second, that in railway service, notwithstanding doubts and opinions to the contrary of those subjects of unfair treatment who harbor deep-rooted grievances hard to reconcile, there are many of position who *are* men; third, that manhood is no bar to achievement; and finally that, in the ultimate analysis, the basis for that respect from others which all men cherish from each is man, not title.

Here was a man who had attained a commanding height in his profession, upon whom distinction had been bestowed on several occasions and, withal, one whose simplicity bore a striking contrast to the austerity, the impetuosity, characterizing some whose sincerity and generosity reflect the baseness of the insincerity and conceit of others and whose modesty might well be held up as an example for all.

Thus, greatly admired and widely respected among men who knew him, A. S. Baldwin, in his life and the circumstances surrounding his death, while apprising men of their insufficiency to live and rule unrestricted by time, afforded a cause for renewed faith on the part of those inclined to harbor doubt and a source of encouragement to those seeking or enjoying position to be none the less men in doing so.

In view of this, then, is not the keynote of that service and the message of that life the exhortation to railway men constantly to conduct themselves *as* men, regardless of the position of leadership it may be theirs to attain?—DAVID A. STEEL, *Associate Editor, The Railway Age.*

Department
Material Means Money
Save It

Fire Hose

**Fire hose has but one purpose:
fighting fire.—Poor Richard III.**

More than seven miles of fire hose were purchased by the Illinois Central System during 1920 and 1921, at a cost of \$26,143.50. This represents an annual expenditure of more than \$13,000. It means that we use more than fifty feet of fire hose daily, at an expense of \$36, or \$1.50 an hour.

Fire hose is short lived at its best. It is usually guaranteed for a period of only three to five years, but experience has shown that a good cotton, rubber-lined fire hose properly cared for will frequently last from ten to fifteen years.

Fire hose is one of the most important of fire-extinguishing agents, and safety, as well as economy, demands that it be properly cared for at all times. Unlined linen hose, used for inside fire protection, must be kept dry, as it is injured every time it becomes wet. Cotton, rubber-lined fire hose should have water run through it at least four times a year. To keep the rubber in good condition and to assure the maximum life of the hose, the hose should be drained and the cotton fabric allowed to dry thoroughly after it has been used. If it is put on a reel and allowed to remain wet after use, hose is liable to become quickly damaged. If the hose is dirty, it should be brushed off with a broom after drying. Fire hose should not be used for general service or any purpose other than fighting fire, except in extreme emergency, and under no circumstances must hot water be allowed to run through it. If it is absolutely necessary to use the fire hose,

it should be thoroughly drained and dried immediately after use.

Fire hose is frequently renewed on account of small leaks due to damage from use other than fire service, and cases may be cited where the life of fire hose was reduced more than 50 per cent through damage from continued use for washing down freight house platforms and other service for which the hose was not intended. This practice not only damages the hose itself but frequently results in damaging couplings and threads, with a liability of there being delays in making connection in case of actual fire. Careless use of fire hose and other abuses that result in damage to the hose not only represent a needless waste of the hose itself but may cause a far greater loss from fire when the hose is needed.

Watch the Deadline!

Material for the magazine is still being sent in after the 15th of the month, in spite of warnings to the effect that the 15th is the deadline for magazine material. Obviously, material arriving so late will have to hold over a month, maybe longer.

Why Is a Standard Color?

THE *Journal* would be pleased to have a photograph of the individual responsible for the color scheme of the Illinois Central. Did he arrive at such a decision because it was pleasing to his eye? Well, then he was color blind. Was it because it was cheap? Well, it looks it, anyway. Because it is durable? We have no means of knowing. Because no other road on this terrestrial globe would pick it? We guess that is the why. Strikingly individual, beyond a doubt. We could stand for a box car in that dress, but a station or a home decorated in the Illinois Central standard color is a horrible nightmare. Would not the Panama Limited be a dream sailing through the Mississippi Valley decked out from pilot to tail lights in the standard color? Or the new \$50,000,000 station more than a companion to the Field Museum in a yellor and dirty faded red? The trainmen who serve the road and its patrons so splendidly, why not have their uniforms in standard color? Hat, whiskers, and shirt, yellow; trousers, collar, cuffs, hose and shoes, faded red? Just a suggestion.

Mr. Umshler's big Marmon, or whatever it is, should be standard in color, and then we would know it before he slows down when on a visit to our metropolis. Mr. Brumley would aid us in finding his habitat in that constantly growing community of Flosmoor did he adopt the standard color. Mr. Clift could be discovered at Olympia Fields more readily did he not deviate from the standard color in his habiliments. Mr. Thompson and his right bower, Gillam, when taking a peep at how the dirt is flying out here, would not slip through our local news so easily did they wear standard colors. We know John Doheney's walk a mile or more, and he could not help us out much. Judge Drennan, in action, needs no assistance, of course, in getting one's lamps trained on

him. Mr. Tarbet's office would aid us very much by notifying us from afar, allowing us time to screw up our courage and prices on land he might want. Not fair to get a man off his guard when asking him for a price on land. We have two prices on land in Matteson: One, Christian dealing with another; few exhibitions along this line, however. Another, price to the Illinois Central.

Mr. Hanley would be unable to get by and set another pump house on the bias if we saw him coming. The sandbag artists at Springfield would be able to keep a weather eye on Mr. Pelley. The fellow who stumps his toe a mile from the Illinois Central right-of-way would be further aided in finding Mr. Hull did he wear the standard colors. The lame, the sick, the halt and the blind would be assured more readily they were in the presence of Doctor Dowdall. It would enable the tough guys to keep out of sight of Mr. Keliher. Scotty, wearing the regulation, would have us know we had arrived at the point where the Central Station should be and it was time to get off, the end of the line. Mr. Lanigan should make our commutation tickets between the metropolis and down town of standard color and standard

INKID SAYS—

price. And he will. A dress suit at Olympia Saturday nights would be more becoming, however, than the standard color on Mr. Lanigan. All Illinois Central stenographers in standard colors—heaven and earth, defend us! Mr. Markham in his office—well, really, that would be carrying the color scheme entirely too far, and we would not suggest it for the president of a great railway corporation like the Illinois Central. This color scheme or standard color has two sides to it, perhaps. And perhaps not. Some day when we are feeling well we may have a word to say in the way of constructive criticism on this standard color question.—Matteson (Ill.) *Journal*, July 20.

Our Embarrassing Station Names

Towns along the Illinois Central, west of Freeport, are of the feminine gender, to wit: Lena, Nora, Elizabeth, etc. This explains the trouble a traveling man got into recently, as told by the editor of the *Hanover Journal*: "A traveling man who makes this town from Chicago said a few days since that a few days ago, while coming west from Freeport on the Illinois Central, he went to sleep. In telling his wife about the circumstances he said that he fell asleep after leaving Freeport, and when he awoke he found himself between Lena and Nora. He had to get an atlas and point out the geographical location of these two towns before he could convince her that everything was all right."—Forreston (Ill.) *Journal*, August 9.

Some Mighty Cu-rus Feelin's!

When a boy, in the early '60s, I was at a trial, in the old courthouse, of a fellow who was charged with sheep stealing. A neighborhood whose people had undergone many deprecations, having lost corn, poultry, now and then a hog or sheep, had trailed the defendant, and was active in his prosecution. Old George McC—, who was of a somewhat irate nature, was the defending counsel. An old resident, Uncle Tommy E—, was a witness, but not anxious to say too much.

Old Mac asked him, on cross-examination, about what he knew of the case.

Uncle Tommy said, "Don't ax me, Mac, fer I've got some mighty cu-rus feelin's."

Old Mac kept pressing his question, and Uncle Tommy repeated his answer three or four times.

Finally old Mac roared: "I don't care about

your feelings. I want you to say what you think in plain words, or say you don't know anything about the case or against the defendant."

"Well, if nothin' else'll do you, Mac, I don't know much about this case, but I've knowed this man [the defendant] some time in our part of the kentry, an' I never seed him at work, and somebody's been takin' things without leave, an' I wouldn't put it a durned bit a-past that chap [pointing toward the defendant] to take a sheep or enny-thin' else he cud git holt of if nobody wuz a watchin' 'im. I told ye, Mac, to not ax me, fer I had sum mighty cu-rus feelin's!"

The culprit was convicted.—F. TOSSEY, *Local Attorney, Toledo, Ill.*

Not Wholly Degenerate

Count Armand Du Bucamp, the Belgian publicist, said the other day in an interview:

"When I hear of any good thing coming out of Germany I wink my eye and think of the story about the lawyer.

"'Gents,' a fat man said in a hotel smoking-room, 'I hate to hear you lambasting lawyers the way you've been doing. A lawyer last year made me a present of \$150.'

"'Yes he did!'

"'Come off!'

"'What are you giving us?'

"But these gibes and jeers didn't move the fat man.

"'It's the solemn truth, gents,' he said. 'You see, I was injured in a railway accident last year, and this lawyer sued the railway company and got \$5,150, but he didn't say a word about the \$150 balance. He made me a present of it.'"—*Exchange*.

The Beach and the Beach Nuts

There is surely a strain of the primitive in each of us. Witness, the beach, and the attendant annoyances, the beach nuts—a varied species indeed. Whether it is a reversion to type or something else, it is undeniably a strong impulse that moves the scrawny, impoverished-looking individual with door-knob-like knees and a 2-by-4 chest to strut about and give the ladies a thrill by an opportunity to behold his manly form and his evident display of "force restrained."

Then there is the fat man, who, ordinarily, is the butt of many jokes directed at his obesity. He, too, must parade and

skirt and stockings, and virtuously wraps herself in a long bathing cape, lest the horrid men see her—ahem—"limbs."

A thrill indeed is afforded when the up-to-the-minute flap-ette races across the sand, her bobbed locks parked in a flaming cap, and her slim body adorned with the skimpiest of bathing suits. She is an economist and believes in saving material—every scrap counts. Shades of our Colonial grandmothers! How she would have been tanned (and not by the sun) for such indecent dress. She swims like a fish until some handsome athlete appears—then she cannot even wiggle and has to be held up and taught each stroke. The envy of her less slender sisters is she. Such epithets as "bold stump" and "hussy" are flung in her direction, but she only tosses her bewitching head and cries "Meouw!" at her enemies.

The fat man's sister, the fat girl, is a heavy subject for discussion. Her entry into the

show these people that there is something to the man of proportions, strength, endurance, vigor, etc. He looks with disdain at his Lilliputian brother with the door-knob knees, and receives in turn an overt glance of appraisal, culminating in a derisive smile. The fat man's day is utterly ruined, and he feels too bulky for his own good. The dapper door-knobs continue to lift 'em up and put 'em down. Hail the conqueror!

Ah! The athlete—there is a man's man. He comes with lithe strides—an inspiring figure, the sun playing upon his bronze skin and herculean shoulders. Music to his ears is the feminine gasp of admiration which greets his approach. It matters not that he is a giant from his feet to his collar bone and a baby doll from his neck to the top of his perfect Greek head. Brain and brawn seldom ride in the same carriage, and why sigh for brains when one's physique is a song without words?

There's the angular maiden who looks askance at bare legs. She wears the passé

lake produces a tidal wave on a small scale. She is proud of her dimpled knees, and, like the fat man, boasts that fat people are always good-natured. She is generally alluded to by her more fortunate (physically) sisters as "porpoise."

One might go on *ad infinitum*. The beach is like unto a circus. There's the fat lady, the chimpanzee, the gorilla, the woman with the pipe-stem lower appendages, the girl whose bathing costume could be used as a postage stamp, and a great company of clowns—to say nothing of the merry picknickers who throw bottles and cans on the sand, with gay abandon, for some unsuspecting victim to walk or sit upon.

A practical hint, dear readers: Before repairing to the beach, consult the friend who never lies—your mirror—find your proper classification, then in a carefree frame of mind proceed to the beach, check your conventions, and have a good laugh at the expense of your fellows. The beach is the limit! Ask the waves.

Favors Unit System of Storing Material

By J. R. STOKES,

Stock-Keeper, Memphis, Tenn.

THE unit system is not a new one, although there has been little written about it. It has been placed in practice at the Memphis storehouse for storing engine castings. The photographs give a general idea of the raised unit platform constructed upon a plank foundation or platform. The wooden platform was originally constructed for storing engine material, but is not recommended, as a cinder foundation, using a mixture of borings and salt in the aisles, will form a composition hard and durable that will outlast timber and provide a smooth surface. It is also inexpensive. In the event cinders are used as a foundation, it is suggested that the lumber

for construction of the units should be treated in order to prevent decay from moisture.

The unit platforms shown are slightly more than four inches in height, which was found to be practical after careful study of loading and unloading heavy materials. The truck, when lowered, will allow the item to rest on the unit platform in such a position as to make the handling or placing a simple matter. The width of the unit is fifty-four inches, which is sufficient to allow storage of a double row of the heavier items on each without loss of space, as will be noted from the views. The length of the unit depends upon the dimensions of the foundation for which it is intended. The trucking aisles between units is three feet, which is practical and conforms

Casting platform prior to unifying.

with store department standards. The main aisles are 5 feet 6 inches wide to allow space for vehicles, especially in the event of store delivery.

After taking into consideration the cost of lumber, durability, etc., it was found that crossing plank 4 by 10 by 16 of common rough yellow pine would construct the best, yet cheapest, unit. This was due to the fact that it would merely require the board to be squared, whereas, if lumber of lighter construction was used, the additional labor cost would more than offset the price of the material involved. The 4-by-10 rough is slightly more than ten inches in width. If a small space between planks is allowed for drainage, deterioration is prevented, and five boards will make the unit fifty-four inches wide. The five planks are tied together by a 2-by-4 nailed securely to each end and flush with the top. The 2-by-4 dressed is slightly less than four inches wide. Since the 4-by-10 is a little more than four inches thick, a space

of about $\frac{3}{4}$ inch near the floor is left to complete drainage.

The unit system can be used to advantage in storing engine and car castings that are too large and heavy to place in standard bins or racks; also in storing frogs, switches, guard rails and other track materials, as well as items that are purchased in kegs or other uniform containers. The advantages or savings of the unit platform can be measured only by the amount of time expended in loading and unloading materials, which in a sense governs the size of labor gangs. The checking of stock quickly and accurately is a feature which is also made possible. Other considerations are the time saved by shop labor, affecting the number of laborers employed, also the speed obtained by shop delivery in getting the material to the proper location, preventing lost motion on the part of shop mechanics.

The use of unit or raised platforms makes it impossible to choke up the aisles and allow material to hang out or be placed in such a

Showing units with enclosing racks

Section of Grate Platform Showing units.

manner as to impair the safety of employees. The material must be properly stacked and grouped. An item placed in the wrong location can be detected at once.

The entire platform presents a neat and uniform appearance. It is surprising to note

that, even with numerous trucking aisles, the material covers less space than before the unit platforms were installed, as is shown by the photographs. The unit platform is without a doubt one of the most progressive steps in modern store-keeping.

The Railway Crossing—A Timely Parody

The following verses, entitled "The Railway Crossing—A Timely Parody," appeared in the Peoria (Ill.) Sunday Journal Transcript, together with a short warning relating to care at crossings:

I can't tell much about the thing;
'Twas done so powerful quick;
But 'pears to me I got a most
Outlandish heavy lick.
It broke my leg and cracked my skull
And jerked my arm 'most out.
But take a seat; I'll try and tell
You how it came about.

You see I'd started down to town
With that 'ere truck o' mine
A-haulin' out a load of corn
For Ebenezer Kline,
And drivin' slow and careful like—
'Cause 'bout a week before
I broke a' spring and blew a
tire,
Which made me mighty sore.

You know about the railroad
line
Crossroad at Martin's Hole?
Well, thar I see'd a great big
sign
Raised high upon a pole;
I thought I'd stop and read the
thing
And find out what it said,
And so I stopped the old bus on
The railroad track and read.

I aint no scholar, recollect,
And so I had to spell;
I started kinder cautious like
With r-a-i- and l.
And that was "rail" as clear as
mud,
And r-o-a-d "road."
I lumped 'em—"railroad" was
the word.
For that 'ere much I knowed:
C-r- and o and double s with
i-n-g to boot
Made "crossing" just as plain
as Noah
Webster dared to do it.

'Twas "railroad crossing." good
enough,
L double o-k "look"—
And I was lookin' all the time
And spellin' like a book.
O-u and t. spells "out," and
"for"
And "the" were not so tough;
'Twas then "look out for the"
—"for the"?
I tried the next word, e-n-g-
That's how it started, certainly.

I got that far when suddenly
There came an awful crack—
A thousand fiery thunderbolts
Just scooped me off the track;
The auto went to Davy Jones;
The corn was ground to mash,
And I was hoisted seven yards
Above the tallest ash.

I didn't come to life again
For 'bout a day or two,
An' though I'm crippled up a heap
I sorter struggle through.
It ain't the pain;
It ain't the loss
Of that 'ere boat o' mine;
But, stranger, how I'd like to know
The rest of that 'ere sign!

ACCIDENT AND

INJURY PREVENTION

Minister Drives Home Points on Safety

The following is from an address which the Rev. Walt Holcomb of Cartersville, Ga., recently delivered before a safety meeting in Boston. Mr. Holcomb is a son-in-law of the late Rev. Sam Jones, the well-known evangelist.

AS a minister, I shall ask the privilege of taking a text, "Is the young man, Absalom, safe?" This is a radio call of the heart for the welfare of one bound to another by the ties of family affection. It is also the war cry of a solicitous father for the personal safety of his son on the battlefield.

Man has never felt himself absolutely safe, but has an ingrained instinct to make himself as safe as possible. And yet, notwithstanding that self-preservation is the first law of nature, there is an inborn impulse in man to take a chance. The people living in the mountains of Old Kentucky can still be found prowling around their native hills with their rifles under their arms, while their trained eyes are on the alert for their feudal enemy. We are thoughtlessly running risks when limb and life are involved.

Safe One Moment; Dead, the Next

Here is the paradox of safety. At one moment, we are the calm, cautious, careful Doctor Jekyll; and, the next minute, the careless, criminal, chance-taking Mr. Hyde. We are swallowing thrill pills, and in our forgetfulness we are overtaken by the great final accident, death, as a result of an overdose. Many an automobilist, just for the thrill of racing with a street car, has left the street red with the blood of helpless childhood or decrepit old age. Just for the thrill of scaling across the track in front of a limited train, the reckless driver has been picked up on the right-of-way, bruised and mangled, weltering in his heart's blood.

If we could dig up the broken bones of every victim of such avoidable accidents, we could station a grim, hollow-eyed, bony-fingered skeleton at every highway crossing in the coun-

try as a frightful warning against carelessness.

When man began to think of the safety of his fellow man, he placed around himself the surest safeguards. This was the first forward step in personal safety. It used to be said that employers did not care for employees except for the work they did, and that the employees cared only for the pay envelope. But that day is past in railway circles, and officials and laborers are now thinking of the personal good of one another. There is a friendly rivalry be-

tween executives and those who toil to see which can play the safest. Organized safety has done more to bind employers and employees together in the bond of brotherhood than any other movement since the Galilean Carpenter proclaimed the brotherhood of man.

Safety Essential in Railroading

Is there safety in the railway realm? Railroading is considered one of the most hazardous callings. The official and clerical workers have paid the supreme penalty. The operation of trains has entailed the loss of limb and life. The section hand has paid the toll of life. The shopmen have suffered the loss of sight and life. The trespassers have been struck by trains and killed. Railroads are safe to ride upon and unsafe to walk upon. I never see a fellow beating it down the track between the rails, when there is a good pike to follow, without pointing my finger at him, saying: "There goes sin on two legs." There is no discounting the hazards associated with the life

of a railway man. To recognize these is to arm yourself with necessary protection.

Yes, I answer, there is safety in railroad-ing, but it must be practiced here as elsewhere. With all the safety appliances and devices of modern railroading, if safety is observed constantly—and not by spurts and spells—a man may die, a natural death while in the service of a railroad.

While the trainmen are playing safe, the public is criminally careless. The officials who order the movements of trains and the trainmen who run them are painstakingly safe. But the general public must be aroused to its danger and citizens to their duty. Safe operation has been instilled in the minds of those who run railroads. This "Safety First" work is entirely a humanitarian movement, and if a utilitarian side has developed this is only one of the many good by-products that has resulted.

Everybody rides on the trains. The traveling public seems to take safety for granted. Travelers are careless in getting to and from trains; off and on trains; standing on platforms and leaning out of windows while the train is in motion.

Place the Proper Value Upon Life

We will never play safe until we put the proper value upon life. If man is no better than a sheep, run over him and let the company pay the market price. If man is no more than a machine, break him and let the company replace him. As the inventor is superior to the invention, so is man superior to a machine that he makes or operates. The most priceless gift is human life, and when it is snuffed out it can never be replaced. There is not enough money in the treasuries of all the railroads to compensate the widow and orphans for the loss sustained in the avoidable death of a father. Railway companies realize this and prefer to spend money in preventing accidents rather than trying to pay for what they cannot repay and replace. It does not matter whether a man wears broadcloth or overalls; eats porterhouse steak or liver; drinks coffee or postum; but it is of immense concern that his life is preserved and conserved. The monumental crime of the age is the carelessness that puts out the light in the Temple of Life.

The philosophy of safety is constant, continuous and continual thought. You cannot afford to be off your guard a single minute. If your mind is loafing up town, while your hand is at work, you are liable to have your hand crushed while your mind is away. The mind

should be the director general for every movement of your body. If you are a rattle-brained thinker, you will be a rattle-brained worker. If men in the shops and offices and on the trains and the track would get the safety habit, it would not only prolong their days, but would be the best financial investment, as they would become more efficient, command larger salaries and make more careful investments with their hard-earned money.

Reminder the Psychology of Safety

As a woman's inner character and innate modesty cast about her a veiled safeguard that protects her virtue in this full-fledged flapper age, so the inner working of a trained mind, when applied, is the best safety appliance for the protection of a man's sight, limb and life.

The psychology of safety is reminder. The safety signs, signals and slogans displayed throughout Boston and New England today are silent and eloquent reminders of caution and carefulness that involuntarily impress the mind and unconsciously order the eye, the hand and the foot.

While I am speaking here in this historic statehouse, where many good laws have been enacted in the interest of safety, let me remind you that unless public sentiment is created the ideals of these laws can never be realized in this commonwealth. The chameleon of carelessness crawls around and changes its color according to the sentiments of its surroundings.

We can make a tremendous pull for safety when we remind those who are in danger of their love for life, since everybody wants to live and provide for and protect his own. The first articulate prayer of a little child, as it kneels as its mother's side, where the wifely and motherly love clamor for supremacy, is in behalf of our safety, as the child says, "God take care of papa." With such prayers bottled in Heaven, how can we be careless on earth? For the sake of the little wife and the outstretched baby arms that hugged our neck upon our last return home, let us go slow and be safe, so they will not be robbed of our visits and be forced to visit us in the silent city of the avoidable dead.

Careful Driver a Safety Factor

However, man is in the greatest jeopardy at the grade crossing. Grade crossings are almost as frequent as mile posts. Automobiles are approaching in an ever-increasing stream. To eliminate the crossings is a physical impossibility. If it were possible, it would require

as much money as it did to build the roadbed. The roads cannot make operating expenses, much less undertake such a stupendous monument to protect the public from unnecessary carelessness. If the railroads would put gates at crossings, they would have to be about three deep to keep some dare-devils from colliding with the passing train. The public highways might raise a bump in the dirt road near a crossing, but the general public would scarcely stand for it. Automatic signals are not always reliable; they would be very little better than the clanging bell and screaming whistle which the law requires and the engineers enforce. You might hang up the scraps of wrecked automobiles at the grade crossings and dig a graveyard for the unfortunate dead and erect tomb-stones as a warning to others. "But if they hear" not Moses and the prophets, they would not be persuaded though one rose from the dead."

This is one place where accidents are preventable, but it does not lie in safety devices or with the engineman and fireman, but with the man sitting up at the steering wheel of the automobile. If the chauffeur would be as careful at the wheel as the engineer is at the throttle, such accidents would be reduced to a minimum. Why should he not be? His carelessness not only may result in his own death along with the deaths of those in his car but it may wreck the train, causing great property loss, unnecessary damage claims, killing the engineman and fireman, along with a great many passengers. But the blame always falls on the railroad. As a result of such accident, an engineer was recently indicted by grand jury for manslaughter, when I thought that the coroner's jury should have been all that was necessary to announce that the automobilist had come to his death as a reckless suicide. Of course, they say that the big mogul ought to stop and let the tin lizzie go by, but law and custom have not so decreed.

Cross All Crossings Carefully

"Stop—Look—Listen," the warning words on the railway cross, if heeded, would solve the problem. As I travel throughout the nation, I am preaching to the public to cross crossings carefully. Here is where I can save property for the railroads, life for human beings, and sorrow for those who otherwise would be bereaved of their loved ones.

As you approach crossings, look with both eyes; listen with both ears; stop with both

feet. It will not take but a second, and it may save you an eternity. A lady friend was out driving with her mother, friend and children. At Eddy's crossing the train comes out of a deep cut and cannot be seen from the pike, making a very dangerous crossing. Her car came rolling over the hill and went spinning down grade toward the track; when near it she applied her brakes and stopped the car. She told her little daughter to get out and look both ways for the train, but, before the child had time to open the car door, the big passenger engine dashed out of the cut and went crashing by. The other women screamed and exclaimed: "Oh, how near we came to being killed!" But the cool, calculating and careful driver smiled and said: "We were in no danger whatever. I always stop my car at a grade crossing."

If every automobilist would practice such caution, there would be no more accidents at grade crossings.

Stopped a Runaway Team

Stopping a runaway team is all in the day's work for Engine Foreman Joseph Clemens of Chicago. On January 30 Clemens' engine, while heading into the Pier Yard, frightened a team hitched to an empty wagon. The animals

headed for Lake Michigan at a gallop. Clemens "hopped" the rear of the wagon, hurried to the driver's seat and tried to pinch them down. The horses, which had been feeding, had no bridles on, and Clemens' efforts were of little avail. He then put all his strength on one rein only, pulling the animal's head so far to one side that it had to stop running in order to breathe. A short distance more, and the team would have been in Lake Michigan.

Clemens is the kind of employe who believes in forestalling a claim rather than making a report later.

Joseph Clemens.

Some Rights That Labor Has and Hasn't

Privileges of Unions Are Those of the Individual Member, and No More; Certain Simple Economic Facts

By THOMAS GIBSON,

From The Financial World, New York

WHEN a case is tried in court the lawyer for each side presents his arguments in such a way as to make his opponent appear wholly in the wrong. This practice results in claims and counter-claims, accusations and counter-accusations which are very confusing to the layman. But there are certain principles on which our laws are based and the root of all these principles is *justice*.

This truth applies to all great controversies, and the only way to decide intelligently which side is right is to examine the basic principles. The main principles which apply to the labor situation may be set forth briefly and simply.

The Rights of Organized Labor

The rights of organized labor may be expressed in a single sentence:

The rights of the union are the rights of the individual member and cannot possibly exceed such rights.

If an individual quits his job, no one can prevent such action. But society can and does object to his interfering with the man who fills his place. This is true of two men or of two million men. Principles cannot be changed by multiplication.

If this were not true, men could combine to do almost anything which the laws do not permit the individual to do.

The right of labor to combine for self-protection, collective bargaining or any other legitimate purpose is not denied. The right of such combinations to prevent others from working where and on whatever terms they please cannot possibly be admitted. Such a privilege would lead first to a most vicious form of monopoly and finally to anarchy. Members of a union who can by peaceable means induce others to join their ranks are within their rights. Members of a union who forcibly constrain others to join them or to adhere to their rules are outside the law.

Real wages consist of the amount of goods which are exchanged for a certain amount of

labor. Nominal wages consist of the number of dollars exchanged for a certain amount of labor. Real wages are the only wages which count. The nominal wages of the Russian worker are now thousands of times higher than ever before, but his real wages are so low that he is facing starvation.

Failure to understand the difference between real and nominal wages has caused much trouble. The principal argument of the union leaders in connection with the shopmen's strike was that the Labor Board had fixed a rate of 23 cents an hour for common labor, which was not a living wage. The fact is that 23 cents an hour was the rate named in certain districts where cost of living was very low. The average rate for this class of labor was fixed at 32.7 cents and the maximum rate at 35 cents an hour. But the point is *that the rate of 23 cents is just as high as the rate of 35 cents*, so far as purchasing power is concerned, and purchasing power is the only thing that counts. The man who moved from the 23-cent district to the 35-cent district would be no better off. This is a good example of the confusion of thought arising from failure to realize the difference between real wages and nominal wages.

What Doubling Wages Means

If the price of living rises, so must nominal wages rise. If the price of living falls, so must nominal wages fall. The rule must work both ways. If, to draw a broad example, the price of living should double, the worker who receives \$3 per day must have \$6 per day in order to maintain his purchasing power. But if the price of living returns to the original starting point and the worker insists on retaining the wage of \$6 per day, what he demands *is that real wages be doubled*. That is, he demands in exchange for his services twice as much goods as before. If this is granted, other classes must suffer. The total product of society is divided among millions of people, and if a certain class gets more than its share other classes must get less than their share. That is as certain as that two and two make four.

The objection may be raised that certain

interests always get more than their share. This is a fallacy arising from a widespread misunderstanding of the functions of capital. There is not space here to enter upon this phase of the subject, but in another article I shall show that the tendency is for capital's share of the total product of society to grow smaller and labor's share to grow larger from year to year. I shall also show that accumulated capital cannot be used in any manner except in giving employment to wage earners at a constantly increasing rate of real compensation.

Because wages must of necessity be based upon commodity prices a number of agitators have raised the cry that labor is being dealt with "as a commodity." This fine-sounding phrase is sheer nonsense. Money is merely a medium of exchange, and dollars cannot be measured in any way except by what they will exchange for. What the laborer consumes as well as what he saves is determined by exchange. A thousand dollars in the bank is merely stored up commodities. The agitators have merely twisted this fundamental fact around into a phrase which causes resentment only because it is misunderstood.

The Make-Work Theory

Many, if not most, wage earners believe they find an advantage in shirking and making a job last as long as possible. This is a great mistake. The total product of society is divided among all the people, and all but a small fraction of everything that is produced is consumed. Whenever the laborer curtails production he curtails his share of the **total production**. The biggest thing the laborer has to learn is that it is just as easy for him to get a large share of a large total production as a small share of a small total production.

This truth is obscured by the tendency of each man to individualize his position. It is hard for him to believe he loses anything by making the job last longer at the same rate of pay. But, as each man is only a part of society at large, he cannot escape the effects of reduced production. As this is an important point I will explain it a little further.

Let the wage earner ask himself why it is that he is now able to have more of the necessities and luxuries of life with less manual effort than at any time in history. Why has the laborer of today more than the rich man of a couple of centuries ago? The answer is "machinery"—the ability to produce many

times the amount of commodities with an equal amount of labor. When machines first began to come into general use the laboring classes objected to them, believing that they would throw men out of work. They did not at once realize that all of the greatly increased product of these machines must be distributed and consumed, and that, if labor did not have the means to secure its share of the product, the machines could not possibly be used. So widespread was the misunderstanding on this point that machines were actually destroyed.

Machinery Multiplies Production

If we assume that there are ten men on an isolated island and that each man must work all day for mere food and shelter, we have a picture of the original state of society. But before long one man invents a bow and arrow and is able to secure meat for all. Thus the onerous labor of nine men is released. Later on one of the nine men invents a wind-mill or water-wheel to grind corn, and more labor is released. And so on until these men have for their daily efforts *ten times as much* as they had before. Here again the principle holds good if applied to thousands or to millions.

Now the advocates of the make-work theory are in exactly the same position as were those who objected to the introduction of machinery. In either case they seek to curtail the total product of society, of which each man is a part.

The reduction of the hours of labor below a reasonable point has precisely the same effect. If it takes three 8-hour days to make a suit of clothes and three 8-hour days to make a pair of shoes and the tailor and shoemaker agree to reduce the hours of labor to six hours, the inevitable consequence is that the tailor must now work four days for a pair of shoes and the shoemaker must work four days for a suit of clothes. Extend and multiply that example as far as you like and the principle involved will not be changed.

If organized labor, instead of seeking to curtail production, would make it a primary rule that every member of the union must deliver a fair day's work for a fair day's pay, the result would be that plenty would be diffused throughout the land. Incidentally, the employer of labor would insist on having nothing but union men.

In this much condensed discussion I have

referred only to *principles*. These principles, once understood, are as simple as they are unalterable. Those who attempt to pervert or controvert economic laws will fail, and their failure will fall as heavily upon themselves as upon others.

The employer of labor who tries to get more than his just share of the total product of society or who refuses to accord labor its legitimate rights will be swept aside. But in the present day and age competition and the laws protect the laborer fully as much as they do the employer.

The labor union which attempts to secure through its collective power an unfair share of the product of society will fail. If it attempts to gain its ends by force and violence it will be destroyed.

Economic laws are as inexorable as they are just. Those who tamper with them, whether laborer or capitalist, whether individual or union, will get the same results as if they were to try to stop a mighty engine by sticking their fingers in the cog-wheels.

Plan Is to Encourage Travel in America

Aroused by the United States government's exploitation of foreign travel, the railroads, hotel men, resort owners and tourist associations of the country are planning a joint campaign to "Sell America to Americans" and to encourage the American people to "See America First."

This concerted plan of action was decided upon following the appearance of an elaborate, profusely illustrated booklet prepared under the direction of the United States Shipping Board entitled "Going Abroad," which describes the attractions of European travel to lure people across the ocean. In the government booklet it is pointed out that "250,000 will journey to Europe, South America or the Orient within the next twelve months."

It is the purpose of the "See America First" advocates to stem the tide of this tremendous efflux to foreign shores and induce Americans to learn something about the beauty, grandeur of scenery and travel attractions of their own country before going abroad.

Alarmed by the propaganda which will tend to increase travel to other countries even beyond this 250,000 mark, the "See America First" adherents have decided to join forces to keep this great army of tourists in this country and give to American business the billion dollars—a conservative figure—those travelers will spend abroad in a year.

Chicago has been selected as the scene of action in this battle to keep Americans and American money in America. The initial step will be the holding of a National Travel and Outdoor Life Exposition, May 7 to 12, 1923, inclusive, in the Coliseum, which will visualize in picturesque style travel in America by rail, water, air and automobile to the playgrounds

of America. Chicago was chosen, according to Milo E. Westbrooke, general manager of the exposition, because it is the gateway to these wonder spots of the United States.

"An illustration of the tremendous trend of travel abroad," said Mr. Westbrooke, "is shown in the records of the steamship lines, which disclosed the fact that on June 10 of this year ten thousand tourists sailed for Europe. While the booklet issued by the United States Shipping Board has for its prime object the encouragement of prospective tourists to utilize government owned ships, the travel propaganda contained in it is most alluring pictorially and in word description of the attractive spots of Europe and the Orient. That is why it is felt that something must be done to induce the tourist to see his own country first and keep the billion dollars or more those 250,000 tourists spend in our own country, where it is needed in this time of business reconstruction.

"Chicago was chosen as the logical place for the holding of this National Travel and Outdoor Life Exposition, because this city is the gateway to the playgrounds of America. Within a night's ride of Chicago are fifty-five million persons, and no cross country traveler even rides through Chicago. They all stop in Chicago on the way to their destination."

An advisory committee, composed of railway and steamboat executives, hotel owners and tourist associations, will supervise the exposition designed to stimulate American travel. An elaborate program is being drafted which will picture to the recreation seeker just what this country has to offer in its wonderful playgrounds. In the words of Mr. Westbrooke, this exposition will be "a market place for recreation."

Smart Sayings of Our Babies

Out of the mouths of babes come surprisingly clever sayings. It has been suggested that along with pictures of Illinois Central babies we devote some space to their smart sayings. Our readers are requested to send in the smart sayings of the babies so that we may print them. Address EDITOR, HOME DIVISION.

Miss Olive O'Reilly, stenographer in the law department, Chicago, contributes the following:

Her niece, Eileen, 2½ years old, and nephew, Billie, 4 years old, quarrel frequently while playing. Eileen is a pugnacious little individual and takes full advantage of the fact that Billie has been warned not to return the blow if she slaps him. Sometimes this is more than Billie can stand. The other day he forgot mother's admonitions and slapped Eileen, whereupon he was punished and told that he must never hit a little girl. Later in the day, after a spell of deep thought, Billie broke out with: "Mother, when will Eileen be big enough for me to hit her?"

Aunt Lillian had had her eyebrows "plucked." Little Marian stood at her aunt's knee, staring up into her face.

"What's wrong, dear?" Aunt Lillian asked.

"I don't know, Auntie, but you look so surprised!"

Kissing the Baby

We feel an almost irresistible though perfectly natural impulse to kiss and caress every baby we see. We like the feel of his satiny cheek against ours. But for the sake of baby's health we should be careful not to touch his rosebud mouth. A heartbroken mother recently told the story of her baby's death of scarlet fever, contracted when a friend of the family, a nurse who had just come off a fever case, picked up the child and kissed her on the mouth. Disease germs lurk in the mouth, nose and throat. The helpless baby must quake inwardly when well-meaning but thought-

less old gentlemen with beards and elderly ladies with defective teeth swoop down upon him. Don't indulge in the dangerous practice of kissing the baby on the mouth. You may like it, but the baby does not.

Helpful Hints

A small quantity of milk added to the water in which sweet corn is boiled will prevent its turning yellow.

To make pastry and pie crusts brown and glossy, brush over with milk just before putting into the oven.

The housewife saves backache from stooping if the kitchen sink and the work table are high enough so that she need not bend over to perform the daily tasks. A high stool is almost indispensable in the kitchen.

A preparation of honey and almond cream will relieve the smart of sunburn.

A tablespoonful of ice cream shaken up with a glass of ginger ale makes a refreshing summer drink.

The harder the times, the closer the real man and woman stick to the job.

Tested Recipes

CHICKEN CROQUETTES.—Mix together 2 cups chopped cooked chicken, ¾ cup thick white sauce, ½ teaspoon salt, dash of paprika, ¼ teaspoon celery salt, and 1 teaspoon lemon juice; stir in 1 egg yolk. Shape, roll in cracker crumbs, dip into slightly beaten egg, roll again in cracker crumbs, and fry in deep, hot fat.—MISS VERNITA TRIBBLE, *Tennessee Division*.

WAFFLES.—1¾ cups flour, 3 teaspoonfuls baking powder, ½ teaspoonful salt, 2 tablespoonfuls sugar, 1 cup milk, yolks 2 eggs, whites 2 eggs, 1 tablespoonful melted butter. Mix and sift dry ingredients; add milk gradually, yolks of eggs (well beaten), butter, and whites of eggs (beaten stiff). Cook on greased waffle irons. Serve with maple syrup.

JIFFY ICING.—To 2 tablespoonfuls of hot milk add ½ teaspoon butter; stir in slowly

1½ tablespoonfuls granulated sugar to make right consistency to spread; add ½ teaspoon vanilla; spread on cake after it has cooled.

PEACH TART.—Line a pie tin with pie crust, as usual. Lay quarters of peaches in the paste, around and around, placing them evenly and closely so that no one piece overlaps the other. Break ten peach stones and arrange them evenly on top of the quarter pieces of peaches. Make a syrup by boiling 1 cup of sugar with 2 tablespoonfuls of water until it threads. Pour this syrup over the peaches. Put a lattice of narrow strips of pie crust across the pie, four each way, and bake.

MRS. ROSE SOEFFNER INGMAN, who before her marriage to Pern Ingman was employed in the engineering department at Chicago, has been lending a hand in the bridge and building department during the vacation season. Mrs. Ingman manifests an interest in the Home Division by contributing the following excellent recipes:

BLITZ TORTE.—Beat 1 cup butter with 4 egg yolks and ½ cup sugar; add 4 tablespoonfuls milk, 1 teaspoonful lemon flavoring, 1 cup flour* and 1 teaspoon baking powder. Pour the mixture into 2 layer cake tins. Cover one layer (to be used as the top) with frosting made as follows: Beat whites of 4 eggs to a froth and add 1 cup powdered sugar. Sprinkle with sliced almonds. (The frosting is to be spread over the cake mixture before baking.) Bake both layers in a slow oven. Remove the layers when done and put together with a filling made as follows: Cook until

thick 1 cup milk or cream, 1 tablespoon cornstarch, 1 egg, and 2 tablespoonfuls sugar. Flavor with lemon.

ORANGE SPONGE.—Dissolve 1 tablespoon gelatine in ⅓ cup cold water. Add ⅓ cup hot water. Cook until it begins to thicken. Remove from fire and add 1 cup orange juice, 1 cup sugar, and whites of 3 eggs, beaten stiff. Fold in ½ pint whipped cream. Put in refrigerator for three or four hours.

OUR BABIES

Here are two representative groups of our babies. We are glad that we are not conducting a beauty contest, for it would be next to impossible to make a selection. After an inspection of the pictures received to date, we can safely say that there isn't an "ugly duckling" in our large family.

No. 1 is Dorothy Hester, 18 months old, daughter of Clarence May, assistant chief clerk to Superintendent Shaw, Clinton, Ill.

No. 2 is Dorothy, 16 months old, daughter of H. P. Liston, chief clerk, Bloomington, Ill.

No. 3 shows Mary Virginia, 2 years old, and Treva, 2 months old, daughters of Conductor Trevor Wayne, Tennessee division, Fulton, Ky.

No. 4 is Blanche Ruth, 3 years old, daughter of Operator W. Stallions, Scales Mound, Ill.

No. 5 is Minnie May, 4 years old, daughter of A. H. Morton, chief clerk of revising bureau, local freight office, Louisville, Ky.

No. 6 is Marjorie Jeanne, 2 years old, daughter of W. L. Sheffler, agent, Washta, Iowa.

No. 7 is Mary Elizabeth, 7 months old, daughter of R. W. Rhue, stock-keeper, Palestine, Ill.

No. 8 is Irma Louise, 6 months old, daughter of Fireman H. C. Reedy, Louisiana division.

No. 9 is Garnet, 4 years 3 months old, daughter J. A. McMurray, engineer, Wisconsin division. In November, 1920, Garnet won fourth place in the Chicago Herald & Examiner "better baby" contest.

No. 10 is Joan, 2 years old, daughter of P. C. Mayer, office manager, purchasing department, Chicago.

No. 11 is Mina Conrad, 4 months old, daughter of D. G. Belton, clerk to Supervisor J. Crahen, Memphis, Tenn.

No. 12 is Lenor Tobey, 4 years old, daughter of Night Foreman Owen D. Minter, Fort Dodge, Iowa.

No. 13 is Barbara, 5½ years old, daughter of Dr. O. D. Diehl, local surgeon, Centralia, Ill.

No. 14 is Mary Ruth, 8 months old, daughter of J. A. Johnson, section foreman, Leland, Miss.

No. 15 is Ilda, 3 years 5 months old, daughter of B. F. Galvani, chief clerk, Vicksburg, Miss.

No. 16 shows Grace, 4 years old (standing), and Virginia, 5 years old, daughters of Supervisor G. H. Peacock, Grenada, Miss.

No. 17 is June, 3 years old, daughter of Passenger Flagman D. G. Grimsley, Illinois division.

No. 18 is Bobbie, 3 years old, son of D. J.

Jones, mechanical assistant, building department, Chicago.

No. 19 is Bob, 2 years old, son of Fireman Harmon Buckley, Minnesota division, and grandson of W. L. Buckley, city passenger and ticket agent, Waterloo, Iowa.

No. 20 is Leonard Arthur, 2 years 2 months old, son of Section Foreman W. E. Palmer, Edna, Iowa.

No. 21 is Richard, 4 years old, son of W. K. Reynolds, mechanical inspector, building department, Chicago.

No. 22 is Charles Hughes, 9 months old, son of Trainmaster H. W. Williams, Fulton, Ky.

No. 23 is Frank P., Jr., 22 months old, son of Frank P. Kennedy, chief clerk to chief special agent, Chicago.

No. 24 is Frank Merrill, 4 years old, son of W. J. Pease, clerk to Supervisor of Signals S. C. Hofmann, Champaign, Ill.

No. 25 is Morris, Jr., 4 years old, son of M. E. Kemper, chief clerk to Superintendent Roth, Mattoon, Ill.

No. 26 is Wilbur Edward, 3 years 9 months old, son of F. W. Moss, in charge of motor car shops, Greenville, Miss.

No. 27 shows Reeves Noble Ingram, 3 years old, and Joel Hunter Woods, 2 years old, grandsons of Road Supervisor G. R. Wilkinson, Sardis, Miss.

No. 28 is John Albert, 7 years old, son of A. W. Fowler, chief clerk, passenger department, Chicago.

No. 29 is Carl Francis, 5 years old, son of Conductor J. Burgess, Centralia, Ill.

No. 30 is Alvin, Jr., 7 years old, brother of Minnie May, No. 5 above.

No. 31 is Robert J., 5 years old, son of J. F. Riordan, supervising agent, Freeport, Ill.

No. 32 is Gordon Phillip, 3 years old, son of Brakeman G. P. Robertson, Louisiana division.

No. 33 is James William, 3 years old, son of Fred W. Plate, supervising agent, Clinton, Ill.

No. 34 is William Jeff, Jr., 32 months old, son of Conductor W. J. Thurman, New Orleans division, Y. & M. V.

Composer From Illinois Central Family

The composer of "Stumbling," one of the year's sensations in popular music, is Zez Confrey, brother of two members of the Illinois Central System family at LaSalle, Ill. William F. Confrey, his brother, is chief clerk in the office of Freight Agent J. M. Egan, and a sister, Miss Margaret Confrey, is a stenographer in the same office.

Zez is the name by which young Mr. Confrey—he is only 25—is known to the musical world; he was christened Elzear. His rise to fame has been rapid. About a year and a half ago he went to New York from Chicago, virtually unknown in New York music circles. In Chicago he had gained considerable reputation as a maker of rolls for player-pianos and as a song writer of promise. Soon after his appearance in New York he placed some of his compositions with publishers of popular music, among the best known of which are "Greenwich Witch," "You Tell 'Em, Ivories," and "Kitten on the Keys." In Chicago Confrey had worked out the melody for "Stumbling," and in New York it was set to a lyric last spring and placed with one of the largest publishing houses. It was a great success, and today it is one of the most popular fox-trots throughout the country.

Zez Confrey.

Confrey is an accomplished pianist, and he has recently organized his own orchestra with which he is making records for Victor. He recently completed a Brunswick contract, and his first records were the Q.R.S. piano rolls.

"Bill" Confrey, chief clerk at LaSalle, is well known among our people on the Wisconsin division. He went to the Illinois Central a dozen years ago after gaining some railway experience with the Milwaukee, and he has proved his ability as an office executive and a business getter.

The Confreys are a pioneer family in the LaSalle vicinity. The grandfather of the song writer and the chief clerk established his residence along the old Illini Trail in the days before the redskins had yielded up their claims to the land, and the story is recorded in the history of the community that Grandfather Confrey barely escaped scalping on one occasion when he attempted to rescue an Indian who was mortally wounded, as the blame for the redskin's death was fastened upon him by the half-breeds.

RAPID WORK WITH FREIGHT

Superintendent J. M. Walsh of the Memphis division reports the following 22-hour delivery of IC-30273, after being handled over parts of three divisions in Mississippi: Loaded at 1:30 p. m., July 26, at Crenshaw; moved to Lambert, ex. local 391; to Gwin, ex. 969; to Yazoo City, extra; to Silver City, No. 548; to Midnight, No. 47; placed for unloading at 11:30 a. m. July 27, at Midnight.

Railway Men

Class of 1950

CLAIMS DEPARTMENT

How a Section Foreman Helped

Last spring a mule was found dead on the right-of-way near Roxie, Miss. What looked like an attempt to perpetrate a fraud on the railroad was defeated by the care and attention displayed by Section Foreman N. K. Farr. Instead of digging a hole and rolling the carcass in and covering it up without giving the situation any particular attention, Mr. Farr, his suspicions being aroused, made a thorough investigation.

First, he noticed no signs that the mule had actually been on the track. The carcass was near the track, but it bore no evidence of having been struck by a train. There was a crushed place on its head which had the appearance of having been made by some blunt instrument. Careful search of the weeds and grass in the neighborhood finally disclosed a brake staff with hair on it similar to that on the mule. There were also the prints of a man's feet, along with those of the mule, leading from adjacent premises, down the bank and up to where the animal lay.

Mr. Farr at the time, however, was unable to get further proof that the animal had been killed by someone as indicated and left near the track with the expectation of a later claim that the mule had been struck by a train. The owner did not make a claim for several months. Possibly he was then under the impression that no one had any idea of the facts in the case. At any rate, a claim was eventually made, a lawyer obtained and suit filed. Trial was had in the justice court. Upon a showing of the facts as above recited, the justice found for the railroad.

Foreman Farr is undoubtedly entitled to much credit for the railroad's being relieved of payment for this mule.—E. W. S.

N. K. Farr.

vocation, as his father was a section foreman and he spent his boyhood days in a section house. He was born at Hamburg.

Mr. Farr owns his home, which is on a 2-acre lot, and is a fancier of pure-bred chickens and dogs. He considers the Ringlet Barred Plymouth Rock fowls the best. He paid \$1 each for the eggs his foundation

stock came from. The purchase was made from E. B. Thompson, Hucherman and Yarbor. He decided to raise the Barred Rock after trying several different breeds of chicks, he says. He is just beginning to raise registered bird dogs. He has two pointers and one setter, and hopes to have pups for sale in the near future.

"In regard to the mule case," he says, "the steps taken by me were not for any purpose except to get justice for the company and for the owner, if possible. But I guess we can't give him justice. I believe in giving justice to everyone, but when a person thinks he can pull a stunt like this one he has another thought coming. I'm never asleep on my job, and I don't think this will happen on the Hamburg section again soon."

As Simple as A B C

A good many persons think a claim agent has a pretty soft job; that, having a pocket full of passes, all he does is to ride around the country, stopping off here and there as strikes his fancy, where he may ask a few questions, draw a check or two and pass on.

But things are not always so simple as they seem. When a fatal accident occurs, in addition to uncovering the facts and circumstances connected with the accident, the claim agent must ascertain the next of kin under the law.

Foreman Farr, the hero of this incident, began his service in the maintenance of way department January 1, 1906, as a laborer, and has been a section foreman on the Vicksburg district of the New Orleans division since August 1, 1912. He comes naturally by his

In some instances this is not so simple as A B C, particularly in cases of negroes, as occasionally their matrimonial entanglements are decidedly difficult to unravel. Here is a typical case:

"C," a negro employe of the railroad, was recently killed. He left a woman with whom he was living and who claimed to be his wife. In support of the contention she exhibited a marriage certificate. This claim was further corroborated by the county record, which showed that a license had been issued and a marriage performed. On the face of it, this made her his legitimate next of kin and heir and entitled to whatever sum of money the railroad might pay on account of the accident causing "C's" death.

Information was furnished, however, that

the widow had been twice previously married and that at the time she married "C" her second husband, "B," was still living. If true, that would, of course, nullify the marriage to "C," and then under the law the next of kin would be the father and mother of "C."

Further inquiry of the widow finally elicited the admission that she had been twice previously married; also that she did not know whether or not the second husband, "B," was living when she married "C." It was further ascertained from her that when she married "B" she assumed her first husband, "A," was dead, but later she discovered he was alive and that he died subsequent to the second marriage and previous to her marriage to "C." The fact that "A" was alive when she married "B" made that marriage invalid, but as he died be-

Several months ago the Greenwood, Miss., compress, on the east side of the track opposite our depot, burned. E. W. Sprague of Memphis, assistant general claim agent of the Yazoo & Mississippi Valley, went to Greenwood, with several claim agents, a court reporter and a photographer, to make investigation of the fire. After photographs of the fire area had been taken, a photograph was made of engine No. 964, which had just taken water at the tank, with members of the party standing near the engine. Those shown in the photograph, from left to right, are: George H. Boulware, court reporter, Memphis; H. W. Hagan, claim agent, Greenwood; Louis Ogilvie, special claim investigator, Memphis; Pete Brady, engineer of No. 964; J. R. Sharpe, claim agent, Memphis (standing on pilot step of engine), and Mr. Sprague.

fore she married "C" that would make the third marriage legal.

This would have ended the matter, had it not then developed that when she married "A" he presumably had another wife living. If so, then her marriage to him was null and void, and hence the marriage to "B" was valid; and if "B" was living when she married "C" that final marriage was illegal, after all.

Meantime a lawyer had presented a claim on behalf of the alleged father of "C," who understood his son's marriage was illegal and that he and "C's" mother would be the legitimate heirs. The father, when interviewed, declared "C" was his son and furnished information as to the date of his marriage to "C's" mother, but admitted that he and his wife were not living together, having separated and taken up with new partners. "C's" mother was then located and interviewed. She frankly admitted that, while she was legally married to the alleged father, he was not the father of "C," since "C" was born two years before her marriage to the alleged father.

It will therefore be seen that the query of "How old is Ann?" is as simple to answer as A B C compared with supplying a correct answer to the query of "Who is the legal next of kin of 'C'?"

All Suits Cost Us Money

Isom Lee, a negro, brought suit in Tangipahoa Parish, La., in January, 1922, alleging that a short time previously he had purchased a ticket at Ponchatoula for Independence, La., and boarded the train; that the conductor came through and took his ticket; that after the train had passed Hammond the conductor came to

him again and demanded fare; and that, upon his refusal to pay additional fare, the conductor ejected him from the train. He claimed to be illiterate and that, therefore, he could not read his ticket so as to know to what point it was good. The conductor said the ticket was issued to Hammond only.

It is possible Lee purchased a ticket to Hammond, thinking he might ride by to Independence and thus save a little money.

When the case was reached for trial in July, the plaintiff's attorney announced that the authorities were after his client on a charge of beating his wife and that, therefore, the plaintiff had left for parts unknown. The attorney withdrew from the suit. The court then, after having the railroad introduce proof showing that the ticket was good to Hammond only, entered judgment for the railroad.

This appears to have been a trifling affair. However, it took considerable of the claim agent's time to investigate and prepare the case for trial, subjected the railroad to expense in having witnesses at the trial and took up some of the court's time.

Certain individuals and certain elements of society continue the accusation that a poor man stands no show in the courts against a rich and powerful corporation. Yet, no matter how poor, trifling and insignificant the individual may be, he enjoys at least the advantage of being able to call a corporation into court on any kind of charge, legitimate or trumped up, and, no matter how clearly it may be proved that the charge was entirely without foundation, he suffers no loss except that of the expected illegitimate gain. Suing under the pauper's oath relieves him of payment of any court costs if he does not obtain a judgment.

Midget Louisville Employee Is Popular

Ivan B. Atcher, clerk in Superintendent T. E. Hill's office at Louisville, is just 4 feet 5 inches tall, and weighs an even 100 pounds. He has been in the service of the company about five years.

It's hardly necessary to say that "Shorty" is his nickname. Everyone on that part of the system knows him. He's a busy person at all times, accomplishes much and always has the best interest of the company at heart.

At present Ivan is on night duty in the superintendent's office, handling strike reports for the general manager's office in Chicago.

He goes on duty at 5 p. m. and remains there until 8 a. m. He was placed in that service at the beginning of the strike.

Ivan was born December 2, 1895, on a farm at Elizabethtown, Ky., a perfectly healthy child, he says. His parents, Mr. and Mrs. Charles Atcher, were normal. They had six children, three boys and three girls. When Ivan was 2 years old he had spinal meningitis and was in bed for nine months. Specialists attending him gave little hope for his recovery, he says. If he became able to leave the bed, his mind would be weakened, they claimed.

Ivan B. Atcher in some characteristic poses.

But now when one watches him in his duties he gets the impression of a very active mind. The attack of meningitis left his arms and legs affected. Their growth has been impaired, but he can use them freely.

Ivan is a member of the Kosair Temple of Shriners at Louisville, and he made the trip to California with that organization last June. At every stop, he says, there was a battery of newspaper cameras waiting to take his picture. He says that he was posed in a thousand different contortions and asked a million questions by newspaper men.

Women were a big bother to him, he says. During a parade in San Francisco, a young woman stepped in front of him three times as he was proudly leading the Shriners down the main thoroughfare. The third time she stopped him and said, "Oh, I just must touch you for luck!" She must have needed a lot of luck, he says, for she picked him up in her arms and gave him a prolonged squeeze. As far as Ivan was concerned, the parade was off from then on, and he had a pleasant chat with the young woman.

Ivan has more than five hundred personal cards and souvenirs of that trip. He met many prominent persons.

IN THE ALLIGATOR COUNTRY

Here is our efficient agent at Manchac, La., Jake Bogue, who had an exciting time recently when he went out to look at some hooks

Jake Bogue.

he had set the night before in the Pass back of the depot. There was a log near the edge of the Pass, and Jake placed his foot on it so as to reach down and pull in one of the hooks. The log proved to be a large alligator, who became indignant at our agent for using his back as a foot rest. Jake by that time remembered some important work

he had not finished, and he decided to return to his office and complete it immediately. Later, however, he succeeded in capturing two small alligators, which were afterward sent by Supervising Agent McCloy to our freight agent at Sioux City, Iowa, to be placed in the city park.

Saw Earlier Days of Tennessee Division

Crossing Watchman, Engine Inspector, Agent and Section and Extra Gang Foremen on List This Month

ANDREW SHEPHERD, D. R. Staley, L. G. McMillion, A. C. Lafferty and W. F. Woods, all employed on the Tennessee division, have been in the service of the Illinois Central and its predecessors, the Mississippi Central and the Paducah & Memphis railroads, for a total of more than 231 years. And they all seem fit for several years more of active service.

Andrew Shepherd, negro crossing watchman at Martin, Tenn., is the oldest employe in point of service on the division. He entered the service of the Mississippi Central Railroad when construction was started at Martin, May 8, 1871. D. R. Staley, engine inspector at Jackson, Tenn., entered the service of the Mississippi Central April 9, 1874, when the fuel used on engines was wood. L. G. McMillion, freight agent at Martin, has spent nearly forty-four years in the service at that place. A. C. Lafferty, section foreman at Fulton, Ky., entered the service of the Paducah & Memphis Railroad May 5, 1876. W. F. Woods, extra gang foreman, has forty and one-half years to his credit.

The Coming of the Yellow Fever

Andrew Shepherd, negro crossing watchman at Martin, Tenn., braved the yellow fever epidemic to look after the company's property there. It was the Mississippi Central Railroad then, and Shepherd was a laborer on the section at Martin.

Each morning Shepherd walked over the section to see if the track was in condition for the passage of trains. When he found something wrong, he reported it to the section foreman, so that repairs could be made before the first train was due. One morning, on his return to the section house after his tour of inspection, he discovered that the entire section crew had left the city. Inquiry brought him the news that the doctors of Martin had ordered everyone who was able to do so to leave the city. The yellow fever was causing deaths by the score.

There was no place for Shepherd to go. No trains on which he could leave were due at that hour. He returned to the section house to await developments, for it was outside of

Some prized souvenirs of W. F. Woods and Andrew Shepherd—commemorative medals issued to veteran Illinois Central employes in 1901.

the city, where danger from the fever was less. To go to his home would have been no comfort; his wife had left the city, as had so many others.

The first train through Martin brought the roadmaster. Shepherd told him of the condition there and that he was the only employe remaining. The roadmaster instructed him to stay there, to continue his duties as trackwalker each day and to report by note to the foreman of the adjoining section.

Epidemic Ended in November

Shepherd stayed. He walked over the section before each train was due. After he had inspected the track, he returned to Martin and carried the mail to the section house, where he placed it on the trains. No trains stopped at the station at Martin. They went through the city at top speed, then stopped at the section house, where Shepherd gave the crews and passengers all the news of those stricken. Trains often lingered as long as twenty minutes, he says.

Five weeks slipped by. Although he was alone, time did not hang heavily on Shepherd's hands, for he was a busy man. He helped at the station and tended the switches in the yard, together with his other duties. Then his

L.G. McMillion

wife came back. She had become lonesome away from home, he says.

On November 1 of that year the first snow fell, and the last person died of the fever. Residents began to return to Martin then, he says.

Shepherd has been in the service of the Illinois Central and its predecessor, the Mississippi Central, for more than fifty-one years, most of that time at Martin. He was born a slave on the Robert Williams plantation at Farmersville, Va., November 12, 1849, and lived there until after the Civil War. He recalls that his days as a slave were hard, and he received many whippings; but he supposes that he needed them at the time. He still has kind thoughts of his master.

Farming in Slavery Days

The Williams plantation consisted of about a thousand acres, he says, and was manned by more than three hundred slaves. Tobacco, oats, rye, barley, wheat and peas were among the things raised. Everyone worked sixteen hours a day in the fields and ate only two meals. The mules were fed once a day, he says. No slave could leave the plantation without a pass. If he did, he was severely whipped. Being late to work, grumbling, slowness and stubbornness were causes for the lash.

When Shepherd first left the plantation, he went to Chattanooga, where he worked for a doctor about seven months. Then he accepted a place on a construction gang of the A. G. S., now the Southern, and worked for nine months. The Mississippi Central Railroad started construction, and he became a laborer with a gang at Martin, Tenn., on May 8, 1871.

His first work for this railroad was cutting timber for ties. Some of the trees that grew on the right-of-way made as many as eight ties. In about eighteen months the track was open to traffic between Cairo and Jackson, Tenn. Shepherd then became a laborer on a construction train under Charles Ross. He remained in that work for some time, was sent to a section at Sharon, Tenn., for a year, and was then transferred to Martin in 1874.

That was the year of the Ed Bailey wreck near Martin. It was considered the most disastrous of that day. A box car slipped from a siding to a bridge on the main line just as Mr. Bailey's train was approaching. The collision caused no deaths, but many were injured. The engine went through the bridge, the fireman was scalded, and Engineer Bailey was dug out

from beneath the wreckage. The track was open to traffic after four days, Shepherd says.

Made Crossing Watchman in 1914

He worked on the section at Martin about seven years, and during that time he had his experience with the yellow fever. In 1881 he accepted a position as baggage handler and porter at the station at Martin, and he continued in that work until he was made the crossing watchman, February 8, 1914.

The Mississippi Central built its track four inches wider than the present standard gauge. All roads in that part were wide then, Shepherd says. When the Illinois Central took charge of the road, the gauge was made standard. Then when cars had to be transferred to other roads, wider trucks had to be put on the cars. The cars were hoisted while this was being done. Sixty cars a day were all that could be transferred at Martin, he says. They were thirty-two feet long then.

Shepherd is a reliable watchman at the crossing in Martin. One can see the driver of each vehicle look to him for the signal to stop or go.

Two years ago he made a visit to the Williams home in Virginia, but found things much different from the way they were when he left there more than fifty years before. The plantation had become smaller by sales of land, and there were only two of the family there—the youngest daughter and son of his master. They were both married and had grandchildren.

"O' co'se they didn't remember me," he says, "but we sho' enjoyed talkin' 'bout dem happy days befo' the wah. Yas suh, I hopes to go back again some day."

Started Firing on Wood-Burner

D. R. Staley, engine inspector at Jackson, Tenn., is one of the few employees still in service who have had the experience of firing a wood-burning engine. In 1874 he was firing on the line between Jackson, Tenn., and Fillmore, Ky.

Mr. Staley obtained his first railway position through a friend who was a conductor on the Mississippi Central Railroad. On April 9, 1873, he started as passenger brakeman between Water Valley, Miss., and Jackson, Tenn. The next year he became a fireman, and two years later he was promoted to engineer.

All of the engines were named in those days. His first one was the "Governor J. D. Porter," No. 52. The fireman was kept busier shining brass than he was throwing logs into the fire,

Mr. Staley says. Neither the fireman's nor the engineer's clothes became soiled on a trip in those days. They wore their best suits and white collars. His salary was \$115 a month.

The freight cars then were of 15-ton capacity, and only sixteen of them were pulled in a train during the day. At night the dew on the rails made it impossible for the engines to pull more than fourteen cars at a time, he says.

The change from wood to coal as fuel in his part of the country came in 1882, Mr. Staley says. And in that year he was placed in passenger service at a salary of \$110 a month. He remained in passenger service until 1903, when bad health caused him to give up his run. He then became an engine inspector at Jackson, Tenn., where he remains today.

On July 20, this year, Mr. Staley became a proud grandfather. His daughter's child is now one of his chief interests.

Mr. Staley has a \$2 bill which was issued by the Mississippi Central Railroad in 1873. S. E. Carey was then the president of the road.

Entered Railway Service in 1875

L. G. McMillion, freight agent at Martin, Tenn., has served the company and its predecessors at Martin since 1875. There was, however, a 4-year break in his service between 1879 and 1882, when he resigned to enter school. Since re-entering the service in 1882, Mr. McMillion's name has not been off the payroll:

He entered the service of what was then known as the Southern Railway Association, later the C., St. L. & N. O. and now the Illinois Central, as a porter in the station at Martin, Tenn., in January, 1875. He continued to act as porter and freight handler until January, 1879, when he resigned to enter the public schools of St. Louis.

On December 10, 1882, Mr. McMillion accepted a position as check clerk at Martin. He was promoted to bill clerk in 1887 and to chief clerk in 1889. September 24, 1892, he was made the agent at Martin, and he has continued in that position since.

In the days of the wood-burning engines, Mr. McMillion says, the passenger trains stopped just south of Martin to replenish the supply of fuel. The entire crew and often many passengers would get out to help fill the tender in order not to delay the trains.

When he was first made an agent, Mr. McMillion found the accounting was simple. There were no government reports to make, and there

were only six tariffs, where now they run into the hundreds.

Track "Two Streaks of Rust"

A. C. Lafferty, section foreman at Fulton, Ky., entered the service of the Paducah & Memphis Railroad, later the C., O. & S. W., now the Illinois Central, as a laborer on the section at Rives, Tenn., on May 5, 1876, when the track, as he describes it, was merely two streaks of rust through the grass. The rails were iron, and there was no ballast, he says. The trains could be heard when they were more than a mile away. The wheels passing over the joints made a lot of racket.

Mr. Lafferty had been a laborer at Rives only a few months when he was sent to Gibbs, Tenn., as the section foreman. Four months later, he was placed in charge of an extra gang. He worked on every mile of the line between Memphis and Louisville, he says. He worked from the break of day to dusk in those days, and if serious trouble occurred he was called out at night.

In April, 1886, he became the foreman at Calvert, Ky. He remained there until December, 1889, when he was transferred to a work train to lay rails at Clarksdale, Miss. That work was finished in less than a year, and he returned to the section at Rives. For the next fifteen years, Mr. Lafferty worked at various places along the line, but not more than a few months on any one section. Several times he returned to Rives.

Mr. Lafferty became the section foreman at Clinton, Ky., in 1905. He remained there until 1914, when he was transferred to his present position as foreman of the section at Fulton.

Cigarette smokers are taboo on Mr. Lafferty's section. Besides the loss of time in rolling and lighting cigarettes, he says, he has found those who are in the clutches of the habit to be poor workers. Mr. Lafferty has never used tobacco, and now at 66 he says that his nerves are as steady as they were when he was 21, his age when he was made a foreman.

There has been no derailment on his section, he says, and none of his handcars has been struck. He has never been seriously injured during his forty-six years of service, and he claims not to have been absent from his duties more than a total of eight months in all of that time. The only serious injury to any of his men occurred about three years ago, he recalls, when the lever of a jack failed to catch,

with the result that a laborer's jaw was broken.

Built Second Cairo-Memphis Track

W. F. Woods, extra gang foreman, entered the service of the company as a bridge laborer at Duck Hill, Miss., February 20, 1882. In 1885 he was promoted to bridge foreman and placed in charge of a construction train.

For thirteen years Mr. Woods worked on all parts of the Mississippi division. He helped construct the Aberdeen district and built bridges. We had 60-pound steel rails in use then, and a 5-mile section at Canton, Miss., was the only gravel section between that place and Cairo, Ill. The bridges were all constructed of wood.

In 1898, Mr. Woods was placed in charge of a gang at work putting in the double track between Cairo and Memphis. With the exception of the thirty-eight miles between Gibbs and Curve, Tenn., this work was completed in 1903. He was then made an extra gang foreman and worked at various points on the division.

In 1914 it was decided to build the thirty-eight miles of double track between Gibbs and Curve, Tenn. Mr. Woods' gang was one of ten extra gangs that were placed in that work. The time allotted for the construction was 155 days, but at the end of 135 days the line was open to traffic, he says.

FOR ARRANGING DESKS

The following standards for the arrangement of office desks are suggested by W. H. Leffingwell, management engineer:

1. Standardize the sizes of desks as much as possible. Most clerical work requires no larger than 4-foot desks.
2. Not more than two desks should be placed side by side. Each should be next to an aisle, if possible.
3. All desks should face the same way. Never put desks facing one another; it offers too many opportunities for conversation.
4. The space between desks should be not less than thirty inches.
5. Aisles should be not less than three feet wide; general traffic aisles, not less than four feet.
6. Have cross aisles not more than fifty feet apart. If space will permit more frequent cross aisles, it is better to have one every twenty-five feet.—*Digested from an article, "How to Save Money by Saving Space in the Office," by Appleton Street in Forbes.*

AFTER BUSINESS

T. A. Landrum, agent at Hollandale, Miss., recently addressed an open letter to the business men of Hollandale calling their attention to what the Illinois Central System means to the

town and asking them to support us with their patronage.

His letter, in part, is as follows:

"We are proud of the town of Hollandale; we are glad that what we have to buy can be bought in Hollandale; and we are glad that people of our town get the benefit of this money that is paid out here.

T. A. Landrum.

"Has it ever occurred to you that you, as business men and merchants, reap the benefits enumerated above, and then let trucks, the owners of which live in Greenville or other places, haul your freight to Hollandale, and that these truck owners don't pay one cent of tax in Hollandale and they don't spend their money in Hollandale?"

"We claim to be part of one of the greatest railway systems in the country. We operate good trains that the public may have the means of transportation to go and come at all times.

"The Illinois Central and Yazoo & Mississippi Valley railroads are always in the lead to make this great country a better place in which to live and to make farm life more attractive, and are always glad that they can help to make living conditions reach a higher plain.

"In view of all this, are we entitled to full claim on your business? If so, we want it. It will give our railroads a chance to make a dividend and to make the present good service even better."

"We will appreciate your business, and we are only too glad to give you good service and be prompt and courteous in our dealings with you."

TO WORK IN OREGON

Effective August 15, Sidney Springer was appointed traveling freight and passenger agent, at Portland, Ore., with office at 520 Spalding Building, 267 Washington Street,

HOUSE PLANS FOR OUR READERS

Concrete

Tiring of paying one-third of his income for two rooms, the apartment renter will find a strong appeal in this cozy, duplex home. With the lot paid for and \$1,000, the remaining costs and taxes should not exceed monthly payments of \$30 or \$40 after the rental from one apartment is deducted.

The first and second apartments are almost identical. A large living room with a cheery sun parlor extends across the front. There is a fireplace and plenty of room for a closet or davenport bed. Two cross-ventilated bedrooms occupy the rear, and the bath and

kitchenette are in the center, with a dining alcove and an entry way to a roofed rear porch.

Most city building codes require firesafe construction, and the architect, H. K. Holzman of Chicago, has designed the building for concrete block with an attractive portland cement stucco exterior and a roof of cement asbestos shingle or concrete roofing tile. Up-keep expenses are thus reduced to a minimum. The heating plant is housed in the basement, where the ceiling is finished with metal lath

First Floor Plan

Second Floor Plan

and plaster for additional provision against fire. For additional information address the Portland Cement Association, 111 West Washington Street, Chicago, Ill. For 50 cents

this association will mail you an attractive book of concrete house plans containing also several pages of good advice about the finer details of building.

Recalls Conductors on Louisiana Division

The article about Conductor Charles E. Dunbar of the Louisiana division which appeared in the *Illinois Central Magazine* for July prompted D. W. Streat, editor of the *Roseland* (La.) *Herald*, to write a reminiscent article about Illinois Central conductors he has known. Mr. Dunbar is the oldest conductor in service on the Louisiana division. Mr. Streat is something in the way of being a veteran himself, only as a newspaper man instead of a railway man. Back about the time of the Chicago fire of 1871 Mr. Streat was a reporter on the *Chicago Tribune*, but for many years past he has conducted *The Herald*. He is known and loved by our Louisiana division trainmen, with a great host of whom he is acquainted. For many years he has "made" the trains at Roseland, and our boys know his familiar figure as well as any of the other landmarks.

Topping the list of his friends comes Ed McMaster, who shares with Charley Dunbar the honor of taking the Panama Limited over the Louisiana division, the two of them heading the conductors' seniority list. "During our many years residence in Roseland," Mr. Streat writes, "we recall the affable Billy Campbell, North Abbott, Billy Moales, Tim Jewett, Dolph Wolf, Martin Arnold, O. C. Betz and Jim Ainsley—all favorably known in years gone by—who passed over the Great Divide."

Ed Moales, now the Illinois Central O. R. C. chairman, is another friend who is mentioned, and Al Broas, Ed Barnes, Charley Clements—"the finest appearing man on the road, now on the 'Merry Widow' run"—Tom Moore, and G. O. Lord.

William Trafton, the Canton, Miss., farmer about whom an article was published in these pages recently, is another, and Mr. Streat calls him "a royal good fellow."

Steve Nall, now retired, Mr. Streat writes, was "noted for his affability and attention to passengers." It is also pointed out that Roseland was named in honor of Mr. Nall's wife, Rosamond Kercheval.

"Next comes Al Loutzenhiser," the story runs, "a man of letters and an all-round mu-

sician, who possesses great abilities for writing and occasionally contributes to *The Herald*."

Then there is John A. Fulmer, "a man of fine physique and tender heart, who is held in high esteem by all patrons, known for his kindness to ladies and little children."

"Another good one is R. D. Robbins," continues the writer, "years ago a freight conductor, but now on passenger run. 'Dick' was noted for being on time with the freight train, and Jim Hoyt, who was local agent at that time, claimed he could set his watch by the train."

A tribute is paid Trainmaster Louis McLaurine, one of the former conductors on the division. Mr. Streat calls him "one of the finest." Henry Ericson, "Wes" Brown, R. E. McInturff, George Muller, John Price, Ed Sharp, Matt Kennedy, Frank Shafer and C. B. Emerich are included.

"The 'bunch' consists of a lot of good fellows," Mr. Streat says, "all efficient, and the Illinois Central Railroad Company should be congratulated on having such a fine lot of conductors in the service."

TO ADVERTISE GULF COAST

The passenger department of the Gulf & Ship Island has received a letter from Vice-President F. B. Bowes of the Illinois Central System in which he states that the railroad will include the Mississippi Coast in the advertisements which will be issued soon for the benefit of winter tourists.

The cities of Pass Christian, Gulfport, Biloxi and Ocean Springs will be specially featured in the folders and other advertising matter which will be scattered broadcast all over the northern and central part of the United States.

In view of the fact the G. & S. I. has decided to put on a through sleeper service between Gulfport and Chicago, beginning with December 1 of this year, no doubt the advertising of the Mississippi Coast cities by the Illinois Central lines will greatly increase the winter tourist business in this section.—Gulfport (Miss.) *Daily Herald*, July 15.

The famous suspended railroad of Elberfeld. By making use of the space above a canal, the elevated road is made possible without obstruction of street traffic.

Railroads of Odd Design From All Parts of the World

Autos now furnish the motive power for the trolleys in Apeldoorn, Holland. Each locomotive is capable of pulling three cars. Before the advent of these gas locomotives the cars were drawn by horses.

Two airplane engines and propellers, one on each end of this car, drives it at a speed of two hundred miles an hour. The car runs on a regular scheduled line between Berlin and Hamburg, Germany.

This unique torpedo-shaped hanging trolley that does service in Burbank, California, has a seating capacity for sixteen persons. It is driven by a propeller at one end. Such construction is practical only in California's climate.

The Malberg railway at Ems is built to conform to the steep slope of the mountainside. The passenger compartment is built in a series of steps so that the seats are always upright.

Only intrepid Alpine mountain-climbers ascend the Wetterhorn in any other manner than by this cable railway. The peak of this mountain is over twelve thousand feet high.

1922 Keeps Our Refrigerator Cars Rolling

Fruit and Vegetable Traffic Is the Heaviest Ever Reported; Constant Increase in Acreage Seen

By E. F. McPIKE,

Manager, Perishable Freight Service

THE production of fruits and vegetables on the Illinois Central System in 1922 has far exceeded the heavy crop of 1921, which itself was heavier than that of 1920 or previous years. There has been a constant increase in the acreage devoted to such products, for which there is a growing demand in the consuming markets.

The comparative figures given next below cover only freight refrigerator cars loaded with berries and green vegetables at stations on our lines both north and south of the Ohio River during the seven months between January 1 and July 31:

1919	4,014 cars
1920	4,317 cars
1921	4,844 cars
1922	10,113 cars

A substantial increase would also result from the addition of carload shipments of berries and green vegetables between January 1, 1922, and July 31, 1922, loaded at stations on so-called "feeder lines" in Mississippi, Louisiana and Texas, amounting to 521 cars, and connecting line traffic from the Rio Grande Valley, Texas, via Baton Rouge, during the same period, amounting to 3,568 cars, or a total addition of 4,089 cars. This, in connection with the item above of 10,113 cars loaded between January 1, 1922, and July 31, 1922, at stations on Illinois Central System lines, makes a grand total of 14,202 cars, of which by far the greater portion consisted of Illinois Central freight refrigerator cars.

Great Increase in Strawberries

The figures above would be somewhat in-

creased by the addition of cars loaded on tracks within switching district of originating stations on home system lines and on which bills of lading were issued by the Illinois Central

As an analysis, in part, of the business originating on Illinois Central System lines, it may be stated that cars of strawberries moved as follows:

	1922	1921
By express	2,334	1,836
By freight	902	84
Total	3,236	1,920

The movement of green vegetables by cars between January 1 and July 31 from home line stations south of the Ohio River, plus St. Louis division traffic, may be itemized as follows:

	1922	1921
By express	1,049	1,085
By freight	7,538	4,587
Total	8,587	5,672

St. Louis Division Picks Up

As one illustration of the marked increase of fruit and vegetable loading at stations on a single division, the following figures for the St. Louis division are given for the period between January 1 and August 13 during the respective years shown:

	1922	1921
Vegetables, (freight)	357	338
Vegetables, (express)	104	97
Apples, (freight)	529	23
Peaches, (freight)	826	None
Total	1,816	458

The grand total tonnage of all kinds of perishable freight moving over the rails of Illinois Central System lines, including both local and interline traffic, during the six months between January 1, 1922, and June 30, 1922, amounted to 950,457 tons, as against 788,476 tons during the corresponding period of 1921.

How Business Has Grown

As an indication of the yearly volume of the grand total of perishable freight business

*Who saves his country saves all things and
all things saved shall bless him.
Who lets his country die lets all things die
and all things dying curse him.*

— From the monument of a
great Georgian - Ben Hill

handled on Illinois Central System lines, the following figures have been compiled:

Year	I. C. R. R. Tons	Y. & M. V. R. R. Tons	Grand Total Tons
1910	950,994	950,994
1911	1,061,350	46,290	1,107,640
1912	1,069,544	47,922	1,117,466
1913	1,112,964	48,891	1,161,855
1914	1,228,822	65,676	1,294,498
1915	1,295,977	263,225	1,559,202
1916	1,435,080	507,909	1,942,989
1920	1,753,041	407,807	2,160,848
1921	1,688,833

The substantially greater tonnage of perishables handled in 1920 was no doubt partly due to the large volume of traffic diverted to the Illinois Central that year because of the inability of certain competing lines to handle their full share of the business during the period of the switchmen's strike.

The use of refrigeration in transit for the

protection of perishable products has greatly increased, as is evidenced from the fact that the records show that during the six months between January 1 and June 30, 1922, there were 70,143 icings and re-icings performed, as compared with 48,011 during the corresponding six months of 1921, or an increase of 22,132.

Good Bonding Important in Signal Work

The following paper was presented at one of the recent educational meetings of the Illinois division signal employees. It was prepared by a committee which studies bonding:

Bonding is one of the most important things that go toward making track circuits for automatic signals and route locking through interlocking plants nearly perfect. Without proper bonding, track circuits would not give efficient service, because, no matter how tight the angle bars are put on the rail, sooner or later rust would form between the two and set up a high resistance, causing a drop in the current flow, which in a track circuit of any length would mean at the relay end there would not be enough current to pick up the relay, causing track failures.

Bonding should be perfectly done, or as near that as possible. First a 9/32-inch hole should be drilled three inches from the end of the angle bar and the holes three inches from that. The holes should be drilled the way that the channel pin is to be driven, when possible to do so, as the hole is larger where the drill enters the rail, and the channel pin, being tapered, will give a long and better fitting contact. Then bond wires should be bent on both ends, so that when the channel pins are driven the bond wires will follow the pin back through the rail. By bonding this way, there will be no tendency to break the wires by striking them, which would be done if wires were bent down.

Bonding. The top wire shows the way the wire is bent before it is applied to the rail. The second wire shows the way the wire is bent after one end has been applied and the loop is made to apply the other end.

The short bend should be bonded first, then bent down to its proper place; then the wire should be twisted so that the loop goes into the hole without being under a twist.

A large or heavy hammer should be used in bonding in channel pins, as a light hammer does not drive the pin in far enough and also batters the end of the pin, so that it cannot enter the hole far enough.

A track circuit, under the very best conditions, has a small margin of current to work on, on account of zinc treated ties, ballast touching rails between ties, dirt and mud in road crossings, salt drippings from cars, and sulphur in cinders, which have a tendency to short out the track circuit. So the better you have your bonding, the better condition your track circuit will be in.

HOUSE PLANS

Southern Pine

Interest in home building does not seem to be confined to any one particular part of the Illinois Central System. So far, the requests for the modern homes booklet of the Southern Pine Association, which is to be obtained free of charge through this magazine, have come from Paducah, Ky., New Orleans, La., East St. Louis, Ill., New York City, Waterloo, Iowa, Vicksburg, Miss., Peotone, Ill., Flora, Miss., Chicago, Ill., Mounds, Ill., Clinton, Ill., Haleyville, Ala., Palestine, Ill., Princeton, Ky., and Memphis, Tenn.

This month we present a 5-room house with a living room that ought to please anybody, since it occupies the whole front of the house. The sleeping porch at the rear really makes it a 6-room house with two bed-rooms. A terrace adds to the size of the porch in front, and a good growth of creeping vines ought to make it cool and cosy at the time a porch is likely to be used. Adequate light and ventilation are provided for, as can be noted by counting the windows and doors.

Remember, the booklet has fifty plans like this, and it is free upon application to the magazine.

Our Pension Department Much Appreciated

Some of First Retired in 1901 Are Still Living, More Than 90 Years Old and Full of Loyalty for System

The statement shown on page 131 of our August issue and printed as one of our monthly statements in the newspapers on our lines has aroused new interest in our pension department. Here are additional facts about this branch of our organization:

IT has been often asked whether the employees of the Illinois Central System appreciate the provisions that have been made for them in the way of pension when they are obliged to retire from active service. As indicative of the spirit in which the pension system is held by the employees, the letter reprinted below, bearing indisputable evidence on this point, is only one of large numbers of voluntary expressions:

"In being notified December 2 of being placed on the honor roll, with pension, I thank each and all my superior officials for many acts of kindness and favors they have shown me in the long years of service I have been with the Illinois Central Railroad.

"I hope and pray all the good officials of the Illinois division will live and enjoy the best of health and enjoy their position as much as I enjoyed mine. It is with regret, on account of old age and health, I asked to be retired.

"Gentlemen, I again thank you, thank you from very bottom of my heart for your kindness to me."

Our System a Model

The Illinois Central was the third railway company in the country to establish a pension system for its employees, having been preceded a few months by the Pennsylvania and the Chicago & North Western. The Baltimore & Ohio, however, had a pension provision in its relief system which had been operative in a certain way for several years. The Pennsylvania and Chicago & North Western pension systems were originally based on a total service requirement of thirty years, whereas the original service requirement of the Illi-

nois Central was but ten years of continuous service, as distinct from total service in the two pension systems which had preceded it, and it is worthy of note that nearly all of the systems which have since been adopted have embodied the feature of last continuous service as a fundamental requirement, and there are today but very few large railroads in the United States that do not have pension systems.

The Illinois Central system last year paid out \$275,734.20 in pensions, and at the close of the year was carrying the names of 684 retired employees on its pension rolls, who were receiving pensions averaging \$34.76 a month, based on an average term of last continuous service of thirty years. There were 164 employees retired on pension last year, and the retirements for the first six months of this year have been at the same rate. Probably more than \$300,000 will be paid this year.

Some Pensioners More Than 90

Many of the pensioned employees who were retired with the institution of the pension system, July 1, 1901, are still receiving their pension regularly each month, as they have done since the date of their retirement, and several of these are now upward of 90 years of age, the oldest being over 93.

Since the adoption of the pension system,

Secretary Burt A. Beck at his desk.

July 1, 1901, 1,511 employes have been retired. Of this number, there were nearly four times the number of voluntary requests for retirement on the part of employes compared with the retirements where the initiative was taken by the company. In some years it has run as high as eight voluntary requests to every involuntary request.

The pension system provides for retirement and pension of employes on reaching the age of 70 years (although arbitrary retirements at this age, temporarily discontinued in 1917, have not as yet been resumed) and for all employes after twenty-five years of service (fifteen in special cases) who have become unfitted for duty.

The pension department is administered by a board of officers known as the board of pensions, at the present time composed of A. E. Clift, general manager, chairman; F. B. Bowes, vice-president in charge of traffic; R. W. Bell, general superintendent of motive power; F. L. Thompson, chief engineer; Dr. G. G. Dowdall, chief surgeon; W. D. Beymer, assistant to vice-president in charge of accounting and treasury departments, and Burt A. Beck, assistant secretary and secretary of the board of pensions, and in charge of the actual administration of the pension department. All of the members of the board of pensions have been in the service of the Illinois Central System for from eighteen to forty-six years. The board of pensions holds its meetings once a month at the office of the pension department in Chicago, where the records of the pension depart-

ment are kept. These records comprise in part the early payrolls, running back to the date of construction of the railroad, and from these records the services of employes are determined.

Loyalty of Pensioners Unquestioned

One of the results of the pension system which is a real asset has been the building up and retention of the spirit of interest in and loyalty to the company on the part of the pensioned employes. Once an employe is placed on the pension roll of honor, he is assured not only of the receipt of his monthly check during the balance of his lifetime but of the continued interest of the company in his personal welfare.

Pensioned employes are not only permitted to engage in other occupations, but are frequently assisted by the company in the securing thereof, provided such are not detrimental to the company's interest—and it is with no small degree of pride that the company can point to the fact that no pension has ever been discontinued during the lifetime of a pensioned employe for any reason of misconduct or other detrimental act.

Every pensioned employe is given an annual pass for himself and wife over the system, and whenever he or any member of his family has occasion to travel over foreign lines the company willingly obtains him transportation for that purpose. That the interest of the pensioned employes and their loyalty to the company can be counted upon has been many times evidenced by their willingness and readiness to return to active service.

Nothing hump-backed like this on our line. What a panoramic camera did to a Big Four engine and track. Original photograph in possession of G. W. Schroeder, stationery storekeeper, Chicago.

Hospital Department

Sanitation—A Development of Many Years

SEVERAL years ago Monday was wash day, Tuesday was devoted to ironing, and so the week progressed, Friday being set aside for cleaning, another day for baking and so on until the house was in order—but that was several years ago when cleanliness was considered next to godliness. The housewife was justly proud of her house and kept it spotless and shining from a deeply rooted feeling of personal pride, which her mother before her had carefully instilled into the growing child.

The art—and it is an art—of being a good and competent housewife was a fundamental in the home educative idea, and the teaching was eagerly absorbed by the growing children, who as eagerly looked forward to having homes of their own and to keeping them as spotless as mother's.

This was cleanliness, and so accepted and spoken of, the body of the cleaner being as carefully cared for as the dwelling. On Sunday, with the house spick and span and with the body neat and clean and covered with freshly ironed clothing, the governing principle, the mind, slowly growing and expanding under the careful home tutelage, was taken to church and given spiritual instruction.

Old-Time Sanitation Effective

Nobody said anything about "Sanitation"—the word was hardly known, much less spoken and discussed—but everybody had the idea of cleanliness, and the competitive efforts of the housewives resulted in complimentary remarks about the neatness of "Mrs. Smith's house," with the resulting cultivation in the mind of "Mrs. Jones" of the ambition to have her house spoken of in equally flattering terms.

The years have rolled on, and our knowledge has grown apace; the idea of cleanliness has spread to varieties of "dirt" other than household dirt; we are beginning to learn that it is not necessary to be sick, that by proper preventives the particular

germ which produces disease can be driven off or killed, and health can take the place of disease—and it is only a furtherance of the old idea of cleanliness which our mothers carefully taught us. Cleanliness is the foundation idea, the corner-stone, upon which the beautiful edifice of health rests.

Dirt may be considered as the cause of disease—but there are many kinds of dirt. Two classes comprising the whole field are spoken of as macroscopic and microscopic dirt—in other words, the dirt which one can see and the kind which cannot be seen except by the aid of a powerful microscope. The first class is as dangerous as the second and often productive of the second; therefore, the world is waging an unceasing war against dirt in all forms and varieties.

The How, When and Why

It is one thing to fight and another to know how to fight—a person may have the strength, but without the knowledge to direct and apply it properly he may be defeated. Great effort is being made today to teach the proper application of the cleaning principle—the how, the when and the why.

The "how" is the means by which the cleaning is accomplished: brooms, mops, soap and water, antiseptics, serums and bacterins. The "when" is the frequency with which the cleaning instruments are used in order to accomplish the maximum of cleanliness and keep the structure up to this standard. The "why" is the reason for doing these things and the manner in which the results are accomplished, a very necessary factor in the educative idea and the one which more than all others will lead to the perpetuation of cleanliness. In this age of reason and education it is not sufficient to tell a person to do a thing a certain way; one must explain why it is best to do it this certain way in order to interest and educate the person instructed; in this way only will the idea be carried on unceasingly

and without unpleasant and suspicious supervision on the part of the instructor. Another factor in the production of improvement by telling "why" is that the train of new ideas stirred up in the mind of the person instructed will often be productive of new methods which are a vast improvement over the old.

Illinois Central Active

The Illinois Central is striving to teach the principle of cleanliness and to cultivate that idea among all its employees; first, for their individual betterment; second, for the greater satisfaction of the patrons of the road, and third, that our reputation of being the cleanest road in the United States may be maintained. It is not desired that the fight be waged by one department, but by all concerned and for the good of all concerned. Co-operation is directly productive of great results. This means that every employe must do his part willingly and intelligently—the smallest factor is directly contributive to the great result—the neglect to clean a window or sweep a floor is just as serious and damaging as the hasty and impolite word spoken to a passenger or the neglect by an agent to inspect his station property each morning to see that his instructions have been carried out.

In due time a standard method of accomplishing cleanliness will come to the surface, but with changing and improving ways of accomplishing results this standard will be constantly advancing. The standard now maintained by the Illinois Central is almost daily being pushed upward, and greater demands are being made by county, state and national government.

TWO MORE LIVES SAVED

For the first time since it was put in the service, the Illinois Central's fast train south-bound which goes through Arcola about 4 o'clock in the afternoon stopped here. The stop was made for Silas Williams and a young man named Marstella, who is visiting at the home of his grandfather, J. C. Olmstead. If the train had not stopped, the two young men would now be fiddling on a golden harp. They were walking along the track beside a freight train that was passing through the city, and the noise of the freight prevented them from hearing the approach of the flyer coming up behind them. Fortunately the engineer of the fast train saw their danger, and suspecting that they did not know of their danger he set the emergency brake, bringing the train to a stop. As it was, the boys narrowly missed being struck by the locomotive of the flyer.—Arcola (Ill.) *Arcolian*, July 20.

Our Monthly Roll of Honor

Below is a list of employes retired at the meeting of the Board of Pensions July 28:

Name	Occupation	Years of Service	Date of Retirement
Augustus J. Smith.....	Draftsman, Engineering Department.....	20	3/31/22
Lester L. Chambers.....	Agent, Kentwood, La.	17	5/31/22
William B. Morgan.....	Train Baggage-man, Wisconsin Division.....	43	5/31/22
William Stemme	Wood Turner, Burnside Shops.....	27	5/31/22
Jerry Conway	Car Cleaner, Chicago Terminal.....	21	6/30/22
Frank Vito	Laborer, Chicago Terminal.....	32	7/31/22
Edward I. Upton.....	Chief Clerk, East St. Louis, Ill.	31	7/31/22
Elmer E. Wilkinson.....	Foreman (B. and B.), St. Louis Division.....	40	7/31/22
Domenico Genovese	Laborer, Burnside, Supply Department.....	25	7/31/22
Y. & M. V. R. R.			
William C. Thompson.....	Engineman, New Orleans Division.....	30	4/30/22

The following deaths of pensioners were reported:

Name	Occupation	Date of Death	Term as Pensioner
Frank M. Williams.....	Conductor, Illinois Division.....	6/16/22	2 months
James Culton	Commercial Agent, Traffic Department.....	6/30/22	4 years
Willis Walkup	Carpenter, Indiana Division.....	6/15/22	19 years
Billie Williams (Col.).....	Hostler, Mississippi Division.....	7/4/22	3 years
Ivory Boynton	Stationary Engineer, Burnside Shops.....	6/5/22	9 years
James Flaws	Carpenter, Burnside Shops.....	7/3/22	15 years
John O'Connor	Section Foreman, Chicago Terminal.....	7/22/22	3 months
Henry Hunt (Col.).....	Fireman, Memphis Division.....	7/20/22	1 year

THE SWASHBUCKLER

By HORACE

Short Story—Complete in This Issue

THIS is a sweet and pretty love story, if you care for that kind. With a smack of red-blooded adventure to give it a tang. Ah, good! you say, with a slight tingle of expectation; a threadbare theme, but possessed of the wonderful attributes of eternal youth withal. Love may grow doddering and silly, but never old. And adventure is the nutmeg sprinkled on the custard; it adds flip and zest.

Roscoe Rogers would soon be 20 years old. This stirring tale begins in winter time, shortly after the advent in the bustling county seat town of Corning of the Page family as a direct result of Sampson Page's having been elected treasurer of and for the said County of Washington, state of—it does not matter. Samps and his household came in off a farm down in Fremont Township. They brought a cow and chickens and a bay buggy-mare and a dog and cat. And, oh, yes, Mrs. Page and a young lady daughter. The daughter was 18 and—and—but wait. Well, anyhow, her name was Dorothy May.

Roscoe Rogers, born in Corning, had shot up from freckled childhood to a sort of hoarse-voiced, blatant youth. People generally conceded that Roscoe was a hard-boiled proposition. Early in life he could easily out-swagger and out-yell most of his associates, and he grew in boisterous assurance as he added inches to his stature. His type was wholly and rudely masculine. Noisy, ribald, rough and tumble, devoid of mincing airs or graces, he despised girls as utterly insipid. He was a natural noise-maker. The variety of ear-splitting devices he owned and operated was appalling to think of.

Roscoe, in the low bass parts, could rock the cradle into profound abysses of the deep.

Staid and serious folk, whose own parlous youth lay long-buried under the sear and sodden leaves which drift down from the tree of self-righteousness, looked askance at Roscoe Rogers. Which disturbed him a lot—not.

As he advanced along the ragged if not rugged road which winds upward from the sunny valleys of childhood to the bosky glens of adolescence, the finer usages of quondam respectability irked him. He became an exponent of the larger emancipation, living the life of a true barbarian. During the summer he fished and hunted, and in winter he followed the highly-scented vocation of fur-trapping, ranging the hills and hollows of the surrounding country side. Generally, he was in bad order with the esthetic portion of society.

So, one day in January, having disposed of his latest accumulation of peltries at good prices, he lingered on the sunny side of the courthouse yard in a state of isolated idleness. He jingled his earned increment with the serenity of mind which might have been felt by the original Astor, who was by way of being some fur-trader, 'tis said. He diffused a fragrant nimbus of—no, that was something else—

Then he saw two girls tripping along the sidewalk. He was well acquainted with one of them; he had been contemporary with her in grammar school and, a little more briefly, in high school.

Her name was Felicia Carpenter; her father was cashier or something in the First National Bank; he mechanically noted that she was wearing a neckpiece and muff of alleged fox skin, probably a Christmas present, from the look of newness thereof.

The other girl was a stranger to him. Her furs were black and elegant; at a hazard, he identified them as Russian sables, unsuspecting that they were in reality cunningly fashioned of common house-cat skins. The girl herself claimed Roscoe's discriminating eye. She was prettier than one of those \$12 bisque dolls which opens and shuts its eyes and says,

"Mama." Felicia was a creamy blonde, but Roscoe had two or three blonde sisters and didn't care for 'em particularly. But the new girl was a blue-black-haired brunette, with eyes like round pieces of anthracite coal—or anything else you like, just so it's jetty and sparkling.

Girls may not mean mischief when they glance sidelong from under demurely lowered lashes at a young man. A girl's eyes are as providence made them, of course. Shall she, perforce, be compelled to wear blinders like a horse when she walks abroad? If you asked a horse to decide, very likely he would say, "Neigh."

Who is competent to chart the panicky oscillations of the compass needle when it is exposed to the magnetism of the pole? How greater then shall be the task of him who attempts to follow the tortuous mental trail of Youth bitten by a love bug. Youth has its own system of logic, a system which seems sometimes to maintain that the longest way around is the shortest cut across. But a boy will climb a gate and be gone while your long-whiskered philosopher stands fumbling and maundering at the rusty latch.

Let it then suffice to say that Roscoe was smitten of Dorothy May Page's endearing young charms in the flick of an eyelash. And it may be that she hadn't seen him at all. Maybe she wouldn't have admitted it if she had seen him—

One day as he made the rounds of his traps the plaintive notes of a peewee gave him an idea. Probably it wouldn't have given you the same idea, but never mind. He hastened home and spent the rest of the day rehabilitating himself into a semblance of respectability—bathing, bay-rumming, barbering, and deodorizing. Then he attired himself in his best, or Sunday, suit, long wrinkled from disuse, went

Roscoe was smitten of Dorothy May Page's endearing young charms.

down town and bought a new, modish cap. Later he proceeded to mobilize certain of his more refined friends. When the shades of evening descended, this devoted company, burdened by various stringed musical instruments and aglow with the fervor of minstrelsy, foregathered in the Page dooryard and rent the stilly night with the strains of serenade. They were true troubadours. Their repertoire was vocal as well as instrumental. Ballads like "Way Down Yonder in the Cornfield" and "My Old Kentucky Home" added to the charm of "The Spanish Fandango" and "Sebastopol." A youth named Hinote, by a peculiar fitness, sang first tenor. His upper register was as shrill as the squeak of a mouse. Roscoe, in the low bass parts, could rock the cradle into profound abysses of the deep.

The serenaders gave their complete program in the shadows of the darkened house without obtaining the slightest hint of appreciation from its inmates. Finally they stole away somewhat chastened and discouraged. It was considered the proper thing always to invite nocturnal visitants of this kind inside and pass cake or some such material evidence of friendly esteem, but the Pages, it seemed, were not responsive.

An hour later, Dorothy May and her parents returned home from playing High Five at the Carpenters'.

The big snow fell a few days afterward. It covered the earth with a chaste mantle nearly a foot in thickness, as described by the *Weekly Times-Herald*. Snow meant coasting. And the premier coasting hill in town was the long, slanting street which ran past the old Judge Barnes mansion, leased and occupied by the parents of Dorothy May Page. Even while the last scattering flakes of the snowstorm lingered in the air, scurrying crowds of little people converged upon the hill—apple-cheeked little maids and shrill-voiced, officious urchins. But these were revelers of the daylight hours. A more formidable host appeared with the day's departure—lusty, hoarse-throated boys in chromatic sweaters and young women in knitted mufflers and coquettish tam-o'shanter.

Roscoe Rogers was a notable figure when coasting was in vogue. He owned a brobdingnagian bobsled nearly twenty feet long, a veritable super-dreadnaught of the snows. It was equipped with a great headlight made of an electric lantern, and a complicated arrangement of gongs and horns—motor-car horns, one a

squawker and the other a fearful ratchet-gear'd affair that would trumpet like a wounded elephant. Hitherto, Roscoe had not permitted girls to ride on his bobsled. He made an exception in the case of Dorothy May, however. And presently his ribald male cronies found themselves repudiated.

Dorothy May was the gayest coaster of all. She appropriated the seat of honor next the steersman, who, in a wonderful green and yellow striped sweater, piloted the clanging, shrieking, uproarious craft down the long speedway, a demoniac ship of pandemonium cleaving the night's brooding serenity. Dorothy May found it easy to walk back up the hill if she clung to a certain strong, green-sweatered arm.

The touch of soft fingers on his sleeve made the young man light-headed. He roared and shouted volleys of raucous satire at other coasters. He cut antics. He disturbed the peace of patient and long-suffering burghers half a mile away.

Mrs. Sampson Page took the lead in opposition to the nightly disturbance. One of her first moves was to forbid Dorothy May from participating in such barbaric revels. The following night there was a noticeable absence of something in Roscoe's life. He missed the sparkle of certain demure dark eyes. Later he led a reconnoitering party into the Page yard. Guarded signals were made. And presently an upstairs window was cautiously raised. A wistful face was seen.

"Oh, you beautiful doll!" brayed Launcelot, "Show some speed. You're late."

"I can't come out," Dorothy May confided. "Papa and mamma have gone to prayer-meeting at the Methodist Church. Mamma said I shouldn't coast tonight."

"Aw—that's a shame!"

"Come on out, anyway!"

"You don't need to stay but a minute."

A chorus of protests and suggestions rose. Dorothy May confessed that her parents had virtually left her a prisoner with the doors locked.

Zounds! Then Roscoe had an idea. He found and brought a ladder, and the lorn maiden was coaxed, dared and browbeaten into descending. She was to ride down just once and return to her cell in the castle tower. But Cinderella always overstays her allotted time. One ride only called for two—and time flies.

Sharp-eyed parents homeward bound untowardly early discovered the tell-tale ladder.

Ho, warders! Out, varlets, a rescue! A rescue!

The maiden was found on Roscoe Roger's bobsled. He erred in begging the question. Mrs. Page's wrath inundated him. "Rowdy! Ruffian!" And the lad was not schooled in the fine niceties of tact and self-restraint.

"Say, but you're some fussy old hen, though! Who do you think you are, anyhow? The Duchess of Dinwiddie, or what? Yah! Go away somewhere and hate yourself!"

Rude and clumsy repartee, even for Roscoe, but he was stirred by a mighty rage. A hawk was about to despoil him of his pet dove.

Some graceless ruffian in the group, inspired by his chieftain's burst of defiance, threw a snowball at the broad back of the departing duchess. The missile hit Dorothy May. She turned, righteously angry and addressed the luckless Roscoe.

"Oh, you are perfectly horrid!" she said. "I'll never speak to you again. You—you haven't even the first principles of a gentleman!"

The next day saw a man with team and wagon unloading and spreading liberal quantities of cinders on the speedway. Coasting was over temporarily on the Page hill.

Roscoe's soul was gnawed by the fangs of a poignant bitterness—for a few days. He had made a sorry mess of his first grand passion. He walked past the old Judge Barnes place once or twice. He saw his divinity finally. She tilted up her nose at him. Wo and alas!

Nevertheless he steeped his lacerated heart

Dorothy May appropriated the seat of honor next the steersman, who, in a wonderful green and yellow striped sweater, piloted the clanging, shrieking, uproarious craft down the long speedway.

in an infusion of vain regrets. He held no rancor toward Dorothy May. He even sent her word that he was guiltless of the snowball which had rent the silken net of true love, so to speak. She accused him of deliberate fabrication.

Spring came. Roscoe felt moved to write poetry. He spent hours composing verses to raven tresses—verse filled with a tragic and divine melancholy. Meantime, he got a job driving a grocery delivery wagon. But the Pages didn't trade at that store.

Came summer and, in the natural course of time, circus day. Now, circus day in a county seat town is an event of some moment. A day of days! First there's the arrival of the show-trains and the unloading of the strings of cages and wonderful paraphernalia. Then there's the spectacle of putting up the big tent and all the little tents, succeeded by the glittering pageant of the street parade. Roscoe, along with many other youths, did not work at his regular job that day. He followed the bewildering excitements of the hour.

The afternoon performance began at 2 o'clock. It was a hot and humid day. The knowing school of goosebone prognosticators opined that the day boded fair to be a weather breeder. In spite of that the big top was filled with a great crowd. Roscoe Rogers was one of the first ones inside. He chose a seat where he could command a view of all three rings. A little later, something else intervened to distract his alert attention from the big spectacle. Dorothy May Page and her mother, the redoubtable duchess, came and sat half a dozen tiers of seats below him. All the county officials had been given free tickets. The twain were quite oblivious of the young man's presence in their neighborhood. He thrilled with a delicious sense of nearness to one whom he deemed fairer than all the houris of Mahomet's paradise.

A circus is, after all, simply a circus. It conforms to a rigid precedent. The circus of today is the same as that of yesterday and tomorrow. It has the same glittering animation, the same gilt and tinsel and animation. Every adult has one time or another been constrained to escort the children to see a circus, so elaborate description is trouble wasted. But if you haven't been present when a storm came up and blew the main tent down, you have, after all, missed something.

The weather became more boding. The air was close, sticky, stifling. Presently there

sounded the grumbling mutter of thunder. A few timid persons went out, but the majority remained. The performance went on. The band played, and aerialists spun and whirled dizzily on their lofty perches. Clowns cavorted and bareback riders danced like butterflies around the sawdust-spread arena.

Then, abruptly, the roar of howling winds sounded outside. The tempest burst with a fusillade of rain and the clatter of a mighty blast. Ropes strained and creaked, canvas flapped and fluttered. Women screamed and babies cried. The guard-ropes on the windward side gave way under the tug of the gale's brief but boisterous onset, the tall supporting-poles swayed drunkenly—then down came the whole vast canopy. The big poles fell away from the side where Roscoe was sitting. But he found himself covered by clinging folds of canvas. Around him rose the bellowings of frightened people. Uproar did not disconcert Roscoe Rogers. Noise was his element. He slid down underneath the tiers of seats and made his way toward the spot where Dorothy May and her mother had been sitting.

He found them directly, wedged among a scrambling chaos of people and swathed in smoke-stained, wet cloth.

"This way," he said briskly, lifting the canvas with one hand and dragging the girl first to sanctuary behind him, then the larger bulk of her mother. "Stay right behind me," he ordered, "and I'll find a way out as easy as—shootin' fish—"

The property tent or some other part of the show structure had collapsed behind the main tent and blocked egress at that point. Roscoe edged along, lifting the canvas for the others as he went. Dorothy May clung tightly to his belt on one side and her mother on the other. He swelled with a mighty, danger-defying, dauntless daring. He rather hoped that a few lions and tigers had escaped and would presently menace them so that he could vanquish three or four bare-handed. But none appeared. The wind had ceased, and only a few drops of rain pelted the tent which impeded their progress.

Roscoe stopped, felt in his pocket and brought out a large pocket-knife.

"I'm tired of fooling around under this thing like a needle in a haystack," he growled. "Here's where we go through," and with that he started slashing. It isn't easy to cut stout duck that yields and gives to one's efforts from all sides. But he got a rent started at length,

A prodigious hole through which the three emerged into the balmy and moist air of the storm-swept afternoon.

and the rest was only a matter of persistence. He lacerated and tore a prodigious hole through which the three emerged into the balmy and moist air of the storm-swept afternoon.

The first person they saw was a circus roustabout whose face bore a forbidding frown as he stared at the slashed canvas.

"Say, you fool farmer!" he shouted. "What d'you want to cut the tent all to pieces that way for when you could a lifted it up and walked out from under? You jays make me sick. But I guess they don't hand the brains around to hurt in these hick settlements."

"Shut up, you big—," Roscoe began, and then remembered his gentle companions. He must not forget that he was a gallant gentleman. "I—I reckon that's right—," he finished mildly. "I beg your pardon, Mister—."

"Nonsense!" It was the outraged duchess who spoke. "Your miserable tent ought to be cut into carpet rags, by all rights. How dare you say a word to this gentleman? He saved our lives. He is a hero. My husband is the county treasurer, sir. Just you open your ugly face to object to this young man's actions, and I'll have you arrested!"

"Say, but you're some fussy old hen, ain't you?" sneered the man. "What do I care who your husband is? Who do you think you are—the duchess of—?"

"You roughneck!" roared Roscoe as he gathered a convenient piece of tent-stake and fell upon the foe.

The circus minion gave ground and promptly retreated, yelling for reinforcements, around a

clutter of wagons. Roscoe threw down his bludgeon and, with a lady on either arm, stalked proudly toward the street, where they mingled with the throng which laughingly or ruefully began to emerge from under the overturned tent.

"I—I'm glad you weren't neither one of you hurt," he said politely.

"Yes, it was lucky for us you happened to be there," Mrs. Page said in a burst of gratitude and effusiveness. "Dorothy May, aren't you going to thank him?"

"Thank you so much—Roscoe," she said dutifully. "It was wonderful of you. I'd like to have you come some evening and play croquet—if you care to—."

"Would I?" murmured Roscoe Rogers. "Gee! I'll sure be there—."

EXPECTANCY OF LIFE

The life expectancy of the women of Illinois is 57.57 years and 55.01 years for the men, according to the life tables for cities and states just published by the United States Department of Commerce. For residents of Chicago the periods are shortened, being 55.33 for women and 52.19 for men. Illinois ranks sixteenth in the table for longevity of its residents.

Chicagoans live longer than New Yorkers, the statistics show. And Pittsburgh occupies the cellar position in life expectancies, the tabulations indicating the natives are to look forward to only 47.16 years of life.

Washington heads the cities with an expectancy of 58.83 years for men and 59.83 for women.

What Patrons Say of Our Service

Some Rapid Service on Freight

The following letter has been received by M. Dorsey, agent at Mattoon, Ill., from H. A. Chuse, president and general manager of the Chuse Engine & Manufacturing Company of Mattoon:

"We were very much pleased when we learned that the two cars recently shipped to Highland, Ill., reached their destination within twenty-four hours after leaving Mattoon. We consider this very fine service and beg to thank you for it."

Service Unseen but Faithful

The following letter was written to President C. H. Markham by Bernard Gruenstein, 307 Calumet Building, 114 North Seventh Street, St. Louis, Mo., while on one of our trains near Memphis, Tenn., en route from New Orleans to St. Louis:

"I know you must be an extremely busy man, and I have my doubts that this letter will ever be passed over to your desk, but, on the chance that it may be, I will risk the time and trouble of writing it. This letter is about a very humble and obscure negro chef whom I have just watched for half an hour. I am informed his name is Walter Cannon, and he has been in the Illinois Central service seventeen years, which in itself must be a remarkable record.

"I was attracted to Walter by the tasty dinner he had prepared to my order. After tipping the courteous waiter, I went back to the kitchen to tip the cook—an unusual proceeding, I admit. After tipping him, I watched him at close range from the doorway. Let me say at once that if every Illinois Central employe were as industrious and as consecrated to routine tasks as this lowly negro, whom the public never sees, seemed to be, the Illinois Central would become the world's greatest public servant, barring none. As I watched Walter I was fascinated by the sheer devotion to duty that was so obvious in every expert move he made in his tiny domain beside the steaming ranges, and I said to myself: 'That's the stuff that makes our American corporations invincible.'

"Only a negro, Mr. Markham, but if all your great army of men were half so faithful you would never have to invite constructive criti-

cisms or suggestions from the public. I am intensely Southern in all my sympathies, but I do want to pay this just tribute to a competent servant, whom I shall never see again, in all probability. I care not a tinker's damn how black his skin may be. There is so little fidelity to duty now that perhaps it is well to single out a case of it from so unexpected a quarter.

"Of course, Walter knows nothing of this letter, but I write it in the spirit of encouragement in the railroad's hour of trial. Of such men as Walter Cannon are America's greatest railroads built."

A Good Impression in the East

The following letter was addressed to J. J. McLane, our eastern passenger agent in New York City, by Jerome Hurley, Broadway, Pine and Welsh streets, Camden, N. J., who handled transportation arrangements for Eastern delegates to the recent national meeting of the Lions' Clubs at Hot Springs, Ark.:

"I am writing you to thank you for the efforts that you put forth in making the trip of the Eastern delegates to Hot Springs a most pleasant and enjoyable one.

"On behalf of these thirty-six delegates, I want to voice their appreciation for the excellent service and courtesy that was extended these men throughout this journey.

"I received the pamphlet that you mailed, on the Panama Limited, and I am pleased to say that I used this train out of Memphis to Chicago, with Mr. Gorman; the two of us had a compartment. The train is all that you claim for it. It is without exception one of the finest that I have ever traveled on.

"Again I thank you for making the wonderful arrangements for us and trust that at some future date I may have the pleasure of seeing you."

Appreciated Suburban Service

The following letter concerning Illinois Central suburban service during the recent street car and elevated strike in Chicago was addressed to President C. H. Markham by Miss Laura W. Clark, 5315 Blackstone Avenue, Chicago:

"May I speak a word of commendation for

the Illinois Central people at the various stations during the past week? I am a regular commuter, but this week necessitated more use of the I. C. than usual, as it was necessary for me to get the people going out from the United Charities for their summer outing-downtown via the suburban. All of the Illinois Central people showed unusual interest and helpfulness particularly the ticket puncher at Woodlawn station in the morning. I understand her name is Mrs. Osborn. I certainly do appreciate this and believe you might be interested in knowing of it."

Received Special Attention When Ill

The following letter to President C. H. Markham is from E. S. Thompson, president of Thompson Brothers & Price Com-

pany, 66-68 Huling Street, Memphis, Tenn:

"Enroute from New Orleans to Memphis—on your train No. 2, I think it was—on June 10 I took violently ill with what later developed to be ptomaine poisoning. I write today, desiring to express to you as president of the road and to the conductor on the train, through you, my sincerest and deep appreciation of his having held the train at McComb City and assisted materially in getting a doctor.

"It affords me much pleasure to state, Mr. Markham, that while ill I received every consideration possible at the hands of the various employes of the Illinois Central with whom I came in contact, which policy of your road I very deeply appreciate."

How to Figure the Earnings of a Railroad

The statements of earnings of the railroads which are published monthly and annually are made up of the following items:

Operating Revenue—This is the total receipts from operating the railroad. Usually about 70 per cent of the operating revenue is from freight, 20 per cent from passenger traffic and 10 per cent from mail, express and all other transportation charges.

Operating Expenses—From the operating revenue is subtracted the operating expenses, the principal items in which are wages, fuel, material and supplies, maintenance of equipment and maintenance of way and structures. The largest single item is always labor.

Net Operating Revenue is operating revenue less operating expenses. From this are subtracted all taxes, and to the result is added

Other Income, which is income from other sources than direct operation. It is often a substantial part of the railroad's income, and

may consist of income from other roads owned or leased, real estate, etc. Other income plus net operating revenue is the

Total Net Income or, as it is sometimes called, the gross corporate income. From this are deducted

Fixed Charges, which are the charges which accrue to the railroads regularly. They consist of leases, rentals and bond interest. After these have been paid there is left

Net Surplus (or net corporate income) available for dividends on stock, and it is also the sum from which reinvestments in the property may be made.

The methods of railway accounting and the making up of balance sheets and income accounts are all prescribed by the Interstate Commerce Commission. Reports are filed with the commission monthly and annually, and are given out for publication in strict accordance with the rulings of the commission.

To Gather Railway Historical Documents

How many readers remember the little old locomotive and cars we used to see rolling along on the railroad? What a contrast they were with those of today!

Some of the lovers of the old-time rolling stock have formed a society to preserve old amrotypes, daguerrotypes, photographs,

lithographs, time tables and anything that pertains to transportation in the old days. Have any of the readers of this article any photographs of old locomotives or cars laid away up in the attic? The Railway and Locomotive Historical Society wants to preserve these photographs and this material and

will gladly welcome any contributions. Due credit will be given the donor, and the society will gladly pay any postage or express charges.

The society will gladly welcome to its membership anyone who is interested in the subject of early transportation in any of its phases. The bulletins frequently issued by the society contain much material of great interest and value, and it is possible to

obtain them without joining, but railway men, whether young, middle-age or retired, are welcome to join, as well as those not in railway service but interested in the early railway transportation of this country.

Further information can be obtained from Charles E. Fisher, 152 Harvard street, suite 8, Brookline, Mass., or from John W. Merrill, Director, 40 Kilby Street, Boston, Mass.

NEWS OF THE DIVISIONS

AROUND CHICAGO

Baggage and Mail Traffic Department

The following letter, dated at London, England, July 23, has been received from Miss Vesta Shoesmith, claim clerk in the baggage and mail traffic department, who is touring Europe:

"We arrived in Liverpool the morning of

July 10, having been delayed a day by running into fog off the coast of Newfoundland. Except for the sight of some beautiful icebergs and the celebration of the Fourth of July by field day sports on deck and a patriotic concert in the evening, our voyage was rather uneventful.

"We brought sunny weather with us into England, where people were complaining about the cold, rainy weather they had been having. Certainly we cannot complain of the weather man since our arrival.

"We had some wonderful coaching trips in the lake district and the Wordsworth country, making our headquarters in the quaint little village of Ambleside, which seems to have been in these lovely mountains always. We stayed at Prospect Cottage, built in the sixteenth century. The drivers of our high coaches, to which we climb on a ladder, wore bright scarlet coats and flourished their whips with an air as they drove their four horses along the beautiful mountain roads. We visited the grave of Wadsworth in the churchyard at Grasmere and Dove Cottage, where he lived so long with his sister, Dorothy. We felt that we could spend our whole time very enjoyably in this part of the British Isles, but, while we are not with a party and can do as we please, we are very anxious to see Holland, Belgium, Switzerland and France; so we try to follow the plans which we made before we knew how difficult it would be to leave each place that we visited.

"We spent four days in Edinburgh, and all agreed that the Scotch have every reason to sing its praises. Princes Street is the most beautiful boulevard I have ever seen, with clubs, hotels and beautiful buildings on one side of the street and gardens and statues on the other. The historic old castle, high above on Castle Hill, is an unusual sight in the heart of a great city, especially for those of us who hail from a new country like the States. We visited many historic places in and near Edinburgh and had a beautiful trip by motor through the Trossachs and by steamer on Loch Katrine and Loch Lomond.

"We broke our journey to London by stopping to see Durham Cathedral, which is wonderfully situated, together with Durham Castle, on a high eminence of land which is almost an island, for the Wear River makes a horseshoe turn and flows around three sides of the land on which the cathedral was built in 999. It was an extremely interesting place to visit.

"In London we have seen the usual city

Invest in a Hamilton if You Want True Time All the Time

BUYING a new watch requires some thought. You are making an investment that should pay you dividends of true time for years and years to come. Eliminate guess-work and make your choice the HAMILTON WATCH, "The Railroad Timekeeper of America"—the watch that Conductor J. E. Hopkinson, of the Boston and Maine Railroad, has carried for twenty-five years with perfect satisfaction.

You owe it to yourself to purchase this watch with a service record. Thousands of your fellow workmen heartily indorse it, and owners of thirty years or of six months standing are equally enthusiastic about its unrivaled accuracy and dependability. Ask your jeweler to show you

The "992" Movement

This is the twenty-one jewel movement that is preferred by so many Railroad Men. Your jeweler will be glad to suggest a suitable case for it and you can choose the dial you require. Make it "your watch," and you'll have true time all the time.

Send for the "Timekeeper," a most interesting booklet showing the various HAMILTONS and giving other valuable watch information.

It is sent postpaid on request. A postal card bring it to you.

HAMILTON WATCH COMPANY, Lancaster, Penna., U. S. A.

Hamilton Watch

"The Railroad Timekeeper of America"

Not room enough to house all our engines in recent rush of business at Evansville, Ind.

sights, and only yesterday, as we were sitting in a park near Buckingham Palace, His Majesty, King George V, rode out on horseback on his way to Hyde Park to review the Territorials; so we felt that we were fortunate.

"Our motor trip to Stope Poges to visit the scene of Grey's 'Elegy in a Country Churchyard' and to Windsor Castle was wonderful. We made a part of the trip to the castle on the River Thames, which was lined on either side by beautiful homes, with gardens sloping down to the river banks. At Windsor Castle we were taken through the state apartments, which are shown in the absence of the king and queen and which, in spite of all of the description we had heard of them, surprised us by their splendor.

"This morning we attended service at St. Paul's Cathedral, and this afternoon visited the National Galleries. Tomorrow we will attend to some business at the American Express and leave by night boat to the Hook of Holland."

Purchasing Department

If the "Inquiring Reporter" were to ask me to name my favorite outdoor sport, writes our contributor, signing herself "One of the Stenos," I would tell him: "A beach party (with the same old moon a-shinin') such as was given on Tuesday evening, August 1, at Jackson Park by the employees of the purchasing department."

The "piece de resistance" was the famous roasted "weenie," while the rest of the menu consisted of sandwiches, pickles, assorted cookies and coffee. A certain popular bachelor was heard to remark: "I never knew Miss Alice could make such wonderful coffee." The girls made several remarks about the "weenies," and no wonder, with all the married men of the department demonstrating their skill in the culinary art. From the way our gallant office manager wielded the fork, it could be seen that he well deserves the title of "chef de cuisine."

After the feast games were played, and an impromptu song recital was given by the Galli-Curcis and John McCormacks of the department. A marshmallow roast concluded the evening's festivities.

Among the guests were: Mrs. C. C. Facquier and Master Billy, Mr. and Mrs. W. T. Walters, Mrs. W. P. Scanlon and Billy, Jr., Miss Edith

Leach, Miss Anna Rubin, Miss Eleanor Becker, Miss May Condon and William and Albert Raymond.

In spite of the street car strike, the folks who were unable to use the Illinois Central had no difficulty whatever in reaching their respective homes, as those who had cars made good use of them. At least one car made two trips. Our purchasing agent, J. J. Bennett, did everything possible to make the party a success.

The spirit of good-fellowship seemed to predominate as never before, and we are all hoping the purchasing department will have many more beach parties.

Chicago Terminal Division

Wrecking Foreman J. Allemon noticed a loose wheel on car SRL 20129 of train NY-2 of the Michigan Central Railroad on July 13, notified the proper authorities and probably prevented a serious accident. Officers of the Michigan Central have expressed their appreciation of Mr. Allemon's act.

ILLINOIS DIVISION Superintendent's Office

Traveling Engineer W. E. Rosenbaum underwent an operation for the removal of his tonsils in the Illinois Central Hospital, Wednesday, August 9.

G. E. Webster has been appointed chief clerk, vice R. G. Miller, who has been granted a leave of absence on account of ill health.

Mrs. Otis A. Barnes, secretary to Superintendent J. W. Hevron, has resigned her position and will leave about September 5 for Salt Lake City, Utah, where Mr. Barnes has been appointed professor in the department of organic chemistry at the University of Utah. Mr. Barnes received the degree of doctor of philosophy in chemistry at the University of Illinois in June.

A recent wedding which came as a complete surprise to his fellow workers was that of Noble Richmond to Miss Genevieve Carpenter, July 15. Mr. Richmond is the son of Mrs. Maude Richmond, and Miss Carpenter is the daughter of Mr. and Mrs. Grant Carpenter of Urbana. Mr. Richmond is employed as clerk to Trainmaster J. T. Stanford.

Miss Fairy Wand, tonnage clerk, announced

her engagement to David Gray of this city at a party July 8. Miss Wand resigned her position, effective July 17, and will be married in the near future.

E. R. Hansley, operator at Kinmundy, died at 6 p. m., July 30, while bathing in the Kinmundy reservoir. A coroner's jury returned a verdict of death due to heart trouble.

Freight Conductor William Callan of the Illinois division extinguished a threatening fire on I. C. 27902 of extra No. 1728 on July 27 and probably prevented the company from having to pay a large claim. The train was at Kankakee when a fire was discovered at the one end of the car. Conductor Callan broke the seal of the car and extinguished the flames before serious damage had been done to automobiles that were in the car. One of the automobiles was only slightly scorched, and it was sent on to its destination. The fire is thought to have been caused by a spark from a passing train, since a place about a foot square was burned on the outside of the car. The wood was not burned through, but the flames went up through the walls of the car. The damage to the car was only slight, an examination at Fordham disclosed.

INDIANA DIVISION

Miss Florence McShane, secretary to Superintendent Roth, is on a two months' leave of absence.

C. B. Winkleback has resigned his position as accountant in the Mattoon offices, effective August 15. He has accepted a position as meter tester with the Central Illinois Public Service Company at Springfield, Ill.

Chief Dispatcher's Office

Miss Victoria Gustivison, clerk to the chief dispatcher, has returned from a month in Chicago and "down on the farm."

C. D. Stucker, second trick at Palestine, is

Wife and daughter of Section Foreman William Dempster, Cloverdale, Ill., Wisconsin division, and some of their beautiful flowers.

Just write, "Send me the Bunn Special." No expense or obligation to you. Only if you are convinced it is dependable in every way—and is the Master Railroad Watch, do you send \$5.75 monthly—at the rate of a few pennies a day. Order today—NOW.

J. M. LYON & CO.

2-4 Maiden Lane New York

off for two weeks. Operator George Alt is filling the vacancy.

Dispatcher E. L. Smith is off for two weeks. Frank Crimmins, second trick "Q," is taking his place. Operator E. R. Duncan is relieving Crimmins.

Brakemen Hunt, Morris, Goff and McGinnis have been promoted to conductors. They are running regularly during the heavy grain and coal movement.

The grain movement on the Peoria district and out of Peoria has been heavy. The Indiana division is running short about 120 grain cars daily.

Agent C. W. Murray of Bargerville, Ind., has been off for ten days, relieved by Operator Gibson.

The coal movement through Evansville from the Kentucky fields is holding up nicely, the Indiana division having moved 7,426 loads out of Evansville during July.

On account of the increasing business through Evansville, a telegraph office has been opened in the north end of Harwood Yards, Evansville.

Brakeman H. T. Cobb was killed August 11 while switching at Sullivan, Ind. He is survived by a wife and one child.

Mattoon Shops

Bert Stull, hostler at Mattoon shops, and Mrs. Stull have suffered a double loss through the deaths of their 11-month-old baby boy, Merle, on July 7, and their 15-year-old son, Joe, on July 11.

SPRINGFIELD DIVISION

Edward Rundle, who has been working in the superintendent's office for several years, has accepted a position in the baggage department at Decatur.

Francis Shumaker has accepted a position as office boy in the superintendent's office.

Mrs. W. W. Armstrong has gone to Evansville, Ind., to visit her husband, who is temporarily employed as switchman on the Indiana division.

Conductor J. Lordan and family have returned to their home in Springfield, after a month taking in the sights of California.

Conductor Harmon, who has been working on local runs between Springfield and East St. Louis, is moving his family to Clinton and will work as a conductor in chain gang service out of this terminal.

Flagman M. H. Sherman has returned to

Home of Section Foreman A. R. Sager of Haldane, Ill., decorated for the Fourth of July, this year.

work after a leave of absence of about six months. During the time he was away, Mr. Sherman was in the government hospital in Chicago, where he underwent five operations. He is greatly improved at this time and feels that the operations were successful.

Conductor J. B. Stewart, while picking cherries at his home in Freeport about six weeks ago, fell out of a tree, breaking his collar bone. He is improving rapidly and expects to be able to return to work in a short time.

Yard Clerk E. J. Foley has returned to work after an absence of about thirty days. Mr. Foley took charge of his father-in-law's grocery store while the latter went west for the benefit of his health.

O. H. Lawson, conductor on the Daylight Special, has returned to work after an absence in Missouri on business. Conductor T. W. McIntyre filled the vacancy.

E. M. Williamson, third trick operator, "CO" office, Clinton, was married on August 6 to Miss Glenna McKinney. They are now spending their honeymoon in the West. Miss McKinney was stenographer at the Illinois Central shops for several years.

J. R. Thorne left August 17 for a trip to the North in an effort to escape the hay fever.

Road Department

Mrs. J. W. Swartz, wife of Assistant Engineer

The Illinois Central's new pumping station on Ramsey Lake, at Ramsey, Ill., put into service August 1.

Swartz, was recently called to Fairfield, Ind., by the death of her grandmother.

Mrs. W. E. Russell and sons, Hunter, Albert, Robert and Howard, and daughter, Eleanor, are spending the summer with Mr. Russell's parents in Benton Harbor, Mich.

Miss Loraine Sylvester, daughter of William Sylvester, B. & B. supervisor's clerk, is spending the summer in California and other western points.

Here is the home of Frank J. Franek, Illinois Central brakeman, at 313 East Washington Street, Clinton, Ill. Mr. Franek has improved his home greatly in the last two years. He finds pleasure and profit in an up-to-date chicken house and yard. This year he raised about a hundred chickens.

Miss Geraldine Reynolds, stenographer in the roadmaster's office, and Miss Julia Coffey, accountant, who have been visiting in Colorado, Utah and California since July 1, resumed work September 1. They report an enjoyable time.

B&B Supervisor S. C. Draper has been suffering from an infected hand, but has improved considerably and is now able to follow out his numerous duties.

Dr. L. D. Draper, son of B & B Supervisor and Mrs. Draper, visited his parents in Clinton,

ST. LOUIS DIVISION

Accountants E. H. Smith and Shelby Hodge and Dispatcher V. F. Lyons attended the national guard encampment at Camp Grant from July 23 to August 5.

There has been a heavy movement of peaches from the St. Louis division the last few weeks, particularly from Balcom, Anna, Cobden, and Makanda. The Elberta peaches grown on the St. Louis division cannot be surpassed by any in the country.

The Lions Club of Carbondale, which has been actively engaged in the eradication of the mosquito, recently gave away an automobile. Professor Furr of the Normal was the winner. The Illinois Central has been active in this campaign.

Joseph H. Swayze, former ticket agent for the Illinois Central at Belleville, Ill., died at 3 p. m., July 24, at the City Sanitarium in St. Louis after an illness of about one year. He was 50 years old. At the time of his death, he was employed as an accountant for the Wabash Railroad.

WISCONSIN DIVISION

The sympathy of Wisconsin division employees is extended to File Clerk Harriett E. Cox and Dispatcher George T. Cox in the loss of their father, who died July 21.

MINNESOTA DIVISION Freight Office, Dubuque

Sympathy is extended to James Ahern, demurrage clerk, in the death of his father, D. C. Ahern, chief of the Western Weighing and Inspection Bureau at Dubuque. Mr. Ahern died at Mercy Hospital, July 27, after a brief illness. Funeral services were held at the cathedral. Burial was in Mount Olivet.

Miss Ruth Vogt, comptometer operator, revising bureau, is enjoying a visit in Washington, D. C., New York and other eastern points.

Fred Rohmberg, former car clerk at Dubuque, paid a visit to his old friends here recently. Fred is now employed by the Minneapolis Drug Company, with headquarters at Minneapolis.

Theo Regnier, revising bureau rate clerk, was called home to Kankakee by the serious illness of his father.

Charles Sullivan has succeeded D. C. Ahern as chief of the Western Weighing and Inspection Bureau. Mr. Sullivan was formerly employed as clerk to Mr. Ahern. Raymond Harron has succeeded Mr. Sullivan.

Transportation Department

H. G. Pierce, agent at Manchester and Mrs. Pierce have returned to their home after spending a month at Lake Louise, Banff, Seattle and San Francisco.

The many friends of Bob White, chief clerk at Waterloo, will be pleased to learn that he will soon resume his duties, after having been confined to the Illinois Central Hospital, Chi-

Above, on a scenic trip between Lake Louise and Sicomous, in the Canadian Northwest. Mr. McCabe is distinguishable as a Shriner. Mrs. McCabe is beside him. In front of them are, left to right, Hazel and Edith.

Upper left, an ostrich farm at Los Angeles, Cal. Left to right, Edith and Hazel.

Lower left, at Lake Louise. Edith is shown.

Superintendent and Mrs. L. E. McCabe of Dubuque and their nieces, Misses Hazel and Edith Riggs, who are employed in the office of the general superintendent of transportation at Chicago, recently made a trip to California, leaving June 3 and returning June 30. Mr. McCabe attended the Shriners' convention at San Francisco the week of June 12.

cago, for the past two months with a broken knee.

A. J. Lemper, engineer, who has been confined to his home for the past year on account of illness, is convalescent.

IOWA DIVISION

Mrs. P. E. O'Connell, wife of Supervisor P. E. O'Connell of Denison, Iowa, died on July 26 at Omaha, Neb., where she had undergone an operation on July 3. Although the operation, which was serious, had been gone through successfully and all went favorably until she was removed from the hospital to the home of a friend, there she took a sudden change for the worse.

The funeral was held on Friday, July 28, at St. Patrick's Church at Dunlap, Iowa, where solemn requiem high mass was sung. Father O'Connell of Sloux City, brother-in-law of Mrs. O'Connell, was celebrant of the mass; Father Desmond of Fort Dodge, deacon; Father Toher of Dunlap, sub-deacon; Father Smith of Onawa, master of ceremonies. Father Bradley of Denison was also in the sanctuary. The sermon was preached by Father Toher, who spoke feelingly of the true Christian life of the deceased and of the ideal wife and mother she had always been.

Six of her cousins acted as pallbearers. Burial was in Pleasant Hill cemetery, beside the graves of her parents. Despite the inclemency of the weather there was a large attendance at the funeral.

KENTUCKY DIVISION

Miss Mary Leitchfield and Dr. Carl E. Abell were quietly married at St. Charles Borromeo Church, Louisville, Ky., July 20, the Rev. John Abell, brother of the groom, officiating. Miss Louise Leitchfield, sister of the bride, and Hill-rick Buckman were the only attendants. Miss Leitchfield, "Our Mary," has been telephone operator on the Kentucky division for twelve years and is known and beloved on the whole division for her never failing courtesy and willingness to help others and for her sunny and loving disposition. Doctor Abell has been located at Harlan, Ky., for the past two years. After a honeymoon trip to West Baden, French Lick and other points, Doctor and Mrs. Abell will be at home at Harlan. In token of the esteem in which we held "Our Mary," the Kentucky division presented the bridal couple with a handsome dining room set.

J. S. Stinebaugh, water supply foreman, who has been seriously ill at his home in Princeton, is much improved.

C. L. Wilson, section foreman, is seriously ill at the Illinois Central Hospital, Paducah, Ky.

Henry J. Wilkerson, per diem clerk, has returned from a 90-day leave of absence. During this time he traveled through Florida and various Southern points.

Report has been received of the death of Charles Buchold, father of Adolph Buchold, clerk in the local freight office, Louisville, on July 18.

TENNESSEE DIVISION

Mr. and Mrs. W. A. Love, recently married, were surprised recently when a number of their friends arrived, bringing a beautiful chest of silver as a token of love and good wishes for their future happiness together. An appropriate presentation speech was made by M. Bryant, inspector of water works, all the guests being members of the water works department of the Illinois Central, except Mr. Klee, who

belongs to the valuation department. The guests were: Mr. and Mrs. P. P. Pickering, Fulton; Mr. and Mrs. Landgraf, Dubuque, Iowa;

Illinois Central water works dam on the Tradewater River near Dawson Springs, Ky. There has been a mill on this site, such as the one shown, for more than one hundred years.

Mr. and Mrs. Scott, Baton Rouge, La.; Mr. and Mrs. Lynch, Baton Rouge, La.; Mr. and Mrs. Brannan, Memphis; Mr. and Mrs. Bryant, Chicago; Mrs. Simpson, Paducah; F. Lingle Carbondale, Ill.; Mr. Klee, Chicago; R. L. Hillehay, Grenada, Miss.; Misses A. Keefe, Mary Powell

Miss Myrtle Wiggs were married at the home of the bride in north Water Valley, by the Rev. L. P. Wasson, pastor of the First Methodist Church. Mr. and Mrs. Lord toured across the country to Sardis, where they caught a train into Memphis, en route to Mexico and to Canada, on their honeymoon. After completing their trip, they will go to Dawson Springs, Ky., their future home." Mr. Lord was formerly employed as instrument man accountant in the engineering department, but has recently been transferred to the Kentucky division. Miss Wiggs is a Water Valley girl, and both have many friends here, who wish them every success.

Conductor and Mrs. J. F. Avery are on an extended trip to Los Angeles and other points in the West.

Engine Foreman and Mrs. W. E. Holley and two children are spending about thirty days in Denver, Kansas City and Afton, Iowa.

Flagman W. R. Thetford is in the hospital at New Orleans for treatment.

Flagman T. D. Sizemore has returned home from the hospital at Paducah, after having been there several weeks with a broken foot, an injury which occurred while he was working temporarily on the Kentucky division. He is greatly improved and will soon be able to resume work.

Flagman and Mrs. T. D. McLeod are being congratulated upon the arrival at their home of twins—a boy and a girl.

H. D. Owens, agent at Coldwater, who was taken to the hospital at Memphis, with an acute attack of appendicitis, is much improved and hopes to be able to return to work in a few days.

H. S. Tyler, employed as section foreman at Vaiden, was instantly killed on July 24 while operating a motor car from his work to his tool-house. Mr. Tyler was employed in the road department on this division on November 12, 1913, and was promoted to section foreman in March, 1916. He was highly esteemed as a section foreman by the railroad and

H. S. Tyler.

Division offices, Fulton, Ky.

and M. Wanecker, Chicago. After a pleasant time together the guests were entertained with a 1 o'clock luncheon at the Usona Hotel, and all left with many pleasant memories of the happy day and good wishes for the future happiness of Mr. and Mrs. Love.

Conductor C. O. Marr, Memphis, Tenn., discovered a defective draw bar in Extra 1566 north, July 10, in charge of Conductor John W. Sawyer, who immediately inspected and located the defective draw bar and possibly avoided a serious accident and the loss of life.

H. O. Cole and L. F. Carpenter, clerks, Fulton, Ky., attended the Elks' state convention, held in Newport, Ky., Wednesday, August 9. Both report a royal reception and good time in Newport and Cincinnati.

J. W. Eakin, formerly at Birmingham, has been transferred to Fulton as clerk of the supervising agent.

MISSISSIPPI DIVISION

as a man by his friends. Mr. Tyler leaves a wife and five children.

LOUISIANA DIVISION

Miss Polly Ard, former clerk to Supervisor Mercer, Yazoo City, has accepted a position as clerk to Supervisor Smith, Hammond, La.

George T. Edwards, rodman, Louisiana division, has been promoted to instrument man, Mississippi division, with headquarters at Water Valley, Miss. Jack P. Murphy, rodman, building department, has been transferred to the position vacated by Mr. Edwards.

The Kentucky and Tennessee divisions have not only borrowed a number of our transportation department men, but also our trainmaster, E. L. McLaurine. The reason is increased business, which, of course, means better conditions for all concerned.

Miss Stella Seater, bill clerk, freight office, Canton, Miss., recently resigned. Her place is being filled by Burton Hayman, former record clerk. C. N. Montgomery is the new clerk being initiated in station routine.

H. P. Campbell, trainmaster, recently purchased a new motor car.

Mrs. Lowe.

Mrs. Robinson.

Miss Brock.

Mrs. McCullough.

Here are Miss Lena Brock, chief clerk to the lumber purchasing agent, elected president, and Mrs. Marguerite B. McCullough, clerk in the freight office, elected treasurer of the Business and Professional Women's Club recently organized at McComb. The club was organized with eighty-six charter members, 35 per cent of whom were Illinois Central employees. A number of these were elected to other offices and appointed on various committees. The club is being sponsored by the McComb Chamber of Commerce and by William McColgan. Since its organization, the membership has increased to 125. The first subject studied by the club was "What Every Business Woman Should Know," by Mrs. Anna Steese Richardson.

W. H. Hodges, former relief clerk on the division, has accepted permanent position as station clerk, Ponchatoula, La.

William Osborn, clerk, Roseland, La., has been off for several weeks on account of undergoing an operation in the Illinois Central Hospital, New Orleans. At present his condition is somewhat improved.

Baggage Clerk C. L. Threeton, Hammond, La., has been on a leave of absence for several weeks, spending the greater part of his time in Colorado.

May D. McMichael, clerk to chief dispatcher, Stockkeeper Stevens and Mrs. Stevens are spending several weeks in the North.

Here are two recent Louisiana division brides: Mrs. Daniel Timmons Robinson, formerly Miss Beulah Glendenning, was employed as performance clerk in the superintendent's office at McComb. Her marriage to Doctor Robinson took place August 12, at Magnolia, Miss. The ceremony was performed by Rev. Mr. Purser of the First Baptist Church that city.

Mrs. Bert A. Lowe, formerly Miss Ruth Lane, was a stenographer in the master mechanic's office at McComb. Her marriage took place at the home of her parents in Summit, Miss., July 15. The ceremony was performed by the Rev. Bracey M. Campbell, pastor of the First Baptist Church. Mr. and Mrs. Lowe left on train No. 2 that night for points in the North and West. They have been at home since August 15 in Los Angeles, Cal., where Mr. Lowe is employed as a mechanical engineer for the Goodyear Rubber Company.

Engineer George McIntyre and Fireman J. L. Matheny, with engine No. 1011 of train No. 33, on arrival at New Orleans, July 22. Mr. McIntyre has been an engineer on the Louisiana division for thirty-two years. Mr. Matheny, who has been on the division twelve years, was promoted to engineer five years ago. These men are two reasons for Louisiana division leadership in fuel campaigns. Photograph by A. A. Dodson, claim agent, New Orleans division.

Store department forces are occupying their new quarters in the shop. Our neighbors now are the forces of the lumber purchasing agent.

Ticket Clerk R. M. Wilson, McComb, Miss., was recently called to Oklahoma on account of the sudden death of his brother.

J. H. Doughdrill, former baggage clerk, McComb, has accepted position as clerk in the freight office at Brookhaven, Miss.

Miss Frances Otken, secretary to chief clerk, superintendent's office, is on a leave of absence, which she is spending in Virginia.

Interest has been revived in the oil well on Cupit Farm, near Magnolia, Miss. The Mid-Central Oil and Gas Company, Inc., whose headquarters are in New Orleans, has obtained permission to operate in Mississippi and has purchased the right to drill on this farm. Workers are now lowering the casing and expect to bring the well in within the next week.

NEW ORLEANS TERMINAL

Z. T. Arnold, accountant, superintendent's office, made a flying trip to El Paso on his vacation and mixed business with pleasure by obtaining an option on several hundred acres of excellent grazing land.

The friends of J. Ogden Nulty were much pleased when he visited them at the superintendent's office recently. Mr. Nulty is a former employe of the Illinois Central, having served both G. E. Patterson, when superintendent at McComb, and J. W. Cousins, superintendent of the New Orleans terminal. He is now connected with the firm of McGlynn & Company, Stock Brokers, New York City. Mr. Nulty was accompanied by his wife, who was Miss Betty Foreman of Brooklyn, N. Y.

H. E. Campbell, rodman, was called to Chicago recently by the serious illness of his mother. He has returned and reports his mother recovering.

Mrs. J. B. Rogan, mother of Roadmaster J. E. Rogan, Extra Gang Foreman F. U. Rogan and Clerk E. A. Rogan, died July 18.

It has been announced that John Olson, clerk in the local office, and Miss Annie Kiel, grain

Some views taken by Claim Agent A. A. Dodson of the New Orleans division at Hammond, La.

No. 1—Section of supervisor's office. Left to right: Supervisor O. E. Smith, twenty-four years with the Illinois Central, who has an enviable record for reduction in personal injuries and stock struck; Ivy N. Stafford, four years clerk to supervisor, who has resigned to become cashier of the Farmers' and Merchants' Bank of Independence, La.; Miss Carrie Rownd, who succeeds Mr. Stafford in Mr. Smith's office. Miss Rownd is a cousin of former District Judge W. S. Rownd of Tangipahoa Parish.

No. 2—Freight office and force in charge. Left to right, standing: Herbert Tucker, warehouse clerk, eighteen months with the Illinois Central; C. S. Rand, agent, sixteen years agent on the Louisiana division; H. K. Buller, warehouse man, five years with the Illinois Central; Hubert Barrett, bill clerk, two years' service; Sam Hatton, check clerk, four years and seven months of service. Sitting: Eugene Clinton and Monroe Taylor, truckers, the former two years and the latter eighteen months in service.

No. 3—Extra Gang Foreman J. H. McMahon, assistant extra gang foreman and crew at work on track. Mr. McMahon has been twenty-six years with the Illinois Central, and is a successful farmer and stock raiser in addition to doing the heavy work on the lower end of the McComb district.

door accountant at Stuyvesant Docks, will be married September 12, after which they will spend their honeymoon in Chicago, Niagara Falls and New York City.

Recently a delegation of twenty-five New Orleans fire fighters visited Stuyvesant Docks on an inspection tour, to become better acquainted with the location of the various hose connections and fire hydrants, so that there would be no delay in case of fire.

Fred DeLong, station accountant, Stuyvesant Docks, spent several weeks with his mother in Louisville, Ky. He also visited friends in Chicago, where he was formerly employed by the Illinois Central.

J. H. Meyer, clerk at Stuyvesant Docks, and Miss Pearl Schaeffer of New Orleans will be married the latter part of September.

Local Freight Office

Joseph Sacco, notice clerk, will leave shortly for Colorado Springs on a 90-day leave of absence.

Miss Elizabeth Loret is off on a 30-day leave of absence which is being spent in the mountains in and about Asheville, N. C.

Harry Dillenkoffer has resigned his position in the local office to accept a position as export bill lading clerk under Agent Scaife at Stuyvesant Docks. He has been succeeded by H.

J. Wilmuth as assistant to the banana clerk, local office.

Miss Louise Lang is visiting in California on a 90-day leave of absence. She has written several fellow-workers in the local office about her sojourn in the "native sons" state.

Station Master's Department

Station Master D. McDerby, Night Station Master E. T. Sloan, Checkman G. G. Bowen, H. M. Nugent, and Gateman J. Carrara have been active in obtaining new business for movement over our rails.

The bulletin board which was placed on the milk platform at Union Station has proved a success. A claim for \$4.50 was recently presented by a shipper on the Y. & M. V. for loss of an 8-gallon can. The number of this can was posted on the bulletin board, and two days later the can was located by one of the checkmen.

A comparative statement of the amount of claims paid for loss of milk and cans for the first six months of 1922, compared with 1921, shows a decrease of \$203.89, covering the whole system.

OFFICE OF G. F. A., NEW ORLEANS

Since February, 1922, the matrimonial bee has been buzzin' 'round the freight traffic depart-

ment at New Orleans, the past season having furnished four benedicts to the force. In February Carl A. Jahn, reconsigning clerk, stepped off into the ranks of the married folks. He was closely followed by John B. Jouandot, secretary to the assistant general freight agent. Since that time J. Jefferson Ray, in the office of our commercial agent, as was noted in the July issue, has joined the ranks.

Then on Thursday, July 27, one of the prettiest weddings of the summer months was celebrated at the First Evangelical Church, Carondelet and St. Mary streets, when Miss Christine Henrietta Kolman became the bride of William George Yung, chief clerk to the commercial agent. The ceremony was performed by Rev. Mr. Becker. The church was beautifully decorated for the occasion. The happy pair left for an extended trip to California, Colorado and other interesting points.

MEMPHIS TERMINAL

A platform 175 feet long and 8 feet wide has been built in the south yards at Memphis between McLemore and Iowa avenues for the inspection of hay shipped into that city.

MEMPHIS DIVISION

C. McComas, agent at Coahoma, Miss., observed wheels sliding on M. K. & T. car 93663, in train No. 172, on August 8. He flagged the train, the car was set out and was found to be off center.

C. G. Williams, operator at Cruger, Miss., observed a brake beam dragging on a car in train No. 54, passing his station August 14, and flagged the train in order that the brake beam could be removed.

Mrs. A. L. Hinton, formerly Miss Katie Moran, clerk in this office, paid us a short visit August 11 and left with us the memory of her old-time cheery laugh.

Brakeman John Holland discovered and reported a bent axle under I. C. 49376, on train No. 1/56, July 7, at Greenwood, Miss.

daughter, Frances Gertrude, born August 4. Mr. McKay is trainmaster on the Memphis division.

NEW ORLEANS DIVISION

A merry party from the offices of the superintendent, master mechanic and division store-

keeper at Vicksburg hied to the woods one day recently and disported themselves with the merry pranks and sylvan games that the poets of old delighted to sing about. The spot selected was in the Bovina neighborhood, a rural settlement. Nearby is the Blue Hole, a real old "swimmin' hole," where for generations the barefoot boys of the community blissfully blistered their backs and tanned their cheeks, much to the horror of the old maids in the vicinity, and in open violation of the injunctions of the "school-marms." The joyous party finished a pleasant day with a plunge in the old swimming hole. J. F. Monger, general foreman of the car department, organized the delightful outing and proved himself an ideal host.

Mr. and Mrs. Adam Werling have returned from their bridal tour. Mr. Werling, clerk in the freight department, Vicksburg, was recently married to Miss Coin Foster.

W. F. McDuff of Superintendent F. R. May's office is in the Chicago hospital undergoing treatment.

Part of the work designed for overcoming future liability to damage from the Mississippi River floods is now under way. The big freight house at Vicksburg is being raised to a point higher than the highest water yet registered, and Levee Street, through which the company's tracks run, is being paved with brick, in place of wood blocks, which constituted the former pavement. Floating blocks gave the company a world of trouble in the recent high water. The work is under the supervision of H. R. Davis, assistant engineer.

Gayle Taylor and H. S. Lewis, rodmen, are recent additions to the engineering department, Vicksburg.

The American Legion is conducting a contest in Vicksburg with prizes for the most beautiful woman and the ugliest man. Needless to say, some of the company's employees are contestants. We are sure of landing the woman's prize, but have given up hope for winning the man's.

H. D. Minor

Judge H. D. Minor, general attorney for the Yazoo & Mississippi Valley Railroad and district attorney for the Illinois Central Railroad, with headquarters at Memphis, Tenn., was born at Macon, Miss., March 9, 1868. He was educated in the public schools and at the Mississippi Agricultural and Mechanical College, taking the degree of Bachelor of Science, after which he attended the University of Virginia for two years, taking diplomas in the schools of Latin and French and the degree of Bachelor of Laws. He was admitted to the practice of law at Memphis in January, 1894. He served as chancellor at Memphis from May, 1909, to July, 1910, when he resigned to take up his present work with the Illinois Central System. He is a member of the Memphis law firm of Burch, Minor & McKay.

CHARLES E. KANE, *Assistant Editor*.

First Steps Taken on Our New Terminal

*President Markham's Prediction Regarding Work
on Chicago Improvement Is Being Carried Out*

ACTUAL construction on the long-looked-for Chicago terminal improvement has begun and will be prosecuted vigorously until the entire project is completed. It is the intention of the management to complete each stage of the work in the time specified in the Lake Front Ordinance, which was fully discussed in the March issue of the *Illinois Central Magazine* in an article entitled "Our Seventy Years on the Chicago Lake Front."

The entire terminal between the Chicago River and Matteson, a distance of twenty-eight miles, is to be largely rebuilt.

The ordinance provides for an initial 2-year period, during which time plans are to be prepared and preliminary steps taken so that the electrification program can be started at the end of that period and the entire suburban service electrified by 1927.

The unsettled industrial period immediately following the World War was not favorable to the floating of a large bond or stock issue to cover the cost of this work. By the spring of 1922, however, the money market became more favorable, and President Markham, being desirous of having the work completed on schedule time, immediately took the necessary steps to provide a working capital for this project.

A large amount of work had already been done on the preliminary plans. Estimates were immediately prepared for the complete project, and the Board of Directors, at the annual meeting, authorized a total preferred stock issue of \$50,000,000 to finance the project. The plan was to issue stock from time to time sufficient to carry on the work, and on May 5, 1922, application was made to the

Figure 1. Field organization headquarters at 43d Street

Interstate Commerce Commission for an initial issue of \$10,929,600. This plan of financing was approved by the commission on May 23, 1922, and the stock placed on the market.

23d Street Dam and New Breakwater

In anticipation of an early start on this work and to provide suitable space wherein the excavated material resulting from the depression of the tracks between 31st and 51st streets could be wasted, the railway company on May 12 awarded a contract to the Great Lakes Dredge & Dock Company of Chicago for the construction of an earth dam extending from the new breakwater built by the South Park commissioners in 1921 to the railway company's existing breakwater. This dam is being constructed of lake bed material by suction dredges and is being built jointly with the South Park commissioners, each paying for the portion of the dam which lies upon its property. The railroad's portion will involve the placing of more than 100,000 cubic yards of

Figure 2. View of 23d Street dam looking north, showing suction dredge placing fill

material. A view of this dam, which is now nearing completion, is shown in Figure 2. When this fill is completed it will impound the area between 16th and 23d streets and provide a convenient dumping place for excavation and other waste material. The dam will also serve as a working platform for the South Park Boulevard viaduct to be built next year by the South Park commissioners, which explains the joint interest of the railway company and the South Park commissioners in this project.

To provide additional dumping area and protect the railway company's tracks after the grade revision work hereinafter discussed is started, a contract was awarded to the Great Lakes Dredge & Dock Company for the construction of approximately 1,100 feet of breakwater between 29th and 31st streets. This contract was let on August 28, 1922, and the work will be completed about November 1.

Some Important Sewer Work

Although not generally known to the public, there is a 16-foot brick sewer located on the company's right-of-way, extending south from 39th Street to 51st Street, also a 20-foot discharge sewer which crosses the right-of-way at the sanitary district's 39th Street pumping station and extends west. Both of these sewers are a part of the sewer system of Chicago and must, because of the lowering of tracks between 26th Street and 44th Place, be strengthened at certain points to carry the railway traffic safely. A number of smaller sewers, ranging in size from one to six and one-half feet in diameter, discharge into the 16-foot

sewer. Before the track depression can be completed, it will be necessary either to lower certain of these sewers or to move them off the right-of-way. After considerable negotiation with the city, it was decided to follow the latter plan, which involves the relocation of two sewers. One of these is fifteen inches in diameter and is to be located in Woodland Park, extending from 35th to 36th streets. The contract for this sewer was let on August 9, 1922, to the Mortimer & Lindstrom Company of Chicago. This work is well advanced and is illustrated in Figure 3.

The other sewer, to be located in Rhodes Avenue, is of brick construction, seven feet in diameter, and extends from 35th to 39th streets, a distance in excess of one-half mile. One of the interesting as well as difficult features involved in the construction of this large sewer is its connection with the 20-foot brick discharge sewer located in 39th Street which extends from the pumping station on the lake front to the Chicago River. As this large sewer runs full and under pressure at all times, the difficulty of breaking into and making a satisfactory connection with it can be appreciated. The contract for the Rhodes Avenue sewer was let on August 23, 1922, to the Underground Construction Company of Chicago. Figures 4 and 5 show the beginning of construction operation on this sewer project.

Removal of Lessees from Right-of-Way

In preparing for the grade reduction work it was necessary for certain lessees of the company's right-of-way to vacate the property and remove their buildings. Notices

Figure 3. Sewer construction in Woodland Park

have been served on all such lessees, and the coal shed and offices of the Philadelphia & Reading Coal & Iron Company, which for many years have been located on the east side of the right-of-way between 38th and 39th streets, have already been demolished.

The bathing beach buildings, located at 25th and 39th streets, were permitted to remain until after the close of the present bathing season, which expired September 15.

Grade Revision 26th to 51st Streets

By the terms of the Lake Front Ord-

Figure 4. Steam shovel at work on Rhodes Avenue sewer

nance, the railway company is required to change the elevation of its tracks between 25th and 51st streets. At certain points the tracks are to be depressed to an elevation of four feet above the level of Lake Michigan, which will require a cut of approximately ten feet. This important piece of work is necessary in order to permit the construction of viaducts to be built across the railway company's tracks by the South Park commissioners at 31st Street, 35th Street, Oakwood Boulevard (39th Street) and 43d Street, also of a subway at 47th Street. These viaducts and subway will connect the city proper with Lake Front Park, which is now being constructed east of the railway company's tracks at very great expense by the South Park commissioners. The greater portion of the excavated material taken from the cut will be used for filling submerged lands north of 23d Street, which area will later be used for coach yard facilities. It will be necessary to use a portion of the material to elevate tracks above the proposed 47th Street-subway. This work involves the moving of approximately three-fourths of a million yards of material, the reconstruction of all tracks between 27th and 51st streets and repairs to the existing breakwater between 29th and 47th streets.

The contract for this work was let on

August 31, 1922, to the States Contracting Company of Chicago. A large amount of material has been assembled on the ground, and construction work has already been started. The project will be well under way by the close of this season and will be completed next year. A field office for the use of the engineering force which will have charge of the construction work has been erected at 47th Street and is illustrated in Figure 1.

The contract price for the several pieces of work herein described totals more than \$1,000,000 and represents a good start on the entire Chicago terminal improvement project.

In summarizing these initial activities of actual construction on this large undertaking, it is well to note that every detail of the work has followed an established program. Last May, when the Interstate Commerce Commission authorized the railroad to issue preferred stock to carry on this work, President Markham stated in the public press that active work toward electrification would be under way within ninety days. The awarding of the contracts for the several projects herein described is in fulfillment of this pledge, and there is no question that President Markham will continue to keep his faith with the public and with the city in carrying on the work.

Figure 5. Excavating for junction of 7-inch and 20-inch sewers at Rhodes Avenue and 39th Street

A Few Problems in Operating a Railroad

Baltimore & Ohio Official Points Out Application of Engineering Principles to Running Trains

A paper on "The Application of Engineering in Railway Transportation," from which the following excerpts are taken, was recently presented by Mr. Brooke before the Western Society of Engineers, Chicago.

By **G. D. BROOKE**,
Superintendent of Transportation, Western
Lines, Baltimore & Ohio Railroad

RAILWAY transportation in its general sense embraces the whole broad field of railway activity: the construction of roadbed, bridges, tracks, buildings, locomotives and cars; the maintenance of way and of equipment; the solicitation of traffic; the making of rates; the operation of trains, stations, terminals, warehouses and docks; the accounting of the revenues and disbursements; and, last but by no means least, the financing necessary to carry on such vast undertakings.

In its more restricted or special meaning railway transportation applies to that part of the railway industry having to do with the movement of freight and passengers, the supply and distribution of motive power and cars, the making and maintenance of train schedules, the operation of freight stations, docks and floating equipment. In this sense transportation is synonymous with operation, as opposed to construction and maintenance. It takes the railway machine and by the turning of the wheels produces the finished products of the railway industry—passenger miles and ton miles. It is to this special or technical meaning of transportation that the discussion will be largely confined.

What an Engineer Must Be and Do

Let us consider what is the test or criterion of an engineer. The national engineering societies require as qualifications of membership from six to ten years' actual practice and some four or more years in responsible charge of work—graduation from a school of engineering of recognized standing being equal to two years of actual practice—and, moreover, the ability to design engineering works. Experience, then, is the requisite of the engineer; and knowledge

G. D. Brooke

and ability gained through this experience, as evidenced by having been in actual charge of work, of having directed such work and of being competent in engineering design, are the things which measure the engineer.

Webster defines an engineer as "one who carries through a scheme or undertaking by skill or astuteness." Wellington's well-known definition of engineering is "the art of doing that well with one dollar, which any bungler can do with two after a fashion." Again, in the introduction to his *Economic Theory of Railway Location*, which is one of the gems of our engineering literature and contains a world of good advice and inspiration to engineers, in writing of the young engineer he says: "His true function and excuse for being an engineer, as distinguished from a skilled workman, begins and ends in comprehending and striking a just balance between topographical

possibilities, first cost and future revenue and operating expenses."

The officers of our railroads, the trainmasters, superintendents, general superintendents, superintendents of transportation, general managers, and others, whatever their years of service or practice in transportation, through their knowledge and ability gained in the school of experience, as evidenced by the organizations, the operations, the work under their direction, have qualified as engineers, transportation engineers, just as truly as have our engineers of construction, mechanical engineers and maintenance engineers qualified in their respective branches of engineering. Our usefulness as transportation engineers is measured by the skill with which we carry through our undertakings, by our ability to do well with one dollar that which can easily be done with two after a fashion, by our capability to comprehend and bring about the proper balance between locomotive maintenance, locomotive operation and other transportation expenses.

Engineering Ideas in Transportation

Moreover, the methods of engineering are generally applicable in dealing with transportation problems. They consist, briefly, of surveys, observations or other means of collecting data, the marshaling of this data by means of drawings, tabulations or other convenient forms, the study and analysis of the information thus prepared, the designing of structures or works or the planning of methods of procedure, and the actual construction in accordance with the designs or the execution of the work according to the plans. In some of the problems of engineering the conditions are, to a large degree, fixed or constant, and can be met with designs or plans of work which are to a certain degree permanent. In others the conditions are gradually changing and have to be met by changes in design. The demands upon the steel rail imposed by increasing wheel loads is a well-known example of the latter.

In no branch of engineering, though, is there such continual changing of the conditions as in railway transportation. Not only is it subjected to varying physical conditions—by which also the maintenance of roadbed and tracks are affected—but the flow of traffic is subjected to the same seasonal changes, and, in addition, there are many other influences constantly being

brought to play upon it. Among these may be mentioned the varying business and industrial conditions; the interruption or restriction of traffic on certain routes by floods, washouts, storms, congested facilities and other causes, resulting in diversions to other routes and thus bringing about heavy increases in the volume of the business to be handled; strikes in the basic industries of coal mining and steel production, making necessary heavy movements in unusual channels or sharp curtailment of the flow of traffic; the discovery and development of new sources of raw material, as of oil fields; and, lastly, competition, especially in periods of thin business.

This inherent characteristic of transportation, variability, places upon the transportation engineer the task not only of thorough study and analysis of the problems arising from the more constant conditions, but also of continually meeting in an effectual and economical way new situations which, although they present themselves almost daily and without warning, are persistently different from their predecessors. A former operating vice-president wrote a few lines in his own handwriting to a newly appointed superintendent of transportation. He said in part: "The successful transportation officer handles his business hot off the bat. Your experience as superintendent will enable you to make decisions quickly." In these terse sentences are fittingly implied the emergency phases of transportation work and the training which qualifies the transportation engineer to meet them successfully.

Efficiency in Passenger Service

In some classes of service the requirements of the traffic fix to a large degree the general features of the schedules, the size of the trains and the character of the equipment. This is particularly the case in passenger service, and the opportunities for economies are not so great as in other branches of service. But even here continued and careful analysis will bear fruit. On a division where there are a number of local passenger runs it may be found feasible, by changing the lay-up points of engines and cars or by coupling up runs, to reduce the number of locomotives and cars required, and even to reduce the crew expense. And as passenger travel varies with the seasons and from other causes, it will frequently be found that cars can be taken off during

light periods and so save locomotive fuel and repairs to equipment and insure greater reliability in the observance of the schedules. Where a passenger train has a fast schedule, particularly if there are a number of stops, the elimination of one car from the train will make a considerable saving in the amount of fuel consumed in making the runs. The cutting off from a 6-car train of one heavy car will easily save a ton of fuel on a 100-mile run over the average profile.

An important feature of transportation is the adaptation of train operation to the requirements of the traffic. The problems to be met vary from the simple one of a slow moving traffic, as of coal or ore on some engine district reaching into the mine fields, where the business can best be handled in slow freight trains, with perhaps one or two local passenger trains a day, to the busy multiple-track trunk line with a heavy and diversified traffic, requiring two or three classes of passenger trains with varying schedules, express and mail runs, two or more fast freight trains, a large volume of slow freight to be moved in tonnage trains, and the local and pick-up trains which handle the way freight, do the station switching and move cars to and from local points.

A Problem in Scheduling Trains

Each case between and including these extremes offers a different problem. A simple one is that of an engine district having a mixed freight traffic requiring some two to three through freight trains, a local freight train, and two local passenger trains a day in each direction. It will probably be found that the best freight service can be given by running at least two freight trains daily on definite schedules, suitably spaced throughout the twenty-four hours, and handling any additional business in extras, run daily or every other day as required. The freight trains may be heavily loaded and the schedules slow, but if they are maintained with regularity the service will be reliable and satisfactory from a traffic standpoint as well as economical and efficient in the use of locomotives and cars.

Branch line trains of this kind should be scheduled to arrive at the junctions so that cars of important freight can be switched out and forwarded without excessive delay in fast freights on the main line, thus affording continuous movement to destination. With a more complex traffic situation a

more elaborate arrangement of train service must be provided. Through passenger trains will be required, one or more fast freight trains, such slow freights as may be needed and perhaps a pick-up or local switch run if the way work is heavy. The important thing is to plan the train service so as to be attractive to travelers and shippers.

The railroad is often compared to the manufacturing plant, but there is this vital difference—the manufacturer, as a rule, turns out the finished product before it is sold; the railroad must sell its product (passenger miles or ton miles) before it can even start to produce them. The manufacturing plant runs to full capacity—at least for the units being operated—accumulates a stock if the output exceeds the sales, and closes down when business no longer justifies operation. The railroad in periods of depression must run its passenger trains, even if only a few seats are occupied, and at least certain of its freight trains, although they move a handful of freight only. The importance, therefore, of providing service which will enable the traffic department to sell transportation, to fill the empty seats and to give the freight locomotive a full load cannot be overestimated.

Importance of Size of Train Load

In recent years the value of a high train load has become to a great extent a matter of course, and many of the railroads have systematic methods of following this important feature of transportation. It is not possible to emphasize too strongly the important relation of the train load to the cost of moving freight. Fortunately, methods of determining the proper tonnage ratings for locomotives have been scientifically established and are available in the proceedings of the American Railway Association and in other engineering and railway literature, so that it is a comparatively simple matter to compute the train load for various speeds on the ruling grades and the adjustment factors to compensate from the frictional resistance of additional cars under varying temperatures.

There remains, though, the ever-present problem of determining under varying traffic conditions the running time over the engine district with given speeds on the ruling grades and of ascertaining thereby the engine rating which will produce ton miles at the minimum cost. On a district having a small percentage of the mileage

(Continued on page 114)

American Legion Headed for New Orleans

*Illinois Central System Will Repeat Its Knights
Templar Accommodations at October Convention*

THE annual convention of the American Legion will be held at New Orleans October 16 to 20, inclusive, and the Illinois Central System is preparing to take care of the visiting "buddies" in much the same hospitable manner in which it handled the conclave of the Knights Templar in the same city, April 24 to 27 this year. The "hotel on wheels," which proved so popular, will be operated again, and there seems to be some likelihood that the parking yard will be called upon to handle a great many more than the 125 sleeping cars it held in April and that there will be a call for other increases in facilities in proportion.

It will be recalled by those who were at New Orleans for the Knights Templar meeting and by those who read the April and June issues of this magazine that the Illinois Central System went into the hotel business on a great scale for the Knights Templar, housing 2,500 persons in the parked Pullman cars, serving 3,211 meals on our dining cars parked in the yard and providing 1,185 shower baths in the temporary clubhouse (improvised from a ware-

house), in addition to providing service of many other kinds for the visitors.

Some Facilities to Be Provided

The card issued for the Knights Templar bore the following directions—and it will be the same for the American Legion visitors who avail themselves of the Illinois Central System's hospitality:

Information Bureau

Located at entrance to Parking Yard at Saratoga Street, between Poydras and Lafayette streets.

Baths

Hot and cold shower baths. Ladies' hours, 2 to 4 p. m. Building, corner Lafayette and Liberty streets.

Barber Shop, Manicuring

Corner Lafayette and Liberty streets.

Laundry.

Laundry returned same day if delivered before 9 a. m. Office, Lafayette and Liberty streets.

Dry Cleaning

Same as above.

Pressing

While you wait, if desired.

Public Telephones

At Information Bureau.

Yellow Cabs

Adjoining Parking Yard.

Dining Cars

Dining cars are parked and will serve all meals. Real Illinois Central service is provided.

Telegrams

Western Union and Postal Telegraph companies' office at Information Bureau.

Mail

For mail addressed care Parking Yard apply to Information Bureau.

Baggage Room

Baggage Room is maintained in building (door No. 23) Lafayette Street, for those who desire to store and have access to their baggage.

For the benefit of the Legionnaires, many of whom saw the real Paris while in overseas service, New Orleans is being advertised as "the Paris of the United States."

Unique Entertainment Looked For

New Orleans is preparing to cast aside its veneer of modernism and re-establish the atmosphere of continental Europe during the convention. Entertainment plans for the 150,000 Legionnaires and visitors expected at the national gathering have been based upon the desire of the American doughboy to live for five days in picturesque surroundings and to be entertained with features typical of the South and the cosmopolitanism he encountered in France.

The invitation

Among the leading events of the program arranged is a French Carnival night, to be directed by a number of French societies whose histories date back to colonial days. The Legionnaires will be guests at three carnival balls similar to those held during the famous Mardi Gras celebrations. Dancers will be attired in elaborate costumes and will wear masks. There will be the customary kings and queens, with their picturesque courts and retainers, and for the veteran who desires informality there will be dances in three public squares.

Delegates to the convention sessions, which will be held in the morning, will meet literally "down on de levee." A large covered pier nearly 1,000 feet long and 400 feet wide, astride the Mississippi River levee, will be used as the convention meeting place. New Orleans will be able to seat 14,000 delegates and visitors in this large structure. One-half of the vast floor space will be devoted to the convention proper, the other half being separated by a partition for telephone and telegraph booths, committee rooms, ticket validating offices and concession booths. The interior of the building will be decorated with flags of all allied powers, Legion emblems and banners and palm trees, so abundant in New Orleans and Louisiana.

New Orleans to Decorate Profusely

The business streets of the city will be illuminated by 28,000 electric bulbs and will be decorated with flags, banners and streamers. A "Court of Honor of the Nations" will be established in ten blocks of the principal street, with corresponding flags and banners of allied powers. Signs indicating the names of the states will feature the "Court of Honor of the States," to be held on the principal residential street. Another highway will be rechristened "American Legion Avenue." Insignia of all divisions in the American army will be suspended across the "Streets of the Divisions," red, white and blue electric bulbs illuminating Canal Street, the main thoroughfare, and all principal side streets.

In the port of New Orleans and on Lake Pontchartrain a convention naval show will be held, the U. S. S. Birmingham, flying the flag of Rear Admiral W. C. Cole, commanding the special service squadron. Six destroyers and twelve seaplanes from the naval air station at Pensacola, Fla., have been ordered to New Orleans during the conven-

Hanford McNider, national commander of the American Legion

tion and will form the representation of the United States at the naval show. Invitations to send ships have been forwarded through the State Department to naval authorities of England, Australia, France, Italy, Japan, Brazil and Cuba.

In conformity with a program for development of athletics in the United States, the Legion will stage during the national convention the first "American Legion National Olympic Meet." Ex-service men, whose ranks include many of the most famous college and semi-pro athletes in the country, will compete for national championships in track and field events, aquatic sports, amateur boxing and wrestling, golf and tennis. There will also be a national marksmanship contest and a tournament of professional boxers. The contestants will be divided into teams representing the various departments of the Legion in all parts of the country. Elimination matches have already been held at state conventions of numerous Legion departments to select teams for the national meet, and other department representatives will be named by their state athletic officers. Track and field athletics will be held at the athletic field of Tulane University; aquatic sports, in the Audubon Park pool; tennis and golf, at various country clubs in and near the city; boxing and wrestling, in a recently con-

structed coliseum. The rifle meet will be fired at the state range.

The Legion will be the host to many notables during the New Orleans gathering. President Harding and General Pershing have tentatively accepted the convention invitation, while definite acceptances have been received from Major-General John A. Lejeune, commandant of the United States Marine Corps, and Samuel Gompers, president of the American Federation of Labor. Convention officials also expect to entertain a famous marshal of France and other World War notables. Prominent also among the distinguished guests will be a number of wearers of the Congressional Medal of Honor, the highest award for bravery made by the United States. The heroes will receive all honors accorded to the most distinguished guests. Their expenses and those of their wives to the convention and return will be paid by the Legion. They will be housed in the best hotels and will review the convention parade in the stand reserved for distinguished guests.

Guests to Review Parade

Convention distinguished guests will review a parade of 50,000 Legionnaires one afternoon of the convention. The veterans will march by states in the order of membership increase during the last year. State units will be accompanied by 100 bands and drum corps expected to participate as the result of a band and drum corps contest to be held during the parade march. Entries, which will be restricted to Legion organizations, will be judged by a committee of New Orleans musicians. Prizes for the band contest will be: First, \$1,000; second, \$500; third, \$250. The winner of the drum corps contest will receive \$250, with a prize of \$100 for second place.

Housing arrangements are being undertaken with a view to entertaining 150,000 visitors. The convention committee will attempt to billet as many guests as possible in the downtown district. The larger hotels will be assigned to distinguished guests and visitors, supplemented by delegations from the more remote states. Hotels, rooming houses, business buildings, halls and lodge rooms will also be utilized. An improvised hotel, with an estimated capacity of 15,000, will be established in the Army Supply Base Building. The married "buddy" who brings his wife to the convention will be housed in the residential districts. A canvass for

rooms in New Orleans homes is already under way.

Hotel Rates for the Visitors

New Orleans hotels have established a uniform rate schedule of \$1.50 a day without bath and \$2.50 with a bath. More than 14,000 visitors will remain in the various Pullman cities. The cars will be provided with the conveniences of a modern hotel. Railway authorities have arranged for dining car service, shower baths, electric lighting and have established a rate averaging about \$2 a day for the visitor. To avoid confusion in making room reservations, the hotels and housing committee has ruled that all reservations must be made through the adjutant of the American Legion department in which the applicant lives. The ruling applies to the general public as well as to Legionnaires.

All employes and officers on the New Orleans terminal of the Illinois Central System have assumed an enthusiastic attitude toward the convention, all looking forward to that eventful time. All departments are being tuned up to the highest pitch in an endeavor to see that 100 per cent efficiency, co-operation and courtesy are rendered.

The detailed program of the convention, as outlined by the American Legion committee in charge, will run about as follows:

MONDAY, OCTOBER 16

Sightseeing Trips Through French Quarter

At 10 a. m., 11 a. m., 2 p. m., 3 p. m. and 4 p. m. visitors may avail themselves of a conducted sightseeing tour through the French quarter. This tour will take place at the same hours on each day of the convention. Women experienced in the art of conducting these tours through the quaint French quarter, which holds so many attractions for the visitors, will personally conduct these tours. Every historical building, battle ground, monument and birthplace of history will be shown in detail to the visitors.

Athletics

On this particular afternoon the athletic championships, heralded all over the United States as an equal to the Olympic Games and a second Interallied Meet, will begin. Aquatic contests, amateur boxing and wrestling eliminations, together with tennis eliminations, will feature.

"Butterfly Corps" and Page Tea

The American Legion Auxiliary has picked fifty of the prettiest girls in the

respective states to act as pages during the convention. A banquet to the "Butterfly Corps" and pages will be given in the afternoon at the Country Club.

Trips to Spanish Fort and West End

Among the night entertainment features, special trips to Spanish Fort and West End are offered. Those familiar with sightseeing in New Orleans know that in Spanish Fort and West End, the two "White Cities," entertainment abounds. A trip to New Orleans without taking in these fairy gardens would not be complete.

Professional Boxing

For those desiring something more of the manly art, a boxing program by the best professional boxers of the country, especially brought to New Orleans to perform for the Legionnaires, has been arranged.

Women's "States Dinner"

For the women not yet inclined to yearn for the excitement of pugilistic encounters, a "States Dinner" has been arranged. This dinner will be a brilliant affair.

French Night

On this first night of the convention, perhaps the biggest attraction of the whole convention will be held—"French Night." At that time "New" Orleans will sleep and dream of "Old" Orleans. Nowhere will there be a trace of "New" Orleans. The whole aspect of the city will be changed, and a "second Paris" will be shown to the visitors. Beautiful girls, dressed in the garb of Normandy, will parade the streets. On the sidewalk tables will be placed, and those alighting from trains will step into France. Street dancing, brilliant lights, Parisian decorations—all will lend their enchanting forces to what is expected to be the overwhelming success of "French Night."

Naval Show

Reluctantly drawing himself away from this attraction, the visitor may marvel at the display of allied naval ships lying peacefully in the river—battleships, cruisers, submarines and seaplanes of every description will be waiting a tour of inspection.

TUESDAY, OCTOBER 17

Athletics

On this morning the rifle meet, which will determine the department championships of the rifle contest as well as the individual championship of the American Legion, will begin. Tennis eliminations will also feature the athletic program.

Reunion Day

This day has been set aside for Reunion Day. Every division not holding a special reunion will be given a space on Canal Street for "get-together" meetings and for a renewal of acquaintances. Those divisions and organizations having special reunions will repair to their meeting halls, where their own business can be conducted.

Athletics

In the afternoon the tennis eliminations and rifle and field meet will continue. On this afternoon also the field and track eliminations will begin. Field and track athletes, world renowned, will contest for supremacy, and to the winner goes the title of "champion of the American Legion." Amateur boxing and wrestling eliminations will also be held.

TUESDAY NIGHT ENTERTAINMENT

Trips to Spanish Fort and West End, as described.

Naval display, as described.

Every night during the convention a

The arrival

"dancing area" will be maintained, where many bands will keep a continual sound of music in the air and passers-by may enjoy themselves at dancing any time.

Carnival Night

On this night the attraction that thousands have come to New Orleans to see will be staged. Three massive carnival balls, each with its own subject and theme and each typical of the world renowned New Orleans carnival ball, will be staged. This attraction in itself is bringing thousands of visitors to New Orleans. In conjunction with these balls the dance entertainment by the famous "Lada" will be staged.

WEDNESDAY, OCTOBER 18

Athletics

During the forenoon the athletic championships will continue. Tennis eliminations will be in order.

Parade

At 2 o'clock in the afternoon the annual

Seeking Another Paris

Veterans of General Pershing's *non de luxe* excursion to France in 1918, whose "parley vouz" is already squeaky in the hinges, are getting measured now for a brand new vocabulary of New Orleans Creole French. Night classes in box car Gallic, flivver "frog" and other dialects with which the American doughboy disrupted the native tongue of La Belle France are now being conducted by local posts of the American Legion.

"Kiss ka see," "ness see paw" and other baseball terms of Paris will dribble from the tongue of the American Legion tourist to New Orleans when the national convention of the Legion is held October 16 to 20. For the old French metropolis of Louisiana will be Frenchier than even the Latin quarter of Paris during the gigantic powwow of former service men. "Gendarmes" will replace traffic cops, "petite cafes" will eclipse the one-arm lunchrooms, and "mademoiselles" will have the flappers fatally faded.

Former Premier Clemenceau of France will be a guest of the Legion at New Orleans if he arrives in this country in time for the patriotic festival. There will be a large delegation of veterans from allied countries.

The flashiest boulevard in Paris will look like Main Street, compared to Canal Street, New Orleans, when the natives launch their projected series of Mardi Gras carnival balls and costume processions.—CAPTAIN E. E. MORGAN, in the *Chicago Daily News*, September 14.

parade will start. Those who have heard of the parade at Kansas City last year need not be told of the magnificence of the occasion. The parade this year will be even bigger and better, if a capacity attendance and the amount of preparation can make it so.

Special Trips

On this night trips to Spanish Fort and West End and the naval display will be in order, as well as the nightly street dancing. Another professional boxing show will be staged.

Hut Show

At 8:30 p. m. Edna Thomas, known to so many of the A. E. F.'ers on account of her entertainments furnished to the boys back in '18, will reproduce some of her shows in a monster "hut show."

THURSDAY, OCTOBER 19

Athletics

On Thursday morning, under athletics, the rifle meet finals will be held. Tennis eliminations will continue and golf eliminations will begin. In the afternoon golf eliminations will continue, as will the tennis eliminations. On this afternoon field and track finals will be held.

Tea to Distinguished Guests

At 4 o'clock in the afternoon a tea to the distinguished guests of the auxiliary will be given at the Delgado Art Museum, City Park.

THURSDAY NIGHT ENTERTAINMENT

Special Trips

Trips to Spanish Fort and West End and naval display.

Banquet

On this night the Legion parish affairs committee of New Orleans will entertain with a banquet to Legion delegates, alternates and distinguished visitors.

Air Raid

Immediately after the adjournment of the banquet a bombing party and air raid will take place. This raid will be supported by an "attack upon the city" by allied fleets in the river.

Street Dancing

Street dancing will continue, and the amateur boxing and wrestling finals will be held.

FRIDAY, OCTOBER 20

Athletics

During the morning tennis and golf eliminations will continue, the finals being held in the afternoon.

The convention will adjourn Friday morning.

New Orleans, City of History and Romance

French and Spanish Influences and Good Cooking Are Still to Be Found in the Vieux Carre

THE fragrance of the Old World still clings to the section of New Orleans that was a French colony more than half a century before the Declaration of Independence was written, a legacy from the early days when for nearly a hundred years it was alternately under the dominion of France and Spain.

Many of the ancient landmarks are gone, including the stately old St. Louis Hotel, with its slave block, the French opera house and the 1-story building at Chartres and Ursuline streets that was said to be the oldest house in New Orleans. The jargon of Latin tongues that once fell upon the ear of the visitor has given way to English as the predominating language; French, Spanish or Italian is the exception instead of the rule. Throughout the quarter cobblestone pavements have been almost entirely replaced with asphalt. The new parish courthouse of white marble, heralding a new era, gleams resplendent in a setting of dingy streets and grimy stone buildings with faded red-tile roofs. Through the green-shuttered windows of homes that were built perhaps more than a century before their present occupants were born, you may hear, if you listen in passing, the lilting strains of a Broadway ballad.

In recent years the so-called French quarter of New Orleans has been modernized in many respects, but a flavor of antiquity is yet to be found in its narrow, winding streets, over which iron-work balconies throw a shade almost as dense as that cast by the neighboring oaks that mingle their moss-laden branches in City Park. The charm of the old town casts its spell upon the visitor as he steps out of broad Canal Street with its showy department stores and its air of American business life into one of the streets of the *Vieux Carre*. The streets bear French and Spanish names, and are lined with tiny, dim-lit shops filled with antique books and furniture, charming

bits of statuary, Indian curios, restaurants that serve sea-food delicacies, oyster stands, sprinkled over and between with buildings occupied as residences.

A Blending of French and Spanish

The architecture of old New Orleans, especially its public buildings, is more Spanish than French. The town was founded by Bienville, a French-Canadian, but for nearly fifty years the territory of Louisiana was ruled by Spain, and New Orleans was the Spanish colonial headquarters. In 1788, during Spanish occupation, the town that had been built by the early French settlers was wiped out by fire, and in its place there grew up a new town that was neither French nor Spanish, but a quaint blending of the two.

Old New Orleans centers upon Jackson Square, the *Place d'Armes* of the original town, where public meetings and reviews of troops were held. The ceremonies of transfer of the territory of Louisiana from France to Spain, from Spain to France, and from France to the United States took place in the *Place d'Armes*. General Andrew Jackson, whose name the square now bears, was welcomed there following his victory over the British on the plains of Chalmette, adjoining New Orleans, in 1815, and acclaimed the hero of New Orleans. Ten years later Lafayette was received there during his tour of the United States. Not the least interesting feature of the old

A 1-story building at Chartres and Ursuline streets

The entrance to the Cabildo

Place d'Armes to the present visitor is the ever-green tropical shrubbery, broken here and there with the flaming brilliance of flowers in every hue.

Facing the square is St. Louis Cathedral, which occupies the site of the first church erected in the territory of Louisiana. A French church was built there more than two centuries ago, when Bienville laid out the town that he named in honor of the Duc d'Orleans, but the present cathedral building was erected at the expense of a wealthy Spanish nobleman, Don Andres

Almonaster y Roxas, following the disastrous fire of 1788. It was then of Spanish design. The three short towers of the facade were half-spheres. Many years after New Orleans became a possession of the United States, however, the facade was entirely rebuilt, and the short towers became the lofty spires now to be seen. Among the attractions of the cathedral are the beautiful frescoes by Humboldt and a reproduction of the Grotto of Lourdes, which forms one of the side altars; the waters that trickle over the rocks were brought to New Orleans from the miraculous shrine that is visited by so many pilgrims in southern France.

A Treasury of Historical Exhibits

To the left of the Cathedral, as one faces it from the square, is the Spanish Cabildo, built shortly after the fire of 1788 as the capitol of New Spain, which now contains the historical exhibits of the Louisiana State Museum. In the main chamber, the Sala Capitular, met the representatives of President Jefferson and Emperor Napoleon who arranged for the purchase of the territory of Louisiana by the United States.

An exhibit room in the Cabildo—battleflags on the wall, the Napoleon death mask in the foreground

In the Cabildo are now to be seen, among other noteworthy exhibits, the Napoleon death mask, in bronze, made by the emperor's physician, the painting of the battle of New Orleans, by Lami, the painting of the ceremony of transfer to the United States, by T. deThulstrup, and the famous folio volumes of "Birds of America," by Audubon, the bird lover, who was a native Louisianan. The architecture of the building is typically Spanish. At the entrance is an artistic wrought-iron door that has been admired by thousands. Within the courtyard that for a hundred and twenty years was used as a prison yard are the doors leading into dark, dank dungeons.

To the right of the Cathedral is the St. Louis Presbytere, originally the home of the Capuchin monks. The Presbytere was erected at a later date than the Cabildo, but it is a companion structure. It is now used to house the agricultural, natural history and industrial exhibits of the Louisiana State Museum.

Robert Glenk, the curator of the museum, is an authority upon the history of the old town, and the visitor finds him an amiable, courteous gentleman, proud of the museum,

The gate to the Cabildo

and filled with intimate bits of history and romance which add to the pleasure of a visit.

Where Royalty Was Once Entertained

The long, graceful buildings which flank the square upon each side were erected during the early part of the 19th century by the Baroness de Pontalba, a daughter of the Spanish nobleman who built the Cathedral and the Cabildo. For many years the Pontalba Buildings were the center of social life in old New Orleans. Royalty was entertained there with gay parties which are still a part of the romance of the old quarter. The buildings are now principally used as boarding houses and inhabited chiefly by artists.

Further reminders of Spanish rule are to be found in the remains of the Commanderia at 517 Royal Street and of the Spanish Fort on Lake Pontchartrain, just outside New Orleans. At the Royal Street entrance to the old Commanderia two guns are imbedded in the sidewalk. In the courtyard, which now forms the rear

A corner in the courtyard of the Cabildo

A typical doorstep

Nineteen

Historic buildings: 1, Napoleon House, Chartres and St. Louis streets; 2, Absinthe House, Bourbon and Bienville streets; 3, ancient Archbishopric, Chartres and Ursuline streets, now the oldest building in New Orleans; 4, Spanish Cabildo, on Chartres street, facing Jackson Square, showing worshipers leaving St. Louis Cathedral; 5, Madame John's Legacy, on Dumaine street; 6, Haunted House, Royal and Governor Nicholls (formerly Hospital) streets; 7, St. Louis Cathedral, on Chartres street, facing Jackson Square.

of Antoine's renowned restaurant, is what is left of the old Spanish calaboose or military jail, guarded by a massive wooden door with a curious wooden lock. The wall of the Spanish Fort on the side next Lake Pontchartrain still stands, topped by a spiked iron fence. Within the wall many of the old Spanish guns still rest upon their emplacements, with a supply of cannon ball close at hand.

There are families in old New Orleans that have lived in the same tight-shuttered homes for many generations, preferring the shabbiness and squalor about them to the dignified surroundings of the homes out on palm-lined St. Charles Avenue, in the town that was built by the Americans. Many of these homes are on Esplanade Avenue,

A Creole home

A street in old New Orleans

now one of the most picturesque, enchanting streets of the old town. The residences are not to be judged by their exteriors. Within the walls are homes most beautifully decorated and furnished, where the charming social life of a century and more ago still holds sway.

Home Life Is on the Courtyards

At the center of many of the old houses,

Courtyard Scenes

Intimate glimpses of courtyards: Upper left, Spanish Commanderia, at the rear of Antoine's; upper right, the Patio Royal; lower left, the Patio Royal; center, at 835 Royal Street; lower right, the Cabildo.

A wall of the Spanish fort that stands on Lake Pontchartrain, just outside New Orleans

hidden from the street, are to be found the courtyards that form such a prominent part of French and Spanish architecture. Beyond the outer walls of buildings that throw upon the street a drab, forbidding exterior one may encounter the most delightful courts that have served as the settings for countless romances of fact and fiction. A fountain tosses gleaming drops of water toward the sky and catches them as they fall upon moss-grown rocks, and a shaft of sunlight, playing upon the court, makes of the drops a million diamonds. On all four sides of the court are balconies upon which swarthy maidens have been wooed by the soft tinkle of guitars and the mellow voices of Latin lovers.

One of the interesting old courtyards that is open to visitors—many are not, as they are in homes still occupied by exclusive families—is at 417 Royal Street, in the building that was once the home of Paul Morphy, the celebrated chess player. The upper floor of the building is used for flats, but on the main floor is the dining room of the *Patio Royal*, with an annex in the courtyard.

The word "Creole," which one finds in

every part of New Orleans, has come to be used for describing anything that is good—creole soups, creole confections, creole vegetables, creole fowls. When the Louisianan desires to place a mark of rare distinction upon anything, he calls it by this musical name. Originally, the term applied to the families which claimed their ancestry from the noble French and Spanish settlers. Proud, aristocratic, these families took upon themselves the name to distinguish them from the newcomers, whose society they disdained. Even their servants became

A Spanish gun

conscious of belonging to another caste, and referred to themselves as Creoles. Although the term has been widely and loosely used, it is still guarded jealously by its original holders and their descendants, and the guide probably will explain with some heat that it does not refer to Louisianans of mixed African blood, as many Northerners are suspected of believing—whether they do or not. One finds negroes bearing such names as Jean, Baptiste, Jules, Antoinette, Marie, etc., and speaking a fluent French. They are principally servants in the homes of French or Creole families, and their fathers and mothers probably served the same families before them.

Where Pirates Had Headquarters

Romance has given old New Orleans a rich endowment. The points of interest celebrated in George W. Cable's novels are still to be found in the old town—the

Haunted House, 'Sieur George's House, Madame John's Legacy, the Cafe des Refugies, and the old Absinthe House, the latter now approaching its one hundredth birthday. The spirit of romance is wrapped up in the Napoleon House, at Chartres and St. Louis streets, which was designed and furnished to serve as a retreat for the exiled emperor when he should be spirited away from St. Helena. Plans had been made, a yacht built and a crew recruited for the exploit, when news was received of Napoleon's death. At Chartres and St. Phillip streets Jean and Pierre Lafitte, the pirates and smugglers about whom many intriguing tales have been woven, are said to have conducted a blacksmith shop, at which they worked to hide their more romantic calling.

Throughout the French quarter, and also in the American section, are to be found those restaurants which have spread the fame of New Orleans as the home of true

culinary artistry. Among the most noted of those which remain in the French district are Antoine's, La Louisiane and Madame Begue's. Antoine's is now conducted by Jules Alciatore, son of Antoine Alciatore, who established the original Antoine's in 1840 on a part of the site of the present courthouse. La Louisiane is conducted by a cousin of Jules, Ferdinand Alciatore, a nephew of the founder of Antoine's.

To mention the restaurants of New Orleans is to call up in the minds of those who have explored the wonderful city a host of savory memories. The city is especially fortunate as the home of remarkable cuisines. The skill of French chefs has been combined with the art of the Old South to invest the city with an atmosphere which sends its savors throughout the country, and it cannot be said that one has seen New Orleans until he has explored its many cafes.

A City of Interest to All

For more than 130 years there have been public markets in the triangle bounded by Decatur, North Peter and Ursuline streets, in the *Vieux Carre*, and from the old French Market, which still stands, come the odors of fish, vegetables, sea-foods, meats and

The alley between St. Louis Cathedral and the Spanish Cabildo

fruits. The market is now French in name only; in its stalls will be found representatives of almost every nation under the sun.

The beauty and romance of New Orleans are by no means confined to the section

In the American town: Upper left, Loyola University; upper right, Tulane University; lower, in the St. Charles Avenue residence district.

lying below Canal Street which teems with historical interest. There are hundreds of attractive, charming spots in the city which the Americans have built about Bienville's town—the lovely city parks, with their gigantic oaks whose ages no one knows and from whose leafed arms hang great clusters of Spanish moss; the battlefield on the plains of Chalmette, where Jackson and his army met and defeated the British; Loyola and Tulane universities; the cemeteries, in which the dead are buried in vaults above ground because of the water that lies immediately below the surface; innumerable monuments to Southern heroes; homes that are built after the architectural style of the Old South; giant freighters and passenger boats in the harbor, flying the flags of every sea-going nation, and the many evidences of the commerce of the port—for New Orleans ranks second only to New York in the volume of its foreign commerce.

New Orleans is truly a cosmopolitan city,

a point at which converge the New World and the Old, the 20th and the 18th centuries, the North and the South.

HE SERVED 37 YEARS

E. T. Leith

N' O'leans

Helas, m'sieus!—full many a day
has died
Since last I trod the wide, clean street
That cleaves N' O'leans, down beside
The broad breast of Ol' Missie . . .

* * * * *

Regardez-donc, if you shall please,
The palm-trees nodding with the
breeze

Caressing City Park.
Ah bien, m'sieus, could you see these
Who love beneath those moon-splashed
trees

So queeck it's dark!
Those girl!—their voice just like a
smile

Out loud! Those boy!—they are so
full with guile;

They "know their stuff!"
"Ho! ho!" they tease, "jes' one,
"Toinette!

Jes' one to prove yo' love me yet!"
"Toinette says yes—

Of course she does . . . beneath
those trees . . .

With moon-beams lit . . . warmed
by the breeze . . .

In City Park!

* * * * *

Helas, m'sieus!—full many a day
will come
Before I walk the wide sweet street
That cleaves N' O'leans, down beside
The soft breast of Ol' Missie . . .

—GYPSY KAY, in *Chicago Tribune*,
"Line 'o Type or Two."

The Board of Pensions, at the August meeting, granted E. T. Leith of Dixon a pension and retirement from the service. The board, in granting full pension, acknowledged faithful, loyal and capable service of more than thirty-seven years. Mr. Leith learned the Morse code at Mason, Ill., and entered the service as relief agent under Superintendent of Telegraph C. R. Jones in June, 1885. Those were the days when an operator had to flag his own train to deliver train orders, before the days of semaphores, when trains were stopped by a green flag by day and a green lantern by night. Mr. Leith is proud of his Scotch blood, is a man of good habits and always enjoyed good health until within the last year or two. Late in the evening of April 17 Mr. Leith was held up while on duty and the office robbed. The incident bore heavily upon his nerves. The matter was most thoroughly investigated by the company's various representatives, and all united in completely exonerating Mr. Leith from blame.

Saving a Million Dollars in Seven Months

*Great Reduction in Claim Payments More Than
Pleases Management of Illinois Central System*

By C. G. RICHMOND,
Superintendent, Stations and Transfers

IN the June magazine the attention of employes was called to the fact that during 1921 the enormous sum of \$2,449,000 was paid out for freight claims, and there was shown the wonderful opportunity for saving a million dollars in claim payments during 1922.

At the beginning of the year, when it was announced that the slogan would be "Save a Million Dollars in Freight Claims During 1922," it seemed an almost impossible achievement to save such a large amount in twelve months.

The response of the officers and employes of all departments in correcting operating deficiencies and overcoming causes for freight claims was indeed remarkable, and with the characteristic Illinois Central spirit the million dollar saving was accomplished in seven months, instead of twelve.

The total freight claim payments for the first seven months of 1922 amounted to \$694,535, compared with \$1,722,636 during the first seven months of 1921, a reduction of \$1,028,101, or 60 per cent.

The number of claims paid for loss of entire packages destined to stations on the Illinois Central System for the first seven months of 1922 totaled 1,202, as compared

Where exceptions originate

with 3,386 during the same period of 1921, a reduction of 2,184, or 64.5 per cent. The total claim payments for loss of entire package during the same period were reduced from \$208,886 in 1921 to \$65,442 in 1922, a reduction of \$143,444, or 68.6 per cent.

In analyzing freight claim payments as to commodity, the freight claim department uses ninety-seven classifications. During the past seven months of this year, as compared with last, eighty-five of the ninety-seven commodities show a decrease in claim payments.

Following is a statement of commodities showing the largest decrease in claim payments for the first seven months of 1922 as compared with the same period in 1921:

Commodity	1922	1921	Decrease	Per Cent
Other vegetable oils.....	\$ 303	\$ 15,838	\$ 15,535	98.0
Agricultural implements.....	1,664	14,832	13,168	88.7
Chemicals and explosives.....	2,813	22,326	19,513	87.4
Coffee	3,062	16,919	13,857	81.9
Fresh meats P. H. P.....	20,318	101,164	80,846	79.9
Sugar from all points.....	23,302	86,994	63,692	73.2
Household goods and second-hand furniture	9,913	35,283	25,370	71.9
Manufactured iron articles.....	14,173	46,416	32,243	69.4
Flour	10,921	32,563	21,642	66.4
Lumber	11,411	32,684	21,273	65.0
Castings, machinery and boilers.....	10,576	29,761	19,185	64.4
Syrup, glucose and molasses.....	7,200	19,984	12,784	63.9
Textiles	14,388	38,060	23,672	62.1
Automobiles and auto trucks.....	17,568	45,799	28,231	61.6
Other manufactures and miscellaneous.....	115,935	293,646	177,711	60.5
Petroleum and its products.....	9,373	23,714	14,341	60.4
Bananas, fruits and perishable.....	127,674	306,028	178,354	58.2
Cotton	15,286	35,827	20,541	57.3
Grain	54,058	110,420	56,362	51.0
Bituminous coal	44,977	90,074	45,097	50.0
New furniture	24,664	45,218	20,554	45.4
Total	\$539,579	\$1,443,550	\$903,971	62.6

Following is a statement showing the reduction in claim payments by principal causes during the first seven months of 1922, compared with the same period in 1921:

Cause	1922	1921	Decrease	Per Cent
Wrecks	\$ 25,006	\$ 110,417	\$ 85,411	77.3
Loss of a package.....	65,442	208,886	143,444	68.6
Delay	80,510	250,400	169,890	67.8
Robbery	23,667	73,142	49,475	67.6
Refrigeration	33,449	76,710	43,261	56.3
Defective equipment	111,262	241,199	129,937	53.8
Rough handling	218,182	435,960	217,778	49.9
Unlocated loss	72,236	138,960	66,724	48.0
Total	\$629,754	\$1,535,674	\$905,920	58.9

While a large percentage of the excessive claim payments of 1921 was due to losses sustained in 1920, when we were passing through the readjustment period and many unsatisfactory operating conditions prevailed, there is still room for marked improvement in the number of exceptions received and claims filed chargeable to rough handling, delay and defective equipment, which are the most prolific causes for claim payments.

These three items are mentioned to call the attention of officers and employes to the importance of continuing their efforts toward corrective action, with a view to further improving the loss and damage situation.

Shippers Gave Fine Co-operation

In considering the causes responsible for these remarkable decreases, we must not overlook the shippers and the excellent co-operation on their part in assisting to overcome causes for freight claims. Many shippers put on "Perfect Package" campaigns during the same month in which the "No Exception" campaign was carried on, which was of great assistance in making the wonderful record of last June, when only 1,485 exceptions were received chargeable to irregularities in the handling of L. C. L. freight on the entire Illinois Central System.

In this connection, an observation of the packages used the last year shows evidence of great improvement

in the marking and packing of shipments, and also in the quality of containers used. In many instances, shippers further strengthened their containers by the use of

wire strapping and seals, which make the package much stronger and more durable, giving greater assurance of its arriving at its destination in sound and satisfactory condition.

While it might be claimed that the general reduction in the price of commodities was responsible in a large measure for these reductions in claim payments, the fact that there was a decrease of 58,390 claims presented in 1921, as compared with 1920, and a decrease of 23,524 presented during the first seven months of 1922, as compared with the same period of 1921, with an increased carload and less-than-carload tonnage,

proves conclusively that increased efficiency and co-operation on the part of the officers and employes of the Illinois Central and Yazoo & Mississippi Valley railroads has resulted in a real improvement in the loss and damage situation.

Payments Now 3.8 Cents a Second

The following is an interesting statement in connection with the claim payments for the first seven months of this year, compared with the same period last year:

Total claim payments, seven months.....	
Claim payments per month.....	
Claim payments per day.....	
Claim payments per hour.....	
Claim payments per minute.....	
Claim payments per second.....	

looks at life in a broad way. He doesn't exaggerate the little mistakes of others and go to pieces over trifling annoyances; he doesn't make a great fuss about every little thing that fails to go just right. The little fellow stumbles, often goes to pieces over trifles, but the big fellow isn't troubled by them. He is too large of mind, too well poised even to notice them. If you spend your time bothering about trifling things,

1922	1921	Decrease
\$694,535.00	\$1,722,636.00	\$1,028,101.00
99,219.30	246,090.85	146,871.55
3,276.00	8,125.00	4,849.00
136.50	338.50	202.00
2.27	5.64	3.37
.038	.094	.056

While, as shown herein, there has been a marked reduction in claim payments during the last seven months as compared with last year, the present conditions call for greater effort on the part of all employes to make as good a showing, or a better showing, for the remainder of the year in order to make 1922 the banner year.

It is generally admitted that revenue paid out for loss and damage represents an indefensible waste of money and results in a great economic loss as well as in dissatisfaction to patrons.

The remarkable reduction in claim payments during the present year is gratifying and highly appreciated by the management. All employes are to be commended for the good results obtained, and their earnest co-operation is solicited in keeping the freight claim payments down.

The accompanying graphic chart shows the decline in claim payments from January, 1921, up to and including July, 1922.

BIG MAN OR LITTLE?

If you spend much of your time scolding and nagging your office assistants, finding fault with your stenographer and everybody else about you, grumbling over trifling mistakes, haggling over little matters, you are not a very big man. A big man

worrying over unimportant matters, you are wasting and using up energy that might be used to produce something. You are not a big man; you are one of the little fellows.—*Success Magazine.*

START RIGHT

No matter what business you may choose, there are three or four things that you must have if you are to start right in life. You must have a capacity for steady, persistent, hard work. There is no honest business or profession in life in which this is not a prime requisite.—*Uncle Henry's Sayings.*

How claim payments have run

For Promotion, Learn the Job Just Ahead

*C. F. Duggan, Chief Clerk to G. E. Patterson, Rose
from Division Accounting Work in 4½ Years*

ALTHOUGH an employe is successfully handling his position, he should keep a close watch on the work of those who are more advanced than he if he hopes for continued success and promotions. Mastering his work will insure him against losing his position, but he cannot advance unless he thinks along advanced lines and studies the more advanced work.

C. F. Duggan, chief clerk to G. E. Patterson, acting general superintendent of the Northern Lines, believes in that rule, and he has advanced to his present position from a clerkship in the division accounting office at Dubuque, Iowa, in four years and six months.

From the very beginning of his employment, his work was first in his mind, of course, but he never neglected an opportunity to investigate and study the work of others about him. He was interested in his work, did it admirably, and then made himself familiar with the results his work was accomplishing. He learned what was done with the fruits of his efforts and was soon able to direct his own work if an occasion arose which required that.

He studied constantly. During the office hours, his mind was occupied with his work. He says that he never was able to find time for anything else through those hours and that he believes there should be time for nothing besides work in any position. The preparation for something better came outside of the regular office hours. That was his own time, and he used it to his best advantage.

Employees Put Brakes on Themselves

Too many employes do their work well, but fail to increase their knowledge of railway work, he says, and the result is that they remain in the same positions. After all, he believes, that is the place for them. They are of more value to the company where they are than they would be elsewhere, for they are fitted for one kind of work alone. They are dependable employes, and the company appreciates their work, but they are putting brakes on themselves when they do not think beyond their own routine.

C. F. Duggan

Mr. Duggan is in a position now where he chooses the employes to fill the vacancies in his office. Long before he was made chief clerk, he was familiar with that work, for he studied it in the hope that he would become one some day. He watched and studied the selections the chief clerks over him had made, and when the time came for his promotion he was fitted for the work. He is still studying the problem of selecting the right man for a vacant position. He considers that as one of his most important tasks, and he finds that wise selections can be made only after obtaining an absolute familiarity with the organization. That means a study of each position in his office as well as a study of the person best fitted for that position.

A supervising clerk can easily make a mistake when a vacancy is filled by an applicant from outside of the office, he says. There is no hard, fast rule by which a man may be chosen. He may appear to be capable of handling the work, but fail completely when he is placed in charge. How-

ever, much can be learned about the applicant through a careful interview, and Mr. Duggan makes his interviews thorough when he is forced to fill a vacancy in this manner. Questions in regard to home life, parents and birthplace give some idea of the applicant's character, while his education and experience in various lines of work help to show if he is fitted for the work. Of course, neatness in the appearance of the applicant will aid materially in obtaining the desired position, but neither handsomeness nor good physique has too much weight with Mr. Duggan. The impression made by the interview is the deciding factor.

Gets a Day's Work Done Each Day

Mr. Duggan makes it a practice to arrive at his desk early each morning. An early start makes the day run smoother, he says, and a smooth-running day means a lot of work accomplished, with a pleasant and early close of the day. There are times when more work is to be done than can be accomplished during the regular hours, but he clears up each day's work that day, because it makes the following day's work more satisfactory and easier to get started on. A clean slate each day makes him happy in his work, he says. His correspondence is always answered the day it is received. He finds that a study of details and reports aids him in handling his work by shorter methods.

Mr. Duggan is only 26 years old. He was born August 8, 1896, on a farm near Ryan, Iowa. He developed his growing muscles and received his primary education there and then went to the high school at Dyersville, Iowa. He was graduated in 1914 and attended the Cedar Rapids Business College the following year. He then accepted a position as stenographer for the Iowa Telephone Company at Cedar Rapids, where he remained until March 8, 1916, when he entered the service of the Illinois Central as a clerk in the division accounting office at Dubuque. He became interested in the new work and studied hard, and it was not long before he received a promotion. He continued to study and was rewarded with promotions in that office, until 1918 found him as the assistant chief accountant. On October 1 of that year he was made the chief accountant of the Illinois division.

Previous to that time, the Illinois division offices had been in Chicago, and the Chicago terminal division had charge of the ac-

counting of the two divisions. There were two superintendents, but only the one accounting department. When it was decided to move the offices of the Illinois division to Champaign, Ill., Mr. Duggan was placed in charge of organizing the new accounting office.

Made Good in Selecting Clerks

A few of the employees in the Chicago office were transferred to Champaign, but most of the new positions had to be filled from the army of applicants who appeared in Champaign when it was learned that the new office was to be opened. The new men were placed in the minor positions until they proved their value and ability and were then promoted. Mr. Duggan used rare judgment in his selection of men, for two of those he chose at Champaign later became chief accountants on the system.

The thoroughness with which Mr. Duggan organized the accounting office at Champaign attracted the attention of G. E. Patterson, then superintendent of the Illinois division, and after the department was running smoothly Mr. Duggan was offered the position as chief clerk to the superintendent. That was on January 16, 1920.

A short time after that Mr. Patterson was appointed the acting general superintendent of the Northern Lines, and on September 1, 1920, he offered Mr. Duggan the position as his chief clerk.

DIES IN AUTOMOBILE ACCIDENT

Raymond B. Woods, 23 years old, employed in the revising bureau at Memphis, lost his life Saturday evening, August 26, in an automobile accident. He and another boy left Memphis in an automobile for Holly Springs, Miss., to attend a country dance. On reaching Byhalia, Miss., they inquired as to the direction to Holly Springs and were told to go straight ahead. A bridge connects two roads at this point, and a newly made road led around the bridge, which was being rebuilt. As there was no warning left at the approach of the bridge, they journeyed ahead for a few hundred feet, when the car suddenly plunged down about six feet. Neither Woods nor his companion was rendered unconscious by the plunge, and both arose to right the car, when Woods fell back to the ground. When his friend reached him, he was dead. Woods saw service in the United States Marines. He is survived by his father, mother, two sisters and three brothers.

Runs World's Largest Cotton Plantation

*L. K. Salsbury of Delta & Pine Land Company,
Scott, Miss., on Our Lines, Controls 65,000 Acres*

IN Bolivar and Washington counties, Mississippi, but chiefly in Bolivar, is located the largest cotton plantation in the world. It is known as the Delta & Pine Land Company, with plantation headquarters at Scott, Miss. Under one management the departments function with the precision of a delicate machine, and to the outstanding genius of one man is their success due. With the development of the area of 65,000 acres representing an investment of \$20,000,000, his achievement can be classed almost as empire building.

As a romance of brilliant accomplishment, this farm stands on a parity with the achievements of genius in any realm of industry and finance. The man whose vision dreamed it and whose generalship and constructive ability wrought it into actuality and whose heart dictated plans of organization and policies of benevolence and humanitarianism, now the admired and respected leader of this mammoth enterprise, was affectionately given the title of "Big Boss" by Sir Herbert Dixon of England, a soubriquet that still clings as a title of endearment as it is pronounced by the officials and laborers from the highest to the humblest.

President an Energetic Organizer

The "Big Boss" is the president, L. K.

L. K. Salsbury

Salsbury of Memphis, Tenn. He is a dynamo of energy. He is an organizer, the equal of the heralded captains of industry and finance familiarly known throughout the country. He is big and strong in physique, in mind and in heart. His modesty has kept

General view of Scott, Miss.

hidden for a decade the wonderful application he has successfully made of system, efficiency and organization to the conduct of the agricultural business in the Delta of Mississippi, in the heart of the South.

Weighing cotton

The work of reclamation has been made complete on these farms. There are thirty-six miles of big dredge canals, twenty-four to a hundred feet wide and six to twenty feet in depth, and there are innumerable smaller ditches. The arrangement is so good that these ditches and canals dispose of the surplus rainfall perfectly. Although the land is level, with alluvial soil, the drainage is so thorough that it may be worked almost immediately after rainfall. The thought held by many that the Mississippi Delta is a swampy, malarial, disease-stricken area is absolutely erroneous. With the application of proper methods it is not only dry and fertile but is as healthful as any part of the country. The top soil has been found to be as deep as forty feet, as at that depth, in digging wells, cypress logs have been found.

Delta Soil Is Notably Fertile

The soil has an abundance of all the elements required for complete fertility. Phosphorus, potash and lime are present in an inexhaustible quantity, and it is only after many years of constant cropping that nitrogen becomes deficient. But all that is necessary to restore its original productiveness is a year's rotation in any of the clovers, cowpeas or other leguminous plants, or application of commercial nitrates. It is a remarkable fact that all winter and summer legumes that will grow anywhere will grow in the Yazoo-Mississippi Delta.

There is a population on the farms of

Cotton wagons at gin

10,000 negroes and 300 white persons. At each tenant's or employee's house may be seen a garden, poultry, high-bred hogs and cows. The set policy has evolved plans whereby cotton is the sales crop, but there are also produced foodstuffs for tenants, employes and livestock. It will be a revelation to many to know that twelve acres is the average farm for a man and wife; if there are children, the acreage is increased until the maximum is about twenty-four

The Delta

The Yazoo-Mississippi Delta—in ancient days covered by the waters of the Gulf of Mexico, later the land of the mound builders, whose monuments reveal to the archaeologist the secrets of an old civilization, and still later the home of the Choctaws and Chickasaws—is in reality not Mississippi, for Mississippi is many feet below the surface of this alluvial plain. The delta is a composite or mosaic of deposits from the many states drained by the majestic river discovered by De Soto.

For countless centuries the river brought down the richest soil of more than thirty states and spread it out over this great valley, creating a fertility as rich as that of the Nile. Through engineering skill the river has been harnessed, the current now being held by the mighty levee system, making secure from flood waters an area capable of sustaining as dense a population as any other like section of the world. In fact, for agricultural performance it has potential power for the greatest rural civilization man has known.

The South is the land of cotton, and Bolivar County, in the Yazoo-Mississippi Delta, ranks first in cotton production as compared with all counties in the cotton states, and it ranks twenty-first in the value of agricultural products as compared with all counties in the United States. This county, named for the heroic leader who is referred to as "the Washington of South America," is immediately adjacent to the county which bears the name of the "Father of Our Country." Thus Washington and Bolivar, at the point of whose swords the independence of the hemisphere was won, have enduring monuments to perpetuate their memory in these counties that stand through Providence as high examples of economic independence.

On the world's largest cotton plantation, Scott, Miss. 1. Clearing land for cotton. 2. Clearing cypress brake for cotton. 3. Hoeing young cotton. 4. Cultivating young cotton. 5. Cotton dusting machines poisoning boll weevil. 6. Battery of boll weevil dusting machines. 7. A field of cotton. 8. Picking cotton. 9. View of ginning plant. 10. Cotton on platform for shipment via Yazoo & Mississippi Valley Railroad.

acres, thus exploding the theory of at least forty acres and a mule.

On this Scott farm will be found fifteen hundred mules, and in addition saddle horses for managers and other officials. Dr. B. M. Davenport, who is a graduate of the Ontario Veterinary College, Toronto, gives his entire time to the care of the livestock on the place. The mules and saddle horses on the place are valued at \$275,000.

Plantation Is Electrically Equipped

The entire plantation is furnished with electric power for lighting and mechanical operation. The power is transmitted by cable from the power plant at Greenville, Miss. The homes, stores, offices, mills and streets are lighted with electric lights. There is an abundant supply of pure water from two great flowing wells nearly two thousand feet in depth. The place has every modern appointment of a complete water system, hot and cold water and baths. Great concrete troughs are provided with running water for the livestock. A beautiful fresh-water lake is picturesquely located in the center of the property and is drained by Deer Creek, winding its way through the Delta. Bolivar Lake was once the main channel of the Mississippi. It is six miles long and from one-half to one-third mile in width.

All the units of the organization are connected by a private telephone system. This is of immense economic advantage, giving to the general manager and the farm manager instant contact with the remote outlying areas. When a new farm unit is to be

opened, one of the first things done is to establish telephone communication.

Homes for Officers and Employees

The homes of the general officers are at Scott. They are attractive residences,

Ditching machine

located on wide streets, facing the lake and Deer Creek. The houses are screened, and the yards are large and made attractive with shrubs and flowers. The homes of the managers on the farm units are similarly built. The homes of the tenants and employees are

standardized houses, with all the needed comforts. All the tenant houses and farm buildings are painted white or whitewashed, and the instant impression is that of cleanliness. The houses throughout the area fairly shimmer in the sunlight.

The farm has its private laboratories and experimental farms for the breeding of seeds and other scientific work. In charge of this work is E. C. Ewing, a graduate of the Agricultural and Mechanical College of Mississippi and a graduate with the degree of Master of Science and Agriculture from Cornell University. Prior to his service on the farm at Scott he was with the government Bureau of Plant Industry. For nine years he has been breeding seeds, striving for a

Plantation store at Scott, Miss.

Bolivar Lake at Scott, Miss.

variety that will yield a longer staple and the maximum production, adapted to the soil type of the Delta. The success obtained is remarkable, and there has been produced a variety of long staple cotton that is as early and prolific as the short staple. This variety, named in honor of the creator of this great enterprise, is known as the "Salsbury type." Another notable result of experimentation is in the spacing of the plants and the rows. The old spacing was sixteen to twenty inches between stalks, with 4-foot rows. The spacing now followed on the farm is six, eight and ten inches, with rows three and one-half feet wide. The most intensive methods of cultivation are employed; with the Salsbury seed, early and prolific, this farm successfully fights the boll weevil, using untiring energy scientifically and intelligently applied.

Effort Is to Make Life Pleasant

Many things have been done to make life on this property attractive and happy. This company's plans could well be studied in solving the so-called race problem. The managers have created a condition that is

ideal. The plans for the pleasure, education, health, happiness and the moral and religious life on the plantation are given the same careful consideration as the commercial and financial program, where percentages must be made and dividends created. The "Big Boss" and his associates have put their hearts into the work and have at times, at great cost, introduced plans and innovations that have had a large part in the building of the spirit of co-operation and making possible efficient co-ordination of so large an enterprise.

A bird's-eye view of Scott, the capital of the enterprise, includes many units, each seemingly small and unimportant but necessary to complete and round out the whole organization.

The sawmill, with a capacity of 12,000,000 feet a year, and a planing and shingle mill handle the timber as the forests are cleared. They not only furnish all the lumber for building operations on the farm but also produce a surplus for shipment to many parts of the United States and to many markets of the world. The great mills are

The plantation sawmill

equipped with modern machinery. The timber brought in on the logging trains is sawed, graded, piled in the yard and loaded for shipment with the same economy and watchful regard for detail that characterizes every other operation on the farm. In the yard at all times is lumber valued at from a quarter of a million to half a million dollars. The timber includes cypress, hickory, elm, oak and gum, ash and cottonwood.

Acreage in Crops Besides Cotton

As mentioned, cotton is the sales and money crop on this plantation. However, to make the farm self-sustaining in food crops alone is a stupendous operation. There are 600 acres in alfalfa, 600 acres in oats, 2,000 acres in pasture, 6,000 acres in corn. The alfalfa yields five cuttings annually. The corn crop is sufficient for man and beast, with a surplus. As an evidence of the surplus of livestock produced, the farm at one time shipped a solid train of thirty cars of hogs and cattle direct to St. Louis.

This property operates a railroad ten miles in length. This road is equipped with a sufficient number of steam locomotives and cars adequately to handle the transportation end of this immense industry and is used in conjunction with the Yazoo & Mississippi Valley Railroad.

Educational advantages beyond the average are provided for the white children. A school, part of the public school system of Bolivar and Washington counties, financially aided by the company, is established on each farm unit for the negro children and makes possible the employment of high-grade teachers. A higher graded school has been built for the negro children, and there is in process of organization a higher vocational school for them where agriculture, elementary mechanics, domestic science, woodwork and other practical courses will be given. Twenty thousand dollars will be appropriated to establish this school. A night school for negroes is in successful operation. It has also been determined to install a moving picture exhibit, not only for entertainment but also for the educational value of the films depicting country life, health and sanitation.

President Alert for Improvement

The president, L. K. Salsbury, dreamed a dream and realized it. An executive, a financier, and a benefactor, he caught the vision of the potential possibilities of the Southland, and in response the natural resources yielded to the hand of labor, capital and sys-

tem. Who is Salsbury? He said once: "God Almighty placed this soil here in the Delta that only needed the heart of faith in its possibilities and the touch of organized processes in its cultivation to establish an agricultural power not excelled anywhere on the earth." And he has seen them all, including the valley of the Nile.

He is the father of processes of seed breeding, intensive production on small acreages for tenants, reclamation, harvesting and marketing that constitute a romance of achievement. He has made his company the largest seller of planting seed and the biggest and most successful user of boll weevil poison and nitrate of soda in the South. He is president and creator of these planting operations and the directing head of many other large and successful projects.

Heretofore the boll weevil poison has been applied by machinery. This plantation is now experimenting with an airplane to ascertain if application can be made with such a machine; if so, the efficiency of application will be increased 100 per cent.

President Salsbury has upon many occasions made the statement that the services rendered by the Yazoo & Mississippi Valley Railroad have contributed in a large measure toward the success of this vast project, and he much appreciates the friendly spirit of co-operation which exists between the officers and employes of the railroad and himself and his organization.

RAILROADS GET MORE CARS

According to the car-service department of the American Railway Association, the railroads of the country had 25,763 more new cars either ordered and under construction or installed in actual service during the first seven months of this year than during the entire year 1921. During these first seven months the carriers installed or had on order 95,199 new freight cars of various kinds, compared with a total of 69,436 such cars ordered or installed during 1921. Of the total, 41,405 were coal cars. New box cars amounted to 39,612 during the period mentioned, of which 8,002 have been actually delivered and placed in service. The railroads' supply of refrigerator cars was also augmented by the ordering of 6,428 refrigerator cars up to August and by the acquisition and installation of 3,870 such cars, a total of 10,318 cars installed or ordered.

Monee, Ill., Named After Indian Woman

Long Search Finally Reveals History of Noted Character Who Had a Reservation All for Herself

By JOHN G. DRENNAN,
District Attorney, Chicago

MONEE is a village on the main line of the Illinois Central, about thirty-five miles south of Chicago. The station is upon the highest ground between Chicago and Kankakee, commonly known among operating department employes as "Monee Hill." At present the company is spending a large amount of money reducing the grade of the track through Monee; this will result in a cut of about twenty-two feet through the village and the separation of all the grade crossings.

The history of the name of this village has been a matter of conjecture and some discussion for many years.

About fifteen years ago I was at Monee on business for the company. As the name seemed somewhat odd to me, I inquired of some of the older residents as to the origin of the name. I was told that Monee was an Indian chief who once lived on a reservation nearby; that Monee had died many years ago and was buried in a grove near the village. I then made inquiry among some of the older residents; one especially, whose name I cannot recall and who gave his age at that time as 78 years, advised me that he knew this Indian chief, Monee; that he remembered when Monee died; saw him buried and could point out the spot where the grave was located. I then decided that I would take the matter up with the Chicago Historical Society and suggest the marking of the spot with some appropriate monument. Soon after, however, important matters claimed my attention, and nothing was done toward the marking of the grave of the supposed Indian chief, Monee.

Thought Monee Was a Woman

Some months ago, when there was need to procure an ordinance from the village, giving its consent to the reduction of the grade of the roadbed through the village, I attended several meetings of the village council. These meetings were also attended by a number of the inhabitants of the village, some of them old men. Here I again brought up the subject of the Indian chief, relating what was told me about the burial spot, but I was informed that the old man

I talked to many years ago was dead. It was thought, however, that the grave of the Indian chief could yet be located. While the subject was being discussed, one of the old residents who was present leaned forward in his chair and said to one of the participants in the conversation: "Joe, I've heard of that Indian chief, Monee, before, but I always thought he was a woman." This remark was regarded as a real joke and told as such from time to time.

Some weeks ago it was suggested again that I look up the history of the Indian chief. I went to the Chicago Public Library and, with the aid of one of its most competent assistants, Miss Adah Whitcomb, delved into the history of the Indians of Chicago and vicinity, but I could find no trace of an Indian chief with the name of Monee. Miss Whitcomb finally suggested that we examine what are known as the Fergus Papers, and we there found in one of the indexes the word, "Monee." We found an article copied from the *Chicago Tribune*, prior to 1883. This article followed, in the Fergus publications, the correspondence between Sydney Breese, one time a United States senator and for many years a justice of the supreme court of this state, and Stephen A. Douglas, while the latter was a United States senator from this state.

Granddaughter's Letter Tells of Monee

This article in the *Tribune* purported to set forth the names of the different stations along the line of the Illinois Central in Illinois and the origin of the names, many of them being Indian names. The station of Monee, it was said, was named for Monee, a Pottawattamie Indian woman, who was the wife of Joseph Bailly, a white trader of much influence in the Calumet region.

Beneath this statement was what might be termed a footnote, consisting of a letter dated at Bailly Homestead, Porter Station, Ind., April 22, 1884, signed by Frances R. Howe. This letter is of considerable length and most interesting. The writer declared that her grandmother, Monee, was not a Pottawattamie Indian; that the father of Monee was a Frenchman named Lefevere and that the mother of Monee was an Ottawa Indian [the Ottawas were regarded as

a superior tribe of Indians]; that the father of Monee had a trading post upon the St. Clair River; that he had died when comparatively young, leaving his Indian wife a widow with two small daughters. The widowed mother and the two little daughters returned to her tribe near Manikac, Mich.

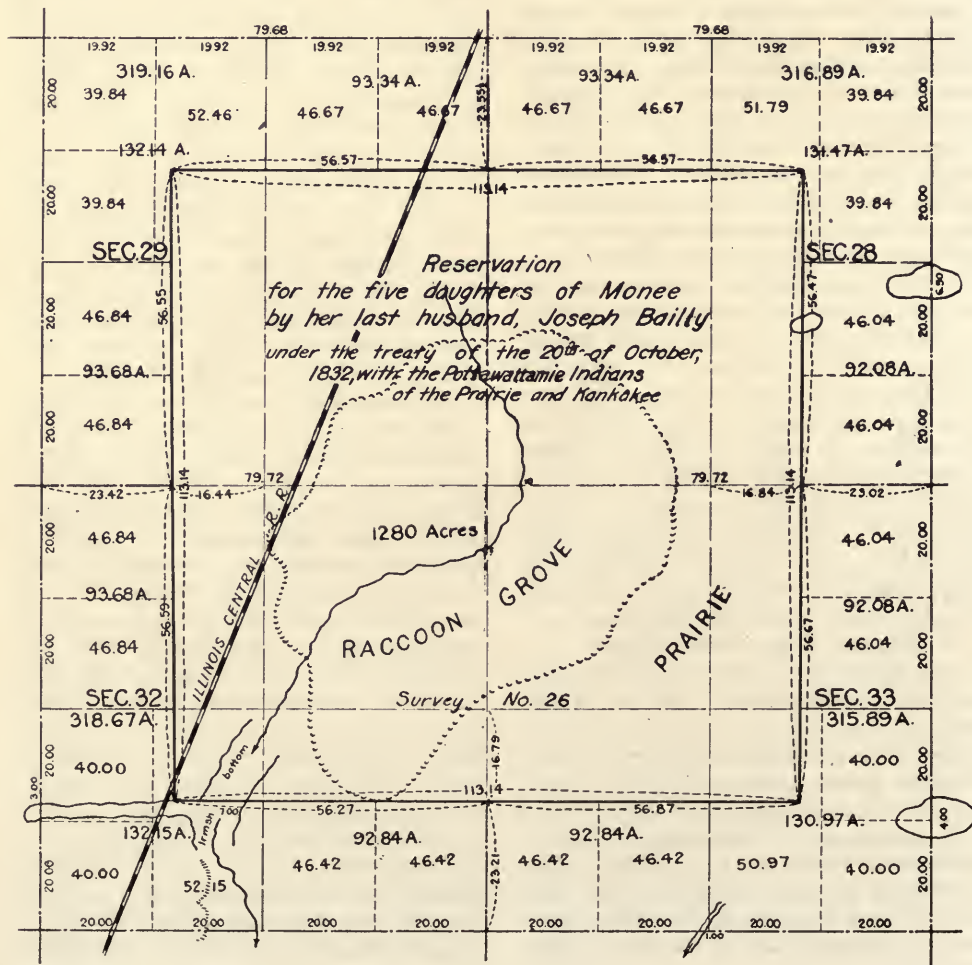

Monee's given name, the one by which she was baptized in the Catholic Church, was "Marie." There was no sound in the Ottawa dialect corresponding with "r," and so she was called by the Indians "Maunee" or "Monee."

While residing with the tribe, she met and married a French trader, Joseph Bailly des Mesdein, afterward known as Joseph Bailly. Bailly was born in Quebec in 1774 and died in 1835 at the Bailly homestead, which he had located near Porter Station, Ind., now on the Michigan Central Railroad. Monee, however, lived until 1866 and died at the age of 83.

Monee seems to have been a woman of much talent and influence with the Indians in the Calumet district, the Pottawattamies. When these Indians, known as the Pottawattamie Indians of the Prairie and Kankakee, made their treaty with the United States October 20, 1832, they caused to be incorporated in this treaty an agreement on the part of the United States to convey to the five daughters of Monee [she had but four daughters, in fact], by her husband, Joseph Bailly, two sections, or 1,280 acres, of public lands, to be thereafter located. On March 30, 1836, a reservation of 1,280 acres of land was located by the authorities of the United States as such a reservation for the five daughters of Monee. A plan of this reservation is shown herewith.

A Reservation Carved Out for Monee

It will be noticed that this reservation is carved out of the center of four sections

(namely: 28, 29, 32 and 33) and includes, practically in the middle of it, what is designated as Raccoon Grove, of approximately 160 acres. The right-of-way of the Illinois Central runs somewhat diagonally through the western half of this reservation. The history of this concession and the records of Will County disclose that Monee had but four daughters, namely: Esther, who married J. H. Whistler; Rosine, who married Francis Howe; Hortense, who married J. H. Wicker; and Eleanor, known as Mother Mary Cecilia of the Sisters of Providence, Terre Haute, Ind.

Life Insurance

It is noticeable that most of us cash our checks on pay day and shortly after spend our two weeks' earnings, paying current bills and incidental expenses. From this it would seem that the majority of us are not more than one jump ahead of the collector. If for any reason our earning power were taken from us, we would be without independent means of support. Before we can better this condition we must build a foundation so we cannot sink lower.

Life insurance is one of the factors that should enter into the construction of this foundation. No wage earner with a regular job should neglect to carry at least a small amount of life insurance. We should not make the mistake of overburdening ourselves with insurance, on which we may later be unable to pay the premium, as this would be as bad as, if not worse than, being without insurance. The amount carried should be governed by the monthly earnings of the individual.

Before taking out a policy, careful consideration should be given to the company, kind of policy and amount. There are many desirable forms of policies, and it requires but little effort to find one to fit the need of the individual.

To the average man life insurance is a mystery; its very simplicity makes it so. The general principle is the grouping together of many persons to protect one another against possible loss.

If we place our personal affairs on a substantial basis, we cannot spend all our earnings satisfying immediate desires. It is but wisdom and reason to provide for old age and disability through secure investment of savings and the protection of a reasonable amount of life insurance.—H. O. VOEGELI, *Chief Shop Accountant, Jackson, Tenn.*

About the time the Illinois Central located its line through this reservation, William B. Ogden, first mayor of Chicago, bought this land from the daughters of Monee for about \$5 an acre.

Monee lived with her daughter, Mrs. Frances Howe, and her granddaughter, Miss Frances R. Howe, on the Bailly homestead; about a mile and one-half from Porter, Ind., until she died in 1866. Her granddaughter, Frances R. Howe, seems to have inherited the Bailly homestead. At her death she willed it to the Catholic Church to be a home for aged nuns, and at present it is so used.

It is manifest that Monee was a woman of much ability, a devout Christian, and transmitted these good qualities to her worthy and generous descendants. It is true that she "was a woman" (as the old Monee resident believed) and well worthy to honor the village of Monee with her name.

LOCAL ATTORNEY DIES

Judge William H. Norris of Manchester, Iowa, died at his home at Manchester on August 20, 1922, at the age of 65. Judge Norris for many years was the able local attorney for the Illinois Central Railroad Company in Delaware County. He was a man of unusual ability and intense industry, and his services for the company were duly appreciated. Judge Norris had not been in the best of health for several years past. The end came almost without warning. He was born at Stoneham, Mass., February 3, 1857, of Irish parentage, came to Iowa when he was 17 years old, was a college graduate both in letters and in law, and for many years was a member of the leading firm of attorneys at Manchester. He was always an active Republican and influential in party councils, a member of the General Assembly of Iowa, and popular throughout his whole life. He will be much missed from the ranks of employes of the Illinois Central.—F. H. H.

THRIFT

Thrift produces prosperity. To develop individual thrift is a pressing national problem. Thriftlessness, the American characteristic, is due to a lack of "know-how"—not to the absence of the desire to be independent. Almost any man who tried to run his business in the way he finances his home—without a definite plan—would end in bankruptcy inside of a year.—ROGER W. BABSON.

Galena, Ill., Dancers Try Stockyards Glide

*Formal Opening of Our New Loading Facilities
Is Featured by a Well-Attended Open-Air Ball*

OPEN-AIR dancing on the cement floor of the gas-lighted stockpens August 18 celebrated the grand opening of the new \$14,000 Illinois Central stockyards at Galena, Ill. The dance was planned by the members of the Co-operative Stock Shippers' Association of Jo Daviess County and the employes of the Illinois Central at Galena.

As construction on the yards was nearing completion, the two hundred members of the stock shippers' association grew more and more enthusiastic. They had worked for some time persuading the company to make the improvement at Galena. Then someone proposed the novel idea of having a dance in the pens to celebrate the opening, and before a day had passed everyone was talking about it. Definite plans began to be formulated, posters were printed and

Where they danced

distributed, and when August 18 arrived the residents of Galena and the surrounding country were waiting impatiently for evening to come.

Plenty of Help Available

The work of preparing the stockpens for the dance was not started until the afternoon of the day of the celebration. The

Two views of the stockyards at Galena. Those in the lower pictures, from left to right, are: James Barnes, who has shipped stock from Galena for twenty-seven years, William White, a stock shipper for twenty-six years and president of the stock shippers' association; Happy L. Day, agent at Galena; John Sanderson, stock shipper; William Campbell, stock shipper.

Caught in action

cement floors were flushed clean, flags were hung at various corners, an orchestra stand was built, and a counter was fixed for the sale of refreshments to the dancers. There were more men offering their services than were needed at the stockyards that afternoon. All were eager to assist in making the event a success, and it required only a few hours to get everything in readiness.

H. L. Day, agent at Galena, and William White, president of the stock shippers' association, were among the first persons who entered the gate of the stockyards when darkness began to settle over Galena. They inspected the work of putting corn meal and rolled oats on the floor to make it smooth.

Large carbide lights were placed at each of the four corners of the pen, and by 9 o'clock the place looked as brilliant as the midway of any carnival.

Only a few persons came at first. They seated themselves on the long benches along the sides. Others walked up cautiously and peered curiously through the fence. When the orchestra arrived a fair-sized crowd had assembled in the "reception room" of the yards.

Mr. Day announced that the first three dances would be free, and after that tickets would be sold at 10 cents each, or three for 25 cents, until enough was taken in to pay the orchestra. Then the dance was on. Kuchemann's Orchestra, with two saxophones, a banjo, piano and drums, started feet to itching that had not danced for years.

Dance Grew in Popularity

Only a few took advantage of the first three dances, but soon more couples began to glide over the floor. Each dance found more persons dancing and the floor becoming smoother. By 10 o'clock the floor was jammed with dancers. The "reception room" was proving much too small to accommodate so many persons. One of the pens was hurriedly put into dancing con-

The Kuchemann Orchestra that furnished music for the dance. Those seated in front, from left to right, are: Miss Hayes, Miss Wilks, Mrs. H. L. Day, R. L. Guensler, chief clerk to Superintendent L. E. McCabe, Mrs. William Rolf, wife of section foreman, Mrs. Fred Geyer, wife of freight house foreman, and Mrs. Jackie Kunard.

Another view of the stockyards. Those in the picture, from left to right, are: Roscoe, the stockyards mascot; James Barnes, J. Callahan, William White, Agent H. L. Day and A. E. Demander.

dition, and part of the throng was asked to dance there. Then the dance continued until the small hours of the morning.

Mr. Day has been the agent at Galena since May 6, 1920. During that time, he says, the annual revenue on shipping stock

from that point has been about \$20,000. He has formed a close friendship with the stock shippers about Galena, and he says that they pledge their whole support toward making the new stockyards a success. He hopes to increase the revenue.

Repaired Central City, Ky., Pumping Plant

The Illinois Central System went to the rescue of Central City, Ky., when its water works pumping station was destroyed by fire at 3 a. m., August 19. The pumping station, which is three miles from Central City, on the Green River, supplies water for the Illinois Central locomotives, as well as for the citizens. As it happened C. R. Knowles, superintendent of water service

for the Illinois Central System, J. P. Hanley, water works inspector, and E. C. Myers, foreman of our whole line water works outfit, were on the division at the time. They took charge of the repairs to the plant, moved Mr. Myers' outfit to the scene by special train arriving at 11 a. m., repaired the boilers and had water pumping by 5:40 p. m. the same day.

Hobnobbing With Our "Movie" Notables

*Illinois Central Girl Gave Hollywood and Vicinity
the "Once Over" on Her Summer Vacation*

By MISS KATHRYN DRAPER,

Secretary to Engineer Auditor, Chicago

WHEN the Union Pacific's Continental Limited pulled out of Omaha at 1:20 a. m., July 10, we found ourselves very much "on our way" for our two weeks' trip to the Pacific Coast. With our daylight saving in Chicago, we had gained an hour on leaving, and Omaha had "central time"; at North Platte, Neb., which we reached at 8:30 a. m., July 10, we changed to "mountain time," gaining another hour; while at Caliente, Nev., at 6:30 p. m., July 11, still another hour was gained as our watches were set back to "Pacific time."

The evening of our first day in Los Angeles we went out to West Adams Street to call, and so had a good idea of our locations and the city when we retired that night. Nearly all the streets were bordered with large and wonderful palm trees of various kinds, while geraniums in profusion graced the entrance to nearly every house, and where there were not geraniums wonderful hydrangea bushes were to be seen.

Early the next morning we took the Pacific Electric's trip to Catalina Island, first passing through the town of Santa Rosa, where every little white bungalow had its gorgeous hydrangea bush.

A Trip to Catalina Island

After approximately a 30-minute ride out of the city we reached the ocean, where the steamer "Avalon" was waiting to carry us fifty miles over the sea. It was a delightful trip and different from "steam launching" on Lake Michigan. The waters were so blue and the whitecaps so very white and the air so fresh and "salty" that our first glimpse of the Pacific fully repaid us for the visit. The harbor was crowded with vessels of all descriptions, mercantile ships, fishing boats, dredges and other craft, and as we sailed away many sea-gulls hovered around the boat.

There are many tuna fish factories, as the tuna fish are found in great quantities in these waters and served abundantly everywhere in Los Angeles. It is most delicious,

"Doug" lends a smile

too, and does not have the sort of "dried-out" taste it has when eaten in Chicago.

Soon, on the deck of a big vessel that looked like a warship, excepting that it had no guns, we spied what seemed to be a regular pirate, with his wooden leg, hopping around and waving his red handkerchief. The next moment we saw the big cameras a little to his left and realized that some pirate "movie" was being made. Everybody waved, and it was very exciting. As we got farther out into the ocean flying fish were seen darting up out of the waters. We did not see real whales until on the return trip; then we saw three, one after another, as they came to the surface and spouted out water. There was dancing on the boat and everything imaginable for sale, and although it was not rough at all and a beautiful day we ate lemon drops all the time.

Viewing Catalina from the boat, an island of volcanic origin owned by William Wrigley, Jr., of chewing gum fame, we could see upon the summit of the highest mountain his wonderful white castle and at the other end of the island the beautiful St. Catharine Hotel, where we had lunch upon arrival and were charmed with the place. A

hotel bus was at the harbor to meet the boat. The drive to the hotel is long and winding, among palms and fir trees, and growing low on the hills we saw holly in abundance, but numerous signs prevented travelers from helping themselves. As we reached the island a huge hydroplane circled the boat many times and performed spectacular stunts in the air. When it touched the water we could easily read its name, "Come Fly With Me." Soon we heard the strains of "Avalon" from the band on the pier as the boat docked, and then it dawned upon us that the song originated there, as Catalina is called the "City of Avalon." It is easy to walk around the island, among the mountains, from "peak" to "peak," as the streets are all laid out as in any other city in a way. There is a wonderful golf course on the island, with many hazards, as would be expected.

Viewing the Submarine Gardens

We took the glass-bottomed boats to see the submarine gardens, the most marvelous sight imaginable. On the boat each person has a certain seat. All the seats are arranged in circles of eight around a sort of railing, and underneath this railing, where the feet do not touch, is the glass bottom of the boat. We looked over the railing into the water, fifty-eight feet deep, and saw the wonders of the sea—starfish, sea cucumbers, sharks, goldfish, sponges (but not the mercantile sponge, as those we saw were of plant life and not animal), colored fish of various shapes and sizes, and plants in abundance. Then, when the ride was almost over, a diver—a big, good-looking fellow—threw six or seven large abalone shells into the sea, and as we looked through the bottom of the boat we saw them fall into the sands beneath. The diver then swam under the boat while everybody watched, picked up the shells and returned to the deck of the boat; in all, he was under water three minutes forty-eight seconds. When back he announced that the shells were for sale, and as they are beautiful (though dripping with seaweed, etc.) nearly everyone on board purchased one, for he had a reserve supply.

The bathing at Catalina Island is wonderful and unusual. The bay is so situated in the Pacific that the sun is always shining there every day in the year. Also Catalina is the only place on the Pacific Coast where these submarine gardens can be seen. Although about the same life exists under the

water at other places on the coast, both Atlantic and Pacific, it is nowhere else so readily accessible.

Tour to Hollywood and the Beaches

The Golden State auto tour to Hollywood and the beaches and "all points of interest en route" was most delightful. Echo Park, the first park we saw in Los Angeles, was where Charlie Chaplin staged the picture, "One Glorious Day"; the guide told us that the lake was sometimes called Chaplin Lake because so many of his pictures were taken there. Soon we came upon the studios, along Hollywood Boulevard, of Charles Ray, Francis Ford, Harold Lloyd, Warner Brothers, Marshall Neilan, Christie, Paramount and Lasky; of all these, Lasky's Studios are the largest, comprising several blocks, and nearly all of them resemble, due to the large high fences around them, big barns or warehouses.

Later on, past the business section of Hollywood, we saw the beautiful estates of May Allison, Pauline Frederick, Nazimova and Gladys Walton. Also, up on a hill as we entered Beverly Hills, was Douglas Fairbanks' mansion, now occupied by a wealthy overall manufacturer of New York. Not far away, but after almost a twenty minutes' ride, we came upon his present residence, Mary Pickford's castle, which is beautiful, with private tennis courts, swimming pool, etc. We also saw the home of Will Rogers and the house where Charlie Chaplin and Mildred Harris were supposed to have spent their honeymoon. Later we saw Chaplin's present home, which is rather quaint, of English style, and not so much a mansion as some of the other movie stars' homes. Wallace Reid's home is very pretty, with imitation thatched roofing, and Charles Ray is his next-door neighbor.

As we drove along the "mansion" of Billy Sunday was pointed out in the distance, and he certainly showed excellent judgment befitting his calling as to the location and style of his domicile. It is on a mountain peak which, from where we were, seemed difficult of access, and the building itself is a plain, square structure, all white.

Before passing Billy's home, while in the heart of Hollywood, we saw the home of the Bernheimer Brothers, widely known due to the famous Japanese gardens maintained on their estate. Their residence, like most of the other beautiful buildings, is high on a mountain, of true Japanese architecture, and the gardens encircle it in tiers,

of which there must be fully fifty. They are approached through long winding walks on the sides and around the grounds, while a long automobile drive from the boulevard below extends around the mountain, winding its way up to the entrance; then directly in front of the entrance to the house is the great stairway of concrete, with pillars and posts and arches of all descriptions covering it above. This entrance is, of course, guarded by gates, and visitors to the gardens can enter only through the regular garden from below or by the auto drive. The gardens are visited by every tourist and resident of Los Angeles, but after 6 o'clock in the evening they are closed to visitors.

The following Sunday afternoon we made another visit to the gardens, independent of any tourist trip, and spent several hours. At the same time did not feel that we had seen everything, and knew that we could visit there again and again. There were swans and water lilies, turtles, frogs, and various beautiful birds all at home in these gardens, surrounded by the natural plants and flowers which we always pictured as their particular background.

The Haunt of the Bathing Beauty

On this drive we passed the Los Angeles and Brentwood country clubs, which, while lovely, cannot boast of much in the way of golf courses; in fact, the golf courses throughout Los Angeles and adjoining places had no lure for us, because for the most part they seemed to be of sand, with nothing that could be really called a fairway or a green. During all the time of our visit we saw no women playing—only men (which probably accounted for the lack of beauty). Golf is not the popular, common game in Los Angeles that it is here. Tennis seemed to be a favorite, though, for so many of the residences have private courts, and we noticed a number of public courts, too.

In Santa Monica are the famed palisades along the ocean—a wonderful walk among shaded palms and ferns, bordered by groves of walnut trees, fig trees, olive trees, beautiful eucalyptus trees and some lovely trees with dainty leaves and pretty blue flowers.

Venice recalled Coney Island or River-view somewhat; the ocean is there and the canal streets and the crowds and noisy amusements. It is a gay place, and we were fortunate enough to arrive there on the day of the annual parade of Mack Sen-

nett's bathing beauties. The "beauties" were beautiful as they appeared, a beauty to a car, and sometimes several, but they could not have gone near the water. There were little girls, varying from 3 years to 16 years, participating; they were the loveliest of all, especially the veritable babies, as they resembled butterflies and flowers in their costumes and were resplendent in gorgeous hues and colors. The contest among the older beauties was between regular actresses and other girls, and we who are curious to know the result expect to find out from the screen just who were the winners. To see the bathing suits or gowns which were worn was worth the trip.

We had been anxious to see the "movie" theaters in Los Angeles, and at our earliest opportunity we went to Grauman's Million Dollar Theater, where Thomas Meighan was featured in "Our Leading Citizen." It is a beautiful theater, of course, but not so very large, and for us who have seen theaters in Chicago, it did not come up to expectations. Grauman, however, is building another theater to be called the Three Million Dollar Theater, which will be several times larger than the other. One of the special features of the program was a little playlet given by ten "movie stars." It was announced that three "movie" stars actually participated in the performance, while the seven others were impersonated. Prizes were to be given for the correct guesses as to the stars who were really there. The impersonations (and otherwise) were Gloria Swanson, Lila Lee, Betty Compson, Rudolph Valentino, Owen Moore, Bill Hart, Chester Conklin and Buster Keaton, and two others we cannot recall. Everybody seemed to agree that Gloria, Lila and Buster were really present.

Visiting the "Movie" Studios

In Culver City is the estate of Henry B. Walthall, one of D. W. Griffith's stars, which has a regular colonial mansion, copied after

A "Robin Hood" scene.

Washington's home at Mount Vernon, and to one who has seen Mount Vernon it is apparently the same residence, except that the grounds are not so large and it is not located at the same distance from the street and is not on the water exactly. In Culver City are the studios of Ince, Goldwyn and Willat. We returned from Culver City via Washington and Wilshire boulevards, wealthy residential streets of Los Angeles, the beautiful Ambassador Hotel being not far from the latter boulevard, on a high terraced hill.

At Universal City we saw many "movie" people, both in the studios making pictures and coming and going to and from lunch; there are only two cafeterias there and no other restaurants. It is a real city, incorporated, having its own postoffice and government; so anyone can imagine what an immense place it is. The Universal Film Corporation produces nearly all serial pictures and employs thousands—the "movie" players are only a minor part of the city's populace, as men of all trades can be found there, carpenters, electricians, etc., to build the settings needed for the pictures.

As we had arrived around noon we were fortunate enough to see many of the "movie" people at lunch, all attired in their make-up, and we marveled at their make-up as they looked so unreal and not nearly so good looking (in the case of the men) nor half so beautiful and wonderful (in the case of the women) as they seem on the screen. It was a treat, nevertheless, to see all this, but if one did not know or could not identify a certain person there was absolutely no way of finding out, because everybody questioned was (and, as we found out later, meant to be) reticent about divulging any information as to "who was who" or what picture was being acted. We did identify Gladys Walton, however, at lunch with a "bell-hop" and one or two others.

After lunch we were taken by bus through the grounds to where a bull fight scene was being staged and were told we were needed to swell the "audience" for the picture, which was to be a comedy styled either "Some Bull" or "More Bull." It was very exciting, getting our places on the board seats, just like going to a ball game (only more so), for all around, at several different points, we noticed large "movie" cameras with groups of men at each operating them. At the director's command those in "the audience" (where we were) stood

up and shouted, clapped their hands, looked frightened and awed when the bull dashed around, sat down again, etc., which performances were all taken by the camera. In a canopied box, at the center, sat the Spanish nobles, who came to see fight, the men attired in royal costume, with sashes, broad hats, etc., and the women with high combs and laces over their heads. One of the women in the box, presumably supposed to be the young daughter of some noble, who had black, bobbed hair, with a red band around her forehead and who wore a pretty apricot shade of georgette dress, asked us if we had a mirror she might use. We handed her a vanity case and held a little conversation. She was Juliette Leonard, really very pretty. All the while these "movie" people sat in the box they chatted and hummed Spanish songs. We took some good snapshots of this bull fight scene, for the bull was real and so were the toreadors, in Spanish costume, with their red and gold capes.

How "Movie" Scenery Is Made

The studio at University City, which is like Douglas Fairbanks' studio, which we saw later in the afternoon, and generally like all others, would be interesting to any visitor. We traversed a great part of the interior of the studio grounds on foot, preferring this way to the bus which had brought us to the bull fight scene, for we were enabled to see the many different "movie" settings much better. In most cases these consist of merely the framework of structures from fences to castles, including banks, freight stations, department stores, office buildings, bungalows, apartments, barns, docks, vessels, beaches, grottos, parks, etc., all the different edifices for scenes showing out-door buildings, entrances, etc. When used for a picture they are decorated and fixed up to portray the particular story. We had the opportunity of entering the inner studios, where indoor, or room, scenes are taken; here, as for the outer buildings, the rooms are fixed up and decorated for certain pictures, as simply the frame-work or general plan of a room is carried out. Here we saw the wonderful stairway and castle tower used for "Foolish Wives." Later on we came to the animals, those used for the jungle pictures—an immense elephant, a camel and monkey, "Jiggs," seen so much in Universal pictures.

On the way to Universal City we passed

Behind the "movie" scenes

through Hollywood via Sunset Boulevard and saw the studios of Vidor, Metro and Robertson & Cole. Also, along a country road, we came upon some camera men taking a comic picture—a race between two automobiles—so we stopped and took some snapshots. The camera men told us it was to be a Bobby Dunn picture. Both chauffeurs were made up greatly, their faces and their attire, and the machines had big white numbers on the front. One of the chauffeurs was Bobby Dunn himself.

Returning from Universal City we passed Mary Pickford's studio, which is the largest in California, and by far the nicest of all we had seen, as it resembles, instead of a big warehouse, many large apartments built around a court; all the buildings are of light yellow brick, with a prosperous-looking "office" at the entrance, surrounded by gardens. Mary was supposed to be busily engaged making over the picture, "Tess of the Storm Country," when we were there.

Watching Douglas Fairbanks Work

We also saw Douglas Fairbanks' studio, as previously mentioned, which is next to Mary's in size and comprises a number of good-looking buildings, in which the offices are located, with the work yards in the

rear, occupying many blocks. The lowest salary paid to any member of the Fairbanks Company was \$7.50 a day, we were told. Here we saw the castle recently erected for "Robin Hood," and when the picture is released we expect to identify the scene on the screen. When we reached the studio we expected to be able to see Douglas himself doing some stage work, but were informed he was working that afternoon at Santa Monica Canyon on a bluff scene for "Robin Hood"; so we hurried away to that point and, arriving there about 3:30 p. m., found the street below lined with cars and the spot crowded with spectators. We made our way to the front, however, and saw everybody in the company who was there that afternoon; we especially noted Charles Monte, apparently of Indian descent, who seemed to be their sun guide, for it was on his advice that each picture was taken. He stood at the end of the bluff and watched the clouds continually for the sunshine.

There were at least twelve knights, all in their coats of mail (which was not of steel, at all, but which will, of course, look like it), with Douglas as the "grand knight," for he held a shield and a wonderful sword and was photographed alone at the edge of the precipice looking up to heaven with his sword raised. The rest of the scene consisted of the entrance of the knights (after the supposed fall of the heroine off the bluff) at the call of some woman in long, flowing robes with a bandaged hand and the appearance from a hut of a little old lady, Enid Bennett—and she really is old, for we have all seen her lots of times on the screen portraying "mother" parts. This playlet was photographed many times and practiced as many, before any film taken. We were loath to leave, but it was late in the afternoon, and the trip almost over, and we had snapped Douglas several times. When we asked him to turn and pose for us he smiled agreeably and did. Incidentally we noted the "scribe" as a member of the company, a lovely woman who sat taking notes and keeping a record of all that took place during the scene as related to the picture.

A Visit to an Old Mission

San Gabriel Mission we also visited. It is one of the oldest in California, built in 1772 by the Franciscan fathers, when the Indians who inhabited that state were being converted to Christianity. An entrance fee was charged here, and a guide escorted us through the courtyard, interesting parts

of the old mission and the chapel, which is still in use, where services are held daily and which has not changed except for the addition of the present-day pews. We went up to the belfry, where two of the four original bells that were brought from Spain are still hanging and ringing. We took some pictures up there, too. In the chapel are statues of different saints, carved by the fathers from wood, and it was indeed marvelous to see the strange and wonderful likenesses to nature and the resemblances to human life that made them seem more beautiful than those we see today. Out in the garden, off the courtyard, is a most luxuriant rose vine, 150 years old, planted when the mission was first built.

The kitchen is interesting. On the shelves stand some of the old, heavy pots used by the Indians more than 100 years ago. The food was cooked in the center of the floor, in a sort of pit, and the smoke rose through the roof. All the help in those days at the mission was performed by the Indians. In an adjoining building, of up-to-date construction, several priests of the order still reside, and that morning we met several who were promenading in the courtyard there. Across the street is a curio shop, for visitors to the mission. While, in a way, it is like all other curio shops, still there are many Indian relics there of interest. Also in the mission itself, near the entrance, religious articles are sold.

After leaving San Gabriel Mission we passed through what is called the Dark Canyon, driving along a wonderful road at the foot of the Sierra Madre Mountains. Along this road we passed beautiful country estates and marveled at the strangeness in the altitude, for every time we approached a mountain the air was hot and heavy, then in a short time, at a turn or angle in the road, or at the entrance to a canyon, it became cold and damp again; then we went out into the country, where it was warm and sunshiny. On this drive we saw many vineyards, orchards of orange and lemon trees, which varied but little in appearance, the main difference being in the lighter color of the lemon trees' leaves. There are also numerous olive trees and grapefruit trees, which are similar to the orange and lemon, but with coarser leaves and thicker branches. In most of these orchards, between the trees, large crops of beans have been planted.

This ride took us to the foot of Mount Wilson, the highest mountain in the vicinity of Los Angeles, and also to the foot of Mount Lowe, the top of which we reached another day. Leaving the mountains and getting on more level ground, we saw avenues of palm trees and fir trees of many kinds. We stopped at one particular avenue of fir trees to view the scene in its magnificence. It is called Pine Grove Avenue, bordered on both sides with large pine trees, and is simply a long, shaded walk, with no houses on either side. During the Christmas season these trees are all strung with electric lights and must present a most wonderful sight. Also there are avenues of rose bushes, heavily loaded with roses, and all along we stopped a little while so as to carry away a more vivid picture of the beauty. Pepper trees are numerous in this part of the country, too, there being seventy-five different varieties of the pepper trees in California. Some of the pepper trees contain bright red flowers and are beautiful.

Saw "Lucky" Baldwin Ranch

The famous "Lucky" Baldwin ranch was passed, "Santa Anita," in the town of Arcadia. This ranch was so called after Miss Anita Baldwin, daughter of its owner. The ranch comprised originally 250,000 acres, part of which had recently been sold to the government for a balloon school, and we saw the aero buildings which had been converted from some of Mr. Baldwin's stables. As we drove along we smelled the odor of incense, as we thought, and were informed that it was the eucalyptus and pepper trees burning. Then we remembered we had seen several small fires along the road. We visited Glendale and Alhambra, where there are many pretty homes, and on returning noticed several oil wells of interest, which resemble the large wireless apparatus seen at receiving stations.

Early one morning we started out for Mount Lowe, which is famous for its unique railway and varied scenes of rugged mountain beauty and grandeur. The journey took us through the millionaire and beautiful city of Pasadena, where we had gone the previous Sunday to Summit Avenue to call, and on that particular afternoon we had seen the famous Busch's sunken gardens. The first stop on the Mount Lowe trip was made near the foot of the mountains, at a point called Rubio Canyon, where the second stage of the journey began. We were surprised at the length of the ticket given

us when we paid the fare of \$2.50 for the trip, for it reminded us of a long railway ticket. However, at Rubio Canyon the second part of the long ticket was torn off, and we changed into the incline cars, which are white and of peculiar construction, built on an incline and operated by cable. The incline is 3,000 feet long, rising 1,300 feet on grades ranging from 58 per cent to 62 per cent. These cars are loaded to only five tons and have been operated for twenty-five years without an accident.

Passed the Lowe Observatory

The next stop was made at Echo Mountain, where another portion of the long ticket was taken up and where we changed cars for the top. The machinery for operating the incline cars is on Echo Mountain, where is also the Lowe Observatory, with the big telescope and a 3,000,000-candle-power searchlight. The third stage of this mountain climb was scenic, being a trolley ride of five miles, passing around 127 curves and over eighteen bridges, climbing to an elevation of 5,000 feet above sea level on a maximum grade of only 9 per cent. This railroad terminates at Ye Alpine Tavern, of quaint Swiss architecture, but to get to the summit, 1,100 feet above, the climb has to be made by pony trail.

It was noon when we reached the tavern, in time for lunch, and instead of taking the pony trail, which we very much wanted to do but owing to our short time could not, we went out on foot to Inspiration Point, where we later boarded the mule-train around the mountain; this was a unique little train, if it could be called such, which was pushed by "Herbert," the mule. The view at Inspiration Point was wonderful, to look down upon the cities below and the clouds around us. At various points on this walk we came upon fir trees heavily loaded with tiny white cards pinned up by other visitors to the mountain; of course, we spent many minutes trying to discover other cards from Chicago for 1922.

While making the ascent of the mountain on the incline cars, all the passengers were asked for their names for publication in the *Mount Lowe Daily News*. Returning in the late afternoon we saw ours under the list of "Visitors to the Mountain, July 17th." The *Mount Lowe Daily News* is a publication that requires only about three hours to print.

This trip "above the clouds" was wonderful. Only one incident marred the day or

Filming a bull fight

our whole trip—we dropped the camera in the water (one of us did) when, after reaching the top, we seemed to be somewhat affected by the altitude.

Saw Fur Coats Worn in July

Returning to Los Angeles in the evening, we recovered sufficiently to attend the Mason Opera House, where we met friends and saw Charlotte Greenwood in "Letty Pepper." We could not but remark the noticeable number of women who arrived at the theater attired in their long fur coats over pretty summer dresses. While it really is cold in Los Angeles in the morning and evening, one does not see fur coats in Chicago theaters in July.

The next two days, on the trip to San Diego, were wonderful. This was another Golden State tour which cost \$10 but which was worth many times that much. Three large touring cars left Los Angeles the morning of the 18th, each with twenty persons, en route for San Diego. They were cars of special make, seating twenty persons comfortably. Our chauffeur was the only man in our car, although there were men in the two other cars, and when we started out there was great waving and shouting to him for that reason. It was exciting, for each car carried the baggage, also, for the crowd, and it seemed as if we were going ever so far away.

On this drive we passed Long Beach, with its beautiful mansions and homes. We stopped a little while at the Virginia Hotel,

on the ocean, a beautiful place. Later on we passed Seal Beach, not far from Long Beach, and drove through Naples and Santa Ana, the smallest and richest county in California, where there were many groves of the famous "Sunkist" oranges. There are many small bungalows of the regular California kind in these little cities, and all have their wonderful hydrangea bushes and palm trees.

The drive was wonderful, for the roads are real mountain highways part of the way, while for a greater part we drove along the ocean and on the famous "Silver Strand," a strip of land five miles long which separates the Pacific from San Diego Bay. To see the waves dash up against the rocks and the land and to look down upon the valleys we had passed through, after ascending a great height, was a most wonderful sight.

At noon we reached San Juan Capistrano Mission, built in 1776, where, after we paid an entrance fee, as at San Gabriel, a guide escorted our party through the mission and grounds. The mission is larger than San Gabriel and wonderfully interesting in about the same things. We have a picture of the gate at the entrance of this old mission. Not so far from the mission is the Palms Cafe, where Galli Curci lost her costly jewels a little more than a year ago.

San Diego an Interesting City

Toward evening, about 6 o'clock, we reached San Diego, a lovely city, so different from the East and still different from Los Angeles or any other Western city. It reflects a certain permanence and spaciousness in all its buildings and grounds, and if we had not known it was the second oldest city in the United States we would have easily imagined that it had held its place throughout many years and had had a share in the making of our history. Perhaps because we were located at the U. S. Grant Hotel, built by U. S. Grant, Jr., where the red-white-and-blue color scheme was carried out in everything, and because we had seen San Diego harbor, where many immense battleships, submarines, etc., were lying at anchor and because we had been taken through the San Diego exposition grounds of 1915, we felt a certain amount of the national importance of this city that was not seen or experienced elsewhere.

Before we reached the exposition grounds, which are almost unoccupied except for a naval hospital in one of the buildings and the concert hall, where daily concerts are

given, we passed through beautiful Balboa Park, where every kind of tropical plant, tree and flower grows profusely. The exposition buildings are large and beautiful, of various styles of architecture, chiefly Spanish, and all white, and it was easy to picture the crowds that were there several years ago.

San Diego has a magnificent stadium, seating 30,000 persons, where many famous men have spoken, including some of our former Presidents.

A Visit Over the Mexican Border

The return trip was made over a somewhat different route than that taken coming. The first point of interest, after crossing the ferry over San Diego Bay, was "San Diego Old Town," which consists of a number of small hamlets in a sort of valley and which looks exactly as if it had been in existence several hundred years and had seen better days. There we saw the ruins of the first mission in California, built in 1769 by Father Junipero Serra, his grave under a huge cross at the top of a high hill, the first jail, the first palm tree in California, planted 146 years ago (old and somewhat barren and a little bent, but still very tall), and the spot where the United States flag was first raised by General John C. Fremont.

Soon we came to the Mexican border and had all the thrills of having our baggage examined by the custom officers, United States and Mexican. Here all the tourists had their pictures taken for the sake of being "on the border," and almost all adorned themselves with wild-looking red blankets and high straw hats, as befitting the occasion. Then into the town of Tia Juana, which is typically Mexican. It is a veritable "Wild West" place, full of saloons and horses; there is a race track there and races held frequently and a great deal of gambling done—it is the "Monte Carlo" of the West. There we saw also a real bull ring where they still hold fights and the citadel fort with Mexican soldiers guarding it everywhere. As we rode slowly past the fort we were informed by the chauffeur that we had better not take any pictures and to remember that we were in a "foreign country," where the penalty was severe, particularly when forts and soldiers were concerned. The guards advanced menacingly as we passed and took great notice of everything.

Later we spent a little while in the curio

shop, seeing all kinds of Mexican articles, fancy work, etc. All visitors were careful to take back with them not more than \$2 worth of merchandise, for everything above that was taxed. Most of the girls bought cigarets, and when we were back in Los Angeles we were told they were horrid things to smoke and that the fellows would never like them. The only modern building and the only one of considerable respectability is the American consulate, which is rather large and on the order of a clubhouse. There is another little building where nearly all the visitors went, just to say that they had had something to drink in this city where all liquor flows freely; this was called the "Log Cabin" and, while respectable, still it had a regular bar and railing.

Crossing back over the border again, we bought the pictures we had taken going in, which had been developed in the meantime. Soon we were out of this part of the country and on the wonderful roads again. There were many Torrey pines to be seen on this ride. Before long we reached the well-known winter resort of Coronado Beach, a beautiful place on the ocean. The hotel is lovely and spacious and built in a sort of square with a court in the center, where are wonderfully shaded walks among the palms and flowers, and an immense promenade and porch overlooking the ocean. Coronado Beach Hotel is said to be the oldest frame hotel building in the United States. The ballroom is wonderful, too, as it overlooks the ocean. Our summer is their "out of season" time, but there were many persons staying there.

Right near Coronado is the famous "Tent City"—a resort in itself, of hundreds of little cottages and tents of several rooms

each, situated directly on the ocean; all these tents and bungalows are rented and occupied the entire year. Riding along the ocean, we saw, much to our amazement, several seals sitting on the rocks.

Where Ramona Was Married

Another spot of interest was "Ramona's Marriage Place," where the heroine of Helen Hunt Jackson's beautiful Indian love story, "Ramona," was supposed to have been married, after traveling hundreds of miles from her home in the days when the Indians occupied all that territory. On one of our previous trips her home had been pointed out. The guides of all the tours make much of these dwellings, and to those who have read the story it is pleasant to see the spots that have been pictured so vividly and realistically in the book. At "Ramona's Marriage Place" there is a wonderful garden and courtyard surrounding an old mission and chapel, after the style of San Gabriel and San Juan Capistrano missions, and the chapel here is still in use, and there are many Indian relics to be seen everywhere. The mission comprises several buildings, of which the architecture alone is interesting, and the various religious articles in the chapel, the altars, statues and pictures, candlesticks, etc., are the same as were there when the mission was founded. The baptismal font is most quaint and unusual; it is in the center of a small room, specially built for it, off the chapel, in a little pit, and is made of the roughest stone, with a copper top. It is large, somewhat like a tub, and looks very much like almost anything but what it really is.

At noon we reached La Jolla, situated on the ocean, among the mountains. It is a beautiful city, indeed, and commands a wonderful view of the surrounding country. Here are the famous "Natural Caves," to go down through which an admission fee is charged. At the entrance is a curio store, and through it we descended 133 steps to the rocks below; the last step is right in the heart of the cave, and from it begins a long, dark, winding walk in which the roar of the waves is heard. Going down the stairs we were greeted with an "anything but delightful" sulphuric

Our party on the Mexican border

odor, and when light was reached this odor changed into a musty, fishy one. The caves opened into a beautiful spot of colored rocks, upon which the water dashed frequently, and, looking up several hundred feet, we waved to the rest of the party (standing on a quaintly built bridge), who had not ventured to go down through the dark tunnel. While we were standing in this spot the persons up above took several snapshots of us, which proved to be good. It is here at La Jolla that many "movie" scenes are taken, because of the picturesque rocks and quaint bridges that overlook the ocean, and the point from which Annette Kellerman dived into the ocean for "A Daughter of the Gods" was pointed out to us.

Leaving La Jolla (which we did reluctantly, as it was such a pretty place), we rode for several hours, enjoying the unusual scenes on every side. While driving through some level country we came upon the fields where the "Everlasting Flowers" grow, which we often see in the florist shops, made into bouquets of various descriptions. There were several stalls along the road where these flowers could be purchased, and, as we had been on the lookout for them, we stopped and bought some. It was with difficulty, however, that we obtained some seeds, as they seemed rather reluctant to sell them. The street was lined with cars, and there were many purchasers, for these flowers are so unusual that it is a popular practice there with all visitors to have some sent home.

Good-Looking Schools in Los Angeles

Several things must be mentioned as especially worthy of note in regard to Los Angeles—the wonderful high school buildings everywhere throughout the city, for example. Every one is a castle, built on high hills or mountains and approached by many picturesque stairways of natural and artificial design and surrounded by veritable gardens of flowers and palms and bushes and trees; they do not look like the solemn institutions of learning we see in Chicago and other Eastern cities, but as somewhere most delightful to go to every day. Then there are the orangeade booths on nearly all the streets, booths painted white and outlined in yellow, refreshing just to look at; the orangeade is the most delicious that could be tasted, for it is made of the fresh fruit and not diluted at all; it is always served in high glasses surrounded by ice.

Fifty-two

All the fruit is so delicious and has so much more flavor than that we get in Chicago. Although strawberries are out of season in Chicago in July, we had the biggest, juiciest, reddest ones imaginable for breakfast in Los Angeles several times. Fruit is cheap, too—cantaloupes were only 50 cents a dozen and the most wonderful cherries only 10 cents a quart when we were there. A big basket of apricots was only 25 cents, and each apricot the size of a large peach, with the most delicious, juicy flavor. We saw carnations growing and marveled at their price—25 cents a dozen—compared with what we pay for them in Chicago!

There are many open markets everywhere in Los Angeles and adjoining cities, where fruit and groceries of all kinds and other merchandise are sold. These open markets are a feature of the city. Some shops and stores had certain stalls or tables out on the walks where articles were sold.

The traffic regulations in Los Angeles do not come up to Chicago's standard; the policemen wear khaki, and, while the main business streets are twice as roomy as ours, everything is so congested that one has to be young and spry to make any progress. We did hear that there were more automobile accidents in California than in any other state, which was easily understood; also that there were more automobiles in Los Angeles than in any other city of its size.

Every building in Los Angeles and the adjoining towns and cities looked as if just recently painted, but we soon learned that (unlike Chicago) everything stayed fresh and clean for ages. After one of our first long trips while there we were startled and surprised to find ourselves looking just about the same as when we had started out in the early morning; after two days we became reconciled to the fact that we did not have to keep "cleaning up" every hour.

Around 5 o'clock on July 23, when the Illinois Central's Hawkeye Limited pulled out of Omaha, we were really "homeward bound." We soon found ourselves in familiar territory, passing town and cities well known to us through the "Official List" by mile-post number, and the next morning, arriving five minutes ahead of schedule, we were right at home in Central Station—Twelfth Street—Park Row—Roosevelt Road—Chicago. We surely had a wonderful trip.

Illinois Central Magazine

Centralia, Ill., Has Modern Icing Station

*New Facilities, Opened June 25, Make Possible
Handling of Nearly Twenty-five Cars an Hour*

ONE of the largest and most modern icing stations on the Illinois Central System was opened at Centralia, Ill., June 25. Twenty-four and one-half cars can be iced each hour if such an emergency arises and the station has to run at full speed. That is an average of less than two and one-half minutes to the car. However, the average time required to ice a car by the force that is maintained at Centralia is from five to seven minutes.

The icing station at Centralia consists of a double-deck platform 980 feet long and 12 feet wide that is connected by chute with an ice factory which is modern in every detail. Endless chains run from the storeroom of the ice plant to the two decks of the platform. These chains carry the 400-pound cakes of ice to the men who ice the cars from the platform. The ice is loaded on a chain at the door of the storeroom and is carried up an incline to a level half way between the two decks of the platform.

If crushed ice is to be loaded, the cakes move to an elevator which hoists them to another incline, where they slide into a crushing machine. The crushing machine is a large cylinder full of spikes. This cylinder revolves as the cakes of ice come in contact with it, and within a very few seconds each 400-pound block of ice is ground into small bits. The crusher at Centralia is considered to be one of the most effective made. The crushed ice is loaded into carts that have a capacity of 800 pounds each

and is taken out on the top platform, where it is dumped through a large metal tube into the top of the cars that are on the icing tracks. There are fifteen such carts.

How Whole Blocks Are Distributed

When the icing does not require that the ice be crushed, the blocks of ice are carried by the first chain to a chute that guides them to another chain on the lower deck of the platform. Friction brakes of hinged oak board are fixed on the sides of the chute so that the speed of the cakes of ice will be arrested before they reach the second chain. A man with a large ice hook stands by the chute to keep the blocks of ice moving smoothly.

When the blocks reach the chain on the lower platform, they are carried its entire length at the rate of 400 trips an hour. Icers stand alongside the platform with ice hooks to take the ice from the chain and dump it into the tops of the cars, where it is broken up and packed in the ice containers with a 12 per cent mixture of salt.

A large salt reservoir is at one end of the platform, and salt containers are about thirty feet apart along both sides of the platform. Rock salt is used.

The two platforms are lighted by a system of flood lights, so that cars can be iced at night if that becomes necessary.

Modern Plant Provides the Ice

The Fasig Ice Company owns the plant that supplies the company with ice at Cen-

General view of the new Centralia icing station

tralia. All the machinery used in the manufacture of ice is electrical and of the latest designs. Six 400-pound ice cans are in motion all the time. An electric hoist raises six cans from the floor and takes them to the dumping platform, where the cans are lowered in a reservoir of water at 65 degrees. The hoist moves the cans up, down, east, west, north and south. The cans are left in the water while six others are taken to another reservoir. By this time the first six have expanded to such an extent that the blocks of ice are loosened. They are then dumped on an incline that runs into the storage room. The present storage room has a capacity of 1,000 tons of ice, and another is being built that will have a capacity of 5,000 tons. A supply of ice is kept in the storage room for emergency. At present the ice factory has a capacity of 200 tons of ice a day and plans are being made to increase this to 300 tons.

The Fasig Ice Company built the plant at Mounds, which was the first regular icing station to be operated on the Illinois Central, and had charge of icing cars at points between Anna and Mounds for several years. In those days the ice was stored in the old sawdust ice storage houses.

A modern telephone system connects the ice plant with the icing platform. When a train that is to be iced reaches the yards at Centralia the trainmaster informs the manager of the ice factory and he informs the men in charge of the icing on the platform. The men go to their stations and wait for the train to be pulled on the icing tracks. There is a track on each side of the

Upper and lower platforms, respectively, of new icing station

platform which will accommodate thirty-six cars. When the cars are placed, the chains are started, and the icing begins.

Plant Cost Illinois Central \$40,000

The platform was erected by the Illinois Central System at a cost of nearly \$40,000, and the machinery on it was installed by the ice company. When the project was first undertaken the railroad contracted for a minimum of 20,000 tons of ice a year at \$3.50 a ton. That contract was to insure a fair return on the money the Fasig company invested in the factory. There is no restriction on the ice company as to selling ice outside as long as the demands of the railroad are supplied.

Although the first ice was manufactured

An icing crew at work

at the plant on June 25, the first delivery to the Illinois Central was not until June 27, when twenty-five cars were iced. No more were placed for icing that day. On August 9 106 cars were iced at this station in twelve hours. An average of 6,500 pounds of ice

was placed in each car. J. C. Boyd, formerly a clerk in Trainmaster F. T. Gibbs' office at Centralia, is in charge of the Fasig Ice Company's plant. He was in the employ of the Illinois Central for about seventeen years.

He Entered Illinois Central Service in 1855

A letter arrived at the postoffice in Fort Worth, Texas, marked on the envelope, "To the Oldest Engineer in Captivity." The postoffice people had no difficulty in dropping it into the right letter box, that of A. J. Wemple, Fort Worth. He is a local institution, and he had been a full-fledged engineer for eleven years when he was called upon to pilot the funeral car of Abraham Lincoln.

Wemple began railroading when he was only 17 years old. He was a fireman on the road which connected Schenectady and Troy, which is now a part of the New York Central System. Railroading in those days was not what it is now. The engines were dinky affairs with one pair of 4½-foot driving wheels, and they burned wood. Many a mile of good rail fence along the right-of-way disappeared mysteriously in those days. But Wemple has lived to see wood supplanted by peat, soft coal, blacksmith coal, hard coal and oil, with electricity now looming as their final successor.

In those days train dispatching was an unknown art. The trains were run by time cards, and if an engineer were thirty minutes behind schedule he had to stop and let the first approaching train pass him. Sometimes he waited until he saw the smoke of the approaching engine in the distance and then scooted for a siding. It was an exciting life.

Engines were not numbered then. They bore names, like ships. Wemple's first engine was the "Buffalo." It was enlivened with a profusion of nickel and brass work, all of which was kept shiny like a piece of jewelry. Every engineer felt a personal pride in the appearance of his "iron horse."

In 1854 Wemple came west to work in Ohio and Indiana. In 1855 he went to the Illinois Central and remained there until the Civil War broke out. He remembers well when the Confederate prisoners, clad in a few rags, were loaded into box cars and shipped into the frosty North, closely guarded by Union soldiers in heavy overcoats.

In 1863 he returned to the New York Central, and shortly after he piloted the funeral train which bore Lincoln's body from Schenectady to Troy on the long run from Washington to Springfield, Ill., where the martyred President's body still rests.

Great solemnity marked the progress of the President's cortege. A pilot train ran ahead of the funeral train. Both were heavily draped in mourning and ran at twenty miles an hour. The pilot train stopped all trains on the parallel track and made them wait until the funeral train had passed.

At each station the bell on the engine tolled, and at the cities the train stopped to let the populace file through for a glimpse of the body as it lay in state. Both trains carried a crew of workmen and repair material, so that there might be no delay from breakdowns.

Wemple came to the Texas & Pacific Railway in 1888 and operated a switch engine continuously until January of this year, when rheumatism forced his retirement.

Wemple says that his only regret is the choice of the standard gauge of track. In the old days they ranged from three feet to six feet, and the final choice was on a width not much greater than the minimum of that day. He tries to visualize the present size of rolling stock had they adopted the 6-foot gauge as a standard. "At least," he says, "it would not be necessary to hook up seven of them to one snow-plow, as is sometimes done in a blizzard in these days."—*The Observation*, R. P. Studley & Company, St. Louis, September, 1922.

MAN'S GREATEST ASSET

Some men seem to think they can absorb sufficient knowledge without effort to do the work of a real man. Others find the time at their disposal too short to do the reading and thinking that they need. A trained mind is a great asset. Might as well expect a man to make an automobile who had never seen an engine as to expect a man to succeed who does no reading and thinking.—*Selected*.

Making a Greater Harbor of New Orleans

*Completion of Industrial Canal Will Enlarge
Capacity of the Second Port of the United States*

By J. T. HALLAM,

Superintendent's Office, New Orleans

NEARING completion as these lines are written is the New Orleans industrial canal, or inner harbor, a project begun in 1918 and involving an expenditure by the city of about \$20,000,000. New Orleans is the second port in the United States; with the new harbor in use by the great industrial development that is looked for, the Illinois Central System's southern terminus may be expected to run New York City a good race for first honors.

The object of the city of New Orleans in building the industrial canal is to possess to the fullest degree three great systems of port operation and to promote industrial development. The systems of port operation that New Orleans will possess are:

1—Public ownership and operation of the river and harbor facilities.

2—Public ownership of land and private operation of facilities on the industrial canal.

3—Private ownership of the land and private operation of the facilities on the new channel to the sea.

Will Shorten Distance to the Sea

The new channel to the sea, commonly called the Gulf of Mexico, will eliminate the necessity for ocean liners and other types of vessels to use the present route (that is, the Mississippi River) from the mouth, or Eads jetties, to New Orleans, thereby shortening the route from the sea to the port some forty or fifty miles. It will also provide passageways free from silt obstruction and other accumulations that prevail at certain periods of low water stages at the Eads jetties. It is expected that the government will appropriate the necessary money for digging the new channel upon the completion of the inner canal, for such a channel will greatly reduce the enormous expense incurred annually by the government in keeping the Eads jetties open for passage.

All railroads entering New Orleans will profit greatly when the canal is opened to

traffic, for industries that will locate on and in the vicinity of the canal will necessarily handle exports and imports, both raw and manufactured, from their plants, warehouses or other facilities to inland cities, and the railroads will naturally receive the bulk of the freight.

Means Business for Illinois Central

The New Orleans Public Belt Railroad has been given monopolistic rights to serve all industries that will locate on the canal, but this is only a switching line, and it will

Facts About the Canal

SIZE: Five and one-half miles long, depth 30 feet below gulf, 150 feet wide at bottom, 300 feet at surface. Lock 1,050 feet long, 640 feet usable length, 30 feet below gulf low water, 75 feet clear width. Channel approach to lock, 125 feet wide on bottom, 275 feet on surface, 30 feet below gulf low water in depth. Width back of lock, 410 feet.

MATERIAL: Earth excavated, 10,000,000 cubic yards; wet excavation, 95 per cent of total; excavated matter used to fill canal zone up to 1,000 feet distance. Estimates included 12,000 lineal feet of sheet piling; 18,000 round piles; 2,500,000 feet lumber for concrete forms, etc.; 125,000 barrels of cement; 100,000 cubic yards of concrete; 6,000 tons of reinforcing steel; 6,500 tons of other steel; each gate leaf to weigh 400,000 pounds, requiring total of 4,000,000 pounds of steel plate and girder construction for gates alone; five gates in all. Volume of water contained, 6,100 acre-feet—i. e., enough to cover ten square miles one foot deep.

OPERATION: By the Board of Port Commissioners, a state agency.

DIFFICULTIES: The difference in level of river and lake; the water and quicksands that caused the excavations to fill from surrounding pressure, overcome by pumping in water to balance the pressure until the steel piling could be driven to hold the outside pressure. The lock is surrounded by a steel cofferdam of 3,600 lineal feet of linked sheet steel piling 50 feet in the ground, and has a margin of safety estimated at 300 per cent.

COST: About \$20,000,000.

The canal is being rushed to completion by forces working three shifts over the spread of twenty-four hours. Three dredges have been digging the canal channel from the locks to the Mississippi River, a distance of about half a mile. The work is a little behind schedule, but it is the general belief that the canal will be opened to traffic in October.

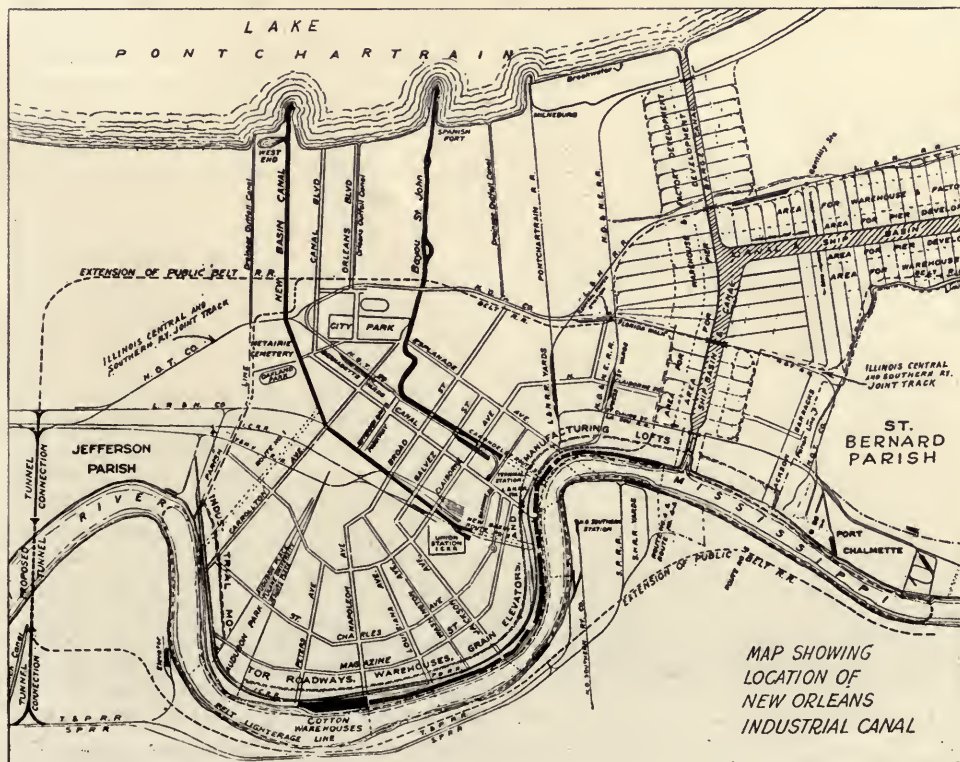

In 1845 some New Orleans merchants petitioned the Louisiana Legislature for permission to erect a shed on the harbor front so that the flour then being brought down by

barge and boat from Cincinnati might be protected from the rain while awaiting sailing ship to the New England states. They explained to the legislature that this commerce was being menaced by the lack of facilities, that the Cincinnati shippers were threatening to withdraw it from the port, and that the only way it could be held would be through the granting of the permit asked for.

The legislature admitted all that the merchants claimed, then refused the permit on the ground that the harbor front of New Orleans was owned by the public, was held for public use, and could not be leased to anyone or be turned over to anyone for development.

There being at the time no spirit of public enterprise through which sheds or other facilities might be created, nothing was done. In time the flour business involved disappeared, and along with it went a lot of other valley commerce. Railroads were being built, and valley commerce had begun to move out by way of the North Atlantic seaboard, where business enterprise might purchase harbor frontage and erect all the facilities it might require.

In the decade of 1840-1850, *DeBow's Review*, which was published in New Orleans

under the editorship of one of the most far-visioned men America has ever produced, pleaded for port facilities, and pointed out again and again the danger confronting New Orleans.

Reason for Building the Canal

Fifty years passed before a real start was made to give New Orleans the port facilities she so badly needed. The Dock Board was formed and empowered to proceed. But no money was given it, and it had to rely upon anticipated revenues alone.

In 1902 a new arrival in New Orleans who had long wondered why New Orleans had lost control over the commerce of the Valley picked up the 1846 bound volume of *DeBow's Review* and read the story of the unsuccessful efforts of the merchants to build a shed on the river front to protect Cincinnati's flour cargoes.

Then and there was born the idea of the industrial canal and inner harbor.

To himself he said: "Control the river level by a great lock opening into a ship canal, the banks of which will not be subject to the Spanish treaty of 1795, which declared the banks of the Mississippi River public property not subject to private ownership and development, and to the Louisiana Purchase treaty with France, which confirmed the Spanish treaty. Connect up the privately owned land in that section of the city by means of lateral canals, thus permitting business enterprise to create all the water-front sites, laterals, basins and slips it might require, and build thereon all the sheds, warehouses, factories and other structures it might need. Ultimately dig a ship channel from inside the lock to the Gulf, which would be free from silt, current, and all the eccentricities of a great silt-bearing river. Do all this within the city limits, so that facilitated and encouraged commerce and industry will pay its proper share of municipal taxes, and several of the really serious economic problems which long have confronted New Orleans will be solved."

How the Work Was Financed

In 1914, after twelve years of propaganda, an amendment to the state constitution was adopted authorizing the Dock Board to build the canal, but the amendment provided no money with which to do the work. Neither did it authorize the Dock Board to sell any of the lands along the canal, though it might lease them. It did, however, authorize the

Dock Board and the Levee Board to contract with each other to build the canal.

In 1918 a meeting of New Orleans leading men was held in the board room of the Hibernia Bank, at which the need for the canal as an inducement and facility for the encouragement of commerce and industry was discussed and fully recognized. City and state officials, as well as commercial exchange and bank presidents, newspaper editors and others present expressed a desire that the canal be built without further delay.

The matter of developing a financial plan was left to one of the bank presidents, and he evolved the idea of having the Levee Board (which was charged with the responsibility of the maintenance of levee lines along the canal and which possessed taxing powers) make a contract with the Dock Board, under which the Dock Board would build and maintain the levees along the canal and the Levee Board would supply the money needed to pay the interest on the bonds to be issued for the building of the canal. The municipal belt railroad, in exchange for monopolistic rights along the canal, was to supply \$50,000 a year during the life of the bonds.

In this way the canal was financed, after some additional enabling legislation had been obtained from the state legislature. Later on the arrangement was confirmed by an amendment to the state constitution.

The Second Port in the United States

Meanwhile the Dock Board between 1900 and 1921 erected many miles of wharves and steel sheds along the river front and completed a great cotton warehouse and grain elevator, all of which have permitted commerce to grow until in 1920 the foreign trade handled by New Orleans reached the billion dollar mark, or the second largest among all the ports of the United States. To do this, however, the capacity of New Orleans' facilities were strained, and, congestion appearing inevitable, ship delays at the wharves had to be severely penalized, thus proving the great need for the canal and the opportunity it would give business enterprise to create additional facilities at no cost whatever to the Dock Board and the public.

The canal lock is complete. By October the canal will be connected with the river harbor. Thereafter, under a policy of development to be devised by the Dock Board, business enterprise may lease canal front

New Orleans Terminal Company bridge over the canal at Florida Walk, used jointly by the Illinois Central and Southern railroads from their respective main lines to the Chalmette yards.

sites on 99-year leases, or it may purchase nearby property and, under an agreement with the Dock Board, connect such property with the canal and develop harbors, terminals, industrial sites, waterside warehouses and other facilities. The privately owned lands susceptible to such development are extensive in area, amounting to more than 50,000 acres.

Probably the greatest engineering feat in connection with the building of the canal was the construction of the lock which will lower ships from the river to the inner harbor. For the following excellent account of its construction I am indebted to Thomas Ewing

Dabney of the New Orleans Item, who published a booklet regarding the project:

Not only is the lock of the industrial canal one of the largest in the United States, but its construction solved a soil problem that was thought impossible of solution. That of the Panama Canal is simple in comparison. The design is unique in many respects. The lock is a monument to the power of man over the forces of nature and to the progress of a community that will not say die.

Because of the great variation in the level of the river at low and high water—a matter of twenty feet—it was necessary to make

the excavation for building the lock about fifty feet deep. In solid soil this would be a simple matter. But this ground has been made by the gradual deposit of Mississippi River silt upon what was originally the sandy bed of the ocean, and through these deposits run strata of water-bearing sand, or quicksand. This flows into a cut and causes the banks to cave and slide into the excavation. Underneath there is a pressure of marsh gas, which, with the pressure of the collapsing banks, squeezes the deeper layers of quicksand upward, creating boils and blowing up the bottom.

Problems Facing Lock Builders

New Orleans has had plenty of experience with these flowing sands in its shallow sewerage excavations. "How, then, expect to make an excavation fifty feet deep?" asked the doubting Thomases. It couldn't be done. The quicksands would flow in too fast. The dredges would drain the surrounding subsoil, but that wouldn't get beyond a certain depth. Furthermore, what assurance was there that the soil that far down would supply sufficient friction to hold the piles necessary to sustain the enormous weight of the lock and the ships passing through it?

Undaunted by these croakings, the engineers, from test borings, calculated the sliding and flowing character of the soil, and estimated the various pressures that would have to be counteracted, balanced this with the holding power of pine and steel and concrete, evolved a plan, and began an ex-

cavation of a hole 350 feet wide by 1,500 feet long, gradually sloping the cut (1 to 4 ratio) to a center where the lock, 1,020 by 150 feet, outside dimensions, was to be built.

The gentle slope of the cut was to prevent slides.

It had been ascertained that the first stratum of quicksand began twenty-eight feet below the ground surface (—3 Cairo datum) and was three feet thick; the second stratum, forty-eight feet below the surface (—23 Cairo datum) and ten feet thick. Coarser sand extended eleven feet below this, from —33 Cairo datum. The second stratum of flowing sand began just below where the lock floor had to be laid. The third layer was eighty feet below the surface (—55 Cairo datum); the tips of the piling would just miss it.

How Work Was Carried On

Excavation began in November, 1918. While the dredges were at work a wooden sheet piling cofferdam was driven completely around the lock, and about 125 feet from the edge of the bank, to cut off the first quicksand stratum. About 150 feet farther in, when the excavation was well advanced, a second ring of sheet piling was driven, to cut off the second stratum, which carried a static pressure of fifty-five feet and was just a foot or so below where the floor of the lock would be. It was not thought necessary to cut off the third stratum.

The excavation was made in the wet. When it was finished the dredges moved

back into the canal, the entrance was closed and the work of unwatering the lock site was begun. This was in April, 1919.

There had never been such a deep cut made in this section. Consequently, the character of the soil, while it could be estimated, could not be known absolutely. And the exact pressure of the gas could not be known.

The sands proved to be more liquid and the gas pressure stronger than anticipated. Quicksands ran through the sheet piling as through a sieve. The walls of the excavation began to slough and cave. The gas pressure became alarming when the weight of earth and water was taken off; sand boils began to develop at the bottom; the floor of the cut was blowing up.

The fate of the industrial canal hung in the scale.

Had to Make Another Start

To meet the situation the engineers pumped a great volume of water into the excavation. Its weight counterbalanced the earth pressure of the side and the gas pressure of the bottom.

Then another ring of sheet piling was driven inside the two others. This one was of steel, and the walls were braced apart by wooden beams ten inches square and fifteen feet apart in both directions. This is one of the largest cofferdams of steel ever driven. As an added precaution against the danger of a blowout by the third stratum of quicksand, which had a static head of seventy-five feet, 130 10-inch artesian wells were driven inside the steel cofferdam. Fifty-six

similar wells were driven between the steel and the wooden cofferdams to dry out the second stratum of quicksand.

In November, 1919, the work of unwatering the lock site again began. Only one foot every other day was taken off. Engineers watched every timber. It was not until January 4, 1920, that the unwatering was complete. The plan had worked. Only in one place had there been any movement—a section of the wooden sheet piling about 300 feet long bulged forward a maximum distance of three inches, when the bracing caught and stopped it.

Then began the work of driving the 24,000 piles on which the lock was to be floated. They are 60 feet long, and their tips are 100 feet below the surface of the ground.

In March, 1920, the work of laying the concrete began. The work was done in 15-foot sections, for only a few of the braces could be moved at one time. When it was finished in April, 1921, the lock was in one piece, a solid mass of steel and stone, 1,020 feet long, 150 feet wide, and 68 feet high, weighing, with its gates and machinery, 225,000 tons and, filled with water, 350,000 tons.

The concrete floor of the lock is nine to twelve feet thick, the walls thirteen feet wide at the bottom, decreasing to a 2-foot width at the top. Six thousand tons of reinforcing steel were used in the construction and 125,000 barrels of cement. There are 90,000 cubic yards of concrete in the structure. Two and a half million feet of lumber were used in building the forms.

Usable dimensions of the lock are 640

View of the large lock foundations and steel bascule bridge over the canal at St. Claude Avenue, Florida

The last lap. View showing dredging that had to be done from the locks to the Mississippi River

feet long, 75 feet wide, and 30 feet (at minimum low water of the river) deep.

The top of the lock is twenty feet above the natural ground surface and six feet above the highest stage of the Mississippi River on record. To the top the ground will be sloped on a 150-foot series of terraces. This will brace the walls against the pressure of water within the monolith. It will be developed to a beautiful park. Heavy anchor-columns of concrete will hold the walls against the pressure of these artificial hills when the lock is empty.

Traffic crosses the canal here by a steel bascule bridge sixty-five feet wide, with two railway and two street car tracks, two vehicle roadways, and two ways for pedestrians. Concrete viaducts lead to the bridge.

Gas and water mains, sewer pipes and telephone, telegraph and electric wires pass under the lock in conduits cast in the concrete.

How Lock Is to Be Operated.

Water is admitted into and drained from the lock by culverts cast in the base. These are eight by ten feet, narrowing at the opening to eight by eight feet, and closed by eight sluice gates, each operated by a 52-horsepower electric motor. It will be possible to fill or empty the lock in ten minutes.

There are five sets of gates to the lock. They are built of steel plates and rolled shapes, four and a half feet thick and weighing 200 tons each. And there is an emer-

gency dam weighing 720 tons, which in case of necessity can be used as a gate.

Four pairs of the gates are of 55-foot size; one of 42-foot. Each gate is operated by a 52-horsepower electric motor. When open, the gates fit flush into the walls of the locks.

In the emergency dam is the refinement of precaution—designed as it was to save the city from overflow in the remote event of the lock gates' failing to work during high water, and to insure the uninterrupted operation of the lock in normal times, if the gates should be sprung by a ship or otherwise put out of commission.

This dam consists of eight girders or sections, 80 feet long, 3 feet wide and 6 feet high. They weigh ninety tons each. They are kept on a platform near the river end of the lock. Nearby is the crane with a 300-horsepower motor that picks up these girders and drops them into the slots in the walls of the lock. To set this emergency dam is a simple thing—merely the work of an hour.

A ship passing through the lock will not proceed under her own power. There are six capstans, two at each end of the lock and two at the middle, each operated by a 52-horsepower electric motor, and capable of developing a pull of 35,000 pounds, which will work the vessels through.

The lock complete counting the bridge and approaches, cost \$7,500,000. One and a half million of this is for machinery, and \$56,000 for the approaches.

Built Home on His Earnings as a Clerk

*Tennessee Division Statistician Refuted Predictions
of His Friends and Found the Task Was Easy*

By W. C. VALENTINE,

Statistician,

Superintendent's Office, Fulton, Ky.

NOTHING else appeals to human nature so much as possession and making that which we possess attractive; and this is just as true of the home as of many other things. We begin to realize this when children—in fact, as soon as the “air castle” period of our life begins—and we look forward to the day when we shall have a home of our own as attractive as that of our own childhood days or that of some playmate. This was true of the writer, and, while realization many times seemed far distant, I am glad to say that today my home is a realized fact.

I began working for the Illinois Central System in August, 1909, as a stenographer in the Fulton district trainmaster's office at Fulton, Ky. Each month it was my motto to save a little, but, like every young fellow starting out on a small salary, I realized how hard it is to make the bank account grow. Nevertheless, I continued to work and save as best I could, and when I was married, in June, 1913, I had managed to have a little “nest egg” stored away.

Started Married Life as a Renter

Immediately on our return to Fulton, after the honeymoon, we began housekeeping in a rented cottage, but it was not long before we realized we were not saving; in fact, we were drawing from the “nest egg,” and it set us to thinking. About this time the home-owning fever began to get red hot, and we decided we would be able to reduce expenses by taking an apartment, thus hastening the day when we would own our own home. This we did. Then we took out stock in the local building and loan association; then we began looking for a building site for our little home, for it was the one desire of our hearts to buy a lot and build, rather than to buy a house built to meet someone else's needs.

When our present lot was located, covered with weeds and debris from a building recently burned, and the price was made known to us, we realized we had only

enough cash to make a small percentage of the payment. But, shutting our ears to the “don't's” and “cant's” from friends and acquaintances, we arranged the payments for the lot and began planning our home in earnest. Our loan in the association matured much sooner than we expected and found us with the lot not paid for, but we could not entertain the thought of waiting, and it was only a matter of hours before we had arrangements made to take care of the unpaid notes on the lot. In a few weeks you could hear the hum of the saw and the beat of the hammer actually at work on “our home.” This was in the spring of 1916. In the spring of 1924 we shall make our last monthly payment in the building and loan association for the investment in our home, at which time the association will owe us a few hundred dollars additional savings we have deposited with it from time to time.

Saved Every Penny as a Clerk

To clear away any doubt, I want to make it clear that not a penny of my investment was inherited. It was earned by me on a monthly salary in an office of the Illinois Central, and the most of it saved by my wife since our marriage, which crushes to earth the statement made before me by a fellow employe recently: “I never knew a

The Valentine home

Plan of the Valentine home

railway clerk who was paid enough to live on and build a home."

I would not have you believe we isolated ourselves from everybody and everything to be able to save and do this, but we feel we have got just as much pleasure from our friends and the social life as we would have otherwise; in fact, more, for we have placed ourselves in that atmosphere of "home owners."

I have not gone into the details of the building and loan association, for the officers of such an institution in any town will be only too glad to explain it in detail to anyone interested, and I heartily commend it to any monthly salaried man who wants to own a home.

ORDINARY QUALITIES

There are two kinds of success. One is the very rare kind that comes to the man who has the power to do. That is genius. Only a very limited amount of the success of life comes to persons possessing genius. The average man who is successful—the average statesman, the average public servant, the average soldier, who wins what we call great success—is not a genius. He is a man who has merely the ordinary qualities.—THEODORE ROOSEVELT.

H. P. MARMADUKE RETIRES

Henry Proctor Marmaduke was retired on pension August 31, terminating almost thirty years of active service on the St.

Louis division. Mr. Marmaduke was born December 12, 1858, in Westmoreland County, Virginia, and came to the Illinois Central in November, 1892, as carpenter in the bridge and building department, being made foreman in 1895. Mr. Marmaduke may be remembered as one who greatly assisted in preparing to handle the crowds at the exposition in Chicago in 1893. He later returned to the St. Louis division, where he was placed as foreman on maintenance work. For many years he was in charge of the Cairo Bridge, where he gave invaluable assistance in fighting high waters from the Ohio and Mississippi rivers. He will reside at Carbondale, Ill., where he has a comfortable home and where he can enjoy the company of his devoted grandchildren.

H. P. Marmaduke

WHAT THRIFT IS

Thrift is a determination to live within a margin for future advancement; to earn a little more than one spends or to spend a little less than one earns, getting meanwhile the value in strength, in satisfaction or in other worldly returns for the money one feels free to spend.—DAVID STARR JORDAN.

Watch the Deadline!

Material for the magazine is still being sent in after the 15th of the month, in spite of warnings to the effect that the 15th is the deadline for magazine material. Obviously, material arriving so late will have to hold over a month, maybe longer.

Editorial

SERVICE AND PROFIT

There seems to be a feeling among some students of railway problems that service is diametrically opposed to profit. That is not true. Not only is there no real conflict between service and profit, but, as a matter of fact, one is not long possible without the other.

A railroad which does not make service to its patrons its first and highest duty may prosper for a time, but its end is failure. A railroad's prosperity depends upon many factors, not the least of which is the good will of those who ship and travel over its lines. Its revenues come from the sale of transportation service, and if it fails to give service in all that the term implies its patrons will soon come to find that they are not getting value received. Service by railroad means a prompt, efficient, courteous performance of transportation, not only in the movement of trains, but in all the manifold departments of the railroad.

On the other hand, a railroad which does not prosper cannot long continue to give the character of service that will win the good will of its patrons. The property must be constantly improved. Despite traffic fluctuations, there is a sharp line of increase, and for the handling of increased business more and better equipment and facilities must be provided. The ability to make additions and betterments depends upon the company's prosperity. A railroad which does not prosper is going downhill.

The interests of the railroad and those it serves, therefore, are linked together. The railroad must be mindful of the best interests of its patrons; its patrons must encourage the railroad, co-operate with it, demand that legislation and regulation shall be constructive, agree to the fairness of charges which will permit the payment of operating expenses, taxes, interest charges, rentals and dividends. For either to do otherwise means loss for both.

"THE OLD RELIABLE"

When the Illinois Central System took over the old Dubuque & Sioux City Railroad—now our Minnesota and Iowa divi-

sions—the Illinois Central west of the Mississippi River fell heir to the proud title that the D. & S. C. had won by its service to Northern Iowa. "The Old Reliable" the people called that line, and as "The Old Reliable" that part of our great system is still known today.

Needless to say, we feel that the title is deserved. As Master Mechanic N. Bell of Waterloo recently wrote in this magazine, we can tell the public truthfully that the Illinois Central System "has a well-maintained roadbed and matchless equipment; that we have 60 per cent of our passenger equipment of steel construction, which is 21 per cent better than of the country as a whole; that our passenger trains were 98.2 per cent on time over the system in 1921; that our passenger engines are the finest that can be built and are carefully maintained in the best condition; that our freight equipment is very good, and our freight and switching power is second to none, and our organization is matchless."

Conditions like those enumerated go a long way toward making a railroad truly "reliable." Passengers and shippers can feel that they are buying true and tried performance, and that disappointments will be the rare exception, not the rule.

One point worth considering in this connection is: The Illinois Central System directly serves ten states besides Iowa, Minnesota, Nebraska and South Dakota. In all fourteen of the states it serves it provides the same efficient, unvarying, reliable service. The Illinois Central System is not any more "The Old Reliable" in Iowa than in Mississippi, in Minnesota than in Kentucky, in Nebraska than in Missouri, in South Dakota than in Illinois—it is merely called so in one place and not in another.

Why not let us spread this appellation, this unofficial trademark, until we make it synonymous with the Illinois Central System as a whole? Until, when one man anywhere in our territory mentions the Illinois Central System, another will immediately recall: "Oh, yes, that's 'The Old Reliable'?" It is a goal worth working for, and certainly the employees west of Dubuque won't be-

grudge the rest of us the pride that is to be found in a name so well deserved.

WHO BUILDS THE HIGHWAYS?

Who shall pay for the construction and maintenance of hard-surfaced roads to be ground to powder under the wheels of motor vehicles, of which many of the most destructive compete with the railroads for freight and passenger traffic? The growing use of motor vehicles for commercial purposes and the extension of hard-road systems to cover the entire country make this an important problem. The railroads and their patrons have a great deal at stake in the solution of it.

There were approximately 10,500,000 motor vehicles in this country in 1921, of which more than 1,000,000 were trucks, commercial cars, taxicabs and busses, engaged in the service of transportation. To a large extent, it is true, the service performed by this motorized fleet is supplemental to the transportation service performed by the railroads, but in many instances the two services are competitive. Whether motor vehicle transportation service is supplemental to or competitive with the railroads, however, does not alter the problem.

The railroads pay for the construction, maintenance and improvement of the roadways over which their trains pass, and that cost necessarily becomes a part of the nation's railway transportation bill. In 1921 the maintenance of the tracks, roadbed, buildings, bridges and other structures used by the railroads cost \$756,948,985. This was exclusive of interest on the investment and improvements chargeable to capital account. It represents approximately 16.5 per cent of the total operating expenses of the railroads in 1921. A considerable part of the revenues received by the railroads from carrying freight and passengers went to pay that cost.

More than 1,000,000 motor vehicles used the public roads for commercial purposes last year. The amount which they paid for that privilege represents only a small fraction of the cost of constructing, maintaining and improving the roadways which they helped to destroy. The total revenues derived from the registration of all motor vehicles and from the issuance of licenses to owners, chauffeurs, manufacturers and dealers amounted to \$122,269,071.33, out of which there was available for road work

\$116,117,167.80, exclusive of taxes on gasoline, which amounted to \$5,302,259.79. As compared with this, however, the construction of highways in the United States last year cost \$767,421,375. The difference represents the amount which the public had to pay out of funds raised by general taxation. In other words, the users of all motor vehicles paid about 15 per cent of the cost of road-building, and the other 85 per cent was paid by general taxation.

The public at large has as great an interest in transportation by railroad as it has in transportation on the public highways. In fact, the benefits accruing from the use of the railroads are more widespread than the benefits accruing from the use of the highways by the more destructive vehicles—trucks, commercial cars, taxicabs and busses. It is no more equitable that those who do not derive immediate benefit from the destructive use of the highways should pay for them than that the public should be taxed for the cost of building, maintaining and improving the roadways used for rail transportation.

It is important to note in this connection that the railroads pay a not inconsiderable portion of the taxes from which come the funds for 85 per cent of the road work. In 1921 the taxes paid by the Class I railroads of the country in the various states amounted to \$237,872,319. This was exclusive of \$37,176,773 in federal taxes, \$79,042 in District of Columbia taxes, \$660,218 in Canadian taxes and \$95,244 in taxes not localized to the states.

In order to emphasize the comparison between motor vehicle revenues and highway expenditures, there is shown herewith a table giving the figures by states for 1921.

It is up to railway men to impress upon the public the fact that every burden placed upon the railroads is a burden upon their patrons. The railroads do not have an inexhaustible supply of funds out of which to pay operating expenses, taxes and other charges. A railroad is an institution organized for the giving of a great public service, in the performance of which certain costs are incurred, and these costs are charged back against the public in the form of freight and passenger rates. The shippers and passengers who use the railroads, therefore, pay the railroads' operating expenses, taxes and other charges as truly as if the railroads were not an intermediate party in the financial transaction.

When the public gets that view of the situation—and it is the proper view—there will be fewer attempts to unload tax burdens and burdensome operating costs upon the railroads. And when the public comes to realize that the cost of building, maintaining and improving the highways is not being paid by those who put them to a destructive use, a solution will be found for this problem.

THE OLD-TIMER KNOWS

Experience is the best preacher. If one beginning railway man tells another that courtesy is the best policy and that it pays to be considerate of the public and fellow employes, the lesson is likely to go to waste on unappreciative ears; but when the old-timer comes along and says he *knows* that such things are true and that courtesy has *paid* him and his road, then the lesson is likely to be remembered.

The *Southern Pacific Bulletin* for September quotes the following letter from an old-timer to a young fellow who had just been promoted to a place where he had to supervise fellow employes and deal with the patrons of the road:

"Of course it is very gratifying to an old-timer like myself to be asked to give you a few hints, based on experience, as to the manner you should assume when you come in contact with the public, as you will every day while in such a position as yours.

"A member of Harding's Cabinet—I cannot now recall who it was—when referring to the cardinal precepts, Faith, Hope and Charity, said that the greatest of all was *Patience*. I will amplify that by adding that if patience is accompanied by a pleasingly courteous manner it will at all times bring satisfaction to even a 'chronic grouch.' Patience of the statuesque kind without making some pleasing suggestion, simply answering questions with a 'yes' or 'no,' is a very aggravating kind of patience. Let your patience be as I have stated, of the pleasant kind, volunteering information and making valuable suggestions at the proper time, for that is what counts with the public seeking information. It will secure for your company business that it would not otherwise secure.

"A railway or steamship man is expected to be a perfect encyclopedia of information, unreasonable though it may seem. He must pass judgment on complaints, often of a trivial character, but do not forget that what may appear trivial to you may appear to the other fellow as a highly important matter, and you must sympathize with his viewpoint, and, if compelled to decline a claim or not to take action on his complaint, do so in such a manner that he will know, 'I am dealing with a fair man who would favorably consider my claim if he could do so, but the rules of his company will not permit it.' With such a feeling you

have not lost a business friend. He will seek you again.

"The position I take can be boiled down to a few words: 'Have due consideration for the feelings of others.'

"Now, you may have under you a few clerks, and that precept is applicable to your treatment of them. Do not link with your authority a cocky assumption of power or a solemn pomposity of manner which, I am sorry to say, is too often indulged in by those who by accident or ability are placed on a pinnacle above those with whom they, but a few days since, were on the same plane, serving the same interests in the same manner.

"Due consideration for the feelings of others is a rare gift, and when possessed is worth conserving. With it there is erected on the part of the worker sincere loyalty and hundred per cent of thoughtful, efficient service. With such loyalty, how secure and happy is the lot of the possessor of that gift, and how pitifully different is the lot of an employer who does not thus cultivate the good will of all!

"It is easy to accomplish. There is no expense involved, and you get good returns for such an investment."

There is little to add to this letter. It is the message of experience, and wise will be the young railway man who patterns his conduct as it advises.

It Pays to Study Other Man's Problems

By D. M. EVANS,
Warehouse Foreman, Rockford, Ill.

In a railroad's organization there are numerous departments, separate, perhaps, but all necessary to railway operation and deriving their revenue from the same common source—the transportation of passengers and freight. No individual or department in railway service is greater than the institution; neither can any individual or department stand alone. There must be co-operation and assistance from others, and hence we have the need of consideration for the other fellow and his problems.

Specializing in a certain line of railway employment is well enough, but if the specialist is blinded to all other things he becomes an obstructionist, defeating the purpose he seeks to accomplish. In railway service greater efficiency results from a broad conception of the general work and appreciating the fact that all employes and departments have their responsibilities and their work to perform.

Oftentimes bad feeling exists between one department and another, each feeling that the one is endeavoring to "do" the other, when as a matter of fact a little familiarity with the working conditions of each and the problems arising in the day's work would promote greater co-operation and a fine fraternal spirit.

In freight-house operation, for example, the study of general conditions and the problems of others is indeed essential, for this department of service requires vision if one is to perform the work properly. The

problems confronting trainmen and engine-men must be considered in the loading of freight, while the knowledge of general conditions—such as the type of engines used on a route to be covered by certain cars or of hump yards and other existing conditions which enter into the safe and proper selection of cars for certain destinations and the proper stowing of their loading—is imperative.

In a freight house and freight office the problems of the railway patron should be considered also, for in many cases there are matters which concern not only the patrons themselves, but perhaps affect the employment of their workmen as well. There are times, no doubt, when a shipper's business reputation or his weekly pay-roll is dependent upon the prompt movement of a certain shipment, and he appeals for some emergency assistance. The ability to visualize the situation and to meet the emergency, if possible, getting away from regular routine, means everything to the one concerned and loses nothing to the railroad.

In our battle against "exceptions" we at Rockford have endeavored to study general conditions and the problems of others as well as to figure out what the other fellow is likely to do in handling our cars en route or our freight at destination, and we load accordingly.

Application of the golden rule, vision beyond our daily duties and a spirit of fairness to our fellow men will enable us to appreciate and to consider the problems and the feelings of our fellow worker.

PUBLIC OPINION

What the

World Thinks

ILLINOIS CENTRAL SERVICE

The *Item* has received a pamphlet issued by the Illinois Central entitled "Making New Orleans Famous for Its Train Service." It is an advertisement for the Panama Limited service, and it may be said in truth and justice that the Illinois Central lives up to its advertising.

The Illinois Central has to a marked degree commanded the loyal, enthusiastic and devoted service of its employees. No railroad in America, or in the whole world for that matter, is more advantageously located from a strategic standpoint than is the Illinois Central. Its Panama Limited service has been maintained in times of war and peace and under all sorts of conditions and stress in magnificent fashion.

No institution is great, no matter what it is worth, or what its seeming advantages, unless it includes the all-important human equation—and somewhere along the line the Illinois Central seems to have done a great deal toward solving this problem.

New Orleans is fortunate that it has water as well as rail transportation. In the rail strikes and crisis the Illinois Central management and its loyal employees have rendered a great service to this city and section.—New Orleans (La.) *Item*, September 11.

ONE OF THE CONTRASTS

All business is based in capital. So is all building, all transportation, and all industrial enterprise. Somebody must save and have liquid assets in order to employ labor or help of any kind. Long experience has shown that men who do save and become able to employ others, who own property and have a direct personal interest in law and order and government, may be trusted more safely than men who have no property in all matters which involve order.

Nobody ever heard of organizations of merchants or of manufacturers, or of bankers, lawyers, doctors or any of the established business concerns, going out in mobs to burn and destroy property, to club to death or hang competitors, or to destroy courts and the institutions under which the United States has become the best country

in the world in which to live and prosper.

Therein lies the significant contrast which marks the different policies and conduct of contending forces in this country. He is the better citizen who upholds law and order at all times.—Chicago (Ill.) *Journal of Commerce*, September 6.

RAILWAY POLICIES

The transportation industry in this country is worthy of serious study for a great many substantial reasons. Adequate transportation is as necessary for the welfare of the country as adequate circulation of the blood is to the well-being of the human body. Necessarily in any study of this subject the relation of employers and employees must be given the attention which its importance warrants—and this is of first importance.

The Illinois Central System, we understand, has developed a plan of co-operation with employees which is at least a good forward step toward a more elaborate scheme designed to insure efficiency in service and comparative freedom from interruption of the business of transportation.

The company has for years pushed the sale of its stock to its employees. This stock is preferred and pays 7 per cent interest annually. A great many employees have availed themselves of this privilege and are now part owners of the road on which they work. This ownership feeling works for both loyalty and efficiency.

The Illinois Central has for many years maintained a liberal pension system for aged, infirm or disabled employees. Recently the minimum pension to aged employees was raised to \$25 per month. This was an expansion of a policy already recognized by the employees as one of the most liberal in the transportation industry in the country.

A third policy pursued by the Illinois Central which seems to be helpful is that of securing officials from the ranks of its own employees.

C. H. Markham, president, entered railway service as a section hand.

C. M. Kittle, senior vice-president, began his railway experience as a yard clerk.

L. W. Baldwin, vice-president in charge of

operation, started railroading as an engineer's apprentice.

F. B. Bowes, vice-president in charge of traffic, entered the service at the age of 15 years as an office boy.

J. F. Porterfield, general superintendent of transportation, started as a warehouse clerk.

R. W. Bell, general superintendent of motive power, was an apprentice in the machinery department.

A. E. Clift, general manager, started to work for the Illinois Central as a call boy.

F. L. Thompson, chief engineer, entered the service as chainman with an engineering party.

A. F. Blaess, engineer in charge of the maintenance of way, made his debut as a railway man as a section apprentice at Gaza, Iowa.

J. V. Lanigan, general passenger agent, entered the service as a messenger boy.

Some roads send out scouts to find capable executives, much as big league baseball magnates look for new players. The policy of the Illinois Central is to develop its officials from its own family of employees.

If we have been correctly advised on this subject, the Illinois Central has had less trouble in the present upheaval than any other road in this section of the country. The road not only has handled its own normal volume of business but has taken on additional business which other lines could not handle. How much of this present status of the road is due to the policies above briefly noted is a question we shall not attempt to answer. The facts speak for themselves. These policies have prevailed for years. Now, when all railroads are having trouble in the adjustment of relations with employees, the Illinois Central, at least, has less difficulty than its competitors.

It is a matter of record that so far no Illinois Central train crew has refused to take out a train or continue its operation on schedule time. In many instances the members of these crews own stock in the company, and they are interested in keeping its record of service above reproach.

It is possible and entirely probable that the forward steps of the Illinois Central in this direction point to a method of development which might be followed by other roads in the country to the immense advantage of employees, employers and the public as a whole. Surely the subject is worthy of careful study.—Council Bluffs (Iowa) *Nonpareil*, August 20.

I CALL YOU MY FRIEND BECAUSE—

You make the most of my good qualities and ignore my bad ones.

You stimulate me to think the higher thought to do the helpful deed, which perhaps without your inspiration would never have been done.

You are always excusing my mistakes, my blunders and lack of tact, explaining away any unfortunate impressions I may make upon others.

You have touched my life to lofty purpose and noble endeavor; you have opened to me new opportunities; made a fuller, larger, richer life possible.

You do not value me for what I have, but for what I am; whether I succeed or fail, whether I make or lose, you are going to stand by me.

You draw a curtain over my faults and weaknesses, and proclaim my strength and my virtues from the housetops; you shield me from the harsh criticisms of the thoughtless and the unkind.

You appeal to the best in me, instead of the worst; you touch the deeper springs of my nature; give me a glimpse of the great within of me, and help me to develop original force and power.

You look behind my peculiarities, back of my defects and deficiencies, and see the real me, not the man I am, but the one I long to be, the man I am capable of becoming.

I feel strengthened, reinforced, buttressed, every time I come in contact with you; you leave me a little more determined to make something of myself, a little more worthy of your faith in me.

You always come to me when I need you; you come in when everybody else steps out or runs away because they think I am disgraced, or that I am down and out and have nothing to give them.

Your very presence is a benediction; it makes me happy to be near you, though neither of us speaks a word, for I know that you are in sympathy with me; that you sympathize with my ambitions and aspirations, believe that there is something in me bigger and grander and nobler than anything I have yet brought out.

You encourage me when others discourage; you stand by me when I am in trouble; you are willing to share my sorrows as my joys; my poverty and failures, as my prosperity and success.

I can open my inmost heart to you, say to you what I can say to no one else, confi-

dent that you will understand me, understand my soul and all my soul's needs; that we can commune without words or visible signs because we understand each other.

No one else can take your place in my life; no one else could fill that great want in my nature which you fill to overflowing. My life would not be complete without you, because I am your other self and you are mine, because we are one in spirit.

You have prodded my ambition and kept it aflame, spurred me on to greater endeavor and kept me from turning back when I had become discouraged by disappointment and failures. When all my plans had miscarried and hope and confidence had almost died, you revived them, urged me to renewed effort and kept me facing toward my goal.

You have always encouraged me to look up, and to live up to the level of my highest gift. You have inspired me to accept from myself nothing but my best; to aim to be a first-class man in everything, to bring out the larger, grander, possible man beating beneath the common, ordinary mediocre man that has thus far been making a living for me.

You have always been loyal to me when others were censorious and my good name was in danger. When I have been, perhaps, careless of my own reputation, when I have said and done indiscreet things and people have talked about me, you have tried to set me straight in their eyes.

You have never lost faith in me, no matter how many mistakes I make, or how often I fail and disappoint you; you still believe that I will amount to something in the world. You have always seen something in me which others, not even my relatives, have seen. You buttress my faith, my self-confidence, because you expect much of me, believe much in me, have great confidence in me.

You always come in when the fair-weather, the friends of my prosperity, go out; because you would share with me your last dollar, if need be, and wouldn't think it a sacrifice; you would do it because you love me.—O. S. M. in *Success Magazine*.

A NOTABLE TESTIMONIAL

Mr. Markham, president of the Illinois Central System, was tendered a notable testimonial of loyalty and esteem last week by the men employed in the company's shops at Waterloo. The testimonial was in

the form of a letter addressed to Mr. Markham and signed by thirty-four foremen, assistant foremen, master mechanic, chief engineer and others in behalf of the shop forces. The letter expressed the confidence of the men in Mr. Markham and their deep interest in the well-being and prosperity of the Illinois Central System. It urged him to send locomotives and cars needing repairs to Waterloo from any point on the system, "and we will repair them." It pledged from the employes of the Waterloo shops "a loyalty of the kind which will stand four-square to every wind that blows in the future." It declared that the citizens of Waterloo were 100 per cent loyal to the Illinois Central and also to its Waterloo employes, and that the employes on their part were equally loyal to the railroad and to the city. It is not often nowadays that railway men are sending such testimonials to railway executives. It is evident that Mr. Markham has won the confidence of his men, not only in Waterloo, but elsewhere on the system, to an exceptional degree. Mr. Markham very properly may take pride in this fact. Success in running a railroad does not consist wholly in giving service and in earning dividends. The really successful executive is that one who, in addition to furnishing the highest quality of service for the public and dividends for the stockholders, handles the human element of his problem in a manner to win the respect, loyalty and confidence of the men who make the running of the trains possible. Mr. Markham has risen from the ranks of railway labor, and thus is equipped as few railway executives are for understanding the problems and the viewpoint of the railway employe. He will unquestionably value highly the testimonial that has come to him from the men of the Waterloo shops. — Sioux City (Iowa) Journal, September 18.

THE VOYAGER

A smooth sea never made a skillful mariner, neither do uninterrupted prosperity and success qualify for usefulness and happiness. The storms of adversity, like those of the ocean, rouse the faculties and excite the invention, prudence, skill and fortitude of the voyager. The martyrs of ancient times, in bracing their minds to outward calamities, acquired a loftiness of purpose and a moral heroism worth a lifetime of softness and security.—*Selected*.

A Letter

Waterloo, Iowa, September 12, 1922.

MR. CHARLES H. MARKHAM,
President, Illinois Central System,
Chicago, Ill.

Dear Sir:

We wish to take advantage of this opportunity to tell you that the visit which you paid us at the Waterloo Shops last Friday, September 8, at which time many of us had the pleasure of shaking hands with you and of getting from you first-hand information in regard to the conditions which exist on our railroad—particularly in the transportation and mechanical departments—was sincerely appreciated by us. We have great confidence in the fair dealing of the organization of which you are the head, and we are proud to be members of that organization.

We are deeply interested in the well-being and prosperity of our railroad, the Illinois Central System, and for its welfare we are anxious to go our full length.

Springfield Division engines No. 1137 and No. 1703 and Wisconsin Division engine No. 783 are rapidly nearing completion after receiving very heavy repairs.

If there are any locomotives or cars anywhere on the system which are not being repaired, send them to Waterloo and we will repair them, as we want this outside work, which means a still "Greater Waterloo." We have in Waterloo a citizenship which is 100 per cent loyal to the Illinois Central System—a citizenship that is also standing firmly and enthusiastically back of us, the employees. There is a oneness about the citizens of Waterloo and the employees of our railroad which makes for the best possible conditions for doing railway mechanical work.

We, the employees of Waterloo Shops, pledge you a loyalty of the kind which will stand four-square to every wind that blows in the future. In addition to being loyal to our railroad, we are also loyal to our city of Waterloo, and we are anxious to have a part in the growth and upbuilding of our splendid city, whose citizenship stands shoulder to shoulder with the management, as well as the employees, of our railroad—the Illinois Central System.

We appreciate, Mr. Markham, that, as the head of an organization composed of more than 60,000 employees, you are a very busy man. We hope, however, that you will visit the Waterloo Shops just as frequently as you possibly can in the future. It will give us great pleasure to have you come, and, in addition to that, we believe you will carry away with you each time you come to the Waterloo Shops a renewed faith and confidence in our willingness and ability to serve well our railroad—the Illinois Central System. Yours for a "Greater Illinois Central System" and a "Greater Waterloo."

JAMES S. SAUNDERS, for Association of Machinists, Helpers and Apprentices.

W. H. FOUTCH, for Association of Sheet Metal Workers, Helpers and Apprentices.

FRED L. L. FOLLETTE, for Association of Carmen, Helpers and Apprentices.

*Employes,
Mechanical
Department,
Waterloo,
Iowa.*

Chicago, Ill., Sept. 19, 1922.
Gentlemen:

Your letter of September 12, expressing appreciation of my recent visit and pledging your continued loyalty to the Illinois Central System, moves me deeply.

The way you have stood by the railroad has been a source of inspiration to me. I believe it has also been a source of inspiration to our patrons and to our other fellow employes. On my own behalf, and in behalf of our officers, I thank you sincerely.

The three-sided partnership which should exist among the public, the employes and the management in the performance of transportation service is splendidly exemplified in the relations of the city of Waterloo and the management

and the employes of the Illinois Central System. This railroad has always felt a deep interest in Waterloo, and in the future, as it has in the past, it will stand ready at all times to do everything it consistently can do for the development of the city of which you are true, loyal citizens.

I believe you know that we have the welfare of our employes at heart. We believe that an army of enthusiastic, happy employes, working for the best interests of the railroad, is one of the greatest assets a railroad can have. You have furnished conclusive evidence that you possess those most desirable qualities in the highest degree. It is in no small part due to such employes as we have in our Waterloo organization that the Illinois Central System stands high among the leading American railroads. We shall continue to do everything we can to advance the interests of those employes who are conscious of the ideals and aims of the railroad and are working at all times, as you are working, for the advancement of those ideals and aims.

I feel that being a member of the Illinois Central System organization means more to me than merely being a railway man. I feel that it means more than that to you, and to our other employes. It means being a part of an organization that is constantly striving to render a great public service, that already has gone far in the development of a service that is outstanding in all respects, and that will go still farther.

Through you I want to express to all the members of our Waterloo organization the pride I feel in the loyalty you have shown. I am proud of the work you have done and are doing, and in the days that are to come I want to work with you, as we have worked together in the past, in building up the city of Waterloo and in making the Illinois Central System a name that is synonymous with "Service."

Sincerely and cordially, I am,

Your fellow worker,

C. H. MARKHAM.

Old-Timers in Chicago Terminal Service

*Four of the Five Veterans on Our List Have Spent
Whole Time in City; Other Has Been a Wanderer*

JAMES BROADBENT, machinist in the shops at Burnside, C. J. O'Neill, clerk in the local freight house at Chicago, Thomas Kelly, engine wiper in the roundhouse at 27th street, John Spencer, bridge-man, and P. F. Sheehan, agent at South Chicago, are five of the oldest employes in point of service on the Chicago terminal.

Mr. Broadbent will round out his fifty-fourth year of service in December. Mr. O'Neill has been in the service more than forty-seven years. Mr. Kelly has served a little more than forty-six years. Mr. Spencer has worked for the company for forty-two years. Mr. Sheehan finished his forty-second year of service on March 20.

The first four of these men entered the service at Chicago and have continued on the roll of the terminal since. Mr. Sheehan entered the service in Iowa, and has been transferred to various places during his service.

Started Work at 70 Cents a Day

James Broadbent, machinist at Burnside shops, Chicago, entered the service as an apprentice at the Weldon shops in December, 1868, back in the days when the street cars of Chicago were drawn by horses. The Illinois Central had only one train in suburban service then, he says. It made two round trips daily to Oakwood.

Mr. Broadbent served four years as an apprentice. His pay the first year was 70 cents a day, and the fourth year it was \$1.20. After his apprenticeship, he became a machinist in the shops and drew \$3.25 a day. When the Burnside shops were opened, he was transferred there, where he remains today.

In his early days of experience, Mr. Broadbent says, the work was much heavier than now. There were no cranes for lifting the heavy metal, and all the work was done by hand. The workman in those days had to be skillful, he says.

When he started, he says, the company had only 150 engines.

He used to ride on the horse cars every morning from his home on Wade Street to Randolph Street. The ride consumed about an hour, he says. At Randolph, he boarded

the suburban train and rode to the shops at 16th Street. The train then went to Oakwood, where it turned on a Y. The only turntable was the one at the roundhouse at the Weldon shops.

Mr. Broadbent says that J. J. Casey, general foreman of the roundhouse at Burnside, was an apprentice under him, and he says that he never saw a harder and more conscientious worker in his life than that young man.

Tested Oil Lamps on Sleeping Cars

C. J. O'Neill, clerk in the freight house at South Water Street, entered the service of the Illinois Central February 10, 1875, when the company owned the sleeping cars on the lines. There were twenty-five in all, and they were lighted with candles.

Mr. O'Neill's first job was as timekeeper and storekeeper in the freight and passenger yards at Chicago. He kept a record of the sleeping cars, and he has the distinction of being the man who tested the first oil lamps that were put on these cars.

In 1877, the second year of his service, Mr. O'Neill says, there was a dispute between the Illinois Central and the Baltimore & Ohio railroads over the use of the freight house at South Water Street. The building belonged to the Illinois Central, but it had been leased to the B. & O. because it was not needed by the Illinois Central at the time of the lease. There came a time, however, when the business of the Illinois Central grew to such an extent that the building was in demand. The B. & O. was requested to move and agreed to do so as soon as another suitable place could be found. Time wore on, Mr. O'Neill says, and the B. & O. made no effort to move away from the Illinois Central property. All the time, the demand for more space was growing on the Illinois Central.

A Mechanical Tug-of-War in 1877

Early one morning, several Illinois Central engines appeared in the freight yards at South Water Street and began moving B. & O. freight cars. The B. & O. engines contested by coupling to the rear of the cars and pulling in the opposite direction. A mighty tug-of-war followed for several

hours. In some cases, two or three small engines of the Illinois Central took hold of a huge camel-back engine of the B. & O. and marched down the track with it. There were no personal contacts; it was a contest of machine strength. The end of the affair found all the B. & O. equipment at Jackson Street. The Illinois Central force then moved into the building at South Water Street.

When Mr. O'Neill entered the service, there were only four suburban trains running. They went as far as Pullman then. There was ample room for a feverish game of checkers in the smoking car of each train, he says. Passengers were few and far between. Pullman was then under construction, and the company ran 25-cent excursions to that place. Many persons made the trip to watch the building, Mr. O'Neill says. Chicago at that time had only 400,000 inhabitants, and there was much rivalry between that city and St. Louis as to which one would grow the farther.

In 1881 Mr. O'Neill became the paymaster's clerk and rode on the pay car between Chicago, Cairo and Dubuque. Many of the older employees have been handed their pay check by him. He was in that service about twenty-one years.

He became a clerk in the Chicago freight house in February, 1903, and has remained in that position since.

Has Had Forty-six Years of Service

Thomas Kelly, engine wiper in the roundhouse at 27th Street, has been in the service of the company for more than forty-six years. He started work in March, 1876, as a helper in the tin shop at Weldon.

But working with tin did not occupy all of Mr. Kelly's time and thoughts. The engines that came into the shops were interesting to him, and after a year had passed he was a fireman on one of them. He was placed in switching service first, then on a suburban train; later he was firing in freight service and then was made engineer on a switch engine in the yards at Chicago. He had been a fireman about four years.

Mr. Kelly remained on the switch engine until about five years ago, when he was made a hostler. Two years ago he became an engine wiper.

He Helped Build Chicago Breakwater

John Spencer, bridgeman, helped put in the breakwater between 16th and 48th streets in Chicago. He entered the service

in February, 1880, as a laborer on the suburban tracks. When construction on the breakwater was started, he was placed on a pile driver. This work was discontinued during the winter months and started again as soon as the ice thawed. It was completed in about three summers, he says.

After the breakwater was completed, Mr. Spencer was transferred to the bridge department and worked out on the lines as well as in Chicago. During the last twenty-five years he has worked steadily in Chicago.

Mr. Spencer was severely injured on April 22, 1912, while he was working on a pile driver. One of the piles slipped from the hook and struck him on the hip. When he recovered from the shock, he says, he thought that he had been injured on the head, but when he tried to arise he found that he could not use his legs. He was in the hospital for several months.

His Record Shows Many Changes

P. F. Sheehan, freight agent at South Chicago, entered the service on March 20, 1880, as a clerk in the station at Jesup, Iowa, where he learned telegraphy and station work. He made such rapid progress that he was sent out on the line as relief agent and operator the first part of the following year, and in May of the same year he was appointed the regular night operator at Independence, Iowa. He remained there until October, 1882, when he returned to Jesup as agent.

Mr. Sheehan's service record is one of several transfers, and he says that he has profited by the experience he gained by each change of location. In August, 1885, he became the agent at Alta, Iowa. He was there only a short time when he was made the freight agent at Le Mars. A change was made in the station force at Sioux Falls, S. D., in 1889, and Mr. Sheehan was sent there as freight agent. He remained there longer than at the previous places he worked, but in January, 1895, a decrease in all lines of business brought about changes. Mr. Sheehan was made agent at La Salle, Ill., where Mr. McCourt, who had been the trainmaster of the Sioux Falls district, had been appointed superintendent of what was then known as the Amboy division.

When the Illinois Central acquired the P. D. & E. in 1902, Mr. Sheehan was appointed agent at Evansville, Ind. He remained in that position until March, 1904, when he was compelled to ask for a leave of absence on account of failing health. He

went to New Orleans, where he obtained a position in the local freight house and stayed until August of the same year.

Sees South Chicago Business Grow

By that time he had fully recovered his health, and he returned to Chicago, where he was given a position as assistant agent at Hawthorne. In September, 1907, Mr. Sheehan was made the night clerk in the Chicago office.

He was anxious for an agency again, and in January, 1909, he was appointed freight agent at South Chicago. At that time the agent there had charge of the business of South Chicago alone, but in 1916 the freight business of Windsor Park and Cheltenham was consolidated with that of South Chi-

cago. Since that time Mr. Sheehan has handled the entire freight business of the South Chicago district, on which there are sixteen active industries and three team tracks. In addition, he has supervised the suburban train service at South Chicago and 83d Street.

Mr. Sheehan says that the suburban service has been greatly increased since he has been at South Chicago. When he first went there, there were only four trains lying over at night, while now there are seven at South Chicago proper and six at 83d Street.

The freight business has correspondingly increased, he says. Not long ago a commercial agent's office was installed in South Chicago.

Some Figures on the Chain Letter Pest

Rotarian Gray of the Louisville Rotary Club has an article in the *Louisville Rotary Wheel* of August 8 that is worth passing on. Many of us during the past few months have received one or more of these chain letters, and the staff at international headquarters has not been omitted:

During the past several months, a number of Rotarians have received and, alas, have forwarded copies of a so-called "good luck" letter.

The letter itself is very short, but the list of victims is extremely long, one of those

received by the writer reaching down to the thirty-sixth chain of nine members each. Do the members of Rotary realize what this would mean if the chain had remained unbroken? Fortunately for us it must have been broken many, many times; otherwise the entire industry of the United States, and possibly of the world, would have been given a most serious jar.

Now, figure it out for yourselves. The thirty-sixth chain would require 58,149,737,002,953,498,998,791,809 letters to be written. Can you read that number, beginning fifty-eight septillion, etc., etc.?

A thousand expert stenographers, writing continuously at the rate of one letter every three minutes for ten hours each day of 300 working days in a year, would require 969,162,283,382,558,316 years to accomplish the task, without addressing the envelopes.

If the letters with the envelope weighed $\frac{1}{2}$ ounce each and the correspondence were loaded in freight cars carrying 50 tons, or 100,000 pounds to each car, it would require 18,171,792,813,421,718,437 cars.

Given a length of forty feet to each freight car, they would extend to a distance of 137,665,097,071,376,654 miles.

A fast freight train, traveling at express speed of 60 miles per hour for twenty-four hours each day, 300 days in the year, would require a total of 320,983,604,311 years to pass a given point.

But what's the use?

—From *Weekly Letter of the International Association of Rotary Clubs*.

MIND IS ETERNAL

If we work marble, it will perish; if we work upon brass, time will efface; if we rear temples, they will crumble into dust; but if we work upon immortal minds, and instill into them just principles, we are then engraving that upon tablets which no time will efface, but will brighten and brighten to all eternity.—DANIEL WEBSTER.

A common scene on Michigan Avenue, Chicago, taken from our general offices

Trouble in the Office

THE pencil has made a number of pointed remarks about the sponge's being soaked all day and the waste basket's being full. The scissors are cutting up, and the paper weight is trying to hold them down, while the mucilage is sticking around to see the stamps get a good licking. The ink's well, but appears to be blue, while bill is stuck in the file and the calendar expects to get a month off. The blotter has been taking it all in.—*Selected.*

Railway Improvements

The 5:15 ran off the track the other night, an' everybody got a joltin' up. One of the pleasant features of the accident was that it loosened all the windows in the passenger coaches so that they can be raised with ease.

The railroad has taken up wireless. They have wireless screens in the windows at the depot.—"Rural Editor's Paragraphs," Chicago (Ill.) *Herald and Examiner*, September 10.

Score One for Transportation

A writer in *The Express Messenger* recently used the following illustration to show the value of express service, but it applies as well to all transportation:

"The average Indiana farmer gets up early, at the alarm of a Connecticut clock, buttons his Chicago suspenders to Detroit trousers, puts on a pair of shoes made in Massachusetts, washes his face in a basin made in Pittsburgh, using soap made in Cincinnati, and dries his face on a towel made in New Hampshire; sits down to a Grand Rapids table; eats hot biscuits made out of Minneapolis flour; has Kansas City bacon and Indiana grits fried in Omaha lard; South American coffee, sweetened with Cuban sugar, and all cooked on a St. Louis

stove; buys Irish potatoes raised in Michigan; canned fruit put up in California, and seasoned with Rhode Island spices; puts on a hat made in old Philadelphia; goes out and puts New York harness on a Missouri mule, which is fed with Iowa corn; plows his land with an Indiana plow. At night he cranks up a Detroit automobile, equipped with tires made in Akron, and takes the family to town to see some Alaskan pictures, made by a New York firm, in Maine. Later he goes home and crawls under a New Jersey blanket, only to be kept awake by an Indiana dog—or the baby."

Unusual

"Anything unusual about this accident?"

"Yes, the fellow who was to blame admitted it."—*Detroit Free Press.*

A Financial Parable

A negro preacher set aside a Sunday for making a missionary appeal to his people and receiving contributions. The day came, and he preached a powerful sermon.

Before the offering he announced that he had a bit of bad news. His chicken house had been broken into the night before and six of his best chickens were gone. He added:

"Now, I doan' want to condemn nobody onjustly, but I hab my suspicions dat the niggah wat stole dem chickens is in dis here aujience dis mawnin'. I futhamo' hab a sneakin' suspicion dat when de collection plate am passed, he will frow nuffin into de box. I shall keep an eye on ebery man. We must hab a big collection fer mishuns. De deacons will now pass de plate."

The deacons went down the aisle while the minister kept his eagle eye on the flock. Every one put something into the boxes. The largest offering for missions the church ever gave was gathered in. Then the pastor announced:

"I doan' want none o' you niggahs to miss you dinnah or lose any sleep worryin' ovah who stole dem chickens. De facts is dat de whole story ain't so. It was only a pahable got up fer financial pupposes."—*Everybody's Magazine*. Recommended by B. H.

They Were Related

The conductor of a freight sent the brakeman forward to put a tramp off they had seen board the train just as they were pulling out. The brakeman went forward,

but when he came to the tramp he found himself gazing into the barrel of a gun, and was ordered back to the rear and informed he might as well stay there and save himself some trouble. The brakeman returned to the caboose.

"Did you get him off?" inquired the conductor:

"No," replied the brakeman. "I couldn't put him off. He's a cousin of mine."

"Well, I'm not troubled with that kind of relatives. I'll put him off," stormed the conductor, angrily. After a time the conductor quietly returned.

"Did you put him off?" the grinning brakeman asked.

"No, he's a cousin of mine, too," the conductor replied.—*Judge*.

Strong for Railroaders

Mose, a negro employed around the freight yard, had been hit by a switch engine and his parts so widely dispersed that they had to put him down as a total loss. Almost before the engine slowed down the claim agent was on his job and had the widow in tow leading her toward the office.

With Saluda was Chloe, a back-fence friend. When the trio reached the railway office the agent produced some papers and began filling them in.

"Now, then, Saluda," he said, "all you have to do is to sign right here, agreeing

to bring no action against the company, and I will make you a present of these five nice, new \$100 bills."

Saluda's eyes bulged out like a crab. Chloe turned to her and gasped.

"Lan' sakes alibe, chile, what you'-all gonna do wif all dat money?"

"Oh, Ah'll buy chickens and watermillions an' a new house an' 'bout a hundred dresses an' jes' whatever Ah needs for de rest er mah life."

"Don't yo'-all need another husband?" asked Chloe.

"Well, Ah don't know 'bout dat, but ef Ah ever does get married agin it'll sholy be to a railroad man."—*Everybody's Magazine*. Recommended by E. W. S.

Not Experienced

Down in Texas the short cotton crop forced a large number of country negroes to the cities. One of these applied for a job at one of the large employment agencies.

"There's a job open at the Eagle laundry," said the man behind the desk. "Want it?"

The applicant shifted uneasily from one foot to the other.

"Tell you how it is, boss," he said finally. "I sure does want a job mighty bad, but de fack is, I ain't never washed a eagle."—*Argonaut*.

Sports Over the System

Office Bowling League Has Sixteen Teams

By WALTER E. Du BOIS,
Voucher Clerk, Chicago

The 12th Street General Office Bowling League is once more upsetting the maples in Chicago.

R. O. Fischer, office manager in the operating department, was elected president of the league, and the league also has a new secretary, August L. Rolff, who will be a busy man, for he is also captain of the champion Engineer Maintenance of Way team. No change was made in the treasurer, the author being re-elected and instructed to keep on writing news and chasing after the money.

Last year we had twelve teams in our league. As a demand was made that we expand, the league this year is increased to sixteen teams. The new teams are from the offices of the Chief Engineer, Chief Special Agent, Terminal Superintendent and General Superintendent of Motive Power.

The entry fee has been raised from \$10

to \$15 per team. As we shall play for thirty weeks, \$720 will be collected by the end of the season. Of that amount, \$540 will be returned to the teams for games won, and the rest, after the secretary and foul line men are paid, will be divided among the fifteen leading bowlers.

Ten of the team captains claim they will finish in first place; so it looks as if the race will be interesting. W. P. Enright,

A Little Action, Please!

We can use more sport news and pictures, particularly from out on the line. The Illinois Central System has probably as large a percentage of its employees interested in sports as any railroad in the country, and there is no reason—save lack of reporting—why the news of their activities should not be published and inter-city and inter-division contests promoted through the magazine. If the demand exists, the magazine will appoint a sporting editor. What say?

father of the league, says the league will be a whole lot faster than last year and that without doubt the averages will improve. Mike Grace of the Chief Special Agent team says it would look like a frame-up if his team won the championship this year, but he says to look out for the sharpshooters next year. Captain McComb of the Off-

R. O. Fischer

icers team, which finished in next to last place last year, plans to finish in first place this year. Captain Knodell of the General Superintendent of Transportation team says his team will finish in first place and he will stand No. 3 among the leading bowlers. Walter Klein of the Purchasing Department has his team down to fighting trim, with only five men on the team.

The General Freight Department, with eleven men, has the largest number of

would-be bowlers; it will keep Captain Koch busy trying them out. Bernbach, individual leader of the league last year, will have to step this year, for several of the other leading bowlers are out after his scalp. Captain O'Connor of the Vice-President Accounting team is so modest he fails to claim first place in the league. The Engineer Bridges and Buildings team, with Block in the line-up, ought to make it hot for the other teams.

A. R. Barnes & Company have again printed the schedules without cost to the league, and the bowlers greatly appreciate their kindness.

The league has changed its meeting place and night. Rooters planning to be present will find us every Thursday evening at 6229 Cottage Grove Avenue, a new establishment, where there are eight alleys on the second floor and eight on the third floor. Our league will be using both floors.

NEW CALIFORNIA AGENT

Effective September 1, A. W. May was appointed commercial agent at San Francisco, Cal., with office at 447 Monadnock Building, vice L. L. Eicholtz, resigned.

Here is the champion official and office force baseball team of the Louisiana division, with headquarters at McComb, Miss. This team lost only one game all season, being beaten on that occasion by the Kiwanis Club team of McComb. The Illinois Central players are, left to right, standing: G. W. Little, timekeeper, sub., left field; J. E. Schneider, chief dispatcher, right field; T. J. Quigley, superintendent, second base; J. A. Parnell, accountant, catcher; G. L. McAllister, dispatcher, first; H. P. Campbell, trainmaster, third; A. B. Simmons, clerk, short; W. T. McGuire, chief clerk, manager and pitcher. Sitting: Curtis Mayfield, rodman, sub., third; E. H. Lewis, assistant engineer, left field; W. D. Dodds, secretary, center field; J. A. Anderson, accountant, sub., right field; H. A. Wilmot, chief accountant, captain and pitcher.

Solved St. Louis Division Water Problem

Illinois Central Rearranged Facilities at Comparatively Small Cost for a Permanent Improvement

The following account of how the Illinois Central overcame a water shortage in the coal fields of the St. Louis division appeared in the August 19 issue of The Railway Age. The information was supplied by C. R. Knowles, superintendent of water service for the Illinois Central System.

DURING the last few years a water supply development has been carried on by the Illinois Central in the vicinity of the coal fields of southern Illinois which has not only solved a serious operating problem at a relatively small expenditure but also has afforded an attractive source of revenue from the sale of water as well as a protection to the company from loss of business in the vicinity affected. Necessitated by reason of a series of annual water shortages sufficiently acute to require the hauling of water in trains for considerable distance at much expense, and not only seriously interfering with the orderly and economical movement of traffic, but actually threatening production of the mines in the vicinity, a program was launched in 1918 involving extensive alterations at several water stations and the installation of a new pumping station. The work was carried out over a period of years and involved a total expenditure of approximately \$240,000, as a result of which the region is adequately protected against trouble from this source for several years to come and a revenue has been afforded from the sale of water to interests not having supplies of their own which has already paid a substantial portion of the entire investment.

The lines under consideration extend from Centralia, Ill., on the north to Cairo on the south, where they not only constitute the middle link of the main line, but form a neck in the bottle between the main line and the important branch diverging to Freeport on the north line of the Illinois Central and the main line and the Birmingham line of the Illinois Central to the south, as well as including the terminus of the line to St. Louis. Further than this the Illinois Central System at this point passes through one of the largest coal-producing fields west

of the Alleghenies, where it has numerous branches and maintains an extensive switching service.

This is a region in which the subsurface water contains such a high content of scale-forming salts as to warrant its use only as a last resort. It is also an area in which the few streams carry much suspended matter and are otherwise more or less undesirable for use because of pollution from mine drainage. As a result it had become a practice for the railroads in this vicinity to obtain their supply from surface reservoirs of their own construction or the property of neighboring towns. The topography of the country lends itself to this purpose, and these reservoirs have invariably afforded supplies of very satisfactory quality for locomotive use. Unfortunately, however, the region is subject to protracted periods of dry weather. This condition, in the face of the heavier demand for water not only because of the greatly increased railway traffic and mining activity but, in the case of municipal supplies, due also to the increases in population, precipitated a situation in which the railroads in that vicinity were confronted annually with a threatening or actual shortage of an increasingly serious nature.

Principal Shortage at DuQuoin

Of the several points on the Illinois Central where trouble was encountered, the situation was most acute at DuQuoin, thirty-five miles south of Centralia. This is a junction point between the main line and the line to St. Louis, upon which business had increased at the rate of approximately 10 per cent a year for five or six years. The supply at this point was obtained from a reservoir whose capacity had been outgrown by the demand. It was a regular occurrence for it to become exhausted about September 1, and it would remain so until about the first of year, either because there was no water available or because of the freezing during the winter of what little water remained in the reservoir.

As it was essential that a supply be maintained at this point it became necessary to haul water in cars from Carbondale, twenty

Our lines in the Illinois coal fields

miles south, or from a branch line station at Sand Ridge, a distance by track of about fifty miles. As an indication of the acuteness of the shortage it was not unusual for as many as three trains of twenty cars each to be operated daily to serve the one station, and during November and December, 1917, and January, 1918 (the most difficult time of the year to haul water) as many as 3,000 cars of water were hauled to this point and emptied into the reservoir. This was an expensive procedure, the cost of hauling water to the one station, in fact, exceeding \$25,000 in 1917, exclusive of rentals and maintenance of equipment. Moreover, these trains seriously interfered with the normal operation of regular traffic, and because of the impossibility of hauling the water in ordinary tank cars at that season of the year, because of weather conditions, the situation required the use of coal cars at a time when these cars were in the greatest demand at the mine.

An annoying situation also presented itself at Bois, midway between DuQuoin and Centralia, where the supply was obtained from the Little Muddy River and from an impounding reservoir of approximately 50,000,000-gallon capacity. While the reservoir water was entirely satisfactory in quality and the Little Muddy River a water of fair quality, and while no shortage had actually occurred at this point up to the time the water supply program was undertaken, a threatening situation existed in the fact that the creek could not be relied upon

for the required supply during more than three to six months of the year, during a part of which time it also carried considerable matter in suspension. Neither could the watershed be relied upon to keep the reservoir filled to its capacity. In addition the old pumping plant had become inadequate to handle properly all the water required during normal times, not to mention the period when a shortage was encountered at other points, particularly at DuQuoin.

Trouble at Carbondale, Too

Hallidayboro, located twelve miles south of DuQuoin, presented a condition somewhat like that at Bois. Deriving its supply from an impounding reservoir of approximately 40,000,000-gallon capacity, from which water was delivered by a steam pump through a mile of 6-inch pipe to the storage tanks, this station afforded an adequate supply of water of good quality under normal conditions, and, as a matter of fact, had never become exhausted. But Hallidayboro was not an economical stopping place for trains, and it presented a cause for concern when, by reason of shortages elsewhere, it became necessary to take more water than usual at this point.

The situation at Carbondale, the next station south on the main line, presented another aspect to the problem than that of shortage. Situated thirty miles south of Hallidayboro and at the junction of the main line with the coal branches, where it was customary for all trains to take water and where as many as 1,500 cars of coal a day were received from the coal-producing section, this station was one of the most important on the system. To meet the demands made upon it, water was pumped from a steam plant on the Big Muddy River, four and one-half miles west of Carbondale, through three miles of 8-inch cast-iron pipe and one mile of 12-inch pipe to service tanks at the roundhouse and in the yards having a total capacity of 100,000 gallons. Aside from a little trouble occasionally encountered by the pipe lines' being too small, this supply was adequate at all times for the demand made upon it, but the quality of the water was bad. As suggested by its name, the Big Muddy River carries large quantities of silt at certain seasons of the year, but in addition to this it also carries matter in solution ranging from one to seven pounds per 1,000 gallons, of which from one to five pounds are scale-forming

solids. Because of this, considerable trouble from leaking of flues was encountered during low water periods, by reason of which it became advisable at such times for trains to take water at points less advantageous from an operating standpoint.

Shortage Threatened Production

The Illinois Central maintained no water stations in the vicinity of the mines tributary to its tracks, but depended for its supply upon the towns of Christopher, Benton, Herrin and Marion, shown on the accompanying map. All of these towns were supplied from impounding reservoirs. With the normal increase which had taken place in the population of these towns, as well as the increased demand for water made upon them by the mines and the railroads, it had become a regular thing for the towns to suffer from water shortages during the late summer and early fall, and when these shortages occurred it became necessary for engines to run for water to DuQuoin or Carbondale, the average distance ranging between three to twelve miles each way. With the interruption to the regular operation of trains by reason of this continual running for water during uncertain seasons, together with the facts that the supply at Carbondale was anything but satisfactory, that the supply at DuQuoin was obtained only by hauling water from other points, and that there was a tendency for the shortages of water purchased from the towns to increase with the growth of the demands made upon them, the situation was becoming a serious one.

Confronted with this state of affairs in the vicinity of the mines, and on the main line, it was evident that something more substantial in character and less expensive in kind was required to remedy the trouble than the hauling of water from points where it could be obtained, and investigations were accordingly made to this end.

At DuQuoin, where about 75 per cent of the shortage occurred, it was not possible to overcome the difficulty inexpensively. With no creek at this point and with the poor quality of the ground water eliminating it from consideration as an auxiliary supply, only two alternatives remained: one, that of deepening the existing reservoir; the other, of building a new one. An investigation revealed the fact that, even if the deepening of the existing reservoir was not prohibitive in cost, there was no assurance that when once it was deepened the

watershed could be relied upon to provide the additional water. It was decided, therefore, to build an additional reservoir and to replace the old pumping plant. The new reservoir was constructed in a valley adjacent to that in which the old reservoir was located. This required the construction of a dam at an expense, along with other details, of about \$128,000. Supplementing this, a new pumping plant was built which consists of two 25-horsepower semi-Diesel engines, belt connected to two 500-gallon-per-minute centrifugal pumps. In addition the 6-inch pipe line was replaced by one and a half miles of 8-inch pipe line, salvaged from improvement work at Carbondale, and a 100,000-gallon service tank was erected to increase the track storage to 190,000 gallons.

Solution Worked Out at Bois

At Bois, as has been mentioned, the water supply was obtained from a stream that could be relied upon for an adequate supply only about six months in the year and from an auxiliary reservoir having an insufficient draining area. The problem, therefore, was one of increasing the water supply. The solution at first appeared to be one of enlarging the impounding facilities and at the same time increasing the watershed, a work which would require the constructing of a second dam across the main valley below the main reservoir and the purchasing of a large tract of land for a reservoir site, at a cost ranging anywhere from \$100,000 and \$150,000 over and above the cost of increased pumping facilities. In working up the plans for the new pumping station, however, the idea was conceived of so arranging the plant that the old reservoir could be filled from the stream during its high water period and then held in reserve for the period when a supply could no longer be obtained from this source.

Working on this basis, the old steam plant was replaced by a new plant, which at DuQuoin consisted of two 25-horsepower semi-Diesel engines, belt connected to two 500-gallon-per-minute centrifugal pumps arranged in duplicate and capable of pumping against a 100-foot head. In addition to this the 6-inch line to the reservoir was replaced by a 10-inch line, an additional storage tank was provided and a water column shifted to a more advantageous location. This work, although it involved a total expenditure of only \$30,000, approximately, has proved entirely adequate for the pur-

pose, the creek affording a certain supply until about September, after which the reservoir can be relied upon for from four to five months. As indicating the economy of this plan over the original one of providing a new impounding facility, approximately 30,000,000 gallons of water were pumped into the reservoir from the creek at a cost not exceeding \$150, while if the additional storage and watershed had been provided the interest and depreciation expense alone at 6 per cent would have been anywhere from \$6,000 to \$9,000 annually.

Having remedied the situation at DuQuoin and Bois, the company found it unnecessary to make immediate changes at other points on the main line, other than at Carbondale, where the facilities for handling the water were increased by replacing three miles of 8-inch pipe with a 12-inch line and installing a water treating plant to remove the incrusting solids and suspended matter from that water. The total cost of the latter project approached \$68,000.

Plant Paid for Its Cost

This having been done, the development was completed by building a temporary station at a point about midway between Herrin and Zeigler on the Little Muddy River. At this point the river is above the principal mine drain inlets and affords a water seldom exceeding one and one-half to two pounds of encrusting solids per 1,000 gallons, as compared with five pounds at Carbondale. The equipment at this point consists of a steam plant of two 45-horsepower boilers and a 50,000-gallon tank, constructed from material salvaged from other points at a cost not exceeding \$16,000. While this plant is not located so conveniently as could be desired to the switch engines operating in this district, it has proved a boon not only to the railroads in the vicinity, but to the mines as well, by affording a suitable supply of water at times when it could not be obtained from the adjacent towns. In the fall of 1919, for example, in addition to all the water required by the Illinois Central, several thousand cars of water were hauled from this station to the mines, the number of which in November, 1920, alone aggregated 838 cars, or about 1,000,000 gallons of water.

At a total cost, therefore, of about \$240,000, a program was carried through which has eliminated entirely a recurring condition characterized by much running for water, as well as the hauling of water in

train loads with the interruption it entailed to the normal dispatch of trains, as well as its expense (the total out-of-pocket cost of hauling water in 1917 approximating \$40,000, excluding the cost of rentals, maintenance, equipment, etc.) The work has resulted also in a great improvement in the water at Carbondale and has worked an appreciable benefit to the company directly and indirectly by eliminating any necessity for curtailment in coal production by reason of water shortage and by affording a considerable source of revenue from the actual sale of water to mines for coal washing and steam generating purposes. To indicate the size of this business, in one month 111 tank cars of water were furnished to the mines from the new station at DuQuoin, 85 from Colterville, 118 from New Athens and 7 from Carbondale, all in addition to the 838 cars from the Herrin-Zeigler pumping plant.

Here is probably the biggest man working on the Wisconsin division. Agent W. C. Shadewaldt of Panola, Ill., shown on the right, is 6 feet 5 inches tall and weighs 250 pounds. With him, for purposes of comparison, we have his little son, George, and Lesley Burrington, who is about 5 feet tall.

Proper Storage of Supplies Saves Money

By D. O. DAWSON,
Stockkeeper, Mattoon, Ill.

MY idea for a good, clean stock is, first, to keep the storehouse and bins in a clean and straightened condition. Then every item can be counted correctly, which is the first move to get stock down to a close margin.

If for any reason you desire to make a check of any certain class of material, you already have your material in such a condition that you can take an inventory of it without difficulty at any time.

All bins should be properly stenciled. This is a good practice, for the reason that, if a bin is stenciled wrongly or material is placed in wrong bin, a mistake might be made when counting, which would likely cause you to order a supply of some item of which you already had from thirty to sixty days' supply on hand.

For instance, the price of a journal box, which every stockkeeper is familiar with, is

about \$10. When you are making up stock-books to order material for the month, and you have twelve or fourteen of these on hand, ten of which are stored in the wrong bin, these ten are consequently overlooked. You therefore place an order for ten to increase your stock to a thirty days' supply. After receiving these, it is found that you are overstocked on this article, which not only increases the days' supply on hand, but increases stock to the amount of \$100, which could easily have been avoided had the proper care been given the storing of material.

Such mistakes will happen in larger and smaller items as well. They can be avoided if bins are properly stenciled and material placed in the correct bins.

By closely observing these details, you will avoid having a stock of surplus material, cut down the cost of handling and make the month's disbursements look much better.

Some good-looking unit storage

The Home Division

Smart Sayings of Our Babies

Our readers are requested to send in the smart sayings of our babies so that we may print them. Address EDITOR, HOME DIVISION.

Little Billie did not understand it at all when Uncle Tim died. He frequently referred to the absence of the man of the house. Last Sunday morning he stopped in to see his aunt on the way home from church.

"Where's your daddy, Aunt Tillie?" asked Billie.

"My daddy has gone to heaven, dear."

"Then I'll be the man around this house," Billie said, proudly.

"Will you, Billie? That will be fine."

"All right. Now you can't kiss me any more," triumphed the youngster.—Miss O. O'R., *Chicago*.

Catherine, 4 years old, was the pet of the neighborhood. She was especially devoted to the three Shaw sisters, one of whom had auburn hair. If she were asked which of the sisters she liked best, invariably her answer would be, "I like Mae, and I like Nan, but I like Marguerite the best, because she has the colored hair."—Miss M. E. C., *Chicago*.

Tested Recipes

BIRDS' NEST.—Take 1 cup brown sugar, 4 apples (pared, cored and sliced very thin), pieces of butter. Line a baking dish with sugar, apples and butter, and pour over it a cake dough made as follows: Cream 1 cup sugar with 1 tablespoonful butter and 2 eggs, add 2 cups flour sifted with 3 tablespoonfuls baking powder, and 1 cup milk. Bake in moderate oven 30 minutes. When done, cut in squares and serve with caramel sauce, made as follows: Boil until thick 1 cup brown sugar, butter size of walnut, $\frac{1}{2}$ cup water, and 2 tablespoonfuls cornstarch dissolved in a little water.

BONNE BOUCHE.—On round of bread put slice of tomato, little onion and green pepper minced, salt and grated American

cheese. Broil until cheese is melted and all is warmed through.—Miss E. L., *Chicago*.

HONEY DROP CAKES.— $1\frac{1}{2}$ cupfuls honey, 1 cupful sugar, $\frac{1}{4}$ pound shredded citron, $\frac{1}{2}$ pound finely chopped almonds, 1 teaspoonful cinnamon, $\frac{1}{2}$ teaspoonful salt, flour enough to make a soft dough. Mix ingredients in order given. Drop the batter on buttered tins; shape in smooth rounds. (Better try one cake first, and then add more flour if the dough spreads too much.) Bake to a light brown.—Miss VERNITA TRIBBLE, *Tennessee Division*.

IRISH STEW.—Select three pounds of lamb from the forequarter; wipe and cut in pieces. Cover with boiling water and cook slowly until tender (two hours or more). After the first hour of cooking, add carrot and turnip cut in cubes (about $\frac{1}{2}$ cup each) and one onion cut in slices. Fifteen minutes before serving add four cups of par-boiled potatoes, cut in thin slices. Thicken with one-fourth cup of flour diluted with cold water, and season with salt and pepper. Serve with dumplings if desired.

Dining Car Recipes

Chef-Cook Jean Fields helps to maintain the high standard of our dining service on the Western lines.

His picture is shown herewith, and below are some of his favorite recipes.

SOUP CREAM POTATO.

— Simmer a small slice onion, leek, celery, bay leaf, a clove, and a piece of ham bone in butter then add 1 cup of flour and simmer again. Pour in 2 quarts of boiling milk and add 2 pounds of raw potatoes, and boil until done. Strain through a strainer. Before serving, add the yolk of 1

Jean Fields

egg mixed with a cup of thick cream, and stir in 3 ounces of butter. Sprinkle with chopped parsley.

LOBSTER A LA NEWBURG.—Select a California lobster. Remove meat from shell and cut in dice. Put in saute pan with $\frac{1}{4}$ cup of butter, $\frac{1}{4}$ teaspoon salt, and a few grains of pepper over a quick fire. Simmer for 5 minutes, or until the meat has a little color. For each lobster tail add 1 cup of thick cream and one "pony" of brandy, and cook for two minutes. Thicken with yolks of 2 eggs mixed with a little cream, and serve in casserole.

POTED SQUAB CHICKEN.—Prepare the same as for roasting; season well, put a small piece of butter in each, and place in saute pan with $\frac{1}{4}$ cup of butter and a small slice of onion. Brown well, basting from time to time. When almost done, drain off the butter and add 1 cup of stock and 1 cup of brown gravy. Finish roasting, strain gravy over chicken, and serve in casserole.

Household Hints for Home Makers

Clothes-line will not stretch if it is boiled before using.

To keep lettuce and salad greens crisp for several days, lay them in cold water in which a pinch of borax has been dissolved.

Stand potatoes in hot water for a few minutes before baking. This will hasten the cooking process.

Did You Know That—

Eight inches from the ground is the smart length for the fall skirt?

White spots on finger nails are in most cases due to rough manicuring? Use all implements gently, and never push back the cuticle with a metal instrument.

Refreshment

It had been a sultry day. From early morning things had gone wrong. I was tired and cross and rebellious. Life seemed too difficult, and there was something close to hatred in my heart. This ride was intolerable. I loathed the closeness and the odor of perspiring bodies. As the car swung around the corner I roused myself sufficiently to look through the open window. The park. Fresh and green, the trees waved their leafy branches, stirred by the gentlest of breezes. A sense of peace stole over me, and the words of Joyce Kilmer's immortal "Trees" flooded my mind, driving out all the hurt. I forgot that I was dog

tired and that the surroundings had a few moments before sickened me. "A tree that looks to God all day and lifts her leafy arms to pray." Refreshed, I left the car and turned homeward. Thank God for the poets, who give their songs to soothe a careworn world; and thank God for the trees, that make the poets sing.

OUR BABIES

Here is another group of our boys and girls, of whom we are justly proud. Aren't they the finest ever?

No. 1 is William L., 3 years 8 months old, son of J. M. Guyon, warehouse foreman, Indianapolis, Ind.

No. 2 shows Prospero Addy, $3\frac{1}{2}$ years old, and Bruce Nathen, 8 months old, sons of Operator P. L. Rowen, Fonda, Iowa.

No. 3 is Carey, Jr., 3 years old, son of Engineer Carey Woods, McComb, Miss.

No. 4 is George Ory, 7 months old, son of G. O. David, yard clerk, Baton Rouge, La.

No. 5 is Joseph T., Jr., 8 months old, son of J. T. Snave, secretary to B. A. Beck, assistant secretary, Chicago.

No. 6 is Robert James, 8 months old, son of Section Foreman Roy Myers, Coleman, Ill.

No. 7 is Joseph W., 20 months old, son of J. S. Westermann, assistant agent, Mounds, Ill. Joseph weighs forty pounds.

No. 8 is Dick, 5 years old, son of Chief Clerk H. O. Brittin, Clinton, Ill.

No. 9 is Edward James, 4 years old, son of J. E. Loesch, receiving clerk, freight station, Omaha, Neb.

No. 10 is Allan T., 3 years 6 months old, son of S. S. Stone, assistant chief rate expert, passenger department, Chicago.

No. 11 is Robert Murray, 10 months old, son of Locomotive Fireman P. F. Ryan, Kankakee, Ill.

No. 12 is Marcus, 6 years old, son of Mrs. Wordie Brooks, stenographer, freight office, Jackson, Tenn.

No. 13 shows Gerard, $3\frac{1}{2}$ years old, and Gordon, $1\frac{1}{2}$ years old, sons of Lou Murray, accountant, superintendent's office, Dubuque, Iowa.

No. 14 is Jack, 3 years old, son of J. J. Reilly, agent, Freeport, Ill.

No. 15 is Esther Mary, 4 years old, daughter of H. Lien, agent, Hollandale, Wis.

No. 16 shows Elizabeth Mae, 8 years old, and Novita Jane, 4 years old, daughters of R. M. Bombarger, switchman, Mattoon yards.

No. 17 is Thelma Catherine Thompson, 11 months old, granddaughter of Car Foreman J. R. Hamlett, Nonconnah shop, Memphis, Tenn.

No. 18 is Jean Elizabeth, 23 months old, daughter of George E. Klee, draftsman, chief engineer's office, Chicago.

No. 19 is Virginia, 5 years old, daughter of Conductor R. W. Crawford, Fort Dodge, Iowa.

No. 20 is Betty Jane, 5 years old, daughter of C. S. Collier, instrument man, office of assistant engineer, Champaign, Ill.

No. 21 is Pauline, 4 years old, daughter of Section Foreman Rufus Nabors, Holly Bluff, Miss.

No. 22 is Patricia, 11 weeks old, daughter of Mrs. E. J. Hollahan, formerly Miss Bernice Murphy, who worked as operator in telephone department, Memphis. Patricia won

first prize in the 1 to 3 months baby contest at Memphis.

No. 23 is Jane Lorene, 8 years old, daughter of George F. Barton, assistant cashier, local treasurer's office, Chicago.

No. 24 is Rosalind Maxine, 18 months old, daughter of J. T. Knupp, switchman, Mounds, Ill.

No. 25 is Marguerite, 15 months old, daughter of Engineer D. Bunch, McComb, Miss.

No. 26 is Cyrell Adair, 6 years old, daughter of Clerk Jesse N. Oliver, freight office, Martin, Tenn.

No. 27 shows Valeta, 6 years old, and Cecel, 4 years old, daughters of Section Foreman L. E. Adams, Alburnett, Iowa.

No. 28 is Mary Emily, 4 years old, daughter of Section Foreman Dee Williams, Birmingham, Ala. Mary Emily is known to her railway friends as "Cy."

A Clean Locomotive Is an Advertisement

By S. R. MAULDIN,
Master Mechanic, Water Valley, Miss.

A locomotive clean in appearance and in proper condition is a good advertisement for any railroad. However, a locomotive may seem clean and have a good appearance to the casual observer when at the same time the wearing parts of the machinery are neglected as far as cleaning is concerned.

To advertise costs money, even if we use merely a good locomotive for the purpose. To have all of the locomotives of any railroad present a neat and clean appearance is not all that is required along the cleaning line, however.

When properly designed and put together the wearing parts of the machine will last longer and give much less trouble from heating of bearings if the machinery is carefully cleaned as often as inspection indicates it is required.

There was a time when the cost for cleaning, both labor and supplies, was given much less thought than at present, due to the fact that the cost was much lower and the cleaning of the locomotive was not so large a part of the cost of handling as it is at the present time. It is hardly necessary to give causes for the increased costs. Perhaps attention should be called to the fact that nearly all locomotives built during the last few years are much larger, entirely different in finish (meaning the painting) and not so easily cleaned with the same supplies as in years past. The rough surfaces do not release the dirt, oil, etc., when rubbed with waste or rags, consequently the locomotive takes longer to clean, and the additional cost is the result.

Cleaning the locomotive is included in the cost of handling. When daily records indicate that this cost is going up, immediate action must be taken to bring it to a lower figure, which can be done only by reducing the amount of labor used. Assuming that the force for handling engines has been

well supervised and only enough men employed to handle economically the locomotives at any terminal, about the only reduction that can be made is in the ranks of the cleaners.

It would be a difficult matter to convince all who are responsible for the proper care and maintenance of locomotives that proper cleaning is as essential as the washing of the boiler or any other operation performed which is in connection with the preparation for service. Only when the cleaning has been neglected to the extent that it causes worn and hot bearings does it occur to those who have made the mistake that the lack of cleaning has required them to add to the repair forces, which also means excessive hours at the terminal for each locomotive neglected.

Those who have given the subject their thought and attention know that it is economy to give the cleaning as much attention as the repairing; further, that a locomotive kept properly cleaned will be given good attention by the engine crew, and the mechanics and other employes will take more interest in the work they perform. Systematic cleaning, with labor carefully selected and supervised by those who know how to clean a locomotive, is necessary.

The selection of labor to be used in the engine house should be given the same careful attention as the selection for any other purpose around the shop premises. It will be noticed that some do good cleaning and others, using the same amount of supplies and time, make little progress; further, there is some skill required to be a good cleaner, and it is a mistake to think it possible to employ a man, turn him over to the "boss wiper" and say, "Here is another cleaner for your gang," for he may turn out to be a poor hand at the business even if a willing worker.

A cleaner who understands his work is just as essential in the maintenance of locomotives as the mechanic.

How Facts Converted a Radical's Belief

James B. Horn, Long an Agitator, Now Urges Teaching of United States Constitution and Economics

The following is an excerpt from an address delivered recently before the Engineers' Club of Philadelphia by James B. Horn, who for eighteen years was a leader among American radicals. He tells of his conversion. Mr. Horn was born in Russia and came to the United States via England. His name in Russian was Zahlman Ber Horn Kalmonovitz.

ALACK of knowledge of the history of human progress, and of human nature in its relation to government, is what permits "isms" to come into being and thrive. I preached the theories of "isms" for many years, simply because I failed to receive the practical education I needed.

It was early in the Great War that I began to receive strange and confusing impressions. As an advocate of higher and higher wages I saw my dreams realized; but they were only dashed to the ground by the counter-realization that higher wages do not mean any more wealth to the worker, that prices followed right along with wages, and that no one was any better off. This was my first jolt, and it was a pretty stiff one; but I passed it over.

When government ownership of the railroads in the United States became an accomplished fact, I said to myself, "Now we are beginning to come into our own." But when I saw that attempt crumble; when I saw what government ownership meant, what it did to the railroads—for I could not help seeing the decreased efficiency, the increased cost, and that the man who works pays the bill—it disturbed me greatly. But even these things did not take me away from my work.

A Disappointment in Russia

Then along came Russia, throwing off the shackles of government and becoming a simon-pure democracy; and when I saw that fail and become an absolute dictatorship and autocracy—the greatest the world has ever known—I received a greater shock than any that had gone before.

What was wrong? I felt it could not be my theories, and yet here was the practical application of a theory which should

have become a beacon of light to the world, and instead of its being a success it proved to be all wrong; things did not work out. My mind was greatly perturbed, and, in fact, it was only a little less than a year ago that I was finally and completely reformed—I will tell of my actual, personal transformation later. I began to realize that all men are not born equal; that the influence of ancestry in the formation of brain and body cannot be denied; that the only equity that can really obtain is the equity that brings greater reward for greater service; that so-called capitalism is only another name for an industrial system in which capital is the reward for accomplishment, which is the result of effect in the giving of service; that maximum production by each and every individual is the only means of bringing about a greater distribution of clothing, of food, of better housing, of all the material comforts of life; that it is only through the encouragement of maximum initiative that the greatest service can follow.

Now these, you may say, are simple truths, but are they given in this simple and convincing form to all men? If they were I would not now be importuning you to establish in your schools the comparative study of social systems, so that the future citizens may arrive at the truth with regard to human tendencies and human relationships after they have studied the structure of government and of society. I feel that the only way I can undo the wrong I have done in the past is by trying to influence you to see that those in your charge are instructed in the fundamental truths about American government and the American social system. If you knew of the proselyting of the workers, both in and out of the shops; if you knew of the numbers of speakers, booklets, pamphlets, *et cetera*, that in this country are daily arguing for the destruction of the American government and of everyone in an industrial position of responsibility, you would gasp.

Education Is the Remedy

There is, however, a simple remedy—not

easy to apply, for it takes diligence and patience. That remedy is *education*. Do not misconstrue what I say. I don't mean education in the generally accepted meaning of the term; I mean education in the sense of conveying the truth about the industrial system under which we live, the explanation of industrial economics—and in that way only can he who has seen the other side of the picture compare and get at the truth.

It is a peculiar and not uninteresting situation. America slumbers and does not realize the undermining processes that have been and are now going on. Have you ever stopped to think that each and every one of you was born into, and grew up in, an industrial system about which you gave little conscious thought, accepting it just as a matter of course? Do you realize that there are now being sown throughout the United States the seeds of another industrial system, which is just the antithesis, the direct opposite, of the existing one?

The system that we have today is a development of the centuries; and as you look at it, as you study it in all its ramifications, it is easy to see how the fundamental principles came into being and made it a working plan, designed to encourage the maximum initiative of each and every individual, to develop maximum production upon the part of every individual. The whole world is now leaning toward socialism, communism or some other "ism." In order to grasp their fundamentals, it will be necessary to squeeze them into a mass, boil them down and look at them simply and clearly. What is the result? The leveling process, all men to be treated as equals, regardless of their capacity or willingness to serve, no one to receive more than the fellow working next to him, regardless of his efforts or ambition. This will lead to the stifling of all initiative. Squeeze them together again and take another look. The result is its second major fundamental, that of curtailing production.

Reducing Production Unsound Theory

Curtailing production, on the theory that it gives more jobs to more men, is an unsound theory. I shall not attempt to go into an analysis of these two diametrically opposing systems. I have stated the simple truth. This truth happened to reach me, and I say "happened" because it has reached but a limited number of those who are in the dark. Is it not a fact that education—

I mean the conveyance of information of the truth—has made this country the most advanced nation in the world? Is it not a fact, after searching the history of all governments, that each one represented the development of the individual, of its men? And after considering the slow process of civilization through the centuries, we find represented in the republican form of government in the United States a plan of human association that is far greater and much better and gives more happiness to the individual than any heretofore devised and practiced by man.

What has caused this nation to become the greatest on the face of the earth? Is it not because of the workable plan which is designed to encourage maximum initiative and maximum output from each and every individual? Any "ism" that tends to combat those fundamentals is striking a blow not only at the government but also at each and every one in an industrial position.

Is it not in your power, is it not your duty, to take a definite part in imparting your knowledge to others?

When I mentioned before an eminent economist, I referred to Mr. G. Y. Clement, editor-in-chief of the American Educational Association. He has my undying gratitude—let me tell you a wonderful and, to me, a strange story.

How Horn Was Converted

About three years after doubts began to form in my brain I found myself in Bridgeport, Conn. I was at a meeting of radicals, largely made up of the workers of the Singer Sewing Machine Company. I happened to feel ill that evening, and I was taken to the city hospital. My wife, who always worked—and here permit me to remark that a radical is not willing to work himself but his wife has to help him out all the time—as I said before, my wife, who always worked, had been receiving some publications from a Philadelphia educational institution. She always urged me to read those folders, but I would have none of it, and I told her I didn't care to read trash. She cornered me, however, while I was lying in the hospital with nothing to read. My wife was my only visitor, and she saw to it that all the reading matter that reached me was those folders, with little stories of economics, that she had been keeping for just such an opportunity. Those little folders were to accomplish that

which I thought was impossible. They did accomplish it. At first I protested strongly, but finally I gave in. I read thirty-six folders in all, and I admit I was confused. Everything was simple and clear, but I was dyed in the wool, and these truths were opposed to the theories I had held as truths for many years. My beliefs were not easily changed. Time passed, and I came out of the hospital with a great big problem in front of me—what to do? Shall I get work in Bridgeport, my old environment? What shall I do? I finally determined to leave. I chose Philadelphia. I did not admit to myself that I chose that point because it was from there I received my light. It is peculiar, it is really mysterious, the workings of the sub-conscious mind.

I came to Philadelphia. I called upon the secretary of the industrial relations committee of the Chamber of Commerce, who directed me to the American Educational Association. After meeting several secretaries I was finally brought face to face with the editor-in-chief, who is the greatest economist with whom I ever came in contact. His outlook upon the masses is much broader, farther advanced than any I had known. Interpreting natural law as a scientist, in the simple language of the layman—understanding was easy. I told my story and asked what I could do in order to undo the great amount of mischief I had done in this great country. He looked upon me quietly and said: "The same way you have spread destructive thoughts you can convey constructive ideas." I took his advice.

Spread Facts and the Constitution

There are twenty million workers all over the United States who are kept in the dark as I was. Some of them are your workers who are getting a constant stream of radicalism through propaganda or literature. Now, why not use your influence, by giving them the right kind of reading? What is that right kind of reading? What is the necessary education? Is it not the simple fundamentals of the Constitution of the United States, which gives them an opportunity to work for whom they will? Is it not of the simple fundamentals of capitalism, showing where it is designed to reward the industrious in conformity with their skill and application? Is it not that of giving to them the economics of industry in plain simple words, so they can understand, whereby they see that unit production gov-

erns everything, that the less there is produced the less there is to go around, and that there is no panacea to overcome the workings of natural law? Is it not to give the men who work for you the plain, simple fundamentals of getting ahead, those principles you have worked out, that have placed you in the position you occupy today, recognizing those great opportunities that you know exist for all?

Are you not inspired to carry the truth, within the scope of your influence, to your own workers, to overcome that false and lying plea of radicalism that is attracting their attention and interest? Give them a copy of the document that was penned by your forefathers. Give them a copy of the manuscript that stands as the emblem and pride of your nation, of my nation and of all the nations—a manuscript which was won through heroism, through sacrifice and suffering—the most sublime paper ever written by man, the Constitution of the United States. These fundamental laws—with an explanation to those who need explanation—are the greatest and most powerful to overcome the radical poison reaching the workers today. Give them the truth about production, instead of the falsehoods the radicals are giving them. Give them in plain, simple words, perhaps for the first time, the truth about capital and labor, and show them where their best interests lie.

STOPPED 12 INCHES FROM CHILD

Engineer W. E. Phillips, Memphis division, by his watchfulness and quick judgment, saved the life of a child while handling train No. 26 on June 10. The train was moving at the usual rate of speed, just south of Davenport, Miss., when Mr. Phillips observed something on the track. At first he thought it was a dog. When he could tell what it was he immediately applied the brakes in emergency in an effort to stop. A little negro child, about 2½ years old, was sitting down against the rail on the fireman's side. Fireman Arthur Bridges went out on the step in front of the engine to pick it up, but Mr. Phillips brought the train to a stop when only about twelve inches from the child. A negro living nearby claimed the child, explaining that it had run away from its home and wandered on the track. Mr. Phillips has been in service on the Memphis division for fifteen years, and the character of his service is manifested in this instance.

C. & O. Editor Heads Railway Safety Work

L. G. Bentley, general safety agent of the Chesapeake & Ohio Railway Company and managing editor of the *Chesapeake & Ohio Employes' Magazine*, was chosen chairman of the steam railroad section of the National Safety Council at the recent meeting of that organization in Detroit, Mich. Mr. Bentley is one of the best-known railway safety men in the country, and the honor which comes to him is the natural result of his recent achievements in this field.

Mr. Bentley started his railway career as a telegraph operator for the Norfolk & Western in 1892 and went into the employ of the Chesapeake & Ohio in the same capacity at Richmond, Va., May 8, 1892. He served in turn as telegraph operator, agent and dispatcher until July 8, 1908. In this period he represented the telegraph operators on their general committee, first as local committeeman, then as secretary and later as general chairman.

July 8, 1908, Mr. Bentley was elected by the board of governors as superintendent-secretary of the Chesapeake & Ohio Hospital Association. January 1, 1913, he assumed additional duties as secretary of the general safety committee. Beginning at that time he developed from a 2-page pamphlet the present successful *Chesapeake & Ohio Employes' Magazine*. November 1, 1918, he left the service of the hospital association to assume charge of the railroad's newly created safety department as general safety agent.

L. G. Bentley

Mr. Bentley has been chairman of the program committee of the steam railroad section of the National Safety Council for the last two years. He performed a like service for the safety section of the American Railway Association at its meeting in Chicago in May of this year. He is also a member of the committee on prevention of highway crossing accidents for the safety section of the American Railway Association and chairman of the subcommittee on publicity.

No Accident in Four Years

Said the Lena (Ill.) *Weekly Star* of July 20: "Ralph Ebert, our Main Street crossing flagman, keeps things spick and span around the crossing. Besides caring for the safety of pedestrians, autos and vehicles, Mr. Ebert takes great pride in his two beautiful flower beds on the lawn east of the crossing shanty. He also has a very nice little park along the right-of-way. Ralph is always on the

A Careless Man

A man, he saw a horsefly fool
Around the hind legs of a mule.
To shoo it off that man knelt down.
He rose up with a harp and crown.

Another man stepped on the gas
And tried a railway train to pass.
He reached the middle of the track.
And now he twangs a harp—alack!

—Exchange.

alert to safeguard the public at this crossing, and when he puts up his 'Stop' signal you can rest assured there is danger in sight."

Here we have some pictures of Ralph Ebert and his park, with its four cherry trees and two flower gardens. In addition to keeping his surroundings beautiful, he saves lives, as there has not been an accident at his crossing since he took charge of it four years ago—September 1, 1918. The sign he uses he painted himself.

Mr. Ebert started working for the Illinois Central as a section laborer at Warren, Ill., in October, 1916. June 16, 1917, while help-

ing the gang unload gravel from the cars, he was injured so that he lost his leg. Fourteen and one-half months later he began his service on Main Street at Lena.

Ralph Ebert and his park

Mark Twain on Effective Selling Talk

"He was the most eloquent orator I ever listened to. He painted the benighted condition of the heathen so clearly that my deepest sympathy was aroused. I resolved to break a lifelong habit and contribute a dollar to teach the gospel to my benighted brethren.

"As the speaker proceeded, I decided to make it five dollars, and then ten. Finally, I knew it to be my duty to give the cause all the cash I had with me—twenty dollars. The pleading of the orator wrought upon me still further, and I decided not only to give all the cash I had with me, but to borrow

twenty dollars from my friend who sat at my side. That was the time to take up the collection.

"However, the speaker kept on, and I lost interest, and finally dropped off into sweet slumber, and when the usher woke me up by prodding me in the ribs with the collection plate, I not only refused to contribute, but am ashamed to state that I stole fifteen cents from the plate."

Of course, the above is Mark Twain. And it applies right here, and is well worth repeating—don't oversell to your customers.

The Earliest Days of Our Indiana Division

*E. R. Alexander Recalls Building of Road and
Arrival of First Locomotive at Palestine, Ill.*

E. R. Alexander, employed in the office of the auditor of freight overcharge claims, Chicago, recently regaled the readers of the Palestine (Ill.) Register with the following chatty account of the early days and old-timers of the Indiana division:

SOME TIME in 1869 or 1870 I went to Robinson with my father on a load of woolen goods from his factory to be shipped on the Paris & Danville Railroad, which is claimed to have been stolen from Palestine along the same lines that are now being worked with the new hard road.

While there I saw my first locomotive and was duly impressed by the wonderful sight, which aroused in my childish mind visions of my future career in which the railroad was to play an important part.

From that time for a few years our only railway activities consisted in playing along the old north and south railroad which had been graded and finished for the track (which never came) extending from Hutsonville to below Palestine in the direction of Vincennes.

About 1872 or 1873 there began to be rumors of an east and west railroad which was to be built through Palestine, extending from Cincinnati to St. Louis or possibly to Quincy and beyond; it was given the euphonious title of "Quincy, Pason & South-eastern," but it never materialized. Growing from this enterprise developed a hybrid proposition beginning nowhere and ending nowhere—just an east and west railroad.

Construction of Real Railroad Begun

In some manner E. Pratt Buell and his box of cigars became interested and with his unlimited gall and glowing accounts he succeeded in raising enough capital to make a start. Points of construction were chosen as Robinson, Newton, Effingham and Sullivan, from which points the enterprise developed in each direction and finally united in the old Indiana & Illinois Southern Railroad, ninety-one miles long, extending from Effingham, Ill., to Switz City, Ind.

Some time in 1875 it was learned that there was actually a trainload of material unloaded at Robinson for the new railroad. Palestine immediately proceeded to cele-

brate, and a mass meeting was called to assemble at night in Den Donnell's pasture above town, where speeches were made and a bonfire lighted and a general jubilee indulged in. (Incidentally Jim Gullett got his new wheel chair the same day and said the town was helping him celebrate instead of boosting the railroad.)

In a short time active construction began from Robinson toward Palestine, assisted by Percy Brimberry and his mules. (When has anyone ever thought of those mules before? But any old timer who does not remember them has a short memory, indeed.) My first contact with the new enterprise was at the "sand cut" just east of Gordons, near the old red barn of J. M. L. Hill, where I viewed with admiration the activities under the direction of Mr. Cooney and his gang of "Paddies." He was later superseded by Abe Cantwell, who brought the track into Palestine and on to the Wabash River, where it was later joined by the eastern end of the road.

The advent of the "Paddies" in Palestine was of short duration, as they moved on to new fields of activity, but one of their number, more intelligent than the general run, remained and later became our permanent (almost) officeholder. I refer to John Broderick, who was elected as assessor for a number of times until it seemed to some that he had a life tenure of the position, but was finally defeated the year I attained my majority, in 1885. He evidently could not stand defeat, as he shortly left for parts unknown.

Arrival of Road's First Engine

The various sections were finally connected, with the exception of the bridge at the river, at which point freight and passengers were transferred by ferry boat. A short time after the track was laid to the river, one afternoon the residents of Palestine were startled by an unearthly racket emanating from some point west of the town, which brought the assembled citizenry to the west side of the town wondering what on earth was about to happen and whether they should make their peace with their Maker or make a run for

their cyclone cellars. Eventually it was learned that a locomotive was coming to town on the new railroad. After a wait of thirty or forty minutes smoke was seen over the tree tops about my grandmother's farm (now the Hotchkiss place), and in due course of time the contraption put in its appearance and was escorted in state by the multitude to its destination in Palestine, where it was immediately christened the "Rackaramus," which name it bore until its final exit. For a time it was the sole representative of the new railroad's motive power.

When the gap between Robinson and Newton was closed a real engine (the "Odell"—named for Judge Odell of Oblong) was brought in and put in active service. Later there was another "iron hoss," a little better than the "Rackaramus," added to the rolling stock, and active service began. A time table was published, and service started between Effingham and Palestine consisting of a "turn around" passenger train and a tri-weekly freight service (get in one day and try to get back the next), bringing Palestine in direct connection with the outside world.

The first general office was at Robinson. Charles Steele and (I think) Speed Price were two of the officers. In a short time Sullivan capitalists predominated, and the offices were moved to Sullivan under the presidency of Perry Blue, at which place they remained until the road passed under the control of the Illinois Central.

The Change to Standard Gauge

In due time there was a wooden bridge placed across the Wabash and through service put on between Effingham and Switz City, the engine "Wolfe" being added to the motive power. The bridge, however, was short lived, as it was destroyed by high water and an ice gorge, which completely demolished it and almost wrecked the road financially. The bridge was replaced by a new iron structure, the road was once more "placed upon its pins," and all went smoothly for a time.

Originally built as a narrow gauge it was handicapped from the fact that all freight had to be transferred at all points of interchange. In 1887 (I think it was) the rails were spread to conform to the standard gauge, and we had a regular railroad, which answered the purpose for a while until the tires began to rot and the old narrow gauge

rails became too weak to bear the loads of standard equipment. The road became unsafe for man and material and was about ready for the junk pile when the Illinois Central took charge and made it the valuable property it is today.

Palestine, being about midway between the terminals and near the break at the Wabash River, was favorably situated as an important point in the development and operation of the railroad and has succeeded by good luck and good support from its enterprising citizens in reaping much benefit from the road. The shops, while never very elaborate, have always been located at Palestine, have proved of great benefit to our community and have been a large factor in the upbuilding of the community.

Troubles of a Master Mechanic

The first master mechanic, I think, was a Mr. Whittlesy, who kept them going until in a heated discussion with E. Pratt Buell he intimated that Mr. B. was a liar, to which E. Pratt replied: "Better men than you have sworn to that." Which terminated the interview, as well as the services of Mr. W.

He was superseded by a Mr. Pickering, who kept the wheels turning, with the help of Dan Mills, blacksmith, and John Markee, Tom Batey and John Johnson as "the force." Mr. P. was a stickler for correct form, as instanced one day when John Johnson had occasion to remark that something was a "right smart" out of line, whereat Mr. P. said: "John, how much is a 'right smart'?"

To which John replied: "Well, Mr. Pickering, right smart is a d—— sight"—which closed the interview.

Mr. Pickering was superseded by M. E. Hotchkiss, who had his full quota of trials and tribulations, as during his incumbency the road was in its death throes. Only by his untiring efforts was the operation of the road made possible. However, he was known as the most efficient wreck expert in the country, and certainly he had experience enough to make him an expert. It was not unusual for his wreck crew to be out on duty for weeks at a time, part of that time being employed in putting its own train on the track.

Some of the Old-Timers Recalled

Of the operating force I can call to mind a few of the old-timers. I think it was Charley Larsen who brought the "Rackaramus" to Palestine on its first trip. Joseph Loughery brought the "Wolfe" on its

first trip across the Wabash bridge. Another old-timer was Charley Cope, who, when his engine "turned turtle" near Gordons, kept on the top as it rolled and landed right side up unhurt when the engine reached the bottom. William Taylor was among the early engineers and located in Palestine when retired. The Norton boys, Scott and Paul, served their apprenticeship on the old I. & I. S. and were in active service until the A. R. U. strike, when they emigrated to Nebraska, taking positions on the C. B. & Q. Ed Mullins was also a Palestine product who entered service with the road and served for a number of years. Other "hog heads" I can recall to mind, but I find that I have forgotten the names. I note a few Palestine boys still among the present force of engineers who are looking forward with regret to their last run, but who will be found game to the end. I also note a few who were with the road during the time that I "pounded the brass" in the troublesome days of the I. & I. S., among them Tom Connor, one of the Hale boys, Frank Courter, John Sumner, Fred Mascher, Charley Wilson and Harry Hulse.

The first conductor was Ed Buell (son of E. Pratt), who ran passenger for a number of years, followed by some whom I am un-

able to remember until the advent of "everybody's friend," Charley Ackerman, who retained the run until retired. While under the Illinois Central I think the first freight conductor was Charles Stiles of Robinson. When through service was begun I call to mind Tom Keith, but cannot recall the name of his partner. They were followed by "Duff" Selby and Emmett Gray, Jim Borders and Ed Brown, Danny Nichols substituting.

The brakemen and firemen came so often and left so soon it is impossible to recall most of them. Among the first I recall were Ed Cunningham, "Lengthy" Martin, Al Leatherman, Paul Joyce, John Ivy, Edgar Vane (now one of the higher officers of the division), Pearce Mills, the Bratton boys, Ed and George, Mose Mullins, Noel Carver and various and sundry "shacks" and "tallow pots" who have made good in their lines and are enjoying their reward in higher and better positions. From the days of the old link-and-pin to the present automatic coupler and air brake was a long road to travel, and to those who have been through the mill the present day brakie appears to be drawing a pension.

Numerous Wrecks Cost Money

Considering the financial condition of the road and the hard working conditions, there were but few labor troubles. I remember but one strike of any consequence, and in that one no act of violence was attempted, except when a big Swede, mistaking Charles Wilson as a spy from the manager's camp, gave him a slight manhandling, but no serious damage resulted, and all was settled satisfactorily to all concerned.

The numerous wrecks were a source of much expense to the company and a constant source of annoyance to the patrons, but I do not recall a death caused from a train wreck. While the road was under construction, as I recall, there was two fatalities: George Norton, who fell from a trestle, and Lou Bouschard, who fell from the Wabash bridge while it was under construction. Other fatal accidents were that of John Beam, who was run over by an engine while at work in the yards, and Roy Thompson, who was killed in active service.

Before the advent of the telegraph Guy Wilson was put in charge of the office at Palestine and attended to the station duties, assisted by his son, Henry, who studied telegraphy in order to take the position when the wire was brought in and the in-

Good Humor Is Contagious

We cannot, of course, all be pleasant,
And it's hard for us all to be good.
We are sure now and then to be
lonely,
And we don't always do as we
should.

To be patient it's not always easy;
To be cheerful it's much harder
still;
But at least we can always be
pleasant
If we make up our minds that we
will.

It pays every time to be kindly,
Even if you feel worried and blue.
If you smile at the world and look
cheerful,
The world soon will smile back at
you.

So try to brace up and look pleasant,
No matter how long you've been
down;

Good humor is always contagious,
But you banish your friends when
you frown.

—F. S. OLIVERI,
*Engine Foreman, New Orleans
Terminal.*

struments installed. However, he was not ready at that time, and "Linen Duster" Daugherty was the first one to "pound the brass" in Palestine, later followed by Joe Davis, Ol Condrey and George Merrick, up to the arrival of our old friend, Sam Kelly of Casey, who held the job for a year or two. "Jolly Joe" Willard was the next victim and kept things going for a while.

During the incumbency of Kelly and Willard my brother, Fred, was preparing himself for the position, which he took when Willard was transferred. Fred held the position for a short time and was superseded by Frank Lindsey. When Frank quit Fred was again put in charge and remained until transferred to the dispatcher's office at Sullivan.

Breaking in as a Telegrapher

In the meantime I had attended the telegraph school at Terre Haute, and in 1891 had the nerve to tackle a position, being sent to DeMotte, Ind., on the I. I. & I. among the hay diggers. I lasted just one week and beat it for old Palestine to finish my course. After a little more preparation I went to Waveland Ind., and landed in a position for a road that was in a worse condition than the I. & I. S. I remained there two weeks, trying to collect enough freight money to pay my fare from Brazil to Palestine, but had to give it up and send home for the funds.

In December, 1891, Fred was transferred to Sullivan, and I was given the station agency at Palestine, with Ira Merrick to do the telegraphing until I got so I could take a train order, when I was put in full charge at the munificent salary of \$37.50 a month. I held the position for five years, during which time I never saw the pay wagon, and when checked out was carrying three years' salary on my "on hand" report.

The trials and tribulations of the road were many during my service at Palestine, due to the decaying condition of the road-bed and rolling stock. In 1896, when I left the service, it was said that there was not a whole rail between Effingham and Sullivan, the road being in fact "two streaks of rust and a right-of-way." I have seen a coal pick do service as railway iron, and gaps of three to five inches in the rails were of common occurrence.

In Newspaper Work and Railroadng

In 1896 I got the wanderlust and left the road to make my fortune in the newspaper field, choosing for my field of operation

Princeton, Ky., at which point I established a Republican newspaper, but found, as my cousin in Vervailles, Ky., put it, "the whites all Democrats and the Republicans all negroes." We managed to reach Evansville minus our original capital and, with the kind assistance of friends, landed again in Palestine, satisfied to try the railway game. I went back to Evansville and took a position with the old "Air Line," which I held for about a year. Being afraid something might happen in Palestine and I would not see it, I moved again and assisted brother Harry to enlighten the people of Palestine in the newspaper way. Two years of this, and the railway bug got me again, this time taking me to Brazil, where I gave my valuable services to the Indiana Midland and the C. & E. I., later transferring to a position as bookkeeper in a brick yard at that place.

Nineteen hundred and one found me again in Palestine. The easy positions on the railroad at Palestine being all filled, I had to look for pastures new, and, together with Ed and George Bratton, landed in Fort Dodge, Iowa, where I took service with the Illinois Central, transferring to Chicago in December, 1901. Three years in the local office and eighteen in the general offices of the Illinois Central complete my railway record to the present time, but I hope to be spared for many future years in which to round out the first hundred years, which I am told are always the hardest.

Maintenance of Way Department **Material Means Money** **Save It**

Dry Cells

Dry cells are cheap to the saying,
dear to the wasteful.

—Poor Richard III.

It will no doubt interest those of our employees who have occasion to use dry-cell batteries to know that during the last four years the Illinois Central System purchased 262,910 dry cells at a cost of \$71,156.45. This represents an expense of \$58.13 for each working day.

The annual cost of these dry cells, capitalized at 6 per cent, equals the interest on an investment of \$296,487.

Much of this expense is due to lack of care in handling and using the cells. Few users of dry cells realize that they require considerable care and that large numbers are ruined or badly damaged through improper handling and storage even before they are placed in use.

Dry cells should never be stored with the terminal end down, nor should the cells be laid on the side; they should always be stored with the bottom down. In receiving dry cells for storage, those in charge should mark the date of receipt on each cell, issuing them in the order of receipt, the oldest ones first.

Dry cells should be stored in a dry, cool place and never near radiators or steam pipes, as excessive heat will wear the cells out more quickly than continuous use in actual service. On the other hand, they should never be allowed to freeze.

Old, weak cells should never be used in the same battery with fresh cells, as the strength and life of the battery will be only that of the weakest cell.

In using an ammeter or battery tester, touch the terminals firmly, but remove the contact as quickly as the reading is obtained. Prolonged contact will short-circuit the cell and run down its strength quickly.

Many motor car operators have the erro-

neous idea that seven or eight dry cells are necessary to provide an efficient spark. Four or five cells are sufficient for any motor car battery and will provide just as good a spark as eight cells, with about three times the life of the 8-cell battery. The 5-cell battery has an added advantage in the fact that it will not burn out the coils and contact point so quickly as one with a greater number of cells, thus actually furnishing more reliable ignition.

HOUSE PLANS FOR OUR READERS

Concrete

This gabled house, with such a continental charm, is called the Lyndhurst and was designed by George H. Schwan, architect, of Pittsburgh, Pa. It is listed as No. 6203 in the booklet of concrete houses issued by

the Portland Cement Association, 111 West Washington Street, Chicago, Ill.

The steeply pitched roof and gables of this charming house are reminiscent of northern France and illustrate a style that is rapidly coming to vogue, especially in

California. Its use, however, is not confined to these parts, as the original design from which this drawing is taken was first built in Ohio and has proved popular elsewhere, as well. The house is thirty-six feet wide, requiring a lot forty-five feet wide.

A fine living room, with a fireplace, occupies the center of the frontage, with a

recessed entrance porch and hall on one side and a large open porch with arched entrance on the other. Behind this are a dining room and kitchen, and above are three bedrooms and a bath. The house is designed for a south aspect and would look particularly well on a corner lot fronting south and west.

Tennessee Operator Boosts Fox Hunting

Thomas G. Marlin, second trick operator at Rives, Tenn., is an ardent lover of fox-hunting. He finds supreme pleasure in all outdoor sports, he says, especially those that require animals as participants. He finds the lives and habits of all domestic animals of great interest, and he classes them among his best and most dependable friends. Breeding good fox hounds is a hobby of his.

T. G. Marlin

An annual fox hunt is held at Reelfoot Lake, which is near our line at Rives. This year's hunt was started September 4 and lasted six days. It was the twelfth hunt at that place, and Mr. Marlin was one of the most enthusiastic supporters.

Fox hunters from all parts of the United States attended the meet with their dogs. There were about 100 men and 125 dogs. Hundreds of spectators gathered to watch the hunt, and tents were pitched close to

the shores of Reelfoot Lake. One of them, about 200 feet long, served as a dining place.

The dogs were loosed several times each day on the trail of lively foxes, and the hunters followed on their horses. When the men returned to camp for their meals there was never much left on the long table that had been burdened with chicken, barbecued mutton, pork and other choice foods.

One of Mr. Marlin's dogs

All set for the fox hunt

CLAIMS DEPARTMENT

Employee Loses Damage Suit.

W. T. Selvage, 64 years old, employed as a car carpenter at New Orleans, in March, 1921, was one day told to replace a glass which had been broken in a coach window. He went to the coach and found part of the glass still in the frame. While trying to take it out he permitted the window to fall, which caused the glass to come out and cut his wrist badly. Ordinarily the cut would have caused a disability of only two or three weeks, but because of some other trouble the disability was considerably prolonged.

It was evident that no one could be at fault for the accident unless it was the injured man. However, he became the victim of bad advice, and, although several efforts were made to settle with him by allowing part of his lost time and letting him go back to work, he wanted to be allowed all the time lost and heavy damages besides. He finally filed suit in New Orleans for \$21,000.

The case, tried in June, 1922, resulted in a peremptory instruction for the railway company. The result was, of course, a great disappointment to Mr. Selvage. He had a belief which amounted to an obsession that he was going to recover a very large sum. He prepared several elaborate drawings of the car window, showing the broken glass, and drawings highly colored showing his arm and hand, the glass falling on the arm, the cut and the blood flowing from the wound.

There are few things more hopeless than to try to disillusion a person who thinks he has a sure thing in a damage suit. This poor man has not only lost the substantial sum which was offered him in settlement, but has lost many months by waiting and preparing for his trial. The lost time he has suffered since he could have returned to work greatly exceeds that due to the injury.—E. W. S.

In the suit referred to above the attorneys for the railroad desired a model of the coach window, so as to be able to demon-

One Hundred Four

J. N. Chapman

strate to the jury how the accident occurred. J. N. Chapman, district mechanical foreman at New Orleans, made an exact and complete model of the window, which greatly pleased the attorneys and no doubt contributed to the satisfactory result of the trial.

Mr. Chapman was graduated from high school in 1903 and entered the shops at Water Valley, Miss., as storeroom attendant under W. H. Watkins, master mechanic. After four months he was promoted to be timekeeper for the general car foreman. He entered the shops as a machinist apprentice August 18, 1904, and served an apprenticeship four years. In July, 1909, he was appointed night round-house man, and after eighteen months he was promoted to day machine shop foreman.

In July, 1911, he resigned to accept a division foremanship on the Missouri Pacific, but returned to the Illinois Central as assistant general foreman in 1912. He was made general foreman, succeeding C. C. Christy at Water Valley, Miss., February 6, 1916; was assigned to valuation work in the mechanical department at Chicago July 9, 1918; was made general foreman at McComb shops in October, 1918, and was later sent to New Orleans as district foreman, a position he is still filling to the credit of himself and the Illinois Central.

Mr. Chapman has been a diligent "safety first" worker and an eager participant in efforts made at New Orleans to reduce personal injuries. In fact, he is a diligent worker in any line which is to the interest of his company and associates in the service.

Commission Decides for Company

Louis McCall, formerly employed as a car

Illinois Central Magazine

repairer in our shops at Mattoon, Ill., recently brought an action against the company before the Industrial Commission to recover compensation, claiming that he injured himself while handling a car wheel on December 31, 1921. He called on varicus doctors, who told him that his condition was not due to an injury. Nevertheless, the company offered him what it considered a reasonable settlement, which he refused to accept, but demanded a large amount of money. With the assistance of an attorney and a couple of witnesses, McCall presented his side of the case before the Industrial Commission, which, after hearing the evidence on both sides, recently decided in favor of the railway company on the ground that McCall's condition was not due to the injury alleged.

Says It Partly in Rhyme

"Uncle Ike" Morrison, an old soldier of Effingham, Ill., who served as a witness in a damage suit involving the Illinois Central, recently addressed the following self-explanatory, half-prose, half-verse letter to Claim Agent C. D. Cary of Kankakee, Ill.:

"As I was sitting out under my grapevine this morning enjoying the rich aroma of the fruit, I was counting over my many blessings, and at first I thought the beauties were the best, but on more sober reflection I counted my friendships to be the dearest under the earth, and then who is it that you can count as your friend?

"In looking back over the long list of my acquaintances during my long life, there came to my mind an Irishman with whom I have been associated on various occasions. Indeed, he is a man whom I have great confidence in and think a lot of; and then I wondered why he had forgotten a poor, old, gray-headed and gray-whiskered soldier who toiled laboriously to and from the courthouse in the city of Effingham in order that he might make known to the world, and especially to the jury, the facts as he knew them pertaining to an alleged crossing. I recall a visit made to me by that friend and how I said unto myself: 'Hooray! I will execute this job with joy, for Charlie's the ready money boy.' And laying all other things aside I straightway to the courthouse hied, and very boldly approached the throne of justice, only to be informed by a cold-blooded bailiff that I should outside remain and there I waited, sweated, fretted and fussed, until at last the task complete,

I journeyed back home again, there to rest; and all the bill you had to pay was just a few dollars, a sum so small I would not have mentioned it at all, if it were not that I, as well as you, must meet H. C. L., and you realize, no doubt, that (even with the booze cut out) when we are forced to pay out more for living than we did of yore—when beans and cheese and rent and ice have hit the ceiling as to price, when eggs a dozen cost a dollar and 50 cents won't buy a collar, and even taxes have increased—a few paltry dollars help a bit, at last.

"Now, Charlie, I am old and getting gray, my body soon will be laid away in some damp grave, both cold and deep, and take

PREVENTS CLAIMS

L. E. Whatley, supervisor at Greenwood, Miss., shown here, has been in the service of this company twenty years. He started as a track laborer, but soon became foreman and later supervisor, in which capacity he has been engaged several years. While his track duties are hard, he still finds time to talk to planters about keeping stock off the right-of-way and to the men about preventing personal injuries. He is never too busy to lend his aid and services to the claim department, and he has been successful in preventing claims. His assistance to the claim agent has been the means of saving considerable money for the company. Photograph by H. W. Hagan, claim agent at Greenwood.

its everlasting sleep, but I expect my soul to fly to golden mansions in the sky (for I do not propose to dwell in purgatory or in hell); and when I am there I will watch and wait beside the Guardian of the Gate, until at last there looms in view a form I recognize as you; and then when Peter turns his eye on me and says: 'Who is this guy?' I'll say: 'Your reverence, he's all right; I knew him well, he knew no spite; he eased his fellow mortal's ills, and (best of all) he paid his bills.' And then the saint with smiling face will say: 'He's reached the proper place; you have given him a title clear, and he may freely enter here; now you may take him by the hand and lead him through the promised land.' I'll take you where they keep the things that angels wear and fit you with a pair of wings, a

golden hat, a robe and crown, and then we both will sit us down upon a pink and purple cloud and sing a chorus long and loud (but at this point I pause to say that ere that song gets under way I'll have to get a heavenly throat for now I cannot sing a note).

"And, Charlie, don't take this for a dun—it surely is not meant for one. 'Tis only penned lest you forget and thereby cause undue regret. For on the final reckoning day, your sponsor may be forced to say: 'The credit ledger shows this guy is just a few dollars shy.'

"Charlie—laying all jokes aside, I do want to say that I would like to go to Des Moines, Iowa, to the G. A. R. encampment, which will begin September 4, and could use the dough."

Pays Tribute to Memory of Tom Kennedy

On page 109 of the April issue of the *Illinois Central Magazine* appeared a story regarding the life and death of Tom Kennedy, negro chainman on the Kentucky division, who was well liked while in service and who was honored by having a monument erected in his memory by the employes of the division. A high officer of another railroad, whom Tom served on the Kentucky division, has prepared the following memorial on Tom's qualifications for acknowledged service in the engineering profession:

"Service—

"Of his, it can be written,
As a plan: without dimensions
Nor from the transit's record
Or by the protractor's radial edge;
But inscribed with the steady lines
Of faithfulness and obedience.
The call of duty only marked his day's
beginning;
Fatigue, the end.
Daylight differed only from darkness in
Its greater adaptability to the work of
his profession.

"His service was a Monument.

"Reliability—

"Of his, it can be written:
That it was a virtue, unaffected
By diversions tempting away from
Constant sense of responsibility,
Developed to that degree which
Relieved employer from all concern
Of response when duty called.

"His reliability was a Bench Mark.

"Loyalty—

"Of his, it can be written:

It was a sacred thing,
Born in the closing slavery days and rich
In affectionate dependence and obligation;
Not diluted by modern doctrines of
Discontent and envy.

"His loyalty was a Foresight.

"These things were elements as fixed and exact

As the mathematical tenets of the profession he served.

Upon them he designed and builded his life structure,

And he earned his degrees—

Not in cap and gown,

Nor with sealed diploma,

But by the sincere and spoken endorsement
Of those with whom he associated.

Consistent in all these things he followed
The teachings of the Great Engineer, and
His Handbook of Life."

NECESSITY OF SAYING

I have often been asked to define the true secret of success. It is thrift in all its phases, and principally thrift so applied to saving. Saving is the first great principle of all success. It creates independence, it gives a young man standing, it fills him with vigor, it stimulates him with the proper energy; in fact, it brings to him the better part of any success—happiness and contentment.—

SIR THOMAS LIPTON.

HOUSE PLANS FOR OUR READERS

Southern Pine

An unusually large number of requests developed from the notice printed in the September issue of this magazine regarding the booklet of house plans to be obtained free of charge upon application to the magazine. In fact the demand made it necessary for us to replenish the supply furnished by the Southern Pine Association, New Orleans, and many of the booklets were somewhat delayed in mailing out to the employees desiring them. If anyone who wrote has not received a booklet by the time this magazine appears, another note to the magazine office will bring a copy by return mail.

From the trend of the requests it appears that many employees are owners of lots and are making a careful search of plans to be sure that the home-to-be will be all that it should be. One of the older employees, in requesting a booklet, explained that he and his wife had been looking forward to building for many years and that they were going to have a place according to their own ideas before it came time for retirement.

If the magazine can encourage employees to become owners or builders of homes and can help them in the selection of plans, then the trouble of offering these plans from month to month will be considered well worth while.

The booklet contains fifty pictures and plans such as those shown herewith. It is

furnished by the magazine through the courtesy of the Southern Pine Association. The American Wholesale Lumber Association has also arranged to co-operate through the local lumber dealers and is prepared to give advice regarding the formation of building and loan associations and other means of financing home building.

Hospital Department

How Some Baths Are Better Than Others

WATER should be frequently used for bathing purposes for just one object—to keep clean. Cleanliness, whether of the person or of inanimate objects, is the foundation of all health. The skin throws out upon its surface the secretions of the oil and sweat glands, and these secretions dry, accumulating while in a moist state dust and dirt and when dried holding this undesirable covering in the form of what is commonly spoken of as dirt. This dirt is objectionable not only for its looks, but also for its odor, which is highly objectionable to all with whom its owner comes in contact.

Dirt also stops the mouths of countless sweat and oil glands. This plugging process, if unrelieved, produces in time a favorable condition for the catching of disease, because the waste products of the body are not carried off and, accumulating, produce a lessened resistance to the entrance of disease. It is the duty of every person to bathe frequently enough to keep clean. A clean person, clean clothing, a clean house, a clean coach or railway station are so many forms of that habit of cleanliness which is one of the fundamental elements of self-respect and proper living.

This habit of cleanliness is also one of our defenses against sickness, and one of the strongest bulwarks which it is possible for us to erect.

A Few Words on When to Bathe

Now as to when to bathe, for bathing indulged in at improper and incorrect times is productive of possible illness. The early morning, immediately upon arising, is one of the best times to bathe, and let it be said the bath should be taken in a fairly warm room, and not standing in a tub filled with cold, still water. Stand in the empty bath-tub and let the water run; use a sponge, the hands or a wash cloth; immediately follow the bath with a vigorous rub with a rough towel. This brings a healthy glow to the skin surface and is followed by a feeling of health.

One naturally asks, "Shall I take a cold

or a warm bath?" The reply is that this matter is one which you will have to decide for yourself, for the reason that bathing affects persons differently, and you will have to ascertain whether you feel better after a cold or after a hot bath. The effect—cleanliness—is the same, but due to the effects upon the nervous system you will feel better or worse after taking your bath in either hot or cold water. In general, it may be said that a hot bath is not advisable when used alone, but should always be followed by the application of cold water and the use of a rough towel.

Some persons cannot stand a cold bath, but it is usually more tonic in its effects upon the nervous system and much more commendable in every way; so take your bath cold when you have found by experience that you can stand it. The relation of the bathing time to eating is important, inasmuch as bathing draws blood needed for the process of digestion to the surface and away from the centers around the stomach where it is most needed. Therefore, it is best not to bathe until three or four hours after eating.

How Best to Take a Hot Bath

Just a word in regard to the hot baths, which some feel it is necessary to take in order to be clean. In the first place, always follow a hot bath by the application of cold water, because the hot bath is relaxing to the skin, muscular and nervous systems, and the application of cold water is required to overcome this relaxed condition and to produce the proper healthy tonic effect of a bath. Second, it is better to temper the hot water to cool and to supplement the lessened temperature by vigorous rubbing to loosen such dirt as adheres to the skin, using soap to aid in this process. Third, the bather will get all the benefit of the bath if he or she uses cold water and a rough cloth or bath towel to apply the soap, thus drawing the blood to the skin surface and producing the tonic effect which should always follow a bath. The use of the flesh brush is desirable in order to reach parts

difficult to reach in other ways; it gives the skin a vigorous frictional cleansing and stimulating effect equal to that attained by the use of a rough towel.

The following rules are applicable to all baths:

Do Not Prolong Cold Baths

First—Cold baths should not be prolonged. To stay in a cold bath longer than

A Nocturne of the Rails

The world is still, and all the town is sleeping.

The morning comes. Some waken with the light,
And some in pain awake to sunlight peeping—

The engine whistle called it in the night.

And some there are whose sorrows distance sleep,

Those whose tomorrows never will be bright,

With wretched souls and eyes that will not weep,

Who long to hear the whistle in the night.

Those little towns the railway tracks divide

Are quite aggrieved and keenly feel the slight

If rushing trains with mighty roaring stride

Should fail to whistle to them in the night.

"I bring a bride unto her waiting mate;

I carry mail, ten tons, yet do not write.

Oh! how I fly to reach the city's gate"—

The engine whistle echoes in the night.

"And in my wings I bring a lusty youth

Unto his home to greet his new-born sprite;

For I am Joy and Hope and Love and Truth,"

The engine whistles through the lonely night.

Ah, me! we hear the engine's clear nocturne,

Borne o'er each field and creek and depth and height;

Telling us of a truth we would not learn—

That all the world is not asleep at night.

—HERBERT W. CANN, *Vice-President, Hurst Commercial Club, Hurst, Ill.*

a minute is undesirable, and the practice of filling a tub with cold water and then standing therein for the length of time required to bathe the entire body is not good, for the reason that the entire system is depressed and the temperature of the blood pulled down to its lowest point. It also produces a tendency toward congestion of the internal organs. This in some cases is dangerous, and a proper reaction cannot be produced by the most vigorous rubbing. Stand in the empty tub and bathe in running water, thus avoiding any possible danger. The shower bath with small holes for the delivery of water (the needle shower) is an excellent and safe method of using the cold water bath.

Second—A cold bath should be taken when the skin is warm; a favorable and proper time is the early morning just after arising. This time—or immediately after exercise or after a hot bath—is the most auspicious period for the cold bath and the time least likely to produce bad after-effects.

Third—Always follow a cold bath by a good rub-down with a rough towel and do not take any bath in a cold room.

Fourth—Judge of the effects of a bath on health by the reaction which follows. If the skin is pale and cold after the rub-down, cold baths should not be indulged in.

Fifth—Do not take any kind of bath within three hours after a meal.

It is to be remembered that the effects of bathing are different for each individual. What is good for one person may be harmful to another; so make judgment for yourself in accordance with observed effects.

STARTED WITH ILLINOIS CENTRAL

James Truman Clark, 70 years old, president of the Chicago, St. Paul, Minneapolis & Omaha Railroad, died suddenly at his home in St. Paul September 9. Mr. Clark's death ended an active railway career of more than fifty years. Mr. Clark was born in Auburn, N. Y., November 20, 1852, and received his early education in the public schools there. His first railway job was as a messenger for the Illinois Central, whose service he entered in 1870. Three years later he became connected with the Chicago & North Western as a clerk. His rise was rapid. At various times he was general freight agent, general traffic manager and second vice-president. On May 23, 1916, he was made president of the C., St. P., M. & O., which position he held at the time of his death.

What Patrons Say of Our Service

Service to a Sick Traveler

On the letterhead of Tonk Brothers Company, 323 South Wabash Avenue, Chicago, Sarah H. Tonk recently wrote to President C. H. Markham as follows:

"It is with sincere pleasure and gratitude that I write to you in commendation of the service which was given me by your road in the early spring. Sickness has prevented my acknowledging this before.

"From the time that your city agent first called on me at the Edgewater Beach Hotel (where I was then confined to my room with a bad case of 'flu') to my arrival back home, I received almost unbelievably courteous and efficient service. Everything was done that could make traveling a pleasure to a sick woman. The special employes assigned to my cars were in every case painstaking and considerate. Especially I wish to mention Mr. Baird, the agent at Jacksonville, Fla., who could not have treated a relative with greater kindness. He not only made it his personal business to see that I continued my trip to Miami without any discomfort, but he even called on me at Miami to arrange the return trip. Everyone connected with the Illinois Central seemed to be personally interested to see that I was treated right.

"This is a service which I have never before experienced, although I have traveled extensively, and it was a revelation to me of what a road can really do.

"Renewed thanks to you and to Mr. Umshler, who was the original 'booster.'"

The Equal of Express Service

J. Roscoe Dennis of the Dennis-Shields Ice Cream Company, Greenville, Miss., recently wrote as follows to T. L. Dubbs, our superintendent at Greenville:

"We wish to congratulate you and your employes for the efficient and prompt manner in which freight is handled after it reaches Greenville. We also would include congratulations for the splendid freight service over your lines. It seems to us that this service is very nearly perfect or about equal to express service. For instance, our firm obtains the ammonia used in the ice and ice cream plants from Memphis, and deliveries are made in less than twenty-four hours after the order is shipped from Mem-

phis, 151 miles from Greenville. Express service would shorten this time very little.

"At this time, when the whole country is rent with disorder, the various strikes are seeking to paralyze transportation and the whole industrial world is in a frenzied turmoil caused by the differences between capital and labor, we think it remarkable and commendable that you and the employes of your company are able to render such valuable and timely service to the public."

Binds Friendship to Our Road

R. S. McKnight, cashier of the People's Bank, Gunnison, Miss., recently wrote as follows to Superintendent T. L. Dubbs at Greenville, Miss.:

"I wish to acknowledge receipt of your letter of the 21st advising that arrangements had been completed for installing electric lights in the station and around the station here and placing posts to keep your passenger way from being cut up by wagons. In behalf of the citizens of Gunnison and surrounding territory, let me thank you and assure you that this is but another link in binding the friendship of our people to your road, and still adds to our special, kindest feelings for you personally."

Service Pleased Road-Builders

President C. H. Markham recently received the following letter from C. S. Young of the Tennialaga Construction Company, P. O. Box 1356, Memphis, Tenn.:

"For the past two and one-half years we have been engaged in the construction of a highway from Memphis to Millington, Tenn., paralleling the Illinois Central Railroad, and during that period we have received several thousand tons of freight at various points on the road, Memphis, Felts, Woodstock, Lucy and Millington.

"In our years of experience and dealings with railroads over the South and East, we have never seen such an effort on the part of railway employes to co-operate with and accommodate a client as has been shown to us by the employes of your road with whom we have come in contact. This applies particularly to your agents, Mr. Moews, Memphis; Mr. De Myers, Woodstock; Mr. Chandler, Lucy, and Mr. Cook, Millington;

to Mr. Harrington, roadmaster at Memphis; to 'Uncle Bob' Deaton, conductor, and F. L. ('Dad') Knapp, conductor, and their respective crews on the switch engines at the Memphis end of the work; and to Mr. Abernathy, conductor, and 'Uncle Ben' Mays, conductor, and their respective crews on the 'local' operating north of Memphis to Millington.

"All of these men were, at all times, ready, willing and apparently anxious to do anything to help us with our work, would 'spot' our cars wherever we wanted them, and there was never an appearance of the disagreeableness that is so frequently found when a crew is asked to do something for you.

"It has been a pleasure to do business with the Illinois Central Railroad, and these men and their associates are responsible for it."

Chicago Red Cap's Honesty Praised

The following letter, which is self-explanatory, was recently addressed to J. I. Nolan, terminal passenger and ticket agent at Chicago, by Frank A. Horne, president of the Merchants Refrigerating Company, 161-163 Chambers Street, New York City:

"Your favor of the 24th inst., addressed to me at my residence, 45 Porterfield Place, Freeport, N. Y., was duly received, and also the package containing the wrist watch which was lost in your station on August 16.

"I desire to thank you for your kindness in holding and sending this watch to me, which had a personal value above its intrinsic worth. I especially appreciate the attention and honesty of your red cap porter, Berl McCree, in turning in the watch to your office. As a mark of my appreciation I enclose my check payable to Mr. McCree, which I will thank you to turn over to him."

Appreciation From Louisiana

The following letter to C. B. Dugan, superintendent of our dining service, is from E. A. Wagner, secretary of the Louisiana League of Homestead and Building and Loan Associations, 201 Title Guarantee Building, New Orleans:

"On July 15 the delegates from Louisiana to the convention of the United States Building and Loan Associations left New Orleans on the Panama Limited on their way to Portland, Me., via Chicago. The dining car of this train was in charge of H. M. West,

and we wish to take this occasion to compliment Mr. West for his splendid service to our party and his kind and courteous treatment, and wish to say that in Mr. West your company has a valued and conscientious employee."

Service Appreciated in Sioux City

The following letter to F. W. Seibert, city passenger and ticket agent at Sioux City, Iowa, from C. A. Jensen, manager of the J. L. Kennedy estate of Sioux City, is in connection with a recent trip made by Mrs. Jensen from Sioux City to Chicago on the Hawkeye Limited:

"I want to take this opportunity to thank you for the courtesies extended Mrs. Jensen in Chicago by the employes of the Illinois Central Railroad Company. I know that you were instrumental in having these courtesies extended to her. I shall endeavor to reciprocate whenever the opportunity presents itself."

Helped Patron Recover Lost Bill

J. W. Smith, agent at Sheldon, Iowa, was recently thanked for going out of his way to render a little service to Miss Alice C. Brown of Hull, Iowa, an Illinois Central patron. As Miss Brown stepped off train No. 715 at Sheldon on August 24, her handbag came open and a \$5 bill fell on the platform. This bill was pocketed by an onlooker, who saw it fall. Miss Brown discovered and reported the loss after she had reached the C., M. & St. P. station at Sheldon. H. H. Beans, a transfer man, who had seen the bill fall, got in touch with Agent Smith, and the two succeeded in having the money returned. Miss Brown wrote as follows to Mr. Smith:

"To you and to all who helped in the return of my money, I wish to say a most hearty 'Thank you.' It was something which none of you needed to help in, and your kindness is, therefore, the more appreciated."

PEACE

Men toil and swear and struggle and chase the seasons 'round the globe. To escape the winter they go to Florida, and to get away from the summer, to the North Cape and Alaska. Money is the thing for which they tempt paresis, money that they may go to Saratoga to have peace, they say. Peace? There is no peace unless you sit down and wait for it to catch up!—HUBBARD.

Traffic Department

Our Lines Serve Coal Fields in 4 States

By R. P. De CAMP,
Assistant Coal Traffic Manager

THE Illinois Central System serves coal fields in Illinois, Indiana, Kentucky and Alabama. The largest fields served by our road are in Illinois, which ranks third in the production of coal in the United States. There are more coal-producing counties in Illinois than in any other state in the Union, 85 of the 102 counties being or having been producers.

The two most important producing counties are in the southern part of the state, where the coal beds attain the greatest thickness. They are Williamson County, of which Herrin and Carterville are representative, and Franklin County, of which Benton, Zeigler, Christopher and West Frankfort are representative. All of these shipping points are served by the Illinois Central.

Our road also serves the principal mines in the Murphysboro, DuQuoin, Centralia, Springfield and Belleville district fields, as well as mines farther north, such as Wenona, LaSalle, Oglesby, Rutland and Minonk. In all there are 141 mines on our road in Illinois, more, by far, than on any other single railroad in the state.

First Coal Mined in Illinois in 1810

The earliest production of coal of any consequence in Illinois was in 1833. The journal of the Franklin Institute for 1836 reports that the first actual mining operations conducted by white men were at the Mount Carbon mines, near Brownsville, in Jackson County, on the banks of the Big Muddy River, a short distance from its junction with the Mississippi. These mines were opened in 1810 and were worked to a limited extent for many years. Another region said to have opened about the same time was near Belleville, in St. Clair County, opposite the present site of St. Louis. This district is still producing coal and is served by the Illinois Central. The outcrops of coal in the bluffs along the river banks first attracted attention, and natur-

ally the first mining operations were started on these exposures.

The coal fields of Illinois are favorably situated with respect to the markets of the Middle West. In addition to that for consumption within the state, coal is shipped from mines in Illinois to seventeen other states, from Ohio on the east to the Dakotas and Nebraska on the west, and from Canada on the north to the Gulf of Mexico on the south.

We Serve Linton Field in Indiana

In Indiana there are eight mines on our road in the so-called Linton coal field, whose billing points are Cass, Caledonia, Dugger and Victoria. We also serve two mines at Evansville. The United States census of 1840 made the first mention of coal produced in Indiana. The industry developed slowly until 1865. About that time the construction of railroads throughout the state gave an impetus to the coal mining industry, which has shown steady progress, except when interrupted by periods of depression. The principal markets for Indiana coal are within the state, points in Illinois, Wisconsin, Michigan and the railroads that use coal as fuel.

In western Kentucky, on our Kentucky division, we serve eighty-six shipping mines. These are on the main line and branches of the Evansville district between Hendersons and Nunns, inclusive, and on the Louisville and Paducah districts between Horton and Dawson Springs, inclusive.

So far as the records of early production of coal in the United States are to be accepted, Kentucky was the third state to enter the list of regular producers.

Kentucky Mining Started in 1827

According to one of the early reports of the Kentucky Geological Survey (published in 1838), the first coal produced in the state was mined in 1827 on the "right side of the Cumberland River" below the mouth of Laurel. This was evidently from either Laurel or Pulaski counties (in eastern Kentucky), but the exact location is not def-

initely shown. By 1860, according to the census of that year, production amounted to several thousand tons. Operations were necessarily somewhat interrupted during the Civil War, but after 1870, when the state had begun to recover from the effects of the Civil War, production recovered rapidly.

There are really two separate coal fields in Kentucky. The field in eastern Kentucky is a part of the Appalachian coal region and is properly considered with the fields of West Virginia, Pennsylvania and Tennessee. The field in western Kentucky, which is served by the Illinois Central, is part of the general interior coal region which includes the fields in Illinois and Indiana. The two fields differ in kind and quality of coal, in mining conditions and in accessibility to markets and distribution of the product.

We Serve Five Alabama Mines

Western Kentucky, although surrounded by other important coal-producing fields, finds a good market for its product within the state and in other states of the Mississippi Valley. It also under normal conditions supplies coal to the points north of the Ohio River in Illinois, Indiana, Iowa, Missouri, Nebraska, South Dakota and Wisconsin.

In Alabama our road serves five mines in the Brilliant district. So far as known, the earliest record of the existence of coal in Alabama was made 1834. The first statement of production in the state is contained in the United States Census report for 1840. The mines in Alabama were probably worked to a considerable extent during the Civil War, but there are no records of the actual production. The development of the present great industry in Alabama really began in 1881 and 1882, when attention was directed to the large iron deposits near Birmingham, and thus the great boom of that city and vicinity was started.

The best grades of Alabama coal are used exclusively for bunkering and export purposes at Pensacola, Mobile, Gulfport and New Orleans. This coal is washed before shipment, which removes any impurities and is a necessary process for coal used for these purposes. Alabama coal is also shipped to points within the state and to points in other states in the Southeast and the Mississippi Valley. By close working arrangements with the Frisco through Aberdeen and having through rates with the Southern via West Point, the Illinois Central also participates in coal traffic from Alabama mines on these lines to southern points on its lines and connections.

Our Monthly Roll of Honor

Below is a list of employes retired at the meeting of the Board of Pensions August 30:

Name	Occupation	Years of Service	Date of Retirement
John F. Waters.....	Switchman, Chicago, Ill.....	23	2/28/22
Patrick J. Clancy.....	Towerman, Chicago, Ill.....	32	6/30/22
George Toney (Col.).....	Laborer, New Orleans, La.....	33	6/30/22
Edmund T. Leith.....	Operator, Dixon, Ill.....	35	7/31/22
John B. Howard (Col.).....	Porter, Mounds, Ill.....	27	7/31/22
Albert H. Miller (Col.).....	Porter (Red Cap), Chicago, Ill.....	28	7/31/22
Herman Gresen	Car Repairer, Kankakee, Ill.....	36	8/31/22
Richard E. Wilie.....	Baggage Master, Cairo, Ill.....	30	8/31/22
Henry P. Marmaduke.....	Foreman (B&B), St. Louis Division.....	30	8/31/22
Charles F. Buchanan.....	Carpenter (B&B), Indiana Division.....	41	8/31/22

The following deaths of pensioners were reported:

Name	Occupation	Date of Death	Term as Pensioner
Robert H. Bowles.....	Conductor, Louisiana Division.....	7/27/22	1 year
Robert Stone	Laborer, Chicago Terminal.....	6/28/22	9 months
Vernon A. Pixley.....	Engineman, St. Louis Division.....	8/24/22	7 years

Operating a Railroad

(Continued from page 11)

of the ruling grade, particularly if broken up into short sections, the locomotives can be rated for fairly slow speeds on the ruling grade—say from seven to ten miles an hour—without seriously lengthening the time over the district. On the other hand, where much of the mileage is of the maximum grade the rating must be made for higher speeds on this grade in order that the time over the district will not be excessive.

Of course, the amount of interference by opposing trains and by higher speed trains in the same direction on single-track lines, and by important high speed trains on multiple-track lines, is a limiting factor in determining the average speed over the district and must be weighed carefully in fixing the locomotive rating. It should be realized that the economical rating of a few months ago when traffic was very thin may not be the economical rating today with the more frequent business, nor that of today the proper rating for next fall, when the volume of traffic will be heavy.

Systematic Classification Important

Another feature of great importance in transportation is a definite scheme of systematic switching or classification and through routing of trains. Although offering possibilities of great economies, it has not received anything like the attention during the last decade that has been accorded the development of the train load, due doubtless to the showing of results of a less definite nature and more difficult to reduce to figures and to the failure of transportation men to realize fully the advantages which follow the establishment of such a scheme. Then, too, a great deal of careful and painstaking work is required, and when the plan or scheme has been developed there is need of a firm hand to supervise it and to see that there are no departures from its provisions.

Detail information as to the routing of business over and the delivery and assembling of loads and empties on each road and terminal district, the amount and character of classification already in effect at each yard, the capacity of each yard both for handling cars and for switching, the character of the traffic and the train schedules must be gathered and prepared in tabulations, diagrams or other convenient form for analysis. And since the officer

who is to work out or design the scheme should have a working knowledge of each yard and each engine district, it seems essential that he supervise and personally engage in the assembling of this information. Then, with suitable plans of the yards and terminals and track charts of all engine districts, he is in position to analyze the problem thoroughly and to draw up a tentative scheme of classification to meet both the divisional and the system requirements.

After this it is advisable to call together in conference the yardmasters and the superintendents and other transportation officers in suitable groups to consider the tentative scheme and make such revisions as may be found advisable. The completed scheme should then be published in suitable form for distribution to the officers and employes whose duty it is to carry out its provisions.

The Principle of Classification

The cardinal principle of systematic classification and through routing of trains is that the first classification yard that switches a car, after the bill is made and it starts on its journey, places it in the classification that will take it through to the point of delivery or to the last yard short of its destination without another switch. Station order switching of cars for the engine districts leading out of each yard and the classification of empty cars according to the class of car and its suitability for loading with different kinds of freight are among its provisions.

To obtain the full benefit of the through routing of trains it is also advisable to establish a scheme of car inspection and repairs by which the equipment will be in condition when loaded or when received in interchange to go through in the proper classification without being out for repairs. Then, with a sufficient volume of business, trains can be built up to move through terminal after terminal as "main trackers" requiring only the changing of locomotives and crews and such inspection as is necessary for detecting unsafe defects which may have developed on line of road since leaving the last terminal.

The economic or intensive utilization of freight cars embraces the principal factors of high average car mileage and high average car loading, which are to a consider-

able degree interdependent. Not only must there be a high mileage per car per day but the unproductive mileage must also be reduced to the minimum. By unproductive mileage is meant the useless haul of cars, whether loaded or empty. When two or four or ten cars are used to move a shipment of freight where one or three or nine would have sufficed, unproductive mileage is made just as truly as where there is a cross-haul of empty cars suitable for the same class of loading. It is here that the feature of proper car loading comes in.

Empty Mileage to Be Expected

By far the greatest percentage of empty mileage is not unproductive mileage, for the reason that in the nature of the traffic there is no possibility of securing a return load, and the movement of the empty is an integral part of transporting the shipment. With the proper realization of this condition, an analysis will show that the opportunities of reducing unproductive mileage are far less than seem to be generally assumed. On a railway system operating in the states east of the Mississippi and north of the Ohio and Potomac rivers, under normal conditions the general movement of traffic and equipment will be somewhat as follows:

Livestock moving from the west and south to the east and north—cars returning empty; packing house products, dairy freight, fruits and vegetables moving east and north—refrigerators returning empty; coal moving from the mines in Pennsylvania, West Virginia, Kentucky and Ohio, to the east and north and to the west and north—cars returning empty except for a certain percentage used for ore, limestone, etc.; lumber, cotton, grain and other farm products, flour, feed, etc., moving east and north in such great volume that a return loading of merchandise and manufactured products is available for only a part of the box cars, flats and mill gondolas in which the business moves, the excess cars—a considerable percentage—moving west and south in large quantities. It would seem, then, that about the only way to make unproductive empty mileage is to haul empty stock cars, refrigerators or box cars east or north or to move empty coal cars away from the mining districts. And such really is the case.

It is true that during the war and the years of heavy business succeeding it the movement of traffic was more nearly balanced, and stock cars, gondolas and even

flats were loaded with cement, stock cars with brick and tile, rough loading box with tinplate and other finished steel products, to a large extent. In fact, a load could be obtained for almost any car capable of being made approximately suitable even at a heavy expense. This condition reached the maximum in March, 1920, when the railroads of the country were able to reduce the empty mileage to 27.7 per cent of the total—the lowest of which there is record. But these were not normal times, nor does there seem to be much likelihood of a recurrence of the balance of traffic which then obtained.

Inexperience Makes Unproductive Mileage

There are a few instances of cross-haul of box cars, rough loaders being used in one direction and good tight cars in the other, causing duplicate empty mileage, but these are exceptions. During the periods when business is falling off rapidly, considerable empty mileage is made in hauling cars to suitable points for storage. Empty mileage is also made in the movement of bad order cars to convenient shops for repairs. None of this empty mileage, moreover, is unproductive mileage, for it is made in meeting situations which arise in the most practicable way.

How, then, is unproductive mileage made? Largely through the inexperience or carelessness of agents, yard clerks and other employees who route the cars improperly. During the extensive relocation of equipment which took place in the autumn of 1920 and the following winter, there was doubtless considerable of this misrouting, for the car service rules had been inoperative for several years, during which many new employees had entered railway service and the personnel of the yard and station forces was untrained or rusty in the handling of cars under the rules. A year later, when another relocation of the same kind but of a less extent took place and these forces were well trained, there was comparatively little of this misrouting of empty cars.

There is even greater improvement in this respect at the present time, although, if all the unproductive movements on a large railway system could be stated in car mileage, the figures probably would be rather startling; on the other hand, if it was reduced to a percentage of the total car mileage, the result would seem insignificant.

indeed and the efficiency of car handling would be found to be high.

How to Boost Mileage and Loading

The attainment of a high average car mileage requires sufficient business to utilize all suitable cars, freedom from congestion in road movement, prompt handling in yards and at stations and quick loading and unloading by shippers or the railroad's own forces. The attainment of a high average carload requires the securing of as many loads as possible in the direction of the preponderating empty movement, the distribution of the cars so as to adapt the size and capacity of the car to the character of the load, co-operation of shippers in loading the cars to either the cubic or the carrying capacity and the obtaining of such maximum loading at freight stations, warehouses and other loading points operated by the railroad.

If the accounts of a railroad are examined it will be found that the expenses directly affected by locomotive utilization and train operation will run around 35 per cent of all expenses and 50 per cent of the cost of maintenance of equipment and conducting transportation. From this it is apparent that here a broad field is offered for effecting real economies. There are a great many elements or factors involved, some of which are the adaptation of types of locomotives to the requirements of the service, the length of locomotive runs, the pooling of locomotives or their operation with regular or assigned crews, the manipulation of power by the chief dispatcher, and the scheduling of slow freight trains out of terminals and over the road.

Here, as in other branches of transportation work, there are many situations to be met, and each requires thorough analysis to determine what is the best solution.

Must Make Use of Engines on Hand

In adapting locomotives to the services on various districts the problem is usually that of using those on hand to the best advantage. The elimination of light types from heavy service and of retiring them permanently or at least so long as heavier locomotives are available is of prime importance; also equally so is the disposition of the occasional type which is unusually vulnerable and is constantly giving trouble on the road or spends too much of its time undergoing repairs. Then, too, it may be found that a certain type of locomotive will

perform more efficiently and reliably in continuous service, or its weight and axle loads will meet possible restrictions, and hence it is peculiarly fitted for use in connection with the lengthening of runs.

On every engine district having a heavy mixed traffic, slow freight trains called at certain periods of the day will make better runs than those called at other hours. The chief dispatcher will be found taking cognizance of this and from day to day arranging the calls of slow freights accordingly. The full development of this idea will prove of much value where a large volume of slow freight is to be moved in extra trains and can be carried a step further by making standard schedules for the movement of the trains over the district. They can be prepared in simple form, for example, giving the running time between points where operating stops are made, as at water stations, coal docks, and helper stations, and can be printed on cards of convenient size to be carried in the pocket or in the back of the time table. These schedules set the pace for the engine and train crews and give them something definite to work to in their trips over the district.

CONDUCTOR A FARMER, TOO

Twenty years ago, when N. S. McLean, 456 Olive Avenue, came to Memphis as conductor in this district on Illinois Central trains, he began thinking of some way to lay aside his earnings. He bought a farm in Baxter County, Arkansas, and improved it as he could afford to spend the money. It is now one of the most productive farms in that section of Arkansas.

Four years ago Mr. McLean set out 700 fruit trees, mostly apples. They are bearing this year, yielding the greatest output, he says, he ever saw from an orchard. The trees are so heavily loaded with the fruit the limbs on many have broken. Quality of the fruit is the highest, as a sample he brought to *The Commercial Appeal* shows.

Mr. McLean is one of the conductors on the Illinois Central's crack passenger train, the Panama Limited. He has been with the road twenty-six years and on this district twenty years. With the exception of two years he has been on the Panama Limited continuously since the train was placed in service.

His Arkansas farm, he says, consists of 140 acres. He makes no attempt at grow-

ing cotton. "I can make more money at other crops," he declares, adding that his corn crop this year was the best he had ever grown.

Mr. McLean has been on a 10-day vacation. He spent every hour of it on his farm and says he longs for the time when he will be financially in a position to go to it and live.—Memphis (Tenn.) *Commercial Appeal*, August 1.

JAMES CULTON, PENSIONER, DIES

James Culton, pensioner, died on June 30 at his home in Portland, Ore., at the age of 67. He had been in the service of the company for more than forty-six years. At the time of his retirement in 1918, he was commercial agent at Denver, Colo. Mr. Culton's first work with the company was

during the summer months of 1869 and 1870 at Dunleith, now East Dubuque, Ill. He attended school in the winter and was a clerk in the agent's office during his vacation. In April, 1872, he became a clerk in the superintendent's office at Centralia, Ill. He was appointed agent in August, 1876, and served in that capacity at Siegel, Makanda and Odin, Ill., and Dodgeville, Wis. He became a traveling freight agent with headquarters at Bloomington, Ill., in August, 1888, and served until 1900, when he was appointed commercial agent at Denver, Colo. He was in that position for eighteen years. During the World War, Mr. Culton was active in relief work at Southport, N. C. Later he moved to New York and then to Portland. He is survived by his widow, one daughter and one son.

AROUND CHICAGO

Suburban Passenger Service

Mrs. L. M. Goodman, ticket agent, who met with an accident nine months ago, has returned to her duties at South Shore station.

Mrs. Minnie Lord has been in the hospital for several weeks on account of sickness. When she is able to travel, she will visit her son in Montana.

Trainmaster E. O. Guyton passed cigars over the arrival of a son August 26. Mother and son are doing nicely.

Flagman H. Janssen, on the Addison run, also reports an arrival—an 8-pound boy on September 2.

Mrs. Maud Phillips suffered a broken shoulder bone in an automobile accident and is being taken care of by the hospital department.

Superintendent A. Bernard had a letter from his former chief clerk, F. T. Collar, who is now located at New Orleans, reporting that he is getting along well in his new field.

Al Frank, night yardmaster at Randolph Street, is proud over the arrival of a 9-pound son, born on August 28.

INDIANA DIVISION

Miss Bonnie Snodgrass and Miss Helen James are new stenographers in Superintendent Roth's office.

C. L. Rager, formerly clerk in the supervisor's office at Bloomington, is filling the position in the roadmaster's office left vacant when Dewey McClain went into the accounting office.

Chief Dispatcher's Office

Dispatcher and Mrs. Morgan Storm are spending thirty days in Seattle, Wash., and other western coast cities. Dispatcher J. W. West, from Carbondale, is relieving Mr. Storm.

Owing to heavy business in "Q" office, Mattoon, another operator has been placed there, Operator Douglass filling the vacancy. Operator Scott, regular third "Q," is filling

the vacancy in the chief dispatcher's office nights, while Operator Ault is relieving in the "Q" office.

Agent E. W. Clensy, Wheeler, Ill., has been displaced by Operator Harry Feldman.

Agent W. E. Gladville of Stewartsville, Ind., has returned from a six weeks' leave of absence.

Business is good on the Indiana division, several new offices having been opened on the north end of the Peoria district.

Operator J. H. Scott, second at Cass, is off duty on account of illness. Operator Winkler is relieving.

Operator James Kern has been granted a ninety days' leave on account of ill health.

Mattoon Shops

George Walker, call boy at Mattoon shops, has resigned to attend school.

A. W. Frederickson, blacksmith foreman, is leaving for a visit in Milwaukee, Wis. Mrs. Frederickson will join him in Chicago.

Mrs. C. C. Powers, wife of our general car foreman, is visiting in Greensburg, Ind.

A. D. Bullock, timekeeper at Mattoon shops, left September 12 with his sister, mother and father in automobile for Niagara Falls, Pittsburgh and other points of interest in the East.

SPRINGFIELD DIVISION

Miss Gladys Westerholt has accepted a position in the chief dispatcher's office, Clinton. This position was formerly held by Miss Catherine Henson, who has accepted a position in the accounting department.

Clerk E. R. Evey, who was taken suddenly ill on the morning of September 12, is much improved at this time.

Agent M. H. Brown of Springfield was called to Decatur the first part of September by the serious illness of his sister.

Miss Julia Coffey and Claire Gray were united in marriage in Vandalia, Ill., the morning of August 26. Mr. Gray formerly worked in the superintendent's office at Clinton, but is now stationed at Madison, Wis. Mrs. Gray was employed as accountant.

Henry O'Brien of Arizona, who formerly worked in the superintendent's office, has been in Clinton for a vacation, visiting his parents and friends.

The following new positions have recently been opened on the Springfield division: Bill clerk at Pana, station clerks at Glen Carbon, Mount Pulaski and Divernon, and yard clerk at Springfield.

Miss Clara Day has returned to service in the accounting department, Clinton shops, after an absence of several months on account of illness.

Here is Section Foreman W. H. Butler, employed at Centralia yard. Mr. Butler entered the service as a section man at Idlewild, Tenn., July 5, 1905, was promoted to section foreman December 1, 1911, at Dyersburg, Tenn., Tennessee division, and was transferred to the St. Louis division October 1, 1918, working in the Centralia yard.

Dispatcher J. A. Vallow left Clinton September 1 for a trip to California.

Dispatcher J. L. Fleming returned to Clinton September 1 after doing service on the Indiana division during the heavy business.

John Sharkey is doing temporary work in the chief dispatcher's office.

Conductor T. J. Boyle of the Clinton district has moved his family and household goods to Centralia. Conductor Boyle has been regularly assigned to passenger trains No. 101 and No. 104, operating between Centralia and Decatur, with lay-over at the former point.

Passenger Conductor J. B. Stewart, who was unfortunate enough to have his collar bone broken by a fall from a cherry tree at his home in Freeport, has returned to work after being out of service for about two months.

J. W. Frey, conductor, Springfield district, has returned to work after a leave of absence of ninety days, during which he looked after personal business.

John H. Stone, who has been working as third trick switch tender for the last six months, has been relieved and has resumed

A day's loading of fruit at Centralia, Ill. Photographed by courtesy of F. Kohl, Centralia merchant

Hamilton Watch

"The Railroad Timekeeper of America"

You Don't Doubt Your Time When Your Watch is a HAMILTON

IT'S dangerous to be in doubt about your time. A Railroad Man must be sure of his time, his signals, his train, and his schedule. The HAMILTON WATCH eliminates doubt about your time. Its fame as an accurate timekeeper is well established among railroad men throughout America, due to its accuracy, sturdiness, and dependability.

Conductor N. J. Lorang, here shown ready to board his train, the "Peoria Flyer" on the Rock Island, has been a conductor for over seventeen years and has owned his HAMILTON for over twenty-two years. In all that time his HAMILTON has rendered True Time service.

If you want accurate time, with doubt eliminated, ask your jeweler to show you the twenty-one jewel "Railroad Timekeeper of America,"

The HAMILTON No. 992
Now Priced at \$48.50
(Movement Only)

When you invest in a "992" you can rest assured that you will have true time—for this is the watch that times many of the fastest trains and is the proven choice of most Railroad Men.

HAMILTON WATCH COMPANY
Lancaster, Penna., U. S. A.

Send for "The Timekeeper," a Book that describes and illustrates the various Hamiltons and gives much valuable watch information.

Home of Chief Clerk H. O. Brittin, Clinton, Ill.

his former position as brakeman on the Springfield district.

Brakeman Paul W. Werner of the Clinton district is the proud possessor of a new automobile.

Road Department

Marion McClelland, who has been employed as rodman on the Springfield division the past summer, resigned his position September 15 to enter the University of Illinois.

Mr. and Mrs. W. J. Apperson and son, Jeffrey, instrument man, and family left September 13 for Memphis, Tenn., to attend a family reunion.

William Draper, son of B&B Supervisor S. C. Draper, left home the last of September to enter the University of Chicago.

Mr. and Mrs. James J. Ryan are the parents of a daughter born September 1. Mr. Ryan is employed as a water service repair man at Springfield.

WISCONSIN DIVISION

Coal Chute Foreman O'Rourke is back on duty after a three weeks' absence.

Section Foreman Roath was recently called to Elgin by the serious illness of his aged mother.

Operator Leah Weiss is again on duty after spending some time with her parents at Olney, Ill.

J. M. Layton, son of the veteran keyman, M. P. Layton, has entered the service as an operator and is working extra on the division.

The local newspaper gives considerable space to comment on the Eye See indoor baseball team which Agent Kelly at Minonk has rounded up, composed mostly of Illinois Central employees. Although not so formidable as the famous basketball team, they have challenged teams of the nearby territory.

Operator Taylor is back on duty after "flivvering" to Virginia and back, where he visited his parents and boyhood acquaintances. Accompanying him on the trip were Mrs. Taylor, son John, and Miss Josephine Zika, a sister of Mrs. Taylor.

Car Inspector Henry Livingston is again on the job after having spent several weeks in Chicago visiting friends and relatives and at the same time specializing in some short term courses.

Many are the favorable comments the local newspapers make relative to the cleanliness and tidy condition of the station grounds and buildings at Minonk as well as the efficient service rendered. It is brought about by the fine co-operative spirit displayed by all employees.

A shower party was held in the superintendent's office Monday night, September 11, when a dinner was given in honor of Miss Mildred Graham, who was married to Charles Michels on Wednesday, September 20. The table was decorated in pink, the centerpiece being a large pink box decorated with roses, which looked very much like a fancy cake.

MINNESOTA DIVISION

Vice-President Calvin Coolidge and Mrs. Coolidge passed through Dubuque on No. 12, September 9, en route from Sioux Falls to Chicago.

Judge K. M. Landis passed through Dubuque last Tuesday, September 8, en route from Chicago to Waterloo, where he spoke at a meeting of the American Legion.

Mrs. W. J. Heckman of Fort Dodge, formerly Miss Hilda Schwartz and employed as an accountant in this office, is visiting friends and relatives in Dubuque.

Lou Murray has resigned as accountant in the superintendent's office and has accepted a position with the Standard Oil Company at Manchester, Iowa.

R. E. Rodeberg, rodman, and Miss Carita White of Fayetteville, Ark., were married August 22 at the home of the bride's parents. After spending their honeymoon in the West, Mr. and Mrs. Rodeberg will reside at 121 Dorgan Place, Dubuque, Iowa.

Mrs. G. V. Uhr, formerly employed as a stenographer in the superintendent's office, but now residing in Chicago, paid us a short visit recently.

KENTUCKY DIVISION

Thomas Labon Davis, supervisor of signals, Kentucky, division, died at his home at Martinsville, Va., on Thursday, August 17, after an illness of a year.

Mr. Davis was born in Henry County, Virginia, May 27, 1885. He attended the public schools and high school of Martinsville and entered the service of the Norfolk & Western as a signal helper in 1902. While with the Norfolk & Western he held successively the positions of signal helper, signal maintainer, signal wireman and signal foreman. Leaving the Norfolk & Western in 1905, he entered the service of the Chesapeake & Ohio as signal inspector. In 1908 he was engaged by the Hall Switch & Signal Company and was placed in charge of the construction of automatic block signals on the Canadian Pacific in Canada. This work completed, he entered the service of the Illinois Central as signal foreman on the St. Louis division in 1911. When the first installation of automatic block signals was authorized on the Kentucky division, he was appointed supervisor of signals in charge of this work. When he arrived

J. M. LYON & CO.
2-4 Maiden Lane New York

on the Kentucky division in March, 1914 there were in service only four tunnel signals, eight wire-connected outlying signals and seven crossing bells. At his death there were in service 430 automatic signals, eight interlocking plants and forty-four crossing bells, practically all of which were installed under his supervision.

Mr. Davis entered the army in June, 1918, served with the 159th Depot Brigade at Camp Taylor, Ky., the 18th Engineers at Fort Benjamin Harrison, and at the time the armistice was signed was a student officer in the Engineer Officers' Training Corps at Camp Humphrey, Va. While in the army he contracted the disease that finally caused his death.

Mr. Davis was a man of commanding appearance and engaging personality and was beloved by all the signal department employes on the Kentucky division, among whom he was affectionately known as the "Big Chief." He was ready at all times to help them in improving their working conditions and assisting them in gaining a better knowledge of their work. His death in the prime of his life and at the pinnacle of his profession was untimely, and his kindly presence will be missed on the Kentucky division.

On August 30, a son, Walter Anderson Thomas, was born to Mr. and Mrs. W. K. Thomas. Mr. Thomas, the father, is demurrage clerk at the local freight office, and is the son of W. S. Thomas, supervising agent, Kentucky division.

J. W. Taylor, chief train dispatcher, Princeton, who has been on leave of absence for the last year, was married at Tuscan, Texas, September 8.

Miss Marion Waggener, clerk to supervisor, Princeton, who has been seriously ill for the last three weeks, was taken to Paducah Hospital for an operation. Her many friends on the Kentucky division will be glad to hear that she is much improved and is reported getting along very nicely.

TENNESSEE DIVISION

Mrs. B. Burges returned to work in the accounting department on September 14 after ninety days' leave of absence in Texas.

The division office has the hunting fever. Most of the boys are great sportsmen and report the squirrels and doves plentiful.

C. J. Keatchum, tonnage clerk, this office, is the proud father of a baby girl, Frances Maurine Ketchum, born September 8.

MISSISSIPPI DIVISION

Engineman C. H. David was married to Miss Dooley of Oxford, Miss., August 20. After a short bridal trip to Memphis, they returned to Water Valley, where they are now at home.

Conductor C. E. Givens and Miss Addie May Sterling of Jackson, Tenn., were married August 9.

Miss Elizabeth Blount, clerk in the store department, has returned after six weeks spent in a girls' camp near Battle Creek, Mich.

Mrs. Gertrude Turner, clerk to the trainmaster, Mrs. Janie Hussey, clerk to the chief dispatcher, and son Lyman and Mrs. W. M. Wilson, wife of the oil house man, have returned from a delightful visit to Niagara Falls, Toronto and Chicago.

Yardmaster and Mrs. W. F. Adams are receiving congratulations upon the arrival of a fine son on August 13.

Mrs. Gladys Walker is back on the tonnage desk after a three months' leave of absence.

J. G. Skogsberg, chief clerk to the superintendent, has returned to work much improved after a leave of absence of sixty days on account of ill health.

John T. Westbrook, Jr., who has been employed as a chainman with the division engineering force, has resigned and will enter Vanderbilt University.

Division Gardener W. L. Hunt has resigned and has entered the University of Illinois at Urbana, Ill.

Machinist Helper Apprentice T. J. Price and Machinist Helper Emmett Kimzey have

Here are views of Joseph E. Gibson, superintendent, and the west side of the McComb, Miss., High School. The McComb schools opened on September 5 with one of the largest enrollments in the history of the town, including many children of Illinois Central employes. The faculty is composed largely of graduates of the leading colleges in the United States and foreign countries.

returned from McComb, Miss., where they went as delegates to the department convention of the American Legion.

LOUISIANA DIVISION

Miss Imogene Yawn, who has been relieving several of the stenographers during the past month, left September 17 for Abilene, Texas, to enter Simmon's University.

J. O. Thompson, former member of the store and claim departments, was a visitor to the superintendent's office September 6.

Supervising Agent and Mrs. W. E. McCloy and Clerk and Mrs. A. Boyd Simmons have been camping on the Tangipahoa, out from Ponchatoula, La.

Agent J. L. Boudousquie, Madison, Miss., sent out a call for additional water barrels for his cotton platform on September 7. Evidently the cotton business is increasing this year.

A. T. Miller is our temporary agent at Gluckstadt, relieving F. P. Jerome, who has been ill in a hospital at Jackson, Miss., for several weeks.

Conductor P. G. Hartman was fatally injured on September 11 at the gravel pit, Brookhaven, Miss. He was buried at Brookhaven on September 13. Mr. Hartman entered the service on November 21, 1903, being promoted to conductor on September 3, 1920. He was well liked by all who knew him, and in his death the Louisiana division lost one of its employees whose future as a conductor promised to be a bright one.

Mechanical Department

We conducted during June and July (understand, this is a matter which is watched continuously but which was intensified during this period) an "Avoid Waste" campaign. We went "over the top," saving everything from a tiny drop of water to the most important of all things, time.

While this campaign was being conducted, several of the young men in McComb shop made double time: Machinist Helper Robert E. Haley was married to Miss Mary Meyers; Apprentice C. W. Wilkes followed in his footsteps and took unto himself Miss Elizabeth Henderson of McComb; Machinist Helper Claude Blair and Miss Margaret Meadows were also married.

Apprentice Instructor W. D. Lyons is wearing a smile that won't come off. He is the proud daddy of an 8-pound girl, Caroline Elizabeth.

Machinist George Balser is also wearing a pleasant look and receiving congratulations on the arrival of a son, John Lyons.

Erecting Foreman John Lyons says grandchildren are getting to be a great proposition. (Both of those mentioned above are his.)

Assistant Blacksmith Foreman Yawn is off on account of sickness. His place is being filled by T. J. Harvey.

Welder W. E. Wennerlund was married recently to Miss Fannie Magee, one of the teachers in McComb High School.

With deep regret we announce the death of

Engineer Jerry D. Ellsworth, who was one of our Panama Limited pilots. Mr. Ellsworth was ill for only a short time before his death, which was caused by a stroke of paralysis.

Machinist Apprentice Garland Lane is ill in the Illinois Central Hospital at New Orleans.

NEW ORLEANS TERMINAL

For the last several years employees of the superintendent's office have made an annual trip to Galveston, Texas, on Labor Day. In the beginning these trips were taken by only two or three of the clerks; however, each year they returned with such exciting tales of good times that each succeeding Labor Day has found the crowd steadily increasing. Last year the party consisted of Messrs. Delph, Katz and Lambou, Mrs. Cronin and Misses Ellsworth and Biersoll. This year Abe Rittenberg, E. J. Phillips, Vic Olivier and Freddie Bartels joined the party. Judging from the hilarious tales they tell of events encountered, there is more truth than poetry in that little song entitled "It's Always Fair Weather When Good Fellows Get Together." Next Labor Day will probably see the superintendent's office represented on the sands of Galveston 100 per cent.

The stork made a visit to 1307 South Liberty Street, New Orleans, August 22, and left a 9-pound boy with Yardmaster J. B. Kane.

Grain Clerk Ray S. Froeba, Stuyvesant Docks, and Mrs. Froeba are being congratulated on the arrival at their home of an 8-pound daughter. Mr. Froeba's first remark was: "A new stenographer for the Illinois Central."

J. F. Reilly, clerk at Stuyvesant Docks, is on a 90-day leave of absence in the mountains of the Carolinas.

Miss Sadie Nichols, clerk at Stuyvesant Docks, has returned from spending several weeks at Stafford Springs, Miss.

William Huston, clerk at Stuyvesant Docks, who has been ill for the last few months, is spending several weeks at Mandeville, La., to recuperate.

Station Master's Department

Checkman G. G. Bowen's family is spending several weeks in Memphis, Tenn.

James P. Labbare, chief clerk to the baggage agent, is spending several weeks in San Francisco. He will stop over in Los Angeles for some time.

The following was overheard by Checkman E. J. Ray one Saturday afternoon around Government yard commissary: A young negro girl passed by, highly scented with perfume.

W. A. Delph, Meyer Katz and Vic Olivier of the superintendent's office, New Orleans terminal, in front of the Beacon Hotel, Galveston, Texas, on Labor Day.

An old negro woman standing near sniffed the air and remarked: "That thar gal done went and spent about 40 cents for cologne to make herself smell sweet. That ain't me—I uses soap."

Local Freight Office

Miss Amelia Finnin, stenographer, has resigned from the service, effective October 1.

Stanley Mendelsohn, collector, has joined the ranks of the benedicts. He was married on Wednesday, September 6, and is spending his honeymoon at Niagara Falls, Buffalo and Chicago. Andy Moore, our popular recon-signing clerk, assisted at the ceremony as best man.

Mechanical Department

The mechanical department at New Orleans on Labor Day was the proud host to three of McComb's fairest daughters, Misses M. Q. O'Quinn, Neola Ansley and Katherin Beasely, employed in the office of Master Mechanic Roddie at McComb. Clerk Degering mustered up an automobile and was master of ceremonies, being ably assisted by Joseph Hodges. Everyone enjoyed having the young women here; and we shall be pleased to have them or any other of our co-employees pay us a visit. Joseph Hodges is permanent chairman of the entertainment committee.

Ed St. John, clerk, expects to leave the service shortly to look after his banking interests.

Clarence Heyman, messenger, has been transferred from the Harahan car department to the district foreman's office, where he is earnestly striving to obtain a clerkship.

One Hundred Twenty-six

Engineer A. Sigur has been commended for alertness in discovering a broken equalizer on NOTM-183 while it was being handled in a Gulf Coast Lines train August 10.

Engine Foreman Jacob Bauer has been commended for discovering MK&T-94103 off center and pair of wheels sliding while being handled by engine in his charge.

Frank C. Jourdan, clerk to the trainmaster, while returning to lunch September 14, met with a serious collision. He quickly recovered and has resumed work.

MEMPHIS DIVISION

Sam Serio, clerk at Clarksdale, Miss., who was operated on for appendicitis in New Orleans, has returned to Clarksdale, is getting along nicely and hopes to return to work soon.

Agent J. P. Hairston, Cruger, Miss., recently discovered a brake beam down on a

The New Orleans terminal has the honor of having among its employes the amateur batamweight boxing champion of the South, "Mike" Cassard, call boy at Harahan yard office, who expects to represent the Southern Amateur Association at Boston this fall. "We are all pulling for him to bring home the amateur championship of his class," writes our correspondent. "We also have in our employ his brother, Jules, employed as messenger in the mechanical department. The Cassard family, of which these two boys are members, is distinguished for its fighters. The three boys, Jules, Mike and Frank, are champions in their classes and are favorites of the boxing fans of New Orleans—a fight is always assured whenever they enter the ring."

Illinois Central Magazine

*"More miles to the pint;
Better service to the mile!"*

*"When Galena Oils go in
Lubrication troubles go out."*

The Test of Railway Lubricants

There is nothing to compare with the test of actual service in determining the quality and durability of railroad lubricants.

The very nature of the work—its widely varying degrees of weight, speed and temperature—demands strength and stamina far beyond the capacity of the average "good lubricants."

Oils that may satisfactorily fill the requirements of ordinary machine lubrication will invariably break down under the strains of railroad work, unless endowed with essentials of strength and endurance peculiar to basic quality.

Galena lubricants, above all, are quality products. The stocks from which they are manufactured are built to Galena specifications from the finest crudes that nature produces. The exclusively Galena Compounding processes—developed by this company through its more than half century of specialization—add the further physical properties necessary to the high type of lubricating efficiency always identified with the use of Galena Oils.

The superior quality of Galena lubricants and the exceptionally valuable lubrication service that accompanies them make possible the unequalled performance records on hundreds of American railroads—records that prove by both mileage and fuel saving their ultimate economy.

Galena-Signal Oil Company

Chicago

and offices in principal cities

car in a train passing his station. Mr. Hairston flagged the train and had the brake beam adjusted, thereby probably averting an accident.

Miss Julia Gaven, secretary to Superintendent J. M. Walsh and division reporter for the magazine, is away on a leave of absence. Miss Gaven expects to spend some time in the West, where it is hoped she will fully regain her health.

Miss Juawice Tabb, one of our efficient tonnage clerks, resigned September 1 and has gone to Chicago to enter school.

The entire division extends its sympathy to J. N. Concklin, division accountant, in the death of his wife on August 20 at Chattanooga, Tenn., where Mrs. Concklin had gone in search of health.

NEW ORLEANS DIVISION

An automobile driver with a friend aboard attempted to cross the track a few days ago at a grade crossing near the Vicksburg yard office. When half way across, the front wheels of the automobile refused to budge an inch, while the rear wheels revolved with amazing rapidity. The driver shot the juice to the engine, but to no avail. Just about that time train No. 30 came around a curve. A yard clerk, seeing the predicament, endeavored to flag the train, but did not succeed. However, others came to the rescue and attracted the attention of the engineer. The brakes were applied, and in the meantime the automobile driver fled. Just before the train came to a stop within a yard of the automobile, the rebellious machine, as if suddenly endowed with human intelligence, gave a jump, cleared the track and went wildly speeding down the road. The onlookers, who by this time had reached the size

of a crowd, took after it, just as in a comedy "movie." An alert switchman finally captured it and returned it to its owner. Nobody hurt.

Chief Dispatcher J. B. Yellowley departed recently for points in the North and East. Mr. Yellowley's objective is New York, where his brother, Ed Yellowley, is chief prohibition enforcement agent. Mr. Yellowley's trip is envied by many of his friends on the division.

Val P. Barrick, incline engine foreman, Baton Rouge, vouches for the following fish story: Engineer Perry Johnson and Conductors O. H. Ford and E. O. Day organized a party and tried their luck at some lake on the Gulf Coast Railroad. They returned to Baton Rouge with a couple of barrels of game fish, each from ten to twelve inches long, every one caught with hook and line. This is the biggest haul made around Baton Rouge for a long while. They generously distributed the catch among their fellow employees.

A number of our conductors and engineers have made Hot Springs, Ark., their happy hunting grounds this summer. Among those enjoying the salubrious environment were Conductors Clinton Davis and R. A. Stafford and Engineer J. S. Thompson.

New York City has attracted several this year. Conductor J. L. Dudley has just recently returned from a trip to that city and other eastern points.

Conductor M. J. Moody reports a delightful time after a sojourn in Georgia.

Miss Nora Ring, stenographer in the office of Superintendent F. R. Mays, is at work again after an illness of several days.

J. H. Evans, one of our pensioned engineers, spent a few days in Vicksburg recently, mingling with old friends.

Here are some views taken at Markham Station, near Moorhead, Miss., on the Memphis division. A frame station was built at this point about a year ago, much to the pleasure of Arthur Ray of Markham plantation (postoffice Baird, Miss.), who sends us these views and writes: "Markham Station revenue will be greatly increased this fall, as Sunflower County has commenced unloading a number of cars of gravel and will unload nearly 400 cars at this point."

Illinois Central System Tells About Shortage of Transportation	Inside Back Cover

R. P. DeCamp

R. P. DeCamp, assistant coal traffic manager, was born at Cresco, Iowa, December 9, 1885, and was educated in the public schools of that city, later being graduated from the Cedar Rapids Business College, Cedar Rapids, Iowa. He entered the employ of the Illinois Central on June 1, 1903, in the freight claim department, remaining there only a few months, when he was transferred to the traffic manager's office, on February 1, 1904, and thence to the Chicago general freight office on April 1, 1908, serving in various capacities. On December 1, 1918, he was appointed chief clerk in the export and import department. On June 1, 1921, he was appointed chief clerk in the general freight department, Chicago. On December 1, 1921, he was appointed chief clerk to Mr. Bowes and Mr. Longstreet, traffic vice-president and traffic manager respectively, and on January 10, 1922, was appointed assistant coal traffic manager, with headquarters at Chicago.

Our On-Time Record Wins Business

*Patrons Give Testimony to Excellence of Illinois
Central Service and Back Their Belief With Cash*

The importance of the Illinois Central System's reputation for maintenance of passenger train schedules is hard to overestimate. With every railroad in the country exerting its best effort to provide satisfactory service, it is noteworthy for patrons to select any one road as outstanding and to give voluntary testimony to its excellence. Yet that is exactly what patrons of the Illinois Central System are doing. They are recognizing the exceptional loyalty and efficiency of Illinois Central System employees. Below are a few of the more unusual testimonials recently received.

Reputation

Good name in man and woman, dear my lord,

Is the immediate jewel of their souls;
Who steals my purse steals trash; 'tis something, nothing;

'Twas mine, 'tis his, and has been slave to thousands;

But he that filches from me my good name

Robs me of that which not enriches him

And makes me poor indeed.

—WILLIAM SHAKESPEARE, "Othello."

AFTER a trip to California and return over several railroads in August, E. V. Donovan, chief of the fire department of Greenville, Miss., was moved to such an extent that he wrote to President C. H. Markham and Vice-President L. W. Baldwin a letter praising the passenger service of the Illinois Central System. His letter to Mr. Markham and Mr. Baldwin ran as follows:

"As I have just returned from attending the convention of the International Association of Fire Engineers, which was held in the city of San Francisco, Cal., I had the opportunity of seeing some of the so-called fine passenger trains and also some of the manifest trains.

"I heard so much of these fine roads and good trains that I took a special interest in making inquiry as to the special time they were mak-

ing, and, to my surprise, out of the sixteen limited trains that I made inquiry about there was not one running on time.

"I heard those people out West boasting so much about their trains, I could stand it no longer; so I took the liberty to tell the delegates (and they were from every state in the Union and foreign delegates from Panama, China, Japan, and Paris, France) that the Illinois Central System

Chief E. V. Donovan and his motor car

had one of the finest passenger trains in the United States, and that train was No. 7 and No. 8, known as the Panama Limited.

"I told them that, under these trying conditions, the Illinois Central System was running trains 98 per cent on time. From the time I left home, out of the whole journey, the only trains on time were on the Illinois Central System, and I take the liberty to congratulate you gentlemen on the splendid manner in which you are managing, and the courtesy of the employes of your road."

Glad to Get Back to Our Line

The following letter was recently received by President C. H. Markham from the Rev. G. Gordon Smeade, M. A., LL. D., Episcopal archdeacon of Mississippi, Jackson, Miss.:

Train No. 502 arriving at De Witt, Ill.

"It has been my pleasure to attend the general convention of the Episcopal Church in Portland, and the trip necessarily took me over a great many different roads. It was really a great pleasure to get back on the Illinois Central, which I did at St. Louis. After all, it is certainly the best road in the South and one of the best in the country. It is really a pleasure to travel on a road so thoroughly equipped and so modern in every respect, and which gets you to your destination on time, which in these days of constant delay is a convenience.

"I hope some of these days when you stop over in Jackson for a few hours that you will let me know, so I can meet you personally. I am anxious to know you better, and for you to know me."

Eager to Use the Illinois Central

The following letter was recently received from an employe now on leave of absence:

"Our successful efforts to maintain 'on time' schedules are bearing fruit and increasing the revenue.

"On a ——— train recently two traveling men were discussing the various roads, condemning several trunk lines and praising the Illinois Central. One said he had made two round trips to Memphis, and the train was on time all the way. The other, en route to ———, was anxious to return to Chicago the following afternoon to make an eastern connection. He said he intended to spend an extra dollar for interurban fare

Train No. 527 at Waterloo, Iowa; Engineer Hackett and Fireman Sciles.

from ——— to Champaign, so that he might ride the Illinois Central into Chicago, feeling certain the Illinois Central would be on time.

"Both also mentioned that the Illinois Central suffered less as a result of the strike, because the employes were more loyal than on other roads.

"I did not know either of these men (they were not railway men), but was much interested in their talk."

Chief Donovan's fire-fighting equipment

Hears Praises of Illinois Central Policy

By PAUL E. ODELL,
Office of General Superintendent,
of Transportation, Chicago

The plan followed by President Markham in making his plain talks to the public and to employes about the problems of the railroad is winning a considerable amount of favorable comment for the Illinois Central System. Wherever I go I hear the plan talked about—at club luncheons, at dinner parties in the homes, at lunch counters and working around engines and freight trains. It goes without saying that the comment is entirely favorable.

I recently received a letter from J. F. Deems of West Burlington, Iowa, a personal friend of mine, who relates an experience that illustrates the attention attracted by the "Markham plan" of building a better relationship among management, employes and the public. The following excerpt from his letter will be of interest to the members of the Illinois Central System family:

"By the way, Paul, what are the details of the plan that the Illinois Central is putting on that I hear so much and so favorably about? On the train between Pittsburgh and Cleveland I heard two men discussing it rather animatedly, even though they were both on the affirmative side of the question. I gathered that it is a scheme Mr. Markham has inaugurated looking to a better understanding by and closer relations among the railroad, its employes and the public.

"If this is true, I know of no field that has been more neglected or is fraught with greater possibilities for all parties inter-

ested, and it should mean much to the Illinois Central to adopt such methods. You should feel proud to be connected with such a progressive institution.

"I am not unaware of the fact that sporadic attempts along this line have been made by other railroads, but somebody seemed to step on them before they got very far. I hope this will not be true of the Illinois Central's effort, as it appeals to me as the greatest opportunity open today to the line that gets in on the ground floor, and, like all opportunities, it is great because it is right.

"I could say a great deal on this, based on my many years of official railway life, but don't want to bore you; however, let me make one reference: What would you think of a large shop where piece work was being introduced and the workmen themselves made three-fourths of the piece prices, many of which were lower than the shop management would have put in? I know the reply of the cynic: 'The management didn't know its business.' But that's just a species of cheap self-laudation. It was merely a question of proper relations between men and management, and as I gather from the many favorable comments I hear that is just what Mr. Markham is trying to establish. More power to him!"

I think any employe is missing a bet if he or she doesn't take advantage of the opportunity to talk to the public, using the sentiment of President Markham, that we are partners and must work together. The Illinois Central System is great because the employes are working *with* the management, not merely *for* it.

Water Valley Celebrates Shop Expansion

October 5 Declared Holiday; Business Men and Employees Show Friendship Between City and Railroad

By A. D. CAULFIELD,
Superintendent, Mississippi Division

THURSDAY, October 5, 1922, was set aside as a holiday by the citizens and business men of Water Valley and vicinity and by the Illinois Central shop employees. The day was commemorated by a large picnic and barbecue held on Greener's Hill, just north of the Water Valley shops, where fully five thousand persons gathered and spent the entire day in jollification and pleasure.

The occasion was in celebration of general improvements in the Illinois Central shops of this place, where 85 per cent of the loyal employees held their hammers and remained at work when a national strike was called by the grand officers of the shopcrafts on July 1. Water Valley and many of the employees of the company had not forgotten the strike of 1911, from which the city and its citizenship had not fully recovered; realizing that capital and labor should co-operate on a 50-50 basis, the employees stood loyal to their positions, to their employers, to their families and to their friends.

The day was ideal. Beginning at 9:30 a. m., a parade was formed at the Illinois Central station, moving through the city to the northeastern part and to the picnic grounds. This parade was headed by W. F. Henry's local band, with more than thirty pieces, followed by many elaborately decorated automobiles and trucks, the rear being brought up by employees of the Water Valley shops on foot.

Showed Value of Shops

On arrival at the picnic grounds, H. H. Creekmore, who was master of ceremonies, delivered an excellent address of welcome. He dwelt especially on the good feeling existing between the city of Water Valley and the Illinois Central Railroad and its employees, pointing out the improvements in the shop yard, which enable the railroad to repair 100 additional cars at a time in the space provided, which necessarily causes the employment of a larger number of shopmen and increases the payroll of the Water Valley shop something like 100 per cent. He said that the amount of money paid out

by the railroad in wages at Water Valley to all employees, including the shopmen, aggregated something like \$1,500,000 a year, which, combined, represented more than the entire cotton crop of Yalobusha County, in which Water Valley is located. He then read letters of regret from the general officers in Chicago unable to be present, including President Markham's letter, which is herewith quoted:

"Your letter of September 25, inviting me to attend a celebration of the improvements made in the repair yards of the shops by

Mayor DeShon's Proclamation

State of Mississippi,
City of Water Valley.

October 2, 1922.

Know All Men by These Presents:

That, whereas the Illinois Central Railroad Company has made and is making extensive improvements in the Water Valley railway shops and is enlarging the extensive plant to almost double its former capacity, and

Whereas the improvements and enlarged plant mean the employment of a larger complement of laboring men, which will give lucrative employment to a large number of our citizens, and

Whereas the railway company by this act not only has demonstrated its faith in the co-operation and loyalty of the citizens of Water Valley and vicinity but has proved its "good will" and desire to help materially in the upbuilding and development of our city.

Now, therefore, in appreciation of what the railway company is doing for our city and community, its employees and the public in general, and to show that appreciation, it has been

Resolved, by employees, local railway officials and city officials that Thursday, October 5, 1922, be set apart and designated as a day of felicitation and celebration.

Every citizen is urged to attend this celebration and enjoy the festivities of the occasion.

I urge and request that all business houses, mills, offices and public institutions remain closed the entire day, and that it be made a day of rejoicing and pleasure.

F. B. DESHON,
Mayor.

October 5

Scenes of the parade that formed at the station and moved through the city to the picnic grounds. W. F. Henry's band led and was followed by elaborately decorated automobiles and the employees of the Illinois Central shops on foot.

citizens of Water Valley and employes of this company, to be held October 5, has been received.

"Nothing would give me greater pleasure than to be present and take part in this celebration, but I regret my engagements are such that it will be impossible for me to do so. I want you and the other citizens of Water Valley and the employes of the Illinois Central to know that I appreciate this manifestation of your friendship just as much as if I were going to be fortunate enough to be with you in person. It is most gratifying to me to know that the citizens of Water Valley and the employes of this company are working together in such splendid harmony. This is the ideal condition, and it augurs well for the future of Water Valley, as well as for the railroad."

A Wonderful Barbecue Dinner

A nice program was arranged for the entertainment during the day by the committee on amusements, competitive prizes being offered.

Promptly at 1 o'clock dinner was served. Tables were arranged in two rows, extending 500 feet and heaped up with a wonderful spread. There were hundreds of baskets of cake, pies, chickens, cookies, pickles, etc., in addition to 3,000 pounds of barbecued beef, pork and mutton prepared by T. Davis and L. K. McNamee, under the direction of the barbecue committee, consisting of these two and T. V. Carr, an employe of the car department, who has an enviable reputation as a grand master in the art of arranging barbecues. Music was rendered throughout the day by Henry's band of Water Valley.

After dinner was served, Master of Ceremonies Creekmore introduced the speakers, the first being Thomas B. King, representative of the Chamber of Commerce of Memphis, a good roads enthusiast. Mr. King entertained the crowd something like an hour with his wit and humor, demonstrating the importance of improved highways as a necessary element of transportation for the rural sections of the state in handling their products to market. He also pointed out that improved highways in connection with the railroads were among the greatest investments of civilization and that, without the transportation facilities of the railroad, little could be accomplished for the rural sections in Mississippi, even if highways were constructed.

Next came George R. James, a prominent citizen of Memphis, who has been devoting much of his time for the last several years to advocating co-operation between the railroads and their employes and between the towns and the country, demonstrating the fact that only through co-operation and service can a community or state prosper. He also spoke of the importance of diversification. Instead of raising all cotton, farmers should plant something to eat, he said. Mr. James is no stranger in Water Valley, being personally known to many of the citizens.

Next came John M. Egan, general superintendent of the Southern Lines, who was formerly division superintendent at Water Valley. He was at home among his friends. Mr. Egan's address had a ring of optimism from start to finish. He spoke of the transportation problems of the present time and said that the employes of the Illinois Central were connected with one of the greatest railroads in the United States; that never in the history of this country had this railroad failed to measure up to the required standard in providing transportation. This applied especially, he said, during the late war, when transportation was so necessary in the handling of men and war material to carry on the great conflict. During that time, he said, the Mississippi division of this great railroad had functioned 100 per cent. In recent times this same division and the Water Valley shops have at all times kept up that standard of operation, and this is due in a large measure to the loyalty and co-operation of the employes of this division and at Water Valley with the division officers. He said that with the increased business of the company, the railroad was expanding each year, which necessarily brought about the enlargement of track, yard and shop facilities at nearly all points, and that while some of the through business through Water Valley over the so-called "old main line" was diverted a few years ago via the low grade route, on account of more economic operating conditions, with the increased business now confronting us it would not be very long before this division would again be called upon to handle about the same amount of business that was diverted.

Praised Citizenship of Employes

The last speaker of the evening was B. Leland of the firm of B. Leland & Company, Water Valley, who is one of its oldest citi-

IC-142154, which was rebuilt at Water Valley, and repair tracks at the shops there. The improvements in the shop yard provide space for the repair of 100 additional cars at a time. The shop force has been increased accordingly.

The roundhouse and new shop extension tracks at Water Valley. The main line is at the extreme right in the lower picture, and the repair tracks are toward the left. The shops are in the background at the right.

zens. Mr. Leland moved to Water Valley when a youth, more than fifty years ago, at which time Water Valley had a population of less than 200; now it has grown to a city of 6,000. Mr. Leland was in Water Valley when the first shops were located. At that time the Illinois Central was known as the Mississippi Central, extending from Cairo to Canton. Mr. Leland paid tribute to the loyalty and high type of citizenship of the railway employees and said that, of the railway men of nearly all classes whom he had known for more than fifty years, a large majority showed the highest type of citizenship.

The prize winners in the contests were:

Best decorated automobile—First, F. J. Monroe; second, W. T. Everett.

Best decorated truck—W. C. Vaughan.

Girls' foot race—Miss Gladys McMinn.

Boys' foot race, contestants less than 15 years old—Mitchell Cox.

Ladies' potato pie eating contest—Miss Alice Shields.

Egg race for children less than 10 years old—Mary Elizabeth Barber.

Ugliest man on the grounds—This contest was hotly contested among several, but the judges finally gave the prize to John Kihnl, an Illinois Central employe, who wore home a new \$5 hat.

Girls' shoe race—Mary Earl Ware.

Scenes at the picnic on Greener's Hill, just north of the shops at Water Valley

Boys' sack race—Raymond Bray.

Ladies' race, all contestants more than 18 years old—Mrs. Rose Gaffaney.

Pretty baby contest—Frances Groves.

Climbing greased pole—Raymond Bray. This young man, the son of J. L. Bray, shop employe, captured two prizes in the contests.

The committees which handled the celebration so successfully were made up as follows:

Master of ceremonies—H. H. Creekmore.

Arrangement committee—F. B. DeShon, mayor, chairman; R. S. Murray, John Sederholm, Earl Truett, Everett Bell, W. H. Goodwin, W. T. Trusty, J. T. Eldredge, W. H. Harvey.

Invitation and speaking committee—J. H. Wagner, chairman; A. D. Caulfield, M. L. Hays, B. Leland, S. R. Mauldin, J. L. Chapman, J. G. Bennett.

Finance committee—F. H. Monroe, chairman for shop; O. T. Hamner, chairman for city; W. H. Stevens, W. E. Garrett, W. H. Goodwin, Luther Thomas, M. D. Dickey, Ben Allen, John Hunter, C. C. Bennett,

J. B. Cowan, Joe McMillan, W. F. Henry, Fred Waldron, Haze Brister, R. R. Mauldin, W. A. Nolen, W. T. Trusty, N. W. Spangler.

Amusement committee—W. J. King, chairman; J. B. Atkinson, T. Q. Ellis, W. E. Hoyt, Mrs. Guy Dean, Mrs. H. Halliwell, Mrs. Ed Kennedy.

Barbecue committee—T. V. Carr, chairman; L. K. McNamee, T. Davis.

Publicity committee—R. R. Mauldin, chairman; B. Leland, L. C. Barber, W. A. Nolen, J. H. Wagner, W. S. Thornton, H. F. Collins.

Central committee—W. C. Kendricks, T. V. Carr, C. B. Whitehead.

Basket committee—Mrs. T. Q. Ellis, chairman; Mrs. W. A. Nolen, Mrs. W. J. King, Mrs. Fred Waldron, Mrs. J. T. Pritchard, Miss Mary Pate, Mrs. J. C. Cost, Miss Estelle Holcomb, Mrs. J. L. Bray.

Truck committee—T. O. Gore, chairman; J. R. McLarty, R. E. Byers, W. A. Nolen, O. T. Hamner, Ross & Company.

Music committee—J. G. Bennett, W. F. Henry.

Treasurer—T. E. Vick.

Secretary—R. R. Mauldin.

Colonel Egan Notes Patrons' Co-operation

"When it comes to co-operation, Memphis shippers and receivers of freight can always be counted upon," said Colonel A. H. Egan, general superintendent of the Yazoo & Mississippi Valley Railroad, in commenting on the work being accomplished in keeping freight cars moving.

A few days ago Colonel Egan sent out an S. O. S. call for co-operation among shippers, asking that the rules for loading and unloading cars of freight at Memphis and in this territory be confined to twenty-four hours. He says the response has been so general that it is now 100 per cent in Memphis and practically as good throughout the entire territory into which extends the Yazoo & Mississippi Valley as well as the Southern Lines of the Illinois Central.

"I never saw a more prompt rally to co-operation with the railroads than has been given in this movement," is the way Colonel Egan put it yesterday. "I want particularly to commend J. H. Townshend, secretary-manager of the Southern Hardwood Traffic Association. He called to see me about the handling of cars, and the response from lumbermen has been general and beneficial to the railroads."

Colonel Egan says, while the car shortage is becoming acute, the Yazoo & Mississippi Valley is maintaining a steady movement of cotton and cotton seed in the Mississippi delta. This has been accomplished by rushing 400 furniture cars, all in first-class condition, to handle these products.

All railroads entering Memphis yesterday were hard pressed to supply cars for local needs. In several instances, where a specified car was requested, the demand was greater than the supply. These conditions, it is announced, can only be improved by continuation of shippers to load and unload cars promptly.

Some shippers are complaining of a shortage in common labor, due, they say, to cotton picking. Pickers are being paid good prices for getting out cotton and have gone to the fields. This, say rail officials, is showing up in Memphis worse than at any point when it comes to quick handling of loaded cars.—Memphis (Tenn.) *Commercial Appeal*, October 5.

Money is a handmaiden if thou knowest how to use it; a mistress if thou knowest not.—HORACE.

Old Rails Used in Mexican Construction

Fred Dean Smith Sends Us Some Notes of Railway Events at Tampico; Sees Old Illinois Central Locomotives

FRED DEAN SMITH, formerly an Illinois Central employe, now connected with the Pierce Oil Corporation and stationed at Tampico, Mexico, is one of the most reliable friends that the *Illinois Central Magazine* has. Although located far from his old haunts, he still keeps his interest in our railroad and finds time to send an occasional photograph and an item of interest to all railway employes and to Illinois Central people in particular. Under date of September 11 he writes:

"There is one magazine which I look forward to every month and whose failure to appear would certainly prove a great disappointment. I enjoy the *Illinois Central Magazine* almost as much as a letter from home, and from the looks of what remains after the rest of the gang get through it seems that others enjoy it, too. The September number, which has just arrived, I have read from cover to cover. I enjoyed especially the articles by W. A. Bradley on the lumber supply and by C. Chandler on the Missouri River bank protection at Council Bluffs, where I spent many a cold day on surveys.

"In order to give some of the old B. & B. foremen some new ideas on cattle yard construction, I am enclosing a few views of a stockyards which was recently put up by the National Railways of Mexico at

Tampico. The pen is about 180 feet long by 130 feet wide and has ten compartments, with three loading inclines. There are 210 brick posts in the yard, each of which would do credit to any respectable cemetery. For fencing, six rows of old 60- and 80-pound rails are used, making a total of about 110 tons of steel in the entire yard. Theoretically, this fence should hold in the meanest and ugliest old bull that ever stepped into the bull ring, and it should recommend itself to your bull fighting fireman on the Minnesota division. The inclines are also framed of old steel rails, as shown in

Loading incline built of rails

Not a cemetery, but a Mexican stockyards

one of the illustrations. Construction was started February 2 and finished May 20 at a cost of about \$9,000.

"The old Illinois Central locomotive is a familiar sight here in Mexico now. Nos. 35, 40, 46, 52 and 62 have regular runs with the (one only) limited passenger train between Tampico and Monterey, on the way to the States. The equipment of this crack train usually consists of one box car for express, one combination baggage and mail, two second-class cars, one first-class car, a Pullman combination baggage and buffet car and a Pullman sleeping car. The last two cars are through cars to Houston, Texas, by way of Brownsville and the Gulf Coast Lines.

"One of the pictures shows what a blessing one particular Illinois Central locomotive means to some people down here. Most of the domestic water supply is obtained from ponds or rain barrels or from

Public water supply at Tampico

an occasional leaking railway water main. In this case a benevolent engineer, together with an excess of water in the tank, insures a day's water supply to several families."

Cleanliness a Factor in Shop Efficiency

By L. GRIMES,

Master Mechanic, Jackson, Tenn.

The two fundamental factors, I believe, in the successful operation of railway shops are clean and orderly premises. It can be taken as axiomatic that when a shop fails in this respect there is a breaking down in efficiency, in economy and in the morale of the men. On the other hand, the manner in which material, tools and supplies are kept will convey to the casual observer a good idea of the manner in which other features of operation are being conducted.

I have had occasion to visit various railway shops, and I have observed that in every case where disorder was prevalent and uncleanness a chief characteristic one would invariably find engines and cars in a neglected condition, matched, as a rule, by defects in the equipment that would be parallel with the untidiness of the plant.

When shops look neat and clean it is a source of pleasure for the workman to spend his time there, but when trash and dirt are lying around on all sides, engine pits filled with debris, corners littered with scrap and everything covered with dust, he is inclined to look upon his work as drudgery and consequently turns out a slovenly job.

Those who are familiar with shop opera-

tion, I believe, will agree with the idea that those parts of the engine which are underneath (and which in order to reach one must go into the pit) demand the greatest attention on the part of the supervising force, for the reason that they are concealed; when the pits are dirty, having an accumulation of stagnant water, the employees who are required to look after this part of the engine enter the pits with reluctance, perform their work as quickly as possible and make an inadequate inspection or no inspection at all to determine if other parts need attention. Conversely, if the conditions underneath the engine are *not* repugnant, the character of work done is better and there is a greater probability of the inspection of other parts and the discovery and repair of other defects, which, if not detected, would possibly result in engine failures or acceleration of wear to reciprocal parts.

There is a natural inclination with the majority of people to "drift with the tide." Where surroundings evince extravagance, waste and carelessness, they unconsciously move in the same direction. They throw usable material into scrap piles and draw new material that is not needed (often more than is necessary to complete the work) and throw the surplus away.

Employees working around clean, tidy

shops often pick up small lumps of coal, discarded bolts, nuts, cotter keys, etc., and replace the coal on the tank and the material in proper receptacles. The manner in which it is done creates the impression that it is not merely a casual or haphazard action, but has really become a habit inspired or cultivated by the general atmosphere, and these little things, in the aggregate, represent a great amount of money to the company. Therefore, the spirit arising from the orderly condition of premises penetrates to all departments of the shop organization, including the offices, and, no doubt, beyond this, even to the homes.

Disorder not only creates a spirit of inefficiency but is productive of fire hazards, as greasy wastes, wornout overalls, scrap paper, etc., follow other material into obscure corners, and the accumulation, in the course of time, ignites either through spontaneous combustion or the careless dropping of a match.

The word "order" does not merely mean that material, tools, etc., should be kept in their proper places and the shop premises clean, but it extends itself into the adjustment of various parts of the car and engine so that they will function to the best possible advantage, and it follows that the object lesson conveyed to employes by orderly and clean surroundings is reflected in the mechanic's performance of his duty—repairing equipment, adjusting and maintaining tools, etc., to the highest degree of efficiency.

Regardless of how indifferent the management may be to the accumulation of scrap and dirt, there comes a time when it is absolutely necessary to have a general cleaning up. The cost of periodic cleaning is really in excess of money spent at the place where the premises are always kept neat and clean, for the reason that each individual at the latter place hesitates to throw waste material on the ground or in the corners, but disposes of it in the proper way, with practically no loss of time to himself or cost to the company. Each act of this kind is an encouragement to personal initiative and cleanliness, which, in other words, is conservation of material and labor.

As I am a member of the mechanical department of the Illinois Central System, it may be inappropriate on my part to mention the excellent accomplishments achieved by this department, but inasmuch as the achievements are freely admitted by em-

ployes in other departments on this railroad and compliments from other sources are continually being paid the Illinois Central for the excellent condition of its power and other features of operation, I think I may use this point in saying that in my opinion the condition is due in a great measure to the fact that order and cleanliness at Illinois Central shops are the outstanding features. Should the day ever come when an inspection of the shops of this company shows a departure from these characteristics, then we may rest assured that on that day we are departing from the principles which have enabled us to reach this high standard of operation.

NEW TIME FOR THE DIAMOND

The schedules of the Diamond Special—trains Nos. 17 and 18—between Chicago and St. Louis were shortened an hour and two minutes and an hour and ten minutes respectively September 24. Each train leaves its station at 11:30 p. m., an hour later than before. The new arrival at St. Louis is 7:23 a. m. and at Chicago 7:25 a. m.

The two trains make the same stops between Chicago and Clinton, except that No. 17 does not stop at Grand Crossing and will stop at Kensington and Harvey only to pick up passengers for Decatur, Springfield, East St. Louis and St. Louis. There are no stops scheduled between Clinton and St. Louis.

To serve the territory south of Clinton, new trains connect at Clinton with Nos. 17 and 18 and are operated via East St. Louis as outlined herewith:

No. 517		No. 518	
4:10 a.m.	Lv. Clinton	Ar. 2:00 a.m.	
5:18 a.m.	Ar. Springfield	Lv. 12:45 a.m.	
5:25 a.m.	Lv. Springfield	Ar. 12:30 a.m.	
8:18 a.m.	Ar. E. St. Louis	Ar. 9:48 p.m.	
8:38 a.m.	Ar. St. Louis	Lv. 9:30 p.m.	

Trains Nos. 517 and 518 make the same stops between Clinton and St. Louis that Nos. 17 and 18 formerly made.

Diamond Special trains Nos. 17 and 18 have the following equipment: baggage-express car, chair car, buffet-club car, sleeping cars between Chicago and Springfield, Chicago and Decatur, Chicago and St. Louis.

An attractive folder announcing the change in our Chicago-St. Louis service has been published by the passenger department.

When vice prevails and impious men bear sway, the post of honor is a private station.—ADDISON.

Rode 1,652 Miles to Give Pint of Blood

*Kirk Perry, Former Employe, Came From Texas in Vain
Attempt to Aid Half-Brother, Illinois Central Conductor*

KIRK PERRY, former employe of the Illinois Central, traveled 1,652 miles from Del Rio, Texas, to Chicago the first part of September to give a pint of his blood in the effort to prolong and perhaps save the life of his half-brother, A. Giles Perry, a conductor on the Mississippi division. But Giles died at 4 a. m., October 17, at his father's home on a farm near Bradford, Tenn. His health had been failing since an attack of influenza in 1920. Death was due to pernicious anemia.

Kirk and Giles were reared together on a farm near Bradford. They played together, had differences, quarrels and even fought; but a true brother-love was never lacking. There were four boys and four girls in the Perry family, but these two boys stuck closer together than any of the others. They were together almost constantly during their youth. One always came to the aid of the other, no matter what trouble arose.

Giles was the older of the two. He entered the service of the company as a flagman on a bridge crew in 1897, when he was 22 years old. He served as a flagman about five years and then was promoted to conductor. While Giles was in that position, Kirk decided that he, too, wanted to start railroading. In 1907 he entered the service as a brakeman and made many trips with Giles.

About three years ago, Giles was promoted to extra passenger conductor. He served in passenger and freight service until November, 1921, when poor health forced him to stop working.

He went to the Illinois Central hospital at Paducah and had been there about six weeks when it was decided that transfusion of blood was the only thing that could possibly save his life. He was taken to the hospital in Chicago, where an operation was performed. A close friend contributed the blood, and Mr. Perry improved immediately. However, the improvement was not for long, and other transfusions were made. Five operations had been performed and the sixth was necessary when Kirk insisted that he be allowed to give his blood. His request was granted, and Giles said that he felt

Giles Perry

Kirk Perry

better after that operation the middle of September than he did after any of the previous ones. He returned to his father's home much stronger, but still unable to work. He was up and about until the evening of October 15, when he went to bed with a severe chill.

Since November, 1921, when he quit work, Giles had been a sicker man than he would believe, his many friends say. His determination to get well and to return to work gave him much of his strength.

Kirk, who returned to his work in Texas after he saw Giles improved from the operation, is now a conductor on the Southern Pacific Railroad, having resigned from the Illinois Central service after a little more than three years with our company. He was unable to leave his position in Texas to attend the funeral.

THE NECESSITY OF TOIL

This law of nature is that a certain quantity of work is necessary to produce a certain quantity of good, of any kind whatever. If you want knowledge, you must toil for it; if food, you must toil for it; and if pleasure, you must toil for it. But men do not acknowledge this law, or strive to evade it, hoping to get their knowledge and food and pleasure for nothing.—
JOHN RUSKIN.

Getting Close to the Onion at St. Ansgar

Farmers on Our Line in Northern Iowa Go Into This Crop and Find That It Makes Land Worth \$500 an Acre

LARGE, well-rounded, red, juicy, smelly onions are highly respected and regarded as fit subjects for discussion in the parlors or on the street corners of St. Ansgar, Iowa, on our Minnesota division. The residents there are interested in the production of onions. The soil in that locality is particularly adapted to the best development of the often-evaded vegetable, and everyone who has a small strip of land raises onions.

The residents talk onions morning, noon and night at St. Ansgar. When reference to the weather is made in a conversation, it is usually: "This is fine onion weather" or "This is not so good for the onions." A stranger in St. Ansgar is interested in the topic of general conversation there because he is not used to the frequent reference to onions, and his interest becomes greater when he is shown one of the splendid specimens that has been grown right in the city.

The red globe onion has been selected as the variety that is best in that locality. It is considered to be the most hardy onion and has been raised there extensively for the last thirty years.

Five Hundred Acres of Onions

The first large crop of onions of St. Ansgar was raised by a man who had moved there from a neighboring town. He recognized that the rich, black loam was about perfect for the production of Allium plants. His first crop brought good prices, and the following year other persons undertook to raise onions. Each year after

Dorothy Moeller, daughter of an onion grower at St. Ansgar, and her chum, Esther Hendrickson, have no horror of onions. Miss Moeller is at the right.

that has found an increased number of acres devoted to that purpose. This year about five hundred acres were planted. The largest field, consisting of 140 acres, was planted by F. J. Sedlacek.

It has been estimated that 20,000,000 pounds of onions will be shipped out of St. Ansgar this season. That will require the use of 800 cars to carry 250 100-pound sacks of onions each. The acreage in onions was nearly doubled this year, and the yield was from 100 to 200 bushels more to the acre than in previous years. The average production has been about 500 bushels to the acre. Forty cars were shipped out in August, and about one hundred in September. The movement will continue until late spring,

A field of onions at St. Ansgar, Iowa

Onions are planted the first part of May. Rows are made twelve inches apart, and the seeds are planted one at a time one inch apart. After the seeds have been in the ground about ten days, the sprouts begin to peep through. Cultivating and weeding by hand then start, and the work continues until the crop is ready to be gathered. When the bulbs have matured, the hand cultivator is converted into a lifter which, when run along the rows, cuts the roots and lifts the onions from the ground. They are then gathered, topped and placed in 1-bushel crates on the field to dry. A machine is sometimes used for the topping, but the bulbs are often bruised as the tops are rolled off; so topping is usually done by hand. After the onions have been in the crates about a week, they are screened and placed in 100-pound sacks according to their size.

Onion Shipping Begins in August

The first onions are usually shipped along the first of August. Some that have been raised from plants mature as early as the middle of July, but the early onions are not so much in demand as the later ones, and consequently do not bring so good a price.

There is no limit to the number of crops of onions that can be raised on one piece of ground, the growers of St. Ansgar say. Unlike other crops, onions do not have to be rotated with something else. However, they need plenty of rain, since the bulb is about 95 per cent water.

After onions have been raised for four or five years on a plot of ground, weeds become scarce. That is due to the careful weeding that is done while the onions are growing.

The greatest difficulty the onion growers

Loading onions at St. Ansgar

at St. Ansgar have is the high wind, which threatens to blow away the rich top soil. As prevention, some of the owners of the smaller fields sow them down in grass in order that the thick roots will hold the soil.

Last year the onions of St. Ansgar sold for as high as \$6 a hundred pounds. That is largely the reason for the great increase in acreage this year, it is said. The price this year is expected to be more like normal, a little more than \$1 a hundred pounds. Late winter and early spring onions often sell as high as \$8 a hundred pounds. The larger onions bring the best prices.

Land Sells as High as \$1,000 an Acre

The onions are shipped from the field until the first frost; then they are put into storage houses and shipped out as fast as cars are supplied. From 250 to 300 100-pound sacks are placed in each car. There are three large onion storage houses at St. Ansgar. A new one was built this year to take care of the increased production.

The cars that are loaded at St. Ansgar are usually sent to St. Louis, Kansas City and Freeport, where they are reconsigned to points in various parts of the central and southern states. Texas, which has a repu-

Onions crated and left in field to dry

tation as an onion state, receives onions from St. Ansgar, Iowa.

Onion land at St. Ansgar is now worth

The Illinois Central station force at St. Ansgar, Iowa. Those in the picture, left to right, are: L. E. Moeller and J. W. Dean, helpers; H. T. Driscoll, operator; F. E. Conca, agent.

A Big Month at St. Ansgar

The busiest place in town this season of the year is around the Illinois Central Railroad station, and this year is an exceptionally busy one. Last week the *Enterprise* had an account of twenty-seven cars being loaded to truck crops in one day. The record for the month was 204 cars, as follows:

Cabbage	25 cars
Onions	97 cars
Potatoes	74 cars
Mixed vegetables	8 cars

Last year the shipments were only a little more than one-fourth as great, being one car of cabbage, fifteen cars of potatoes and forty-one cars of onions.

This makes a vast amount of work for the depot force. For, while they have nearly four times the business of a year ago, they have just the same amount of help, and it keeps them jumping sideways and working early and late to handle the business. What makes it worse is the fact that, while more cars have been secured than ever before, not nearly so many cars were furnished as shippers wanted on some days, and some were apt to feel they were not getting their share. In order to handle this feature of the matter, Agent Conca keeps a record which shows exactly the number of cars ordered by each person and the number furnished. But it is not an easy matter to handle on days when four or five cars are wanted for every one furnished. Considering the general car shortage over the country, the Illinois Central has certainly done splendidly in giving this station as many cars as it has.—St. Ansgar (Iowa) *Enterprise*, October 4.

A St. Ansgar cabbage field

more than \$500 an acre, and some has sold as high as \$1,000 an acre.

F. E. Conca is the Illinois Central agent at St. Ansgar. He has handled the shipments of onions out of there for the last six years. He entered the service in 1905 as agent at Robins, Iowa, and was agent and operator at various places until 1916, when he was sent to St. Ansgar.

HE THAT RULETH HIS SPIRIT

When you give someone a piece of your mind—

You are handing out something that no one wants—

You are giving something that will bring no value in return—

You are making investments in hatred that will never serve you well—

Explosions of temper may give a fancied relief—

But not from the back fire that will come in time—

Not from the loss of good will that no one can live rightly without—

Not from pent-up ill feelings that will try to get even with you—

A cool head gives a clear eye and a steady voice—

And clear eyes and a steady voice command respect—

And without respect our little success is quite an empty thing—

No man wants to boost the grouch—

No man offers aid many times to the one who flies to pieces—

And says whatever he happens to think—

Temper indicates weakness, not strength—

It reflects discredit on the pilot of the mind—

It indicates that no one controls the very home of the soul.—FORBES.

More Than 90, but They Can Ride Horses

Two Mississippi Great-Great-Grandmothers Give Good Exhibition at Tate County Fair at Senatobia

MRS. MARY SOLOMON, 95, of Coldwater, Miss., and Mrs. Demaris Yarbrough, 91, of Senatobia, Miss., surprised those who attended the Tate County Fair at Senatobia, on October 12 when they entered the ladies' riding contest. Although both are great-great-grandmothers and nearing the century mark, they rode their mounts with as much ease and grace as any of the younger entrants. Each received a \$5 gold piece for her remarkable skill as a horsewoman.

Mrs. Solomon says that she cannot remember when she could not ride a horse. When she was a child 4 or 5 years old, she used to ride to church on horseback behind her father, and she says that she danced many a jig standing up behind her father. But she was not allowed to have a horse of her own until she was a little older. By the time she was 13 she could manage a horse as well as many men and made several trips through the Tennessee wilderness that had been vacated by the Indians only a few years. When a trip was to be made by the family, she says, she refused to ride in the carriage, claiming that it gave her a headache. On this complaint, she was always granted the privilege of riding her horse, and she says that she could easily keep up with the rest.

Tennessee was a beautiful country, with wild grape and pea vines growing everywhere, she says, and the stock kept as fat as butter-balls.

Rode to School on Horseback

When she was 15 years old, she went from Bolivar, Tenn., to Smithland, Ky., to attend school. There were no railroads there in those days. Trips were either made on horseback or in closed wagons. She rode her pony, carried enough clothes to last her a year, she says, and was on the road about a week. Each night she stopped at a house to rest. But she was not alone on this trip. There were several relatives in the party.

Mrs. Solomon says that she would like to see the young woman who could carry enough clothes on horseback to last her a year nowadays. Her experience has been that they take a trunkful of clothes off to

Mrs. Yarbrough (on the left) and Mrs. Solomon at the Tate County Fair

school and then keep the mails hot with requests for more.

Mrs. Solomon has always ridden a horse side-saddle. She says that she was taught that ladies should ride that way, and she does not intend to change her ideas with time. When the request came for her to ride at the fair, she eagerly accepted it for two reasons—to show the people that she was still able to ride and to show the young ladies how they rode in her girlhood days.

Rides Only on a Side-Saddle

A side-saddle was found for her after a long and tiresome search. She had disposed of her own. On the day of the event, she sprang to her horse with the ease that she did in former years and handled him just as masterfully. She wore a riding habit that had been modeled after the ones worn in her early days.

When she heard that Mrs. Yarbrough was to ride the modern way, like a man, Mrs. Solomon says that she at first refused to ride by her side, but coaxing won her over.

Mrs. Solomon rode horseback at the Hernando fair in 1919 and received so much publicity over the occasion that she said she decided right then and there not to ride

any more. She didn't care for so much notice. Then when a friend learned that she was to ride at the Senatobia fair, she asked Mrs. Solomon if she was not afraid of getting the "big-head" over so much honor.

"No!" Mrs. Solomon declared. "I am used to being honored. My husband honored me, and my children all honor me."

Also Learned to Ride as a Girl

Mrs. Yarbrough was not such a constant horseback rider in her youth as Mrs. Solomon, but she always rode a great deal. She was not trusted alone on a horse until she was about 15. Her first experience with horses was also behind her father.

She says that she and her brother used to ride horseback to visit an aunt who lived about seven miles from their home. They would always start their journey in a slow trot and keep that pace until they were out of sight of their home, then turn their horses loose. She, too, always rode side-saddle until the Senatobia fair.

The suggestion that she ride at the fair came when she was enjoying her ninety-first birthday dinner on September 29. She said that when someone expressed the opinion that she would not be able to ride any more, it made her determined to do so. She wanted to prove to them that she could. She immediately sent a communication to Mrs. Solomon, a life-long friend, and arrangements were made.

Both Are Great-Great-Grandmothers

Mrs. Solomon was the oldest of nine children in her family, and she is the only one now living. She was married when she was 17 years old and is the mother of fourteen children. Nine of her children grew up, and seven of them are still alive. The oldest one is now 77 years old. She has thirty-six grandchildren, the oldest of whom is about 50; twenty-two great-grandchildren, the oldest one 30; and one 3-year-old great-grandchild.

Mrs. Yarbrough has three sisters, two half-brothers and one half-sister living. Their ages range from 84 to 70. She was married when she was 20 years old and is the mother of five children, all of whom are living. She had sixteen grandchildren, the oldest 42; fifteen great-grandchildren, the oldest 22; and two great-great-grandchildren whose ages are 3 and 1.

Both of these women have good, clear eyes, and seem to have perfect vision. When a clipping of small print was handed to

Mrs. Solomon, she read it easily without the aid of spectacles, while a granddaughter was compelled to hunt her glasses to see what was on the paper. Mrs. Solomon has not used spectacles for more than twenty years.

A LOSS TO US ALL

T. A. Langlois

The death of T. A. Langlois on Friday, August 22, at his home, 5024 South Aberdeen Street, Chicago, was a shock to his many friends.

Mr. Langlois was in the service of the Illinois Central about sixteen years and until four years ago was secretary to the late A. S. Baldwin, then chief engineer, when he was promoted to the position of assistant chief clerk, a position he held at the time of his death.

The large number of floral offerings at the funeral signified the many friends Mr. Langlois had made during his lifetime. His wife and family lose a good husband and father, and he will be greatly missed by all who knew him.

W. J. Garrity, formerly chief clerk to the engineer of bridges, was named to succeed Mr. Langlois, but has since been assigned to the general manager's office. A. M. Campbell is now assistant chief clerk in the engineering department.

T. W. Place, Western Lines Veteran, Dies

Pensioned Master Mechanic Was an Old-Time Engineer and Prominent in Waterloo, Iowa, Civic Circles

THOMAS W. PLACE, the grand old man of our Western Lines, who saw the whole history of our service west of Dubuque from its inception in 1857 to the present time, died at his home, 312 High Street, Waterloo, Iowa, at 12:30 a. m., October 9, at the age of 89. Sturdy of frame and mentally alert, he kept his faculties to the last. He had enjoyed good health until only a few months ago, and he was bedfast only about two weeks.

Mr. Place, as an engineer, handled the engine that pulled the first train west from Dubuque, on the old Dubuque & Pacific, later the Dubuque & Sioux City and now the Illinois Central, May 11, 1857—more than sixty-five years ago. Four years later he became master mechanic of the road, and held that position when the shops were moved from Dubuque to their present location at Waterloo in 1870. He remained as master mechanic until retired on pension in 1901. For fifty-two years he was prominent in the civic, business and religious activities of Waterloo.

Prominent in Waterloo Activities

After moving to Waterloo Mr. Place took an active interest in civic affairs during the early years of the city's development. He was a member of the east district board of education from 1876 to 1885, and served on the city council in 1872, 1877, 1878, 1879 and 1880. He was a member of the Masonic order, I. O. O. F. and several railway organizations.

Mr. Place was a churchman of the old school. He was one of the incorporators of Christ Episcopal parish at Waterloo in 1881 and became a vestryman and junior warden at the first meeting of the society. For forty-one consecutive years he was re-elected vestryman and named warden, advancing to senior warden about twenty years ago.

"His long connection with railway affairs, during the years when he drove the old-time engines over hitherto untraveled sections of Iowa, and his long service as master mechanic in the shops, as well as those years of quiet life since his retirement, won for Mr. Place the confidence and personal

Thomas W. Place

esteem of thousands of rail workers, officials and citizens," said the Waterloo *Evening Courier* of October 9. "He saw and aided in the development of railroading in all its mechanical branches. His career embraced the romance of steam railway operation."

Was Native of New Hampshire

Thomas Wheelock Place was born at Acworth, Sullivan County, N. H., January 2, 1833, the son of Ebenezer and Polly Place. His father died when he was 3 years old and his mother in Waterloo in 1874.

Mr. Place remained on the home farm until he was 17 years old and attended district school in Sullivan County. He then entered the employ of Parks & Woolson, Springfield, Vt., manufacturers of machinery for finishing woolen goods. With them he learned the machinist's trade, continuing with them until 1852, when he was employed in the locomotive works at Boston, Mass. The following year he entered railway training.

In 1853 Mr. Place became a locomotive fireman on the Northern Railroad of New Hampshire, later the Boston & Maine Rail-

road. In January, 1854, he went west, stopping at Chicago, where he entered service with the Chicago & Aurora Railroad, now part of the C., B. & Q., as machinist. The following April he became a locomotive engineer on the Chicago division of the Illinois Central lines.

In 1856 he moved to Dubuque, where he became an engineer with the Dubuque & Pacific. May 11, 1857, Mr. Place ran the first passenger train west of Dubuque.

Forty Years as Master Mechanic

In 1859 Mr. Place was made foreman of the engine repair shop of the Dubuque & Pacific, and in May, 1860, he accepted a similar position with the Chicago & Alton at Joliet, Ill. September 1, 1861, he became master mechanic of the Dubuque & Sioux City, which was the successor to the Dubuque & Pacific. The shops then were located in Dubuque.

In the fall of 1867 the Dubuque & Sioux City Railroad was merged with the Illinois Central, and Mr. Place was retained as master mechanic under the new arrangement. In November, 1870, the shops were removed to Waterloo.

Mr. Place remained as master mechanic until November 1, 1901, when he was retired under pension regulations. That he was permitted to enjoy good health for more than twenty years after retiring from service at 69 is a record attained by few.

The esteem in which he was held by the shopmen of his regime is evidenced by the fact they presented him a horse and buggy when he retired. This was before the automobile became popular.

Leaves Widow and Four Sons

July 24, 1860, Mr. Place was married at Julien, Dubuque County, to Miss Mary Josephine Myers, who survives him. For nearly half a century they occupied the residence on High Street, Waterloo, one of the few spots in the city where the march of progress has not been permitted to curtail old-fashioned, spacious grounds nor mar the beauty of garden, trees and lawn.

Four sons were born to Mr. and Mrs. Place, all of whom survive. They are James William, St. Louis, Mo.; Frederick E., Chicago; Augustus M. and Dorrence M., Waterloo.

Impressive services marked the last rites for Mr. Place at Christ Episcopal Church, Waterloo, Wednesday afternoon, October 11. A large concourse of friends attended the service, the funeral being one of the largest

ever held in Waterloo. Floral tributes from the Illinois Central System, men in railway circles, prominent churchmen and scores of floral pieces from friends throughout that part of Iowa were banked about the casket.

The Rev. E. B. Mounsey, pastor of Christ Episcopal Church, was in charge of the service, and was assisted by Bishop Harry Longley, Des Moines, and the Rev. Thomas Horton, St. Mark's Episcopal Church, Waterloo. Dr. John Lysart, Dubuque, and the Rev. Mr. Hornsby, Independence, were also present. Burial was in Fairview Cemetery, Waterloo.

Editorial Tribute to Mr. Place

The *Waterloo Tribune* of October 11 carried the following editorial tribute to the memory of Mr. Place:

"Almost to the end of his life—nearly 90 years—Thomas W. Place remained in full possession of his faculties. He was mentally alert, taking keen interest in the progress of the day. Physically, he was strong and active. Only within the past few months was there sign of weakening.

"Just now the Rock Island Railroad is celebrating its seventy years. Seventy years ago the first railroad was built west of Chicago. It was not until 1855 that the first rail of a railroad was laid west of the Mississippi. In 1856 this railroad, crossing the river at Davenport, reached Iowa City.

"Thomas W. Place, machinist and engineer, arrived in Chicago in 1854, when beyond that city there was little but undeveloped prairie. He reached Dubuque in 1856, following almost the first rails out of Chicago. The Rock Island lines were ahead of Mr. Place only a year. What is now the Illinois Central was called the Dubuque & Pacific. The road was destined for the Far West. California gold was the attraction. The '49ers were reaping the fruits of their discovery. Railroads were racing to them—some of the money being supplied from California. Then came the panic of 1857. Before complete recovery, came the Civil War, and railway work was delayed.

"When Mr. Place arrived in Dubuque, it was the chief city of Iowa. The railroad did not reach Des Moines until ten years afterward. The government was seeking settlers for Iowa land at \$1.25, or so, per acre. Wonderful Iowa has been built up since Thomas W. Place reached manhood. He saw it all. He saw that \$1.25 land sell for \$400 and more per acre. He saw school-houses and churches built and towns and

Length of Road One Hundred Miles

Brownie on duty and off duty at Dubuque

and then he runs to meet the engine. He greets the train with a yelp, stops suddenly just in time to keep from being hit, turns, runs alongside the front wheels of the engine and thus warns the persons on the platform of danger if they are standing too close to the moving train. When the engine comes to a full stop, Brownie turns, looks about to see that all is well and returns to his shady spot to resume his nap.

No one seems to know where Brownie came from or how long he has been at Dubuque. More or less like Topsy, he "just grewed." It is impossible to tell what kind of dog Brownie is, but it is thought that some place back in the line of his ancestors there was an airedale, for Brownie has a curly back. He is gentle and kind-hearted, but as independent as a homeless dog dares be.

Brownie has an army of friends among the employes at Dubuque, and he keeps them all devoted to him by treating each one to the same amount of affection. Democracy is his principle. He never allows any one person to take up too much of his time. The result is that the employes are always eager for a chance to pet him, and

they never grow tired of his company. His code of life makes him appear exceedingly independent at times. He has been known to pass his best friends on the street without recognizing them. But they only smile on such occasion and save Brownie the scraps from their lunches on those days the same as on all others.

Occasionally Brownie tires of Dubuque. At such times he hops into a baggage car and rides to one of the stations farther along the line. He may stay away a day or a week, but he always returns to Dubuque the same way he left. One of the Dubuque employes went to Freeport on company business one day and found Brownie at the station in that city. Recognition was mutual, it was said.

Brownie is partial to the Illinois Central, but there are times when he goes for a short ride on one of the other roads running into Dubuque.

It seems that Brownie is welcome wherever he may be. Employes miss him when he is away from the station at Dubuque.

There is always room for a man of force, and he makes room for many.—EMERSON.

Transportation Problems of 1922 Outlined

President Markham Tells Farm Equipment Manufacturers That Possibilities of Railroads Are Unlimited

The following address on "The Transportation Problems of 1922" was made by President C. H. Markham before the members of the National Association of Farm Equipment Manufacturers in session in Chicago October 18.

THE sustained welfare and prosperity of the farm implement business—and, in fact, of all business—depend upon having a national system of strong, efficient railroads, able to furnish their patrons at all times ample transportation service.

The importance of having railroads able to serve the public adequately and efficiently is forcibly impressed upon us just at this time by the sudden revival of business activity following a prolonged period of depression. A few months ago the railroads found it difficult to provide storage space for idle equipment, and now they are hard pressed to supply all the cars needed for the transportation of coal, farm products, building and construction materials, and other commodities. It is certain business will continue to be good and railway traffic heavy this fall and winter, and that there will be some unavoidable inconvenience to shippers. However, if the public will be patient, realizing the handicaps under which the railroads are struggling, and will be liberal with its support and co-operation, I believe we can go through the winter without serious distress. The railroads, you may rest assured, will do their utmost with their limited facilities.

Ordinarily, fall and winter supplies of bituminous coal are partly laid in during the summer, before the heavy season of railway traffic occasioned by winter and the movement of farm products begins. Last summer, however, the unionized bituminous mines were inactive for practically five months, and as a result a heavy coal traffic is thrown upon the railroads at a period of the year when other traffic, under normal conditions, is at its height.

Considerable Increase in Crops

The bulk of the enormous crops which the farmers of the United States have raised this year as their contribution to a season of plenty will be marketed during the next few months. The Department of Agricul-

ture has estimated that the country's fourteen leading farm crops this year are valued at \$7,134,654,000, as compared with \$5,935,861,000 in 1921, an increase of about \$1,200,000,000. Moreover the 1922 farm crop has been put into the ground and brought along to harvest at materially reduced costs, as compared with the last few years, which means that, at prevailing prices, the farmers bid fair to make profits that can be spent in the purchase of goods. All the leading crops are expected to be larger in bulk than last year, with the exception of corn, which, however, promises to make a good crop. Cotton lost ground during the late summer, due to the drouth and the boll weevil, and, since there was a small carry-over from last year, the cotton trade is expecting a shortage of cotton during the next year. However, conditions in the South have improved substantially over what they were during the last two years. The South is being gradually weaned from its dependence upon cotton for its "money crop," and the production of livestock, dairy products, grains, hay, fruits and vegetables is proving the economic salvation of that part of the country.

Industry generally has been getting back to normal after the long depression, although its return has been interrupted by strikes. As is always the case with strikes, they have caused not only voluntary idleness in the industries in which they have occurred, but other workers have been made idle by the restricted buying power of their fellow workers. Now, however, the industrial skies are clearing, and I believe we shall find the employment situation improving constantly.

A year ago, when the railroads were in a position to provide more transportation service than their patrons demanded, there was widespread agitation for lower rates, although the railroads as a whole were not earning their dividends. The demand for lower rates was so insistent that the Interstate Commerce Commission ordered reductions in rates which, together with the reductions voluntarily made by the railroads, amounted to about \$400,000,000 annually, based upon the amount of traffic handled in 1921. When this agitation for reduced

rates was going on the public gave little thought to the need for getting the railway machinery of the country into shape to handle the rush of business that was certain to follow the depression. Now that the railroads are straining every nerve to provide the transportation service demanded by the increased flow of business, I predict that we shall hear little agitation for lower rates and a great deal of agitation for more railway facilities and equipment.

Trend of Business Hard to Predict

The business of the country increases periodically, although the increase is very irregular and marked by wide fluctuations. The freight traffic of our railroads in 1921, for example, was less than in any year since 1915, a falling off from the traffic of 1920 of about 25 per cent. It is difficult to draw a line on the chart of business and predict that business will increase at a given rate. In the decade from 1890 to 1900 the freight traffic of the railroads increased 86 per cent, in the decade of 1900 to 1910 80 per cent, and in the decade of 1910 to 1920 62 per cent.

One thing is certain: The capacity of the railroads to handle the business of the country must be increased constantly, regardless of temporary fluctuations in traffic, or else there will be constantly recurring periods such as the present one in which the transportation machinery of the country is overloaded. No machine functions as well when it is overloaded as when it is carrying no more than its capacity, and the transportation machine is no exception. When just one more car or one more locomotive is needed than is available, the whole machinery of the railroad slows up. The shipper whose wants cannot be satisfied promptly is inconvenienced, and many other shippers are inconvenienced. The problem of railway management is to provide the right amount of cars, motive power, terminals and other facilities and equipment to handle the peak load of business without undue strain, and without, on the other hand, creating an over-supply.

The railroads have been handicapped by adverse conditions in carrying out their program for keeping facilities and equipment up to the needs of the country. They began falling behind several years before the World War, when rates were so low that earnings were depressed and investors were driven to other markets. Railway men, seeing what was coming, warned the public of the danger of a continued restrictive

policy and its effect upon railway development. In an address delivered in 1912, the late James J. Hill called public attention to the fact that investors were being driven out of the railway market by a policy of strangulation against the railroads. He declared then that the natural material growth of the country would create a chronic transportation congestion unless this policy were abandoned and the railroads were permitted to earn enough money to pay principal and interest on investments made for enlarging and improving railway facilities and equipment.

Whether or not heed was paid to this warning is shown by the figures on the number of miles of new track built each year since then. In 1912, the year in which Mr. Hill's address was made, the railroads built 4,212 miles of new track—that is, including all track, not merely new lines. In the following year, 1913, they built 4,467 miles. Since then there has been an almost steady decline, and during the last four years they have built an average of only 933 miles a year. Moreover, since 1916 the number of miles of track abandoned each year has exceeded the number of miles of new track built.

Building of Equipment Decreased

The rate at which new equipment has been installed has likewise fallen off in recent years. For about a decade preceding the war, when the earnings of the railroads were kept down by low rates, and they were not enabled to secure the capital needed for extensions and improvements, they did not provide themselves with new equipment as rapidly as the growth of the country demanded. During the last four years, however, they have not even been purchasing as much equipment as before the war.

During the ten years ending with 1917, the railroads installed an average of 2,677 locomotives each year, of which 1,696 went to take the places of engines that were sent to the scrap heap. During the last four years, however, they have added an average of only 1,772 locomotives a year, or only 76 more than they formerly sent to the scrap heap each year. During the last four years the rate at which locomotives have been retired from service dropped to an average of 1,073 a year, which means that the railroads, in order to handle the business of the country, have had to keep in service locomotives that should have been placed on the retired list.

The same is true of other kinds of equipment. During the ten years ending with 1917 the railroads added an average of 120,254 freight cars a year and retired 82,416 a year, while during the last four years they have been able to add an average of only 59,740 a year and retire an average of only 59,258 a year. In the ten years ending with 1917 the railroads each year sent an average of 1,713 passenger cars to the scrap heap and put 2,770 new ones in service, but during the last four years they have added only 1,168 new ones a year and retired only 821 a year.

Rate of Return Set at 5½ Per Cent

When the period of federal control came to an end, the Transportation Act, under which the railroads have been operated since that time, provided that freight and passenger rates should be based upon their estimated power to earn for the railroads as a whole an annual net operating income of 5½ per cent upon tentative valuation, to which an additional ½ per cent could be added to provide for additional facilities and equipment. This rate was to extend for two years, or until March 1, 1922, after which time the Interstate Commerce Commission was to determine what should be a fair and reasonable rate of return. The Commission this year decided upon 5¼ per cent upon tentative valuation as fair and reasonable, and rates were revised based upon their estimated power to earn a net operating income at that rate.

These were estimated earnings. As a matter of fact, the net operating income of the railroads in 1921, instead of being 6 per cent upon their tentative valuation, was only 3.31 per cent, which was just about sufficient to pay their rentals and interest charges, leaving nothing for dividends to the owners of the property or for additions and betterments. And in this year, in two months of which the railroads were supposed to realize a net operating income at the annual rate of 6 per cent, and since then at 5¼ per cent, earnings have been constantly below the estimate. For the first seven months of 1922 their net operating income was equivalent to an annual rate of 4.36 per cent upon tentative valuation. In other words, they failed by about \$156,800,000 to realize a net operating income at the 6 per cent rate.

Railway Investment Market Improves

The revenues of the railroads will be increased as traffic continues to grow, and the

financial reports of the railroads this fall and winter probably will be materially improved. In anticipation of this increase, the market for railway investments has already picked up, and since the first of this year the railroads have been making more extensive investments. During the nine months of January 1 to September 30 this year the railroads placed orders for 1,649 locomotives, which was more than seven times the number ordered during the whole of last year; 112,920 freight cars, which was nearly five times the number ordered during the whole of 1921, and 1,437 passenger cars, which was about six times the number ordered in 1921.

It is to the interest of every man engaged in gainful occupation that the railroads shall be permitted to expand as the business of the country expands. In order to do this, they must be allowed to adjust their freight and passenger rates, the rates of pay of their employes and the other items of income and outgo so that their net earnings will be sufficient to attract investors to railway securities.

It has become practically impossible for the railroads to make substantial improvements in and additions to their plants from surplus earnings for the very fact that under regulated rates surpluses do not accumulate. The railroads have been forced to give their patrons the immediate rather than the deferred benefits of the economies which have been made in railway operation, constantly accepting reduced rates and financing additions and betterments with borrowed money. That tendency to lower rates was interrupted by the increased cost of labor, materials and supplies brought about by the war, but it is an undisputed fact that prior to the war American railway rates were the lowest and American railway service was the best in the world. I believe American railway service is still the best in the world, and I believe the constant effecting of economies and readjustment of labor and other costs will again work about to make American railway rates the lowest in the world, if they are not the lowest at present.

Service Rests With the People

The American people can have whatever kind of railway service they want and are willing to provide for. Practically every phase of railway management and operation

They Practice and Preach Owning a Home

Chicago Employees Find That Their Sacrifices Are Well Worth While When the Results Are Considered

By **ROBERT HOOK,**

Flagman, Chicago Terminal

TO OWN your own home is surely a comfort for a man like myself, with a moderate salary as a flagman on the Illinois Central for the last ten years. But it is not what you earn; it is what you save.

The first thing is make up your mind that you really want a home; then go after it. It means a lot of real, earnest, hard work for a few years. It means you cannot enjoy all the good shows or a lot of fine clothing. It means you must practice economy.

We wanted a nice home, but we found we could not pay rent and save, too; so we thought it best to pay rent to ourselves. We paid out rent just as if we did not own our own home, and, with the rent from upstairs, we were always ready when our notes came due.

We never hired any work done. We managed to do everything ourselves, thus cutting out all decorating and other expenses.

In two and a half years we managed to save \$2,500, and in the four and a half years we have been married we have saved nearly \$5,000. With the little cash we had on hand, we got along very nicely. Now we can enjoy the comforts of our own nice home at 1450 East 71st Place and a nice income from it.

Mr. and Mrs. Robert Hook

I can sincerely say, with the little discomforts we had to endure, it surely is worth the effort of anyone who cares to own his own home to get right down and practice thrift and good management.

Previous to our marriage, Mrs. Hook was employed by the Illinois Central in the ticket receiver's office at Randolph Street, Chicago; so it can be seen that our success is the result of good Illinois Central co-operation.

Build Your Own Home

By **FRANK SANDERS,**

Signal Department, Chicago Terminal

My advice to the married wage earner is to build outside the city and avoid high rent and taxes.

I've paid rent for city flats and houses, and thirteen months ago I was forced (my wife being taken away on account of a mental breakdown) to choose between storing my furniture and renting a room for myself or building a home of my own to put the furniture in, thus saving storage and having a room also. So I chose building. I had a lot in Riverdale, Ill., just out-

The Hook residence

side Chicago, on the Illinois Central main line. This lot was 35 by 100 feet and valued at \$200. I made a small loan, figured out the material and built the home myself after my regular hours on the Illinois Central. The only money spent for outside help was \$64.50, which covered water brought to the front of the house, gas brought into the basement, a sewer connection and labor to help set twelve 7-foot foundation posts.

The house has a living room, bedroom, kitchen, dining room and bathroom.

The ground is of clay formation, and I have the basement in full size, with a cinder floor. A concrete wall will be my next move, and after that an addition to the house.

No expensive inside finish was used. The house has yellow pine trim, heavy plaster board nailed to studs, joints cemented, and painted. The roof and sides down to the bottom of the windows have 4-in-1 red asphalt shingles over ship-lap, which eliminates paint. I used beveled siding from the shingles down to the floor level and matched lumber from the floor level down to the ground level.

The house is complete as far as I have gone, with the exception of wiring for lights.

Mr. Sanders built this himself

The total cost to date, lot included, is \$1,140. The house is one and one-half blocks from the Illinois Central station at Riverdale and three blocks from city cars.

I write this thinking it might be beneficial to others wanting a home at a really small cost.

Patron Remembers Courtesy of an Official

By MISS GRACE E. HOWARD,
Wheaton, Ill.

The Panama Limited stood at the terminal station in Chicago. The train crew was making the final preparations for another southern trip. A man entered the train, and with him was a woman, small and rather delicate, looking a little worn, but with grit up for the undertaking.

There was just time for the man to arrange her belongings. As he left her and the two wrung each other's hands at parting, she said: "Good-by, father. I'll say more in a letter when I get farther off."

The train moved out through the grim city and across wet, chilly fields. The day was a weary and cheerless one in November, and even the visions of the near approach of Thanksgiving, with its loaded tables and glad fellowship, could not cheer up the passengers who read or rested in the cars.

The Panama Limited, however, with good

equipment and service, was doing all in its power to solace its passengers with warmth and comfort and speed. Mr. Pullman himself would have felt gratified to survey it.

A gentleman just in the prime of life and bearing the stamp of a man of affairs in a business way strolled through several cars, half idly, half wishing to break the monotony of the day and the pressure of such cares and grievances as were at that time bearing somewhat heavily down upon his spirits.

He was going back to his own seat which he had left, thinking to regale himself with what was still unread of the newspaper. As he passed where the small woman sat, he heard her and the courteous stewardess exclaiming about a lost purse. They were anxiously turning over the various bundles, but to no avail. The purse was gone.

The next stop scheduled was Champaign. That was hours distant. But the passengers were mystified to notice that very quickly

the Panama Limited came to a standstill at one of the stations and a red-capped employe was dispatched to the telegraph office. Then the great engine swept on with its long line of cars, toward the blooming land of the South.

The gentleman of affairs had spoken a word with the small woman and left her. But at Champaign, another red-cap ran to the train with a telegram which the gentleman received and with great satisfaction delivered to the passenger. It read: "Father has purse. Will mail it to New Orleans."

This merry ending of an unpleasant circumstance led to a conversation between the two pleased travelers, so enlivening and animated that they found the dullness quite gone from the November day.

The woman confessed that she now remembered leaving the purse at the telephone desk, but she added that it was her habit to take her troubles in prayer to the Heavenly Father and that she found joy in realizing that, even when trouble was caused by her own failure, the Heavenly

Father was still merciful, and ready to forgive, and often found someone who was willing to do a deed of kindness.

Soon the conversation turned to the ever interesting topic of business. The gentleman showed her his card. It was the card of a railway official. That explained the mysterious fact that the train had stopped contrary to schedule. Then came an illuminating explanation of some of the simpler phases of the large problems and undertakings in railway extension, which revealed a life devoted with unstinted abandon to the development of that great civic necessity and blessing, the railroad.

Through months and months and even on foreign seas and in strange lands, the small woman remembers the gallant and disinterested service of the companion of that brief hour and wishes for him success in its quintessence.

They that can give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety. — BENJAMIN FRANKLIN.

Some scenes of beauty on our Western Lines

Why American Railroads Are Leaders

John R. Mott, Y. M. C. A. Executive, Gives Observations and Tells How His Organization Helps Morale

In connection with the recent semi-centennial celebration of the founding of the Railroad Young Men's Christian Association of North America, the following address on "Factors Underlying the Leadership of the Railroads of America" was given by John R. Mott, general secretary of the international committee of the Young Men's Christian Associations. The address was delivered at a luncheon at the Hotel Commodore, New York City, attended by more than one hundred eastern railway executives.

I VALUE highly the privilege of meeting in an intimate way with this company of men of wide outlook, of large achievement and of proved responsiveness to the highest ideals and purposes. As the chairman has indicated, it has been my lot to devote much of my life abroad as well as here in America to traveling work. I find myself, therefore, always at home in the midst of railway men, having spent now nearly thirty-five years in almost incessant travel among the nations. I am prepared to appreciate sympathetically as well as with my whole mind's assent the finer aspects of this work in honor of which we meet today, and also, lying back of that, the work of the railroads themselves. Every time I come back from a foreign journey, whether from the Orient or from the western nations or from those that lie south of us, I have a deepened sense of appreciation of the unique and stupendous service rendered by the railroads of America to the upbuilding of the life of our nation.

It is due to the railroads that we have had the almost unbelievable development of the vast material resources of the American continent. It is due to the railway service, and this is often overlooked, that there has been facilitated so largely the nation-wide dissemination of intelligence as well as the physical and social well-being of the American people. Likewise, the railroads have done more than any other one factor to promote the unity of the nation. Just as the Civil War fused together forever the American states politically, so the ceaseless shuttling of the railroads has made possible and done much to realize the

John R. Mott

social unification and the real spiritual solidarity of our strongly sectional and markedly cosmopolitan population. How much that means only those of us fully appreciate who travel widely over the land. Moreover, the American people do not realize the great contribution of our railroads in preventing some of the great ills and perils that have well nigh undone other nations and have actually brought on some of the greatest calamities of mankind.

Transportation a Bar to Famine

When on my recent visit to China I heard of the terrible havoc and suffering caused by the famine, I said, "How much of this might have been prevented by an adequate railway service." When in India I have found, even under the matchless administration of Britain, how great famines at times still obtain among the three hundred millions of Hindustan, and have said, "What would not be the situation were it not for the railroads they have, and what is not a widely extending country saved by having an adequate railway system?" When I was in Russia in the summer of 1917 with my

good friend General Scott, sent by the President as members of the Root Mission, and we saw the crumbling of the Russian Army and the rise of Bolshevism, we recognized that the principal thing which made this great catastrophe possible was the breakdown of the means of communication. The reason we have had to pour tens of millions of dollars' worth of provisions into Russia this year to save them from starvation, and the reason the great political distemper of Bolshevism, like a malignant disease, still eats its way into the heart of Russia, is insufficient transportation.

Think also of the great contribution of American railroads in opening in the railway service boundless opportunity to successive millions of men for useful work and for advancement. Our railroads constitute one of the greatest schools, if not the greatest school, of democracy we have.

Why is it that the American railroads hold the primacy among the railway systems of the nations? It is a fact familiar to those present that America has practically one-half of the railway mileage of the entire world. That, however, is not what impresses us so much as the causes which have given the railroads of America their unique distinction and great achieving power.

Our Wide American Opportunities

What are some of the factors which have made the American railroads great and given them leadership among the railway systems of the world? I may be far afield, but I think one of the factors has been the spaciousness of the opportunity. They had a vast continent thrust upon them to be opened, settled, subdued and developed. There was something about this which appealed powerfully to the imagination and also to the adventurous and heroic in strong men. It served to call out the best that was in them. Someone might say: "Is there not a great continent in Africa? What about Siberia, which is nearly three times the size of Canada or the United States?" Yes, their day will come, and I predict that the very spaciousness of those vast areas, which grew upon me as I made my long journeys over them, will yet challenge some of the greatest minds and release the latent energies not only of the Russian people but also of other nations whose co-operation they must have.

The admitted leadership of American railroads may also be explained by the free-

dom which they have had to evolve plans and project them through the decades, notwithstanding embarrassing and harassing restrictive legislation—legislation which in its practical effects or outworking has often proved to have been unpatriotic. When we contrast the developments on this side of the Atlantic with those in the European nations and even more with those in Latin America—we recognize that we have had a measure of liberty that has made possible our showing what railroads can do and how they can serve the interests of a great people.

Another factor that explains the greatness of our railroads has been the eminent leadership which these enterprises have had. I make bold to say that there is no work in America or in any other country which has called out among men more power of vision, more capacity for initiative, more organizing ability, that is, the ability to wield and combine men, than has the leadership of the railway systems of this country.

Power of Money and Co-operation

Undoubtedly another cause has been not only the power of mentality and personality to which I have called attention, but likewise the money power. What undertaking in America or in any other nation has had so largely poured out upon it the great energies of capital, not only of the rich but also of what we might call associated poverty? What project have we today that is more truly American?

Then I like to add another factor that has made us forge to the front. That has been our power to co-operate. I remember the discerning remark of Senator Root: "You may judge the degree of advancement of a nation's civilization by its ability to co-operate with other nations." This is just as true of companies as it is of nations. Judging by this test, the railway companies of this country have evolved into a high stage of advancement and present an example of which we may be proud. We all remember the days of keen and remorseless competition, even unto warfare. It sometimes had its advantages in calling out the latent capacities of men and companies; but we have evolved, I repeat, into that state where railroads, notwithstanding centrifugal energies, have shown their ability to co-operate with one another, and, what I sometimes think is even more striking, have developed unusual capacities of co-

operation internally. When we think of troubles between companies and men we may at times feel depressed, and wonder whether or not this point is true, but if we contrast what we have here with what they have in certain other nations, we shall find abundant ground for encouragement and hope.

Were I to mention another factor, it would be to emphasize the general character and spirit of the men in the service from top to bottom. I do not wonder that you are proud of this service. Nor do I wonder that the thing that causes us most solicitude is the fact that at times we are conscious that there is not the desired solidarity, or the sense of the solidarity that does exist. This leads us right into the heart of what has brought us here today.

The Good Influences of the Y. M. C. A.

Among the influences that have made possible the remarkable personnel of the American railway systems is the work of the Railroad Young Men's Christian Association. It deserves to be ranked very high indeed, if we may judge by the testimony of the railway officials. What agency has begun to do as much to promote right character, right relationships, and right spirit among the men in the varied services as has the Young Men's Christian Association?

The word that I suppose we heard most frequently in the war was the word "morale." You will remember the dictum of Napoleon that morale is to other factors in war as three to one. The World War was a war of morales. You will recall that Hindenburg in the early days of the war said that the victory would ultimately be achieved by the nation that had the strongest nerves. I do not like that word as well as I like the word "morale," which represents, as I see it, the spirit of the men.

It will be interesting to remind ourselves of what it was that at times tended to destroy the morale of men in the armies. War-tiredness in some cases was the cause; again it was idleness; at other times it was uncertainty or doubt; and not infrequently it was what we called enemy propaganda. These were among the principal influences. On the other hand, what were the causes that contributed most powerfully to the building up and maintaining of high morale? As I answer this question my answer will constitute in some respects the best outline I could give of the work of the Railroad

Young Men's Christian Association, because what this organization is striving to do along railway lines of the country is to promote the right morale, that is, the right character, attitude and spirit of the men. I would, therefore, ask the question again: What were the factors in the war that did most to maintain and strengthen morale? One of them undoubtedly was the promotion of the physical comfort of the men. I do not need to fill in what you will find in these pages [referring to a pamphlet on the table]. That is one of the great objects of the railway association. When you think what it does with its dormitories, restaurants, rest rooms, athletic features, its homelike lounges, you understand what we mean by the physical comfort of the men. A second factor that contributed to morale was the mental and heart contentment of the men. Again you will recall vividly the entertainments, the lectures, the reading rooms of the army Y. huts and of the Railroad Y. buildings at terminal and division points, and you recognize the full force of this point.

Important to Keep Men Occupied

The right use of the leisure hours had very much to do with preserving and strengthening morale. I trace nineteen-twentieths of the troubles among young men to unaccounted-for hours—sometimes an evening off, sometimes a day, sometimes a week-end. It is to these vacant hours that I trace the lapses and falls of men. We cannot well overstate the importance of a program such as that of the association to occupy usefully the vacant spaces in the time of men.

Another thing that contributed much to feeding the morale of men in the war was the opportunity the association afforded them to change their minds. After spending long days and nights in the trenches, or after being on the battlefield where they witnessed scenes and had experiences which they would fain forget, or after the irksome routine of camp life, to be able to go into a bright and cheerful room and mingle with their fellows and converse with the men and women workers in charge and enjoy the diverting games and uplifting ministries to mind and spirit was the means of transforming their whole mental outlook.

Another influence that made for morale was the consciousness the men had that they were not forgotten, that the people back at home—the citizens of their native

land—believed in them, were indeed interested in them, and followed them there, not simply through government taxes but through such welfare organizations as the Young Men's Christian Association. Tens of millions were contributed for Y. huts, equipment and facilities. The same influence is exerted by the Railroad Y. with its generous backing from the companies and their stockholders and friends.

A Tribute to the Secretaries

The secretarial leadership of this work has also had a profound influence. I can speak freely on this point because I am not known technically as a railway secretary. But I know these secretaries and how they have spent themselves and how they count it a high honor to be of service to the railway men. They have helped immeasurably, in my judgment, to keep alive the ideals that have done so much to feed the spirit and maintain the morale of the men.

Let me emphasize as a chief factor the ministry of pure religion, the religion that St. James spoke of, pure and undefiled, which is being exemplified, lived and communicated in the religious program of these associations. What did this not mean to men going into battles; what has it not meant to men since in the more difficult period following the Armistice; what has it meant to millions of men in the railway service, who through these associations have come under the wonderful, superhuman influence of Jesus Christ.

Well, therefore, may we today, on the turning of the fiftieth milestone of the work of the Railroad Young Men's Christian Association, pay our tribute to this nationwide, beneficent, efficient and fruitful organization. It has accomplished a great work. With its hundreds of associations, with its scores of thousands of members, with its large property interests of many millions, with the backing of nearly every railway company of importance in the land, with the wide outreach of its influence to other lands, it is on the threshold of vastly greater achievements.

A Peace-Maker in Industrial Conflict

If I were to mention another great result that has been achieved and is being increasingly achieved, next to its influence on the character and spirit of the men, I would speak of the unifying power of the Railroad Young Men's Christian Association. In these recent fateful and tragic years we have witnessed an alarming development

and manifestation of the divisive forces of mankind. I sometimes think the greatest problem before us for the next fifteen years is the racial problem, not only the divisive tendencies among the races but among the nations. Nor would I overlook another great divisive tendency—that in the social and industrial order. The conflict is on. What does it not mean that we have an organization which for fifty years has shown its ability, as no other society with which I am familiar, to unite in one membership, one program, and one objective, the employers and employees, and this in a voluntary and not an obligatory way, with the largest possible freedom of expression and action, and, therefore, insuring the finest and most effective co-operation? What has it not meant? I am not surprised that the other great industries of the world have finally been convinced after watching for years this practice game of the Railroad Y., and now we cannot keep up with their demand for the extension of the Young Men's Christian Association work on the railway association model to their industries. Nor should we wonder that industrial leaders in Europe and in Asia have requested that we send experts to study their fields at first hand and to plan agencies and facilities for their service. Discerning observers recognize afresh the stabilizing and steady guiding power of this work.

Sees Need for "Grand Strategy"

In a time of strain like the present, it assumes added meaning and importance. To my mind, we are summoned at a moment like this to expand greatly our plans. There are some things on which we have to call time, but this is not one of them. This is one of the projects from the nature of the case that should be expanded until the helpful network of the organization is spread much more intimately over all classes of men throughout all the railroads of America. We want to keep in mind what the French call "grand strategy." By grand strategy they mean that which takes in the whole map—all the fronts. As I look over our great American republic and notice the spaces that are without these facilities and without the helpful working of these vital and steadying processes, I say let us have grand strategy that takes in every railway system in its entirety. To this end we must expand greatly the resources for this work. So far as I can see there is no more highly multiplying use of money right now than

that of relating it to these plans, to influence aright the ideals, the character, the spirit, the efficiency, the relationships, the

output of the men to whom we commit such unparalleled interests of property and of human life.

Waterloo Y. M. C. A. Helps First-Aid Idea

In pursuance of the policy of the Waterloo, Iowa, Railroad Y. M. C. A. to extend to the men of the Illinois Central the very best of service, a first-aid room and dispensary has been opened in the "Y" quarters at the Illinois Central shops. This department of service is directly under the supervision and authority of the hospital department, with Dr. F. W. Porterfield, division surgeon, in command in co-operation with the other local members of the hospital staff. All of this class of work is carried on strictly under the rules of the Illinois Central's hospital department. The Y. M. C. A. is assisting in giving information as to when employes may meet the company doctors and also keeping the dispensary in shape for service.

The men of any department of the company can meet a company physician between 11 a. m. and noon on any working day. This means that the shopman can consult the company doctor without losing time for himself and saving time for the company. Many minor ailments as well as serious accidents can be properly taken care of with

the saving of much pain and suffering. On an average, ten to fifteen or more men are served daily through this effort.

The first-aid room is beautifully decorated in white enamel, with suitable furnishings and a complete stock of medicines, surgical dressings and other articles necessary for first-aid work. Through the general co-operation of the medical department, the safety committee of the shops and the Railroad Y. M. C. A., it is hoped that the employes will be able to avail themselves of the best knowledge and service of the hospital department.

Special noonday lectures on first aid and health will be conducted the coming winter. Dr. F. W. Porterfield will hold classes for the special training of representative men to do emergency work until a physician can be called.

The accompanying photograph shows a class in first-aid instruction under the direction of Dr. H. W. Sigworth, one of the company's local physicians. Roy A. Graham is the executive secretary of the Railroad Y. M. C. A. at Waterloo.

First-aid instruction at the Waterloo, Iowa, Railroad Y. M. C. A. In the photograph, reading from left to right, are: Adam Leeper, welder; Charles Horseley, roundhouse foreman; Robert Ingersoll, boilermaker; William Wilgus, boilermaker; Harry Steinmeyer, air brake foreman; William Bruger, blacksmith; Albert Kann, acting assistant roundhouse foreman; Otto Templin, cabinet maker; John Mead, blacksmith; Dr. H. W. Sigworth, local surgeon; Frank Reynolds, mill foreman; J. J. Whitney, air brake machinist; Adolph Feusner, foreman, boiler shop; Theodore Wwinner, machine shop foreman; Samuel Scott, machine foreman; James Pennington, pit gang foreman; James Robbins, machinist; L. D. Massey, store department; Howard Carr, machinist; H. J. Seely, general foreman.

Rube Burrow: Some Reminiscences of 1888

Notorious Southern Outlaw Held Up Illinois Central Train at Duck Hill, Miss., When Employe Was Killed

Passengers on the Birmingham district of our Tennessee division may note, as they pass over the Brush Creek viaduct, near Corinth, Miss., a sign calling attention to the existence of a cave near at hand that was at one time the shelter of Rube Burrow, notorious outlaw of the '80s. One of Rube's best-known adventures was his robbery of an Illinois Central train near Duck Hill, Miss., December 15, 1888. As an instance of heroic devotion to duty by Illinois Central employes, the story of this robbery is well worthy of record.

By C. E. SIEBER,
Traveling Engineer, Mississippi Division

RUBEN HOUSTON BURROW, the outlaw, was born in Lamar County, Alabama, December 11, 1854. His early life in Lamar was an uneventful one. He was known as an active, sprightly boy, apt in all athletic pursuits, a swift runner, an ardent huntsman and a natural woodsman. He possessed a fearless spirit and was of a merry and humorous turn (a characteristic of the Burrow family), but he showed none of those traits which might have foreshadowed the unenviable fame acquired in after life.

Rube Burrow's old companions in Alabama recall distinctly the day he left Lamar County for Texas in the autumn of 1872. He worked a while on his uncle's farm, but soon drifted into being that nondescript character known as a Texas cowboy. Shortly after this all Texas was startled by the bold and desperate adventures of Sam Bass and his band of train robbers, with which Rube was erroneously supposed to have been associated. Possibly inspired, however, by the notoriety which Sam Bass had achieved and by the exaggerated reports of the profits of Bass' adventures, contrasted with the sparse returns from his own more plod-

Rube Burrow

C. E. Sieber

ding occupation, Rube was seized with a desire to emulate his deeds of daring and achieve at once fame and fortune. From then on one robbery followed another in various sections of the country.

Boarded Train at Duck Hill, Miss.

On the cold and cheerless night of December 15, 1888, the northbound express train of the Illinois Central Railroad, which had left New Orleans for Chicago at 7 a. m., pulled into the station of Duck Hill, Miss., twelve miles south of Grenada, thirteen hours after its departure from New Orleans. The manner in which the engine was boarded and the train stopped is best told in the language of A. J. Law, the engineer in charge of the locomotive. He said:

"I pulled out of Duck Hill station at 10:05 p. m. The fireman called to me to look out, that there was a car of cotton ahead on the side track. I pulled slowly by, in order to avoid igniting the cotton by sparks from the engine, and when I had passed the cotton the fireman said: 'All right, let her go.' I started ahead lively and pres-

ently saw the two robbers climb up on my engine from the east side. The smaller man got on first. I thought they were tramps and was in the act of slowing up to put them off when the smaller man covered me with a big pistol and said: 'Don't stop here! Go on! Go on.'

"I then saw that the men were masked. I asked, 'Where do you want to stop?'

"He replied, 'I'll tell you where to stop.'

"I pulled along, and when we had gone about a mile he said: 'Stop here—stop now!'

How Express Car Was Entered

"I put the air on full and stopped as quickly as I could. The little man did all the talking. When we stopped he got down on the ground and fired his revolver two or three times. The train had hardly stopped when he commenced shooting. The other man said, 'Get down.' My fireman and I were then made to go ahead, on the east side of the train, to the express car.

"Here they stopped us, and the tall man called out to the messenger, 'Open up! Open up!'

"The messenger looked out of the door,

P. B. Wilkinson, conductor, born December 16, 1846; died May 7, 1914, at the age of 68; employed as flagman on the Illinois Central March 8, 1873; promoted to conductor February 15, 1874. At the time of his death he was on regular passenger service between Jackson, Tenn., and Canton, Miss., where he had been employed for more than thirty years.

and the tall man asked, 'Where is your other man?'

"The messenger said, 'I have no other man—no one here but me,' to which the reply was, 'Help this man into the car!'

"The messenger, being covered by the revolver of the larger man, extended his hand and helped him into the car.

"About this time Mr. Wilkinson, the conductor, came out of one of the rear coaches with his lantern, and the smaller man, who stood guarding us, told me to tell him to go back. I did, and the conductor went back, but in a couple of minutes came out again. I saw two forms get out of the car.

"I said: 'You had better go back, or they will shoot you; they are robbing the express car.' The fireman and I were between the robber and the rest of the train. He kept us in front of him as a sort of breastwork.

"Some one in the direction of the passenger coaches called out: 'Law, where are you?'

"When I answered, a voice said: 'Look out! I am going to shoot!'

"I stepped back from the train as the

A. J. Law, engineer, born March 7, 1858; died May 20, 1920, at the age of 62; entered the service of the Illinois Central November 1, 1882. At the time of his death he was handling trains No. 2 and No. 3 between Canton, Miss., and Memphis, Tenn., runs which he had had for fifteen years.

firing commenced, and I broke and ran for the woods, which were close by."

Employee Volunteered to Join Fight

Meantime the robber who had entered the car handed a sack to Harris, the Southern Express messenger, and bade him deliver up the contents of his safe. At this juncture the firing on the outside of the car began, and, advancing to the door while still keeping an eye on the messenger, the robber fired three shots into the air.

Conductor Wilkinson, on first coming out, had taken in the situation. Going back into the coaches he announced to the passengers that the train was being robbed and asked who would assist him. Chester Hughes, a brave young fellow from Jackson, Tenn., who was a fireman on the Illinois Central between Jackson, Tenn., and Cairo, who was, with his sister, deadheading from Durant to Jackson, Tenn., arose quickly and said: "I will, if I can get anything to shoot with."

Two negroes seated near by had each a .38 caliber Winchester rifle. These weapons were quickly gathered by the conductor and Hughes, who, loading them with cartridges furnished by the owners, went forth to do battle with the robbers. It was Conductor Wilkinson who had warned the engineer to protect himself, and he fired the first shot at the robbers.

Advancing abreast, these brave men fired shot after shot at the dark form of the robber who stood as a sentinel on the outside of the car and who unflinchingly held his ground, returning with steady aim charge after charge from his revolver. Finally young Hughes dropped his Winchester, exclaimed, "I am shot!" and fell to the earth. Wilkinson raised the brave young fellow to his feet and dragged his unconscious and bleeding form into the coach. Returning to the steps of the front coach, he renewed the firing at the robbers.

Death of Fireman Chester Hughes

The robber in the car had, meantime, obtained the money from the messenger (about \$2,000) and, backing out of the car, still holding his pistol on the messenger, he joined his comrade on the ground. Under the fire of the conductor, both retreated to the woods near by.

Chester Hughes had been in charge of a widowed sister, who, with several small children, was en route to Jackson, Tenn. The sister knew nothing of her brother's

Brush Creek viaduct, near Corinth, Miss., where is to be seen a sign calling attention to Rube Burrow's old hiding place, a cave in the vicinity.

participation in the fight with the robbers until he was carried back into the coach, when she prostrated herself in affectionate embrace over his body, from which life was fast ebbing away. The scene was an agonizing and affecting one. The unerring aim of the robber had sent three shots through the body of young Hughes, all entering the abdomen within a radius of six inches. The unfortunate but daring young fellow lived only a few minutes. The same train on which he had embarked in the vigor of health and buoyant spirits bore his lifeless form to the home of his widowed mother at Jackson.

The Southern Express Company and the Illinois Central Railroad promptly presented his grief-stricken mother with a fitting testimonial of appreciation for the heroic conduct of her son. The name of Chester Hughes will always be remembered as that of an employe faithful unto death.

Detectives Placed on the Trail

The whole country was aroused by the brutal murder of a passenger on one of the great trunk lines of railroad, in one of the most populous districts of the South, and it was determined that no expense or labor should be spared in bringing the criminals to justice. General Manager C. A. Beck and Superintendent J. G. Mann of the Illinois Central were in Memphis in a spe-

cial car at the time. During the night a violent and general rain storm had prevailed, and the telegraph wires were down in many places. The news of the robbery did not, therefore, reach Memphis until about midnight. The railway and express officials remained at the telegraph office all night, seeking the details, and left about daylight for the scene of the robbery. The aid of the Pinkertons was summoned, and several of the most expert detectives of the Chicago agency soon arrived at Duck Hill. The Pinkerton detectives, on their arrival at Duck Hill, however, were unable to find a trace of the robbers. There was no clew from which to begin a search for them.

Meantime, in a quiet way, the detectives of the Southern Express Company were at work on the theory that Rube Burrow was the leader in the robbery at Duck Hill. It was discovered that Rube Burrow and Joe Jackson had ridden away from the farm of Fletcher Stevens, in Tate County, Miss., on December 1, 1888, and, after having paid a visit to Rube's brother-in-law, Berryhill, who lived eighteen miles from Oxford, had proceeded to Water Valley, Miss., where they had spent the night. Going thence to Duck Hill, they had robbed the train in the manner described. After having mounted their horses, tethered in the woods some half a mile from the spot on which the robbery occurred, they had ridden through

a drenching rain a distance of forty miles by daylight. The next day they had camped in the brush, had divided the spoils of the robbery, and at sundown had resumed their journey, until they reached Lamar County. Here they remained in seclusion.

Rube Burrow was shot to death by J. D. Carter after his escape from jail at Linden, Ala., October 7, 1890. The body of the bandit was buried among the hills of Lamar County on the morning of October 10, 1890.

L. C. Brock, alias Joe Jackson, who assisted Burrow in the Duck Hill train robbery, was captured and taken to the Jackson, Miss., penitentiary for safe keeping, pending his appearance for trial in the federal court. He had elected to plead guilty and receive a sentence of life imprisonment for the offense of robbing United States mail at Buckatunna, Miss., September 25, 1889, rather than be taken to Duck Hill, because the penalty of death by hanging he knew would be his fate. He felt also that the outraged friends of Chester Hughes, the heroic passenger who had been shot down in cold blood, would probably mob him if he were taken there for trial. On November 10, 1890, the day set for his trial, he committed suicide by jumping from the fourth story of the penitentiary building.

Circumstances are the rulers of the weak; they are but the instruments of the wise.—
SAMUEL LOVER.

Narrow Escape From Canadian Bear in 1872

The following story of adventure has been contributed to the Illinois Central Magazine by R. Drewery, assistant custodian of Central Station, Chicago, for twenty-seven years an employe of the Illinois Central.

When our party started out to hunt and trap through the Saskatchewan Valley in 1872, we were all, as the boys express it, "good and green," but possessed of a great desire for excitement, and not having any set occupation. We had just received our discharge from the Canadian Army, comprising an expedition to put down some trouble in Manitoba. We all felt weary of the life we had been leading, as soldiers in time of peace always do. So I set about to organize a hunting party. At first I did not intend to take more than ten, thinking it would be hard to get a large number of

even tempered men that would remain so for an unlimited period, but when it got to be known what we were out for, applications were so numerous that I deemed it good policy to get away as early as possible rather than run the chance of losing friends or making enemies. So, with sixteen in our party, we finally started, with the regimental band playing "Good-By, Charlie."

After tramping about twelve miles we came to a deep ravine, made camp, prepared supper and retired early. The next morning being Sunday, we remained in and about camp all day, some of the party indulging in short walks just to enable them the better to know where to begin, but all came to the conclusion that there was nothing doing.

On Tuesday we broke camp and made about forty miles under a hot sun. This made most of us very tired, and when we

got into camp we were not long turning into our blankets. Most of us enjoyed a good night's rest, and we were all up early in the morning. I was surprised to hear a couple of the boys say that they had been awakened by the barking of wolves and the screech of the owl, as nothing like that had disturbed me.

While preparing breakfast we heard a crackling in the underbrush on the edge of the ravine, which seemed to increase momentarily, so much so that most of the boys grasped their rifles and started out. I was cook that morning and had to remain in camp.

Presently I heard a shot fired, and then came lots of tramping and loud whooping, so I figured that something had been wounded and was being followed. I gathered things together so as to keep breakfast warm and then went after the others.

I had not gone very far when I found tracks of blood. When I investigated I found them to be that of an animal, which was a relief. So I kept on and soon came in sight of my first black bear, badly wounded and pretty nearly done up. I brought my rifle up and blazed away. I hit him, but only wounded him worse, for he appeared to quicken his pace, and as the brush was very thick I could not get a second shot at him.

I kept on and soon saw him let up and finally fall to the ground, dead, to all appearances.

Then the thought came to me of what a fine thing it would be to get his hide off before the other fellows got in. Dropping my rifle, I drew my knife, approached and started to lay hold of him by the throat, when to my surprise he lifted up on his hind legs and made a blow at me with one of his paws, hitting me across the knife wrist, almost breaking it, at the same time catching his claw in my chest and badly cutting it.

The force of the blow knocked me down, and the bear was quickly standing over me

with a paw on either side of my head and he was stooping down, his breath in my face.

Just about then I was perspiring drops about the size of a marble. But what was that? Some snapping branch? Was someone approaching? The bear seemed to think so, for he raised his head, which certainly was a blessed relief to me, if even it was but for a moment. Again I heard the voices of those who might be able to aid me. They were excited and in hot discussion, but I could not make out what they said. Again came that horrible quietness for what seemed to me to be an interminable time, but which in reality was not more than a few seconds, when I heard the report of a rifle, and the bear fell over.

I afterward learned that the shot that killed him was fired by one Bill Goodbody. It was only after realizing the imminent peril I was in that he dared to risk it, but at last he made up his mind that a human life was at stake. Bringing his rifle between his feet, for he had lain down at full length on his back with his feet toward me, he made up his mind to kill or relieve me. His aim was fortunate, and the shot took effect in the head of the bear, just between the eyes.

When we finally took the bear into camp and weighed it we found that it tipped the scale at 500 pounds without the hide or entrails. For my part I have always been wary of bears. To this day I carry the scar on my chest, a hollow in which I can secrete a good-sized marble.

ADVERTISES PANAMA LIMITED

A folder containing some recent advertisements concerning the Panama Limited has been issued by General Passenger Agent W. H. Brill at New Orleans. The advertisements cover many of the phases of the excellent service of the Panama Limited to Chicago and are so attractive that the reader's attention is drawn to them at once.

Freight Engines Rebuilt for Suburban Use

Four of the old 401 type freight engines built in the '90s have been converted into suburban engines for service at Chicago. Those which have undergone the change are Nos. 402, 408, 438 and 485. They have been converted into Nos. 1451, 1452, 1450 and 1449. The construction work was

done by our own forces in the Burnside shops. Nos. 402 and 408 were in switching service at New Orleans before it was decided to convert them into suburban engines, and 438 and 485 were in switching service at Springfield, Ill.

The converted 401 type of engine is

Above, the type before conversion; below, after conversion.

larger than any of the other suburban engines. The next largest suburban engine to the 401 type is the 1448.

A table comparing the old 401 type engines with the converted engines and suburban engine 1448 follows:

	401 Type	Nos. 1449-1450	No. 1448
Weight of tender loaded.....	80,000 lbs.	70,200 lbs.	62,600 lbs.
Weight of engine on drivers....	106,400 lbs.	114,650 lbs.	85,000 lbs.
Weight on front trucks.....	19,600 lbs.	16,125 lbs.	15,700 lbs.
Total weight	206,000 lbs.	200,975 lbs.	163,300 lbs.
Tractive force.....	23,299 lbs.	23,299 lbs.	17,547 lbs.
Size of cylinder.....	19" dia. 26" stroke	19" dia. 26" stroke	18" dia. 24" stroke
Size of drivers.....	56½"	56½"	56½"
Capacity of tender.....	{ 3,850 gals. water	{ 3,000 gals. water	{ 2,750 gals. water
	{ 7½ tons coal	{ 6½ tons coal	{ 5½ tons coal
Size of fire-box.....	114½x33¾"	114½x33¾"	96x43½"
Flues	{ 236—2" outside dia. { 236—2" outside dia. { 224—2" outside dia.		
	{ 11' 15-16" in length	{ 11' 15-16" in length	{ 11' in length
Diameter of boiler.....	60½" inside	60½" inside	54" outside
Heating surface of fire-box....	173 sq. ft.	173 sq. ft.	131.8 sq. ft.
Heating surface of flues.....	1,358 sq. ft.	1,358 sq. ft.	1,280.4 sq. ft.
Total heating surface.....	1,531 sq. ft.	1,531 sq. ft.	1,412.2 sq. ft.
Grate area	25.75 sq. ft.	25.75 sq. ft.	29 sq. ft.

Compares British Rail Situation and Ours

President Samuel Rea of the Pennsylvania Finds a Better Condition Overseas, but a Rather Gloomy Outlook

Samuel Rea, president of the Pennsylvania Railroad, has written the following article on conditions affecting the railroads in the United States and those of Great Britain. Recognized as one of the leaders of American railroading, he also for years has been a close student of the finances and operation of English railroads. He recently returned from a visit abroad. His article discusses the effects of the war on the railroads.

I WAS not in England long enough to make any detailed inspection of the British railroads, but so far as I could observe I found them to be in good physical condition, with both management and men bending every effort to give the most economical and efficient service. The equipment also was in good condition and the passenger service excellent. The first-class rates, between 6 and 7 cents a mile, with third-class about 3½ cents, seemed to indicate that our straight fare of 3.6 cents a mile in the United States (with an average revenue per passenger mile of but 3.088 cents) is not unreasonable, considering existing costs and taxes.

I heard no agitation for a lowering of the rates. They have had and will have grave questions affecting wages and working conditions, and have met them so far. Their plan of automatically adjusting wages with the index of the cost of living so far appears to have been helpful.

Speaking generally, I found that decided progress had been made in the direction of restoring pre-war conditions after four years' wartime operations. One factor which I presume has contributed largely to the present high-class physical condition of the British railroads is that the government made prompt and liberal final settlements for the period it controlled them—not interfering, however, with their orderly management, which was left with the railroads during government control. The government and the roads fixed a fair compensation for the use of the railroads, but war conditions made it impossible to maintain and replace the road and equipment equal to pre-war standards, and this the govern-

Samuel Rea

ment recognized. It likewise recognized that good railroads would be an important factor in post-war prosperity and business resumption.

* * *

The amounts due on such final settlements were not all immediately paid, but were agreed to, so that the companies knew where they stood and could arrange their physical and financial conditions accordingly. The final settlement involved the payment of £30,000,000 down and another £30,000,000 to be paid at the close of this year, which money, I understand, has been largely used in rehabilitating the railroads and maintaining their credit. These sums were in addition to the rental compensation paid to the owners for the use of their properties, based on the net income each earned in 1913, plus a return on additional capital expenditures.

This leads me to reflect on the situation in this country—a rather unfortunate one for the United States railroads. Only a proportion of the larger systems have finally settled with the government either for the federal control period from January 1, 1913,

to February 29, 1920, or for what is known as the guaranty period, from March 1 to August 31, 1920. This failure promptly to settle their accounts results in millions of dollars, properly believed to be due the railroads, being withheld, while the government is making extensive examinations of the accounts of the railroads and trying to determine various formulae for arriving at the amounts due, so that it probably will be another year before many final settlements are reached.

If this money had been promptly paid over to the railroads they could have long since brought their properties and equipment up to a much higher standard and purchased a great deal more equipment, so that with the extraordinary run of traffic this fall and winter they would be prepared to handle it efficiently and economically. Indications are that there will be a shortage of cars and transportation facilities before long; and while every effort is being put forth to mitigate the blow to business and to the public, railway managements will no doubt be criticized for lack of foresight in not providing adequate facilities. Then the truth will be recognized of the great cost to the country of the policy, or lack of a policy, by which many railroads have been handicapped, not only by having large sums tied up in these government settlements, but by the low net income during the last decade, which has paralyzed general railway expansion.

* * *

I am not apologizing for the railroads; they are at all times ready to improve and expand the service and facilities to the full extent that the earnings and resources permit. They cannot ask the public to supply money for railway equipment and improvements without first demonstrating that the earnings will be available to pay a fair return thereon. Their record for developing the country prior to the war and their co-operative record of 1917 under their own voluntary organization stand unexcelled.

When one looks back at the situation in the spring of 1921, the year following the return of the railroads to their owners, and the slump in business, when payments had practically ceased for the ordinary monthly traffic balance settlements and they were unable to meet their bills for fuel, materials and supplies, with hundreds of millions of dollars due, it is remarkable that many of them did not break down.

It was only the broad-minded policy of the banks of the country and their appreciation that the railroads were fundamentally sound and must ultimately be equitably supported by the country for the service they render that caused them to grant credit to thousands of their customers who had sold materials and supplies to the railroads. By October, 1921, the railroads had fairly cleared the situation so far as meeting current liabilities, but at the sacrifice of all addition and betterment work, and necessarily with more or less deferred maintenance work.

* * *

In reference to the consolidations into what will ultimately be about four railway groups of Great Britain, I found that the work was progressing rapidly; that in some of the larger systems they had made progress in absorbing their many subordinate companies through amicable arrangements as to the exchange of stocks. Failing to agree with the owners of such properties by January 1 next, the matter will be decided by the Railways Amalgamation Tribunal.

It is doubtful if any one can at this time say what the financial outcome will be with the new groupings, as so much depends upon the rates they will be able to charge and the wages which they will have to pay, the volume of traffic and what economies may be realized from the consolidations, both in reduction in the number of corporations, officers and employees and the curtailment of train service. It would seem as if they would have to face the same question that the railroads of the United States did, that while under the Transportation Act our roads were expected to realize $5\frac{1}{2}$ per cent or 6 per cent on the value of the property devoted to public use, as a matter of fact they have not realized that rate, and there is no method of recovering the difference.

The unique feature of our Transportation Act, dealing with the disposition of excess earnings over 6 per cent on any particular railroad, is, however, expected to be enforced; that is, the earning of a fair return has not yet become mandatory, but the recapture clause is. Notwithstanding the railway legislation in the two countries is rather similar, it is needless to say that England did not adopt this extraordinary provision respecting so-called excess earnings. In England each of the groups is

expected to receive net income that would be equivalent to that of 1913, plus the proper return for additional capital expenditures, and, as with us, the rates are supposed to bring those results; but whether the economic conditions that England faces in its world-wide trade competition will permit such increase in rates as to realize such net income is problematical.

My own view is that under such circumstances they will land just where the railroads of this country did: namely, make the sacrifice and take what net income was coming to them under the then existing economic conditions of the country, and be forced to restrict their operations and all improvements.

Considering the territory, population and natural resources still not properly served by our railroads or lying undeveloped, and the great improvements in railway facilities,

equipment and service that still are ahead of us, I feel that railway service is the country's greatest necessity, but we must adopt a much more liberal policy of legislation and regulation to release us from the destructive action and strings that have almost strangled the roads.

We must get this replaced by a free scope for corporative initiative, under constructive regulation, to develop the country through these railroads, which the public directly owns, by the best and cheapest transportation methods, in which America must lead the world. This program is impossible unless the citizens and their institutions, which own the railroads, can be assured of fair returns on their investment and given encouragement to furnish the additional capital required, with opportunities equal to those afforded other industries to share in the prosperity of the country.

Paper Delves in Illinois Central History

The following reminiscences are from the Amboy (Ill.) News:

Opening of the Machine Shop

L. W. Marston of Chicago, who lived in Amboy when he and the town were young, writes appreciatively of our venture into "Sixty-Five Years Ago" history and recalls that the Illinois Central shops in Amboy commenced operation somewhere about that time. His father, C. H. Marston, he says, was the first master mechanic.

The account of the starting of the machinery which was given in the *Amboy Times* of May 8, 1856, will be of interest to railway and shop men of today as well as to "old-timers" and many others. Editor Pratt says:

"We were present at the starting of the new stationary engine just put up at the Illinois Central Railroad works in this place. While waiting for the steam to come up we learned the following particulars: The engine is estimated at 80 horsepower; cylinder, 20 inches in diameter; .3.. feet stroke. The flywheel is 14 feet in diameter and serves also as a drum for the main driving belt.

"The motive power is furnished by two tubular boilers 5 feet in diameter and 15 feet in length.

"A line of shafting extends half way across the west end of the machine shop, pursuing its course into the blacksmith

shop and across its entire width. From the end of the shaft, at right angles thereto, in the middle of the west end of the machine shop, another line of shafting runs the entire length thereof and is connected to the former by bevel gears, making in all about 300 feet of shafting. On the first named line is a large cast iron drum, which receives the main belt from the fly wheel.

"The machinery was manufactured at the works of John Curtis at Auburn, N. Y., and the boilers at the Illinois Central Railroad works at Chicago, Ill.

"When the steam gauge indicated 20 pounds pressure to the square inch, the throttle valve was opened and the steam let into the cylinder. With but little assistance in starting, the ponderous flywheel commenced its revolutions, moving the different lines of shafting and the machinery attached thereto. The performance was indeed excellent and does great credit to Mr. Berdine, who has not only superintended the putting up of this machinery, but has done the greater part of it with his own hands.

"Mr. Berdine is from Brooklyn, N. Y., where his family now resides, but we are happy to learn that he has determined to take up his abode in this place."

Illinois Central Stock at Par

In the same issue of the *Times* it is re-

ported that on the 28th of April, 1856, 7,000 shares of Illinois Central stock were sold at par. "The top has by no means been reached yet," says the *Times*.

Two weeks before (April 24) the *Times* quoted the Chicago *Herald* in an article on Western railroad securities as saying that Illinois Central bonds closed firm at 87½ per cent, having been sold at 86 a day or two before. The returns of railway and land sales had arrested the downward movement and created a reaction. "A year or two since," the *Herald* said, "the project was considered by some of our otherwise capitalists one of the wildest speculations. Now it is considered one of the best and safest investments of the day. * * * It is estimated that the gross earnings this year will amount to two and a half millions of dollars."

The *Herald*, in the same article, arguing for western railroads as good investments, said that the La Crosse and Milwaukee Railroad was doing a large business on about fifty miles of road, had carried \$10,000 in January, \$20,000 in February and \$27,000 in March.

Receipts for February, 1856

The receipts of the Illinois Central Railroad for February, 1856, 66 years ago, were as follows:

Passenger	\$48,301.26
Freight	53,382.32
Received from other roads.....	7,213.44
Mails and expresses.....	4,511.53
Total	\$118,907.00
February, 1855.....	59,324.00
Increase	\$59,583.10

The receipts of other western roads for February, 1856, were:

Michigan Central	\$144,535
Michigan Southern	133,789
Galena & Chicago.....	97,000
Chicago & Burlington.....	69,096

It will be seen from the above that the Illinois Central receipts had doubled in a year. The road was then still in process of construction. It was completed before the end of that year, the last division of the Chicago branch, Mattoon to Centralia, being opened September 27, 1856. A history of the road from land grant to completion is given in the *Times* of November 13, 1856.

For the six months ending October 31, 1856, the gross receipts of the main line and

Galena branch, according to the statement given out by the state treasurer, were:

Freight	\$361,793.51
Passengers	540,170.18
Extra baggage	1,976.74
Express	9,499.12
Mail service, two quarters.....	22,655.16

\$936,094.71

Deduct for discount on currency 14,041.41

\$922,053.30

Five per cent of which is paid

into the treasury, amounting to \$46,102.66

Against 31,529.00

paid on the 1st day of June, 1856.

The *Times* (December 18, 1856) quotes the Chicago *Journal*:

"This is a handsome increase on the previous six months for the main line. When the percentage on the receipts of the Chicago branch, to be increased under the contract to 7 per cent, is added to the state's profit upon the road hereafter, our readers will readily perceive that the original estimates were not put too high."

THE PROMISE OF TOMORROW

After his own seventy-five years of marvellous individual development, Thomas A. Edison says that man is yet in the chimpanzee stage of mental development, and has gained but a mere glimpse of his environment. He believes not only in man's limitless progress on this earth but that science may ultimately bridge the gulf between the here and the hereafter, between the visible and the invisible world.

The developments of tomorrow may exceed our wildest dreams of today. There is not a single invention, discovery, or device, no matter how wonderful it may seem, that is not likely at any moment to be supplanted by something better. The finest, the most marvelous piece of machinery that has ever been devised by man may even now be headed for the scrap-heap. There is no name so secure in the hall of fame, there is no leader in any line of endeavor today, who is not likely to be superseded by someone who is yet entirely unknown to fame!

What a spur is here for the ambitious youth of today! What boundless opportunities, what great rewards, await the energy, the ability, the zeal and the persistence of those who are eager to achieve; to do big things that will push the world forward.—*Success Magazine*.

Agent Makes a Hobby of Raising Flowers

*J. M. Harker of Cedar Falls, Iowa, Plants Vacant
Lots in Gladioli and Sells 4,000 Blooms in One Season*

MANY of us have hobbies which give us enjoyment, but he is indeed fortunate whose favorite avocation is also a source of pleasure and delight to others. A man with such a hobby is J. M. Harker, Illinois Central agent at Cedar Falls, Iowa.

Mr. Harker is a great lover of flowers of all kinds, but his special favorite is the gladiolus, which he raises with success and profit. And what gorgeous, splendid flowers his are! Each is a perfect specimen, both in form and in color.

The Harker residence stands on an attractive corner lot, 68 by 132 feet, on which one finds ample evidence of the owner's love for floral beauty. Here one may find the iris in several pretty color combinations, salvias and cannas, gorgeous peonies in white, pink and red, and lilacs. Here, also, behind his small greenhouse, Mr. Harker employs a trellis work to conceal effectively the less attractive features of his back yard. As a screen for his trellis framework are used three lilac bushes and four climbing honeysuckles, with delphinium for the foreground and wild cucumber to top it off.

Bought Extra Lots for a Garden

Mr. Harker acquired his attractive home some eleven years ago. Finding the sur-

Mr. and Mrs. J. M. Harker

rounding grounds inadequate for garden needs, he deemed it necessary to purchase two additional city lots, each 50 by 125 feet. These are adjacent to his home, making it convenient for him, with his good wife's assistance, to work this piece of ground to best advantage both before and after office hours.

It was his original intention to utilize these two lots for a truck garden and for fruit trees and berries, but the notion to

Mr. and Mrs. Harker in their field of gladioli

raise flowers there occurred to him shortly after the acquisition of the ground, some six years ago. The splendid success with the beautiful gladioli which he has ever since grown is a monument to his diligence and his ambitious and untiring efforts.

Mr. Harker has found his delightful hobby a profitable one. During 1921 he disposed of about 4,000 gladioli blooms to florists, yielding him a return of \$225. Other flowers sold added about \$80 more. Last winter he took in approximately \$25 for bulbs purchased by local florists. This year, owing to the favorable season for raising gladioli, even by amateur horticulturists, his net return has been somewhat smaller than that for the previous season, although about five hundred more flowers were grown.

Has Good Crops Besides Flowers

While about three-fourths of his ground is devoted to the culture of the gladioli, there is still good room for the raising of other flowers and vegetables. Of red and black raspberries there were produced enough this season to more than pay for the lots at the then current market prices of berries. On these lots Mr. Harker raises some choice asparagus and also "Country Gentleman" and "Golden Bantam" sweet corn, which for flavor cannot be excelled. One apple and three cherry trees have yielded

The Harker home at Cedar Falls, Iowa

abundantly, and the grape vines and currant bushes have produced as much as could possibly be needed for family consumption.

The Harkers are also the happy grandparents of two charming boys, Richard and Orville Hager, 5 and 3 years old respectively, the sons of Mr. and Mrs. Harker's older daughter.

The younger daughter is employed in her father's office at the station. Mr. and Mrs. Harker are justly proud of their family, their home and their wonderful flower garden. Their success with flower growing should prove an object lesson to other Illinois Central families who have ambition and a little spare time.

AN INQUIRY FROM ENGLAND

"Is there a lecture or debating society on the Illinois Central System? If so, possibly we might enter into an arrangement for an exchange of proceedings," writes L. F. Williams, secretary of the Lecture and Debating Society of the Great Western Railway of England, in a letter commenting on the September number of the *Illinois Central Magazine*. The magazine, unable to give an affirmative answer, passes the inquiry on to any of its readers who may care to get into direct touch with Mr. Williams. His address, in addition to that given above, is "Paddington Station, London, W.2, England."

COURAGE

Courage is an attitude of mind and emotion which helps in the perfecting of recollection. Courageously facing all issues; bravely looking at all situations; the habit of constructive attention; the desire to think, say and do the strong thing keeps the mind clean and free for positive action and the free flow of words and ideas.—*Universal Psychology Review*.

Richard and Orville Hager, 5 and 3 years old respectively, with some of their grandparents' flowers.

Keen Eye Solved a Big Cigarette Robbery

*How Young Patrick McHugh Asked a Question and Started
Special Agent Peter McHugh, His Father, on Right Trail*

It is always worth while to keep your eyes open. If young Patrick McHugh, Illinois Central employe at Memphis, Tenn., had not happened to notice what brand of cigarettes a fellow clerk was smoking, \$10,000 worth of stolen cigarettes might not have been recovered and his father, Special Agent Peter McHugh, might not have been able to fasten the crime upon the proper persons. But Patrick did notice, and the stolen goods were found, and the accused were brought to justice, as is always right and proper.

ABOUT 5 a. m., August 25, the Frisco Railroad delivered to the Illinois Central yards at Memphis eighteen cars, one of which was RI-155789. Chief Yard Clerk Marshall, in checking up these cars, found that RI-155789 had a Frisco double switching order tacked on it, to wit: No. 574217-19, reading "J. E. Tate & Company, Washington Team Track." This firm deals in hay and grain.

The Washington team track is a Southern Railway team track. In checking up these cars, Chief Yard Clerk Marshall called up the Cotton Belt and asked about this RI-155789. The Cotton Belt advised that it had no billing to cover. The car was then switched to the Washington team track, as per carding, about 3 p. m., August 25.

At 11 a. m., August 28, it was discovered that this car was a car of merchandise that should have been placed at the Illinois Central out-bound freight house for the Cotton Belt, and in it was a large shipment of Chesterfield cigarettes. The car was immediately switched from the Washington team track to the Illinois Central out-bound freight house, where it was found that the seals were broken on both doors. A check of the car developed that 251 cases of Chesterfield cigarettes, valued at approximately \$19,000, were missing.

Car Handled on a Forged Order

The cigarettes had been stolen while the car was on the Washington team track between August 25 and August 28. Special Agent Peter McHugh of the Illinois Central was at once notified of the shortage and robbery, and Peter got busy—very busy, even though he was up to his eyes with work in

Peter McHugh

connection with the shopmen's strike. He at once notified Chief of Police Burney, Chief of Detectives Griffin and the sheriff's office of the robbery. His investigation soon developed the fact that the double switch order on the car when received by the Illinois Central from the Frisco was a forgery, the forged cards having been taken from a book of switch orders that was stolen from the Frisco K. C. Junction office, Memphis, about five months previously.

Suspicion pointed to certain former railroaders, but not a single clue to the stolen cigarettes could be found. On September 4 Special Agent McHugh reported to Chief Keliher at Chicago that he was morally certain of the identity of four of the thieves who had stolen the cigarettes, and he named them, but was unable to find a clue as to where the stolen cigarettes had been secreted, sold or transported. Although the Memphis police, sheriff's office, Special Agent McHugh and his assistants kept up an unrelenting search and inquiry, day and night, not a single trace of the stolen cigarettes was obtainable until the evening of September 15, twenty-one days after the

robbery had taken place. Then things began to happen, and happen fast.

A few minutes after 5 o'clock the evening of September 15, Patrick McHugh, son of Special Agent McHugh, employed in the accounting department of Superintendent J. M. Walsh's office, Grand Central Station, knocked off work for the day, put on his hat and coat and proceeded to take the elevator on the third floor. Getting into the elevator, he met another clerk employed in the building. He noticed that this clerk was smoking a Chesterfield cigarette. Having the subject of the stolen cigarettes on his mind constantly, he asked this clerk where he got his Chesterfield cigarettes. The clerk replied that he got them from a fellow clerk in his office. Patrick took the very next elevator back to the third floor, where is located the office of Special Agent McHugh, and he reported to his father what he had seen and been told. Needless to say, the elder McHugh was interested.

Found Where Cigarettes Were Sold

Special Agent McHugh believes in action; so he immediately got in touch with the clerk referred to. This clerk promptly and frankly told Mr. McHugh that he bought his Chesterfield cigarettes at a certain grocery store and offered to go with Special Agent McHugh to the store and point out the man from whom he purchased the cigarettes. To the grocery store as fast as an automobile would go went Special Agent McHugh and the clerk. Arriving at the grocery store, the clerk pointed out the proprietor as the man who had sold him the Chesterfield cigarettes.

Special Agent McHugh asked the groceryman where he got the cigarettes.

The groceryman replied: "I bought them

—bought two cases from a farmer called Joe, who sells me vegetables and has a farm about ten miles out in the country. I gave him \$20 a case for them." Turning toward the door as a man entered, the groceryman exclaimed: "Here is farmer Joe now. Say, Joe, where you get them cigarettes you sold me the other day?"

Joe came forward and explained that on August 26 three white men and a negro, whom he described so accurately that their identity was known to Special Agent McHugh, came to his farm and rented his barn, agreeing to pay \$300 for the use of the building for an indefinite period. That same night they placed several truck loads of cigarettes in the barn. These men had paid only \$75 down for rent of the barn; so he took two cases of the stored cigarettes from the barn and sold them to the groceryman for \$20 each, as he felt that the men who rented the barn would not pay him in full if they succeeded in removing all the cigarettes before settlement, and he was trying to beat them to it. He reported that, while part of the cigarettes had been removed, there was a considerable amount remaining in the barn.

Rescued \$10,000 Worth of Booty

Calling two city detectives who had been assigned to the case and a deputy sheriff, Special Agent McHugh and one of his men again demonstrated the speed qualities of his automobile in a flying trip to farmer Joe's barn, ten miles from Memphis. Under the hay in the barn were found 132 cases of the stolen cigarettes, valued at \$10,000. Leaving guards in charge of the recovered cigarettes, Special Agent McHugh and the city detectives returned to Memphis and at once placed the accused persons under ar-

Two truck loads, a part of the \$10,000 worth of stolen cigarettes recovered by Special Agent McHugh

rest. Three of them had been named by Special Agent McHugh in his report to Chief Kelihier on September 4 as being implicated in the robbery.

In less than three hours from the time young Patrick McHugh noticed the clerk smoking a Chesterfield cigarette in the elevator, \$10,000 worth of stolen cigarettes had been recovered, and the accused persons were in jail, a record that Special Agent McHugh can well be proud of.

To Patrick McHugh is due commendation for his keen observation and quick thinking. Had he, like ninety-nine out of a hundred, paid no attention to the clerk smoking a cigarette, Special Agent McHugh and the

Memphis police force might still be looking in vain for the stolen cigarettes.

The Illinois Central does not happen to be responsible for the loss of the cigarettes, as it acted as agent for the Cotton Belt in the switching and placing of this car. The loss is a matter to be determined between the Cotton Belt and the Frisco Railroad, which delivered the car with forged switch orders. Both the Cotton Belt and the Frisco are indebted to Special Agent McHugh for his untiring and splendid work in the case, which reduced their loss by \$10,000. The Illinois Central and its special agents' department are to be congratulated upon having a man of Special Agent McHugh's ability and energy on their staff.

The Railroads, Arteries of Our Nation

By E. A. McCARTHY,

Office, Auditor of Freight Receipts

America has become accustomed to accepting the marvels of American ingenuity and organization so complacently that the magnificent triumphs of brain and brawn in this great land of ours are seldom appreciated. The practical application and development of the sciences have nowhere else advanced so rapidly, nor have they elsewhere been so uniformly co-ordinated to the public's welfare, the comfort and the betterment of living conditions.

When one stops to consider the extent of this country, the rapid colonization of the territories within its boundaries—the "granary of the world" it has been called—the thousands of teeming industrial centers that strive to satisfy and certainly succeed in satisfying the exacting peoples of all nations, the hundreds of magnificent cities and a thousand other marks of culture and progress that we possess, the thoughtful person must of necessity be impelled to inquire into and below the surface of actual accomplishment and endeavor to arrive at the factors which have brought about the results we recognize everywhere about us.

These extraordinary conditions are usually explained as the outcome of the American spirit of progress and energy, the bountiful resources of mineral stores with which we are endowed, and the extensive scale of agricultural projects. No doubt these explanations are in part true, but they do not sense the precise analysis of things as we find them.

Only a few generations ago found our land the home of aborigines. Our golden fields of corn and other agricultural products were the prairies over which the bison roamed at will, and the skyscraper, of which we are wont to boast, has supplanted the wigwam of the Indian.

The "prairie schooner" with its energetic frontiersmen came. For months they had trudged their weary way, impeded by the difficulties of uncertain routes, inclement weather and a host of other aggravating circumstances which taxed their will to the limit of endurance. With no other luster to their prospects than the surety of a parcel of land, they forsook their homes and loved ones; the ties of friendship and associations of years that were dear to them were left behind, lost save for the forlorn hope that years of constant effort might make a return visit possible.

To these indomitable spirits whose rugged tenacity of purpose opened up to the nation and the world a supply never before equaled, gratitude of the most sterling quality is due. They created the incentive and opened the portals to an empire of incalculable possibilities.

The same old element of human ambition to advance and improve conditions proclaimed itself. The pioneers had established themselves; the land they settled yielded abundantly to their efforts; others were induced to follow in the trail marked out by them, and the Golden West became a living part of a growing nation.

The necessity for closer links with the

older states and the rest of the world became apparent. The crude facilities for the passenger and freight traffic groaned under the voluminous products of the virgin soil and finally failed as the requirements became overpowering.

The urgency grew; railroads became established; space that had previously precluded the movement of crops to favorable distribution centers no longer existed; extraordinary possibilities beyond the fairest dreams of the original settlers presented themselves, and countless thousands were lured to the South and West so that they, too, might profit by and partake of the colossal development. The railroads were the arteries of the nation through which sped the blood and energy of millions.

With the natural development which they nurtured, their expansion kept constantly abreast. Where they went communities were formed, increased and prospered and were enhanced or retarded according to the degree or quality of rail service extended to each community, until today this service has become so much a part of the life of the people as to be absolutely indispensable.

Continually expanding and improving, a system of transportation to extend to and tap and supply the most remote districts, the American railroad is without parallel; its organization, equipment and service are nowhere equaled. More than 400,000 miles of track have been laid; the most powerful engines that the genius of man can contrive

are utilized. Luxury to a degree nowhere else attempted is lavishly used in equipping passenger coaches; safety devices, excellent roadbeds are some of the features which go to make our railroads.

"Our" railroads they are, inasmuch as they are essential to our very existence. They are responsive to our every want—yea, desire!—be it for the necessities of life or a desire for travel.

It must be remembered, however, that the splendid achievement we possess in the form of our railroads is the fruit of the combined efforts of all connected with them through the years they have existed. Transportation has been reduced to a science, and the minds of some 2,000,000 engaged in its service are occupied in applying that science to the end that the public may be benefited most at the least cost consistent with the continuation and improvement of present facilities.

Amazing, indeed, is the ease with which enormous movements of products, raw and manufactured, are handled and the manner and accuracy of transportation make it an almost perfect functioning factor. Too much credit cannot be accorded the railway men of the United States. They have performed, and are performing, a service to their nation never equaled. They have every reason to be proud of their accomplishment, and the public certainly should respond with a full measure of accord, encouragement and co-operation.

Where our tracks widen out in Grant Park, Chicago

Combating the Calfless and Pigless Farm

Problem Is Up to Southern Banker and Merchant; Less Talk and More Action Needed to Make Diversification a Reality

By JOHN FIELDS,

Editor, Oklahoma Farmer

IT IS a fact that those who control land and credits largely determine what farmers do. Whatever is the matter with agriculture in the South today, responsibility for most of it rests with the land-owners, bankers and credit merchants of the South.

A study of reports of conventions and conferences to consider the state of Southern agriculture leads to the conclusion that, hitherto, they have been long on oratory and short on operation. The end to be sought was never better expressed than by Henry W. Grady, when he said:

"When every farmer in the South shall eat bread from his own fields and meat from his own pastures and, disturbed by no creditor and enslaved by no debt, shall sit amid his teeming gardens and orchards and vineyards and dairies and barnyards, pitching his crops in his own wisdom and growing them in independence, making cotton his clean surplus and selling it in his own time and in his chosen market and not at a master's bidding—getting his pay in cash and not in a receipted mortgage that discharges his debt but does not restore his freedom—then shall be the breaking of the fullness of our day."

Many Calfless and Pigless Farms

Those sentiments so beautifully expressed are always applauded wherever quoted—applauded, and that is all.

Dr. Seaman A. Knapp started the agricultural demonstration work in the South and laid the foundation for its agricultural rejuvenation. Among his Ten Commandments of Agriculture are these:

"Increase the farm stock to the extent of utilizing all the waste products and idle lands of the farm."

"Produce all the food required for the men and animals on the farm."

On many occasions he reiterated, "One of the foundation principles of our work is that the farmer should raise the food for the family and for the farm stock so that his principal cash crop may be all profit."

Those who have been carrying on the agricultural demonstration work in the South

have failed to obtain the results for which Doctor Knapp hoped. That cotton farmers generally have not been influenced by agricultural oratory and have not practiced these sound precepts is clearly shown by some recent reports of the Bureau of the Census. This table shows the number of farms in each 100 farms in the cotton states which raised no calves and which raised no pigs in 1919:

	Pct. Calfless	Pct. Pigless
North Carolina	62.8	62.9
South Carolina	63.0	62.7
Georgia	56.4	57.6
Alabama	46.2	54.1
Mississippi	47.9	52.5
Louisiana	57.6	54.7
Texas	46.5	61.6
Arkansas	48.2	53.7
Tennessee	35.4	45.4
Oklahoma	35.3	56.3

Oratory has been ineffective. Demonstration has failed to do the job. The men who have controlled land and credit in the cotton states have to a large extent blocked the earnest work which county agents and home demonstration agents have been doing. Bankers and merchants have put up money for calf clubs, pig clubs, and poultry clubs because it has been fashionable—quite the thing—to do so. They sought to buy agricultural development and prosperity. Yet in their daily work of passing upon farmers' credits, these same bankers and merchants have continued putting emphasis on cotton—and numerous children to pick the cotton without pay.

Don't Know What Milk Tastes Like

John Burroughs wrote: "Where the cow is, there is Arcadia; so far as her influence prevails, there is contentment, humility, and sweet homely life." All of us join in campaigns to induce city children to drink more milk, but we give no thought to the fact that more than one-third of the children living on the cotton farms of the South do not know what milk tastes like—they haven't tasted it since they were weaned. Instead of being sustained and strengthened by a drink of nutritious milk when weary with chopping or picking cotton, they are

juiced up with a dose of chill tonic and told to hop to it.

Here are the plain facts of the business:

If every farmer in the cotton states had, in 1920 and 1921, fed and milked one cow; bred and fed one sow and fattened and killed and cured meat from her litter; and made full use of what two dozen hens, assisted by a rooster, would have produced, things would be very different now.

If bankers and merchants had not extended credit for the production of cotton to any tenant farmer who did not have at least one cow, one sow, two dozen hens and a rooster, and a rental contract under which the land-owner provided suitable shelter for livestock and permitted the production of feed on a share-crop basis, few land-owners, cotton farmers, bankers, and merchants would be in trouble now.

Having got into a variety of difficulties through financing cotton farmers upon what has been proved so conclusively to be the reverse of a money-making basis, isn't it time to insist that they put their farming

on a living-making basis first before raising any cotton?

I am sure that the time to do this is now. You can't buy your way out of the present situation. You must work your way out. As a starter, when any farmer comes to you for credit and confesses that he hasn't a cow, a sow, and a flock of hens, you should register amazement, astonishment, surprise, apprehension, dismay, solicitude and consternation; get red in the face and pound the table at the very thought that any farmer who has neglected to supply himself with this minimum of family-feeding livestock should think that he can get from you credit on which to make a cotton crop.

Farming Must Not Be a Gamble

Then calm down and talk it over with him and try to get him started as cheaply as possible, with livestock which may be purchased locally, impressing him with the fact that regular feeding and care are as important as breeding in getting profitable returns. A cow, a sow, two dozen hens and

a rooster, properly cared for, will produce more food before next fall than their present cost will buy. If you have customers or tenants who must be fed until they make a crop with which to pay interest on the old notes and accounts, you can't feed them more cheaply than by putting them in the way of feeding themselves with the products of the livestock which should be on every farm.

Farming should first of all be based on plans which make it a living-making cinch instead of merely a money-making chance. Those who control credits in agricultural communities cannot escape responsibility for the disaster which inevitably comes from unsound farm practices.

The philosophy which affects to teach a contempt of money does not run very deep.—HENRY TAYLOR.

Make all you can, save all you can, give all you can.—JOHN WESLEY.

Old Rip Van Hoodwinker's return

Train Rules Two-Thirds of a Century Old

*Booklet of Instructions for Dubuque & Pacific, Effective
May 1, 1857, Was Keepsake of the Late T. W. Place*

The late T. W. Place of Waterloo, Iowa, whose death is recorded on another page, was engineer on the first passenger train that ran west from Dubuque, Iowa, on the old Dubuque & Pacific, now the Illinois Central, on May 11, 1857. That was more than sixty-five years ago. Mr. Place was a loyal friend of the Illinois Central Magazine from the time of its inception, about ten years after his own retirement, and among the things he contributed for the magazine's use, through Secretary Burt A. Beck of the pension department, was a booklet on "Instructions for the Running of Trains, Etc., on the Dubuque & Pacific Railroad; to take effect May 1, 1857." The booklet was signed by D. H. Dotterer, superintendent. The contents of the booklet are reprinted herewith, since it is felt that the reader may take some interest in comparing them with present regulations and in noting the change—or lack of it—produced by two-thirds of a century of operation. Among these rules, of course, are those observed by Mr. Place on his first run from Dubuque, less than two weeks after the booklet was issued.

General Regulations

1. EMPLOYEES of the Company disapproving these or other Regulations of the Road, or not disposed to aid in carrying them out, are requested not to remain in the employ of the Company.

2. Each person in the employ of the Company is to devote himself exclusively to its service, attending during the prescribed hours of the day or night.

3. He must obey promptly all instructions he may receive from persons placed in authority over him, and conform to all the regulations of the Company.

4. He will be liable to immediate dismissal for disobedience of orders, negligence or incompetency.

5. No one, whatever may be his rank, will be allowed to absent himself from his duty without the permission of the Head of the Department in which he may be employed.

6. No one will be allowed to quit the Company's service without giving ten days' notice.

7. All persons in any way leaving the

Company's service must deliver up the property of the Company entrusted to their care.

8. If any such property shall have been improperly used or damaged, a deduction to make good the damage or supply new articles.

9. Rudeness or incivility to Passengers will in all cases meet with immediate punishment.

10. All persons in places of trust in the service of the Company must report any misconduct or negligence affecting the safety of the Road, which may come within their knowledge, and their withholding any such information, to the detriment of the Company's interest, will be considered a proof of neglect and indifference on their part.

11. All Employees of the Company are expected and required, in all cases, to exercise the greatest care and watchfulness to prevent injury or damage to persons or property, and in doubtful cases take the safe side.

12. Each person will be held legally liable for injury occasioned to persons or property by his negligence, and the Company reserves the right of withholding any pay due them to defray the expenses of the same.

13. The pay of any man suspended from duty will be stopped. No persons employed by the Company are allowed gratuities.

14. In all cases where instructions may not be understood, or when the course to be pursued admits of any doubt, the parties in charge shall so act as in no way to compromise the safety of the Road, seeking afterwards, with the first opportunity, the necessary explanation of the proper officer.

15. Any alterations or modifications of these instructions will accompany the Time Tables as Special Instructions, and such Special Instructions will remain in force only while such Time Table to which they are attached continues in use.

16. The clock in the Superintendent's office at Dubuque is the Standard Time of the Road for the clocks at all Stations and the watches of all men in the employ of the Company. For the convenience of such of the Employees of the Company as cannot

regulate by this clock, other clocks will be designated on the Time Table (at Stations) as standards.

Signals

17. A Red Flag by day, and Lantern by night, when shown or swung on the Track, are Signals of Danger. On seeing which, the Engine-man must come to a full stop with the Train or Engine.

18. All Signals violently given are also to be considered Signals of Danger. Red Flags or Red Lanterns will never be used as Signals of Caution only—but always of Danger.

19. A Bi-colored Flag, (combined Red and White,) or a Green Light, is a Signal of Caution, and when exhibited, the Engine-man must proceed slowly. Green Lights are used for all Switches.

20. One large White Light shall always be exhibited on the front of the Engines on the Road after dark.

21. A Red Lantern must be hung on the rear of all Trains that are on the Road after dark.

22. A Red Flag in the day, and a Red Lantern at night, placed on the front of an Engine, indicates that the Engine or Train is to be followed by another.

23. One sound of the Whistle is the Signal to Stop.

24. Two sounds of the Whistle is the Signal to let go the Brakes, and sometimes of Starting the Train.

25. Three sounds of the Whistle is the Signal for Backing the Train.

26. Five or more rapid sounds of the Whistle is the Signal for Wooding up, or calling in Flagmen.

27. Signal Cords shall be used on all Trains, and shall extend from the rear Car to the Whistle or Alarm Bell or Engine.

28. One long continuous sound of the Whistle at such places as shall be designated on approaching a Station, denotes a First Class Train. Two distinct sounds, a Second Class Train.

Rules for the Running of Trains

29. The Trains are classed as to priority of right to the Road, as indicated in the Time Tables.

30. All Trains of an inferior class must keep out of the way of all Trains of a superior class, going in either direction.

31. Trains of an inferior class moving in the same direction with Trains of a superior class, must get out of their way by going into the nearest Siding.

32. No Train, under any circumstances, shall leave a Station before its time, as specified in the Time Table.

33. No Freight Train having the right to the Road must leave any Station or end of double track, when by the Time Table it should pass a Freight Train, till five minutes after its time, per Table; and this five minutes allowed for safety, must operate at every succeeding Station, till it shall have passed the expected Train.

34. No Freight Train must leave a Station immediately preceding a Station where a Passenger Train may be expected to be passed, unless it shall be able to arrive at the latter Station, by its average rate of running, ten minutes before the time for the Passenger Train to leave the Station.

35. No Train shall proceed towards a Station where it expects to pass a Train having a right to the Road, unless it has ample time to arrive at that Station ten minutes before the time, per Time Table, for the latter Train to leave that Station.

36. An Extra Engine or Train following a regular Train (whose Engine carries a Red Flag or a Red Lantern) must always be taken and considered to be a part of, and to have all the rights of that Train, and no more, and the Conductors and Engine-men of all other Trains must so regard it.

37. An Extra Train or Engine following a leading Train must be kept near, but never less than a mile distance from the Train ahead, excepting when near Stations, in order that the opposite Trains may have as little detention as is consistent with perfect safety at the passing Stations.

38. Freight Trains are not allowed to run faster than fifteen miles an hour, unless from some unavoidable delay, originating after they passed the last Station, it shall be necessary, in order to give a Passenger Train the Road or to avoid a collision.

39. If any part of a Train is detached when in motion, care must be taken not to stop the Train in front before the detached part has stopped; and it is the duty of the Brakemen on such detached part to apply their Brakes in time to prevent a collision with the Cars in front.

40. Gravel Trains, when leaving an Engine House or principal Station for their work, or when returning to the same, shall, whenever practicable, take the time of one of the regular Freight Trains; when this is impracticable, they shall proceed with the

utmost caution, never risking the safety of the Road, and they shall never be on the Road within ten minutes of the running time of any of the Passenger Trains. Neither shall they be on the Road within ten minutes of the running time of the Freight Trains, except when the points between which the Gravel Train is working are not more than three miles apart. In such cases, (that is, where the Gravel Train is working on a run not extending over three miles,) the Conductor of the Gravel Train may keep at work in respect to Freight Trains only in the times of Freight Trains, provided he invariably stations a man with a Red Flag one thousand feet, or more, when advisable, in the direction of the Freight Train which is due, and beyond the point where he is at work; or in both directions from the extremes of where he is at work, if Trains are due from both sides; these men to continue on the watch, under all circumstances, until the Freight Train comes up.

41. On the arrival of a Freight Train, the Gravel Train must immediately proceed to the Turn-out in advance of the Freight Train, causing as little delay as possible.

42. The Conductors of Wood and Lumber Trains shall be governed by the same rules.

43. Red Flags or Red Lanterns must always be placed at a safe distance on either side of the ground where the Gravel Trains are at work, and a man must remain with them when Trains are expected to arrive according to Time Table. The Conductors of Gravel Trains, as well as the Engine-men and Foreman in charge of the repairs, will be held responsible for the strict observance of this rule, and every additional precaution which particular circumstances may make necessary to the safety of the Road. The same precautions will be observed when single cars are at work on the Road when repairs of bridges are going on, or any description of repairs which interfere for the time with the safety of the Track.

44. The large full face figures on the Time Table indicate the regular passing places of Trains.

45. In case of an accident happening to a Train requiring it to stop on the main line of Track, the Conductor of such Train is required to send a trusty person with a Red Flag, if in the day time, or a Red Lantern, if at night, one quarter of a mile in the direction that Trains may be ex-

pected to approach, to give them timely notice to hold up. Should the detention be caused by a broken Car Wheel, it should be spragged, and, if possible, pulled to the first siding; if this cannot be done, the Freight should be changed to other Cars, and the Car should be put off the Track as carefully as circumstances will admit, at a point where it will be most convenient to be repaired and replaced.

46. Whenever it becomes necessary to back a Train to a Station, it must be done with great care, keeping a man constantly in advance of the rear end of the Train, to warn any Train that may be approaching.

47. If Freight Trains are at any time obliged to keep the main Track in passing Passenger Trains, a man with a Flag by day, or a Lantern by night, must be always sent back half a mile (or more, when necessary) in the direction of the approaching Train, to give suitable warning for it to approach carefully, and the Conductor of the Freight Train must see that the Switches are right for the passage of the Passenger.

48. The rear Car of every Train must be a Brake Car, in good order, and a man must, when Trains are in motion, be always stationed on that car. This rule applies to Gravel, Wood and Lumber Trains, as well as all others.

49. Whenever any Train (excepting Passengers Trains) gets behind its time, per Time Table, so as to lose its right to the Road and interfere with the running of other Trains, it shall run into the first siding, and can afterwards only proceed as an Extra Train.

50. No Train is allowed to run faster than at the rate of five miles an hour over the principal bridges and trestlings, gradually reducing the speed down to the above named point before entering on such bridges or trestlings.

51. No steam must be used in passing through covered bridges; and in shutting off and letting on steam, care must be observed to do it without producing any concussion to the Train.

Regulations for the Conductor

52. He will have entire charge and control of the Train, and all persons employed on it, and is responsible for its movements while on the Road.

53. He must see that the instructions are observed by those under him, and report daily all violations of them.

54. He must see, before starting his Train

from any Terminal Station, that his cars are clean and in good and safe order, particularly examining the Wheels, Brakes, Springs, Draw-heads, Locks and Couplings. And while on the Road, that the routine of duties of those employed on the Trains, and which are not detailed in these Instructions, are faithfully attended to.

55. He must see that he has upon the Train Signal Flags, Red Lanterns, with a sufficient number of ordinary Lanterns, one Axe, a Saw, Spiking Hammer, Spikes and Chairs, spare Shackles and Pins, Oil, &c. He must also see that he has a Signal Cord properly connected. See Rule No. 27.

56. He will duly call the attention of the Repairer of Cars, or the Station Agent, in his absence, to any damage which may have been done to the Cars, or to any which may come to his knowledge, that it may be promptly corrected, and he must notice these in his reports, giving full details.

57. He is responsible for attaching the Tail Lamps to the last Car of the Train, and must see that the Red Flag or Lantern is upon the Engine when his Train is to be followed by another. When a Car is detached on the way, he must see that the Tail Lamp is removed and re-attached to the Train.

58. He will make no stops longer than shall be necessary for the business of the Road, except for refreshments at Stations designated on Time Tables.

59. The Conductor of a Train carrying a Red Flag or Lantern shall, on arriving at a Station beyond which it is not to be carried, notify the Station Agent of the fact, in order that he (which it shall be his duty to do) may give notice thereof to the Conductors of other Trains interested, which may not have reached that Station. The first-named Conductor shall also notify such Conductors when he meets them, and the Extra Train must arrive at Stations not later than the latest time prescribed for the Regular Trains.

60. Whenever an Extra Train or Engine is to follow another, notice thereof must be given to the forward Train, and the Conductor must notify the Station Agents and all Conductors whom he meets of the fact, besides carrying the proper Signal. All Trains, when they are to be followed by Extra or Irregular Trains, must never be stopped where the view from behind is not clear for a distance sufficiently great to stop a Train after coming in sight.

61. It is his duty to check the Engine-men when they run unsafely, and to prescribe to them, when he sees fit, the regular rates allowed on the Table, or slower rates, if the Track is in bad order.

62. Conductors must be careful never to make the Signal for Starting while Passengers are getting aboard, and should, in making it, stand near the front end of the forward Passenger Car.

63. He must not allow any person to ride in the Baggage Car, excepting the Baggage Master, or outside of the Cars, without permission.

64. He must prevent Passengers endangering themselves by imprudent exposure. In the event of any Passenger being Drunk or Disorderly, to the annoyance of others, he must use all gentle means to stop the nuisance; failing which he must, for the safety and convenience of all, exercise his authority and keep him in a separate place until he arrives at the next Station, where the Passenger must be left.

65. He is reminded that it is his duty to require of the Engine-man attention to the Rules of the Road.

66. Negligence or recklessness on the part of an Engine-man will be taken as proof of the inefficiency of the Conductor, unless such conduct has been duly and distinctly reported on every occasion of its taking place. He will, at the same time, treat the Engine-man with that consideration due to his very responsible duties, and is recommended always to advise with him in cases of difficulty.

67. In case of accident to the Train, or of stoppage on the main Track from any cause, he must immediately, and always, station men with Red Flags by day, or Red Lanterns by night, on each side of the spot, at a sufficient distance from the crippled Train to allow an approaching Train time to hold up before reaching the obstructing Train, and he must do this as a matter of course, at all times and places, and has no right to assume that there are no Trains approaching, on either side of him.

68. He may command the services of any Freight, Wood or Gravel Engine on the Road, either to forward his own Passengers or to carry a message. He will take the best measures within his reach to have his Train forwarded with the least possible delay, and every person in the neighborhood,

(Continued on page 111)

A Missed Opportunity Didn't Worry Him

Warner Busenbark, Chief Clerk to General Superintendent J. M. Egan, Learned His Work Thoroughly

SOME persons believe that an overlooked opportunity does not necessarily mean a doubtful future. They appreciate what they are doing and spend all their efforts in developing themselves for the positions they have and for future advancement in the same line. To this class belongs Warner Busenbark, chief clerk to General Superintendent J. M. Egan at New Orleans. His life has been one of much hard work in a determined effort to succeed after he came to the realization that he missed in his youth what might have been a great opportunity. His efforts are now bearing fruit in the form of a successful railway career.

When he was but 11 years old, young Busenbark was doing odd jobs as well as attending school at New Albany, Ind. His father was a merchant at that place. Of course, Warner could not make much, but he was as proud of his earnings as his father was of him. The thought that he was really helping spurred him on to greater efforts, and at 14 he held a steady job with a regular salary. His first work was as a grocery clerk, a position that gave him the chance to meet and talk to people. He liked his customers and did everything in his power to please them. It was this good nature that won for him the friendship of the buyers at that store, and there is no doubt that he held business for his employer as well as made new and steady customers.

Turned Down Chance in a Factory

Such a lad seldom escapes the attention of a shrewd man. A factory owner came to Warner one day with a proposition.

"Warner," the man said, "I'm looking for a bright and industrious boy like you to take into my factory to learn every phase of its operation. I can't pay you much to start with, but you will earn more as time goes on."

The last statement made more of an impression on Warner than all else. He was eager to earn money to be able to help at home. The larger salary appealed, however, and he stayed in the grocery store.

Warner Busenbark

That was the incident in his life that he now considers as a possible great opportunity. He realized only a few years after it occurred that it might have been a chance for him, and that realization made him even more determined to succeed in what he was doing.

He continued to go to school and work outside of class hours until he had finished his public school education; then he entered the New Albany Business College to learn to become a stenographer. In addition, he studied commercial law each evening. When he had completed the business courses, he accepted a position, July 17, 1906, as a stenographer in the office of the superintendent of the Illinois Central Railroad at Louisville, Ky. A. H. Egan was then the superintendent there, and G. T. Roach was the chief clerk.

Knows All Branches of Office Work

Mr. Busenbark gained a vast amount of experience in the office there. He held every

position, except that of chief accountant, from stenographer to chief clerk. That is the reason he is so capably fitted for the position he now has. He knows what is expected of every position in a general superintendent's office, and he can direct the work with a thorough understanding of what is required.

On March 28, 1909, just two years and eight months after he had entered the service, he was made the acting chief clerk. Before this, he had been stenographer to the chief clerk, clerk, stenographer to the superintendent, assistant chief clerk, time-keeper and then assistant chief clerk. The position as timekeeper was a promotion, since the salary was an increase. When the salary allowed for the assistant chief clerk was increased, he was transferred to that position.

Mr. Roach, the chief clerk, was painfully injured when fire destroyed the offices at Louisville on March 11, 1909, and Mr. Busenbark was appointed to act as chief clerk until Mr. Roach recovered. The chief clerk returned to the office in October of that year, and Mr. Busenbark again held the assistant's chair until he was promoted to chief clerk on May 19, 1913. L. W. Baldwin was the superintendent at that time. Later L. A. Downs and then T. E. Hill were the superintendents.

Mr. Busenbark remained as chief clerk until August 10, 1916, when he accepted the position as chief clerk to L. A. Downs, who was then the general superintendent at New Orleans. Since that time, J. J. Pelley and then J. M. Egan have been the general superintendents there.

During his early days of railway work, Mr. Busenbark says, each employe in the office knew fairly well the work of all the others. When one was forced to be out of the office, his work was kept up to date by the other members of the force. And there were not so many employed in a superintendent's office then, he says. The force was increased to its present size about four years ago.

Watch the Deadline!

Material for the magazine is still being sent in after the 15th of the month, in spite of warnings to the effect that the 15th is the deadline for magazine material. Obviously, material arriving so late will have to hold over a month, maybe longer.

CAR AGENT DIES

William E. Hausen, traveling car agent (working out of the office of the general superintendent of transportation, Chicago), who died July 27, was born in New York, September 30, 1865. Later his parents moved to Bloomington, Ill., where he attended business college. At the completion of his course, he took work as a clerk for the Chicago & Alton Railroad, remaining with that road twenty-one years. At the time he left he was chief clerk in the maintenance of way department, under William Riley.

Mr. Hausen took employment with the Illinois Central in 1902 as traveling car agent, a position he occupied until his death. Since this work took him over the entire system, he met employes in all walks, and, as he was of a social, genial spirit, his friends are numbered by the hundreds. He was an honest, faithful and trusted employe in every sense of the word, and his death is a great loss to the road.

Mr. Hausen was a member of the Wade Barney Lodge, No. 512, A. F. & A. M.; Past Master (1894-1896) of De Maloy Commandery, No. 24, Bloomington, Ill.; Lincoln Chap-

ter, No. 177, R. A. M., and Lincoln Council, No. 68, N. W.

Burial was in the Masonic section of the

National Bohemian Cemetery, Chicago. He leaves a wife and a 12-year-old daughter.

—O. O. C.

Grain Dealers Pleased by Special Service

The Grain Dealers' Special, views of which are shown herewith, was used by members of the Grain Dealers' National Association from such points as St. Louis, Kansas City, Omaha, Ellsworth, Kan., Sioux City, Iowa, Bridgetown, Ill., and Decatur, Ill., en route to the national convention that was held in New Orleans October 1 to 4.

The train, which left St. Louis at 1:30 p. m., October 1, was composed of the highest grade Pullman equipment, also one of our sun parlor cars and a dining car. It arrived New Orleans at 8:50 a. m. the following morning.

"The excellent service performed in connection with the meals served in the dining

car was the cause of 100 per cent satisfaction," writes F. D. Miller, assistant general passenger agent at St. Louis. "I have accompanied a great many special movements, but never one before where all the members of the party were not only satisfied but expressed themselves as receiving a service they never anticipated. Plenty of amusement was furnished en route.

"Such favorable comment was made regarding the dinner served, especially by a number of the ladies, that I conducted them to the dining car kitchen so they could see how such splendid service was performed in such a small space. It seemed a source of wonderment and elicited further praise."

Gateman Takes Pride in His Little Garden

The Chicago terminal has been making special efforts to improve its station grounds, parks and facilities in general. All passenger trains entering and leaving Chicago over our line carry a large number of sight-seeing patrons. It is surprising to know what a little of the right kind of effort will do in improving the standard condition of our premises.

At one of the busiest street crossings, 121st Street and Michigan Avenue, on the Blue Island line, extreme personal interest

has been taken by one of our crossing gatemen, Mike Morris, who takes pride in keeping his surroundings in a neat and tidy condition. He took it upon himself to plant the portion of the waylands on his side of the fence with garden stuff and flowers, and he spends his spare moments when relieved from duty in keeping the waylands beautiful. He has supplied considerable garden stuff to his friends and neighbors.

The watchman's house is exceptionally neatly kept in the inside as well as the out.

Two views of Mike Morris' garden

This house is cleaned every morning before his hours of duty.

Mr. Morris has been employed at this par-

ticular location as gateman for the last seven years. No personal injuries in any way stand against his record.

Fast Work Saves Life of Child on Track

The employes' train left Nonconnah shops at Memphis, Tenn., at 11 a. m., September 14, north-bound, with engine No. 2323 and three coaches handled by Engineer Thomas McHugh, 524 East Trigg Avenue, Memphis, Fireman P. W. Mahoney, 529 High Street, Memphis, and Conductor W. H. Owens, 233 Lucerne Place, Memphis. When approaching the first curve south of the Speedway, the engineer and fireman noticed something in the center of the track which they say appeared to them as a piece of paper. They discovered in a moment that it was a small

child. Engineer McHugh made every effort to stop his engine; the fireman went out the side window and along the running board on the side of the boiler and had just reached the front end of the engine as it came to stop within a few feet of the child.

Mr. McHugh has been an employe of the company since 1889, and has never been concerned in an accident and has never killed or injured a passenger or an employe. He is the father of two children, Thomas McHugh, Jr., 21 years old, and Agnes C. McHugh, 14 years old, and has

resided in Memphis since June, 1889, having moved there from Holly Springs, Miss. His fireman, P. W. Mahoney, is the nephew of the late Engineer J. J. Mahoney, who spent his entire career with this company. He was employed as a locomotive fireman on April 26, 1917, and was promoted to a locomotive engineer February 28, 1920. He is the father of one child, Gladys Mahoney, 4 years old, and he has never been concerned in an accident or killed or injured an employee or passenger.

When Engineer McHugh brought his train to stop, he found a beautiful little 1½-year-old girl with brown eyes and light-hair in the center of the track. The mother was running to get the child off the track. The child had been playing in a neighbor's yard with a kitten, and it appears that the kitten ran away and got on the railway track and the child followed it. Several of the neighbors witnessed this heroic feat of the engineer and fireman.

No. 6, passenger engine of the Chicago, Memphis & Gulf, Illinois Central System, which is handled by Engineer Thomas McHugh and Fireman P. W. Mahoney, who figured in the rescue of a child.

On duty. Fireman P. W. Mahoney (on the left) and Engineer Thomas McHugh

EDUCATION

The entire object of true education is to make people not merely do the right thing, but enjoy the right things; not merely industrious, but to love industry; not merely learned, but to love knowledge; not merely pure, but to love purity; not merely just, but to hunger and thirst after justice.—JOHN RUSKIN.

Seniority

In recent months the question has been frequently asked: "Just what does seniority mean to the railway worker?"

Seniority to the railway worker means the privilege of employment based on years of service. There are many advantages to be derived by reason of prior seniority, foremost of which is the assurance of protection, when forces are reduced, against the rights of junior employees; also the right of advancement, when vacancies occur, to a more agreeable job in the trade, providing the worker possesses the necessary skill to perform the duties of the assignment to which he aspires.

Seniority rosters are maintained which show the standing of each employee in each craft. His rating begins upon the date of entering the service, and his privileges accumulate from that time. That is, when a man enters the service of a railroad, his name and the date of his employment are listed. Thus the man who has been longest in the service would head the list, and, transversely, the youngest man would be at the foot. Rights are based upon continuous service and increase in value according to the number of years of unbroken employment with the railroad.

The employees who enjoy the greatest seniority are practically assured of permanent employment, with attendant security of future.

From the foregoing it may be seen that seniority to the railway worker is equivalent to good will to the business establishment. It increases in value as continuous service with the railroad accumulates.—H. O. VOEGELI, Chief Shop Accountant, Jackson, Tenn.

Editorial

PENSION RECORDS RESTORED

Illinois Central System shopmen who went out during the shopmen's strike of 1911 and later returned to the service, and who remained loyal during the recent shopmen's strike, have been notified that, in appreciation of their recent loyalty, the management has restored the pension rights they forfeited in 1911. That is to say, their pension records will now stand exactly as they stood when the men left the service in 1911, with full credit for the additional time served since they returned to work following the 1911 strike.

FOR THE YOUNGER GENERATION

After all, each of us is working to maintain a home, whether it be an individual hall bedroom or an all-embracing establishment with a fireside, wife and kiddies and all that goes to make such a place complete. However much we are interested in our work, we spend at least two-thirds of our life away from it, and our work itself is undertaken with the idea of making more enjoyable or more bearable the homes we inhabit. The efficiency of the great Illinois Central System is to a considerable extent due to the contentment that is to be found in Illinois Central homes, and anything that goes to make better homes for Illinois Central employes will indirectly make this a greater railway system.

The Illinois Central housewife is an important part of the Illinois Central establishment. Realizing this fact, the *Illinois Central Magazine* has had in operation for more than a year a Home Division that is meant to be of service to the Illinois Central womenfolk. This department is meant to be a clearing place of housewifely information for our women readers, and it is to be hoped that they will take advantage of its opportunities to even a greater extent than they already have.

But even by reaching the employe and his wife the magazine has not touched everybody in the typical Illinois Central home, which, it is to be presumed, is also the typical American home. For the satis-

faction of the parents, we have recently been printing photographs of Illinois Central children, and that brings up the thought that we ought to have some material of interest for the remaining half or three-fifths of the family. In the December issue we plan to begin giving the children a page or two of distinct interest to them, and the innovation will be continued if the interest aroused seems to make the project worth while.

Frankly, it pleases us to see the magazine taken home. We like to have it read and appreciated by all the members of the family, so that the great institution we are all working for will be brought a little closer to us all. By enlisting the interest of the children, we naturally hope that they will be brought up in Illinois Central fidelity, so that they will be ready to take up and carry on our tasks when we are reluctantly forced to lay them down.

PRESIDENT MARKHAM AT WATERLOO

President Markham was the principal speaker before the Rotary Club at Waterloo, Iowa, October 9. For this occasion the Rotary Club had as its guests, in addition to Mr. Markham, the foremen of the Illinois Central shops at Waterloo. Mr. Markham therefore had the privilege of talking before not only the representative business men of Waterloo but also the foremen of the shops of his own road.

This occasion was a fine example of the three-cornered partnership which should exist among the public, railway employes and railway management, for the three factors were splendidly represented in the Waterloo meeting. In closing his address Mr. Markham said: "I want to close by trying to add another word of appreciation of this opportunity of meeting you gentlemen, and particularly to thank you for your courtesy in inviting here a number of my fellow employes from the shops."

The term "fellow employes" which Mr. Markham always uses when he refers to other employes of the Illinois Central System is truly expressive of the situation

which exists between him and the other employes of the road. Mr. Markham always takes the position that the employes of the Illinois Central System are working with him and not for him. With him it is never a case of "Go on, boys," but it is always a case of "Come on, boys." This is the kind of cement that helps to hold a railroad and its management together.

The employes of the Waterloo shops are entitled to be congratulated upon having the privilege of living in such a splendid and beautiful city, and the city of Waterloo is to be congratulated upon having the employes of the Waterloo shops as citizens. Certainly that is an asset of which any city might well feel proud. There is every evidence of the fact that Waterloo is proud of this asset and means to cultivate it and protect it in every proper way within its power.

NAVY DAY

Lying on our desk is a letter calling attention to the celebration of Navy Day, which occurred on Friday, October 27. The celebration is fostered by the Navy League of the United States, a civilian organization which has for its purpose the promotion of a more general understanding of the United States Navy and its services to the Republic, past and present.

In a recent letter to Theodore Roosevelt, acting secretary of the Navy, calling his attention to the designation of October 27 as Navy Day, and asking the co-operation of the Navy and the Navy Department in its celebration, R. J. Kelley, president of the Navy League, wrote as follows:

"Our country is a republic. The Navy belongs to the people. Therefore, the people of the country should be informed in every detail as to what their Navy is doing for them, for it is on them that the Navy depends for its support.

"The Navy has a splendid record of which our people may justly be proud. It is our great defensive weapon, and has never caused a war. It has been a potent factor, throughout its history, in preserving peace. The Navy itself earnestly worked to bring about the success of the recent Limitation of Armament Conference, and heartily indorses that great conception.

"Over and above these considerations, however, the Navy is a great and potent factor for the development and aid of our people during peace times. I do not believe the farmers and manufacturers of this country

realize how closely the Navy is interwoven with their every-day affairs. I think it is our duty to put them in possession of the facts in order that they may know that their peace-time prosperity is constantly aided by our Navy."

An observance of Navy Day seems to us to be very appropriate. Even those persons living on the seaboard, who are frequently reminded of the Navy and its services, have an altogether inadequate picture of the importance of this department of the government's activities. For the rest of us, our ideas about the Navy are principally based upon a limited contact with representatives of the seafaring department of our fighting forces, possibly supplemented by the views which appear in the cinema news films.

The Navy did not take part in the World War in the spectacular fashion that the Army did, with the exception of the Marine units, a branch of the Navy organizations, which were attached to the Army and performed so brilliantly in the offensive movement of the Soissons-Rheims sector, beginning before Chateau Thierry and Belleau Wood. But the Navy was in the war, performing its less dramatic part thoroughly, devotedly. The convoy service, the anti-submarine patrol, the mine barrage—these were essential factors in the prosecution of the war, and the Navy executed them well.

But, while the pages of American history are glorified by the brilliant record of our Navy, its greatest service is the service of peace. To quote from a statement by Henry Breckenridge, of the Navy League:

"Our peace and prosperity are safeguarded by the Navy. It is an agent of stability in a troubled world. It carries no threat, but it lends authority to America's voice, speaking for altruism, justice and law."

A NATIONAL PERIL

A recent check made of the traffic passing over grade crossings on fifty-two railroads showed that out of about 306,000 drivers of automobiles and horse-drawn vehicles more than 156,000 observed no precaution whatever in the way of looking in either direction or reducing speed. The check was made by the committee on grade-crossing protection of the American Railway Association July 15 and 16. The result of the check was as follows:

Number of vehicles passing.....	306,306
Looked in both directions.....	62,829
Looked in one direction.....	61,687

Observed no precaution.....156,607
Speed of 20 or more miles..... 26,453

More than half of the drivers observed no precaution whatever in the protection of their own lives, the lives of the other occupants of their vehicles, and their property. Twenty per cent of them looked in one direction. Only about 20½ per cent observed ordinary care.

Multiplied instances of serious accidents testify to the accuracy of these observations. A mule-drawn wagon was recently struck at a crossing between Freeburg and New Athens, Ill., where the view is clear and unobstructed to the driver for more than half a mile, with no noises or objects to attract attention. In that case the father and mother of three children were killed. Recently a man crossing a single track grade-crossing on our lines in a Ford sedan looked only one way. As his machine came upon the track a passenger train from the other direction struck him.

These instances could be multiplied. They bring to our attention forcibly the situation revealed by the figures reported by the committee.

If an indictment of such a serious nature should be brought against so large a number of citizens as 156,000 in any other situation, reflecting upon the simple horse sense of the people, the allegation would be denounced as emanating from a diseased brain. Suffice it to say that if these adult drivers, many of them parents, were to permit their own children similarly to expose themselves to such danger, the community would censure such indifference toward the little innocents. Why should the community be less interested in the bread-winner for these little ones? If the state regarded it the duty of the people to conserve the manhood and womanhood of the country by taking the narcotic and the intoxicant away, why is it not the state's duty to compel the driver to exercise the simple duty of stopping before reaching the zone of danger? This would practically eliminate the crossing peril.

LITIGATION IN MISSISSIPPI

Many readers will recall efforts which were put forth by President Markham some years ago to awaken public sentiment in Mississippi on the subject of damage suits against corporations in that state, more particularly the railroads. The statements

made by Mr. Markham at that time, which were published in many of the local papers of the state, indicated that for some reason a most unhealthy condition existed with respect to litigation in Mississippi. The material found in those statements showed that suits were being brought on all sorts of trivial causes of action, and that in many cases these suits were resulting in large verdicts which seriously depleted the revenues of the railroads.

An examination of the recently published docket of the Supreme Court of Mississippi for the September term, 1922, covering all cases filed with the Supreme Court up to August 25, 1922, shows what beneficial results have followed from the missionary efforts which have been made by Mr. Markham and the others whom he interested in this matter. On this docket are 213 civil cases. Out of 213, the Illinois Central System has only five, one being against the Illinois Central and four against the Yazoo & Mississippi Valley. Of the four cases against the Yazoo & Mississippi Valley, two are on appeals of plaintiffs who were defeated in the lower court. As a matter of fact, the Illinois Central System has only three cases in the Supreme Court taken there at its instance.

When we compare the condition of the docket of the Mississippi Supreme Court some ten years ago with reference to Illinois Central System cases with the condition indicated by the docket just referred to, the improvement which has been made in Mississippi in that time becomes apparent. Before the crusade was undertaken by Mr. Markham nearly one-third of the cases submitted to the Mississippi Supreme Court were railway cases and a large number of these cases were against either the Illinois Central or the Yazoo & Mississippi Valley. At the present time railway litigation in Mississippi, so far as these companies are concerned, is no more extensive in proportion to miles operated than in other state.

The public has come to understand that if anyone has a just claim against the Illinois Central System he can get an adjustment out of court which will prove more profitable than litigation.

Of course, as long as accidents happen and as long as human nature is as it is, there will be suits against railroads, as well as other corporations and individuals, but it is safe to say that this is no more true in Mississippi than elsewhere.

PUBLIC OPINION

What the

World Thinks

THE I. C. MAGAZINE

The October number of the excellent *Illinois Central Magazine* devotes much of its space to New Orleans, with a cover showing an illuminated glimpse of the harbor.

There is a long and interesting article on the American Legion convention, and another profusely illustrated describes the city of history and romance.

In a different vein J. T. Hallam of the superintendent's office tells in text and pictures of the work of enlarging the city's harbor facilities and forecasts that when the Industrial Canal is completed and in operation traffic over the Illinois Central will be greatly augmented.

The magazine has a wide circulation in the Mississippi Valley, and New Orleans ought to reap much benefit from the prominence it has received in the October number.—New Orleans (La.) *States*, October 10.

A FAILURE IN ITALY

The biggest problem Italy has to solve in order to bring about an amelioration in her present financial difficulty is a radical reorganization of her railway system. This is the opinion generally expressed by leading industrial men in Italy. The deficit of nearly 7,000,000,000 lire certified in the 1921-22 budget was 1,500,000,000 more than it was estimated eight months ago, and this extra deficit was especially due to the railway administration, for instead of 1,000,000,000 as it was expected, it showed a loss of 1,600,000,000.

The conviction is growing in Rome that the government should "get out of business" and cede the railroads as well as the telegraph and telephone to private interests. The argument is that the government loses about 2,000,000,000 lire per year by running these public services, whereas private interests could not only run them to greater satisfaction of the public but could also, within two or three years, derive a handsome profit from them. Besides saving the 2,000,000,000 loss, this would increase the government's revenue in the shape of taxes that would be paid on profits.

Before the war the state railroads em-

ployed 120,000 men, and at present, to do the same work, there are 210,000 men. It is thought that private interests, aided properly by the government, could reduce the number of employes to the pre-war figure in two or three years and then begin to make profits, for 90,000 unnecessary employes consume in salary alone nearly 1,500,000,000 lire.—Chicago (Ill.) *Journal of Commerce*, August 21.

STRAIGHT TALK

Had it not been for the railroads this country—the Middle West—even Harrison County, would have been more or less the home of the Indians and buffaloes, and still there are people in the country who do all in their power to harass the railroads. The public, on one hand, including the government and the different commissions, and the employes on the other. We'd get along a lot better if the roads were allowed to operate their properties without too much interference.

There are still fellows in the country who will insist that the railroads are guaranteed 6 per cent. However, they are not guaranteed anything. If they earn any income they are allowed to keep 5½ per cent of it, before they divide with the government.—Logan (Iowa) *Observer*, September 28.

SIX INCHES

A banker in Brighton, Ill., dreaming about stocks and bonds as he drove his automobile at different speeds as his mood dictated, suddenly realized that he was about to collide with a fast passenger train. He stopped his car, and the train whirled by. He was saved by a small margin of six inches. As an able banker he knew that six inches was too narrow a margin for safety, but this was an after-thought.

There was a time when it was generally considered that only hot-headed fools drove their flivvers into railway trains, but now every age has been represented, and every dignified profession and business and trade has been represented on the long list of fatalities caused by indiscreet driving. Some of these drivers were sober; some

were not. Some were on business bent; others, out for joy rides.

Warning seems to be useless. If Solomon made a mistake when he said all men were liars, it certainly is proving true that Barnum was right, anyway. The newspapers may save time by setting up several headlines: "Killed in wreck" or "He rammed his car into a freight engine." Every day the accidents happen. Somebody is going to start a crusade not to save the babies but to save the boobs. One of these hot days a law will be passed requiring every automobile to come to a full stop before crossing a railroad and, to remind the autoist that he is approaching a railroad, an automatic gate or a bump will be placed on each side of the crossings to do the thinking for the foolish folk who can't think for themselves.—Cedar Rapids (Iowa) *Gazette*, September 8.

INCENDIARY

The United States has been, is and always will be a free country where industrial, religious and political disputes will be threshed out on the basis of free expression, obedience to the law and tolerance.

A law-abiding citizenship which has had no curb on its tongue or pen and no restraint beyond tolerance has been able to settle, without violence, every important question which has arisen since the founding of the country.

It is a late day, despite the trend to anarchy dished up as modernism and disguised under the various names of Karl Marx, Lenine and McNamara, to come into a peaceable community which has a reputation for an industrial and civic standard equal to that of any municipality in the United States and preach violence.

The Constitution of the United States reads, and has been interpreted for more than a century as reading, that a majority shall rule. It has been majority rule, and it shall be unless the red flag of anarchy is nailed to the capitol mast in Washington.

The opinions of men and their leaders are important so long as they deal with a situation which concerns any integral part of our country or community.

Paducah has lent a willing ear in every case where a part of her citizenship has had an issue at stake. But Paducah cannot afford to allow her citizenship to be judged by the utterances of one who urges minority rule.

The curfew law has just been ended; it would seem that the commissioners knew wherewith they dealt when they imposed its stringent regulations. Opposition to organized, legal and recognized government founded on the best thoughts of those who established this government is being spouted from the convention platform.

Men who served overseas are being urged to turn against the flag they served in the cause of humanity to upset the cause of humanity. They are told, "If necessary we will take up guns and fight." It is the heresy of the anarchist being preached to patriotic Americans.

Will an incendiary speaker obtain a following of men who have been law-abiding home-owners, steady workers, husbands, fathers and respected citizens?

A time has come for a realignment. No bolshevist shall dictate to Paducah citizens and home-owners a course which shall place them on the same level with the ignorant peasant of Russia who has been conscripted under the banner of the bomb thrower.

There is just one way for any group or party to enforce its views upon the people of the United States, and that is through the lawful and orderly course of the ballot.

Instead of wasting time preaching class hatred and the spirit of terrorism—and it is wasted time because the broad citizenship of this country will never be influenced in the slightest by this type of attack—let men who are not satisfied with American ideals and American government as it is practiced today educate a following that will go to the polls and enforce their views, not with guns, but with the ballot.—Paducah (Ky.) *News-Democrat*, September 12.

ROAD WRECKING

President Frank Terrace, speaking before the twenty-third annual convention of the Washington State Good Roads Association at Ellensburg, Wash., this week, says:

"The legitimate function of a highway is, first, the accommodation of private owners of vehicles for their individual pleasure and business. They are not designed or intended as permanent roadbeds for transportation business and can never be depended upon to fulfill that function.

"We have not yet developed a roadbed which will stand the everlasting pounding of this traffic for which highways were never intended. Roads that were designed and built honestly for 95 per cent of the

traffic have been hammered to pieces by 5 per cent of the traffic.

"The early destruction of many of our highways has called for rebuilding on a far more expensive scale, and for all new highways to be designed for the heaviest traffic, which is only 5 per cent. Are we to continue this expensive construction and maintenance to provide a practically free right-of-way roadbed and maintain the same for a traffic which pays nothing for its use except a simple license, the same as any ordinary pleasure vehicle?

"It is generally conceded that a highway capable of standing the legitimate 95 per cent of travel can be built for \$30,000 per mile (16-foot road). If this abnormal traffic is to be perpetuated, we must pay at least \$50,000 per mile, an extra \$20,000 per mile for 5 per cent of the travel. Are we going to stand for this—to make and maintain such roads for traffic never contemplated, which cannot take the place of railroads, and only serves to bankrupt them?

"Electric and steam railroads are absolutely the only safe, sane and permanent means of commercial traffic; and no country can prosper without them. Their rights-of-way must be bought, tunnels and cuts made, bridges and culverts built, tracks laid, engines and cars bought, and all kinds of buildings erected at enormous cost to operate this essential means of transportation. The same railroads must pay their share of cost and maintenance of the highways which are giving practically free rights to their competitors. Can we do without railroads? If not, we should see that they have the right to a fair return on their investment.

"The farmers of this state have suffered because the public authorities, state and county, in employing people, especially on the road building, set a day rate with short hours that would bankrupt every farmer in the whole state if he had to meet it, and he is more or less in competition with it. When a man in the hay field or milking cows receives his \$3 a day working ten hours and finds out that right along the road a fellow is working at \$4 or \$5 a day, eight hours, the farm employe becomes dissatisfied, and then trouble arises.

"Taxes on farms are running from \$2.50 to \$20 per acre, and this is prohibitive. If we do not take care of this basic industry, which furnishes 80 per cent of all the pro-

duction, we cannot long boast of being the 'Great United States.'

"The easiest way and cheapest plan of obtaining money for road building and upkeep is by a tax on gasoline. We must not lessen our interest nor lay off in any way in pushing our road program to completion."
—Philadelphia (Pa.) *News Bureau*, September 25.

FRUITS OF RESTRICTION

Some three years ago this newspaper called attention to the wide disparity between the railroads and all other classes of undertakings in respect to new capital at their disposal. Since then the ratio of railway financing to total corporation issues has increased somewhat, but even last year, in the midst of general industrial depression and while the railroads were still struggling to overcome the physical degeneration of the federal control period, the carriers sold less than one-quarter of the security offerings by all privately owned corporations. In nine months of this year the ratio has fallen again, the railroads having obtained little more than one-fifth of the total subscriptions by investors.

Actually the situation has been worse for the railroads than these figures would indicate, because the bulk of railway financing since the end of federal control has been done for the refunding of debts contracted anywhere from two to twenty or thirty years previously. The railroads, moreover, had no such profits to carry forward from war-time inflation as did great numbers of industrial undertakings.

Today every prediction, of this and other financial and technical journals, as to the logical results to be expected from this lopsided application of available new capital has been verified. From literally every quarter of the United States come complaints of insufficient transportation service to accommodate the volume of business that might be done. For the last week of September freight car loadings were within 3 per cent of the high record, made in the middle of October, 1920. This season's traffic peak had not been reached when these figures were compiled, and, because of a menacing shortage of fuel at the threshold of winter, this year's peak load will inevitably be greater and last longer than usual.

Under the rate-making mandate of the Transportation Act the Commerce Commission attempted in 1920 to create a general

rate scale, yielding 6 per cent upon its tentative appraisal of the whole railway investment. Although the actual yield for the first year under the new schedules was only half of the intended return, and under a trade recovery improved to only a fraction more than 5 per cent early this year, the commission found itself helpless to resist political pressure for widespread reduction of freight rates. At a time when suspension of coal mining was clearly foreshadowed certain members of the commission expressed the fear that unless rates were reduced railway earnings for the ensuing twelve months would exceed a fair return.

It happens that the market for railway bonds has been far more favorable this year than it has been most of the time since the

armistice. But the trouble is that the railroads have done far too much bond financing already to take on still more debt except for their most urgent needs. With the Commerce Commission's forward calculations of railway returns chronically wrong, the sound financing of railway expansion with share capital has been for years a practical impossibility.

In fairness it should be added that responsibility for the country's woefully inadequate transportation facilities rests primarily not with the Commerce Commission, but with shippers who cannot see more than ninety days ahead and an army of politicians who never by any chance think beyond the next November.—*Wall Street Journal* (New York), October 14.

The Baggage-man in Our Public Relations

By J. B. ARVIN,

Train Baggage-man, St. Louis Division

Handling of baggage and of mail, as nearly every train on the St. Louis division handles mail, can be done with a system to decrease damages and claims to the railroad as well as to the passenger or the sender of the mail.

As I have noticed, all the other baggage-men, as well as myself, see that the baggage and mail are put into the car with care and are handled with care after they are in the car. This will save money for the company and also prevent loss for the patrons.

As I have noticed, when a piece of parcel post (as a pasteboard box) is broken and we know some of the contents will be lost out, not only while in our care but after it has passed into someone else's hands, we tie it up with string or in some other way, so we know that the contents will be safe. We re-wrap trunks and suitcases where the rope has come off or been broken or a suitcase that has been stuffed so full that the catches will not stay fastened. I have seen this done time after time.

Baggage-men help to keep trains running on time. We unload and receive baggage and mail as quickly as possible without doing any damage to whatever we are handling, in order that we shall not delay trains, as we know that we have passengers who are going farther than our division point and who may have but a few minutes to wait for their train. I don't think it will

make friends for the Illinois Central if we are the cause of delay.

We are putting forth our best effort to eliminate damages and delays for trains on our division.

Some Bad Luck in the '80s

Val P. Barrick, incline engine foreman at Baton Rouge, La., tells this one of his experiences in the early days:

"My first work with the Illinois Central was in 1886. I came down the Ohio River on a raft of logs from Point Pleasant, W. Va., to Cairo, Ill., and there hired as a brakeman on the incline before the bridge was built—and when I say brakeman, I mean a job having to do with brakes, link-and-pin coupling. I'll say it took pig-iron men in those days.

"One day we were loading the boat, and as we tipped over the hill the engine broke off. It was up to me and the hand brakes to stop the cut. I got them stopped all right before they went off the back end of the boat, and the pig-iron yardmaster said: 'Boy, you sure did a good job!'

"Stuyvesant Fish was standing by, and he said: 'Young man, did you examine that coupling before you started?'

"'Yes sir,' I replied, 'but the pin jumped out.'

"'You did well,' he continued. 'You should be rewarded.'

"The next day I was fired by the pig-iron yardmaster. A boomer friend of his came along, and he gave him my job."—T. T.

The Careful Crossing Campaign

Notwithstanding the extensive educational campaign conducted from June 1 to September 30 to prevent automobile grade-crossing accidents, the result on the Illinois Central System shows that there were 235 automobile grade-crossing accidents during that period as compared with 139 such accidents during the same period in 1921. The 235 accidents referred to caused the death of seventeen persons and injury to sixty. Although there was an increase of 69 per cent in the number of accidents, there was a decrease of 6 per cent in the number of casualties.

The Illinois Central System has succeeded in reducing the number of accidents resulting in injury to its passengers and employees. However, the number of motor vehicle grade-crossing accidents has been steadily increasing for years.

We earnestly request that enginemen continue to do their part in assisting to prevent this class of accidents by giving proper warning signals and by being on the lookout while they are approaching public highway crossings. If those who drive motor vehicles would do their part, there would not be any motor vehicle accidents, but they will not do it, and therefore they must not be depended upon to do it. It is our duty to protect them just as far as it is humanly possible to do so.—S. M. C.

After Longfellow

The shades of night were falling fast;
A fool stepped on it and flew past.
A crash! He died without a sound;
They opened up his head and found—
Excelsior!

Ten Fatal Accidents an Hour

Seventy-six thousand accidental deaths—a life every six minutes—was the toll paid by careless America during 1920, according to the report of the National Safety Council presented at the eleventh annual Safety Congress, which opened in Detroit, August 28. The 1920 toll of accidents represents the total population of the state of Nevada, and while it was a decrease of 3,300 from

1911, it was only 400 less than the 1919 total. The automobile fatality frequency for 1920 was thirty deaths a day, a total of 11,000 for the year. People died from falling accidents of all kinds at the rate of thirty-four a day. Burns claimed twenty-two lives a day, a total for the year of 8,088. Railway accidents showed no decline, as there were 7,769 such deaths. More than twice as many men died accidentally as did women.

Says That Safety Pays

"Safety first" is not only a humanitarian slogan but an economic one," Judge E. H. Gary, chairman of the United States Steel Corporation, declared in an address before the Merchants Association of New York October 10 in connection with the observance of "Safety Week." Many large business firms, Judge Gary said, are spending millions annually in the promulgation of safety and general welfare plans. "The proposition now engaging our thought and action," Judge Gary said, "is first of all one of humanity, but it is also economic. A nation which decreases deaths and injuries by accidents is in the highest and best sense conservative and conserving its resources."

Step aside a little oftener to talk with God and thine own heart.—FLAVEL.

A Safety Summary

Failure to

- Protect with blue flag,
- Exercise care,
- Resist dangerous practices,
- Signal trains,
- Observe rules and orders,
- Note and regard signals,
- Adjust couplers properly,
- Look where you step,

- Impart safety ideas to co-workers,
- Notice causes of accidents,
- Judge side or overhead clearances,
- Use goggles,
- Run motor cars carefully,
- Yield to safety pleas—

will make the words "Personal Injury" a reality to you and perhaps mean fatal injury.—R. L. ORNE, *Claims Department, Chicago.*

Nan Carter

Make Your Good Points Known

Few women understand the importance of conscious development of personality. A really charming woman is not one who can be classified by a single word; hers is no particular type. She has a style all her own. She cultivates that characteristic which distinguishes her from other women. She selects clothes which bring out all the beauty of her figure. She studies colors and lines. If her hands and arms are beautifully formed, she emphasizes their beauty by the type of sleeve she selects, and she devotes extra time to the care of her hands. Or it may be that her pretty foot is her best card, in which case she dresses it with care. She has no ambitions to look like Mrs. Smith or Mrs. Brown, however fashionable those good ladies may be. She does not ape the mannerisms of her next door neighbor. She does not slavishly follow the prevailing mode, regardless of its adaptability to her figure. Red may be the raging color of the season, but if it happens that her crown of glory is of the Titian shade she does not blindly select a red gown. Her conversation is not noticeably punctuated with the latest slang. She moves easily and gracefully. Her manners are gracious, and if her voice is true and clear she seeks to improve it. She is just herself—a charming self—so “different” and therefore as refreshing as a lake breeze on an August day.

Study your face and your figure, and then develop your good points, thus obscuring the bad ones.

Household Hints for Home Makers

To clean granite pans which have been burned, half fill with cold water, add washing soda, and heat to boiling point; then wash in the usual way.

Paraffin covers for jelly glasses may be melted and used again and again, if they are washed and put away as soon as the jelly is uncovered for use.

Cake will crack on top if the oven is too hot or if too much flour has been used.

In selecting poultry, it should be noted that a young, tender chicken has soft feet,

The Children's Page

We have been trying through the various departments of the magazine to reach the members of the Illinois Central family—to provide something of interest for the menfolk and for the womenfolk. We fear, however, that we have neglected a most important part of the family circle: namely, the little people. True, we publish their pictures and the smart things they say, but we want to do more than that. In the December issue we will introduce a page or two for the children. We want interesting material for this section, such as stories, puzzles, games, contests. We invite the boys and girls to write to Aunt Nancie, who will be glad to hear about their work and play, their school days and holidays, their pets and pastimes. Aunt Nancie will reply to the letters through the columns of the magazine. We ask our readers, and especially our mothers and fathers, to co-operate with us and make suggestions along this line. Letters pertaining to the children's page should be addressed to Aunt Nancie, in care of the *Illinois Central Magazine*.—N. C.

smooth skin, soft cartilage at the end of the breastbone and an abundance of pinfeathers. A good turkey should be plump, have smooth dark legs, and soft cartilage at the end of the breastbone.

The addition of $\frac{1}{4}$ teaspoon nutmeg, a few drops lemon juice and a little grated lemon rind improves the flavor of baked apples.

The dreaded task of window washing is greatly simplified by using a chamois. Dip chamois (about fifteen inches square—not too large) in a pail of lukewarm water; after it is thoroughly soaked, squeeze it slightly and wash the windows; the process of washing the window may be repeated if necessary. Then rinse the chamois in water, wring it dry, and wipe the window. This method is simple and is a great labor and time-saver. To prolong the life of the chamois, a cloth can be used to wash the windows, wiping the windows dry with chamois wrung free of water. After using

the chamois, wash it in lukewarm water with soap, rinse several times and hang up to dry.—MRS. FRANK RYMKO, *Stenographer, Office of Illinois Central Magazine, Chicago.*

Are You a Tin Can Cook?

What would you do, Mrs. Tin Can Housewife, if your husband were to get stubborn and refuse to eat one of your canned dinners some day? A good substitute would be a vegetable dinner, prepared in a very few minutes. Purchase from your grocer, where you are in the habit of buying your tin cans, some fresh vegetables; from your butcher, some small pieces of tender meat. Pare and cube the vegetables and place them in a covered dish with enough water almost to cover them. Chop the meat in small pieces and place it in a covered dish to cook. Never cook meat and vegetables together, or both will lose their natural flavor. When the vegetables are nearly done, stir in a tablespoonful of corn starch dissolved in water, with salt and pepper to taste. Place the meat in the center of a large platter, then the vegetables a spoonful at a time around it, garnish with a row of creamed Irish potatoes and a few sprigs of parsley, and the result is a dish fit for the man of the house. A wholesome fruit salad and a nice juicy pie will finish the dinner, and hubby will strut around like a peacock and say, "My dear, let me help with the dishes; we are going to the new movie theater tonight."—MISS VERNITA TRIBBLE, *Tennessee Division.*

Tested Recipes

PUMPKIN PIE.—1 cup sifted pumpkin, $\frac{1}{2}$ teaspoon salt, 1 saltspoon mace, $\frac{1}{2}$ teaspoon cinnamon, $\frac{2}{3}$ cup sugar, 1 egg, $\frac{1}{2}$ cup scalded milk, $\frac{1}{2}$ cup scalded cream. Combine the first four ingredients; beat the egg and mix with sugar, pour the milk and cream into this slowly; combine with the pumpkin mixture and pour into a deep pie plate lined with plain paste. Bake thirty-five to forty minutes. Spread with whipped cream sprinkled over with finely chopped nut meats, and serve.

MINCE MEAT.—Two cups chopped beef, 4 cups sugar, 1 nutmeg (grated), 2 cups boiled cider, rind and juice of two lemons, 4 teaspoons salt, 4 teaspoons cinnamon, $1\frac{1}{4}$ cups each of chopped raisins, citron and currants, 1 teaspoon ground cloves, 1 cup suet, finely chopped. Mix and scald. Pack down in

jars and pour a little brandy on top. When ready to use, add 6 cups chopped apple and stoned raisins to taste.

RAISIN PIE.—Seed and mince two cupfuls of raisins and stir into them a gill of water, a cup of sugar and a heaping teaspoonful of flour. Fill pastry shells with the mixture, lay strips of pastry over the top, and bake.

MAPLE CAKE.— $\frac{1}{2}$ cup butter or substitute, 2 cups maple sugar, 2 eggs, $2\frac{1}{2}$ cups flour, $\frac{2}{3}$ teaspoon soda, 1 cup buttermilk, 2 teaspoons baking powder, $\frac{1}{2}$ teaspoon ginger. Cream the butter; gradually add the maple sugar, crushed fine; add the eggs, beaten without separating the whites and yolks; dissolve the soda in the buttermilk, and add the milk alternately with the flour, which has been sifted, measured, and sifted again with the ginger and baking powder added. Bake in a tub loaf pan about 50 minutes. Cover with maple icing, made as follows: Dissolve 1 cup maple sugar and 1 tablespoon corn syrup in $\frac{1}{3}$ cup of boiling water. Boil until it forms a soft ball when tested in cold water. Pour the syrup in a fine stream on the white of one egg beaten very light, beating constantly meanwhile. Continue beating until cool, spread on cake, and decorate with English walnuts.—Miss V. T.

VIRGINIA SMOTHERED CHICKEN.—Split tender chicken down back; season with teaspoonful of salt and one-quarter teaspoon pepper. Put in dripping pan with cupful of hot water; leave in oven until tender. When it begins to brown, make paste of two tablespoonfuls each of butter and flour, spread over chicken and baste every ten minutes until brown. Remove chicken to hot platter. Make gravy of drippings, adding cup of milk, and pour over chicken.

OUR BABIES

No. 1 is Cyril Arthur, $3\frac{1}{2}$ years old, son of Cyril E. Trust, secretary to chief clerk to general freight agent, New Orleans, La.

No. 2 shows Lloyd (standing), 7 years old, Delmont, 4 years old, Francis, 21 months old, and William, 9 years old, grandsons of H. S. Murphy, B. & B. foreman, Fort Dodge, Iowa.

No. 3 is Julian Eugene, $1\frac{1}{2}$ years old, brother of Cyril Arthur, No. 1 above.

No. 4 is James Vincent, 9 months old, son of Harry Cosgrove, car repairer, Cherokee, Iowa.

No. 5 is B. E. William, 4 months old, grandson of Alex Herbert, pumper, Burnside, La.

No. 6 is Harold C., 7 months old, son of W. C. Pryor, chief bill clerk, Baton Rouge, La. Harold weighs twenty-one pounds.

No. 6 is William J., 2 years 5 months old,

son of P. M. Yetter, contract attorney, operating vice-president's office, Chicago.

No. 8 is William H., Jr., 19 months old, son of W. H. Lawshe, traveling auditor, Chicago.

No. 9 is Frank P., Jr., 2 years 8 months old, son of Frank L. Coyer, clerk, general foreman's office, Kankakee, Ill.

No. 10 is Paul James Durbin, 4 years 11 months old, adopted son of Supervisor J. W. Purcell, Fulton, Ky.

No. 11 is Edmond M., 4 years old, son of Operator E. E. Truitt, Independence, Iowa.

No. 12 is Edward Peyton, 13 months old, son of G. P. Robertson, brakeman, McComb, Miss.

No. 13 shows Mark Samuel and Sara Marguerite, children of Peter J. McHugh, special agent, Memphis, Tenn. Sara Marguerite, who is better known to her friends as "Little Sis," is here shown after making her first Holy Communion.

No. 14 is Samuel Jean, 15 months old, son of Conductor F. S. Mooney, Centralia, Ill.

No. 15 is Martha Frances, 5 months old, daughter of Flagman R. A. Harris, Mississippi division.

No. 16 shows Billie, 5 years old, and Jane, 4 years old, children of Assistant Engineer John W. Swartz, Clinton, Ill.

No. 17 is Mary Esther, 6 months old, daughter of Trainmaster W. H. Petty, Durant, Miss.

No. 18 is Martha Virginia, 3 years 9 months old, daughter of J. A. Varnado, night chief clerk, Baton Rouge, La.

No. 19 is Pauline, 4 years old, daughter of Section Foreman J. E. Wood, Greenville, Miss.

No. 20 is Bernice Irene, 2½ years old, daughter of Track Foreman John Erlewine, Ackley, Iowa.

No. 21 is Betty Jane, 2 years old, daughter of Engineer E. B. Smith, Amboy, Ill.

No. 22 is Maxine Elizabeth, 4 years old, daughter of J. S. Armstrong, yard clerk, Madison, Wis.

No. 23 is Wilma Kathlyn, 5 years old, daughter of Joe Eddington, accountant, Mattoon, Ill.

No. 24 is Marcella Louise, 3½ years old, daughter of L. H. Petri, assistant chief clerk to Superintendent Roth, Mattoon, Ill.

No. 25 is Carlotta M., 5 years old, daughter of Instrumentman L. W. King, McComb, Miss.

No. 26 is Millie Christine, 2 years 8 months old, daughter of Section Foreman George Spillman, Oakfield, Tenn.

No. 27 shows Shirley Janise, 10 months old, and Dorothy Eileen, 2½ years old, children of R. L. Morgan, employed in office of agent, Sioux Falls, S. D.

No. 28 is Annie Lena, 6 months old, daughter of J. J. Freeman, brakeman, Louisiana division.

Smart Sayings of Our Babies

Our readers are requested to send in the smart sayings of our babies so that we may print them. Address EDITOR, HOME DIVISION.

Mack is 3 years old and doesn't talk very plainly. He completely lost his heart to Aunt Grace when she visited his house. One day, just before she was to return to her home, she asked Mack how much he would sell himself for to come and live with her and be her little boy. Mack's price was a penny; so it was all settled between

them that he was to go with Aunt Grace. That night when his mother was undressing him she said to him:

"What is mother going to do? She won't have any little boy any more, and she's going to be very lonesome."

Mack slid down from her lap, went to his little coat pocket, took out the penny Aunt Grace had given him and went over to her, threw it in her lap and said:

"There's your penny."

"Why, Mack, what does this mean? I thought you sold yourself to me."

"I changed my mind; my pwice has don up; I'm a nickel now," said Mack.—Miss M. E. T., Chicago.

Edward has just learned to whistle and is proud of his accomplishment. The other day he said to his little sister:

"Jane, why don't you whistle?"

"I tan't," lisped the tiny girl, sadly. "Dod didn't dive me a whithle."

THE LEADER

The distinctive characteristic of the leader is always initiative. Elbert Hubbard has defined initiative as the ability to do a thing without being told.

Apply the initiative yardstick to your own efforts. How much supervision do you require? How much telling is necessary to keep you going right? How many people above you devote some of their time to directing your efforts? Try this and then remember that supervision is a high-priced kind of service—and then on top of this remember that you pay for every dollar's worth of your own supervision.

Isn't it clear, isn't it plain to you that when somebody else has to tell you what to do next, when to do it, and how, that he must be paid for his service and isn't it clear that you must foot the bill?

The independent worker—the one who needs no goad other than his own ambition to keep him busy—eventually becomes the leader. He is a leader from the very beginning.

How naturally all of us follow the man of initiative—the one who seems to see a little farther into the future than we. How quickly such a man gathers about him a retinue of followers ready to do his bidding, and how easily and how naturally he sets the pace and maintains it.—B. F. WILLIAMS, in *The Business Philosopher*.

True Happiness in Arkansas

WOOD RAINWATER of Morrillton, Ark., in reply to a request from an editor for a "piece," recently indited the following epistle to *Commerce and Finance*, New York City:

Morrillton, Ark.

Dear Mr. Price.—You request my services to help edit *Commerce and Finance*. I couldn't think of it. I live in a little town in Arkansas with forty-one of the finest folks on earth and about 4,000 more equal to other inhabitants. We have no grafters, thieves, moonshiners, labor or capital, nobody kicking about the Lord's or Congress's favoritism, taxes or poverty. We have golf club, fishing club, K. K. club and home brew club.

I have a private 6-day bank that nets me all I can spend. I wind it up Monday and it runs until Saturday without my attention or worry. I ship five cars of chickens to New York every week; and the profits are my worry, as my wife's folks are rich, and I want to keep from showing too much prosperity. I fish two days a week, play golf three and close up on Thursday for the benefit of my girl stenographer, and play the fiddle all day Sunday.

I have six friends here and can see them in fifteen minutes. You have about five in New York, and you couldn't find them in a month.

When you die, if you go to Heaven, you have to come right through Morrillton; if you go to hell, you have to go by Hot Springs, only fifty miles from here. This is the gateway to either place. Besides these things we have flappers, movies, paved streets, swimming, petting and poker parties, curly headed boys with red neckties that play guitars and mandolins. What more does New York offer?

As soon as you die you'll come by here and forever kick yourself for seeing nothing but high buildings, traffic cops and strangers. We have a congressman who resigned because Harding keeps them in session doing nothing, which keeps him out of Arkansas.

Mr. Price, it's a dirty shame a fine fellow like yourself has to live in New York on a treadmill. Come on down to Arkansas. I'll give you my chicken and egg profits or my bank profits—either is as much as you can spend. Besides you can live and know forty-one of the finest folks on earth, besides other things.

Train Equipment Defined

A Pullman porter running to the South recently told Superintendent J. P. Leach of the Chicago districts a new classification

Seventy-eight

of railway cars that he had heard from a negro car checker.

"Engine, letter kyar, sittin'-up kyar, layin'-down kyar, eatin' kyar an' lookin'-out kyar," ran the checker's soliloquy.

Translated this would be, of course, engine, mail car, day coach, sleeper, diner and observation car.—*The Pullman News*.

Modern Childhood

How dear to my heart are the games of my childhood,

'The sports that we had by the old swimming pool,

The slingshots we used in the deep tangled wildwood,

The mibs that we played on our way home from school.

But now as I pause on the corner to hear them

And hark to their joyous and innocent tones,

I find as I amble up noiselessly near them

The children are using a couple of bones—

The innocent children,

The sweet, blue-eyed children,

The 12-year-old children

Are rolling the bones.

Ah well I remember how nimbly we hustled
And beat it to bed at the first stroke of nine;

Ah well I remember how swiftly we rustled
For fear of a slap at the base of the spine.
We hiked to the hay when the curfew was ringing

And woke in the morning all hungry and glad;

We never had heard about cabaret singing,
But now all the children know more than their dad—

The innocent children,

The sweet, blue-eyed children.

The 12-year-old children

Know more than their dad.

—Selected by "TEDDY," Office of Auditor of Freight Receipts.

On the I. C. With McIntyre

[With best apologies to friend O. O.]

SIXTY-SEVENTH ST., Sept. 26.—One climbs a long flight of stairs to board the train here; oddly enough, on reaching town, one has to climb another flight of stairs to reach street level. And yet the I. C. is far from being in run-down condition.

I amuse myself, while waiting on the platform for the express, watching the townward trains go by on the other tracks.

Illinois Central Magazine

There scoots the Panama Limited, a proud Pullman affair with stewards in white coats and an observation platform. Wonder when McCutcheon will finish the "Heir at Large." A local train is starting on the voyage to Chicago. A local, by reason of its lightness, runs faster than an express between express stations; but I will pass this one at 12th Street.

At last my train. The smoker, as always, is a parallel-seated car compelling one to watch his fellow-passengers. There on the opposite side sits a young woman, legs neatly crossed, reading her newspaper quietly and smoking a cigaret. She rides on the smoker every morning. Nobody seems to notice her. There's Ben Hecht, getting on with his broad telescope hat. He doesn't look around. Several celebrities use this train. Here is Professor Linn, with the inevitable Fatima not quite falling from the center of his open lips. There is T. B. Hinckley of the Drama League. In a corner, conversing in low tones, are the piano player and the drummer at the Palace Theater. Delmar, the pianist, is an old army friend of mine. I pretend not to notice him. I owe him a cigaret.

From 53d Street to Roosevelt Road, the right-of-way skirts the lake. The water looks rough this morning. Hope we will not be derailed and steam into the waves. I never get sick at sea, but on Lake Michigan you can never be sure. There's a man reading *The Post*. How intelligent he looks. He is turning to the editorial page. He turns past it. Of course he has read my column before getting on. The new Field Museum looms into sight. Already quite dirty. Wrigley Building needs washing, too.

Randolph Street. All out! One stands for ten minutes on the left foot, while the throng of woman shoppers clutters up the narrow stairway. Two women can displace more room than twenty men. You can always tell the suburban matron from the metropolitan shopgirl. The stenographer moves right along, without shifting or backspacing. Mayor Thompson ought to move the subway over to State Street. And make the shoppers use it. No, I don't want a tag.—RIG, in "From Pillar to Post," *Chicago Evening Post*, September 26.

Yazoo Valley Contentment

White man rid by my cabin one day;
Mus' been f'm de Nawth, f'm whut he say.
"Huccom yo laffin' an' prankin' erroun?
Yo' doan own nary a foot ob groun'.
Yo' cloes' all tatters," dat white man say,
"Yet yo' lows t' be happy all de day.
Mebbe yo's got 'ligion dat meks yo' ack
Jes' happy an' foolish an' crazy-lak."

"Well, suh," I 'sponds t' dat ar man,
"I meks de bes' of whut comes t' han'.
My cloes' is rags, but I has good health
An' that's mo' bettah dan all yo' wealth;
Effen all banks fail, doan' fret me none,
My worries all sink wid de settin' sun;
I lives wid de posies an' birds an' trees,
My conscience cla'r and my soul at ease."

White man he studied f'r quite a while,
Gib' me a seegar an' a frien'ly smile.
"I reckon," he 'lowed, "yo' has de right slant,
I'd lak t' trade places, on'y I can't.
Doan' fret yo' haid bouten bonds an' stocks,
Yo's sho' crazy," Rastus—jes' lak a fox!"
—E. F. Y. in "Line o' Type or Two," *Chicago Tribune*.

INKID SAYS—

What Patrons Say of Our Service

A Friend Through Thick and Thin

F. K. Conn, president of the Bayou Land & Lumber Company, Yazoo City, Miss., recently wrote as follows to President C. H. Markham:

"Some years ago, our little company located a sawmill on one of your branch lines—the Yazoo & Mississippi Valley—at a point now known as Bayland, Miss.

"There have been times when we could have used more cars. Under some of the most trying circumstances, it seemed that we could not get equipment to move enough lumber to keep up our pay-roll, but we have always pulled through together, and at no time have we been compelled to close our mill because of inadequate service.

"Last spring, when we were overflowed from stem to stern, your officials voluntarily placed box cars on our tracks to house our labor.

"Through the coal strike and the railway shopmen's strike, we have got almost 100 per cent service.

"I sat at my desk today thinking how much this spirit of unselfish co-operation has meant to us, and I want to express to you, the highest official of the Illinois Central System, our appreciation of the consideration and service we have received from the employes of your line."

Service Just as Advertised

The following letter was recently received by W. H. Brill, our general passenger agent at New Orleans, from Sam Lozano, 1005 Main Street, Baton Rouge, La.:

"I am in receipt of a check from the Chicago office for \$2.88, in payment for an unused ticket which I forwarded to you for adjustment. Allow me to thank you for the immediate attention give such a trivial matter. It only demonstrates what you advertise regarding service whether of a major or of a minor nature."

Took City Children to Country

Joel D. Hunter, general superintendent of the United Charities of Chicago, 168 North Michigan Avenue, recently wrote as follows to President C. H. Markham:

"The summer outing work for 1922 closes this week. Through the generous assistance of the Illinois Central and other

railroads in granting free transportation, we were able to give 9,192 mothers and children a glimpse of the country and two weeks or more respite from the tenement districts of Chicago.

"It is remarkable what two weeks' fresh air, sunshine and good food can do. The children came back brown and rosy and filled with the joy of country life. This added vitality and enthusiasm will tide them over a good many months. Were it not for the courtesy of the railroads in granting free transportation, we would have been unable to have provided an outing for so many of Chicago's needy families.

"May we take this opportunity to express our appreciation to the railway employees—gatemmen, conductors and brakemen—who through their kindly and cheerful interest in seeing that the youngsters were safely and comfortably conducted made our work a pleasure."

Making Travel a Pleasure

The following recent letter to President C. H. Markham is from Ivy G. Kittredge, city attorney of New Orleans:

"My wife, accompanied by three other ladies, went to Canada this summer via your road. Our mutual friend, Mr. Hunter Leake, at my request wired your Mr. Nolan of Chicago in the hope of getting better accommodations from Chicago to their destination. This gentleman met the ladies (strangers in your city and unused to traveling) at the train and did everything that could be done to help them out, got them sleeping accommodations on another line, etc.; and then when they returned last week, they wrote the gentleman, who again went out of his way to make their passage through Chicago, the securing of accommodations, etc., easy and agreeable.

"In addition to thanking Mr. Leake and Mr. Nolan, please permit me to thank you and to congratulate you as a railway president who has made traveling over your road by more or less untutored lady travelers a constant and continuous pleasure.

"All four were delighted with the Illinois Central, delighted with the menu in your dining cars, and in fact said that no service on other lines used in any way compared

with the magnificent service that you render the public. The courtesy of your agent throughout and the service of your road are the highest encomiums that the management might expect, and I shall certainly, in season and out of season, tell of this gratifying experience and do all in my humble capacity to get my friends, going from or coming to the South, to make use of your line and profit by the luxury of traveling on the Illinois Central."

Appreciated Good Baggage Service

D. S. Deford, western division manager of

the Grand Rapids Show Case Company, Grand Rapids, Mich., recently wrote as follows to Checkman G. G. Bowen of the Union Station force at New Orleans:

"We have received the trunk that you were kind enough to express to us, and I am writing to express my appreciation of your courtesy. It's indeed delightful to meet men in your position who are so considerate of the welfare of those of the traveling public who are unfortunate enough to make careless mistakes. Believe me that your consideration is indeed most sincerely appreciated."

Some Folklore From Early Railroad Days

C. A. Kiler, furniture dealer of Champaign, Ill., recently wrote as follows to President C. H. Markham:

"I am enclosing a song which was written by the 'wagoners' at the time when the railroads were first being built in this country. It is interesting because it shows that these men were sure that they were going to be ruined by the building of railroads. It is also interesting because the Americans at that time thought that the Irish immigrant was going to overrun the country."

The song follows:

Come, all ye jolly wagoners,
Turn out man by man,
That are opposed to railroads
Or any such a plan.
It ruins our plantations
Wherever it does cross;
It ruins us poor wagoners;
We cannot sell a horse.

Chorus:

Then carousing we will go,
Then carousing we will go,
Never mind, me hardy fellows,
For we're all true blues, ye know.

Go to Philadelphia, enquire for a load,
And directly they will tell you
That it's gone on the railroad.

Now the Irish come over by whole shiploads
With their shovels and their picks

To work on the railroads.

And when they're fixed,

They'll fight like dangnation
With their cudgels and their sticks.

Chorus.

An American with safety

Along the road he dast not pass,
For they'll bung up both his eyes

For one word of his sass.

Crying: "Hey, chilly, dang your eyes,

We'll lay the boogers low."

Never mind, me hardy fellows,

For we're all true blues, ye know.

Chorus.

If it wasn't for the torment,

I'd as soon be in hell

As upon a railroad

Or on a canal.

Come, all ye jolly wagoners

That have at home good wives,

Go to your plantations,

And there spend your lives.

And when your corn is cribbed

And all your small grain sowed,

Then all you'll have to do will be

To damn the railroad.

Chorus.

THE LARGER GOAL

When a very high-salaried official of the United States Government was asked to tell the secret of his success, he said: "I haven't succeeded. No real man ever succeeds. There is always a larger goal ahead." If you think you are a success, you aren't. The minute you slow down, you're slipping. Activity is the law of growth. If you can't imagine the larger goal ahead, you'll never reach it. There must be a constant urge in your heart before there can be betterment in your life.—JEROME P. FLEISCHMAN, in "Uncle Jerry Says."

Five Veterans Started Work in the '70s

Louisiana Division Old-Timers Were Employes of the New Orleans, Jackson & Great Northern, Predecessor of the Illinois Central

FIVE men on the Louisiana division started their railway careers with the New Orleans, Jackson & Great Northern Railroad, predecessor to the Illinois Central, back in the '70s. Four of them started as laborers, and the fifth says he was the first apprentice in the shops at McComb. The five men have been in the service for a total of more than 228 years, or an average of nearly forty-six years each.

P. J. Somers entered the shops at McComb as an apprentice molder in 1873. His father had been in the service as a stationary engineer for many years before him. S. A. Fant started working as a laborer in 1877. John Marsalis became a section laborer in 1877. Louis Mixon, negro, loaded gravel in 1877. Sam Randall, negro, began railway work in 1878.

Has Been a Molder Ever Since 1873

P. J. Somers is doing the same kind of work today that he did during the first days of his railway experience in May, 1873. He is a molder in the shops at McComb and has been continuously on the payroll there for more than forty-nine years. His first work as an apprentice was learning to make cores for the pieces that were to be molded, and today he is making cores.

Mr. Somers claims to have been the first apprentice to enter the shops at McComb. His father was a stationary engineer at New Orleans for the New Orleans, Jackson & Great Northern Railroad, predecessor to the Illinois Central, and was one of the first settlers of McComb when the shops were moved to that city. P. J. Somers was a lad of only 14 years then.

An apprentice on the molding floor is taught first to make cores, Mr. Somers says, and continues in that work for about a year, after which he is allowed to help with the molding. Mr. Somers explains that the cores are made of sand in shapes to conform in size with the hollows which the pieces to be molded are to have. The sand cores are baked so that they will retain their shapes, and are then placed in their proper position in the mold. After

the metal has been poured and cooled and the mold knocked apart, the sand core will be found on the inside of the piece that has been molded. The core is destroyed after it has served its purpose of making the desired hollow.

Saw the Beginning of McComb, Miss.

There were only two or three houses in McComb when the shops were moved there from New Orleans in the early part of 1872, Mr. Somers says, and he remembers the first burial in the cemetery.

Mr. Somers served four years as an apprentice, and then was sent to a large foundry in New Orleans that he might broaden his training in molding. T. G. Grenar, the master mechanic at McComb then, advised him to go and promised to keep his name on the employes' roll at McComb. Mr. Somers went to New Orleans in 1877, was fortunate enough to escape the yellow fever and returned to the McComb shops a much better molder in 1878. He has been there since.

The principles of molding have not changed since he first learned, Mr. Somers says. Even the tools he works with are the same kind; but, of course, there have been changes in the kinds of things molded. The molding of the parts of modern machinery requires more skill on the part of the molder, he says. Some parts of modern machinery make the molder's work complicated and much more difficult than did the simple parts of the early machinery.

No Keeping a Good Man Down

When S. A. Fant was a section laborer at Hazlehurst, Miss., back in 1877, his foreman, A. M. Hamill, did not consider him capable enough for a recommendation to become a foreman; but the following year found Mr. Fant a foreman just the same. J. Deaton was the roadmaster then. He recognized ability in young Fant that qualified him to become a foreman, and the roadmaster made the promotion regardless of the fact that Fant's foreman had not recommended him.

Mr. Fant entered the service as a laborer on Mr. Hamill's section at Hazlehurst on

Veterans of the Louisiana Division

John Marsalis

S.A. Fant

P.J. Somers.

Louis Mixon.

Sam Randall

March 2, 1877. It was the New Orleans, Jackson & Great Northern Railroad then. In October of the same year, Mr. Hamill's gang was transferred to Crystal Springs. Mr. Fant stayed with that gang until November, 1878, when he went to the section at Terry as track walker. After he had been there two weeks, the foreman married and left Mr. Fant in charge of the section for the rest of the month.

Roadmaster Deaton must have had his attention fixed on the results of Mr. Fant's work at Terry, for as soon as the foreman returned from his wedding trip Mr. Fant became a foreman and was placed in charge of the section at Johnston, Miss.

The first work Mr. Fant was confronted with on his section was surfacing the track, and the work that kept his gang busy every day was patching the old iron rails. They took out broken rails, cut them, patched and made runs out of the pieces. Steel rails of 56-pound weight were laid on his section that same year.

Showed Section to Old Foreman

After Mr. Fant had directed the work on his section at Johnston for about a year, Roadmaster Deaton was so proud of the results that he gave Foreman Hamill a pass and instructed him to visit Mr. Fant's section to see the fruits of the young section foreman's labors. Mr. Fant's section withstood the rigid inspection.

Mr. Fant had been the foreman of the section at Johnston for fifteen years when he decided to quit railroading for the farm. He had bought a small farm at Johnston, and his whole interest was centered in tilling the soil; but it took only a year for the attraction to wear off, he says. He was not satisfied away from the rails, ties and ballast, and he made an application to return to the service as a section foreman.

He was placed in charge of the section at Hazlehurst—the scene of his first railway experience. He was there three months, then went to the section at Martinsville for four months, took out an extra gang for about four months, returned to the section at Johnston for a while, went out with another extra gang, worked in the yards at McComb a few months and then left the service for a year. He returned to the service as foreman of the section at Johnston, and he remains there today.

Gave Notice of Broken Rails

John Marsalis, machinist in the shops at

McComb, was a husky 20-year-old lad in 1878, and was a laborer on the section at Johnston, Miss., when Mr. Fant was made the foreman there. Mr. Marsalis had entered the service the year before, but he worked only three or four months at a time.

The first knowledge he gained of a railway track was when he and his two brothers walked the right-of-way of the New Orleans, Jackson & Great Northern between Johnston and Summit to attend school at the latter place. They found many broken rails in those four and one-half miles, and they always reported their discoveries to the section foreman. On one occasion, Captain Williams, who was the superintendent at that time, was present when John Marsalis' two brothers reported a broken rail near Summit. The superintendent took their names and thanked them for their good work. A few days after that, the two boys received a summons to be in Summit on a certain day. They went, and to their surprise found the president of the road there in a special train. The president told the boys that he had heard of their reporting a broken rail to the section foreman, expressed his appreciation for their thoughtfulness and presented each with a gold watch and chain.

Both Legs Crushed by a Train

In 1881 Mr. Marsalis became a brakeman on the Louisiana division. He continued in that service off and on until November 23, 1888, when he had a serious accident. He was climbing down the side ladder of a freight car when one of the rods gave way. The light screws which were used in those days to hold the rods were pulled out by his weight, he says. He fell to the side of the train, and his feet were thrown across the rails. His right leg was badly crushed three inches below the knee, and the left one just above the ankle. The accident occurred at the north crossing at Magnolia. The crew of the train knew nothing of the accident until it arrived in McComb. Mr. Marsalis was given all possible attention at Magnolia, while McComb was notified and a train sent after the injured man. He was taken to the hospital at McComb, where he was further treated. It is now difficult to detect by his walking that Mr. Marsalis has two artificial legs.

On July 1, 1889, he began operating a drill press in the shops at McComb, and he has been in machine shop service since.

The capacity of the shops there has been more than doubled since he entered the service at McComb, Mr. Marsalis says. He has seen four locomotives built from the ground up there. Two of them were under construction when he started working. The last one was completed in 1892, he says. Two of them were freight and the other two were switching engines. Each part was molded and fitted in the shops at McComb. In his first days of shop experience, the wheels had to be taken off the axles to be turned on the lathe, and only one tire could be turned at a time. Each member of the shop force in those days was a general mechanic, he says, and could do capably any work from the rails up. The work was done largely by hand, and the parts were made to fit snugly. After an engine had been overhauled and new parts put on, it had to be placed first in switching or local service, he says, to "limber it up." Those tight fits made the engines run mighty hot, Mr. Marsalis says.

Started Work in First Gravel Pit

Louis Mixon, negro laborer on the section at Ponchatoula, La., worked in the first gravel pit owned by the New Orleans, Jackson & Great Northern, he says. It was the Carter Hill pit at Chatawa, Miss. Mixon started loading gravel there in 1877, when he was about 20 years old. He had been reared near Chatawa, having spent his early days on a plantation.

Mixon hadn't worked in the gravel pit long before most of the laborers struck for more pay. The pit was closed for the time. Pat Sullivan was the foreman of the section there then, and he gave Mixon a job as a laborer on his section. After he had been there two or three years, he accepted a job as laborer under Section Foreman Rip Walter at Tangipahoa, where he worked for nine years.

Much work was being done on the right-of-way between Hammond and New Orleans then, and Mixon was sent to La Branch to work on a section. He labored in the swamps for three years and was stricken with the swamp fever. After two months, he was able to work again and accepted a place on the section at Ponchatoula under William Finley. Mr. Finley is still the section foreman at Ponchatoula, and Mixon says that he never worked under a better man.

Mixon had been at Ponchatoula two years when the levee broke. The men worked

in the water day and night, and Mixon became ill with the swamp fever again. It was a hard pull to recover this time, he says. He was down in bed three months, and then walked about for the same length of time before he regained enough strength to return to work. When he was strong enough to work, he was given a job on the section under Mr. Finley, and he has been there since.

About seven years ago, Mr. Finley gave him the job of walking the track. He finds no breaks since the 90-pound rails have been laid, he says.

Finds Section Work Easier Now

Sam Randall, negro laborer at Hammond, La., says that the section laborers of today do not work so hard as they did back in 1878, when he first started railroading. The 90-pound steel rails, creosoted ties and good ballast are responsible for making the work lighter, he says. The right-of-way of today does not break down so commonly under the wear and tear of service as it did back in the early days, although the trains are much heavier.

Randall's first railway work was as a laborer on a section of the New Orleans, Jackson & Great Northern at Ponchatoula, La. Iron rails were in use then, and the gauge was four inches wider than the standard gauge.

He labored with the iron rails, mud ballast and few ties for about two years, he says, when the Illinois Central took charge of the railroad. Then the work of transforming the gauge into standard width, laying new ties and steel rails, started.

Randall worked on the Ponchatoula section for about three years and was then transferred to the Hammond section. Since then he has spent most of his time on that section. He worked in the yards at McComb for about three months and kept the passenger sheds at the station in New Orleans clean for about two years. After that, he returned to the section at Hammond, and has been there off and on since. At present, he is keeping the yards clean there.

THEY KNOW THE PANAMA

A letter addressed, "General Passenger Agent, Panama Limited, Chicago, Ill.," was mailed in Bellevue, Iowa, at 4:30 p. m., September 25, and delivered to J. V. Lanigan, Room 502, Central Station, before 11 a. m., September 26.

HOUSE PLANS FOR OUR READERS

Southern Pine

Despite the approach of winter, the demand is still keeping up for the booklets of house plans which are being distributed free of charge to prospective Illinois Central System home-builders by this magazine through the courtesy of the Southern Pine Association of New Orleans. Perhaps many who are planning to build in the spring will spend the winter deciding on the design best suited to their needs; and certainly no thought should be spared on a matter so important, for few of us can build more than one house in a lifetime.

The plan shown herewith is a sample of the fifty which appear in the booklet, each with a photograph of the completed house and a diagram showing the floor arrangement. After the plan has been decided upon, the prospective builders should take the booklet to their retail lumber dealer and point out the particular house desired; he will then obtain from the Southern Pine Association a set of building plans and figure out the approximate cost of the construction.

"These plans are prepared by skilled architects and are creations, not copies," the booklet explains. "No expense has been spared to make them as practical and economical as possible. Any competent contractor can, by following the plans, produce from them a home which will be beautiful in design and a source of continuous satisfaction and pride to the owner."

The American Wholesale Lumber Asso-

ciation is also co-operating in this encouragement of home-building and will work through the local retailers in making its best information available. It is also offering to assist those desiring to organize building and loan associations.

NEW WORK FOR H. L. DAY

Effective October 1, General Freight Agent W. Haywood announced, H. L. Day was appointed traveling freight agent at Peoria, Ill., with headquarters at 1133 Jefferson Building. Mr. Day has been agent at Galena, Ill.

CLAIMS DEPARTMENT

Wouldn't Settle and Lost Suit

January 18, 1922, train No. 522 killed a cow near Belzoni, Miss., which belonged to Allen Hall, a negro. Hall put in a claim with the railroad for \$150. Under the facts developed by an investigation, the company did not appear liable; so only \$20 was offered in compromise of the claim. The owner declined this and filed suit in the justice court for \$200. The justice allowed him \$150. The railroad appealed to the circuit court, where the case was tried in August.

The engineer testified he was running about forty-five miles an hour when the cow ran up on the track about seventy-five feet in front of the engine and that it was impossible to avoid striking her. He was corroborated by the fireman and also by the witnesses introduced by the plaintiff; so the judge instructed the jury to return a verdict for the railroad.

The negro who owned the animal was influenced in declining settlement and suing the company by the white man on whose place he lives. Now the owner is short a cow and the railroad is short the expense of defending the suit, which was not inconsiderable.

Notwithstanding this and many like cases, most of the stock owned along the line of the railroad in Mississippi will be turned out to graze as soon as the crops are gathered. During the winter months a considerable slaughter of stock will occur if the experience of previous years is any criterion.

How to Prevent Stock Claims

The following suggestions are offered by Supervisor T. J. Flynn of the Indiana division to his foremen for the prevention of stock claims:

Make frequent inspection of all fencing, gates, cattle guards, water gates, etc., especially where stock is being pastured, to make sure that everything is in good condition, so that stock cannot get on the right-of-way.

When you see signs of stock or know of

it on the right-of-way, go at once and consult the owner. If you personally find the stock on our waylands, drive it home and inform the owner in a nice way that the stock is liable to be killed and that you have known of cases where trains have struck stock and been derailed, killing and injuring several persons. In cases of this kind, write to me, giving the stock owner's name and all promises he made you.

Each foreman should keep on the best of terms with land-owners along his section. When you find a farm gate open, do not go to the owner and say: "You will have to keep your gate closed, or I will take it down." Approach him in a manly way and say: "Mr. Jones, I see some one has left your gate open again"—and watch the results.

When stock is tied on the right-of-way, the foreman should consult the owners, explaining to them that this is against the management's wishes. If you cannot get results in this manner, advise me, giving the name of owner, his address, etc., and I will handle it through the roadmaster.

Stock which is allowed to run at large is the worst trouble we have to contend with, as in most cases owners of such stock have no pasture, but own from one to four head of old horses for trading purposes, which are in most cases worthless but which become very valuable when struck. In cases of this nature, the section foreman must be alive, talk to the owners and make a note of all such conferences; then, if you cannot get results, call on the highway supervisor, soliciting his aid.

Since stock requires considerable water, it will crowd through fences, especially at those points where water stands on the right-of-way and there is none in the field. The foreman must watch these places very closely, maintaining a strong fence.

I often see stock with heads through the right-of-way fence, and no doubt you foremen see this almost daily. In cases of this kind, it is only going to be a question of a short time until the stock gets through the fence. Watch this, making such repairs

to the fence as are necessary to prevent its being torn down.

Damage Suits Not So Popular Now

Lincoln County is one of the banner counties of Mississippi. Its citizens are justly proud of its fine system of public schools, gravel highways and magnificent farms, which have been developed within the last few years. The county was formerly a mecca for damage suit lawyers, and a large verdict was almost invariably returned against any railroad which was so unfortunate as to be sued. Its citizens, however, discovered that, while they were enriching a few damage suit lawyers, they were driving capital from their doors, and they determined to erase that stigma from the fair name of the county.

A recent case in that county was that of John May against the Illinois Central Railroad Company. Mr. May is a popular citizen of Lincoln County, living on one of the fine gravel highways a few miles from Brookhaven, the county seat. On April 24, 1921, when he drove his automobile into town, he desired to cross from the west to the east side of the railroad at Cherokee Street. A gravel train was backing on the crossing as Mr. May approached. Despite the shouts of warning given by the crossing flagman, two trainmen and several citizens who happened to be standing nearby, he drove his automobile into the side of one of the moving gravel cars.

Mr. May would have seriously injured one of the brakemen had not the brakeman leaped just before the automobile struck the car; the automobile struck the step of the car on which the brakeman was riding, bending it back under the car. The train was stopped instantly, saving Mr. May from personal injury, although his automobile was damaged.

He immediately employed an attorney, not giving the company an opportunity to adjust the matter with him directly, and the claim agent was unable to effect a reasonable settlement, which the company desired, even though it was not responsible for the accident.

Suit was instituted for \$1,000, a part of which was for damage to the automobile and the remainder for nervousness which Mr. May claimed to have suffered, although he admitted he sustained no personal injury. The jury could not see it Mr. May's way and returned a verdict in favor of the

company. It is therefore evident that the citizens of that county meant exactly what they said when they declared they were tired of having such suits take up their time and cost then in the long run large sums of money.—H. G. M.

Jury Puts Blame on the Driver

In a suit against the Government for the destruction, during federal control, of a Ford truck in a grade-crossing collision, a jury recently decided that the driver of the truck was responsible for the accident. The case was tried in the Jefferson Circuit Court at Louisville, Ky., October 3. Blakely Helm of the firm, Trabue, Doolan, Helm & Helm, represented the Government.

The accident happened on our Thirteenth Street and Portland Avenue crossing in Louisville, October 10, 1919, about 4 o'clock in the afternoon, broad daylight. The plaintiff, Ralph Wolff & Sons, of Louisville, undertook to show that the crossing flagman was not in sight, that the view was obstructed and that no warning was given of the movement of the cars which struck the truck. It developed, however, that the driver of the truck, instead of exercising due care and caution for his own safety, was looking in the other direction. The crossing flagman made frantic efforts to attract his attention, but he heedlessly drove upon the crossing in front of the moving cars. His only action then, when waking up, was to kill his engine, making anything but a collision impossible. Fortunately, the driver and another employe of the Wolff company, with him at the time, jumped, and neither was injured.

It frequently happens that owners of expensive trucks and other vehicles entrust them to careless or inexperienced drivers, and that perhaps accounts for a good many expensive and often fatal crossing accidents. Those who suffer such losses are sometimes willing to charge them up to the railroad without stopping to think that responsibility, more often than not, lies with the driver of the car. The railroads and others are fighting hard against these crossing accidents, but all their efforts are unavailing unless the driver of a car is willing to do his part in the matter of looking out for his own safety and the safety of any other who may be in his care.—P. M. G.

Riches amassed in haste will diminish, but those collected little by little will multiply.—GOETHE.

Sports Over the System

Pins Are Falling in Office Bowling Leagues

By WALTER E. Du BOIS,

Voucher Clerk and League Treasurer

The owners of the new bowling alleys at 6229 Cottage Grove Avenue, Chicago, could not finish erecting the alleys in time for the opening night of the 12th Street General Office Bowling League, but the pins started falling on October 2, and we will be after that head pin until next May.

The Land and Tax team has started out as if it intended to win every game, but the season has a long way to run. The Auditor of Miscellaneous Accounts team has upset the largest number of pins, and Captain Carney hopes to keep up that record. The General Freight team, which won twenty-eight out of the last thirty-three games played last year, is out after first place; it has shot high game and high series so far. The General Superintendent of Transportation team has started out better than last year, and Captain Knodell of that team has shot high game and high series so far and is leading the league. The Vice-President Purchasing team is doing good work in spite of the loss of Grace, who is now leading the Chief Special Agent team. The Engineer Bridges and Buildings team has not warmed up yet, but Block and Stone are getting their eyes on that head pin. Captain Ed O'Connor of the Vice-President Accounting team lost one of his best bowlers when Collier was transferred to the office of the Auditor of Miscellaneous Accounts, but Ed intends to win more than half of his games, anyway. The women are turning out as fans in larger numbers each week, and the bowlers greatly appreciate that fact and are glad

The Sportsman

Ten tests of a sportsman may be given as follows:

- (1) He does not boast.
- (2) Nor quit.
- (3) Nor make excuses when he fails.
- (4) He is a cheerful loser.
- (5) And a quiet winner.
- (6) He plays fair.
- (7) And as well as he can.
- (8) He enjoys the pleasures of risk.
- (9) He gives his opponent the benefit of the doubt.
- (10) And he values the game itself more highly than the result.—HERBERT N. CASSON, in "Making Money Happily."

THE OFFICIALS WERE DISPLAYING LOTS OF CLASS

ONE CHIEF CLERK GOT BEAT BY HIS OFFICE BOY— (NOTE EXQUISITE MIRTH REGISTERED ON HIS RAND-M'NALLY)

THE SPECIAL AGENTS SHOWED THEIR FORM— THEY OFTEN BOWL WITH SQUARE BALLS

SOME BIRDS GET SLIGHTLY IRRITABLE WHEN THEY FOUL!!!

SOME OF THE GENERAL OFFICE-CAKIES WERE OUT-

MEMPHIS MAY HAVE SOME CRACK BOWLERS BUT THEY HAVE NOT ANY ROOTERS LIKE THIS

THE VICE PRESIDENT AND GENERAL MANAGERS' TEAM IS FIRST AT THE—WRONG END—

they are now bowling on alleys that are free from one of the objections to other bowling alleys, tobacco smoke. The ventilation is ideal, and the women can enjoy the games thoroughly without discomfort.

The figures quoted below covering the standing of the league are not official, but were prepared by the writer, and some slight errors may appear therein. In checking over the twenty leading bowlers, we note that the names of Rolff, Grace, Breitzke, Brown and Coble are missing, but we expect they will soon strike their stride and enter the select circle.

63d Street League Active Again

The 63d Street General Office bowlers at Chicago started their season well, getting some fine scores the opening night, Friday, September 29. Frank Pierce, last year's individual leader, averaged 196 for his first night's work, and Calloway was second with 186. The bowling is done every Friday evening at 6711 Stony Island Avenue, and rooters of both sexes are welcome. The Seminole Limited was sidetracked at the second session, and the Diamond Special passed it, making a clean sweep of three games in a row. By handicapping the New

Orleans Special, Freeport Peddler and Hawkeye Limited, the league has succeeded in evening the teams, and now it is a battle all the time. George Miller was in rare form the second week, averaging 203 2/3. Calloway was second for the evening with 202 1/3. A prize is awarded the man having high game on each pair of alleys. The opening night the winners were: Pierce, 203; E. Miller, 201; Tersip, 195; Calloway, 231. The second week's winners were: Kempes, 212; Devitt, 228; G. Miller, 229; Calloway, 217. Below is the standing of teams and individuals for the first six games:

Teams	Won	Lost	Per Cent	High Game	High Series	Average
Daylight Spl..	5	1	833	855	2432	799

HAVE YOU THE COURAGE?

To meet failure and obstacles on every hand?

To meet your enemies with love for hate, good for evil?

To move steadily toward your goal with a serene mind when you know that others ridicule and consider you a failure?

To remain in obscurity to support a parent, or a helpless sister or brother, when you have the consciousness of the ability to do big things?

To bear the blame which belongs to another because you do not want to bring pain to others?

To speak the truth when a lie would help you out of difficulty?

To forego extravagance so that you may provide for the future welfare of those dependent upon you?—*The Mariner*.

Why Dining Car Meals Are So Enjoyable

Train Patron Is Eating to Kill Time, Instead of Killing Time to Eat, Says "Ike" Greenberg, Steward

The following article on "Eating to Kill Time" is from the Sunday magazine section of the New Orleans (La.) Item.

THIS concerns the psychic value of a dining car meal.

The argument is that knocking a vacuum in a \$2.50 lay-out on a dining car stimulates the physiological, psychological and emotional processes more than a \$10 arrangement on terra firma, Broadway and the Vieux Carre included.

"Ike" Greenberg, veteran steward on the Panama Limited, has the affirmative and the floor. "Ike" talks like a Harvard professor when it comes to eating, and here is what he says:

"On land you kill time to eat, but on a train you eat to kill time. That has a very decided effect on the digestive apparatus and the general effectiveness of any meal.

"When a fellow goes into a restaurant or hotel dining room his main idea is to finish as quickly as possible and get on to something else. He has to dress for the theater or has to get back to business. He isn't thinking of his dinner. He is thinking of what he is going to do when it is finished.

"Now, on a dining car a passenger has all the time in the world, and nothing to do with it. He goes into the diner in just the opposite frame of mind. He wants something fine to eat and wants to lose himself in it. That is true dining. That's the way they used to dine before they started building skyscrapers."

Dining Car Meals Comparatively Cheap

At this point the steward mused for a moment in silent and inward contemplation of his subject.

Then he added: "And do you know, some people have an idea it is costly to eat on a dining car? Do you know you can get cheaper and better service on our diners than in most restaurants I know of?"

"Ike" Greenberg, whose real front name is Isadore, has been doing the "Casey Jones" on the dining end of the service for some twenty years. For a long time he was on the Canadian Pacific line. He went on the Panama Limited service when the special was inaugurated as the South's finest train,

"Ike" Greenberg

some six years ago. He is the second oldest steward from point of service on the Illinois Central rolls.

He is one of the best known men in Southern railroad service. Hundreds of passengers who travel the Limited regularly between here and Chicago know him as "Ike" and depend upon him implicitly.

Steward Greenberg has seen dining car service grow from nothing to everything.

"It used to be that the dining car was so rocky your coffee resembled a Yellowstone geyser more than anything else. Why, lots of times the diners would get more in their laps than anywhere else. When they first started putting in fans they let them blow directly on the tables. Sometimes when there was more power than allowed for those fans used to get up a speed that was something powerful. They used to have a joke about the waiters trying to bring ham and eggs through the car and those fans blowing all the bacon off.

Trains Run Smoothly Today

"In those days if you were sitting at a table and another passenger came lurching in to get a seat, you never could tell whether

he would sit in the seat held for him by the waiter or would come lurching into your lap.

"But now—"

The steward beamed.

"Now that's all changed. Why, do you know you can place a pair of sugar tongs on end in one of the diners and they will remain standing until you knock them down? That's how easy rollin' our diners are nowadays. And our fans are fixed so they never blow above the table. The air all circulates under the tables. A cup of coffee will remain warm longer on our tables than on most restaurant tables."

Mr. Greenberg has observed a number of queer things about how and what the public eats in his years of service. For one thing he says it is all bunk about the men of each locality being strong for their own dishes. For example, he points out that New Orleans men boarding the train at this terminal always call for Chicago steaks, while the Yankees at the other end always call for shrimp a la Creole, red fish court bouillion, gumbo filet and other such Latin delicacies.

For this reason the Limited service features only the Chicago stuff from here up and only New Orleans stuff from Chicago down.

Services Rendered by a Steward

The veteran holds that a steward is a very important personage on a train. He points out that often he is called upon to warm milk for the baby and warm a hot bottle for the fat man with a sudden attack of chills.

He tells a story about a man who was suddenly taken sick on one of the Pullman cars and called loudly and emphatically for medical aid. Not a doctor could be found the length and breadth of the train. So they called on Steward Greenberg.

The steward donned a chilling expression, looked deeply intellectual and went in to give the sick man a mixed dose of castor oil, iced tea and dissolved aspirin tablets.

"Sure, he got well," admitted the physician.

And you have often heard the old joke about the raw-boned country fellow who, when given a member's ticket at the annual convention of Bull-Elks and told he could eat and sleep on it, measured it alongside his own huge frame and remarked he'd "be derved if he could or would."

Steward Greenberg tells a better one about a Jackson, Miss., citizen who had to buy a Pullman ticket to get a seat. The Jacksonian came wandering back to the diner subsequently.

He ordered everything they had on the bill of fare and ate it. When they submitted the bill he showed them his Pullman stub.

"Naw, you can't pull that on me," retorted the diner when they tried to explain. "I bought my ticket. What'ya think I paid my money for?"

One other point Mr. Greenberg would never forgive us if we omitted: the Limited diner carries from 5,000 to 6,000 pounds of ice every trip, 2,000 gallons of cooking water and 30 gallons of drinking water.

THE HABIT OF COMPLAINING

Many literally spoil their lives by indulging in the bad habits of complaining and fault-finding. They complain continually about the weather and about everything and everybody to such an extent that fault-finding becomes a fixed habit. They get so obsessed with the faults of others, and the idea that the world is going to the dogs becomes so fixed that they really believe that the tendency of life is downward and evil, seeing everywhere evidences in support of their delusion. Their life reflects the nature of their beliefs. Their pessimism robs them of initiative and the power to overcome, achieve, persist and conquer; consequently they are failures in the battle of life; and this only confirms them in their belief that "everything is out of joint." People such as these are avoided by the happy and healthy-minded; they naturally attract to themselves others of a similar type of mind, who help to make them more depressed and miserable. Thoughts and beliefs affect the life. One who looks on the dark side of things finds himself in a gloomy world, and life is to him a dread, somber existence. What he looks for he generally finds, for life is, to a large extent, a reflection of the inner thought life. If he looks for faults in other people he finds them, for whether they are there or not, he will see them just the same, for he actually sees in others his own faults. This peculiar state of mind leads to delusional insanity and the asylum, yet it all begins with fault-finding and looking on the dark side of things.—*Science of Thought Review.*

Hospital Department

Sanitation and What It Means to Us All

THIS word is so often misused that it would now seem fitting through the columns of the *Illinois Central Magazine*—where the thousands of employees, with their families and friends, can read and consider leisurely the scope and application of this term—to print a heart-to-heart exposition of the word, in order to make clearer not only its vastness but also its relation to preventive medicine.

Health is and always has been recognized as the foundation of wealth and happiness, yet for decades past has been largely the result of accidental circumstances, such as the gift of a sturdy constitution, irregular and inefficient efforts at caring for the body, spasmodic reforms in eating, ineffectual promises "never to do that again," etc.

When, through the development of studies on life and its processes, chemistry and physics began to shed light in places formerly dark, sanitation began to develop, and it has grown steadily ever since.

A Wonderful Opportunity Open

Today, were the known principles of this science applied thoroughly and conscientiously to the varying conditions and ills to which flesh is heir, there would be effected a wonderful betterment in the health of the community.

The statesman, Disraeli, said, "The care of the public health is the first duty of the statesman," and Huxley speaks of the human body as "a wonderful physical mechanism." The duty of the present-day sanitarian is to advise and educate "engineers" of this "physical mechanism" so that it may not be wrecked by misuse, ignorance or malicious fault, and have to be scrapped long before the end of its normal term of service.

Three classes of dangers are to be encountered: first, those constitutional handicaps acquired by birth which necessitate a more guarded course through life; second, the abuses of the body and the exercise of poor judgment in the care of the body; third, the surroundings and relation of occupation to the individual health.

When hygiene is spoken of, although the term is possibly older and more classical, we are not using a word which is strictly abreast of modern progress and action. Therefore "sanitation" has been selected to express latter-day thought on a subject which may be defined as the science and art involved in the promotion and betterment of community or public health. This term includes preventive medicine, sanitary engineering and the various branches of municipal, county, state and national sanitation and their administration.

By consideration of the experiences and mistakes of the past, wisdom for the future is acquired. Therefore, in the consideration of how to prevent loss of life through sickness, a survey of the amount and kind of that sickness must be taken. Vital statistics furnished by the government give us a firm foundation upon which to build.

In 1914, just before the beginning of the world war, there existed an annual death rate of fourteen persons out of every thousand, while the figures for 1890 showed twenty deaths per thousand. Thus it is seen that six lives per thousand were saved during those years through the advance in sanitary methods of prevention, but a consideration of the number of lives leads us no nearer our goal—it is the age and cause of these deaths which will give the required information.

Campaign to Save the Infant

Thus it was found that a majority died when less than 1 year old. Immediately there was a campaign by earnest workers to educate those who had the care of infants, to see that those infants had the proper food and surrounding healthful conditions. This campaign is still being carried on, and with great success.

The successful survival of the infant gives a foundation for the later healthy youth, who eventually becomes the sturdy citizen, father or mother. This supervision was and is all in the field of sanitation. It is called infant welfare.

Next comes the care of the child in the

schools, with all the problems of properly constructed buildings, well ventilated, lighted and heated; of books which have type of plain legibility, so as not to fatigue and strain the growing eyes; of hours of study and recreation; of clothing and food and many other problems of great interest to the sanitarian. All these had to be worked out and applied.

Efficiency the Final Test

Then come the youth and maiden, of varying degrees of health and resistive qualities, perhaps engaged in some outside occupation or doing the work at home. Statistics for these ages were to be made and studied carefully, to see what dangers threatened and how they were to be avoided.

Finally comes the age of the worker, whether it be in shop and office or in the open, and the consideration of his or her health on that important question of degree and efficiency of productivity. This is the culminating age which proves the worth of all previous efforts to place a sound mind in a sound body.

Statistics also inform us as to the prevalence of disease. Here is read the statement that tuberculosis, the great white plague, leads all others, with organic heart disease coming next, and with pneumonia occupying the third place on the mortality list.

The question must then be asked, "How

many and which of these deaths are preventable by practicable public health measures?" The answer is given when we realize that yellow fever no longer exists, that typhoid fever is becoming more and more rare, that diphtheria is preventable through the use of antitoxin, and that malaria can be ended through the destruction of the mosquito.

This is truly an age of progress, and one has to travel fast if he would not be left behind. Sanitation is no exception to this statement. Notable achievements are taking place every year, each one marking a decided advance in sanitary science. The Illinois Central is abreast of the march.

MAN'S POSSESSIONS

He that loses his conscience has nothing left that is worth keeping. And in the next place look to your health; and if you have it praise God and value it next to a good conscience, for health is the second blessing that we mortals are capable of—a blessing money cannot buy. And as for money, which may be said to be the third blessing, neglect it not, but note that there is no necessity of being rich, for there are as many miseries beyond riches as on this side of them; and if you have competence enjoy it with a meek, cheerful, thanking heart.—*IZAACK WALTON.*

Our Monthly Roll of Honor

Below is a list of employes retired at the meeting of the Board of Pensions September 28:

Name	Occupation	Years of Service	Date of Retirement
George Schleicher	Section Laborer, Minonk, Ill.....	19	8/31/22
Charles E. McNeil.....	Conductor, Kentucky Division.....	17	8/31/22
Charles Jacobs	Carpenter (B&B), Iowa Division.....	18	8/31/22
John B. Gibbs (Col.).....	Laborer, Cairo, Ill.....	27	7/31/22
Jacob M. Gaines.....	Section Foreman, Mattoon, Ill.....	22	7/31/22
Peter Woock	Laborer, Waterloo Storehouse.....	31	9/30/22
Moses Hart	Section Laborer, Leitchfield, Ky.....	38	9/30/22
Y. & M. V.			
Peter S. Law.....	Engineman, Vicksburg Division.....	39	7/31/22

The following deaths of pensioners were reported:

Name	Occupation	Date of Death	Term as Pensioner
Warren B. Woodruff.....	Clerk, Burnside Shops.....	8/18/22	12 Years
Calvin Stephens	Pumper, Mississippi Division.....	9/ 4/22	7 Years
John J. Lambert.....	Yardmaster, Chicago Terminal.....	9/13/22	4 Years
Patrick Bradley	Crossing Flagman, Indiana Division..	8/29/22	1 Year
Edwin P. Bean.....	Clerk, Burnside Storehouse.....	9/15/22	3 Years

HOUSE PLANS FOR OUR READERS

Concrete

Unfortunately, the field offered by the small home is so limited that it does not generally afford opportunities in the way of service, accomplishment, or financial re-

muneration sufficiently great to encourage the architect to enter it. The loss falls upon the public; it is deprived of the beneficial influence which good architecture sup-

FIRST FLOOR PLAN

SECOND FLOOR PLAN

plies and which goes far to make the homes of a nation attractive.

Our house plan service has been designed to remedy this deficiency. Its purpose is to make available the knowledge and experience of the professional architect through the publication of carefully selected plans by many architects of repute which are in a measure representative of the

best modern ideas of a number of such experts. Through the co-operation of the Portland Cement Association, 111 West Washington Street, Chicago, Ill., we are able to publish each month plans for attractive homes. A handsome book containing the entire series can be obtained from the association for 50 cents.

Each plan is one which has been thoroughly tried and not found wanting; this is the true test of its success. Even an architect may learn by experience, and these plans are the result of mature experience on the part of each designer. Each plan is substantially similar to that of a house which has actually been erected and in which a family has lived.

Selections from representative members

of the architectural profession from Boston to California are included in this series. This insures a variety of design and a regional adaptation of plan which will suit almost any purse or purpose. There are plans for wide lots and for narrow lots; for any frontage, north, south, east, or west; for cottages, bungalows, and 2-story houses; for farm or city use; for houses with or without basements; in fact, for almost any kind of small house the prospective home-builder may desire.

Last, but not least, arrangements have been made so that readers may obtain at nominal cost complete working plans, including specifications and bills of materials, of any of the plans published in this magazine.

Weighing of LCL Freight Is Important

By R. B. GOE,

Supervisor of Weighing and Inspection

Railroads are legally bound to assess freight transportation upon actual weight, no more nor less, whether the shipment be transported in carload or less-than-carload quantities.

Much has been accomplished in recent years toward perfecting scales for carload weighing, in order to determine a correct basis for assessing freight charges as well as correct methods of obtaining weights to be used for such a purpose; but little has been done as to weighing facilities and weighing of less-than-carload shipments, which, it is estimated, make up from 6 to 10 per cent of the total tonnage and require approximately 30 per cent of the total freight equipment to transport.

Less-than-carload freight, for many reasons, cannot be loaded as compactly or as heavily as straight carload freight; therefore, transportation costs are greatly increased. It is more liable to loss and damage, and consequently it takes a higher rate than carload freight.

It is just as important to provide adequate scale facilities for weighing less-than-carload shipments and to see that they are accurately weighed at forwarding stations as it is to have accurate scales and weighing conditions for carload freight.

Until recent years all less-than-carload freight weighing was done on hand beam scales, and it is still considered the more

accurate and satisfactory method at smaller freight houses, where the volume of business is not so large and there is ample time to do the weighing; but at the largest houses, where the volume of business is such as to delay seriously the handling when weighing is performed on hand beam scales, the dial or semi-automatic scale is considered more economical in that it avoids delays incident to the handling of a hanger weight and the moving of poises to get the weight balance, all of which slows down the movement of freight through the house.

The location of the scales is another important feature which should be given careful consideration, as it has been found many times in some of the largest freight houses that it is impossible to find a scale platform not covered with freight within several doors from the one at which the freight is received.

A summary of a statement compiled in this office for August, 1922, covering less-than-carload freight reweighed, shows that 618 stations on the entire system, or 61.4 per cent, reweighed 14.1 per cent of the total less-than-carload shipments handled, increasing our freight revenue \$3,638.90.

A statement of freight underbilled at stations on our own lines shows but 8.4 per cent underbilling. While this is a great improvement over previous years, there is yet room for reduction in the number of underweight shipments, and it is hoped forwarding stations will continue to give this important feature the required attention.

The Old and the New Ideas in Railroading

Brief History of Development; How American and British Planners Worked Along Differing Lines

By G. H. DANVER,
Traveling Engineer, Indiana Division

RAILROADING is an occupation which, more than any other, vitally affects the interests of our entire population. The prices of food and clothing, the cost and comfort of travel, the speed and convenience of communication by mail, and social relations — matters concerning every individual of a civilized nation — are closely dependent on railway facilities and service.

Directly the railroads furnish employment to about two million persons of all classes and indirectly, through such occupations as locomotive and car building, rail milling, lumber industries, tie plants, railway supply houses, etc., to many thousands more.

Railroads, as we know them, originated in the tramways or wagon roads which were built in England in the middle of the sixteenth century to haul coal from the mines to the coast shipping points. In those early days rails were made entirely of wood. Later it became necessary to cover them with sheets of metal, known as strap rails, in order to add to their length of endurance. With the introduction of iron into general use in the eighteenth century, both the wheels of conveyance and the rails were constructed of that metal. The present standardized product of our great iron and steel mills and locomotive and car shops is the evolution of former practices and a story in itself.

First Steam Engine in 1769

We have all heard or read the story of how James Watt devised his steam engine in 1769 and how its great possibilities as a commercial force were sensed.

As time went on various attempts were made to apply steam to transportation. None of these efforts proved practical, however, until in 1827, when George and Robert Stephenson perfected a tubular boiler, applied the hook motion to the valve gear (a few old-timers yet living recall that means of distribution of steam to the cylinders) and thereby perfected in their engine, known as the "Rocket," all the necessary principles of steam locomotion. This en-

gine paved the way for the modern locomotive, with its numerous convenient appliances for efficiency and labor saving.

Development immediately took place in England and America, the pioneer countries to sense the value of the locomotive as a means of transportation, but along entirely different lines of endeavor, to perfect the locomotive. The English undertook to conform their roads to the limitations of their engines, which, having very little side play or lateral in driving boxes, could not make sharp curves, and they made costly expenditures to secure straight alignments and easy grades. The Americans, with a view toward cheaper road construction, applied their attention to changes and improvements in their locomotives. The first few, of course, were modeled after the "Rocket." We entered almost immediately upon an era of progress in this particular field of locomotive construction, which has made for our nation a world-wide reputation and established it as a center for the world's supply of locomotives.

First Pullman Made in 1865

Improvement in equipment has materially kept pace with the locomotive. The first Pullman was constructed in 1865, but the commodious and elegant drawing room and observation cars or sleepers of our Panama Limited are as far ahead of the original pattern as the modern hotel is beyond the country inn.

The first practical vestibule train was run in 1887, an improvement which not only promoted the comfort of passengers by eliminating the jarring together of the cars, but also provided a safe passage throughout the entire length of the train.

All-steel construction was first generally utilized in 1897 in freight cars as the outcome of a desire to carry greater loads and eliminate certain repairs to bodies of cars without increasing the dead weight, but it is increasingly used now in all classes of cars for freight and passenger service.

Mileage extension is a subject in which figures best tell the story. Beginning with 23 miles in 1830, by 1840 the railroads of the United States increased to 2,618 miles; by 1850, to 9,021; by 1860, to 30,635. Sta-

tistics inform us that the next ten years showed the effects of the Civil War, but the mileage in 1870 had nevertheless reached 52,914. The next decade showed a marvelous gain of more than 40,000 miles, but this was outdone in the ten years following, when almost 70,000 miles were added. In 1900 the total was estimated at 193,345, with an increase each year until at present we have approximately 270,000 miles of railroad in the United States.

Success Depends on Individual

After all, this phenomenal success in railway construction and operation is primarily due to the co-operation of every employe on the railroad. Whether you be a successful manager of men, a white-faced, soft-handed clerk or a rugged unskilled laborer on the road, no railroad can prosper without your co-operation and economical management. It is not the 100,000-horse-

power locomotives or the endless chain of freight and passenger cars or the well-appointed terminals or the solidly laid tracks or the intricate signal system; it is not all the elaborate network of equipment that makes the railway wheels go round twenty-four hours of every day of the year -- it is the human heart.

A railroad depends upon every human being connected with its maintenance and operation. Unless the greater majority of those constituting the organization are working in harmony and working heartily, the results can only be disappointing. Success comes from the human heart, not from material or machinery. After all, the real heroes of transportation are the conscientious, dependable employes who stay on the job and keep the wheels going through fair weather or foul. They have made possible this wonderful progress in railroading.

New Race Course Planned Along Our Line

Plans to give Chicago the only real derby course in the world and to bring back racing on a huge scale, including the renewal of the American Derby, to be run the third Saturday in June of each year for a purse of \$100,000, are going rapidly forward as a result of the successful test meeting which closed recently at Hawthorne, according to French Lane, writing in the *Chicago Tribune* of October 15. The program, as outlined by the promoters, calls for the building of New Washington Park at Riverdale, on the main line of the Illinois Central, fifteen miles south from the loop, and the organization of a corporation which will have backing to the extent of \$1,500,000 and whose membership will include the big business men of Illinois.

Judge Joseph A. Murphy, acting for the promoters of the proposed new company, has taken an option on 280 acres of land at Riverdale which does not expire until June 1. Steps to bring about the organization of the company will be taken at once.

New Washington Park, according to the proposed plans, will have a track of a mile and a half, the true Derby distance, inside of which will be constructed a mile track, with both courses using the same home stretch. The American Derby once around the mile and a half course will give the race an international distinctiveness, Judge Murphy believes.

A modern racing plant, the finest in the world if it is possible to reach such a goal, will be constructed. It will include concrete stands, concrete stables, each of different architecture, and a clubhouse with an immense double deck seating porch to accommodate several thousand members on Derby day, and which will be kept open throughout the year. A sloping lawn providing a good view of the entire track tops off the arrangements, and the club will have ample space for members who desire to summer on the grounds.

The new park will also include a football field, baseball field, polo field, golf course and tennis courts, and is to be built with the idea of taking care of county fairs, poultry, stock, and horse shows. There will be ample room for the parking of automobiles.

Racing will be offered along the same lines as the sports was conducted at old Washington Park years ago, including a 25-day meeting opening the third Saturday in June of each year. The corporation will be distinct from the Illinois Jockey Club, although executive officers of the Illinois Jockey Club will have executive positions in the proposed new organization. Hawthorne will continue to be used for short spring and fall meetings.

A finance committee of prominent men is being organized, and the movement will be

under way within the next few weeks. Outside capital will not be solicited, the promoters say, as they intend to make it a Chicago Institution as nearly as possible.

The new park is reached by concrete

roads from the city and from the great state highways and by unequaled train service on the main lines of the Illinois Central and several other roads. It will be a 20-minute ride from the loop by train.

Newly proposed home of the American Derby, on our lines south of Chicago. This is a drawing of the racing plant which promoters plan to build at Riverdale, fifteen miles south of Chicago's loop. It will be called New Washington Park. The promoters plan to make it the home of the American Derby, and if present plans are carried out it will be the finest racing plant in the world. The track is to be so constructed that both a mile and a mile and a half course will be available, using the same stretch for both ovals.

Shipping Construction Shows Big Decline

Shipping construction began to decline in the fall of 1919, when some 8,000,000 tons were being built. According to figures given by Lloyd's Register of Shipping, world shipbuilding is now actually below the pre-war level. That the fall is still continuing is seen by the fact that, whereas in April some 3,679,622 gross tons were in hand, the July 1 figures show that the world total had declined to 3,235,430. Stoppage of construction had affected Great Britain more than all the other maritime nations combined. The British total was 300,000 tons below pre-war figures; England, however, has the

greatest tonnage under way at present. Some of the other maritime nations show increases. The total work under way in German shipyards is estimated at 500,000 gross tons, or about 200,000 tons more than any other country except Great Britain. Danzig alone is reported to be building 45,000 tons of merchant ships. Italy, France and Holland still retain their tonnage position. Japan shows the least decline, her decrease being only 1,800 tons from April 1 to July 1, 1922. The United States still has its 6 per cent of the total, as in 1914.—*Current History*.

The Proper Handling of Material Tickets

By MISS ELIZABETH BLOUNT,
Clerk in Division Storekeeper's Office,
Water Valley, Miss.

THE storekeeper is more or less at a loss at inventory time to account for the shortage or overage in the material classifications as reflected by the balance sheet and inventory. To my mind, this is largely due to improper pricing and classifying of material tickets, Form 1262.

This feature of accounting is the most important part of store department accounting, as at least 50 per cent of the disbursements are obtained through the use of these tickets, and the importance of correctly pricing and classifying them can readily be seen.

In the course of a year, from one inventory to the next, any material classification can be easily thrown out of line by the improper handling of material tickets. It is the duty of the stockkeeper, when a ticket is issued, to see that it gives full and detailed information as to the materials furnished and to see that correct weights or sizes are shown, to enable the price clerk properly to price and classify them.

Must Watch Second-Hand Material

On account of the difference in price of new and second-hand material, it is necessary that the ticket show whether new or second-hand, as material classifications can be thrown out of line by charging too much as well as by not charging enough for an item. Special attention should be given to tickets calling for items which are not on hand; where some other item can be substituted, the ticket should show this information.

Too much attention cannot be given to pricing of material and to seeing that correct prices are received each month from the general storehouse, purchasing agent or other division stores. Priced invoices should be carefully scrutinized as soon as

received, and, if there is a large variation in the price of an item from the previous invoice, the matter should be taken up with the shipper to ascertain if the price quoted is correct. Then, when you are satisfied as to the correctness of the prices, these should be entered in the price book, an important feature which should be kept up to date at all times and which should be in such a condition that anyone can readily obtain the price of any item.

Notification of Errors Important

When prices are posted from invoices received from the general storehouse and division stores, the material classification on them should be carefully checked to see that the material is received in the proper class, so that disbursements will correspond; if an error is detected, the shipping storekeeper should then be notified as to the error in classifying and advised to disburse in the proper class.

The ticket clerks should familiarize themselves with the maintenance of equipment and transportation accounts in order to determine whether tickets for material should be billed to shops or divisions. This will save considerable correspondence and corrections in accounts.

This subject covers a large field and should be watched continually by everyone concerned. I have only touched upon the principal points, but I feel that, if everyone concerned would handle material tickets more carefully, it would greatly assist in keeping a representative balance in the various classes on the monthly balance sheet.

NO JOKE ABOUT SAFETY

There's no worse man in the shop than the reckless villain who sneers at his mates and calls them mollicoddles for being careful about accidents. I don't believe in fighting without a darn good reason, but I'd be tickled to see Jack Dempsey hand that guy a wallop.—*The Night Watchman*.

Maintenance
of Way
Department

Material Means Money

Save It

Globe Valves

Valves are a check on waste;
Save the valve, and you save all.
—Poor Richard III.

The average employe probably does not realize the large number of globe valves required annually on a railway system as large as the Illinois Central. During 1920 and 1921 the Illinois Central and Yazoo & Mississippi Valley purchased 22,359 globe valves at a cost of \$80,083.11, an average of 11,179 globe valves a year at an annual cost of \$40,041.55. This means that thirty-seven new globe valves were used each working day, at an average daily cost of \$133.47. There is probably no item used on a railroad that is subjected to more abuse through improper handling than the globe valve, nor are there many devices in use of more importance than globe valves so far as waste is concerned.

The accompanying photograph shows several hundred valves reclaimed from scrap at Burnside. At least 85 per cent of these valves will be placed back in service by making minor repairs that could very readily have been made in the field, while nearly all of the 15 per cent that will be destroyed

have been carelessly damaged through abuse.

There are many ways in which a valve may be damaged. For example, careless closing of valves results in more leakage and waste than any other one thing, yet it is a common practice to close a valve against the seat with sufficient pressure either to buckle the seat or to strip the stem. Some valve operators use the same force in closing a $\frac{3}{8}$ -inch valve as they use in closing a 3-inch valve. Due consideration should always be given to the size of the valve, as it does not require any great effort to strip or twist off the stem of a small valve.

Another bad practice is using wrenches on the wheels of valves. This invariably results in breaking the hand wheel or twisting off the stem. Failure to keep the valve stems properly packed not only causes great waste and an unsightly condition but often results in bursting the packing gland through trying to pull up the packing tight enough to make a joint. Failure to close valves firmly results in a leakage that causes a wire drawn seat and ultimately requires a new valve. Many valves are badly damaged before they are put in use, through

Several hundred globe valves reclaimed at our Burnside Shops.

using a pipe wrench to screw them in place or by not using oil on the threads, with the result that the valve is distorted through the excessive force required to make the joint. Multiple seat valves are damaged by allowing the seats on the head or plate to become loose or by placing new plates im-

properly. Closing a steam valve against the seat when cold invariably results in damage to the seat or the stem when the valve becomes heated.

If proper consideration is given the question of globe valves, material economies may be effected by all departments using them.

Plants Show Some Evidences of Reason

Many years ago, my study of outdoor life convinced me that birds and animals alike think and reason; they have a language which is easily understood; they have a sense of location all their own; wireless calls are heard much farther than the animal can be seen; they have a knowledge of surgery. I have seen the broken bone of a bird set in a manner that would be a credit to any surgeon, and bleeding in a bear from a rifle bullet stopped with moss and mud—all going to show that the brute creation possesses some of the higher faculties which we have thought belong exclusively to man.

The sundew, a flesh eating plant, requires for food a bit of meat, a fly, or a scrap of boiled egg, and will reach for them, but will not budge for a pebble, a bit of wood, or anything it does not care for. This shows reasoning power, a sense of touch and feeling, else why this discrimination between what the sundew can digest and what it cannot?

Plants have also a sense of sight, or something that takes the place of sight. Plant the bulb of a tulip in a dark place and watch it "walk" over to the nearest spot of sunshine, not in an hour, not in a day, but give it time and it will get there. Its walking is by sending out a long, slender shoot in the direction of the light. A bulb forms on the end of this, the old one is absorbed until only a dried-up skin remains, and one step has been taken. This is repeated time after time, until the desired spot is reached. Never a mistake, never an advance in the wrong direction! It seems strange to believe that many plants have a sense of smell, that it is possible they may appreciate the fragrance of their own blossoms. This appears the more likely, because if such a plant is approached with anything that has a strong, offensive odor, it will often wrinkle up its leaves and close its blossoms. If the disturbing element is not removed, the plant may even wither and die.

With the climbing plants, you will see an interesting thing if you set out a slip of honeysuckle near a movable piece of lattice work. When the slip has taken root and started its growth, it will be seen that its feelers are headed directly for this framework, unless there is in another direction a pole, a fence, or other object that answers equally well. But here happens a strange thing which shows the plant has more sense than many give it credit for. Move the lattice work to the opposite side of the vine and its climbers will change their course and again head for the frame in its new position.

Does the honeysuckle scent it? Does it see it? These things and many others like them certainly show us the wonders of creation. There are many things to learn which now we dimly vision.—EDWARD T. MARTIN, in *The Harmonizer*.

OLD-TIMERS, REMEMBER THIS!

The Rip Van Winkle Sleeping Car Company! Isn't that a fine, somnolent cognomen for a concern that peddled sleep to passengers? How many persons today remember it and know that it is now a part of the Pullman Company? . . . In the days following the Civil War Mr. George M. Pullman controlled the sleeping car business throughout most of the North. The South was the home of the independent companies, and there were many of them. The presiding genius in this section was Mr. E. H. Paine, who had exclusive rights over the Memphis & Charleston road, held heavy interests in the Harris Sleeping Car Company, operating between Louisville and Nashville, and then secured control of the Rip Van Winkle, which ran cars between Cairo, Ill., and New Orleans over what is now the Illinois Central. He also had the control of the Paine, Wang & Sheldon Sleeping Car Company, which operated from Mobile to New Orleans and also over the Mississippi Central, now Illinois Central.—*The Pullman News* for October.

Appearances Frequently Have Importance

*Definite Value of Neatness and Presentability in
the Business World Should Not Be Overlooked*

By MISS FLORENCE McSHANE,
Indiana Division Correspondent

WE often hear the expression, "judging from appearances," and it is a fact that impressions are frequently formed thus. For instance, when referring to a person, we speak of his appearance as being dignified, impressive, cheerful, haughty, gloomy, well-groomed, gaudy, flashy, slovenly, etc., and we speak of places as having the appearance of being well kept, neat, tidy, clean, or neglected and run-down, as the case may be.

In all parts of the world vast sums of money, as well as the time and effort of highly intelligent and efficient persons, are consumed in attaining the beautiful. Each year travelers go abroad to see the many wonderful and marvelous spots that are there to be enjoyed. In our own United States are many places of decided beauty and interest. We have our national parks, with all their true natural loveliness, unusual formations and gorgeous coloring; the national cemeteries, with their many stately monuments representing the different states in the Union, surpassing in dignity, immensity and beauty, a fitting tribute to those who so nobly did their part in our wars; the various capitol buildings, with their many forms of splendid architecture; beautiful parks in cities, where much attention is given to well-kept grounds, hedges, plants, unique fountains—and improvements are constantly going on in all these places to make their appearance more and more pleasing.

Important in the Business World

The merchant realizes the value of having his shop windows present an attractive appearance to the passer-by and pays worthwhile salaries to window decorators to accomplish this purpose. The home lover, in furnishing his abode, collects rare paintings, rugs and furnishings to enhance the beauty of the place most treasured by him.

Professional people probably realize more than the average person the value of appearances. The producer of a play is thorough and painstaking, even with the minutest detail, in connection with settings,

scenic and spectacular effects and the various effects of different lightings. The director is no less exacting in laboring with a view of creating a certain impression in the minds of his audience. Actors, singers and speakers diligently cultivate confidence, poise and stage presence before making an appearance, as they understand the full value of critics' opinions.

In the business world appearances have a decided value also. When a person is desirous of obtaining a position the first step is usually to write a letter of application. This letter is an important factor and will be a help or hindrance to the writer, depending on its general appearance, the taste in stationery, form of letter, legibility, usage of words and correct spelling. All will be considered by the recipient before he accepts or "excepts" the application. If the former, a request will likely be made of the writer to appear in person to confer, and who can tell how much the personal appearance has to do with whether the applicant is successful or not? This does not have reference to a prepossessing or a plain-featured individual, but rather to a well-groomed, refined, intelligent looking person in contrast to the slovenly, unkept, stupid one, and there is little excuse, if any, for the person who is physically fit to earn a living not having self respect enough to be clean, at least. Unfortunately, some individuals seem to be unacquainted with various toilet articles, clothes brush, tooth brush, shoe polish, etc. While the old saying that "each one has to eat a peck of dirt before he dies" may be literally true, it does not necessarily mean that it must be let accumulate under finger nails, neither is it a grievous offense to build up run-down heels occasionally and put back the creases in clothes where they once belonged. It is never too late to give up prejudices.

May Overestimate Value of Looks

While a good personal appearance should not be underestimated, we frequently meet those who seemingly overestimate it, in fact, have become so much concerned with it that they have very little time to devote to the really essential things of life. This extreme is to be deplored, and if not rem-

edied is dangerous. It is at least disappointing to become impressed with a person, due to his or her appearance, and then find only a vacuum beyond what is visible. It is even preferable to meet with the uncouth one, whose worth-while qualities are hidden.

Being appropriately dressed runs parallel with a good appearance. In whatever walk of life one finds himself placed he should dress fittingly for that occupation, and it will command respect. Men laboring in shops, around locomotives and machines (which necessarily are accompanied by oils and greases), cannot remain spotless in their attire all day and would not be expected to. (Their transformation comes at the close of their day's work, and it is about as wonderful as that of the caterpillar into the butterfly.) The capable engineer, in his blue overalls and cap, plus the big smile, ready to take his train out, is always a pleasant sight. The conductor and brakeman on the train, in becoming regulation uniform, readily call forth admiration. On entering an office, it is always pleasing to be given attention by a well-groomed, courteous personage, whose orderly surroundings reflect his own attitude.

There Is a Chance for Everybody

While no one person is able to make the whole universe beautiful, each is allotted a small space—even if it is only the few feet occupied in daily labor—that can be improved upon in various ways. Those working at desks and tables can have them present a tidy appearance or vice versa; likewise, those working around machines and lathes; an engineer who gives his engine attention need not publish this fact, as it shows for itself a station agent's make-up is more or less summed up in the view one gets of his premises when alighting from a train. If things have a run-down look, platform in need of repairs, litter lying here and there, out-of-date signs in conspicuous places, correspondence piled helter-skelter on a desk, and a general untidy appearance pervades the whole place, the character of the man in charge is at stake, as character really is just a lot of habits, and if one is careless over and over again, that one habit in time becomes pretty well formed. On the other hand, what a different feeling it causes to approach a place the premises of which show that a really live person watches over it.

The section foreman is responsible for

keeping his territory in clean condition. Just a little time each week spent around tool houses and station grounds will make a material difference in the appearance of things and will do away with broken down fences, worn-out signs, absence of paint here and there, grass not mowed and other dilapidated aspects. Of course, it requires effort to achieve results and consumes time and attention. There are those who seem to have the same attitude as Rip Van Winkle, who had the worst-conditioned farm around because his fences fell to pieces more rapidly than any one else's, the weeds grew quicker on his ground than anywhere else, and it always set in to rain when he had made up his mind to do his work.

However, from the appearance in the *Illinois Central Magazine* of the agents' stations, section foremen's homes and other views, it would seem that the employees are much alive to "keeping up appearances."

When one has taken care of the territory allotted him in the best way he knows how, carefully handling each task assigned him, he will be able, when greater responsibilities are placed upon him and many persons and places put under his charge, to handle them capably and systematically. The desires of such a one will quickly become known to his subordinates—that he is exacting and in earnest in wanting things done in an efficient, correct and thorough manner and will not tolerate slipshod, careless methods. Each department will naturally regulate itself to harmonize with the executive's views. People are more or less like sheep, inclined to follow a leader. All he need do is set a standard, and by his precept as well as example he can build up what kind of organization he desires, and his personality will dominate it. Thus, if the person in charge of others is careful about appearances, his attitude will be reflected in the appearance of the persons and places under his jurisdiction.

THE EFFECT OF CRITICISM

There is no truer test of a man's qualities for permanent success than the way he takes criticism. The little-minded man can't stand it. It pricks his egotism. He "crawfishes." He makes excuses. Then, when he finds that excuses won't take the place of results, he sulks and pouts. It never occurs to him that he might profit from the accident.—THOMAS A. EDISON.

Railway Problems of 1922

(Continued from page 29)

is supervised by one or more of the legislatures, commissions and boards that exercise control over railway affairs, charged with promoting and protecting the public welfare. Through these agencies, public opinion rules the railroads. The problem therefore, is to create a public opinion that will be constructive, not destructive; that will make the railroads better able to render that prompt, efficient service which is their obligation to the community, not less able to render it. The public needs to be educated about the railroads and their problems, so that it will demand of its representatives who legislate, regulate and supervise railway affairs a constructive, forward-looking treatment of the railway question.

Railroads Are Under-Capitalized

From time to time it is suggested that we should return to the days before regulation and give to railway managements the utmost freedom in running the railroads. These suggestions doubtless grow out of the many abuses which have crept in during the thirty-five years since regulation first began to spin its entangling web about the freedom of railway managements. I do not favor such suggestions. I believe that the railroads, because of their fundamental importance to the welfare of all other business, should be operated under the supervision of agencies controlled by the public. The blame for past abuses lies not in regulation itself, but in the fact that regulation has not at all times been intelligently inspired and directed. While removing regulation would correct some abuses, the proper way of insuring railway progress, in my opinion, is to educate the public on railway matters, so that regulation will be fair and constructive.

I feel that there is a great need for a better understanding of the railroads and their problems. If public opinion about the railroads is to be constructive, the public must be intelligently and fully informed on the subject. We have had too much of quack remedies; the railroads need a capable physician. It is unfortunately true that public opinion about the railroads has in the past been largely dominated by those who have been working, either consciously or unconsciously, for their destruction.

Take the matter of alleged over-capitali-

zation as an example of how public opinion has been misled by anti-railway agitators. For years we have heard a great deal about the railroads being over-capitalized. Critics of the railroads were finally successful in having the Congress provide for a valuation of all the railway property in the country by the Interstate Commerce Commission. That valuation work has now been going on for more than eight years. The railroads' critics fully expected that the Commission's valuation would show the railroads as a whole to be over-capitalized. As a matter of fact, however, it has already shown that the railroads as a whole are greatly under-capitalized. When the Transportation Act went into effect in 1920 the Commission was required to determine a tentative valuation of railway property for rate-making purposes, and, after reviewing the material which had been assembled in its valuation proceedings and other information gathered during the thirty-five years of railway regulation, it placed the tentative valuation for rate-making purposes at \$18,900,000,000, which was approximately \$2,350,000,000 greater than the total outstanding stock and bond issues of the railroads at that time. Again this year the Commission reaffirmed its former valuation estimate. I believe you will agree with me that this is sufficient evidence to convince any fair-minded person that the railroads of the country are under-capitalized.

We must educate the public if we are to expect intelligent public opinion. You men can help to do that by giving facts to combat the untruths you hear, and by demanding of railway critics who impose their views upon your communities that they support their statements with proof.

Waterways Valuable in Early Days

Many persons believe inland rivers and canals should be used more extensively for transportation purposes. I am not opposed to inland waterway transportation where such transportation is more economical and more practicable than by rail, but I am opposed to wasting millions of dollars upon chimerical projects that are impracticable and uneconomical. The agitation for waterways has in the past been based too largely upon sentiment instead of common sense.

I can join heartily in paying a tribute to the service performed by our early inland waterways. They were the forerunners of the railroads, pioneers in the field of transportation. They made possible an early set-

tlement of this Middle West country, and for a good many years they were the principal means of carrying on commerce. That, however, was in the days before the railroads had reached a stage in their development where they surpassed these primitive carriers in economy and practicability.

Steamboat days on the Mississippi have been clothed with a romance which stirs our hearts and enkindles our memories, but an appeal to that sentiment does not constitute sufficient evidence that the impulsive old river can be made to carry a considerable portion of the traffic required by the millions who now populate its valley. It is pleasant to dream of giant boats and barges plying up and down our inland rivers and canals carrying the products of agriculture, mines and factories, but when it comes to making the dream a reality we are confronted with the fact that during the last half century the world has taken long strides forward and methods of transportation have been developing with it.

Experience on the Erie Canal

An experiment is now being made by the Government, under the auspices of the War Department, to determine whether or not barge transportation on the Mississippi River between St. Louis and New Orleans is practicable and economical. The Illinois Central System is not opposed to this experiment; in fact, we have been co-operating with it and are watching the outcome with interest. I believe we can safely be guided by the light of the Government's experience. If we find that transportation by water on the Mississippi—or, for that matter, in any section of the country—is more efficient and economical than by rail, the railroads, I believe, should not be forbidden, but encouraged, to use the waterways as auxiliary transportation lines. The railroads are already organized for and engaged in the business of transportation, and whenever and wherever water routes can be used effectively to lessen the cost of transportation or to make transportation more efficient, rail shippers, in my opinion, should be given the opportunity to benefit from the use of such water routes by the co-ordination of water and rail lines into a unified system of transportation.

It seems to be a pretty general experience that traffic fails to materialize for inland waterways in the volume anticipated by their advocates in seeking funds for building them. Two recent instances of that are

the Erie Canal and the Hennepin Canal, one in New York, the other in Illinois, two of the leading industrial states of the nation.

The Erie Canal has been entirely rebuilt by the state of New York at a cost which makes the total investment in it close to a quarter of a billion dollars. It affords a toll-free, 12-foot waterway in a direct line of traffic between the Middle West and our greatest American port, passing through a region densely populated and intensely developed industrially. Nearly \$20,000,000 has been spent upon providing terminal and warehouse facilities. It is difficult to conceive a project carrying a greater assurance of success, but what is the result of this vast expenditure?

The enlarged canal was opened in 1918 for its entire length, and since then there have been four seasons of navigation in which to determine whether or not traffic will seek such a route when it is provided. In 1880 the Erie Canal, then only 7 feet deep and in all respects a primitive trafficway, carried 4,608,651 tons of freight. In the four years of 1918 to 1921 its traffic grew from 667,374 tons to only 993,639 tons. The money which has been spent upon the Erie Canal is equal to about one and twenty-seven hundredths per cent of the tentative valuation placed upon the railroads of the country, but in 1920 the traffic of the canal was only about sixty-five thousandths of 1 per cent of the tonnage carried by the railroads. When we consider the cost of maintenance and operation and the charges against the investment which the taxpayers of New York have to pay, we find that in 1921 it cost the taxpayers about \$7 for each ton carried on the Erie Canal, over and above what the shippers paid to barge operators. On the other hand, the total cost of transportation by railroad, including the cost of maintenance and charges for the payment of interest on borrowed funds and dividends on capital investment, is borne directly by the users of railway transportation service. Not only are the taxpayers freed from the necessity of building and maintaining the lines over which railway trains are run, but the railroads themselves are among the largest taxpayers in the country. In 1920 and 1921 they paid more than a quarter of a billion dollars each year in taxes.

Canal Traffic at \$37 a Ton

The Hennepin Canal, which extends from the Illinois River at a point southwest of

La Salle to the Mississippi River at Moline, Davenport and Rock Island, has been built by the Government at a cost of more than \$7,500,000. The cost of operation during the fiscal year ending June 30, 1921, was more than \$107,000. However, the traffic of 1921 was only 12,949 tons, and in 1920 it was only 7,428 tons. Figuring interest on investment at only 5 per cent, this means that the taxpayers spent more than \$37 for each ton that was carried over the canal last year!

I do not believe it is because of any lack of business sagacity that men who are constantly seeking more economical ways of carrying on their business use the railroads in preference to these modern, well-equipped waterways. I believe it is because they have found the railroads more dependable and railway service more economical. Waterways in this climate are at a disadvantage. The season of navigation in New York and northern Illinois averages less than two-thirds of the year. Conditions under which traffic moves will not permit shippers to route their freight by water lines for two-thirds of the year and by rail lines for the other third. The railroads are under an obligation to do their utmost to provide facilities and equipment for handling the peak load of business, but it is not economical that they should equip themselves to handle the peak of fall and winter traffic, while much of their equipment stands idle during the summer months, when the inland waterways are in operation.

During the past half century the railroads have been built up to perform an intensified service. Rail lines of standard gauge extend into practically every town and hamlet in the country. A car loaded at the mouth of a southern Illinois coal mine, at the door of one of your plants or one of the thousands of other industrial plants, or on a siding in a small town of the great grain belt can be set down in any other part of the country without a transfer of cargo. Even though your plant may be located so that your products can be loaded directly into watercraft, only a small part of your territory can be covered by direct water shipments; somewhere in the line through which the bulk of your traffic passes there must be a haul by rail, making a transfer of cargo necessary. Once a freight car is loaded and moved out of the terminal, the expense of moving it over the road is a small part of the total expense. Transfers

of cargo add greatly to the cost of transportation. It must be evident, then, that the relative cost of transportation by rail and by water cannot fairly be measured by the charges made by rail and boat lines.

Possibilities of Rail Transportation

Over and above whatever saving some shippers might effect by using the waterways in spite of these handicaps, however, I regard it as distinctly unfair to tax all the people for the benefit of the limited few who can use the waterways. Furthermore, I regard it as unfair to the railroads to be compared with a transportation agency which is not required to help in meeting the cost of providing, maintaining and operating an expensive trafficway.

Some advocates of inland waterways contend that the rail carriers have reached a limit in their development and a failure to augment their facilities and equipment with water carriers will create a chronic transportation shortage. I believe that is not true. I believe the possibilities of rail transportation have only been touched, and the coming years will witness a greater development of railway transportation capacity than any of us now dream. There is no limit to the amount of business the railroads can handle, if they are given fair treatment by the public and permitted to grow. The only restrictions upon the amount of transportation service they can provide are the restrictions placed upon them by the public.

In referring to inland waterways, I do not, of course, include such waterways as the Great Lakes and short canals connecting great bodies of water, upon which conditions are favorable to a large traffic, and I do not oppose the use of inland rivers and canals wherever and whenever it can be demonstrated that they can be used successfully.

The losses and social disturbances caused by the strikes of coal miners and railway shopmen during the past summer have focused the attention of many thinking people upon the undesirability of strikes as a means of settling disputes between employers and employees.

The Public's Interest in Strikes

Strikes are civil warfare. When any group of individuals attempts to force the public to accept its demands, without regard to their merit, it is a declaration of war against organized society. The fact that warfare may sometimes be waged in a righteous cause makes war none the less

horrible. Likewise, the fact that strikes may sometimes be the means of enforcing meritorious demands does not hide their evil aspect.

There is no peaceful way of settling disputes except by the methods of arbitration. Arbitration is the only way which has respect for the rights of both parties to the dispute and for the rights of the public. Recognizing this fact, we have established courts for the arbitration of the numerous individual controversies which spring from the relations of individual members of the community, and we are seeking to carry out the principle of arbitration in the settlement of international disputes. I submit that the principle must be applied to the settlement of industrial disputes which threaten to jeopardize the rights of the public.

A refusal to arbitrate matters in dispute implies either a selfish motive on the part of the individuals refusing arbitration, or else a distrust in the honesty and integrity of our people. I believe that we can rely upon the fairness of public opinion, when the public is given the facts intelligently, and I believe that any person or group of persons can obtain substantial justice by arbitration.

It has been the experience of the world that the crystallization of public sentiment must precede, not follow, legislation. We have had numerous instances in our own country of where legislation for which the public had not been prepared in advance has served to create disrespect for and evasion of law. Public sentiment must be aroused against strikes. The public must demand that disagreements between employers and employes engaged in fundamental industries such as railway operation and coal mining be settled by arbitration, and that both parties, employers and employes alike, abide by the results. If our laws are oppressive they should be changed by the ordered process of law, not by evasion, and so long as they are in effect they should be lived up to. Likewise, if injustice is done in the arbitration of industrial disputes, the wrong must be righted by a means which has respect for the rights of others.

Prosperity Lies in Co-operation

The railway shopmen lost their strike this past summer because they attempted to jeopardize the interests of the public and overthrow decisions of the United States Railroad Labor Board, regardless of the merits of their demands. In the end, they

found it necessary to go back to work and take up their grievances in the manner provided for the settlement of such disputes, of which they could have availed themselves without a resort to force and without creating a national upheaval.

I am fairly appalled by the enormous amount of insidious propaganda that is being distributed among the workers of the country for the purpose of fomenting strife and unrest. Our working people must be educated if we are to overcome the effect of this campaign to destroy American principles and American government. I cannot place all the blame for this situation upon the labor unionists, for the public generally needs nothing more than it needs a schooling in the fundamental principles of economics. We fall easily into habits of loose thinking, the consequences of which are disastrous.

Our civilization as it stands today—and it is far better than any other the world has ever known—rests upon the principle that we are all members of a community in which each one of us attempts to perform his share of the work of the community, and in return receives the satisfaction of fulfilled wants accordingly as he contributes to fulfilling the wants of others. The doctrine that one of us, or one group of us, can prosper by beating down someone else or some other group is the most harmful theory ever devised and turned loose upon the world. We prosper only as we help others to prosper.

REPLACING BANK-NOTES
