R. A. Rutledge, whose appointment as chief engineer of eastern lines of the Atchison, Topeka & Santa Fe has already been announced, was born December 13, 1863, at Jamestown, Pa. He attended the University of Kansas from 1884 to 1891, and began railway work August 1, 1892, with the Gulf, Colorado & Santa Fe. From 1894 to 1896 he was city engineer at Florence, Colo., and county supervisor of Fremont County, Colo., and was then until June 15, 1897, surveyor U. S. Department of Mines at Cripple Creek District, Colo. He returned to railway service on the latter date as instrumentman for the Gulf, Colorado & Santa Fe. On December 1 of the following year he was made assistant engineer, and from October, 1904, to January, 1910, was resident engineer of the same road. He was then promoted to assistant chief engineer of that road, with headquarters at Galveston, Tex., which position he held until he was appointed chief engineer of the eastern lines of the Santa Fe, with office at Topeka, Kan., as above noted.

F. M. Bisbee, who recently was appointed chief engineer of the Western Lines of the Atchison, Topeka & Santa Fe, with headquarters at Amarillo, Tex., was born September 27, 1855, at Brunswick, Me. He was educated at the University of Maine, and began railway work in 1878 with the Atchison, Topeka & Santa Fe as rodman. Later he was transitman, and subsequently went to the Mexican Central as superintendent of construction, afterwards returning to the Santa Fe as superintendent of tracklaying. He was then made superintendent of track, bridges and buildings of the Gulf, Colorado & Santa Fe, and later until October, 1896, was superintendent of track, bridges and buildings of the St. Louis & San Francisco. From October, 1896, to July, 1900, Mr. Bisbee was general manager and chief engineer of the Tennessee Central, and from January, 1901, to July, 1903 he was general manager of the Los Angeles Land & Water Company. He was then until 1904 engineer for B. Lantry & Sons, railroad contractors, at Ft. Madison, Iowa. In July, 1904, he became engineer of the Western lines of the Atchison, Topeka & Santa Fe at La Junta, Colo., which position he held until he was promoted to chief engineer of those lines, as above noted.

The authority of G. W. Wildin, mechanical superintendent of the New York, New Haven & Hartford, with office at New Haven, Conn., has been extended over the Central New England; and (on the New Haven) he has been put in charge of the maintenance of electric locomotives or multiple unit cars, and the operation and maintenance of power stations up to and including the lines at the crossarms outside of the switch house. George O. Hammond has been appointed assistant mechanical superintendent of the New York, New Haven & Hartford, and the position of assistant to the mechanical superintendent has been abolished. H. C. Oviatt, general inspector at New Haven, has been appointed assistant mechanical superintendent, and the position of general inspector has been abolished. J. L. Crowe has been appointed superintendent of shops, Electric divisions, reporting to the mechanical superintendent, with headquarters at Van Nest, N. Y. Joseph McCabe, division master mechanic at Waterbury, Conn., has been appointed master mechanic of the Shore Line division, with office at Harlem River, N. Y., to have jurisdiction over matters west of New Haven. C. H. Reid, general road foreman of engines, has been appointed master mechanic of the Western division, with office at Waterbury, Conn., succeeding Mr. McCabe, and F. W. Nelson, road foreman of engines, Western division, has been appointed general road foreman of engines, with office at New Haven, succeeding Mr. Reid.

The following changes in organization on the New York, New Haven & Hartford, and the Central New England were made effective May 1: E. Gagel, chief engineer, has been given charge of the engineering department and will have jurisdiction over all matters pertaining to construction and standards. The authority of W. J. Backes, engineer of maintenance of way of the New York, New Haven & Hartford, with office at New Haven, Conn., has been extended over the Central New England. He will have charge of tracks, bridges, buildings and signals. Division superintendents will report to the engineer of maintenance of way, on all matters coming within his jurisdiction. Division engineers will report to and receive instructions from the division superintendents. They will have charge of and be responsible for the safe maintenance of tracks, bridges, buildings and signals, and will take over such men as may be assigned from the bridge, building and signal departments. They will report to the engineer of maintenance of way, on matters pertaining to inspection of physical property, construction and standards of maintenance, other than signal standards, on which they will report to the signal engineeer. G. A. Rodman, inspector of bridges and buildings at New Haven, Conn., has been appointed general supervisor of bridges and buildings, in charge of the inspection of all bridge and building work to be done by the maintenance of way department, with office at New Haven. He will report to the engineer of maintenance of way. The office of superintendent of bridges and buildings has been abolished, and the duties heretofore performed by the superintendent of bridges and buildings are assigned to division engineers. I. D. Waterman, engineer of construction at New Haven, has been appointed construction engineer in general charge of construction work. A. S. Tuttle, division engineer of construction at Boston, Mass., has been appointed construction engineer in charge of grade crossing eliminations in the state of Massachusetts, and such other work as may be assigned to him. C. W. Lord has been appointed office engineer at New Haven, in general charge of office drafting department, and such other matters as may be assigned to him. W. H. Moore, engineer of bridges at New Haven, has been appointed engineer of structures, and will have charge of the design of all bridges and structures. L. J. Carmalt, assistant chief engineer of the Central New England, at Hartford, has been appointed construction engineer in charge of work on the Central New England, and will perform such other duties as may be assigned to him. The office of assistant chief engineer of the Central New England has been abolished.

OBITUARY.

Peter E. Bowman, formerly superintendent of the New York division of the New York, New Haven & Hartford, died on May 9, at his home in New Haven, Conn., at the age of 65.

Clarence Deming, for 15 years, until 1912, an editorial writer on the *Railway Age Gazette*, died at his home in New Haven, Conn., May 8, at the age of 65. Mr. Deming was born at Litchfield, Conn., and was graduated from Yale College in 1872. He had been a journalist throughout his active life, and as such had traveled in many countries for the New York *Evening Post*. He was for several years an editorial writer on that paper. He was a man of broad culture and looked at railroad and economic topics, as at all other affairs, from a high plane of moral integrity. His personality was perennially pleasant, so that his acquaintances—all who really knew him—esteemed him for his lovable qualities as well as for his ability as an investigator and his courage as an upholder of righteousness in public affairs. Mr. Deming is survived by his wife, one son and two daughters.

Loan for Bolivian Railway.—The Bolivian government has received information from its agent in Paris that he has placed a loan for $7,500,000 for the construction of the railway from Quiaca to Tupiza which would join up at the former station with the Central Northern system.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Charlotte Harbor & Northern has ordered 2 consolidation locomotives from the American Locomotive Company. The dimensions of the cylinders will be 20 in. x 26 in., and the diameter of the driving wheels will be 54 in.

The Amaga Railroad, Colombia, has ordered 2 prairie type locomotives from the American Locomotive Company. The dimensions of the cylinders will be 12 in. x 16 in.; the diameter of the driving wheels will be 33 in., and the total weight in working order will be 62,000 lbs.

The Chicago, Rock Island & Pacific has ordered 2 mountain type passenger locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 28 in. x 28 in. cylinders, 69 in. driving wheels, and in working order will weigh 328,000 lbs.

The Aluminum Company of America has ordered 1 six-wheel switching locomotive from the American Locomotive Company. The dimensions of the cylinders will be 20 in. x 26 in.; the diameter of the driving wheels will be 50 in., and the total weight in working order will be 144,000 lbs.

The Solvay Process Company, Syracuse, N. Y., has ordered 1 six-wheel switching locomotive from the American Locomotive Company. The dimensions of the cylinders will be 19 in. x 24 in.; the diameter of the driving wheels will be 51 in., and the total weight in working order will be 122,000 lbs.

CAR BUILDING.

The Erie is considering the purchase of 5,000 freight cars.

The Baltimore & Ohio has ordered 500 gondola cars from the Cambria Steel Company; 40 baggage cars from the American Car & Foundry Company; and 5 seventy-foot combination baggage and mail cars, 7 fifty-foot combination passenger and baggage cars, 25 seventy-foot coaches, 15 sixty-foot smoking cars and 4 seventy-three-foot dining cars from the Pullman Company.

IRON AND STEEL.

The Baltimore & Ohio has ordered 1,300 tons of rails from the Maryland Steel Company.

General Conditions in Steel.—There has been but little change in the steel industry during the past week. The mills continue to operate at as near their full capacity as possible and the volume of new orders is still very light. Manufacturers feel that consumers will be forced to place large orders before very long, and consequently are not contemplating any price reduction. If the crops are successful, and present indications suggest that they will be, there will be a decided improvement in the buying movement. During April the average volume of new business placed daily was not much over 26,000 tons, comparing with more than 40,000 tons in March and between 45,000 and 50,000 tons a day in the corresponding period of last year.

SIGNALING.

The Chicago, Lake Shore & South Bend is to install automatic block signals throughout the length of its line—70 miles. This is an electric line from South Bend, Ind., westward toward Chicago. The company had been ordered by the Indiana Railroad Commission to install signals on 12 miles of its line, but has concluded that the whole road should have this improvement. The plans provide for the use of "light" signals.

Plans for Brazilian Railway Approved.—The President of Brazil has signed a decree approving definite plans and estimates amounting to $1,100,000 for the railway line between kilometer 0 to 105 of the Coroata to Tocatins Railway.

Supply Trade News.

Charles R. Westcott has been elected secretary and treasurer of the M-C-B Company, Chicago.

The E. D. E. Company, Chicago, Ill., has moved its offices from 1449 to 1402-1404 Railway Exchange building.

The Railway Utility Company has removed its office from the Monadnock building to 226 South LaSalle street, Chicago.

The Baldwin Locomotive Works is preparing to begin construction on the first unit of its new plant at East Chicago, Ind., for which approximately 370 acres of land was purchased last year.

The Hall Switch & Signal Company, New York, has acquired the patent rights formerly owned by the General Railway Equipment Company, the United States Electric Company and the Sandwich Electric Company, and will hereafter make and sell Gill selectors, Sandwich selectors and other apparatus and equipment formerly handled by those companies.

The White Enamel Refrigerator Company, St. Paul, Minn., has closed a contract with the Grand Trunk for 32 large refrigerators to be installed in the new $2,000,000 Fort Gary Hotel at Winnipeg. The contract amounts to approximately $30,000. This company also furnished the refrigerator equipment for the Chateau Laurier and the Central Union station at Ottawa, Ont.

The Power Specialty Company, New York, is building a new erecting shop, at its works at Dansville, N. Y., to handle the increasing demand for Foster superheaters. This shop will be 300 ft. x 96 ft., and will be completed in about two months. This company has recently received orders for Foster superheaters from the Jones & Laughlin Steel Company, Pittsburgh, Pa.; the Brier Hill Steel Company, Youngstown, Ohio; the Rhode Island Company, Providence, R. I., and the Havana Electric Railway Light & Power Company, Havana, Cuba.

The Railroad Supply Company, Chicago, has announced a reorganization of its signal department, under which J. M. Fitz Gerald, now engineer maintenance of signals of the New York Central & Hudson River, becomes general manager of the signal department, effective on May 20, with headquarters in the Bedford building, Chicago. Mr. Fitz Gerald entered the motive power department of the Boston & Albany in June, 1902, and later became mechanical engineer and signal engineer of that road. In March, 1910, he was appointed assistant signal engineer of the New York Central, and on April 1, 1911, engineer maintenance of signals.

Willis E. Holloway and Paul W. Holstein have resigned their positions with the Jeffrey Manufacturing Company, Columbus, Ohio, to go to the Roberts & Schaefer Company, Chicago. Mr. Holloway has been with the Jeffrey company for nine years. He will have charge of the marketing of the new Marcus combination screen and picking conveyor which the Roberts & Schaefer Company has recently acquired. Mr. Holstein has been associated with the Jeffrey company for the past 21 years. During a large portion of this time he was contracting engineer on coal tipple and coal washing plant construction. He will have charge of this branch of the Roberts & Schaefer Company's business, principally in the West Virginia field.

P. G. Jenks has been made assistant to the president of the Standard Steel Car Company, Pittsburgh, Pa., with office at Chicago. Mr. Jenks started in the office of the Schoen Pressed Steel Company at Pittsburgh in 1899, and in 1902 was made treasurer of its successor, the Pressed Steel Car Company, Pittsburgh, Pa. From 1907 to 1909 he was manager of the Western Steel Car & Foundry Company, Chicago, with office in that city. From 1909 to May 1, 1913, he was a partner in the steel and pig iron firm of Banning, Cooper & Company, Ltd., Pittsburgh, Pa., which position he has resigned to go to the Standard Steel Car Company, as mentioned above. Mr. Jenks is a brother of C. D. Jenks, vice-president of E. S. Woods & Co., Chicago.

The General Electric Company, Schenectady, N. Y., has received among recent orders the following: Six 200 h. p., four-

motor, locomotive equipments, twenty 140 h. p., four-motor car equipments, and fifty-two 60 h. p. railway motors for the St. Louis, Springfield & Peoria; one 1,325 k. v. a. motor generator set and switchboard apparatus for the Northwestern Pacific for installation at its Alto power house, near Sausalito, Cal.; nine 150 k. v. a. transformers, six 200 k. v. a. reactances, two 200 k. w. induction motor driven exciters and switchboard apparatus for the Rhode Island Company, Providence, R. I; two 100 h. p four-motor car equipments, and three Sprague General Electric multiple unit trailer car equipments for the Norfolk Southern; and thirty-six 60 h. p., two-motor car equipments for the Southern Pacific. M. F. Westover, Schenectady, and I. S. Keeler and C. P. Moore, both of New York, have been elected directors of this company.

Robert Roberts Bishop, for the past 25 years representative of L. C. Chase & Co., Boston, Mass., maker of Chase goat brand mohair car plushes, died at Mount Clemens, Mich., on May 5, at the age of 55. At the time of his death his office was at Detroit, Mich. Mr. Bishop was born at Holliston, Mass., in 1858. He prepared for college at a Boston private school, and was graduated from Harvard University with the class of 1880, among his classmates being Theodore Roosevelt and Robert Bacon. In 1888 he went to L. C. Chase & Co., as a representative in the sales department. He retained this position until the time of his death. While his unusual zeal, conscientious thoroughness and business ability were generally recognized, his fine qualities as a man stood out in even higher degree. He had many friends in the railway and supply business.

Robert R. Bishop.

W. P. Hawley, whose election to the vice-presidency of the United States Light & Heating Company, New York, has been announced in these columns, was born in Chatham, N. Y., August 1, 1883. He received a high school education at that place, and after graduation worked in the state bank for five years. In September, 1904, he left Chatham and came to New York. He entered the service of the Manhattan Lighterage Transportation Company, which was sold to the Central Railroad of New Jersey on January 1, 1905. On that date Mr. Hawley took a position with the United States Light & Heating Company of New Jersey. Upon the consolidation of the United States Light & Heating Company of New Jersey, the Bliss Car Lighting Company, Milwaukee, Wis., and the National Battery Company, Buffalo, N. Y., under the name of the United States Light & Heating Company, of Maine, Mr. Hawley was made manager of the New York office, which position he still holds in addition to his duties as vice-president

W. P. Hawley.

C. A. Seley, formerly mechanical engineer of the Chicago, Rock Island & Pacific, announces the organization this week in Pittsburgh of the American Flexible Bolt Company. It will manufacture locomotive staybolts and other bolts, embodying a new method of construction invented and developed by Ethan L. Dodds, formerly connected with the Erie Railroad, Pullman Company, etc. The preliminary tests and experiments have resulted so satisfactorily that the company organization has been effected and will actively enter the commercial field. The general offices are in the Union Bank building, Fourth and Wood streets, Pittsburgh, Pa. The shops are at Zelienople, Pa., thirty-two miles west of Pittsburgh, on the main lines of the B. & O., B. R. & P., and the Harmony Trolley Line, an excellent shipping and manufacturing point. Machinery for a very considerable production has been installed and is in operation, and the property of the company will permit convenient expansion as the business is developed. The officers are: C. A. Seley, president; J. A. Frauenheim, vice-president and general manager; H. T. Frauenheim, secretary and treasurer; Ethan I. Dodds, chief engineer.

TRADE PUBLICATIONS.

Unions.—The Jefferson Union Company, Lexington, Mass., has devoted a small illustrated folder to a brief historical sketch of Benjamin Franklin and to the efficiency of Jefferson unions.

Hydraulic Speed Gears.—The Waterbury Tool Company, Waterbury, Conn., has published an illustrated booklet entitled The Waterbury Hydraulic Speed Gear, furnishing illustrations and full descriptions of these gears and including diagrams and tables.

Speed Recorders.—The Chicago Pneumatic Tool Company has issued a booklet containing full descriptions and illustrations of the Boyer railway speed recorder, together with detailed instructions for applying and operating the apparatus, and a catalog of repair parts.

Locomotive Cranes and Grab Buckets.—The Orton & Steinbrenner Company, Chicago, Ill., has issued an attractive illustrated booklet describing its locomotive cranes, drag line excavators, clam shell buckets, coal crushers, electric and steam hoists, and other elevating and conveying machinery.

Oxy-Acetylene Welding and Cutting.—The Davis-Bournonville Company, New York, has published an attractive illustrated booklet on oxy-acetylene welding and cutting apparatus. This booklet contains illustrations and descriptions of the various types of equipment, and shows the layout of several types of generating and compressing plants.

Waterproofing Cement Products.—The Chicago Ironite Waterproofing Company, Chicago, has devoted several illustrated booklets to ironite, a metallic waterproofing for all sorts of cement products. Ironite is designed to overcome the drawback to the porosity of cement products. These booklets include general descriptions, testimonials and specifications and tests.

Flexible Couplings.—The Francke Company, New Brunswick, N. J., has devoted bulletin No. 18 to Francke flexible couplings for direct connecting steam and gas engines, steam and water turbines, etc. The bulletin is illustrated and includes dimension tables and price lists. Inquiries should be addressed to the Smith-Farrell Company, Inc., general sales agents, 90 West street, New York.

Fuel Economy.—The Valley Iron Works, Williamsport, Pa., has published an interesting illustrated booklet entitled The Economical Burning of Coal. It gives a treatise on how coal can be burned to insure greatest economy, smoke prevention, etc., with hand firing. Illustrations and descriptions of the different grates made by this company, including the Ajax shaking and Ajax dumping grates, are also given.

Postal Car Lighting.—The Safety Car Heating & Lighting Company, 2 Rector street, New York, has issued a 30 page booklet dealing with the requirements of postal car lighting as specified by the United States government. Floor plans of full postal and apartment cars are included, showing the lamp locations, and illustrations and tables of this company's recommended lamps and fixtures for postal cars are given.

Railway Construction.

Asherton & Gulf.—According to press reports plans are being made to build the extension from Asherton, Tex., west to Eagle Pass, about 50 miles. The line may eventually be further extended up the valley of the Rio Grande to Del Rio, an additional 50 miles. It is understood that negotiations are pending for extending the line from Asherton Junction east to a point on the gulf coast either at Corpus Christi or at Rockport. (March 14, p. 528.)

Boston & Maine.—See an item in General News regarding the completion of the Hampden Railroad from Bondville, Mass., to Springfield, 16 miles, also the new line from South Vernon, Vt., north to Brattleboro, to be opened for business on June 23.

Canadian Northern.—A line has been located between Parry Sound, Ont., and Callander. The route is from a point on the Toronto-Sudbury branch at mile 170, northeasterly through Whitestone, Golden Valley, Restoule and Nipissing to Callander, where connection is to be made with the main transcontinental line. The new line will cross the Whitestone, the Maganatawan, the Pickerel, the South and the Wistiwasing rivers, also Commanda creek. At the crossing of the Maganatawan river, there will be a deck span bridge 100 ft. long and 45 ft. high, with about 300 ft. of trestle approaches, and over South river there will be a bridge 300 ft. long and 25 ft. high. Construction work on the line will not be carried out this year.

Canadian Pacific.—An officer writes that the company has made surveys for a line from Metaline, Wash., to Trail, B. C., also for an extension of the Crows Nest Pass line west, but nothing definite has been decided as to building these lines.

Chicago & North Western.—See South Dakota Roads.

Fostoria & Fremont (Electric).—This company, which operates the line from Fremont, Ohio, southwest to Fostoria, is making surveys, it is said, for an extension over two routes to Port Clinton. One survey is being made from Fremont north to Oak Harbor, thence east to Port Clinton, and the other from Fremont northeast to Port Clinton.

Grafton, Fairmont & Clarksburg Traction.—According to press reports this company which was organized some time ago to build from Grafton, W. Va., west via Pruntytown, to Meadland, thence north via Boothsville to Fairmont, 32 miles, with a branch from Boothsville southwest to Bridgeport, 7 miles, will ask for bids at once for work on the section between Grafton and Pruntytown. George R. Kirk, president; J. W. Kirk, general manager, and J. W. Roberts, chief engineer, Grafton.

Grand Marais & Northwestern.—Incorporated in Minnesota to build from Grand Marais west to a connection with the Duluth & Northern Minnesota, about 50 miles, and to build branch lines. A proposition has been submitted by the promoters to the voters of Cook county asking for $100,000 in aid of the project. A. Mitchell, president, and J. Jenswold, secretary, Duluth.

Grand Rapids & Northwestern.—A contract for the construction of the line from Ludington to Grand Rapids, Mich., has been awarded to the J. H. Flick Construction Company, Chicago, and actual construction work is to be started at once. J. N. Tittemore, Chicago, is president.

Hampden Railroad.—See Boston & Maine.

Houston & Brazos Valley.—According to press reports work has been started on an extension from Freeport, Tex., to Bryan Heights, where the mines of the Freeport Sulphur Company are located, about three miles. (March 14, p. 529.)

Lehigh & New England.—A contract has been given to the Reed Construction Company, it is said, to build a five-mile spur line south to Bath, Pa.

Memphis, Dallas & Gulf.—According to press reports grading work and track laying is to be started at once to complete the extension north to Hot Springs, Ark.

Minnesota, Dakota & Western.—An officer writes that a contract has been let to M. W. Barnard, Minneapolis, Minn., to build an extension of the Deer river branch, 10 miles south, and the work is now being carried out by Olson & Tully. The clearing is nearly completed, and grading has been started. It is expected that the improvements will be finished by September of this year. A contract has also been let to Fred Smith, Laurel, for extending the Loman branch, west across Black river, two miles, on which work is to be started this month. This includes all the construction work that the company expects to carry out during 1913.

Montreal & Southern Counties (Electric).—An officer writes that the present track extends from Montreal, Que., through St. Lambert to Longueuil, 7 miles, and from St. Lambert to Golf Club, 1½ miles. New track is being laid from Golf Club to the Central Vermont Railway, 2½ miles, and the Central Vermont is to be electrified to Richelieu, 15 miles. It is expected that the section from Gold Club to Richelieu will be opened for operation early in May and that the Central Vermont electrification from Richelieu to St. Cesaire, 15 miles, will be completed this year. Surveys for an extension from St. Cesaire, via Abbotsford, to Granby, 16 miles, have been made, but it has not yet been decided when contracts for the work will be let. There will be one 200 ft. steel truss bridge, and three trestles. A station will be built at Abbotsford, and substations will be built at Abbotsford and at Granby. The company expects to develop a traffic in dairy products, fruit, coal and farm products. Work on a branch south to La Prairie and on the extensions will probably be started next year. (December 20, p. 1235.)

Ogden, Lewiston & Northern (Electric).—According to press reports this company will begin work this summer on a line from Ogden, Utah, north to Preston, Idaho, about 65 miles. The company was recently incorporated at Salt Lake City, Utah.

Oregon Railroad.—According to press reports contracts are to be let soon to build a section of this line. The company was organized in February with a capital of $500,000, to build from Salem, Ore., southeast via Stayton and Minto to Bend, about 115 miles. The incorporators include G. A. Kyle, J. N. Mounce and A. L. McCloud. J. H. McNary, Salem, is attorney.

Paris & Mt. Pleasant.—An officer writes regarding the reports that an extension is to be built from Paris, Tex., to Atoka, Okla., and into the Lehigh coal fields, that nothing definite has yet been decided as to this extension, and surveys for such a line have not yet been made. The company has completed the line from Mt. Pleasant to Bogata, 32 miles, and regular service will be started by June 1. (May 2, p. 1013.)

South Dakota Interurban.—Work on a section of this electric line it is thought will soon be started. The company was organized several years ago to operate a line with branches from Sioux City, Iowa, into South Dakota, across the counties of Union, Clay, Lincoln, Turner, Yankton, Hutchinson Davison, Douglas, Charles Mix, Aurora and Brule, about 200 miles. W. E. Miller, Sioux City, has been securing right of way in South Dakota for a long time and has succeeded in getting a loan of $5,000,000, through the Farmers' Loan Company of Sioux City, upon the property already acquired and to be secured through the proceeds of the loan.

South Dakota Roads.—Residents of the town of Wood in Mellette county, S. Dak., are now securing a right of way for a line west from Winner, the present terminus of the Chicago & North Western "Rosebud Line." It is understood that if the right of way is secured, the C. & N. W. will build an extension of about forty miles to Wood.

Stockton Terminal & Eastern.—An officer of this company, which operates a line from Stockton, Cal., northeast via Linden to Bellota, 18 miles, writes that work is now under way by the company's men, building on Union street, Stockton, from the present terminus to Stockton channel.

Taber Transit.—An officer writes that contracts are to be let in a few weeks to build from Taber, Alta., north to the coal mines at Retlaw and at Bow City. The work will be mostly earth work, with about 20,000 cu. yds. of solid rock work. The approximate cut per mile will be 5,000 cu. yds., and the approximate fill about 7,000 cu. yds. The maximum grades will be 1.9 per cent. and the maximum curvature 10 degrees. There will be one steel bridge 420 ft. long, and eight short pile trestles. The plans also include putting up four stations; twelve freight sheds; car barns and office buildings. The company expects to develop

a traffic in coal and grain. J. F. Kramer, president, and V. O. Eastland, chief engineer, Calgary. (Apr. 18, p. 925.)

Texas Roads.—According to press reports a contract has been entered into between J. Fry, representing the Empire Construction Company, Omaha, Neb., and the commercial club of Big Springs, Tex., for the construction of a railroad from Tucumcari, N. M., to San Antonio, Tex., over 600 miles. The contract provides that Big Springs is to be made both a passenger and freight division point, also that the main shops and general headquarters will be at that place. Surveys will be started at once and track laying is to be begun before January, 1914.

Toronto, Hamilton & Buffalo.—This company has bids under consideration for building second track from Welland, Ont., to Smithville, 16.5 miles.

Trona Railway.—An officer writes that location has been made for a line from Searles, Cal., on the Southern Pacific in Kern county, northerly and northeasterly to the northwestern corner of San Bernardino county to the place known as Borax Lake or Searles Lake, 32 miles. The company expects to begin construction work in May. The maximum grades will be 2½ per cent., and the maximum curvature 4 deg. The line is being built to carry the output of reduction works, including soda-ash, potash and borax. The company also expects to develop a traffic in ores. Joseph K. Hutchinson, president, Claus Spreckels building, and W. A. Cattell, chief engineer, Foxcroft building, San Francisco.

Willapa Bay & Eastern.—An officer writes that the location is now being made and construction work is expected to be started soon from Lincoln Creek in Lewis county, Wash., west to Raymond and South Bend. The maximum grades will be 1 per cent., and the maximum curvature 4 deg. The company expects to develop a traffic in forest products. J. R. Holman, chief engineer, Seattle, Wash. (April 18, p. 926.)

RAILWAY STRUCTURES.

Keokuk, Iowa.—The Chicago, Rock Island & Pacific is planning the erection of a new freight depot to cost between $40,000 and $50,000.

Montreal, Que.—An officer of the Canadian Pacific writes that the company is building large extensions to the Angus shops, including the following: steel passenger and freight car shops, locomotive shop extension, new bolt and nut shop, power house extension, upholstering shop extension, general office building extension, pattern storage building extension, and maintenance building. The cost of the improvements will be about $500,000. (May 2, p. 1913.)

Saint Clair, Pa.—The Philadelphia & Reading has given contracts to Irwin & Leighton, Philadelphia, for two new car repair shops to be built at St. Clair, Pa. The buildings are to have one story, and will be 45 ft. high. One will be 83 ft. 10 in. wide x 604 ft. 8 in. long, and the other 53 ft. 9 in. wide x 464 ft. 8 in. long. They will be of steel, concrete and brick construction, with steel sashes. Work was started on the improvements on May 13.

Whitestone, Ont.—See Canadian Northern under Railway Construction.

Railroad Construction in German East Africa.—The German line from Dar-es-Salaam on the east coast of German East Africa, to Ujiji on Lake Tanganyika, reached Tabora early in 1912, and on October 1 was 82 miles west thereof; the line will be completed, presumably, early in 1914. The 530 miles of line from the coast to Tabora cost about $20,000,000, or $37,000 per mile. The line from Tabora to Kigoma, a bay on Lake Tanganyika about three miles north of Ujiji, will be 260 miles long, and will probably cost over $42,000 per mile. The completion of this railroad will put Lake Tanganyika, one of the most beautiful lakes in the world, within 20 days of Europe. With the completion of the German and Belgian lines to Lake Tanganyika, rail and steamer service will cross Central Africa from Dar es-Salaam to the mouth of the Congo on the west coast of Africa.—*Mining and Scientific Press.*

Railway Financial News.

Detroit Southern.—As the holders of outstanding certificates of deposit representing more than 50 per cent. of Detroit Southern division first mortgage 4 per cent. bonds have not filed dissent to the plan of reorganization mentioned in our issue of April 18, 1913, this plan has been declared operative. Bondholders and holders of certificates of deposit will be permitted to share in the reorganization only upon subscribing and paying to the Central Trust Company, New York, $500 for each bond of $1,000 deposited by them. The depositors, on the completion of the reorganization, will, in exchange for each $2,000 of bonds deposited and each $1,000 in cash paid, receive $1,000 in new adjustment mortgage bonds, $2,000 in new preferred stock and $1,000 in new common stock.

Hudson & Manhattan.—Stockholders will vote on May 29 on the question of authorizing the new bond issue mentioned in last week's issue. The reorganization plan has been assented to by the holders of about 99 per cent. of the 4½ per cent. bonds and by holders of 97 per cent. of the stock.

Lake Shore & Michigan Southern.—See New York Central & Hudson River.

Laramie, Hahns Peak & Pacific.—A new committee has been formed, consisting of Eugene J. Fabens, chairman, James W. Greene, Edward B. Carleton and Robert P. Clapp, to represent the first mortgage bondholders. Mr. Greene and Mr. Carleton have resigned from the committee of which Frank D. Pavey was chairman, because they thought that the interests of the first mortgage bondholders and those of the holders of the refunding bonds conflict, and that it is best to separate them. The committee in a circular requests the holders of the first mortgage bonds not to consent to the issuance of the $315,000 receiver's certificates asked for by the Hemphill committee, as mentioned in last week's issue, and advises the bondholders to request the trustees to foreclose the mortgage.

Mexican Northern.—This company has declared a semi-annual dividend of 1½ per cent., comparing with 2 per cent. paid semi-annually from 1910 to 1912 inclusive.

Mobile & Ohio.—The stockholders have authorized the purchase of the St. Louis & Cairo, now leased, and an issue of $3,000,000 Mobile & Ohio, St. Louis division 5 per cent. bonds and a mortgage upon the property purchased to secure the bonds. The St. Louis & Cairo runs from East St. Louis, Ill., to Cairo, 159 miles.

New York Central & Hudson River.—On June 16 stockholders will vote on the question of consenting to a plan for the consolidation of the Lake Shore & Michigan Southern and certain other lines with the New York Central & Hudson River. The New York Central now owns 90 per cent. of the common stock of the Lake Shore & Michigan Southren. This stock is pledged as security for the 3½ per cent. Lake Shore collateral bonds, and before the two companies can be consolidated the consent of the holders of 75 per cent. of these bonds will be required. The New York Central proposes to offer to the consenting bondholders the privilege of exchanging their 3½ per cent. bonds par for par for 4 per cent. bonds to be issued under and secured by a new mortgage on the railroads of the New York Central, including the lines recently consolidated. The total amount of bonds under this new mortgage will not exceed $167,102,400. The plan also includes the execution of another new mortgage, to be called the refunding and improvement mortgage, secured upon the same property as the first new mortgage, but subordinate to it, and upon such other property as the directors may determine to include thereunder. Under this improvement mortgage bonds may be issued for additions and betterments, to refund the short term notes and to provide for other general purposes.

Pittsburgh & Susquehanna.—This property will be sold on June 2, at Osceola Mills station on the line of the road. The road runs from Philipsburg, Pa., to Fernwood, 20 miles.

St Louis & Cairo.—See Mobile & Ohio.

*Illustrated.

THE reports of the committee on stokers of the Master Mechanics' Association have in the past been confined largely to descriptions of the machines and the results of the experimental working of a few locomotives equipped with them. Within the past year the status of the locomotive stoker has changed so rapidly that it can now fairly be said that the device has advanced beyond the experimental stage. There are over 300 large locomotives in regular service, mostly of the mikado and Mallet types, equipped with mechanical stokers, and as many more on order are being so equipped, a fact which in itself indicates that those railroads which are now using stokers have found sufficient merit in them to warrant their co-operation with the manufacturers in eliminating defects and developing the machine to a thoroughly practical basis. While the claims of the firemen, that the work of firing the larger classes of locomotives is becoming beyond physical endurance, are not conceded by the railroads, the point remains one of contention, and the perfecting of the mechanical stoker, which will relieve the fireman from practically all physical exertion, should tend to greatly simplify future controversies with this class of labor. The committee on stokers of the Master Mechanics' Association this year has for its chairman the assistant superintendent of motive power of the Norfolk & Western, a road which is operating a number of Mallet locomotives equipped with stokers, and with the development that has taken place in these machines during the past year, it is probable that a report of more than ordinary interest from the operating standpoint will be presented at the June convention.

ONE of the conditions in which it is impracticable to protect a train by flag is that where the roadbed does not afford safe footing for the flagman. A case of this kind is reported, on another page, in Mr. Belnap's account of a collision at Gothenburg, Neb.—a long bridge exposed to a furious wind. Wind might possibly be provided against by stout railings, but that is not the only danger encountered at bridges. Ice and sleet make trouble of this kind at innumerable places every winter; not usually so positive and pronounced a danger as a blizzard, but still a serious obstacle to the uniform enforcement of the flagging rule. Such adverse conditions ought to be more carefully taken into account when estimating the value of flag protection. Uniformity is held to be a cardinal virtue in the framing of rules and in their enforcement; to secure it in the matter of flagging requires that many diverse conditions be taken into consideration. The single element of low temperature in northern climates may become a danger; and with a blizzard it may make the flagman's task absolutely dangerous to himself. A temperature of 40 degrees below zero may become dangerous to trains even before the flagman suffers any peril of life or limb, because of the temptation to neglect which assails a man when he is in distress. The increase in danger due to cold and snow has been recognized by some managers by the promulgation of a rule that snowplows should be protected by the space interval even when the space-interval system was not regularly employed. It is a plain lesson of experience that there are circumstances where the space interval is the only system that is both safe and reasonable. The automatic block system cannot be operated on single track without a provision for communicating ahead when a train is held by a false-stop indication; and, therefore, to deal with such situations as that at North Platte the rational provision is a manual space-interval system in reserve; telegraph or telephonic communication between stations which are open (or between conductors by means of roadside telephones). With this, the deficiency of the automatic system is made up for by a substitute which can be called even better than the system supplanted; while dependence on the flagman is admittedly an unscientific expedient.

A "STUDY of Railway Growth and Railway Earnings of the Railways of the United States for the Decade 1901-1910" has been compiled by F. E. Williamson, transportation expert and statistician for the Trade and Transportation Bureau. Apparently the object of this compilation is suggested by the note to Table H, which says: "The increase, 1910 over 1901, of 158.9 per cent. in the amount paid in dividends on capital stock, and 42.6 per cent. in the average rate paid on dividend-paying stock, indicates that the return upon the capital stock, 1910 over 1901, more than kept pace with the percentage increase, 1910 over 1901, of the various units in tables A to G (tables based on units of service, equipment and capitalization)". The other night at the Economic Club dinner in New York, B. F. Bush, speaking immediately after A. B. Garretson, expressed surprise at the figures for dividend increases quoted by Mr. Garretson and was apparently unfamiliar with their source. It is probable that Mr.

Garretson got his figures from the same source as that used by Mr. Williamson, namely, the annual statistical report issued by the Interstate Commerce Commission, the last complete available one being for the year 1910. In quoting the figures which he did Mr. Garretson specifically called attention to the fact that these were the figures that were used by the unanalytical railroad employee. Our transportation expert and statistician is apparently willing to take his figures with no more analysis than Mr. Garretson gives the ordinary brakeman credit for. The Trade and Transportation Bureau figures show $405,771,416 paid in dividends; but of this amount the Interstate Commerce Commission's report shows that $293,836,863 only was dividends paid to the public, the remainder being dividends paid to other railway companies and so forming part of the funds on which they drew to pay dividends. In 1901 the dividends paid to the public amounted to $131,627,672. The percentage of increase is a little over 123 per cent., as against 159 per cent. shown by the Trade and Transportation Bureau exhibit. Whereas the average rate paid on *dividend paying* stocks was 7.50 in 1910 and 5.26 in 1901, the average rate paid on all stock *in the hands of the public* in 1910 was 5.29 per cent. and in 1901 a little over 3.20 per cent. We find, therefore, if we analyze the Interstate Commerce Commission's returns and try to get at what railroad capital is actually receiving on its investment that the rate of increase in per cent. paid in 1910 over 1901 is higher than is shown by the Williamson compilation; but it is pertinent in this relation to call attention to the fact that the rate of increase of dividends paid on a stock, which pays nothing in 1901 and pays 1 per cent. in 1910, is *infinity*. The fact of the matter is that a return of less than 3½ per cent. on railroad stock in the hands of the public in 1901 is a concrete measure of how inadequately the hopes of the investor in railroad securities of that period had been realized, and the fact that during these nine years his hopes have only been realized to the extent of less than 5½ per cent. paid on railroad stocks is certainly not an argument of any very great effectiveness against a demand on the part of investors for making railroad securities somewhat more attractive.

SOME DISPUTED POINTS IN RAILWAY VALUATION.

2.—Investment from Earnings.

IT has been the policy of the railway companies of the United States to invest large amounts of their earnings in permanent improvements in their properties. The earnings thus invested usually have been surplus earnings over what were required to pay operating expenses and interest on indebtedness, and in many cases they have been surplus after the payment of operating expenses, interest on indebtedness and larger or smaller dividends on part or all of the outstanding stock. In some instances where this practice has been followed the outstanding capitalization has represented only investment of funds raised by the sale of securities. In other cases part of it has consisted of securities issued for nominal or no consideration. Whether the total capitalization has represented investment actually made by the security holders, or part of it has represented such investment and part of it has not, there have been some cases where investment from earnings has been made before the owners of the securities have received a "fair return" on their actual investment, and other cases where it has been made after they have received such a "fair return." The total amount of these surplus earnings invested in the railways of the United States up to June 30, 1909, as carried on their books, was stated by Commissioner Lane in the opinion in the Western rate advance case to be $800,642,923.

It is clear that if railway valuation were based entirely on cost of reproduction this entire investment would have to be excluded. In the various state valuations based on the cost of reproduction it has been included, but the valuation law under which the Interstate Commerce Commission will act provides that it shall ascertain more than the cost of reproduction. It is to ascertain and report in detail as to each property owned by any said common carrier for its purposes as a common carrier, the original cost to date, the cost of reproduction new, the cost of reproduction less depreciation, and an analysis of the methods by which these several costs are obtained and the reason for their differences, if any." The commission is also to ascertain and report separately other elements of value. After having ascertained all the elements the commission is both to include them in its report and to base its own estimate of the value of the different railways on them. If the railways disagree with the commission's conclusions they can appeal from it to the courts. It is evident, therefore, that all investments from earnings must be ascertained and reported, but the weight to be given to them is yet to be determined.

One view advanced by some lawyers and economists is that the owners of a railway or other public utility are entitled to have included in its valuation and to receive a return on only the actual investment from their own capital made by them, and that invested surplus earnings over and above interest on bonds and reasonable dividends on stock are not really investment by the owners. Commissioner Lane expressed this thought in the Western rate advance case, when he said, "Perhaps the nearest approximation to the fair standard is that of bona fide investment—the sacrifice made by the owners of the property considering as part of the investment any shortage of return that there may be in the early years of the enterprise." In other words, if a road is capitalized for $50,000 a mile, of which $25,000 is bonds representing actual investment and bearing interest at 4 per cent., and $25,000 is stock, also representing actual investment, on which dividends averaging 6 or 8 per cent. have been paid, and if, in addition, $15,000 per mile has been invested from earnings, the owners of the railway are not entitled to have this $15,000 included in the valuation. On the other hand, if the railway is capitalized as stated, and the bondholders have always received their interest, but the stockholders have received only 3 or 4 per cent. on their part of the investment and have allowed 3 or 4 per cent. to be invested in the properties, then the investment from earnings should be included in the valuation. This theory was strenuously insisted on by the attorneys for some of the western inter-mountain communities in the Pacific coast rate cases.

It is contended, on the other hand, by other lawyers and economists, that all investments from earnings should be included in a valuation. It is urged, in the first place, that when practically all of the railway mileage of the United States was built and the permanent improvements in it were made there was nothing in the charters of the railways, in the constitutional or statutory provisions applying to them, or in the law of public service callings as laid down by the courts, to indicate that investments made by railway companies from earnings would be treated differently from investments made from any other source. Therefore, those who built the railways built them on the assumption that, like investors in other concerns, they would be allowed to profit by their investments from earnings. The railway corporations of the United States could have followed the practice of those of England and paid out to their security holders annually all of their net earnings. There was nothing in the law, and there is nothing in the law now, to prevent this. Therefore, it is argued, to refuse to include in the valuation the investment from surplus earnings would be to break the public faith with the owners of railways and to confiscate part of the value belonging to them by what would be, in effect, retroactive legislation. Furthermore, it is argued, the application of this principle would lead to some absurd results. Reverting to the example already used, on this principle a railway, the original cost of which was $50,000 a mile, and which had earned the annual interest on its bonds, 6 per cent. on its stock and enough to invest $25,000 a mile from surplus earnings, making the total invested in it $75,000 a mile, would be valued at $50,000 a mile. A railway, which also originally cost $50,000 a mile, which had been in operation 10 years, and which during this period had paid 4 per cent. interest on its bonds and earned only 6 per cent on its stock, of which one-half had been invested in the property, would at the end of the period represent

an original investment per mile of $50,000 and an investment from earnings of $3,750, or $53,750 per mile. Obviously, the former railway, which had cost $75,000 a mile and was the better earner would be the more valuable, and yet on this principle, while a valuation of only $50,000 per mile would be put on it, a valuation of $53,750 a mile would be placed on the road which both had cost less and earned less. The valuations having been made on this principle, the question naturally arises, as to the valuation on which railway rates would be adjusted.

The foregoing summarizes the news on both sides of this very important question. How important it is, is indicated by the figure regarding the total investment from the surplus given by Commissioner Lane.

PROPOSED GOVERNMENT OWNERSHIP IN ALASKA.

IN extremely few countries has the adoption of government ownership of railways been preceded by full and intelligent discussion of the relative advantages of state and private management. There was pretty full discussion in Germany and Switzerland, and the decision was for state ownership. In Italy there was made the most exhaustive investigation in history, and the decision was against government management, but because of complicated financial relations between the government and the railway companies, state management came, anyway. With these exceptions, state ownership and management usually has resulted from fortuitous and temporary conditions or snap judgment. A beginning is being made with state ownership in the United States in the same way. The federal government acquired the Panama Railroad, not because it was decided that state ownership was preferable on principle—that point was not discussed—but because this road was to be used as an instrumentality in the construction of the Panama canal. Now government ownership in Alaska seems likely to be adopted without any consideration of the principle involved. To adopt the policy in disregard of the principle involved is to adopt it in disregard of the probable results.

On August 23, 1912, Congress passed a bill to create a commission to investigate the transportation question in Alaska and report "in respect to the best and most available routes for railroads in Alaska which will develop the country and the resources thereof for the use of the people of the United States." Within a week President Taft appointed a commission composed of Major Jay J. Morrow, Corps of Engineers, United States Army, chairman; Alfred H. Brooks, geologist in charge of division of Alaskan Mineral Resources, Geological Survey, vice-chairman; Leonard M. Cox, civil engineer United States Navy, and Colin M. Ingersoll, consulting railroad engineer. The three largest states in the Union are Texas, California and Montana. The area of Alaska is 20,000 square miles greater than the combined areas of these three states, and is one-fifth the area of the entire United States. This indicates what an assignment the commission was given. To execute it in a way that would enable it to make a report that would deserve respect would have required many months. Nevertheless, the commission, which included only one engineer of railway experience, made its report to the president on January 30. This was but five months after its appointment, and those five months were fall and winter months, during which the extreme weather in Alaska makes investigation of railway routes in that territory extremely difficult or impossible. Yet not only does the commission undertake to tell the best routes for the construction of railways in Alaska and recommend the building of two lines, but it also essays to estimate in considerable detail what the railways along all the different routes considered would cost to construct, what traffic they could expect, what rates they could make, and what their fixed charges, gross earnings, operating expenses and net earnings would be. And it is proposed on the basis of such an investigation and report that Congress shall embark the government of the United States on a policy of public ownership of railways in Alaska that it is estimated will at the start cost $35,000,000. The very fact that such a proposal can be seriously made and considered is an argument against government railway ownership in this country. Government ownership is a success in Prussia. But can any one imagine the Prussian government doing business in such a way? Can anyone imagine private capitalists giving engineers only five months—most of them winter months—to report on a proposed expenditure of $35,000,000 on railways in a country like Alaska?

The argument is advanced that the natural resources of Alaska should be developed, that a prerequisite to their development is the construction of a large new mileage of railways, and that the government should do this, first, because it can do it at a lower cost of capital, and second, because it is more likely to build an adequate mileage than private companies, because private companies must earn profits while the government need not.

That the natural resources of Alaska ought to be developed and that the construction of new railway mileage is essential for this purpose will not be controverted. The new mileage may be secured in any of three ways. Its construction may be left to private companies without government aid, or the government may build it, or private companies subsidized in one way or another by the government may build it. The three main objects to be sought are, first, that the new construction shall be adequate; second, that the total economic cost of the transportation provided, including operating expenses and return on the capital invested, shall be made as low as practicable; and third, that the rates shall be so made as best to develop the potential and handle the available traffic. The potential and available traffic would be the same for either government or private railways. Under government ownership railways ought to be built in the same places as they would be built by intelligent private capitalists, namely where the potential and available traffic are greatest. A traffic that would pay government railways would pay private railways, provided that the one were to be constructed and operated as economically as the other; and—again with the same proviso—a traffic that would not pay the one would not pay the other. If private railways were built and the government guaranteed their interest the government could by regulation make the rates as low as it could make them on government railways since if there were a deficit the government would make it good from taxation just as it would in the case of railways it owned. If the traffic and the rates applied were the same in either case the gross earnings would be the same; and in that event whether the total earnings would be sufficient to pay operating expenses and a return on capital—and if they were not, whether a larger deficit would have to be made good from public taxation under government or private ownership—would depend entirely on the economy with which the roads were developed and operated. The whole question, then, is whether public or private management would be the more economical.

The Alaskan railroad commission concluded that the total amount necessary to pay a return on capital and working expenses would be less under government than under private ownership. This was based on the assumption that the government could borrow money for construction cheaper than private companies unaided by government guarantees of interest. It was tacitly assumed that the cost of construction and operation by the government would be the same as by private companies. But, in the first place, it is not necessarily true that the government could borrow money at a lower rate than private companies. As the commission itself indicated, if the government guaranteed part or all of the interest of private companies as the government of Canada is doing in some cases, the private companies could borrow money as cheaply as the government. And in any event, the question whether construction and operation by the government or private companies would be the cheaper is a more important question than which could borrow capital the cheaper, for on most railways the operating expenses amount to more than the necessary return on investment. In the year ended June 30, 1911, the operating expenses of the railways of the United States were 68.66 per cent., and their net earnings, from which all return on investment was paid, only

31.34 per cent. of their gross earnings. The expenses per mile were $7,867, and the net earnings $3,593. Therefore, a 10 per cent. saving in operating expenses would have amounted to $786.70 per mile, while a 10 per cent. saving in net earnings would have amounted to only $399.30 per mile. In Canada in the fiscal year 1912 operating expenses were 68.7 per cent. of gross earnings and net earnings 31.3 per cent. of gross earnings. These figures show that on most of the existing railways of North America it is more than twice as important to economize in operation as in cost of capital.

Now, statistics of railways throughout the world show that government management is usually less economical than private management. The following table gives the capitalization or cost of construction per mile of state railways in six leading countries and of private railways in six leading countries:

State Railways.	Capitalization or cost of construction.	Private Railways.	Capitalization or cost of construction.
Belgium	$187,787	United Kingdom	$274,562
Italy	124,586	France	148,886
Switzerland	116,692	Spain	77,077
Prussia-Hesse	114,000	United States	62,657
Canada (Intercolonial)	64,095	Argentina	56,161
New South Wales	63,999	Canada	55,829

This table does not indicate that under government ownership railways cost less than under private ownership. The private company that formerly owned the Panama Railroad, which was then a double-track line, had a capitalization of $221,120 per mile, while the reconstruction of the railway as a single-track line by the United States government cost $226,190 per mile. It is especially significant, as Alaska is a new country, that the cost of construction of both the government-owned Intercolonial of Canada and of the state railways of New South Wales has been larger than is the capitalization of the private railways of either the United States, Argentina or Canada.

Data regarding the expenses of operation are even more significant. While the traffic density—passenger and freight—of the private railways in France is 84 per cent. heavier than that of the state railways, their operating expenses per mile are but 5 per cent. greater. While the density of traffic of the railways of Canada as a whole is 83 per cent. as great as that of the government-owned Intercolonial, their operating expenses per mile are only 77 per cent. as great. While the density of traffic of the government-owned but privately operated railways of Holland is 43 per cent. greater than that of the Danish government roads, their operating expenses per mile are only 23 per cent.. greater. While the density of traffic of the Spanish private roads is 70 per cent. as great as that of the Italian government railways, their operating expenses per mile are only 39 per cent. as great. The French private roads have a traffic 68 per cent. heavier than the Swiss state roads, and their operating expenses per mile are only 9 per cent. greater. The traffic of the French private roads is 68 per cent. as heavy as that of the Prussian-Hessian state roads, and their operating expenses per mile are only 60 per cent. as great. The density of traffic of the Argentine private roads is 10 per cent. greater than that of the New South Wales government roads, while their operating expenses per mile are 2.4 per cent. less. The Canadian private roads have a traffic 63½ per cent. heavier than that of the New South Wales government roads and their operating expenses per mile are only 5½ per cent. greater. The railways of the United States as a whole have a traffic density 66 per cent. as great as that of the Prussian-Hessian government roads, and pay wages more than twice as high, and yet their operating expenses per mile are only 52 per cent. as great as those of the Prussian-Hessian government roads. The railways of United States group 2 handle a traffic 143 per cent. more dense than that of the Prussian-Hessian roads and pay wages twice as high, and yet their operating expenses per mile are only 11 per cent. greater than those of the Prussian-Hessian lines. It is a rule almost without exception that under conditions at all comparable the cost of operating government railways is larger in proportion to the traffic that they handle than on private railways.

Further evidence that government operation is almost invariably more expensive than private operation is afforded by the statistics of the railways which in recent years have been transferred from private to government management. The Western Railway of France was taken over by the government in 1908. In four years under government management its traffic increased 12 per cent., while its operating expenses increased 50 per cent. In the last ten years it was under private management the operating ratio of the Panama Railroad never exceeded 66 per cent. Under the management of the United States government it increased in 1905 to 77½ per cent.; in 1906 it was 79.5; in 1908, 74.5 per cent.; in 1911, 70.8 per cent. The increase in earnings between 1904 and 1911 was 84 per cent., and in expenses 110 per cent. The average operating ratio of the Italian railways under private management during the five years ending 1905 was 67½ per cent. Government operation was resumed in 1905, and never since then has the operating ratio been less than 77 per cent., and in 1908 it rose to 83 per cent. In view of all these facts it is rather startling to find a commission assuming without investigation or discussion that government development and operation of railways in Alaska would be as economical as private development and operation.

It may be said that under government management the railway mileage of Alaska would be increased faster than it would be under private management. This is an argument often advanced for government ownership in new countries. But the evidence shows that if a country affords any business for railways to handle they will be more rapidly constructed under private than under public ownership. In no country in the world did railway construction go on so rapidly until within recent years as in the United States. The only continent on which from the beginning the railways have been owned and operated by the government is Australia. There, if anywhere, the evidence that railways will be more rapidly developed in a new country by the government than by private companies should be forthcoming. Argentina and Canada are other new countries, and in them the great majority of the railway development has been left to private companies. The area of Australia is three times as great as that of Argentina and 70 per cent. as great as that of Canada. The following table, giving the railway mileage in Australia, Argentina and Canada in 1880 and 1911, shows where the increases in mileage have been most rapid:

	1880.	1911.	Increases.
Australia	3,580	16,078	12,498
Argentina	1,408	19,843	18,435
Canada	6,874	25,400	18,526

It will be seen that in this period of 31 years the increase in mileage in both Argentina and Canada was 50 per cent. greater than it was in Australia. There has been for years one transcontinental railway across Canada, and soon there will be three. There is one across Argentina in connection with the Chilean railways. Australia, under government ownership, is still waiting for its first transcontinental railway. Furthermore, the statistics given do not do justice to Canada, for in 1911 there were 11,633 miles under construction in Canada, of which 1,560 miles were in operation. When all the mileage now under construction in Australia and in Canada is finished, Canada, with an area less than 50 per cent. greater than that of Australia, will have almost three times as large a mileage of railways.

If past and present experience is any criterion, private companies will provide a larger mileage and construct and operate it more economically than the government wherever the conditions warrant railway development. They will warrant it wherever the available and potential traffic are sufficient to make railways pay. And if the resources of Alaska are not sufficient to make the railways pay, in the long run, why should the people of the United States be taxed to subsidize either government or private construction in Alaska? If, however, the government is to adopt the policy of subsidizing construction the experience of the world indicates that it would secure more results with a given amount of subsidies if it subsidized private companies, as Canada is doing, than if it went into the business of building and owning railways on its own account.

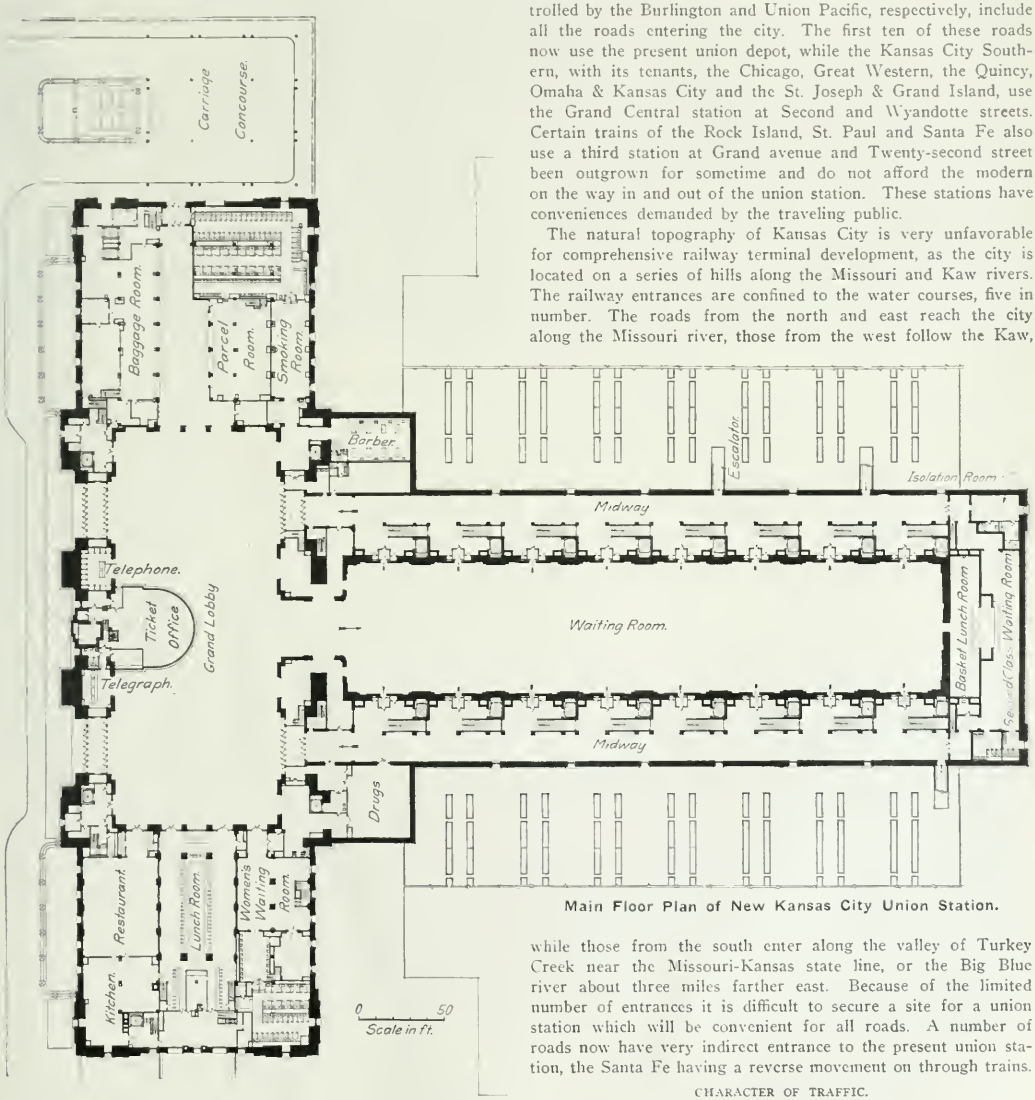
NEW KANSAS CITY, MO., PASSENGER TERMINAL.

Union Depot for All Roads Approaching Completion. Project Includes Belt Line and Complete Facilities.

The largest railway terminal development now under way, except the Grand Central Terminal in New York, which is now nearing completion, is that of the Kansas City Terminal Railway at Kansas City, Mo., where improvements estimated to cost $40,000,000 are being made. This work includes a new union station for all the roads entering the city, a belt line for passenger and freight traffic connecting with all the roads, new local freight houses, terminal switching yards for freight interchange, etc.

The Kansas City Terminal Railway Company is a corporation chartered for the purpose of providing new terminal facilities. The stock is owned equally by 12 roads, the Santa Fe, Alton, Burlington, Rock Island, St. Paul, Missouri, Kansas & Texas, Missouri Pacific, Frisco, Union Pacific, Wabash, Great Western and Kansas City Southern, which, together with the Quincy, Omaha & Kansas City and the St. Joseph & Grand Island, controlled by the Burlington and Union Pacific, respectively, include all the roads entering the city. The first ten of these roads now use the present union depot, while the Kansas City Southern, with its tenants, the Chicago, Great Western, the Quincy, Omaha & Kansas City and the St. Joseph & Grand Island, use the Grand Central station at Second and Wyandotte streets. Certain trains of the Rock Island, St. Paul and Santa Fe also use a third station at Grand avenue and Twenty-second street been outgrown for sometime and do not afford the modern on the way in and out of the union station. These stations have conveniences demanded by the traveling public.

The natural topography of Kansas City is very unfavorable for comprehensive railway terminal development, as the city is located on a series of hills along the Missouri and Kaw rivers. The railway entrances are confined to the water courses, five in number. The roads from the north and east reach the city along the Missouri river, those from the west follow the Kaw,



Main Floor Plan of New Kansas City Union Station.

while those from the south enter along the valley of Turkey Creek near the Missouri-Kansas state line, or the Big Blue river about three miles farther east. Because of the limited number of entrances it is difficult to secure a site for a union station which will be convenient for all roads. A number of roads now have very indirect entrance to the present union station, the Santa Fe having a reverse movement on through trains.

CHARACTER OF TRAFFIC.

The problem of providing for the passenger traffic at Kansas City is radically different from that at any of the other large stations recently built. While large numbers of suburban passengers are handled at the Pennsylvania and Grand Central terminals at New York, and the North Western station at Chicago, there is practically none of this traffic at Kansas City.

Also while at the other stations there is practically no transfer of passengers to other trains leaving the same station, and nearly all the passengers, both through and suburban leave the building immediately on their arrival at Kansas City, both through, transfer and local Kansas City traffic are handled. The Santa Fe, Rock Island and Missouri Pacific each run a number of trains daily through the city. Numerous other trains on these roads, as well as all trains on the other roads, stop and start here. This gives rise to a large transfer of passengers from one train to another, over 30 per cent. of those handled through the union depot in 1911 being ticketed through, in addition to a large number of others who bought tickets locally to Kansas City and then to their destinations.

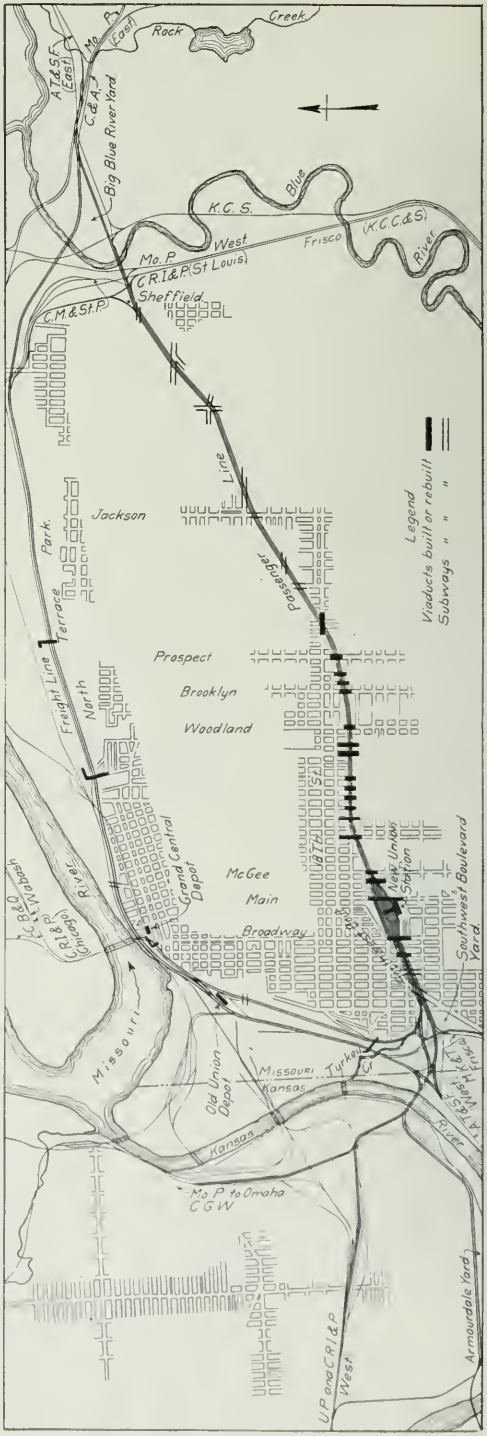
On trains passing through the city, considerable switching is necessary in the station to set in or remove dining cars, connecting line sleepers, etc. This requires a track layout such that a switch engine can work readily with minimum interference with other operations. These distinctly local conditions materially influenced the designs for tracks and buildings to provide for handling the trains promptly and expeditiously and to care for the passengers between trains.

Largely because of the importance of Kansas City as the gateway to the southwest, the number of passengers handled is out of all proportion to the size of the city. In 1911, 78,542 trains with 456,334 cars were handled for the ten roads entering the union depot alone. Over 2,215,000 pieces of baggage were handled in the union depot alone in 1911, and 2,076,084 pieces in 1912. This, combined with that handled at the Grand Central station in Kansas City, makes a total of 2,500,000, equal to that at South station, Boston, the largest in this country. Kansas City has a maximum daily record of 10,000 pieces of baggage as compared with a maximum of 6,000 pieces at the Pennsylvania terminal, New York. The income from storage on baggage at the union depot in 1911, amounted to $20,384, and in 1912 to $19,457, while the parcel room receipts for 1911 were $41,480, and for 1912, $40,564. The ticket sales in 1911 at the union depot ticket office alone, exclusive of Pullman tickets, numbered 1,401,238, amounting to $4,892,438, while in 1912, 1,330,544 tickets were sold amounting to $4,501,781.

The transfer of mail is also very heavy because of the number of diverging routes. The proportion of mail transferred, to that going through without change, is so great that the Santa Fe finds it more expeditious to set out one mail car and pick up another on its through trains and to transfer the mail going through, rather than that to be unloaded. From 225 to 300 tons of mail are handled through this station daily, and as most of this is transferred from one train to another, the terminal company must assume charge of the transfer and bear the expense, which is no small item in itself. The amount of mail handled compares very favorably with that at South station, Boston, where about 250 tons are handled daily, and at the Pennsylvania station in New York, where between 220 and 260 tons are handled.

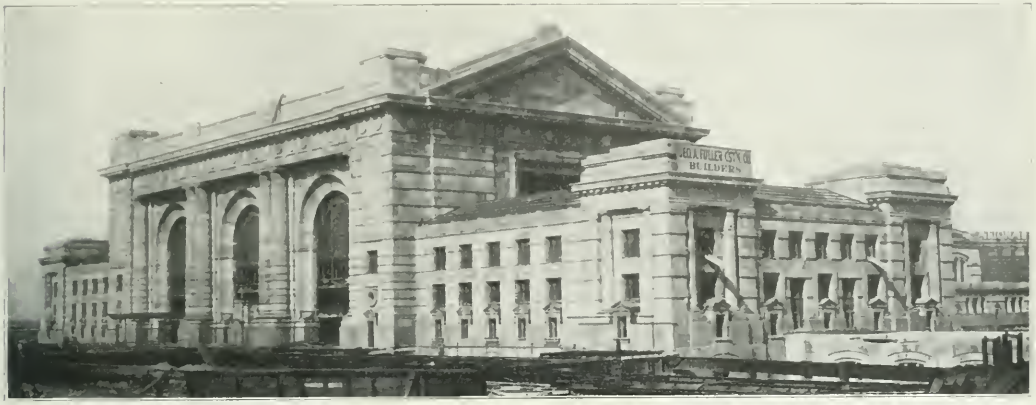
A careful study of the increase in the traffic passing through the present union station shows that the number of trains has doubled every 13 years, the number of cars every 12 years, and the amount of baggage handled every 11 years. Naturally, this rapid increase in traffic long ago caused the old station to be completely outgrown. Also, the confusion and inconvenience resulting from maintaining two stations has long been recognized, and when plans for the new station were considered, opportunity was offered to combine in one terminal.

Negotiations have been conducted with city officials looking toward a reconstruction of these terminal facilities for several years, and ordinances providing for this work were passed in 1909. These ordinances were ratified by the voters at a special election and the preparation of plans was begun at once. As the details were worked out it became evident to the city and to the Terminal company that certain changes which affected the ordinances in details only rather than the general plan were necessary for the best interest of both parties. Accordingly a



Map of Portion of Kansas City Showing Terminal Railway Tracks.

revised ordinance was prepared and passed by the city council in June, 1911. The most important changes made were regarding grades east and west of the new station. This ordinance provides for the construction of a union passenger station west of the present Grand avenue station, four freight stations where local freight will be received for all roads, a belt line formed by the lease of existing tracks and the construction of additional track where necessary, and the complete separation of street and railway grades.



The South or Plaza Side of the New Station.

THE PASSENGER STATION.

The most important individual feature of this plan is the passenger station which is being constructed at a cost of about $5,000,000. As shown on the accompanying map, the new station is located between Broadway and Main streets, opposite Twenty-third street, about three miles southeast of the present union depot and about 30 ft. above it, where it is safe from such floods as put the old station out of service in 1903. The station building is four stories in height above the basement or track level, with a sub-basement for express and baggage. It faces to the south on a large plaza covering two city blocks, purchased for this purpose by the terminal company. The creation of this plaza required the removal of 630,000 yds. of earth and rock, as the original site was a high hill sloping directly to the track. Beyond a wide boulevard this area will be parked, and the city will grade approaches to the streets on top of the hill. The Park Board of Kansas City is now considering sloping a portion of the hill to the level of the plaza as far south as Twenty-fifth street. The plaza is on the level of the main floor of the station, or one story above the tracks and connects directly with Main street and Broadway.

The main station building is "T" shaped with a stem projecting out over the tracks. The head house is 510 ft. long and 150 ft. wide, while the portion over the tracks is 410 ft. long and 165 ft. wide. The building is of Bedford stone with granite trimmings on the faces and bush hammered concrete in less important places. The exterior walls are of massive masonry, the Bedford stone being backed with brick, while the interior is of steel frame construction with reinforced concrete floors throughout. The foundations for the main building are carried to rock, while the train shed piers are supported upon rock upon spread

The New Union Station—Looking East over Express Building.

footings resting on undisturbed natural soil or on Raymond concrete piles where there is a considerable depth of recent fill. Provisions are made for extension of the building over eight additional tracks which may be required in the future, giving 50 per cent. additional space for standing trains and waiting room.

The main or plaza level will be devoted to facilities for the public, all of which are on this floor, while the three upper floors over the end wings will be given over to general offices for the terminal company and tenants whose business is associated with that of the railways. Two main entrances lead from the plaza to the grand lobby in the center of the building. This room is 230 ft. x 100 ft., and is 85 ft. high, being open to the roof. Three large arched windows face on the plaza. With the exception of the ticket office, which is located under the center window on the south side, this lobby will be free of all obstructions. The lower portion will be finished in Tennessee marble with Kasota marble above. It will be lighted by large electroliers suspended from the ceiling.

Leading directly from the grand lobby, and extending over the tracks, is the main waiting room. This room is 54 ft. high, with a flat ceiling, and will be lighted by side wall lights. On each side of the main waiting room are train gates leading to the different platforms. Concourses are provided just outside these gates in which are located the stairways and elevators. Entrance to the station from trains will also be gained by these same stairs and elevators to the concourses from which the passengers will pass directly to the main lobby without going through the waiting rooms.

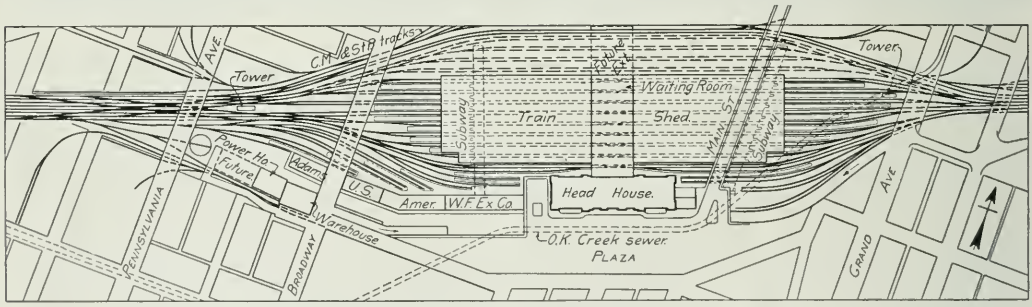
A lunch room, restaurant and women's waiting rooms are located in the east wing, directly off the grand lobby, while baggage and check rooms and men's waiting rooms are located in the west end. A drug store, newsstand, etc., will be along the north side of the main lobby. A covered cab-stand is provided on the plaza level along the west end of the station.

The basement or track level floor will be devoted to commissary, baggage and mail rooms. Baggage and mail will be received from a driveway on this level under the plaza, which connects with Grand avenue and Broadway, and will be lowered from this floor to the sub-basement from which two tunnels pass under the tracks beyond the ends of the station, with elevators to each platform. In this way all trucking at the track level is avoided and interference to passengers is eliminated. The interchange and sorting of mail, baggage and express, will be confined to this sub-basement level. The express business is also taken through these tunnels, and the sub-basement to the express building, a two-story structure with sub-basement west of the station. This building is 1,000 ft. long and 60 ft. wide, and is divided for the use of the four express companies operating into Kansas City. Offices for the use of these companies will be provided on the second floor of this building. A power house to provide, heat, light and power for all purposes about the station, at the coach and engine yard at Southwest boulevard, and for the interlocking towers at each end of the yard will be located opposite the west end of the express house.

Sixteen through passenger tracks are provided in addition to two thoroughfare tracks. The tracks are built in pairs, alternating 12.5 and 31.5 ft. centers, with concrete platforms between 8 in. above the top of rail. No special track construction will be provided. Each pair of tracks will eventually be connected by two crossovers opposite the center of the station, affording flexibility of train movement. Low train sheds 1,400 ft. long will be constructed over the tracks. All trains will pull through the station and stop with the baggage cars near the tunnels leading to the baggage and mail rooms, and the passenger cars near the stairways. In addition to the through tracks, several stub tracks will be provided at the east end of the station for the handling of mail cars, while similar tracks will be built opposite the express rooms at the west end for express business. Two of these latter tracks will be depressed so that the floor of the car will be level with the express room floor to facilitate loading.

BELT LINE CONNECTIONS.

Four main tracks will lead east from the new station to Sheffield. West of the station to the Frisco crossing there will be six main tracks, the two outer tracks all the way from Sheffield to the union station being for freight, while the two center southerly tracks will be used for passenger movements. Between the station and the Frisco crossing all tracks will be used as

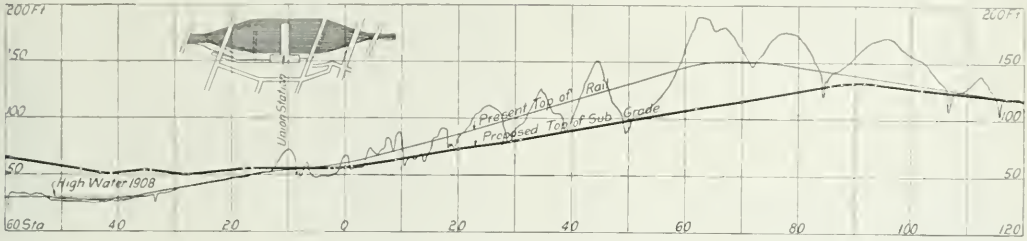


Track Layout Through Station.

may be found convenient, for passenger movements, for freight movements or for movements of empty equipment to and from the coach yards.

At Southwest boulevard, a short distance west of the station, it was originally planned to separate the grades of the freight and passenger tracks, the freight tracks descending while the passenger tracks rise to a higher level. Under this plan the freight tracks would cross the Kaw river at the site of the present bridge and at practically the same elevation, turning abruptly to the west just across the bridge and continuing to Armourdale yard. A single track freight line connects the west end of this yard with the Union Pacific and Rock Island at Clark Junction. Connections from this low level freight line will be made with the Santa Fe, Frisco and Missouri, Kansas & Texas on the east side of the Kaw river, while a low level freight line will extend through the center of the present yard south of the union depot to a connection with the roads entering over the Hannibal bridge and with a north side belt line. The high level, or passenger, line will extend across the Kaw river on the upper deck of the same bridge, which carries the freight line, and will then divide into two double track lines, one extending north on a high steel viaduct across the present Rock Island and Union Pacific tracks to a connection with the Missouri Pacific main line to Omaha, the other turning west and descending to a connection with the Union Pacific and Rock Island. At the present time this high level line has not been definitely author-

ized and the low level line may eventually be used for passenger traffic also. Another double track high level passenger line leaves the main track at Southwest boulevard and follows around the face of the bluff to a connection with the Burlington, Wabash and Rock Island near the Hannibal bridge. From Sheffield to the Hannibal bridge along the Missouri river the belt line for freight traffic will consist of two tracks, one of which will be



Profile Through Big Cut East of Station.

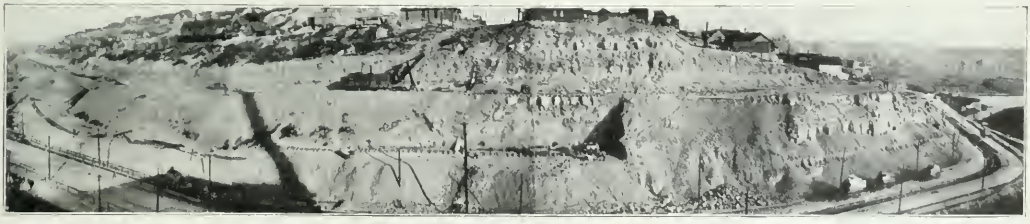
turned over by the Alton, and the other of which is now being built. The construction work along this freight line is very light.

When these lines are completed, facilities will be provided for direct and expeditious movement of both passenger and freight traffic without interference with each other, and with no railroad grade crossings on the passenger lines except three close together at Sheffield, plans for the separation of which are now being considered. All crossings of street and railway tracks

track connections to these industries be maintained with comparatively little interruption.

This cut is about two miles long and requires the removal of about 1,000,000 yds. of earth and rock, of which about 750,000 yds. have been removed up to the present time. Because of the congested conditions, it has been necessary to give up one track to construction purposes and to separate the remaining track as a single track main line within the limits of the work. A block averaging about three-quarters of a mile long is established,

Burlington Connection Shortly After Work Was Started.



Burlington Connection on April 1, 1913.

along the passenger line will also be separated, and there will be few grade crossings with streets on the north side freight line.

EXCAVATION WORK.

This extensive track arrangement requires a large amount of excavation, the heaviest work being the reduction of the grade on the existing line east from the station site through the divide between the Turkey Creek and Big Blue valleys from 1.5 per cent. to 0.9 per cent. The heaviest cut on the old line was about 40 ft. deep, a short distance east of Woodland avenue. On the new grade the tracks are being lowered 38 ft. further at this point, and the cut is being widened for four tracks, where

crossovers are placed at each end and the intervening distance is operated as single track with telephone block.

Because of the narrow right-of-way owned and the difficulty and expense of securing additional land in a well built up residence and industrial community, retaining and facing walls are required in the deep portions of the cut and are being built as fast as the excavation proceeds. The material in this cut consists of a heavy clay overlying rock which is badly fissured and broken. In excavating through the rock it was first intended to use a Sullivan channeling machine to secure vertical faces for about 1,200 ft. in the deepest portion of the cut, in this way reducing the amount of retaining walls required, but the rock

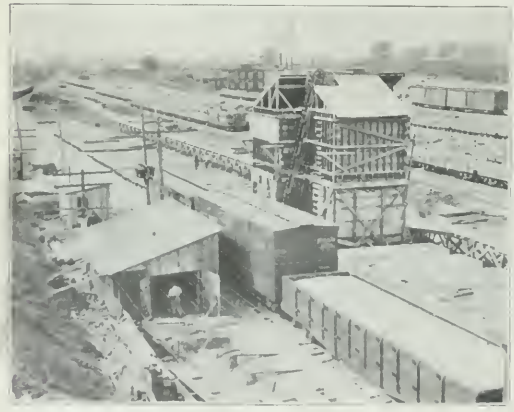
was so fissured that it was impossible to use the channeler with any degree of success. About 60 per cent. of the material consists of rock and shale which has to be shot, requiring very careful handling of explosives. The material is loaded by steam shovels into flat cars and 12 yd. Western air dump cars, and is hauled over the main line to fill the Blue River and Southwest boulevard yards and to raise the main tracks west of the station, 500,000 yds. of filling being required between Grand avenue and the Frisco crossing alone. The operation of these dirt trains on the main line results in considerable delay to the hauling trains, but in spite of these unfavorable conditions, the shovels have made very favorable records.

As the cut is lowered the amount of water coming into it increases, and it is necessary to keep outlet ditches open. In

Abutments for Twenty-fifth Street Subway.

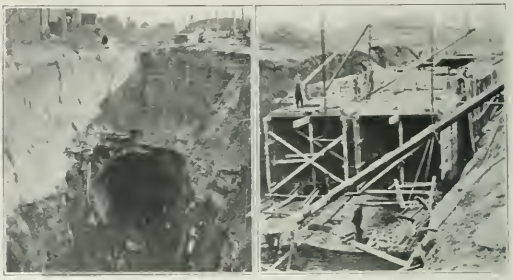
the final arrangements, a sewer ranging in size from 48 in. down, will be laid between the two center tracks sufficiently low to remove surface drainage and seepage, and to drain the wire conduit which will also be laid in the retaining walls through this cut. All sewers and water mains had to be lowered below the new grade in advance of the steam shovel work and because of the depth of the cut this has made very expensive work in certain places. Also, the fact that the city authorities required that all street car lines be kept open while the work is in progress and that only every other street without car lines could be temporarily closed, complicated the situation.

Another piece of heavy grading work is on the high level



Concrete Mixing Plant in Slab Yard Near Big Blue River.

Burlington connection between Southwest boulevard and the junction with the present tracks at St. Louis avenue, a distance of 9,300 ft. This double track passenger line is being built at an elevation considerably above that of the old yard alongside and requires the moving of 900,000 yds. of material, 40 per cent. of which is rock. The location of this line rendered necessary a change in several streets and the construction of several retaining walls to support the hill and streets above. Brook street is now being moved inside the curve from Twenty-fifth street to Allen avenue, and Allen avenue in turn is being moved further up the slope. The accompanying cross section and photographs give an idea of conditions at this place. One of the retaining walls is 1,700 ft. long and varies in height from



Circular and Rectangular Sections of O. K. Creek Sewer.

14 to 39 ft., with a maximum surcharge of material of 35 ft. Over 30,000 yds. of concrete is required in these walls and other work on this connection.

Allen avenue varies from 10 to 50 ft. above the tracks, and is 50 ft. wide. The railway company is required to do all the work in connection with building the street. At one point it was necessary to move two 20 in. and one 30 in. high pressure water mains which were laid up the slope of the hill. To do this a tunnel 240 ft. long was built, 100 ft. of which was inclined upward at an angle of 45 deg., and the three pipe lines were placed

Box Abutment Under Construction for Woodland Ave.

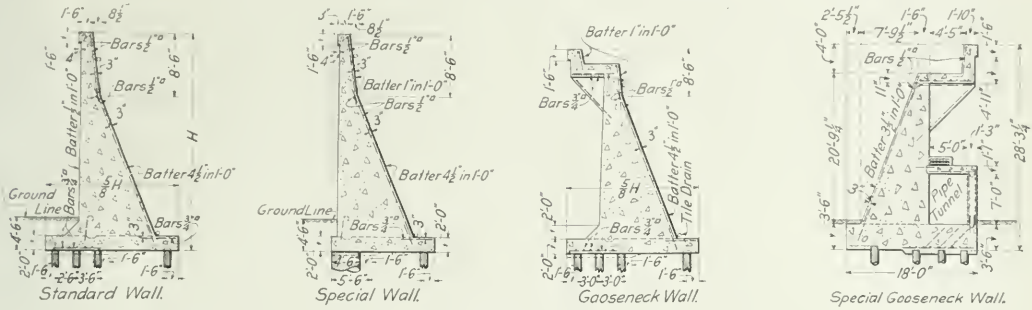
in it. In this same vicinity a 150,000 gal. oil tank belonging to the Frisco also had to be replaced with another located further up the hill. Because of the non-interference with traffic, the grading on this connection was let by contract. All other grading work, however, is being done by company forces.

YARDS.

Facilities for the handling of passenger engines and equipment will be provided by the construction of a yard in the triangle between the main line, the Frisco tracks and Southwest boulevard, a short distance west of the new station. At present each railway takes care of its own equipment, hauling trains in some instances three or four miles from the station to the coach yard. A number of the roads will use these new facilities immediately upon the opening of the station, and it is expected that eventually all will do so, although, for the present, as one or two of the roads have recently made extensive additions to their coach yard facilities, they may continue to use them. Complete

facilities will be provided for the care of locomotives and passenger equipment. A roundhouse and coal chute, water cranes, coach cleaning yard and icing facilities are all being constructed. About 175,000 yds. of filling was required for this yard, all of which is in place, this material coming from the station site and from the big cut.

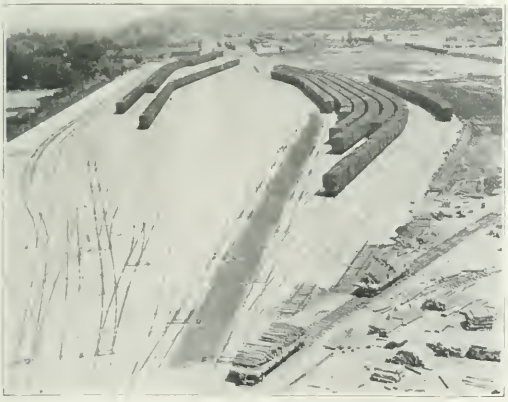
Two yards were provided for freight traffic, one at Armourdale in the Kaw river bottoms at the west end, and the other just east of Big Blue river. At the present time the terminal railway will not act as a belt line to transfer traffic between the different roads, although this may develop at some future date.



Standard and Special Retaining Wall Sections.

However, a large and increasing number of industries are located along the lines of the terminal company and freight for these industries is delivered to the roads by the terminal. The two yards are primarily for the interchange of this business between the terminal company and the other roads. They are so located that those roads entering from the west or over the Hannibal bridge will exchange freight through the Armourdale yard, and those entering via Sheffield will deliver in the Big Blue yard.

The Armourdale yard is a flat yard with 26 tracks, in addition to two main tracks and a passing track along the north side. The layout is clearly shown in one of the accompanying photographs. A six track rectangular engine house, with a capacity of 12 engines is located at the west end of the yard for the use of switch engines. A small machine shop for making light repairs is also built in connection with it. A 100,000 gal. steel oil tank is provided for the storage of fuel oil which is used by the terminal company engines.



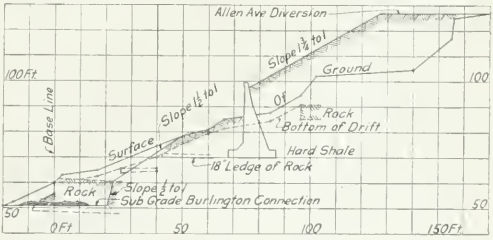
The Armourdale Yard.

The Big Blue yard is located between the Alton and Santa Fe tracks east of the Big Blue river. To make room for this yard it was necessary to move the Alton tracks north for a distance of about a mile and to construct a new bridge for this line across the river. The grading here was considerably heavier than in the Armourdale yard, the material being brought from the big cut. This yard will also be a flat yard. Complete facilities for the care of switch engines will be built here ultimately, and it is planned in the future to erect a machine shop capable of handling all classes of locomotive repairs.

The original ordinance provided that four freight stations be built for the handling of local and team track freight for all roads. It was specified that one of these be located at McGee street just east of the new station, one near Norton avenue and Fifteenth street, another in the Blue Valley just north of Sheffield, and the fourth near Grand avenue and the Alton tracks on the freight line. The McGee street freight yard, which has recently been completed and is now in service, includes a brick freight station 56 ft. x 176 ft. in size, with two platform tracks and 17 team tracks, with a capacity of 300 cars. Work has not yet been begun on the three other yards.

BRIDGE WORK.

A very important feature of the terminal improvements is the bridge work, the work already authorized being estimated to cost over $4,000,000, and requiring over 27,000 tons of steel, while over $1,000,000 additional work is included in the proposed



Cross-Section Showing Work Along Burlington Connection.

double track, double deck bridge over the Kaw river and the steel viaduct for the high level passenger line in Kansas. The majority of this work is for viaducts and subways in streets, it being necessary to reconstruct 13 viaducts, to construct 11 new viaducts and 11 new subways, and to reconstruct one subway.

If built the most important structure will be the two deck bridge across the Kaw river west of the new station, which will consist of two 300 and one 140 ft. spans. The two 300 ft. spans will be through spans for both decks, while the shorter span will be built as a deck structure for the upper level. The bridge is designed for Cooper's E-60 loading on all four tracks. About 4,800 tons of steel will be required for this structure, which will replace another bridge on the same site and will rest upon the present piers which were carried to rock when the present bridge was built in 1907. The high level passenger line viaduct in

Kansas will be about 12,000 ft. long and will require about 15,000 tons of steel.

The standard construction for street viaducts is steel deck girders resting on concrete abutments and piers, the lower surfaces of these girders being encased in concrete with a cement gun to protect them from the action of the locomotive gases. Much trouble has been experienced here with the corrosion of steel in the older structures, and it is planned to prevent this in future works. Likewise, trouble has been experienced in one or two cases with the gases attacking concrete, but it is believed that this is the result of the chemical action set up between the stone, which is a local limestone, and the gases. The clearance at the viaducts ranges from a minimum of 19 ft. to a maximum of 56 ft. at Woodland avenue. All viaducts are designed to carry street cars, whether tracks now pass over them or not. Concrete decks are placed on all these viaducts, which are then paved with creosoted wood blocks. Both brick and wood block pavements are being placed in the subways.

The subways are of the flat concrete slab type resting on abutments and curb and center supports. An important departure from standard practice is being made here in the casting of the entire structure above the footings, including the vertical pillars and cross girders, as well as the top slabs for a number of these bridges in units at one central slab casting yard and erecting them with a derrick. Eight subways are being built in this manner, while others will be built monolithic, because of local conditions. The first of these unit construction types of subways has recently been completed and was described in the *Railway Age Gazette* of December 13, 1912. A minimum clearance of 13 ft. is required in all subways, and 14.7 ft. where there is street car traffic.

Among the larger viaducts are the Broadway viaduct, just west of the station and a structure at The Paseo, one of the city boulevards. The Broadway viaduct is 80 ft. wide and 700 ft. long exclusive of approaches, or 1,300 ft. long overall and is estimated to cost $475,000. The Paseo boulevard structure is 1,000 ft. long, including approaches; 50,000 yds. of earth being required for the grading of these approaches.

One interesting detail of the construction work which introduced several complications was the necessity of maintaining connections with the industries located on the old track level through the big cut. This required the construction of three bench tracks north and one south of the main line, leading off parallel to it on steeply ascending grades. Where these bench tracks pass under viaducts, box abutments have been provided as shown in the photograph of the structure at Woodland avenue, these abutments being found to be practically as cheap as posts and buttressed abutments where the excavation for the buttressed abutments was heavy. Another interesting detail was developed in the design of the retaining wall along the north side of the tracks between the new station and the passenger coach yard. It was necessary to carry a 5 ft. x 7 ft. steam tunnel for this distance of 6,200 ft., and in certain places the only suitable location was in a recess in this retaining wall. The special design of this wall is shown in one of the accompanying drawings, about 1,000 ft. of this section being built.

One of the conditions imposed upon the terminal company by the city in its ordinance was the construction of a large sewer 6,225 ft. long from Twenty-second street and Grand avenue to Turkey Creek, although this sewer laid for the greater part of the distance entirely out of the railway property. This work required an expenditure of about $930,000. With the exception of a 1,200 ft. tunnel near the center, the sewer was built in an open cut of 55 ft. maximum depth. The sewer was circular in section, 2' ft. in diameter at the upper end, gradually enlarging to a double 15 ft. 8 in. x 15 ft. box at the lower end, the rectangular section being designed to get the sewer under certain streets. Over 180,000 cu. yds. of excavation and 38,000 cu. yds. of concrete were involved.

Automatic signals will be provided on both the freight and passenger lines, the average interval being one mile, although the signals will be placed on the grades to secure a uniform time interval. Upper quadrant R. S. A. standard signals will be adopted outside of the station with dwarf signals through the station limits. While the details of the interlocking plants have not been definitely determined upon at this time, there will be a power interlocking plant at the east end with about 110 units and one at the west end with about 150 units, power for these plants being supplied from the central power house. Other towers will be built near the Santa Fe crossing at the east end, at Sheffield, at the Frisco crossing and at the Santa Fe crossing near the Kaw river, while the plants at Bridge Junction and at the union depot will be rearranged.

At the present time the exterior work at the new station is largely completed, and it is expected that the station building will be entirely completed late this year. It is expected that the excavation of the big cut and along the Burlington connection will also be completed about this same time. The Armourdale yard is now completed and in service, while the grading is finished for the Blue River yard. Seven viaducts are completed, while three others are completed with the exception of placing the floor slabs.

This work is all being handled under the direction of John V. Hanna, chief engineer, Kansas City Terminal Railway; A. C. Everham, assistant chief engineer; G. E. Tebbetts, bridge engineer; J. Tuthill, building engineer; S. O. Swenson, electrical engineer; G. E. Ellis, signal engineer, and A. H. Stone, assistant engineer. The construction on the west, central and eastern ends of the work is being handled under the direction of J. M. Hammond, E. P. Weatherley and D. S. McCalman, respectively, division engineers, to all of whom we are indebted for courtesies in connection with the preparation of this article.

DISCIPLINE ON THE BALTIMORE AND OHIO.*

We read much of misfits and "square pegs in round holes" in the industrial world, and in the railway service come in contact with a little of it, but when one delves into the records for the number of train-service men removed for incompetency he is struck by the small percentage he finds. On the other hand he finds that nearly all dismissals are due to no other reason than downright failure to comply with rules and regulations thoroughly understood by those removed. Harrington Emerson and Dr. Hugo Münsterberg have without doubt made great strides in the science of interpreting individual characteristics through psychological and physiognomic traits, particularly in those operatives requiring much dexterity in their work; and while every railway officer responsible for recruiting and strengthening his train-service organization would eagerly take advantage of the fruits of this service, he has learned by experience that he does not need mechanical geniuses nearly so much as he does young men of healthy mind and body and endowed with what is commonly known as mother wit, good common sense and an ambition to get along in the world. By the exercise of close scrutiny of applicants, and his fairly well developed knowledge of human nature gained in the school of experience, he is reasonably well qualified to select the right kind of men, yet at the same time he is not unmindful of the surprises in store for him arising from the complexities and varieties of the human family: "nature never rhymes her children, nor makes two men alike."

It is possible to make discipline so severe and clock-like in its precision as to vitiate initiative and to finally instill in the minds of the rank and file the feeling that the railroads existed principally for the sake of discipline, and not discipline as one of the important elements in the operation of the railroads.

The time-honored custom of taking men out of the service

*Extracts from a paper by Frederick C. Syze, trainmaster of the Baltimore & Ohio, St. George, S. I., N. Y., read before the New York Railroad Club, May 16.

for from one week to three months for violations has never been a marked success, and frequently has imposed upon the supervising officer the unpleasant duty of temporarily, at least, depriving a man's family of its means of sustenance through no fault of its own; the family was punished more than the real culprit. . . . I have known many instances in which men have courted a suspension in order to get time off for pleasure or for some other purpose.

The Brown system of discipline was expected some ten or fifteen years ago to universally supersede the suspension system, but I have been told it did not prove very effective except where there was already a good class of men who took great pride in keeping their records clean.

Mr. Syze said that he had not fully informed himself concerning the progress of the Brown system on other roads lately, and he went on to describe the action of the Baltimore & Ohio in doing away with suspensions by an order which was issued by vice-president A. W. Thompson last January, and which was noticed in the *Railway Age Gazette* at the time. Mr. Syze showed samples of the blanks used on the Baltimore & Ohio to keep the individual records of the employees. Continuing, he said:

As instructed by Mr. Thompson, all cases seeming to require discipline are promptly, though deliberately and thoroughly investigated before the record is made, for when it is seen by a careful consideration of an employee's record he is "slipping backward" in spite of admonitions, reprimands and "record disciplines," he is removed from the service, never to re-enter it. In this lies the great efficiency of this system of discipline. I find it is more effective in each instance, as so far used, than the old system of suspensions. In many cases disciplined employees have told me frankly that they would "rather serve time than sign that paper"; and others have said, "You can bet your life this is the last one of these things I'll get if I know myself." What better proof can one ask as to the value of this system? It has also been observed that extra men do not fare so well under the new system as under the old.

Unionism, as every supervising officer knows, is an element to be reckoned with in administering discipline, not unionism as a whole perhaps, but that misguided element of it which, for some reason I could never account for, seems to take umbrage at railway companies for having the temerity to exercise their rightful prerogative of cleansing the service of men of proved unfitness. On the other hand, I know old members of the brotherhoods who are broad enough and big enough to see things from the company's view point and who fully recognize the latter's right to run its own business in the interest of its owners and the public; but there is unquestionably a percentage of the younger element which relies, to a degree never intended by the father of organized labor, upon the unions for protection in their wrongdoing and indifferent service.

Although the use of intoxicants among train-service men is on the decrease, it is still one of the most troublesome problems to deal with, particularly as many men drink off duty and in places and ways that it is difficult to get sufficient evidence of to administer discipline. A great improvement has been made in the last few years, however, and encourages us to hope for a continued improvement in the future.

DISCUSSION.

It was agreed by all those who took part in the discussion that discipline was essential to the proper conduct of railroads as well as of any other business affairs, and also that to hold men in proper restraint, some form of punishment must be threatened or inflicted. The point was emphasized, however, that it is not the strongest man physically who rules, but rather the man of the greatest force of character and will. So the Baltimore & Ohio system that has discarded all penalties save the final one of dismissal for the incorrigible will be a success in the hands of a strong man. With a weak one the scheme would spell disaster.

"Discipline by commission" is in vogue on the Erie No decisions or penalties are imposed by the superintendent. Every infraction of the rules is investigated. Records of such investigations are held back until the Monday afternoon following their completion, when they are presented at a meeting of the division staff and discussed. The records are read, the character of the man involved is shown and, after a full discussion of the case, the staff recommends the penalty to be imposed. Discipline so administered produces good results. The superintendent has nothing to do with the matter, as an individual, as it is taken out of his hands. As a rule, there are but few appeals from the decision, and these are taken back to the staff.

The principle underlying this method is that discipline should not be administered by one man and be the arbitrary expression of his will. The overbearing, tyrannical superintendent of former days was the cause of the first banding togther of the men for self-defence, which by regular increments has led to the present attitude on the part of labor organizations.

The Brown system of merit and demerit marks was touched upon. It substitutes marks for suspension, but depends for its value on the care with which the marks are adjusted. Those who spoke recommended it where there is a high grade of men employed; men who take pride in clean records. But where there is a large, unruly and partially anarchistic element it is not successful. As the old dispensation appealed to fear, the Brown appeals to the pride of the man, and if there is no pride there is nothing to which to appeal to except the fear of dismissal. When the number of demerit marks approaches the dismissal point, the men become nervous and their very nervousness is said to cause mistakes.

Favorable mention was made of the idea that employment and discipline of men should be in the hands of an employment bureau which should maintain the records and discipline. It should have a board before which all matters could be brought. All men are not amenable to the same discipline. No wise parent attempts to treat all of his children in the same manner, and so the same treatment cannot be applied to the heterogeneous mass of railway employees; and yet there must be a semblance of uniformity. The ignorant man should be relieved and instructed. He should be shown and drilled in the importance of obedience and should be taught that if he will but obey, the permanency of his position is insured. If men cannot be kept in the proper way by kindly talk and exposition, then the question of dismissal is pertinent.

One speaker brought out the significant point that if men are to be reprimanded for mistakes, it is a great help to compliment them for good work. Judgment must play a part in the execution of every task. For the novice complete obedience is the only safe course; but, as he increases in knowledge and experience, he can lay aside the blind following of instructions for a wider latitude in which his personal judgment may play the guiding part.

There was general agreement that it was not best for each department to administer its own discipline, but that it should be done by a board representative of all departments, and, perhaps, even including a representative from the men. Then it should be realized that men can be led to any heights; but it is difficult to drive them. It is better to reform than dismiss. Old men should be retained, and new administrations should familiarize themselves with past records and not be swept away by a desire to use new blood. The responsibility of employing should not be put in the hands of subordinates, nor should the power to discharge. When the occasion arises for the administration of discipline it should be done fearlessly and without any consideration as to the attitude that the labor organizations may assume, first making sure that the decision is based on the merits of the case, the requirements of simple justice and the demands of public safety.

HENRY M. FLAGLER.

Henry M. Flagler died at his winter home, West Palm Beach, Fla., on May 20. He was 83.

At the time of his death he was chairman of the board of the Florida East Coast Railway, which had been built largely with his money, entirely under his direction and as a part of his general plans for the development of the east coast of Florida. Mr. Flagler made a large fortune in the development of the Standard Oil Company, but his chief interest in life in the last 15 years had been the development of the Florida East Coast, and the building of this railroad, which in many ways is the most unique of any in the United States, gives Mr. Flagler properly a place of no little importance in the railroad history of this country. The Florida East Coast runs from Jacksonville south along the extreme eastern shore of Florida to almost its southernmost end, and is there carried from the main line to the string of keys which ends with Key West. There is no more striking example in the history of western railroad building, of a country apparently without traffic whatsoever except that which would be developed after the building of a railroad, than this Florida East Coast line. The country through which it runs is largely a sand beach, with the everglades of Florida back of it. For through traffic it would have to compete directly with the Atlantic ocean. It must have taken imagination amounting almost to genius, as well as vast personal wealth, to begin such an undertaking as the building of this line. Mr. Flagler lived long enough to see the entire line, including the extension over the keys to Key West, in operation.

H. M. Flagler.

The 637 miles of line cost, with the equipment, $39,117,000, and was capitalized at $36,000,000, or about $56,000 a mile. Its earnings from operation in 1912 amounted to $4,427,000, or about $7,134 per mile. Its earnings, after the payment of expenses, rentals and taxes, amounted to $973,000 in the year 1912, or about 2.5 per cent. on the actual investment.

It is probable that Mr. Flagler never considered his railroad as an investment for the purpose of getting the highest possible interest on his money. It was built for the development of the country through which it runs, and as such it has already proved a success. Edwin Lefevre says that the value of the taxable property in the districts exclusively reached by the Flagler road has increased over $50,000,000 since he began it, and that there are today only about 25,000 acres under cultivation for fruit and vegetables out of a total of about 3,500,000 acres now available for such cultivation. In 1912 the Florida East Coast Railway carried 727,000 tons of freight, with an average haul per ton of 163 miles and an average ton mile rate of 1.772 cents, and with total freight revenue of $2,099,000. Vegetables alone furnished 63,238 tons of traffic and $380,923 of freight revenue. Even more remarkable, pineapples furnished 32,137 tons of freight and $165,667 of freight revenue. Thus over 18 per cent. of the total freight revenue was from vegetables and nearly 8 per cent. from pineapples. Lumber furnished the largest tonnage of any one class of commodities—145,000 tons—but, of course, takes a very low ton mile rate, furnishing but $183,000 of revenue.

Passenger earnings amounted to nearly 40 per cent. of the total operating revenue. Mr. Flagler furnished the money to build the Ponce de Leon and the Alcazar hotels at St. Augustine, the Breakers at Palm Beach, and other of the great Florida East Coast hotels.

Henry M. Flagler was the son of a Presbyterian minister of Canandaigua, N. Y. He started out to support himself when he was 14, and went into the grain business in Bellevue, Ohio, where he probably became acquainted with John D. Rockefeller, and before 1870 he was a member of the firm of Rockefeller, Andrews & Flagler, which in that year was dissolved and the Standard Oil Company formed. There is one story of Mr. Flagler's life that is probably so characteristic that it is worth repeating. When he first went to work in Republic, Ohio, he had a five-franc piece, accepted at that time for a dollar, and a few pennies. He never spent the five-franc piece, and in later life took a considerable pride in the possession of this particular coin.

John D. Rokefeller, in his random reminiscences of men and events, says of Mr. Flagler: "He invariably wanted to go ahead and accomplish great projects of all kinds. He was always on the active side of every question, and to his wonderful energy is due much of the rapid progress of the Standard Oil Company in the early days. It was to be expected of such a man that he should fulfill his destiny by working out some great problems at a time when most men want to retire to a life of considerable ease."

New Line for Belgian Congo.—The branch of the Great Lakes railroad, 167 miles long, starting at Kabalo, 50 miles above Kongolo, and ending at Lukuga on Lake Tanganyika, opposite the German post Ujiji, is well under way. On December 31, 1912, 60 miles of rails had been laid, and for 40 miles farther the grade was completed, as is also the 150-yd. bridge across the Luizi. This road should be finished by the end of 1913 or soon after. Coal was discovered near this line a year ago, about ten miles from the lake.—*Mining and Scientific Press.*

Brazilian Railway Concession.—The President of Brazil has signed a decree granting the petition of the Companhia Estrada de Ferro Dourado, concessionaire of a subvention for building a railway which was to have started from Ibitinga, running to Rio Tiete, thence to a convenient point on the Bocaina-Barity branch, serving the town of Jahu, and terminating at Ayrosa Galvao. The petitioners asked for the substitution of Sao Joao das Tres Barras for Ibitinga as the starting point. The length of the line is to be 33 miles.

THE PROBLEM OF RAILWAY VALUATION.*

The Change in the Public's Attitude Toward the Carriers and the Various Difficult Questions It Has Raised.

By Logan G. McPherson,
Director of the Bureau of Railway Economics.

For several months the Bureau of Railway Economics has been studying the question of a valuation of the railways. It has been our hope to issue first a preliminary and elementary exposition of the various factors that necessarily must be taken into account in making such a valuation and of the arguments that must be taken into consideration. It is the hope to follow this preliminary exposition with a rather complete digest of what has to this time been said upon the entire subject. We thought at first that the preliminary exposition which perhaps will be entitled "A Primer of Railway Valuation," would be rather a simple matter; that it could be prepared in comparatively a short time and that we would then devote our energies to the complete digest.

As, however, we began to study the subject, so many different points arose, there were so many arguments bearing upon every point and often in extreme conflict, that it was necessary to endeavor to get our bearings. We have therefore read through the existing body of literature upon this subject, have made an elaborate collection of all of the expressions that have been worth while upon the different points involved, have classified these expressions under various headings, and have given careful consideration to all of them.

The result has been to make very clear, what was apparent in the beginning, that there is a fundamental difference of opinion not only as to the use to which a railway valuation can be put, and as to how it should be made, but as to the social point of view from which the subject is approached.

As one of the best ways to clear up one's own mind in regard to a proposition is to be obliged to state that proposition. I have been very glad to accept the invitation to speak upon this occasion in the hope that what I am struggling to express may, perhaps, serve as a statement preliminary to the preliminary statement which the Bureau of Railway Economics hopes to issue.

Once upon a time when I had been designated to open a discussion at a meeting of an economic club, the chairman in his introduction gave me a sly dig by remarking that he hoped I would present the situation as it then existed, and not as it had previously existed, but that of course I was welcome to present it anyway I wanted to. My reply was that I am constitutionally and temperamentally unable to present any subject in the light of the present without developing it in the light of the past. Therefore, with your kind permission I shall endeavor to lead up to what seems to me to be the beginning of the demand for a valuation of the railways.

There was a time, of course, when there were no railways, when there were no great mills and factories. This was before the use of steam. In Europe in past centuries there have been laws limiting the prices of commodities: there were a few of such laws in the early days of our colonies, but they were an inheritance from Europe and rapidly fell into disuse. The spirit of our forefathers in this country was that of individualism. Opportunities of every kind were freely open to every one with the capacity to use them. The right of unrestricted and unregulated individual enterprise was cherished as an essential part of individual liberty. In the matter of prices, generally speaking, the buyer got as much as he could for what he had to sell, and the purchaser paid as little as he could for what he had to buy. It was thought that if the seller asked too much, or if it were found that he was making large profits other producers would enter the market and the price would be brought down to the lowest level at which there would be sufficient production to supply the demand. This, speaking generally, was the theory of competition, of a fair field and no favor, when men's valors were considered their own best gods.

THE OLD ATTITUDE TOWARD RAILWAYS.

When the railways were a demonstrated success this country wanted railways more than anything else and the people went to any length to get them. Until well along in the nineteenth century this country had more land than it knew what to do with. In the undeveloped regions it could be had not only for the asking, but for the taking. Homestead acts and the doctrine of squatter sovereignty were designed to bring settlers to the land. Not infrequently a settler took title to more land than he could use, to more land than he had the tools and appliances for cultivating. There is a story of a man who sent his son to see if he could not get a mule in exchange for three or four acres of land. The boy came home, reported that he had the mule, that he succeeded in slipping another acre over on the man he had bought it from, making him take five acres instead of four. Thousands of acres of land in what was then the wild west were bestowed upon anyone who would offer to build a railroad. Sometimes every alternate acre was thus bestowed, and the price of the remaining alternate acres doubled, or more because of the enhancement that railway service would bring in their value. This land as a rule was of little benefit to a railroad company until the railway had been built and a measure of traffic had developed.

It was expected that the railways would profit from the increase in the value of their land that would result from the development of traffic. That was the inducement held out in the grants of these lands to the railways. It was expected that the multiplication of railways would establish competition between them and that this would insure fair charges and good service. Therefore, the railways were unquestioned in their right to administer their property in the same manner that other business enterprises administered their property. Indeed, in those days it was an accepted principle that a man was welcome to whatever he could make out of any tool or instrument that he had. If with a set of tools a carpenter by skill and knack could make more money than another carpenter with tools equally good, he was welcome to it. If a wagoner who kept his horses in good condition and his wagon in good repair and was industrious and thrifty made more money than a rival wagoner, lacking these qualities, he was welcome to it. The faith of the people in the restraints of competition dispelled all fear of unfair charges for transportation; the love of individual liberty forbade all thought of interference with business enterprise.

It must ever be borne in mind that the whole theory of competition implies inequality between the competitors. To the swift, the strong, the farsighted, and often to the cunning comes the greater reward. In the United States the railways were built and they were operated upon the competitive theory. It developed that the strongest competitors for the service of the railways reaped the greatest profit from the service of transportation. Larger shippers secured lower rates and better facilities than the small. Industrial and commercial centers served by several competing railways obtained the benefit of lower rates than were accorded smaller communities with lower competitive strength.

The efforts of the country to obtain railroads led to its being supplied with more railways than were needed at the time. The

*An address delivered at the banquet of the American Association of Freight Traffic Officers at Washington, D. C., on May 16.

fact that many railroads were built in advance of traffic and that there was bitter competition between redundant railways led to bankruptcies and reorganizations. Investors lost money, and their losses made other investors chary. They would not risk their funds except upon liberal inducements. They bought bonds at a discount with stock thrown in. Here again, those who furnished the capital that enabled the railways to continue in service were encouraged to look to the future for their reward.

THE DEPARTURE FROM THE COMPETITIVE THEORY.

Now, as we all know, in certain lines of our industrial activity there has been during the last twenty-five or thirty years or so a departure from the competitive theory. Workingmen have allied themselves in trades unions for the purpose of obtaining a certain uniformity of wages. Large producers of many commodities and large dealers in many kinds of merchandise have entered into alliances to maintain agreed prices. The railways at various times entered into agreements to maintain rates, but they were never very successful. The people didn't like such alliances; they wanted competition among the railroads to continue, and therefore they established the Interstate Commerce Commission and enacted laws which have made competition in rates well nigh impossible. The commission has been enjoined to see that rates be reasonable. From the days of the teamsters and stagecoaches the common law has ordained that rates for transportation be reasonable.

This Association of Freight Traffic Officers is composed of the very last men in the world who need to be told how the freight rate systems of the United States have developed. Broadly speaking, rates have been made that would get the traffic. Although the freight rate structures of the United States have often been characterized as a chaotic jumble, the truth is that they have been the resultant of varying forces; and, broadly and generally speaking, have well served the needs of the industry and the commerce of this country. This does not mean that they have always satisfied all of the industrial and commercial competitors. Far from it. As competition means the success of the swift, the strong, the far-sighted, and not infrequently the cunning, those who have been lacking in these qualities or in other respects have been deficient in competitive strength, and have sought the enactment of laws that would redress their weaknesses. They have had the sympathy of the great majority of the people of this country. It is said that as the railways are public servants, discharging what many have come to consider to be essentially a function of the government, they should treat all of the public alike.

Now, we are approaching the crux of the question. Upon the meaning, upon the significance, upon the construction which the people of this country place upon the public service character of the railways as set over against their character and necessities as private enterprises, depends not only the manner in which the valuation of the railways of this country shall be made, but the manner in which that valuation shall be used.

When this country was young, when land could be had for the taking, when cities were small, poorly lighted and the horse car was the means of urban transportation we did not hear anything of public utilities. As lighting by gas extended and gave way to lighting by electricity; as the cable car succeeded the horse car, and in turn has been displaced by the electric car; and as our cities have increased tremendously in population, it has become evident that a company having the electric light privilege or the local transit privilege, or the water power privilege for a particular city has a monopoly; that unless restrained it can fix its prices so high as to restrict the use of its service, or at a level that will give it profits far in excess of those obtained in business in general. There has been much litigation as to the amount of profit which should be allowed to such a company. It has been held that what such a "company is entitled to demand, in order that it may have just compensation, is a fair return upon the reasonable value of the property at the time it is being used for the public"

ARE THE RAILWAYS MONOPOLIES?

It is said that the railways are monopolies, and that as such their rates should be regulated. That the railways in respect to certain kinds of traffic partake of the monopolistic character every one knows; but no one knows so well as the men who constitute this association that the greater part of their traffic has always been competitive, and that they have had to fight for every ton of this traffic which their respective companies have carried. Now, it seems to me for this and other reasons that there is a very great distinction between a company having the exclusive right to furnish electric light to a city or electric transportation or water power, and a railroad company owning lines traversing a wide expanse, serving many communities and often under conditions which are not monopolistic. It has been held, however, by the United States Supreme Court in a very celebrated case, that of Smyth vs. Ames, in a decision rendered on March 7, 1898, "that the basis of all calculations as to the reasonableness of rates to be charged by a corporation maintaining a highway under legislative sanction must be a fair value of the property being used for the convenience of the public."

When the Interstate Commerce Commission was given the authority to determine what shall be a reasonable rate it found itself confronted with a series of freight rate structures in different parts of the country in which the rates seemed to be an inextricable maze. Therefore, it welcomed the decision of the Supreme Court in Smyth vs. Ames. Throughout the ensuing years it has besought the Congress to provide for a valuation of the railways of the United States, and it has not sought in vain.

I do not suppose that any member of the Interstate Commerce Commission would hold that upon the valuation of a railway alone can be determined just what shall be any specific rate. It is widely held, however, that a valuation of the railways will serve to determine what shall be the general level of rates. That is, that if a railway is to have a fair return upon a fair valuation the rates will be reasonable that will permit it to have such a fair return. Now, when we use such expressions as a "reasonable rate" and "a fair return," and "a fair valuation," I am reminded of the time when it is said that a considerable delegation of citizens of a foreign country went to the house of the prime minister. When he appeared upon the balcony and asked what they wanted, they said "We want our rights." He replied, "Very well, you shall have them." They went away satisfied. I am also reminded of that political convention at which when the committee on the platform were considering the tariff plank, one member suggested the expression, "We are in favor of judicious legislation in regard to the tariff"; and another member suggested an amendment making the clause read, "We are in favor of wise and judicious legislation in regard to the tariff."

WHAT IS A FAIR VALUATION?

What is to constitute a fair valuation and what is to constitute a fair return upon that fair valuation we do not as yet know, and it is to be hoped there will not be the devil to pay before we find out. There are many elements that enter into a valuation of the railways. The manner of determining the valuation of any one of these elements will depend in large measure upon the extent to which the people of this country regard the railways as the property of private investors, and the extent to which they regard them as public service corporations akin to the public utility corporations that furnish light and transportation and water within the limits of a municipality. Certain it is that when the railways of this country were built they were regarded from the standpoint of the investors as private property, their limitations as public servants did not affect the proprietary right to buy and sell real estate or other property at prevailing market prices. From this standpoint, which would seem to be guaranteed to them by the law of the country, the railways are certainly entitled to have their rights of way and their real estate in general valued at the prevailing prices for similar real estate; they are entitled to benefit by the enhance-

ment of value as much as farmers and other land owners are entitled to benefit by the enhancement of value which has come with a growing population and development of markets, an enhancement which of course would not have come without the means of communication and transportation which the railways have furnished. On the other hand, there are those who hold that as the railways perform a public service they are not entitled to what is designated as the unearned increment in the value of their lands. These hold that a railway is entitled to a return only upon what the property of a railway has cost. They disregard excellence of location, excellence of administration, those economies which are due to managerial skill.

It has been the practice of many railway companies not to pay out all of their net profits to stockholders, but to reinvest a part of those profits in building up and extending the plant and equipment. There are railways which have followed this policy at all times; there are others which have followed it especially in prosperous years; there are many railways which for years habitually reinvested all of their profits without making any return to stockholders whatever. It is pointed out that inasmuch as all of these profits could have been paid out to stockholders and new capital acquired for increased capital expenditure upon which return would have had to be paid, it is no more than fair that return be allowed upon the reinvested surplus. Yet there are those who hold that surplus frequently signifies profits above fair return to stockholders, that it therefore belongs to the public and that even when reinvested in the property the stockholders are entitled to no return upon it.

FAILURE OF LAW TO KEEP PACE WITH ECONOMIC CHANGES.

In many cases lands have been donated to railways; that is, the passing of the title has been designated as a donation, although concession has been exacted from the railways as consideration. The government has in some cases in making such a so-called donation stipulated for concessions in the transportation of troops or the carrying of the mails. On the one hand, it is claimed that as such lands are held by the railways under proprietary rights they are entitled to a return upon them as property, to use them and to dispose of their use as property. On the other hand, it is claimed that as such lands are acquired without capital investment a valuation of the railways should take no account of their value.

These are but a few examples of the difference of viewpoint. It would be wearisome to enter into a discussion at this time of all of the factors that are affected by this difference of viewpoint. Are the railways to be valued at what they have cost, or at what it would cost to reproduce them, or upon the commercial or market value of the plant and going-business? These are but a few of the factors in regard to which there is difference of opinion, and each of these factors subdivides into manifold elements in regard to each of which there is difference of opinion.

It is not my purpose to endeavor to point out any solution. I have only hoped to indicate the seriousness of the problem and know that my effort has been all too inadequate. This much is certain, that the law has not kept pace with the changes that have occurred in our economic structure within the last generation. This was strikingly made manifest in the decision of Justice Hough in the Consolidated Gas Company case in which he first considered the value of the company's franchise from an economic standpoint, and then from a legal standpoint, arriving at conclusions that were respectively at variance. Another thing is certain, that whatever be the ultimate decision as to what constitutes a proper valuation of the railways and what may be the return to which they are entitled, that decision cannot be made retroactive throughout a regime during which the construction of railways as private property was encouraged, and their administration as private property was sanctioned by the law of the land.

There is another consideration which appeals to me as of foremost importance. A bank president once asked the head of a manufacturing establishment, who was endeavoring to negotiate a loan, just what were his "cold assets." The reply was that it was not so much the cold assets as the "hot assets" that brought about results. He said that anybody with the money could build or could buy a manufacturing plant, but that the selection of the proper men, the development of an organization in which one and all work together to promote economy and efficiency is a far more difficult task and entitled to the greater reward to the attainment of which such an organization is the most effective instrument. In the valuation of the railways, the so-called "physical valuation" which is but a valuation of the cold assets, are we not in danger of losing sight of the human element which alone can make these cold assets of use to the people?

Whatever may be the modification in our social structure, whatever may be the readjustment in our law, it behooves our country first and foremost to retain the services and stimulate the services of the efficient man, the man who can make two blades of grass grow where but one grew before, the man who can plan, design, and direct, the man who can bring about organized and efficient effort. It is to such men that we owe our present industrial and commercial development. It is through their efforts that the efforts of the multitude are lifted to a higher level and made more efficient in the service of the human race.

TRANSFERRING FLOUR AT FORT WILLIAM.

The new shed on the Canadian Pacific dock at Fort William, Ontario, is now in operation. It is a double decked structure, 950 ft. by 60 ft., the upper story for the reception of rail freight, and the lower one for freight unloaded from the vessels to be loaded on cars. For the unloading of freight from cars, there is a trestle along the rear of the building, the height of which is such as to bring the car floor at the level of the upper freight shed floor. The lower floor of the shed has a similar track for outgoing rail freight. One of the principal commodities handled is flour in bags, and a flour bag loading machine is used. Along the rear wall, and just under the upper floor, there is an endless belt, 26 in. wide, running the full length of the building, driven by a motor at one end. It is similar in every way to the usual conveyor belt, the upper part running over closely spaced idler pulleys. The belt is open the length of the building. At five points near one end of the shed, corresponding to the port openings of the vessel to be loaded, there are cross belts of the same width under the floor, at a slightly lower level, enabling the bags of flour on the belt to pass under the floor. These lead to chutes at the front side of the building, to which inclines can be attached for sliding the bags directly into the hold of the vessel. On the longitudinal traveling belt are dumped the bags of flour from as many cars as are ready to be unloaded, irrespective of the make of the flour. At each of the cross belts on which it is desired to divert the bags into the vessel's hold, there is arranged a vertical board, at an angle of 45 degrees to the motion of the longitudinal belt. This board, coming down just over top of the upper belt, diverts the bags of flour on to the cross belts; and thence they are carried into the hold. These diverting boards are set in vertical guides, each with a rope passing up over a pulley above. At each of the cross belts there is stationed a man who either leaves the board down and diverts the bag on to the cross belt or raises the board and allows the bag to pass on to that one of the cross belts to which it should be diverted. The belts move at a good rate of speed and, consequently, quick action on the part of the board operator is required; but by its means as many as five different brands can be unloaded on the belt simultaneously, and be diverted to the proper hold. It is the usual thing to unload as many as five 30-ton cars in an hour, or at the rate of 150 tons an hour.

RAILWAY STOREKEEPERS' ASSOCIATION.

The Convention at Chicago This Year Was More Than Ordinarily Successful and Included Several Important Reports.

The tenth annual convention of the Railway Storekeepers' Association was held at Chicago, May 19 to 21, J. R. Mulroy, general storekeeper of the Pullman Company, presiding. The opening prayer was offered by Rev. William E. Barton. Eugene Chamberlain, manager equipment clearing house, New York Central Lines, made the opening address.

President Mulroy, in his address, commented on the important work accomplished by the association in raising the standard of the supply department and reported a material increase in the membership of the association.

G. G. Yeomans in an address emphasized the great opportunity of all storekeepers in furthering the success of their respective roads. Their opportunities are unbounded and their importance may be appreciated when it is remembered that they handle each year supplies valued at about $250,000,000. About 9 per cent. of the gross earnings of railways is spent for material, or 17 per cent. when fuel is included. The great possibilities for savings were illustrated by the fact that about $220,000,000 is invested in material, a decrease of which to the smallest degree would represent a considerable capital that could be used for other purposes. According to statistics all the roads are carrying a year's supply of material on hand, a condition which could be much improved by the combined action of the storekeepers with the other departments.

The secretary-treasurer's report showed a membership of 744, including 150 new members. There is a cash balance of $886.81 in the treasury.

A resolution was adopted inviting the arbitration committee of the M. C. B. Association to attend the meetings of the association and participate in the entertainment features.

Piece-work—It was pointed out that the storekeepers were in a position to greatly benefit by the adoption of piece-work. J. H. Waterman (C. B. & Q.) reported splendid success by its use in his timber treating plant, where 2,000,000 ties, or their equivalent, were handled per year.

Stationery.—The stationery committee advocated the handling of stationery by the general stores organization rather than by a separate organization.

Lumber—The committee on the uniform grading and inspection of lumber advocated the advisability of adhering to the 13/16 in. car siding in reply to a request of a lumber dealer to adopt ¾ in. This was done to prevent, where possible, the use of re-sawn material.

INACTIVE AND OBSOLETE STOCK.

Five papers were presented on "Reducing Inactive and Disposing of Obsolete Stock." Abstracts of these follow:

E. J. Roth (C. B. & Q.):—All obsolete stocks are inactive, but of course all inactive stocks are not composed entirely of obsolete material. It should pass without question that the thing to do with obsolete material is to scrap it and utilize the scrap to the best possible advantage. Obsolete forgings can usually be worked over in a blacksmith shop into standard articles with a slight loss. The value of scrap brass is not much less than that of the manufactured product.

The real difficulty lies with the inactive stocks of standard material. The best remedy of course is prevention. With the better methods of arriving at the proper quantities of material to order, due to the almost universal use of stock books, there is no doubt that the percentage of inactive material to total stocks has been considerably reduced in the past few years.

There are certain stocks which from their very nature are and probably always will be inactive. Stocks of material carried for strictly emergency use are of this character. It is the practice on our road to carry emergency stocks of bridge lumber and piling and of track material on each operating division. These are charged to and are under the supervision of the division storekeeper. The quantity carried is determined in consultation by the storekeeper, the operating department and the bridge and building department. About all the storekeeper can do is to watch them closely and give special attention to particular articles which show the least movement. The accumulation of material by the operating and bridge and building departments is bad, for the time usually comes when a clean-up is made and the material is shipped back to the storekeeper, frequently increasing his stock of material of the kind shipped in beyond reasonable limits and giving him material which has often become obsolete while out of his care, but which could have been used if he had had it before.

In our experience the most effective remedies for reducing inactive stocks in storehouses and material yards have been:

First—Maintain stock books at all points where material is carried, whether this is directly in charge of a representative of the store department or of some other department.

Second—List all material of all kinds in the stock book.

Third—Carefully check the stock book to determine material that is surplus.

Fourth—Send with orders from division or district stores to the general storekeeper stock books or their copies and stock lists. Stock lists with a description of the material printed on them, containing information as to material on hand, due, ordered current year, ordered past year and surplus, if any, have seemed the better practice. This leaves the stock book in the hands of the stock man where it belongs, and the printing of the description of the material on the stock lists insures the material being listed on all reports to the general storekeeper in the same order and facilitates checking them with the orders in the general storekeeper's office. One of the other large railroads in the middle west is putting into effect a plan which appears very efficient and economical. Their storekeeper's stock book is printed in duplicate, two sheets being placed together, which are exactly alike except that the bottom sheet has perforations separating the entries for each month. A carbon sheet is placed between the sheets when stock is taken and after all the information has been filled in, the carbon copy is torn off at the perforations. These carbon copies for material in each classification are sent to the office of the general storekeeper where they are pasted in a printed stock book, a duplicate of the one which the storekeepers have. The slips from each store are identified by classification and page number and placed in the general storekeeper's stock book next to corresponding slips from other stores opposite the items they cover. This gives the general storekeeper a complete stock book for the entire line with very little if any additional work.

Fifth—When making orders consult frequently and freely with responsible officers in the departments using the material ordered for stock as well as for special work.

Sixth—Assemble surplus material as far as practical at the general or distributing store, where it is readily available for use at any point where needed, storing it with other material of similar kind so that it will be constantly before the stock man and may be used by him at every opportunity in filling orders—frequently by substitution, this always with the consent of the party ordering.

Seventh—Where surplus material is of such a character or conditions are such that it would entail unnecessary expense to move this to the general or distributing store, a special report to the general storekeeper or the general or distributing store of all such material with complete descriptions, etc., should be made.

Eighth—Advertise surplus material among the departments which might be able to use it. On this I wish to lay particular stress. We have found that with the knowledge which they get, from the periodical reports we make them, of engines, pumps, boilers, large pipe, second hand lumber, brick, track material, etc., etc., on hand, the engineering, operating, mechanical and bridge and building departments are frequently able to arrange their plans for work to use such material instead of purchasing new. The storekeeper must have a knowledge of the purpose for which such material was originally purchased or can best be used and bend his energies in directing toward it the attention of the men who order material for this particular kind of work.

Ninth—A surplus committee composed of practical men from the mechanical, engineering and store departments, periodically visits each storehouse and material yard, going over the stock in detail with the storekeeper and his stockmen, considering all surplus material of all kinds whether obsolete or not and authorizing scrapping of obsolete material or surplus material where, upon thorough investigation, this is found advisable.

Possibly the most important feature of our present plan is that of working closely with the departments who use the material. This accounts for a great deal of what success we have had. The storekeeper who can keep closely enough informed as to market conditions affecting time of delivery of material, and so gage his estimates of future requirements that he will not order and receive more material than he actually requires, will not have to worry much about inactive stocks.

H. A. Anderson (Pennsylvania):—There are several conditions which have heretofore been largely instrumental in the creation of surplus and inactive items:

First—The ordering of material in quantities largely in excess of actual current requirements.

Second—The ordering of material months in advance of requirements, considered necessary on account of stringent market conditions.

Third—The decrease of working hours and force.

Requisitions should be based on the average consumption for the preceding three months, considering amounts on hand and due on requisitions, as well as the length of time requested by the purchasing department in which to furnish material under normal conditions. There are, of course, many circumstances entering into this matter, over which the stores department has no control. This is especially the case on the larger systems, where heavier and more modern equipment is constantly being placed in service on main line divisions. This results in the transfer of the lighter equipment to branch line divisions, or the disposition of such by sale.

Changes in designs and standards are usually effected without regard to the stock of parts on hand made from previous designs, and have resulted in many items becoming surplus or inactive. To correct this, instructions should be issued that material of older design be disbursed until the exhaustion of the stock, except where a question of safety may be involved. In this latter event, arrangements should be made to have the balance of the original supply disposed of through the scrap account, immediately upon receipt of the new material.

It has often been considered necessary, particularly during periods when mills and factories are booking orders many months in advance, to request stores departments to anticipate requirements from three to nine months in advance of deliveries. This practice has also been responsible, in many instances, for articles finally finding their way to the lists of surplus and inactive material. The fact that manufacturers frequently fill orders in one consignment, instead of shipping in accordance with the delivery program as specified on requisitions, has a tendency to destroy the belief that such advance requisitions are necessary.

Decreases in working hours and force are productive, perhaps, of the greatest quantities of surplus stock with which we have to contend. Conditions making necessary such curtailment in hours and force are not discernible any great length of time in advance, and the reductions are made only when the question of expenses makes them imperative.

In determining what amounts shall be reported as surplus care must be exercised to consider the issues of preceding months, and in the case of "seasonal" material, to issues during a corresponding period of the previous season. In addition, it is also essential that consideration be given the amount of stock permitted to be carried on hand, and the length of time required in which to replenish the stock by requisitions on manufacturers. After deciding upon surplus items, a list should be prepared and forwarded to the officer responsible, under the organization, for the transfer of such material. The list (upon receipt by the purchasing agent or general storekeeper), should be checked with all requisitions calling for the purchase of material. As a rule, the men doing such checking are those who have not had an active and intimate connection with supplies and for this reason detailed information should be such as would enable them to transfer an advertised article instead of allowing orders to be placed with manufacturers. Such transfer will be to the ultimate good of the railroads, even at the expense of a small charge for re-handling and movement over the road, as they will avoid the outlay of additional capital.

The accumulation of inactive and obsolete material has been brought about chiefly through the release of equipment, changes in design and standards and to reclaiming from the scrap of items without regard to requirements. There is little that can be done in the case of this material, lacking authority or ability to disburse the old standards until exhaustion of the stock, but to consign it to the scrap pile. The proper course would be to make disposition immediately upon the appearance of the inactive items. Having considered the disposition of an item after being reported as surplus for twelve months, and deciding to prolong its existence, except where, during such period, there may have been call for the article, it is thought that such item should be discontinued on the surplus list and included on the list of inactive and obsolete material. This inactive list should contain the same information as the surplus list, except that the entire stock, as a rule, should be shown. In the column "Number of Times Reported," the first appearance of the item should be indicated as "one." It should be necessary that its listing among the inactive items be continued only three or four months before again being considered for final disposition. This last "attention" should be given jointly by the representatives of the operating and stores departments, and, lacking visible use for the material, it should be scrapped and the difference between the carrying and scrap values debited to the expense account to which the material would have been charged, had it been actually used. In so disposing of either surplus or inactive material, particularly on the larger systems, it is likely that a small quantity of more or less serviceable material will be scrapped, but it is inconceivable that such seeming waste can total in money value the expense incurred by perpetuating the material in stock, considering the interest on investment and the clerical labor involved in handling and in monthly accounting for and reporting such items.

In connection with the lists which have been mentioned, it would be well to state that these would seem hardly necessary when the railroad is operating under the general storehouse plan. To such storehouses, we presume, would naturally be shipped all surplus and inactive material and the final disposition of it be there decided.

Finally, the fundamental principles in successfully controlling inactive and obsolete stock are harmony and co-operation between the operating and stores departments, first to avoid, if possible, the accumulation of such material, but lacking in this, to constantly keep the items of material before us and follow a regular system by which the disposition will be promptly accomplished.

E. J. McVeigh (Grand Trunk):—How do we acquire inactive and obsolete stock? There are several ways. One is by bad ordering; another, ordering material before the work to be done has been fully and carefully planned. Then there are, of course, the cases where our executives find it advisable to make changes irrespective of careful and proper planning. It is also created by changes made in our methods and equipment in an effort to

meet the changing conditions of our country. Under the system in vogue on most roads today the storekeeper cannot do very much toward minimizing this stock. I have found that in proportion to the quantity of material used by them, the departments ordering obsolete and inactive material are, the electrical, bridge and building, engineering, motive power, car department and stores. And they are guilty in the order as named. Unfortunately, there is a tendency toward the evil of dealing with the electrical department directly, and permitting the separate storehouse. The engineering department creates inactive, and at times obsolete stock, through the action of young and inexperienced men. The bridge and buildings department create inactive stock by ordering material that they hope, or expect, to use this year, but find they can't. And they create obsolete stock by making changes and getting away from standards. They may not always be at fault in the matter, but they do it.

The motive power and car departments create little inactive, but much obsolete stock, and this is natural, and we all understand it. Our engines and cars with their spare parts are constantly going out of date, and these must go to the scrap pile.

What inactive and obsolete stock does the storekeeper create? I confess I am at a loss to point out wherein he does this thing. He orders what he knows from his experience will be called for by the different departments. If the departments make changes without notifying him that such changes are to be made, and by so doing leave him with material on hand, is such material made inactive or obsolete through his action? I say, no.

Assuming that the storekeeper has the authority and facilities he should hold up requisitions for material that he knows will become inactive and obsolete. He should see to it that there is no such material scattered over the road under his jurisdiction, but that such material (and there will always be some in spite of all he and others may do to prevent it) is collected at the stores, all left overs, ordered by mistake, ordered in excess of requirements and scrap.

W. D. Stokes (Ill. Cent.)—In summing up the general efficiency of the supply department on a railroad, two things are invariably considered: first, the ability to satisfactorily and promptly deliver material as required for maintenance and operation, and second, the conservation of stock or material and the supplies investment.

The causes contributing to a surplus of either staple, hard or obsolete stock are numerous and do not always indicate, upon analysis, either carelessness or indifference. Change of plans involving special materials, work deferred on account of insufficient appropriation previously anticipated, transfer of equipment between operating territories, change of standards, and purchases in excess of requirements in taking advantage of favorable market conditions either of price or delivery, are the most frequent reasons and are perfectly consistent and to be expected, as are also anticipations of slow deliveries or requirements in excess of what proves to be the actual case as frequently occurs.

In connection with the foregoing, repairs either temporary or permanent made in lieu of replacement after special and expensive items have been secured, or ordered and in such status as to necessitate taking off the consignor's hands, result in materials being, often by reason of their character, dead stock for an indefinite period.

Careful scrutiny of requisitions before affixing signatures and investigation where thought necessary; frequent consultations with operating officers with a view toward keeping in close touch with anticipated programs and a feeling of confidence and the utmost cordiality between the storekeeper and his customers, will probably eliminate a number of sources for future worry and add to the efficiency both of the individual and the department.

In the movement of materials for any purpose and more especially when not for prospective early requirements, economy in the use of facilties is obviously an important consideration. Back hauls should be avoided and as far as possible, loading of cars to less than capacity tabooed.

On roads equipped with a general storehouse, the simpler plan is to ship to it all surplus and obsolete material, and while there is no question as to the effectiveness of this system from an individual standpoint, it is objectionable, for various reasons, in that it places a premium on indifferent storekeeping, is expensive of transportaton and disturbs the general store's stock by reason of its being impossible to anticipate the extent to which the fluctuation will affect it, and the necessity for maintaining a staple stock irrespective of such unlooked for additions. Furthermore, there is comparatively little reduction in total stock balances effected, and except for prompt weeding out purposes, it is difficult to see what may be accomplished in this manner.

In departing from indiscriminate or hap-hazard methods, the first consideration would seem to be the establishment of some tangible system of interchange between stores, and in order to accomplish this result it is obvious that a knowledge must be had by all interested, of location and amount available, and for the sake of rapid consummation it has been the practice, to some extent, to make up at each division store, periodically, an itemized list of all surplus articles, sending one copy to each of the other stores and to the general store; and from this in lieu of ordering on the general store, requisitions are made between stores and prompt action obtained.

Another plan, apparently ideal, for medium sized roads, is to so arrange requisition forms as to show in addition to amounts on hand, due and ordered, the average monthly consumption, and from these the general storekeeper issues what may be termed a general store back-order on division stores, to serve in lieu of orders on the purchasing agent.

An elaboration of the foregoing and possibly the most efficient of any, contemplates having all items printed in stock books in order to insure uniformity of order and to have a surplus stock list printed in the same order, arranged to show the amount of surplus of all items in the same order, together with the average monthly consumptions and the amount on hand, in order to give the general storekeeper an opportunity for getting a line on the situation; such stock lists to be forwarded with the requisitions or at a time specified and used by the general storekeeper in making transfers, the idea being that with the items appearing in the same rotation as on the requisitions written from the stock books, the work of location would be minimized; furthermore, the necessity for sending stock books with the requisitions would be obviated.

Semi-monthly lists of hard stock, material on hand for work deferred, and principal items of heavy character on hand, will, if furnished the general storekeeper, ofttimes result in movement, in lieu of purchases.

One thing must be an absolutely imperative requirement, viz.: Correct information given regarding the amounts on hand and due, as without this precaution no hope can be entertained of intelligently coping with the situation.

Disposition of obsolete material presents a less complicated problem and is dependent largely on decision, location and amount. By decision is meant the passing by competent operating authority on items set aside or relieved, in order that the storekeeper may take further steps toward disposition as obsolete, when so determined; this is usually the greatest drawback, largely due to an aversion to burdening operating expenses with the shrinkage, although occasionally lack of time is advanced as the reason.

H. Stevens (Nat. Ry. of Mex.) in his paper on this subject, laid particular stress on the maintenance of way department material, mentioning various materials and methods of application that gave good results. He stated that a certain type of ballast car that had the sides opening up was well adapted for handling treated ties on account of their slippery nature. A storage yard for these ties would be a valuable adjunct to the treating plants, to allow their shipment at times of least traffic. The culled ties could also be used for temporary work, thereby saving the first class ties for more important work. He mentioned the use of old rail in making yard frogs and crossings. There should be a

shop for this work, also for the repairing of switches, frogs, etc. All frogs and switches could be shipped to a shop of this kind before being scrapped, so that the usable material could be saved. In speaking of lumber he mentioned the good results being obtained by the L. S. & M. S. at Collinwood, Ohio, by the use of a resawing machine for reclaiming old lumber and timber which is cut into ties, crossing plank, bridge members, etc.

He also spoke of the importance of purchasing the highest grade of track tools obtainable, not only from a maintenance point of view but from the better results being obtained by them. All materials should be carefully tested.

In regard to emergency material he spoke of the emergency cars on the L. S. & M. S. which provide for the roadmasters on the important divisions and are so distributed along the line that with the co-operation of the operating department a broken frog or switch may be repaired in a comparatively short time. By using these cars the emergency stock of frogs and switches has been materially reduced.

Discussion.—A committee including the chief draftsman, chief car inspector, and men from the engineering department, besides the local men, was recommended for following up inactive and obsolete material. By this method the material could be better disposed of, especially those parts belonging to foreign cars, and the chief draftsman would be more particular to notify the storekeeper in advance of changes in standards. The system in vogue on the Northwest system of the Pennsylvania was also mentioned, whereby the chief clerk of the motive power department acts as the general storekeeper.

COUPLER MARKINGS.

A. H. Young (St. L. & S. F.):—We have about 40 different types of couplers on the railroads of this continent and the number is still increasing, although it is several years since the Master Car Builders' Association took up the question of designing and adopting a standard M. C. B. coupler. From an economical standpoint, the question of supplying repair parts for so many different kinds of automatic couplers should be a strong argument in favor of a single standard, and a coupler that could be used in repairing either foreign or system cars. The railway storekeepers are just as deeply interested in this matter as the master car builders or other railway officers, because it means not only less delay and less trouble in making repairs to foreign equipment, but will bring about a reduction of several thousand dollars in the amount of repair parts now necessary to be carried in stock by every railroad in this country.

We should take some action to have all coupler parts marked in such a manner that they may be quickly and correctly identified. This can no doubt be accomplished without adding any expense to the manufacturer, or much trouble to the Railway Storekeepers' or Master Car Builders' Associations, by compiling a complete list of all couplers now in use, assigning a number to each coupler with the parts classified under the proper heading and designated alphabetically; the coupler number with the alphabetical prefix to be cast in each piece by the manufacturer.

If all coupler parts were made with this identifying mark, it would enable the storekeeper or car department foreman to use the greenest and cheapest laborer on his force to handle this class of material without the assistance of experienced and higher priced workmen.

[A committee was appointed to work up a system of markings of couplers for better identification.]

SPECIFICATIONS FOR AND TESTING OF MATERIAL.

W. Davidson (Ill. Cent.):—Ordering material by specifications will help a storekeeper's stock for the reason that the company will get full value for every dollar spent; they will get what they desire made up or furnished according to their own specifications. Purchasing first class material will bring about a saving in more ways than affecting the stock of the storekeeper. It is expensive to apply inferior material to equipment, etc., at a loss of labor in removing and applying again. If a company buys material by specifications, in time it will reduce stock, as good material lasts longer and gives better results.

Specifications, when made up, should be considered from all sides so that they will not be too rigid, but should be plain, short and to the point and as near to commercial specifications as practical.

It is not necessary to make up specifications for all material, but only for such items as lumber, axles, wheels, tires, engine and staybolt iron, common, round and flat iron, brass, malleable, gray and steel castings, rubber goods, firebox, boiler and tank steel, paints, oils, frogs, switches, etc. All of the above material should be inspected at point of shipment where practical and if not, requisition should specify "To be inspected at destination."

Material not ordered by specifications should be watched by the storekeeper and the parties using it should be at liberty to criticize and complain and report any inferior articles received. This will keep a check on the engineer of tests or inspector or whomsoever the company has to inspect the material. The inspector should be required to go over the storekeeper's stock on hand with a view of catching material furnished that is inferior, which has not been ordered by specifications, or inspected at point of shipment, reporting such articles to the storekeeper, so that he can return to manufacturers. A manufacturer having a shipment or two returned will undoubtedly wake up and furnish a better grade of material on future orders.

J. S. Sheafe (engineer of tests, Illinois Central):—If for no other reason than that of appearance, the test department should be separated from the purchase and store departments. As the mechanical department uses the bulk of the stock carried, it is perhaps better for the inspection to come directly under such jurisdiction. With material purchased without specifications and with more or less indifferent inspection the loss to a company would, without doubt, be more than enough to pay for the support of a testing department. It is advisable for each road to have its own specifications and to put in, whenever possible, something which will prevent the substitution of poorer material.

On the Illinois Central a specification is blocked out and several copies are sent to the purchasing agent who submits one to each manufacturer for his criticism. It will always be found that this criticism is forthcoming and from the whole it is possible to fix the high limits of requirements to each of which two or three companies have agreed. If necessary, as sometimes happens, a revision can be made and again submitted.

On the one hand the specification should protect the companies' interests; on the other, it should not be used as a barrier to prevent the acceptance of material which is commercially good; that is, by means of a technicality to work a hardship on the manufacturer. Brevity is quite as much to be desired as any other one thing.

The testing of material is simply the following out of carefully predetermined methods, together with a little judgment or common sense. The arbitrary rejection of a large quantity of material on a technicality should be frowned upon, unless it is repeatedly evident that the manufacturer shows no disposition to improve his product. Although all chemical laboratory, and some physical laboratory, work is more or less technical, yet the constant effort should be towards practical simplicity.

Chemical laboratory results are of secondary importance, in many materials tested, to a practical performance or comparison. They are valuable more as a check or as a prophecy as to what the material will or will not accomplish in service.

As for the effect on stock of material inspection there is no reason for the store department to suffer any inconvenience in

normal times. The storekeeper desires quality in material quite as much as any other official. Credit or discredit, directly or indirectly, easily reflects upon him and his department whether or not deserved, if he distributes poor material. He has as close a working knowledge of what the material is, where it belongs and what function it is to perform, as any one except the man who directly uses it. He is as anxious to have a supply of any needed commodity as the man who wants to use it. He appreciates the loss of revenue resulting from engines and cars held up for material. Such being the case, and with close working relations, the store department will never be affected by any inspection, or rejection, of material. If necessary to accept any rejected material all the storekeeper wants is an explanation as to wherein it is too poor for use and he will do his part, and more, towards keeping it away from the railroad premises.

It has always appeared to me that the purpose of the test department should be to serve and not to dictate, to strengthen and not to tear down, and to be an asset rather than a liability. If it is modeled along these lines it is fulfilling its purpose and will render itself more and more worthy of recognition.

F. H. Hanson (L. S. & M. S.).—The purchaser who does not inspect or test material bought in the open market very often receives material that has been rejected by the purchaser who does inspect or test, or who has his material furnished to specifications.

The method of purchasing only a few brands of material, of long established excellence and reliability, is reasonably safe and invariably insures the purchase of good material; it is, however, frequently found to be expensive, for while the product may be first class, its cost is greatly in excess of that of material of less popularity but which might withstand the necessary tests admirably.

The practice of purchasing on the basis of specifications and the testing and inspecting of all material places all bidders on a fair and equal basis, and at the same time protects the manufacturer against unfair, discriminative and unwarranted complaints. He knows what is wanted and the specifications show him what will be accepted.

The tests and inspections are merely means of determining whether the material furnished is of the kind and quality ordered, or, in other words, to prove that the requirements of the specifications have been complied with.

Discussion.—Inspection should be rigid and in accordance with specifications, for otherwise poor material will be obtained, and it will not be fair to manufacturers who make first class material, as they may be under-bid by less careful manufacturers. This refers to secondary material as well as the more important.

ROLLING MILLS FOR SCRAP DOCKS.

G. G. Allen (C. M. & St. P.):—The C. M. & St. P. has, for many years, manufactured practically all of its freight cars and a large proportion of its locomotives, and one of the best methods we have found for employing the rolling mill is to select the scrap—old arch bars, rods, etc.—shear them to the proper size, and roll them for special parts that enter into the construction of this new equipment, such as brake hangers, carry irons, brake jaws, bolts, etc., that are required in very large quantities. Thousands of drift bolts for the bridge and building department are made from re-rolled iron, in fact comparatively little new iron is used for common bolts for any class of work.

The mill requires a floor space of about 25 ft. x 32 ft. This allows space for storing billets as well as the rolled iron. The mill proper, which rests on a concrete foundation, is composed of two cast iron housings, set on rails similar to the rails of a motor, allowing of the adjustment of housings to accommodate different lengths of rolls. The housings are designed with rectangular openings which allow of fastening the bearings in which the rolls revolve. The bottom roll, being connected to the driving shaft, is fitted with a gear wheel which meshes with a gear on the top roll. These gears vary in diameter as the rolls vary. The rolls are made of cast iron, designed with ends grooved to act as key seats, and connected to the driving shaft. Different rolls are used in order to accommodate the different kinds of iron. The machine is belt driven, operating at the rate of 135 r. p. m., and is driven from a line shaft in connection with four 100-lb. cushion hammers and a 4-in. forging machine, by a 29½ h. p. motor. The mill requires 50 to 60 amperes running loaded and 20 to 30 amperes running light. A current of 220 volts is used.

The straightening table is a cast iron block, 5 in. thick, 3 ft. wide and 8 ft. long, and is located directly in front of the mill. The furnace is of brick work and cast iron plates, securely bolted together, and occupies a space at the side of the mill 17 ft 7 in. by 6 ft. It is arranged with one firing door and three material floors. Youghiogheny coal is used for fuel.

The initial cost of installation which includes patterns and experimental work, is as follows:

Rolling mill	$939
Furnace	450
Motor	669
Total	$2,058

Following is operating expense per nine hour day:

Roller, 33½ cents per hour	$3.01½
Heater, 33½ cents per hour	3.01½
Catcher, 24 cents per hour	2.16
Straightener, 24 cents per hour	2.16
Common labor, about	2.00
Fuel, power, etc.	6.00
Total	$18.35

The billets used are from 12 to 24 in. long and the output of the machine varies from 3 to 6 tons per day, depending on the size of the material rolled. Various tests made from time to time, have demonstrated the fact that the re-rolled iron is of good quality and usually superior to the ordinary grades of new iron, the improvement being due to the additional rolling. Naturally, however, the quality of the re-rolled iron must depend to a considerable extent on the material of which the original bar is composed and can be determined only by a test of each piece, which would be impracticable. This element of uncertainty therefore, as a rule, precludes the use of the product of the mill for the more important work, the exceptions being instances where the material in the billets is known to be good. The cost of rerolling, not including value of scrap, is from $3 to $6 per ton, according to the size of iron rolled, and the profits will average $10 per ton.

A recent statement from the general storekeeper of the Illinois Central is to the effect that the present average daily output of their rolling mill is 3½ tons, cost for labor and fuel $4 to $4.75 per ton, and profits $700 to $900 per month.

The Chicago & North Western is also operating a mill of the C. M. & St. P. type at their Chicago shops, reducing 1¼ in. and 1⅛ in. round to ⅞ in. and ¾ in. The daily output is 1½ tons and costs about $8 per ton. In addition to this they have ordered an Ajax three-roll-mill which will have a capacity of from 2 in. to ⅝ in. It is the intention to operate both mills.

The Chesapeake & Ohio has an Ajax reclaiming roll on its scrap dock at Huntington, W. Va. This has been in operation about five months, rolling flats up to 1 by 3 in., and rounds and squares up to 2 in., turning out finished bars as long as 13 ft. 6 in. Total cost of rolls, furnaces, oil tanks, shed, motor, etc., in the neighborhood of $12,000. Average daily output 3½ tons, on which it is stated they are making a profit of $1,100 a month.

The Southern Pacific is operating a rolling mill on the scrap dock at its Sacramento general shops, with a maximum output of 100 tons and an average output of 90 tons a day. Total cost per ton, including scrap, $28.60—total profits per year, $56,000. This, however, would hardly be considered a rerolling mill proposition such as I have attempted to cover, but a general rolling mill, and I have no doubt that further information can be obtained that will be of great interest, especially to roads located at considerable distance from the base of supplies.

As the difference between the market price of new iron and

the market price of scrap is not always maintained at the same level, the profits per ton from the operation of rerolling mills must necessarily vary. The greater this difference, the greater the profit, but with sufficient tonnage to keep a mill steadily employed and manned by a regular crew, the profits from such a mill as I have described, having a capacity of from 3 to 6 tons per day, should not, at any time, be less than $10 per ton.

Discussion.—The discussion led to the general subject of scrap. The Rock Island handles scrap with magnets on locomotive cranes at less than two cents per ton, as against twenty-five to thirty-five cents by hand. The Southern Pacific reclaimed $960,000 worth of scrap last year at about one-half the cost of new material.

STORAGE AND HANDLING OF ICE.

Three papers were presented on this subject, abstracts of which follow:

G. T. Dunn:—Storage for ice should be such that it will accommodate the supply for all departments at any one point for the entire season. Experience has taught us that the larger the volume the less shrinkage will be. Ice can be handled more advantageously if packed on its edge than if packed on its side. When stored on its edge it is necessary as each layer is placed in the house to adze off the cakes to obtain a uniform surface on which to place the second layer and so on. All crevices or cracks in ice so packed must be completely filled with snow when possible to obtain it or ice broken up fine. After the house is once filled, a covering of shavings, saw dust or hay, preferably shavings of about from twelve to eighteen inches, should be placed over the top.

Ice stored for use in icing refrigerators should, from an economical standpoint, be stored on its side in that it is broken up more or less when used for this purpose, and that less loss will be had through shrinkage.

We store our ice on a piece-work basis, and by so doing make a saving of from three to five cents a ton. The following are figures covering the storing of ice for the past three years:

1911	1,436.25 tons	Cost per ton	$.239
1912	1,415.9 tons	Cost per ton	.266
1913	1,520.6 tons	Cost per ton	.251

These figures represent all expenditures such as the cleaning of the house, boarding up of the doors, covering over of the ice and removal, installation of hoisting engine, etc.

Clarence Foster (C. & A.):—The most important consideration for the preservation of ice is the proper construction of a house which will minimize the shrinkage. After the ice is in the house all doors should be sealed and the embankments around the foundations should be gone over to see that no air can get into the chambers from below. A slight opening for air underneath can cause havoc in the way of shrinkage. No separate chamber should be opened until necessary for the removal of the ice. It is necessary to have a little larger air space between the rows when storing artificial ice and we have even found it advisable to put thin boards between the layers. If care is not taken in the storage of artificial ice it will congeal and in some cases dynamite will be necessary in its removal.

We find at Roodhouse, where the re-icing is all done by hand, except the crushing, that one and one-half to two minutes is the average time needed per car. The ice is handled with crews of twelve to fourteen men. On the Chicago & Alton we add to the first cost of the ice in the house 30 to 33 1/3 per cent. to cover shrinkage, which leaves but a small amount for adjustment at inventory time.

The Roodhouse station is handled in the nature of an outside operation. Ice, salt, labor and incidentals are debited to a ledger account in the general storekeeper's office the same as material at a division or terminal store. Charges to departments for ice furnished, and bills rendered versus shippers are credited. Any profit or loss accruing from the operation of the station is cleared monthly through operating expenses.

D. C. Curtis (C. B. & Q.):—Ice 22 in. square is the best size to pack and handle. A competent inspector should be at the loading point or field to see that the ice is furnished in accordance with the specifications. An inspection at the loading point saves paying for hauling and handling ice not suitable for packing, and there is also an added saving in the shrinkage caused by packing irregular ice.

A large loss of ice is caused by the methods used in taking it out of the house. It should be so handled that the cakes taken out will be the same size as the cakes packed. The care ice houses receive, is the determining factor as to what the shrinkage will be. In insulated houses, openings between the sill and foundation will cause an enormous shrinkage and in some houses this has caused the ice to melt for a distance of 6 ft. from the wall the entire height. Insulated houses should have no openings to the outside air, and should be as near air tight as it is possible to make them.

Ice packed in sawdust should be gone over at least twice a week to see that all cracks and openings are closed. Sawdust on top of ice will crack in ten days, so that 20 per cent. of the top surface of the ice will be exposed and this soon causes holes, and a very large shrinkage. Hay is a better covering for ice than sawdust, as it will not crack or form openings and expose the ice to the air. The space between the ice and roof of covered ice should be as large as possible, and so arranged as to have perfect ventilation, to remove the hot air caused by the sun's direct rays on the roof.

The cost of construction and insulation of ice houses that will pay for the interest on the investment can be closely figured and is a matter that should receive very much more attention than it has in the past. The accompanying table is based on observation and shows that shrinkage pays for the cost of insulation where ice is worth over 80 cents a ton in the houses:

House No. 1 is a house having several thicknesses of good insulating material such as lith cork board, water proof paper, sawdust, etc.

House No. 2 is a house with $1.00 less per ton of storage room spent for insulation.

House No. 3 is simply a shell to hold the sawdust or hay packed around the ice.

	House No. 1.	House No. 2.	House No. 3.
Cost of construction per ton of storage room	$4.00	$3.00	$1.50
Per cent. shrinkage	10	25	40
Additional cost for additional capacity to provide for shrinkage	.00	.45	.45
	$4.00	$3.45	$1.95
Interest at 6 per cent	$ .24	$ .207	$ .117
Depreciation 4 per cent	.16	.138	.078
Insurance, taxes, repairs, etc., 4 per cent	.16	.138	.078
Total cost per year of investment	$ .56	$ .483	$ .273

To provide for the loss by shrinkage using house No. 1 as the basis, ice in the different houses costs:

	House No. 1.	House No. 2.	House No. 3.
At 50 cents per ton	$ .50	$ .575	$ .65
At 80 cents per ton	.80	.92	1.04
At $1.20 per ton	1.20	1.38	1.56

The amount of money lost per ton each year by shrinkage using house No. 1 as a basis, would be:

	House No. 1.	House No. 2.	House No. 3.
At 50 cents per ton	$ .00	$ .075	$ .15
At 80 cents per ton	.00	.12	.24
At $1.20 per ton	.00	.18	.36

From the above table it will be seen that the difference between the additional cost of investment for construction of house No. 1 and the amount of money lost by shrinkage of ice in houses No. 2 and No. 3 will be as follows:

	House No. 1.	House No. 2.	House No. 3.
Ice at 50 cents per ton—			
Cost of investment	.....	$ .077	$ .287
Loss by shrinkage	.....	.075	.15
Ice at 80 cents per ton—			
Cost of investment	.....	.077	.287
Loss by shrinkage	.....	.12	.24
Ice at $1.20 per ton—			
Cost of investment	.....	.077	.287
Loss by shrinkage	.....	.18	.36

It will be seen that when ice costs 80 cents per ton in the house, it would only cost 7.7 cents more to build house No. 1 than house No. 2, and the saving in the amount of money lost by shrinkage would be 12 cents, or it would save 4.3 cents on every ton, and the insulated house No. 1 should be built. When ice costs over 80 cents per ton in the house, it pays to build a well insulated house.

However, the question as to how early in the season the ice will be used, should be taken into consideration. In houses of more than one room it would pay to construct one of the rooms cheaper than the others, and use the ice out of this room first, before the real warm weather begins and heavy insulation is necessary.

It is poor policy to build a house of over 1,500 tons capacity that will require packing the ice in sawdust or hay, as it is expensive to buy the packing and waste it all in 2 or 3 years, to say nothing of the labor involved in the packing and handling. Where ice is cheap it is not necessary to build an expensive insulated house, but the ceiling should have as much, or more, insulation as the walls. The rooms should be as near air tight as it is possible to make them, and the ice should be hoisted by a skip hoist through an opening in the ceiling and then lowered by counterbalance elevator or gravity chute to a cooling room, and used from this cooling room as desired.

The service buildings for taking care of ice for passenger car use are the largest producers of shrinkage on a railroad. A service building should be well insulated and have a small vestibule equipped with a bench properly arranged for washing, draining the water off, and cracking the ice in a bin where the ice can be easily shoveled out. All this should be sanitary and so arranged that it is not necessary to touch the ice with the hands. This vestibule should be large enough to hold the necessary ice carts and receptacles which are needed in connection with this service. In icing passenger cars at the last division before reaching terminals, only enough ice should be put in the coolers to run the car to its destination, with, of course, enough extra to take care of the average delay.

There is a big loss of ice in refrigerator and cream cars by not keeping them in continuous service. In loading refrigerator cars in the winter time, a canvas curtain is used over the door to prevent the cold air getting in. This curtain is used at but very few points in the summer time to keep cold in. Instructions should be issued to all freight agents to use the canvas curtain whenever it is necessary to keep the door open. The use of these curtains will prevent a big waste of ice.

It is true the first cost, or cost f. o. b. car, is small, but added to this the cost of hauling, cost of packing, interest, depreciation, and taxes, etc., on the building in which it is stored, brings the cost up to where it is too expensive to allow ice to melt where it can be prevented. When the stored supply is exhausted in the hot summer months, the purchase price of ice is then $1.50 to $3.50 per ton, and this is the value of the ice which has been allowed to melt. Each year it costs thousands of dollars above the winter market price for the ice which it is necessary to purchase in summer. On a railroad of 5,000 miles or more, Daresay the waste in ice amounts to from $50,000 to $100,000 per year.

Discussion.—Mr. Roth of the Burlington claimed that his road saved $50,000 by putting the handling of ice in the hands of the storekeeper.

OIL HOUSE AND WASTE STORAGE.

C. S. Coe (A. T. & S. F.):—The Santa Fe has discarded the old time oil house, maintained separate from the storehouse, which necessitated two extra employees, one for the day and night, and instead a reinforced concrete basement has been adopted of sufficient size, according to the importance of the division point, to handle the illuminating and lubricating oils, varnishes, japan, greases, compounds and everything required in this class of material. This oil basement is situated as far from the storehouse as is desired, the oil being drawn by the Bowser system of long distance pumps situated in one end of the storehouse. This places the issuing of oils with the store department employees the same as other materials and eliminates the employing of special oil house men.

One of our most essential features is the handling of oil from the general oil house to the division oil houses. To accomplish this successfully, about forty-five 10,500 gal. capacity system tank cars are especially assigned to the store department for service at the general oil house. All oils ordered from the oil companies are consigned to the general oil house and transferred to these assigned system tank cars, thus saving per diem or demurrage charges. We have adopted colors for the different kinds of oils so that all employees will know at a glance what kind of oil is in a can, drum or any oil container, and will also recognize it as company material and handle accordingly. The assigned tank cars are also painted with a 24-in. stripe around each end of the tank in accordance with the above, and are stenciled for the kind of oil they are used for, boarded for store department service, and never used for any other kind of oil unless released by our department. All hose, pipes, valves, connections and other fittings are also painted according to colors, and there is no chance of getting oils mixed in taking the supply.

These tank cars on leaving the general oil house under load are routed over the line, making from five to ten points, according to the distance and the amount of oil required; they are then returned to the general oil house, reloaded, and again routed out for another trip, and are routed so each tank makes a trip about every thirty days; we have enough tanks to cover the entire road in this period.

The general oil house is a one-story concrete building having a basement, 50 ft. wide by 160 ft. in length. The storage capacity for illuminating and lubricating oils is about 125,000 gal. and consists of a series of 10,000 gal. tanks. The storage for turpentine, varnish, japan, paints, linseed oil and similar materials consists of a battery of tanks erected in such a way that by the use of an air hoist and carrier, barrels can be raised to a track and run by gravity to any desired tank and emptied. The material is then drawn for shop use or shipment by the long distance, automatic measuring, Bowser pump system. A sufficient space is partitioned off by a steel door where the heavy paste and compounds are kept in open stock for retail purposes.

On the main floor are located 32 self-measuring Bowser pumps. Steel counters are used for wastes and journal packing, while standard steel shelving is used for can paints and similar material. One side of this floor is used for storing of waste in bales and will be partitioned off with a fine screen wire to protect it from pieces of oily waste or anything which might cause fire.

Eleven power pumps are installed for the transferring, unloading and loading of tanks and supply cars, and for filling of drums and barrels for road shipments. These pumps have a capacity of from 8,000 to 10,000 gal. each per hour, and the maximum quantity of oil that can be transferred in a day is almost unlimited.

Indicating gages, in appearance similar to a steam or air gage, register the amount of oil in the storage tanks in the basement at all times, and can be placed anywhere in the building, on the wall, or in the office, and show at a glance just what oil is on hand, thus saving the necessity of going to the basement to take measurements.

Discussion.—The Illinois Steel Company saved $8,000 by adopting the centralized oil house at their plant.

EFFECT OF STORES DEPARTMENT ON OPERATING COST.

H. C. Pearce (So. Pac.):—A well-organized stores department on a railroad has the same direct effect and influence that a skillful and economical housewife has on the economical operation of the household.

How to measure the value of a well-organized, efficient and economical supply department in dollars and cents is as im-

possible as it is to measure the value of an efficient, capable and economical administration of household affairs. The work is so far-reaching and so interwoven with all departments that it is impossible to segregate the unit of saving into dollars and cents, but its need and usefulness are so apparent and its field is so well defined that it is fundamental. The real value of a well-organized and efficient supply department can only be determined by the final results of the operation of the property. Its service should be measured from day to day. The condition of the property under its control shows for itself. The investment is indicated by the balance sheet. The real economy which is effected will be best shown by the percentage of *purchases* to the *issues* over a period, with knowledge of conditions.

I appreciate that it will be said that this is not an accurate unit of measure for the reason that some roads manufacture more than others, etc. This is true, but it will not affect comparisons on the same railroad and statistics have little value other than for comparative purposes and with full knowledge of conditions.

The supply department should be organized and operated to *reduce* purchases and not to *increase* them. The unit of price, unless service and need are considered, is a false one. The real unit is making the most of what you have and making everything give its full measure of usefulness and so handling and disposing of the salvage as to obtain every dollar there is in it, the ultimate purpose of it all being the *net* cost of materials and not the *first* cost. The economical housewife does all these things and in addition, which is probably more important than anything else, by precept and example lays the foundation for a self-respecting, self-supporting and capable family. This is what an efficient supply organization should and will do for a railroad.

It is to this department that we must look for savings in values, which are otherwise generally overlooked. The dollar is watched, checked and supervised. The same value in material hardly receives a thought. Our railroads must look to their supply departments to protect their materials to the same extent that it now looks to its accounting and treasury departments for the protection of its dollars.

The first purpose of a supply department is to supply the needs of the railroad. It must be organized in such a way that what is best suited for the purpose can be laid down promptly at the time it is needed at the least cost. The saving made by having an organization of this character can never be shown by statistics. It is represented only in the cost of the work.

Its second purpose is to market the salvage. With railroads having their own foundries and rolling mills, the railroad itself is its best customer and salvage should be handled in such a way as to apply it to the requirements of the railroad to the best advantage.

I will not attempt to go into detail as to how the salvage on our railroads should be handled, controlled and marketed. This matter was presented at last year's convention and in an article appearing in the *Railway Age Gazette*, issue of December 13, 1912. I wish to simply point out the one fact that the use and marketing of salvage is of second importance only to the providing and caring for the company's property.

The third purpose of a supply department is to handle its material with the least expense, always taking into consideration the first two principles, i. e., that it is necessary to provide and properly care for what you have.

The fourth purpose is to prevent deterioration and reduce interest on investment, deterioration for want of proper care and housing facilities, system, etc., changes in standards, changes in plans, curtailment of forces, lack of proper facilities and lack of proper care. The losses here are enormous. Very few railroads appreciate the enormous amount of money that is being lost annually in this way. An efficient organization should be such as to have perfect control and knowledge of every item on hand and on order and the organization should be so conducted as to reduce losses by deterioration, changes in plans, changes in equipment, etc., to the lowest possible basis. Interest on the investment is a big item and one which should be fully considered by any well-organized department, but this is one of the items which are exposed and the management can easily watch and protect this item, and, further, if the other purposes I have mentioned are taken care of, this item will take care of itself.

I have purposely avoided going into statistical details. My purpose has been to simply present certain fundamentals underlying the organization and the results that such an organization would have on the net revenue of a railroad company.

N. M. Rice (A. T. & S. F.):—The effect of a well-organized store department on the operating cost of a railroad, is far-reaching. In their organization the Santa Fe purchasing and stores departments are somewhat different from those of other railroads, in that the head of each reports to the same vice-president and while to a certain extent each is a separate department in itself, yet at the same time the two departments work in accord; consequently the assistance given by either department to the other brings advantageous results not obtainable otherwise.

Primarily, purchases made of railroad material and supplies, governed by quality and controlled by competitive bids, as well as those items bought under contract, assist very materially in laying the foundation of an economic effect on the operating cost; however, should the effort stop here the surplus and consequent waste thereafter to be encountered would destroy entirely the results thus far obtained.

It is well known that a railroad operating under most favorable circumstances, in so far as management is concerned, will suffer, from a monetary standpoint, from gross errors made in over-estimates of material required in construction of renewals. Then again there is an expensive outlay to meet the demands of new conditions. To reduce the expensive effect of conditions such as these, the store department must keep in touch with the situation and handle through its channels, the surplus and out of date material, giving credit to operating accounts, and then by application, by substitution, wherever possible, prevent expenditures, proved unnecessary by the acceptance of the substitute. The sources from which reclaims can be made are numerous and embrace items ranging from large and expensive bridge timbers left on the right of way at some bridge to serviceable second-hand track spikes found in the scrap yard, and which when returned to the stock of the store department and the proper operating account receives credit therefor has its effect on reducing operating expenses.

In a great many cases even where full care and caution are used by the heads of the different branches of the operating or constructing department, in figuring estimates and in placing requisitions for material required for some specific work, changes made after the material is on the ground and charged to that particular work, will oftentimes result in several dollars' worth of material being left unused, which if not taken up and turned back to store stock for credit and used elsewhere, will necessarily stand charged to the work for which it was originally ordered, and even though at that particular time it is the intention, at some future date, to use this material in connection with similar work at some other point, the probabilities are when that time arrives, if ever, it will be found that deterioration will prevent, thus necessitating another supply of material and its consequent additional charge. Conditions, however, on the Santa Fe, under which the store department endeavors to make its system effective, practically demand the prompt return of this material to its jurisdiction, and there have been years when the value of material returned to stock, on the entire Santa Fe system, amounted to over $2,250,000, or approximately 6 per cent. of the issues. In these figures, however, are included approximately $420,000 worth of serviceable material reclaimed from scrap.

The mechanical working stock at terminals and shops embraces exactly the same features as the line stock, only it is conducted

on a larger scale and carries with it the additional advantage of being located in close proximity to the work for which it is required, thus dispensing with the necessity of mechanical department employees making long trips for material and thus securing their greater application to the work. This principle of handling is in universal practice on practically each and every item of material, the objective point being to prevent charges for material until actually required.

With the practice of issuing supplies and stationery from supply cars, which run monthly, the requisitions are made for thirty day needs only, instead of considering it necessary to carry on hand an extra 30 or 60 day stock for emergency, thus reducing charges to this class of operation, monthly, to a minimum.

One of the many economic effects on operation can be procured in systematizing the storing and distributing of oil. In the first place the cost of the oil is placed at the minimum, when proper storage has been provided therefor, by purchasing for delivery in tank cars. The use of steel tanks for storage and self registering pumps for delivery eliminates the inevitable attendant loss, not including increase in purchase price, when bought in barrels and issued therefrom through faucets. Practical tests by competent engineers show losses, in the barrel and faucet method of handling, of from 5 to 25 per cent. on lubricating oils and on volatile oils the loss is much greater.

Another source from which the store department can always draw means with which to affect operation is the scrap yard. Each and every ton of scrap picked up on the right of way or at terminals and sent in to the central scrap yard is just that much reduction in charges to operating accounts, and the more care and diligence that are employed in sorting the scrap and in the reclaiming of serviceable material, just that much more benefit will accrue. Brass, of course, is the one item of scrap, which on account of its value, stands out clear and distinct as requiring more care, more diligence in following up, than any other single item. Monthly comparisons of receipts of scrap brass with purchases of new, as well as care in safe storing are essentials, which, if overlooked, play havoc with returns in this class of scrap. When one takes into consideration that the cost of new brass on the Santa Fe System for one year is between $700,000 and $750,000, while the value of scrap brass sold is approximately $500,000, it is needless for me to add anything further to prove the effect on operation by this one item of scrap alone.

Reclamation and utilization of serviceable material taken from scrap has each year broadened and expanded until now practically no item which can be utilized to an advantage is placed on the market for sale. As mentioned heretofore, the value of serviceable material reclaimed from scrap approximates $420,000 yearly, while the sale of scrap, restricted somewhat on account of unsatisfactory market prices, has averaged for the past two years $1,250,000.

An arrangement is in effect on the Santa Fe whereby the store department periodically makes a check of way car equipment, and even though requisitions for this class of supplies are approved by trainmasters and superintendents, it is amazing in how short a time a surplus will accumulate. Just a short while ago a check of 32 cars resulted in the return to stock of $2,291.94 worth of supplies not required, an average of $71.62 per car. The return to stock of these items, of course, affects the operating cost of a railroad.

Fuel is the most expensive single item for which railroads pay and the one single item which can be made the greatest factor in handsome returns to operation. We have on the Santa Fe organized a branch of the store department, which gives its entire attention to this pursuit. If information procured on methods in use on other railroads in connection with handling fuel is correct, the system under which we are operating is decidedly more far-reaching than any other in existence.

It was not until June, 1908, that the store department assumed entire control of fuel handling. It is therefore necessary to use the twelve months following that date as a basis of comparison for the three fiscal years ending since June, 1909. While the decrease per ton mile since that time is fairly good, yet as this was the initial year in our efforts to reduce consumption, in view of the success secured since, it is apparent that the decrease over periods prior to June, 1908, for the years following 1909 is really greater than actually appears. The following is the result of the comparison of the fiscal year 1912, years 1910 and 1911 being not so good, but still a considerable decrease under 1909.

Ton miles	29 per cent. increase
Fuel consumed	16.2 per cent. increase
Fuel consumption per ton mile	9.7 per cent. decrease

Or in other words, the efficiency of a ton of coal was raised 9.7 per cent., which, when applied to a $9,500,000 yearly fuel bill, shows the effect on operation in no uncertain terms.

In the face of this decrease, for the first eight months of the fiscal year 1913, due to more rigid supervision, there is a further reduction over the same months of 1912 of $421,438.83. These figures take into consideration increase in purchase price of fuel and are based on the increased efficiency this year over last of a ton of fuel as compared with the increased cost to operation, had the efficiency of the fuel remained stationary or decreased.

Discussion.—G. G. Yeomans presented some interesting figures taken from an article published by him in the *Railway Age Gazette* of July 19, 1912, showing the savings made by establishing a stores department on a road where there was none before. The average reduction in operating expenses and purchases for five years after the store department had been in force was $1,359,000 and $774,000, respectively. The average increase in car mileage density, the best unit by which to measure material for a road for the five years, was 16.4 per cent., showing that the road was using more material. This road was no exception to other roads without a store department. N. M. Rice explained the system of handling fuel on the Santa Fe.

STORE HOUSE CASTING PLATFORMS.

D. Kavanagh (C. R. I. & P.) :—It is desirable that the casting platform should be at the car floor height. In case it is not practical to have it thus, there should at least be a small platform for loading and unloading cars, reached by a platform hoist. The platform should be so arranged that sufficient space is allowed to pile castings of different pattern numbers separately. Each kind of casting should be placed together and in numerical order of pattern numbers as far as possible; that is, all grates, piston heads, draw castings, steam pipes, etc., should be grouped separately, as this arrangement makes a neater looking casting platform and also is more economical in putting away castings or getting them out for shipment, and is in my estimation a better plan than attempting to group various castings together for any certain class of locomotives, as in the latter instance if you have two or three classes of engines that take the same pattern of piston head, you have two or three patterns of castings in as many different places on the platform.

There should be a suitable storage shed to accommodate finished castings. This shed should be provided with the necessary racks to accommodate such material as cylinder packing rings, vibrating cups, etc., and the larger finished castings, such as crossheads, piston heads, cylinder heads, etc., should be kept on the floor suitably arranged for convenient handling. The office of the casting platform foreman, or stockman, could be located in this building. The finished casting house should be heated, as this class of material deteriorates not alone in the open air, but also in the natural moisture of an unheated building.

At points where the volume of material handled will warrant the expenditure, a crane operated by steam or electricity—a locomotive hoist or traveling crane of some kind—should be used. At smaller points an air hoist may be built at a comparatively small cost and will answer the purpose reasonably well. In all cases in considering the question of crane facilities, the cost of machinery must be taken into consideration in connection with

the benefits to be derived from such improvements. It is important that the foreman or stockman in charge of the casting stock keep himself posted on all new power that is being built or purchased requiring a new pattern of casting, as well as to keep himself advised of castings that are becoming obsolete on account of changes in standards or on account of some particular type of locomotive going out of service.

LUMBER SHEDS.

W. E. Hatter presented a paper on this subject, recommending a building having a space of 2½ in. left between the siding boards, they being placed at such an angle as to prevent snow or rain from beating through. The building should be adequately lighted, or otherwise the material will season slowly and become susceptible to dry rot, mildew, etc.

All kiln dried material should be stored in a special room in which the conditions produced by the kiln will be retained. The room should be tight but ventilated and maintained at an even temperature.

Following is an itemized list and approximate cost of material needed for the construction of such a shed, having a capacity of one million feet of lumber.

Roofing paper	$ 536.54
Slate roofing	1,054.14
Glass	89.90
Oak floor for piling lumber	1,164.37
Oak floor between tracks	379.67
30,811 ft. 1 in. siding pine	687.70
37,750 ft. underlining for state at $32.00—white pine.	888.00
6,900 ft. flg. in dry shed at $27.00	186.30
Cement floor	200.00
Rafters, joists, beams, etc.	1,000.00
Total	$6,986.62

STANDARD SUPPLY CAR.

Two papers were presented on this subject, abstracts of which follow:

D. D. Cain (So. Pac.):—The supply car, when properly handled, is one of the greatest savers of material and money of any branch of the supply department. The real purpose of the supply car is to deliver material where it is wanted at a specified time each month, and at the same time pick up all tools and other material not needed and make a monthly clean-up of all scrap on the division.

The standard for supply cars should be in the standard of operating cars rather than in the standard car. To properly handle material with supply cars, the following will be needed on each division or district:

First—An oil car with the required number of tanks for oil. This car should be equipped with hand pumps and with an air pressure arrangement, the air to be used wherever it is necessary to draw any large quantity of oil, and at the same time the hand pump can be used for filling smaller orders. The air is taken from the train pipe line through a reducing valve.

Second—A general car equipped with the necessary shelves for small miscellaneous material and supplies for all departments. This car should be arranged with space for sleeping accommodations for the attendants and a desk at which to transact the clerical business necessary.

Third—A car with the necessary racks for roadway tools, block signal supplies, large station supplies, and similar material.

Fourth—A car for case oils, gasoline, etc., where used.

Fifth—A car for stationery if it is delivered by supply cars.

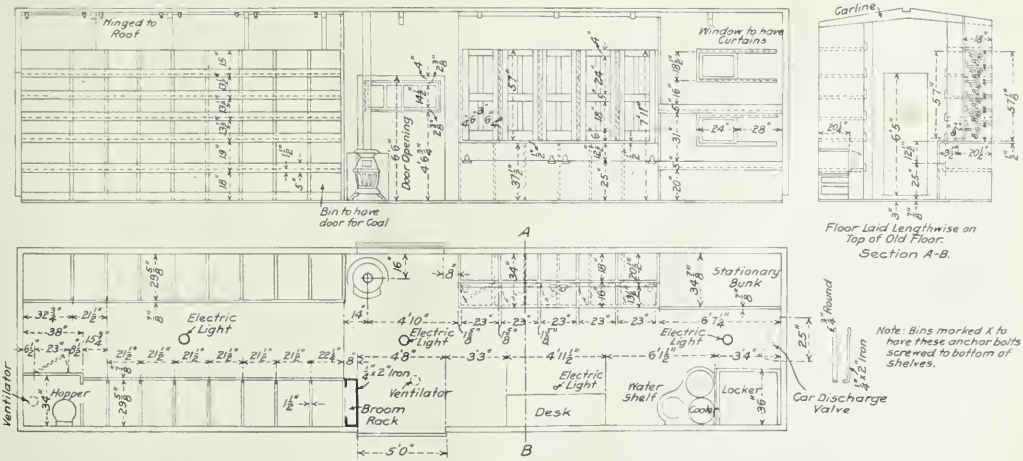
Sixth—A car for spikes, track bolts, and track supplies.

To the above should be added the necessary cars for assembled jobs complete, also hand cars, velocipedes, frogs, switches, track trimmings, etc., and, where treating plants are operated, lime, soda ash and distillate, and such flat cars as may be needed with side boards for scrap.

The first five cars should be equipped with end doors to enable the attendants to pass from one car to another while the train is in motion for the purpose of assembling material for the next stop. These cars should also be equipped with electric lights, which can be installed at a cost of $35 per car. We use a set of the same batteries that operate our block signals. In practically all of our supply trains on eight divisions we use from twelve to as high as thirty cars, depending on the amount of business each month.

With a properly organized division and the supply cars in charge of a thoroughly competent division storekeeper, there is no need for requisitions being delayed by having the approval of every officer on the division. These cars are built for action, and we are going to deliver what is needed and pick up everything that is not needed. Requisitions covering the estimated requirements for the ensuing thirty days are made by all departments and sent direct to the division storekeeper. These requisitions are stamped, "Supply Car," and turned over to the supply car storekeeper and assistant, who draw off a summary of the material required and check it with the various section storekeepers. Any items short are immediately reported to the storekeeper, and, if considered necessary, the proper steps are taken to secure them.

It should be understood that supply cars must be sent out equipped with all needed supplies. If they are not, it means extra packing, billing, and shipping by local trains and there is nothing so detrimental to the operation of the supply car as



Standard General Supply Car—Southern Pacific.

being out of handles, track tools, or any supplies required.

The making out and forwarding of the requisitions and the checking and loading of the cars must be handled with despatch, and the supply train, loaded with full equipment of tools and all miscellaneous supplies for all departments, including frogs, switches, track bolts, spikes, and extra hand, velocipede and push cars and assembled jobs, is now ready to leave.

Schedules showing the dates on which these cars move, train numbers, etc., are prepared in advance and placed in the hands of division engineers, roadmasters, section foremen, agents, signal maintainers, pumpers, trainmasters, yardmasters, etc., so that all tools, scrap, etc., may be ready for quick inspection and handling.

The supply car must always be accompanied by the division storekeeper and by the roadmaster and signal supervisor over their own respective districts in order to be properly handled and to get the best results. Stops must be made at each tool house and station. Tools and supplies required are checked between stations and made ready for quick delivery.

The receivers of the material, i. e., signal maintainers, section foremen, agents, etc., receipt on the face of the requisition for the supplies delivered by the supply car storekeeper and the supply car storekeeper in turn receipts on the face of the shipping inspected by all the above men and any necessary business is transacted on the ground with the agents and section foremen personally. Tools are inspected and, if any surplus tools or materials are found, they are turned over to the supply train and the proper credit allowed. It may be that the tools on hand are badly worn and none were ordered, but no red tape is allowed to stand in the way and the necessary tools and supplies are issued, a memorandum requisition being made for charge. Then no excuse can be given the superintendent that sufficient material or tools were not on hand to do efficient work for the next thirty days. The turning in of old tools is rigidly enforced. Even the return of old brooms and similar material is required for the moral effect.

Scrap is taken from the bins and placed on the proper cars, the sorting being done at the time of loading, which costs no more as the bins at the tool houses are arranged as to wrought, cast, etc. This saves considerable labor at the general scrap docks.

The superintendent and other officers by this method of inspection become thoroughly acquainted with conditions at each point and the need for all material on the division, knowledge which they could not obtain by any other inspection. The division storekeeper becomes a very valuable assistant to the

notice for all serviceable material, tools, scrap, etc., turned over to him. Thus the bookkeeping operations are reduced to a minimum and are completed on the ground with the user and deliverer of the material together at the time. This in itself performs a very useful detail in connection with the operations.

When supply cars were first introduced on the Southern Pacific we ran them in local trains, but we found that the proper time could not be given unloading and picking up without seriously delaying the train. Consequently about every three months we ran a clean-up special. The superintendents found that our supply trains were not playthings and that they actually delivered the material required for thirty days, with the result that they combined their own trips with ours. Thus, on practically all divisions we now have our supply trains run on a regular monthly schedule as an inspection train accompanied by the superintendent, resident engineer, division storekeeper, roadmaster, etc. This is not an expense but a saving, as the same engine that pulls the superintendent pulls the supply train, and the local freights are relieved of this work and handle commercial freight only.

The supply train stops at every tool house, signal shop, pump house and station on the division and each point is thoroughly division as he becomes intimately acquainted with the desires of the superintendent regarding the operation of the division and is able to carry them out in the issues of material.

If it is not consistent with the policy of some roads to run special supply trains, they can be handled on local freights, but, to get efficiency, they must, at all times, be accompanied by the roadmaster and the division storekeeper, who has authority over all material on his division regardless of where located. The same care must be taken regarding having on hand what is required and regarding the delivery and picking up of scrap and all unnecessary supplies. On some railroads it is maintained that, while supply trains are useful on long stretches of railroad with light traffic, they can not be operated satisfactorily on roads with heavy traffic. With us our heaviest supply trains are operated on a division where we have 55 passenger trains per day on a double track.

In handling material with supply cars there is the following saving: No delays to trains on account of train crews stopping at each point during the month to handle thousands of articles needed along the line. No waste labor in packing material. No labor expended in billing thousands of articles that are handled from the supply trains. No cars destroyed for shippers by having

oil spilled in them. No billing or shipping back of empty containers to the store. No pilfering of material. No loss from breakage. No claims or correspondence regarding shortages.

One of the greatest advantages of the supply cars is the fact that we are able to carry out the exchange arrangement regarding station supplies, signal supplies, track tools and supplies. This can be accomplished in no other way. When tools are delivered we insist that the old tools be returned to us in exchange or a satisfactory explanation given at the time on the ground as to why an exchange cannot be made.

There is also the advantage of picking up old material, scrap, second-hand tools, etc., and bringing them to the shops each month, picking out the serviceable material, getting the scrap ready for sale, and repairing tools, hand cars, etc., for the next month's trip. We appear to forget that, in picking up scrap without the use of supply cars, a flat car may be set out by the local train at ten or twenty stations, delaying the train and keeping the car out of service.

The more we work with supply cars the more uses we find for them. On some of our divisions we arrange to send out, as far as possible, all assembled shipments with the supply trains. That is to say, every job which does not assume the importance of immediate action is assembled at the division store and shipped out direct to the work with the supply train and set out exactly where it is wanted with absolutely no delay to local trains and no back hauls.

When men are sent out to do the work, they know that the material is there complete, and that there are no breakages or shortages to delay them. The superintendent and proper officers, who, as before stated, accompany the supply train, know that the material has been delivered, and no delay to the completion of these jobs can be passed up to the store department.

The supply cars can be used to good advantage between trips in supplying and keeping in shape small outside stores where they can not be supplied on regular trips of the supply cars, although as many of these points as possible should be handled on schedule supply car trips.

Properly handled, the supply car is the economical medium through which to deliver substantially all material used in ordinary operation and maintenance, with the exception of lumber. Even with this we have at times distributed fencing, stringers, etc., at considerable saving. There should be no local shipping of company freight unless in carload lots.

L. O. Genest (Can. Pac.):—Our eight cars are operated as separate units and patrol 7,500 miles at stated monthly intervals, and are equipped and directed by four divisional storekeepers with a storeman in charge of each car. Deliveries are confined to light supplies and tools, such as are required for maintenance purposes for stations, sections, water supply, etc. Requisitions from each of the sixteen sub-divisions are sent to each of the respective divisional storekeepers not later than the twenty-second of the month for the following month's requirements, and are fastened separately (with brass fastener) in station order for each department and each section or branch, as the case may be, to enable a check to be made in the superintendent's office to insure receipt of all requisitions. The storeman in charge of the car wires the superintendent a day or so in advance stating the sub-division of his district the car will cover so that all concerned may be advised to have their oil cans and old material in readiness for the arrival of the car. Second-hand and worn out tools and material unfit for further service, such as axes, brooms, brushes, chisels, pails, shovels, lamps and fittings, etc., are returned to the storeman in charge of the car before deliveries of new supplies of a similar kind are made. Section foremen, unable to meet the car, deliver to the nearest agent their empty oil cans and whatever second-hand and worn out material they have for exchange.

In the event of storemen being unable to obtain the signature of agents, roadmasters or section foremen, on account of their absence at night or for other causes, the train conductor signs receipt form acknowledging delivery of the goods. A careful record is kept of the tools, etc., issued, and old tools turned in in exchange, and periodical statements furnished the general superintendent drawing his attention to any falling off in exchange. To insure the correct loading of each car the quantities of supplies and tools, etc., are detailed and totaled on wholesale lists. This information is abstracted from combined receipt and shipping slip, which is written from the original requisition, and ultimately sent to the audit office, after pricing, to serve as a basis for invoicing the particular department and account.

Our standard 47-ft. supply cars contain six oil tanks, two with a capacity of 700 gal. for coal oil, and four with a capacity of 155 gal. each for car, signal, valve oil and disinfectant. . The coal oil tanks are equipped with No. 40 Bowser pumps fitted with vacuum valves to prevent syphoning; the smaller tanks are equipped with faucets, and tanks are fitted with automatic measuring gages.

Discussion.—The Santa Fe, in addition to operating in the same way as the Southern Pacific, carries workman for making minor repairs along the line that would not pay for sending a special man from the nearest shop. H. C. Pearce stated that the Southern Pacific supply train carries all kinds of material of which small quantities are required.

OTHER BUSINESS.

The Monday afternoon session was opened with an address by R. M. Huddleston, general auditor, New York Central Lines west of Buffalo.

F. W. Brazier addressed the association Tuesday morning, laying particular stress on correct discipline.

E. J. McVeigh presented a paper, "The Authorized List," which was referred to the committee on recommended practices for further consideration.

A paper was presented on the stationery storehouse Canadian customs regulations. Many roads in the States do not properly ship their materials that are sent to Canada. Each shipment should be covered by suitable invoices and certificates. The Canadian roads have experienced considerable difficulty in releasing this matter from the customs officials, and the paper was presented for the information of the members.

A committee also reported on a standard book of rules. This book was drawn up for the purpose of having a concise and a ready reference for roads desiring to start a store department, and is supposed to represent the best practice of all the roads. The committee has not fully completed the book, and is to be congratulated on the thoroughness with which it is handling the work.

The following officers were elected for the ensuing year: President, J. W. Gerber, Southern Railway; first vice-president, G. G. Allen, Chicago, Milwaukee & St. Paul; second vice-president, H. C. Pearce, Southern Pacific, and secretary-treasurer, J. P. Murphy, Lake Shore & Michigan Southern.

NEW LINES FOR BRAZIL.—The president of the state of Sao Paulo has signed a decree authorizing an expenditure of $30,000 for expenses in surveying a railway from Guaratingueta to Cunha, and a decree authorizing the Paulista Railroad to construct and work a 30-mile branch line from Nova Odessa on the company's Campinas-Rio Clara line. It will cost $1,000,000.

PROJECTED RAILWAY CONSTRUCTION IN GREECE.—The development of railway communication throughout western Macedonia and Epirus is occupying the serious attention of the Greek government. It is proposed to link up the existing railway system in southwestern Macedonia with the Thessalian railways by constructing an extension of 62 miles and by widening the present narrow-gage lines. The existing line from Volo to Kalabaka is to be extended to Grevena and thence via Siatista to Sorovits, where it will join the main line from Saloniki to Monastir. From Grevena it is proposed to construct a line running westward via Metsovo to Jannina and thence to Preveza. As soon as peace has been concluded the Greek government will raise a loan of $58,000,000 to $77,000,000 for railway extensions and improvements.

HORACE G. BURT.

Horace Greeley Burt, for the past two years chief engineer of the Chicago Association of Commerce committee on Smoke Abatement and Electrification of Railway Terminals, and formerly president of the Union Pacific, died at the Oak Park Hospital, Oak Park, Ill., May 19, from the effects of an operation performed a few weeks ago. Mr. Burt was born in January, 1849. He was graduated from the high school at Terre Haute, Ind., in 1867, and from the University of Michigan in 1873. He began railway work in March, 1868, as rodman on surveys and construction of the St. Louis, Vandalia & Terre Haute, and from December, 1869, to December, 1870, was engaged on location and construction of the Joy railroads in Kansas. He then attended the University of Michigan until February, 1873, when he went to the Milwaukee & Northern for one month. He was next employed in the engineering department of the Chicago & North Western from March, 1873, to the summer of 1881, at which time he was made superintendent of the Northern Iowa division. In December, 1883, he was transferred to the superintendency of the Iowa division, and in October, 1887, he was promoted to chief engineer. He became general manager of the Fremont, Elkhorn & Missouri Valley in November the following year, leaving in July, 1896, to go to the Chicago, St. Paul, Minneapolis & Omaha as general manager. Three months later Mr. Burt was elected third vice-president of the North Western in charge of traffic, retaining that position until January 1, 1898, when he resigned to become president of the Union Pacific. After leaving the Union Pacific he took a trip around the world for his own recreation and instruction, leaving during the winter of 1904 and returning to Chicago in 1905. After returning from abroad he engaged in business as consulting engineer at Chicago, returning to active railway service again in January, 1909, when he was appointed receiver for the Chicago Great Western. In September of that year he once more took up private practice as consulting engineer at Chicago.

H. G. Burt.

Mr Burt was probably best known from his connection with the reconstruction of the Union Pacific after Mr. Harriman got control. He was president during the general rehabilitation of the lines, shops and equipment. Later, while consulting engineer, he made a series of recommendations for the rehabilitation of the Kansas City Southern, which have been and are being carried out. He also had charge of important dock work at New Orleans, La., for the St Louis & San Francisco and the Southern Railway, and reported on part of the Puget Sound extension for the Chicago, Milwaukee & St Paul. He was suggested to President Roosevelt to take charge of the Panama Canal, but the position was not offered him. His experience covered the operating, traffic, engineering and executive departments. He was a persistent worker and was never satisfied until he had completed his work in the most thorough manner. He worked day and night. He was a reserved man and seemed brusque to most, but had a sympathetic side, which only his friends knew. He preferred to do his own thinking, and was inclined to dig into details himself unless he had intrusted them to a subordinate in whom he had implicit confidence. He was willing to receive the opinions of others without resentment, no matter how much they differed from his own, but he decided for himself. He took his trip around the world on his own account and not for Mr. Harriman. He had expected to make his report on the electrification of the Chicago terminals by January 1.

SPECIAL COMMITTEE ON LEGISLATION.

A meeting of the railways supporting the special committee on Relations of Railway Operation to Legislation was held in New York on May 21. The committee made its semi-annual report which was approved. The following is a summary of the report:

Three hundred and thirty-one roads (223,418 miles) are supporting the work of the committee.

At the third session of the Sixty-second Congress a bill was passed making the theft of property being transported in interstate commerce a federal crime, and constituting the transporting of any such stolen property from one state to another a separate offense.

This is the only legislation affecting railway operation passed at that session.

For reasons which are well understood, it appears probable that a number of bills will be pushed during the present congress, and the committee anticipates the necessity for active work during the next twelve months.

The working arrangement entered into by a committee representing the railways and a committee representing the employees, under the Hours of Service Act, was to expire on January 1, 1913, at which time a further conference on the subject was to be held.

In view of the fact that the Interstate Commerce Commission some months ago revised its reports in order that the effect of this working arrangement might be more clearly ascertained, it has been continued, by the tacit acquiescence of all parties thereto, until such time as the necessary data for consideration is available and further conference can be had on the subject.

After July 1, 1913, the rules for the inspection of locomotive boilers, issued by the Interstate Commerce Commission, June 2, 1911, require the setting of a factor of safety for locomotives which were in service prior to January 1, 1912.

This matter is of the utmost importance, as the establishment of such a factor of safety higher than is necessary would result in the elimination or reconstruction of a large number of effective locomotives now in service.

It will be necessary to conduct conferences with the Bureau of Locomotive Boiler Inspection, to precede hearings before the Interstate Commerce Commission.

In preparation for this, your committee has issued Circular No. 43, dated May 15, 1913, asking for the information necessary for a preliminary study of this question, and will be prepared to undertake these negotiations if authorized thereto by the railways at interest.

In view of the necessity for the uniform application of the rules for the inspection of locomotive boilers, your committee has collected, from all available sources, the rulings and opinions which have been expressed relative to the application of these rules. A compilation of these has been made, and such of them as seem in accordance with sound practice will be issued for the general information of the railways.

In order to show the progress of the construction of steel and steel underframe passenger equipment cars, your committee issued Circular No. 40, January 10, 1913, asking the railways as to passenger train equipment in service December 31, 1912, that acquired in the calendar year 1912, and that under construction or contracted for but not yet received on December 31, 1912.

A bulletin showing the results of this compilation will be issued.

In report No. 9 you were advised that further conferences with regard to the lighting specification were under way.

As a result of these conferences, on January 14, 1913, a lighting specification was issued to the railways in Bulletin No. 44, which had been approved by the Postmaster General December 28, 1912.

In order to give full effect to this specification, your committee arranged for the formulation of lighting plans to be used in connection with it. These plans are completed, and, upon approval by the postoffice department, will be issued to the railways.

In order to deal more intelligently with the various bills which have been introduced in congress looking to the compulsory adoption of block signals, the Sub-Committee of Signal Engineers secured data showing unit costs for construction, maintenance and operation of manual and automatic block signals. This information was transmitted to the railways through Circular No. 41, February 26, 1913, and the roads were requested at that time to advise the number of miles upon which automatic or manual block signals are now in service or under construction, and the number of miles upon which such signals would be installed, assuming that they would be required upon all passenger lines except those on which but one train at a time was operated.

Replies to this circular are now being tabulated, that the data may be available when bills requiring the establishment of block signals are under discussion in congress.

Your committee calls the attention of the railways to the order of the Interstate Commerce Commission, issued March 13, 1911, extending the time within which equipment in existence July 1, 1911, must be brought into conformity with the United States Safety Appliance Standards.

It urges that the railways examine their individual situation with respect to this matter, and expedite the equipment of cars with these safety appliances so far as may be consistent.

The lack of adequate laws prohibiting and penalizing trespassing on railway rights-of-way in the several states results in the deaths of a great number of citizens annually.

Your committee procured the introduction of bills to remedy this in a large number of state legislatures. Practically none of the states legislated on this subject, and the situation remains as it has been heretofore. In view of this, it is an open question whether federal legislation should not be sought.

During the first four months of 1913, forty-one state legislatures were in session. Twenty-seven of these had adjourned May 1. Up to that date there had been introduced into these legislatures 1,308 bills affecting railway operation, of which 174 were enacted into laws.

A bulletin will be issued analyzing the state legislation enacted during 1913 throughout the country. At the present time it can be said that there is little change in the tendency toward burdensome regulation. It is significant that eastern states, which have heretofore been relatively exempt from this kind of legislation, have been more active in this respect during the last two years. A large number of headlight laws now on the statute books in the various states, involving conflicting requirements, seem to point to the desirability for federal legislation on this subject.

In report No. 9 you were advised that the committee had undertaken the initial steps looking to the formation of committees of operating officers in a number of states at the request of the roads operating therein. Such committees were formed in the following states: Arkansas, California, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Utah, Washington, Wisconsin, Wyoming.

The results obtained in most of the states where these committees were active have been such as to justify this method of dealing with state legislation.

The committee arranged to keep itself informed of all bills affecting railway operation introduced and passed in all states, and has kept its supporters advised. It has also made available for the use of the state committees data which has been found useful, either in Washington or in other states, thus co-ordinating the work of these committees as far as possible.

J. F. McGuire, general manager of the Lehigh Valley, was elected to succeed J. C. Stuart, vice-president of the Erie, as a member of the committee.

PLANS FOR NEW UNION STATION AT CHICAGO.

Plans for the proposed new passenger terminal at Chicago for the roads now using the old union station at Canal and Adams streets, the Pennsylvania Lines, Chicago, Burlington & Quincy, Chicago, Milwaukee & St. Paul, and Chicago & Alton, were placed before the committee on railway terminals of the Chicago City Council at public hearings on May 17 and 19, with the announcement that the roads are prepared to begin work at once, as soon as the sanction of the city is received in the form of permission for necessary street and alley changes. The general plan showing the location of the new terminal with reference to the present station, the official plan of the Chicago Plan Commission, and the proposed new post office building were described in the *Railway Age Gazette* of August 23 and 30, 1912, pages 354 and 390, but the detailed plans for the structure had not then been completed.

The designs have been made by D. H. Burnham & Co., who have been working out various studies for the new station for several years. The main station building, or headhouse, is to be on the west side of Canal street, bounded by Adams street on the north, Jackson boulevard on the south, and Clinton street on the west. To the east of the headhouse, and occupying the block east of Canal street to the river, between Jackson boulevard and Adams street, will be the main concourse, which will have on its north and south sides substantially two separate systems of stub-end tracks, 11 tracks for the roads entering the station from the north, and 15 tracks for the roads entering from the south. The concourse will be a covered building 180 ft. wide and 250 ft. long.

The principal feature of the main building is a waiting room 300 ft. long, 100 ft. wide and 120 ft. high. It is to be lighted by arched windows rising 100 ft. above the sidewalk. The entire space occupied by the building is to be about 320 ft. x 370 ft.

In architecture this building will be in classic style, freely interpreted and adapted to modern utilitarian requirements. Externally it will be featured by a Corinthian colonnade extending around the four sides. This colonnade will rise 64 ft. from the ground, the standard height adopted in the design of the chief buildings of the World's Fair in 1893. This Corin-

thian order will be surmounted by a high attic story which will form a complete belt crowning the main mass of the building. Above this in the center will rise the vaulted arches and pediments of the large room within.

The character of this hall in proportions, design and adornment was an inspiration from the thermal establishments of imperial Rome where, in the baths of Diocletian and Caracalla, the world first witnessed the development on a grandiose scale of the system of round arch and vaulted architecture.

The material for the exterior of the main building will be American white granite. The interior of the waiting room will also be white stone, as befits a structure which must combine solidity, dignity and cleanliness.

The concourse, between Canal street and the river, with low roof rising from the center of a broad plaza, will be a vaulted building, and will harmonize in exterior structure with the main building.

The descending street grade from the river west proved a fortunate circumstance, and advantage was taken of it in designing the main building. The floor of the waiting room is below the street level and on the same elevation as the tracks in the concourse. Measured from Clinton street on the west the tracks will be only 12 ft. below grade. There will, therefore, be no long flights of stairs between travelers within the station and their trains.

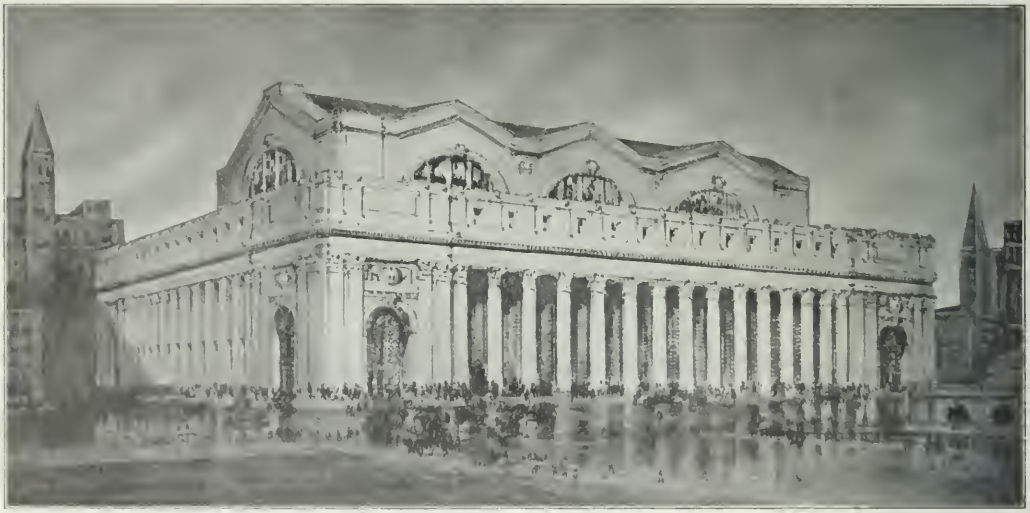
The buildings have many entrances. The main building will have no "main entrance," but will be equally accessible on all four sides. The designers have taken account of the fact that in a modern terminal passengers must be able to approach from any direction and pass at once by the most direct line to the waiting train. Entrances and exits must be universal that cross-flow may be avoided, time be saved and effort be unwasted. It is planned that there will be no crowding, even in the hours of the suburban rush. The people will be "melted away" through many passages. Access to the concourse will be as free as to the main building.

The main building and the concourse will have streets on all sides. Along the river a broad boulevard will flank the concourse on the east. Nowhere will there be anything to hamper access, egress or free movement within. Without will be broad streets and ample plazas. Cab stands will be conveniently located and under cover within the headhouse and concourse.

In designing this passenger terminal the aim has been to create a railway station completely separated from all railway service save the most convenient and expeditious handling of passengers and baggage. Elaborate office building features have been omitted; there will be only such offices as are necessary to the operation of the terminal itself.

The closest attention has been given to the needs and desires of the traveler. In addition to conveniently disposed ticket offices, baggage rooms and information bureaus, there will be grouped about the main waiting room restaurants, telephone and telegraph stations and numerous shops for which there is an increasing demand as the conveniences of traveling increase.

Facing the concourse there will be 26 train tracks—11 leading to the north and 15 to the south. In the lower levels beneath headhouse, tracks and concourse will be provided the most modern equipment for the mechanical handling of baggage, mail and express. Baggage will be passed up to the cars from below. Mail sacks will be handled in the same manner. Methods for the mechanical handling of mail, worked out in recent years in the Chicago postoffice will be further improved, and it is predicted that the facilities will show some striking advances in modern, scientific methods for the saving of time and labor.



Proposed New Union Station, Looking Northwest from Canal and Jackson Streets.

The location of the terminal, as decided upon by the roads now using the old union station, and announced by them last August, has aroused considerable controversy among the advocates of various plans for a general scheme of location for all new railway terminals to be built in the city. For this reason a committee on railway terminals, consisting of 15 aldermen, was recently appointed by the city council to consider the questions of electrification and the location of proposed terminals. This committee has begun a series of hearings at which it proposes to consider all plans that may be submitted to it. At a hearing on May 14 Jarvis Hunt, the architect of the new Kansas City union station now under construction, described before the committee the plan which he has recently been advocating before various local organizations, which provides for central passenger and freight terminals for

all roads except the North Western to be located south of Twelfth street. The plan also contemplates the straightening of a bend in the Chicago river, and the re-location of railway freight terminals along the river in order to open up new streets into the central business district. Mr. Hunt urged the committee to force the union station roads to join the central terminal plan by refusing the necessary permission for their proposed station.

On Saturday, May 17, a hearing was held to allow the union station roads to present their plan. A. J. Earling, president of the Chicago, Milwaukee & St. Paul; Darius Miller, president of the Burlington, and J. J. Turner, vice-president of the Pennsylvania Lines, testified that they had investigated the Twelfth street plan and found it impracticable, but that after several years of planning they were ready to proceed along the lines announced last year, and to build for Chicago one of the finest railway stations in the world. Mr. Earling said that the Hunt plan could not be carried out in 50 years; that the location of the Chicago river would interfere with the operation of trains into the station, and that track elevation plans would so complicate the matter that no feasible arrangement could be worked out. Mr. Miller said that on account of the location of the river there was not enough room south of Twelfth street, and that it would require trains to enter the station by a draw bridge, which would be intolerable. Mr. Turner not only objected to the plan on account of the lack of space, and the conditions imposed by track elevation, but declared that Chicago is too large for one central terminal, both on account of the distances that would be involved, and the congestion that would be created.

F. A. Delano, president of the Wabash, placed before the committee various studies of the general plan he has long advocated for the location of the terminals of railways entering Chicago from the south on the south side of Twelfth street as widened into a boulevard, in accordance with the Chicago plan. He said he did not appear as the advocate of any particular plan, and that he had not proposed a union station, but a series of stations on Twelfth street for the groups of roads now using separate stations. He thought the Hunt plan included several excellent suggestions, but that the committee, with the advice of competent engineers, after having considered the various plans proposed, could devise a better plan than any that had yet appeared. He resented the statement that a location south of Twelfth street is impracticable and criticized some of the arguments made against it. He declared that if the Pennsylvania group of roads do not move back to Twelfth street the Rock Island and the New York Central Lines now using the LaSalle street station probably would not move back nor the roads now using the Western Indiana station at Polk and Dearborn street. Therefore, if the plan for the union station at Jackson street is adopted, the result will be six separate stations, as at present, with no relation to each other, or to the local transportation lines of the city.

He was followed by A. H. Smith, senior vice-president of the New York Central Lines, who said the New York Central had not seriously considered any plan for a new terminal in Chicago in the near future, and that the LaSalle street station would be adequate for some time to come. He frankly announced that the New York Central believed it now had an advantageous location, and that if the Pennsylvania were allowed to retain its present location near the heart of the city the New York Central could not afford to move south, and he thought that it would not be fair to ask the Pennsylvania to move south to Twelfth street, leaving the New York Central where it is. If the Pennsylvania moved its terminal south the New York Central would be willing to consider doing so also, but would want to know "where it would light before it jumped."

At another hearing on Monday, May 19, W. A. Gardner, president of the Chicago & North Western, said that the North Western with its new terminal had no reason to consider any of the new plans. The principal reason for its change in location when the new station was built was to eliminate the drawbridge over the river at the entrance to the station, which caused many delays to trains, and that while he was not interested in the Twelfth street plan, he thought no railroad man would want to place a new station where a drawbridge would be required to enter it, and he thought it would not be a good plan to put so many stations in one place.

C. H. Markham, president of the Illinois Central, declared that the Illinois Central was "too well fixed" at present to consider joining with the other roads in any union station plan, and therefore had not considered the Hunt plan. The Illinois Central is practically under contract with the city to build a new station, he said, and will ask permission of the city council to locate its station on the present right of way at Twelfth street and Indiana avenue, facing north. This will be a stub-end terminal, except for the suburban tracks, which will run through to Randolph street along the lake front as at present. It is planned to have room for 32 or 36 tracks on an upper level and 36 more on a lower level. He was asked by an alderman whether the station was being planned with reference to electrification, and answered by saying that there was nothing in the plan that would interfere with electrification. Mr. Miller made a similar statement for the proposed union station.

The union station plans were described to the committee by E. R. Graham, of D. H. Burnham & Co., who is also the architect of the Chicago Plan Commission. He declared that the site proposed for the union station is not at variance but in complete harmony with the Chicago plan, which originally proposed as the best available locations for permanent passenger stations for all the roads, first, between Canal and Clinton streets from Lake to Twelfth streets, and second, on Twelfth street widened. When the roads decided on the location for the new union station it was approved both by the plan commission and by the executive committee of the Chicago Association of Commerce, with a recommendation that the new postoffice building be located immediately west of the station. The plan committee also recommended that the main east and west axis of the Chicago plan be relocated so as to center on Jackson and Adams streets. The plan therefore provides for the terminals of the west side roads on Canal street and of the south side roads on Twelfth street, the Illinois Central at approximately its present location and other roads west of it, thus locating all terminals where they will be most accessible to the center of the city and to each other. With Michigan avenue widened and continued to connect with the North Side, Twelfth street widened to a boulevard, and Canal street boulevarded from Twelfth street north to Chicago avenue passing the North Western terminal at Madison street, all stations would be connected by a square of boulevards within which there would be no railway tracks.

Another hearing is to be held by the committee on Friday to consider other plans.

New Railroad Company in Brazil.—The Companhia Estrada de Ferro Agricola de Santa Barbara has been formed in Sao Paulo to construct a railway between Villa Americana or some other point on the Paulista Railway and the town of Santa Barbara, to engage in agricultural pursuits in the zone served by said railways, to exploit waterfalls, and to purchase and sell agricultural products.

Station Platform Charges in England.—The London & Northwestern now makes a charge of one penny for admission to train platforms at Waterloo station, London, and it is said that all of the large English roads contemplate imposing a like charge. This practice, designed to prevent unnecessary congestion on platforms has been in operation at a number of stations in Europe heretofore. It is said that the Lancashire & Yorkshire has adopted it at the Victoria station, Manchester.

THE AMERICAN RAILWAY ASSOCIATION.

Meeting in New York Receives Reports from Several Committees. Membership Is Now 358, Representing 267,177 Miles.

The spring session of The American Railway Association was held at the United Engineering Society building, New York City, on May 21, 1913. There were present 213 members, represented by 200 delegates.

The Executive Committee reported that the membership now comprises 358 members, operating 267,177 miles, an increase of 10 members, and an increase of 162 miles. The associate membership now comprises 137 members, operating 7,913 miles, an increase of 13 members, and an increase of 633 miles.

The Executive Committee stated that a member of the association had brought to its attention the question of shipping broken glass in bulk and which was duly referred to the Committee on Transportation. The following recommendation was received from that committee:

The Committee is of the opinion that shipments of broken glass in bulk should be accepted only when loaded in closed cars; when accepted for shipment in open cars the glass must be enclosed in packages. It was the feeling of the committee that the question should be brought to the attention of the various traffic associations so that the tariffs might be revised to cover the suggested recommendation of the committee.

The Executive Committee concurred in this recommendation and referred it to the several traffic associations. Advice has been received that the Official and Southern Classifications have been so changed to cover satisfactorily the suggestion made by the Committee on Transportation.

The Executive Committee also reported in connection with the action taken by the association to eliminate Per Diem Rule 5, effective July 1, 1913, that it adopted at a meeting held on February 5, 1913, the following resolution:

Resolved, That the president be authorized to request the appointment of a committee of traffic officials of two respectively, from the various traffic associations of the country interested and involved, to consider the request of certain switching lines for relief on account of the elimination of Per Diem Rule 5, effective July 1, 1913, and that this committee be requested to confer and act with the Committee on Relations between Railroads in the consideration of the subject.

Immediately following the meeting of the Executive Committee the Trunk Line Association, the New England Freight Association, the Southeastern Freight Association, the Southwestern Tariff Committee, the Trans-Continental Freight Bureau and the Western Trunk Line Committee were requested to designate representatives from the territories covered by these organizations to consider the subject in question.

In order to give sufficient time for the committee of traffic officials to complete its work in conjunction with the Committee on Relations Between Railroads, it is now proposed that the date for the elimination of Per Diem Rule 5 be changed from July 1, 1913, to January 1, 1914.

In connection with the elimination of the Per Diem Rule 5, it is the feeling that a further examination should be made of the subject of reclaims, and for that purpose the president of the association was requested by the Executive Committee to appoint a commission to study the question. The commission has been asked to report its conclusions to the Executive Committee in time for presentation to the association at its November meeting.

The president has appointed as members of this commission, J. A. Delano, receiver, Wabash Railroad; W. L. Park, vice-president, Illinois Central, and George L. Peck, vice-president, Pennsylvania Lines West of Pittsburgh.

In its report the Executive Committee stated that a number of members of the association have suggested to the Executive Committee that the association should recommend what in its opinion should be considered proper practice at cross-overs. This important question was referred by your committee to the Committee on Transportation for its recommendations and that committee made the following report to the Executive Committee:

Relative to the question regarding the proper practice to cover cross-over movements both as to rules and signaling which has been referred by the Executive Committee to the Committee on Transportation.

The subject has been carefully considered and it is the opinion of the Committee on Transportation that cross-over movements should be made under such careful speed regulations as are required by local conditions.

The committee believes that to make safe the use of signal installation, or cross-over arrangements, all railroads must require absolute obedience to the rules and regulations governing the observance of signals, the use of cross-overs and the speed of trains through turn-outs; and that with such proper speed regulations and enforced obedience thereto, cross-over movements at reduced speed may be made with safety.

The committee further recommends that on main tracks the top (high speed) arm of home interlocking signals should not be used for cross-over or diverging movements.

The Committee on Transportation also reported to the Executive Committee that it does not believe that a requirement that trains must come to a stop before using a cross-over is necessary for safe operation, and that it is inadvisable to require trains to come to a stop when unnecessary, because it introduces an added element of danger.

The Executive Committee stated that at the request of a member of the association, and in view of the importance of the subject at the present time, it has requested the Committee on Transportation and the Committee on Maintenance acting jointly to define the essential requisites for the installation of automatic train stops and has referred the general subject of automatic train stops to them.

The Executive Committee also reported a memorial note placing on record an application of G. W. Parker, the first president of the American Railway Association, who died on January 19, 1913. When the former General and Southern Time Conventions were consolidated into the organization which subsequently became the American Railway Association at Cincinnati, Ohio, on April 14, 1886, Mr. Parker (who was then the vice-president and general manager of the St. Louis, Alton & Terre Haute Railroad) was unanimously elected its first president, serving in that capacity for the ensuing year. During his administration the organization was placed upon a firmly established foundation. His great interest in the association was shown not only at this time, but during its entire subsequent existence and he was present at its last meeting held in Chicago on November 20, 1912.

The Executive Committee also reported that W. F. Allen had been re-elected general secretary and treasurer, and J. E. Fairbanks, assistant general secretary and assistant treasurer, for the ensuing term.

The Committee on Transportation presented a report in which it submitted several questions and answers concerning practice under the Standard Code of Train Rules and the Standard Detour Agreement, which were approved by the association. The committee stated that its investigation of the current practice on the various railroads in regard to train rules has been most extensive and thorough, and that it has obtained a mass of information which is being carefully examined in detail. While the committee has been actively engaged with this subject and has devoted a great deal of time and attention to it, it is not as yet ready to report. The committee also reported that an auxiliary committee had been appointed to consider the best method of promoting the widespread establishment of "safety first" organizations among the officials and employees of members of the association. This committee consists of the following: R. C. Richards, general claim agent, Chicago & North Western; George Bradshaw, general safety agent, New York Central Lines; W. B. Spaulding, claim attorney, St. Louis & San Francisco; J. W. Coon, assistant to general manager,

Baltimore & Ohio, and S. J. Peterson, general claim agent, Union Pacific.

The Committee on Maintenance reported that the question of the standard dimensions of box cars had been taken up with the several classification committees, and is being developed as rapidly as its importance will permit. The committee presented a summary of replies to circular No. 1239, showing the progress which has been made in the adoption of the resolution approved by the association on May 17, 1911, respecting the subject of salt-water drippings from refrigerator cars. The committee also included in its report a summary of replies to circular No. 1263, respecting the number of freight cars, passenger cars and locomotives equipped with safety appliances, as required by the United States Safety Appliance Standards, as of January 1, 1913, as follows:

	January 1, 1912.	July 1, 1912.	January 1, 1913.
Number of members reporting	287	323	324
1. (a) Freight cars in service	2,048,267	2,237,946	2,268,068
(b) Passenger cars in service	46,455	49,658	51,114
(c) Locomotives in service	53,072	59,599	60,898
2. Fully equipped with safety appliances required by United States Safety Appliance Standards, promulgated by Interstate Commerce Commission in its Order, dated March 13, 1911:			
(a) Freight cars	119,540	254,681	464,633
(b) Passenger cars	9,478	17,747	24,687
(c) Locomotives	14,391	33,784	47,483
3. Fully equipped with secure grab-irons or hand-holds on the ends and sides of each car, as required under Section 4 of the Act of 1893 as amended April 1, 1896, and March 2, 1903:			
(a) Freight cars	2,046,906	2,237,773	2,268,062
(b) Passenger cars	46,336	49,647	51,112

The Joint Committee on Automatic Train Stops reported that E. C. Carter had been elected chairman. The committee stated that the subject of automatic train stops had been carefully considered, but requires more time for its satisfactory investigation. It presented a series of tentative definitions and requisites of installation covering systems of automatic train control. At the request of the joint committee these were discussed and referred back to it for further consideration.

The Committee on the Safe Transportation of Explosives and Other Dangerous Articles reported that in response to requests from shippers of explosives and other dangerous articles, the Interstate Commerce Commission has agreed in conference upon several minor amendments to the regulations, and a date will be named upon which a hearing will be held. The committee also reported that the Board of Railway Commissioners for Canada has revised its regulations for the transportation of explosives to make them conform to the regulations prescribed by the Interstate Commerce Commission as amended January 1, 1912. The regulations for the transportation of dangerous articles other than explosives will be submitted to the board for adoption as soon as the result of the hearing in Washington is ascertained.

The Committee on Electrical Working advised that it has no changes to suggest in the standard limiting clearance lines for third rail working conductors, as adopted by the association, but proposes, after conference and agreement with the American Railway Engineering Association and the American Electric Railway Engineering Association to submit at a future meeting a recommendation for the prolongation of certain of the clearance lines within the space between their termination and the nearest running rail. The committee also reported that it had under consideration the question of clearances for overhead working conductors which it proposes to discuss with the Electrical Working Committees of the American Railway Engineering Association and the American Electric Railway Engineering Association, with a view of presenting a full report, at a later date, with recommendations covering the essential overhead clearance requirements. In advance of the final report, the committee submitted as information its preliminary conclusions of the limiting conditions to be met in operation with the existing rolling stock dimensions and locations of overhead permanent way obstructions. It is hoped that this information will prevent further encroachment upon the space required for the installation of overhead conductors by the building of cars of a height exceeding the recommended standard of the Committee on Maintenance.

The Committee on Relations between Railroads presented an amended form of Per Diem Rule 9, which was approved by the association. Amended forms of Car Service Rule 15, and also the standing resolution of the association covering the subject of advertisements on freight cars were presented and approved by the association. The following interpretations to Car Service Rules 10 and 15 were also presented and approved:

Question.—Under Car Service Rule 10 as adopted November 20, 1912, may claims for cars received prior to that date be made at any time prior to November 20, 1913?

Answer.—Yes.

Question.—Under Car Service Rule 15, effective September 1, 1912, must the delivering line, in the absence of a local agreement, honor a per diem reclaim to cover the detention of a car or cars held while undergoing transfer?

Answer.—No.

The association approved the recommendation of the Committee on Relations between Railroads that a monthly report be obtained from the members of the home and foreign cars light weighed on their lines.

A revised form of average agreement for use under Rule 9 of the National Car Demurrage Rules was approved.

The following resolution was also adopted:

Resolved, That proper car distribution rules, as referred to in the note to National Car Demurrage Rule 1, Section B, should include a provision to the effect that empties placed in time for loading and not loaded, part loads and loaded cars for which billing has not been furnished be charged against the succeeding day's allotment.

The committee reported that the Sub-Committee on Packing, Marking and Handling of Freight has been in constant communication with Classification Committees and Weighing Bureaus respecting the marking and packing of freight, and that on the recommendation of the Sub-Committee 30,000 copies of an article entitled "Why Some Men Fail" have been distributed. Instructions for trimming coal on freight cars as recommended by the Committee on Relations between Railroads were approved by the association.

Interpretation No. 39 rendered by the Per Diem Rules Arbitration Committee was approved as follows:

Question.—Are claims under Per Diem Rules 5 and 11 valid when presented by claiming road to the local freight agent of road from which allowance is claimed?

Answer.—No. Claims are not valid unless sent to proper car service officer of road from which allowance is claimed.

The track scale specifications and rules as recommended by the Committee on Relations between Railroads were approved as recommended practice by the association.

Henry Miller, general manager for the receivers of the Wabash, was elected second vice-president of the association; W. G. Besler, vice-president and general manager, Central of New Jersey, and Fairfax Harrison, president, Chicago, Indianapolis & Louisville, were elected members of the Executive Committee; Benj. McKeen, general manager, Pennsylvania Lines West of Pittsburgh; J. C. Stuart, vice-president, Erie, and G. W. Taylor, general superintendent of transportation, Southern Railway, were elected members of the Committee on Nominations. The New York Central & Hudson River, the Pennsylvania Railroad and the Seaboard Air Line were elected members of the Committee on Transportation. The Chicago & North Western, the Chicago, Rock Island & Pacific, and the Philadelphia & Reading were elected members of the Committee on Maintenance. The Chicago, Milwaukee & St. Paul, the Illinois Central and the Southern Pacific were elected members of the Committee on Relations between Railroads.

The association decided to hold its next session in Chicago on November 19, 1913.

General News.

The Southern Railway has made a general increase in the pay of shopmen.

The Union Pacific is now double-track from Omaha, Neb., to Cheyennee, Wyo., 516 miles. This is by far the longest stretch of double-track railroad west of the Missouri river.

A freight house of the Cleveland, Cincinnati, Chicago & St. Louis, at Indianapolis, was partially destroyed by fire on the night of May 8. The loss, including a large quantity of freight, is estimated at $10,000.

Twenty-seven farmers along the lines of the Texas & Pacific Railway in Louisiana have filed suits against the road for damages ranging from $139 to $1,500 each for alleged failure of the company to furnish cars in which to ship their produce to the markets.

Four hundred men employed on the construction of the Kettle Valley Railway, a subsidiary of the Canadian Pacific, went out on strike on May 9, putting a stop to work on 47 miles of the road. Agitation by officers of the Industrial Workers of the World is said to have led to the strike.

The joint tunnel committee of the Denver commercial organizations has received a letter from President Darius Miller, of the Chicago, Burlington & Quincy, saying that the Burlington will be glad to see the Denver, Northwestern & Pacific tunnel completed, and "hopes to be able to co-operate with the company in making it profitable and useful to the commercial interests of Denver."

Disturbance of traffic in northern Mexico by reason of the activity of the rebels in that region seems to be growing worse rather than better; and press despatches from Mexico City say that a complete suspension of operations after June 1 is in contemplation. This is in furtherance of a plan to weaken the rebels by cutting off their supplies. In Chihuahua no railroads are operating south of Chihuahua City.

The state's attorney at Bridgeport, Conn., announces that the trial of President Mellen and ex-Vice-President McHenry, of the New Haven road, for manslaughter, in connection with a derailment last October will be postponed until the September term of the Superior Court. His plan to have the trial take place the present month could not be carried out on account of the assignment of judges allowing insufficient time.

The amount paid out by the Pennsylvania Railroad in the year 1912 for goods damaged in wrecks was only $1,600; while on claims for losses due to theft, the aggregate payments were $28,908. As the lines of the Pennsylvania run through many states the officers are congratulating themselves on the new federal law, the Carlin act, under which thieves stealing from interstate shipments may be prosecuted in the federal courts.

The workmen's compensation act passed by the legislature of New York at its session recently adjourned, has been vetoed by the governor, who finds serious objection to the law because it will not reduce the amount and cost of litigation, which is the crying evil under the present system. The governor thinks that the legislature should try again next year, and formulate a law which shall more fully carry out the promises which have been made by the democratic party.

Marcel G. Brindejone des Houlinais, a French aviator, on May 18, flew from Hendon, England, to Calais, and back, without landing, a total distance of 100 miles, in 55 minutes; and he carried one passenger. On May 17 a flight in an airship was successfully made from Key West, Fla., to Havana, Cuba, the aviator taking a $10,000 prize which had been offered by the Cuban government. On the 19th another aviator, who failed in the competition of the 17th, made a successful flight, occupying two hours and ten minutes.

The Advisory Committee of the railroads which was created at the meeting in New York City, April 24, to attend to matters connected with federal valuation, met in New York, May 16. The committee will confer with the Interstate Commerce Commission at Washington, May 27. Thomas W. Hulme has been chosen secretary of the committee. Samuel Rea is general chairman; L. F. Loree, chairman of the eastern group; W. W. Finley, chairman of the southern group, and Hale Holden, chairman of the western group.

The New York State Civil Service Commission, Albany, announces competitive examinations June 14 in various cities for a number of positions in the service of the state, and of counties and villages. Among these are junior bridge draftsman, salary $900 to $1,200; bridge designer, salary $1,500 to $2,100; junior railway engineer for the Public Service Commission, First district, salary $900 to $1,200, and inspector of steel, salary $1,500. For the last-named position several men will be wanted to go to the steel manufacturing plants in Pennsylvania.

A press despatch from Hinton, W. Va., reports that on Tuesday of this week a train of the Chesapeake & Ohio in which were six passengers was swept 300 ft. down the mountain side by a landslide, and the six passengers killed. The train consisted of an engine, three freight cars and a caboose. The passengers were in the caboose. The train had been stopped between Sewell and Landisburg because of an obstruction on the track, due to a storm, and while the train was at a standstill and the trainmen were clearing the track, the cars were overwhelmed by a mass of earth which fell from the mountain above.

Beginning on July 1, the Texas State Railroad, operating between Palestine, and Rusk, Tex., will be operated under the jurisdiction of the governor instead of the State Prison Commission. Governor Colquitt has announced that he will assume the active management, and that instead of reporting a monthly loss he believes he will be able to make the road earn from $1,000 to $2,000 a month. The governor recently made an inspection trip over the road with President W. B. Scott, of the Sunset Central Lines, for the purpose of obtaining advice from a practical railway man. A number of improvements are contemplated.

The ticket office of the Pennsylvania Railroad at Pittsburgh has been reorganized so that a passenger can now get a ticket to any station by going to any one of the windows which is open. There are eight windows and the attendant at each of them has a complete stock of tickets. Heretofore, different windows were assigned to different divisions or sections of the road. Six additional sellers have been employed and the working hours of the men will be lessened. Four windows are open at all times, and this number is increased to eight during that portion of the day when travel is heaviest. By the new plan, which is the same as that in force at New York, Washington and Baltimore, a passenger standing in line and delayed by someone ahead of him who holds a long conversation with the ticket seller, can drop out of the line and go to another window.

The Pennsylvania Railroad reports that recently enacted legislation governing railroad operation in the States of New York, New Jersey and Pennsylvania will cost it about $1,200,000 a year. In Pennsylvania the full crew law costs the road $555,085 and the semi-monthly pay bill, which has just become a law, $275,000 a year. In New York the full crew bill will cost $101,160 a year. In New Jersey the grade crossing bill if literally enforced would cost the Pennsylvania more than $60,000,000. But aside from that the semi-monthly pay bill in that state costs $30,000, the crew law $219,840 and the drinking water law $18,000 a year. Thus the legislation in these three states, excluding the New Jersey grade crossing bill, will cost the Pennsylvania $1,199,085 a year. This sum represents the annual return at 5 per cent. upon nearly $24,000,000 of capital. The expenditure by the Pennsylvania on account of new laws, Federal and state, from August 1, 1906, to January 1, 1913, was $10,936,134.

Boston & Maine Pensions.

The Boston & Maine now pays $8,200 a month in pensions to 258 employees. In the thirty months from October 1, 1910, to March 31, 1913, there has been an increase in the pensions paid to employees amounting to $169,742. The rate of increase in the amount of pensions paid is greater this year than in either of the two previous years, showing how the system is being extended.

The number of pensioners at the present time is 258. There are 22 general and other officers receiving a total of $2,409; fourteen clerks receiving $324; forty-seven agents and stationmen

receiving $1,073, thirty-nine switchmen and watchmen receiving $675; thirty-nine enginemen receiving $1,245; sixteen passenger conductors receiving $545; six freight conductors receiving $198; four other trainmen receiving $110; forty-eight shopmen receiving $1,142, and twenty-three section foremen and laborers who get $481.

Hope Deferred.

After thirty-seven years of agitation and expectation on the part of the people of Western Canada, the first mile of the Hudson Bay Railway was completed May 17, when the J. D. McArthur Company's engine No. 15 finally crossed the Saskatchewan river, pushing before it a rail laying machine and hauling one material car. About 500 men are now at work on the first portion of the road and it is expected to lay almost half of the track this year.

The Pennsylvania's Mileage.

The annual record of transportation lines of the Pennsylvania Railroad shows a total of 11,644 miles of line in the system, and 25,695 miles of track. The system paid out last year $188,749,312 in wages, or $7,346 for every mile of track, and there are more than eight employees for every mile. While the present mileage of line is only 1,088 greater than in 1902, there has been an increase of 1,335 miles in second track, 277 in third track, and 224 in fourth track; and an increase of sidings and yard track from 5,916 to 8,965, or 3,049 miles.

Coal Producers Big Consumers.

The Department of Mines of Pennsylvania reports that in 1901 only 9.2 per cent. of the amount of coal shipped was consumed at the mines for steam and heat; while 10 years later, in 1911, this amount had risen to 11.4 per cent. In 1901 the number of tons of coal shipped from the anthracite regions of Pennsylvania was 45,271,608, and the number of tons consumed at the mines was 4,880,932. In 1911 the figures were $71,227,687 and 8,171,494. At some of the mines where twenty-five to thirty tons of water have to be pumped or hoisted for every ton of coal extracted, over 25 per cent. of the coal produced is used for steam and heat.

A Fifty-Year Comparison.

A man who bought 100 shares of Pennsylvania Railroad stock 50 years ago—say the first day of the battle of Gettysburg—paid approximately $6,000 for it. If he kept it until today he would have received about 6 per cent. on his money all that time, but his capital would now be only $5,600.

Had a man on the same day bought a piece of real estate for $6,000 in the central part of Philadelphia or in any direction around it or in almost any other thriving town, the increase in his capital now would be very great, in almost every case. One man who 24 years ago paid $30,000 for a Chestnut street property recently refused $400,000 for it. His capital has multiplied by more than 15.

It is a curious thing that there is such a general impression that those who own railroads have grown rich with amazing rapidity. The truth is that a dollar invested half a century ago in America's largest railroad and the one where traffic is densest and the people richest, and where business has grown the fastest, is worth a little less than a dollar today. Similar comparisons might be made with the other standard lines of the East.—*Philadelphia Public Ledger.*

Loyalty with a Definite Meaning.

The very unusual action of Illinois Central employees in offering to aid the company financially, following its losses from floods and other causes, was noticed in the *Railway Age Gazette* of May 16, page 1101. The publication of this fact brings out another case, that of employees of the Buffalo & Susquehanna in 1911. On September 25, of that year, J. S. May, superintendent, received a letter from H. E. Marvin, an engineman, acting as "secretary for employees," saying:

"The employees desire to express in a suitable way their appreciation of the attitude and kind treatment of the Receiver, Mr. H. I. Miller, the Assistant Receiver, Mr. E. R. Darlow, and yourself, and our belief in your policy of making and maintaining a successful railroad. We greatly regret the accident which occurred some time since, and the employees, therefore, are cheerfully requesting you to deduct a day's pay to help offset in so far as possible the financial loss caused by the above mentioned accident. We wish it, however, distinctly understood that we are not by this action trying to influence in any way your decision in regard to any men who are at present out of the service, as we have learned from our pleasant relations with you in the past that you are absolutely fair.

"It must be gratifying to know that today you stand in a unique position in American railroading as being the possessor of the good will, respect and the whole hearted effort of every man in the service. That this is true is evidenced by a great many facts."

Basis of the Model Station.

Even though a station may be perfect from the standpoint of official rules and regulations, it may yet fall far below when judged by the traveling patron. I want people to know that they are just as welcome when they come into this station to have some money changed, as when they enter to purchase a ticket across the continent.

Neither my clerks nor myself want passengers to think that they are obligated to us; we feel that we are obligated to them. I always make it a rule personally to request an investigation of any grievance held against us by anyone. Sometimes little unfortunate matters will occur where there is a misunderstanding between passenger and employee. We are glad to hear complaints, as it gives us opportunities to forestall repetitions of the kind. By having our weaknesses pointed out by patrons, we can therefore fortify ourselves in our weakest places, and thus can better please the public. Each day I make it a point, on arriving at the station, to inspect thoroughly all departments, not from the viewpoint of the agent but rather that of the passenger.—F. E. Watson, Pasadena, Cal., in *L. & N. Bulletin.*

International Engineering Congress, 1915.

In connection with the Panama-Pacific International Exposition, which will be held in San Francisco in 1915, there will be an International Engineering Congress, in which engineers throughout the world will be invited to participate.

The congress is to be conducted under the auspices of the following five engineering societies: The American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers.

These societies, acting in co-operation, have appointed a permanent Committee of Management, consisting of the presidents and secretaries of each of these societies, and 18 members living in San Francisco. The personnel of this committee is as follows: Representing the American Society of Civil Engineers, Geo. F. Swain (president), Chas. Warren Hunt (secretary), Arthur L. Adams, W. A. Cattell, Chas. Derleth, Jr., and Chas. D. Marx; representing the American Institute of Mining Engineers, Charles F. Rand (president), Bradley Stoughton (secretary), H. F. Bain, Edw. H. Benjamin, Newton Cleaveland and Wm. S. Noyes; representing the American Society of Mechanical Engineers, W. F. M. Goss (president), Calvin W. Rice (secretary), W. F. Durand, R. S. Moore, T. W. Ransom and C. R. Weymouth; representing the American Institute of Electrical Engineers, Ralph Davenport Mershon (president), F. L. Hutchinson (secretary), J. G. De Remer and A. M. Hunt; representing the Society of Naval Architects and Marine Engineers, Robert M. Thompson (president), D. H. Cox (secretary), Geo. W. Dickie, W. G. Dodd, Wm. R. Eckart and H. P. Frear.

The committee has effected a permanent organization, with Prof. Wm. F. Durand as chairman, and W. A. Cattell as secretary-treasurer, and has established executive offices in the Foxcroft building, San Francisco.

The ten members of the committee, consisting of the presidents and secretaries of the five national societies will constitute a committee on participation, through whom all invitations to participate in the congress will be issued. The actual management of the congress and the work of securing and publishing papers will be in charge of the members of the committee resident in San Francisco.

The papers presented at the congress will naturally be divided

into groups or sections. During the congress each section will hold independent sessions, which will be presided over by a chairman eminent in the branches of engineering covered by this section.

The scope of the congress has not as yet been definitely determined, but it is hoped to make it widely representative of the best engineering practice throughout the world, and it is intended that the papers, discussions and proceedings shall constitute an adequate review of the progress made during the past decade and an authoritative presentation of the latest developments and most approved practices in the various branches of engineering work.

Southeastern Accounting Conference.

The chairman of the Southeastern Accounting Conference has announced the appointment of the following standing committees for the ensuing year:

Committee on Efficiency.

W. D. Beymer, chairman (C. of G.); J. M. Rodgers (N. & W.); C. B. Glessner (B. & O.); F. C. Uhlman (Virginian); W. J. Baker (Old Dominion Steamship Company); R. Kemp Slaughter (A. B. & A.), and A. P. Ottarson (N. C. & St. L.).

Committee on General Accounts and Subjects.

M. F. Molloy, chairman (C. N. O. & T. P.); Joseph W. Coxe (N. & W.); Geo. Becker (L. & N.); J. W. Nokely (C. & O.); O. B. Bidwell, Jr. (Merchants & Miners Transportation Company); Wm L. Markley (N. Y. P. & N.), and H. H. Laughton (Southern Railway).

Committee on Freight Accounts.

William McGowan, chairman (B. & O.); W. D. McCaig (A. C. L.); J. V. Bryant (C. N. O. & T. P.); H. C. Carlile (N. Y. P. & N.); J. A. Robinson (Southern Railway); B. B. McCaa (S. A. L.), and H. B. Cutter (L. & N.).

Committee on Passenger Accounts.

T. H. Wright, chairman (S. A. L.); W. H. Alexander (G. & F.); L. C. Esschen (I. C.); H. M. Hood (N. O. M. & C.); W. M. Mooney (T. C.); M. T. Lanigan (W. & T.), and G. S. LeGrande (A. C. L.).

Committee on Disbursements.

J. H. McEwen, chairman (N. C. & St. L.); J. A. Muse (C. C. & O.); R. A. Williams (A. C. L.); L. B. Enslow (C. & O.); G. F. Tucker (G. & S.); R. B. Walker (S. A. L.), and A. E. Fowler (Southern Railway).

Illuminating Engineering Society.

At a meeting of the Convention Committee of the Illuminating Engineering Society held in Pittsburgh, Pa., May 16, it was decided to hold the next annual convention in that city during the week beginning September 22.

The Convention Committee consists of C. A. Littlefield, chairman, New York Edison Company; P. S. Millar, president of the Society, Electrical Testing laboratories; H. S. Evans, Macbeth Evans Glass Company, Pittsburgh, Pa.; W. A. Donkin, Duquesne Light Company, Pittsburgh, Pa.; D. McFarlan Moore, General Electric Company; M. C. Rypinski, Westinghouse Electric & Manufacturing Company; C. J. Mundo, General Electric Company; J. C. McQuiston, Westinghouse Electric & Manufacturing Company; W. J. Sterrill, United Gas Improvement Company, Philadelphia, Pa.; S. B. Stewart, Philadelphia Company, Pittsburgh, Pa., T. J. Pace, Westinghouse Electric & Manufacturing Company, and Prof. H. S. Hower, Carnegie Technical Schools.

W. D. Donkin, Duquesne Light Company, was selected as chairman of the Local Committee on Arrangements, which will have charge of the convention. J. C. McQuiston was appointed chairman of the Publicity Committee.

The program, details of which have not as yet been completed, will consist, in addition to the technical sessions, of a reception and dance, several excursion trips and visits to various industries in Pittsburgh.

Traveling Engineers' Association.

The twenty-first annual convention of the Traveling Engineers' Association will be held at the Hotel Sherman, Chicago, Ill., commencing Tuesday, August 12, 1913, and continuing four days.

The subjects to be discussed include committee reports as follows: "Uniform Instruction to Enginemen on the Handling of Superheat Locomotives," by J. W. Hardy, chairman. "Credit Due Operating Department for Power Utilization and Train Movement that Reduces the Consumption of Fuel per Ton Mile," by M. J. Howley, chairman. "The Care of Locomotive Brake Equipment on Line of Road and at Terminals, also Methods of Locating and Reporting Defects," by H. A. Flynn, chairman; also papers on the following subjects: "Advantages Obtained with the Brick Arch in Locomotives," by LeGrand Parish; "What Can We Do to Eliminate the Black Smoke Evil on Locomotives," by J. H. Lewis; "Scientific Train Loading—Tonnage Rating. The Best Methods to Obtain Maximum Tonnage Haul for the Engine over the Entire Division, Taking into Consideration the Grades at Different Points on the Division," by S. O. Beyer, Jr.

American Institute of Electrical Engineers.

At the annual meeting of the American Institute of Electrical Engineers, held in the Engineering Societies' building, New York, on Tuesday, May 20, two papers entitled Trunk Line Electrification, by Charles P. Kahler, of the Oregon Short Line, and 2400-Volt Railway Electrification, by H. M. Hobart, of the General Electric Company, were presented. Both of these papers discussed the electrification of western lines with moderate traffic and each worked out in some detail comparative examples of the cost of installation and operation by steam and by electricity. As a means of reducing the first cost, both of these papers also advocated the purchase of power from private concerns rather than the construction of separate power houses. The paper by Mr. Kahler will be printed in an early issue.

Western Railway Club.

The annual meeting and election of officers of the Western Railway Club has been postponed until May 27. There will be an entertainment, including a burlesque banquet cabaret show and the Western Railway Club's famous German band.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York. Annual meeting, October 14-15, Philadelphia, Pa.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and Sepember.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June 16, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND [illegible] SUPPLY MEN'S ASSOCIATION.—H. A. Nealy, Joseph Lucas Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que. 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago. 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa., 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 859 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCE ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria; 2d Thursday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—I. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Telcg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—I. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—I. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Great Northern has advised the Duluth Commercial Club of the addition of eight daily package cars from Duluth to points in Minnesota and North Dakota.

The Canadian Northern has announced that through passenger service between Chicago and Winnipeg via Duluth will be established on June 7, over the Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha, providing a train each way every day, leaving in the morning and arriving the next morning.

Commercial travelers, in convention at Sacramento, Cal., want the State Railroad Commission to secure for them a law requiring railroads to carry aliens in separate cars, the same as negroes are carried in some of the southern states. The drummers say that their health is imperiled by the presence of objectionable aliens in first class cars.

The federal grand jury at East St. Louis, Ill., on May 16 returned five indictments charging rebating and discrimination in 63 counts against the Vandalia, the Cleveland, Cincinnati, Chicago & St. Louis, the Chicago, Indiana & Southern, the Grand Trunk and the O'Gara Coal Company which is said to have received the benefit of the discriminations. There are three counts against the Vandalia, 20 against the Big Four and 20 against the Big Four and the Chicago, Indiana & Southern jointly. The Grand Trunk and the coal company are charged in 20 counts jointly with receiving and granting unlawful concessions.

R. B. Shimer & Company, commission merchants, have been indicted by the federal grand jury at New York on the charge of soliciting and receiving information from a railroad agent concerning shipments of freight belonging to other parties, without the consent of either shipper or consignee. The case refers to shipments of eggs over the Baltimore & Ohio, received in New York last year. An agent of the road gave information as to the names of the shippers. The Interstate Commerce law, section 15, paragraph 6, makes an offense of this kind a misdemeanor and imposes a fine of not more than $1,000. H. C. Shimer, head of the firm, gave bail in $2,000.

The latest agricultural enterprise reported by a railroad is that of the New York, New Haven & Hartford in establishing a mill, at West Stockbridge, Mass., to grind lime for the benefit of the farmers of western Massachusetts and Connecticut. Representatives of the industrial bureau maintained by the road, learning that one of the principal needs of the soil in New England was lime, cast about for a supply of that article; and they found that the extensive deposit near West Stockbridge was of a suitable character. The Grangers' Lime & Marble Company has been organized, with Wilson H. Lee as president. Mr. Lee is vice-president of the state board of agriculture. It is proposed to sell ground lime at $1.50 a ton, and they expect to turn out 40,000 tons a year. This, however, is only a beginning; the farmers along the New Haven lines could make good use of 700,000 tons a year.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended from May 7 until November 7 the schedules in a supplement to Agent M. P. Washburn's tariff, which proposed to advance rates on ground iron ore from points in Alabama, Georgia and Tennessee to Boston, Mass., New York, N. Y., and Philadelphia, Pa.

The commission has suspended from April 23 until July 17 certain schedules in certain supplements to the tariff of the Norfolk & Western, which cancel existing through rates applicable to tanning extract from Lynchburg, Va., to points located on the Bangor & Aroostook.

The commission has suspended until September 11 the supplement to Agent F. A. Leland's tariff, which proposed to advance rates for the transportation of calves from Refugio, Tex., to New Orleans, La., and St. Louis, Mo., from 44½ and 52½ cents per 100 lbs., respectively, to 60 cents per 100 lbs., with a minimum carload weight of 17,000 lbs.

The commission has suspended until August 16 the schedules in certain tariffs, which proposed to cancel through joint rates (both class and commodity) now in effect from and to stations located on the Kansas City & Memphis and points located on or reached via the St. Louis & San Francisco, providing that combination would be applicable, which would have resulted in material advances.

The commission has suspended from April 25 until August 23 the operation of the supplement to the tariff of the St. Louis & San Francisco which, by the cancellation of through joint rates leaving in effect combination rates, advances rates for the transportation of lumber and articles manufactured therefrom, in carloads, from points in Arkansas and Missouri to points in Iowa, Minnesota and other States. The increases amount to about 2 cents per 100 lbs. in all instances.

Rates on Glass Sand Reduced.

Charles Boldt Company v. Chicago, Rock Island & Pacific et al. Opinion by the commission:

In this case the complainant contends that the rate of $1.80 per ton for the transportation of glass sand in carloads from Ottawa, Ill., to Cincinnati, Ohio, is unreasonable. Reparation is asked. The commission decided that the rate in question was unreasonable to the extent that it exceeds $1.60 per 100 lbs., but that as the rate of $1.80 per 100 lbs. had not been unreasonable in the past, no reparation should be awarded. (27 I. C. C., 11.)

Joint Rates on Lumber Cancelled.

In re investigation and suspension of lumber rates from Mississippi to eastern points. Opinion by Chairman Clark:

The commission decided that the cancellation of joint rates on lumber from points on the Gulf & Ship Island and New Orleans Great Northern via the Illinois Central to points in eastern Trunk Line territory, eastern Canada and New England should be permitted, as other through routes and joint rates via shorter and more direct lines were provided, and as no increased charges to the shippers or receivers were involved. (27 I. C. C., 6.)

Reparation Awarded.

Central Coal & Coke Company v. Missouri & Louisiana et al. Opinion by Commissioner Prouty:

In this case the complainant asks for reparation on its shipments of coal over the lines of the defendant from coal mines near Bonanza, Ark., to destinations in Oklahoma, Missouri, Iowa, Kansas and Nebraska during the period between September 26, 1910, and February 27, 1911, during which time the defendants failed to maintain joint rates. The prayer of the complainant was granted. (27 I. C. C., 40.)

Express Package Incorrectly Marked.

Parlin & Orendorff Plow Company of St. Louis v. United States Express Company. Opinion by the commission:

An express package, on which an incorrect destination was marked by the shipper, was offered for transportation with receipt already filled out by shipper and showing correct destination. Carrier before signing receipt changed destination shown thereon to agree with that marked on package, and then transported the package to the latter destination. The commission decided that the carrier in issuing receipt was not bound to call attention to the change in destination and should not be required to return the goods without charges. (26 I. C. C., 561.)

Rates on Logs Reduced.

Memphis Freight Bureau v. Illinois Central et al. Opinion by the commission:

The complainant contends that the rate of 13 cents for the transportation of logs from Pearson, Miss., to Memphis, Tenn., is unreasonable. Reparation is asked. The commission decided that the through rate of 13 cents per 100 lbs was unreasonable to the extent that it exceeded a combination of intermediate rates amounting to 9.25 cents, consisting of the initial carrier's local rate of three cents from Pearson to Jackson and a distance rate of the Illinois Central from Jackson to Memphis. The commission ordered that in future the rate from Pearson to Memphis should not exceed by more than three cents per 100 lbs. the local rate from Jackson to Memphis. Reparation was awarded. (27 I. C. C., 1.)

Middlesboro, Ky., Discriminated Against.

Middlesboro, Ky., Board of Trade v. Louisville & Nashville et al. Opinion by the commission:

The commission decided that Middlesboro, Ky., was discriminated against in favor of Jellico, Tenn., by the Southern Railway in its class rates from Birmingham, Ala., and other southeastern points, and ordered that in future the rate to Middlesboro from the points in question should not exceed the rates to Jellico from the same points. The commission also decided that the class rates, water and rail, from New York and other eastern points, and the all-rail rates from the Ohio river crossings to Middlesboro were unreasonable as compared with the rates from the same points to Jellico. The commission prescribed reasonable rates for the future. While no testimony specifically affecting the commodity rates was introduced, those rates should be readjusted to conform to the findings in this case, as should also the rates from the interior eastern cities as shown in Agent Ryan's tariffs. Reparation was denied (27 I. C. C., 14.)

Ice Rate Reduced.

People's Fuel & Supply Company v. Grand Trunk Western et al. Opinion by Chairman Clark:

In this case the complainant contends that the rate on ice from Silver Lake, Wis., to Chicago is unreasonable. Reparation is asked. The shipments moved from Silver Lake to Hawthorne, Ill., over the line of the Minneapolis, St. Paul & Sault Ste. Marie; from Hawthorne to Elsdon over the Illinois Northern; and from Elsdon to the plant of the complainant at Chicago over the Grand Trunk Western. Prior to August 1, 1911, the switching charge of the Grand Trunk on ice from the Soo line was $3 per car irrespective of weight, and this amount was absorbed by the Soo line when its revenue for the line haul equaled or exceeded $15 per car. On August 1, 1911, the Grand Trunk Western increased its rate for its share of the service and on November 15, 1911, again increased its rate to a minimum of $9 per car. The through rate was increased by this action of the Grand Trunk Western as the Soo line refused to absorb more than $3 per car. No evidence was introduced to prove the reasonableness of the increases and the commission decided that the present rate was unreasonable to the extent that it exceeded the rate in effect prior to August 1, 1911. Reparation will be awarded. No order was deemed necessary. (27 I. C. C., 24.)

Lumber Rates Reduced.

Michigan Hard Wood Manufacturers' Association et al v. Transcontinental Freight Bureau et al. Opinion by Commissioner Prouty:

In the original case, 22 I. C. C., 387, the commission decided that the rate of 85 cents per 100 lbs., for the transportation of hard wood lumber from the mills of the complainants to Pacific coast terminals was unreasonable, and that a rate of 80 cents per 100 lbs., for this service would be reasonable. The commission understood that the mills of all the complainants were included in the southern portion of the southern peninsular of Michigan, and awarded reparation on shipments from that territory. The complainants filed a petition for rehearing saying that their petition had related to the entire southern peninsula of Michigan, and that no good reason existed why the same rate which applied to the territory named in the opinion should not also be extended to the more northerly territory in which were situated many of the mills of the complainants. The commission decided that its opinion had been rendered under a misconception and granted a rehearing. The commission decided that the 80-cent rate should apply to the entire southern peninsula and that reparation should be awarded on shipments from all mills in that region on the same basis. A voluntary association can not by claiming reparation generally in behalf of its members interrupt the running of the statute of limitations as to those members. In this case the association filed the complaint in behalf of certain of its members who are specifically named, and also in behalf of certain other indi-

viduals not members of the association who are also named. The commission decided that this was in substance a petition by the firms and individuals whose names are given and the case should be treated as though those persons were described as petitioners. The complaint contains no explicit statement that the complainants made shipments under the 85-cent rate, but alleges that they are shippers of hard wood lumber between the points named, that an extensive business had been built up under the 75-cent rate, which business had been injured and its existence imperiled by the 85-cent rate; and asks for a refund. The commission found that this petition is simply a filing of the claims of those firms and individuals named and will interrupt the running of the statute from the date when the petition was filed. The original petition claimed reparation from August 1, 1908, but subsequently complainants asked reparation from January 1, 1905 when the 85-cent rate became effective. This cannot be permitted. All the original complainants are entitled to reparation with respect to shipments subsequent to August 1, 1908; and the five complainants not mentioned in the original proceeding whose claims were first filed September 19, 1912 are entitled to reparation on shipments subsequent to September 19, 1910. The defendants claim that as the complainants increased the price of their lumber by the amount of the increase in the transportation charge, they have suffered no damage. The complainants assert that in subsequent settlement between the consignees and themselves, the freight money was in all cases repaid to the consignees. The commission decided that reparation would be awarded when the complainants had proved that they had refunded the amount of the freight charges. (27 I. C. C., 32.)

STATE COMMISSIONS.

The Wisconsin Railroad Commission has ordered a general reduction of 20 per cent. in the rates for transportation of merchandise by express, to go into effect in 20 days. The hundred pound basing rates are considerably altered and the graduate scales on which the charges for the various weights are computed are completely changed.

COURT NEWS.

The appellate division of the supreme court, in one of the suits against the Delaware & Hudson growing out of the issuance of fradulent bills of lading two or three years ago, has decided in favor of the road. In this suit, that of Kausch, assigned to Williams, the lower court had given the plaintiff a verdict of $50,711; but this is now reversed. It is expected that Williams will appeal to the higher court. Other suits, aggregating $650,000, are pending against the road. Oliver, one of the men tried as a principal in the crimes connected with these bill-of-lading transactions, has never been convicted but he is now under indictment in New York county. Palmer, the freight agent who was implicated, was convicted but has never been sentenced.

The decision of the supreme court of the United States, holding the Norfolk & Western liable for damages on a shipment of tobacco when the damages occurred on the boat of the Old Dominion Steamship Company, was reported in the *Railway Age Gazette*, May 16, page 1107. The bill of lading in this case bore the usual stipulation that no carrier should be liable for damages occurring beyond its own line, the company resting its claim for the justification of this stipulation on the fact that its action in giving a through rate was involuntary. In the Virginia State court the decision against the road had been based on the ruling of the supreme court in an earlier case where there was a presumption that the carrier was a voluntary party to a through route and rate, whereas in the present case the Norfolk & Western had not formed any through route with the Old Dominion. Being required by the statute to give a through bill of lading was claimed to be the same as having its property taken without due process of law. But the decision, by Mr. Justice Holmes, shows that in the earlier cases, depended on by the Virginia court, the supposed through routes were only presumed. The present case goes against the Norfolk & Western on the ground that there is no substantial distinction between this and the earlier cases.

Railway Officers.

Executive, Financial and Legal Officers.

Frank J. Lawlor has been appointed acting treasurer of the Chicago, Terre Haute & Southeastern, with headquarters at Chicago, succeeding E. F. Young, retired.

Bruce Wyman, professor of law at Harvard University, has been engaged by the New York, New Haven & Hartford as consulting counsel in matters affecting interstate commerce.

Edward Francis Kearney, who has just been elected first vice-president of the Texas & Pacific, in charge of maintenance, operation and traffic, with headquarters at New Orleans, La., and Dallas, Tex., was born March 27, 1865, at Logansport, Ind. He was educated in the public schools and began railway work in 1882 as telegraph operator for the Pennsylvania Lines, and was subsequently freight clerk, chief operator superintendent's office, train despatcher and trainmaster's clerk and chief clerk to superintendent, until December, 1899, when he was made trainmaster at Indianapolis, Ind. In February, 1903, he went to St. Louis, Mo., as superintendent of the Terminal Railroad Association and St. Louis Merchants' Bridge Terminal Railway. One year later he left to become supervisor of mails of the Chicago, Rock Island & Pacific, and two months afterwards was appointed general superintendent of transportation of the St. Louis & San Francisco, resigning in October. Mr. Kearney went to the Missouri Pacific in April, 1905, as superintendent of terminals at St. Louis, and on February 15, 1908, was made superintendent of transportation of that road and the St. Louis, Iron Mountain & Southern. He was promoted to general superintendent of transportation of the Missouri Pacific system, in January of this year, and now assumes the vice-presidency of the Texas & Pacific, as above noted.

E. F. Kearney.

Operating Officers.

J. A. Somerville, superintendent of transportation of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with office at St. Louis, Mo., will assume the duties and authority of E. F. Kearney, who recently resigned as general superintendent of transportation.

J. F. Keegan, superintendent of the Monongah division of the Baltimore & Ohio, at Grafton, W. Va., has been appointed superintendent of the Chicago division, with headquarters at Garrett, Ind. J. M. Scott, assistant superintendent of the Cumberland division at Keyser, W. Va., succeeds Mr. Keegan, with headquarters at Grafton, and M. H. Cahill, who recently resigned as superintendent of the Buffalo division of the Delaware, Lackawanna & Western, succeeds Mr. Scott.

Traffic Officers.

H. W. Stoutenborough has been appointed assistant general freight and passenger agent of the Bingham & Garfield, with headquarters at Salt Lake City, Utah.

H. C. Bush has resigned as traffic manager of the Colorado Midland and the office is abolished. L. C. Rafert, chief clerk in the freight department, has been appointed general freight agent, with headquarters at Denver, Colo.

G. Z. Phillips, general passenger agent of the Baltimore Steam Packet Company, Baltimore, Md., has been appointed assistant general passenger agent of the Seaboard Air Line, with headquarters at Jacksonville, Fla., effective June 1.

W. G. Barnwell, general freight agent of the Atchison, Topeka & Santa Fe Coast Lines, with headquarters at Los Angeles, has been appointed assistant freight traffic manager, with office at San Francisco, Cal., succeeding Edward Chambers, promoted. H. P. Anewalt, assistant general freight agent at San Francisco, succeeds Mr. Barnwell. Effective June 1.

C. E. Perkins, general freight agent of the St. Louis, Iron Mountain & Southern, at St. Louis, Mo., has been appointed assistant general traffic manager, a new position. The office of assistant to general traffic manager has been abolished and A. T. Stewart has been appointed general freight agent of the Missouri Pacific, with office at Kansas City, succeeding K. M. Wharry, resigned. E. H. Calef, assistant general freight agent at St. Louis, has been appointed general freight agent of the St. Louis, Iron Mountain & Southern, succeeding Mr. Perkins. W. I. Jones, assistant general freight agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, in charge of coal traffic, has been appointed assistant general freight agent in charge of solicitation of outside agencies and interchange, succeeding J. B. Trimble, assigned to other duties, all effective June 1.

Ralph C. Caples, general agent of the traffic department of the New York Central Lines, with headquarters at New York, has been appointed general traffic manager of the Western Maryland, with headquarters at Baltimore, Md. He was born on December 23, 1872, at Fostoria, Ohio, and was educated at Oberlin College, Oberlin, Ohio, also at Northwestern University, Evanston, Ill., and in 1896 entered Princeton University, Princeton, N. J. Previous to this, at the age of 18, he became yard clerk on the Lake Erie & Western, at Fostoria; the following year was advertising agent of the New York, Chicago & St. Louis, and in 1892 he became traveling passenger agent for the Mobile & Ohio. After leaving college he was passenger agent of the Delaware, Lackawanna & Western at New York, and then for two years was general passenger agent of the Detroit & Lima Northern, now a part of the Detroit, Toledo & Ironton. During 1900 and 1901 he was general manager at Tampa, Fla., of the Florida West Coast Transportation Company, operating a line of steamers. In 1907 he entered the service of the New York Central & Hudson River, and in May of that year was made special representative of that road. In February, 1909, he was promoted to general agent of the traffic department, covering all New York Central Lines both east and west of Buffalo, N. Y., and leaves that position on June 1, to become general traffic manager of the Western Maryland as above noted.

R. C. Caples.

Engineering and Rolling Stock Officers.

F. E. Hutchison has resigned as electrical engineer of the Chicago, Rock Island & Pacific.

George Peck has been appointed roadmaster of the Canadian Pacific at the Calgary, Alta., terminals, in place of T. Bradshaw, transferred.

M. C. Blanchard, division engineer of the Atchison, Topeka & Santa Fe, at Topeka, Kan., has been appointed office engineer at Topeka, in place of K. B. Duncan, promoted.

I. J. Putnam, division engineer of the Chicago & North Western at Boone, Iowa, has been appointed principal assistant engineer, with headquarters at Chicago. M. E. Thomas, division engineer of the Minnesota and Dakota divisions at Winona, Minn., succeeds Mr. Putnam as division engineer of the East and West Iowa, and Iowa and Minnesota divisions at Boone. Mr. Thomas is succeeded by W. J. Jackson, division engineer of the Madison division at Madison, Wis., and Lee Jutton takes the place of Mr. Jackson.

P. Alquist, who has been appointed superintendent of the car department of the Missouri, Kansas & Texas, with office at Sedalia, Mo., as announced in last week's issue, was born in Stockholm, Sweden, in 1874. Mr. Alquist came to this country in 1885, settling at Memphis, Tenn. He started his railroad career as car repairer for the Illinois Central at Memphis in the early part of 1895, working for the same road as car interchange inspector, rip track foreman, assistant general foreman, and general foreman of the car department of the Memphis, Mississippi and Fulton divisions until 1910, when he left to go with the Cincinnati, Hamilton & Dayton as general foreman of the car department at Lima, Ohio. He left that road after about eighteen months' service to go to the Pere Marquette as general car foreman at Grand Rapids, Mich., general inspector and chief inspector of car department respectively, until his recent appointment as superintendent of car department of the Missouri, Kansas & Texas, succeeding W. A. Mitchell, who was master car builder. The office of master car builder has been abolished. Mr. Alquist was vice-president of the chief interchange inspection association at Toledo, Ohio.

P. Alquist.

Kenneth B. Duncan, whose appointment as engineer of Gulf lines of the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex., has already been announced in these columns, was born September 5, 1878, at Princeton, Ind. He was graduated from Purdue University in 1902. Mr. Duncan began railway work in November, 1899, with the Cleveland, Cincinnati, Chicago & St. Louis at Mt. Carmel, Ill., and with the exception of two winters spent at Purdue University, remained with that road until June, 1902. He was then with the U. S. Department of Agriculture, engaged in drainage investigations at Fresno, Cal., until February, 1903, when he went to the Gulf, Colorado & Santa Fe as draftsman at Galveston. From July, 1904, to June, 1905, he was an instructor in civil engineering at Purdue University, and the following three years he was with the Houston & Texas Central successively as topographer, on location, resident engineer and division engineer on construction. Mr. Duncan returned to the Gulf, Colorado & Santa Fe in June, 1908, and for three years was assistant to the chief engineer at Galveston, leaving in June, 1911, to become office engineer of the Atchison, Topeka & Santa Fe at Topeka, Kan., which position he held until his promotion on May 1 as engineer of the Gulf lines of the Gulf, Colorado & Santa Fe, as above noted.

K. B. Duncan.

Morgan K. Barnum, who has resigned as general superintendent of motive power of the Illinois Central and the Yazoo & Mississippi Valley, was born on April 6, 1851. He graduated from Syracuse University in 1884 with the degree of A. B. and later received the degree of A. M. He began railway work the year he graduated as a special apprentice in the shops of the New York, Lake Erie & Western, now the Erie, at Susquehanna, Pa. He was then consecutively machinist and mechanical inspector and later general foreman of the same road at Salamanca, N. Y.; general foreman of the Louisville & Nashville shops at New Decatur, Ala.; assistant master mechanic of the Atchison, Topeka & Santa Fe at Argentine, Kan.; superintendent of shops at Cheyenne, Wyo.; district foreman at North Platte, Neb., and then division master mechanic at Omaha, Neb., on the Union Pacific; assistant mechanical superintendent on the Southern Railway, and in February, 1903, he was made superintendent of motive power of the Chicago, Rock Island & Pacific, and in April of the next year was made mechanical expert of the Chicago, Burlington & Quincy. In 1907 he was appointed general inspector of machinery and equipment of the same road. He left that road in April, 1910 to become general superintendent of motive power of the Illinois Central and the Yazoo & Mississippi Valley, from which position he has just resigned.

M. K. Barnum.

L. J. Putnam who has been appointed principal assistant engineer of the Chicago & North Western, with office at Chicago, was born on February 17, 1878, at Manchester, Iowa. He was educated at Cornell College, Mount Vernon, Iowa, receiving the degree of B. S. in civil engineering in 1903, and of C. E. two years later. He began railway work in June, 1898, with the Illinois Central; and in June of the following year went with the Chicago & North Western as an instrument man, and he has been with that road ever since. From February, 1901, to March, 1906, he was assistant engineer on construction, location and maintenance, and was then made acting division engineer of the Ashland division at Kaukauna, Wis. From March, 1907, he was consecutively assistant engineer in charge of second track and terminal improvements at Janesville, Wis., assistant engineer in charge of the bascule bridge over the north branch of the Chicago river and of the Wells street yard at Chicago; resident engineer of the Milwaukee track elevation; resident engineer of the Escanaba ore dock construction; and from July, 1910, to April 1, 1912, he was with the Milwaukee, Sparta & North Western, the new line of the Chicago & North Western across Wisconsin, first as resident engineer on construction, and then as acting resident engineer. On April 1, 1912, he was promoted to division engineer at Boone, and now becomes principal assistant engineer of the same road as above noted.

L. J. Putnam.

Robert W. Bell, superintendent of machinery of the Illinois Central at Chicago, has been appointed general superintendent of motive power of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Chicago, succeeding M. K. Barnum, resigned. Joseph H. Nash, superintendent of the Burnside shops, has been appointed superintendent of motive power for the Illinois Central lines north of the Ohio river, with headquarters at Chicago, and Frank B. Barclay, master mechanic at McComb, Miss., has been appointed superintendent of motive power of the Illinois Central lines south of the Ohio river, and of the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., all effective June 1.

Purchasing Officers.

G. E. Scott has been appointed assistant purchasing agent of the Missouri, Kansas & Texas System, with headquarters at St. Louis, Mo., effective May 15.

OBITUARY.

William Edward Davis, passenger traffic manager of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., died on May 15, at Vaudreuil, near Montreal. He was born on August 2, 1850, at Wilson, Niagara county, N. Y., and began railroad work in 1868, as a clerk on the Hannibal & St. Joseph, now a part of the Chicago, Burlington & Quincy. From 1873 to 1877, he was with the Kansas City, Fort Scott & Gulf, now a part of the Frisco system, and in August, 1877, he entered the service of what is now a part of the Grand Trunk system, then known as the Chicago & Lake Huron. This company afterwards passed to the control of the Grand Trunk and is now what is officially known as the Grand Trunk Western. He was subsequently to April 1, 1896, assistant general passenger agent of the Grand Trunk and then to May, 1900, was general passenger and ticket agent of the same road at Montreal. On May 1, 1900, he was appointed passenger traffic manager of the entire system and at the time of his death was also passenger traffic manager of the Grand Trunk Pacific.

W. E. Davis.

Henry Schlacks, formerly superintendent of machinery of the Denver & Rio Grande, died on May 16, at Chicago, aged 73 years. Mr. Schlacks was born November 25, 1839, at Daun, Rhine Province, Germany. He began railway work in August, 1855, as machinist apprentice at the Weldon shops of the Illinois Central, and after completing his apprenticeship was machinist for that road until June, 1865. He was then with the Chicago, Rock Island & Pacific from June, 1866, to January, 1873, successively as foreman erecting shop, foreman machine shops and general foreman. On the latter date he returned to the Illinois Central as master mechanic, and from November, 1882, to February, 1893, was superintendent of machinery of that road. In December, 1893, Mr. Schlacks became superintendent of machinery of the Denver & Rio Grande, resigning in August, 1902. Mr. Schlacks was the father of Charles H., vice-president of the Western Pacific; Henry J., an architect in Chicago; Joseph T., vice-president of the McCord Manufacturing Company, Detroit, Mich.; William J., with McCord & Company, Chicago; Edward L., in the coal business in Nebraska, and Robert J., manufacturers' agent in Denver, Colo.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Texas Midland has ordered 2 consolidation locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 22 in. x 28 in. cylinders, 56 in. driving wheels and in working order will weigh 190,000 lbs.

The Atlanta, Birmingham & Atlantic, mentioned in the *Railway Age Gazette* of January 31 as being in the market for 5 locomotives, has ordered this equipment from the Baldwin Locomotive Works. These locomotives will be equipped with the Baker valve gear.

The New York Central Lines have ordered 45 locomotives from the American Locomotive Company and 10 switching locomotives from the Baldwin Locomotive Works in addition to the 124 locomotives recently ordered and mentioned in the *Railway Age Gazette* of May 9.

CAR BUILDING.

The Hocking Valley has ordered 1,000 coal cars from the Ralston Steel Car Company.

The Bethlehem Steel Company, South Bethlehem, Pa., will soon place orders for about 50 freight cars.

The Seaboard Air Line will soon place orders for 10 seventy-foot steel coaches, and 5 seventy-two-foot steel dining cars.

The Great Northern has ordered 20 baggage cars, 25 coaches, 25 combination mail and baggage cars and 2 mail cars from the American Car & Foundry Company.

The Erie has ordered 1,000 hopper cars from the Pressed Steel Car Company, 1,500 box cars from the American Car & Foundry Company, 1,500 box cars, 500 hopper cars and 500 gondola cars from the Standard Steel Car Company.

IRON AND STEEL.

The Atchison, Topeka & Santa Fe has ordered 15,000 tons of rails from the Illinois Steel Company.

The Missouri, Kansas & Texas has ordered 175 tons of structural steel from the American Bridge Company.

The Chicago, Burlington & Quincy has ordered 225 tons of structural steel from the American Bridge Company.

SIGNALING.

The New York, Ontario & Western has adopted green for the night clear indication in fixed signals and yellow for caution; and has changed the colors of signal blades also, following in general the standards in force on the New York, New Haven & Hartford. Heretofore, automatic signals had blades with square ends and train order signals had pointed blades. The accepted standard has now been made universal throughout the length of the company's lines; automatic block signal arms, pointed; distant signal arms, fish tail, and painted yellow; train order signals with rounded ends. On this road there are a considerable number of automatic signals, controlled by track circuits, in isolated sections, not making a complete block system. These have now all been made caution signals. Several different gangs of men were employed and the changes were made throughout the line on the same day. The color of switch targets and lights was also changed at the same time.

Railway Surveys in Brazil.—The President of Brazil has signed a decree authorizing $65,000 for expenses in the definite surveys of a railway from Coroata, in the State of Maranhao, to the right bank of the Rio Tocatins, and a decree approving the definite surveys and estimates amounting to $1,000,000 of the last section (67 miles) of the Campo Maior to Anarracao branch.

Supply Trade News.

The Pilliod Company, New York, has moved its offices from room 1823, 30 Church street, to room 829 in the same building, where larger floor space has been secured.

George D. Rosenthal, manager of the St. Louis, Mo., office of the General Electric Company, Schenectady, N. Y., died in New York on May 19. Mr. Rosenthal had been with the company for over 20 years.

The Engineering Construction Company has been organized, with offices at 106 North LaSalle street, Chicago, to do a general engineering and contracting business. The officers are: I. J. Crowley, general manager; E. A. Clark, chief engineer, and Jas. X. Gunning, secretary and treasurer.

J. W. Cleary, one of the oldest electric headlight men in the country, who joined the forces of the National Electric Headlight Company in Indianapolis in 1891, and in 1899 became associated with the Pyle-National Electric Headlight Company, Chicago, as traveling engineer, has resigned his position and will go abroad for several months.

The American Blower Company, Detroit, Mich., announces that William C. Redfield, having been appointed a member of President Wilson's cabinet, has deemed it advisable to terminate his business connections, and therefore has resigned as vice-president and director, and has retired from active participation in the management of the company.

TRADE PUBLICATIONS.

Water Power Plants.—The Stone & Webster Engineering Corporation, Boston, Mass., has published an illustrated booklet entitled Water Powers, giving brief data regarding various water power plants constructed by this corporation. Of the 12 plants described, six are for companies managed by the Stone & Webster Management Association, and six are for companies which are not in any way affiliated with the Stone & Webster organization.

Rolled Steel Wheels. This is the title of a 56 page catalog just issued by the Standard Steel Works Company, Philadelphia, Pa. The book is very completely illustrated and includes dimensioned drawings of rolled steel wheels for all classes of service together with complete specifications. For the guidance of purchasers, data and dimensioned drawings of the standard axles of the Master Car Builders' and Master Mechanics' Associations are also given.

Asbestos Metal.—The Asbestos Protected Metal Company, Beaver Falls, Pa., is publishing a series of illustrated bulletins giving general descriptions of Asbestos Protected Metal which is designed to meet the demand for an economical roofing and siding material which will incur only small maintenance cost. The booklets include estimating data and descriptions of Asbestosteel, concrete roof and floor construction and Asbestosteel, lath wall and ceiling construction.

New Line for Norway.—A short railway is to be constructed connecting Aalgaard with the present Stavanger-Egersund Railroad. It will be the first branch line to penetrate the mountainous region, although requiring no difficult engineering feat, for its roadbed will lie in one of the valleys. According to the estimates announced on April 9 by the engineer who has made the preliminary survey, the line will be 8¼ miles in length, have a maximum grade of 2 per cent, and will cost approximately $275,000. There is a possible alternative preliminary survey, hence the exact location of the right of way will not be determined until about the last week in May. As this proposed line to connect Aalgaard with the present Stavanger-Egersund Railroad is a government project any inquiries should be addressed to the Bureau of National Railways, Christiania, Norway.

Railway Construction.

California, Shasta & Eastern.—This company which was recently incorporated in California with $600,000 capital, has secured control of the Anderson & Bella Vista, formerly the Terry Railroad, a lumber line, 16 miles long, and plans to rebuild the road and to build an extension to Ingot, 12½ miles.

Canadian Pacific.—See Toronto, Ont., under Railway Structures.

Cincinnati, New Orleans & Texas Pacific.—The new second main track between Citico, Tenn., and Boyce, just out of Chattanooga, has been completed and was put in service on May 15. The company is now at work on 29.6 miles of second track between Erlanger, Ky., and Williamstown. (June 21, p. 1589.)

Glengarry & Stormont.—An officer of this company writes that the line will probably be built, from St. Polycarp Junction, Que., on the Canadian Pacific via Williamstown to Cornwall, 30 miles. The work will involve handling about 10,000 cu. yds. a mile. There will be three steel bridges, each to have a 100 ft. span. The company expects to develop a traffic in agricultural products, cotton goods and furniture. C. L. Hervey, chief engineer, 400 St. James street, Montreal, Que. (April 11, p. 863.)

Hudson River Connecting.—See New York Central & Hudson River.

Lake Erie & Northern.—An officer writes that the general contract has been given to Johnson Bros., Brantford, Ont., and work is now under way on the line from Galt, Ont., to Paris, Brantford, Simcoe and Port Dover on Lake Erie, 53 miles. The company expects to begin tracklaying in July, and to develop a traffic in coal and manufactured articles. W. P. Kellett, chief engineer, Brantford. (May 2, p. 1013.)

Logan Rapid Transit Company.—See Ogden Rapid Transit.

Matador & Northern.—Organized in Texas to build from a point on the Quanah, Acme & Pacific to Memphis, Tex., about 75 miles. It is understood that the first division will be built at once, and it is planned to eventually extend the line north from Memphis to Canadian, an additional 100 miles, where connection is to be made with the Santa Fe. The headquarters of the company are at Matador.

Minnesota & International.—An officer is quoted as saying that the company is planning to build a cut-off from Leaks, Minn., southwesterly to a connection with the main line of the Northern Pacific at a point just west of the Northern Pacific hospital, about 5.8 miles, to provide an easier entrance into Brainerd. It is expected that the work will be started soon.

Montezuma San Juan Southern.—An officer writes that the company has been incorporated in Colorado with $4,000,000 capital, and surveys will be started at once. Financial arrangements are being made with Baron Ludwig de Leopold, Paris, France. The plans call for building via Cortez, Colo., south to Fruitland, N. Mex., thence to Grants, where connection is to be made with the Santa Fe, about 200 miles. It is expected that contracts for building the line will be let in about four months. There will be one steel bridge, also terminal stations. G. O. Harrison, president, and Emil Stein, general manager, Cortez. (April 18, p. 925.)

Muskogee & Missouri Pacific Connecting.—Incorporated in Oklahoma to build an 8-mile line from Muskogee, Okla., to a point on the St. Louis, Iron Mountain & Southern, two miles south of Ft. Gibson. Former Governor Joseph Haskell and J. Hall are incorporators.

New York Central & Hudson River.—The New York Public Service Commission, Second district, recently held a hearing upon the application of the Hudson River Connecting for permission to construct a line from Stuyvesant, Columbia county, N. Y., to Fuera Bush, Albany county, with two branches, also to issue $250,000 capital stock, and upon the application of the New York Central & Hudson River to purchase the capital stock of the Hudson River Connecting. (April 11, p. 863.)

New York, New Haven & Hartford.—The Connecticut legislature has passed a bill authorizing the Westchester Northern to build and operate a line in Connecticut. The plans call for building from White Plains, N. Y., to Danbury, Conn. The company has a New York charter and asked for the right to build and operate in Connecticut. (October 11, 1912, p. 710.)

Ogden Rapid Transit.—An officer writes that the Logan Rapid Transit Company is now building an extension south about 12 miles to Wellsville, Utah, and arrangements are being made to build a connection from the Ogden Rapid Transit at Brigham north to Wellsville, a distance of from 16 to 25 miles, according to the route selected. Arrangements are also being made to build an extension of the L. R. T. north via Lewiston to Preston, Idaho.

Texas Roads.—Plans are being made by residents of Ennis, Tex., to build a line, it is said, from Ennis to a connection with the Trinity & Brazos Valley, either at Bardwell or at Emhouse. A bonus of $30,000 is being raised by residents of Ennis in aid of the project. E. M. Thomas, A. L. Berge and E. Raphael, of Ennis, are interested.

Westchester Northern.—See New York, New Haven & Hartford.

West Tennessee Traction.—An officer is quoted as saying that financial arrangements are about completed to build this line. The plans call for building from Memphis, Tenn., northwest via Brownsville to Jackson, 86 miles. D. T. Bennett, president; D. G. Sargent, vice-president and general manager, Memphis. (January 24, p. 191.)

RAILWAY STRUCTURES.

Bloomington, Ill.—The Chicago & Alton has awarded a contract to Westinghouse, Church, Kerr & Company, for the construction of a machine shop and other buildings.

Chicago, Ill.—The Minneapolis, St. Paul & Sault Ste. Marie has announced that the new freight terminal being built on the west side of Chicago by the Central Terminal Railway will be completed by January 1, 1914.

Duluth, Minn.—The Minneapolis, St. Paul & Sault Ste. Marie has announced that its roundhouse at this point is to be enlarged from a 12-stall to a 20-stall structure.

Eola, Ill.—The Chicago, Burlington & Quincy has announced that approximately $700,000 will be expended in the construction of a large freight yard at this point. Ten tracks will be completed this year, and others will be added later.

Lake Junaluska, Fla.—The Southern Railway is putting up a passenger station at Lake Junaluska, formerly Tuscola, which is three miles east of Waynesville. The contract for the construction work has been let to the Melton Construction Company, Greensboro, N. C. A small freight house is also being put up by the railway company's forces.

Memphis, Tenn.—A contract for the construction of the union passenger station to be used by the Illinois Central, Chicago, Rock Island & Pacific and St. Louis & San Francisco, has been awarded to the James Alexander Construction Company, of Memphis.

Toronto, Ont.—An officer of the Canadian Pacific writes that the north Toronto grade separation work includes the elevation of over 3 miles, to be mostly five track, necessitating the contraction of 10 subways. Bids will shortly be asked for building the subway at Yonge street. A contract has been given to Jennings & Ross, Ltd., Toronto, for the subway at Avenue road, and this work is now under way; contracts have been given to Wells & Gray, Ltd., Toronto, and work will be started shortly on the subways at Davenport road, at Spadina road, at Holland avenue, and at Bathurst street. Bids have been received and are at present under consideration for the subways at Shaw street, at Christie street, at Ossington avenue, and at Dovercourt road. The work of raising the track will be carried out by the Canadian Pacific with company's forces. The new station to be built just east of Yonge street will be used jointly by the Canadian Pacific and the Canadian Northern Ontario, and bids will probably be called for the erection of this building soon. At the present time about one mile of track has been elevated between a point east of Yonge street and west of Avenue road. (May 9, p. 1053.)

Railway Financial News

Baltimore & Ohio.—The circuit court of Baltimore has held that the B. & O. did not need to obtain the approval of the Public Service Commission of Maryland before issuing the $63,250,000 4½ per cent. convertible notes which were recently sold.

Boston & Maine.—This company has sold to J. P. Morgan & Co., New York, $12,000,000 one-year 6 per cent. notes of June 2, 1913, and $2,000,000 Connecticut River Railroad one-year 5 per cent. notes. This provides for about $12,000,000 bonds and notes falling due June 10, 1913, and for additional working capital.

Chesapeake & Ohio.—The Hocking Valley, of whose $11,000,000 stock the C. & O. owns $8,825,800, has declared an extra dividend of 4½ per cent. in addition to the regular quarterly dividend of 1¾ per cent. The Hocking Valley paid 3 per cent. total in 1911 and 7½ per cent. total in 1912, and is paying regularly quarterly dividends at the annual rate of 7 per cent. The Chesapeake & Ohio declared the regular quarterly dividend of 1¼ per cent., payable June 28.

Chicago, Rock Island & Pacific.—The $7,500,000 *railroad* 5's, held in the treasury of the railway company and maturing September 1, will, it is understood, probably be extended for 10 years.

Chicago, St. Paul, Minneapolis & Omaha.—This company has sold $2,500,000 5 per cent. debenture bonds, due March 1, 1930, to Rhodes & Company and White, Weld & Company, both of New York.

Cincinnati, Hamilton & Dayton.—This company has asked authority of the Ohio State Public Service Commission to issue $787,000 5 per cent. first mortgage bonds, to be sold at 80 per cent. The money is to be used in repairing damage done by the March floods.

Denver & Salt Lake.—This company has filed in Denver a notice of increase of stock from $10,000,000 to $35,000,000.

The city of Denver has voted 3 to 1 in favor of a proposition to build a $5,000,000 five-mile tunnel through the Rocky mountains at a 9,000 ft. level for the Denver & Salt Lake road.

Erie.—J. P. Morgan & Co., New York, have undertaken to extend to July 1, 1943, the $4,000,000 6 per cent. New York, Lake Erie & Western Docks and Improvement first mortgage bonds maturing July 1, 1913. Of the total $4,000,000 bonds there are outstanding in the hands of the public $3,396,000. The new bonds are to bear interest at the rate of 5 per cent., and are offered in exchange for the maturing bonds at par.

Hocking Valley.—See Chesapeake & Ohio.

International & Great Northern.—The Texas railroad commission has granted the request of the International & Great Northern for an addition to the valuation of its property for the item "value of right of way of $591,143," which item was not included in the former valuation under which bonds have been issued.

Midland Valley.—Harris, Forbes & Company, New York, and Drexel & Company, Philadelphia, are offering $4,500,000 new first mortgage 5 per cent. bonds of April 1, 1913-1943 at 92, yielding about 5½ per cent. on the investment. The road runs from Wichita, Kan., to Fort Smith, Ark., 321 miles.

J. H. McDonough, of Dallas, Tex., has been elected a director, succeeding J. B. Dodd, of New York.

National Railways of Mexico.—Press despatches from London say that arrangements are being made for a Mexican government loan for $25,000,000, a part of which is to be used to pay for the reconstruction of property destroyed during the Mexican revolutions.

New York & Harlem.—Harold Vanderbilt has been elected a director, succeeding J. P. Morgan, deceased.

New York, New Haven & Hartford.—A quarterly dividend of 1½ per cent has been declared, payable June 30. This reduces the annual rate from 8 per cent, which has been paid from 1897 to the present time, to an annual rate of 6 per cent.

A stockholders' committee has been formed consisting of George Von L. Meyer, chairman; Charles F. Adams, 2nd; Philip Dexter; Wilmot R. Evans, president of Boston Five-Cent Savings Bank; James L. Richards, president of Massachusetts Gas Co.; Charles A. Stone, of Stone & Webster; and Eugene V. R. Thayer, president of Merchants National Bank, Richard Olney and B. W. Palmer will act as counsel. Two or three additional names will later be added.

Circular to stockholders says:

"It is evident from price of stock there is uneasiness on the part of investors, although gross earnings are increasing and assets, according to the validation commission, considerably exceed all liabilities, including stock. Policy of the company ought to be studied, all facts bearing on future management to be ascertained, and appropriate action taken to remove apprehensions of investors.

"It is the intention of the committee to invite co-operation of directors. We do not now express any judgment as to the management. Probably the decline has been due, at least in part, to rapid expansion of activities and consequent increases of capitalization, and charges.

"To determine whether expansions have been wise requires more accurate acquaintance than we possess and than shareholders possess. The more important question, whether policy of expansion should be continued, deserves immediate consideration. It may be period of rest and consolidation should follow. Equally it may be that partially completed recent acquisitions cannot wisely be so treated.

"It is time investigation concerning future policy be made on behalf of stockholders, looking to determination of these vitally important questions and proper steps to care for various interests affected. Public employees and stockholders are all equally concerned in future policy. Investigation and subsequent action by a committee of those who have had no hand in any of the policies, and may, therefore, be unbiased, would be useful.

"Any such action, to be of value must be the action of the greater part of stockholders. Unless the committee has stockholders behind it, nothing can be accomplished. Therefore, we request you to sign proxy sent herewith, and agreement to furnish additional proxies if committee finds necessary."

Seaboard Air Line.—James B. Colgate & Co., and Townsend Scott & Son, both of Baltimore, Md., have bought $750,000 first mortgage 5 per cent. bonds, of April 1, 1913-1953, of the Tampa & Gulf Coast, guaranteed principal and interest by the Seaboard Air Line. The Tampa & Gulf Coast is being built from a connection with the Tampa Northern through the Pinellas peninsula, 77 miles.

Southern Pacific.—Kuhn, Loeb & Company, New York, have sold $5,000,000 4½ per cent. equipment trust certificates at a price to yield nearly 5 per cent. These certificates mature in annual instalments over ten years. They are part of the $10,120,000 equipment trust certificates recently authorized.

See also Union Pacific.

Tampa & Gulf Coast.—See Seaboard Air Line.

Temple & Northwestern.—The property of this company has been sold to W. S. McGregor, of Temple, Tex., who had previously held control.

Union Pacific.—There has been substituted under the Oregon Short Line refunding mortgage bonds, $6,170,000 Baltimore & Ohio common, $4,000,000 New York Central & Hudson River stock, $3,300,000 San Pedro, Los Angeles & Salt Lake 4 per cent. bonds and $55,000,000 Oregon Short Line refunding 4's (the total issue of these bonds is $100,000,000, of which $45,000,000 are outstanding and this $55,000,000 now deposited under the mortgage has been in the treasury of the Union Pacific) for the $108,000,000 Southern Pacific stock which heretofore formed part of the collateral for these bonds. This leaves the entire $126,000,000 Southern Pacific stock, which the Union Pacific owns, free in the Union Pacific treasury.

Wheeling & Lake Erie.—On May 7 five directors were elected as follows: F. S. Cook, W. A. Turner, Myron T. Herrick, of Cleveland, Ohio, and W. R. Nicholson, of Philadelphia, Pa., by the majority interests, and Ralph E. Cohen, of Steubenville, by the minority interests.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,100 copies were printed; that of those 8,100 copies, 6,646 were mailed to regular paid subscribers and 344 were provided for counter and news companies' sales; that the total copies printed this year to date were 190,259—an average of 8,648 copies a week.

Volume 54. May 30, 1913. Number 22.

CONTENTS

*Illustrated.

THE railroads of Missouri have decided to appeal the train crew legislation in that state to the highest court, viz., the people themselves. They are circulating a petition for submission of the measure to a referendum vote. There seems to be little doubt that they will get the necessary signatures to the petition. This action by the Missouri roads merits the heartiest commendation. It seems to be the belief of many that the interests of the railways and the people are necessarily conflicting, and that whatever will hurt the former must be good for the latter. No better means for correcting this notion is available than that of public discussion of train crew legislation. The appeal of the roads to the people may or may not result in the nullification of the train crew legislation; but the evidence it will afford that the roads are not afraid to lay their case before the public can hardly fail to produce a favorable impression on the latter. The experience of recent years indicates that if, in the long run, the roads are to get fair treatment, they can do so only by going behind governors, legislatures and commissions to those who make and unmake all public officials. The roads secured a referendum in Arizona last fall on several measures that had been passed by the legislature. They conducted an actual literary and speech-making campaign, and while all the measures were adopted, the vote polled against them was large, and it seemed that if the campaign had lasted a few weeks longer most of the bills would have been beaten. If the roads in Missouri do get the train crew law submitted to the people it is to be hoped they will carry on an actual educational campaign throughout the state. Only in this way can they actually test the value of a referendum. The arguments that can be made against the train crew legislation are so overwhelmingly convincing to every rational mind that if the roads cannot get the public to vote against it their situation is bad, indeed.

AT the convention of the International Railway Fuel Association, held last week in Chicago, railway fuel contracts and the storage of railway coal were discussed at some length. The coal operators strongly urged a reduction of the "spread" or difference between the maximum and minimum amounts that could be demanded by the railways at their pleasure, as specified in all coal contracts. They also advocated an extension of the practice of storing a large amount of coal in the summer months for the next winter's use. In support of this it was pointed out that plenty of coal cars are available in the summer, while the contrary is true during the cold weather. Furthermore, the coal could be hauled in summer without further complicating the traffic problem, which, on most roads, is serious during the winter months. If coal is stored, as suggested, the necessity for the wide range of daily or weekly tonnage that can be demanded, which sometimes is as much as 100 per cent., disappears. On the other hand, it seems that coal stored for several months will cost from 15 to 60 or 70 cents a ton more than coal direct from the mines. The exact amount varies with the quality. This is due to the cost of the extra handling and the depreciation of the fuel, owing both to the rehandling and the weathering. While some slight reduction in price might be offered in some cases, it would not cover the difference in value and the locomotives would be supplied with a lower grade product at a higher price. The present practice, while evidently somewhat of a hardship to the coal operator, is the only satisfactory one to the railway, and unless conditions change materially it will probably be continued. A fuel contract that is entirely satisfactory to the operators is in use by one railway, at least, and does not require the storage of coal during the summer. In this case the future requirements are estimated with the greatest care and the "spread" is but a small percentage of the minimum. When more coal than the maximum is required, a premium of a small amount is paid for the first mutually determined amount, a larger premium for the next increment and so on. Such a contract is practically ideal if the future requirements can be determined with reasonable accuracy.

THE use of the telephone in railroad service increases so rapidly that its extent can be realized only by frequently looking back. Our railroads neglected the advantages of long-distance telephone facilities for a number of years, but they are rapidly catching up, and today—as New York City reports in use 500,000 telephones, or nearly as many as the aggregate number in the three cities of London, Paris and Berlin—the railroads of America can report nearly or quite 100,000 miles of long distance telephone circuits. (In the matter of ordinary short-distance telephone communication the railroads have not been lacking in enterprise.) This estimated total is based on the statistical report of the Interstate Commerce Commission, noticed in our issue of May 16, page 1063, and on the data given by Mr. Johnson, superintendent of telegraph of the Pennsylvania Railroad, in his paper which was read last week

at St. Louis, and which is abstracted in another column. The government's total of road having telephone despatching wires is 68,097 miles. On the basis of the partial statistics gathered by Mr. Johnson it will be safe to add to this mileage at least one-third to represent other circuits, used for messages; and in the five months since the statistics were collected there has been such a considerable addition that the total is more likely to run above than below 100,000 miles of line. In addition to this there is an aggregate of 23,002 miles of road on which telephones are used for manual block signaling, an increase in 12 months of 6,458 miles. That the introduction of the telephone has greatly simplified train despatching is now a commonplace fact. Not so fully appreciated, perhaps, is the value of the portable telephone. Mr. Johnson estimates that telephones carried on work trains increase the efficiency of such trains no less than 40 per cent.; and his track-repair foremen, of whom 138 have telephones, are estimated to be 45 per cent. more efficient because of this aid. While these, no doubt, are rough estimates, they are highly suggestive, nevertheless. Among other interesting facts Mr. Johnson reports 3,324 telephones in use in booths and in other places along the Pennsylvania Railroad outside of stations, towers and offices. The Western Electric Company, which reports new orders for telephone despatching apparatus nearly every week, this week gives the names of eight railroads, on which 2,200 miles of telephone circuits are to be put up. One of these is an electric road, the order for which covers thirty miles; the others are the Chicago, Burlington & Quincy, 405 miles; Chicago & North Western, 105 miles, and a message circuit of 85 miles; Denver & Rio Grande; Lehigh & New England; Missouri, Kansas & Texas, 1,000 miles; New York Central, 70 miles, and Seaboard Air Line, 285 miles. The Denver & Rio Grande order includes 26 portable sets for use on trains.

SOME DISPUTED POINTS IN RAILWAY VALUATION.

3.—Depreciation.

A VERY important problem in railway valuation, and one regarding which there is a wide divergence of opinion, is that of depreciation and the allowance which should be made for it. Many railway men contend that no deduction for depreciation of track and roadbed should be made in the case of a properly maintained road. For the first ten years after a road is built, or until renewals become fairly constant, there is undoubtedly depreciation of the ties, rails and track structure which is not offset by repairs and renewals. But during the same time there is a definite appreciation of the roadway and surface, owing to their becoming better adapted to the service of transportation, so that at the end of this period the entire track and roadway are more valuable for the purpose for which they exist than when built. After this period of approximately ten years both depreciation, on the one hand, and appreciation due to solidification and adaptation on the other hand, cease if a road is reasonably maintained.

The general practice of the state commissions has been to deduct a percentage for depreciation from the various units entering into the valuation. It would seem that if depreciation should be thus allowed for, so ought appreciation to be, and in some cases it has been. This item of appreciation has been handled in two ways. In making an appraisal of the Spokane & Inland Empire the Public Utilities Commission of Washington fixed 110 per cent. of the reproduction cost new as the reproduction value of the grading at the time the valuation was made. In Minnesota appreciation was provided for by a separate item, "adaptation and solidification of roadbed" amounting for all the roads in the state to $11,743,007, which was 21 per cent. of the reproduction cost of the grading, clearing and grubbing. The commission mentioned, however, whether this allowance was proper. In the valuation by the Massachusetts commission of the New York, New Haven & Hartford an allowance of $500 per mile, or a total of $805,000, was made for solidification, this being considered by the commission as very low. A similar allowance was also made by the commission in Washington in valuing the roads of that state. This appreciated value was also admitted in the recent valuation in New Jersey, but because of its indefiniteness no figure for it was included in the final report.

In Michigan and Wisconsin, on the other hand, depreciation was deducted without any allowance being made for appreciation.

Aside from the method of allowing for depreciation, the extent of the allowance for it has varied greatly. For instance, in New Jersey the item for track laying and surfacing was depreciated 25 per cent. on the assumption that while 50 per cent. of the labor was devoted to surfacing and remained in the property, undiminished, the other 50 per cent. was devoted to the laying of the track and depreciated with the track structure. In the valuation of the Spokane & Inland Empire an annual depreciation of 6.7 per cent. was charged against the item of track laying and surfacing. In Michigan this charge was 2.5 per cent., while in Wisconsin, Minnesota and Massachusetts full reproduction value new was allowed. Again, the item of ballast was depreciated 33.2 per cent. in the Wisconsin appraisal, while in Minnesota, Michigan and Massachusetts no deduction on this account was made.

With reference to equipment, the problem is perhaps less complicated, but even here at least two methods have been used. The plan adopted in Michigan and later used in Wisconsin was for representatives of the commission to make examinations of large numbers of each kind of equipment operating within the state, and accept the average per cent. of depreciation of the equipment actually inspected as typical of all of it. In Michigan about 33,000 freight cars were thus inspected, while in Wisconsin it was stipulated that 50 per cent. of the locomotives, 50 per cent. of the passenger cars, and not less than 20 per cent. of each class of freight cars operating wholly or partly in Wisconsin should be inspected. The percentages founded on these inspections were then applied to all the equipment. In Washington, on the other hand, the depreciated value of the equipment was determined by the use of mortality tables. Knowing the ages of the various classes of equipment, which were available from the records, and the average life, straight line depreciation could be readily applied and the average value for each unit of equipment determined. The Washington commission believed that more accurate figures were secured in this way and at a lower cost than by other methods.

ST. LOUIS & SAN FRANCISCO RECEIVERSHIP.

THE immediate causes of the receivership of the St. Louis & San Francisco are misfortunes due to the flood and to the general state of railroad credit; the ultimate causes were financial. Unlike the case of the receivership of the Missouri Pacific, the St. L. & S. F. receivership is not due in any degree to past mistakes in the operation of the road. The St. Louis & San Francisco and its subsidiary, the Chicago & Eastern Illinois, have been and are fully maintained in accordance with the standards of the best roads in their territory. The St. L. & S. F. itself is a heavily capitalized road and in addition to this the company has assumed in the process of expansion various burdens, some of which have proved too heavy for it to carry. Most conspicuous of these burdens is that of the purchase of the Chicago & Eastern Illinois.

In 1902 the St. Louis & San Francisco offered to buy the preferred stock of the C. & E. I. for $150 per share and the common stock for $250 per share, and on June 30, 1912, had bought $8,096,000 of the total outstanding $12,146,500 preferred stock ($3,154,500 of this preferred stock was issued in 1911-12 to stockholders of the Evansville & Terre Haute to effect the consolidation of this property with the C. & E. I.) and $7,217,800 of the $13,626,100 common stock, the entire remaining $6,408,300 of common stock being deposited with the Equitable Trust Company of New York to be issued only for enlargement or improvement of the property. The St. Louis & San Francisco issued trust certificates in exchange for this C. & E. I. stock, paying on these trust certificates amounts equal to 6 per cent. on the par value of the preferred stock deposited under them and 10

per cent. on the par value of the common stock. The C. & E. I. would therefore have had to pay 6 per cent. dividends on its preferred and 10 per cent dividends on its common to enable the St. L. & S. F. to wash the cost of carrying this investment. In the fiscal year ended June 30, 1912, however, the C. & E. I., while paying 6 per cent. on the preferred, paid but 5 per cent. on the common, which would leave a difference of $360,890 to be made up by the St. Louis & San Francisco.

In addition to this, the St. L. & S. F. had to pay in that year from profit and lose $903,969 deficit on the New Orleans, Texas & Mexico, beside making advances to other subsidiaries for additions and betterments, etc.

When the Chicago, Rock Island & Pacific and the St. Louis & San Francisco separated in 1910 the prospects for both roads appeared to be improved by the separation. The Rock Island, however, was not burdened with any expensive guarantees, such as that of the Frisco on the C. & E. I. stock. It was for this reason, possibly, that the C. R. I. & P. was enabled to get its money needed for improvements since 1910 at a more reasonable rate than was the Frisco. On June 30, 1912, the St. Louis & San Francisco was carrying $12,929,615 unextinguished discount on funded debt, and the combined balance sheet of the Frisco and the C. & E. I. and New Orleans, Texas & Mexico showed loans and bills payable of $7,459,107. The St. L. & S. F. last September sold $2,600,000 2-year 6 per cent. secured notes, dated September 3, 1912, due September 1, 1914. These notes were offered by the company's bankers to the public at par, and presumably the money cost the Frisco well over 7 per cent. In the fiscal year ended June 30, 1912, the net increase in funded debt and equipment bonds and notes was $7,918,907, and the increase in amount of unextinguished discount on funded debt was $2,196,527, of which $903,969 was charged out to profit and loss for that year and the remainder added to the amount carried on the balance sheet, the total of which at the end of the year has already been commented on.

The application for receivership of the St. Louis & San Francisco was on a bill of complaint by the North American Company, which said that the St. L. & S. F. was unable to pay $400,000 matured notes. At the same time an application was made for the appointment of a receiver for the Chicago & Eastern Illinois. President Winchell and Thomas H. West, of the St. Louis Union Trust Company, were appointed receivers of the Frisco, and W. J. Jackson, vice-president, and Edwin W. Winter, formerly president of the Northern Pacific, and more recently president of the Brooklyn Rapid Transit, were appointed receivers of the C. & E. I. The Frisco has $2,225,000 notes maturing on June 1, and it was apparently an absolute impossibility to sell any securities with which to refund these notes.

The receivership ended one of the gamest fights to prevent such an outcome in the history of American railways. If hard and able work by an excellent organization could have kept these properties solvent they would have remained solvent. No railway president in the country has worked harder than Mr. Winchell has since he went to the Frisco Lines somewhat over three years ago. He has almost lived in his car out on the line supervising personally as far as he could the operation of the properties, and contributing in a way for which he is peculiarly fitted to increasing the popularity of the Frisco Lines. The work of the traffic and operating departments separately and their team work have been admirable. On the part of the traffic department no stone has been left unturned to find and develop new sources of business. The operating department has made a fine and successful fight both to improve the service rendered and to increase the economy with which it has been rendered. The Frisco has had available very small means for improving its physical property. Nevertheless it has been well maintained, and by careful and thorough supervision its average revenue freight trainload was increased from 195 tons in 1903 to 221 tons in 1909, and to 255 tons in 1912. In spite of the relatively meager funds available many improved methods of handling business and dealing with the public have been adopted. Several of these have been described from time to time in the *Railway Age Gazette*, such as the systems of handling loss and damage claims, of moving merchandise freight and of giving station agents large authority in the handling of claims and the solicitation of traffic. It cannot be too emphatically said at this time when there might develop some misunderstanding as to the facts that the organization and personnel of the operating and traffic departments of the Chicago & Eastern Illinois and the Frisco have been exceptionally good, and that their officers have done all that men can do to prevent the result which has now come.

ACCIDENTS ON PRIVATE AND STATE RAILWAYS.

A SOCIALIST writer in a popular magazine recently has been discussing railway accidents in this country and seems to be approaching the conclusion that government ownership is the only efficient remedy for them. If the accident statistics of the railways of the United States be compared with those of the leading state railways of the world, and no other comparisons be made, the conclusion is sure to be drawn that state railway management conduces to safety. But a conclusion based on this evidence alone would be unscientific and misleading. In order to reach a sound conclusion as to whether state management is superior in respect of safety or any other matter to private management it is necessary to make comparisons of several classes. One of the most enlightening classes of comparisons is between state and private railways in the same country. The least satisfactory class of comparisons is between railways in different countries, because in different countries the conditions are apt to be quite different and may be widely different.

To ascertain whether there is any relation between state or private management and safety the *Railway Age Gazette* recently asked the Bureau of Railway Economics to compile from the official reports of the railways of a number of countries data showing the ratios of the numbers of accidents to passengers to the numbers of passengers carried, or the numbers of passengers carried one mile; and the ratios of the numbers of ac-

(a) Casualties to passengers include only those occurring in train accidents.

cidents to employees to the numbers of train miles run and to the total numbers of employees. The data furnished relate to countries where private management is almost the sole policy, to countries where state management is almost the sole policy, and to countries where there are both state and private management. Only statistics relating to fatalities will be given here, both because of limitations of space and because figures for injuries are compiled on varying bases in different countries. The wide discrepancy between the bases on which injuries are reported is illustrated by the fact that in the United States all employees are reported as "injured" who are incapacitated for duty more than three days out of the ten immediately following the accident; that in the United Kingdom all are reported who are incapacitated for one day; that in Germany only those are reported who are incapacitated for work for at least fourteen days; and that in France only those are reported who are incapacitated for at least twenty days. Obviously, comparisons between statistics made up on such different bases are worthless. There are also differences between the bases on which fatalities are reported, but these do not vitiate comparisons. In the table on the preceding page figures are given separately for the state and private railways of Austria, France, Sweden, Switzerland and Germany. Figures are also given for the railways of Canada and those of the United States.

In the foregoing table the unit on which comparisons of fatalities to passengers are made is the number of passengers killed for 100,000,000 passengers *carried one mile*. In several countries statistics for passengers carried one mile are not compiled, and the following table gives for the United Kingdom, Italy, New Zealand and Victoria information similar to that given for other countries in the preceding table, except that in the following table the unit on which comparisons of fatalities to passengers are based is the number of passengers killed for 100,000,000 passengers carried, regardless of the distances they were carried.

Fatalities to Passengers, Employees and Other Persons Resulting from Train Operation.

	Mileage.	Number passengers killed.	Passengers killed per 100,000,000 pass. carried.	Number employees killed.	Number employees for one killed.	No. employees killed per 1,000,000 train miles.	Other persons killed.
United Kingdom (Private). Year ended Dec. 31, 1911.	23,417	112	8.40	430	1,416	1.003	617
Italy (State). Year ended December 31, 1909.....	8,875	43	54.38	122	1,227	1.8475	228
New Zealand *(State). Year ended March 31, 1911..	2,742	7	62.50	10	1,288	1.2283	18
Victoria (State). Year ended June 30, 1912.....	3,543	9	8.63	26	.....	1.8791	32

*Includes casualties in train accidents only.

A glance at the table is sufficient to show that the accident records of Canada and the United States are relatively bad. Only a second glance is necessary to show that there is no relationship between state railway management and safety. The figures show that generally the accident records of state railways are worse than those of private railways in the same country. The proportion of passengers killed was greater on the private railways of Austria, Sweden and Germany than on the state railways of the same countries; the opposite was the case in France and Switzerland; and the proportion of employees killed was greater on the state railways than the private railways in every case. The worst record in Europe is that of the French state railways. In proportion to the number of passengers carried one mile they killed almost four times as many passengers as the railways of any other leading country o Europe, and three times as many in proportion as the railways of Canada or the United States. Nor was their record in the year for which figures are given exceptional. "The six big railway accidents which have occurred in France for the last five years have been on the state systems, three on the old system and three on the Western," said Pierre Leroy-Beaulieu, a member of the Chamber of Deputies, in a paper before the Royal Economic Society of London on January 11, 1912. Their record for killing employees is also the worst in Europe.

New Zealand has been held up by socialistic writers to the admiration of the world because of the alleged safety of its railways. It is, therefore, interesting to note that of the railways for which figures are given in the second table those of New Zealand killed more passengers in proportion than any others, their record in this respect being almost eight times as bad as that of the railways of the United Kingdom, and worse even than that of the railways of Italy. While the record of the French state railways for safety is very bad, that of the five large private railways of France is extremely good. There is close competition for first place between the private railways of France, the private railways of the United Kingdom and the state railways of Prussian-Hesse. The Austrian railways, both private and state, make nominally the best records, but probably this is largely because trains are less numerous and their speed lower in Austria than in the United Kingdom, France, Germany and the United States.

The figure in the tables which perhaps stands out the most prominently is that showing that in the year ended June 30, 1911, 6,438 "other persons" were killed on the railways of the United States. Of these, 5,284 were classified by the Interstate Commerce Commission as trespassers. Most of the rest of the "other persons" were killed in accidents at highway grade crossings. The accident record of the railways of the United States compares badly enough with those of most of the railways of other leading countries without having this large number of fatalities to trespassers, which is due to inefficient government and not to railway management, added to it.

The reader who studies the statistics on the subject with an open mind is sure to conclude that under similar conditions the accident records of state railways are certainly no better than those of private railways, and that there is no connection between state management and safety. The accident record of the railways of the United States is not due to private management, but to local conditions which the government and public must co-operate with the railway managements in dealing with if they are ever to be remedied. On the one hand, the railway managements should exhaust every resource at their command to reduce accidents. On the other hand, the government and public should give the railways a chance to earn enough money to make necessary improvements, should back them up in adopting and enforcing rules necessary for safety, should keep trespassers off their rights of way, and should then hold the railway managements up to the highest standards of public duty.

NEW BOOKS.

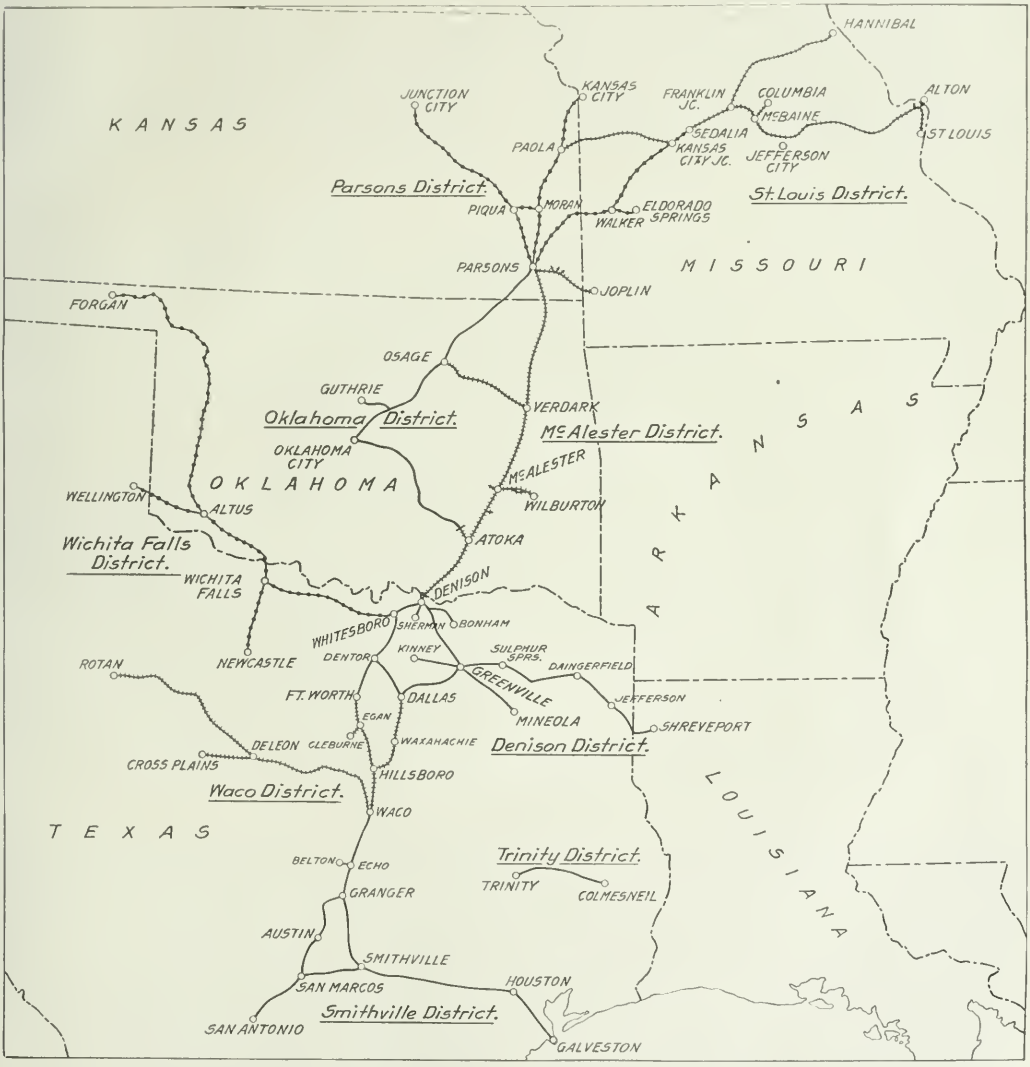
Safety Valve Rating. By Alfred R. Carhart, E.E. Bound in paper; 105 pages, 6 in. x 9 in.; 8 illustrations. Published by the Crosby Steam Gage & Valve Company, Boston. Copies sent free on application to Mr. Carhart at 40 Central street, Boston, Mass.

This book is intended only as an elementary discussion of the subject of safety valve rating. Three new rules are proposed and are developed one from another, all the calculations being given in detail. The preliminary discussion takes up the objections to present rules and makes comparisons between them; the subject of reduced lifts is discussed. Various considerations in safety valve design are next taken up, such as limiting the size of the valves, the disadvantages of larger valves and increased lift and the advantages of flat-seated valves. There are numerous tables included, and six appendices are given at the end of the book, dealing with such subjects as Napier's rule, formulas for flat and bevel seated valves, calculations of pressure, etc.

STUDIES IN OPERATION—THE M. K. & T.

A Substantial Reduction Made in the Transportation Ratio of the Texas Lines Without the Addition of Heavier Power.

The Missouri, Kansas & Texas operates 3,399 miles of road, of which 1,635 miles are in Texas, and few companies with lines in Texas have ever succeeded in making the operation of their Texas lines profitable. The M. K. & T. north of the Red river has for a number of years had to help bear the burden of the operation of the lines south. It is therefore the profitable operation of the Texas mileage which presents the most difficult problem to be solved, and in the successful solution of it lies the hope of the greatest possible development of the country and of the future prosperity of the railroad company. In the eight months ended March 31 the Texas lines showed a net operating income of $2,973,279, as compared with $945,841 net income for the corresponding eight months of the previous year, an increase of 214 per cent. It is proper to point out, however, that even with this extraordinary increase in net income, the Texas lines are probably not earning a fair return on the invest ment in them, but it is true the prospects for the Texas lines are good for the first time in the history of the company.



The Missouri, Kansas & Texas, Showing the Operating Divisions.

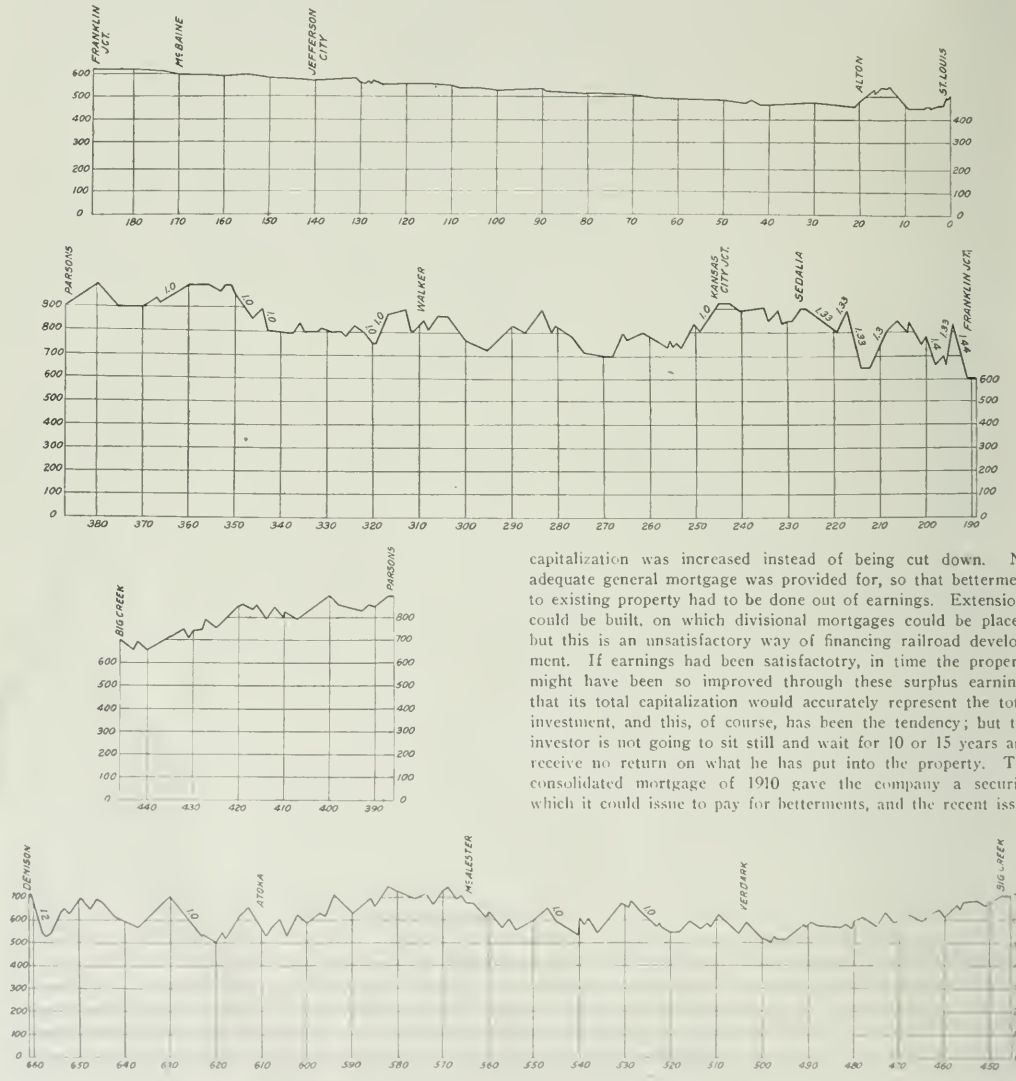
To adequately understand operating conditions on the M. K. & T. it is necessary to review briefly the history of the property. In 1888 the Missouri, Kansas & Texas was lost to Gould control by being placed in the hands of receivers. The Goulds

had bought or built the property piecemeal, their idea being to form a Gould system in the southwest combining the M. K. & T., the Texas & Pacific and the International & Great Northern. Some idea of the way in which the lines were put together may be suggested by the fact that the main Gould line from Chicago to Houston, Tex., was made up by using the Wabash, the M. K. & T., the Texas & Pacific, via Palestine, and the I. & G. N. At the time the Goulds had the M. K. & T., the headquarters of the company were at Palestine, Tex., which is about one hundred miles from the nearest station on the M. K. & T.

At the time of the receivership the road was quite incomplete; the receivers were given permission to make certain extensions and when the property was reorganized certain further extensions and purchases were made. The Oklahoma lines were acquired after most of the other roads had already got lines in Oklahoma. Later the Texas Central was acquired and more recently the Wichita Falls lines were purchased. After the termination of the receivership there was a lack of continuity of policy. At times the road was managed from New York, at other times from St. Louis. The sums required for rebuilding the lines on modern standards were so great that a sort of hand to mouth program of betterment was pursued.

The reorganization of the company in 1888 was carried through without foreclosure sale, and the somewhat top-heavy capitalization was increased instead of being cut down. No adequate general mortgage was provided for, so that betterment to existing property had to be done out of earnings. Extensions could be built, on which divisional mortgages could be placed, but this is an unsatisfactory way of financing railroad development. If earnings had been satisfactotry, in time the property might have been so improved through these surplus earnings that its total capitalization would accurately represent the total investment, and this, of course, has been the tendency; but the investor is not going to sit still and wait for 10 or 15 years and receive no return on what he has put into the property. The consolidated mortgage of 1910 gave the company a security which it could issue to pay for betterments, and the recent issue of $19,000,000 notes was secured by a deposit of these consolidated mortgage bonds. This situation has been a drawback to the company's credit, the effects of which are still shown in the prices at which its securities are selling.

The result of this kind of a history may easily be imagined. The system as a whole at the time the present management took it over about two years ago was most unevenly developed. The Texas lines especially had been inadequately developed, and



Condensed Profile Main Line M. K. & T., St. Louis to Denison.

while the main line of the company north of the Red River was in fairly good shape, even here there was a considerable betterment work to be done before heavy locomotives could be put in operation. The company had a surfeit of light and obsolete power.

The M. K. & T. has had for a long time a strong traffic department. About 35 per cent. of the total operating revenue comes from passenger service, and largely through the efforts of the traffic department the "Katy" passenger service was widely known. This much the new management had as a valuable legacy from former managements.

In addition to this, the road serves a territory that is developing about the most rapidly of any in the United States. While the M. K. & T. is not the short line in a single important instance, it nevertheless reaches all of the best cities in Texas and some of the best in the southwest, and now has an important and growing business in Oklahoma. Besides, however, taking a property that was unevenly developed, the new management found an operating, mechanical and engineering organization that was by no means satisfactory, and which was working under conditions often very far from modern. It is absolutely necessary to appreciate this before it is possible to understand the changes that are being made, the unsatisfactory showing that was made in the year ended June 30, 1912, and the extent of the progress in the present fiscal year.

Of course, in comparing the showing made in the first eight months of the present fiscal year with the corresponding period of the year before it should be borne in mind that the conditions in the year before were quite abnormal. It may be true, however, that in part these abnormal conditions were the result of the non-application of the very methods the application of which is meeting with so much success in the current eight months.

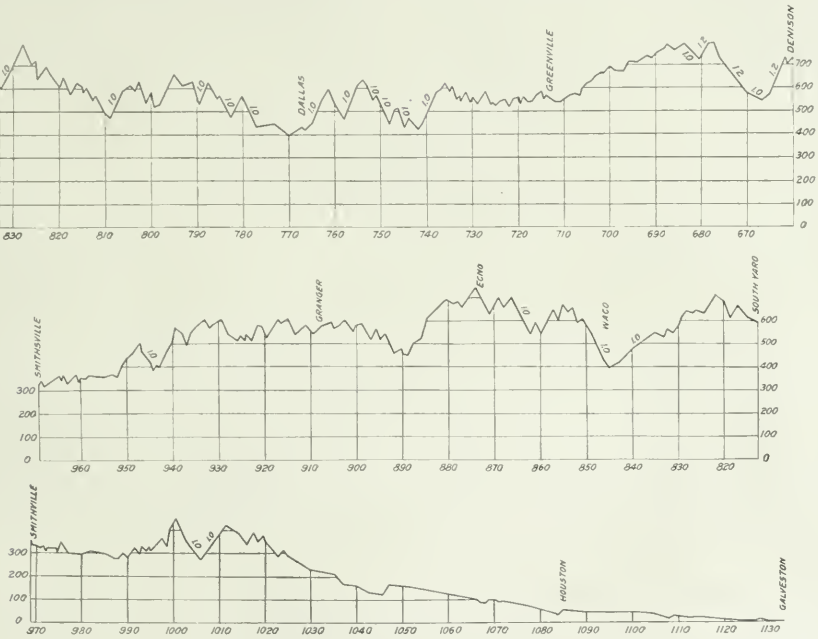
One of the first undertakings that the new management carried out was to give the property a strictly divisional organization. It was divided into two grand divisions; the lines north of Denison and the lines south of Denison. The new president, while making his headquarters in St. Louis, spends most of his time in Texas; the general manager is in Dallas. The accompanying diagram shows the scheme of the organization.

The lines north of Denison were divided into four divisions—the M. K. & T. calls them districts—each in charge of a superintendent, and the lines south into four, excluding the "orphan line."*

Under the former organization the superintendent had entirely lacked authority to either finally dismiss an employee or to adequately decide on increases of force. He is now given very full authority. The mechanical department had not been under the direction of the superintendent, but now the superintendent is given authority over the master mechanic and is held directly responsible for the performance of the mechanical department on his division. He likewise, as will be seen by the diagram, has jurisdiction over and is responsible for maintenance of way on his division.

The Hine system of unit organization has not been adopted in its entirety, but certain features of it are used in the divisional organization that has been adopted. There is one common division superintendent's file, and all letters, whether they pertain to the mechanical, engineering or train service departments, are kept in this file. The offices of the entire staff of the superintendent are located in the same building. The Hine distinction between line and staff officers is recognized in the M. K. & T. form of organization. Thus the chief engineer of maintenance is a staff officer of the general manager, as is also the superintendent of motive power, and in the same way the engineer of maintenance is a staff officer of the general superintendent. These changes in organization were preliminary to an effort in the direction of the most obvious possibility of economy—namely, increasing the train load.

The average revenue train load on the entire system was 241 tons in 1912, and was about 175 tons on the Missouri, Kansas & Texas of Texas. The reasons for this very low average train load were, first, that the physical condition of the property, especially in Texas, did not permit of the use of heavy modern



Condensed Profile Main Line M. K. & T., Denison to Galveston.

*The "orphan line" runs from Trinity, Tex., to Colmesneil.

locomotives, and even where, as on parts of the main line north of the Red River, heavy power could have been used, it was not. As will be seen from the accompanying profile, the road has heavy grades—throughout Texas the ruling grade is 1 per cent. Double-heading could not be done because in Texas the laws forbid it, and north of the river the company in the past got itself into an agreement with its employees which provided that the only double-heading which could be done was where no increase in tonnage was made to the train and a second caboose was carried. Furthermore, the nature of the traffic is such that over 40 per cent. of the total car mileage is made by empty cars and the loaded movement has necessarily to be performed at fast speeds.

Out of St. Louis the M. K. & T. gets a large and what should be a fairly profitable merchandise business. Since, however, this business is highly competitive, the movement of it must be rapid and prompt. For example, there are from two to four through freights run south out of St. Louis each evening. The nature of the St. Louis division is such that it would be perfectly possible to operate considerable heavier locomotives; but, since to get the business at all the first train of merchandise must be started from St. Louis by about eight o'clock p. m., regardless of whether or not even a light engine has its full rating, no gain can apparently be made by assigning to this division heavier power. By eleven o'clock or so a train load of manufactures, beer, etc., is ready to move, and possibly an hour or so later a second train of merchandise.

The merchandise movement over the entire system is almost without exception southbound and must, of course, be loaded in box cars. The north-bound movement at present consists principally of cattle, fruit and vegetables. The cattle are loaded in stock cars, the fruit and vegetables in refrigerator cars. The principal coal fields on the M. K. & T. are in the neighborhood of McAlester, Okla., and a quite heavy movement of coal is shipped down into Texas. At present there is no north-bound lading for the coal cars. There is no south-bound lading for the refrigerator and stock cars and there is a comparatively small north bound lading for the box cars in which merchandise has been shipped south. The cotton movement, which is presumably the most profitable traffic which the M. K. & T. has, nearly all moves in four months of the year, beginning in August, and this also is a south-bound movement unbalanced by any north-bound traffic.

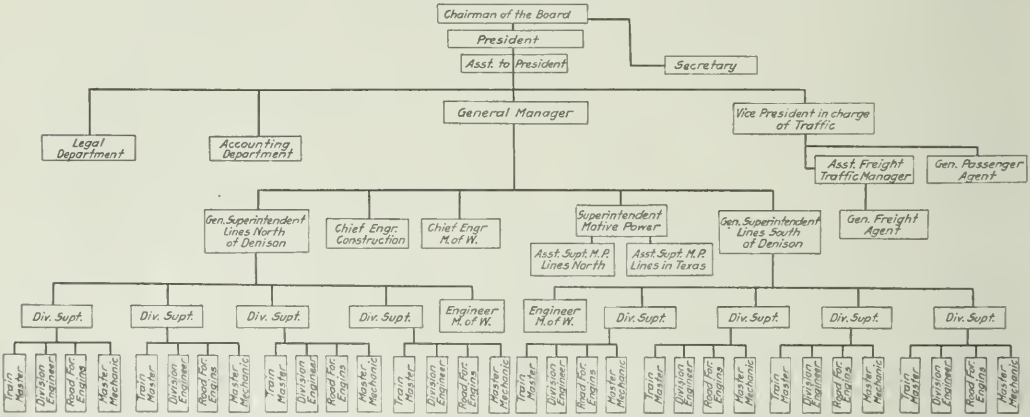
When Mr. Schaff became president, one of his first undertakings was to lay the foundation for the development of a north-bound traffic. On the M. K. & T. proper there is [illegible] timber, but the so-called "orphan line" which runs from Trinity, Tex., to Colmesneil, lies in the heart of the timber country of East Texas. Arrangements are now being made for a line connecting this "orphan line" with the main line. The installation of the divisional form of organization has already been mentioned. The next step was the preparation of the physical property for the use of heavier power. Fifty Mikado locomotives were ordered, ten of which are to be placed in operation from Waco, Tex., to Smithville, and the remainder on the main line from Sedalia, Mo., via Parsons, Kans., and McAlester, Okla., to Denison, Tex. The bridges on the line on which heavier power was to be installed were immediately renewed where necessary with steel or concrete structures, and 60 and 66-pound rails were taken out and replaced with 85-pound rail. A five-year program was started of replacement of chatts ballast with stone ballast on the main line north of the Red River, and an immediate beginning was made on the lines in Texas in strengthening the burnt clay ballast that is used in this territory. An eight-year program of renewing all wooden bridges on the main line with permanent structures of concrete or steel has been commenced.

There are two classes of freight locomotives in service at present for main line work. These are what are called 30 per cent. and 41 per cent. engines, the first class having 30,000 lbs. tractive effort and a total weight of 152,000 lbs., and the second class having a tractive effort of 41,000 lbs. and a total weight of about 200,000 lbs. On the main line of the St. Louis division 30 per cent. locomotives are in use and have a rating of 1,850 tons, except between New Franklin and Sedalia, Mo., where to get this rating it is necessary to double-head. From Sedalia to Denison the 41 per cent. engines are in use, with the following rating:

Sedalia to Parsons	1,521 tons
Kansas City to Parsons	1,215 tons
Parsons to North Wagoner	1,960 tons
North Wagoner to North McAlester	1,570 tons
North McAlester to Atoka	1,800 tons
Atoka to Denison	2,620 tons

The new Mikado locomotives which are being put in service have a tractive effort of 53,000 lbs., and it is estimated that their rating will be about 38 per cent greater than that of the old 41 per cent. engines. The rating of the 41 per cent engines and 30 per cent. engines in Texas is shown in the following table

From	To	Per cent. engine	Tonnage rating
Denison	Fort Worth	30	870
Denison	Fort Worth	41	1,180
Fort Worth	Hillsboro	30	1,045
Fort Worth	Hillsboro	41	1,425
Denison	Dallas	30	985
Denison	Dallas	41	1,340
Dallas	Hillsboro	30	900
Dallas	Hillsboro	41	1,230



The Divisional Form of Organization on the Missouri, Kansas & Texas.

From	To	Per cent. engine.	Tonnage rating.
Hillsboro	Waco	30	960
Hillsboro	Waco	41	1,310
Waco	Smithville	30	960
Waco	Smithville	41	1,310
Smithville	Houston	30	980
Smithville	Houston	41	1,330

The heavier power is just now arriving, but in the year and a half in which the present management has had the property, operating conditions have changed to an extent that is really remarkable because it is not due to heavier power, but to other activities.

Without doubt the single most important change that was made was that of organization. The concentration of authority and responsibility in the superintendent was a long step in itself; the establishment of the company's headquarters in Texas was a recognition of the tremendous possibilities of the country served by the M. K. & T. in that state. There were a thousand other changes made, possibly the great majority of them nothing more than the establishment of generally accepted modern operating methods, the net results of which, however, are quite strikingly shown in the two accompanying tables of figures for the lines in Texas.

M. K. & T. Ry. Co. of Texas.

Some of the changes made in operating methods are worth mentioning. It had been the practice to do part of the local business with the through freight trains in an attempt to give the through trains their full rating, but with the result that through trains were anywhere from twelve to twenty-four hours late arriving at destination. Instructions were issued to use through trains for through business only, all local work, which on the M. K. & T., as on most other roads, amounts largely to a switching business, is done by local crews and carried in local trains. A somewhat similar idea was carried out in passenger service. In the first place the schedules were re-adjusted, so that it was possible, under the proper operating conditions, for all passenger trains to be on time. Additional local trains were put on, running a certain distance ahead of the two fast through trains. The result was that the local service was improved and that the through service was brought up to a standard never before considered possible. At present about 95 per cent. of all passenger trains are on time at destination. The saving made in overtime has been remarkable.

It had been the practice to load north-bound freight into the first available car without any regard for car-loading, since there was a great surplus of empty cars moving north in any case. Instructions have now been issued to devote as much care to full car-loading north-bound as south-bound. Full trains of empty cars are run north-bound and the surplus locomotive and caboose is run north as the first section of the passenger train. Here again the saving in overtime has been remarkable. Company freight which had been moved indiscriminately in revenue freight trains is now moved in revenue trains *only*, where a distinct advantage can be gained by filling out a train's tonnage rating.

At many places on the M. K. & T. the water is not good. A chemist has been engaged and a comprehensive study of water conditions is now being made. Good results are already being obtained by the use of compounds for water treatment at numerous places, especially in Texas.

It used to take from two to four months for the traffic department to explain away the delays to shipments during the four rush months, August to December. The handling of cotton for export shipment is a service that requires a great degree of accuracy, but one which is handled under very heavy pressure. A system of notification of shippers as to the progress of their shipments has been inaugurated. A careful record of rush traffic is kept in one general office of the shipments all over the line. Shippers, therefore, can find out at any time just where their goods are and what are the prospects of delivery within any specified time. A system has just been started of sending cotton waybills on to Galveston, Tex., by train mail, so that expense bills may be made up for them before the arrival of the cars containing the shipments. Under this system, of course, cars move on card waybills. In this way notification of the arrival of a shipment of cotton and the bill of lading covering such shipment can be delivered to the consignee literally within a few minutes of the arrival of the car at Galveston. The importance of such service lies in the fact that cotton is sold very often at a price which is the current quotation in Galveston at the time of the arrival of the shipment. A question of minutes, therefore, may be of considerable importance.

It has been found that heavy movement can be materially facilitated and congestion avoided by moving cotton trains in fleets.

The make-up of trains in the yards has been studied with a view to economical operation of the whole system. Yard masters who previously made up trains without any apparent knowledge of how the cars were to be handled at destination points, are now instructed so that the train is made up in a way which will avoid as far as possible switching at way stations or destination. As a matter of fact, this studying of the needs of the system as a whole and the adaptation of local conditions to these needs has been almost as important a factor in the improvement of operating conditions as the change to a logical divisional organization. Before the present management took over the property, division superintendents received no monthly earnings' statements, and this was characteristic of the lack of co-operation between the different parts of the system.

A material reduction is being made in the operating ratio, and yet considerable increases in many instances are being made in operating forces; where heretofore there were two road foremen of engines, there are now eleven; where heretofore it took an agent three to four months to get authority to make an addition to his forces, he can now make that addition on his own authority and is then called on to justify such an addition.

Labor conditions are probably the hardest problem that the

M. K. & T. has to face. In the past public opinion and legislative activities in Texas were violently anti-railroad—but in 1912 Texas was almost the only state in the Union that passed no adverse railroad legislation. This matter therefore—adverse legislation—appears to be getting better, but the labor problem remains. With a business that varies so widely in volume as between different seasons, the M. K. & T. in Texas is to a certain extent at the mercy of a floating class of very undesirable employees. There has been a spirit of insubordination, a disregard of rules, a lack of loyalty that has hurt all of the railroads in Texas to a marked degree. The lack of authority given to superintendents and the sort of hopeless attitude which was taken toward the operation of the Texas lines of the M. K. & T. at various times in the past history of the road did nothing to better this condition. Naturally with a stronger and firmer administration there was engendered a certain hostility, especially among the rougher elements of the employees, on which the company is dependent to some extent for its trainmen. The hope of the company to better this condition lies largely in the possibilities, first, of educating public opinion; second, of opening a future for steady and profitable employment to the younger generation of men who are growing up along its own line. The difficulty is that the railroad company has to compete so strongly with other industries in a new and rapidly developing country where both labor and capital are at a premium. A strong administration which will hold out a prospect of permanent employment, of fair treatment, and of chances for advancement for those who show loyalty to it, is the one hope of a railroad situated in that part of Texas through which the Missouri, Kansas & Texas runs. The things that are being done to improve operating conditions suggest such an administration. Coupled with this is a certain cheerful optimism that it would seem in the long run would be bound to have its effect from the top to the bottom of the organization. On the lines north there is now a fair degree of esprit de corp. For instance, Parsons is a railroad town almost pure and simple, and it is a "Katy" town.

It would seem that in the long run if a permanent organization can be built up, fair treatment, optimism and success should be sure of permeating down through the rank and file until it builds up that asset which is so essential to the operation of any railroad, a loyalty to the company. In the year and a half that the new management has been operating the property it would be foolish to expect that such results could be completely accomplished. It is true, however, that a substantial start has been made in this direction. Western men are quick to recognize efficiency, especially efficiency that is practical rather than theoretical. Success in the West is given a value even greater possibly than it has in the East. The showing that is being made on the Texas lines stands a fair chance of cumulative effect. Of course, there is always the danger of adverse and hostile legislation which may be brought to bear against any corporation which is making a success in Texas. But if the M. K. & T. can get with it the imagination and the good feeling of the best class of people whom it serves, and this is the class that the present management is aiming its service at, it should have a strong weapon with which to fight class agitators and professional demagogues.

This is a far more serious problem than that of building up the physical condition of the property. Credit is quickly sensitive to success and the adoption of modern methods in railroading are meeting with success on the M. K. & T. It remains to be seen, however, whether those who are to benefit the most by such a development as is being carried out on these lines will be as quick to appreciate the advantages that will accrue to them from such a change. The possibilities of the Southwest, the fertility of the black land belt of Texas, the increase in land values, the remarkable crops of this section have so often been described that it seems superfluous almost to mention them here. Rich as is the yield of this black belt of Texas, only a fraction of the possibilities of the country have as yet been realized. It is this fact which is the justification for the expenditure of the very considerable sums which the Missouri, Kansas & Texas is putting into its property in the way of additions and betterments. As long, however, as the operating ratio of the lines in Texas remained in the neighborhood of ninety per cent., the railroad failed to share in the growing prosperity of the country.

The operating problem of the Missouri, Kansas & Texas is like that of every other road, intimately connected with its traffic conditions, but on the M. K. & T. to a rather unusual degree operating conditions depend, and with them the prosperity of the territory served, on the support which the management can elicit from its own employees and from the people whom it serves.

The operating methods that are being introduced are not new; they are based simply on standard practice, as it has been developed on other roads; but the conditions and luckily also the possibilities, are quite unusual. It is not difficult for a man to figure out with a fair degree of accuracy what would be the result in dollars and cents of a reduction of grades, of the introduction of heavier locomotives, of the development of the traffic which will tend to eliminate empty car mileage, but it is a far nicer problem and one requiring an unusual degree both of patience and determination to introduce modern methods on a road which has heretofore been operated under an entirely different theory. This is the operating problem which is being solved by the M. K. & T.

INSTITUTE OF CONSULTING ENGINEERS CONSIDERS VALUATION.

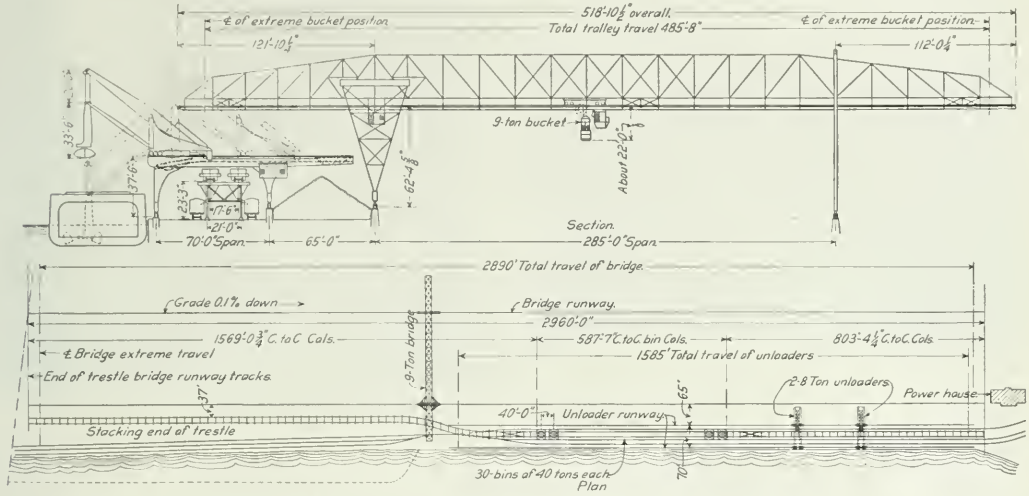
A special meeting of the American Institute of Consulting Engineers was held at the Engineers' Club, New York, on Thursday evening, May 22, to discuss the subject of railway valuation. About 25 members and guests were present and participated in the discussion. As this association is composed of the leading consulting engineers of the country, who are free from affiliations with either of the parties primarily interested in the forthcoming valuation, it is in position to view the subject from an unbiased standpoint. The discussion was for the most part general in nature, dealing with the broader principles which should govern rather than with the smaller problems of a direct engineering nature. The need for a very careful and thorough appraisal as a means of protection to the public, investors and railways alike was strongly emphasized, and the point was urged that the best talent available should be secured to carry out the work. In view of the vast interests at stake it was the consensus of opinion that no one of less experience than the chief engineer of a road should be called on to pass upon the estimates and appraisals made by that officer. There was also a feeling expressed by several speakers that the making of this national valuation was the first step in the government ownership of the railways.

Much interest was added to the meeting by the presence of Jean de Pulligny, chief engineer of the department of public works of France, who stated that the French railways, both government and private, have been valued for 60 years. In this case, however, the original cost or book value only is considered. The first cost of construction has been kept as various roads have been built and this cost has been increased from time to time by that portion of the cost of improvements which should be charged to capital account. No account is here taken of any increase in land or other values not represented by an actual outlay of capital. As the government guarantees a fixed rate of earnings upon this book value of the property it has worked out satisfactorily in that country. These valuations are kept up by engineers of the same education and experience as the chief engineers with whom they come in contact.

CANADIAN PACIFIC COAL UNLOADING DOCK.

New Plant Located at Ft. William, Ont., Having Large Capacity and Differing Radically from Designs Commonly Used.

A coal unloading plant has recently been installed by the Canadian Pacific at Fort William, Ont., which is essentially different from the plants commonly used for handling coal. The unloading equipment is similar to that used in some of the most recent designs of ore unloading plants at lower lake ports, and as this dock is designed to unload coal from the same boats that carry ore down the lakes, there is no reason to believe that the type of plant which has so successfully handled ore will not also serve with satisfaction for coal. The principal features which distinguish this new dock are the provision that has been made for expansion and the use of extremely large buckets for handling the coal. The plant has been located on a low marshy island opposite the city of Fort William at the Canadian head of the lakes where there will be abundant room for any amount of expansion desired. Two movable bridges are being built to reach the island. The buckets used on the unloaders have a capacity of eight tons, and those in the transfer and rehandling bridge nine tons, while in coal unloading plants of the more common type, 5.5 tons is about the largest bucket that is used. It is not expected that coal will be broken as badly with this equipment as is usual in the smaller plants, since the amount of coal that comes in contact with the crushing edge of a large bucket is much less than when the same amount is handled in smaller units. The buckets are in two parts, being of the same general design as those used for handling ore, although slightly modified to allow coal to flow freely from both ends when the halves are forced together, thus preventing the crushing of coal against the top of the bucket.



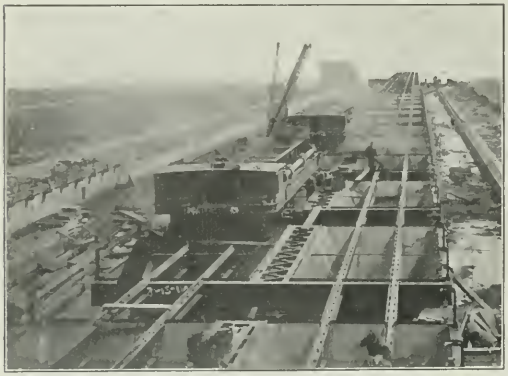
Sectional Elevation and Plan of Canadian Pacific Coal Unloading Dock.

General View of Dock Soon After It Was Placed in Service.

UNLOADING EQUIPMENT.

The river channel from the lake has been dredged by the government to a depth of 27 ft. and a width of 400 ft. The

face of the dock along which boats can anchor is a little less than 1,600 ft. long. There are three of the Hulett unloaders serving this dock face, which have a travel of 1,585 ft. These unloaders are carried on steel structures weighing about 600 tons and having a span of 70 ft. between runway tracks. The walking beam carrying the bucket is operated over a track on the framework of the unloader, the bucket leg being suspended from the outer end of the walking beam and so arranged that



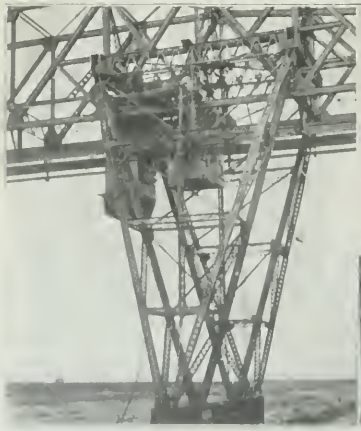
Looking East from Unloader During Construction, Showing Bins and Larry Cars.

it can reach all parts of the hold of a vessel. The man who operates the bucket is located inside the bucket leg, allowing him to get a good view of the work at all times.

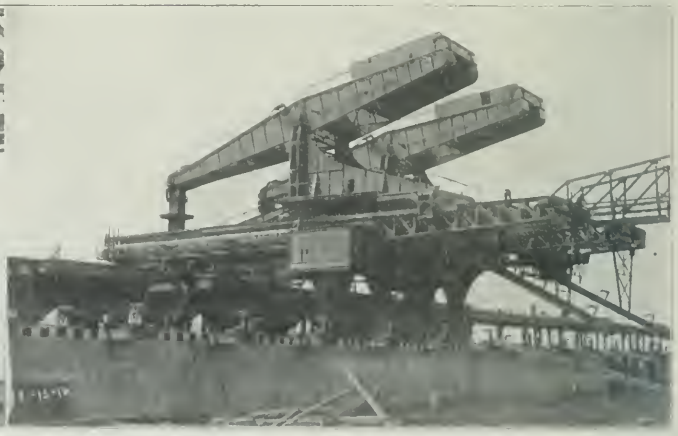
The coal is dumped by the unloader bucket into a conveyor car, also supported from the framework of the unloader and operated by a man in a cab at the rear end of each machine who also directs the travel of the whole machine along the face of the dock. The conveyor car is built in the form of a steel bin which can be discharged in any position on its runway. Each conveyor car has a capacity of two buckets of coal. These conveyor cars are dumped either into scale larry cars running over the loading bins under the main span of the unloader or into a temporary storage pile under the rear cantilever arm of the unloader. The larry cars are low, flat cars of 35 tons capacity, consisting of a double hopper carried on scales. The scale beam is located in the operator's cab at one end of the car. It records the weight automatically so that the operator has no calculations to make. Coal is discharged from these cars through undercut gates operated by air cylinders, the controlling valve being located in the operator's cab and air

Looking West from Unloader During Construction, Showing Trestle and Storage Space.

being supplied from a small compressor hung beneath the car body. At the rear end of each unloader a movable chute is provided, into which the coal for the temporary storage pile can be dumped to prevent the breakage of coal so discharged. This chute can be adjusted to suit the natural flow of the coal on the pile, having a telescope arrangement to allow it to be raised as the height of the pile increases. The transfer bridge spanning the main storage ground back of the unloaders has a total length of 518 ft., 10.5 in., the span between runway tracks being 285 ft. The nine ton bucket which is operated on this bridge has a total travel of 485 ft. 8 in., and the bridge itself can move 2,890 ft. along the runways. Additional storage space can easily be secured by extending this travel if necessary.

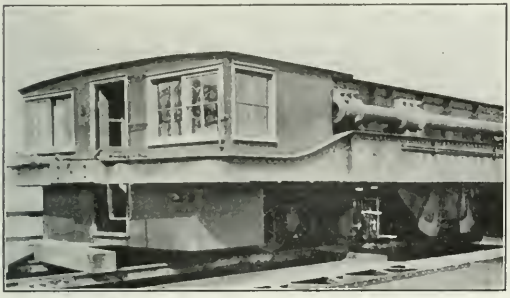


Operating Leg of Transfer Bridge.



The Two Hulett Unloaders and Some of the Coal Hoppers.

The unloaders are carried on three 4-wheel trucks under each tower, the wheels being 24 in. in diameter and 24 in. gage. The main tower of the transfer bridge is carried on four 4-wheel equalized trucks, all wheels having a diameter of 30 in., and the trucks having a gage of 36 in. center to center of wheels. The two end trucks are drivers and the two interior ones idlers. The shear leg of the bridge has a 4-wheel equalized transfer truck at each end and a 4-wheel spring idler truck in the middle. The wheels in these trucks also have a 30 in. gage. The maximum moving load per wheel on the unloader trucks is 45,000 lbs., and the maximum standing load per wheel is 70,000 lbs. The same standing load per wheel is maximum for the trucks under the transfer bridge. The maximum moving load for the bridge is 58,000 lbs. on each tower wheel and



The Operating End of One of the Larry Cars.

50,000 lbs. each for the wheels under the shear leg. The tracks supporting both the unloaders and the transfer bridge are laid with 100-lb. rails on tie plates and secured with screw spikes. The third rail for power is of 85-lb. section in both cases. The unloader runways are level, but the tracks under the transfer bridge are on a grade of about 0.1 per cent.

LOADING AND STORAGE EQUIPMENT.

As the country served by the Canadian Pacific is agricultural, a very large proportion of the company's freight equipment consists of box cars, making it necessary to utilize these cars for hauling coal from the head of the lakes back to the western provinces. With the facilities that have been at hand for loading coal into box cars, the percentage of full capacity loads was too low, resulting in a very considerable loss in revenue. It was one of the requirements, therefore, in the design of the new plant that it be capable of rapidly and accurately loading box cars to the maximum tonnage. This feature of the plant has been very carefully worked out and the problem has been solved successfully. When cars are being loaded directly from boats, the coal is taken out of the boats by the unloader buckets, deposited near the face of the dock in the conveyor car which travels back on the framework of the unloader and dumps the coal into one of the scale larry cars running over the loading bins. There are 30 of these steel bins arranged in two rows of 15 each and spaced 40 ft. center to center. The amount of coal placed in each bin is accurately regulated by the scale car, the practice being to load each bin with the capacity of a given car which is waiting in a string of empties in the adjacent yard. In order to do this rapidly, a man in the yard checks the capacities and numbers the 15 empties and gives the list to the operators on the dock, who follow it in loading the 15 bins in one row. When this string of 15 empties is spotted alongside the bins loaded for them, each car receives its maximum tonnage by simply emptying all the bins and there is no loss of time in trimming or weighing. When box cars are being loaded, Christy loaders are used which are of a special design for this plant. These loaders operate on runways under the trestle supporting the bins, the supporting carriage being so arranged that each loader can be shifted from side to side so as to operate under either row of bins. It is driven by a single motor equipment in either of these positions. Two loaders are provided so that when a string of empties on one side of the trestle is to be loaded, one loader starts working at each end of the string and loads the cars successively towards the middle. While the loading is going on on one side, the loads on the other side are being pulled out, the bins refilled and another string of empties spotted, so that when the loaders finish on one side they are shifted over under the other row of bins and can load from the middle toward both ends. This makes the loading process continuous and eliminates all needless waste of time.

If coal is not needed for immediate shipment when a boat comes in, the conveyor cars, instead of being dumped into the larry cars, are run back onto the cantilever arm of the unloader structure and the coal is dumped into the temporary storage pile between the rear unloader runway and the front transfer

Unloaders in Operation.

bridge runway. It is picked up from this pile by the transfer bridge bucket and deposited wherever desired in the main storage pile under the transfer bridge. The cross section of the temporary storage pile into which the unloaders can dump the coal is equal to that of any of the boats in this service, so that a boat can be unloaded into this temporary pile without any unnecessary movements of the unloader along the dock face.

When it is desired to load cars from the storage piles, the nine ton bucket operating on the transfer bridge picks up the coal from the pile and dumps it directly into the larry cars. The trestle on which the larry cars operate is continued alongside the transfer bridge runway beyond the end of the dock face in order that these cars may be loaded by the transfer bridge without unnecessary movements of the entire bridge. The trestle is equipped with two sets of crossovers so that the larry cars can be transferred from one track to another and kept in continuous operation.

Cars intended for loading at the dock are brought from Fort William around the north side of the storage ground and into the plant at the east end. A through track is provided along the face of the dock adjacent to the loading track, which provides access to a three track gravity yard located west of the face of the dock. From this yard cars can be run at will in strings of 15 or less and spotted at the loading bins by car hauls running the length of the dock adjacent to each loading track. After being loaded the cars are hauled to the east end of the dock from which they are handled by switch engines.

A large part of the preliminary work of construction was done during the season of 1911 and work was carried on through the winter of 1911-1912. The site was cleared in June, 1911, and excavations for the foundations were begun about August 1. Placing of concrete was begun about the first of October and was carried through the winter, sometimes at temperatures as low as 40 deg. below zero. All concrete work was of mass design and ample precautions were taken to prevent freezing. In order to raise the level of the ground which will be used for storage, considerable material from the hydraulic dredges in the channel leading to the dock was used for filling. The problem of getting material to the work was a very difficult one at certain stages. There was then no rail connection with the island except by car ferry, and it was necessary to transport the heavy structural members used in the unloading plant across the river on a ferry which had a capacity of only one car. During the closed season for navigation, a temporary trestle was thrown across the river between Fort William and the island, and some equipment was hauled in over this.

The construction of this plant has been handled under the direction of J. G. Sullivan, chief engineer of the western lines; Frank Lee, principal assistant engineer, and D. C. Chisholm, resident engineer at Fort William. The Wellman-Seaver-Morgan Company, Cleveland, Ohio, had the contract for the coal handling plant; Amos Harned being the contractor's superintendent on the work.

USE OF TELEPHONES ON THE PENNSYLVANIA RAILROAD.*

The first use of the telephone for despatching trains on the Pennsylvania was in 1897 on the South Fork branch, 32 miles long. At that time the number of trains was four a day, but for the last ten years the average movement is eighty trains a day, and there has been no accident due to any misunderstanding of orders. The Pennsylvania now uses 17,000 telephones; some of them owned and others leased.

In the preparation of this paper, there was secured information from 35 prominent roads (not including the Pennsylvania) operating 115,000 miles of line, and the statistics obtained from these different companies is summarized. Much of the information given is of the same character as that recently published by the Interstate Commerce Commission. Other facts of interest are as follows:

Average number of train orders sent per day over each despatcher's circuit by telephone, 77.2; average on telegraph circuits, 56.6; number of cases of trouble per month per 100 instruments on telephone lines, 8; number of cases of trouble on telegraph lines, per 100 instruments, 9. Reporting as to the efficiency of lines, the average efficiency is 94.3 on telephone lines and 72.8 on telegraph lines; this being taken as evidence of the well understood fact that telephone lines are less troubled than the telegraph by bad weather. The 35 companies report about 1,000 portable telephones in use, as follows: On freight trains, 268; on wrecking and work trains, 386; on passenger trains, 150; in the hands of track foremen, 20; miscellaneous, 168. The number of telephones in boxes or booths at sidings is given as 5,255; number at automatic signals, 206.

On the Pennsylvania Mr. Johnson's inquiries show the following averages: Average cost of a way station installation, $128; average number of train orders per despatcher's circuit, per day, on single track lines, 32. The efficiency of telephone lines is impaired by bad weather 5 per cent.; of telegraph lines by bad weather, 17 per cent. The number of portable telephones on wreck and work trains is 107; on passenger trains, 4; in the hands of track foremen, 138; miscellaneous, 47. Mr. Johnson estimates that the efficiency of wrecking trains is increased by the use of the telephone 45 per cent.; of work trains, 40 per cent.; of passenger trains, 45 per cent., and of track foremen, 45 per cent. The number of telephones in boxes or booths at sidings is 2,081; number at automatic block signals, 312, and at intermediate points along the road, not previously included, 931.

On nine out of twenty-three divisions of the Pennsylvania the telegraph is kept in service for emergency use, after the telephone is installed. There has been no reduction in the number of telegraph operators at small stations. Explaining an apparently higher cost of installations on the Pennsylvania as compared with other roads, it is stated that emergency equipment is maintained at most or all of the stations; test panels are also freely installed, so as to facilitate patching of wires when necessary. The small number of orders issued by the despatchers of the Pennsylvania is explained as probably due to the extensive use of automatic block signals. Telephones at outlying points along the road have been found of great value. A standard shelter box has been devised, the door of which, hinged at the top serves, when open, to protect the user of the telephone from rain or snow.

A special wall telephone has been developed for installation in the shelter boxes and booths which is expected to give excellent results. It is equipped with an insulated transmitter and all exposed metal parts are insulated, including the generator crank, switch hook and transmitter. The receiver has concealed binding posts. The windings of the receiver, induction coil, ringer and generator-armature and cords are given a special moisture-proof treatment. Exposed metal parts which are ordinarily nickeled will be finished in a dull black.

Mr. Johnson says that on the Pennsylvania, as on other roads, an accurate estimate of the saving made by the introduction of telephones is difficult to get at, although the importance of the saving is universally recognized. The Great Northern reports that the acceleration of train movements since the use of the telephone has produced a saving of $85,100 a year.

Mr. Johnson thinks that there has now been sufficient experience with telephone apparatus to warrant action looking to standardization of equipment. Concerning loud speaking receivers he says: "We have conducted some experiments with loud speaking receivers with a view to relieving the despatcher of the burdensome head receiver and providing him with a substitute to use during lightning storms. The snapping or cracking noises of static discharges during these storms become very

*Abstract of a paper by J. C. Johnson, superintendent of telegraph of the Pennsylvania Railroad, read at the annual meeting of the Association of Railway Telegraph Superintendents at St. Louis, Mo., May 20.

annoying with the standard head equipment, and while it may not be altogether dangerous, it is at least objectionable. It is possible that some of the despatchers have expected too much from the use of the loud speaking receiver, and have thought that it should be readily heard when they are some distance from it, instead of arranging the receiver to be heard at a distance of about 6 in. or a foot from the ear when the operator is directly in line with it. There is quite a field for development in this particular part of the apparatus, and we are confident that something will eventually be developed along this line which will be the solution."

The Pennsylvania is considering the installation of underground cables for emergency use. With such a cable looped into every station and signal station the road could cope with any adverse weather conditions. In station offices arms or brackets to hold the telephones are found of great value. The cost of maintenance of cords is reduced, the telephone is less disturbed by local noises, telephones do not get knocked off the desk, and with a head receiver the operator is free to use both hands for other work. The Pennsylvania has telephones on some of its limited trains, and also on its private cars, for use while lying at large terminal stations.

At certain points along the road five-pair emergency cables 1,000 ft. long are kept ready, on special reels, to be used in making quick temporary repairs in case of damage by storms or blasting operations, etc. Mr. Johnson has in mind the construction and equipment of an emergency car equipped with a switchboard apparatus, emergency cable, selector equipment, etc., with which a temporary despatcher's office could be set up at any point.

Mr. Johnson discusses one of the principal objections to the use of the telephone, that an operator at a station does not know the location of approaching trains as he does when he has the Morse telegraph, by which he can hear what is going on among other offices while attending to his office work. With a head receiver so connected that he could move around the office, or with a loud speaking receiver, the operator could perhaps get this information from a telephone line; it is a question, however, whether operators ought to burden themselves with this information, a large portion of which is of no value to them. The constant wearing of a head receiver for eight hours is objectionable, as sometimes the pressure produces painful sensations; and it may make the ears too sensitive to weather conditions. On divisions of light traffic a signal circuit is provided so that way stations can call the despatcher by means of a buzzer, and he need not wear the receiver at all times. Some despatchers are nervous during thunder storms, but some of the oldest have found no trouble wearing the receiver through all kinds of storms. Rubber ear cushions are worn by some despatchers, but these are objectionable, as they cause excessive perspiration. The loud speaking receiver would seem to be the best remedy for troubles due to thunder storms. Many of the oldest despatchers have worn the head receivers through all kinds of storms and have never received any injury, but there is a snapping and crackling sensation which disturbs the more timid.

The benefits derived from the use of the telephone, as summarized by Mr. Johnson are set forth in about the same way as has been done by other superintendents in the past. Using the telephone a period of one or two months is sufficient to train an operator, as compared with six months to a year where the Morse telegraph is used. The saving in the time of sending and completing orders is estimated at about 40 per cent. With the telephone there is no chance that an operator will leave the train-wire open. Many operators have said that it seemed a hardship to go back to the telegraph key, as has had to be done in case of trouble on the telephone selectors. Many telegraphers suffering from paralysis of the fingers or other disabilities have been enabled to maintain their positions. Derailments have been prevented; Mr. Johnson, however, gives only a single instance, that where a trackman discovered a broken flange and the train endangered by the break was stopped just before going down a steep grade.

The conclusion of the paper is that as the use of the telephone is constantly being extended, it is not rash to predict that it will eventually supersede the telegraph entirely, not only for despatching, but for the transmission of messages also.

REPORT ON GOTHENBURG COLLISION.

The Interstate Commerce Commission has issued a report, by Chief Inspector Belnap, dated April 16, giving the causes of the rear collision of passenger trains on the Union Pacific at Gothenburg, Neb., March 14, in which four passengers were killed. This collision occurred at 3:37 a. m. in a severe snow storm, and the cause was the failure of the engineman of train No. 12 to see an automatic signal which indicated stop about 1,000 ft. in the rear of passenger train No. 4, which was standing at the station. The distant signal, 2,427 ft. in the rear of the stop signal, was at caution and the engineman saw it and reduced his speed to about 20 miles an hour, but smoke and snow blowing to the southward obscured the home signal and he passed it without seeing it; then, while drifting along and trying to locate his position, he suddenly saw the fusee which was being waved by the flagman of the standing train about 100 ft. in the rear of the last car. Train 4 had been there only two minutes, and no blame is attached to the men on that train. The fireman, on account of some little difficulty in keeping up steam, had seen none of the signals during the run from North Platte, about 35 miles. The engineman had a good record of 14 years' standing. He had been on duty only two hours and seventeen minutes.

This report, in explaining the spacing of the trains over the 35 miles from North Platte to Gothenburg, incidentally shows the care and precision with which flagging is carried out on the Union Pacific, and also illustrates some of the difficulties of flagging. Passenger train flagmen have been instructed—whether in print or by word of mouth does not appear—that at regular stops the flagman must immediately take his position 60 ft. from the rear of his train and be prepared to protect his train should an emergency arise. After waiting five minutes, if the train does not start, he must go back, according to rule 99. Flagman Frosch was carrying out this rule at Gothenburg. His train was behind time, and so was the following train; but the line is fully equipped with automatic block signals, and as telegraph offices were 12 miles or more apart, dependence for spacing was placed wholly on the block signals.

About one mile east of North Platte there is a long bridge, over which the road is single track. On this bridge the signals, on the night in question, were out of order, and stood in the stop position throughout the night, all trainmen being notified accordingly. But although, according to the report, the trainmen had been notified, it is also said that the conductor of No. 12 instructed his engineman to carry the flagman on the engine and proceed slowly across the bridge, not deeming it safe for the flagman to walk across ahead of the train on account of the severe storm. Train No. 4 had also complied with the rule requiring a flagman to be sent in advance when a signal on single track indicates stop; and it consumed 17 minutes in crossing the bridge; but No. 12 took only about 10 minutes, thus shortening the time interval between the two trains, which had been 16 minutes apart leaving North Platte. The time interval was further shortened, because the second train made no stops at stations.

Longitudinal Railway, Chile.—During 1912 there were 362 miles of railroad constructed at a cost of $14,999,000 by the syndicate building the Longitudinal Railway connecting Santiago and Iquique under a 5 per cent. guaranty by the Chilean government. It is expected this line will be completed and open for traffic before the close of 1913.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.

Includes Among Other Important Reports Those on Self-Propelled Cars and Semi-Bituminous and Lignitic Coals.

The fifth annual convention of the International Railway Fuel Association was held in Chicago, May 21-24. President H. T. Bentley, principal assistant superintendent of motive power, Chicago & North Western, presided. The opening prayer was offered by Rev. William Carson Shaw.

The secretary reported a total of 523 members, which during the convention was increased to about 590. The total number of members attending the convention was 278.

PRESIDENT'S ADDRESS.

Mr. Bentley commented on the rapid growth of the association since its inception five years ago, the membership having grown from 35 to over 500 members during that time. He pointed out that whereas 500,000,000 tons of coal are used annually, only 75,000,000 tons are actually turned into service and power, showing what a wide field of improvement was possible by fuel engineers. A great saving may be made by those having anything to do with fuel by carefully studying the various conditions under which they are handling it. Its constantly increasing cost requires that a special effort be made for the satisfactory use of the lower grades of coal. There are quantities of lignite beds throughout this country which, if a uniform supply was required, could be mined at a profit; therefore by stimulating its use a much cheaper fuel would be available. This fuel has been used successfully on locomotives and is also suitable for the production of producer gas.

Another feature in regard to cheaper fuel is the use of pulverized coal which is being investigated by one of the railroads. The obstacles heretofore encountered appear to have been in the inability of the fire brick to withstand the intense heat generated, and means for properly pulverizing and storing the coal in the tender. Attention was also directed to the fact that the coal could perhaps be obtained from the mines at a reduced cost during the summer months and stored with a net saving. Mention was made of fuel saved, due to the better design of locomotives and the use of superheaters.

MR. QUAYLE'S ADDRESS.

Robert Quayle, superintendent of motive power, Chicago & North Western, mentioned the possibilities of increasing the thermal efficiency of locomotives. He agreed that the large grate area was more efficient for burning coal as suggested in Dr. Goss' paper of last year. Particular stress was laid on the proper preparation of the coal for the locomotive and of assisting the fireman as much as possible in the performance of his work. An important factor is the co-operation and team work between the engineer and fireman. The use of brick arches and superheaters was advocated, the latter to be applied to all classes of engines, even switchers.

MR. PEABODY'S ADDRESS.

Francis S. Peabody, president of the Peabody Coal Company, Chicago, followed Mr. Quayle with an interesting talk from the operator's standpoint. He stated that about 40 per cent of the coal was left in the mines for the simple reason that it could not economically be removed. There are 22,000,000 acres of coal in the State of Illinois and only 1 per cent. of it is being used. About 57,000,000 tons are being taken from these mines and records show that the average production doubles in about 10 years. In speaking of the railroad contracts he said that the maximum and minimum clause was causing great inconvenience to the mine operators, as the roads were inclined to demand the maximum tonnage at times that were most inconvenient for the operators to supply it. This was especially true in case of strikes. The strike of 1912 caused an increase of 6 cents per ton in the cost of coal.

In 1897 the cost of coal at the mine was 25 cents per ton, but now it is 90 cents. Sixty per cent. of this is paid to labor. Railroads should store four months' supply during the storage period as advantage could be taken of the decrease in traffic and the lower cost for transportation, and it would keep the mines busy during the dull season. A storage yard with trestles and steam shovels for loading was recommended, the cost of storage being only 15 cents per ton—2 cents for unloading, 3 cents for loading and 10 cents for depreciation. These figures, however, apply only to certain grades of coal; others depreciate more rapidly.

CONTRACT FORM FOR PURCHASE OF COAL.

A proposed standard form of contract covering the purchase of railway fuel coal was presented by a committee of which J. G. Crawford (C. B. & Q.) was chairman. One of the provisions on which there was a difference of opinion was the relation of car tonnage to the number of the purchaser's cars at the mine. Eugene McAuliffe (Frisco Lines) questioned the desirability of mentioning in the contract the number of cars to be supplied at the mine by the purchaser, while thoroughly believing that the purchaser should co-operate with the mine operator in this respect. He favored the storage of coal where practicable and strongly recommended that the invoices should carry the serial number of the contract. In considering the contracting of coal as a general proposition, Mr. McAuliffe pointed out that the condition of the mine should be considered by the railroad on whose line the mine was located, or on which the railroad relied for its coal supply. By this is meant the accepting of fuel that is not quite up to standard, but must be disposed of, the price, of course, being satisfactory to both the operator and the railroad.

Other members suggested that the contract should include specifications as to the fusing point of the ash, the heat value, the percentage of ash in the coal, and a standard method of obtaining samples.

SUB-BITUMINOUS AND LIGNITIC COALS.

Samuel B. Flagg, engineer, Department of the Interior, Bureau of Mines, read a paper on this subject from which the following is taken:

The effort to reduce operating costs has resulted, on the one hand, in a demand for much more powerful locomotives, and, on the other hand, in a tendency to utilize lower grades of fuel, among which may be mentioned the lignitic and sub-bituminous coals found in certain sections of the country. Lignitic coals are characterized by a high moisture and high volatile matter content, by a fairly low percentage of ash, and by a low heat value. The lower grades of sub-bituminous coal differ from the lignites mainly in their appearance, as is indicated by the designation "black lignites" that is frequently given them. These lower grades of sub-bituminous coal like the lignitic coals, are high in moisture and volatile matter contents and low in heating value. Their behavior upon exposure to the air is also similar to that of the brown lignites. The better grades of sub-bituminous coals, on the other hand, have a much lower moisture content and higher heat value; in fact, the heat values of some of them are considerably higher than those of many of the bituminous coals. Even these high grade sub-bituminous fuels, however, have the same tendency to disintegrate upon exposure to the air, and the same is true upon exposure to heat in a furnace. Another characteristic feature of both the lignitic and sub-bituminous coals is their liability to heat in the pile or bunker and to take fire spontaneously.

A few typical analyses of fuels from some of the different fields are given in the table below, the last two being classed

by the U. S. Geological Survey as medium grade bituminous coals, although they are frequently designated as sub-bituminous or liginitic coals. The Bureau of Mines is authority for the analyses given in the first, sixth and seventh columns.

It has been estimated* that of the coal easily accessible and still remaining in the coal fields of the United States one-third is represented by the lignitic and sub-bituminous deposits. The principal beds of these coals are found in Texas, North Dakota, South Dakota, Montana, Wyoming, Colorado, New Mexico and Washington. The fields of the lower grade coals commercially most important today are those in Montana, Wyoming, Colorado, New Mexico and Washington. About 2,000,000 tons of sub-bituminous coal per year is taken from the Bull Mountain field in Musselshell county south of Roundup, and the Red Lodge field in Carbon county near Red Lodge in Montana.

Mining costs in the different fields producing sub-bituminous coals vary considerably, probably ranging between 80 cents and $1.70 per short ton as extreme values. These costs, of course, are proportionately higher where the output is small than where the development has been more extensive. They are also affected by the physical mining conditions.

Because of the disintegrating effect of heat on these coals, it is especially important that the coal in the tender should contain little slack. Nearly all of the sub-bituminous coals suffer more or less seriously from breakage unless carefully handled in the screening and loading processes. In the loading of either open or closed cars precautions may be taken by using an apron on the screens or the car-loader so that the coal has less of a fall.

Opinions seem to differ as to the necessity for shipping these fuels in closed cars when intended for railroad use. The cost of loading and unloading box cars is obviously greater than when gondola or drop-bottom cars are used. The increased cost obtained from three authorities ranges from four to ten cents per ton of coal. This is probably offset to some extent by the prevention of loss in transit.

The question of storing such coals involves not only the slacking and the deterioration resulting therefrom, but also the liability of spontaneous combustion. The author's limited experience with coals of this type leads him to the belief that they may possibly be stored for a short time without serious deterioration from the standpoint of their steaming value in locomotive use, but that the coals which are not impaired after storage for a year are more likely medium grade bituminous coals than either sub-bituminous or lignitic.

*Production of Coal in 1907, by E. W. Parker, in Mineral Resources for 1907, U. S. Geological Survey.

The liability of spontaneous combustion, although greater for the lignitic fuels, is considerable in the case of the sub-bituminous coals and dust or slack must not be allowed to accumulate.

The substitution of these low grade coals for bituminous fuel introduces, in addition to the difficulties already mentioned, a number of problems of operation. The grate area must be greater—one authority says 50 per cent. greater—than would be required for good bituminous coal. High drafts are necessary to maintain the required rates of combustion, and to get them the exhaust pressures must be increased to such an extent that the efficiency of the locomotive is reduced 5 to 10 per cent. thereby. One point in favor of these coals that should not be overlooked is the freedom from clinker troubles. The percentage of earthy matter in them is usually low—in many instances under 5 per cent.—and the sulphur content is also low.

In some sections the greatest problem connected with the use of sub-bituminous fuels has been the one of preventing spark troubles. The first attempts to solve this problem were made with different sizes and arrangements of screens and usually included two screens for the gases to pass through. It was usually found, however, that one of the screens clogged and prevented the free steaming of the engine. By using a single screen properly set most of the clogging trouble can be done away with, unless there is a steam leak in the smoke box or wet slack coal is being used, and some roads claim to have found the screen as satisfactory and effective as any means for eliminating spark troubles. Screens set horizontally will, with some forms of stacks, remain clear longer and give less trouble than if set on an incline, and likewise small mesh netting of small wire is more satisfactory than small mesh netting made of large wire.

A front-end arrangement designed to reduce in size the sparks or cinders, and also delay their delivery from the stack has been patented by the American Locomotive Company. On the western lines of one road a number of locomotives have been equipped with this device and it is stated that the sparks are reduced to such small size that they give no trouble. Some of the engines so equipped have been in service as long as four years, and others for over two years, and during this time no fires have been set by sparks from them, although they are operated on the most dangerous divisions of the line.

Another front-end arrangement was designed by one of the road engineers of a western road and has been used principally in locomotives burning coal from the Roundup, Montana, district. With this arrangement the sparks do not pass through any screens or netting, the success of the device depending rather upon the delayed delivery of the solid particles, thus allowing them time to cool down.

In the following table are given some of the principal data and results of road tests made by different railroads to determine the value of the lower grade fuels. The variation in the equivalent evaporation per pound of coal as fired shows probably better than anything else the relative values of the coals for locomotive service. For the last three tests these figures could not be inserted, as it was impossible to compute them from the data at hand. So far as the writer knows none of these coals in question have the very high moisture content or the other identifying lignite characteristics such as those of the

Gross ton-miles	Number of cars in train	Train weight, tons	Average steam pressure	Coal used, pounds	Water used, gallons	Equiv. evap. from and at 212° F. per lb. of coal fired	Average speed-miles per hour	Service	Remarks

Williston, N. Dak., fuel, analysis of which is given in the first table in this paper.

The costs of using bituminous and sub-bituminous coals given below were determined for one road whose sources of supply for the two kinds of fuel were Buxton, Iowa, and Hudson, Wyo., respectively. Cody, Neb., was considered as the approximate dividing point for the use of the two fuels and costs were figured to and from that point, using the results of a dynamometer car test as the basis of computations.

Bituminous Coal.		Sub-bituminous Coal.	
Price at Buxton, Ia.....	$133.83	Price at Hudson, Wyo.....	$153.26
Cost of haul to Cody, Neb..	196.26	Cost of haul to Cody, Neb..	171.46
Cost to return empties.....	54.63	Cost to return empties.....	47.88
Total cost	$384.72	Total cost	$372.60

Saving in favor of Wyoming coal, $12.12.

The results of these tests show that the better of these low-grade fuels can be used, and, in fact, they are today being used over those divisions of the roads where length of haul of bituminous coal makes it too expensive or otherwise inadvisable to use the latter fuel. Some of the lines which are today using this sub-bituminous fuel are using it on the same engines that at other times burn bituminous coal. It is possible that it may sometimes be found of sufficient advantage to build all the locomotives which are to be fired with the lower grade fuels with special reference to obtaining the best results from them.

The probability of a marked increase in the use of the true lignites in the near future is believed to be not great. The present undeveloped condition of the parts of the country in which the lignites are found, their low heating value, and the availability of the better sub-bituminous coals are all factors that will check the increased use of lignitic coals for steaming, and particularly for locomotive purposes.

DISCUSSION.

C. T. Malcolmson stated that the heat value of run-of-mine coal was increased 18.4 per cent. by briquetting as shown by some 600 tests.

W. S. Roberts (Roberts & Schaefer Company) mentioned as the greatest factor in briquetting the obtaining of a suitable binder. His experience showed that a pitch binder had given the best results. The whole proposition of briquetting is a purely engineering one, and it should be carefully studied. Most of the failures are due to not giving it the proper consideration.

J. G. Crawford (C. B. & Q.) stated that there should be plenty of air opening in the grates, that the ash pan should be tight and the air openings should be covered with netting. He also found the lignite burning locomotives not as powerful as those burning bituminous coal.

E. W. Pratt (C. & N. W.) mentioned engines in service on his road that were especially designed for burning lignite. These have a grate area 50 per cent. larger than the other engines of similar type, but until the gyrus spark arrester was installed they threw a large number of sparks.

Mr Crawford thought that brick arches should be used on all lignite burning engines on account of the large amount of slack in the fuel and the rapid breaking of the lumps.

Mr. Flagg stated that this device would greatly increase the efficiency of the fuel as it would allow the high volatile matter to become thoroughly consumed.

SELF-PROPELLED CARS.

The authors of this paper, S. T. Dodd and B. H. Arnold, of the engineering department of the General Electric Company, considered all types of self-propelled cars, but went more thoroughly into the discussion of those with internal combustion engines. In a summary of those operated by steam the committee said:

"In summing up the position of the steam motor car, we note that of all the types which have been built very few have been duplicated and none have been adopted as standard by operating roads in spite of the fact that they have been before the public for a length of time reasonably sufficient for their development. The objections which seem to have prevented their success are apparently:

"Cost of maintenance. The necessity of developing a relatively high horse power in a limited space results in a special or cramped design of boiler and engine which is not economical in maintenance or repair.

"Limited tractive power, or excessive weight on drivers. The majority of cars of this type which have been built have the driving power applied to one axle only. Frequent stop service, for which the independent car should be particularly fitted, demands a high tractive effort in starting, if acceptable schedule speeds are maintained, and such tractive effort is not obtainable without a fairly high proportion of the weight upon driving axles. This results in excessive weight on the driving wheels when there is only one driving axle.

"Limited operating radius: Tanks of 100 gals. of fuel and 1,000 gals. of water seem to be acceptable in practice. This represents a weight of fuel and water of nearly 10,000 lbs., and gives apparently an operating radius of only about 50 miles for fuel and 30 to 40 miles for water. For practical success, it appears that such a car should have an operating radius of about 100 miles without recharge."

The chief difficulty in regard to cars operated by compressed air seems to lie in their inability to develop a sufficiently high speed for railway service with a thoroughly practical design.

In the consideration of the storage battery car it was shown that while cars of small capacity and of a rather limited radius of operation had proved very successful in street car service "a car for branch line service might fairly be assumed to have a weight of 40 tons and to require about 50 watts per ton mile for operation. This is equivalent to 2 k. w. per car mile, or for a run of 100 miles, without recharging, would require a battery which would have a weight of about 10 tons or one-fourth the total weight of the car. These figures are presented to show that long distance operation of heavy cars without recharge of battery would entail a prohibitive weight of battery."

Internal Combustion Engine Car.—Under this heading were considered the gasolene cars with mechanical and electrical transmissions. The McKeen car was somewhat briefly described, its maximum low and high speeds being given at 10 to 15 m. p. h., and 60 to 70 m. p. h. respectively. In April, 1913, 138 of these cars were in service on 50 different railroads. Among other mechanical drive passenger cars the Fairbanks-Morse Company, Chicago, has built a car with single trucks, steel body and a seating capacity of 21. The P. H. Batten Company, Chicago, has also built cars of this type with a seating capacity of about 30 passengers which are in operation on three roads in the central west. The Stover Motor Car Company, of Freeport, Ill., has supplied small single truck gasolene cars on the Waterloo, Cedar Falls & Northern and the Chicago, Rock Island & Pacific. The Hall-Scott Motor Company, Oakland, Cal., has built double truck cars with a seating capacity of 50, and a 100 h. p. four cylinder engine driving the rear axle through longitudinal transmission and double gears.

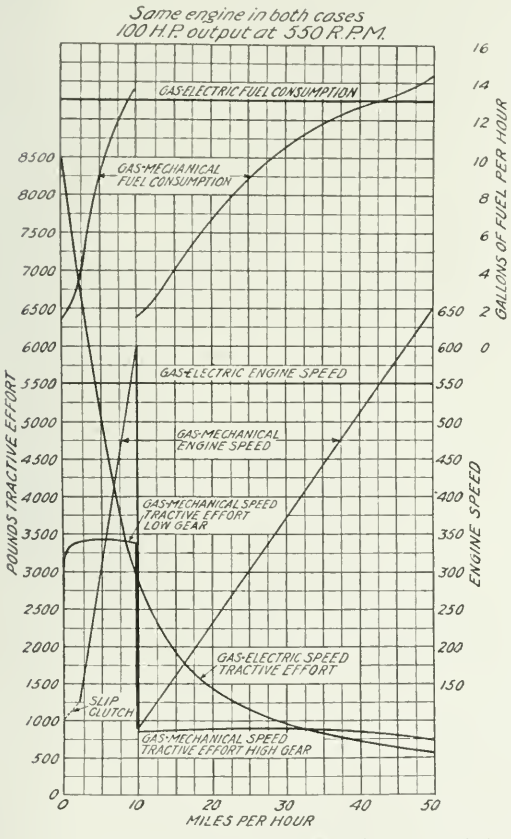
The gas-electric car was next considered, the General Electric Company's type being described. There are 50 of these cars in regular daily service. The operation of the gas-electric car, made by the French Westinghouse Company, and which has recently been introduced in this country by the Drake Railway Automotrice Company, on the Arad-Csanad Railway, Hungary, was mentioned. These cars are running approximately 1,000,000 car miles per annum at an average maintenance cost of 2.5 to 3 cents per mile.

Speaking of the combination of the gasolene electric car with a storage battery auxiliary, the paper said:

"The fact is, that the storage battery is of no real value in combination with the electric drive, as it has been developed today. The real value of the electric drive is the possibility of working through a wide range of voltage and current. With a storage battery auxiliary this advantage would be eliminated, as

the generator would be forced to work at the constant voltage of the storage battery. The weight and cost of the battery is a considerable item and the same weight and cost could be expended to greater advantage in increasing the capacity of the engine and generator, if necessary.

"Comparing now the characteristics of the mechanical drive gasolene car, and the electric drive gasolene car, the fundamental difference between them lies in the method of transmission of the power between engine and axle. The comparison of the characteristics is well illustrated in the curves shown herewith. These curves show the speed, tractive effort, and gasolene consumption of a car equipped with a 100 h. p. 550 r. p. m. gasolene engine, driving in the one case, through electrical transmission,



Characteristics of Gasoline Car. Mechanical Transmission Compared with Electrical Transmission.

the motors geared to 33 in. driving wheels, and in the other case, through mechanical transmission, a single pair of driving wheels, 42 in. in diameter. The slow speed gear reduction has been assumed at 7.5 to 1 and the high speed gearing at 1.6 to 1. These conditions correspond approximately to those ordinarily obtained on mechanical drive gasolene cars of this weight and capacity. The following characteristics are to be noted:

"In the electric drive car the engine speed is independent of the car speed and is maintained at the normal value 550 r. p. m. throughout the whole range of car speed. In the mechanical drive the engine speed is proportional to the car speed. It starts at a low value with the starting of the car, and increases with the car speed up to 600 revolutions at a car speed of 10 m. p. h. At this point the change gear clutch is thrown in, the engine speed is cut down to 100 r. p. m., with the higher gearing, and is again raised with the car speed to 650 r. p. m., at a car speed of 50 m. p. h.

"*The engine horse power* is approximately proportional to the engine speed. With the electric drive the horse power is maintained at 100 h. p. throughout the range of car speed, but with the mechanical drive the horse power varies, reaching its maximum value at the maximum speed corresponding to the two gear ratios.

"The electric drive car, on account of its constant horse power output, develops a tractive effort which varies inversely with the speed. The speed-torque characteristic of the electric drive is very similar to that of the steam locomotive. The maximum tractive effort is limited by the slipping point of the wheels, or by the maximum current which the generator can drive through the motors with the full engine output. General Electric gas-electric cars will in practice develop a maximum tractive effort of 10,000 to 14,000 lbs., depending on the gearing."

Fuel—The authors stated that the Baumé or any other such scale told very little of the relative suitability of various gasolenes or naphthas as they would be greatly affected by the character of the oil field from which they originally came. A better method is based on the fractional distillation. The following is abstracted from the remainder of the report.

"The specifications of these light distillates should give the initial boiling point, that is the point at which the liquid starts to vaporize, the final boiling point at which all liquid has disappeared from the flask, and possibly two or three points in between and the percentages which should boil over at these temperatures. The initial boiling point should be the maximum temperature which will insure easy starting. Final boiling point should be set as high as possible so as to produce a fuel which will not burn too rapidly, and yet this must not be so high as to cause carbon deposit. Fuel should, of course, be free from water and other impurities.

"The following specification for liquid fuels will be found very satisfactory for use on gas electric cars. As a matter of fact, a considerable number of cars are operating with fuels having dry points in excess of those here specified:

"Fuel shall be free from impurities.

"The initial boiling point shall not be in excess of 185 degs. F.

"Dry point shall not be in excess of 356 degs. F. (Dry point will be indicated by a small puff of white vapor from residue in flask.)

"The fractional distillation proceeding at the rate of one drop per second should be recorded in 10 per cent. cuts.

"The first 10 per cent. should distill at a temperature not in excess of 230 degs. F.

"Fifty per cent. should distill at a temperature not exceeding 270 degs. F.

"Not less than 97½ per cent. of the liquid should be recovered from the distillation.

"Generally speaking, alcohol, either wood, grain or denatured, is a fuel better even than gasolene, and undoubtedly will figure more prominently in the future than it has in the past. Its advantages lie in the fact that it can be obtained from any vegetable matter and is, therefore, available in nearly all parts of the earth. The apparatus required is simple, inexpensive and the cost of production small. Chemically, alcohol is a much more simple substance than gasolene and will be found more uniform. The one bar to its use is a legal one. The government requirements as to inspection, bonding and storing are such as to increase the price unduly. Once these restrictions are removed, alcohol should be a popular fuel. It is true that alcohol has a lesser heat value than gasolene, 14,000 B. t. u., as compared with gasolene at about 20,000, and, therefore, somewhat larger quantities will be needed for the same amount of work, but alcohol should be profitably sold for 4 or 5 cents a gallon if the legal restrictions were out of the way."

The following operating results of the General Electric Com-

pany's gas-electric cars on the Minneapolis, St. Paul, Rochester & Dubuque Electric Tract. Company were included:

Cost of Operating Gas-Electric Motor Cars from January 1 to August 31, 1912.

Total motor car miles	216,498
Total trailer car miles	75,948
Total car miles	292,446
Per cent. of time trailers hauled	35.5
Number of motor cars in service	8
Length of line, miles	37.34
Maximum grade, per cent	1.5
Schedule time for express trains	1 hr. 17 min.
Average distance between stops for express trains, miles	3.734
Schedule speed m. p. h. of express trains	29.1
Schedule time for local trains	1 hr. 35 min.
Average distance between flag stops for local trains, miles	1.067
Schedule speed m. p. h. of local trains	23.6
Gals. fuel used per motor train mile	.758
Gals. fuel used per car mile	.527

	Total cost for 1 year.	Av. cost per motor train mile.	Av. cost per car mile.
Wages of crew	$12,056.95	$.0557	$.0412
Fuel (naphtha)	17,622.26	.0814	.0603
Lubrication (gas engine)	1,141.56	.0052	.0039
Journal oil	77.77	.0004	.0003
Supplies and car heating	1,389.03	.0064	.0047
Maintenance of electric equipment	1,949.81	.0090	.0067
Maintenance of cars and trucks	1,394.56	.0065	.0047
Shop expenses of heating	3,507.77	.0162	.0120
	$39,139.71	$.1808	$.1338

An appendix included a list of questions to be used in the qualifying examination for gas-electric motor car operators, a monthly report of mileage and expenses and a report of expense of general overhauling.

DISCUSSION.

O. S. Beyer (C. R. I. & P.) spoke of the storage battery car as being too light to meet the conditions of railway service with the increasing demand for steel equipment. The maintenance costs, the reliability and depreciation of the gas-electric car should also be considered, the latter item being considerable when compared to the depreciation of a small locomotive and car which it replaces.

D. C. Buell (U. P.) pointed out that the chief troubles experienced with all motor cars were from a lack of the proper instruction of the men handling them, that the whole proposition was in its infancy, comparatively speaking, and that troubles should be naturally expected. The motor cars are here to stay and their development will constantly be going on.

J. H. Tracy (Electric Storage Battery Co.) presented a written discussion stating that the lead battery car could be operated at 100 miles per charge at a free running speed of 30 m. p. h. with a seating capacity for 70 passengers and a suitable baggage compartment. A car 34 ft. 4 in. long, weighing 32,000 lbs., the battery weighing less than 8,000 lbs., and having a seating capacity for 32 passengers, is being operated on the Lewisburg, Milton & Watsontown Passenger Railway. This car has run 20,000 miles, or approximately 122 miles a day, from October 9, 1912, to April 1, 1913, losing only 19 miles from the full schedule which was due to a damaged charging plug. The current consumption was 4.25 ampere hours per car mile. With an average live load of 1½ tons the actual power consumption amounts to 41 watt hours per ton mile. The ruling grade is 0.7 per cent. A two-car train can also be successfully operated at a decrease in the power consumption of two single cars.

F. E. Drake (Drake Railway Automotrice Co.) mentioned the service given by the "Dracar" gas-electric motor car, on the M. O. & G. Five cars are in service, the longest run being 210 miles per day. During the month of April 15,800 car miles were made at 3.3 miles per gallon of gasolene. The operating expenses per car mile were 16.4 cents. Three men are required on each car because of the state laws.

J. E. Osborn (Ann Arbor) reported that one of the main troubles with the McKeen motor car was the breakage of chains. He also stated that they operated on 2½ miles per gallon. Kerosene has also been used as a fuel with these cars.

It was also brought out that motor cars were oftentimes operated under conditions that were unsuitable for steam trains, and that trouble should be expected in these cases.

MODERN COALING STATION.

A progress report of the committee on modern locomotive coaling stations, of which Hiram J. Slifer, consulting engineer, is chairman, was presented. The committee, realizing that no definite design of coaling station could be made to fit the conditions of all climates, has only considered certain dominant factors that pertain in all cases. The committee recommended that a careful study regarding the character and permanency of the fuel supply be made before constructing permanent chutes; that the coaling stations be located away from the terminal a distance equal to that which can be covered by one tank supply of coal, and that no engines, except possibly one or two fast passenger engines, be coaled at the larger terminals. This recommendation, of course, being subject to the prevailing conditions. Forty-one questions were sent to the members for reply, but sufficient information has not been collected to make possible a complete report. Eighteen replies were received.

The gravity chute was generally favored where sufficient room was available and the cost of property was not excessive. Eight members favored this type where 10,000 tons or more are handled per month. Twelve members favored the balanced bucket type where space for chutes was restricted. This type was especially favored for large stations. The bucket type conveyor was recommended by three members and it was especially noted that where this or the previous type was used there should be a duplicate hoisting arrangement. Seven members recommended the locomotive crane and clam-shell for the smaller stations and for temporary use. Three members recommended the use of the inclined trestle with coal pockets, into which the coal is shoveled from the cars, for smaller stations handling less than 50 tons per day and where a more expensive plant could not be considered. An inclined skip car type of plant and a mono-rail system taking the coal from depressed tracks to the bins were also suggested.

Frame, concrete and steel construction were all recommended for various circumstances such as permanency of structure and economical considerations. Creosoted timbers were also mentioned in connection with the frame construction. It was the unanimous opinion that an operator should not be required to look after more than one plant. As a general rule the storage of coal was not recommended except under special conditions.

Eight replies opposed a weighing device for determining the amount of coal consumed by each locomotive, six favored it and three were qualified but in favor of it. The consensus of opinion was in favor of gasolene engines for operating mechanical coaling stations. It was agreed that there was more or less depreciation due to coal passing through a handling plant, but this could be corrected to a certain extent by breaking the fall of the coal through deflectors, spirals or by some other mechanical device. Considerable difficulty has been experienced in handling plants by the lump being separated from the fine coal with a result that some engines get all fine coal and others all lump.

The locomotive crane equipped with a clam shell bucket was not considered as good as the modern coaling station and should be used for emergency service only. The following reply gives the operating costs of different types of stations:

Two Balanced Buckets, 350 Tons Capacity.—First cost, $22,000. Cost of operation, 2 to 8 cents per ton; average cost, 3½ cents per ton. Cost of maintenance, 2 cents per ton. Fixed charges, interest 5 per cent. and depreciation 5 per cent. per annum, 2 cents per ton.

Link Belt, Bucket Conveyor, 700 Tons Capacity.—First cost, $37,000. Cost of operation, 1.7 cents per ton. Cost of maintenance, 1.4 cents per ton. Fixed charges, interest 5 per cent. and depreciation per annum 5 per cent., 1.5 cents per ton.

Link Belt, Bucket Conveyor, 150 Tons Capacity.—First cost, $9,000. Cost of operation, 5.6 cents per ton. Cost of maintenance, 3.0 cents per ton. Fixed charges, interest 5 per cent. and depreciation 5 per cent. per annum, from 1.0 cent to 2.0 cents per ton.

Inclined Conveyor, Belt, 150 and 350 Tons Capacity.—First cost, $10,400 and from $13,000 to $23,000. Cost of operation, from 1.5 cents to 8.8 cents per ton. Cost of maintenance, from 0.1 cent to 0.7 cent per ton. Fixed charges, interest 5 per cent. and depreciation 5 per cent. per annum, from 1.4 cents to 3.6 cents per ton.

Locomotive Crane.—Average total cost, 20 cents per ton.

Inclined Trestles with Pockets.—First cost, $4,000 to $12,000. Cost of operation, from 1.0 cent to 5.0 cents per ton. Cost of maintenance, average 2.0 cents per ton. Fixed charges, interest 5 per cent. and depreciation 10 per cent. per annum, from 1.0 cent to 2.0 cents per ton.

Large Balanced Buckets, 15 Tons Capacity, Running Up Vertically and over Horizontal Track, Capacity 1,500 Tons.—First cost, $64,000. Cost of operation, 2.0 cents per ton. Cost of maintenance, 3.0 cents per ton. Fixed charges, interest 5 per cent. and depreciation 10 per cent. per annum, 1.6 cents per ton.

DISCUSSION.

J. W. Hardy (C. R. I. & P.) presented some photographs showing the manner in which the coal is broken up after passing through a coaling station, and said that run-of-mine coal with 50 per cent. slack would run as high as 72 per cent. slack after passing through the coaling station. Another test with railroad lump having 25 per cent. slack when received in the car showed an increase of 40 per cent slack by the time it got on to the tender. He substantiated the replies received by the committee in regard to this question.

J. G. Crawford (C. B. & Q.) stated that egg coal in passing through such stations would come out worse than run-of-mine coal, which could be purchased for from 15 to 20 cents a ton less.

LOCOMOTIVE BOILER SCALE.

J. S. Sheafe (Ill. Cent.), chairman, read the committee report on this subject. The committee was unable to secure much data on the subject of heat loss due to boiler scale, and believes that such loss is considerably over-estimated. It was pointed out that in order to keep the tubes 100 per cent. clean the tube borers should be educated as to the importance of doing their work in a thorough manner and that they should be carefully watched by the foreman in charge. Convenient and accessible plugs should be supplied in order to thoroughly inspect the boiler after it has been washed out.

Larger arch tubes were recommended to adequately take care of the steam generated in them. The ideal way to treat water is in settling tanks so that it may be commercially pure before being put in the boiler. The adding of a boiler compound by the guess method is to be generally discouraged, and each treatment should be chemically correct, as much harm may be done otherwise.

The use of pure amorphous graphite was strongly recommended as it is purely mechanical in its action, having a tendency to break off the scale as well as preventing its formation. A simple laboratory experiment was made by applying this grade of graphite to one side of a plate and intermittently boiling. After 80 hours, extending over a period of 10 days, the graphite was still as active in its protection of the plate as it was originally. The opposite side of the plate was rusty.

In an appendix to the report attention was directed to the return of Henry Kreisinger to the service of the United States Bureau of Mines to resume experimentation on the transmission of heat into steam boilers. It is planned at present to investigate the following factors: Effect of velocity of gas through tubes, effect of initial temperature of gas, effect of the steam pressure in the boiler, effect of the different diameters of tubes, effect of the different lengths of tubes, effect of conductivity of the tube metal (both iron and copper tubes will be used at different times), effect of scale on the water side of the tubes, and effect of a coating of soot on the gas side of the tubes. Illustrations accompanied the report showing the arrangement of the testing apparatus.

DISCUSSION.

Mr. Bentley emphasized the importance of keeping the boiler clean, both inside and out, and of the careful inspection by either candles or pocket flashlights, as used on the North Western. Too much boiler compound will be apt to pit the tubes.

W. E. Dunham (C. & N. W.) did not notice any appreciable difference between the hard and soft scale as regards the fuel consumption. He suggested that the arch tubes be increased in size in the engines handling specially bad water, but if used, special care must be exercised to prevent failure. On the North Western the boilers are blown-off every mile in the bad water district to reduce the concentration of the boiler compound.

R. Collet (Frisco Lines) stated that too extensive blowing-off would greatly decrease the fuel economy.

OTHER PAPERS.

Construction, Development and Operation of a Bituminous Coal Mine.—J. A. Garcia, Allen & Garcia Company, Chicago, presented an interesting paper on this subject describing the latest practices in mine operation. He stated that an extraction of 75 per cent. should be made from a mine properly developed and operated 200 to 250 days per year. In the section of the country about Chicago the percentage of extraction is about 56 per cent. The remaining 44 per cent. is allowed to remain, as it would cost more to mine it than its price in the market. The best of engineering practice is required in the construction of a mine to insure its permanency and safety. It was stated that track scales under the tipple were unsatisfactory and should be so located only when it is not possible to secure the proper gradient.

W. S. Roberts, in the discussion, stated that this was an important item, as it would greatly facilitate the obtaining of correct weights and the railroads could aid the operators by locating their tracks accordingly. He also pointed out that a mine provided with up-to-date equipment would be in a position to furnish coal more nearly to specification than other mines without such equipment, and that this should be considered when comparing the various contract bids.

It was pointed out that the railways could greatly assist in mine operation by making their orders more uniform and keeping the mines supplied with cars, which in both cases would benefit the railroad as well as the mine operators. The variation in the quality of coal was laid to the labor conditions prevailing throughout the mining industry. It was also suggested that representatives of the miners be included in conservation committees as they were in a better position than any one else to effect the savings.

Firing Practice—A committee, of which D. C. Buell (U. P.) was chairman, presented a report on what it considered the best practice in firing locomotives. It was well received and thoroughly discussed by the association. The different items included firing tools, draft appliances and blower, care of boiler tubes, hand firing, mechanical stoking, education of firemen, interesting railroad officers in fuel economy, waste of coal for which the fireman is responsible and methods of obtaining the co-operation of the fireman.

The committee is to incorporate in its next report the suggestions adopted during the discussion, together with designs of the best practice in firing tools.

OTHER BUSINESS.

The following officers were elected for the ensuing year: President, R. Collet, superintendent of fuel service, Frisco Lines; first vice-president, D. R. Sebastian, fuel agent, Chicago, Rock Island & Pacific; second vice-president, D. C. Buell, chief educational bureau, Union Pacific, Illinois Central and Central of Georgia. Executive committee, two years, B. P. Phillippe, C. F. Ludington, J. S. Sheafe and F. F. Gaines; for one year, Eugene McAuliffe and W. H. Averill.

Chicago received the largest number of votes for the next convention.

Railway Improvements in Roumania.—A bill has been introduced in the Roumanian parliament to authorize the expenditure within the next five years of $80,000,000, for the completion of railway lines now under construction, the improvement of existing lines by double tracking, building of new stations, etc., and the construction of new lines of about 1,000 miles in length and of a bridge over the Danube.

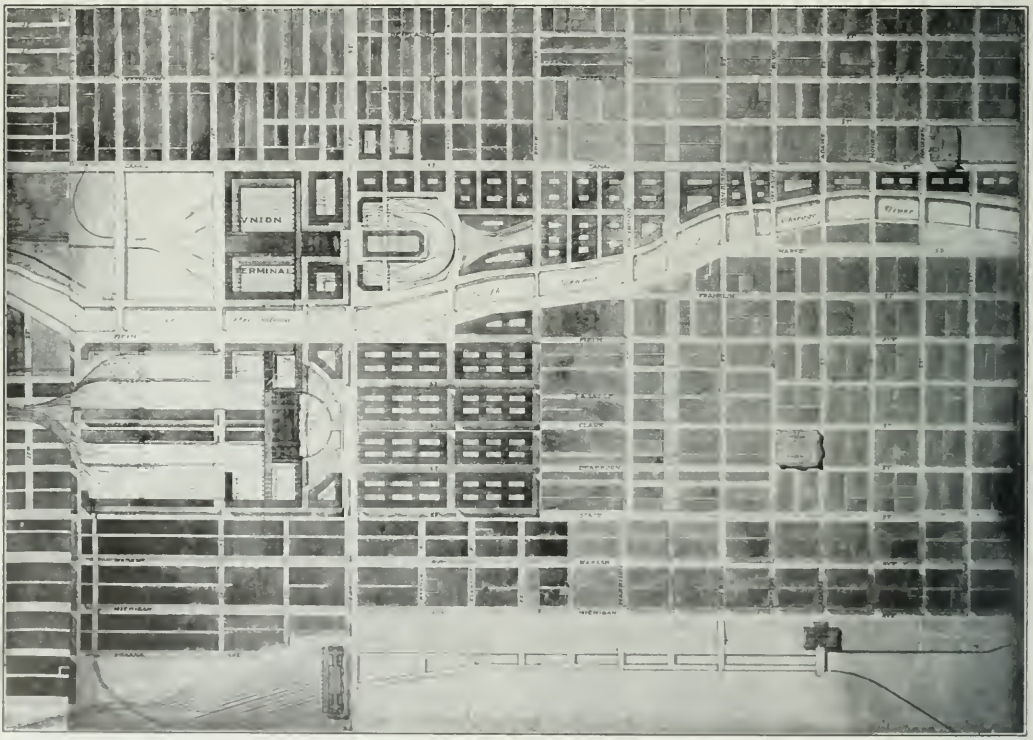
RELOCATING OF CHICAGO RAILWAY TERMINALS.

The Principal Features of the New Plans with Some of the Reasons for Rebuilding the Chicago Terminal District.

A new plan for the relocation and co-ordination of the railway passenger and freight terminal system of Chicago was submitted to the City Council Committee on Railway Terminals at a hearing on May 24 by the Chicago Plan Commission, a body appointed by the mayor to study and recommend means for the improvement of the city on the basis of a scheme prepared several years ago by a committee of the Commercial Club, known as "The Plan of Chicago." This new plan provides for a series of passenger terminals on the south side of Twelfth street in three units, one between Michigan avenue and the lake for the roads using the Illinois Central terminal; one between State street and the Chicago river for the roads now using the Dearborn and LaSalle street stations, and one between the river and Canal street for the roads now located west of the river and using the Union and Baltimore & Ohio stations.

The new plan was presented by Charles H. Wacker, chairman, and W. D. Moody, managing director of the Chicago Plan Commission, as "representing the best product of the efforts of the executive officers and the architectural and engineering staff of the commission, but not passed upon by the commission," pursuant to a resolution adopted by the Plan Commission after the failure of the efforts of its subcommittee on railway terminals to induce the roads now using the Union station to change their plans for a new station to harmonize with the Chicago plan. It was submitted to the committee for their consideration in connection with a vigorous objection to the plan for the location of the new Union station between Jackson, Adams and Clinton streets and the river, as described and illustrated in last week's issue, which was declared "a distinct menace to the future welfare of the city."

The objection was not directed solely at the plan for the passenger terminal, but was based largely on the grounds that it contemplated a new freight terminal for the Pennsylvania Lines, to replace the present freight facilities on the site of the proposed Union passenger terminal, to be located between Jefferson and Desplaines streets, from Van Buren south to Ewing, and that the passenger and freight terminals together would constitute a "permanent impregnable Chinese wall" hemming in the expansion of Chicago's congested business district toward the west and south, besides preventing the carrying out of a comprehensive permanent plan for the railway terminals of the city as a whole. The plan is based mainly on the plans that have long been advocated by F. A. Delano, president of the Wabash, for a series of terminals on Twelfth street, and the proposals of the original plan of Chicago as drawn by D. H. Burnham. It includes the idea



Plan of the Central District of Chicago Showing Proposed Three-Unit Plan of Passenger Terminals at Twelfth Street, Proposed Straightening of Chicago River and Proposed Development of Railway Property North of Twelfth Street for Warehouse and Business Purposes.

suggested in the plan recently advocated by Jarvis Hunt for the straightening of a bend in the Chicago river between Twelfth and Sixteenth streets, but rejects his plan for one central terminal, and it places the new Union station on the west side of the river, while moving it back to Twelfth street, instead of requiring the railroads to cross the river to enter the station, as proposed by Mr. Hunt's plan. Instead of a central freight terminal at Sixteenth street, as proposed by Mr. Hunt, it provides for the use of railroad property north of Twelfth street for large freight terminal and warehouse buildings entered by tracks underground and for the opening of streets through territory now closed by railroad property.

The principal features of the plan, together with some of the reasons advanced by its framers as to the need for reconstructing the Chicago terminal district, are given in the following extracts from the report:

The report states that at present Chicago has a population of 2,250,000 people and a central business area of one-quarter of a square mile with a mixed fringe of business and warehousing surrounding it. It is estimated that this loop district is carrying today 60 to 70 per cent. of its ultimate business capacity, and that to provide for the business necessities of a population of 5,000,000 people at least 50 per cent. more area than is now in use will be required. The business district can grow southward only along three streets; it can grow westward and northward only after jumping the gap of the river and adjacent railroads, which ranges from 400 to 700 ft. wide on the north and from 1,100 to 1,500 ft. at Harrison street. It is declared that the history of cities shows that only under the strongest sort of pressure will business jump even the smallest gap.

"In order to bring about a more orderly development of business southward and a movement of business westward, it is necessary to remove the obstacles which are restricting and making the growth unshapely and disorderly. The terminals—freight and passenger—must either be removed altogether or else the areas which they occupy must be developed in such a way that they will become a magnet rather than an obstacle to business.

"The location of the river and of the railroads immediately adjacent has been a hindrance to the westward flow of business and the trend of the river eastwards and the presence of the railroads in long strips up to the loop has broken up and is preventing west of State street a solid movement southwards.

"For proper development to take place in the future in either of these directions, it will be necessary to overcome both of these forces which are operating to break it up and obstruct it."

Then follows a description of the street system of Chicago, showing the condition of imperfect and inadequate means of passage to and from the central district, caused by the location of the river, the changing of the street system south of Jackson boulevard to accommodate the railroads, and "improper development by the railroads of the property owned by them south of Polk street and the closing by them of streets."

"If business is to grow southerly and westerly," the report declares, "we must develop east and west streets south of Jackson boulevard, and north and south streets between Michigan avenue and Halsted street." The report then continues: "As a means, at one and the same time, for relieving restrictions on business growth, for improving the street system and for providing for the city railroad terminals which will be adequate for present needs, and which will provide for expansion in the future, it is proposed that all passenger terminals of the railroads be moved back to Twelfth street, that the river channel be changed from Twelfth street to Sixteenth street, and that the space occupied by the railroads north of Twelfth street be developed for freight-warehouse and wholesale occupancy.

"The movement of business can then be progressive and natural. It is immaterial, as far as business is concerned, what is under the street surface, and if all the railroad tracks be placed under ground business can flow over them without interruption. The lower part of the buildings can be used as delivery floors and the upper sections as offices and business houses. Along the river, west of the present business center, buildings can be built which in appearance will not differ in any way from business buildings. Loading to and from these warehouses can be done in courts over the tracks inside the buildings and the frontages along the streets can be used for stores if so desired. When business demands outlet to the west this occupancy will give place.

"It will be readily seen that most of these improvements, which are practically the only means of relieving downtown congestion, are bound up with and dependent on a complete rearrangement of railroad facilities, and lie for the most part on railroad property.

"The railroad passenger terminals as proposed are dependent on the straightening of the river. This is proposed from Twelfth street to Sixteenth street, and the new channel provided will be 200 feet wide. (This is an improvement recommended by the Harbor Commission and by the Sanitary District.)

RAILROAD TERMINALS.

"The passenger terminals should be accessible to all parts of the city. They should be reasonably close to the business district. They should be within easy reach of each other. They should be perfectly placed in their relation to the present and proposed transportation facilities. They should cause a minimum congestion on the streets in their neighborhood. They should not interfere with the growth of the business area. They should not be located so as to in any way obstruct or disarrange the street system. They should be as economical in first cost and operation as compatible with convenience and service to the public. Their operation should be noiseless and smokeless.

"Under the preferred plan Twelfth street should start from Michigan avenue, with the Field Museum and new Illinois Central station at its intersection with Michigan avenue, as a double-deck street, and continue as such to the river. West of Canal street it will be a one-level street. On the south side of Twelfth street, east of the river, it is proposed to provide business buildings and a station which centers on Clark street. This station will house the Lake Shore, Rock Island and Western Indiana group of roads. On the north side of Twelfth street there will be buildings which will have a combined utility of stores, offices and warehouses. West of the river, as far as Canal street, there will be on the south side of Twelfth street, the station building for the Union terminal group of railroads, with adjunct office development. On the north side of Twelfth street there will be offices or station building development. The above arrangement with the additions of the Illinois Central station proposed at Indiana street and Michigan avenue, will constitute a three-unit plan interrelated along Twelfth street.

"The Illinois Central-Michigan Central group will occupy their present station. The Western Indiana or Polk street station group, consisting of the Wabash, Grand Trunk, Santa Fe, Monon, Chicago & Eastern Illinois, Chesapeake & Ohio, and Erie will be united with the Rock Island-New York Central lines, or LaSalle street station group to occupy the large terminal centering on Clark street. The Union terminal group, consisting of the Pennsylvania, Burlington, Alton and St. Paul railroads, will receive the B. & O., or Harrison street station group, and occupy the terminal between the river and Canal street.

"The passenger terminal which it is proposed to place between State street and Fifth avenue, extended, will have its head house or terminal building centering on Clark street. In order to allow of the looping of trains, it is necessary to place this building 300 ft. south of Twelfth street. In front

of the head house and between it and the loop will be an open plaza at the level of Twelfth street viaduct. Into this plaza and to the entrance to the station are taken the street car tracks which run on the upper level of Twelfth street. All traffic coming to the station along this upper level will also be cared for there. Entrances to the station for both vehicles and street car passengers are provided on Clark street, Dearborn street, LaSalle street, and on the lower level of Twelfth street.

"Directly back of the station building and at the level of Twelfth street the plaza and the head house floor is placed the concourse with the incoming section to the left and the outgoing section to the right of the head house.

"Express and baggage buildings may be placed in the central area between the incoming and outgoing sections of the station and when the station is electrified the space under these buildings may be used for car yards and later made an addition to the station. Building development may take place over the whole station area as soon as electrification is complete. In order to relieve Twelfth street of as much station traffic as possible driveways are provided along each side of the head house which are connected independently of Twelfth street with Canal street to the west and by a bridge over the river with Fifth avenue and the plazas of the other terminal.

FREIGHT TERMINALS.

"It is proposed that all the railroad property north of Twelfth street not taken for passenger terminals and such of the station area as can be built over after electrification be developed as freight terminals with warehouse and wholesale offices on the upper floors.

"East of the river this area owned by the railroads and developed in this manner can be approached from the south by tracks which will pass under the station along the west line of the terminal. These tracks will pass over Wentworth avenue, south of Sixteenth street and the lower level of Twelfth street. At this latter point they will be at an elevation of about 6 ft. below Chicago city datum, or about 19 ft. below the normal street level of 13 or 14 ft. above Chicago city datum. As soon as the elevation of 6 ft. is reached, branch tracks will be run out from the main running tracks into each of the warehouse blocks which they will serve. Each of these warehouse blocks will have its own private teamway or driveway and all the loading and unloading will be done there.

"On the west side of the river it is proposed that the approach tracks to the passenger station from the north be placed under Canal street from Madison street to Harrison street so as to leave all the area between Canal street and the river north of Harrison street free for wholesale and warehouse buildings. This area has the advantage of providing rail and water connection.

"Tracks for serving the properties to the east of the passenger approach tracks will pass around the east side of the terminal of the Union terminal association, and then up through the center of this area or along the east edge close to the river. These tracks will be at an elevation of about 6 ft. above Chicago city datum.

"Tracks to serve the area lying between Canal street and the approach tracks to the passenger station will be carried between the west side of the terminal and Canal street.

"The former of these freight connections will serve the Pennsylvania and the Alton property and the latter the Burlington property.

"The property lying to the north of Van Buren street as far as Madison street between Canal street and the river is held by the Pennsylvania and proposed for the new Union terminal. It can still be held by them for freight warehouse and wholesale purposes, and the area now held by the Alton south of Van Buren street can still remain Alton property to be used for freight warehouse and wholesale purposes. This will be a more economical use of the property than would its use for passenger terminal purposes

SUBURBAN TRAFFIC.

"The heavy lines of suburban travel are from the north and west over the Northwestern and Milwaukee, from the south over the Illinois Central, Rock Island, Lake Shore, Pennsylvania, and from the west over the Burlington. At present these lines of travel are grouped into travel leaving the center of the city from the west of the river, travel entering from the south and travel entering from the east. It has been one of the aims of this study of the railroad situation to care for this suburban travel and bring it as far into the center as possible, even though it has been thought necessary to place the terminals themselves at Twelfth street, and it is proposed to handle this class of travel in the following manner. The lines which use the Union terminal west of the river, and enter from the south will deliver their suburban trains on to tracks set aside for that purpose, which shall run along the west side of the terminal to Harrison street. From Harrison street to Madison street these tracks will be placed under Canal street and from Madison street they shall parallel the Milwaukee tracks to some point to the north of the loop, where there can be placed a loop where the trains can be turned or else a yard where they can be stored.

"The Milwaukee suburban trains, and at some time in the future, the Northwestern suburban trains can be handled in the same way, using the Twelfth street station or else running farther south to a loop or yard. In this manner the whole loop will be served by these lines, and it is apparent that a large amount of travel can be handled each way at the rush hours. It is proposed to handle the traffic on the lines which use the terminal east of the river in much the same way—that is, to bring it up to the north end of the business center. It is proposed to pass suburban traffic over the present tracks of the St. Charles Air Line from Clark street to the lake front. Thence it will use tracks on the Illinois Central right-of-way to the river, where a loop can be provided for use of both this traffic and of suburban traffic over the Illinois Central. This loop would undoubtedly be an advantage to this road and with it, it could handle the additional burden which is outlined.

"As an alternative of this, these suburban traffic lines might be brought into the center under ground to the present passenger stations, and there turned, or they might be carried north of the river to a run-around or yard.

"With this complete arrangement for suburban business, the center of the city would then be served at all points along its edges, and at no time would a second fare be necessary to get to the business district, as is the case in New York.

"The arrangement of suburban lines along the west bank of the river and along the Illinois Central right of way, with a loop north of Randolph street, would be flexible and economical for the railroads and a convenient solution for the public."

Then follows a detailed plan of connecting the railway terminals with the local transportation system of the city, surface and elevated railways and the proposed subway.

In presenting the plan to the committee Mr. Wacker severely criticised the Union station roads for ignoring the Plan Commission, and accused them of attempting to "railroad" their plan through the council without reference to the revised plan which was submitted to them on May 16. He argued that a comprehensive scheme must be worked out and the railways be required to co-operate if the business district of the city is to be allowed to expand, and that any plan that does not provide for expansion to the west and south, and the reclamation of a part of the central territory now occupied by railway tracks should not be encouraged. Of the quadrangle bounded by Twelfth street, Halsted street, Chicago avenue and Michigan avenue, which the plan of Chicago proposes to make the central business district of the city, he said that 32.5 per cent. is owned by the railroads, and that if the Union station roads are permitted to retain

their present location all hope of inducing competitive roads to move their stations back to Twelfth street must be abandoned. To provide for proper expansion additional streets must be opened up east and west and north and south, as provided by the plan, including a new main east and west artery or "civic axis" on Congress or Harrison street, leading to a civic center at Halsted street, where it is proposed to erect a city hall at the point of convergence of several main diagonal streets which penetrate the northwest and southwest sides of the city.

The plan for the proposed freight terminal of the Pennsylvania lines, as described by E. R. Graham, architect for the Union station roads, contemplates an architecturally attractive head house facing on Van Buren street, a warehouse building occupying the block from Van Buren to Harrison street, and a loading and unloading platform in the block south of Harrison street, between Jefferson and Desplaines streets. The terminal would be approached by four tracks south of Twelfth street, and two tracks north of that street at an elevation of from 20 to 27 ft. above the street level. This would provide for the handling of all package freight designed for local consumption. Loading and unloading would all be done entirely on the property of the railroad, and five entrances to the loading and unloading platforms would be provided in one block. Tall masonry walls would border the tracks along their entire length, so that the freight cars would be out of public view.

F. A. Delano, president of the Wabash, sent a letter to the committee at the hearing on May 23, criticising the plan of the roads for the Union station, and also addressed the committee at the hearing on May 24. He said that many features of the Pennsylvania plan were bad, as tending toward the restriction of the business district instead of providing for its expansion. He opposed the change in the proposed civic axis of the city from Congress street north to Jackson, saying that the growth of the city was toward the west and southwest, and he objected to allowing any tracks over the streets north of Twelfth street. He advocated no particular plan, and admitted there were many difficulties in the way of getting all the roads to agree on a general scheme, but thought the committee was in a position to refuse its sanction to any project that did not tend toward a solution of the whole terminal problem. He therefore suggested that a final decision on the plan proposed by the Union station roads be deferred a few months, and that the engineers of the various roads get together in a conscientious effort to work out the problem in a co-operative way. The adoption of the Union station roads' plan would mean, he said, that nothing would be done by the other roads toward working out a general solution, whereas he was sure that the Rock Island and Lake Shore would agree to move back to Twelfth street if a satisfactory plan is evolved. If all interested would place their cards on the table perhaps a better plan than any yet suggested could be worked out.

The plans for the Union station announced by the Pennsylvania Lines, the Chicago, Burlington & Quincy, and the Chicago & Alton were endorsed by the Chicago Real Estate Board at a meeting on May 22, by a vote of 95 to 10. They have also been approved in resolutions adopted by the people of several suburbs served by the Union station lines, and by a large number of west side property owners who have appeared at the various hearings and protested against any plan of locating the proposed terminal on Twelfth street. A large number of prominent business men have also written to the committee or appeared at the hearings, expressing a preference for the Union station lines plan over the Twelfth street plan, and particularly over the Hunt plan for a central terminal, while a few have expressed a preference for the latter or some other plan. The Chicago Building Trades Council submitted a resolution urging the approval of the Union station plan on the ground that it would give employment to a large number of men.

At a hearing on May 26 an entirely new plan was submitted to the committee by Irving K. and Allen B. Pond, architects. This scheme provides for a series of terminal units between Canal and Clinton streets, paralleling the river, extending from Madison street south to Twelfth street, and connected by a series of elevated tracks, on two levels, one for through trains and one for suburban traffic, operated on the loop principle with the stations inside the loop. This terminal system would accommodate all roads except the Illinois Central, and it was suggested that the Union station roads could build their proposed passenger station in approximately the present location, as the first unit.

At the meeting of the city council on Monday night three ordinances were presented on behalf of the Union station roads to provide for necessary street and alley changes in connection with their terminal plan.

An enabling act to provide for the incorporation of a holding company to construct the Union station, with a capitalization not to exceed $50,000,000, was passed by the Illinois legislature on May 22, after assurance had been given by the railways that they would pay to the state the full fee for such incorporation instead of incorporating under the "not for profit" act.

RAILWAY TELEGRAPH SUPERINTENDENTS.

The thirty-second annual convention of the Association of Railway Telegraph Superintendents was held at St. Louis, May 20, 21, 22 and 23, with over 200 members and ladies present, and President J. B. Sheldon in the chair. At the opening session Belvidere Brooks, vice-president of the Western Union Telegraph Company, spoke briefly, referring to the importance of harmonious relations between the telegraph company and the railway telegraph superintendents, and to the problems that were constantly arising for solution. The auditing committee reported total receipts of $1,972 and disbursements, $1,377, leaving a balance on hand of $595. Secretary P. W. Drew announced that the association now had 200 members, active and associate. A large number of new active and associate members was elected.

The Committee on Wire Crossings, G. A. Cellar, chairman, presented a report which, with a few amendments, was adopted; and the specifications embraced in it were ordered to be submitted to the American Railway Association.

A committee, E. P. Griffith, chairman, reporting on "Form for Delivery of Telegrams to Trains," advised that a universal system for making such deliveries or reporting non-deliveries would be impracticable. A paper on telephone transmission, by Elam Miller and C. A. Robinson, was read in abstract by Mr. Robinson and discussed by M. H. Clapp.

The next paper, entitled, "Use of telephones by railroads for despatching trains, and for messages," by J. C. Johnson, of the Pennsylvania Railroad, was read by I. C. Forshee, electrical engineer of that road. This paper is abstracted in another column. It brought out a long discussion, which was participated in by Messrs. William Bennett, Charles Selden, E. P. Griffith, W. J. Camp, C. S. Rhoads and others. The cost of way station telephone equipment was the subject of special interest to the members. Reference was made by various speakers to the value of concrete telephone booths.

On Wednesday morning P. J. Howe (W. U. T.) read a long paper on inductive disturbances. A. Wray, of the Rock Island road, said that the best means of insuring that lines shall be clear of inductive disturbances from power lines is to keep away from them. On his road harmonic ringers are used. These respond to alternating currents of different frequencies. This method of party line ringing is very successful. By its use any one of four parties may be called on a metallic line, or any one of eight called by ringing to ground from each side of the metallic circuit. He suggested that it might be possible to design relays that would respond only to the frequency for which they were built and in this way

make telegraph circuits free from inductive disturbances from parallel power circuits.

N. E. Smith (N. Y. N. H. & H.) gave some experiences as a result of induction from the single phase 11,000-volt traction system of his company, which he thought had no equal. He gave a detailed account of the efforts to overcome inductive disturbances, and the satisfactory results obtained.

M. H. Clapp (N. P.) presented a paper on protection against lightning, which was discussed by I. C. Forshee (Pennsylvania) and others. Mr. Forshee described the methods of protection employed on his road. R. E. Chetwood (W. U. T.) said that railroads spent much money on protective apparatus and failed to get the results expected because of poor grounds. It was hard to devise any standard method of making grounds. The best way is to drive pipes in the earth and use salt. If necessary drive several pipes and connect them in parallel. Vacuum lightning arresters, he stated, could not always be relied on. Their efficiency depended upon the vacuum, and the word of the manufacturer was the only guarantee that could be obtained as to this. His company is to introduce a new type of cable box which will be an improvement on the present type.

At the afternoon session, R. F. Spamer (Western Electric Company) read a paper on "Main line power for selective circuits, including transmission and signaling." In the discussion on this E. C. Keenan read a communication from C. S. Rhoads, Jr., engineer of the Hall Switch & Signal Company, New York, in which it was stated that there are points other than first cost, depreciation, etc., which must be considered in the choice of battery supply for selector circuits. The human element, he stated, was a strong factor. Reliability is what is desired, not cheapness. Storage battery gives excellent results when properly maintained, but it has disadvantages. Dry battery has some excellent points in its favor. It can be installed and maintained by any inexperienced man. No reserve battery is absolutely necessary, and the first cost is reasonable. Primary cells, he said, are almost beyond consideration for railroad telephone service, except for certain specified uses. Chemical rectifiers are slow to come up to voltage after being idle. This fact is against them for main battery purposes. Motor-generators give reliable service and require very little attention. E. E. Hudson (Thomas A. Edison Co., Orange, N. J.) called attention to the reliability and low maintenance costs of primary cells.

H. D. Teed, superintendent of telegraph of the St. Louis & San Francisco, read a paper on the full use of wires, describing various improvements which have been made on his road. The first essential in getting full service out of all wires on a large system is to have an energetic manager and a wire chief, supplied with the necessary testing instruments—voltmeter, ammeter and Wheatstone bridge—who will appreciate their responsibility and the value of the property whose efficiency is in their hands. In adopting telephones, it was the policy on the Frisco to use them everywhere that economy could be effected. If good for despatching, telephones should be also good for messages; and it follows that the great volume of correspondence which burdens most railroads can be reduced also. From the headquarters of this road at Springfield, Mo., lines radiate in six different directions; and on four of these lines message circuits have been installed as well as despatching circuits. The message circuit and the despatching circuit together are used to make a phantom circuit for through business, and this has been very successfully carried out. The arrangement of the phantom circuit cost only $800, and it takes the place of an expenditure of $143,000 which would have been necessary if a separate new line had been put up. On all of the message circuits the signaling is done by monitor operators at Springfield. The Frisco makes extensive use of telegraphone instruments, to talk by telephone over telegraph wires, but only for moderate distances.

In the discussion of Mr Teed's paper, R. F Finley (N. Y. C.) reviewed the work done and what is proposed on the New York Central lines in the West in order to obtain the full use of facilities. M. H. Clapp, A. B. Taylor and others took part in the discussion, after which M. C. Allen, of the Western Union at New York, read a paper entitled "Organization for Maintenance of Lines."

On Thursday the paper of Mr. Allen was discussed at length by G. A. Cellar, A. B. Taylor, C. Selden, C. S. Rhoads, W. J. Camp and others, all of whom commented favorably on the practicability of the plan outlined by Mr. Allen. Mr. Cellar stated that he saw no reason why the organization described by Mr. Allen would not apply to railroads as well as to telegraph and telephone service.

J. F. Richardson (C. P.) read the paper of J. B. Sheldon, entitled "Organization for Wire Chiefs and Telephone Inspectors." W. J. Camp, A. B. Taylor, J. F. Caskey and others described the methods in vogue on their respective lines, and a general discussion ensued.

At the afternoon session amendments were made to the by-laws providing that hereafter only one meeting of the eastern and the western divisions be held annually, instead of two, and that the officers of the divisions be elected at the annual general meeting. The eastern division will hold its annual meeting in November, and the western division in March. Additional meetings can be called on the application of five members.

The committee on "Preparing Uniform Rules for Train Orders by Telephone," through Chairman L. M. Jones, of the Santa Fe, Topeka, Kan., reported progress.

At the session of Friday morning officers were elected as follows: President, William Bennett, Chicago & North Western, Chicago, Ill.; first vice-president, A. B. Taylor, New York Central Lines, New York; second vice-president, N. C. Walstrum, Norfolk & Western, Roanoke, Va.; secretary and treasurer, P. W. Drew, Minneapolis, St. Paul & Sault Ste. Marie, Chicago, Ill.

New Orleans was selected as the place, and May 19, 20, 21 and 22 the time for next year's convention. W. H. Potter, Southern Railway, Washington, D. C., was elected chairman of the eastern division, and Mr. E. C. Keenan, New York Central Lines, Chicago, chairman of the western division. After the installation of the new officers the convention at 11:45 a. m. adjourned.

SHIPPERS AND THE ADVANCE IN FREIGHT RATES.

The Railway Business Association has published in Bulletin No. 13 its arguments in favor of freight rate increases for the eastern roads. The association urges railroad managers to confer directly with shippers and says that industrial and traffic bureau representatives should have sanction from their employers for a liberal attitude. The bulletin starts with the following statement signed by the president of the association:

"Fight" is not an appropriate name for the new effort of the eastern roads to raise freight rates. There isn't any fight about it. It is a conference. Antagonism to railways has subsided. Regulation of rates is complete. Confidence in the Interstate Commerce Commission is thorough. The public views the situation with equanimity. Shippers, consumers, the press and everybody else are obviously content that the roads should make their showing if they can and get the advance if they need it.

This is progress. It is vastly more important that railway questions shall be settled in good temper than that any particular rate case shall be decided any particular way. It is to be hoped that the country has seen its last "fight" over freight rates.

The Railway Business Association presents in this bulletin two exhibits. One is that the railroad share of total new securities issued has been declining sharply until it was in 1912 the lowest of the decade, while other corporations were

issuing their highest. The other is a number of extracts from representative newspaper editorials breathing a spirit of willingness to consider the proposed advance without prejudice. These two exhibits taken together signify first that there is something the matter with railway credit upon which railway ability to serve the country adequately depends, and second, that whatever is the matter the country wants the Interstate Commerce Commission to find a remedy, in which there will be general and cheerful acquiescence.

In that frame of mind no nation is apt to make a serious mistake. The country is to be congratulated on having emerged into an era of calm thinking and good feeling with regard to transportation.

GEO. A. POST,
President, Railway Business Association.

The exhibit in regard to the need for higher rates and the small amount of new securities issued by the railroads is substantially as follows:

Applying for the reopening of the advanced rate case of 1910, the eastern trunk lines are about to go before the Interstate Commerce Commission and endeavor again to show need for larger revenue.

Lessons learned three years ago by all concerned should, and we believe will, make possible at this time a procedure distinguished by good feeling, by earnest purpose to ascertain what is the highest public interest and by conference and co-operation for the best results.

It is necessary that the railway managers should demonstrate their need. It is desirable that shippers and the public shall appreciate the burdens of cost which have been and are being laid upon the roads, the greatness of the task which the roads must perform to meet their obligations to the public and the generous allowance which ought to be provided for doing, on the higher scale of operating cost, the vastly greater things demanded by the miraculous growth of our agriculture, commerce and industry. Shippers and railroads can aid the commission substantially by endeavoring to reach agreements as to the schedules and the traffic upon which the increases, if any are to be granted, should fall.

The Railway Business Association is not a party to rate cases and will not discuss the schedules involved in this proceeding. Being, however, deeply interested in the welfare of the roads, which are the customers of our members, and having on general grounds as business men and citizens an earnest desire to promote enlightened methods of solving railway questions, we regard it as our function to encourage the fullest ascertainment and employment of pertinent facts. It would be possible for anyone desiring to resist advances otherwise than on the merits to make prominent at such a time past railway practices which have been criticised and alleged current shortcomings of individual companies susceptible of an interpretation injurious to the roads. Such attacks, indulged in at the hearings or through the newspapers, though foreign to the question whether the roads with existing revenue and under existing conditions can perform service adequate to the public need, might complicate the already difficult task of the commission and result in national injury.

We urge all those who discuss the question to deal in authentic information bearing directly on the merits. We ourselves shall invite attention to such facts as we feel competent to obtain.

Our study of the credit situation of the roads gives a result so striking that in our judgment it should arrest attention and demand consideration. The generally accepted authoritative record of listings on the New York Stock Exchange is the file of the *Commercial and Financial Chronicle*. That publication presents early in each calendar year a table giving new securities listed during the year preceding by all corporations, classifying railroads separately. For all corporations the *Chronicle* of January 25, 1913, page 241, gives a table covering a series of ten years, from which, adding stocks and bonds together and segregating steam railroad from all other corporations, we get the following:

NEW SECURITIES LISTED.

Year.	Total.	Non-Railroad.	Railroad.	R. R. Percentage of Total.
1903....	$1,008,179,095	$511,404,695	$496,774,400	49.2
1904....	710,946,400	246,994,350	463,952,050	65.2
1905....	1,513,461,550	797,954,750	715,506,800	47.2
1906....	1,234,667,950	680,753,900	553,914,050	44.8
1907....	996,845,050	582,102,250	414,742,800	41.6
1908....	1,386,885,450	680,222,850	706,662,600	50.9
1909....	2,424,482,585	911,473,770	1,513,008,815	62.4
1910....	2,047,664,045	1,241,830,885	805,833,160	39.3
1911....	1,224,449,230	721,555,780	502,893,450	41.0
1912....	1,816,008,540	1,470,221,540	345,787,000	19.0

An analysis of this table shows that from 1903 to 1909 inclusive, the steam railroad share of total issues of all corporations listed on the New York Stock Exchange fluctuated until 1909, when it was 62.4 per cent., the highest of the decade except 1904. After 1909 there was an annual drop in the amount of railway securities issued. In 1912 railroads issued only 19 per cent. of the total for all corporations, and this was the lowest percentage and the smallest amount for any one of the ten years.

In 1909 there were listed by all corporations issues aggregating $2,424,482,585. Of this total steam railroad corporations put out $1,513,008,815, leaving for other corporations $911,473,770.

In 1912, all corporations issued $1,816,008,540, of which steam railroads issued $345,787,000, leaving for other corporations $1,470,221,540.

In 1909, therefore, the railway securities issued were $601,535,045 more than the non-railroad, and in 1912 the non-railroad securities issued were *more than four times the railroad securities*.

The securities put out by railroads in 1909 were 62.4 per cent. of the total for all corporations.

If this ratio had been maintained in 1912 the railroads would have issued in that year $1,133,189,328, or *more than three times* as much as they did issue.

This decline in railway issues was persistent year by year since 1909. Corporations other than steam railroads issued in 1909 securities aggregating $911,473,770, in 1910, $1,241,830,885, in 1911, $721,555,780, and in 1912, $1,470,221,540. Steam railroads issued in 1909, $1,513,008,815, in 1910, $805,833,160, in 1911, $502,893,450, and in 1912, $345,787,000.

In other words, corporations other than steam railroads have issued since 1909 securities showing an increase in every year excepting 1911, whereas the steam railroad issues have declined in every year since 1909. The non-railroad issues in 1912 were $558,747,770 more than they were in 1909, while the railroad issues in 1912 were $1,167,221,815 less than they were in 1909, a falling off of 337.5 per cent.

"RELIEF MUST COME"—PROF. RIPLEY.

So independent an authority and careful investigator as William Z. Ripley, Profesor of Economics at Harvard University, accepts as sufficient the fact that "Today the Chicago, Milwaukee & St. Paul cannot sell its 4½ per cent. bonds at par," and declares:

"Relief in the form of rate advances must come. Unless relief does come from that source, the public is going to be denied the facilities and the accommodations to which it is justly entitled."

Many executives of industrial enterprises whose annual freight bills are the largest have for some time felt the danger that a breakdown of transportation facilities would cause them losses a hundred fold greater than any advance in freight rates which the roads were likely to file or the commission sanction. These matters are ordinarily left in the hands of experts whose specific job is to keep rates down. This occasion calls for first-hand study of the problem by heads of concerns.

It was evident after the hearings in 1910 that able and influential traffic experts looked forward to another such proceeding determined to contribute all they could to a friendly atmosphere from which appeals to popular prejudice

should be banished and in which the common purpose should be to reach a wise result.

Traffic representatives of shippers and of business bodies are entitled to have at this time the assurance that those who employ them are cognizant of the situation and will appreciate the reason why the presentation of the carriers' case is scrutinized in an amicable rather than in a hostile attitude.

To the commission above all is it due that public sentiment shall seem broad and farsighted. There is no precise point at which the rate from New York to Chicago can be fixed as the only reasonable and equitable rate. What would be a wise rate if the railways had developed their facilities in advance of the traffic might not be at all an adequate rate if facilities had lagged behind and the public wanted the roads to catch up and resume leadership.

In the case at bar facilities have lagged behind. Even with the mild weather and unprecedented co-operation of shippers and railroads to expedite car movement in the fall of 1912 the net car shortage rose to 51,102, and the gross number of cars asked for and unavailable to 73,745. A winter of normal severity would undoubtedly aggravate this situation into a serious and perhaps a disastrous congestion. Traffic has grown faster than facilities.

Does the public want the roads to overtake traffic and go on ahead as in the past?

This is for the public to say, and it is a perfectly proper function of administrative statesmanship for the commission to heed public demand on that point.

We take it for granted that the railway managers will offer shippers the frankest explanation of the situation and arrange opportunities for the fullest exchange of views. We are confident that the public now understands much more thoroughly than three years ago the increased operating cost which has been imposed upon the roads by wage arbitrations and by outlays compelled under federal and state statutes, and appreciates much more vividly the expensive undertakings which confront the roads in the enlargement of terminals, mostly in the heart of large cities where land-cost is highest.

This diffusion of knowledge gives reason to hope that the public will consider the new application for rate advances on the merits and without prejudice.

MASTER BOILER MAKERS' ASSOCIATION.

The seventh annual convention of the Master Boiler Makers' Association was held in Chicago, May 26 to 29, President M. O'Connor, general foreman boiler maker, Chicago & North Western, presiding. John H. Smythe, Parkesburg Iron Company, made the opening prayer. Addresses were then made by W. L. Park, vice-president of the Illinois Central, and John F. Ensign, chief boiler inspector, Interstate Commerce Commission.

W. L. PARK'S ADDRESS.

I shall take advantage of this opportunity to endeavor to point out the way in which your association can be helpful to the railroads by discussing the tendency of laws affecting your craft, thereby assisting the operating department of which your railroad membership is a part, in correcting certain abuses of the railroads that are insidiously creeping into our national and state jurisprudence.

There are being inflicted upon the railroads numerous laws, rules and regulations, some of which have real merit, many of which, however, are ill considered, ill-advised, inconsistent, unnecessary, unreasonable and impossible of compliance. They are born in ignorance of the existing conditions, not always sincerely in the interests of the safety of the public or the employees of the railroad. There is frequently to be observed in their proposal a taint of commercialism or self-interest. The railroads cannot, therefore, be justly criticised for being on the alert to safeguard their interests and to see that the public who pay the bills are not imposed upon. A proper and reasonable regulation of our railroads is necessary. The public may be easily misled, and is very apt to be, if those who are employed upon the railroads are not keenly alive to passing events and zealous in protecting their employer—the stockholder—from the effect of unnecessary and expensive regulation.

There is unquestionably a sincere disposition on the part of the administrative part of our government to be reasonable; it is not their intention or desire to be otherwise. They, however, do not make the laws. Once placed on the statute books they have no other course but to enforce them. If railroad men are asleep at the switch and permit obnoxious laws to be passed, they must content themselves thereafter with the best possible observance until they can be modified or repealed. To change laws once passed is extremely difficult. The advisable course is to oppose them vigorously at their inception and continually until killed or harmlessly amended. Expert knowledge will remove the fangs from almost any venomous measure.

The difficulty in opposing adverse legislation is in invoking this expert assistance continuously as well as at the critical time. So called "efficiency experts" who do not know a gusset sheet from a crown sheet, or a hydraulic shear from a press, or the completed boiler from an air reservoir, are on hand before and after to explain the deficiency of present practice, and pneumatically exploit some hobby that would work out if the railroads were compelled by law or regulation to adopt their scheme. The good laws we should approve and improve.

It is natural that we should, on this occasion, discuss first the rules and instructions for inspection and testing locomotive boilers and their appurtenances as authorized and required by the Act of Congress approved February 17, 1911. We have now had an opportunity to observe the working of this law for nearly two years. In referring to the report of the chief boiler inspector for the first year, I am struck with the apparent lack of intsructions and failures to make systematic tests on the part of the railroads. Not until after the inspection bureau was organized did the railroads get together on uniform rules. There is no doubt, so far as I can judge from Mr. Ensign's report, of the advisability of a boiler inspection law. The law if reasonably applied can apparently work little hardship.

The great bulk of the defects are broken stayholts, tell-tales stopped up, plugged flues and unclassified steam leaks, few of which would make the locomotive unserviceable or unsafe. The report records only three explosions during the year which, out of a total of some 65,000 locomotives in use, speaks well for the efficiency and carefulness of our master boiler makers and their assistants.

The inspectors should be met with in a co-operative spirit, and every facility afforded them to do their work properly. The intelligence, knowledge and ability of the railroad master boiler maker is at least equal to that of the federal inspector, and the higher plane upon which you establish your reputation for honest effort to co-operate with the law, the greater will be the respect for and deference to your judgment when a dispute arises over the inspection of an engine.

While we have perhaps less to criticise in connection with the boiler inspection law than many of the others of recent mintage, the fact must not be overlooked that it, as well as those of similar import, entail additional supervision and a duplication of labor adding heavily to the financial burden of the railroads.

The public must be kept fully advised of this, as they pay the bills. If there is to be added to the cost of operation refinements that have not heretofore been considered necessary, the cost of service must inevitably rise. As you are aware there has been created comparatively recently great additional expenses incident to hours of service, standardization of equipment, air brake requirements and those relating to safety appliances, none of which in any way add to the efficiency of the service, but very materially interfere with and impede traffic; nor do operating officials generally admit that they noticeably affect the safety of trains, at least not to any extent greater than would have been the natural evolution of good practice.

The sequel has demonstrated conclusively that accidents are not in this way prevented or decreased; the money could have been much better spent for more permanent track, block signals, grade separation, interlocking, stronger equipment, safer shop conditions and modern tools and appliances, and in many other ways well known by practical railroad men, to be efficacious in the prevention of accidents.

"Safety to the employees and to the public" is made a cover for all kinds of class legislation, and is being worked day and night to this end. I am glad to testify that there is coming about a desire on the part of government officials to confer with those who are responsible for the expenditures, and to get at both sides of these questions, which is encouraging.

There are many other laws pending, which I would like to bring to your attention had I the time. The so-called "full crew bill" is the most pernicious. It is entirely unnecessary. Where it is made a law it becomes a dead letter, as it is utterly impossible to comply with it and satisfy the patrons. It is simply an outrage on industrious people and an insult to railroad management. The headlight law is unnecessary legislation in behalf of those who have a certain system of lighting.

If the railroads are not used as a means to promote private or class interests; if they are made better and safer and permitted to earn enough to provide for the convenience and safety of employees, as well as the public, we are all benefited.

I. F. ENSIGN'S ADDRESS.

Mr. Ensign called attention to the moral obligation of the boiler makers, not only to their employers but to the general public, by being sure that the locomotive boilers are in an absolutely safe condition before they are sent out on the road. He emphasized the importance of having men perform the inspections who thoroughly realize the importance of their work, and who would insist that the necessary repairs be made before the engine was allowed to be used.

He favored the placing of a boiler maker in charge of all work done on a boiler, such as the installation of the various boiler appurtenances. From July 1, 1911, to December 31, 1912, 16 deaths and 1,383 injuries were due to the failure of these appurtenances, which could have been easily repaired had they been given the proper inspection.

The effect of the boiler inspection law has been to make the railroads more careful in the inspection and maintenance of their power with a noticeable decrease in engine failures on some roads. It was also stated that during the last nine months over 4,000 locomotives have been ordered from service without any appeal to the chief inspector by the affected roads.

PRESIDENT'S ADDRESS.

Mr. O'Connor spoke of the responsibility of the boiler maker, urging the members to carefully study the difficult problems that frequently arise in the work of boiler construction. In speaking of the apprentices he said: "We should do everything we can to encourage and help them and by their examples they will lead other men who are selected to fill their places, if only they are taught to show that mental culture on moral and mechanical ideas is a pleasure to them as well as a duty."

REPORTS OF SECRETARY AND TREASURER.

The secretary reported a total membership of 415, with 313 in good standing. Sixty-eight applications for new members were received the first day of the convention. The treasurer reported a cash balance of $441.67.

MR. SELEY'S ADDRESS.

C. A. Seley, president of the American Flexible Bolt Company, addressed the convention Tuesday morning. Speaking of railroad legislation he emphasized the statements made by speakers on the first day of the convention concerning the civic duty of the railroad employees and suggested that the members advise their representatives concerning intended laws which especially concern their work. Railroads are the only corporations that have government regulation without being allowed to set the price of their products and should have the employees' co-operation. He mentioned the efficient way in which the boiler inspection laws are being enforced.

MIDWAY SUPPORTS FOR BOILER TUBES.

J. A. Doarnberger (N. & W.), chairman of the committee, presented the report and spoke of the general tendency toward the longer tube, the greatest length being 24 ft. when 2¼ in. tubes were used and 22 ft. for the 2 in. tube. The 22 ft. tube does not seem to require the intermediate support, the buoyancy of the water being sufficient to support the tubes between the tube sheets. While there have been intermediate supports applied experimentally they were of such design as to make the removal of the tube an expensive and difficult proposition.

A good rule deduced from tests and experience shows that so long as the length of tube does not exceed 110 diameters (outside measurements) satisfactory results may be obtained. Good results have been reported from the 24 ft. tube, 2¼ in. diameter, with the intermediate support, but the difficulty of removing the tubes still remains; while tubes of this diameter have been installed without the support there is no available data as to the results. The two prime objections to the long tubes are, first, their manufacture, and second, the efficiency of their supports and the retardation of the gases. While the long tubes receive material support from the water they are liable to spring leaks when the boiler is hauled over the road empty.

It was also shown that while other parts of the locomotive have been improved, the rate of combustion being increased, etc., the general arrangement of the tubes in the boiler, the methods of application and the treatment thereafter are substantially the same as they were 25 years ago. The question of intermediate supports is not to be regarded as an impracticable, or an unnecessary arrangement; on the contrary, the idea seems to be good, but it introduces the difficulties of interference to circulation and to the removal of the tubes, both of which are serious.

While some designers are going to the above limits in lengths of tubes, the adoption of the combustion chamber has affected the situation. Dr. Goss in his report on the tests of the Jacobs-Schupert and radial stay boilers, made at Coatesville, Pa., has shown that while the ratio of heat absorbed by the flue varied with the length of the flame, which might be accepted as a function of the fuel, the rate of heat absorbed per foot of heating surface by the firebox to that absorbed per foot of total heating surface, with a moderately long flame bituminous coal, is as 6.15 to 1. The combustion chamber will therefore undoubtedly find more favorable consideration than in the past, especially since some of the objections to it seem to have been removed by changes in boiler design.

Discussion.—Most members found little difficulty with long as compared with short tubes. Long tubes are more likely to leak on account of the greater expansion. Midway supports are objectionable because of difficulty in removal of tubes, poor circulation of water, and the inclination to cut the tubes because of vibration. The method of arching tubes to allow for expansion by deflecting the tube sheets one-eighth inch while the tubes are being installed is not considered good practice.

UNSAFE CONDITION OF A BOILER.

A committee, of which E. W. Young, Interstate Commerce Commission, was chairman, presented a report on "When is a Boiler in a Weak and Unsafe Condition?" in which were mentioned as the causes of boiler trouble the faulty and defective design, poor material, poor and careless workmanship, improperly made repairs, bad water and improper care. Among the contributary causes were mentioned the rigidity of construction which would not allow for free expansion and contraction; this might be caused by too rigid staying and the improper location of the stays.

A well designed boiler should have every part of the same strength at all temperatures, and so placed that adjacent parts

will expand and contract together under all conditions, and will not work against each other.

A poor and careless workman may cause many defects, not only from poor workmanship but by using improper material. Repairs to boilers are very important and should be carefully made. Bad management is the chief source of boilers getting in a weak and unsafe condition. All troubles can be discovered before becoming dangerous by careful, painstaking and competent examinations.

Discussion.—The ends of sheets should be carefully shaped when rolled. In case of a red hot crown sheet bank the fire and get water into the boiler as soon as possible to harden sheet. It is not necessary for the boiler to cool down before introducing the water.

WELDING SUPERHEATER FLUES.

It was the opinion of the committee reporting on this subject (B. F. Sarver, Penna., chairman) that all safe-ending should be done at the firebox end, thereby always having good and new material at the place it is most needed. It is necessary to keep these large flues tight at all times to obtain successful results. The demands on a superheater flue at the firebox end are as great, if not greater than on an ordinary tube, and under some conditions, such as bad water and the failure to keep them absolutely clean, they are very liable to give trouble and require considerable work to keep them tight. There should not be more than one weld in these flues at any time, as old welds will give trouble. To do this it is necessary when safe-ending to cut the tubes as close to the tube sheet as possible; the first end should be 5 in. long, the second 8 in., the third 11 in. and the fourth 14 in., which is possible with the average flue welding machine.

The flue with the safe-end attached is heated in a furnace arranged to give a narrow flame on the joint to be welded. When at a welding heat the flue should be bumped against a water cooled iron block, inserted in the rear wall of the furnace, which will practically weld the tube while in the fire. It should then be placed on a welding machine which revolves around the tube. With such a machine the weld is made much quicker than in the machine that requires the tube to revolve, but it is claimed that the first type of machine will not leave a smooth finish on the inside which will cause the flue to clog rapidly. Also it is found hard to keep the two parts straight. The committee did not report as to which was the best type of machine and recommended further consideration of the subject.

Discussion.—Most of the members weld the superheater flues the same as smaller tubes and with good results. Some have safe-ended the front end of the tubes with good results, but the firebox end should be safe-ended where possible. Rollers are best for welding although the pneumatic hammer has been found satisfactory. Trouble has been experienced with a cold mandrel cooling the tube when welding.

EFFECT OF SUPERHEATERS ON THE LIFE OF FIREBOXES AND FLUES.

C. L. Hempel (U. P.), chairman, reported that the committee had gathered information from several railroads having engines equipped with superheaters of the Baldwin, Vaughn-Horsey and Schmidt type, the steam pressure ranging from 165 to 200 lbs., and that the committee is unable to find any well founded claim to show that superheating of steam has a detrimental effect upon the fireboxes or flues, but, to the contrary, it is shown that the life of the fireboxes and flues is prolonged considerably, from the fact that where steam is superheated the working pressure is reduced. However, there are many large engines carrying 200 lbs. working pressure with superheaters that show no ill effect on fireboxes or flues.

Discussion.—The superheater increases the life of the firebox due to lower boiler pressure and less water evaporated. One member reported a failure of a superheater pipe on account of its damper not being used. General opinion favored the use of the damper. Welding the superheater tube end in the firebox increases the life.

MR. QUAYLE'S ADDRESS.

Robert Guayle, superintendent motive power and machinery, Chicago & North Western, addressed the convention Wednesday morning. He urged the members to participate more freely in the discussions and to bring new ideas to the convention each year. They should know just what kind of material was being used in the shop, and what was the best material for each purpose. Information along these lines should be sought for in books and from experts. He commented on the ill effects of punching sheets and predicted a discontinuance of the practice. Special care should be taken when laying-out so as to avoid the use of drift pins. Boiler makers should be honest and fair to themselves and not allow bad work to go out of the shop. Treat the government inspectors fairly and aid them in their work, for the locomotive boiler inspection law is a great thing. Superheaters add to the life of the boilers and should be used on all locomotives. The more extensive use of welding in boiler work is to be commended.

Frank McNamany, assistant chief boiler inspector, urged the men to aid the government inspectors so as to get the best possible results. The law represents the best practice and is entirely practical.

OXY-ACETYLENE AND ELECTRIC WELDING FOR BOILER REPAIRS.

A. N. Lucas (C. M. & St. P.), chairman of this committee, reported the successful use of both these welding processes in many railroad shops. One of the greatest savings made with the oxy-acetylene process is the cutting out of old or damaged parts. Both processes are used for welding cracked sheets, patches, pitted shells and tubes, etc. Difficulty has been experienced in welding vertical cracks, but this has been overcome by making the patch oval instead of rectangular. Some railroads are cutting their superheater unit pipes and welding them with the oxy-acetylene process. The chief objection to the electric welding process is that no cutting can be done with it, and although it does very good welding it is not as fast as the oxy-acetylene.

Discussion.—Eight electric welding machines are in use on the Erie, and about 60 per cent. of the work done by them is on boilers. It is necessary to preheat the sheets, and steam jets are used for that purpose. The weld should be one-eighth inch thicker than the sheet. Patches are put on the flue sheets at all points and flues are also welded in.

On the Rock Island difficulty is experienced in making welds on flanges and in welding between flues and rivets in the tube sheet flange. Vertical welding is good for only two or three months. Apparatus for both oxy-acetylene and electric welding should be in each shop. Keep the parts to be welded clean and hammer the metal while hot. Eight tubes are welded per hour with electric welding on the Erie. Electric welding does not interfere with other work being done on the locomotive.

BEST DESIGN OF GRATE.

C. J. Murray (So. Pac.) strongly recommended the rocking finger grate for bituminous coal-burning engines. On the Chicago & North Western a close meshed grate, similar to what is used on the hard coal burning engines on the Delaware, Lackawanna & Western, is used on locomotives burning lignite with good success. On oil burning engines there are no grates, but the ash pan, or brick pan as it is called, must be absolutely air tight.

F. D. Timms (C. H. & D.) also recommended rocking finger grates, the fingers to be 6 in. in length and the dump grates at the rear of the firebox. A good steady fire can be maintained on these grates, and when dumping the fingers will crush the clinkers, and at the same time force them into the ash pan.

EFFECT OF CHEMICALLY TREATED WATER ON BOILERS.

The committee, of which A. E. Shaule (D. M. & N.) was chairman, sent out questions to the members from which it was determined that good results had been obtained from the use

of soda ash and caustic soda. There is some difference of opinion as to benefits derived from treated water as a preventive of corrosion. One member reported the use of a polarized metallic preparation, applied direct to the boilers in bars distributed over crown sheet and tubes before closing the boiler and after each washout. This produces an effect more mechanical than chemical; it has an affinity for the material the boiler is made of and forms an amalgam over the boiler plates and tubes which prevents scale forming, also in the case of dirty or scaly boiler the fissures in the scale render it susceptible to removal because the material gets access to the plates and tubes through them, resulting in the scale becoming rapidly loosened and removed, falling to the mud ring or to the bottom of the boiler under the tubes, where it is blown or washed out. Local conditions govern the application of the treatment.

Investigation shows that increased mileage between washouts is obtained by using treated feed water.

Reports indicate that the life of the flues and fireboxes has been lengthened from 150 to 500 per cent. by using treated water. There is also a substantial decrease in cost of maintenance and running repairs.

The use of soda ash will cause trouble to injectors, discharge pipes and check valves. It will also require a larger amount of cylinder lubrication, but such expense is offset by the reduced cost of boiler maintenance.

The cost of treating water is 4 cents per 1,000 gals. on the Santa Fe; and 2 to 5 cents, according to conditions, on the Canadian Pacific. The polarized treatment costs about 3 cents per 1,000 gals.

OTHER BUSINESS.

J. F. De Voy, assistant superintendent motive power, Chicago, Milwaukee & St. Paul, made an address at the closing session on Thursday morning, and the election of officers was held. The report of this session was not received in time for publication in this issue, but will be noticed next week.

FUEL FAMINE IN RUSSIA.—There has been great scarcity of fuel in Russia, and this has seriously interfered with the development of the industries of the country, which are increasing faster than the production and supply of fuel. In consequence, the government proposed to permit the importation to Russia, without duty, of coal from abroad, chiefly for the needs of the railroads.

BAGGAGE RATES IN GERMANY.—No special provision is made in the regulations of the German railways relative to the cost of shipment of samples accompanying commercial travelers, baggage of this class receiving the same consideration as that enjoyed by the traveling public generally. There is no exemption of any character for baggage shipped over the German railway system other than an allowance of 55 lbs., which the traveler is allowed to carry with him in his compartment. Baggage checked to destination is subject to the payment of a rate which varies according to the zone and weight. There are 14 zones, the first having a distance of 15.5 miles and succeeding zones increasing by 31 miles each, up to 497 miles, beyond which distance there is a flat rate which varies only with the weight of the baggage.

FRENCH TRANS-AFRICAN RAILROAD.—The French project for a trans-African railroad from Algiers to Cape Town, using the Belgian-English line from Stanleyville to Cape Town, took rather definite form last year by the incorporation of L'Union Française pour la Realisation des Chemins de Fer Trans-African. In January, 1912, an expedition to make a preliminary survey from Colomb-Bechar, the present southern terminus of the Algerian railroad, to Lake Tchad, started out from the former point. The engineer who arrived at Lake Tchad in September is said to believe that the crossing of the Sahara desert presents no unsurmountable difficulties. From Lake Tchad the line will presumably follow the divide between the Shari and Nile basins and will enter the Belgian Congo at Semio on the Bomu river, from there going to Stanleyville.—*Mining and Scientific Press.*

General News.

Natural gas has been found near Medicine Hat on the Canadian Pacific, the first well throwing out about 2,000,000 ft. a day.

The New York, New Haven & Hartford now has 402 former employees on its pension roll, and the monthly payments amount to $158,941.

An anti-pass bill, amended to permit members of the legislature, their families and one clerk or secretary to receive free railway transportation, has been reported favorably by a committee of the Illinois house.

The large shops of the New York, New Haven & Hartford at Readville, Mass., are now running eight hours a day, five days a week; a reduction in the time of most of the men of fourteen hours a week.

The Nebraska state board of equalization has fixed the valuation of the Union Pacific property in the state at $81,192,530, an increase of $3,060,368 over that of last year. The main line valuation was increased $5,000 per mile.

The train accident near Sewell, W. Va., May 20, noticed in our last issue, did not occur on the Chesapeake & Ohio, as reported in the press despatches, but was on a narrow gage line of the Beury Coal & Coke Company.

The Brotherhood of Railway Trainmen, in convention at San Francisco, has adopted resolutions contemplating an effort to obtain additional safety legislation, including a requirement for couplers operated from both sides of a car, and amendments to the hours of service law.

The new office building of the Canadian Pacific Railway, on the corner of King and Yonge streets, Toronto, will be opened next month. This building is 16 stories high and is spoken of as the highest office building in the British Empire. The building is fireproof, 82 ft. x 90 ft.

The Baltimore & Ohio announces that after June 1 its employees will be paid semi-monthly. Laws requiring employees to be paid twice a month have lately been enacted in Pennsylvania and in Indiana; and the company has decided to extend the same practice to other states.

Reports that the Pennsylvania Railroad intends to use a wireless telegraph between Philadelphia and Pittsburgh have again been published. There seems to be no foundation for the statement that the road will establish such a system; but it has a wireless apparatus at Philadelphia and communications have been sent by it to Harrisburg.

A bill before the legislature of Connecticut makes compulsory one day of rest in seven for train despatchers, telegraph operators, towermen and ticket sellers; and representatives of the Order of Railroad Telegraphers have presented to members of the legislature a memorial giving a list of stations in the state at which men, 648 in all, have to work seven days in a week.

Congressman Neeley, of Kansas, has introduced in the House a resolution directing the attorney general to proceed against the Missouri Pacific to recover $3,362,346 due on subsidy bonds advanced by the government in aid of the construction of the Central Branch of the Missouri Pacific. Mr. Neeley has also made a formal request, direct to the attorney general, that action be taken.

Railway mail clerks, said to number 8,000, have sent to the postmaster general a petition asking that white mail clerks be not required to work in the same cars with negro clerks. It is declared that in some instances whites are subject to the authority of negro superiors. A special protest was made, because on long runs members of the two races frequently have to share the same sleeping quarters.

The Missouri, Kansas & Texas has appointed a valuation committee, with S. B. Fisher, chief engineer of construction, as its chairman. It is announced that the work of the committee will be to ascertain and report in detail as to all property owned or used by the railway, the original cost to date, the cost of reproduction new, the cost of reproduction less depreciation, and analysis of the reasons for their differences.

New rules of the pension department of the Frisco Lines have been issued which provide that after July 1, men inexperienced in railway work who are over 35 years of age, and experienced men over 45 years of age will not be employed, except that provision is made for temporary service, irrespective of age, at the discretion of the president, and the age limit will not be enforced in the case of services requiring professional qualifications.

Telegraphers of the Erie Railroad continue to give out statements to the effect that a strike is impending. After hearing the representatives of the operators a month or two ago, the company made an increase in pay, but the brotherhood leaders now say that the new rates are unsatisfactory; and they declare that a strike vote has been taken, and that it shows that 97 per cent. of the operators have voted to sustain their leaders in a strike if such action shall be found desirable.

A press despatch from Martinsburg, W. Va., May 26, reports that nine workmen were killed and four injured by being struck by an eastbound passenger train of the Baltimore & Ohio at Doe Gully, W. Va., on that day. The victims were workmen for contractors engaged on the Magnolia improvement, and they were running from a blast. In getting away from the danger of the blast, and at the same time avoiding a westbound freight train, they ran in the path of an eastbound passenger.

The Canadian minister of railways announced at Ottawa this week that a resolution will be introduced in the House of Commons providing for a great railway subsidy programme, the principal feature of which is a cash grant of $15,640,000 to the Canadian Northern. This will be divided into three parts, one of $6,400 a mile to the Canadian Northern Ontario towards the construction of the line from Toronto to Ottawa, not exceeding 250 miles, another of $12,000 a mile towards construction of the line from Ottawa to Port Arthur, not exceeding 910 miles, and another subsidy of $12,000 a mile towards construction of the road from Edmonton, Alberta, to the British Columbia boundary in the Yellowhead Pass, not exceeding 240 miles.

With the summer time table, going into effect this week, the Pennsylvania Railroad announces four new through passenger trains between New York and western points. Westbound these trains leave New York as follows: Pittsburgh day express 9:25 a. m., Commercial express 10:04 a. m., Panhandle limited 12:04 p. m., Chicago express 6:30 p. m. The last mentioned is a section of the St. Louis 24-hour train. The names of through trains are changed as follows: The Chicago Special will be known as the Metropolitan express; the Pennsylvania limited (heretofore running to Chicago, Cincinnati and St. Louis) will only go to Chicago; the Keystone express will be a new name for the Chicago and St. Louis express, starting at 2:04 p. m., and the second section of this train will be called the Panama-Pacific express; the Chicago limited will be known as the Manhattan limited.

The Minnesota Federation of Commercial Clubs at its seventh annual convention, at St. Paul, Minn., May 15, adopted a resolution: "That it is the conviction of this federation that more railroad construction, rather than more railroad legislation, is the great need of this state at the present time; that the legislature should not interfere with the freedom of action and initiative on the part of the carriers, and the laws tending to increase the cost of railroad service, without affording a compensating revenue, be condemned, and that this federation believes there should be at this time a sincere, state-wide effort for the encouragement of railroad extension, with special reference to the construction of lines that will permit the settlement of unoccupied areas, and the building up of a sentiment that will abate anti-railroad prejudice and create between the railroads and the business interests of this state, a pleasant working relation and a fellowship backed by fairness on both sides."

The committee of railroad presidents which has been formed to deal with the subject of valuation of property, under the recent federal law, conferred with the Interstate Commerce Commission in Washington on Tuesday of this week. A statement given out by the commission following the conference says that there was a general exchange of tentative views, but no determination of important points. "A cordial spirit of co-operation was manifested by the railroads," giving promise of the avoidance of many controversies that otherwise would arise, and promising also economy in the work and avoidance of needless duplication. The following railroad officers participated in the conference: Presidents Rea, of the Pennsylvania; Brown, of the New York Central; Willard, of the Baltimore & Ohio; Loree, of the Delaware & Hudson; Underwood, of the Erie; Baer, of the Reading; Finley, of the Southern; Emerson, of the Atlantic Coast Line; Harahan, of the Seaboard Air Line; Johnson, of the Norfolk & Western; Chairman Kruttschnitt, of the Southern Pacific; President Winchell, of the St. Louis & San Francisco; Vice-President Storey, of the Santa Fe; Presidents Bush, of the Missouri Pacific; Mudge, of the Rock Island, and Gardner, of the Northwestern; Vice-President Holden, of the Burlington, and Chairman Trumbull, of the Chesapeake & Ohio.

Automobile Record.

At the "bowl" course in Brooklands, England, May 27, W. G. Scott and L. G. Hornsted ran an automobile 914 miles, 1,920 ft., in 12 hours; or at the rate of 76.20 miles an hour, breaking all records for periods of seven hours and over.

British Railway Accidents in 1912.

The accident report of the British Board of Trade shows that in the calendar year 1912, the casualties due to train accidents amounted to 867, namely, 20 passengers and 6 employees killed, and 683 passengers, 154 employees and 4 other persons injured. The number of passengers killed is 6 larger than in the preceding year. Accidents of other kinds bring the total number of persons killed, in connection with the movement of trains, up to 1,011, and of injured to 8,700. Adding casualties in which the movement of cars or engines were not concerned, we have a total of 1,118 persons killed and 32,620 injured.

Banker Favors Rate Increase.

John J. Mitchell, president of the Illinois Trust & Savings Bank, Chicago, is quoted in a newspaper interview on the railway situation as follows:

"I fail to see, however, how we can have any of the old-time prosperity until the railroads are better treated than they have been and get what is their due. For years all their costs have been forced up and their revenues have been forced down. They are the largest employers of labor in the country and the treatment accorded them has not been fair. But I think there are better times in store for them.

"There is less opposition now to the 5 per cent. advance in freight rates which the eastern roads are asking than there was. If it is granted it will be a great help. Another would be a decision favoring the railroads in the Minnesota rate case. That and the increase in freight rates would go a long way in helping to re-establish the credit of the railroads and would enable them to secure the funds required for the important work they have on hand."

Railway Committees Confer with Shippers on Rate Advance.

The eastern railways that are negotiating with the Interstate Commerce Commission for 5 per cent. advance in freight rates have appointed a number of committees of traffic officers to confer with the shippers in many of the most important business centers affected, in the endeavor to secure their co-operation. A committee composed of George F. Randolph, vice-president of the Baltimore & Ohio; George D. Dixon, vice president of the Pennsylvania, and J. M. Fitzgerald, president of the Western Maryland, conferred with the committee of the Merchants' and Manufacturers' Association of Baltimore for this purpose, on May 16, and another committee composed of W. C. Maxwell, general traffic manager of the Wabash; William Hodgdon, freight traffic manager of the Pennsylvania Lines; George H. Ingalls, freight traffic manager of the New York Central lines west; W. B. Biddle, vice-president of the St. Louis & San Francisco; B. C. Stevenson, vice-president, Toledo, St. Louis & Western, and C. L. Thomas, freight traffic manager of the Baltimore & Ohio Southwestern, held a conference with the transportation committee of the Business Men's League of St. Louis on May 23. Similar conferences were held on May 20 with representatives of the Illinois Manufacturers' Association at Chicago and with representatives of the shippers' organizations at Indianapolis on May 20. A committee will visit Boston.

Master Boiler Makers' Association.

Among the exhibitors at the convention of the Master Boiler Makers' Association, held at the Hotel Sherman, Chicago, May 26-29, were the following:

American Arch Company, New York.—Displaying Security brick arch and Games locomotive furnace. Represented by Le Grand Parish, G. M. Bean, J. J. Anthony, Jno. P. Neff, Chas. Coons, W. L. Allison, F. G. Boomer, M. K. Tate, Geo. Wagstaff, J. M. Horine, C. E. Miller, C. F. Pfeiffer and G. C. Denney.

American Flexible Bolt Company, Pittsburgh, Pa.—Displaying boiler staybolts. Represented by C. A. Seley.

Burden Iron Company, Troy, N. Y.—Displaying engine and staybolt iron and Burden rivets. Represented by G. H. Pearsall, Fred Gardner, J. G. Kirby, F. L. Nicholson, M. C. Beymer, E. S. Richardson and A. W. Whiteford.

Carbon Steel Company, Pittsburgh, Pa.—Displaying firebox and boiler steels, nickel and nickel crown alloy steels. Represented by E. K. Harris, H. W. Tennell and J. P. Williams.

A. M. Castle Co., Chicago.—Displaying Luken pressed steel cover plates. Represented by L. M. Henoch, W. B. Simpson, C. M. Chamberlain, A. C. Castle and George Boyce.

Champion Rivet Company, Cleveland, Ohio.—Displaying Victor rivet and M. C. B. knuckle pins. Represented by D. J. Champion and W. H. S. Bateman.

Chicago Pneumatic Tool Company, Chicago.—Displaying new type electric drill for heavy flue rollers, pneumatic and electric tools. Represented by C. E. Walker, Jno. Campbell, Michael O'Connor, T. G. Smallwood, J. W. McCabe, Edward Aplin, Pete Flavin, J. L. Canby and C. Priddy.

Cleveland Pneumatic Tool Company, Cleveland, Ohio.—Displaying Bowes hose couplers, Cleveland ball bearing air drills. Represented by H. S. Covey and C. J. Albert.

Cleveland Steel Tool Company, Cleveland, Ohio.—Displaying punches, dies, rivet sets and chisel blanks. Represented by R. J. Vernning, V. D. Gilmore and W. S. Barnes.

Dearborn Chemical Company, Chicago. Represented by C. B. Hennessey, A. W. Cruch, J. F. Franey, J. D. Purcell and J. H. Cooper.

J. Faessler Manufacturing Company, Moberly, Mo.—Displaying boiler flue expanders, flue cutters, etc. Represented by J. W. Faessler, C. F. Palmer, G. R. Maupin and F. E. Palmer.

Flannery Bolt Company, Pittsburgh, Pa.—Displaying Tate flexible staybolt. Represented by J. R. Flannery, B. E. D. Stafford, Tom R. Davis, Wm. Wilson, Thos. Leahy and Geo. Howard.

Globe Seamless Steel Tubes Company, Chicago.—Displaying Globe seamless steel tubes. Represented by Harrison L. Davies and Geo. Thust.

Hilles & Jones, Wilmington, Del.—Displaying catalogs and circulars of their output. Represented by Wm. H. Connell, Jr.

Inland Steel Company, Chicago. Displaying open-hearth rivets. Represented by Herbert L. Hart.

Independent Pneumatic Tool Company, Chicago.—Displaying new turbine drill and other pneumatic tools. Represented by Jno. D. Hinley, Robt. T. Scott, Jno. P. Bourke, Harry Tinney, Geo. Wilson and Fred Passins.

Ingersoll-Rand Co., New York.—Displaying Little David riveting hammers and drills. Represented by Chas. Dougherty, J. P. Gillies, L. J. Davis and J. D. Rathburn.

Jacobs-Shupert U. S. Firebox Company, New York.—Displaying Jacobs-Shupert sectional firebox. Represented by C. B. Moore, G. H. Pearsall, M. C. Beymer, A. W. Whiteford, W. L. Bean, J. C. Reid, Fred Gardner, J. L. Nicholson, F. W. Peterson and J. G. Kirby.

Liberty Manufacturing Company, Pittsburgh, Pa.—Displaying Cyclone tube cleaners. Represented by Charles C. Hughes and S. A. Bockins.

Locomotive Superheater Company, New York.—Displaying section of superheater flue, set in back and front, showing prossers and rollers for superheater flues. Represented by Gilbert E. Ryder, C. A. Schaff and Jno. Bell.

Lovejoy Tool Works, Chicago.—Displaying boiler tube expanders, beading tools and boiler shop small tools. Represented by W. H. Danzell and T. H. Lovejoy.

Mudge & Co., Chicago.—Displaying spark arrester. Represented by S. S. Lawson and J. J. Winchell.

Christopher Murphy & Co., Chicago.—Displaying Carter's stayholt iron and O'Neill rapid tube cutter. Represented by Christopher Murphy.

Oxweld Railroad Service Company, Chicago.—Displaying oxy-acetylene welding and cutting apparatus. Represented by C. B. Noore, G. H. Pearsall, M. C. Beymer, W. L. Bean, A. W. Whiteford, F. W. Peterson, J. C. Reid, Fred Gardner, J. L. Nicholson and J. G. Kirby.

Parkesburg Iron Company, Parkesburg, Pa.—Displaying Parkesburg charcoal iron boiler flues, charcnal iron superheater flues and swaging and swelling of same. Represented by Geo. Thomas, C. L. Hampton, H. C. Hunter, J. H. Smyth, W. H. S. Bateman and L. P. Mercer.

Pittsburgh Steel Products Company, Pittsburgh, Pa.—Displaying cold drawn seamless steel boiler tubes. Represented by Chas. R. Phillips and Cyrus R. King.

Joseph T. Ryerson & Son, Chicago.—Displaying model punch in operation, drills, tube expanders, etc. Represented by E. T. Hender, J. T. Corbett, A. M. Mueller, J. P. Moses, C. E. Pynchon, Geo. Merrill and L. H. Bryan.

Siemmond & Wenzel Electric Welding Company, New Ynrk.—Displaying electric welders. Represented by L. S. Smith and G. S. Stuart.

Scully Steel & Iron Company, Chicago.—Displaying everlasting blow-off valve used by 36 leading railroads, guaranteed drop tight for two years; 200,000 working. Represented by Geo. Mason, Jr., Geo. A. Cameron, Andrew Verschuur and W. I. Jones.

The Pearsall Company, New York.—Displaying high speed drills, sectional roller expanders, reamers, etc. Represented by G. H. Pearsall, Fred Gardner, J. G. Kirby, F. L. Nicholson, M. C. Beymer and E. S. Richardson.

Vulcan Engineering Sales Company, Chicago.—Displaying Hanna riveter. Represented by Jas. T. Lee, J. T. Georgeson and W. H. Huelster.

United States Graphite Company, Saginaw, Mich.—Displaying Mexican boiler graphite. Represented by H. C. Woodruff, J. G. Drought and J. W. Eviston.

Worth Bros. & Co., Coatesville, Pa.—Displaying steel plates and iron tubes. Represented by B. A. Clements and C. A. Keenan.

M. M. and M. C. B. Enrollment Committee.

The work of the Enrollment Committee of the M. M. and M. C. B. conventions to be held at Atlantic City, N. J., June 11-18, has been arranged and will differ from the practice in recent years. Two new rules have been adopted as follows:

Badges for members of the M. M. or M. C. B. associations or special guest badges will not be given to any but the rightful owners. No member of the Railway Supply Manufacturers' Association will be permitted to take one for delivery except upon the owner's written order and the receiver must sign for said badge.

No badges will be issued to members of the M. C. B. association except on the payment of a fee of one dollar ($1.00); M. M. and special guest badges will be issued to those entitled to them free of all charge until noon, Saturday, June 14, at which time M. M. badges will be withdrawn and a charge of one dollar ($1.00) made for all special guest badges, except that a member of the M. M. association taking out a special guest badge and paying the fee of one dollar will be given his M. M. badge gratis; likewise members of the M. M. association who are also members of the M. C. B. association can get their M. M. badge by paying for the M. C. B. badge.

The work of the committee has been so arranged that enrollment will be possible at almost any time of day throughout the conventions. The committee has been divided into three shifts, each of which will report for duty according to a regular schedule so that although the committee will be represented during a much greater part of the time than has previously been the case the individual members will not have longer hours than before. The system of enrollment will be the same as that used in 1912 and the members of the Railway Supply Manufacturers' Association will be enrolled as heretofore.

The committee is made up as follows: F. N. Bard, Barco Brass & Joint Co., Chicago; F. E. Beal, Magnus Metal Co., Atlanta, Ga.; C. W. Beaver, Yale & Towne Manufacturing Co., New York; Harold A. Brown, *Pocket List of Railroad Officials*, New York; E. Bjerregaard, *Official Guide*, New York; Charles H. Gayetty, Quaker City Rubber Co., Philadelphia, Pa.; R. F. Moon, Westinghouse Electric & Manufacturing Co., Philadelphia, Pa.; H. G. Newman, The H. W. Johns-Manville Co., New York; E. T. Sawyer, Commercial Acetylene Railway Light & Signal Co., New York; Benjamin A. Smith, W. H. Coe Manufacturing Co., Providence, R. I.; F. H. Smith, Gold Car Heating & Lighting Co., New York; J. A. Stevens, F. W. Devoe & C. T. Raynolds Co., New York.

International Railway Fuel Association.

Among the exhibitors at the convention of the International Railway Fuel Association held in Chicago, May 21-24, were the following:

Dickerson Manufacturing & Supply Company, Clinton, Ill.—Bull's eye water gages. Represented by C. Dickerson.

Goodman Manufacturing Company, Chicago.—Photographs of electric coal cutting machines and electric mining locomotives. Represented by F. S. Mott and H. H. Small.

Hawkes Boiler Company, Chicago.—Model of Hawkes boilers. Represented by C. W. Hawkes and H. E. Wallis.

Link Belt Company, Chicago.—Photographs of coal tipple, coal crushers, chain retarding conveyors, coaling stations and locomotive cranes. Represented by J. C. Nelleger.

Locomotive Superheater Company, New York.—Photographs of Schmidt superheaters. Represented by G. E. Ryder, F. A. Schaff, W. G. Tawse, R. M. Osterman and W. Boughton.

Manistee Iron Works, Chicago.—Model of Continental chain grate stoker for stationary boilers and Rees Roturho centrifugal pump. Represented by Henry Vick.

Mudge & Co., Chicago.—Mudge-Slater spark arresters. Represented by B. W. Mudge, S. S. Lawson and J. J. Winchell.

National Graphite Lubricator Company, Scranton, Pa.—Model of graphite lubricator and photographs showing installations. Represented by L. S. Waters.

Ogle Construction Company, Chicago. Model of automatic all-steel locomotive coaling station. Represented by R. A. Ogle and C. F. Bledsoe.

Parsons Engineering Company, Wilmington, Del.—Photographs of Parsons system of combustion in locomotive fireboxes showing elimination of smoke. Represented by W. H. Savery.

Roberts & Schaefer Co., Chicago.—Photographs of Holmen coaling stations in concrete, steel and wood. Represented by C. P. Ross, E. E. Barrett, Frank Schroeder, James Shannon and W. R. Roberts.

G. L. Simonds & Company, Chicago.—Dean arch tube cleaner, Vulcan soot cleaner for water and fire tube boilers, Eclipse smoke indicators, Hayes gas analyzing instruments and draft gages. Represented by F. A. Moreland.

T. W. Snow Construction Company, Chicago.—Photographs of coaling stations. Represented by T. W. Snow, R. A. Blake and M. D. Miller.

U. S. Graphite Company, Saginaw, Mich.—Mexican boiler graphite. Represented by H. C. Woodruff, J. G. Drought and J. W. Eviston.

George D. Whitcomb Co., Rochelle, Ill.—Photographs of gasolene motors for mine haulage. Represented by J. H. Coley.

Association of Railway Telegraph Superintendents.

Among the exhibitors at the convention of the Association of Railway Telegraph Superintendents, held at the Hotel Statler, St. Louis, May 20-23, were the following:

Automatic Electric Company, Chicago.—Private branch exchange telephone systems, standard Keith line switch type board, individual connection type board, telephone train despatching selector system, Holtzer-Cabot motor-generator sets, and Raven Brand supplies. Represented by J. H. Finley.

Bunnell & Co., Inc., New York.—Goldbug vibrating transmitters and C. O. A. relays. Represented by J. J. Ghegan.

Central Electric Company, Chicago.—Indirect lighting system, and demonstration of Alexalite system of illumination, Okonite wire and tapes, Columbia lamps, Maxolite weather proof reflectors, etc. Represented by J. Lorenz and G. M. Cox.

Thomas A. Edison, Inc., Orange, N. J.—Primary battery sets. Represented by E. E. Hudson, F. J. Lepreau and P. A. Garrity.

Electric Time Recorder Company, Chicago.—Mastron time system, embracing master mechanisms, secondary clocks, time recorders, etc. Represented by Andrew Nilson and F. W. Straub.

Gottschalk Waterproof Sanitary Transmitter Company, New York.—Waterproof transmitters. Represented by W. J. Lowrie, Jr.

Hall Switch & Signal Company, New York.—Telephone arms and Gill and Sandwich selectors. Represented by W. E. Harkness, J. L. Moore and W. L. Cook.

National Electric Specialty Company, Chicago.—Vacuum lightning arresters.

National India Rubber Company, Bristol, R. I.—Represented by A. P. Eckert.

Railway Electric Manufacturing Company, Chicago.—Alternating current selectors. Represented by H. O. Rugh.

Remington Typewriter Company, New York.—Typewriter with a Wahl adding and subtracting machine. Represented by M. K. Deale.

Western Electric Company, New York.—Selector apparatus, wireless telegraph set for emergency purposes, vacuum protectors, telegraph and telephone jack boxes, and two types of Thompson-Levering Wheatstone bridges. Represented by G. K. Heyer, R. F. Spamer, R. N. Hill, J. A. Kiek, E. V. Adams and G. E. Cullinan.

Railway Signal Association.

The next meeting of the Railway Signal Association will be held at Hotel Astor, Broadway and Fourty-fourth street, New York, on June 11 and 12. Reports will be presented by Committees 2, 3, 4, 5, 6, 8 and 10. Committee No. 2 will submit proposed standard drawings of switch layouts, with different arrangements of facing point locks and detector bars. Committee No. 3, Power Interlocking, will submit specifications for the installation of vitrified clay conduit, and will propose reconsideration of action taken in 1911 on circuit plans for electric interlocking. Committee No. 4 will submit specifications for d. c. interlocking relays and for vibrating highway crossing alarm bells; and will propose changes in the existing specifications for d. c. relays. Committee No. 5 will propose additions to and revisions of the information now on record concerning the manual block system, including three drawings. Committee No. 6 will submit drawings of six new standards; crank stands, pipe carrier side, details and assembly of pipe carriers; assembly of bolt lock, and position of detector bar and location. Committee No. 8 will propose additions to the existing specifications for electric railway signaling; including impedance bonds and single phase track transformer; also for switch boards.

Committee No. 10 will submit specifications for lead type stationary storage battery.

J. E. Saunders will present a paper on selection of motor generators for use as frequency converters, 60 to 25 cycles, and another on 25 cycle versus 60 cycle a. c. power for railway signaling.

Signal Appliance Association.

There will be a meeting of the Signal Appliance Association at the Hotel Astor, New York, on June 11, in connection with the meeting of the Railway Signal Association which will be held at the same place, June 11-12.

The Signal Appliance Association has extended to the members of the Railway Signal Association an invitation to participate in an excursion on the afternoon of June 11 around the water front of New York, both North and East rivers, thence down the coast to Rockaway Point and landing at Coney Island for a shore dinner. The boat, which has been specially chartered for the occasion, will not leave Coney Island for New York until late in the evening.

Western Railway Club.

Officers of the Western Railway Club have been elected as follows: President, Henry Larue, formerly of the Rock Island Lines; first vice-president, W. B. Hall, Union Railway Equipment Co., and second vice-president, E. W. Pratt. Three new directors were also elected as follows: C. J. Olmstead, Westinghouse Air Brake Co.; J. H. Tinker, superintendent motive power, Chicago & Eastern Illinois, and H. H. Harvey, general car forewarder, Chicago, Burlington & Quincy.

American Society for Testing Materials.

The sixteenth annual convention of the American Society for Testing Materials will be held at the Hotel Traymore, Atlantic City, N. J., June 24-28.

Freight Rate Increases in England.

The railway companies of Great Britain have given notice that the general increase in freight rates which they have been authorized by the government to make, in consequence of the increase in wages of employees which had to be made two years ago, will be put in force July 1 next. Although the agreement with the government was made in August, 1911, the change in the law which gives the necessary authority was only completed a few weeks ago. It is said that, even after the contemplated increase, the rates will still be within the maximum tariffs prescribed by Parliament prior to 1894.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 19, 1914, St. Louis.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York. Annual meeting, October 14-15, Philadelphia, Pa.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, November 19, 1913, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June 16, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Summer meeting, June 25-26, Charlevoix, Mich.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillshurn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

Albert Weil, secretary and treasurer of the Louis Lipp Co., bath tub manufacturer of Cincinnati, has been sentenced by United States Judge Hollister to serve 60 days in prison for violation of the interstate commerce law, in falsely stating the weight of freight shipped.

Train Disaster in the Congo.

A press despatch of May 20 from Boma, Belgian Congo, reports 20 passengers and 3 trainmen killed by the falling of a train into the river from a bridge 150 ft. high. The entire train fell, and no person on it was saved.

Traffic Club of New York.

At the meeting of the Traffic Club of New York, held on May 27, two resolutions were offered by the Public Affairs Committee for adoption by the club. One of the resolutions was opposed to the clause in the Sundry Civil Bill which forbids any part of the appropriation made for the enforcement of the Sherman Anti-Trust Law, to be used in the prosecution of labor or farmers' organizations and the other urged that provision be made for the continuance of the Commerce Court. Both resolutions were unanimously adopted.

Traffic Club of Chicago.

J. F. Barron, general agent of the freight department of the Union Pacific, at Chicago, addressed the Traffic Club of Chicago on May 20, giving an interesting description of methods of handling L. C. L. freight at the local stations of the Illinois Central, of which he was until recently local freight agent. He described a new method, introduced since the strike last year, known as the multiple truck system, by which 5 to 15 trucks are used for each trucker, and instead of waiting for a truck to be loaded or unloaded the trucker takes another truck and handles another load, eliminating much of the empty truck movement and the enforced idleness of the truckers a large part of the time, which prevailed under the former system. Mr. Barron said that it had been demonstrated that this plan reduces the cost of floor movement about one-third, 50 per cent. of whatever saving is made being distributed among the freight handlers in the form of increased pay. He suggested that in the absence of mechanical carriers or moving platforms in the city terminals the efficiency of freight handling could be greatly increased by the establishment of large outer sorting platforms or warehouses where outbound package freight could be assembled and consolidated, and where the floor movement could be performed by mechanical devices.

The Traffic Club will hold its first outing of the season at the Beverly Country Club on Tuesday, June 3. The program includes golf and tennis tournaments, baseball game, and bridge for the ladies.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 143-A, giving a summary of car surpluses and shortages by groups from February 14, 1912, to May 15, 1913, says:

The total surplus on May 15 was 61,269 cars; on May 1, 53,977 cars; and on May 23, 1912, 123,683 cars. Compared with the preceding period; there is an increase in the total surplus of 7,292 cars, of which 4,949 is in box, 227 in flat, 24 in coal and 2,092 in miscellaneous cars. The increase in box car surplus is in all groups, except 9 (Texas, Louisiana and New Mexico), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The increase in flat car surplus is in all groups, except 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), and 10 (as above). The increase in coal car surplus is in all groups, except 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 7 (Montana, Wyoming, Nebraska and the Dakotas), and 10 (as above). The increase in

miscellaneous car surplus is in groups 1 (New England Lines), 2, 3 (as above), 4 (the Virginias and Carolinas), 5, 7 (as above), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), 9 (as above), and 11 (Canadian Lines).

The total shortage on May 15 was 10,975 cars; on May 1, 14,178 cars; and on May 23, 1912, 7,482 cars. Compared with the preceding period; there is a decrease in the total shortage of 3,203 cars, of which 3,273 is in box, 826 in miscellaneous, and an increase of 403 in flat and 493 in coal car shortage. The decrease in box car shortage is in all groups, except 10 (as above). The decrease in miscellaneous car shortage is in all groups, except 9 (as above). The increase in flat car shortage is in groups 4, 5, 9, 10 and 11 (as above). The increase in coal car shortage is in groups 2, 4, 5, 9, 10 and 11 (as above).

Compared with the same date of 1912; there is a decrease in the total surplus of 62,414 cars, of which 767 is in flat, 58,801 in coal, 2,847 in miscellaneous, and an increase of 1 in box car surplus. There is an increase in the total shortage of 3,493 cars, of which 963 is in box, 831 in flat, 1,577 in coal and 122 in miscellaneous cars.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report, and a diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

Summary of Revenues and Expenses of Steam Roads in March.

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for March are as follows:

The railways whose returns are included in this bulletin operate 222,086 miles of line, or about 90 per cent. of the steam railway mileage in the United States. Total operating revenues for the month of March, 1913, amounted to $241,048,818. Compared with March, 1912, the total operating revenues show an increase

CAR SURPLUSES AND SHORTAGES.

Date.	No. of roads.	Surpluses Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

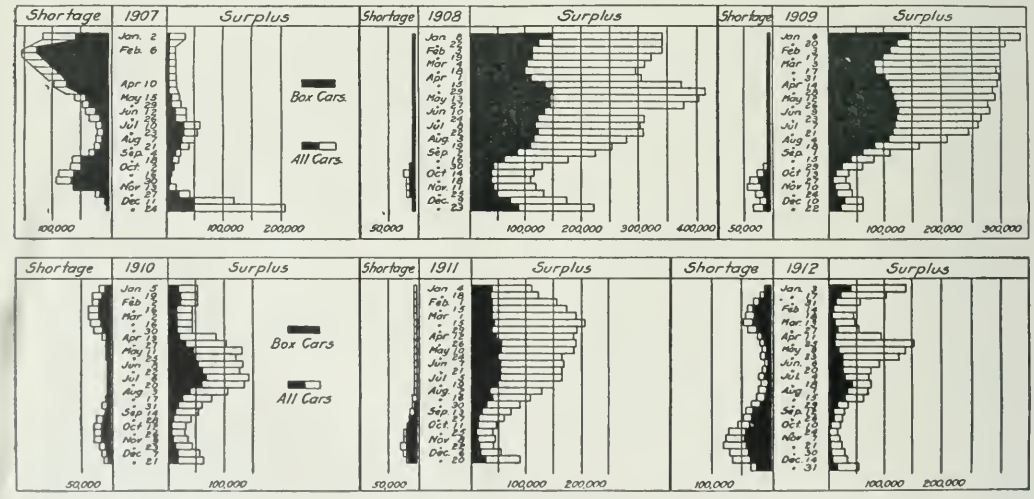
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

of $9,864,272. These total operating revenues per mile of line averaged $1,085 in March, 1913, and $1,051 in March, 1912, an increase of $34 or 3.2 per cent. Freight revenue per mile increased 1.2 per cent. and passenger revenue per mile 10.3 per cent.

Operating expenses amounted to $178,234,167. This was $14,104,236 more than for March, 1912. These operating expenses per mile of line averaged $803 in March, 1913, and $747 in March, 1912, an increase of $56 per mile, or 7.5 per cent.

Net operating revenue amounted to $62,814,651. This was $4,239,964 less than for March, 1912. Net operating revenue per mile of line averaged $283 in March, 1913, and $305 in March, 1912, a decrease of $22 per mile, or 7.3 per cent.

Taxes for the month of March amounted to $10,418,258, or $46.91 per mile, an increase of 7.7 per cent. over March, 1912.

Operating income averaged $235 per mile of line, and in March, 1912, $261, thus decreasing $26, or 9.9 per cent. Operating income for each mile of line for each day in March averaged $7.57, and for March, 1912, $8.41.

The operating ratio for March was 73.9 per cent., which is comparable with 74.4 per cent. in February, 1913, and 71.0 per cent. in March, 1912.

The railways of the eastern district show a decrease in total operating revenues per mile of line as compared with March, 1912, of 1.8 per cent., the railways of the southern district show an increase of 5.8 per cent., and the railways of the western district an increase of 8.5 per cent. Operating expenses per mile increased 7.6 per cent. on the eastern railways, 5.7 per cent. on the southern railways, and 8.6 per cent. on the western railways. For the eastern railways net operating revenue per mile decreased 25.0 per cent., for the southern railways it increased 6.2 per cent., and for the western railways it increased 8.5 per cent. The increase in taxes per mile was 7.8 per cent. in the eastern district, 6.9 per cent. in the southern district, and 8.0 per cent. in the western district. Operating income per mile decreased 31.3 per cent. in the East, while it increased 6.6 per cent. in the South, and increased 9.4 per cent. in the West.

Comparison of the returns for the nine months of the fiscal year with those of the corresponding months of the previous fiscal year reveals an increase in total operating revenues per mile of 9.4 per cent., an increase in operating expenses per mile of 8.9 per cent., and an increase in net operating revenue per mile of 10.5 per cent. This net operating revenue per mile of the eastern railways increased 6.5 per cent. as compared with the corresponding period of the previous year, that of the southern railways increased 5.9 per cent., and that of the western railways increased 16.3 per cent.

When the returns for the three months of the calendar year 1913 are compared with those of the corresponding months of 1912, they show an increase in total operating revenues per mile of 8.3 per cent., an increase in operating expenses per mile of 8.2 per cent., and an increase in net operating revenue per mile of 8.6 per cent. This net operating revenue per mile decreased 1.0 per cent. in the eastern district as compared with the corresponding period of the previous year, increased 16.4 per cent. in the southern district, and increased 16.0 per cent. in the western district.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1912 and of the calendar year 1913 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:

PER CENT. OF TOTAL OPERATING REVENUES.

	March,		Fiscal year ended June 30,		Calendar year ended December 31,	
	1913.	1912.	1912.	1911.	1912.	1911.

INTERSTATE COMMERCE COMMISSION.

The commission suspended from April 15 until October 15, certain revised pages of the tariff of the Canadian Pacific, which would advance rates on paper from Brownville Junction, Me., to Akron, Ohio.

The commission has suspended until October 14, certain tariffs which contain advances in rates on wheat from Kansas City, Mo., and other points to Edwardsville, Ill., Lawrenceville, Ill., and other points.

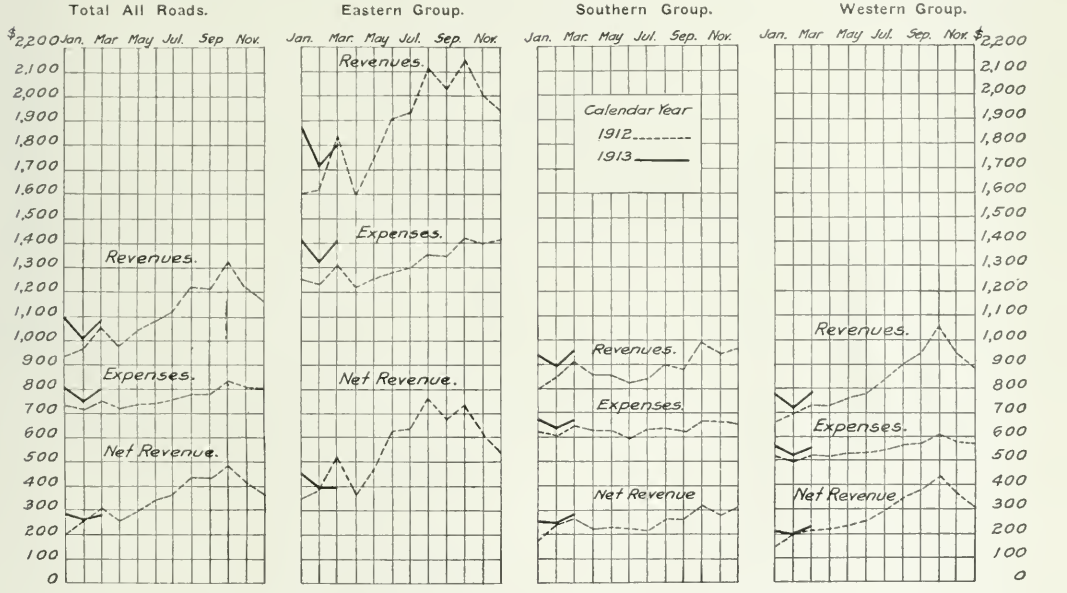
The commission has suspended from May 2 until November 1 certain tariffs, which proposed to advance class and commodity rates between points in Iowa and Minnesota and points in Pacific coast territory.

The commission has suspended from March 31 until September 30, the items in certain tariffs which would increase rates on flax tow, flax moss and flax fiber in carloads, from St. Paul, Minn., to Chicago, Kansas City, Mo.

The commission has suspended from May 2 until August 30 the item in a supplement to Agent F. A. Leland's tariff, which contains advanced rates on cotton seed and cotton seed products from points in Texas to New Orleans, La.

The commission has suspended from May 10 until September 6 the supplement to the tariff of the Alabama Great Southern which advances rates on logs, c. l., from stations located on the Alabama Great Southern to Chattanooga, Tenn.

The commission has suspended from May 1 until August 29 the schedules contained in certain tariffs, which proposed to



Monthly Revenues and Expenses Per Mile of Line in 1912 and 1913.

advance rates for the transportation of butter and eggs from Topeka, Kan., to Memphis, Tenn., and other points.

The commission has suspended from March 31 to September 30, certain tariffs which would increase rates on lumber from Memphis and other points to New Orleans and other destinations.

The commission has suspended from May 1 until November 1 the schedules contained in a supplement to the tariff of the Delaware & Hudson, which proposed to eliminate milling-in-transit privileges extended to shipments of corn milled or mixed at Oneonta, N. Y.

The commission has suspended until July 17 the schedules contained in certain tariffs, which proposed to cancel joint through class and commodity rates from and to stations on the Bangor & Aroostook on shipments routed via the Maine Central.

The commission has suspended from May 5 until September 2 the schedules contained in a supplement to Agent W. P. Emerson's tariff, which contain advances in class and commodity rates between New Orleans, La., and other points in the south and points in Illinois.

The commission has suspended from May 1 until November 1 certain schedules in a supplement to Agent C. H. Griffin's tariff, which proposed to advance charges for the refrigeration of carload shipments of fruits, vegetables, etc., between points in Colorado and Utah.

The commission has suspended until October 14, certain tariffs, containing new regulations governing the switching of coal and coke from the lines of certain carriers to certain stations on the Chicago, Milwaukee & St. Paul located within the limits of the Chicago switching district.

The commission has suspended from May 5 until September 2 the operation of the schedules in a supplement to the tariffs of the Southern Pacific, which propose to increase by $2 per 2,000 lbs. rates on lumber from certain points in California to El Paso, Tex., and other points.

Reparation Awarded.

G. L. Jubitz, assignee, v. Southern Pacific et al. Opinion by the commission:

The commission decided that the rate of $3.094 per gross ton for the transportation of coke from Wilkeson, Wash., to Salem, Oregon, was unreasonable to the extent that it exceeds $2.55 per gross ton, and prescribed that rate for the future. (27 I. C. C., 44.)

Complaint Dismissed.

E. I. DuPont DeNemours Powder Co. v. Pennsylvania Railroad et al. Opinion by Commissioner Harlan:

As the shipment involved in this case was delivered to the consignee on June 18, 1907, and as the complaint was not filed until July 15, 1909, the complaint is barred by the period of limitation fixed in the act. (27 I. C. C., 59.)

Milburn Wagon Co. v. Toledo, St. Louis & Western et al. Opinion by the commission:

In this case the complainant alleges that the rating of freight vehicles with springs, in carloads, in the Southern classification is unreasonable. The Southern classification now provides a second class rating with a minimum of 8,000 lbs. for 36 ft. cars and the complainant seeks to have the Southern classification so amended as to provide a fourth class rating with a minimum carload weight of 12,000 lbs. The commission decided that the present rating was not shown to have been unreasonable. (27 I. C. C., 63.)

Break-Bulk Rates on Grain.

In re investigation and suspension of advances in break-bulk rates by carriers for the transportation of grain and grain products from Milwaukee, Manitowoc, and Kewaunee, Wis., to Boston, Mass., New York, N. Y., Philadelphia, Pa., Baltimore, Md., and other points. Opinion by Commissioner Meyer:

The respondents failed to meet the burden of proof which the statute places upon them as to the reasonableness of the proposed advances in local, joint, and proportional break-bulk rates, domestic and export, on grain and grain products from Milwaukee, Manitowoc, and Kewaunee, Wis., to points in trunk line territory east of Niagara frontier, and the commission ordered them to cancel the suspended tariffs. (27 I. C. C., 78.)

Live Stock Rates Reduced.

Rock Spring Distilling Company v. Illinois Central et al. Opinion by Commissioner Meyer:

The complainant contends that the rates on cattle between Owensboro, Ky., and Kansas City, Mo.; East St. Louis, Ill.; Chicago and New York are unreasonable, compared with the rates from the same points to Evansville, Ind.; Louisville, Ky., and Cincinnati, Ohio. Reparation is asked. The present rate from East St. Louis to Owensboro is 21.7 cents per 100 lbs. The commission found that this rate was unreasonable to the extent that it exceeds 15 cents per 100 lbs. with a minimum weight of 20,000 lbs. and prescribed that rate for the future. The commission also decided that in future the rate from Chicago to Owensboro should not exceed $32 per car.

The commission found that the present rate from Owensboro to New York via Louisville was excessive, but no order could be issued, as the complainant had not joined as party defendants the carriers participating in the rates from Evansville to New York. Reparation was denied. (27 I. C. C., 54.)

Joint Rates on Plaster and Gypsum Rock.

In re investigation and suspension of advances in rates by carriers for the transportation of plaster, gypsum rock, stucco, plaster board, from Blue Rapids and Irving, Kan., to points in Arkansas, Kansas and Missouri. Opinion by Commissioner Harlan:

The defendant proposes to cancel joint through rates on plaster and gypsum rock from Blue Rapids and Irving, Kan., to destinations in Arkansas and Missouri. The cancellation of these rates would result in advances ranging from 2 cents to 7 cents per 100 lbs. The complainant asks the commission to require the defendant to continue to maintain the joint through rates now in effect. The commission found that the motive of the St. Louis & San Francisco in cancelling these joint through rates was to compel the consumers on its lines to purchase the commodity in question from the manufacturers whose plants were located along its lines, as it would then secure the entire revenue instead of sharing it with connecting lines on shipments from points of origin not on its own lines. The commission decided that this practice discriminated against the manufacturers who were not located on the lines of the St. Louis & San Francisco and ordered the defendant to withdraw the tariff which would cancel the joint through rates. (27 I. C. C., 67.)

STATE COMMISSIONS.

The Railroad Commission of Montana has issued an order making general reductions in freight rates on fruit and vegetables; and will hold a hearing on the subject on June 10.

The Missouri Public Utilities Commission has announced its construction of the anti-pass section of the act creating the commission, ruling that passes issued before July 1 can be used after that date only by persons excepted in the act.

The Illinois Central and the Yazoo & Mississippi Valley have filed a suit in the federal district court at Baton Rouge, La., attacking the constitutionality of the recent order of the Louisiana commission governing the flagging of trains. Among other points it is contended that by these rules the commission attempts to regulate interstate commerce.

COURT NEWS.

The International & Great Northern has asked the Texas Supreme Court for a rehearing on its recent decision when it issued an injunction to restrain the removal of the company's shops from Palestine, Tex.

The Chicago, Milwaukee & St. Paul has filed an appeal to the United States supreme court from a decision of the Wisconsin supreme court which upheld the Wisconsin law requiring that the upper berth in a sleeping car be kept closed unless it is sold.

The Colorado & Southern has appealed to the United States Supreme Court from the decision of the Colorado Supreme Court sustaining the Colorado Railroad Commission's action in ordering the road to restore service on its branch running over Boreas Pass.

In the federal court at Atlanta, Ga., May 23 in the case of the Georgia State Railroad Commission against the Seaboard Air Line, a decree, signed by Judge Newman, sustained the commission in its order requiring the construction of a connecting track at Lawrenceville, between the Seaboard Air Line and a branch of the Southern Railway.

The supreme court of the United States in a case against the Delaware, Lackawanna & Western has decided that a track laborer on that road is engaged in interstate commerce, and therefore that an injury to him comes under the federal law regulating compensation for injuries. It appears that at the time the man was injured he was hurt or endangered by two trains, one of which was not engaged in interstate traffic; and that because of this situation the railroad company denied the application of the federal law. The circuit court of appeals for New Jersey decided in favor of the road, but this opinion is now reversed. Justices Lamar, Holmes and Lurton dissented from the opinion of the majority.

Hours-of-Service Law Applies to Unwritten Train Orders.

The decision of the circuit court of appeals, at New Orleans, in the suit against the Houston Belt & Terminal Company, in the case of a towerman who conveyed oral train orders by telephone, was noticed in the *Railway Age Gazette*, May 16, page 1109. The head notes of this decision, in full, are as follows:

1. If a towerman gives to another towerman information over the telephone that trains have started, on receipt of which the second towerman must throw switches, line up tracks, and hold trains as a matter of duty and without discretion on his part, it is evident that these towermen use the telephone to despatch, report, transmit, and deliver orders pertaining to or affecting train movements.

2. An order affecting train movements may be given by a wave of the hand or the flash of a lantern, and its disobedience might cause as dire consequences as the failure to obey a written message.

3. To limit the word "orders" as used in the proviso in section 2 of the act to technical "train orders" emanating from the train despatcher's office would be to pervert the plain meaning of the statute.

4. Necessarily an order affecting train movements can be given by any subordinate having to do with trains and switches, such as a towerman.

5. The Government is not bound to negative the exception as to "case of emergency." The railroad must plead and prove facts which constitute such a defense.

The towermen in this case occupied towers about three quarters of a mile apart, near the main station in Houston. The line between the two towers is double track. From the testimony it appears that the time interval system is in use, and that actual operation of the space interval by the towermen takes place chiefly in cases where it is necessary to move trains on one track or the other in a direction opposite to the current of traffic.

As to the fifth point in the head note the court says:

"The railroad contends that the rulings of the court were correct because plaintiff did not negative that the acts and conduct of the defendant complained of came within the exception of the act, which reads as follows:

". . . in case of emergency, when the employees named in this proviso may be permitted to be and remain on duty for four additional hours in a 24-hour period on not exceeding three days in any week.

"The action, though for a penalty, is civil in its nature, and the pleader is not required to state his cause of action with the exactness and particularity that would be necessary in a criminal indictment. In the nature of things, in most cases arising under the act, facts bringing the case within the exception would be only within the knowledge of the railroad, and the government should not be required to allege that of which it knows nothing simply to conform to a mere technicality of pleading. If facts existed that would bring the case within the exception, they constituted a defense that the railroad should have pleaded and proved."

Railway Officers.

Executive, Financial and Legal Officers.

W. C. Logan, who recently resigned as secretary and auditor of the Wichita Valley, at Wichita Falls, Tex., has been appointed chief clerk to the auditor of the Ft. Worth & Denver City at Ft. Worth, Tex.

The officers of the Denver & Salt Lake, formerly the Denver, Northwestern & Pacific, are now as follows: Newman Erb, president; W. E. Morse, vice-president and general manager; Ward E. Pearson, treasurer; H. B. Blanchard, secretary, and E. W Meyer, auditor and assistant secretary.

J. F. Waddell has resigned as auditor for the receivers of the Denver, Laramie & Northwestern. J. L. Terry has been appointed general superintendent and auditor for the receivers, with headquarters at Denver, Colo. The office of superintendent for the receivers is abolished. Effective June 1.

A. H. Wheatley, assistant to the president of the Alaska Northern, and E. L. Davis, general superintendent, both with headquarters at Seward, Alaska, have resigned. Their duties will be assumed by A. W. Swanitz, chief engineer and manager, and H. Tozier, superintendent, with headquarters at Seward.

H. B. Myers, assistant general freight and passenger agent and assistant auditor of the Liberty White at McComb, Miss., has resigned, to accept service elsewhere, effective June 1, and traffic matters formerly handled by Mr. Myers will in future be handled through the office of W. M. White, president and general manager.

B. L. Winchell, president of the St. Louis & San Francisco, and Thomas H. West, chairman of the St. Louis Union Trust Company, have been appointed receivers of the St. Louis & San Francisco. W. J. Jackson, vice-president and general manager of the Chicago & Eastern Illinois, and E. W. Winter, of New York, formerly president of the Northern Pacific and later until 1911 president of the Brooklyn Rapid Transit Company, have been appointed receivers of the Chicago & Eastern Illinois.

H. S. Walker, whose appointment as auditor of Morgan's Louisiana & Texas Railroad and Steamship Company and the Louisiana Western, with headquarters at New Orleans, has already been announced in these columns, was born July 19, 1878, in Princess Ann county, Va. He entered the service of the Seaboard Air Line at the local agency at Richmond, Va., in 1900, and subsequently was made chief clerk. He removed to Fernandina, Fla., in 1902, retaining his position as chief clerk at that point. He went to the Gulf & Ship Island in 1904 as agent at Gulfport, Miss., resigning in 1906 to engage in mercantile business. Mr. Walker returned to railway service in 1908 with the Southern Pacific Lines in Louisiana, and has now been appointed auditor, as above noted.

Operating Officers.

Joseph M. Boyd, assistant general air brake inspector of the Northern Pacific, has been appointed trainmaster of the Fargo division at Fargo, N. D.

R. H. Dwyer, formerly trainmaster of the Illinois Central at McComb City, Miss., and later division superintendent of the Missouri Pacific at Pueblo, Colo., has been appointed superintendent of construction of the Tela Railroad, with headquarters at Tela, Honduras.

James Daniel Beaver, who has been appointed assistant superintendent of the Pittsburg, Shawmut & Northern, with office at St. Marys, Pa., as has been announced in these columns, was born on February 5, 1875, and began railway work as an operator on the Western New York & Pennsylvania, now a part of the Pennsylvania Railroad, and was later agent, and then despatcher on the same road. He left the service of that company to go to the Plant System of railways, now a part of the Atlantic Coast Line, and in 1901 went to the Pennsylvania Railroad as despatcher, resigning in 1905, to become assistant trainmaster on the Pittsburg, Shawmut & Northern, which position he held at the time of his recent promotion as assistant superintendent of the same road.

H. W. Stanley, whose appointment as general manager of the

Seaboard Air Line, with headquarters at Portsmouth, Va., has been announced in these columns, was born on February 13, 1874, at Petersburg, Va., and was educated at Lynchburg High School. He began railway work as a telegraph operator on the Norfolk & Western, and held various positions on the road until December, 1895, when he became chief clerk to the superintendent of the Southern Railway at Knoxville, Tenn. He went to the Seaboard Air Line in May, 1897, and has been in the continuous service of that road ever since, first as secretary to the general superintendent, and then consecutively chief clerk to the general superintendent and general manager, trainmaster, superintendent, superintendent of transportation, assistant general superintendent, general superintendent of transportation, and assistant general manager, which position he held at the time of his recent appointment as general manager of the same road as above noted.

H. W. Stanley.

J. F. Keegan, whose appointment as superintendent of the Chicago division of the Baltimore & Ohio, with headquarters at Garrett, Ind., has been announced in these columns, was born on March 29, 1870, at Cleveland, Ohio, and was educated at St. Columba's Academy, in his native town. He began railway work on November 1, 1895, with the Cleveland, Columbus, Cincinnati & Indianapolis as a telegraph operator, and in June, 1890, left that company to go to the Cleveland, Lorain & Wheeling, now a part of the Baltimore & Ohio, as telegraph operator and car distributor. From September, 1891, to May 15 of the following year, he was train despatcher of the same road at Uhrichsville, Ohio, and was then chief despatcher of the Baltimore & Ohio, at Cleveland. From September, 1903, to September, 1906, he was assistant trainmaster of the same road first at Cleveland and then at Wheeling, W. Va. In September, 1906, he was promoted to trainmaster at Parkersburg, W. Va., and in December, 1910, was transferred in the same capacity to Keyser, W. Va. On March 15, 1911, he was appointed division superintendent of the same road at Wheeling, and in October, 1911, was made superintendent of the Monongah division at Grafton, W. Va., which position he held at the time of his recent appointment as superintendent of the Chicago division, as above noted.

J. F. Keegan.

Traffic Officers.

H. Beardshaw has been appointed traveling agent of the Kansas City, Mexico & Orient, with headquarters at Pittsburgh, Pa.

John S. Hickey has been appointed soliciting agent of the Central of Georgia, with office at Chicago, succeeding George B. McGill, resigned.

H. B. Weatherwax has been appointed industrial agent of the Delaware & Hudson, with office at Albany, N. Y., succeeding I. H. Shoemaker, resigned.

H. C. Bush, who recently resigned as traffic manager of the Colorado Midland, has been appointed traffic manager of the Idaho & Washington Northern, with office at Spokane, Wash.

J. A. Morgan has resigned as commercial agent of the St. Louis Southwestern at Paragould, Ark., to become traffic manager of the National Cooperage Association, with headquarters at St. Louis, Mo.

W. S. Merchant, traveling passenger agent of the St. Louis & San Francisco, with headquarters at Cincinnati, Ohio, has been appointed division passenger agent at that place, succeeding J. F. Govan, who has been appointed general agent of the passenger department of the Chicago & Eastern Illinois.

W. I. Jones having been promoted to assistant general freight agent, in charge of solicitation, of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, the position of assistant general freight agent, in charge of coal traffic, is abolished. C. E. Warner is appointed coal traffic agent, with headquarters, St. Louis, Mo. Effective June 1.

L. D. Knowles, general agent of the Missouri Pacific, and the St. Louis, Iron Mountain & Southern, at Pittsburgh, Pa., has been promoted to assistant general freight agent, with headquarters at Omaha, Neb., succeeding C. E. Wagar, resigned. C. C. McCarthy, general eastern freight agent, at New York, succeeds Mr. Knowles, and J. B. Trimble, assistant general freight agent at St. Louis, Mo., succeeds Mr. McCarthy.

The following appointments on the Illinois Central are announced, effective May 15: C. C. Kunz, commercial agent at Dubuque, Iowa, in place of M. S. Beals, promoted; Ben Stone, traveling freight agent, with office at Bloomington, Ill., succeeding J. H. Lipsey, resigned to engage in other business; C. L. Netherland, traveling freight agent, with headquarters at Ft. Dodge, Iowa, in place of Mr. Stone; J. F. McMahon, traveling freight agent, with headquarters at Waterloo, Iowa, succeeding J. Rosenzweig, resigned to engage in other business; L. Huekels, contracting freight agent at Dubuque, vice J. F. McMahon, promoted; J. F. Ward, contracting freight agent at St. Louis, Mo.; J. B. Russell and B. E. George, contracting freight agents at Chicago.

Arthur Tipton Stewart, whose appointment as general freight agent of the Missouri Pacific, with office at Kansas City, Mo., has already been announced in these columns, was born May 11, 1872, at Humboldt, Kan. He received a high school education at Independence, Kan., and began railway work July 1, 1890, as stenographer for the Chicago, Rock Island & Pacific at Topeka, Kan. He went to the St. Louis Southwestern September 1, 1891, as secretary to the general manager, and in June of the following year he was made secretary to the freight traffic manager of the Missouri Pacific. Ten years later, on May 1, 1902, he was promoted to assistant general freight agent, and in September, 1908, he was appointed assistant to the vice-president in charge of traffic. In January of the present year Mr. Stewart was made assistant to the general traffic manager, with headquarters at St. Louis, Mo., and his recent promotion as general freight agent, as above noted, is effective on June 1.

A. T. Stewart.

Edward Henry Calef, whose appointment as general freight agent of the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, Mo., has already been announced in these columns, was born May 26, 1867, at St. Louis. He began railway work January 29, 1884, as messenger in the freight claim

department of the Missouri Pacific, and from October, 1893, to May, 1894, was chief clerk in the overchange division of that department. He was then for two years traveling freight claim adjuster, and from June, 1896, to November, 1897, was live stock agent for Indian Territory. The following year he was in the freight traffic department, and in December, 1898, was made chief clerk to the assistant general freight agent of the St. Louis, Iron Mountain & Southern at St. Louis. From November, 1899, to March, 1905, Mr. Calef was commercial agent at Sedalia, Mo., on the latter date being made division freight agent at Little Rock, Ark. In September, 1908, he was promoted to assistant general freight agent at St. Louis, which position he held until his appointment on May 20 as general freight agent, as above noted.

C. E. Perkins, who on June 1 became assistant general traffic manager of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, as announced in our issue of last week, was born in 1871 in Chicago. He began railway work in 1891 as office boy in the freight office of the Kansas City, Fort Scott & Memphis, at Kansas City, Mo. After five years of service with that road, principally as freight clerk, he went to the St. Louis & San Francisco as chief clerk to the general agent at Kansas City. In 1897 he was made chief tariff clerk for the Kansas City, Pittsburg & Gulf, now known as the Kansas City Southern. He was afterwards made chief clerk in the freight department, and later was appointed assistant general freight agent. For a time he was stationed at Texarkana, Ark., as assistant general freight agent and also as general freight agent of the Texas line of that road. In 1906 he was again transferred to Kansas City as assistant general freight agent, and in March, 1909, he went to the St. Louis, Iron Mountain & Southern as assistant general freight agent at St. Louis. He was made general freight agent of the Iron Mountain on January 1, 1910, and is now promoted to assistant general traffic manager of the Missouri Pacific system, as above noted.

C. E. Perkins.

Engineering and Rolling Stock Officers.

William J. Ridley has been appointed road foreman of engines of the Fargo division of the Northern Pacific at Fargo, N. Dak.

William H. Dyer has been appointed master mechanic of the Georgia & Florida, with headquarters at Douglas, Ga., succeeding E. C. Hanse, assigned to other duties.

R. G. Knight has been appointed roadmaster of the Northern Pacific at Staples, Minn., succeeding Philip McGuire, who has been retired and pensioned by the company.

G. A. Ziehlke has been appointed signal supervisor of the Kansas division of the Union Pacific, with headquarters at Kansas City, Mo., succeeding Frank W. Pfleging, promoted.

E. D. Jackson, assistant engineer of the Baltimore & Ohio at Baltimore, Md., has been appointed engineer of the Philadelphia division, with headquarters at Philadelphia, Pa., succeeding C. C. Cook, transferred to the Pittsburgh division.

E. C. Carter, chief engineer of the Chicago & North Western has been assigned to special duties in connection with valuation of property of the company and until further notice is relieved from active duties of his office, which will be discharged by W. H. Finley, assistant chief engineer.

Joseph McCabe, whose appointment as master mechanic of the Shore Line division of the New York, New Haven & Hartford with headquarters at Harlem River, N. Y., has been announced in these columns, was born on December 6, 1863, at New Rochelle, N. Y., and was educated in the public schools of his native town. He began railway work on August 11, 1881, with the New York, New Haven & Hartford and in 1885 was appointed fireman and later was made engineman. In December, 1902, he was promoted to road foreman of engines, and in January, 1907, was made master mechanic, becoming general road foreman of engines later in the same year. In April, 1912, he was appointed master mechanic of the Western division, and now becomes master mechanic of the Shore Line division of the same road as above noted.

Frank W. Pfleging, signal supervisor of the Kansas division of the Union Pacific at Kansas City, Mo., has been appointed signal engineer, with headquarters at Omaha, Neb., succeeding J. C. Young, deceased. Mr. Pfleging was born May 27, 1877, at Terre Haute, Ind. After graduating from high school he took the electrical engineering course at Rose Polytechnic Institute, graduating in June, 1901, with degree of B. Sc. Between the junior and senior years he was employed by the Chicago & Eastern Illinois as signal repairman, and in July, 1901, he went with the Union Pacific, where he was employed successively as draftsman, maintainer, foreman of interlocking, signal foreman, general signal foreman, until January 1, 1903. On the latter date he was made signal supervisor, with headquarters at Cheyenne, Wyo., and in February, 1912, he was transferred to Kansas City, Mo., in a similar capacity. His promotion to the position of signal engineer, as above noted, becomes effective on June 1.

F. W. Pfleging.

Purchasing Officers.

Lewis Mims, superintendent of the Sunset-Central Lines of the Southern Pacific at Lafayette, La., has been appointed fuel and timber agent of those lines, with headquarters at Houston, Tex., effective June 1.

L. B. Wood, general storekeeper of the Sunset-Central Lines of the Southern Pacific, will also assume the duties of purchasing agent, with headquarters at Houston, Tex., effective June 1. R. S. Stephens, who has held the position of purchasing agent for 25 years, has been retired on account of failing health and placed on the pension list of the company.

Special Officers.

The agricultural, industrial and immigration departments of the St. Louis Southwestern Lines have been consolidated, with W. R. Beattie in charge as agricultural and industrial commissioner. W. J. Doyle, heretofore in charge of the industrial and immigration department, has been assigned to other duties. P. T. Cole, L. E. Saupe and C. C. Rockenbach have been appointed assistants to Mr. Beattie, with such duties as may be assigned them by him. Headquarters, St. Louis, Mo.

OBITUARY.

Edwin O. Miller, commercial agent of the Chicago, Rock Island & Pacific at Lincoln, Neb., died in that city on May 20, aged 65 years.

Hon. George G. Crocker, chairman of the Boston Transit Commission, and for 20 years a member of that body, the commission which supervised the construction of the Boston subways, died at his home in Cohasset, Mass., May 26, at the age of 69. Mr. Crocker was chairman of the Massachusetts State Railroad Commission for four years, 1887-1891. He was graduated from Harvard College in 1864, and from the Harvard Law

School in 1866. He was a man of high character and has been a member of the state legislature six terms, during one of which he was president of the senate.

Alexander Forsyth, superintendent of shops of the Chicago, Burlington & Quincy at Aurora, Ill., died on May 19, at the St. Charles hospital, Aurora, aged 68 years. Mr. Forsyth was born in April, 1845, in Cumberland county, England. His entire railway service was with the Chicago, Burlington & Quincy, with which road he commenced work in 1869 as a machinist. From October, 1880, to October, 1881, he was general foreman at Beardstown, Ill., and then became master mechanic at that point. In January, 1887, Mr. Forsyth was transferred to Aurora as master mechanic, which position he held until March, 1906, when he was appointed superintendent of shops.

Archibald Guthrie, of the railroad contracting firm of A. Guthrie & Company, of St. Paul, Minn., died in Chicago on May 15, aged 69 years. Mr. Guthrie began railway work in July, 1866, with the St. Paul & Pacific laying track, and was with that road and the St. Paul, Minneapolis & Manitoba successively as clerk in freight office, brakeman, conductor, purchasing agent, and assistant superintendent, until July, 1881, when he was made superintendent of the Northern division at Barnesville, Minn. Subsequently Mr. Guthrie was consulting engineer, and later he became associated with Foley Brothers, railway contractors, until 1897, when he engaged in business for himself. He was also a member of the firm of Guthrie, McDougall & Company, railway contractors, of Portland, Ore.

Robert S. Seibert, president of the East Broad Top Railroad & Coal Company, died on May 24, at Oak Lane, Pa. He was born on May 9, 1856, and began railway work in January, 1874, as a telegraph operator on the Pennsylvania Railroad. The following October he became agent and operator of the East Broad Top, and in May, 1877, was made trainmaster of the same road. In November, 1881, he became train despatcher on the Chicago & Eastern Illinois, and in March, 1886, went to the West Shore as train despatcher, and was later trainmaster on the same road. In May, 1888, he was on the Denver & Rio Grande, and in October, 1891, was appointed superintendent of the Pueblo Union Depot Company. The following year he was made general manager of the Nevada Southern, and in 1896 became general manager of the California Eastern. From January, 1900, to July, 1902, he was also vice-president of the same road. He returned to the service of the East Broad Top Railroad as general manager in July, 1903. From November, 1903, to January, 1911, he was president and general manager, and since January, 1911, had been president of the same company.

Frank H. Myers, formerly division superintendent of the Chicago, Milwaukee & St. Paul, who died suddenly at his home in Minneapolis, Minn., on April 8, of apoplexy, was born September 5, 1876, at Adeline, Ill. When fifteen years of age he learned telegraphy, beginning railway work in September, 1894, with the Chicago, Milkaukee & St. Paul, with which company he remained until his death. He was operator and agent until 1900, and then for one year was division operator. From 1901 to 1905, he was assistant train despatcher, and the following two years was chief train despatcher. In 1907 he was made assistant superintendent of the Chicago terminals, and in May, 1908, he was promoted to the superintendency of the Prairie du Chien and Mineral Point divisions at Milwaukee, Wis. He was transferred to Minneapolis, Minn., in October, 1910, as superintendent of the River, Iowa & Minnesota, Wabash and Chippewa Valley divisions, which position he held at the time he died.

F. H. Myers.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The International Great Northern has ordered 10 consolidation locomotives from the American Locomotive Company. The dimensions of the cylinders will be 22 in. x 30 in., the diameter of the driving wheels will be 57 in., and the total weight in working order will be 217,000 lbs.

CAR BUILDING.

The International & Great Northern is in the market for 200 coal cars.

The Chesapeake & Ohio has ordered 2,000 coal cars from the Standard Steel Car Company.

The Lehigh Valley is in the market for 1,000 forty-ton box cars and 1,000 fifty-ton coal cars.

IRON AND STEEL.

The Missouri, Kansas & Texas has ordered 330 tons of bridge material from the Wisconsin Bridge Company.

The Kansas City Southern has ordered 7,000 tons of rails from the Illinois Steel Company.

General Conditions in Steel.—A great deal of attention is being directed to the course of the steel industry in Germany. Prices have been declining abroad and there is likely to be a very heavy falling off in output of steel during the summer months. Many cancellations are reported. So far as the American steel industry is concerned the week opens with very little change. There has been no increase in orders, and prices are stationary. Mills continue to operate full, but smaller specifications indicate a slowing up within the next month or two unless there is a material change in the situation for the better.

Proposed Portuguese Railroad.—It is proposed to build a railroad in Portugal, from Estremoz, through Souzel, Fronteira, Alter do Chao, and Portalegre, crossing the Eastern Railway and extending to Castello de Vide, on the Caceres branch. When the line yields 5 per cent. net on the cost of construction, the concessionaire must begin an extension from Castello de Vide to the Beira-Beixa line. Free transportation of all necessary construction materials will be granted by the government railways. The usual cost of labor in railway construction work in Portugal is about as follows: Laborers, $0.47 a day; masons, $0.75; stone workers and carpenters, $0.94; bosses, $1.41.

Transportation of Dogs in England.—For some time past negotiations have been proceeding between the Railway Clearing House and the National Canine Defence League with respect to the conditions under which dogs are conveyed by rail and steamer. The railway companies have now advised the National Canine Defence League that animals tendered for conveyance in packages which are obviously too small for them will be refused. The companies decline to undertake the provision of food, but have agreed to the suggestion of the league that they should endeavor to arrange for the dogs to be given water wherever practicable, if the senders will indicate this requirement on the labels.

Proposed Line for China.—The governor of Fukien province, China, has requested the Swatow Chouchowfu Railway to revive the project of a railway to connect Chouchowfu with Amoy, which was under discussion some years ago. The governor suggests that Fukien province subscribe half the necessary capital, the balance to be raised in Kwangtung. This project was originally mooted by Mr. Chang, a director of the Swatow Chouchowfu Railway, who proposed to float a joint stock company in Swatow, but when he died it was dropped. If the money can be raised and the line built it will serve rather to tap the country lying between Amoy and Swatow than to act as a means of communication between the two ports which are already connected by regular steamship services.

Supply Trade News.

The Roberts & Schaefer Company, Chicago, has been awarded a contract by the Cleveland, Cincinnati, Chicago & St. Louis to build five large Holmen coaling plants at Paris, Ill., Lynn, Ind., Lilly, Ill., Anderson, Ind., and Dayton, Ohio.

The "Dracar," made by the Drake Railway Automotriee Company, Chicago, has been selected by the French government for service in connection with the government arsenals and the port of Brest. The Paris office of the company will supply five cars.

J Campbell Hopkins has been appointed manager of the railway department of the National Oil Gas Generator Company, Chicago. Mr. Hopkins has, for a number of years, been connected with steam railways in the capacity of consulting engineer and internal combustion engine expert.

Allan S. Barrows, for several years western representative of the Pantasote Company, New York, will shortly retire from that position to become vice-president and general manager of the Cassava Products Company, and will be located at Good Hope, Falmouth, Jamaica, British West Indies.

The Forsyth Brothers Company, Chicago, has transferred all right and title in its Forsyth draft gear, buffing device, radial device, truck actuated device and yoke, and the Chaffee centering device to the Waugh Draft Gear Company, Chicago, and all future negotiations and correspondence relating to these devices should be carried on with the Wendell & MacDuffie Company, general sales agents, 165 Broadway, New York.

C. W. Pank, manager of the St. Louis, Mo., office of Fairbanks, Morse & Company, Chicago, has been made general director of sales of that company, with office in Chicago. L. Norvell, manager of the railway supplies department of the same company, with office in St. Louis, has been made manager of the St. Louis office, succeeding Mr. Pank; and F. O. Roy has been made manager of the railway supplies department, with office in St. Louis, succeeding Mr. Norvell.

TRADE PUBLICATIONS.

Queen & Crescent Route.—The general passenger department has issued an attractive booklet describing scenes along its route, entitled "From the Window."

Wrecking Cranes.—The Industrial Works, Bay City, Mich., has issued a large illustrated folder describing a wrecking crane of 150 tons capacity manufactured by the company.

Chicago & North Western.—The passenger department has issued an illustrated booklet on "The Lakes and Resorts of the Northwest," giving information concerning hotels and rates, also a booklet entitled "Summer Vacation Tours," describing the personally conducted all-expense tours to the west, managed by the department of tours of the North Western and the Union Pacific.

Air Compressors.—The Chicago Pneumatic Tool Company has issued bulletin No. 34-L, containing general engineering information of value to users of compressed air. It includes tables, giving efficiencies of air compression at different altitudes, densities of gases and vapors, mean effective pressures and horse power, loss of pressures due to friction in pipes, also information for intending purchasers, showing the data required for intelligent estimates. Views of various types of compressors are given, as well as illustrations showing the interior of the company's compressor plant at Franklin, Pa.

Greek Railway Plans.—The Greek government is at present giving great attention to the question of improving communication in eastern Macedonia and Epirus, and proposes to link up the railway system in southwest Macedonia with Salonika by enlarging and extending the lines in Thessaly. To this purpose the line from Volo, in Thessaly, to Kalabaka, on the Turkish frontier, will be extended to Grevena and thence to Sorovitch, where it will join the Salonika-Monastir Railway. A branch line will connect Grevena and Janina, the route chosen being via Metzovo or Konitza.

Railway Construction.

Atlin Railway.—Application is being made in Canada for incorporation to build from a point on the southern end of Atlin lake, B. C., or near the town of Atlin, southern to a point on the Taku river at the international boundary, and from a point on that line easterly to the southern end of Teslin lake. Smith & Johnston, Ottawa, are solicitors for the applicants.

Bradentown, Manatee & Arcadia.—This company is planning to build a line, it is said, from Bradentown, Fla., southeast via Manatee to Arcadia, about 55 miles. Rights of way are now being secured and it is expected that construction work will be started during July. J. G. Barkley, Tampa, Fla.; C. B. Jenkins, Charleston, S. C., and A. W. Jones, Augusta, Ga., are interested.

Brule Lake.—An officer writes that surveys have just been finished and the company expects to begin work at once from a point on the Grand Trunk Pacific east of Brule lake at mileage 996 west of Winnipeg, Man., north six miles to the property of the North Alberta Coal Company. The work will be difficult. The line which is being built to carry coal will have maximum grades of 2 per cent. G. G. S. Lindsey, president, and James McEvoy, chief engineer, Toronto. (April 18, p. 925.)

De Queen & Eastern.—An officer of this company which operates a line from De Queen, Ark., east to Dierks, 27 miles, writes that the company owns the Texas, Oklahoma & Eastern, operating a line from Valliant, Okla., on the St. Louis & San Francisco east to Broken Bow, in McCurtain county, 24 miles. The company has under consideration the question of building an extension in the near future between De Queen and Broken Bow, 25 miles, connecting the two lines. The extension of the De Queen & Eastern from Dierks northeast to Hot Springs, about 70 miles, which has been under consideration for some time, will probably be built next year.

El Paso & Southwestern.—An officer is quoted as saying that construction work will be started soon on a branch from Whitewater, N. Mex., to the Burro mountains to provide an outlet for the mines of the Burro mountain district.

Fort Smith, Subiaco & Eastern.—This company, which operates a line from Paris, Ark., east via Subiaco to Scranton, 14 miles, will build an extension, it is said, from Scranton east to Dardanelle, about 25 miles.

Kanawha & Michigan.—According to press reports this company is making plans to build under the name of the Middleport & Northwestern, a branch line from Middleport, Ohio, northeast to Marietta, about 50 miles.

Lehigh & New England.—An officer writes regarding the report that a contract has been given to the Reed Construction Company, to build a five mile spur line south to Bath, Pa., that the company is about ready to let a contract to build from Snyder, Pa., to Catasaqua. The work on this five mile line includes handling about 160,000 cu. yds. (May 16, p. 1115.)

Lehigh Valley.—A contract has been given to the John F. Dolan Construction Company, New York, to build the extension of the Seneca Falls branch from Seneca Falls, N. Y., east to Cayuga Junction. (April 25, p. 974.)

Meridian & Memphis.—An officer writes that this road is now in operation from Meridian, Miss., northwest to a point about 22 miles from Meridian, and that the line through to Union, in all 32 miles, will probably be put in operation about the middle of June. (March 14, p. 529.)

Miami & South Florida.—Application has been made for a charter in Florida, it is said, to build from Palm Beach, Fla., south via Miami, and Homestead to Detroit, about 100 miles. The company will have a capital of $500,000 and headquarters at Miami. H. C. Roome, president.

Middleport & Northwestern (Electric).—Incorporated in Ohio, with headquarters at Columbus, to build an electric line via Meigs, Athens and Washington counties to Marietta. The incorporators include D. N. Postlewaite and J. C. Nickert.

New York Subways.—The New York Public Service Commission, First district, has asked for bids on June 24, for the

construction of section No. 4 of the Broadway-Fourth Avenue rapid transit railroad. This line will be operated by the New York Municipal Railway Corporation (Brooklyn Rapid Transit) under the Dual System contracts. The Broadway subway is now under construction from Trinity Place and Morris street, in the borough of Manhattan, to a point in Broadway midway between Houston and Bleecker streets. Section No. 4 extends from this point north under Broadway to a point 390 ft. north of the southerly line of Fourteenth street. It will be a four-track subway, and the section includes a local station at Eighth street and half of the express station at Union Square. Bids are wanted for the construction only and are not to include the laying of tracks, or the interior work in stations.

The Northeastern Construction Company, New York, will probably be given a contract to build a 400-ft. subway from the Fourth avenue subway, Brooklyn, as now completed, to the lower track level of the Manhattan bridge at its bid of $596,400.

Oklahoma, New Mexico & Pacific.—It is understood that contracts are to be let soon to build from Ardmore, Okla., west via Lone Grove, and Hewitt to Waurika, thence southwest to Byers, Tex., about 70 miles. J. L. Hamon, president, Lawton, Okla. (February 21, p. 373.)

Orange-Northeastern.—An officer writes that contracts for building the first ten miles from Natchitoches, La., south were to be let on May 28. The plans call for building from Orange, Tex., in a general northeast direction along the east side of the Sabine river to Merryville, La., thence via Leesville to Natchitoches. J. Tansy, St. Louis, Mo., has been given a contract for some of the work, which calls for handling about 25,000 cu. yds. to the mile. The maximum grades will be 1 per cent. and the maximum curvature 3 degrees. The company has taken over the Nacogdoches Railway, a lumber road, also the Lutcher Moore lumber road, and these lines will form part of the system. J. Alphonse Prudhomme, president, and A. R. Carver, chief engineer, Nachitoches, La. (March 21, p. 692.)

Rome & Gadsden.—This company will ask for charter in Alabama to build from Gadsden, Ala., northeast to Rome, Ga., about 60 miles. J. B. Wadsworth, president, J. M. Garvin, first vice-president, Rock Run, Ala.; J. N. King, second vice-president, Rome; J. P. Smith, treasurer, Center, and L. S. Daniels, secretary, Rome, Ga.

Tampa & Gulf Coast.—An officer is quoted as saying that $750,000 of bonds have been sold and the proceeds will be used for building an extension to St. Petersburg, Fla., and to other west coast towns. Surveys have been under way for some time, and it is understood that construction will be started at once.

Texas, Oklahoma & Eastern.—See De Queen & Eastern.

RAILWAY STRUCTURES.

Ardendale, Ont.—See Norwood.

Cleveland, Ohio.—The Pennsylvania Lines have received bids for moving the old Euclid avenue station and reconstructing it with a number of additions.

Lexington, Ky.—An officer of the Louisville & Nashville writes that some of the bridges are now being reconstructed between Lexington and Jackson, on the Lexington & Eastern. The railway company will build the masonry with its own forces, and contracts for the superstructures have been let to the Louisville Bridge & Iron Company.

Norwood, Ont.—The Railway Commissioners of Canada have authorized the Canadian Pacific to construct a bridge on the Toronto subdivision, Ontario division near Norwood station; also a bridge on the Havelock subdivision of the Ontario division near Ardendale station.

St. Louis, Mo.—The Terminal Railroad Association of St. Louis has awarded a contract to the St. Louis Unit Construction Company for the erection of a $60,000 station building at Third street and Washington avenue.

Springfield, Mass.—The Boston & Albany will put up an addition to its freight house 60 ft. long, the new part to be two stories high and to be fitted up for the offices.

Railway Financial News

Boston & Albany.—The New York Public Service Commission has authorized this company to issue $3,637,000 bonds, to be guaranteed principal and interest by the New York Central & Hudson River, to refund a like amount of bonds maturing October 1, 1913.

Boston & Maine.—In addition to the $12,000,000 one-year 6 per cent. notes mentioned as having been sold to J. P. Morgan & Co., New York, last week, the company has sold $5,000,000 of these notes, thus making $17,000,000 one-year 6 per cent. notes sold to J. P. Morgan & Co. in all. In a letter in regard to the additional $5,000,000 Boston & Maine notes President Mellen says that $2,500,000 of the proceeds will be used for payment to the New York, New Haven & Hartford for advances due about June 2, and the remainder will be used for improvements now under way which could not be discontinued without serious loss.

Brooklyn Rapid Transit.—A quarterly dividend of 1½ per cent. has been declared on the stock, thus placing it on a 6 per cent. annual basis, as compared with the former annual basis of 5 per cent.

Canadian Pacific.—Baring Brothers & Company, London, have sent a letter to holders of the first mortgage 5 per cent. bonds, due July 1, 1915, offering to redeem these bonds at 102 on June 25, and to pay on July 1 the July 1 coupon.

Denver & Salt Lake.—This company has increased its capital stock from $10,000,000 to $35,000,000.

Detroit, Toledo & Ironton.—Judge Sater, of the United States district court, has confirmed the sale made on April 17, of the Ohio Southern division of the Detroit, Toledo & Ironton for $1,550,000.

Laramie, Hahn's Peak & Pacific.—The bondholders' protective committee asks deposits of the first mortgage 6 per cent. bonds due July 1, 1929, under an agreement which provides that if the committee holds a majority of the $240,000 bonds outstanding, it may sell them as a block for not less than 95, and also that the committee shall prepare a plan of reorganization.

Lewisburg & Tyrone.—This property, which includes about 85 miles of road, is to be sold on June 16, under foreclosure of the mortgage securing $488,000 4½ per cent. bonds, all of which are owned by the Pennsylvania Railroad.

Missouri, Kansas & Texas.—White, Weld & Company, and Brown Brothers & Co., both of New York, are offering $1,900,000 Missouri, Kansas & Texas equipment trust 5 per cent. notes of June 1, 1913, maturing semi-annually to June 1, 1923, at prices to yield from 5¼ per cent. on specific maturities December, 1914, to June, 1917, and 5½ per cent. on equal amounts of each maturity or on specific maturities December, 1917, to 1923. These notes are secured on new standard equipment costing $2,376,000, 20 per cent. of the purchase price having been paid by the railway company in cash.

New York Central & Hudson River.—See Boston & Albany.

New York, New Haven & Hartford.—See Boston & Maine.

Pittsburgh & Shawmut.—This company is to pay off $750,000 of the $3,250,000 equipment and first lien collateral trust 6 per cent. notes, due June 1, 1913, and arrangements have been made with the Guaranty Trust Company and Rhodes & Co. to extend the remaining $2,500,000 to June 1, 1914, at 6 per cent., the collateral remaining the same. The bankers are offering the new issue subject to the option of the holders of the old issue for extension at 99½, yielding 6½ per cent. Holders of the old issue who agree to an extension will receive $7.50 in cash for each $1,000 note extended.

St. Louis Southwestern.—Stockholders of the Texas company are to vote on the question of buying the property and franchises of the Stephenville, North & South Texas under the law recently passed by the legislature permitting the merger of certain roads in Texas.

Southern Pacific.—The attorney-general of the United States has stated definitely that unless the Central Pacific is separated from the Southern Pacific he will bring another suit to compel this action.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE, BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY,
WOOLWORTH BUILDING, NEW YORK.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies .....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,150 copies were printed; that of those 8,150 copies, 6,650 were mailed to regular paid subscribers and 344 were provided for counter and news companies' sales; that the total copies printed this year to date were 198,409—an average of 8,626 copies a week.

VOLUME 54. JUNE 6, 1913. NUMBER 23.

CONTENTS

*Illustrated.

IT now seems certain that the full crew law passed by the Missouri legislature at its last session will not go into effect until the people of the state have had a chance to pass on it As already noted in these columns, the railways have been circulating a petition asking for a referendum vote on the measure; and they have now secured the number of signatures requisite to having it put on the referendum ballot. Save for this appeal to the people the law would have gone into effect on June 24. The referendum vote will not take place until October, 1914, and the initiative petition renders it inoperative until after that time. The Missouri law applies to crews of both passenger and freight trains. It prohibits any railway from operating any passenger, mail or express train wholly within the state that is not equipped with a crew consisting of at least an engineer, fireman, conductor and flagman, or to operate any passenger, mail or express train of six cars or more that is not equipped with a crew consisting of at least an engineer, fireman, conductor, flagman and brakeman. As to freight trains, it prohibits the operation of any train composed of less than 40 cars without a crew consisting of at least an engineer, fireman, conductor, flagman and brakeman, or any train composed of 40 cars or more that does not have behind the engine a crew consisting of at least a conductor, flagman and two brakemen. Freight trains doing local switching, or loading and unloading local freight, must also have crews behind the engine consisting of at least a conductor, flagman and two brakemen. The law does not apply to railways less than 45 miles long, or to relief or wrecking trains, nor is it operative during strikes of men in train service. The most expensive provision, of course, is that requiring crews including at least a flagman and two brakemen on all trains 40 or more cars long. The railways have estimated that compliance with the act would increase their annual operating expenses more than $500,000, this estimate being based on the number of trains on which they would have to put an additional brakeman and on the average wages paid to this class of employees. The referendum law gives ample time for full discussion of the important questions raised by such legislation as this.

THE first comprehensive telpherage system installed in this country for handling L. C. L. merchandise at freight houses was that which has been in use in the Missouri, Kansas & Texas double-deck freight house at St. Louis, Mo., since 1911. The management has now decided to take out this system and substitute for it a trucking system, using elevators. Without in any way suggesting agreement or disagreement with the reasons which have influenced the M. K. & T. in their decision to abandon the telpherage system, it is interesting to enumerate the principal of these reasons. Of course, the immediate cause was the fact that the expenses since the establishment of the telpherage system, which was described at some length in the *Railway Age Gazette* of June 23, 1911, page 1647, had been steadily mounting until at present they are considerably over 50 cents a ton. This is exclusive of interest charges on the plant itself. The reasons given for these increases in costs are first, that it was never feasible to carry out the scheme for which the telpherage system was originally designed. This scheme was that the telphers should pick up a loaded truck on one platform and move it to any other platform in the building. It was found absolutely impossible to operate the telphers in this way, where the weights of loads and character of merchandise vary so widely, and where the time consumed in loading and unloading trucks was so different for different characters of loads. The telphers got in each other's way and the congestion and confusion was fatal to quick and accurate handling. The telphers at the present time are being operated parallel to the platform only and after the freight is lowered through the hatch ways to the lower floor of the freight house it has to be trucked from there to the proper car door, which may be on some other platform. This, of course, comes very nearly adding the expense of operating the telpherage system to the expense that would be incurred in any case in trucking the freight. This impracticability of using the telpherage system in the way in which it was intended would probably in itself have been sufficient to lead to the decision to abandon it.

A SECOND objection has been found. In theory it would seem that the larger the truck load that could be handled the greater the economy, and under the telpherage system a large two-ton truck on four wheels, setting up 4 to 6 in. above the floor, is used. In practice the time consumed in loading from the platform on to this truck all sorts of articles, some so heavy as to be impossible of loading by one man, and unloading these same articles again outside the car—for it was found that

in properly loading the car the large truck could not be wheeled into it after the first few bundles of freight had been stowed—was so great as to more than offset the theoretical economy of the larger truck. The first difficulty, that of the design, may, of course, be simply due to the design of the particular plant installed at St. Louis and may not be a valid reason against the adoption of telpherage systems by railroads at other or differently designed freight houses. The second objection is more nearly fundamental. The experience of one set of men in charge of one particular telpherage system is by no means enough on which to base a conclusive opinion as to the possibilities of the telpherage system, but, as was previously pointed out, it is interesting. The system which is to replace the telpherage system will be that of hand trucking, with elevators carrying the loaded trucks from the upper floor to the lower one where the cars are loaded. It is believed from experience that a man with a hand truck can handle nearly all of the varieties of packages which are sent in L. C. L. lots. The idea is to eliminate so far as possible all waiting by the truckers. A man will pick up his two-wheel hand truck load, take it to the proper elevator, run the truck on to the elevator, pick up an empty truck and go back for another load. The elevators are designed for four hand trucks and the trucker on the lower level will take a loaded truck from the elevator, run it to the car door or into the car, drop it and pick up an empty truck and run it back on to an elevator.

BEGINNING June 23 the number of express trains daily, except Sunday, each way between New York and Boston will be increased to 18, the Boston & Maine having announced that its new Bondsville route will be opened on that day, with two through trains, starting from both termini at about 11 a. m. and 11:30 p. m. Ware, Barre, Oakdale and Hudson—is any New York traveler able to locate these towns accurately on the map?—will then become express stations. Also Waltham, the home of J. O. Fagan. The trains will run through in six hours, the distance being about the same as via Worcester or via New London (232 to 234 miles). The 18 trains will start from New York at 8:00, 8:14, 9:15, 10:00, 10:02, 10:50, 12:00, 1:00, 1:02, 2:00, 3:00, 4:00, 5:00, 5:33, 11:10, 11:33, 12:00 midnight, and 1 a. m. The "Air Line" through Middletown, which once was exploited as the *only* rational route for New York-Boston travelers who really desired to properly economize their time, must now feel exceedingly small and disheartened. Not one of the 18 trains goes through Middletown. Lines running through large cities, with the facilities of double track, possess advantages which outweigh a matter of 20 miles in distance as surely as a ton of coal outweighs a mile of telegraph wire. Providence, New London, Hartford, Springfield and Worcester have long since secured these advantages. The smaller places above named will now get the advantage of through trains, not by their bigness, but by the bigness of Mr. Mellen's plans for utilizing the Central Massachusetts division of the Boston & Maine. He proposes also to run through cars three times a day from Northampton south through Holyoke, 18 miles to Springfield and thence east to Boston, and vice versa, so that citizens of Northampton or Holyoke who have the hardihood to use the Boston & Albany will, no doubt, henceforth be hard to find. An old-time phrase is brought to mind in the declaration of Vice President Campbell, of the New Haven road, that the Boston & Albany will have to yield that part of the traffic between Springfield and Boston "to which the Boston & Maine is fairly entitled." It will be "entitled," of course, to all it can get, by giving good service and low prices. However, old style methods of securing "title" to traffic have been largely done away with, and the coming strife will be very dignified and orderly, no doubt. The new link from Bondsville to [illegible], 16 miles long, is termed by Mr. Mellen a "bridge"; its local traffic will be too small to count. The line has cost $4,000,000, or $250,000 a mile, and even at that the trains will have to use about two miles of the Boston & Albany main line at Springfield.

SOME DISPUTED POINTS IN RAILWAY VALUATION.

4—Intangible Values.

UNDOUBTEDLY the most difficult items to appraise properly are those intangible elements commonly grouped under the term, "going value." Much attention has been paid to these items in the valuation of public utility properties, and the courts have often decided that a company is entitled to a valuation that shall include an allowance based on the fact of its existence as a going concern. In railway valuations the practice with reference to intangible values has varied, largely because of the different purposes of the valuations and also because of the difficulty in arriving at these values. The organization for the soliciting and transportation of business gives an old line a market value in excess of one of the same physical value which has just been completed. Again, the strategic position of the Pennsylvania in Pittsburgh, of the New York Central in New York City, of the Burlington at several large centers of the other Hill lines at Seattle, is reflected in the earnings of these roads. Many other considerations of a similar nature might be enumerated.

In the Michigan valuation, made in 1900 for the purpose of taxation, $35,814,043 was allowed for the non-physical or intangible values. This figure was arrived at by capitalizing at 7 per cent. the average surplus for the period of ten years next preceding the valuation, which was equivalent to a net income of 6 per cent. after the payment of a tax of 1 per cent. In other words, this valuation took into consideration the effect of the earning power of a road upon its market value. In Wisconsin no allowance was made for intangible values, although subsequently in the hearing in the two-cent fare cases, the Railroad Commission conceded that these values existed and should be taken into consideration in deciding upon the reasonableness of rates.

In Washington, this subject was considered at length and interesting conclusions were drawn. The density of population tributary to the line; the density, class and permanency of traffic; the facilities for doing business; the grades and curvature; fuel supply and other conditions affecting operating expenses—were all considered. In the cases of the Northern Pacific and Great Northern in Washington, it was shown that the business would naturally tend to increase and the market values were estimated at about 1 per cent. above the cost of reproduction in the case of the Northern Pacific, and between the cost of reproduction and the depreciated value in the case of the Great Northern. The market value of the Oregon Railroad & Navigation Company was likewise estimated at more than 20 per cent. in excess of the cost of reproduction. On the other hand, the Bellingham Bay & Great Eastern being dependent for traffic almost entirely upon forest products, one-half of which had been removed at the time of the valuation, the market value of this road was estimated at slightly less than half its cost of reproduction new.

In New Jersey the tax law under which the valuation was made provided that all intangible elements, including the increased cost of land when used for railway purposes, should be valued in one group. The method adopted was similar to that used in Michigan, the surplus being capitalized at 7.896 per cent. (6 per cent. plus a tax rate of 1.896 per cent.). The total intangible value for all roads was fixed at $75,841,600, or 20 per cent of the total valuation. As this amount was practically equivalent to the amount deducted for depreciation, it left the present value, including intangible values, practically equal to the cost of reproduction new or about the same result as was arrived at in Michigan.

On the other hand, in the Minnesota valuation, and in the Massachusetts valuation of the New Haven, no cognizance was taken of intangible values. In the Massachusetts valuation, however, Professor Swain discussed the value to the New Haven of its perpetual trackage rights over the New York Central & Hudson River from Woodlawn into the Grand Central Terminal, and placed this at $6,000,000. For the purpose of his valuation,

however, which was to justify the securities of the New Haven, this item was omitted from the totals, as no capital had been issued against these trackage rights.

THE ST. LOUIS & SAN FRANCISCO AND ITS BANKERS.

THE rather sudden creation of the receivership of the St. Louis & San Francisco brings up some rather interesting questions in regard to the relations between railroad companies and their bankers. The policy of the various railroad companies in this respect has differed widely. The New York Central & Hudson River, when there was a rumor that it was about to change its bankers a few years ago, made the positive statement that J. P. Morgan & Co. had been and would continue to be its sole bankers. The Southern Railway likewise apparently has the fixed policy of selling its securities through Morgan & Company. On the other hand, the Pennsylvania Railroad has not hesitated in the past to award an issue of new securities to any strong banking syndicate which would pay the price, which the Pennsylvania directors considered fair. E. H. Harriman at one time, objecting to the price which Kuhn, Loeb & Company asked for their services as underwriters in the sale of Union Pacific securities, sold these securities directly to bankers and investors in Europe and the United States.

Some of the main facts in the history of the St. Louis & San Francisco's banking relations in the last two and a half years, insofar as it has been made public, are substantially as follows: In January, 1911, Speyer & Co., New York, bought from the railroad $7,000,000 15-20 general lien 5 per cent. bonds, offering them to the public at 87, yielding the investor 6¼ per cent. Before the end of the month it was announced that the bankers had disposed of all of their holdings. In April of the same year Speyer & Company sold 35,000,000 francs ($7,000,000) of these 15-20 year general lien 5's to French bankers; the price which the company received for its bonds not being made public, but the offering price in France to private investors being considerably higher than 87, the offering price of the bonds sold in this country in January. Later in April, 1911, the company paid off $4,000,000 4½ per cent. notes, and during that same month a syndicate was formed, headed by William Salomon & Co., New York, and G. H. Walker & Co., St. Louis, Mo., to underwrite an issue of New Orleans, Texas & Mexico division first 5 per cent. bonds, of which $5,000,000 were taken by these bankers at this time. In May, 1911, the company sold $2,500,000 2-year 5 per cent. notes dated June 1, 1911, to F. S. Moseley & Co., New York and Boston, which notes were offered to the public on a basis to yield 5½ per cent., and which notes are the ones which the railroad company has now found itself unable to refund. In July, 1911, the railroad company called for payment $4,000,000 notes callable in 1911, but not due until 1912. In August, 1911, Speyer & Company bought $3,000,000 equipment trust notes, the selling price of which was not announced at the time. In September, 1911, the Guaranty Trust Company bought and offered to the public at par $1,776,000 5 per cent. equipment notes, and later in the same month the "Frisco Refrigerator Line" was formed, which bought a certain amount of equipment and presumably issued securities through some bankers to pay for this.

In October, 1911, it was announced that the Frisco had acquired a part interest in the New Orleans, Mobile & Chicago, and a little later it was announced that a trackage agreement for which the Frisco had been negotiating with the Missouri Pacific and the St. Louis, Iron Mountain & Southern had fallen through, and that a trackage agreement had been made with the Louisville & Nashville, which had taken an interest in the New Orleans, Mobile & Chicago. In December, 1911, Speyer & Company bought from the railroad and offered to the public at 89, yielding 6⅛ per cent., $2,553,000 15-20 year general lien 5 per cent. bonds. Later in the same month the railroad company announced that it intended to build its own line from Port Barre, La., to a connection with its New Orleans-Houston line, apparently in consequence of the failure previously mentioned to make trackage arrangements with the Gould lines. In January, 1912, $3,122,000 15-20 year 5 per cent. bonds were listed on the New York Stock Exchange, and additional bonds were sold in France. In April, 1912, William Salomon & Co., and G. H. Walker & Co., offered at 95 $12,300,000 New Orleans, Texas & Mexico division first 5's, and at this time it was announced that in all this syndicate had bought $28,300,000 of these bonds, the railroad company at that time paying off $8,000,000 notes. In May Speyer & Company sold $3,000,000 additional 15-20 year 5's in France, and at that time it was announced that in all 100,000,000 francs ($20,000,000) of these bonds had been sold in France. It was in May that the decision of the lower courts was confirmed deciding that the railroad company could not issue certain of its bonds for general purposes which had been set aside for refunding purposes. In August Speyer & Company bought $2,250,000 "Frisco Construction Company" 5 per cent. equipment notes, and in September the Salomon-Walker syndicate took from the company $2,600,000 2-year 6 per cent. notes secured by New Orleans, Texas & Mexico bonds. In November the Salomon-Walker syndicate offered to the public at par $1,000,000 Quanah, Acme & Pacific 6 per cent. bonds guaranteed as to interest by the Frisco, and also carrying a guarantee of redemption by July 15, 1921, at 105 by the Frisco.

It is sometimes true that a railroad company suffers in its operation through interference in management by its bankers. It is also sometimes true that a railroad company has to pay a price which its directors may consider too high if it deals always with one banking house. It may quite possibly have to pay a somewhat higher price to this banking house if it offered its securities for competitive bidding. On the other hand, railroad securities have never, so far in the history of the United States, been sold successfully on a large scale and over an extended period without the co-operation of banking interests. There is another fact which has to be taken into consideration. If one banking house is the recognized agent through which a railroad company is to sell its securities, the credit of that railroad company becomes of vital interest to the bankers. This has its drawbacks, as has already been mentioned, when it leads to interference with the management. In times of stress, however, when money is hard to obtain, the fact that the bankers have sold to their clients the securities of a road of which they are the recognized agents makes it morally imperative for these bankers, insofar as they can, to protect their clients, and in so doing necessarily tide over, if possible, the railroad company.

Here is where the difficulty lay in the St. Louis & San Francisco case. Speyer & Company claimed that they were perfectly willing to help further finance the Frisco, but that they were not willing to bear the entire burden. It is significant that the notes which the company was unable to refund were an issue sold to an outside banking firm. The bankers' first duty, of course, is to their customers who have trusted in their judgment in making their investments. It is quite possible that in the case of the St. Louis & San Francisco the bankers believed that the best interests of their clients could only be preserved through permitting the road to go into the hands of a receiver and so disentangle itself from certain of its obligations, such as the guarantee of dividends on the C. & E. I. stock. Of course, other explanations of the rather sudden receivership can be offered. One thing, however, appears to be clear: the interests of all parties can best be conserved by a continuance of the effective and economical operation of the railroad. In the interests of the security holders and of the public served by the Frisco, no financial disagreements ought to be permitted to interfere in any way with the best possible operation of the railroad as a railroad.

Through an unfortunate inadvertence the phrase "unlike the receivership of the Missouri Pacific," etc., was used in the editorial in the *Railway Age Gazette* of May 30, discussing the receivership of the St. Louis & San Francisco. Of course no receiver has been appointed for the Missouri Pacific, and the ref-

erence to it in this connection was a complete mistake which we keenly regret.

THE PRESS AND PROPOSED ADVANCES IN FREIGHT RATES.

THE tone adopted by the newspapers in discussing the proposed advance of 5 per cent. in freight rates in eastern territory is a striking and conclusive proof of a great change in the attitude of the public toward the railways which has occurred within the last few years. When the railways sought to advance their rates in 1908, and in 1910, they were severely criticised by the press both for this and for the general policy of many of their managements. The petition of the eastern roads for an advance in rates which has just been filed with the Interstate Commerce Commission has been received in an entirely different spirit. Newspapers which three years ago denounced the railway managements for faults of omission and commission, now frankly concede that in recent years most of the managements have been doing their best to operate economically, and at the same time meet the reasonable demands of the public. Publications which then flatly opposed any advance in rates as being unnecessary and unwarranted, now grant that the floods and other adverse natural conditions from which the roads have suffered, the general advances in wages that they have had to make, the rise that has occurred in the rate of interest that they must pay, the decline that has come in the value of their securities, and the brake that has been put on new construction and permanent improvements, have changed the entire situation and made the petitions for higher rates appear much more reasonable than did the similar petitions formerly presented. The following quotations are typical of what the newspapers are saying:

Philadelphia *Public Ledger:* "When the Interstate Commerce Commission takes up this freight rate request it is bound by every instinct of national welfare to consider it in the broadest possible way. The pastime of bullying railroads has ceased to be popular, because it is too dangerous. The commission can do the country a very exalted service by dealing justly with the railroads without any unnecessary delay."

Chicago *Tribune:* "The resort of the Frisco and the Chicago & Eastern Illinois railroads to receivership, while it is not to be interpreted as significant of railway conditions in general, emphasizes the heavy pressure under which railway management has been raising a voice of protest and warning. . . . This has had, thus far, a less serious effect upon the general business situation than might have been expected, but it is now more important to consider whether the country's vital interest in ample and efficient transportation does not demand some prompt relief of conditions making for the extreme conservatism referred to. This relief, it would seem, must come if at all in the form of a reasonable but sufficient advance of freight rates. When this demand was made by the railroads two years ago the public opposed it because it was felt that the railroads had not made a case and did not come into court, as it were, with clean hands. . . . Since that time the railroads have placed themselves in a better position. They have by no means removed all the grounds for fair objection to their finance, their administration or their politics. But reforms have been instituted and economies achieved and there has been a desirable and profitable toning up of policy from the point of view of the public service."

Chicago *Inter Ocean:* "The most obvious remedy for the relief of the railroads is an increase in their rate charges. When this increase was proposed by the railroads a few years ago there was a general outcry in [illegible]. Has not the time arrived when it is plain that a small increase in rates will avert more serious conditions?"

Saturday Evening Post: "For three years railroad expenses have been quite steadily increasing in a ratio greater than the increase in revenue. Advance in wages recently secured by firemen and engineers will, of course, still further augment expenses. Other wage advances will be demanded. [illegible] of the strongest railroad bond issues ever brought out in this country was offered to the public only last month at better than 4½ per cent., and only a portion of it was taken. Roads of first class financial standing are paying 5½ and 6 per cent. on short-term notes for capital to meet their [illegible]. Weak lines are paying pawnbrokers' rates. There is no [illegible] that labor, supplies and capital will cost less. The [illegible] other [illegible]. We do not think it should be the policy of the [illegible] that the [illegible] are never under any circumstances to be granted [illegible]. They are entitled to an impartial judgment on the [illegible] we [illegible] they will get it."

[illegible] *[illegible]:* "It is not merely the falling prices of railroad [illegible] that [illegible] the danger of the present iron [illegible] of [illegible] railroad rates. The refusal of the public both here and in Europe, to invest money in [illegible] bonds or other securities of the [illegible] and best managed American railroads, save at almost prohibitive prices, shows that we have passed the line of prudence and reason in restricting the profits of our transportation systems."

Philadelphia *Record:* "The interests of the railroads and the public are identical, for one cannot suffer serious losses without the other being greatly affected. The present situation calls for fair and just treatment of the railroads if future trouble is to be avoided."

New York *Tribune:* "The public is interested not only in seeing that the railroad workers receive a living wage. It is interested even more vitally in seeing that the railroads receive a living wage. The railroads must earn enough for their own upkeep. They must earn enough to have a surplus to put into non-dividend paying improvements, for the public demands them. They must earn enough to grow as the country grows."

New York *American:* "The granting of the eastern railroads' application for (5 per cent.) higher freight rates would have immediate and marked effect in restoring confidence in railroad securities. Not a few railroad bonds are now at panic prices, while stocks in several prominent instances are at the lowest levels in recent years. The costly floods and the adoption of higher wage scales have aggravated the situation."

New York *Herald:* "Unless they are promptly permitted to increase their charges they cannot continue to supply efficient service even on the present basis, and are assuredly unable at this time to comply with the unreasonable demands of employees, involving further enormous increase of operating cost."

Philadelphia *Bulletin:* "It is to be recognized that the general railroad business of the country is not in a condition to stand further increases of expenses without being granted a right to additional earning power."

Boston *Post:* "The public will have to chip in a bit for the increased pay to employees, and we believe it is perfectly willing to."

St. Joseph (Mo.) *Gazette:* "Restrictive conditions have been overplayed in some states. Railroad expansion is most completely at a standstill. Let us take stock of the results of the restrictive and hampering legislation we have subjected the railroads to for a generation, and see if it is not barely possible that we have overdone it."

Perth Amboy (N. J.) *Evening News:* "It is not surprising that the railroads have announced their intention of asking the Interstate Commerce Commission for the right to increase rates, and we believe the public will sanction granting the same."

Springfield (Mass.) *Republican:* "Much has been made of the claim that greater efficiency in running railroads would increase their revenues, but unless we are to assume the grossest kind of laxness hitherto, this alone would not produce earnings sufficient for the emergency. We cannot be justified in regulating railroads to death. The railroads are likely to find the Interstate Commerce Commission much more favorably disposed than once toward some measure of relief."

Dallas (Tex.) *News:* "The argument which the railroads make is pretty well linked together, and the links, to the superficial view, at least, appear to be made out of something like flawless metal. It is for the commission to determine whether they are or not. At least they make out good enough prima facie case to entitle their request to deliberate and unbiased consideration."

The change in the attitude of the press reflects the change that has taken place in the attitude of the public. The change in the attitude of the public has been brought about, first, by more circumspect and efficient management of railways, and, second, by the policy followed by the railways in recent years of frankly and squarely meeting in public discussion every issue affecting them that has been raised. As the Chicago *Tribune* says, "the case for the railroads has been pressed through legitimate publicity, and public opinion unquestionably is more favorable than it has been for many years." This more favorable attitude on the part of the public could not have been brought about without full and earnest presentation and defense of the railways' case to the public; but it is also emphatically true that it could not have been brought about if the railways had not had a good case to present and defend; and they had so good a case chiefly because their managements have been doing in recent years very few things that invited just criticism.

NEW BOOKS.

Principles of Irrigation Engineering. By Frederick H. Newell and Daniel W. Murphy. Size 6 in. x 9 in., cloth binding, 293 pages, 16 plates and 54 ills. Published by McGraw Hill Book Co., New York. Price $3

The authors of "Principles of Irrigation Engineering" are respectively the director and engineer in charge of drainage of the United States Reclamation Service, which stamps their writing with a degree of authority. The book is intended to cover not only the construction and operation of irrigation works, but the broader question of the feasibility of constructing such systems. It is designed to interest the statesman concerned with questions of public welfare and the capitalist seeking an investment, as well as the engineer who is called upon to plan the engineering work.

THE AUTOMATIC TRAIN STOP PROBLEM.*

Exposition of the Difficulties Encountered in Adapting Automatic Stops to Miscellaneous Railroad Service.

By A. H. Rudd,
Signal Engineer, Pennsylvania Railroad.

Automatic stops are not a "cure-all" for the dangerous features of railroad operation. They will not prevent derailments due to failures in rolling stock, track or bridges, or to excessive speed, washouts or landslides. . . . . They *may* prevent collisions and excessive speed over short crossovers. While some automatic-stop systems have indicators in the engine cabs, none gives indications for diverging routes. Should the apparatus fail, the engineman would be without any signal system until repairs were made, probably at the *end of his run,* unless the engine were immediately side-tracked as disabled and another substituted.

It follows, therefore, that, for safe operation, none of our present safeguards may be abandoned. We cannot save in the maintenance of track or structures, reduce our policing nor relax our vigilance in any degree. Our men must still be keyed up to watch their track and signals. We can effect no saving in cash or brains. The automatic stop must, if installed, be used solely as an adjunct to our present systems. The engine runner should be constantly alert and should watch his track for obstructions which cannot be anticipated by advance information. A [visual] cab signal constantly taking his attention from the outside observation is not only useless, but a positive detriment. The engineman is not an automaton and the installation of anything tending to lessen his feeling of responsibility would be most unwise, to put it mildly.

Cab signals should not be used either with or without automatic stops. In order to get the safest and best operating results the handling of the train must be left absolutely and entirely with the engineer as long as he properly controls it. He must know that it is so left to him, but that any lapse on his part will be checked and discipline imposed; that the automatic stop is not to do his work for him, but, like the smashboard and derail, is provided as an additional efficiency test. The safe handling of air brakes requires considerable skill; their frequent application by mechanical means not under control of the engineman would be very detrimental, causing discomfort to passengers and possibly serious freight wrecks. The automatic stop should be inoperative as long as the engineman properly functions. . . .

For the past six months the Pennsylvania Railroad reports show 99.74 per cent. efficiency in observing fixed signals at stop. The percentage of *accidents* resulting from the twenty-six-one-hundredths of one per cent. of failure to observe stop signals is not available. The disregard of a stop signal does not in itself result in accident; in most cases, no disaster follows. It is readily seen that such accidents constitute a small proportion of our totals.

On the Pennsylvania Railroad over $4,500,000 has been appropriated for construction and maintenance of signals in 1913. Of this appropriation, nearly $3,000,000 is for new work, which would be required even if automatic stops were installed, and similar sums will be required for a long term of years; though the road is more advanced than the majority.

P. J. Simmen has published a study of the causes of train accidents as reported by the Interstate Commerce Commission, in which he says that 64.8 per cent were preventable by a complete signal system, assuming of course that such system includes an automatic stop. What part of this percentage would the stop *per se* have prevented which would not have been avoided by the block system and other necessary signals, assuming, of course, that the stop was always effective? We can only guess! But one point stands out glaringly—that, in 4½ years, with all the signals in use in this great country, only 46 accidents are shown to have resulted from disregard of semaphore signals at stop (and some of these may have been dwarf signals for slow movements), and one to "dead engineer," a total of 47 or 8.4 per cent., while the balance of the 64.8 per cent. or 56.4 per cent. would have been avoided by the installation of fixed signals *which are needed* under any conditions; less, of course, whatever percentage of these new signals might have been over-run. Were all these 46 signals which were over-run properly located? Were they provided with distant signals? We know some were not. If the fixed signal system were complete, would they have been over-run? We might speculate indefinitely. . . . Not over nine per cent. of the big accidents which attract so much attention *might* be prevented by automatic stops, but if the signal system were complete and efficiency tests were regularly and adequately carried on, 55 per cent. of these accidents would be eliminated without the use of automatic stops. In fact, taking the Pennsylvania Railroad record as a criterion, the figures would be nearer 60 per cent.; it being acknowledged that 35 per cent. are not preventable by any signal system. And it should be remembered that a stop will not prevent an accident caused by a train, after properly stopping or being automatically stopped, speeding up and passing the next signal at too great speed.

An automatic stop cannot be located at the distant signal or between the distant and the home, for, if an engineman has obeyed the distant signal and is approaching the home prepared to stop, he is doing his duty and should not be interfered with. It must, therefore, be located at the home signal, but must be so located that, if a train passes it at highest speed, it may be stopped before it has reached the danger point, preferably with a service application. The automatic stop therefore must be located at a stop signal at least 4,000 ft. from another stop signal placed at the danger point.

If a movement is to be made over a short crossover, the brake must, in ordinary operation, be applied 4,000 ft. away and again at the crossover and the stop released in each case. Long crossovers must be handled as now, or else stops, as indicated above, must be made whenever movements are to be made diverging from the main straight route. At railroad grade crossings one train must be braked 4,000 ft. away if another train is to cross; and the same is true at junctions. This would be particularly burdensome where they were scheduled to connect for the transfer of passengers. In manual block territory, additional power-operated signals would have to be provided at each interlocking and block station.

In automatic territory the present rule is "stop and proceed." To continue such operation, means must be provided to enable enginemen to release after the stop has operated or to make it ineffective after a train has stopped according to rule. This device must be inaccessible to the engineman until train has stopped, as, otherwise, it might be used wrongfully. In fact, it might be well to require the co-operation of two men to release the brakes. This inaccessibility will impose delay at each stop and proceed signal, particularly onerous in congested districts; in many cases requiring additional tracks to handle passenger traffic promptly.

In the case of freight trains, the chance of pulling apart if brakes are released while trains are running at slow speed after heavy application is recognized. A stop should, therefore, be made and as the train line opened by the stop could not be closed for an appreciable length of time, the air would probably be entirely exhausted, so that the time required to pump up 80 or 90 cars must also be considered. Furthermore, the application of the emergency brake to a slow moving train, especially freight,

*From *The Signal Engineer;* abridged.

might produce a more serious accident than if the train were not stopped; endangering not only the train so stopped, but those on adjoining tracks. Separate freight lines might be the cheapest and most satisfactory remedy.

In certain districts—for example, between Summit avenue, Jersey City, and Manhattan Transfer—we were forced to devise means by which electric trains could be operated at short intervals and close together while providing sufficient advance warning to stop heavy steam trains. This is accomplished by displaying four indications, viz., (1) "proceed," (2) "pass next signal at medium speed," (3) "prepare to stop at next signal" and (4) "stop and proceed." By this method information is given for three blocks in advance, but trains may be operated only a block apart. The introduction of automatic stops with two "stop" and one "caution" signal back of each train would, in the rush hours, reduce the capacity of this line to one-third of the existing arrangement. This would mean four additional tracks across the Meadows. These additional signals and tracks will not help at grade crossings and junctions nor in terminals—in fact, will give relief only for straight-away following movements; indeed, the introduction of automatic stops would require an entire rearrangement of existing signals at a tremendous cost.

Automatic stops are impracticable in large terminals and at busy junctions and crossings. While they might be used in congested districts approaching such points, the cost of additional tracks and signals must be added to the cost of installing the apparatus on the ground and equipping all locomotives. . . . Money available could be more advantageously expended on visual signals and other safeguards which are still needed and which would prevent more accidents than would automatic stops. It is, of course, impracticable to equip each car with a stopping device—detached cars would not be affected by its operation. Apparatus must be so arranged that the leading engine on entering the block will not apply the brakes on the second engine of a double header or on a pusher engine; and so that switching movements will not be affected by it. . . .

Stops using electric contacting devices are not reliable, although they may have satisfactorily met certain demonstrative tests, and no stop having contacting devices of any kind is desirable. There remain a few other types which may be but are not yet fully developed to meet steam road conditions. . . . It may be said that some of the automatic stops have been tested with perfect success during winter months. But the exact conditions that will throw the whole system out of operation may not occur in several winters. The difficulty in keeping trains moving during winter storms is great enough without having them stopped by wholesale failures of an automatic device.

The installations in our tunnels at New York, on the Manhattan Subways, etc., are successful, but simply because the exceptional conditions existing at these particular locations make the problem an easy one.

An automatic stop located at the proper point for fast trains would require slow trains to stop at an unnecessary distance from the danger point. Unnecessary stops of heavy freight trains, or stops far short of the points where stops are really necessary, have a serious effect on the operation of a busy road. It takes time to start such trains and get them up to speed. The problem with which many railroad men are struggling is to keep the slow freight trains moving rather than to get them stopped.

With an engine switching at the point where an automatic stop is located to stop trains moving toward a danger point some distance away, the conditions may be such that the stop must be "set" to stop any train that may approach, at the same time the stop should not interfere with the switching movements which do not dangerously approach that point. The stop must stop a train that might be wrecked at an open switch and not stop the train that is to go on the siding at that same switch; must stop a train that might collide with another and not stop an engine that has to be coupled to a train.

If any safeguard other than the expansion of the fixed signal system is decided to be necessary, and the money can be obtained, an automatic stop *per se* should not be considered, but attempts should be made to develop a continuously controlled speed controller without contacting devices, if possible; so arranged as to leave the control of the train in the hands of the engineman until and unless he exceeds a safe speed. . . .

The sum and substance of the matter is that automatic stop devices must meet the test of approval by the judgment of practical railroad men, based on years of experience with actual railroad conditions and with appliances employing similar mechanism. . . . For the present any funds available should be devoted to the expansion and perfection of our existing block and interlocking systems, which must be provided in any event and which will eliminate the great majority of collisions; and then, if it is conclusively shown that improved discipline and pride on the part of locomotive engineers in their honorable profession such that they will, of their own accord, co-operate with the managements in their efforts to eliminate careless or incompetent men and make greater efforts to perform their duties more perfectly, all fail to produce the desired results, the general use of a speed controller should be required to check against the single kind of human failure, which is its only function.

Mr. Rudd by diagrams shows the extent to which the capacity of a railroad is decreased by introducing automatic stops and the necessary overlaps. With trains 500 ft. long, running straight away, under the automatic block system, at 60 miles an hour, and with signals spaced so as to give adequate braking distance (4,000 ft.) between the distant and the home signal, and allowing 500 ft. for the engineman to get a fair view of the distant signal the space between trains will be 9,730 ft. With automatic stops this will be increased to 13,730 ft. Running under caution signals at 20 miles an hour the space, under the present system is 4,705 ft.; with automatic stops it would be 8,705 ft. In these calculations the time allowed for a signal arm to move from one position to another is 7 seconds.

Proposed Line for Argentina.—Salvador Botey has applied to the government of the province of Santa Fe, Argentina, for a concession to build a railway from Rosario to Rufino.

Rival of the Railroads in 1832.—The subject of steam carriages on common roads is already beginning to attract great attention in this country and we are afraid will operate not a little to the disadvantage of our enterprising neighbors at Baltimore who are so entirely engrossed with railroads. The directors of the Fredericksburg and Potomac Creek Railroad Company have determined for the present, in view of this matter, merely to graduate and level their road and have sent to England to obtain a steam car to use on it. If this succeeds, a new era will have arrived, and railroads will be superseded almost entirely. Success, we say, to improvements of all kinds.—*Extract from the Alexandria Gazette, published in the American Railroad Journal of August 4, 1832.*

Proposed Russian Railway.—It is reported that the Committee for New Roads in St Petersburg has decided to grant a concession for a railroad in the Caucasus from Borjom to Kars, with a branch line to Olti and a line to the village of Balkaya, and that its construction is practically assured. Since the plan has been approved by this committee it is said there will probably be no difficulty in obtaining approval of the other government departments, especially as the plan is favored by the high officials of the region in which the railway will be built, and by the ministry of war, the ministry of ways and communications, the ministry of finance and the ministry of commerce and industry. The majority of the members of the Imperial Duma are usually in favor of having the railways constructed by the government rather than by private enterprise, but since the Borjom-Kars railway will be built entirely by private capital (with a guarantee of the government for its revenue), the question of finances for its construction will not have to be submitted to the legislative departments.

GRAND TRUNK GRADE SEPARATION IN TORONTO.

Highway Grade Crossings Are Being Eliminated and Plans Made for New Terminals Including Union Passenger Station.

Three lines of the Grand Trunk enter Toronto, Ont., from the west, converging west of the central portion of the city and running along the water front to the union station and terminal yards located within a few blocks of the business and administrative center of the city. This station is also used by some of the trains of the Canadian Pacific and the Canadian Northern.

In planning with the city and Board of Railway Commissioners for the elimination of grade crossings in the city, the Grand Trunk divided its lines into three sections: the first, west of the Canadian Pacific crossing near Strachan avenue; the second, between this crossing and a point just east of the River Don near Logan avenue; and the third, extending from this point east. The work undertaken in the first section (Part 1) is now practically completed. This has involved only the Hamilton line, which skirts the lake front.

Map of Portion of the City of Toronto Showing Grand Trunk Lines on Which Grade Crossings Are Being Eliminated.

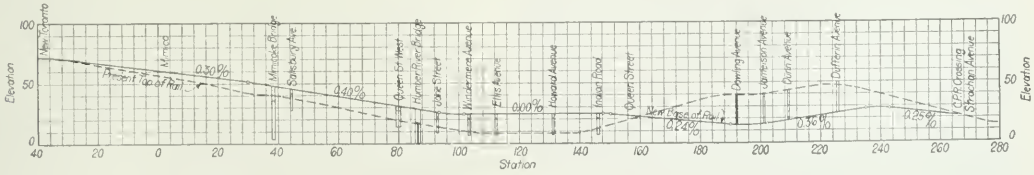
UNION STATION AND TERMINAL SECTION.

The Railway Commission has approved the plans for work to be done in the second section. This includes the building of a new union station and the rearrangement of the terminals of the Grand Trunk and the Canadian Pacific. The elimination of grade crossings through this central district, which is occupied by numerous tracks and lined with docks and warehouses along the lake, was a difficult problem, as the company disliked to elevate all its tracks to allow streets to pass under them, and the city objected to having the streets raised on overhead bridges. Three streets west of the present station are now carried over the tracks, and for these and several others this seems to be the logical method, for the street paralleling the tracks with which these cross streets connect is at a considerably higher elevation than the tracks and approaches to the viaducts from that side can be made quite easily. The section south of the tracks, however, is low and flat and it is difficult to obtain a satisfactory grade to such viaducts from the south side.

The plan as approved calls for the elevation of all through tracks and some yard tracks with overhead street crossings at Bathurst, Spadina and John streets, subways at all streets between York and Princess, and a steel viaduct 600 ft. long to carry all tracks over Berkeley and Parliament streets at the junction of the Grand Trunk and the Canadian Pacific on the east station approach.

East of Church street there are so many industries located close to the south side of the elevated line, which are now reached by individual grade crossings, that a new street will have to be laid out paralleling the tracks, on which these plants can face, and surface tracks will be laid along this street to be operated by the Canadian Pacific. A similar arrangement will be made for the plants north of the elevated line, the tracks on this side to be operated by the Grand Trunk. The board has ordered that no trains be operated over these surface tracks between Church and Parliament streets during May to September inclusive, except between 10 p. m. and 6 a. m. unless the merchandise carried is perishable, in which case a flagman must precede the train on foot. This arrangement is claimed by the railway companies not only to be dangerous to the public, as switching movements will be carried on at the mouth of all subways, but that the industries will be seriously hampered while the work is in progress, and, therefore, have submitted an alternative plan to the commission, showing a new location for the elevated tracks farther south, thus allowing all construction work to be completed before any alteration is made to the present facilities. All of these questions will be decided shortly by the Railway Board.

The station building will be located between York and Bay streets, facing Front street, just east of the present building. In a report prepared by the Civic Improvement Commission and presented to the city in 1911, by John M. Lyle, consulting architect, this station location is harmonized very nicely with the proposed plan for city improvement. In this report an administrative square is recommended to be located between University and Yonge and Agnes and Queen streets, which would be connected with the station by a broad avenue to be constructed between York and Bay streets. The city has as yet taken no active steps toward carrying out this plan, however. The station will be of the through type with ten tracks. A Bush train shed will be supported on columns set in the center of 18 ft. passenger platforms, and covering, in addition to the adjacent tracks, 12 ft.



Profile of the Portion of the Grand Trunk Affected by the Toronto Improvement.

baggage and express platforms which are provided between each pair of tracks. The passenger platforms will be reached by stairs from a transverse subway below the track level and baggage, mail and express being delivered to the narrow platforms by elevators from separate subways for each class of service. This separation of the passengers from the other business of the station should eliminate all confusion in the train shed. The passenger subway is entered from a concourse 80 ft. wide along the train shed which slopes down from the waiting room level

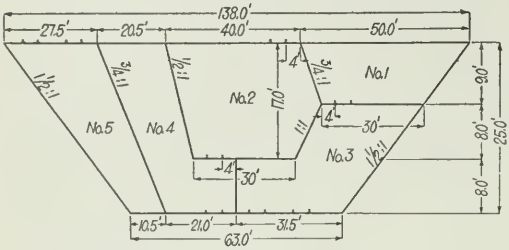


Diagram Showing Sequence of Shovel Cuttings.

on a 4.1 per cent. grade. The concourse will have exits at both ends in addition to the connection with the main waiting room alongside, although the complete details of the building have not yet been decided upon. The Canadian Pacific now expects to build a union station with the Canadian Northern in North Toronto, which will take many of its trains out of the present union station. Until a final decision as to this matter is reached, the building and yard plans are subject to some changes.

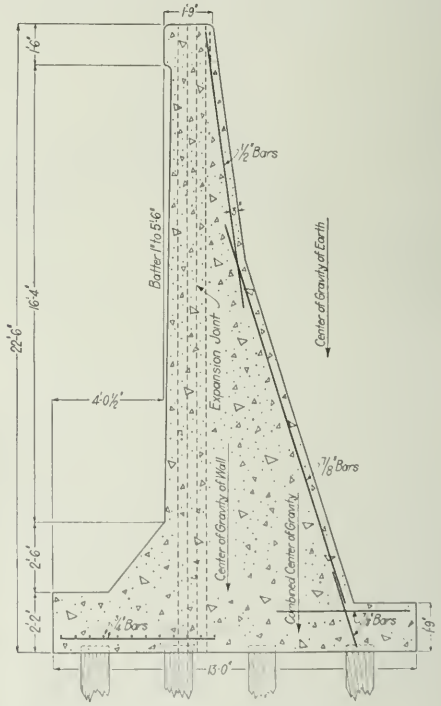
GRADE SEPARATION IN PART I.

The work on the section west of the Canadian Pacific crossing was begun in August, 1910, but was seriously delayed that fall

Laying Sod on New Slope in a Cut.

by the trainmen's strike. Most of the grading was done during the summer of 1911, and the foundations for some of the subways and overhead bridges were placed. This work was resumed in the spring of 1912, and was practically completed during the summer. This work has cost about $2,000,000, of which the city paid one third of the cost of a two-track construction, although four tracks have been laid. The excavation for foundations amounted to 75,000 cu. yds.; the grading totaled 800,000 cu. yds.; 67,000 cu. yds. of concrete and 3,100 tons of steel were placed; 7,000 sq. yds. of macadam, 7,000 sq. yds. of stone block and 4,000 sq. yds. of granolithic pavement have been laid; 10 miles of new track have been installed and 4 miles of old tracks altered; 100,000 sq. yds. of sod were required for the slopes of the new cuts.

In addition to the regular freight and passenger business which the Grand Trunk handles between Toronto and Hamilton, this piece of track carries the Toronto-Buffalo traffic of the Canadian Pacific and all freight movements into and out of Mimico yard, where the Grand Trunk handles all its classification for the Toronto district. The old double track line between Toronto station and Mimico had from 275 to 300 movements daily, which made it badly congested at times. In planning the grade separation in this district, therefore, it was thought best to make this line four track, thereby increasing its capacity to handle business and considerably simplifying the problem of making cuts as deep as 25 ft. and fills as high as 16 ft. without interrupting traffic. The two outside tracks of the new four track line will be operated for freight traffic and the inner two for passenger service.



Typical Section of Retaining Wall.

The roadbed will be brought up to the highest standard of track construction used on the system, 100 lb. rail, hardwood ties and rock ballast being used.

The accompanying profile shows the change in grade which has been made. The old line had a hump near the east end of the section and a sag west of this hump, with maximum grades of 0.7 per cent. By cutting down the hump and filling the sag, it was possible to secure a grade line having a maximum 0.4 per cent. grade and at the same time secure a balance between cut and fill which would eliminate the necessity for extensive borrow or waste. The latter feature was really the more important consideration, for the reduction in grade on these six miles of line does not allow any change in rating over the operating district and the same rise has to be overcome. Leaving the Canadian Pacific crossing, the new grade rises on a 0.25 per cent grade for a short distance, then falls on a 0.36 per cent. grade under Dufferin, Dunn, Jameson and Dowling avenues.

From the latter street, the grade is rising again, intersecting the old grade near Queen street, which is carried over the tracks on an overhead bridge with long approaches. West of this point, the new grade is level over Indian road, Howard, Ellis and Windermere avenues, and then rises on a 0.4 per cent. grade crossing Jane street, the Humber river, Queen street West, Salisbury avenue, Mimicoke creek and Church street. In all there are five overhead street crossings, eight subways and two waterway crossings.

EARTHWORK.

The excavation consisting mostly of blue clay and some rock on the eastern half of Part 1 was handled by three steam shovel outfits using 90 ton Marion shovels and standard gage Haskell

Looking East at Dunn Street Before Excavation Was Begun.

& Barker cars with a Lidgerwood unloader. One side of the cars was taken out and a side plow used in order to facilitate the handling of the hard and coarse material. The cut was taken out in three benches, always keeping two running tracks open for traffic. The fact that as much additional right of way would have been needed to carry the running tracks during the construction of a double track line on the new grade as has been used in making it a four track line was a strong argument in favor of the plan adopted. The additional right of way was acquired on the south of the old tracks. The accompanying

Looking East at Dunn Street While the First Shovel Cut Was Being Made.

cross section which was furnished to the shovel supervisor, and the three progress views of Dunn avenue show the method used in the excavation. The first of these views was taken before the work was started. In the second, the running tracks have been shifted to the extreme northern edge of the right of way, and a steam shovel is finishing the first cut along the south right of way line. The next cut was made under the track which is seen in the center of the view, the material being loaded into trains operated in the cut on the right. Then by cut No. 3 shown in the cross section, the elevation of final subgrade was reached and the two running tracks were thrown down on this level. The remainder of the southern half of the cut marked 4 and 5 in the cross section was then removed, there being always room

Looking East at Dunn Street After the Third Shovel Cut.

for a loading track alongside the shovel without interfering with traffic on the low level. In the last view, the two tracks on the right are on final subgrade, and there remain two shovel cuts on the left to be removed.

The standard cut slope is 1½: 1, back filled, if necessary, to get a true slope. All cuts are sodded, thus materially improving the appearance of the right of way and preventing the slope from washing and filling up the ditches. The sod was bought by contract at eight cents a square yard, f. o. b. cars. It was

Dufferin Street Overhead Bridge at Entrance to Exhibition Grounds.

hauled about 35 miles and laid by company forces at a total cost of 22.71 cents a square yard, apportioned as follows:

Sod	8.00c. per yd.	Pegging	.79c. per yd.
Freight	5.00c. per yd.	Trimming slope	1.34c. per yd.
Train service	3.70c. per yd.	Incidentals	.21c. per yd.
Unloading	.39c. per yd.	Foreman	.41c. per yd.
Carrying	2.08c. per yd.		
Laying	.79c. per yd.	Total	22.71c. per yd.

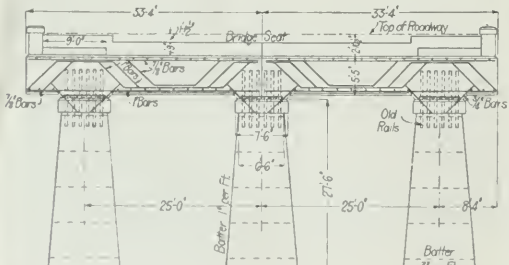
As it was impossible to secure additional right of way along the Industrial Exhibition Grounds, which are adjacent to the line just west of the Canadian Pacific crossing, it was necessary to build a retaining wall along the south side of the cut at this point. The section of the wall built is shown in an accompanying

drawing. Reinforcement is provided in this wall for the footing and the inside face.

OVERHEAD BRIDGES.

As excavation proceeded under the streets, temporary frame structures, cribbing or framed bents were erected to carry the street traffic. In several cases it was necessary to carry gas mains over the cut during construction work. At Dunn avenue, vertical sections of the pipe were inserted at each side of the right of way and the horizontal section over the cut was supported by a cable anchored to posts at each side. In the finished construction these mains were buried in the floor of the overhead bridge.

The concrete abutments for the overhead bridges were placed by a mixer outfit mounted on cars requiring only one track for its operation. The mixer car was equipped with a tower which could be dropped down to allow the car to be moved under structures and this mixer car was coupled to a hopper car and a series of material cars. The aggregate was wheeled from the material cars to a specially designed measuring box in the hopper car just back of the mixer, where the proportion of the aggregate was determined and the mixed sand and stone dropped into a small car which was pulled up an inclined track over the mixer car to a point from which the materials could be dropped into the mixer. The mixer discharged directly into the elevator bucket, from which the concrete was dropped to place through wooden chutes. About 30 men were used with this plant, 10 loading wheelbarrows on the material cars, 10 wheeling and 10 operating the mixer and placing the concrete. This force is exclusive of the carpenter gang employed on forms. One abutment

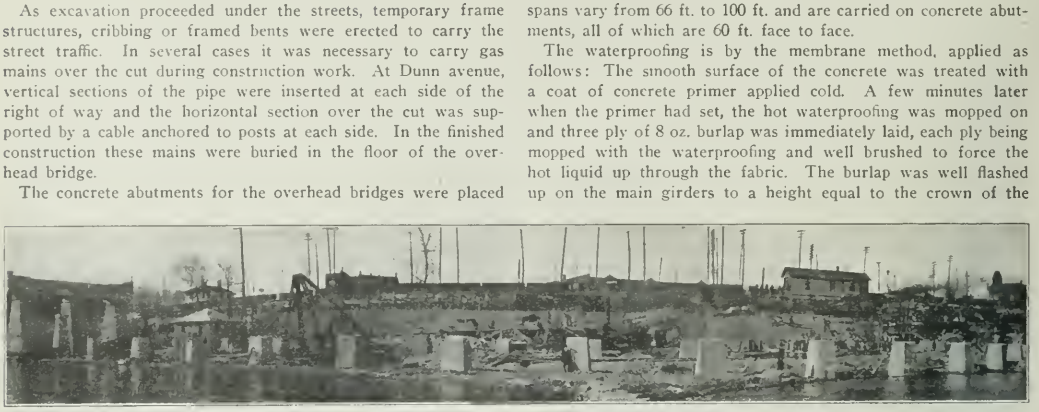


Elevation of Abutment for Sunnyside Overhead Highway Crossing.

containing about 900 cu. yds. was placed in 10 working days by this plant. The concrete used in abutments was a 1 : 2½ : 5 mixture.

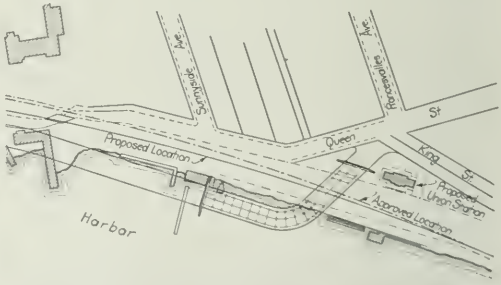
The standard overhead highway bridges are of the through plate girder type. The floor beams which carry I beam stringers are suspended from the girder webs continued through the bottom flanges at connection points. Two six ft. sidewalks are supported outside the girders on brackets from the floor beams. An ornamental lattice fence is provided outside of each sidewalk. The floor system is encased in concrete which continues above the stringers at the center line of the street, thus draining water to special waterproofed channels along the main girders. The spans vary from 66 ft. to 100 ft. and are carried on concrete abutments, all of which are 60 ft. face to face.

The waterproofing is by the membrane method, applied as follows: The smooth surface of the concrete was treated with a coat of concrete primer applied cold. A few minutes later when the primer had set, the hot waterproofing was mopped on and three ply of 8 oz. burlap was immediately laid, each ply being mopped with the waterproofing and well brushed to force the hot liquid up through the fabric. The burlap was well flashed up on the main girders to a height equal to the crown of the finished road. The sidewalks were waterproofed in the same manner, except that only two ply of burlap was laid. The whole bridge was then swabbed with waterproofing to seal all joints and laps of the fabric. While this final application of waterproofing was being made and was still hot, one layer of asbestos felt was laid with joints lapped 3 in. and sealed with the waterproofing.



Panorama of Sunnyside Crossing Showing Abutment and Footings for Steel Trestle Approach.

A protection of ¾ in. of mastic was laid over the waterproofing in convenient widths and all joints sealed by ironing. The finished surface of the sidewalks is of the same material, but is of a richer mixture applied ¾ in. thick. The finished surface of the road is a 4 in. creosoted block pavement laid on a 2 in. sand cushion. To reduce the floor depth to a minimum in order to obtain an easy road grade at one bridge, the mastic protection was laid on the roadway in two layers each of 1¼ in. with lapped joints and used both as a protection to the waterproofing and a wearing surface for the roadway, thus saving the 6 in. taken up by sand and blocks. Two different waterproofing materials were used, one supplied by the Standard Asphalt & Rubber Company, the other by the Johns-Manville Company, the general specifications for each being practically the same.



Plan of Sunnyside Crossing Showing Location of New Viaduct and Station.

SPECIAL STRUCTURES.

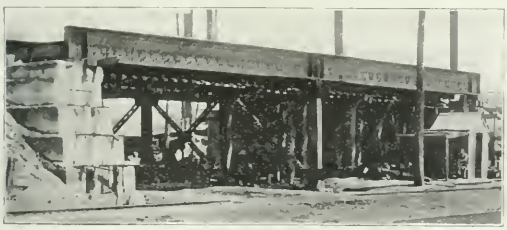
The Queen street grade crossing has been known as one of the most dangerous in Canada. Not unfrequently 40,000 pedestrians and 2,500 vehicles pass over this point within 24 hours. Vehicles approaching from the north were not in sight from the

track, as the road was at a considerably higher elevation than the railway and approached the crossing on a steep grade. The new crossing is a short distance east of the old one at a point where the north bank is high enough to allow the bridge to spring from an abutment on that side almost at present ground level. On the south side a steel viaduct will carry the road from the bridge around a sharp curve to an abutment, from which a descent to the present level will be made on an earth fill having a grade of 2.17 per cent. One of the photographs shows the

Looking East from Jane Street, Showing the Elevated Section.

abutment at the end of the steel viaduct and the pedestals for the columns of this viaduct. The lake will be filled to a line outside these pedestals, using the material taken from the point of the cut between the lake and the tracks just east of the Queen street crossing. The decision to carry this street up to an overhead bridge was reached after the grade line was fixed so that the cut and fill do not balance by the amount needed in the earth embankment for the roadway approach. A portion of this, however, can be secured by widening the cut at the point next to the lake, as mentioned above.

The viaduct section of the Queen street bridge consists of 17 spans. The I-beam stringers are carried on floor beams supported directly on the steel bents. The first eight spans from the crossing are of irregular lengths varying between 22 and 23 ft. The next six spans are 25 ft. 6 in. long, and the last three are respectively 25 ft. 6 in., 27 ft. and 28 ft. The maximum height of columns is at the third bent from the crossing where the distance from the top of piers to the top of roadway at the center line of the bridge is 35.97 ft. Transverse bracing is provided to connect adjacent bents to form towers. The crossing over the four tracks is skewed 30 deg. and is made by two plate girder spans, the longer girders being 92 ft. 4⅝ in. center to



Two-Span Subway at Keele Street.

center of bearings and the shorter ones 61 ft. 3⅝ in. On account of the length of these spans, three girders are used, one being on the center line of the bridge. A double track street railway is carried over this bridge, the tracks being spaced 10 ft. 2⅞ in. center to center. The roadway is 60 ft. wide and a 9 ft. sidewalk is carried along both sides on brackets from the floor beams. The street railway rails are carried on short sections of wooden ties under each rail, the ties resting directly on the I-beam stringers. The concrete casing, waterproofing and pavement are the same as used on the standard highway bridges.

The abutment at the end of the viaduct is of a special design, shown in one of the accompanying drawings. There are three columns 10 ft. 9 in. by 19 ft. at the bottom and 6 ft. 6 in. by 6 ft. 4.5 in. at the top, carried on footings 14 ft. by 24 ft. which support a transverse beam of reinforced concrete 66 ft. 8 in. long, 6 ft. 2 in. deep and 6 ft. thick, the bridge seat being 27.68 ft. above the top of footings. The back wall is carried up 1 ft. 9 in. above the bridge seat. The columns are battered 3 in. per foot on the front face and are stepped in 1 ft. 3 in. at intervals of 5 ft. on the back face, the sides being battered 1 in. per foot. The tops of these columns are bonded to the cross beam by old rails 8 ft. long, spaced 1 ft. center to center and extending into the top of the columns for half their length. There is no other reinforcement in the columns. In addition to the bond, the cross beam is reinforced with 1 in. bars in the lower plane of reinforcement which are bent up to resist shearing stresses and ⅞ in. bars in the upper plane of reinforcement.

As a suburban station is maintained at the Queen street crossing, a new station design was arranged to harmonize with the proposd highway bridge. This building is on the original ground level above the tracks near the intersection of King and Queen streets and is connected with the track level by a foot bridge spanning the first two tracks and connecting with a stairway which leans down to a passenger platform 450 ft. long between the two middle tracks. There is also a baggage elevator in one

Four-Span Subway Carrying Omen Street West Under the Grand Trunk.

end of the station which connects with a baggage-way at track level. Driveways are provided to connect the station with the streets so that carriages can approach without difficulty. The building itself is of stone and brick of a type not uncommon for such structures.

The Humber river is crossed on a four track deck girder structure of two 100 ft. spans designed for Cooper's E50 loading. The old bridge was a double track, single span, through truss on masonry abutments. A slight change in line was made to permit the construction of most of the new bridge south of the old one. The new concrete pier and all of the two abutments, except the north wing walls, were built and the south half of the new bridge was erected without disturbing the old bridge. Traffic was turned over the new bridge, the old bridge was dismantled and the wing walls of the new abutments were then completed over the old masonry. The north half of the new bridge was then erected.

Although all the foundations were made by driving 60 ft. piles to refusal through clay and sand strata, a peculiar settlement of the east abutment occurred after the new bridge was in service. The first sign of settlement was a crack which developed at the junction with the old masonry. Shortly after, a distinct settlement of the back end of the abutment could be seen. It is a well-known fact that in the vicinity of Toronto are found some of the finest examples of the glacial period in existence, each

recession being indicated by alternate strata of clay, sand and sometimes peat. It was found upon examination that a 10 ft. layer of peat, 35 ft. below the surface, must be flowing or compressing, thus allowing a gradual settlement. It was decided to drive a number of rows of piles around the south edge of the foundation in order to compact the supporting strata and stop the trouble. This apparently served its purpose, for the settlement ceased until a continued rainy spell came, when the back end began to sink again. A further examination indicated that the piles driven around the site were sinking at the same rate as the abutment, but it was noticed that the movement was gradually decreasing and it has now entirely ceased after a maximum settlement of 3 ft.

The other stream crossing is over Mimicoke creek near the western limits of the work. A single span double track deck truss bridge was replaced by a four track deck plate girder structure, the girders being erected outside the trusses in such a way as to keep the bridge open for traffic.

EMBANKMENT AND SUBWAYS.

West of the Queen street crossing (Sunnyside) there is a continuous fill to Mimico, the western end of the work. The traffic was first diverted to two temporary tracks along the north right of way line laid on an embankment which had been raised to the height of the old two track grade. One track in the unused portion of the right of way was then raised on a trestle to the height of the new grade. This trestle was filled and the banks were widened from this fill. When the embankment was wide enough to permit it, two running tracks were diverted to their final position on the higher elevation and the remaining fill necessary to make the embankment of four track width was completed. This fill was allowed to take its natural slope, except at one point, where adjoining buildings made it necessary to put in a short length of retaining wall on the north side.

The standard subway used on this work consists of half through girders between tracks with 20 in. 65 lb. I-beams set transversely and carried from the girders by means of web connections. These I-beams and supporting girders are encased in concrete of a 1 : 2 ½ : 5 mixture to protect the steel and carry the ballasted track. This concrete is waterproofed in the same manner as the highway bridges described above. The mastic is applied in two 5/8 in. layers and is carried up to flashing angles on the main girders. The joints in the mastic are arranged to drain the water to the ends of the bridge. A 2 in. cement mortar coat is provided over the waterproofing upon which the ballast is laid. The street width face to face of abutments is 60 ft., a single support on the center line of the street being provided. These supports consist of steel bents on concrete pedestals.

The first plans for separating grades in Toronto were made and work on Section 1 was started under the direction of Howard G. Kelley, vice president, formerly chief engineer, and this work was completed under the direction of H. R. Safford, chief engineer. J. R. W. Ambrose was engineer of grade separation in direct charge of the work in the field. G. A. Mitchell, supervisor of bridges and buildings at Toronto, handled the construction of the bridges, and D. McCooe, superintendent of grade separation, directed the company forces handling the grading. The Canadian Bridge Company and the Canada Foundry Company fabricated the steel work.

New Railroads in Sicily.—The Italian government has recently definitely ordered the construction of two further sections of the complementary narrow-gage railroads provided for by the royal decree of July 12, 1906. One six-mile section to run from San Carlo to Caltabellotta via Burgio, in the province of Girgenti, will cost $225,000. The other eight-mile section to connect the town of Gibellina, province of Trapani, with Belice, province of Girgenti, will cost $478,640. It is understood that tenders are being filed with the Direzione Generale delle Ferrovie dello Stato at Rome.—*Consular Report.*

TRAIN ACCIDENTS IN APRIL.[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of April, 1913:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
*2.	Lehigh Valley	Buffalo.	rc.	F. & F.	0	4
25.	Louisville & Nash.	Corbandale.	bc.	P. & P.	1	10
26.	Illinois Central	Duquoin.	rc.	P. & P.	0	2

The trains in collision near Buffalo, N. Y., on the 2nd were westbound freights. A long freight train drawn by two engines running at good speed ran into the rear of a preceding coal train. Four trainmen were slightly injured. The wreck took fire from one of the engines and 12 cars were burned up. The cause of the collision was improper flagging and excessive speed. The collision occurred on a freight line where trains are required to run under control.

The trains in collision near Corbandale, Tenn., on the morning of the 25th, were northbound passenger No. 104 and southbound passenger No. 101. A mail clerk was killed and 7 trainmen and 3 passengers were slightly injured.

In the collision near Duquoin, Ill., on the 26th, a passenger train ran into the rear of a preceding freight, wrecking the caboose. The engineman and fireman of the passenger train were slightly injured by jumping off.

The trains in collision at Baldwin, Wis., on the night of the 27th, were eastbound passenger No. 2 and a westbound extra freight. Both engines were wrecked and three cars of the passenger train and five of the freight were badly damaged. The engineman and the baggageman of the passenger train were killed and five passengers were injured, none seriously. The collision was reported as due to misunderstanding of orders on the part of the freight.

The trains in collision near Quincy, Mass., on the 28th were a southbound passenger and a northbound work train. Both engines were badly damaged. The passenger train was heavily loaded and the work train carried sixty laborers. Ten of the laborers and two passengers were injured.

The train derailed near Wolcottville, Ind., at 3 o'clock on the morning of the 7th was westbound passenger No. 7, and the engine and baggage car were overturned. The engine lodged in 7 ft. of water. The engineman was killed, and the baggageman injured. All of the passengers escaped with slight injuries. The cause of the derailment was a broken rail.

The train derailed near Kinloch, Mo., on the night of the 8th was eastbound passenger No. 2, and three passenger cars were overturned and ditched. Seventeen passengers and three other persons were slightly injured.

The train derailed near Ascalon, Colo., on the night of the 10th was eastbound passenger No. 110, drawn by two engines. It was derailed in a snow drift in a cut, and the leading engine was overturned. The engineman of the second train was killed, and 3 trainmen, 3 mail clerks and one passenger were slightly injured. The snow drift was about 2 ft. deep, and the pilot

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed

of the engine was bent down so as to derail the front truck.

The train derailed near Evansville, Ind., on the 20th, consisted of an engine, one passenger car and a caboose, the engine running backward. While moving at about 30 miles an hour the train went off the track and the cars fell down a bank. The man running the engine was killed and several other employees were injured. The cause was excessive speed and defective track, damaged by flood. The conductor and engineman had absented themselves and the fireman was in charge. He was killed.

The train derailed near Ravenna, Ohio, on the 22nd was westbound passenger No. 11. Two sleeping cars were overturned, and four passengers were injured.

The train derailed near Beldens, Vt., on the 27th was northbound passenger No. 65. The tender and five cars were ditched. Eight passengers were slightly injured. The cause of the derailment was not determined.

Canada.—The derailment of a passenger train on the Central Vermont near St. Lambert, Quebec, April 13, was reported in the *Railway Age Gazette* of April 18. Six passengers and one employee were killed and 30 passengers and two employees were injured. The cause of the derailment is said to have been excessive speed, 35 to 40 miles an hour, when the engine was running backward.

PROPER AIMS IN TRAINING FOR RAILWAY SERVICE.*

By H. G. Hetzler,
President, Chicago & Western Indiana.

In deciding upon the kind of service that one will devote attention to, the aim should be, if possible, to select that which will be congenial, and for which the individual is seemingly best qualified, as it would be a mistake to choose for a life's business a work that is distasteful and into which it would be hard to throw one's best thought and energy. There is really no easy road to what is termed "success." Advancing in railroad service is no exception to this rule. The work is exacting and sometimes discouraging, but I want to assure you that the field is a splendid one.

During the past few years the civil engineers have been busy studying methods and schemes to increase the efficiency of the railroads and at the same time reduce the cost of operation. Improvement has been made in many cases where lines have been relocated so as to reduce the grades and improve the alignment; terminals have been changed and enlarged so as to facilitate the movement of traffic through them. The mechanical engineer has been just as active, and splendid development has been wrought in motive power and car equipment. The electrical and signal engineers, by their endeavors, have not only aided in efficiency, but have also to a marked degree increased the safety of operation. Nevertheless, the opportunities for the future engineer in the service are unbounded.

The development of our country will demand, in order to meet its requirements, the addition of thousands of miles of track, together with the equipment and facilities necessary to operate them. Laws and regulations have been and constantly are being imposed by state and nation upon railroads, which give rise to many new conditions.

The increase in population, with the consequent increase in the value of property, which are the conditions in our growing cities, add their share to the difficulties encountered. These and many other conditions indicate that the engineer of the future should aim not only to be familiar with strictly engineering problems, but also to keep in touch with the desires of the public and endeavor to comply with them, and at the same time obtain the best results from a railroad viewpoint.

The railroad service is made up of various departments, each differing from the other in its requirements. They are, however, so thoroughly dependent, one upon another, that if for any reason one department does not come to the required standard the entire service is affected more or less by this weakness. Therefore, one should, in addition to being familiar with his own department, understand in a general way the requirements of the other departments, in order to thoroughly co-operate with and bring about the best results, not only for the railroad but for one's self. I can best illustrate this by a personal experience.

Some years ago I was employed in the maintenance of way department of a railroad when a vacancy occurred in another branch of the service which would have been a promotion for me if I had obtained the appointment. The superintendent, thinking that I might feel disappointed on account of not receiving the promotion, called me to his office and said he would have liked very much to give me the position but because I apparently had not been thinking of any department but my own, he did not believe I was in shape to be transferred to the other department. This certainly was a new viewpoint for me, and I immediately commenced to study not only my own work, but at the same time to become familiar with the work of the other departments, and I assure you that although I was disappointed at the time, the disappointment proved to be a benefit.

On entering the service of a railroad, one becomes a part of a large force of employees working in various occupations. It should be the aim to keep in such a frame of mind and thought as to enable one to work hand in hand with brother employees for the improvement of the service. One cannot advance materially in the service without becoming a leader of men, and to become a leader, one must not fail to co-operate with and hold the esteem of one's fellow workers.

A railroad being a public service institution, its prosperity (just as in the case of an individual or business concern) depends to a large extent upon its standing in the community served. Therefore the aim should be to serve the public in such a manner if possible as to warrant its approval.

It is difficult to point out the particular aims that apply more especially to railroad service than to other work, but I will feel that I have partially succeeded if you carry in mind those I have mentioned, which can be summarized as follows:

Endeavor in entering the service to choose the department that will be congenial and for which one feels best qualified.

Keep in touch with the demands of the public.

Master the details of your chosen department and become familiar with the requirements of the other departments.

Co-operate with your fellow workmen and the public.

*Abstract of an address at the Railway Conference at the University of Illinois, Urbana, Ill., on May 9, 1913.

NEW LINE FOR FRENCH EQUATORIAL AFRICA.—A line 360 miles long will soon be built from Pointe Noire on the Atlantic coast, just south of Loango, French Equatorial Africa, to Brazzaville, on Stanley Pool. This year the government proposed to vote $17,000,000 for the construction of this line and the betterment of the ports at either terminus. It will take some eight years to build.—*Mining and Scientific Press.*

HAICHOW-LANCHOW RAILWAY, CHINA.—Two detachments of engineers are now locating the Haichow-Lanchow Railway. For the present the line is to be built only to Lanchow, but a further extension is contemplated to Suchow in Kansu. This is one of the most important railway projects which China has ever undertaken. It will open up a vast territory through the greater part of which there are no navigable waterways. This statement applies particularly to the provinces of Shensi and Kansu, foreign imports into which, and the exports therefrom must be carried on the backs of animals or of men over difficult mountain paths at great expense and with much loss of time. The projected line will cross two other provinces—Honan and northern Kiangsu, the first of which is served in some degree by the Peking-Hankow and the Kai-feng-fu-Honan-fu railways, and the second by the Grand Canal and the Tientsin-Pukow Railway.

COMBUSTION IN LOCOMOTIVE PRACTICE.

Not Thoroughly Understood and Presents Wonderful Possibilities from the Standpoint of Increasing Boiler Efficiency.

By J. T. Anthony.

American railroads use about 135 million tons of coal annually, at a cost of some 240 million dollars, or 12 per cent. of their total operating expense. Managers and motive power officers, the country over, are well aware of the fact that a large part of this coal is wasted through imperfect combustion, and their efforts to locate the cause and apply a remedy have, in many cases, resulted in the fireman's exaltation to the position of "chief goat." Too often has he been held responsible for a condition of affairs for which he was little or in no wise to blame.

Volumes have been written about methods of firing; about "bright, light and level fires"; about "cross firing"; about "single scoop firing"—all of them good methods and useful, maybe, when it is possible to follow them, but none of them sufficient to approximate perfect combustion in the firebox of a modern locomotive. During recent years the public has been waging an earnest fight against the smoke nuisance, and the railroads have been forced to give the matter serious attention, but most of the attention has been directed to the firemen in the form of instructions, and not enough attention has been given to the design and equipment of a locomotive firebox that can be fired by the average fireman, with an ordinary grade of coal, under every day conditions and without making smoke.

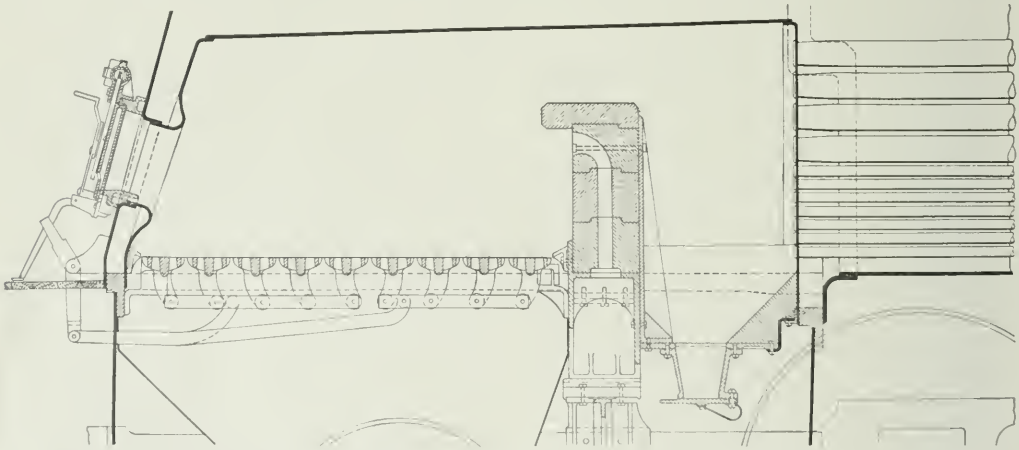

Fig. 1—Gaines Combustion Chamber Applied to a Pacific Type Locomotive.

Bituminous coal, which is used almost exclusively for locomotive purposes in this country, is not a homogeneous substance and cannot be successfully treated as such. This fact has been appreciated by some engineers in designing furnaces for stationary power plants; but locomotive designers and builders have for the most part either ignored the characteristics of their principal fuel or have been influenced by the limiting conditions of weights, clearances and possible complications in firebox construction, to such a degree that they have done comparatively little along this line, and today the fire brick arch of Security type is the only device that is used to any extent as an aid to combustion in locomotive fireboxes.

Bituminous coal consists principally of fixed carbon which burns on the grate with little or no flame, and volatile matter which burns above the fuel bed with a long flame. In order to approximate perfect combustion in the firebox of our modern, high-powered locomotive, with ordinary firing, it is essential that the following provisions be made:

First, a secondary air supply above the fire.

Second, an intimate mixture of the volatile matter and the air.

Third, flame-way or combustion chamber space sufficient to allow all gases to be completely burned before reaching the back flue sheet.

In an ordinary locomotive firebox all the air is supplied through the grate. As this air comes in contact with the glowing coals of carbon at the bottom of the fuel bed, it gives up its oxygen, two parts of which readily unite with one part of carbon to form carbon dioxide. The carbon dioxide thus formed passes on up through the fuel bed and unless accompanied by an excess of air, on coming in contact with the glowing carbon it gives up part of its oxygen and is reduced to carbon monoxide. When the carbon monoxide thus formed is brought in contact with oxygen or air which is heated to a sufficiently high temperature, it will be completely burned to carbon dioxide; otherwise, the gases may be chilled and pass off unburned, at a loss of about 10,000 heat units per pound of carbon, since carbon burned to carbon dioxide generates 14,600 heat units, while only about 4,400 B. t. u. are produced when carbon is incompletely burned to carbon monoxide.

Bituminous coal contains from 25 to 50 per cent. volatile matter which, being rich in hydrogen, has a very high heat value, generating from 12,000 to 21,000 heat units per pound of gas. These volatile hydro-carbons, principally of the methane series, are driven off at a comparatively low temperature, when green coal is thrown on the fire, and if supplied with a sufficient quantity of heated air (or oxygen) will readily ignite. If there is no excess air above the fuel bed they pass off unburned, producing smoke and leaving behind a deposit of soot in the firebox and tubes. If there is a partial supply of air, the hydrogen, having greater affinity for oxygen than the carbon, takes up the available oxygen from the air forming steam, while the carbon is set free and either passes off in fine particles as smoke and soot or

combines with an insufficient quantity of oxygen to form carbon monoxide.

This shows the vital necessity for air above the fire, air being the medium through which oxygen is supplied; but an excess of oxygen alone is not sufficient, for flue gas analyses often show incomplete combustion with large excess of oxygen. It is important that the air be heated, as hydrogen will not combine with oxygen below about 600 deg. F., nor carbon with oxygen below 800 deg. F.

When air at atmospheric temperature is admitted into the firebox it has to be heated up to the igniting point before its oxygen is available for combustion, and if it enters in a large shaft, as through an open fire door, it is possible for it to flash through the firebox and into the flues before the igniting temperature is reached, in which case it hinders rather than aids combustion, and at the same time endangers the flues.

It is necessary to have an *intimate* mixture of the volatile matter and the air in order that *every particle* of carbon and hydrogen contained in the former may come in contact with the required amount of oxygen contained in the latter. In no other way can perfect combustion be obtained, yet this is a point that has been largely neglected up to the present time.

It is very apparent that the flame-way or combustion chamber space should be long enough to give the gases *time* to mix and burn completely before striking the flue sheet, for the flames are extinguished on entering the small fire tubes and combustion ceases. The advantage of a combustion chamber has been appreciated by many and used to some extent; but most roads have, in the past, refrained from the use of the common, water-leg type of combustion chamber on account of the complications in construction and maintenance costs.

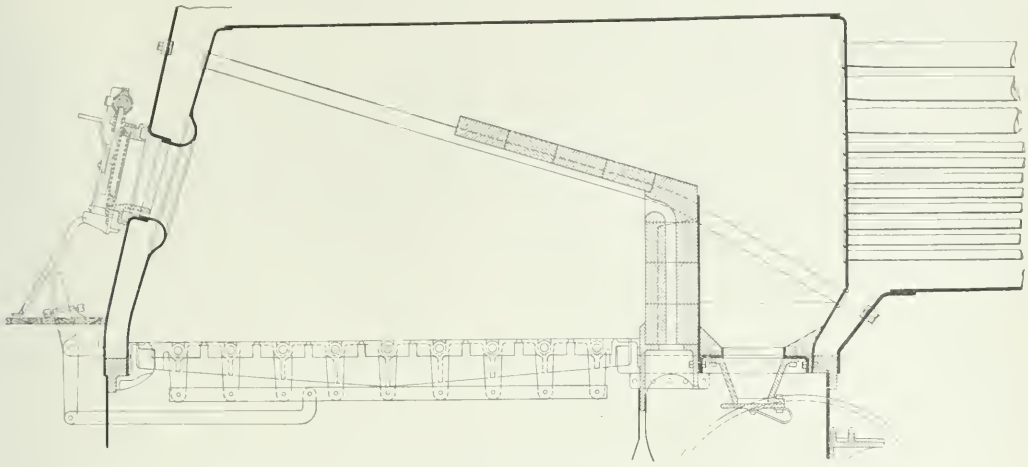

Fig. 2—Gaines Combustion Chamber Combined with the Security Arch.

THE SECONDARY AIR SUPPLY.

The amount of air needed above the fuel bed depends upon the composition and per cent. of volatile in the coal, the rate of combustion, the efficiency of the gas mixing devices and the volume of the firebox and combustion chamber. That the composition and per cent. of volatile matter influences the air supply is very apparent. Since all the volatile matter burns above the fire, the per cent. of air required above the fire will vary with the amount of volatile in the coal and on the proportion of hy-

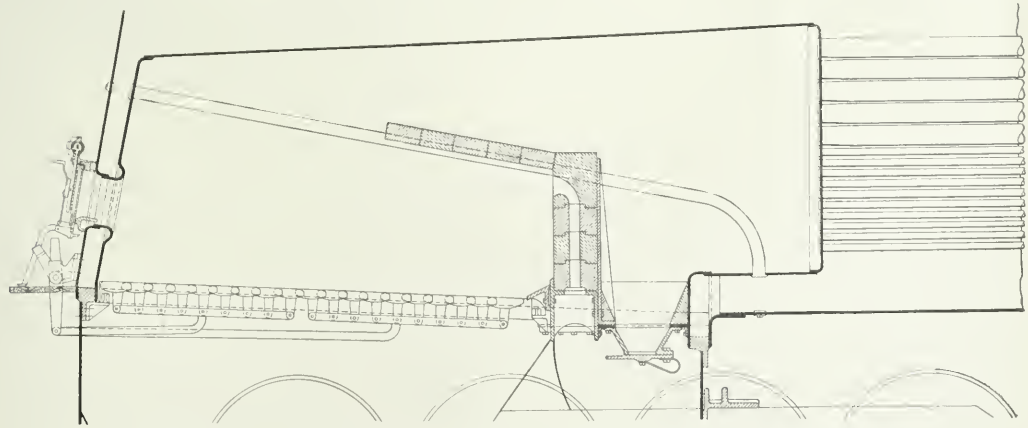

Fig. 3—Gaines Furnace with a Barrel Combustion Chamber as Applied to a Mallet Locomotive.

drogen and carbon in the gases, other things being equal, as a pound of hydrogen requires about three times as much air for complete combustion as a pound of carbon.

As the rate of combustion increases, the fire usually becomes thicker and this increase in thickness of the fuel bed, by offering more resistance to the passage of air, tends to reduce the air supply above the grates at a time when it needs to be increased, owing to larger volume of volatile gases being distilled and to the increase in the amount of carbon monoxide reduced from carbon dioxide in passing up through the thicker bed of coals.

The efficiency of a gas mixing device has a direct bearing on this secondary air supply. If it were possible to get a perfect mixture of the combustible gases with the air, the theoretical amount of air required would be sufficient to assure each molecule of methane, carbon monoxide, hydrogen or other combustible meeting with its needed oxygen; but in actual practice such a condition is impossible and it becomes necessary to supply an excess of air in order that each molecule of combustible gas may readily find its mede of oxygen in the short time available, for the gases linger in the firebox only the fractional part of a second even under medium rates of combustion, and when the rate is high the time is almost nil.

Increase in firebox and combustion chamber volume promotes combustion by lengthening the flame path and giving the gases more time to mix and burn. If the firebox is shallow and the combustion chamber restricted, the flame-way and time are reduced, so it becomes necessary to increase the speed of combustion in order to burn the gases completely before they enter the fire tubes, and this can only be accomplished by increasing the air supply. When a volume of combustible gas is brought in contact with oxygen or air heated to the proper degree, a chemical reaction (combustion) begins with a high velocity, but as the reaction continues the velocity becomes less and less and combustion becomes more difficult. This is due to the fact that as combustion proceeds the amount of burned gas increases while the unburned gas and oxygen decrease, and the mass of burned gas (or product of combustion) mixing with the combustible gas and oxygen tends to separate them, makes their union difficult, and retards combustion. From this well established law of "mass action" we learn that "the speed of a chemical reaction (combustion) increases with the weight of the reacting substance in a unit of volume," though not always in direct proportion. Thus we see that an increase in air supply is all that is needed to increase the velocity of combustion, and the law holds true for solids as well as gases. We see it illustrated in every-day practice at the blacksmith's forge, in our domestic heaters and in a locomotive firebox.

A pound of carbon when burned will give off 14,600 heat units. The amount of heat given off is unaffected by the speed of combustion if the combustion is perfect, but when we wish to increase the degree of heat or raise the temperature it is necessary to increase the speed of combustion, and this is accomplished by supplying more air, or increasing the draft.

What has been said in the preceding paragraphs relates to hand-fired furnaces, but the general principles hold true for stoker firing as well. It should be stated, however, that stokers of the under-feed type have an advantage over other methods of firing in eliminating smoke. This is due to the fact that the coal is fed in slowly and heated up gradually, which results in the light-hydrocarbons being slowly driven off while the heavy "tarry" hydrocarbons, which are the principal smoke producers, are left behind and burned on the grates. With over-feed stokers or hand-firing the green coal is thrown in on top of a white hot fuel bed, is heated up instantly and the volatile matter being driven off rapidly, carries with it a large part of the tarry hydrocarbons, which pass off partly unconsumed, producing smoke, as it is impossible to hold them in the firebox until combustion is complete. With hand-firing a part of the finely powdered coal is also unavoidably lost, as it is caught up by the stream of cold air rushing through the open fire door and carried out of the firebox before combustion takes place. This condition can be helped by providing suitable baffles.

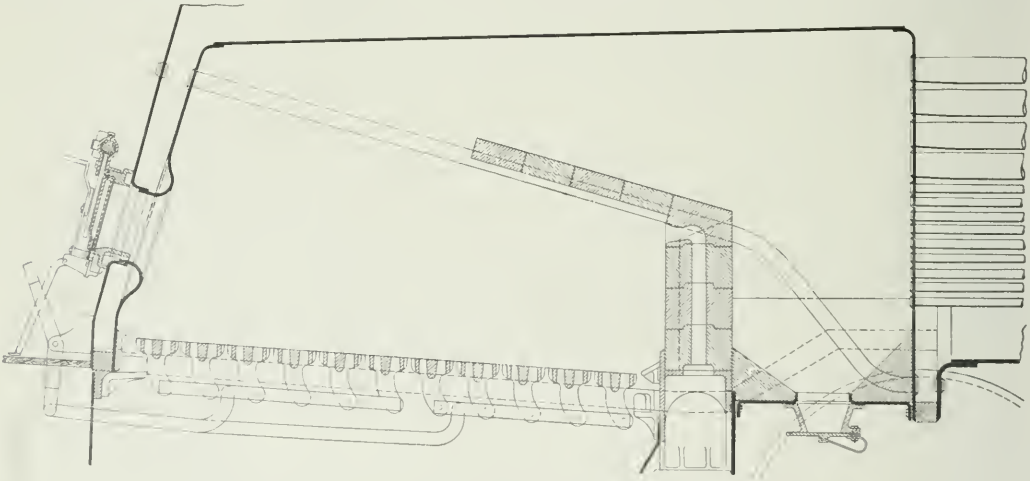

Fig. 4—Gaines Furnace as Used on a Locomotive with Large Diameter Drivers.

THE EFFECT OF EXCESS AIR.

While it is generally admitted that an excess of air is desirable as an aid to complete combustion, the objection is often raised that the excess oxygen carries with it a large per cent. of inert nitrogen which dilutes the products of combustion, absorbs heat and lowers the temperature to such an extent that the gain in combustion is more than offset by the heat losses.

It is true that the temperature falls as the air supply increases; but temperature is not the only factor that enters into the case. The heat generated on the grate of a locomotive is imparted to the firebox surface largely by radiation; that is, the heat travels directly from the fuel bed to the firebox sheets without the aid of any material agency such as the gases of combustion, and the quantity of heat so imparted depends on the temperature and area of the fuel bed, other things being equal. Since air

is practically unaffected by the action of radiant heat, it is possible that the introduction of the desired quantity of it above the fuel bed could be accomplished with little or no effect on the quantity of radiant heat imparted to the firebox heating surface.

A large part of the heat that passes out of the firebox with the gases of combustion is imparted to the fire tube heating surfaces by convection, that is, by the action of the small particles of heated gas striking against the tubes, giving up their heat and being replaced by other heated particles—a continuous interchange of cooled particles next to heating surface for heated ones from the body of the gas.

From the definition it is evident that the rate of heat transfer by convection depends on the activity or rate of interchange of the particles of gas. An interesting theory in regard to this was advanced by Professor Reynolds in a paper read before the Literary and Philosophical Society of Manchester in 1874. This was afterwards elaborated upon by Professor John Perry and has more recently received quite a bit of attention at the hands of Professor Breckenridge and others interested in the tests conducted by the government at the St. Louis fuel testing plant.

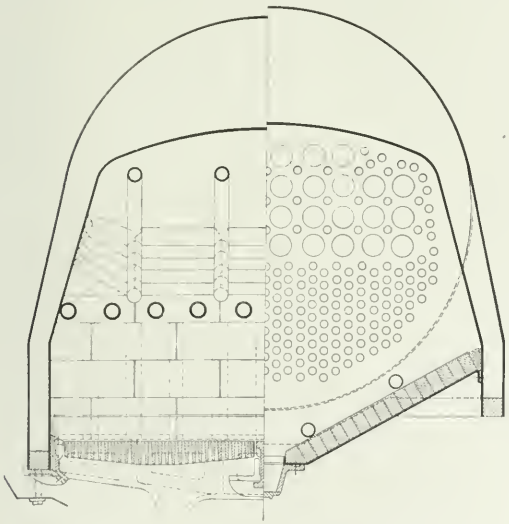

Fig. 5—Showing the Air Ducts Opening into the Firebox and the Method of Applying the Combustion Chamber Floor.

According to this theory the rate of heat transfer from the hot gases to the fire tube is "proportional to (1) temperature differences of the gases and the metallic surface; (2) density of the gases; (3) velocity of the gases parallel to the metallic surface, and (4) specific heat of gases at constant pressure. A large number of steaming tests of coals conducted by the U. S. Geological Survey gave results that seem to prove the correctness of this theory, and it has been treated quite fully in bulletins issued by the Department of the Interior.

Factor 1 is self-evident. It is also plain in studying factor 2 that since the molecules of heated gas give up their heat by striking against the metal tube, the amount of heat given off will depend on the number of blows struck. This in turn depends on the number of molecules in a unit volume of the gas, or the density of the gas. As the temperature increases, the gases expand and the number of molecules per unit of volume decrease; hence any gain by increase in temperature is partly neutralized by decrease in density.

The vital importance of the velocity of the gases (factor 3) is proved in every day locomotive practice. When we wish to increase the capacity of our boiler we burn more coal, that is, we put a larger mass of gas through the tubes and thereby increase the velocity. "If twice the mass of gas is put through the tube per second, at the same initial temperature, very nearly twice as much steam will be generated." This is due to the fact that as the molecules of gas strike the metal of the tube and give up their heat they become more or less "bound" by the attraction of the metal and entangled with the soot film, and there is soon built up a film of cold non-conducting gas. In order to keep up the heat transfer it is necessary that the cold molecules of gas be replaced by the hot ones, and this is accomplished by the action of the hot molecules which are flying back and forth perpendicular to the surface of the tube, the dislodging and scrubbing effect of which is proportional to the velocity of the body of the gas parallel to the heating surface.

Equal volumes of all gases under the same conditions of temperature and pressure contain the same number of molecules, but since different gases on cooling give off varying amounts of heat per degree of temperature drop—have different specific heats at constant pressure—it is evident that the same number of blows struck by the molecules of different gases will result in different amounts of heat transfer; hence factor 4.

According to the tentative formula proposed by Professor Perry the rate of heat transfer from the gases to a unit area of fire tube per second is proportional to the product of the above four factors. This being the case, it is evident that any decrease in temperature, due to increasing the air supply, is partly neutralized by an increase in the volume (velocity) and density of the products of combustion, and the product of the four factors decreases but little as the air supply is increased—the specific heat being taken as a constant (.24) without serious error.

A pound of carbon requires about 11.6 lbs. of air for complete combustion, theoretically, but any attempt to fire a locomotive with the air supply cut down to this point would result in a heavy fuel loss due to incomplete combustion. With 100 per cent. excess air complete combustion can readily be obtained, resulting in a saving of from 15 to 25 per cent. in fuel, which more than offsets the approximately 5 per cent. loss in heat absorption due to the excess air—this loss in heat absorption being confined almost entirely to the flue surface which takes up from 50 per cent. to 60 per cent. of the heat utilized by the boiler. Perhaps 100 per cent. excess air is more than could be recommended in every day practice, this depending largely on the manner of introducing the air, the efficiency of the mixing devices, combustion chamber space, etc.; but this amount has been used in both stationary and locomotive practice with good results, and there are instances on record where boiler efficiencies as high as 84 per cent. have been obtained with 120 per cent. excess air.

Road tests on a Pacific type locomotive equipped with a Gaines furnace, of the type shown in Fig. 1, gave results that seem to check with what has been said above. With a rate of combustion of 57 lbs. per square foot of grate per hour, the flue gas analyses showed 116 per cent. excess air with an average of .015 per cent. carbon monoxide. Under these conditions the front end temperature was 465 deg. F., while the over-all efficiency of the boiler reached 80 per cent.—the equivalent evaporation per square foot of heating surface being 11.35 lbs. per hour.

It is possible that the efficiency in the above case was partly due to the fact that with perfect and smokeless combustion the heating surface was kept free from all soot accumulation, it being well established that the resistance to heat transfer from the gases to the water is due largely to the non-conducting films of soot and scale.

All locomotives equipped with the furnace mentioned above have been singularly free from accumulations on the fire side of the heating surface. The increase in air supply, resulting in high velocity of gases through the tubes, keeps them swept clear

of all fine particles of ash or cinders that carry over, and makes frequent flue blowing unnecessary.

THE GAINES LOCOMOTIVE FURNACE.

Primarily, a fuel bed of bituminous coal is a gas producer, and in order to get all the heat available out of the coal it is necessary to make provision for burning the combustible gases above the fuel bed. To successfully accomplish this requires:

First: A secondary supply of heated air above the fuel bed.
Second: A thorough mixture of the air and combustible gases.
Third: Sufficient flame-way or combustion chamber space.

These are the theoretical requirements. The practical man asks, How can these desired results be obtained without excessive cost and firebox complications? Can any device be installed that will turn the trick and yet be thoroughly mechanical in construction, easy to maintain, and foolproof in operation?

Profiting by several years' experience with locomotives equipped with Wooten type fireboxes, with fire brick bridge walls built across the mouth of barrel combustion chambers, F. F. Gaines, superintendent of motive power of the Central of Georgia, designed and patented a locomotive furnace of the type shown in Fig. 1. This consists essentially of a fire brick bridge wall extending across the firebox, forming a combustion chamber between the wall and flue sheet, the tubes being shortened and the firebox lengthened sufficiently to admit of this application, while the grate remains normal. The bridge wall is carried by a casting extending across the firebox and secured to the mud-ring at each side by studs. This casting also supports the grate frames; the buck stays in the rear, which prevent the wall from toppling, are likewise bolted to it. The floor of the combustion chamber is made of cast or wrought iron plates, protected with fire brick to prevent burning out. In order to take care of cinder accumulation in the combustion chamber a spark hopper is provided in the center, the floor being given sufficient pitch to cause all accumulation to drain out when the hopper is opened. The bridge wall is built up of special fire brick of such size as can be easily handled, and in these brick are cored air passages matching the openings in the carrier casting. The size and number of the air ducts vary according to the character of the fuel, area of grate and rate of combustion, as these factors determine the amount of air needed above the fuel bed.

When the locomotive is operating the wall becomes white hot, with the result that the outside air, being forced through the air ducts, under the influence of the pressure drop in the firebox, is heated up quite appreciably before being discharged into the firebox. As it issues from the ducts near the top of the bridge wall the heated air comes in contact and mixes with the combustible gases that are forced to pass up over the top of the wall. Combustion begins the instant the air comes in contact with the gases and the reaction continues until the combustible gases are all burned to carbon dioxide, or the flames are extinguished on entering the tubes. (In case the combustion chamber space is limited and the flame way is short, the air supply should be large in order that combustion proceed rapidly and the flames burn out completely before striking the flue sheet.)

In Fig. 1 the wall is shown extending up to within 15 inches of the crown sheet, as in practice it has been found desirable to carry the wall as high as possible without obstructing the draft; this increases the baffling effect and promotes the mixture of the air and gases. Aside from its aid to combustion, this wall also offers complete protection to the flues. The combustion chamber being made thoroughly air tight, it is very evident that it would be impossible for any cold air to reach the flues through a hole in the fire or through an open fire door, for air entering through either of these places would be forced to pass up over the wall and come in contact with the flames, hot gases and incandescent brick, thereby being heated up and rendered harmless before reaching the flues.

The first locomotive equipped with this device has been in service about four years and it has proved an unqualified success in improving the steaming qualities, saving fuel, reducing smoke and cinder nuisance and prolonging the life of the flues. The success of the first installation was followed by the application of the device to a number of other locomotives on several Eastern roads. All locomotives so equipped have given good service and in several ways have shown to advantage over similar engines equipped with arches, but the fact that arches of the security type were giving good service and possessed many advantages over other devices, could not be lost sight of, and after some trials the Gaines combustion chamber and Security arch were combined—the combination as shown in Fig. 2 being known as the Gaines locomotive furnace.

This combination is ideal in every respect, possessing all of the advantages of the Gaines wall and Security arch, with none of the disadvantages. The arch tubes add to the effective firebox heating surface and increase the circulation, both of prime importance. The addition of the arch back of the wall doubles the flame-way without increasing the length of the firebox, increases the effectiveness of the heating surface at the back of the firebox, increases the mixing of the air and combustible gases and on account of the longer flameway gives the gases longer time to burn, thereby reducing the amount of excess air required.

It is often impossible to apply arch tubes to fireboxes with shallow throat sheets on account of the lack of firing clearance, and in many cases it is impossible to keep the bottom tubes open because of slag and cinders going over on top of the arch and plugging them up. The bridge wall does away with these troubles. A deep throat sheet is no longer necessary for firing clearance under the arch, and any cinders or slag that pass over the bridge wall fall into the hopper from which they are easily drained at the end of the run.

A locomotive furnace of the type shown is especially adapted to overfeed stoker firing, providing, as it does, a flash wall to fire against, with an arch to baffle and hold the fine particles of coal in the firebox until they are mixed with the heated air and burned, thereby eliminating smoke and cinders and keeping the flues and tubes free from all accumulation.

The application shown in Fig. 1 is admirably adapted for locomotives in bad water districts where it is impossible to maintain arch tubes. It is effective in fuel economy, eliminates smoke and cinders and protects the flues. It is shown on a Pacific type locomotive, but can be easily applied to any other type.

The Gaines locomotive furnace is shown in Fig. 2 as applied to a Mikado locomotive, and, as pointed out, this possesses several advantages over the type shown in Fig. 1. It is equally well adapted to the Pacific, consolidation, switcher or Mallet locomotives.

The Gaines furnace applied to a Mallet locomotive firebox with a barrel combustion chamber is shown in Fig. 3. While this type of combustion chamber is not necessary with the Gaines furnace, it was used in this case to reduce the excessive length of flues and to balance the weights on drivers, it being impossible to carry the mud-ring forward to the flue sheet without interfering with the reversing gear. The barrel combustion chamber has met with much opposition in the past owing to its complications and cost of maintenance, but in recent years much of this trouble has been eliminated by the liberal use of flexible stays and by welding the seams. The large dead water space beneath the barrel has also been a source of much trouble, but this may be easily overcome by applying arch tubes as shown. Here the five 3½ in. tubes add 70 sq. ft. to the effective firebox heating surface, evaporate about 4,000 lbs. of water per hour, and produce quite a circulation in an otherwise dead water space, thereby reducing the variations in temperature around the barrel, making the expansion and contraction uniform and eliminating leaky seams and stays. A study of the illustration brings out the fact that the application of this furnace permits of great flexibility in design and location of the firebox with respect to the wheel arrangement.

The conventional type of firebox on an Atlantic, Pacific or Mikado locomotive is always located back of the rear driver, this construction being necessary in order to get the deep throat that is required to keep the grate line well below the bottom flues. On large Pacific and mikado locomotives, excessive flue lengths or the use of barrel combustion chambers necessarily follow this practice. In trying to keep the center line of the boiler as close as possible to the rails, the builders are forced to bring the firebox down close to the top of the frames and trailer wheels; this results in shallow ash-pans that burn out easily, complicated wheel housings, and, very often, insufficient air openings.

On consolidation and Mallet locomotives, the firebox being located above the drivers, the grates are placed as low as the wheels will permit—scant attention being paid to the ash-pan—while the required firing clearance between the grates and bottom flues is obtained by raising the center of the boiler to the necessary height.

The Gaines furnace, by its method of construction and application, does away with most of the bad features mentioned above. Fig. 1 shows the grates of a Pacific type locomotive raised up on a line with the belly of the boiler, the mud-ring being carried forward above the drivers and cradled in the center, the depth of the throat being reduced to a minimum. This permits of the boiler being brought lower on the frames without impairing the ash-pan. It might appear that the reduction in firebox depth, by reducing the volume and heating surface, would lower the efficiency, but firebox volume is valuable only in so far as it increases the flame-way, and depth can be sacrificed if the length of the firebox gives the flame-way desired. The amount of radiant heat imparted to the firebox heating surface depends, as stated before, on the temperature and extent of the radiating bodies; and since the firebox receives the larger part of its heat by radiation it is evident that the extent of the heating or evaporating surface is of secondary importance.

In Fig. 2 the firebox of a Mikado locomotive is carried forward above the rear drivers; this location of the back flue sheet reduces the flues to a reasonable length without the aid of a barrel combustion chamber. The shallow throat permits the boiler to be kept well down on the frames without crowding the ash-pan, while at the same time a firebox volume, much in excess of the ordinary, is obtained.

On the Mallets shown in Fig. 3, the grates are also located above the belly of the boiler. This construction allowed the boiler to be lowered 6 or 8 in. without harm to the ash-pan, while a firebox of exceptionally large volume and long flame-way was obtained.

Where drivers of very large diameter are used a construction similar to that illustrated in Fig. 4 can be employed to good advantage. Here a firebox of normal depth is maintained, while that part of the mud-ring around the combustion chamber is carried up and over the drivers, being dropped in the front center sufficiently to take care of the throat sheet. While a little unusual, this firebox construction presents no difficulties and no trouble has been experienced with locomotives so equipped. It will be noticed that the front of the mud-ring is directly above the pedestal and that the firebox is unsupported at this point, the weight of the grates, furnace and firebox being transferred to the frames back of the rear driver through the furnace bearer and frame brace; the boiler expansion is taken care of by a sliding connection between these castings. This feature is illustrated in Fig. 5, which also shows the air ducts opening into the firebox and the method of applying the combustion chamber floor.

SUMMARY.

While the locomotive has been greatly improved in general design and refinement of details during the last few years, but little attempt has been made to improve the evaporative efficiency of the locomotive boiler. The demand for more steam, following the increase in size of cylinders and rise of pressure, has been met by increasing the size of the boiler and not by increasing its evaporative power, although the superheater, by improving the quality of the steam, has reduced the demand on the boiler.

It is possible that future builders will be forced to pay much attention to the design of a furnace that can be fired by the average fireman in such a manner as to get all of the available heat out of the coal, and to arrange the heating surface so as to readily absorb the heat made available. With our present design of firebox and boiler, an evaporation of about 52 lbs. per square foot of firebox heating surface, and 8 lbs. per square foot of tube heating surface has been obtained. An evaporation of 90 lbs. per square foot from experimental boilers in laboratory practice, without injury to the plates, would seem to indicate that the practical limit has not yet been reached.

The firebox has been correctly called the "business end" of the locomotive. If a big business is desired a big firebox with ample grate area and long flame-way is necessary. A large grate covered with a white-hot fire—in conjunction with a mass of incandescent brick work, properly arranged, and a long combustion chamber filled with flames—gives a very extensive radiating surface from which the heat readily passes to the surrounding firebox sheets.

The increased heating surface on the modern locomotive boilers has been obtained by increasing the number and length of the flues, and the fact that the front end temperatures on locomotives with tubes 20 to 24 ft. in length are but little, if any, lower than the temperatures on locomotives with tubes from 12 to 16 ft. long, would seem to indicate that the heating surface gained by excessive flue lengths is largely "conversational"—nice to talk about, but of little practical value. Shorter tubes and longer fireboxes and combustion chambers would probably improve the steaming qualities of the boiler, while an increase in the velocity of the gases over the heating surfaces, and an increase in the circulation of the water around the heating surfaces will result in increased evaporation until the point of "critical velocity" is reached.

The problem of increasing boiler efficiency should be attacked from the firebox end. First, get a furnace with which it is possible to approximate perfect combustion with ordinary firing, thereby making available all of the heat contained in the coal, and then locate and distribute the heating surface so as to readily absorb the heat made available—a difficult problem, but worthy of study and effort.

ACCIDENT BULLETIN NO. 45.

The Interstate Commerce Commission has issued Accident Bulletin No. 45, containing the record of railway accidents in the United States during the three months ending September 30, 1912. The number of persons killed in train accidents was 288 and of injured, 4,598. The total number of casualties of all classes including "industrial accidents" amounted to 3,109 killed and 51,331 injured. These are summarized as follows:

TABLE NO. 1—CASUALTIES TO PERSONS—STEAM RAILWAYS.

Causes	Passengers (classes *a*, *b*, and *bb*)		Employees (including employees not on duty)		Other persons (trespassers and non-trespassers)		Total persons

Table No. 1a.—Comparison with Former Records.

Item	Bulletin 45	Bulletin 44	Bulletin 41
Passengers killed in train accidents	88	14	65
Passengers killed, all causes	156	52	116
Employees (on duty) killed in train accidents	153	99	104
Employees (on duty) killed in coupling	32	46	42
Employees (on duty) killed, total (Table 1b)	712	554	626
Total passengers and employees (items 2 and 5, above)	868	606	742
Other persons killed (including trespassers, non-trespassers, and employees not on duty), all causes	2,127	1,696	2,016
Employees killed in industrial accidents	114	93	131
Grand total (items 6, 7, and 8)	3,109	2,395	2,889

This table shows a noticeable increase in every item, in the quarter under review, over the corresponding item in the preceding bulletin, with the exception of item 4, "Employees killed in coupling," which shows a decrease of 14 killed. Compared with the same period of the preceding year all items show increases with the exception of two—employees killed in coupling and in industrial accidents. The large number of passengers killed in train accidents will be understood when it is recalled that in the quarter under review occurred the disastrous wrecks at Corning, N. Y., Wilpen (Ligonier) Pa., and Western Springs, Ill. Of the 2,020 "other persons" killed 1,663 were trespassers, of whom 39 were killed in train accidents; 313 were riding on cars or attempting to do so, and 1,254 were struck or run over by trains. This last item (1,254) is 50 per cent. larger than the number of *injured* in the same class.

The total number of collisions and derailments in the quarter now under review was 3,935 (1,537 collisions and 2,398 derailments), of which 171 collisions and 298 derailments affected passenger trains. The damage to cars, engines, and roadway by these accidents amounted to $3,366,401. This sum is greater than that reported in this quarter since 1907, as will be seen by Table No. 2.

Table No. 2—Collisions and Derailments.—Steam Railways.

Classes	Number	Damage to road and equipment	Number of persons Kil'd	Inj'd
Collisions, rear	245	$330,074	72	431
Collisions, butting	164	309,357	55	783
Collisions, trains separating	140	52,814	1	53
Collisions, miscellaneous	988	443,794	29	724
Total	1,537	$1,136,039	157	1,991
Derailment—				
Due to defects of roadway	510	$418,486	14	614
Due to defects of equipment	1,124	859,085	22	317
Due to negligence	131	83,214	8	100
Due to unforeseen obstruction	104	222,169	28	247
Due to malicious obstruction	18	14,455	..	49
Due to miscellaneous causes	511	633,953	47	782
Total	2,398	$2,230,362	119	2,109
Total collisions and derailments	3,935	$3,366,401	276	4,100
Total for same quarter of—				
1911	3,034	$2,533,170	189	3,776
1910	3,130	2,871,501	303	3,352
1909	2,741	2,316,014	180	3,341
1908	2,567	1,950,408	176	2,729
1907	4,279	3,605,696	309	4,534

Derailments due to defects of roadway and to defects of equipment are divided into sub classes, eight for roadway and 13 for equipment, and these are totaled in Tables 2a and 2b.

A new table, No. 1d, shows what may be called a surgeon's classification of the injuries which are classified by causes in the principal table of the bulletin. For example, of the 4,230 passengers injured in class *a*, 12 suffered the loss of a leg (or both legs), 10 sustained fractured skulls, 20 were scalded or burned, etc.

Three other new tables, 4a, 5a, and 8a, subdivide the causes of miscellaneous accidents on or around trains; of cases where trainmen strike overhead bridges, etc., and of miscellaneous accidents on or around trains.

Twenty pages of the bulletin are taken up with summaries of the reports, made by the chief inspector, on accidents which were investigated during the quarter. These accidents are as follows:

Delaware, L. & W.	East Corning, N. Y.	July 4.	Rear collision
Ligonier Valley	Ligonier, Pa.	July 5.	Butting collision
Illinois Central	Courtland, Miss.	July 12.	Derailment
Chicago, B. & Q.	Western Springs, Ill.	July 14.	Rear collision
Southern	Vance, Tenn.	July 17.	Derailment
N. Y. N. H. & H.	Stonington, Conn.	July 25.	Rear collision
Denver & Rio Grande	Pueblo, Colo.	July 31.	Derailment
Chicago, M. & P. S.	Keechelus, Wash.	Aug. 12.	Derailment
Cincinnati, H. & D.	Antioch, Ill.	Aug. 25.	Derailment
Northern Pacific	Hot Springs, Wash.	Aug. 30.	Butting collision
Chicago & N. W.	Lyndhurst, Wis.	Sept. 1.	Derailment
Chicago, St. P. M. & O.	Hustler, Wis.	Sept. 2.	Derailment
Southern	Holton, Ga.	Sept. 5.	Derailment
Rutland	Bennington, Vt.	Sept. 7.	Butting collision
N. Y. C. & St. L.	Erie, Pa.	Sept. 10.	Derailment
N. Y. C. & H. R.	East Rochester, N. Y.	Sept. 15.	Rear collision
Louisville & Nashville	Kiserton, Ky.	Sept. 20.	Collision—misplaced switch
Pittsburgh, Shawmut & N.	Niles, N. Y.	Sept. 22.	Butting collision
Kansas City Southern	Air Line Junction	Sept. 26.	Butting collision

Electric railways reporting to the commission (not included in the foregoing statistics) had 107 persons killed during the quarter and 1,362 injured; and there were 52 collisions and 25 derailments. Train accidents are charged with eight fatalities; 4 passengers and 4 employees. The total number of passengers killed from all causes was 10 and of employees 19 (6 in industrial accidents). The number of trespassers struck or run over by cars was 57; 38 killed and 19 injured.

A TRAIN (?) DESPATCHER.

Fifteen thousand cars were handled in the yards of the Buick Motor Company, of Pontiac, during the year, inclusive of the thirteen trainloads of Buicks sent to the west. Outgoing cars numbered 7,600, and incoming freight 8,000 carloads.

The company has comparatively recently installed a new system whereby a despatcher is put in charge of all inter-factory deliveries [by means of motors running in the streets]. He sits all day with a telephone receiver clamped to his ear, directing the drivers from one loading station to the next. There are 22 motor trucks and ten horse-drawn vehicles always on the job, and it is estimated that the system saves the company in the neighborhood of $100,000 a year.

Four switch engines are kept all day, and two all night, shunting cars and making up trains in the Buick yards. Three transfer cars are kept busy at the motor building for loading during the day, and at night they are rolled up to the dock at the assembly plant.—*Michigan Manufacturer.*

Railroad Construction in Africa.—The Benguella railroad, which has as its goal the Katanga copper belt, in the extreme southern section of the Belgian Congo, is, as projected, about 1,225 miles long. Of this, 425 miles, from the Katanga copper belt to the Belgian Congo frontier, is to be built by Belgian capital. The Atlantic end of this railroad was opened to traffic on September 17, 1912, for 270 miles from Lobita bay. By July, 1913, it should reach Bihi and have 325 miles of railroad under operation. Upon arrival at Huambo, a little over one mile above sea-level, the most difficult part of the line will have been finished. Should capital be found for the completion of this road, it will be a most valuable adjunct to the exploitation of the Katanga copper belt, since it will give a short-line competitor to the railroads from the south.—*Mining and Scientific Press.*

WHY FREIGHT RATES SHOULD BE INCREASED.*

Expenses Have Advanced, Interest Rates Have Risen and the Railways Require Larger Earnings for Proper Development.

By Daniel Willard,
President Baltimore & Ohio Railroad.

The subject of railroad freight rates is such a large one that it would be quite impossible to discuss it at all satisfactorily within the proper limits of a letter, but a brief history of the Eastern advance rate case, otherwise known as Interstate Commerce Commission case No. 3,400, and some reference to subsequent developments in that connection, may be of interest.

In 1910 the railroads operating within what is known as official classification territory—which may be roughly described as that part of the United States bounded on the north by Canada, on the east by the Atlantic ocean, on the south by the Ohio and Potomac rivers and on the west by the Mississippi river—filed new freight tariffs, which provided for an increase of certain freight rates, chiefly those known as class rates, and the advance varied from 10 to 20 per cent.

At the request of the Interstate Commerce Commission the date when the increased rates should become effective was postponed by the carriers, and a hearing was ordered by the commission so that the railroads might have opportunity to present their case and those opposed equal opportunity to present theirs. Extended hearings were had, and as a result of it all the commission in its decision, handed down early in 1911, found, first, that the railroads had failed to establish a necessity for increased revenue.

Second, it was suggested that even though a necessity had been established, it was doubtful if the plan proposed was the right way in which to obtain such revenue. And it was further pointed out that there was a depression of all kinds of business at that time, and that the carriers ought not to expect to raise their rates when business was generally dull.

However, the commission also said, among other things, that should it come about that their views were not sustained by future developments, and should it appear at any time that there was a real necessity on the part of the carriers for increased revenue, in order that they might be in position to provide such facilities as the public required, they would, upon request, give the matter further consideration. They said they would not hesitate, under such circumstances, to authorize such rates as would be reasonable.

The carriers accepted the situation and, I am confident, made strenuous efforts to meet the conditions imposed upon them with rates then in effect. Rigid economies were enforced and vigorous efforts were made to obtain greater efficiency of operation in all departments.

In a number of important instances, since the decision above referred to, dividends have been reduced. In at least three cases receivers have assumed charge of the property.

During the first two years immediately following the decision—that is, 1911 and the early part of 1912—the commerce of the country showed little, if any, increase. But during the latter part of 1912 and the early part of 1913 there has been marked activity in business of all kinds, and the gross earnings of the railroads generally for the year ending June 30, 1913, will probably be the largest in their history. It might be thought from this that they should now be able to show sufficient surplus above interest and dividend requirements to justify such further capital expenditures as may be necessary. A careful study of the facts, however, I believe will show that this is not the case.

First of all, the rates which were in effect in 1910 have not in the aggregate been maintained—that is to say, while certain increases have been made during that time, decreases also have come about. The net result has been, for example, a reduction in the earnings of the Baltimore & Ohio Company on the freight business handled by that company in October, 1912, of more than $100,000 when compared with what they would have been in October, 1909. In other words, if the same rates, classifications and conditions had been in effect in 1912 that were in effect in 1909 the Baltimore & Ohio Railroad Company would have received in October, 1912, more than $100,000 more than it did receive for the business actually handled in that month.

Not only has the general basis of rates been reduced—to some extent because of orders of the Interstate Commerce Commission, and perhaps, to an equal or greater extent by commercial conditions or influences which are beyond the power of the carriers to resist—but during the same period expenses have also very greatly increased, as explained below.

THE HEAVY INCREASES IN EXPENSES.

Again in the case of the Baltimore & Ohio, the wage increase of 1910 amounted to approximately $2,500,000 per year, when applied to the number of men at that time employed. The increases which have been granted—either voluntarily or by virtue of arbitration awards—within the last twelve months have resulted in adding between $800,000 and $900,000 more to our expenses each year. Further, as is well known, the conductors and trainmen now are engaged in taking a strike vote for the purpose of enforcing their demands, which call for an increase, I understand, of approximately 17 per cent.

Prices of various kinds of material also have advanced since 1910, notably in the case of fuel coal, ties and equipment. The coal bill of the Baltimore & Ohio Railroad amounts to, approximately, $6,000,000 per year, and within the last two years, there has been an advance in the price of coal of upward of 10 per cent.

The increase in price of ties, while not so great in the aggregate, will be large. The prices asked and paid for locomotives and freight and passenger cars are higher today than was the case three years ago for equipment of the same kind.

Furthermore, legislation of various kinds—both state and federal—has had an important influence upon expenses. The so-called full crew bill, which has become a law in many of the States, requires the railroads to employ one extra man on all trains of more than a certain length, although the railroad managers unanimously believe the law to be unnecessary and unwise. But regardless of whether such laws are wise or not, the expense is the same and must be met.

The hours of service law, boiler inspection law, laws in various States prescribing standards of construction for caboose cars, laws with reference to the construction of postal cars, revised orders with reference to safety appliances upon new equipment, as well as upon existing equipment; laws with reference to grade separation, etc., etc.—all have tended to very greatly increase the cost of operation; and further, the public demands, expects and receives a higher standard of service in all directions than has ever been the case before.

This results, for instance, in the running of a greater number of passenger trains than the business itself would justify over the lines where the traffic is light; and also in a higher standard of freight service—that is to say, carriers are required to furnish cars more promptly, and to move them with less delay. While no one recognizes better than the railway executives that the service is not always satisfactory, and is frequently not such as they would like to furnish, I believe it is, nevertheless, a fact that, upon the whole, it is on a more satisfactory basis today than ever before, but this all means greater expense in operation.

*An article in the Philadelphia *Public Ledger*.

RISE IN INTEREST RATE AN IMPORTANT FACTOR.

Another very important element is the rate of interest which railways are obliged to pay upon new capital raised for improvements and betterments. It may be argued that the interest basis on all investments has been raised within recent years, and that the very best securities pay higher rates today than ever before, and that the railroads are not peculiar in this respect. But, even so, they are still required, in common with others, to pay a much higher rate of interest than was the case some five or ten years ago.

Ten years ago if a railroad company with well established credit decided to increase its capital for improvement purposes —we will say $1,000,000—it was customary to assume that the interest charge on that account would be approximately $40,000 per year. Under existing conditions, the interest charge would be between $50,000 and $60,000 per year as a minimum, and, in some cases, even in excess of $60,000. This item alone, as you will see, becomes very important when large systems—like the Baltimore & Ohio—are spending upward of $20,000,000 a year, and ought to do so, for betterments, extensions and new equipment.

Taxes have increased largely during the last three years. In the case of the Baltimore & Ohio Company, the increase in that one item since 1909 amounts to more than $900,000 a year. I think it is perhaps not a matter of common knowledge, although one of public record, that the American railroads, as a whole, pay each year in taxes more than $120,000,000.

The various influences which I have mentioned all have tended to reduce the margin between income and outgo. And it has become so narrow that the railroads—many of them, at least—do not feel justified in further increasing their capital charges, because the burden assumed by so doing might seriously interfere with their ability to maintain reasonable payments upon existing capital issues.

The result is that the railroads generally in official classification territory are very rapidly coming to a stop so far as matters of capital expenditures are concerned. Inasmuch as few, if any, are able to provide for new additions and improvements out of surplus earnings, it is quite certain that the railroads in the territory referred to will not be able to keep pace with the growing commerce of the country.

On that account many have felt that a moderate advance in freight rates is not only justified, but actually ought to be made at this time. Also that in view of the changes which I have referred to, the Interstate Commerce Commission would be disposed today to grant the request which the railroads contemplate making—that they be allowed to advance all freight rates in official classification territory 5 per cent.

It was suggested before, in the case known as No. 3,400, that if the railroads had established the fact that they needed additional revenue at that time, the method which they proposed for obtaining it was not the right or best way, in that it imposed increases of from 10 to 20 per cent. upon some rates, and made no increase whatever upon certain others.

It was argued, and with much force, that the relation of rates which then existed had come about through a long period of competition and regulation, and that anything which tended to disturb that relationship should be avoided, if possible. The carriers recognize the force of that argument, and, in the present instance, have recommended that the increased revenue be obtained by advancing all rates an equal amount—that is to say, 5 per cent. If this were done, it is believed that commercial conditions would be very little, if at all, disturbed thereby.

BUSINESS CONDITIONS NOW FAVORABLE.

It also was argued in the previous case, that, even if the carriers did desire additional revenue at that time, the same condition was more or less true with all other business. That is to say, it was a period of commercial stagnation, and it was said that the carriers ought to raise their rates, if at all, during a time of commercial activity, and not when business was dull. The force of that argument also was recognized.

The volume of business which is being handled today is probably greater than at any other time in the history of the country, and profits are supposed to be upon a generally satisfactory basis. If that is true, it would seem that business ought to be able to stand, with very little discomfort, the small advance in freight rates now proposed.

This proposed increase has been considered and advocated chiefly by the officers directly in charge of the properties involved—men who, in nearly all instances, have spent their lives in the railway service, who are now salaried officers of such corporations, and who realize fully that they occupy the dual position of trustee for the owners of the properties, and also that of semi-public officials responsible to the public for the proper maintenance and operation of the properties in their charge. It would seem that their opinion in a matter of such grave importance to the country as a whole ought to be given serious consideration.

Personally I have the utmost confidence in the intelligence, fairness and patriotism of the gentlemen who constitute the Interstate Commerce Commission. I entertain no doubt whatever that when the matter reaches them they will eventually decide it in light of all the facts presented.

I believe, however, that the right solution of this case is of such importance and of such vital interest to all concerned that there ought to be, and I indulge the hope that there will be, no such general opposition to the proposed advance this time, as developed in the previous case.

The public is constantly letting it be known, and properly so, that it desires to ride in steel coaches; that it wants, when it travels, the protection of the electric automatic block; that it wants to be properly provided with cars of suitable kind when it has freight to ship, and that also it wants its freight moved promptly and with regularity to its destination, and the public is no more anxious to have all the things above mentioned, than I, as chief executive of the Baltimore & Ohio Company, am anxious to furnish them. But such things are expensive, and cannot be furnished unless the money is available; and it is not available at this time.

A 5 per cent. increase on all freight rates in official classification territory, if granted, would probably increase the gross revenue of the carriers involved upward of $40,000,000 per year, and while that sum seems large of and by itself, it is not large when considered in connection with the whole matter. It would mean an increased average charge on all the business handled in the territory referred to of approximately 5 cents per ton; and, if I mistake not, the 5 per cent. increase which is now requested will fall short of what is reasonably necessary, unless some of the influences which have tended to increase so greatly operating expenses in recent years should in some manner be checked.

I have outlined above, in a general way, my reasons for believing that the 5 per cent. increase as requested should be granted. It is hardly necessary that I should add that the carriers expect to be able to produce ample and specific evidence to support the general statements which I have made, and I feel confident of their ability in this instance to fully sustain the burden of proof which rests upon them.

I wish to call attention again, by way of emphasis, to the fact that the men who are representing the railroads in this particular movement will be affected very little, if any, in a personal way by the outcome of this issue. They are, by virtue of their positions, the trustees of the properties, and they are also, in a very proper sense, semi-public officials charged with important public duties to perform. Should their request for increased revenue in the present instance be denied, as was the case in 1910, they will continue as they have in the past, to fulfill their obligations to the public as best they may, while at the same time not unmindful of the proper responsibility resting upon them as the fiduciary agents of those whose money has been invested in railway securities with the proper expectation of a fair and reasonable return.

I do not believe the American people, as a whole, desire to be unfair to the railroads or to those who have invested either their earnings or their inheritance in railway securities.

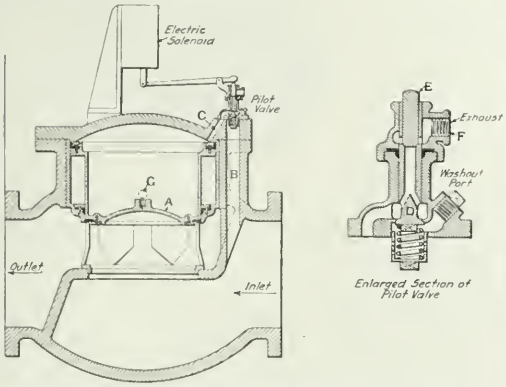
RAILROADS NOT A COMPLETED INSTITUTION.

If the railroads were a completed institution, and if further additions and extensions were unnecessary, the whole subject would present an entirely different phase. But they are not completed, nor will they ever be completed, so long as the commerce of the country continues to grow, and conservative estimates have shown that the roads interested in this particular case will probably be required for some years to come to raise in some manner each year for additions and betterments a sum well upward of $500,000,000.

It is absolutely out of the question to think of providing such a sum from the surplus earnings of the roads, nor would such a policy be advocated or desired. Undoubtedly it is desirable that a considerable portion of that sum should come from each year's surplus. But much the larger part must be realized from the sale of new securities. In order that there may be a sale, it is necessary that there must also be some one to buy, and it should be remembered that the act of buying is one of purely voluntary action. But people will not buy railroad securities—which is another way of saying that they will not invest their money in railroads—unless they believe they will receive as good return upon the money so invested as they would if it were invested in some other line of undertaking with similar risk and responsibility.

ELECTRICALLY OPERATED WATER SERVICE VALVE.

The water service valve shown in the illustration is operated by means of an auxiliary or pilot valve controlled by an electric solenoid. The illustration shows the valve in an open position and in order to close it the auxiliary valve must be opened either by means of the solenoid or by moving it by hand. When the auxiliary valve is opened, water passes through the passage *B*, through the auxiliary valve and the passage *C* to the chamber above the main valve *A*. As the upper surface



Water Service Valve Controlled by an Electric Solenoid.

of the valve *A* is greater than the lower, the difference in the pressure closes the valve. When the solenoid is released the auxiliary valve closes and the valve *D* opens, permitting the water above the valve *A* to pass through the port *C*, raise the valve *E* and escape to the atmosphere through the exhaust port *F* and the pressure of the water below the valve *A* opens it. The restricted passage of the water from above the main valve acts as a cushion to prevent it from opening too quickly and at the same time air is drawn in through the ports *G*, which acts as a cushion to prevent the valve slamming when closing. This valve is manufactured by the Golden-Anderson Valve Specialty Company, Pittsburgh, Pa.

CONVERTIBLE SEAT FOR COMPARTMENT CARS.

Sleeping car berths are not as wide as could be desired because of the limitations placed on the width of the cars, and the necessity of providing sufficient aisle space. In compart-

Seat End in Position for Extending Berth.

ment cars, however, where there is a separate passageway through the car outside the compartments, there is no objection to using the aisle for extending the berths, and some of the compartment sleeping cars running in the Twentieth Cen-

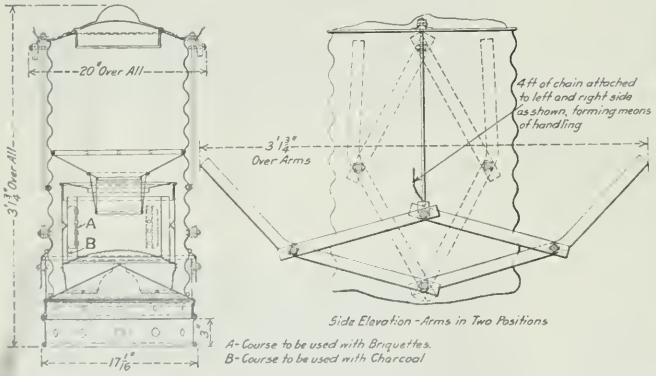
Seat End Locked in Position for Day Travel.

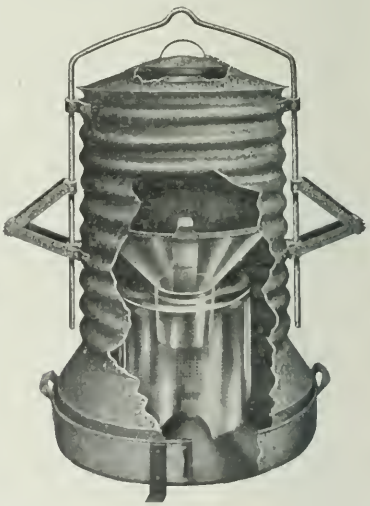
tury Limited are equipped with a device for this purpose. The seat ends are hinged so that they can be swung down and supported by an angle brace and form a horizontal extension of the seat. When the two seats are pulled out, as is ordinarily done in making up a lower berth, a filler is placed between the two ends after they have been lowered, thus forming a full size bed. In traveling long distances passengers frequently become tired and wish to rest during the day, and with this type of seat the end may be swung down at any time and a comfortable couch provided on which a person may stretch out at full length.

This extension seat was invented by Mrs. R. C. Smith, Chicago, Ill., and the patents are controlled by the Pullman Company.

BAXTER CHARCOAL CAR HEATERS.

A charcoal heater that is inexpensive to operate, and one that has given efficient service in extremely low temperatures, is shown in the accompanying illustrations. The outside shell is made of corrugated metal and forms the body of the heater, supporting the magazine at the top and creating a radiating surface around the fire pot of such area as will insure all boxes and packages not catching fire should they fall against it. A positive lock on the base secures the fire pot to the shell, preventing the hot coals from being emptied from the heater into the car in the event of accident. The hasp on this lock is provided with slots for two positions, permitting the fire pot and its grate to be varied in its distance from the feed spout of the magazine, thus creating a simple means of regulating the rate of combustion by changing the thickness of fire without altering the inlet draft passage areas.





Baxter Charcoal Car Heater for Perishable Freight.

The heaters are started by means of an igniter or "starter," which is made of blotting paper saturated in a solution of potassium nitrate and then pressed into the shape of a pie plate, being provided with a hole in the center. These starters are placed on the grate and a lighted match is applied to the edge of the hole in the center of the igniter, which burns without a flame; the magazine is then replaced and the supply slide opened. The heater is then in full operation.

A report on one of these heaters in use on a Canadian road tells of a carload of potatoes, passing through temperatures of 38 to 42 deg. below zero, being received when the outside temperature was 38 deg. below in perfectly good condition. A carload of beer passing through temperatures of from 28 to 36 deg. below, was received with an inside temperature of 40 deg. above with the thermometer registering 35 deg. below outside of the car.

These heaters are manufactured in three sizes; the No. 1 or the large size is designed for use in protecting less than carload business, in which service the car door on local trains is not only opened often, but is frequently allowed to remain so for many minutes, thus requiring the generation of considerable heat in a short time to again raise the temperature in the car to the proper degree. The No. 2 heater is designed to fit into the ice bunkers of refrigerator cars, and is provided with an automatic brace, as shown in one of the illustrations, which locks it fast in the center of the bunker. Two of these heaters are used with each car, one in each bunker. The No. 3 is a heater designed to meet the requirements of breweries where a suspended heater is preferable. These heaters are in a size between the No. 1 and No. 2, and are provided with heavy hooks which fasten into the screw-eyes applied to the carlines, thus suspending the heater out of the way of the kegs which are rolled on the floor of the car. The No. 2 heater will operate 36 hours without refilling, at a cost of 15 cents for the charcoal; the other heaters will operate up to 96 hours without refilling. It will be noted from the drawing that briquettes may also be used. An additional feature of the charcoal heater is the giving off of the carbon monoxide gas which not only helps to preserve any fruit or vegetable freight carried, but also kills any animal life that may be confined in the car, such as rats, mice, tarantulas, etc. For this reason the car should be opened a few minutes before any person is allowed to enter.

These heaters are in service on 15 railroads, including three of the larger systems of this country. They are made by the Klauer Manufacturing Company, Dubuque, Iowa.

Surveys for African Railroad.—The surveys for the railroad from Lusambo, on the Sankuru river, to Bukama, on the Upper Congo river, are finished, and work will presumably begin upon the arrival of the Cape-to-Cairo railroad at Bukama in 1914 or 1915. The route will probably be changed, however, as further surveys are being carried on with the idea of fixing the western terminus at N'Dolo on the Lower Congo railroad near Leopoldville. The proposed new route touches Luebo, Luluabourg, Kanda Kanda, and Mutambo, Mukulu, and not Lusambo, joining the Cape-to-Cairo railroad at Lubende, some 15 miles south of Bukama. The line as outlined would be about 1,250 miles long.—*Mining and Scientific Press.*

General News.

A. B. Garretson, president of the Order of Railway Conductors, was re-elected at the annual meeting of the brotherhood in Detroit last week.

On June 1, the Chicago & Alton abolished the practice of allowing train "butchers" and news agents on its trains. News agents will be permitted to canvass trains during stops at important points.

The Denver & Rio Grande and the New York, New Haven & Hartford are distributing among their agents and employees booklets, pointing out the advantages of courtesy, by Elbert Hubbard.

George Bradshaw, Highland, N. Y., formerly chief safety agent of the New York Central, has just finished a safety inspection of the shops, yards and other works of the Buffalo, Rochester & Pittsburgh; and has delivered a number of "safety-first" lectures to the employees of the road.

Following the recent action of the New York, New Haven & Hartford at its large car shops, the Boston & Maine has made a reduction of about 1 hour a day in the working time in the shops throughout its lines. It is expected that the short-time schedule will be kept in force several weeks.

The New Mexico Corporation Commission has asked the attorney general to give his opinion on the matter of compelling the Chicago, Rock Island & Pacific to comply with the provisions of statutes of New Mexico by filing articles of incorporation. The Chicago, Rock Island & El Paso, and the Chicago, Rock Island & Choctaw companies have filed their articles of incorporation with the state, but the commission seems to feel that this is not sufficient.

The Brooklyn Rapid Transit Company, operating surface and elevated street railways in Brooklyn, N. Y., announces an increase in the pay of employees, to take effect July 4 next, which will amount to from 4 to 15 per cent., the increases varying according to length of service and the records of individuals for efficiency. About 6,000 men will enjoy the benefit of this increase, and the additions to the pay roll will amount to several hundred thousand dollars a year.

The monorail extending from Bartow station on the New York, New Haven & Hartford, New York City, to Belden's Point, about 2 miles, has been given up. The company operating it, which is controlled by the Interborough Rapid Transit Company, has been reorganized, and a standard gage surface electric railroad will be put in operation over this route. The monorail was operated for passenger business a considerable length of time, but it has not given satisfaction.

The number of freight cars moved over the Middle division of the Pennsylvania Railroad in the month of May was 185,876, the heaviest movement on record. The number of cars is less than the number moved in May, 1907, but, in consequence of the large increase in the number of cars of high capacity, the amount of freight moved was greater than in the earlier period. As compared with May, 1912, the total number of cars increased about 15,000; and the increase over May, 1911, was 30,000.

The length of the lines of the Delaware, Lackawanna & Western operated by the block system is 739 miles. This is 75 per cent. of the total of the passenger lines operated by the company. An officer of the road calls attention to the fact that this percentage is not stated in the report issued by the Interstate Commerce Commission which was reprinted in the *Railway Age Gazette* of May 16, page 1059. The percentage of passenger *tracks* worked by the block system is 83.3, not 46.6, as stated in the report.

The O'Brien Construction Company has removed its machinery and fixtures from the line of the Southern New England Railway, an agreement having been reached between the officers of the railway and the contractors for the cancellation of their contract. It appears that the legislature of Rhode Island passed an act authorizing the lease of the road to the Central Vermont but that the governor vetoed it. John S. Murdock, vice-president of the railway company, says that there is now no hope of obtaining money until the legislature shall again meet.

A school for railroad department secretaries of the Y. M. C. A. will be conducted at Lake Geneva, Wis., July 12 to 25, at which several lectures will be given on the subject of "Safety First." Among the lecturers will be L. F. Shedd, general safety supervisor of the Rock Island lines; L. Wilbur Messer, general secretary of the Y. M. C. A.; John F. Moore, general secretary of the railroad department at New York; W. N. Northcott, general secretary of the railroad department at Chicago, and A. G. Knebel, international secretary of the railroad department.

The Canadian Pacific has raised its shopmen's pay 10 per cent.; this is the result of negotiations which have been in progress at Montreal for the past two weeks between delegates of the federated shop trades and the officers of the railway. All the employees of the mechanical and car departments on the company's eastern lines, some 9,500 in number, will benefit by the increase. Time and a half will be allowed for overtime and for work on legal holidays. The men affected by the changes, which went into effect June 2, and will continue for one year, are machinists, boilermakers, blacksmiths, brass workers, buffers, sheet metal workers, steamfitters, plumbers, general car builders and carmen, employed in the district between Port Arthur and St. John.

On the occasion of the celebration of the semi-centennial of the state of West Virginia, at Wheeling, in the week beginning June 15, the Baltimore & Ohio will make a display of locomotives illustrating the history of the steam engine in railroad service from the year 1827, when the road was begun. A number of old engines will be shown in operation under their own steam. The Hempfield yard of the road in Wheeling is directly opposite the City Hall and the railroad exhibition will be a prominent feature of the celebration. This exhibit of locomotive history will be under the direction of Major J. G. Pangborn, who directed the preparation of the great historical display of locomotives for the Baltimore & Ohio at the World's Fair in Chicago, in 1893.

D. F. Jurgensen, engineer of the Minnesota Railroad & Warehouse Commission, in a paper which is to be read before the Mississippi Valley States Convention on Railroad Valuation at Des Moines, Iowa, June 6, draws attention to what he considers an opportunity for the state railroad commissioners of the various states to aid the public in what he characterizes as "in reality a contest between the carriers and the public, with the Interstate Commerce Commission as the court or umpire to represent the public." He calls attention to the fact that at the coming valuation hearings in the question of land values, the railroads only will be represented, that the Interstate Commerce Commission will not itself be familiar with the facts, and suggests that since the state railroad commissioners are thoroughly familiar with the facts, they should represent the public in this "contest."

Electrification and Terminal Discussion in Chicago.

The Chicago city council committee on railway terminals on June 2 voted to recommend for passage an ordinance requiring the railways of Chicago to operate their trains by motive power "other than steam, or that will not produce smoke or noxious gases," after July 1, 1915, under a penalty of $200 for each offense. This action was taken after a series of hearings at which officials of the Chicago Association of Commerce and the executive officers of the principal railways had asked the committee to postpone consideration of the ordinance until the conclusion of the thorough investigation now being made by the association's committee on Smoke Abatement and Electrification of Railway Terminals. A report of this investigation, which has been under way for two years, is promised by January 1, 1914.

At the hearings officials of the Association of Commerce and engineers of the investigating committee have explained in detail the work which has been carried on under the direction of the late H. G. Burt as chief engineer. The aldermen were apparently influenced by an attack on the Chicago Association of Commerce made by Alderman Long, who introduced the ordinance, and who declared that the association was aiding the railways in a policy of delay. Nearly three years ago a committee of the association made an investigation, the details of which have never been made public, and reported a finding that electrification was "both practicable and feasible." The railways

were informed of the report, and at the instance of the association's officers the present committee was formed on which the railways are represented by only four members out of 17, and the railways agreed to finance a thorough investigation by competent engineers. The investigation has cost $250,000 to date, and Hugh Patterson, electrical engineer of the committee, said at one of the hearings that it would require another year to complete the investigation along the lines mapped out, but that the report could be prepared by the first of next year by curtailing a part of the work.

The council committee on railway terminals temporarily postponed its consideration of the subject of the location of new terminals, pending its decision on the electrification question, but the matter continues to arouse a lively public discussion. Mayor Harrison has announced that he is in favor of the plan proposed by the union station roads for a new station between Jackson and Adams streets, as described in the *Railway Age Gazette* of May 23, and the west side property owners at several meetings have protested vigorously against any plan of moving the terminal south to Twelfth street, as proposed by the City Plan Commission. A committee of the Western Society of Engineers has suggested to the committee that it employ competent engineers to assist it in the consideration of the entire problem. The *Chicago Tribune* has opened its columns to the presidents of all roads entering Chicago for a discussion of the station problem, and articles have been presented by Messrs. Delano, of the Wabash; Miller, of the Burlington; Markham, of the Illinois Central; Gardner, of the Chicago & North Western; Worthington, of the Chicago & Alton; Earling, of the Chicago, Milwaukee & St. Paul, and Wood, of the Pennsylvania Lines.

The City Club has announced a series of discussions on the subject at noonday luncheons during this week and next, at which the advocates of the various plans will have an opportunity to present their views. The speakers announced include E. R. Graham, of D. H. Burnham & Company, the architects for the union station; Darius Miller, president of the Burlington; Walter D. Moody, managing director of the Chicago Plan Commission; Jarvis Hunt, Irving K. Pond and Allen B. Pond, architects, who have submitted independent plans, and F. A. Delano, receiver of the Wabash.

The Request for Higher Freight Rates.

The circular in which the Michigan Manufacturers' Association invites its members to express their views on the subject of a 5 per cent. horizontal advance in freight rates, deserves the sanest consideration of the members of the association. The directors of the association have tentatively endorsed the request. It seems probable that a horizontal advance will prove least burdensome and disturbing in the event that an advance has to be made. It cannot seriously disturb any competitive conditions, because it will fall evenly upon all classes of competitors and producers. With the tremendous advance in the item of taxes alone, now consuming 12.36 per cent. of the net operating revenues of the entire railroad system of the country, it would seem that government, which is the recipient of the taxes, should allow a commensurate return, from that standpoint alone, from the operations of the railroads.

This paper has devoted a great deal of its space to the discussion of the relations of the railroads and the people, and we believe that the arguments put out have met with a good deal of response. From the best study this paper can make of the subject the advances are quite necessary to the maintenance of the railroad establishment on its present plane of efficiency, and to the attraction of the new capital required to make the necessary additions to mileage and to facilities.—*Michigan Manufacturer.*

Flash Light Signals to Stop Motorists.

The Lehigh Valley has in use at a highway crossing at South Plainfield, N. J., a signal to warn wayfarers of the approach of trains, which gives both a visual and an audible indication; and the visual indication at night is given by means of an acetylene flash light. This device is furnished by the Commercial Acetylene Company, 30 Broadway, New York City, and the [illegible] in these columns in connection with the report of the last annual meeting of the Railway Signal Association (Railway Age Gazette, October 18, 1912, page 730). The signal at South Plainfield, like a number of others on the Lehigh Valley, is in the shape of a Hall "banjo" (disk signal), having been converted from a signal formerly used as an automatic block signal. Toward the highway the light shows white when no train is approaching, and red when the track should not be crossed. The regulation of the intermittent action of the light is so adjusted that there are about 60 flashes a minute, each flash lasting about 2-5 of a second. We have spoken of the light as a warning for motorists, but, of course, it shines for all, both great and small. As flash lights are not visible elsewhere on the highways of New Jersey, persons approaching this crossing are warned in the most striking manner possible, that they are approaching a railroad crossing.

American Railroad Employes' and Investors' Association Discontinued.

At a meeting on April 15, the executive committee of the American Railroad Employes' and Investors' Association, having considered carefully all the conditions, the work accomplished and probable future needs and support by the membership, concluded that it is not desirable to continue the general work of the association. Accordingly further operations of the general organization and officers were ordered suspended as of June 1, 1913.

In taking this action the committee voiced its satisfaction with the work accomplished and the intention not to prejudice continuation of its branches locally where desired or further work along the lines of the movement in territories where deemed expedient. All application fees collected from employees since June 1, 1912, will be refunded.

In making this announcement the general officers of the association expressed to the members their sincere appreciation of the support and co-operation which has been rendered.

The association was organized in September, 1908, at a meeting in Chicago attended by the executive officers of the principal western railways and the chief officers of the railway brotherhoods for the purpose of promoting harmony between railways and their employees, and "to cultivate and maintain between its members such a spirit of mutual interest and such concern on the part of all of them for the welfare and prosperity of American railways as will best promote their successful and profitable operation for the benefit alike of their employees, investors and the public."

P. H. Morrissey, former grand chief of the Brotherhood of Railroad Trainmen, who has been president of the association since its organization, with office in Chicago, has, as stated elsewhere, been appointed assistant to vice-president H. E. Byram of the Chicago, Burlington & Quincy.

Master Boiler Makers' Association.

Officers of the Master Boiler Makers' Association have been elected as follows: President, T. W. Lowe, Canadian Pacific; first vice-president, J. T. Johnson, Atchison, Topeka & Santa Fe; second vice-president, Andrew Greene, Cleveland, Cincinnati, Chicago & St. Louis; third vice-president, D. A. Lucas, Chicago, Burlington & Quincy; fourth vice-president, J. B. Tate, Pennsylvania; fifth vice-president, C. P. Patrick, Erie; treasurer, Frank Gray, Chicago & Alton.

List of Exhibitors of the Track Supply Association.

The Track Supply Association will hold its exhibit at the Auditorium Hotel, Chicago, September 9-12, 1913, in conjunction with the thirty-first annual convention of the Roadmasters' and Maintenance of Way Association. The following supply concerns have already taken space: Ramapo Iron Works; The P & M. Co.; The Rail Joint Co.; Lackawanna Steel Co.; Fairbanks Morse Co.; Pennsylvania Steel Co.; National Lock Washer Co.; Elliott Frog & Switch Co.; The Railway Equipment & Publication Co.; Associated Manufacturers Co.; American Hoist & Derrick Co.; Fairmont Machine Co.; Simmons-Boardman Publishing Co.; *Railway Age Gazette, Signal Engineer*, The Joyce Cridland Co.; Louis Blessing; James C. Barr; Q & C Co.; M W Supply Co.; The American Guard Rail Fastener Co.; Crerar-Adams & Co.; Templeton, Kenly & Co., Ltd.; Indianapolis Switch & Frog Co.; Union Switch & Signal Co.; Hayes Track Appliance Co.; Verona Tool Works; The

National Malleable Castings Co.; Haggard & Marcusson Co; Positive Rail Anchor Co.; Carnegie Steel Co.; William Wharton, Jr. & Co., Inc; Hubbard & Co.; The Hobart Allfree Co.; Hall Switch & Signal Co.; Mudge & Co.; Southern Railway Supply Co.; The Railroad Supply Co.; Sellers Manufacturing Co; Max Forge Co.; Beaver Dam Malleable Iron Co.; Keystone Grinder & Manufacturing Co., Pittsburgh, Pa.; Northwestern Motor Car Co., Eau Claire, Wis.

American Society of Civil Engineers.

At the meeting of the American Society of Civil Engineers, held on June 4, two papers were presented for discussion as follows: The Philosophy of Engineering, by Maurice G. Parsons, Jun. Am. Soc. C. E.; and The Elevation of the Tracks of the Philadelphia, Germantown & Norristown Railroad, Philadelphia, Pa., by Samuel Tobias Wagner, M. Am. Soc. C. E. The latter paper was illustrated with lantern slides. These papers were printed in the *Proceedings* for April and May respectively.

Special Libraries Association.

The fifth annual convention of the Special Libraries' Association will be held at the Hotel Kaaterskill, Catskill Mountains, N. Y., June 24-26.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass. Convention, May 19, 1914, St. Louis.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York. Annual meeting, October 14-15, Philadelphia, Pa.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and Sepember.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—H. G. McConnaughy, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 19, 1913, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andrencetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June 16, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Summer meeting, June 25-26, Charlevoix, Mich.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCE ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria; 2d Thursday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—J. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

Beginning June 15, the Pennsylvania Railroad will grant stopover privileges quite generally at Harrisburg, Pa. One-way limited tickets will carry a ten-day privilege.

Beginning Monday, June 9, the Metropolitan Line will run passenger steamers direct from New York to Boston and from Boston to New York, starting from each port daily, including Sundays, at 5 p. m. The vessels to be used are the Massachusetts and the Bunker Hill, large and fast steamers. These vessels are oil burners and they have wireless telegraph apparatus.

By agreement of representatives of the railways, shippers and the Texas Railroad Commission it has been decided that the Texas commission shall institute a test suit against some of the railways terminating at Galveston, to determine the respective jurisdictions of the Texas and interstate commissions as to traffic passing over the wharves at Galveston, and destined to interior points in Texas. The question is raised with reference to the action of the roads in filing tariffs with the Interstate Commerce Commission canceling the absorption of loading charges at the Galveston wharves after June 2. The Texas commission immediately gave notice of a proposal to offset this by a horizontal reduction of two cents per 100 lbs. in the rates.

Car Location.

The accompanying table, which is taken from car location bulletin, No. 6 of the American Railway Association, gives a summary of freight car location by groups on May 1, together with surpluses and shortages on the same date.

Car Location on May 1, 1913.

	New England.	N.Y., N.J., Del., Md., Eastern Pa.	Ohio, Ind., Mich., Western Pa.	Va., W. Va., No. & So. Carolina.	Ky., Tenn., Miss., Ala., Ga., Fla.	Iowa, Ill., Wis., Minn.	Mont., Wyo., Neb., Dakotas. INTERSTATE COMMERCE COMMISSION.

The commission has suspended from May 1 until November 1 certain tariffs, which proposed to advance rates for the transportation of various commodities between Missouri river points.

The commission has suspended until September 29 the schedules in certain tariffs which would advance rates on brick c. l. from Athens and other points in Ohio to Huntington, W. Va. For example, the present rate on brick from Athens, Ohio, to Huntington, W. Va., is $0.80 per 2,000 lbs.; the proposed rate, $1.15 per 2,000 lbs.

The commission has suspended from May 30, until September 27, certain tariffs, which proposed to advance rates on lumber from shipping points on the Southern Railway in Tennessee, North and South Carolina and Georgia to Virginia cities, eastern seaboard and interior eastern points. The advances proposed range in amount from ½ cent to 5 cents per 100 lbs.

The commission has suspended from June 1 until September 29 certain schedules in Agent W. H. Hosmer's supplements, which proposed to increase rates on scrap iron and old rails between St. Paul and Duluth, Minn., and Chicago, St. Louis, Mo., and points taking same rates. The proposed increase in the scrap iron rates amounts to from ½ cent to 2 cents per 100 lbs., and that in the old rail rates from 1.7 to 3.6 cents per 100 lbs.

The commission has suspended from May 15 until September 12 certain tariffs, which proposed to advance from 1½ to 2½ cents per 100 lbs., charges applicable to shipments of structural iron and steel stopped in transit for fabrication at fabrication points throughout Central Freight Association territory, excepting certain fabrication points located in Illinois. Under the present tariff provisions, a carload of structural iron or steel, viz., beams, plates, tees, bolts, bars, etc., shipped from Pittsburgh to Chicago may be stopped at Toledo, Ohio, to undergo further process of manufacture and then be forwarded to destination at the Pittsburgh-Chicago rate plus 1½ cents per 100 lbs. The suspended tariffs proposed to increase this charge one cent per 100 lbs. Some of the fabrication points affected are Buffalo, N. Y.; Zanesville, Ohio; Toledo, Columbus, Mt. Vernon, and Muncie, Ind.

Coal Rates Within the Chicago Switching District.

In re investigation and suspension of new regulations and passages governing the switching of coal and coke in carloads from connecting carriers destined to certain points on the Chicago, Milwaukee & St. Paul, located within the limits of the Chicago switching district. Opinion by Commissioner Clements:

Coal consigned to stations on the Chicago, Milwaukee & St. Paul in Chicago is delivered to that road at Galewood, a point within the switching limits of Chicago. Hitherto, the St. Paul has received for its service from Galewood, $4 per car of 60,000 lbs. and under, out of the joint rate from the mines, and ten cents a ton for any excess over that weight from the shipper. The St. Paul now asks 20 cents per ton for this service. The carriers to Galewood refuse to absorb more than $4 per car, so the increase would fall entirely on the shippers. The commission decided that the proposed increased rates had not been justified and ordered the defendant to cancel the suspended tariffs. (27 I. C. C., 71.)

Rates on Pulp Wood Reduced.

Pulp and Paper Manufacturers' Traffic Association, Chicago, Milwaukee & St. Paul, et al. Opinion by Chairman Clark:

The commission decided that the rates on pulp wood in carloads from points in Minnesota to points in Wisconsin and the upper peninsula of Michigan, were unreasonable and prescribed maximum rates for the future from points in Minnesota to the gateways and to the junction points en route to the gateways, applicable upon shipments destined to points in Wisconsin and the upper peninsula of Michigan. (27 I. C. C., 83.)

Rates on Anthracite Coal Reduced.

Wayne R. Brown v. Boston & Maine et al. Opinion by Commissioner Meyer:

The complainant contends that the rates on anthracite coal

from various mining points in Pennsylvania to Scotia, N. Y., are unreasonable and discriminatory against Scotia in favor of Schenectady, N. Y. Scotia is situated on the north bank of the Mohawk river, opposite Schenectady, and is connected with that city by a bridge. At present the rates on the prepared sizes, which constitute the bulk of the complainant's trade, are 20 cents higher to Scotia than to Schenectady, except on shipments moving via Mechanicville, in which case the difference is 5 cents. The 5 cents differential is held to be reasonable by the complainant, but cannot be taken advantage of on account of the increased cost of the coal at the mine from which the shipments move via Mechanicville. The complainant showed that on a large number of commodities freight rates to Scotia were the same as those to Schenectady. The defendants maintained that Schenectady was given lower rates than Scotia on account of water competition, which did not exist at Scotia. The complainant stated that the new barge canal would occupy the whole of the Mohawk river between Scotia and Schenectady, thus providing water transportation for Scotia as well as Schenectady. The commission decided that the rates complained of were unreasonable and discriminatory and prescribed reasonable rates for the future. (27 I. C. C., 47.)

STATE COMMISSIONS.

The newly established public service commission of West Virginia consists of the following four members, appointed by the governor on May 31: Virgil L. Highland, Clarksburg; Howard N. Ogden, Fairmont; Wade C. Kilmer, Martinsburg; Charles H. Bronson, Huntington.

A meeting of members of the state railway commissions of Missouri, Iowa, Kansas, Oklahoma, and possibly some other states, is to be held at Des Moines, Iowa, on June 6, for the purpose of deciding whether these states shall accept the physical valuation of railway property to be made by the Interstate Commerce Commission, or whether the states shall make their own valuations. The law requiring the commission to make the valuation requires that it be distributed by states.

The Minnesota Railroad & Warehouse Commission has found that questions of railroad signaling have become so important that it has deemed it necessary to appoint a signal engineer, and Wilfred Kearton, hitherto supervisor of signals on the Northern Pacific, has been appointed to that office. He will report to the chief engineer of the commission. Mr. Kearton was born in Maryport, England, June 2, 1866. He came to this country in 1884, and in 1886 went to work for the Union Switch & Signal Company. In 1887, he took a position as signal repairman on the Pennsylvania Lines west of Pittsburgh at Liverpool, Ind. With the exception of three years, during which he was occupied in signal work on British railways, Mr. Kearton remained with the Pennsylvania Lines until 1910, being signal supervisor at Pittsburgh for several years. In 1910, he went to the Northern Pacific as construction inspector, with office at St. Paul; and he had charge of the installation of automatic block signals on the St. Paul and the Minnesota divisions. Since February, 1912, he has been supervisor on the eastern district.

COURT NEWS.

The third court of civil appeals at Austin, Tex., has rendered a decision holding constitutional the act of the legislature in 1909, authorizing the railroad commission to order the construction of union passenger stations. It is held that unless the findings of the commission are clearly unjust and unreasonable they should not be disturbed by the courts.

The Texas law designed to compel railway companies to maintain sheds for the protection of workmen engaged in repairing cars at all repair points except those where merely light repairs are made, has been declared invalid by the judge of the district court, in sustaining a demurrer of the International & Great Northern, on the ground that the law does not define the term "light repairs."

The appellate division of the Supreme Court of New York decides that a commission merchant in New York City, sued by the Pennsylvania Railroad for an undercharge on a freight bill, is not liable, the goods having gone out of his hands and the owner having been settled with. The shipment in question consisted of two carloads of peaches, from Georgia, in 1907. The bill, $488, for freight and icing, was paid; but subsequently the railroad found that a mistake had been made and demanded $3.45 additional. On refusal to pay this sum the suit was brought. A carrier is bound to collect the full lawful charges; but it does not follow that the consignee is liable; the contract was made, not with him, but with the consignor. Where a consignee accepts goods, he becomes obligated, by an implied contract, to pay the charges; but if the carrier induces him to accept the goods on the theory that the freight charges are as stated in the bill, it does not follow that the consignee is liable for an undercharge subsequently discovered. Presumptively the consignee is the owner of the goods, but this presumption is not conclusive; and in this case the consignee was not the owner. He was innocent of any intent to participate in an evasion of the law.

What Is Included in Interstate Commerce?

The decision of the United States Supreme Court in the case of Pedersen, a track laborer on the Delaware, Lackawanna & Western, who was held to have been engaged in interstate commerce, was noticed in the *Railway Age Gazette*, page 1201. The full text of this opinion, which was delivered by Justice Van Devanter, shows that the decision hinged on the question whether a man carrying bolts to be used in repairing a bridge was engaged in interstate commerce the same as though he had been actually at work using the bolts.

The road was engaged in interstate and intrastate commerce. Pedersen was an iron worker repairing a bridge. In carrying a sack of bolts to the place where they were to be used he had to pass over a temporary bridge, where he was run down and injured by an intrastate passenger train, of the approach of which its engineman negligently failed to give any warning. The first court held that the injury was not within the terms of the federal act. The Circuit Court of Appeals held that although this ruling was wrong, the plaintiff was not entitled to recover under the federal law, because he was not employed in interstate commerce. The Supreme Court holds that bridges are indispensable to interstate commerce; that the carrier must keep them in repair, and that this work of repair is so closely related to commerce as to be in practice and in legal contemplation a part of it. The law proceeds on the theory that the carrier must exercise due care to prevent or correct any defect in its cars, engines, machinery, tracks, roadbed, etc. The act of taking the bolts to the point where they were to be used is to be deemed a part of the work of repair. It was a minor task, but essentially a part of the larger one, as is the case when an engineman takes his engine from the roundhouse to the track on which are the cars which he is to haul in interstate commerce.

Justice Lamar dissented, and in this was joined by Justices Holmes and Lurton. Justice Lamar is unable to assent to the proposition that a man carrying bolts to be used by him in repairing a railroad bridge is employed in interstate commerce. This work was not a part of commerce, but an incident which preceded it. A line must be drawn between those employees who are employed in commerce and those engaged in other departments of the carrier's business. If a man on his way to repair a bridge is engaged in interstate commerce, then the man in the shop who made the bolts to be used in repairing the bridge is likewise so engaged. If the shopmen are to be included, then we must include the paymaster and the bookkeeper of the shop. The hours of service law shows the intent of Congress; that law applies only to those engaged in the movement of trains. The safety appliance law refers, not to machines in the shop, but to cars and locomotives, which are the immediate instruments of transportation.

PROPOSED BRIDGE OVER THE GANGES RIVER.—The East Indian and Bengal and North Western Railways have under consideration the question of bridging the Ganges at Mokameh. The points between them are being gradually settled. The ferry now in operation at Mokameh is worked by the Tirhoot State Railway.

REVENUES AND EXPENSES OF RAILWAYS.

Railway Officers.

Executive, Financial and Legal Officers.

W. B. Patterson has been appointed assistant auditor of the Chicago, Indianapolis & Louisville, and W. E. Lawson has been appointed freight claim agent, with headquarters at Chicago, succeeding D. C. McNiff, transferred to other duties. The settlement of overcharge and loss and damage freight claims is now under the jurisdiction of the accounting department.

B. L. Winchell and Thomas H. West, receivers of the St. Louis & San Francisco, announce that from May 29, and acting for and under the direction of the receivers, W. C. Nixon, with the title of chief operating officer, will have charge of the maintenance and operation of the physical property; W. B. Biddle, with title of chief traffic officer, will have charge of all traffic and development matters; and A. Douglas, with title of chief accounting officer, will have charge of the books and accounts.

P. H. Morrissey, who has been president of the American Railroad Employees' and Investors' Association since January 1, 1909, has been appointed assistant to the vice-president in charge of operation of the Chicago, Burlington & Quincy, with headquarters at Chicago. Mr. Morrissey was born September 11, 1862, at Bloomington, Ill., and was educated in the public schools of that city, graduating from high school in 1879. He began railway work in 1879 as call boy in the locomotive department of the Chicago & Alton at Bloomington, and the following year entered the train service as a passenger brakeman. Subsequently he was freight brakeman and freight conductor. He left active railway service in 1890 to assume the position of Vice Grand Master of the Brotherhood of Railroad Trainmen, which organization he had joined in February, 1885. He continued in that capacity until August 1, 1895, when he became Grand Master, which office he retained until January 1, 1909. While serving as Grand Master of the Brotherhood of Railroad Trainmen in 1903, Mr. Morrissey attracted a great deal of favorable notice by his action in a controversy between the Wabash and its employees. Judge Adams of the United States Circuit Court had issued an injunction restraining the brotherhood as an organization from ordering a strike, and when the men were planning to ignore the injunction, Mr. Morrissey insisted on their respecting the order of the court while it remained in effect. The injunction was dissolved, but meanwhile an amicable settlement of the dispute was reached. He has been a leading advocate of the plan of conducting labor negotiations by groups, and has always been insistent on the inviolability of labor agreements. He was also one of the prominent advocates of the Erdman act. During the past four years Mr. Morrissey has served as arbitrator in a large number of wage controversies between railways and employees. In 1910, with Interstate Commerce Commissioner E. E. Clark, he arbitrated the demands of the conductors and trainmen on the New York Central & Hudson River, making an award which was later adopted by other lines. He also represented the enginemen in the arbitration proceedings begun in eastern territory in May, 1912, and arbitrated the demands of the enginemen, firemen, conductors and trainmen on the Coal & Coke Railway, under the Erdman act in 1911. He has served in numerous lesser wage arbitration proceedings, at times being the representative of the employees and at other times, acting as sole arbitrator for both parties.

P. H. Morrissey.

Operating Officers.

J. H. Milton, superintendent car department of the Chicago Terminal division of the Chicago, Rock Island & Pacific, has had his jurisdiction extended over the entire Rock Island system.

W. R. Mann, chief despatcher of the Houston & Texas Central, has been appointed assistant superintendent, with headquarters at Ennis, Tex., in place of J. F. Sugrue.

R. C. Watkins has been appointed acting superintendent of the Galveston, Harrisburg & San Antonio, with office at San Antonio, Tex., succeeding J. E. Taussig, granted leave of absence.

J. F. Sugrue, assistant superintendent of the Houston & Texas Central at Ennis, Tex., has been appointed superintendent of the Lake Charles & Northern, with headquarters at DeRidder, succeeding John K. Fahey, resigned.

John D. Patterson, formerly superintendent of terminals of the Louisville & Nashville, at Atlanta, Ga., has been appointed general superintendent of the Panama Railroad, with headquarters at Colon, Panama, succeeding J. A. Smith, resigned.

The general headquarters of the Third district of the Chicago, Rock Island & Pacific, including the system south of Caldwell, Kan., in the states of Oklahoma, Texas, Arkansas, Louisiana and Tennessee, will be moved on June 15 from Ft. Worth, Tex., to El Reno, Okla. C. W. Jones is general manager of this district.

J. W. Knightlinger, assistant superintendent of Morgan's Louisiana & Texas Railroad & Steamship Company and the Louisiana Western Railroad at New Orleans, La., has been appointed superintendent, with headquarters at Lafayette, La., succeeding L. Mims, assigned to other duties. Mr. Knightlinger is succeeded by J. K. Fahey, heretofore superintendent of the Lake Charles & Northern.

William Lynch, trainmaster of the Texas & Pacific at Bunkie, La., has been appointed superintendent of the Rio Grande division, with headquarters at Big Spring, Tex., succeeding A. G. Whittington, resigned, to become superintendent of the San Antonio division of the International & Great Northern, with headquarters at San Antonio, in place of John R. Jones, assigned to other duties. J. M. Thompson succeeds William Lynch.

William Thomas has been appointed trainmaster of the First district, Albuquerque division, of the Atchison, Topeka & Santa Fe Coast Lines at Gallup, N. M., in place of L. M. Shipley, who has been transferred to the Second district of that division as trainmaster, with office at Winslow, Ariz., in place of A. R. Woods, acting trainmaster. Mr. Woods has been made trainmaster of the First district, Arizona division, at Needles, Cal., to succeed C. G. Fluhr, who has been transferred to Fresno, Cal., as trainmaster of the First and Visalia districts in place of J. A. Christie, promoted.

Phil. Carroll, assistant general superintendent of the Southern district of the Missouri Pacific system, has been made superintendent of the Missouri division, extending from St. Louis, Mo., to Hoxie, Ark., with headquarters at Poplar Bluff, Mo., succeeding J. Cannon, and the former position has been abolished. Mr. Cannon has been transferred to the Eastern division, extending from St. Louis to Kansas City, with office at Sedalia, Mo., in place of A. J. Alexander, who is made superintendent of the Colorado division, with headquarters at Pueblo, Colo., this division extending from Hoisington, Kan., to Pueblo, Colo. T. A. Shea, whom Mr. Alexander succeeds, has been appointed superintendent of the Valley division, which extends from Little Rock, Ark., to Ferriday, La., and Monroe, and will have headquarters at McGehee, Ark. He succeeds C. M. Alexander, resigned. Effective June 1.

J. M. Scott, whose appointment as superintendent of the Monongah division of the Baltimore & Ohio, with headquarters at Grafton, W. Va., has been announced in these columns, began railway work as an operator on the Chesapeake & Ohio in 1891. The following year he went to the Cincinnati, Hamilton & Dayton as an operator, and was promoted to train despatcher in 1895, becoming trainmaster of the same road in 1903. He was appointed superintendent in 1905, remaining in that position until August, 1910; he then went to the Kansas City Southern, and on January 1, 1911, left that company to take a position with the Indiana State Railroad Commission. On August 5, 1912, he

was appointed supervisor of transportation of the Baltimore & Ohio, and in January, 1913, became assistant superintendent of the Cumberland division at Keyser, W. Va., which position he held at the time of his recent appointment as superintendent of the Monongah division of the same road, with headquarters at Grafton, as above noted.

Traffic Officers.

William F. Nagle has been appointed traveling freight agent of the Lehigh Valley, with office at South Bethlehem, Pa., succeeding E. G. Baumer, deceased.

J. H. Bingham has been appointed traveling freight agent of the Missouri Pacific and the St. Louis Iron Mountain & Southern, with office at Indianapolis, Ind.

George T. Bell, assistant passenger traffic manager of the Grand Trunk and the Grand Trunk Pacific, at Montreal, Que., has been appointed passenger traffic manager of both these companies, succeeding W. E. Davis, deceased.

A. W. Crowther has been appointed general freight and passenger agent of the Sugarland Railway, with headquarters at Sugarland, Tex., succeeding C. A. Davis, resigned.

J. W. King, traveling freight agent of the St. Louis, Iron Mountain & Southern at San Antonio, Tex., has been appointed district freight agent of the International & Great Northern at that place.

T. H. Wilhelm, assistant general freight agent of the Chicago, Rock Island & Gulf, has been appointed general freight agent, with headquarters at Ft. Worth, Tex., succeeding J. C. McCabe, deceased. M. J. Dowlin succeeds Mr. Wilhelm.

W. A. Scrivner, division freight agent of the Texas & Pacific at El Paso, Tex., has been appointed traffic manager of the Aransas Harbor Terminal Railway, Aransas Pass Channel & Dock Company and Port Aransas Transportation Company at Aransas Pass, Tex.

Henry P. Anewalt, whose appointment as general freight agent of the Atchison, Topeka & Santa Fe Coast Lines has already been announced in these columns, was born January 3, 1868, at Allentown, Pa. He graduated from the high school in Allentown in 1884, and began railway work the following year as clerk and cashier in the local freight office of the Atchison, Topeka & Santa Fe at Kansas City, Mo. He was later successively chief clerk in the commercial office and contracting agent at that place, and subsequently became general freight and passenger agent of the Santa Fe, Prescott & Phoenix at Prescott, Ariz., until April, 1905. He was then appointed assistant general freight agent of the Coast Lines of the Atchison, Topeka & Santa Fe, with office at San Francisco, Cal. He remained in this position until June 1, at which time he was promoted to general freight agent of the Coast Lines, with headquarters at Los Angeles, Cal., as above noted. Mr. Anewalt's entire railway service has been with the Atchison, Topeka & Santa Fe system.

H. P. Anewalt.

J. M. Ball, district freight agent of the International & Great Northern at San Antonio, Tex., has been appointed general cotton agent, with headquarters at Houston, Tex., and will have charge of matters relative to the transportation of cotton, cotton seed and cotton seed products.

H. A. Fidler having resigned as division freight agent of the Detroit, Toledo & Ironton at Ironton, Ohio, the position is abolished. E. C. Brooks is appointed general agent at that place, and will have supervision of operation in the Ironton district and charge of traffic in the territory formerly under the jurisdiction of the division freight agent.

J. C. Valentine, traveling freight agent of the Texas & Pacific at Shreveport, La., has been appointed commercial agent of the International & Great Northern at Dallas, Tex., succeeding Cooper Nott, transferred. C. H. Lewis has been appointed traveling freight agent, with headquarters at St. Louis, Mo., in place of C. B. Fox, who will succeed Mr. Valentine as traveling freight agent of the Texas & Pacific.

Wilmer C. Stith has been appointed traffic manager of the Terminal Railroad Association of St. Louis, with headquarters at St. Louis, Mo., succeeding J. L. Penney, assigned to other duties, effective June 1. Mr. Stith was born at St. Louis, June 21, 1858, and began railway work in August, 1877, as messenger in the general freight office of the St. Louis, Iron Mountain & Southern. He was employed in various capacities in that office, which was afterwards combined with the general freight office of the Missouri Pacific system until September, 1886, when he was made assistant general freight agent of that system. From January, 1890, to January, 1892, he was general freight agent of the Kansas City, Fort Scott & Memphis at Kansas City, Mo. Mr. Stith returned to the Missouri Pacific system on the latter date as general freight agent, and in December, 1899, was promoted to freight traffic manager. He resigned in April, 1908, to become traffic manager of the Waters-Pierce Oil Company, where he remained for about three years. For the last two years he has been engaged in special traffic and transportation work, the past ten months of which have been spent with the Terminal Railroad Association of St. Louis.

W. C. Stith.

Engineering and Rolling Stock Officers.

F. G. Glover has been appointed electrical engineer of the Rock Island lines, with headquarters at Chicago, succeeding F. E. Hutchison, resigned.

Charles Hansel, consulting engineer, New York, has resigned as chief engineer of the Cincinnati Union Depot & Terminal Company, effective June 1.

R. B. Elsworth, assistant signal engineer of the New York Central & Hudson River, at Albany, N. Y., has been appointed engineer maintenance of signals, succeeding J. M. FitzGerald.

G. O. Huckett, road foreman of the Chicago, Burlington & Quincy at Wymore, Neb., has been appointed master mechanic of the Sterling division, of the same road, with headquarters at Sterling, Colo., in place of H. M. Barr, resigned, effective June 1.

Charles Yoder, assistant engineer of the Lake Shore & Michigan Southern at Cleveland, Ohio, has been appointed assistant engineer of track of the Lake Shore & Michigan Southern and the Dunkirk, Allegheny Valley & Pittsburgh, with headquarters at Cleveland.

V. D. Simar, having resigned as chief engineer of the Duluth, South Shore & Atlantic and the Mineral Range, all matters pertaining to engineering, bridges and buildings will be handled by E. R. Lewis, assistant to the general manager, with headquarters at Duluth, Minn.

P. J. Carter, who resigned last year as office engineer of the Gulf, Colorado & Santa Fe, at Galveston, Tex., to pursue post graduate work at the University of Wisconsin, has recently been appointed office engineer of the western lines of the Atchison, Topeka & Santa Fe, and his headquarters will be at Amarillo, Tex.

G. S. Goodwin, assistant mechanical engineer of the Rock Island Lines, has been appointed mechanical engineer in charge of locomotive design, with headquarters at Chicago, and E. G. Chenoweth has been appointed mechanical engineer in charge of car design, with headquarters at Chicago, succeeding C. A. Seley, resigned, who had charge of both departments. G. W. Lillie succeeds Mr. Goodwin as assistant mechanical engineer at Silvis, Ill. Effective June 1.

L. Jutton, whose appointment as division engineer of the Madison division of the Chicago & North Western, with headquarters at Madison, Wis., has already been announced in these columns, was graduated from the University of Illinois in civil engineering in 1902. For about a year afterwards he was engaged in structural steel work, and in September, 1903, he entered the employ of the Chicago & North Western. He held various positions in the bridge department, and at the time of his recent promotion, as noted above, he was general inspector of bridges, with office at Chicago.

F. H. Hanson, whose appointment as assistant master car builder of the Lake Shore division of the Lake Shore & Michigan Southern, with headquarters at the Collinwood shops, Ohio, has been announced in these columns, began railway work on August 9, 1891, as transfer man on the Lake Shore & Michigan Southern, at Elkhart, Ind. The following year he was made fireman, and in September, 1893, was appointed baggage man at Elkhart. He was subsequently car inspector, night foreman and general foreman at the same place, and in September, 1908, became division general foreman at Collinwood, Ohio. He remained in this position until January 16, 1912, when he was appointed supervisor of materials at Cleveland, which position he held at the time of his recent appointment as assistant master car builder of the same road as above noted.

Edward Douglas Jackson, whose appointment as division engineer of the Baltimore & Ohio, with headquarters at Philadelphia, Pa., has been announced in these columns, was born on July 1, 1882, at Front Royal, Va., and was educated at the Virginia Military Institute. He began railway work on July 1, 1902, with an engineering corps of the Baltimore & Ohio, and in August, 1906, was appointed assistant division engineer at Pittsburgh, Pa. From January, 1907, to April, 1909, he was assistant engineer of the same road at Baltimore, Md., and then to February, 1910, was engineer of the Chicago division. He was appointed assistant engineer in the operating department, with headquarters at Baltimore, in February, 1910, and in November, 1911, was made assistant engineer maintenance of way, at Baltimore, which position he held at the time of his recent appointment as engineer of the Philadelphia division of the same road, with headquarters at Philadelphia, Pa.

OBITUARY.

Napoleon Bonaparte Lasier, general baggage agent of the Baltimore & Ohio Chicago Terminal Railroad, died at his home in Chicago on May 27.

Joseph G. Cutler, roadmaster of the Northern Pacific at Walla Walla, Wash., died in the latter city on May 29, aged 55 years. Mr. Cutler was born at Cambridge, Mass., and was graduated from Lawrence Scientific School at Harvard University. He began railway work in 1881 as rodman for the New York West Shore & Buffalo. He was then with the Canadian Pacific, Lake Huron, Tunnel & Western and Burlington & Missouri River until 1888, when he was made resident engineer of the Washington & Columbia River. In 1893 he was appointed chief engineer, and in 1895, also treasurer, of that road, and later, when the Northern Pacific acquired the Washington & Columbia River, he was made an assistant superintendent. Subsequently he became roadmaster of the branch from Pasco to Walla Walla.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Southern Railway is making inquiries for 15 mikado locomotives and 10 Pacific type locomotives.

The Trinity River Lumber Company has ordered 1 mogul locomotive from the Baldwin Locomotive Works.

The Coast Fish, Oil & Fertilizer Company has ordered 1 four-wheel switching locomotive from the Baldwin Locomotive Works.

The Louisiana Railway & Navigation Company has ordered 3 ten-wheel locomotives from the Baldwin Locomotive Works.

CAR BUILDING.

The Union Railroad is making inquiries for 296 freight cars.

The Southern Railway is making inquiries for 400 fifty-ton hopper cars.

The Atlantic Coast Line is in the market for 100 flat cars and 25 caboose cars.

The Carolina, Clinchfield & Ohio is making inquiries for a number of coal cars.

The International & Great Northern has ordered 1,000 freight cars from the American Car & Foundry Company.

The Lehigh Valley, mentioned in the *Railway Age Gazette* of May 30, as being in the market for 1,000 box cars and 1,000 coal cars, has ordered 1,000 coal cars from the Standard Steel Car Company, and is negotiating with the Pullman Company for 1,000 box cars.

IRON AND STEEL.

The Cordoba Central, Argentina, has ordered 10,000 tons of rails from the United States Steel Corporation.

The North Coast has ordered 2,500 tons of bridge material from the American Bridge Company.

The Norfolk & Western has ordered 3,000 tons of bridge material from the United States Steel Corporation.

General Conditions in Steel.—The conditions in the steel industry show no change. Orders have been small and there have been some slight reductions in prices on the part of independent companies to induce consumers to enter the market. The larger companies have, however, shown no desire to take new orders at a sacrifice in prices. A revival in the buying movement is not expected until the early part of next month, as the tariff question will not be definitely settled until that time. It is also believed that consumers will have more confidence in the promising crop outlook in the early part of July, and this should be an important factor in inducing them to place heavy orders.

Indo-Chinese Railway Connection Proposed.—The Burma Chamber of Commerce, backed by those of Liverpool and Manchester, have again moved in the matter of linking up the Indian with the Chinese railways. The route most favored is the one by the Southern Shan States line from Thazi to Taunggyi and into China via Kengtung, as it would pass through fertile land besides affording the easiest route into China.

New Railways for Ceylon.—The 17-mile extension railway from Ratnapura to Pelmudulla in Ceylon will soon be completed; in the words of the governor, this line "follows generally the valley of the We-ganga river and taps a large country planted in rubber in the Dele and Watapola districts. It also serves the rich districts of Rakwana and Balangoa." From the present terminus at Kahawatte surveys are being made to Madampi to the south and also one from Mahawatte to Opanaiki. The two extensions to Rakwana and Galangoa are also under consideration. All these lines, when completed, will open out a very fertile country.

Supply Trade News.

The Orenstein-Arthur Koppel Company, Koppel, Pa., has made the Canadian Fairbanks-Morse Company, Ltd., Montreal, Que., its agents for Canada.

G. Haven Peabody has been appointed to represent the Lima Locomotive Corporation in the west, with headquarters at 520 McCormick building, Chicago.

The Baldwin Locomotive Works has awarded a contract to the H. A. Strauss Co., Chicago, for the heavy concrete construction work on the new plant at East Chicago, Ind.

The D. & A. Post Mold Company, Three Rivers, Mich., has moved into new and enlarged quarters, necessitated on account of the growth of the business, which has recently included several large railway orders.

The Raymond Concrete Pile Company, New York, has received a contract for placing Raymond concrete piles for the foundations of the train shed for the new union passenger station at Kansas City, Mo.

The Roberts & Schaefer Company, Chicago, has received a contract from the Indiana Harbor Belt Railway to build two large reinforced concrete coaling plants at Chicago. The contract price is about $32,000.

A. C. Moore, general manager of the Safety Car Heating & Lighting Company, New York, has been made vice-president of that company, with office in Chicago. Mr. Moore will have entire charge of the western business of the company.

The McKeen Motor Car Company, Omaha, Neb., has just shipped a 70 ft. 200 h. p. steel gasolene motor car to the Oregon-Washington Railroad & Navigation Company, at North Yakima, Wash. The car made the entire trip of 2,000 miles under its own power. The company has also shipped two 55 ft. gasolene motor cars to the Minneapolis & Northern Railway, a 22-mile interurban road from Minneapolis to Anoka, Minn., which has been built for operation exclusively with McKeen cars. A 200 h. p. freight locomotive for this line will be delivered shortly.

George L. Hall, vice-president of the Q & C Company, New York, died in that city on June 1, at the age of 46. Mr. Hall was born at Bedford, Pa., on February 25, 1867, and graduated from Princeton University in 1889. For several years he was in the engineering department of the Pennsylvania Railroad, and was later connected with the Baltimore & Ohio. Mr. Hall was afterwards president of the National Railway Materials Company, which position he resigned to become vice-president of the Q & C Company.

G. L. Hall.

The Electric Storage Battery Company, Philadelphia, Pa., has received an order from the Atchison, Topeka & Santa Fe, for 62 sets of the Chloride Accumulator to be used for car lighting, in conjunction with a recent order given by that road to the company for axle lighting generators. These batteries are standard on the Santa Fe.

A conference of the chief inspectors of Robert W. Hunt & Co., having in charge the inspection of rails and fastenings at the various mills of the United States, was held in Pittsburgh on May 13 and 14. At the meeting various matters were discussed relative to the inspection of rails, joints, bolts, spikes and tie plates, the idea being to bring the inspectors into closer contact, with a view to harmonizing and systematizing the work to the end that more consistent action and results would be attained. Samples of the various types inspected, specifications and report blanks were on exhibition, and the different points were thoroughly discussed. The meeting was in charge of D. W. McNaugher and C. W. Gennet.

TRADE PUBLICATIONS.

FROGS.—The Railway Appliances Company, Chicago, has issued an illustrated folder describing the Fewings Wrecking Frogs.

MACHINERY.—MacGovern & Company, Incorporated, New York, has issued a new catalog of electrical and steam machinery, cars and car equipment.

CHICAGO, BURLINGTON & QUINCY.—The freight department has issued in booklet form a schedule of package cars from St. Louis, with a description of the company's package car service.

SIGNALING.—The Union Switch & Signal Company has just issued bulletin No. 66, describing in detail its apprenticeship course. The bulletin is illustrated with a large number of very fine views of the various departments of the company's works.

JOINT PIPE.—The National Tube Company, Pittsburgh, Pa., has issued a 40-page booklet describing Matheson joint pipe, and including numerous half-tones showing installations and methods of laying and joining the pipe. Among the advantages enumerated in the text are the reduced weight of this pipe as compared with cast iron, the additional strength against bursting, the reduction in lead required for jointing, the adaptability of the pipe to sharp curves and the advantages of the burlap and tar coating. The booklet is artistically arranged, and the cuts are finished in duotone.

CONCRETE CONSTRUCTION.—The Unit Construction Company, St. Louis, has issued an attractive illustrated booklet on the unit method of construction for reinforced concrete buildings. Unit construction is a patented method of assembling materials and erecting reinforced concrete buildings. It differs from the ordinary method of reinforced concrete construction in that all concrete is cast in forms on the ground in the shape of individual units, which are seasoned and then assembled in place in the building as provided for in the design. The book contains illustrations showing a large number of examples of this type of construction in various large buildings throughout the country.

OPPORTUNITY FOR RAILWAY CONCESSION IN ECUADOR.—The Ecuadorian government has practically canceled its contract with Edward Morley for constructing the line from Cuenca, in the southeastern portion of Ecuador, to Huigra. It seems that Mr. Morley has not been able to secure the funds to complete this work. Here is still a good opportunity for some American firm. This road is much needed, and the firm coming forward with the funds to do the work will certainly receive every reasonable concession from the government.—*Consular Report.*

PASSENGER IRREGULARITIES IN VICTORIA.—The Victorian Railway Commissioners intend to rigidly enforce the regulations in respect to the prosecution of persons traveling on the railways without tickets and those who use first with second class tickets, etc. This particular form of offence is assuming alarming proportions. An idea of the extent of the habit may be gaged from the fact that in 1910 there were 2,094 pasengers traveling with out-of-date tickets and occupying first class compartments with second class tickets. In 1911 the number had increased to 2,919, while in 1912 it rose still higher to 3,599. According to the records for the first three months of 1913 the number is steadily increasing. In January 470 instances were detected, in February 402, and March 499. If this average is maintained the number of punishable offences will have amounted to about 6,000 by the end of the year. The principal excuse of those who travel in a higher class than their ticket provides is that of "overcrowding." Until the electric service is actually started overcrowding will be unavoidable during the rush hours. The offenders in this class will, therefore, receive less punishment than those who travel without a ticket.

Railway Construction.

Alabama Roads.—An officer of the Tidewater Securities Corporation, with headquarters at Birmingham, Ala., writes that this company has been organized with $100,000 capital, to promote, finance and construct the following: Birmingham & Gadsden.—Under this name a company is to be organized with a capital of $1,500,000, to build a railroad from Gadsden, Ala., southwest to Birmingham, 60 miles; the Birmingham & Tidewater is to be organized with a capital of $1,500,000, to build a railroad from Birmingham to the Warrior river, 30 miles; the Tidewater Navigation Company is to be organized with $1,500,000, to equip a line of steamboats and barges to operate a line on the Warrior and other rivers south to Dauphin Island, a distance of 438 miles, and the Dauphin Island Railway & Harbor Company has been organized with $1,500,000 capital to develop Dauphin Island as a port and terminal for transportation lines. This company owns Little Dauphin Island and has grants from the United States government to build a railroad and to dredge the harbor. These four projects will provide a route between the Birmingham district and the Gulf. They will be constructed separately, and will be operated as separate units, also as a through line.

Birmingham & Gadsden.—See Alabama roads.

Birmingham & Tidewater.—See Alabama roads.

Burro Mountain.—See El Paso & Southwestern.

Canadian Northern.—This company has filed with the city authorities of Toronto, Ont., revised plans for a western entrance into the city. The plans call for the construction of a four-mile line, and include the construction of a 2,360-ft. tunnel to be 30 ft. wide and about 25 ft. deep, from a point just south of Davenport road, east of St. Clarens avenue, to a point just east of Talbot avenue. The tunnel will be built for two tracks with a center wall running through its entire length. The tracks will be depressed to the west and bridges erected over the streets, and the Humber will be crossed on a high level bridge. The new plans were made to avoid crossing a number of streets at grade and the Grand Trunk yards north of St. Clair avenue. The company has asked the Railway Commission of Canada to approve the plans.

Canadian North Western.—The House of Commons Railway Committee has passed the bill received from the Senate incorporating this company with $15,000,000 capital to build a railway 1,800 miles long from Winnipeg, Man., to Lethbridge, Alberta, thence to Pas, Man., and back to Winnipeg. H. De-Walden C. Montague of Beaulieu, Que.; F. W. Baker and H. E. Brittain, of London; W. F. Morgan, Jr., New York, and Toussaint Brosseau, Montreal, Que., are incorporators. (March 14, p. 529.)

Chicago & Western Indiana.—It is announced that work will be started at once on the elevation of the tracks in Chicago between Seventy-first and Eighty-third streets, in accordance with the ordinance of 1908. This will give the Western Indiana an elevated track from Twenty-second street to Eighty-third street. The tracks of the Belt Railway are also to be elevated from Wood street to Wallace street, making a total of about three miles for the two lines.

Cleveland, Akron Short Line (Electric).—An officer writes that the plant call for building from Cleveland, Ohio, south to Brooklyn, Independence, Breckville, Richfield, Ira, Old Portage and Akron to Barberton. Henry F. Chapman, president and W. F. Hawley, chief engineer, Cleveland.

Corinth & Northeastern.—Incorporated in Mississippi, it proposes to build from Corinth, Miss., northeast to the Tennessee river near Hamburg, Tenn., about 18 miles. A. Rubel, G. [illegible] and W. E. Small are directors.

Cumberland Valley.—An officer writes that bids have been asked for 87,000 cubic yds. of excavation work in connection with the elevation of the grade between the Potomac river and Berkeley State, West Va., a distance of 8 miles. Bids will probably be asked for a single track bridge in the near future, to be built over the Potomac river to replace the present bridge.

Dauphin Island Railway & Harbor Company.—See Alabama roads.

El Paso & Southwestern.—An officer writes that a grading contract has been given to Chadwick & Dayo, Tucson, Ariz., to build under the name of the Burro Mountain from section 34, township 19 south, to section 22, township 19 south, in New Mexico, about 14 miles. The company will carry out the bridge work and track laying with its own forces. The grading involves handling about 20,000 cu. yds. to the mile, maximum grades will be 2 per cent., maximum curvature 10 deg. (May 29, p. 1205.)

Gadsden, Bellevue & Lookout Mountain.—An officer writes that grading work has been started on the first section from Fisk street, Gadsden, Ala., to Noccalula Falls, 3.1 miles. Address U. J. Virgin, New Orleans, La.

Grand Marais & Northwestern.—An officer writes that the prospects of building this line are good, and the company expects to let contracts about October 1. The projected route is from Grand Marais, Minn., west to a connection with the Duluth & Northern Minnesota, about 50 miles. A number of branch lines are also included in the plans. The line will be built to carry iron ore and forest products. Arthur Mitchell, president, Duluth, Minn. (May 16, p. 1115.)

Great Northern.—An officer writes that a contract has been given to Grant Smith & Co., for grading and tunnel work on a change of line a quarter of a mile long in the Cascade mountains, state of Washington, replacing two 10 deg. curves with one 5 deg. curve, and piercing a 1,200-ft. double track tunnel. The railway company will carry out the track laying. There will also be a 900-ft. double track combination snowshed. (April 25, p. 973.)

Kansas City, Kaw Valley & Western (Electric).—An officer writes that contracts will be let in 60 days for work on a line from Kansas City, Kan., west, via Bonner Springs to Lawrence, 40 miles. O. K. Williamson, chief engineer, Bonner Springs, Kan.

Lehigh Valley Transit.—An officer writes that work is now being carried out on a part of the line between Allentown, Pa., and Philadelphia, removing the present track from a highway to a private right-of-way. A contract for this work has been given to the Allen Engineering & Contracting Company, Netcong, N. J.; it includes work on a section of about 3½ miles north of Quakertown, also on ½ mile south of Sellersville, and on about 3½ miles between Souderton and Lansdale. There will be one steel viaduct about 270 ft. long and 40 ft. high, and several small bridges ranging in length from 20 ft. to 50 ft. The new line will have easier curves and grades than the existing line. All the necessary right-of-way for a double track line has been secured, although only single track will be laid at the present time. (May 9, p. 1052.)

Minneapolis, Merrill & Marinette.—Incorporated in Wisconsin with $400,000 capital, to build from Merrill, Wis., to Antego, also to build from Merrill to Prentice Junction, in all 75 miles. J. N. Potter, L. V. Anderson, A. H. Wright, E. F. King, E. C. Harding and C. Solum, all of Merrill, are incorporators.

Moberly, Huntsville & Randolph Springs (Electric).—An officer writes that contracts were to be let on May 29, for building from Moberly, Mo., via Huntsville to Randolph Springs, 12 miles. The maximum grading will be 3 per cent. C. H. Dameron, president, and John J. Mundinger, chief engineer, Huntsville. (January 3, page 38.)

North and South Carolina Roads.—Plans are being made to build a line from Rockingham, N. C., south to Cheraw, S. C., about 25 miles. William Gillispie, Cheraw, may be addressed.

Oregon Roads.—According to press reports a contract has been given to Olson Brothers, of Seaside, Oregon, to build a logging line in Clatsop county, Oregon, from a point near Gearhart Park east to the Lewis and Clark river. It is said that the work will be started at once. M. J. Kinney is back of the project.

PENNSYLVANIA SYSTEM.—The record of the mileage of the road on December 31, 1912, shows that the total length of the main line on the lines east of Pittsburgh, Pa., and Erie is 5,333 miles of first track, with 1,888 miles of second track, 551 miles of third track, 483 miles of fourth track, and 4,587 miles of company's sidings, a total of 12,842 miles. There was an increase of 4 miles of first track, 17 miles of second track, 2 miles of fourth track, and 43 miles of company's sidings, a total increase of 66 miles. On the Pennsylvania lines west of Pittsburgh and Erie, the mileage is 3,103 miles of first track, 1,347 miles of second track, 216 miles of third track, 130 miles of fourth track, and 2,577 miles of company's sidings, a total of 7,373 miles. During the year there was an increase of 5 miles of first track, 5 miles of third track, 9 miles of fourth track, and 51 miles of company's sidings, and a decrease of 5 miles second track, a total increase of 65 miles. The mileage of the Vandalia Railroad is 927 miles of first track, 106 miles of second track, 8 miles of third track, and 682 miles of company's sidings, a total of 1,723 miles. The grand total of all lines, including those operated by and associated in interest with the Pennsylvania Railroads, is 11,644 miles of first track, 3,652 miles of second track, 803 miles of third track, 631 miles of fourth track, and 8,965 miles of company's sidings, a total of 25,695 miles. Of this 6,338 miles of first track is east of Pittsburgh and Erie, and 5,306 miles is west of Pittsburgh and Erie.

PEORIA, CANTON & GALESBURG (Electric).—An officer writes that contracts will probably be let in June to build from Peoria, Ill., west to Farmington, 25 miles, thence northwest to Galesburg, an additional 25 miles. Horace Clark, president, Peoria, and L. L. Summers & Co., chief engineers, Chicago. (May 9, p. 1052.)

PHILADELPHIA & READING.—An officer writes that a contract has been given to C. P. Bower, Reading, Pa., for the grading and masonry work on a new low-grade freight line in Philadelphia from a point between the Germantown branch crossing of the Richmond branch, and Clarissa street bridge over the Richmond branch. The new line is being built to improve the conditions at Wayne Junction station, and will eliminate the heavy grades on the existing yard tracks south of the station.

QUANAH, ACME & PACIFIC.—This company has completed work on the extension from Paducah, Tex., west to Roaring Springs, 42 miles, and has been authorized by the State Railroad Commission of Texas to issue $300,000 of bonds on the extension. Surveys are now being made, it is said, for the extension west across the Panhandle of Texas to Roswell, N. Mex. It is understood that the line will eventually be extended from Roswell southwest to El Paso, Tex. (February 21, p. 374.)

TEMPLE, NORTHWESTERN & GULF.—This is the new name of the Temple & Northwestern, which has about four miles of track laid from Temple, Tex. The new company has a capital of $100,000, with headquarters at Temple, and plans to build from a point four miles west of Temple northwest via Gatesville to Dublin, thence northeast to Dallas. The incorporators include J. H. Thompson, J. Lane, R. O. Faires and W. A. Vinson, all of Houston, and J. H. McGregor, of Temple. (February 28, p. 412.)

TIDEWATER NAVIGATION COMPANY.—See Alabama roads.

VIRGINIAN RAILWAY.—An officer writes that a contract for the construction of a tunnel for two tracks and revision of alinement through Jennys Gap between Lester and Slab Fork in Raleigh county, W. Va., has been let to W. W. Boxley & Co., Roanoke, Va. In regard to double tracking the line for a distance of four miles, with additional side tracks for the storage of coal, no contract has been let for this work.

RAILWAY STRUCTURES.

BALTIMORE, MD.—President Samuel Rea of the Pennsylvania Railroad has submitted plans to the city authorities of Baltimore for improvements to the Northern Central Railway terminals in the valley of Jones' Falls, north of Bath street. It is proposed that the Calvert street facilities should be used for freight service exclusively, but if the city favors the retention of a passenger service, the railway company will later include as part of the plan such facilities as would adequately accommodate the local passenger traffic, and at the same time interfere as little as possible with the development for freight purposes. In that event, it would be necessary to elevate such passenger facilities alongside of Calvert street and over the freight tracks down to a new terminus on the north side of Bath street at Calvert street, and there put up a building suitable both for freight and passenger service, the latter on the upper level. It would also be necessary to arrange the freight houses so that in the future their second stories may be utilized as well as the first stories at the track level. The plans for this terminal, exclusive of passenger facilities, contemplate a four-track connection from the Union station down the valley of Jones' Falls. They also include enlarged freight sheds and carload delivery tracks, and to carry out this work would necessitate the vacation of a large number of streets. The plan also calls for the construction of an overhead bridge 50 ft. wide, south of Madison street, extending from Calvert to Constitution. The necessary properties involved in this new development, not previously owned by the Northern Central, have been acquired or are in process of acquisition, at an estimated cost of over $1,000,000.

BERKELEY, W. VA.—See Cumberland Valley under Railway Construction.

KANSAS CITY, MO.—The Kansas City Southern is planning the erection of a six-story office building.

PENSACOLA, FLA.—An officer of the Gulf, Florida & Alabama writes that bids will probably be asked for this fall to build a two-story passenger station and office building at Garden and Coyle streets in Pensacola. The building is to be 45 ft. wide x 150 ft. long; it will have brick walls, stucco covered, and reinforced concrete floors. The cost of the improvements will be about $50,000.

PITTSBURGH, PA.—The West Penn Railroad has plans made for building a large freight station at North Side, Pittsburgh. To carry out the improvements it will be necessary to erect overhead bridges over two streets.

TEMPLE, TEX.—The Atchison, Topeka & Santa Fe is preparing to begin work shortly on the erection of a new freight depot, transfer sheds and platforms.

TORONTO, ONT.—The plans for extensive railway improvements in Toronto, long the subject of controversy, are again changed in a bill introduced in the Canadian Parliament by Hon. Frank Cochrane. The parties in interest are the Grand Trunk and Canadian Pacific Railways and the Toronto Harbor Commissioners. The plan for a four-track viaduct has been abandoned, and the Railway Commission will issue an order for a six-track viaduct, close to the water's edge. The bill authorizes the different parties concerned to expropriate property between the tracks and the water. It provides that the railways, for the purpose of the viaduct and connected works or for carrying out any agreement in respect thereto, and approved by the Railway Commission, may expropriate: "All or any land and lands covered by water in the city of Toronto, lying within the district south of the existing right of way of the Canadian Pacific, from Yonge street east to the line of Berkeley street, and south of the existing right of way of the Grand Trunk from the Berkeley street line, east to Cherry street and extending out to the present Windmill line; and also a strip of land south of the Windmill line and extending to Cherry street."

WINOOSKI, VT.—Bids are wanted until June 10, by J. M. Morrison, engineer and superintendent of structures of the Central Vermont, at St. Albans, Vt., for a bridge to be built at Winooski, Vt., near Burlington, for the Central Vermont and the towns of Colchester and South Burlington. The proposed design is a reinforced concrete arch and viaduct for carrying the highway over the Winooski river and over the Central Vermont tracks. The estimated cost is $20,000.

PROPOSED LINE FOR INDIA.—At the last annual meeting of the Mysore Planters' Association, a resolution was passed urging on the secretary of state the necessity for bringing force to bear on the government of India to sanction the construction of the section, running from the Mysore frontier to Mangalore, a distance of but 50 miles. The Mysore state is rapidly developing railways within its boundaries.

Railway Financial News

Baltimore & Ohio.—The Public Service Commission of Maryland has approved an issue of $10,000,000 equipment trust 4½ per cent. certificates, maturing in ten annual instalments.

Chicago, Rock Island & Pacific.—White, Weld & Company, New York, have bought and are offering $4,410,000 5 per cent. equipment notes, series H, maturing $441,000 annually from July 1, 1914, to July 1, 1923, at prices to yield 5½ per cent. for equal amounts of each maturity. These equipment notes are a direct obligation of the C. R. I. & P. Railway (old company) and are secured by 50 mikado locomotives, 30 six-wheel switching locomotives, 30 Pacific type locomotives, 2 mountain type locomotives, 1,500 forty-ton steel underframe box cars, 500 steel gondola cars, 50 caboose cars and 72 steel passenger train cars, costing $5,521,000, of which the railway paid 20 per cent. in cash.

Grand Trunk Pacific.—The Canadian government has agreed to lend, at 4 per cent., $15,000,000 to the Grand Trunk Pacific, which loan is to be guaranteed principal and interest by the Grand Trunk. The agreement is subject to ratification by the Canadian parliament.

Kansas City, Fort Scott & Memphis.—See St. Louis & San Francisco.

Missouri Pacific.—United States representative Neely, of Kansas, has requested President Wilson to have the attorney general begin proceedings against the Missouri Pacific to recover $4,500,000 for government aid said to have been extended to the Missouri Pacific in 1862.

National Railways of Mexico.—Kuhn, Loeb & Company, Speyer & Company, and Ladenburg, Thalmann & Company, all of New York, have bought from the railroad company and are offering to the public $26,730,000 2-year 6 per cent. secured gold notes. The offering price to the public is 97. These notes are part of an authorized issue of $29,160,000, which is to be secured by the pledge pro rata as notes are issued of $24,800,000 National Railways prior lien 4½ per cent. bonds and $17,000,000 National Railways general mortgage 4 per cent. bonds, which 4 per cent. bonds are guaranteed principal and interest by the Mexican government. The proceeds of the sale of these notes was used by the company to pay the $10,000,000 notes which matured June 1, 1913, and further proceeds will be used to take up $13,000,000 notes due November 15, 1913. A part of the security for the new notes is now deposited as security for the $13,000,000 notes due November 15.

New Orleans, Mobile & Chicago.—A protective committee for the first and refunding mortgage 5 per cent. bonds, consisting of John W. Platten, chairman; Robert Fleming, James G. Cannon, F. W. Scott and T. N. Strothers, has been formed. The St. Louis & San Francisco and the Louisville & Nashville jointly are understood to control this road.

Pere Marquette.—Judge Landis, of the United States district court, has given permission to the Bankers Trust Company, New York, to bring foreclosure proceedings under the mortgage securing the $17,295,000 improvement and refunding first mortgage bonds. This suit is to be consolidated with that of the American Brake Shoe & Foundry Company, under which Frank W. Blair was appointed receiver.

St. Louis & San Francisco.—The following is a list of the protective committees which have been formed for various classes of St. Louis & San Francisco securities:

For the general lien 15-20 year 5 per cent. bonds of the St. L. & S. F., Speyer & Company, New York, ask the deposit with the Bankers Trust Company, New York.

For the refunding 4 per cent. bonds of the St. L. & S. F., Frederic Strauss, of J. & W. Seligman & Co., chairman; James N. Wallace, president of the Central Trust Company; V. J. Hemphill, president of the Guaranty Trust Company; Edwin G. Merrill, president of the Union Trust Company; Harry Bronner, of Hallgarten & Company; Charles W. Cox, of Lawrence Wiechrop & Company, Breckenridge Jones, president of the Mississippi Valley Trust Company of St. Louis.

For the New Orleans, Texas & Mexico first mortgage 5s, Willard V. King, president of the Columbia-Knickerbocker Trust Company, chairman; Stedman Buttrick, of Estabrook & Company, Boston; Lewis L. Clarke, president of the American Exchange National Bank; C. A. de Gersdorff, of William Salomon & Co.; Lewis B. Franklin, vice-president of the Guaranty Trust Company; A. Lichtenstein, of Heidelbach, Ickelheimer & Company; C. S. W. Packard, president of the Pennsylvania Company for Insurances on Lives & Granting Annuities, of Philadelphia. George E. Warren, of New York, is secretary of the committee.

For 2-year 6 per cent. debenture notes due September, 1914: H. E. Cooper, vice-president of the Equitable Trust Company, chairman; Charles T. Rhodes, vice-president of the Girard Trust Company of Philadelphia; T. A. Whelen, Jr., of Whelen, Duer & Lanahan, of Baltimore, with A. Ludlow Kramer, of 37 Wall street, as secretary.

For the trust certificates for Chicago & Eastern Illinois stock and stock itself: 1. For trust certificates representing either common or preferred stock of the C. & E. I.—Henry H. Porter, Alvin W. Krech and Harry A. Vernet, committee, with Richard R. Hunter, secretary, request immediate deposit of trust certificates and also stock certificates with the Equitable Trust Company, 37 Wall street, New York, depositary. 2. For trust certificates representing only preferred stock of C. & E. I.—W. Emlen Roosevelt, chairman; Horace J. Morse, Joseph Walker, Jr., Otto T. Bannard, W. P. Bliss and W. Redmond Cross, committee, with George E. Roosevelt, secretary, 30 Pine street, New York. Holders either of C. & E. I. preferred stock or stock trust certificates issued for the same will be asked to deposit with the New York Trust Company, 26 Broad street, New York, as depositary.

For the Kansas City, Fort Scott & Memphis bonds: E. V. R. Thayer, chairman; F. L. Higginson, Francis R. Hart, Alfred D. Foster and Frank H. Damon, secretary, 50 State street, Boston.

The Interstate Commerce Commission has been asked by representatives of some of the holders of St. Louis & San Francisco securities to make an investigation into the use of the proceeds of the bond sales in recent years of the St. L. & S. F.

The syndicate formed for the sale of New Orleans, Texas & Mexico 5 per cent. bonds was dissolved on June 2, and it is understood that considerable amounts of these bonds remain unsold in the hands of the syndicate members.

See also New Orleans, Mobile & Chicago.

San Antonio, Uvalde & Gulf.—The Texas railroad commission has placed a valuation of $3,093,985 on the road which is now in operation from San Antonio to Carrizo Springs, with main line and branches totaling 197 miles.

Union Pacific.—The directors have proposed two plans to meet the requirements of the Supreme Court's decision in regard to the sale of Southern Pacific stock, either of which they announce they are ready to carry out. The first plan provides for the sale of the $126,650,000 stock of the Southern Pacific at public auction, with a minimum price fixed, and provision made for underwriting the sale. The second plan proposes to deposit this Southern Pacific stock with a bank or trust company without, however, giving any voting power to the stock, and providing that the trustee shall issue beneficial certificates without voting power, but entitled to dividends issuing these certificates pro rata to Union Pacific stockholders. These certificates are to be exchangeable for Southern Pacific stock upon affidavit that the holder is not a holder of any Union Pacific stock. This means that the Union Pacific stockholder who receives such certificates may sell his Union Pacific stock and then be entitled to Southern Pacific stock itself or may sell the beneficial certificate to a non-holder of Union Pacific stock, who will be entitled to exchange it for Southern Pacific stock.

Wabash-Pittsburgh Terminal.—The United States district court has authorized the sale of $4,000,000 new receiver's certificates. The $1,700,000 receiver's certificates due June 1 were provided for, and the balance is to be used to settle a claim of the Wabash Railroad for $2,250,000.

Wabash Railroad.—See Wabash-Pittsburgh Terminal.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico $5.00
Canada 6.00
Foreign Countries (excepting daily editions) 8.00
Single Copies ..... 15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue more than 9,200 copies were printed; that of those more than 9,200 copies, 7,048 were mailed to regular paid subscribers; 200 were provided for counter and news companies' sales; and 1,700 were printed for distribution at Atlantic City and for use as sample copies.

NOTICE OF COPYRIGHT.

THIS and all subsequent issues of the Daily Railway Age Gazette published in connection with the 1913 meetings of the American Railway Master Mechanics' Association and the Master Car Builders' Association are copyrighted under the United States copyright law by the Simmons-Boardman Publishing Company, publisher of the Railway Age Gazette, and all persons are hereby warned against making unauthorized use of any of the contents of The Daily, whether reading matter or illustrations.

It is well known that we have from year to year incurred much expense for the purpose of furnishing our readers with early, complete and properly edited stenographic reports of the proceedings of the conventions of these associations. Some other publications have appropriated large parts of these edited reports of the proceedings and republished them without credit to this paper. We have copyrighted all of the reading pages of The Daily for the purpose of stopping this practice.

We desire in this connection expressly to disavow any desire or purpose to interfere with the publication or use by the associations or their members of either their own reports of the proceedings, or of the reports made by the Daily Railway Age Gazette. So far as the proceedings of the conventions are concerned, our copyright covers them only as they are reported by the Daily Railway Age Gazette. And the associations and their members individually are hereby authorized to make any use they desire of our reports, except that they must not be republished without the express permission of the Simmons-Boardman Publishing Company, in any publication or periodical except those issued by the American Railway Master Mechanics' Association or the Master Car Builders' Association.

ONE convenience which those attending last year's conventions greatly missed and which those attending this year's conventions will be glad to find once more available, is free roller chairs for members and guests of the associations. When the spirit of reform moved the associations last year the free rolling chairs were abolished along with several features of the entertainment program. They were much missed; and it was decided to provide them again this year at the expense of the two railway associations and the supply association.

IT has been the practice each year to describe in the *Daily Railway Age Gazette* new devices or equipment of special interest to the members of the mechanical associations. This year, for the first time, these descriptions, except in the case of complete new cars and locomotives, are restricted to new devices, or distinct improvements in old ones, which are on exhibition on the Million Dollar Pier or at the track exhibit. This should add considerably to the value of the *Daily* to the convention attendants, as it may bring to their notice important new developments on exhibition that might otherwise be overlooked. We desire to take this opportunity to thank those exhibitors who replied so promptly and fully to our requests for material of this sort, and have thus assisted us in making the columns more attractive in this respect.

THE steady and rapidly increasing growth of the amount of space required for exhibitors at the Atlantic City Conventions has been remarkable; it seems practically impossible to meet the ever-increasing demands of the exhibitors. With close to 89,000 square feet of exhibit space this year the comparative demands are almost as great as when only 70,000 sq. ft. were available a few years ago. Almost 5,000 sq. ft. have been added this year by the extension of Machinery Hall. Not less remarkable than the growth of the exhibits as a whole has been the increase in the number of machine tools on exhibition (most of them in operation) within the past few years. This year there are more than ever; most of the large tools are in Machinery Hall, although small ones will be found throughout the pier. Last summer the roof was blown off of the Annex during a heavy wind storm, which was little less than a cyclone. The debris was piled almost as high as Capt. Young's villa, and, indeed, damaged it to some extent. After the accident the old structure was cleaned out and replaced by a steel arch roof structure which adds greatly to the appearance of the Annex.

THE Enrollment Committee at the June Convention has always done good work. Indeed, when we consider the tremendous task of correctly enrolling and classifying the large list of convention attendants and the fact that complete up-to-date lists are published each day, we marvel at the accomplishment. Only good management, hard work and a good system could bring it about. This year the committee expects to still further improve its work and that without placing an extra burden on the shoulders of its members. The registration booth will be open a great part of the time, but as explained on another page, the committee has been organized in such a way that, although its members will have hard work and plenty of it, the demands on their time will not be much, if any, greater than in former years. The members of the association will undoubtedly appreciate the fact that they can register directly upon arrival at the pier, or, if not, that clearly printed signs will indicate just when the registration booth will reopen, and that unless the plans of Chairman Yardley go wrong, and we don't think they will, the booth will reopen at the time advertised.

THE committees of the mechanical associations merit commendation for the comparative promptness with which they got their reports ready this year. Just how prompt they were is illustrated by the fact that Secretary Taylor was able to mail all the reports of both associations from Chicago in time for them to be in the hands of F. F. Gaines, superintendent of motive power of the Central of Georgia, at his office in Savannah, Georgia, on June 4, exactly a week before the opening day of the Master Mechanics' Convention. It is devoutly to be hoped that the improvement made this year will be even more marked next year, for it is impossible to receive live and valuable discussion unless the members have plenty of time to study over the reports and prepare their notes for discussion. The desirable thing would be to have the more important reports in the hands of the members weeks instead of days before the convention, and this can only be done by prompt and aggressive work on the part of each committee.

CONVENTION Hall was badly crowded during most of the sessions of both the M. M. and M. C. B. Associations last year; sometimes members were turned away because they could not get into the hall. This year the size of the hall has been increased about one-third, and it is hoped it will provide ample accommodation for all who wish to attend the meetings. Two things should not be overlooked. In the first place, a hard and fast rule should be made, and enforced, to prevent trucking or noisy demonstrations anywhere near the hall. The noise of wind and water and necessary movements in the vicinity are bad enough without adding to them. Then comes an obligation on the part of the members of the association who take part in the discussions. There is little use taking part in them unless those speaking can be heard by the other members. Railway mechanical men are not generally trained as public speakers, and for that reason they should take greater care in speaking slowly and distinctly so that they may be heard throughout the room. Nothing is so discouraging to a speaker as to hear a hum of conversation while he is speaking, but often it is his own fault because of his remarks being so low or indistinct that the other members can hardly be blamed for being inattentive.

THE MINNESOTA RATE CASE DECISION.

THE decision of the Supreme Court in the Minnesota rate case has no direct bearing on the work of the mechanical officers of railways; but the regulation of railways is of real concern to all who are connected with them because on how they are regulated depends how they can be managed. Therefore cases such as this and, in a special degree, this Minnesota case, have come to have an intense interest for everybody connected with the businesses of operating railways and of making and selling equipment and supplies to them. The first feeling created by the decision in the Minnesota case is likely to be one of pessimism. A more careful consideration of its significance will reduce the feeling of pessimism and even inspire one of more or less optimism.

There were two great questions involved. One was that of valuation of railways; the other, that of state interference with interstate commerce. The findings of the master in chancery and of the lower court on various points regarding valuation were very favorable to the railways. The Supreme Court has overruled the lower court on several of these points. But its rulings are not so unfavorable to the roads as might at first appear. One of the most important questions involved was that of the correct basis on which to appraise railway land in valuations for rate making. Some persons have contended that railways are not entitled to benefit by the so-called "unearned increment" in their land and that it should be valued at its original cost. The railways have pointed out that it costs them more than other persons to acquire land, and have contended that it should be appraised at what it would cost to acquire it now, which would be from 50 per cent. to 1000 per cent. more than its present market value for other than railway purposes. The Supreme Court apparently takes a middle ground, and holds that in valuation for rate making railway land should be appraised at its present market value for ordinary purposes. This principle is open to criticism, and is clearly inconsistent with the theory that valuation should be based on the present cost of reproducing a railway. But it does allow railways to benefit by the increase in the market value of their land.

The ascertainment of the value of a railway, the court says, is "not a matter of formulas, but there must be a reasonable judgment having its basis in a proper consideration of all relevant facts." No criticism can be made of this broad, general proposition. But differences of opinion are sure to arise as to the reasonableness and fairness of its application in specific cases. In the Minnesota case the Supreme Court held that the rates in question were confiscatory as applied to the Minneapolis & St. Louis. As to the two other roads directly involved—the Northern Pacific and the Great Northern—it did not hold that the rates were not confiscatory, but merely that the roads had not proved that they were confiscatory. There is nothing in the decision seriously to shake the faith of those who have believed that the general valuation which Congress has authorized the Interstate Commerce Commission to make will exceed the capitalization of the railways as a whole.

The state rates involved in the Minnesota case were made so low that the railways had either to reduce their corresponding interstate rates or to discriminate against interstate commerce. They contended that the fixing of rates by state authority that practically forced them to reduce their interstate rates was an unconstitutional interference with interstate commerce. The Supreme Court holds that Congress having adopted no legislation to restrict the regulation of interstate rates by state authorities, the states are left free to regulate them as they think proper so long as they do not make them confiscatory. This part of the decision is a blow to those who have believed that the problem of rate regulation would be brought much nearer to solution by an early concentration of authority over all rates in the Interstate Commerce Commission. Nevertheless, the decision is an advance over previous decisions of the Supreme Court in that it very clearly implies that if in the judgment of Congress state regulation of rates interferes with interstate commerce, Congress may by appropriate legislation restrict or abolish it. Thus the question of state interference with interstate commerce ceases to be a judicial one to be settled by the court, and becomes one of public expediency to be settled by public opinion and by Congress.

The decision is such as strongly to direct attention to the important fact, too often forgotten, that in the long run the railways must look to the public rather than to the courts for the full protection of their rights and interests. The courts will fix the minimum below which their earnings cannot be reduced without confiscation. But it is requisite to the adequate development of the railways that they shall be allowed to earn more than the minimum return necessary to save their property from confiscation, and only public opinion can secure for them the opportunity to earn more than this minimum. Likewise, it is to the interest of the railways that regulation of them shall be concentrated in the national government; and the Minnesota decision settles that only public opinion can bring this about. The education of public opinion regarding railway problems has been shown in recent years, by long train of developments, to be the most important work that needs to be done by those who appreciate how essential is the prosperity of the railways to the prosperity of the country. Fortunately much progress along this line has been made, and not for years has public opinion regarding railways been as intelligent and friendly as it is now.

PROGRAM FOR THE WEEK.

MASTER MECHANICS' CONVENTION.

WEDNESDAY, JUNE 11, 1913.

Prayer	9.30 A. M. to 9.35 A. M.
Address of president	9.35 A. M. to 9.50 A. M.
Intermission	9.50 A. M. to 9.55 A. M.
Action on minutes of convention of 1912	9.55 A. M. to 10.00 A. M.
Reports of secretary and treasurer	10.00 A. M. to 10.15 A. M.
Assessment and announcement of dues; appointment of committees on correspondence, resolutions, nominations, obituaries, etc.	10.15 A. M. to 10.25 A. M.
Election of auditing committee	10.25 A. M. to 10.30 A. M.
Unfinished business	10.30 A. M. to 10.35 A. M.
New business	10.35 A. M. to 10.45 A. M.
Discussion of reports on:	
Mechanical Stokers	10.45 A. M. to 11.00 A. M.
Revision of Standards	11.00 A. M. to 11.30 A. M.
Specifications for Cast-steel Locomotive Frames	11.30 A. M. to 12.00 M.
Individual Papers:	
Maintenance of Electrical Equipment, by C. H. Quereau	12.00 M. to 1.00 P. M.
Engine Testing Plant, Prof. E. C. Schmidt	1.00 P. M. to 1.30 P. M.

THURSDAY, JUNE 12, 1913.

Discussion of reports on:	
Main and Side Rods	9.30 A. M. to 9.45 A. M.
Safety Appliances	9.45 A. M. to 10.00 A. M.
Design, Construction and Maintenance of Locomotive Boilers	10.00 A. M. to 10.30 A. M.
Steel Tires	10.30 A. M. to 10.45 A. M.
Minimum Requirements for Headlights	10.45 A. M. to 11.00 A. M.
Standardization of Tinware	11.00 A. M. to 11.05 A. M.
Superheater Locomotives	11.05 A. M. to 11.30 A. M.
Specifications for Materials Used in Locomotive Construction	11.30 A. M. to 12.00 M.
Individual paper;	
Three-cylinder Locomotives, by Mr. J. Snowden Bell	12.00 M. to 1.00 P. M.
Subjects	1.00 P. M. to 1.30 P. M.

FRIDAY, JUNE 13, 1913.

Discussion of reports on:	
Use of Special Alloys and Heat-treated Steel in Locomotive Construction	9.30 A. M. to 10.30 A. M.
Smoke Prevention	10.30 A. M. to 11.00 A. M.
Engine Tender Wheels	11.00 A. M. to 11.30 A. M.
Individual Paper on:	
Tests of Superheater Locomotives, by Dean C. H. Benjamin	11.30 A. M. to 12.00 M.
Resolutions, correspondence, etc.	12.00 M. to 12.15 P. M.
Unfinished business	12.15 P. M. to 12.30 P. M.
Election of officers, closing exercises	12.30 P. M. to 1.30 P. M.

Adjournment.

ENTERTAINMENT.

WEDNESDAY, JUNE 11.

Orchestra Concert, 11.00 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Social Gathering and Informal Dance, 9.00 P. M.—Blenheim Exchange, Marlborough-Blenheim Hotel.

THURSDAY, JUNE 12.

Orchestra Concert 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Informal Dance, 9.30 P. M.—Entrance Hall, Million Dollar Pier.

FRIDAY, JUNE 13.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Musicale, 9.00 P. M.—Entrance Hall, Million Dollar Pier.

SATURDAY, JUNE 14.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

SUNDAY, JUNE 15.

Concert, 11.00 A. M.—Marlborough-Blenheim Hotel Orchestra, Jacques Kinsbergen, musical director: Prelude and Intermezzo from Cavalleria Rusticana (*Mascagni*); (A) Ave Maria (*Gounod*); (B) Mighty Lake Rose (*Nevin*); Andante Religiosa (*Thome*); Cello Solo; Norwegian Folk Song (*Ole Bull*); Mr. Carl Johner; Serenade, Le Millions D'Arlequin (*Drigo*); Dreams (*Wagner*); (A) There is a Green Hill Far Away (*Gounod*); (B) Pastoral Dance (*German*); Fantasie Lohengrin (*Wagner*).

Concert, 8.45 P. M.—Overture Mignon (*Thome*); Piano Solo, A Flat Major Polonaise (Chopin) Mr. Joseph Lanin. Fantasie, La Boheme (*Puccini*); Violin Solo, Gypsy Airs (*Sarasate*), Mr. Jacques Kingsbergen; Cansette (*Schindler*); Cello Solo, Antante Cantabile (*Cui*); Fantasie Faust (*Gounod*).

MONDAY, JUNE 16.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Social Gathering and Informal Dance, 9.00 P. M.—Blenheim Exchange, Marlborough-Blenheim Hotel.

TUESDAY, JUNE 17.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Informal Dance, 9.30 P. M.—Entrance Hall, Million Dollar Pier.

COMPLAINTS.

The Committee on Arrangements, composed of D. F. Crawford, C. E. Fuller and S. G. Allen, will be glad to undertake to adjust all complaints of any nature during the convention. Communications should be sent to the office of the secretary of the Railway Supply Manufacturers' Association, Million Dollar Pier.

CHAMPIONSHIP BILLIARDS.

Willie Hoppe, world's champion billiard player at the 18.2 balk line, and Harry Cline, ex-champion, will play two exhibition games of billiards of 300 points each on Thursday and Friday evenings of this week at the Islesworth Hotel. Both games will be called promptly at 8.30 o'clock. An invitation has been extended to the members and guests of the M. M. and M. C. B. Associations and the Railway Supply Association. Admission will be by card only, application for which should be made at the Enrollment Booth.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.

The functions of the Railway Supply Manufacturers' Association are so well known to those who attend these conventions that to relate them would seem, at first blush, to be out of place. But there are several thousands of stay-at-homes who read The Daily religiously, and it is to them that the following explanation is addressed.

The Railway Supply Manufacturers' Association is a "trust," if there ever was one. It is a combination of several hundreds of large and small concerns who make and sell those things with which the railway mechanical department has to do. The capital represented runs into the millions, and it has no competitors. It avoids the internal revenue tax by refusing to incorporate. The one redeeming feature is that it does not restrain trade. In fact, it does more than just the opposite—it promotes friendly relations.

S. G. ALLEN
President.

The association is a dignified organization of business men. It co-operates with the M. M. and M. C. B. associations by assuming all responsibility for the miniature World's Fairs of railway appliances that have so much to do with the success of their annual conventions, and it relieves the parent associations from the burden of details incident to the promotion of social intercourse. The job is a big one, and it is a distinct pity that the results cannot be seen and appreciated at first hand by the vast army of railway men which perforce cannot attend these conventions.

B A HEGEMAN, Jr.
Vice-President

The active work of the association centres in the officers and executive committee. The president, Samuel G. Allen, is one of the most lovable fellows in the world. He has those qualities which make for success in any undertaking—business ability and a natural inclination to be always fair and courteous. He left college in 1891 as a lawyer, but after practicing for some five years he decided to follow commercial pursuits by accepting the general managership of the Franklin Air Compressor Company, now a part of the Chicago Pneumatic Tool Company. Mr. Allen is Vice-President of the Franklin Railway Supply Company, secretary of the American Arch Company, treasurer of the Locomotive Superheater Company, vice-president of the [illegible] Devices Company, secretary of the American Materials Company, and vice-president of the General Equipment Company—all of New York City; and secretary of the Executive and Finance committees of the American Brake Shoe & Foundry Company, Mahwah, N. J.

Benjamin A. Hegeman, Jr., vice-president of the association, is much like Mr. Allen in many ways. His one advantage is that he was once a railway man. Mr. Hegeman was born July 14, 1860, and graduated from Mt. Washington Collegiate Institute in 1877. In 1878 he entered the freight department of the Delaware, Lackawanna & Western and ten years later resigned to become general manager of the Lackawanna Live Stock Transportation Company. In 1899 Mr. Hegeman was made eastern sales manager of the American Car & Foundry Company. In 1901 he organized the U. S. Metal & Manufacturing Company and assumed the presidency, which office he still holds. Mr. Hegeman is also president of the Anglo-American Varnish Company, of Newark, N. J.; vice-president of the Damascus Brake Beam Company, of Cleveland, Ohio; and vice-president of the New York & North Shore Traction Company, of Long Island.

J. D. CONWAY,
Secretary-Treasurer.

As to the only officer who draws a salary from the association, John D. Conway, secretary and treasurer, we respectfully refer the reader to his biography as printed in *The Daily* of June 14, 1911, page 1344, with the modification that since last June he has lost the adornment that used to cover his upper lip.

On the opposite page we show nine of the members of the executive committee. The others, besides the president and vice-president, are Frank J. Lanahan, whose picture we were unable to get; George L. Morton, chairman of the committee on by-laws; and J. C. Whitridge, chairman of the hotel committee. The likenesses of the last two will be found elsewhere.

The executive committee is divided into seven geographical districts, as follows: First District (New England states and Canada) one member—F. M. Nellis, Westinghouse Air Brake Company, Boston, Mass. Second District (New York and New Jersey) three members—Lucian C. Brown, Elwell-Parker Electric Company, New York City; O. F. Ostby, Commercial Acetylene Railway Light & Signal Company, New York City; and E. H. Walker, Standard Coupler Company, New York City. Third District (Pennsylvania) two members—Frank J. Lanahan, Fort Pitt Malleable Iron Company, Pittsburgh, Pa., and George N. Riley, National Tube Company, Pittsburgh, Pa. Fourth District (Ohio, Indiana and Michigan) two members—J. R. Blakeslee, Ajax Manufacturing Company, Cleveland, Ohio and J. C. Whitridge, Buckeye Steel Castings Company, Columbus, Ohio. Fifth District (Illinois, Wisconsin, Iowa and Minnesota) two members—J. Will Johnson, Pyle-National Electric Headlight Company, Chicago and W. W. Rosser, The T. H. Symington Company, Chicago. Sixth District (Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Kentucky and Tennessee) one member—George L. Morton, Galena-Signal Oil Company, Atlanta, Ga. Seventh District (states west of Mississippi river, including Louisiana but excepting Iowa and Minnesota) one member—S. M. Dolan, American Car & Foundry Company, St. Louis, Mo.

The four members who will automatically retire at the close of

F. M. NELLIS.

J. R. BLAKESLEE.

W. W. ROSSER.

G. N. RILEY
Chairman, Finance Committee.

J. WILL JOHNSON
Chairman, Exhibit Committee.

E. H. WALKER
Chairman, Badge Committee.

S. M. DOLAN.

LUCIAN C. BROWN
Chairman, Information Bureau.

O. F. OSTBY.

Some of the Members of the Executive Committee of the Railway Supply Manufacturers' Association.

the present convention are Messrs. Blakeslee, Brown, Rosser and Walker. Their successors will be elected for three-year terms each. The president and the vice-president are members ex-officio.

The several committees having to do with this year's convention are as follows:

ENTERTAINMENT COMMITTEE.

William K. Krepps (chairman), Crucible Steel Company of America, New York; Edward P. Chaffee, O. M. Edwards Company, New York; J. P. Landreth, Garlock Packing Company, Chicago; L. B. Sherman, *Railway Age Gazette*, Chicago; John D. McClintock, William Sellers & Company, Inc., Philadelphia, Pa.; Leonard J. Hibbard, L. J. Hibbard & Company, New York; Harry S. Hammond, Pressed Steel Car Company, Pittsburgh, Pa.; C. D. Eaton, American Car & Foundry Company, New York; Gilbert E. Ryder, Locomotive Superheater Company, New York; W. C. Wardell, Welsbach Company, Gloucester, N. J.; H. A. Nealley, Joseph Dixon Crucible Company, Boston, Mass.; William S. Furry, Ohio Injector Company, Chicago; Roger J. Faure, Commercial Acetylene Railway Light & Signal Company, New York; Edward S. Toothe, Nathan Manufacturing Company, New York; E. H. Janes, Standard Steel Castings Company, Cleveland, Ohio; Richard J. Sheridan, Chicago Railway Equipment Company, New York; P. M. Brotherhood, Manning, Maxwell & Moore, New York; J. D. Purcell, Dearborn Chemical Company, Chicago; C. J. Donahue, American Locomotive Company, New York; H. O. Fettinger, Clement Restein Company, Philadelphia, Pa.; J. M. Crowe, Railway List Company, Pittsburgh, Pa., and W. J. Caton, Brown & Company, Inc., New York.

The chairman, W. K. Krepps, is manager of the eastern railway department of the Crucible Steel Company of America, with office in New York City. He was born at Columbus, Ohio, April 15, 1878, and has had a high school and college education. On leaving college, in 1899, he was appointed secretary of the Department of Charities of Columbus. On February 24, 1901, he entered the employ of the Crucible Steel Company of America at Pittsburgh, and on April 25, 1912, was appointed to his present position. At the beginning of 1907 he took a two years' course in the night classes of forging and metallurgy of the Carnegie technical schools.

W. K. KREPPS
Chairman, Entertainment Committee.

The subcommittees of the entertainment committee are:

Door.—In charge of entrance to all entertainments. Messrs. McClintock (chairman), Faure, Furry, Janes and Wardell.

M. M. Social Gathering and Informal Dance.—Wednesday evening, June 11, at the Marlborough Blenheim. Messrs. Chaffee (chairman), Sherman, Nealley, Janes, Purcell, Caton, Fettinger and Sheridan.

M. M. Dance.—On pier Thursday evening June 12. Messrs. Hibbard (chairman), Toothe, Landreth, Eaton, Hammond, Donahue, Ryder and Brotherhood.

Musical Evening.—On pier, Friday, June 13.—Messrs. Sherman (chairman), Toothe, Crowe, Nealley, Sheridan, Chaffee, Fettinger and Landreth.

M. C. B. Social Gathering and Informal Dance.—Monday evening, June 16, at the Marlborough-Blenheim. Messrs. Hammond (chairman), Hibbard, Furry, Faure, McClintock, Wardell, Caton and Crowe.

M. C. B. Dance.—On pier, Tuesday evening, June 17. Messrs. Landreth (chairman), Brotherhood, Ryder, Purcell, Eaton, Donahue, Chaffee, Sheridan and Sherman.

Introduction Committee.—To promote sociability at all dances. Messrs. Eaton (chairman), Toothe, Brotherhood, Nealley, Fettinger, Purcell and Hibbard.

Ushers' Committee.—In charge of seating guests and distribution of programmes at entertainments and dances.—Messrs. Ryder (chairman), Hammond, Donahue, Crowe, Caton, Nealley and Sheridan.

TRANSPORTATION COMMITTEE.

Joseph H. Kuhns (chairman), Republic Rubber Company, Chicago; J. T. Anthony, American Arch Company, New York; G. P. Berger, Gould Coupler Company, Chicago; Carter Blatchford, Spencer-Otis Company, Chicago; A. W. Brown, United & Globe Rubber Manufacturing Company, Trenton, N. J.; Fred Elliott, Acme Paint Company, Detroit, Mich.; Walter Greenwood, Texas Company, New York; William T. Hawley, U. S. Light & Heating Company, New York; Fred Hiland, Patten Paint Company, Chicago, George Hull Porter, Western Electric Company, Chicago; C. R. King, Pittsburgh Steel Products Company, Pittsburgh, Pa.; George A. Nicol, H. W. Johns-Manville Company, New York; M. F. Ryan, Pittsburgh Spring & Steel Co., Chicago; J. F. Shurch, Railway Materials Company, Chicago; J. J. Toomey, Ball Chemical Company, Pittsburgh, Pa.; and H. N. Turner, Kay & Ess Company, New York.

J. H. KUHNS
Chairman, Transportation Committee.

ENROLLMENT COMMITTEE.

Charles B. Yardley, Jr. (chairman), Jenkins Brothers, New York; F. N. Bard, Barco Brass & Joint Company, Chicago; F. E. Beal, Magnus Metal Company, Atlanta, Ga.; C. W. Beaver, Yale & Towne Manufacturing Company, New York; Harold A. Brown, Pocket List of Railroad Officials, New York; E. Bjerregaard, The Official Guide, New York; Charles H. Gayetty, Quaker City Rubber Company, Philadelphia, Pa.; R. F. Moon, Westinghouse Electric and Manufacturing Company, Philadelphia, Pa.; H. G. Newman, H. W. Johns-Manville Company, New York; E. T. Sawyer, Commercial Acetylene Railway Light and Signal Company, New York; Benjamin A. Smith, W. H. Coe Manufacturing Company, Providence, R. I.; F. H. Smith, Gold Car Heating & Lighting Company, New York, and J. A. Stevens, F. W. Devoe and C. T. Raynolds Company, New York.

Charles B. Yardley, Jr., chairman, is the railroad representative of Jenkins Brothers, New York City. He is 30 years old and was married last month. He has been connected with Jenkins Brothers for several years, the last four as railroad representative. Prior to that he sold silverware,

and then cottons and silks. Mr. Yardley is also secretary and treasurer of the Railway Materials Association, the organization of railway supply men having to do with the meetings of the Railway Storekeepers' Association.

C. B. YARDLEY, Jr.
Chairman, Enrollment Committee.

EXHIBIT COMMITTEE.

J. Will Johnson (chairman), Pyle-National Electric Headlight Company, Chicago; Frank J. Lanahan, Fort Pitt Malleable Iron Company, Pittsburgh, Pa., and O. F. Ostby, Commercial Acetylene Railway Light & Signal Company, New York.

Chairman Johnson, more familiarly known at these conventions as "Heap Big Bill," was born at Charlestown, S. C., in 1869. He entered the service of the St. Louis & San Francisco in 1886, working in the telegraph department and in the ticket and freight office. Later he was for one year a brakeman and for two years a fireman; and for 11 years he was a locomotive engineer. In September, 1902, he went to the Pyle-National Electric Headlight Company and was made special representative in February, 1904; sales agent in 1908; and general manager in January, 1912. He is a member of the executive committee of the Railway Supply Manufacturers' Association.

BADGE COMMITTEE.

E. H. Walker (chairman), Standard Coupler Company, New York City; J. R. Blakeslee, Ajax Manufacturing Company, Cleveland, O.; and W. W. Rosser, The T. H. Symington Company, Chicago.

The chairman, Mr. Walker, is vice-president of the Standard Coupler Company. As he tells it, his career has been "short and checkered." He was born on December 10, 1871, and after leaving school worked for a number of railways, including the Great Northern, Santa Fe, Burlington and Soo line. In 1904 he entered the employ of the National Surety Company, and during the year following he was given charge of the sales department of the Standard Coupler Company. He was elected vice-president in 1910. Mr. Walker is a member of the executive committee of the association.

COMMITTEE ON BY-LAWS.

George L. Morton (chairman), Galena-Signal Oil Company, Atlanta, Ga.; F. M. Nellis, Westinghouse Air Brake Company, Boston, Mass., and J. R. Blakeslee, Ajax Manufacturing Company, Cleveland, O.

George L. Morton, chairman, is a member of the executive committee and represents the Galena-Signal Oil Company at Atlanta. He was born in North Carolina in December, 1866, and has been identified with the oil business for some 27 years, the last 20 with the Galena-Signal Oil Company. He has always had a fondness for politics, and for the 20 years from 1891 to 1911 he served in some capacity as a member of the legislature of North Carolina, for a part of the time as presiding officer of the Senate. During the last two years of his term he was acting speaker of the House of Representatives. When the Spanish-American war broke out, Mr. Morton was president of the National Association of Naval Militias and served as assistant to the chief of the auxiliary naval force in southern waters, having had under his command at one time 26 converted yachts, monitors and torpedo boats.

BUREAU OF INFORMATION.

Lucian C. Brown (chairman), Elwell-Parker Electric Company, New York City, and O. F. Ostby, Commercial Acetylene Railway Light & Signal Company, New York City—both members of the executive committee of the association.

GEORGE L. MORTON
Chairman, Committee on By-Laws

Lucian C. Brown, chairman, whose portrait appears on another page, was born at Avon, Ohio, in 1879, and was educated in the public schools of Columbus. After leaving school he entered the employ of the Case Manufacturing Company, of Columbus, and there learned how to build cranes. He then studied mechanical engineering at the Ohio State University, and after leaving college went with the Morgan Engineering Company, at Alliance, Ohio, resigning after he had become superintendent, to accept a similar position with the Rarig Engineering Company, of Columbus. He next entered the employ of the Nova Scotia Iron & Steel Company, at Sidney Mines, Nova Scotia, as superintendent of erection, leaving there to go with the Ralston Steel Car Company, of Columbus, Ohio, of which he later became vice-president, in 1910. Mr. Brown resigned from the Ralston Steel Car Company to go into business with his brother selling railway equipment, and they now handle the general sales agency for the United States and Canada of the Elwell-Parker Electric Company, of Cleveland, Ohio.

HOTEL COMMITTEE.

J. C. Whitridge (chairman), Buckeye Steel Castings Company, Columbus, Ohio; S. M. Dolan, American Car & Foundry Company, St. Louis, Mo.; and W. W. Rosser, The T. H. Symington Company, Chicago.

J. C. WHITRIDGE,
Chairman, Hotel Committee.

John C. Whitridge, chairman, is assistant general manager of the Buckeye Steel Castings Company, Columbus, Ohio. He was born in Richmond, Ind., educated in the public school and graduated from the high school of that place. He then entered the maintenance of way department of the Pennsylvania Railroad at Richmond and Indianapolis and remained until 1892 when he began the mechanical engineering course at Purdue University. In 1895 he graduated and at once assumed the duties of associate editor of the *Railroad Gazette*, under David L. Barnes, with offices in Chicago. In 1902 he joined the forces of the Buckeye Steel Castings Company.

FINANCE COMMITTEE.

George N. Riley (chairman), National Tube Company, Pittsburgh, Pa.; E. H. Walker and Lucian C. Brown.

Chairman Riley is special agent of the National Tube Company and has been connected with that concern since 1873. He had been a boilermaker, having learned the trade in the Pittsburgh shops of the Pennsylvania Railroad, where he was first employed in 1865. Mr. Riley is also superintendent of motive power of the McKeesport Connecting and Benwood & Wheeling and superintendent of machinery of the Lake Terminal (Lorain, Ohio), three industrial railways. This is Mr. Riley's twenty-fourth year as an attendant at these conventions; and he has been active in the affairs of the Railway Supply Manufacturers' Association and its predecessor for a greater part of that period, in 1910 as Treasurer.

VANADIUM STEEL DRIVING AXLES AND FRAMES.

Heat treated chrome-vanadium steel driving axles have given an exceptional service on the Lake Shore & Michigan Southern, both as regards amount of wear and the freedom from failure. Careful records made by this road covering 15 locomotives having vanadium steel driving axles and 12 locomotives of the same class with carbon axles, show that the chrome-vanadium has averaged about twice as much mileage per .01 in. wear. These records cover two years and observations were made each time the locomotives were taken in the shop. Each journal was measured at five different points to determine the wear and the average wear of all of the journals on each engine was taken as the basis for determining its mileage per unit of wear. At the last report, January, 1913, the vanadium axles had averaged 41,900 miles per .01 in. wear while the carbon steel axles had averaged 20,090 miles on the same basis. The total mileage of the locomotives was practically the same in every case. On the basis of maximum wear per .01 in. reduction in diameter, the vanadium axles gave 12,870 miles as compared with 5,770 miles for the carbon steel axles.

In addition to the better wearing qualities of this material the increased strength is a matter of considerable importance. Out of 580 axles of this type now in service, some of which have been running since 1910, there have been but two failures, or less than ½ of 1 per cent. Advantage has been taken of this greater strength in connection with the front, intermediate and back axles of the latest Mikado locomotives built for this company; the diameter of the axles has been reduced to 9¾ in. between the journals, which are 11 in. x 12 in. Compared with carbon steel axles with journals of the same size, this is a reduction in diameter of ¾ in. in case of the front and intermediate axles and 1 in. in the case of the back axles. This company is also experimenting with the use of this material in connection with valve motion parts and has ordered it for use on the pins, bushings and link blocks of the heavy Mikados recently received.

The service of vanadium steel frames has been even more exceptional and out of a total of 1500 frames of this material in service on three different roads, on each of which frames of this type have been in service for five years or longer, there has been but one failure that is in any way traceable to the material. While over 25 per cent of the locomotives [illegible] 200,000 lbs. built last year by the different locomotive builders were equipped with vanadium steel frames, the service on the three roads mentioned, viz., New York Central & Hudson River, Delaware Lackawanna & Western, and Southern, extends a longer period and larger numbers than any of the others and therefore is more conclusive as to the advantages of this material.

Vanadium steel frames were first put in service on the New York Central & Hudson River in 1908. In that year a contract was let for one of a lot of heavy Pacific type passenger locomotives, the remainder of the order being equipped with carbon steel frames. These engines have a total weight in working order of 266,000 lbs. with 171,500 lbs. on drivers; the cylinders are 22 in. x 28 in. and the boiler pressure is 200 lbs. Up to the present time there has been no failure of these frames and they are still in service in first class condition. In 1910, however, failures began to occur on the carbon steel frames for this lot of engines and up to date there has been 35 frame failures. Analysis of the records show that of the 15 failures during 1910 and 1911 only 7 engines participated, while in the 20 failures during the year 1912 and up to March of 1913 the failures were confined to 9 engines. One of the engines had one failure in 1910, one in 1911, six in 1912, while another had one failure in 1911 and two in 1912; a third had one failure in 1910, two in 1912 and the fourth had three in 1910, three in 1911 and two in 1912.

The frequency of the failures in a few frames would indicate fatigue or gradual fracture of the metal under repeated stresses and vibrations and would go to show that under present operating conditions with plain carbon cast steel frames, fatigue takes place very rapidly, greatly shortening the life of the frame. The sectional area of the broken frames at all points was well within approved practice for locomotives of their weight as adopted by the builders. They were of the single front rail type, the rail being cast integral with the main frame and had a most elaborate and substantial system of frame bracing.

The experience as a whole indicated that frame bracing would not give a complete solution of the problem and the result has been that vanadium steel is now practically a standard for frames for road engines on the New York Central & Hudson River. This road now has 371 locomotives in service equipped with this type of frame and the records show that of the entire number there has not been a single failure up to the present time.

The Southern has had the most extensive experience with vanadium steel frames of any in the country. Frames of this material have been standard on that road since 1907. The records show that out of a total of almost 500 frames, some of which have been in service for 6 years, there have been but three failures, two of which were due to failures of other parts of the locomotives and not chargeable against the frames. In reality, therefore, during this entire service there has been but one failure of vanadium frames. These frames are on all types of locomotives, and even switch engines are now being given vanadium steel frames.

Frames of vanadium steel were first introduced on the Delaware, Lackawanna & Western in 1908. In that year 34 locomotives were equipped with frames of this material. Prior to that time the Lackawanna had used wrought iron frames exclusively. The records show that the result has been a practical elimination of frame failures and in the five years since 1908 during which time 155 locomotives with vanadium frames have been put in service, there have been but six failures of frames of this type. These were confined to a group of eight heavy 10-wheel passenger locomotives weighing 214,000 lbs., which were built in 1908, and all occurred at one point. Careful investigation showed that they were due entirely to design and not to the material. This was proved by five sister engines built in 1910 on which there was a slight alteration made in the design of the frames at the point of previous failure and all trouble with breakage was immediately stopped.

The experience of this company has been so successful that of all the locomotives purchased since 1908, nearly 80 per cent have been furnished with vanadium steel frames. This includes all types from the standard six wheel switchers, weighing 132,000 lbs. to the heavy Pacific type passenger locomotives, weighing 284,000 lbs. and the Mikado type locomotives weighing 312,000 lbs.

MASTER MECHANICS REGISTRATION.

Aldcorn, Thos., Marlborough-Blenheim.
Allison, W. L., Western Sales Manager, Marlborough-Blenheim.
Anthony, F. S., Supt. Machinery, Texas & Pacific Ry., Traymore.
Arden, D. D., M. M., Savannah & Statesboro Ry., Baltimore.
Arp, W. C., Supt. Motive Power, Vandalia R. R., Marlborough-Blenheim.
Averill, E. A., Managing Editor, Railway Age Gazette (Mechanical Edition), Traymore.
Babcock, W. G., Master Mechanic, N. Y. C. & H. R., Sterling.
Barton, T. F., Master Mechanic, D., L. & W., Traymore.

Riley, Geo. N., McKeesport Connecting Ry., Marlborough-Blenheim.
Roope, Thos., Supt. Motive Power, C. B. & Q. Ry., Strand.
Schmidt, Prof. E. C., Univ. of Illinois, Haddon Hall.
Seley, C. A., Pittsburgh, Pa., Chalfonte.
Shoemaker, H., Shop Supt., N. Y. C. & H. R., Traymore.
Smethurst, Thomas, Supt. Motive Power and Rolling Stock.
Smith, P. F., Jr., Supt. Motive Power, Penna. Lines, Brighton.
Smith, R. D., Supt. Motive Power, Boston & Albany Ry., Dennis.
Stocks, W. H., Dennis.
Storey, J. W., Car Dept., Central of Ga. Ry., Chester.
Strause, M. H., Master Mechanic, N. Y. C. Lines, Sterling.
Summerskill, T. A., C. V. R. R., Traymore.
Taylor, J. W., Secy. M. M. Ass'n, Marlborough-Blenheim.
Thomas, W. H., Dennis.
Thomson, H. R., Master Mechanic, Newburg & South Shore Ry., De Ville.
Tolleiton, W. J., G. M. Supt., Rock Island Lines, Marlborough-Blenheim.
Wagstaff, Geo., Traymore.
Wahlen, John, Master Mechanic, Montpelier & Wells River R. R., Arlington.
White, A. M., Traymore.
Wiest, E. N., Dist. Inspector of Locomotive Boilers, Haddon Hall.
Wildin, G. W., Mech. Supt., N. Y., N. H. & H. R. R., Chalfonte.
Wright, R. V., Managing Editor Ry. Age Gazette, Dennis.
Yates, L. L., Supt. Car Dept., Chalfonte.
Young, C. B., Mechanical Engineer, C. B. & Q., Traymore.

MASTER CAR BUILDERS.

Anthony, F. S., Supt. Machinery, Texas & Pacific Ry., Traymore.
Arp, W. C., Supt. Motive Power, Vandalia R. R., Marlborough-Blenheim.
Averill, E. A., Managing Editor, Railway Age Gazette (Mechanical Edition), Traymore.
Baron, Jacob, Car Inspector, Ky. & Ind. Terminal R. R., Lexington.
Brazier, F. W., Supt. Rolling Stock, N. Y. C. & H. R. R. R., Marlborough-Blenheim.
Connolly, J. J., Supt. of Motive Power, D. S. S. & A., Chalfonte.
Coutant, M. R., M. M., Ulster & Delaware R. R., Shelburne.
Crawford, D. F., Gen. Supt. Motive Power, Penna. Lines, Brighton.
Cyr, J. W., Supt. Motive Power, C. B. & Q., Strand.
Davisson, F. E., Supt. Machinery, San Pedro, Los Angeles & Salt Lake R. R., Dennis.
Dawson, L. L., Supt. Motive Power, Ft. W. & D. C., Brighton.
DeVoy, J. F., Asst. Supt. Motive Power, C. M. & St. P., Shelburne.
Dooley, W. H., S. M. P., C. N. O. & T. P. Ry.
Dunham, W. E., Supervisor Motive Power and Machinery, C. & N. W., Traymore.
Flory, B. P., Supt. Motive Power, N. Y., O. & W., Marlborough-Blenheim.
Flynn, W. H., Supt. Motive Power, Mich. Cent., Marlborough-Blenheim.
Fogg, J. W., Master Mechanic, Baltimore & Ohio, Chicago Terminal R. R., Chalfonte.

Fuller, C. E., Asst. Gen. Mgr., U. P., Marlborough-Blenheim.
Gaines, F. F., Supt. Motive Power, Central of Ga. Ry., Dennis.
Garstang, Wm., General Master Car Builder, C. C. C. & St. L. Ry., Marlborough-Blenheim.
Giles, C. F., Supt. Machinery, Louisville & Nashville R. R., Chalfonte.
Gould, Jos. E., Supt. Motive Power, Norfolk & Southern, Dennis.
Hessenbruch, T. E., Gen. Inspector, P. & R., Haddon Hall.
Julien, B., Gen. Car Foreman, U. P., Dennis.
Keegan, J. E., Supt. Motive Power, G. R. & I., Chalfonte.
Kinney, M. A., Supt. Motive Power, Hock. Val., Traymore.
Laughlin, Geo. F., Supt. Armour Car Lines, Marlborough- Blenheim.
Lewis, W. H., Supt. Motive Power, Norfolk & Western Ry., Marlborough-Blenheim.
McCuen, J. P., General Inspector, Queen & Crescent Route, Dennis.
McFeatters, F. R., Supt., Union R. R., St. Charles.
MacBain, D. R., Supt. Motive Power, L. S. & M. S. Ry., Marlborough-Blenheim.
Manchester, A. E., Supt. Motive Power, C., M. & St. P., Traymore.
Miller, Geo. A., Supt. Motive Power, Florida East Coast R. R., Sterling.
Mitchell, W. A., Master Car Builder, Mo. Kan. & Texas Ry., Dennis.
Montgomery, H., Supt. Motive Power & Equipment, Bangor & Aroostook R. R., Dennis.
Moore, B. R., Supt. Motive Power, D. & I. R., Traymore.
Neuffer, J. G., Supt. Motive Power, C. & Gt. W., Brighton.
Park, E. A., Supt. Motive Power, P. & P. U., Dennis.
Pfahler, E. P., Loco. Boiler Inspection Division, Interstate Commerce Commission, Lexington.
Pratt, E. W., Asst. Supt. Motive Power, C. & N. W., Marlborough-Blenheim.
Rae, Clark H., Asst. Supt. Machy., Louisville & Nashville R. R., Chalfonte.
Randall, J. B., Master Mechanic, L. H. & St. L. Ry., Traymore.
Roope, Thomas, Supt. Motive Power, C. B. & Q., Strand.
Seley, C. A., Chalfonte.
Smith, R. D., Supt. Motive Power, Boston & Albany Ry., Dennis.
Tollerton, W. J., General Mechanical Supt., Rock Island Lines, Marlborough-Blenheim.
Wahlen, John, M. M., Montpelier & Wells River R. R., Arlington.
Wildin, G. W., Mech. Supt. N. Y., N. H. & H., Chalfonte.
Wright, R. V., Managing Editor Ry. Age Gazette, Dennis.
Yates, L. L., Chalfonte.
Young, C. B., Mechanical Engineer, C., B. & Q., Traymore.

M. M. GUESTS.

Arter, W. D., Asst. Eng., N. Y. C. & H. R. R., Pennhurst.
Batchler, Col. J. M. T., U. S. Army, Beaumont.
Bunnell, F. O., Eng. of Tests, C. R. I. & P. Ry., Traymore.
Carey, W. S., Secy. Gen. S. M. P., Penna. Lines, West, Russell.
Chambers, Andrew, Retired Eng., Atlantic City.
Cozan, W. S., Supt. of Appr., Erie R. R., Chalfonte.
Donovan, A. G., Gen. Mgr. S. W. Mechanical, American Car Lines, Chelsea.
Eichler, A., Marlborough-Blenheim.
Ensign, John F., Chief Inspector Loco. Boilers, I. C. C., Marlborough-Blenheim.
Frauendrener, W. J., Supt. of Shops, L. S. & M. S., Traymore.
Fuller, Edward, Marlborough-Blenheim.
Fuller, Harry, Marlborough-Blenheim.
Hall, John M., Haddon Hall.
Hunt, Robt. M. E., Fla. East Coast, Sterling.
Jones, W. F., General Storekeeper, N. Y. C. & H. R., Chalfonte.
Kapp, J. B., Asst. Master Mechanic, Penna. R. R., St. Charles.
Kellogg, Frank, Lexington.
Kellogg, Ralph, Lexington.
Kellogg, Vernon, Lexington.
Kuhns, I. C., Purchasing Agent, Ill. Central, Dennis.
Ladd, G. T., Brighton.
Lewis, T. F., Marlborough-Blenheim.
McLausland, A. G., Retired Supt., Atlantic City Ry., 1709 Atlantic Ave.
McGuffy, George B., Haddon Hall.
McManamy, Frank, Asst. Chief Govt. Boiler Inspector, Haddon Hall.
Machova, E. F., Master Mechanic, A. T. & S. F.
Merrill, A. J., Dennis.
Nicholas, Lewis, Jr., Dep. Inspr. Loco. Boilers, I. C. C., Lexington.
Pennal, W. P., Master Mechanic, R. C. & S., Lexington.
Purcell, Jno., Asst. to Vice-Pres., Santa Fe, R. R., Traymore.
Robinson, T. M., Chief Draftsman, Hock. Val., Traymore.
Scudder, Charles J., U. S. Loco. Inspector, Haddon Hall.
Setchel, P. H., Mechanical Engineer, B. & O. S. W., Haddon Hall.
Truden, J. L. G., Supt., B. & O. R. R., Dennis.
Wier, W. L., Chief Clerk, Penna. Co., Chalfonte.
Wilson, D. H., Gen. For., Fla. E. Coast Ry., Sterling.
Wintersteen, John, Locomotive Boiler Inspector, Interstate Commerce Commission, Lexington.

THE SPECIAL TRAIN FROM CHICAGO.

The Pennsylvania M. C. B. & M. M. special train left Chicago, at 3 o'clock Monday afternoon, arriving at Atlantic City at 2.47 p. m. Tuesday. There were 145 guests aboard. The train consisted of two locomotives, one club car, six 12-section drawing and stateroom sleepers, two seven-compartment double drawing room sleepers; six compartment-observation cars and two dining cars. It was in charge of R. B. Jones, Chief Clerk to Assistant General Passenger Agent Pennsylvania Lines West of Pittsburgh. The following came on the train:

H. T. Bentley, Prin. S. M. P. & M., Chicago & Northwestern, Chicago, and Miss Louise Bentley, Chicago.
R. B. Jones, Pennsylvania Lines, Chicago.
G. N. Van Sweringen, Chicago Railway Equipment Co., Chicago.
Owen W. Middleton, Railway Master Mechanic, Chicago.
Robert T. Scott, Independent Pneumatic Tool Company, Chicago.
Harry F. Finney, Independent Pneumatic Tool Co., Chicago.
R. A. Norling, Independent Pneumatic Tool Company, Chicago.
Vernon Job, Independent Pneumatic Tool Company, San Francisco.
Willard A. Smith, Railway Review, Chicago.
Fred M. Egolf, Curtain Supply Co., Chicago.
Stanley W. Midgley, Curtain Supply Company, Chicago.
A. LaMar, M. M. Pennsylvania Co., Chicago.
Mrs. A. LaMar, Chicago.
E. G. Haskins, M. M. Denver & Rio Grande, Salida, Colo.
Thomas Madill, Sherwin-Williams Company, Chicago.
Huntley H. Gilbert, Pressed Steel Car Company, Chicago.
Frank L. Johnson, Pressed Steel Car Company, Chicago.
C. W. Seddon, Supt. M. P. & Cars, Duluth, Missaba & Northern, Proctor, Minn.
Mrs. C. W. Seddon, Proctor, Minn.
L. R. Phillips, National Tube Co., Chicago.
Mrs. L. R. Phillips, Chicago.
Frederic T. De Long, Chicago Railway Equipment Co., Chicago.
John J. Faas, Traveling Engineer, Manning, Maxwell & Moore, New York.
Mrs. John J. Faas, New York.
J. W. Cyr, Supt. M. P., Chicago, Burlington & Quincy, Chicago.
Thomas Roope, Supt. M. P., Chicago, Burlington & Quincy, Lincoln, Neb.
J. W. Horne, Norton Company, Chicago.
C. B. Young, Mechanical Engineer, Chicago, Burlington & Quincy, Chicago.
Geo. E. Sevey, Otis Steel Company, Cleveland, O.
Mrs. Geo. E. Sevey, Cleveland, O.
Edward Wray, Railway Electrical Engineer, Chicago.
L. L. Dawson, Supt. Motive Power, Fort Worth & Denver City, Childress, Tex.
L. L. Yales, Superintendent Car Department, Pacific Fruit Express.
Mrs. L. L. Dawson Childress, Tex.
F. J. Magerstadt, Railway Utility Company, Chicago.
Paul Kraatz, Tool Maker, Chicago.
W. F. Dunham, Supervisor Motive Power & Machinery, Chicago & Northwestern, Winona, Minn.
M. H. Haig, Mechanical Engineer, Atchison, Topeka & Santa Fe, Topeka, Kan.
E. W. Pratt, Asst. Supt. M. P. & Machinery, Chicago & Northwestern, Chicago.
Mrs. E. W. Pratt, Chicago.
W. T. Swift, S. F. Bowser & Co., Fort Wayne, Indiana.
A. L. Whipple, Standard Heat & Ventilation Co., Chicago.
Mrs. A. L. Whipple, Chicago.
F. F. Davisson, Supt. M. P. & Machinery, San Pedro, Los Angeles & Salt Lake, Los Angeles, Calif.
Mrs. F. F. Davisson, Los Angeles, Calif.

J. G. Neuffer, Supt. M. P., Chicago Great Western, Oelwein, Iowa.
Mrs. J. G. Neuffer, Oelwein, Iowa.
Harold A. Smith, Railway Review, Chicago.
Geo. F. Laughlin, Gen. Supt. Armour Car Lines, Chicago.
Mrs. Geo. F. Laughlin, Chicago.
Edwin B. Ross, Buchanan Electric Steel Co., Buchanan, Mich.
Mrs. Edwin B. Ross, Buchanan, Mich.
W. A. Blanchard, American Steel Foundries, Chicago.
F. R. Shoenberger, U. S. Metal & Mfg. Co., Chicago.
J. H. Rodger, Safety Car Heating & Lighting Co., Chicago.
P. M. Elliott, Camel Co., Chicago.
Mrs. P. M. Elliott, Chicago.
C. A. Hardy, Whiting Foundry Equipment Co., Chicago.
Mrs. C. A. Hardy, Chicago.
Oscar C. Hayward, Tousey Varnish Co., Chicago.
S. S. Lawson, Mudge & Co., Chicago.
Thomas O'Malley, O'Malley-Beare Valve Co., Chicago.
O. H. Baker, Illinois Steel Co., Chicago.
C. D. Jenks, Edwin S. Woods & Co., Chicago.
Mrs. C. D. Jenks, Chicago.
C. E. Fuller, Asst. Gen. Mgr., Union Pacific, Omaha, Neb.
E. H. Gold, Chicago Car Heating Co., Chicago.
M. C. Beymer, Jacobs-Shupert Fire Box Co., and Oxweld R. R. Service Co., Chicago.
B. Pratt, New York Air Brake Co., Chicago.
J. P. Landreth, Garlock Packing Co., Chicago.
Mrs. J. P. Landreth, Chicago.
E. A. Park, Supt. M. P. & Cars, Peoria, Ill.
Charles Riddell, Standard Steel Works Co., Chicago.
C. G. Nash, Universal Draft Gear Attachment Co., Chicago.
Mrs. C. G. Nash, Chicago.
J. W. Hathaway, Union Draft Gear Company, Chicago.
William Miller, Pyle-National Electric Headlight Co., Chicago.
Mrs. William Miller, Chicago.
Frank W. Furry, Ohio Injector Co., Chicago
William S. Furry, Ohio Injector Co., Chicago.
F. W. Edwards, Ohio Injector Co., Chicago.
C. B. Royal, Galena-Signal Oil Co., Chicago.
Mrs. C. B. Royal, Chicago.
J. F. De Voy, Asst. Supt. M. P., Chicago, Milwaukee & St. Paul, Milwaukee.
Geo. R. Boyce, A. M. Castle & Co., Chicago
C. W. Richards, D. W. Bosley Co., Chicago.
W. A. Bennett, Griffin Wheel Co., Chicago.
Mrs. W. A. Bennett, Chicago.
A. B. Wegener, Camel Co., Chicago.
A. W. Brown, United & Globe Rubber Mfg. Companies, Chicago.
W. E. Magraw, Railway List Company, Chicago.
Bradley S. Johnson, T. H. Symington Co., Chicago.
A. D. McAdam, Ralston Steel Car Co., Chicago.
A. E. Manchester, Supt. M. P., Chicago, Milwaukee & St. Paul, Milwaukee.
E. B. Van Patten, Murphy Varnish Co., Chicago.
W. M. Wilson, J. Rogers Flannery Co., Chicago.
Geo. L. Harvey, Frost Railway Supply Co., Chicago
H. A. Varney, National Boiler Washing Co., Chicago.
L. F. Wilson, Railway List Company, Chicago.
Mrs. L. F. Wilson, Chicago.
E. B. White, National Boiler Washing Co., Chicago.
E. D. Garfield, Manning, Maxwell & Moore, Chicago.
R. T. Brydon, Wadsworth, Howland Company, Chicago.
C. R. Naylor, T. H. Symington Co., Chicago.
H. W. Jones, Marshall & Huschart Machinery Co., Chicago.
Dalton Risley, Railway List Company, Chicago.
C. W. Rhoades, Valentine & Company, Chicago.
P. C. Jacobs, H. W. Johns-Manville Company, Chicago.
Allan Wallace, Philip Carey Company, Chicago.
Mrs. Allan Wallace, Chicago.
Chas. P. Williams, National Lock Washer Co., Chicago.
Mrs. Chas. P. Williams, Chicago.

THE ENROLLMENT COMMITTEE FEELS GOOD OVER THE PROSPECT.

Top row, left to right—H. G. Newman, H. W. Johns-Manville Company; E. T. Sawyer, Commercial Acetylene Railway Light & Signal Company; R. F. Moon, Westinghouse Electric & Manufacturing Company; E. Bjerregaard, The Official Guide; Harold A. Brown, The Pocket List of Railroad Officials; Benjamin A. Smith, W. H. Coe Manufacturing Company; C. W. Beaver, Yale & Towne Manufacturing Company.

Bottom row, left to right—F. E. Beal, Magnus Metal Company; F. H. Smith, Gold Car Heating & Lighting Company; Charles H. Gayetty, Quaker City Rubber Company; C. B. Yardley, Jr., (Chairman), Jenkins Brothers; J. A. Stevens, F. W. De Voe & C. T. Raynolds Company; F. N. Bard, Barco Brass & Joint Company.

CORNELL DINNER.

The seventh annual dinner of the Cornell men attending the conventions will be held at the Marlborough-Blenheim at 7.30 Friday evening. All Cornell men who wish to attend are requested to leave their names at Mr. Averill's desk in the *Railway Age Gazette* space to the right of the main entrance.

TELEPHONES ON THE PIER.

A Bell Telephone will be placed between each two exhibit booths on the pier. These are available for free local service for exhibitors. Long-distance calls can also be made from these stations.

U. S. MAIL.

Mail addressed care of Secretary's Office, Million Dollar Pier, will be taken care of and distributed when called for at that office.

WESTERN RAILWAY CLUB ANNUAL MEETING.

The annual meeting of the Western Railway Club was held in Chicago May 27, for the election of officers and the annual entertainment, the performers in which were all members of the club. The program included a number of vocal and piano selections. The features of the evening were dancing by the "Heavenly Twins," and various selections by the Western Railway Club German Band. This famous aggregation played six classical (?) selections under the direction of Jack Ponic. About 400 members were present, and thoroughly enjoyed the evening.

That it was a real German band is evident from the appearance of the players. Those who heard it say it was still more evident from the harmonious sounds which resulted from its efforts. The "Heavenly Twins" may be discovered by studying the back ground.

The following officers were elected for the ensuing year: President, Henry La Rue, formerly of the Rock Island Lines; first vice-president, W. B. Hall, Union Railway Equipment Company; second vice-president, E. W. Pratt, assistant superintendent of motive power Chicago & Northwestern, and secretary, Jos. W. Taylor. Three new directors were also elected: C. J. Olmstead, Westinghouse Air Brake Compnay; J. H. Tinker, superintendent motive power, Chicago & Eastern Illinois, and H. H. Harvey, general car foreman, Chicago, Burlington and Quincy.

RAILWAY SUPPLY MANUFACTURERS' ANNUAL MEETING.

The annual meeting of the Railway Supply Manufacturers' Association will be held in the Convention Hall on Young's New Million Dollar Pier, Saturday, June 14. The hour of meeting will be duly bulletined. District meetings for the election of executive committee members will be announced in the *Daily Railway Age Gazette* and by special poster.

WESTERN RAILWAY CLUB GERMAN BAND.

Upper row, from left to right—J. H. Kuhns, Republic Rubber Company; Jos. W. Taylor, secretary; W. H. Benfeldt, Western Electric Company; Jack Ponic, Rhode Island Union; Mr. Forsythe, J. Will Johnson, Pyle-National Headlight Company; Geo. H. Porter, Western Electric Company.

Lower row, from left to right—W. B. Hall, Union Railway Equipment Company; Geo. Royal, Nathan Manufacturing Company; C. B. Royal, Galena-Signal Oil Company; J. S. Sutton, Chicago & Eastern Illinois; John Ball, assistant purchasing agent, Chicago & North Western; G. H. Bryant, Thomas Prosser Company.

GOLF.

The Country Club of Atlantic City extends the privilege of its Club House to all members and guests during their stay, and admission to the grounds will be by official badge. The club is located at Northfield and may be reached at half-hour intervals by the Shore Fast Line Electric cars, leaving from Boardwalk and Virginia avenue, also by the Atlantic City and Suburban Traction Company's cars, leaving from Florida avenue and Boardwalk. Running time, about twenty minutes.

RECITALS.

Mrs. Caroline B. Nichols, Ladies Orchestra, Fadettes of Boston will give recitals in the Atlantic City Exposition, Boardwalk and Kentucky avenue, morning, afternoon and evenings, including Sundays, beginning 10 a. m., June 14. All badge members will be admitted free.

M. M. ASSOCIATION OFFICERS, 1912-1913.

President, D. F. Crawford, G. S. M. P., Penna. Lines; First Vice-President, T. Rumney; Second Vice-President, D. R. MacBain, S. M. P., L. S. & M. S. Ry.; Third Vice-President, F. F. Gaines, S. M. P., Central of Ga. Ry.; Treasurer, Angus Sinclair, New York City. Executive Members: G. W. Wildin, M. S., N. Y. N. H. & H. R. R.; C. F. Giles, S. M., Louisville & Nashville R. R.; Wm. Schlafge, G. M. S., Erie R. R.; C. A. Seley, American Flexible Bolt Co.; J. F. Walsh, G. S. M. P., Ches. & Ohio Ry.; E. W. Pratt, A. S. M. P., C. & N. W. Ry. Secretary, Jos. W. Taylor, Chicago, Ill.

STANDING COMMITTEES.

1.—Revision of Standards.—W. E. Dunham (Chairman), Supervisor, M. P. & M., C. & N. W. Ry.; A. R. Ayers, G. M. E., L. S. & M. S. Ry.; M. H. Haig, M. E., A. T. & S. F. Ry.

2.—Mechanical Stokers.—A. Kearney (Chairman), A. S. M. P., N. & W. Ry.; J. A. Carney, S. S., C. B. & Q. R. R.; Geo. Hodgins, New York City; J. M. James, S. M. P., Penna. R. R.

SPECIAL COMMITTEES.

3.—Specifications for Cast-steel Locomotive Frames.—C. B. Young (Chairman), M. E., C. B. & Q. R. R.; E. W. Pratt, A. S. M. P., C. & N. W. Ry.; R. K. Reading, S. M. P., Penna. R. R.; O. C. Cromwell, M. E., B. & O. R. R.; C. E. Fuller, A. G. M., Union Pacific R. R.; L. R. Pomeroy, J. G. White & Co.

4.—Main and Side Rods.—W. F. Kiesel, Jr., A. M. E., Penna. R. R.; H. Bartlett, G. S. M. P., Boston & Maine R. R.; G. Lanza, Mass. Institute of Technology; H. B. Hunt, American Locomotive Co.; W. E. Dunham, Supervisor M. P. & M., C. & N. W. Ry.

5.—Safety Appliances.—D. F. Crawford (Chairman), Gen'l S. M. P., Penna. Lines; M. K. Barnum, Chicago, Ill.; C. B. Young, M. E., C. B. & Q. R. R.

6.—Design, Construction and Inspection of Locomotive Boilers.—D. R. MacBain (Chairman), S. M. P., L. S. & M. S. Ry.; C. E. Chambers, S. M. P., C. R. R. of N. J.; T. W. Demarest, S. M. P., Penna. Lines; F. H. Clark, G. S. M. P., B. & O. R. R.; R. E. Smith, G. S. M. P., A. C. L. R. R.; E. W. Pratt, A. S. M. P., C. & N. W. Ry.; J. Snowden Bell, New York City.

7.—Steel Tires.—L. R. Johnson (Chairman), G. S. S., Can. Pac. Ry.; J. R. Onderdonk, Engr. Tests, Balto. & Ohio R. R.; C. H. Hogan, D. S. M. P., N. Y. C. & H. R. R. R.; R. L. Ettenger, C. M. E., Southern Ry.; L. H. Turner, S. M. P., P. & L. E. R. R.

8.—Minimum Requirements for Headlights.—D. F. Crawford (Chairman), G. S. M. P., Penna. Lines; A. R. Ayers, C. M. E., L. S. & M. S. Ry.; C. H. Rae, G. M. M., L. & N. R. R.; F. A. Torrey, G. S. M. P., C. B. & Q. R. R.; Robt. Quayle, S. M. P., C. & N. W. Ry.

9.—Standardization of Tinware.—A. J. Poole, S. M. P., Seaboard Air Line Ry.; M. D. Franey, A. M. M., L. S. & M. S. Ry.; J. C. Mengel, M. M., Penna. R. R.

10.—Subjects.—G. W. Wildin (Chairman), M. S., N. Y. N. H. & H. R. R.; A. W. Gibbs, C. M. E., Penna. R. R.; C. E. Chambers, S. M. P., Cent. R. R. of N. J.

11.—Specifications for Materials Used in Locomotive Construction.—W. C. A. Henry (Chairman), S. M. P., Penna. Lines; H. T. Bentley, P. A. S. M. P., C. & N. W. Ry.; H. E. Smith, Chemist, L. S. & M. S. Ry.; Frank Zeleny, Engr. Tests, C. B. & Q. R. R.; A. G. Trumbull, M. S., Erie R. R.

12.—Use of Special Alloy Steels and Heat-treated Steel in Locomotive Construction.—C. D. Young (Chairman), Engr. Tests, Penna. R. R.; Henry Bartlett, G. S. M. D., Boston & Maine R. R.; S. M. Vauclain, Baldwin Loco. Wks.; H. B. Hunt, American Loco. Wks.; J. C. Little, M. E., Chgo. & N. W.

13.—Smoke Prevention.—E. W. Pratt (Chairman), A. S. M. P., C. & N. W. Ry.; J. F. De Voy, A. S. M. P., C. M. & St. P. Ry.; W. C. Hayes, S. L. O., Erie R. R.; T. R. Cook, A. E. M. P., Penna. Lines; M. K. Barnum, Chicago.

14.—Engine-tender Wheels.—Wm. Garstang (Chairman), S. M. P., C. C. C. & St. L. Ry.; W. C. A. Henry, S. M. P., Penna. Lines; A. E. Manchester, S. M. P., C. M. & St. P. Ry.; R. L. Ettenger, C. M. E., Southern Ry.; J. A. Pilcher, M. E., Norfolk & Western Ry.; O. C. Cromwell, M. E., Balto. & Ohio R. R.

15.—Arrangements.—D. F. Crawford, G. S. M. P., Penna. Lines.

WEAR YOUR BADGE.

As all members and guests of the associations are not known to the entertainment committee, who must use due diligence to insure their protection and privileges, they will greatly assist in this work by wearing their official badge at all times during the conventions.

SPECIAL TRAIN FROM NEW YORK.

Among those who came down on the Central of New Jersey yesterday afternoon were:

A. R. Ayers, general mechanical engineer, N. Y. C. L.
S. A. Bickford, master mechanic, N. Y. C. & H. R.
J. B. Canfield, master mechanic, B. & A.
J. H. Clark, superintendent, B. & O.
M. D. Franey, master mechanic, L. S. & M. S.
Philip H. Munshull, master mechanic, N. Y., O. & W.
P. P. Mirtz, mechanical engineer, L. S. & M. S.
W. M. Perrine, master mechanic, C. of N. J.
George W. Rink, mechanical engineer, C. of N. J.
Frank B. Smith, Victorian State Railways, Australia.
Harry D. Vought, secretary, New York and Central Railway Clubs.

Among those who arrived on the Pennsylvania special yesterday were:

T. F. Barton, master mechanic, D. L. & W.
G. J. Duffy, master mechanic, L. E. & W.
J. T. Flavin, master mechanic, C. I. & S. and I. H. B.
G. W. Good, supervisor piece work, N. Y. C. L.
W. C. Hayes, superintendent locomotive operation, Erie.
Charles H. Hogan, asst. supt. of motive power, N. Y. C. & H. R.
William F. Jones, general storekeeper, N. Y. C. & H. R.
J. H. Manning, superintendent motive power, D. & H.
T. M. Ramsdell, master car builder, C. & A.
W. H. Winterowd, mechanical engineer, C. P.

INFORMATION BUREAU.

As a convenience to members an information bureau has been established and will be located on the pier, adjoining the enrollment booth, to the left of the main entrance. This year the committee has engaged the services of a professional who has had a long experience in this kind of work at Atlantic City, and who is thoroughly posted on all matters of interest in connection with the city and the conventions. He will take charge of the bureau today and be on

hand throughout the convention. O. F. Ostby and L. C. Brown are the committee in charge.

BATHING ACCOMMODATIONS.

Accommodations for bathing may be had by all members and guests of the conventions wearing the official badges at the following rates, including suits:

Reed's Baths (Boardwalk under Hotel Dennis), 25 and 50 cents per person.

Brighton Casino (with indoor swimming pool), 50 cents per person.

Free admission to Brighton Casino (including concert, reading and writing rooms) to members and guests wearing official badges.

This rate applies only to those wearing the official badge.

The Hygeia baths and pool located on Boardwalk above Heinz Pier offers a reduction of 20 per cent. from the regular rate of 50 cents for swimming. Ocean and pool bathing may be had at one charge. This pool is 120 by 60 feet and is filled with ocean water heated to 76 degrees. Men and women are permitted to bathe at the same time.

STENOGRAPHIC SERVICE.

Miss L. H. Marvel has been appointed official public stenographer for exhibitors and members of the association. Location of her office will be duly bulletined during the convention. Dictation will be taken over telephone, or stenographers will be sent to exhibitors' booths upon telephone request, and work delivered. Special rates for the conventions are as follows: Letters, dictation direct to the machine, 15 cents per page; shorthand dictation and transcribing, 25 cents per page; carbon copies, each, 5 cents per page; engagements by the hour, $1.00. The above rates are for double-spaced letters. Only members wearing the official badge may have the privilege of this special rate.

PAST PRESIDENTS, MASTER MECHANICS' ASSOCIATION.

H. M. Britton	1868 to 1876.	Deceased.
N. E. Chapman	1876 " 1880.	Deceased.

TAXICAB AND GARAGE SERVICE.

Richard G. Edwards, main office, 1210 Atlantic avenue, Atlantic City, N. J., is under contract to have available at Arkansas avenue and Boardwalk, the Marlborough-Blenheim Hotel, as well as all other prominent hotels, taxicabs for use of members and guests wearing official badges. Rates are as follows:

One or 2 passengers to any part of city, 50 cents. Each additional passenger, 25 cents. Five-passenger touring car per hour, $3.50. Seven-passenger touring car per hour, $5.00. Five-passenger touring car, per 10 hours, $30.00. Seven-passenger touring car per 10 hours, $35.00. Taxicabs per hour, $3.50.

Garage service for private machines will be provided by this company at the following rates: 75 cents per day without service. $1.50 per day with service. $7.00 per week with service.

PRECAUTION AGAINST THEFT.

There has always been more or less stealing from the exhibits during the evening and night when they are supposed to be closed. By vigilant work on the part of the exhibit committee it has been reduced to a comparatively small amount during the past few years, and certain precautions have been taken this year to stop it entirely, if such a thing is possible. In this connection it might be well for the practical joker to confine his operations to other things than the exhibit, for anyone caught thieving will be made an example of, and no attempt will be made to discriminate between the thief and the joker.

Monday night an exhibitor reported the loss of $250 worth of material, some of which had been specially prepared for the exhibition and could not be replaced. Later developments showed that a practical joker had been at work. Probably when he gets through with the committee in charge of exhibits he will not care to repeat the offense; future offenders of this sort will be given even less consideration, and will have to suffer the same penalty as a real thief.

ROLLING CHAIRS.

The transportation committee will provide roller chairs for all members and guests of the convention wearing official badges, from the following stations to be maintained June 11 to 18, inclusive: Main Entrance Million Dollar Pier, Marlborough-Blenheim Hotel, Traymore Hotel, Young's Hotel, Chalfonte Hotel, Chelsea Hotel. The transportation committee will show every courtesy and attention to those wearing the official badge.

Chairs will be furnished free from the six stations only to members wearing the official badge.

From Stations.

The Pier	9.00 A. M. to 6 P. M.
Marlborough-Blenheim	9.00 A. M. to 6 P. M.
Traymore Hotel	9.00 A. M. to 6 P. M.
Young's Hotel	9.00 A. M. to 6 P. M.
Chalfonte Hotel	9.00 A. M. to 6 P. M.
Chelsea Hotel	9.00 A. M. to 6 P. M.
To both Informal Dances on Pier	8.30 P. M. to 10 P. M.

Unoccupied chairs may be stopped at any point on the Boardwalk, except between Marlborough-Blenheim and Pier, and they may be used in either direction, but must be reported at first checking station passed. Convention chairs are not allowed to wait more than fifteen minutes. Any of Shill's chairs may be had after hours for continuous trip in any one direction for 25 cents per person. Hourly riding can be arranged for on the regular rate basis. Private chairs may be secured at special rates through the Transportation Committee only.

This courtesy will only be extended to those wearing the official badge.

Conventionalities.

J. F. Hill, master mechanic W. & L. E., at Brewster, Ohio, arrived Monday evening and is stopping at the Marlborough-Blenheim.

A. Dixon, superintendent of shops of the Canadian Pacific at West Toronto, Canada, arrived Tuesday afternoon, and is at Haddon Hall.

J. F. McCuen, general inspector Cincinnati, New Orleans & Texas Pacific at Waterloo, Ky., arrived Tuesday afternoon, and is stopping at the Dennis.

J. W. Fogg, master mechanic, Baltimore & Ohio Chicago Terminal at East Chicago, Ind., arrived with his wife yesterday. They are stopping at the Chalfonte.

J. Alexander Brown and Joe Taylor were pointed out in conversation on the Boardwalk. Said B to A, "We all know Joe Taylor; but who in ——is J. Alexander Brown? What?"

George L. Morton, of the Galena-Signal Oil Co., who is also a member of the executive committee of the supply men, arrived Monday night, and is stopping at the Chalfonte.

W. H. Flynn, superintendent of motive power of the Michigan Central, at Detroit, Mich., arrived with his wife Monday evening. They are stopping at the Marlborough-Blenheim.

W. J. Tollerton, general mechanical superintendent Rock Island Lines, Chicago, arrived yesterday morning with Mrs. Tollerton. They are stopping at the Marlborough-Blenheim.

Mr. and Mrs. Harry H. Schroyer and Harry U. Morton, Chicago, accompanied by David Pye and William S. Conwill, New York, arrived Tuesday by motor from New York. They are stopping at the Strand.

Cooper started the row; but it was Staff's fault. He should have known better than to have offered George a daily paper that habitually subordinates sporting news to the more commonplace everyday business topics.

Edwin S. Woods, supply man of Chicago, will not be with us this year owing to his having been taken sick with typhoid pneumonia about three weeks ago. He has since been a very sick man, but is now on the road to recovery.

W. R. Warner of the Warner & Swasey Company, will not be able to greet his many friends at the convention this year, as he has sailed for Europe to attend the convention of the International Society of Mechanical Engineers to be held in Germany.

J. Will Johnson, general manager of the Pyle-National Electric Headlight Company, who is chairman of the Exhibit Committee, arrived Sunday evening, and is staying at the Traymore. Needless to say, he has been on the job ever

Joe Taylor was on the Job Early.

J. Snowden Bell, an Early Arrival.

W. Garstang, General Master Car Builder of the Big Four.

T. Rumney, Late of the Rock Island.

since he arrived. Mrs. Johnson, who is so well known and popular among the convention visitors, will not be here this year.

J. F. Deems, past president of the Master Mechanics Association is not accompanied by Mrs. Deems this year. He has recently completed a new summer home on Cape Cod and Mrs. Deems preferred to oversee its furnishing personally.

Mr. and Mrs. John E. Kilker are attending the conventions and staying at the Traymore. Mr. Kilker is general superintendent of the Pyle-National Electric Headlight Company. This is Mrs. Kilker's first visit here on the occasion of the conventions.

William Garstang, general master car builder, Big Fern, Indianapolis, Ind., attended a regular periodical meeting of mechanical officers of the New York Central Lines in New York yesterday, arriving here Monday night. Mrs. Garstang and daughter arrived last evening.

Mr. and Mrs. W. C. Arp, superintendent motive power, Vandalia, Terre Haute, Ind., arrived Sunday night and are stopping at the Marlborough-Blenheim. Mr. Arp, together with Messrs. Strickland Nice, E. O. Warner and August Elliott, played a 36 hole foursome yesterday.

Stanley Bullard, vice-president of the Bullard Machine Tool Company, was accompanied to Atlantic City by Mrs. Bullard, their little daughter, Francis, and Mrs. Bullard's mother, Mrs. George Cleveland. All of the party except Mr. Bullard returned yesterday to their home at Bridgeport, Conn.

J. B. Randall, master mechanic Louisville, Henderson & St. Louis, at Clover Port, Ky., arrived with his wife Monday evening. They are stopping at the Traymore. Mr. Randall stated the weather was very warm at home Saturday, but turned quite cool Sunday, and the weather here did not surprise him.

C. H. Rae, assistant superintendent machinery of the Louisville and Nashville at Louisville, Ky., arrived with his wife on Monday evening. The L. and N. builds practically all of its new locomotives at the Louisville shops, and is now turning out some large superheater consolidations at the rate of one a week.

C. H. Rae, Assistant Superintendent Machinery, Louisville & Nashville.

J. E. Conner, superintendent motive power, Central of Georgia, and LeGrand Parish, president of the American Arch Company, were seen busily engaged in a brick arch combination conversation on the pier Tuesday afternoon. Mr. Gaines was elected a member of the executive committee of the International Railway Fuel Association at its last meeting.

John T. Brown of the Damascus Bronze Company at Pittsburgh, who has been a regular attendant at the conventions for many years, died in Pittsburgh on May 20. Two years ago he was unable to attend the conventions with his friend McFeatters, but last year was present and in a quiet way had a most

W. B. Hall, the New Vice-President of the Western Railway Club, and Mrs. Hall.

enjoyable time with his many friends. His absence will be felt this year.

C. A. Seley, until recently general mechanical engineer of the Rock Island, and who has been extremely active in the work of the two mechanical associations for many years, is enrolled as a supplyman this year. He is president of the American Flexible Bolt Company of Pittsburgh, and from his appearance yesterday seemed to be getting lots of satisfaction out of his new job.

J. D. DeVoy, assistant superintendent of motive power Chicago, Milwaukee & St. Paul, is ready to match shop output with anyone. The West Milwaukee shops are turning out two new locomotives a week and twenty-six new box cars a day in addition to all repair work. In addition to this new motive power the company has purchased 300 new locomotives mostly to be used on the Western lines. Mr. DeVoy is at the Sheldon.

Secretary Taylor of the mechanical associations arrived Monday, coming by way of New York. Probably many members do not realize how long Mr. Taylor has had his present connection with the associations. He was elected secretary at Old Point Comfort in 1899, and therefore the conventions this and next week will be his fourteenth. In other words, next year he will celebrate his "crystal anniversary" as secretary.

W. H. Lewis, superintendent motive power Norfolk & Western at Roanoke, Va., arrived yesterday and is stopping at the Marlborough-Blenheim. As usual he was accompanied by John McKenzie, now with the Johnson Frog Wrecking Co. of Cleveland, formerly superintendent motive power of the Nickel Plate. Messrs. McKenzie and Lewis joined the association in Philadelphia in 1876 and have been attending together regularly ever since.

Jas. E. Keegan, superintendent motive power, Grand Rapids & Indiana at Grand Rapids, Mich., J. J. Conolly, superintendent motive power and machinery, of the Duluth, South Shore & Atlantic at Marquette, Mich. and W. L. Wilt, chief clerk to the superintendent of motive power of the Pennsyl-

vania Lines at Fort Wayne, Ind. arrived Tuesday morning and are stopping at the Chalfonte. They say they will always be together—three of a kind.

That pleasant ray of sunshine, Scott Blewett, was on hand as usual to welcome the first vanload of toilers that arrived on Sunday afternoon. That old, familiar greeting, so natural to those whose good fortune it is to know him, made us all feel that it was but yesterday when the same scene was last

Left to right—W. E. Maxfield, M. M., Texas & Pacific; B. M. Carr, American Car & Foundry Company; F. S. Anthony, S. M. P., Texas & Pacific.

enacted. Mrs. Blewett, too, is here; and they and their rivals as early birds, Mr. and Mrs. D. C. Noble, completed the circle that at once took us back to the good old Saratoga days.

Thomas K. Dunbar reached Atlantic City from Chicago Monday and registered at the Shelburne. In his home city last week he acted as master of ceremonies at the wedding of his sister, Miss Bessie Dunbar, to Sidney Andersen. The wedding took place at the Blackstone Hotel and was one of Chicago's social events of the week. Mr. Andersen and his bride will visit Atlantic City on their honeymoon and will meet many of their Chicago and Eastern friends at the social entertainments held in connection with the conventions.

W. N. Mitchell of the International Correspondence Schools has recently arrived at his home in Chicago after making an 18,000 mile trip through the United States, Mexico and Cuba. He attended fifty-seven railway "safety first" meetings in the United States in the course of his visits to various cities. It is with considerable regret that he will not attend the conventions at Atlantic City this year, as his time will be very much occupied in Chicago on account of his long trip. Mr. Mitchell has not missed attending the conventions during the past 20 years.

Mr. and Mrs. Edward C. Bates, of Boston, and their daughter, Miss Consuelo, are attending the convention this year, and are at the Dennis. It will be remembered that Mr. Bates was Chairman of the entertainment committee for eight consecutive years. His last attendance at the conventions was at Saratoga twelve years ago, when he was accompanied by his bride. Mr. Bates began his railroad career on the Union Pacific in the late sixties under J. H. Congdon, who was then superintendent of motive power of that road.

For the first time in sixteen years Mark A. Ross is attending the conventions unaccompanied by Mrs. Ross. Mrs. Ross remained at home in Chicago to entertain visitors, the visitors being Mr. and Mrs. Earl G. Smith of Idaho. Mr. Smith is well known to convention visitors, being a former secretary of the Railway Supply Manufacturers' Association. Mrs. Ross has so many friends among the convention visitors that she will be much missed. Besides coming without Mrs. Ross this year, Mr. Ross comes in a new business capacity, having recently assumed charge, on its creation, of the headlight department of the Buda Company.

W. O. Duntley, president of the Chicago Pneumatic Tool Company, returned on June 2 from his annual tour of inspection of the company's plants in Europe, having been gone two months, and is expected to arrive in Atlantic City for the conventions on Thursday. The company's business in England and on the continent is growing steadily and a great portion of the products of its American factories is shipped abroad, notwithstanding the fact that it has a large output from its factories at Fraserburg, Scotland and Berlin, Germany. In line with the general prosperity of which industrial concerns have been partaking, the company's total shipments for April broke all records, despite the fact that all previous records had been broken on several occasions within the last twelve months, and its Detroit and Cleveland plants are working 22 hours a day.

Charlie Williams and Harry Finnell, "The inseparables," need no introduction. They are with us annually at Atlantic City. They arrived early, as usual, and after two hard days' work installing their exhibits decided to settle a long standing dispute as which played the better game of golf. Armed with their clubs they proceeded to Atlantic City's pretty links at Northfield and lost no time in the preliminaries.

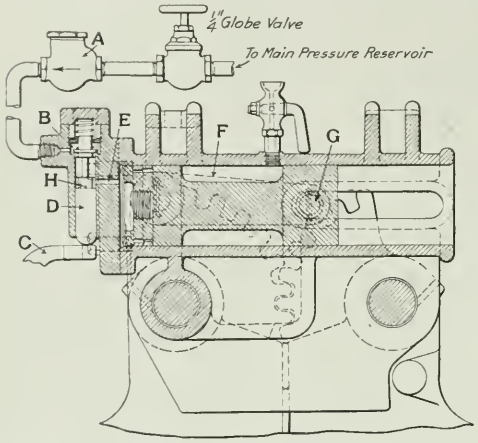
They played seventeen holes and Dame Rumor hath said there was a wager on each hole throughout the bitterly fought contest. At the finish of the seventeenth hole they were "all square": Charlie had won seven, Harry seven, and they had halved three. So it was then proposed, and promptly accepted, that an even dozen balls should go to the winner of the eighteenth, the final hole. Darkness was rapidly approaching as they drove from the tee. The hole was a short one and both players, though considerably excited, made good drives. As they drew near the hole in the mottled gloaming Harry was unable to find his ball. Charlie naturally refused to assist in the search, claiming that there was too much at stake. "Sorry, old top," he exclaimed, "but I

A. G. McCausland, Retired Division Superintendent, Atlantic City.

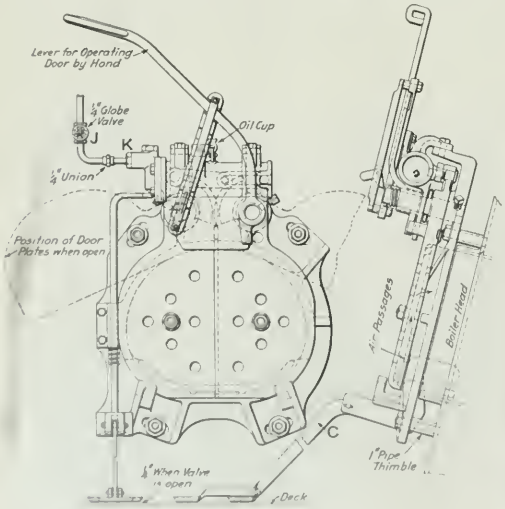
want the honor of beating you and then, too, I can use that dozen balls in my business. So go to it, sport, and I'll just sit here and wait the allotted five minutes." Harry at once proceeded to scramble around in search of his ball and after edging some 75 feet away from his rival finally yelled triumphantly, "Here it is—just here at the edge of these bushes." "You're a liar," was Charlie's reply, "I'm sitting on it."

IMPROVED FIRE DOOR.

Several improvements have recently been made in the pneumatic fire doors manufactured by the Franklin Railway Supply Company, New York. In the latest type, which is shown in the illustrations, the doors, instead of sliding, swing from pivots on the top of the door frame. In opening, the link which connects the piston to the door comes down to the center line, straightening out the links and gradually diminishing the force so that there is not sufficient to slam the doors in opening. The doors are closed by gravity, but are so balanced that when coming to the closed position there is only sufficient weight to hold them together,



Section Through Franklin Fire Door Operating Cylinder.

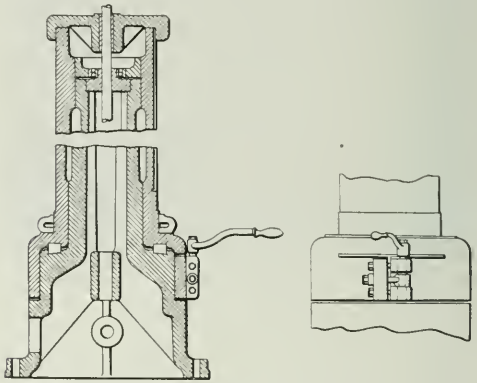


Franklin Fire Door.

the retarding effect of the exhaust passing from the cylinder acting as a cushion to prevent slamming; it is claimed that this device is practically noiseless in its operation. To operate the door air is carried from the main reservoir through the 1/4 in. globe valve and strainer valve *A* to cavity *B*. When the pedal is operated the movement is transmitted to the valve rod *C* which raises the valve *D* and admits air to the cylinder through the port *F*, thus moving the piston. The movement of the piston opens the doors by means of the connecting link *F* and the pin *G*, by which the piston is connected to the left-hand door plate. When the pedal is released the valve *D* seats, shutting off the air supply and opening the cylinder to exhaust through the port *H*; the doors then close by gravity, the air in passing through the exhaust port *H* acting as a cushion to prevent them slamming.

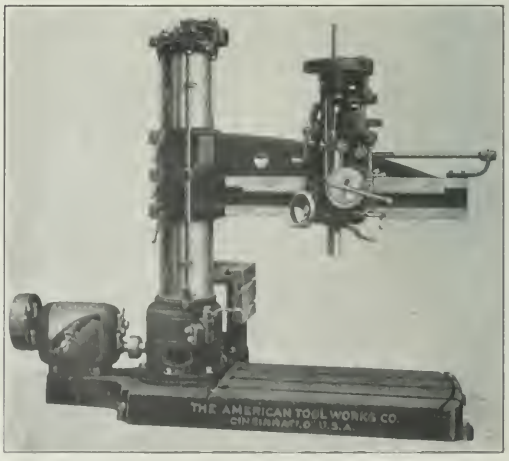
IMPROVED RADIAL DRILL.

Among the machine tools which are being shown this year by the American Tool Works Company, Cincinnati, Ohio, is a radial drill with an improved clamping and column construction, the details of which are shown in the drawing. This embodies a ball-bearing which is interposed between



Column and Clamping Arrangement of Radial Drill.

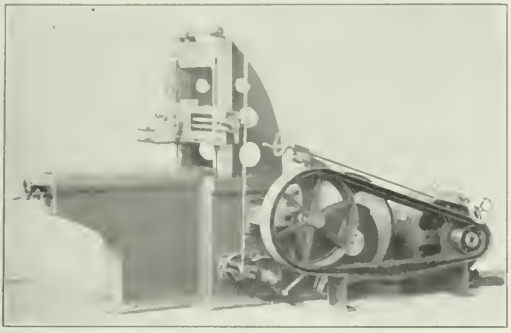
the column and sleeve at the top and takes the side or radial thrust of the latter and makes the arm swing more easily. The sleeve or outer column revolves on hardened conical roller bearings and may be readily swung around and clamped in position by means of an eccentric clamping device. This binds the sleeve firmly to the inner column, which extends entirely through and has full bearing on the sleeve at both top and bottom. All the gears in the machine are made of steel, the pinions being cut from bars, while the large gears are cut from steel castings.



Radial Drill Showing Improved Clamping Device.

HEAVY SERVICE CRANK PLANER.

The crank planer illustrated herewith forms part of the exhibit of the Cincinnati Shaper Company, Cincinnati, Ohio. The head of the machine swivels on each side of the vertical for angular planing and is graduated in degrees; the down feed screw is provided with a compensating unit of bronze for taking up wear and also a micrometer collar reading to .0001 in. The length of the stroke is adjusted by a removable crank wrench and the position of the cutting stroke may



Cincinnati Crank Planer for Heavy Service.

be regulated by a hand wheel on the end of the bed while the machine is in motion. The feeds for cross travel and vertical motion are automatic and as they take place on the return stroke, do not require a stroke longer than is necessary for the cut. The power is obtained from a variable speed motor which is connected to the machine by a belt, as shown in the illustration. The space occupied by this planer is 12 ft. 9 in. by 4 ft. 10 in. and the machine weighs about 7500 lbs., with the motor.

ADJUSTABLE BRAKE HEAD.

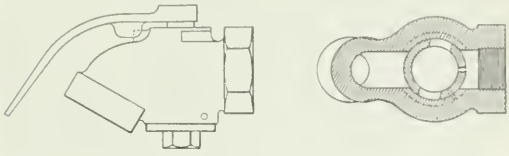
The illustration shows a new adjustable brake head which is designed to meet the requirements of modern high speed passenger equipment. The adjustment feature of the head commends itself on account of its simplicity, accessibility and minimum number of parts. The adjustment is controlled by a cast steel lock at the back of the head, having the same contour on its bearing surface as the sleeve. By the contact of the steel lock against the sleeve, the head

Adjustable Brake Head.

is held firmly and rigidly at the angle prescribed by the seating of the brake shoe, the force of contact being controlled by tightening the nut on the bolt at the top of the head. The location of the adjustment lock bolt at the top of the head is such that any adjustment in the angle of the head can be made, or any wear between the head and sleeve can be taken up while the beam is in service. The head is on exhibition at exhibit space 552-553 of the Buffalo Brake Beam Company, New York.

IMPROVED ANGLE COCK.

An interesting type of angle cock is shown in the illustration. The plug has a small hole drilled in it and there is a corresponding hole drilled in the casing, both being near the bottom. In cutting off cars, if the angle cock handle is turned to a position just short of the closed posi-



Kendrick Angle Cock.

tion, the air in the hose will escape through these ports; the angle cock can then be entirely closed and the hose uncoupled without the usual escape of air. This device is the invention of W. D. Kendrick, and is being exhibited by the Kendrick Improved Valve Company, Globe, Arizona.

IMPROVED HYDRAULIC PIT JACK.

An improved hydraulic jack for use in drop pits is being exhibited by the Watson-Stillman Company, New York. The hand operated pump previously used has been replaced by a pump driven by a design of air engine that can be attached to any style or size of jack manufactured by this company. Air at a pressure of about 90 lbs. per sq. in. is employed and is carried from the shop air line to the pump by means of the ordinary air hose. The operating valve may be placed in any convenient position, permitting the foreman, or man in charge, to operate the lift from a point where he can conveniently direct the rest of the work. By the use of air power, the speed of operation of these jacks is very greatly increased. When it is desired to raise the saddle up to the work, air is admitted directly into the top of the reservoir, forcing the water into the cylinder and

Improved Telescopic Pit Jack.

lifting the ram at almost any desired speed. As soon as the load becomes too great for this pressure, the air is by-passed into the air engine which will then take up the work of lifting the wheels. In the jack illustrated the ram raises at a rate of 7½ in. per minute under full load, and has a capacity for 15 tons. The jacks when operated by a hand power pump have a lift of 2 in. per minute.

In the jack on exhibition the total rise is 49½ in. The ram is telescopic in two lengths, which have diameters of 3 in. and 4½ in. respectively.

RELIANCE JUNIOR JOURNAL JACK.

A 15-ton hydraulic journal jack, which weighs but 35 lbs., is being exhibited by Philip S. Justice & Co., Philadelphia, Pa. This type of jack is also made in the 25-ton size, which weighs 42 lbs. In both cases the height of the jack when closed is 10 in. and it provides for a lift of 5 in. It is raised by a lever in the usual manner, but is lowered by means of a thumb key. This key opens and closes the lowering valve which is independent of the pumping mechanism and a half turn of the key starts or stops the load at any point without jar and gives complete control over the speed or resistance of the lowering weight.

"Reliance Junior" Journal Jack.

All valves are at the bottom of the ram and thus accessible without disturbing the working part of the jack. A stuffing box is provided at the top of the cylinder for preventing the entrance of grit or other foreign matter between the cylinder and the ram, thus protecting the cylinder from being scored. The general appearance of these jacks is shown in the illustration. The 15-ton size has a base 5 in. in diameter and the 25-ton size has a base 6 in. in diameter. The total height closed and the lift are the same in both cases.

CHARCOAL IRON SUPERHEATER TUBES.

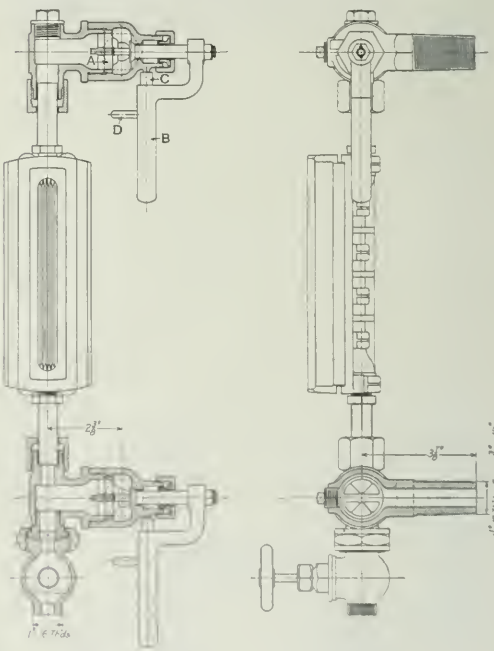
The Parkesburg Iron Company, Parkesburg, Pa., whose sole output consists of knobbled charcoal iron boiler tubes, has on exhibition a number of samples of tubing, showing the tests to which different specifications require material to conform, as well as other samples showing the ductility of the metal. Special attention is being given to the models of superheater flues and safe ended tubes. The success which has attended the use of superheaters in locomotives has influenced this company to develop their facilities for turning out the large tubes required by the Schmidt superheater more expeditiously than was formerly possible. There has been a growing demand for the best grade of charcoal iron tubes for this purpose, and charging machines have lately been installed at Parkesburg as well as additional hammers for doing the necessary swedging. The latter operation requires extreme care, or the inherent quality of the iron is likely to be damaged.

On successive orders from one company, making a total of 7,000 5½ in. and 5⅜ in. tubes swedged and swelled, only 12 have been reported as having failed in application, and no complaint has been received of those in service. On an [illegible] order only one tube failed in setting out of 352 applied. This freedom from trouble in handling would probably not be obtained with steel tubes, but it is believed [illegible] charcoal iron. After [illegible] two years' service these iron tubes are still in first-class condition, there being no evidence of corrosion or crystallization.

The sections of safe ended flues [illegible] above are [illegible] gage, the safe ends were originally 2¼ in. and drawn down under a hammer to 2 in. as they were welded to the body grade. By this process of iron to iron, it is claimed that the best weld obtainable is secured. These sections have been pulled to destruction in a testing machine, and the tensile strength obtained runs over 40,000 lbs. per square inch. The fracture occurs usually in the weld, but the weld is not pulled apart. Steel flue ends often break at the weld, and many times on the second weld from the end, and it is claimed that those who use a good iron end properly safe ended will have no trouble, and in addition to this long life will be obtained by using charcoal iron tubes, because of the non-corrosive nature of the material and its fibrous structure.

SAFETY CUT-OUT VALVE FOR WATER GAGES.

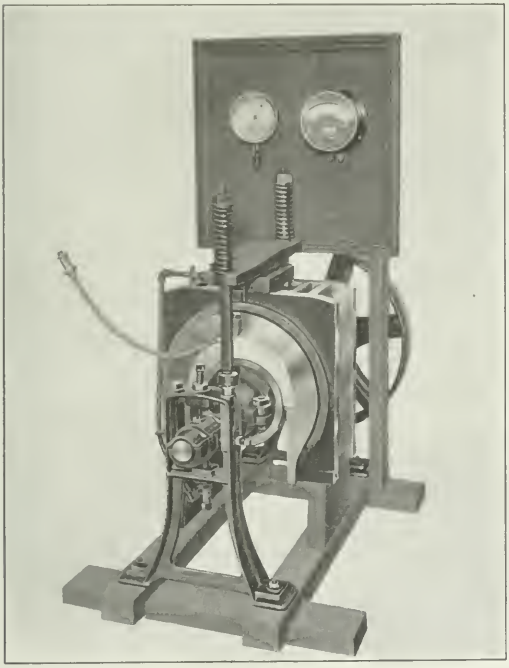
The Nathan Manufacturing Company, New York, is exhibiting a valve which will indicate by the position of its operating handle whether it is open or not, and which, it is claimed, cannot be opened by an accidental blow. This valve is shown in the illustration in connection with a reflex water gage. It consists of a rotary disc valve *A* operated by means of the handle *B*; when the handle *B* points downward the valve is open. The handle can be moved only in one direction, and when it is turned to the horizontal position the valve is closed and the handle is held rigidly by means of a spring actuated latch *C*; it cannot be moved from this position unless the latch *C* is pulled out of its socket by means of the latch pin *D*. While the engineman is occupied with the replacement of a broken glass or packing the stems of the gage, the valve cannot be moved from its closed position by any accident, and is, therefore, not only quick closing and independent of any screw motion, but is also a safety device. The valve is substantially designed to withstand hard usage.



Safety Cut-out Valve Applied to a Water Gage.

FORCE FEED LUBRICATOR.

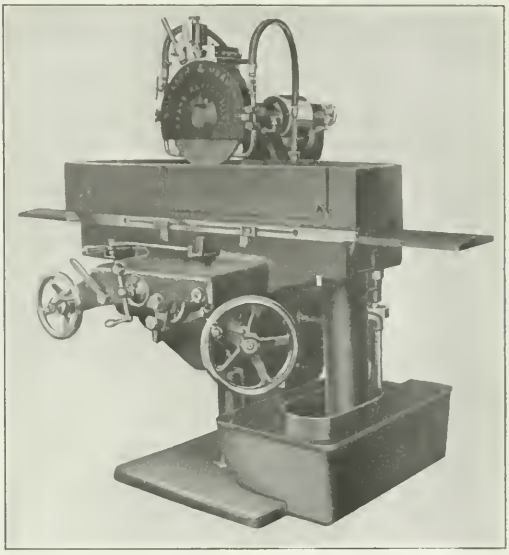
Included in the exhibit of McCord & Company, Chicago, is a locomotive lubricator which is being used to demonstrate that company's new diaphragm terminal check valve, which it is claimed will maintain a constant pressure in the oil pipe. The exhibit also includes a new type of duplex double acting pump, and machine for testing driving box lubrication. The lubricator pumps oil to the driving box shown in the illustration at a pressure indicated by the gage shown on the left of the board behind the box. The ammeter on the right of the same board indicates the current consumption in revolving the axle. A small valve is provided to relieve the pressure of oil from between the bearing and the journal when desired, and it is claimed that the ammeter has recorded as high as 23 per cent. reduction in friction between lubricating under pressure and with no pressure, using the same oil in both cases. This reduction in friction is due to increasing the thickness of the film of oil between the journal and the bearing by raising the driving box off the journal.



Machine for Testing Driving Box Lubrication.

SURFACE GRINDING MACHINE.

An improved surface grinding machine is being shown in operation by the Wilmarth & Morman Company, Grand Rapids, Mich. It is claimed that with this machine a cut of .05 in. to .07 in. can be taken without overheating. The table is provided with large water guards and has three key slots, the central one extending beyond the working surface and allowing for clamping long work. A large water tank is fitted to the base of the machine and is so arranged that it can be conveniently removed for cleaning out the sediment. A partition divides the tank into a settling basin and a pump chamber so that the pump will operate only with practically clear water. The pump is driven from a pulley on the rear of the spindle and no pump bearings are under water; the water is piped to both sides of the wheel with a convenient adjustment of the flow on either side of the wheel hood. The cross feed mechanism is fitted with an adjustable double nut for the feed screw, which makes it possible to eliminate back lash, while at the same time providing for the free working of the screw. The grinding wheel is 12 in. in diameter and the working surface of the table is 8 in. by 24 in. The longitudinal movement provided is 25 in., the transverse movement 9 in. and the vertical movement under a 12 in. wheel is 9½ in. The machine occupies a floor space 58 in. x 96 in. and weighs 2215 lbs.



Improved Surface Grinder.

LIST OF EXHIBITORS.

The exhibit space on the Million Dollar Pier has been increased to 88,222 square feet, or 4,715 more than last year. In spite of the large increases in space which have been made during the past few years, difficulty is still being found in accommodating all of those who would like to exhibit. The greater part of the increase in space this year was obtained by adding an extension 100 feet long to Machinery Hall.

Acme Supply Company, Chicago, Ill. Tuco weatherproof window model; Camel back sash rest; weatherproof window with Conwell lock; vestibule curtain outfit complete applied to wood post; vestibule curtain outfit complete applied to steel post; Steel end door; Chanarch car flooring; freight car ladders; deck sash and frames; rack curtains; improved diaphragm; apex diaphragm. Represented by H. H. Schroyer, H. U. Morton, D. Dunbar and T. K. Dunbar. Spaces 563, 567.

American Abrasive Metals Company, New York, N. Y.—Alundum; feralun; safety car steps; safety treads; safety ladder feet; wheel truing brake shoes; model stair with safety treads. Represented by H. W. Mowery and J. P. Warfel. Space 634.

American Arch Company, New York, N. Y.—Security arches; Gaines locomotive furnaces. Represented by Le Grand Parish, John P. Neff, W. L. Allison, J. T. Anthony, George Wagstaff, M. K. Tate, Chas. Coons and C. E. Miller. Spaces 412, 414.

American Balance Valve Company, Jersey Shore, Pa.—Model main valves of the slide and piston types; Walschaert valve gear model; Stevens-Wilson valve gear models. Represented

by J. T. Wilson, Frank Trump and C. C. Young. Space 383

American Brake Company, The, St. Louis, Mo.—Exhibit with the Westinghouse Air Brake Company. Represented by R. E. Adreon, and F. E. Schwentler. Spaces 19 to 29.

American Brake Shoe & Foundry Company, Mahwah, N. J.—Brake shoes and brake heads. Represented by R. M. Brower, F. H. Coolidge, J. R. Haywood, R. E. Holt, E. L. Janes, G. R. Law, W. S. McGowan, F. W. Sargent, J. S. Thompson, J. B. Terbell, L. R. Dewey, J. G. Tawse, C. P. Wright and F. L. Gordon. Space 416.

American Brass Company, Ansonia, Conn.,—Extruded brass and bronze sections applicable to car ornamentation and construction, bare and insulated copper wires; alloys for electrical and other purposes;—sheet metal; non-ferrous alloys; seamless and brazed brass and copper tubing; bronze rod for bolts; forgings or shafting; also in the forms of turbine bucket blading; die-pressed brass; bronze and copper parts; drawn copper bar; strips and special shapes for all grades of work. Represented by Wm. H. Rippere, R. S. Wildman and W. W. Cotter. Space 534.

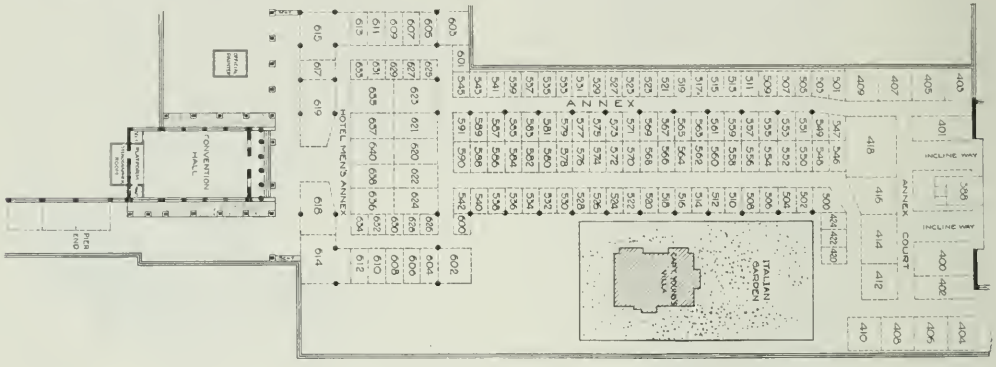
safety treads, lead and carborundum filled, steel and brass base; Mason structural steel treads; Empire safety treads; Stanwood non-slipping, self-cleaning car steps and treads; Karbolith composition car floor for steel cars, and Mason non-slipping safety ladder shoes. Represented by Henry C. King, L. H. Myrick and R. C. Davison. Space 542.

American Nut & Bolt Fastener Company, Pittsburgh, Pa.—Bartley nut and bolt fasteners. Represented by O. A. Blackburn, Robt. Spencer, Christopher Murphy and Edwin M. White. Space 322.

American Piston Company, Indianapolis, Ind.—Grapho-metal packings for pistons, air-pumps and cab valves. Represented by F. O. Fitton, V. D. Morrison and S. P. Morrison. Space 543.

American Pulley Company, The, Philadelphia, Pa.—Pressed steel pulleys for electric car lighting; pressed steel wheels for inspection and hand cars; pressed steel split pulleys for line shafting; pressed steel whole pulleys for motors and generators. Represented by Morris W. Rudderow. Space 627.

American Roll Gold Leaf Company, Providence, R. I.—XX gold,



Arrangement of Exhibit Shack at Ocean end of Pier.

American Car and Foundry Company, New York, N. Y.—Cast iron chilled wheels mounted on axles. Represented by Scott H. Blewett, Clark Dickerman, Clark D. Eaton, Wm. C. Dickerman and John McE. Ames. Space 619.

American Car & Ship Hardware Manufacturing Company, New Castle, Pa.—Bearing metals for drivers and rods; phosphorus bronze and manganese bronze castings; aluminum castings; car trimmings; babbitt metals; Babcock safety water glass protector. Represented by P. J Flaherty and F. H. Babcock. Space 182.

American Flexible Bolt Company, Pittsburgh, Pa.—Locomotive stay bolts; frog and switch bolts. Represented by C. A. Seley, J. A. Frauenheim, H. T. Frauenheim and Ethan I Dodds. Space 174.

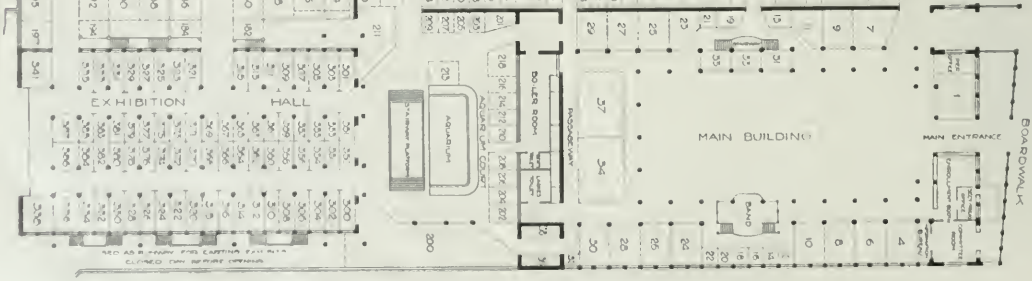
American Locomotive Company, New York, N. Y.—Reception booth. Represented by James McNaughton, J. D. Sawyer, J. E. Dixon, C. J. Donahue, H. B. Hunt, J. B Ennis, W. P. Steele and W. L. Reid. Spaces 420, 422.

American Mason Safety Tread Company, Boston, Mass.—Mason

aluminum leaf and imitation leaf in rolls; bronze; bronzing liquid. Represented by T. J. Lawler, G. E. Lawler, Chas. H. Bowers and Chas. E. Smith. Space 626.

American Steam Gauge & Valve Manufacturing Company. Boston, Mass.—New American locomotive pop safety valve; duplex air brake gages; guaranteed locomotive gages; dead weight tester; test gages; valve testing outfit; hydraulagraph; whistles, and water glass guards. Represented by R. B. Phillips, E. H. Smith, P. H. Ryan and C. A. Allen. Spaces 332, 334.

American Steel Foundries, Chicago, Ill.—The vulcan truck; Andrews side frames; cast steel bolsters; Simplex bolsters; brake beams; Davis cast steel wheels; Simplex couplers; Alliance couplers; Susemihl roller side bearings; springs; miscellaneous castings. Represented by R. P. Lamont, Geo E. Scott, R. H. Ripley, W. J. Lynch, T. D. Kelley, J. V. Bell, G. F. Slaughter, W. Ross Gravener, Geo. C. Murray, Theo. Cook, P. J. Kalman, D. T. Harris, J. W. Dalman, W. A. Blanchard, A. S. Crozier, T. H. Hopkirk, W. M. Rogovine,



Arrangement of Exhibit Shack at Boardwalk end of Pier.

P. A. Martin, M. R. Maclean, R. E. Janney, Geo. G. Floyd, I. B. Ernst, H. Blanchard, W. G. Wallace, J. W. Weinland and Louis E. Jones. Spaces 193, 195.

American Tool Works Company, The, Cincinnati, Ohio.—One 30 in. x 14 in. motor driven American lathe; 16 in. x 8 in. motor driven American tool room lathe; 6 in. American motor driven radial drill; 3 in. American motor driven radial drill; 24 in. American back geared crank shaper. Represented by R. S. Alter, C. K. Cairns, H. W. Schatz and J. C. Hussey. Spaces 103, 105, 107, 109.

American Vanadium Company, Pittsburgh, Pa.—Reception booth. Represented by W. A. Bonitz, W. J. Bird, G. L. Norris, H. C. Richardson, P. A. Bevan, G. T. Ramsey, E. W. Strong and R. B. Steele. Space 614.

Anchor Packing Company, Philadelphia, Pa.—Air pump packing; throttle packing; air pump gaskets; Tauril; high pressure gage glasses; superheat valve discs; specialties in packing. Represented by W. R. Haggart, L. E. Adams, J. B. Webb, B. J. Miller, C. M. Barnes, D. J. Murray, A. A. Rute, E. F. James, E. C. Adams, J. F. Edmunds, W. W. Waring and J. D. Maguire. Space 371.

Ashton Valve Company,, The, Boston, Mass.—Locomotive open pop and muffled safety valves; blow-off valves; locomotive steam gages; steam heat gages; air brake gages; caboose gages; inspector's test gages and testing outfits; wheel press recording gages; dead weight gage testers; rear end train and signal cocks; air pump piston swabs; locomotive whistles. Represented by Joseph W. Motherwell, Albert C. Ashton, Joseph F. Gettrust and William H. Foster. Space 506.

Automatic Ventilator Company, New York, N. Y.—Miniature car, equipped with automatic ventilators; miniature demonstrating models of the automatic ventilator; full size samples of various types of automatic ventilators for service in passenger and railway mail cars. Represented by George H. Ford, Wm. J. Fleming, Jr., Harold E. Lavelle, and Frank A. Barbey. Space 309.

Baker Brothers, Toledo, Oho—High speed heavy duty drilling machine; ball bearing gear box for heavy duty drilling machine. Represented by George E. Hallenbeck and W. W. Elliott. Space 101.

Baldwin Locomotive Works, Philadelphia, Pa.—Reception booth. Represented by Grafton Greenough, L. H. Fry, E. B. Halsey, Charles Riddell, F. W. Weston, W. R. Keys and C. H. Peterson. Space 9.

Barco Brass & Joint Company, Chicago, Ill.—Engine tender steam connection; engine air connection; engine tender water connection; round house blower sets; flexible joints for boiler washout connection; flexible joints for general purposes; flexible joints for car connection. Represented by F. N. Bard and Lesley W. Millar. Space 609.

Baush Machine Tool Company, Springfield, Mass.—One 6-foot heavy geared radial drill; automatic staybolt drilling machine. Represented by Walter H. Foster. Space 115, 117.

Berry Brothers, Detroit, Mich.—Finished panels of wood and iron; samples of raw material; a demonstration of spar varnish. Represented by D. W. Moreland, W. E. Paye and Jas. S. Stevenson. Space 378, 380.

Besly & Company, Charles H., Chicago, Ill.—No. 51-26-L motor driven Besly disc grinder; No. 15-30-C Besly pattern maker's disc grinder; Helmet temper taps, spiral circles and oil; display case of Helmet temper taps; samples of work done on Besly disc grinder. Represented by Edw. P. Welles, Chas. A. Knill and Wm. H. Allen. Space 148, 150.

Best, W. N., New York, N. Y.—Oil and tar burners for locomotive, marine and stationary boilers, also for furnaces of various types and sizes; portable furnace for welding locomotive frames; heating rails for bending; portable furnaces for raising steam when testing boilers in boiler shop, for firing up locomotives to set the pops, etc. Represented by B. F. Mears. Space 300.

Bettendorf Company, The, Bettendorf, Iowa.—One Bettendorf 50-ton box car underframe as furnished for Harriman Lines equipment; one Bettendorf 40-ton box car underframe as furnished for C. M. & St. P. equipment; one Bettendorf truck for dismantling purposes; one new design Bettendorf 70-ton truck; one set of trucks with variable load brake. Represented by J. W. Bettendorf, J. H. Bendixen, A. F. Macpherson, F. K. Shults, E. E. Silk, J. G. Hope, Peter P. Beck, C. J. W. Clasen, W. G. Ransom and E. J. Bettendorf. Space 200.

Bird-Archer Company, New York, N. Y.—Boiler compound. Space at end of pier.

Blackall, Robert H., Pittsburgh, Pa.—Blackall ratchet brake lever; improved Lindstrom ratchet brake lever; Lindstrom ratchet brake lever; new hand brake installations on all types of freight and passenger equipment, assisting to comply with the requirements and regulations of the Interstate Commerce Commission. Represented by Robert H. Blackall and E. Emery. Space 502.

Boker & Company, Hermann, New York, N. Y.—Tool steel. Space 541.

Bowser & Company, Inc., S. F., Ft. Wayne, Ind.—Complete gasoline and oil storage equipment, consisting of long distance and first floor self-measuring pumps and storage tanks; "Red Sentry" enclosed long distance pump with electric lamp attachment; complete oil filtering system; self-registering pipe line measures. Represented by W. T. Simpson, F. T. Hyndman and E. H. Barnes. Space 30.

Brown Automatic Connector Company, Chattanooga, Tenn.—Brown automatic steam air and signal connector. Represented by M. A. Brown. Space 404.

Brown & Company, Tom, Chicago, Ill.—Sectional and roller flue expanders; Lovejoy frictionless roller flue expanders; improved flue cutter; drop forged beading tools; 50-ton high speed and 25-ton journal jacks. Represented by Harry W. Stannard. Space 587.

Brubaker & Brothers, W. L., Millersburg, Pa.—Hand, nut, staybolt, spindle, tapper, boiler, hob, washout, patch bolt and pipe taps; square and hexagon bolt dies; end mills; all styles of reamers both carbon and high speed steel. Represented by J. A. W. Brubaker, W. S. Rose and F. E. Harrison. Space 554.

Buckeye Steel Castings Company, The, Columbus, Ohio.—50-ton car truck complete with "Buckeye" cast steel truck; bolsters and "Buckeye" cast steel truck frames (channel sections); Buckeye cast steel truck bolsters; Major top lift and under lift couplers; cast steel M. C. B. journal boxes; cast steel key-connected draft yokes; freight car truck for M. C. B. committee on brake beams. Represented by S. P. Bush, J. C. Whitridge, C. B. Goodspeed, Geo. Groobey; Geo. T. Johnson and J. G. Bower. Space 603, 605.

Buda Company, The, Chicago, Ill.—Railway motor section cars; electric shop trucks; electric headlights; automobile motors; ball bearing jacks; cone bearing jacks; "Hyduty" new style Paulus track drill; "Hyduty" Wilson bonding drill. Represented by Mark A. Ross, H. P. Bayley, W. Krause, T. H. Wheeler and N. C. Study. Space 178, 180.

Buffalo Brake Beam Company, New York, N. Y.—Buffalo passenger brake beams for all classes of service including P. C. and L. N. equipment, with adjustable, automatically adjustable, and rigid heads; Buffalo freight brake beams for all classes and capacity of equipment, including E. & L. Beams for all classes and capacity of tenders and electrical equipment, for standard, broad and narrow gage. Represented by S. A. Crone, E. Strassburger, T. E. Carliss, R. C. Fraser and O. W. Meissner. Space 552, 553.

Buffalo Foundry & Machine Company, Buffalo, N. Y.—Gun iron castings; Bell steam hammers; vacuum pumps; vacuum drying and impregnating apparatus; photographs. Represented by E. G. Rippell, H. D. Miles, David Bell and E. G. Sleeper. Space 37.

Bullard Machine Tool Company, The, Bridgeport, Conn.—Thirty-six inch vertical turret lathe, new era type, in operation; unit details of construction showing continuous flow system of lubrication; test samples of crucible chrome nickel steel used in construction. Represented by S. H. Bullard, J. W. Bray, R. H. Snider, J. H. Van Yorx, F. B. Smith, W. B. Price and Geo. E. Merryweather. Space 111, 113.

Burden Sales Company, New York, N. Y.—Staybolt and engine bolt iron; refined iron and iron rivets. Represented by G. H. Pearsall and F. H. Gardner. Space 338.

Burroughs Adding Machine Company, Detroit, Mich.—Burroughs adding, listing and calculating machines. Represented by F. A. Willard and D. Lesseig. Space 568, 569.

Buyers Index Company, Chicago, Ill.—Publication, Railway Supply Index-Catalogue. Represented by N. F. Rehm, D. J. Beaton and C. W. Cozzens. Space 628.

Camel Company, Chicago, Ill.—No. 27 door for plain box cars; No. 27 door for double door automobile cars; No. 30 door for inside sheathed steel superstructure plain box cars; forked angle carlines; forked "I"-beam carlines; burglar-proof bottom door guides; N. R. S. hose bands. Represented by J. M. Hopkins, A. B. Wegener, J. F. Comee, and P. M. Elliott. Space 523, 525.

Carborundum Company, The, Niagara Falls, N. Y.—Carborundum and Aloxite wheels; Carborundum brand garnet paper; Aloxite cloth. Represented by R. S. Marvin, C. C. Schumaker, C. C. Lathrop, W. W. Sanderson and R. H. Hogg. Space 191.

Carey Company, Philip, The, Cincinnati, Ohio.—Magnesia and asbestos products; pipe covering; car insulation; roofing; deco veneer for wainscoting interior trim, etc. Represented by Allan Wallace, D. R. Warfield, N. S. Kenny and P. A. Johnston. Space 555.

Carnegie Steel Company, Pittsburgh, Pa.—Schoen solid steel wheels; freight car wheels with standard and large hub; slick gear blanks; heat treated axles; steel sheet piling; steel cross ties and Duquesne joints; vanadium steel for railway

service: stereopticon photographs of manufacturing processes and installations. Represented by John C. Neale, W. G. Clyde, I. W. Jenks, John McLeod, R. B. Woodworth, V. S. Yarnall, N. B. Trist, G. F. Goddard, J. C. Neubauer, H. W. Summers, W. N. Jeffress, C. B. Friday, H. L. Baker, W. L. Allen and J. H. McAlarney. Space 418, 546, 547.

Chase & Company, L. C., Boston, Mass.—Mohair car plush in plain and frieze. Friezette in variety of patterns. Chase leather for car-seat coverings and curtains. Plain and Spanish imitation leather. Represented by W. P. Underhill and H. T. Wight. Space 10.

Chicago Car Heating Company, Chicago, Ill.—Vapor system of car heating, steam heat and hot water system specialties. Represented by Egbert H. Gold, Jos. E. Buker, B. A. Keeler, George T. Cooke, Roswell P. Cooley, Jos. Frumveller, E. E. Smith, Elmer W. Rietz, James R. Reniff, F. F. Coggin and Edward A. Schreiber. Space 212, 214, 216, 218.

Chicago Pneumatic Tool Company, Chicago, Ill.—Chicago pneumatic air compressor; pneumatic hammers, drills, rivet busters, etc.; portable electric drills and grinders. Represented by W. O. Duntley, C. E. Walker, W. P. Pressinger, Thomas Aldcorn, J. C. Campbell, J. W. McCabe, C. B. Coates and Edw. Aplin. Space 618.

Chicago Railway Equipment Company, Chicago, Ill.—Brake beams of the "PC" Creco, "EL" Creco, Diamond Special, Diamond, Drexel, National Hollow, Kewanee, Reliance, Sterlingworth, Ninety-six, Monarch, and special types; Monitor bolsters; Creco roller side bearings; brake slack adjuster; automatically adjustable brake head; semi-adjustable brake head; removable leg brake head; Creco sliding third point support and safety device; reversible and duplex brake beam struts. Represented by E. B. Leigh, Arthur Wyman, F. T. De Long, G. N. Van Sweringen, E. A. Le Beau, R. H. Pilson, R. J. Sheridan, Ralph M. Wiggin, C. A. Maher and C. H. Williams, Jr. Space 635.

Chicago Varnish Company, Chicago, Ill.—Panels showing the "Ce Ve" process of a quick and reliable manner of painting cars and engines. Represented by Geo. S. Bigelow, A. C. Morgan, O. H. Morgan, R. K. Buckman, Jr., F. N. Gundrum, Jr., and F. L. Olds. Space 572, 573.

Cincinnati Bickford Tool Company, The, Cincinnati, Ohio.—One 6-foot Cincinnati Bickford high speed, high power, plain radial drill; one 28-inch Cincinnati high speed shaft driven upright drill with tapping attachment. Represented by Sherman C. Schauer, H. M. Norris and Lee Schauer. Space 100.

Cincinnati Planer Company, The, Cincinnati, Ohio.—One 36 in. x 36 in. x 8 in. new heavy pattern, reversible motor driven planer with four heads. Represented by B. B. Quillen, Charles Meiers and George Langen, Jr. Space 100.

Coe Manufacturing Company, W. H., Providence, R. I.—Coe's ribbon gold leaf and Coe's gilding wheels. Represented by E. J. Arlein, B. A. Smith and S. H. Swallow. Space 633.

Collins Metallic Packing Company, Philadelphia, Pa.—Collins wheel flange lubricator; Collins metallic packing. Represented by J. Geo. Wholey, Michael Collins and James F. Lennon. Space 364.

Commercial Acetylene Railway Light & Signal Company, New York, N. Y.—Equipments for acetylene railroad signaling; acetylene headlights, car lighting, boat lighting, marine lighting and acetylene welding. Represented by C. E. Lee, D. Ahldin, O. F. Ostby, E. T. Sawyer, H. G. Doran, C. A. McCune and R. J. Faure. Space 201, 203, 205, 207, 209.

Commonwealth Steel Company, St. Louis, Mo.—Photographs, printed matter, blue-prints and other illustrations of Commonwealth devices. Represented by Harry M. Pflager, Geo. E. Howard, Poone V. H. Johnson, Chas. S. Shallenberger and Wm. P. Stout. Space 313, 315.

Consolidated Car Heating Company, Albany, N. Y.—Packless steam specialties; sylphon diaphragms; single and twin vapor traps; single and twin admission valves; quick opening end valves; automatic lock couplers; electric heaters and switches for 600 and 1,800 volts; door operators. Represented by C. C. Nuckols, Thos. Farmer, Jr., W. S. Hammond, Jr., C. V. Martin, H. Hawley and Butler Keys. Space 189.

Cooper Hewitt Electric Company, Hoboken, N. J.—Cooper Hewitt electric lamps; Cooper Hewitt quartz lamps; Cooper Hewitt [illegible] operating direct current Cooper Hewitt lamps. Represented by E. M. Haviland and M. B. Buckrath, Jr. Space [illegible]

Crane Company, Chicago, Ill.—Locomotive pop safety valves, [illegible] locomotive ash pan blower [illegible] Crane [illegible] Crane tilt steam traps; Crane [illegible] pressure. Represented by F. D. [illegible] G. S. Tuttle. Space 582, 584.

Cresinit, Jr., [illegible] Scranton, Pa.—Extension car step. Represented by [illegible] and George F. Taylor. Space 326.

[illegible] & Valve Company, Boston, Mass.—Railroad appliances for locomotives. Represented by M. D. Johnson. Space 630.

Curtain Supply Company, The, Chicago, Ill.—Curtain fixtures, including ring 88 curtain fixtures with conductor's ticket or check holder; Rex all-metal curtain roller; Rex steel vestibule curtain roller; Rex vestibule curtain release handle; Rex vestibule curtain opening shield; Rex steel sash balance showing both cable and chain attachments; Rex vestibule curtain opening shield; No. 6 vestibule curtain hook; No. 6 vestibule curtain handle; No. 10 vestibule curtain release handle; Standard 6-plait diaphragm; 6-plait apex diaphragm; opening plait diaphragm; new type of C. S. Co. fireproof diaphragm. Represented by W. H. Forsyth, R. F. Hayes, S. W. Midgley, F. M. Egolf and George E. Fox. Space 638.

Damascus Brake Beam Company, The, Cleveland, Ohio.—High speed passenger brake beams; solid and truss type of brake beams; forged steel fulcrums; adjustable heads. Represented by Albert Waycott. Space 539.

Davis Boring Tool Company, St. Louis, Mo.—Davis expansion car wheel boring tools in four different styles; Davis expansion boring tools for turret lathes and turret boring mills; Davis expansion boring tools for boring driving box brasses, connecting rods, eccentrics, wheel centers, etc. Represented by Emery E. Davis, J. W. McKeen and Theo. Rowe. Space 153.

Dearborn Chemical Company, Chicago, Ill.—Scientific treatment for locomotive boiler waters, prepared to suit conditions shown by analyses of the waters, to prevent foaming, scale, leaking, corrosion, etc. Represented by Robert F. Carr, J. D. Purcell, G. W. Spear, A. W. Crouch, J. F. Franey, J. H. Cooper and H. G. McConnaughy. Space 6, 8.

DeForest Sheet and Tinplate Company, The, Niles, Ohio.—DeForest best bloom galvanized; metal fence posts; Lohmannized sheet steel; convolute reinforcement; locomotive jacket steel; nestable corrugated galvanized culverts; cluster metal shingles; tank steel; corrugated roofing. Represented by Wade A. Taylor and Edward D. Thompson. Space 307.

Detroit Hoist & Machine Company, Detroit, Mich.—Pneumatic and electric turntable tractors; pneumatic and electric hoists; pneumatic motors. Represented by J. C. Fleming and F. B. Fleming. Space 155.

Detroit Lubricator Company, Detroit, Mich.—Bullseye locomotive lubricators; air cylinder lubricators; air pump lubricators; transfer fillers; boiler valves; balanced throttle valves; mechanical force feed oilers; flange lubricators. Represented by F. W. Hodges and A. D. Homard. Space 637.

Diamond Specialty & Supply Company, Philadelphia, Pa.—Watertown automatic cylinder drain cocks; Watertown safety water gages; Watertown safety squirt hose device; Steinbrunn boring bar; Jena water gage and other glasses; Mauger type reflex water gages. Represented by W. M. Wills, A. D. Austin, T. R. Hood, L. deL. Berg and C. E. Miser. Space 320.

Dickinson, Inc., Paul, Chicago, Ill.—Cast-iron and fire-proofed wood smoke jacks; cast-iron and galvanized iron ventilators; cast-iron chimneys. Represented by A. J. Filkins and J. A. Meaden. Space 213.

Dieter Nut Company, New York, N. Y.—D. S. safety nuts. Represented by P. W. Dieter and H. L. Winslow. Space 4.

Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite products specially prepared for railway use; Dixon silica-graphite paint; air brake graphite and graphite greases; lubricating graphite; crucibles; belt dressing; graphite brushes; boiler graphite; pipe joint compound; engine front finish; both dry and liquid. Represented by H. A. Nealley, J. A. Tucker, Wm. Houston, H. W. Chase and L. H. Snyder. Space 24.

Draper Manufacturing Company, The, Port Huron, Mich.—Draper improved pneumatic tube welding machine; pneumatic turn-table motor; Draper improved ball finishing tools for repairing superheater ball joints; valve facing tools; ball check valves. Represented by Thomas Draper. Space 310.

Duff Manufacturing Company, The, Pittsburgh, Pa.—Genuine Barrett track and automatic lowering jacks; Duff ball bearing screw jacks; Duff high speed screw jacks; Duff Bethlehem forged steel hydraulic jacks. Represented by T. A. McGinley, E. A. Johnson and C. A. Methfessel. Space 401.

DuPont de Nemours Powder Company, E. I., Wilmington, Del.—Fabrikoid artificial leather for upholstery; vestibule curtain material; car curtain material. Represented by J. K. Rodgers and C. Hallock Selkman. Space 504.

Eagle Glass & Manufacturing Company, Wellsburg, W. Va.—Oilers, torches, supply cans and grease buckets for railroad and contractors' use. Represented by J. L. Fusner and S. A. Paull. Space 600.

F. D. E. Company, Chicago, Ills.—Flaxlinum insulation for refrigerator cars, steel passenger equipment, ice-houses,

etc.; deafening for bridges, buildings, tracks, etc.; ventilator for refrigerator cars. Represented by Frank M. Gilmore. Space 11, 13.

Edison Storage Battery Company, Orange, N. J.—Edison storage batteries for car lighting, operation of railway signals, telephone train dispatching, ignition, and stationary lighting, and for operation of industrial and baggage trucks. Represented by R. A. Bachman, W. G. Bee, H. G. Thompson, F. V. McGinness, C. A. Luckey and O. Hildebrandt. Space 636.

Edwards Company, Inc., The O. M., Syracuse, N. Y.—Window fixtures for steel and wood equipment; trap doors and fixtures for steel and wood equipment; all metal shade rollers and sash balances; railway padlocks. Represented by O. M. Edwards, E. F. Chaffee, C. H. Rockwell, W. C. Bradbury and T. P. O'Brian. Space 620.

Electric Controller & Manufacturing Company, The, New York, N. Y.—Lifting magnet in operation; automatic motor starters; automatic controllers; reversing planer drive; drum controllers; solenoid brakes, etc. Represented by R. G. Widdows, E. C. Ryan and W. C. Jackson. Space 160, 162, 164.

Electric Storage Battery Company, The, Philadelphia, Pa.—Various types and accessories of storage battery cells for car lighting, signal, vehicle and automobile self starting service. Represented by Charles Blizard, E. L. Reynolds, F. L. Kellogg, J. L. Woodbridge, F. G. Beetem and H. E. Hunt. Space 607.

Elwell-Parker Electric Company, The, New York, N. Y.—Drop frame type electric storage battery baggage truck; freight car type electric storage battery truck; industrial type electric storage battery truck. Represented by Lucian C. Brown and George W. Brown. Space 341.

Emery Pneumatic Lubricator Company, The, St. Louis, Mo.—Pneumatic Lubricators and Lubricant; The Emery brake cylinder lubricant. Represented by E. A. Emery, H. C. Miller and G. L. Janis. Space 373.

Equipment Improvement Company, New York, N. Y.—Markel removable driving box brasses; flangeless shoes and wedges; solid main rod ends; lateral motion plates and perfection box car door guide and seal. Represented by W. E. Weatherly and O. J. Jensen. Space 33.

Eveland Engineering & Manufacturing Company, Philadelphia, Pa.—Eveland electric riveters; consisting of one motor driven electric riveter; one universal electric riveter; one portable electric riveter and one small bench electric riveter. Represented by S. S. Eveland, H. F. Martin, Howard Engard, Frank Nunn and E. C. Hawley. Space 304.

Fastnut, L'td., London, England.—Fastnut washers and wrenches. Represented by W. H. Cook. Space back of 190.

Federal Engineering Company, The, Wilmington, Del.—Barrett duplex closed and ventilated freight car door. Represented by Howard L. Pyle and Frank F. Slocomb. Space 531.

Flannery Bolt Company, Pittsburgh, Pa.—Tate flexible staybolts; adjustable crown staybolts; flush flexible staybolts; installation tools for applying Tate flexible staybolts; F. B. C. arch bar and column bolt nut locks. Represented by J. Rogers Flannery, B. E. D. Stafford, Tom R. Davis, W. M. Wilson, George E. Howard, James J. Flannery, Thomas J. Leahey and Barton H. Grundy. Space 590, 591.

Forged Steel Wheel Company, Pittsburgh, Pa.—Various types of solid wrought steel wheels for freight car, engine truck, tender truck and passenger train car services of steam railroads. Sections cut therefrom to demonstrate the quality of material and workmanship. Represented by J. B. Brady, R. L. Gordon, J. P. Rapp, C. G. Bacon, H. G. Macdonald and W. A. Libkeman. Space 558.

Fort Pitt Malleable Iron Company, Pittsburgh, Pa.—Reception booth. Represented by Frank J. Lanahan. Space 538.

Franklin Railway Supply Company, New York, N. Y.—Franklin pneumatic fire door; power grate shaker; water joint; strainer valve; ball joint; "K" lock nut. Represented by Samuel G. Allen, W. L. Allison, R. G. Coburn, J. S. Coffin, C. W. F. Coffin, W. H. Coyle, A. G. Elvin, J. L. Mohun and S. D. Rosenfelt. Space 412, 414.

Frost Railway Supply Company, The, Detroit, Mich.—Harvey friction spring gears; Detroit metal weather strip. Represented by Harry W. Frost, George A. Cooper and George L. Harvey. Space 560.

Galena-Signal Oil Company, Franklin, Pa.—Reception booth. Represented by S. A. Megeath, C. C. Steinbrenner, E. H. Baker, Colonel B. H. Grundy, F. A. Guild, J. E. Hall, William Holmes, Robert McVicar, W. A. McWhorter, George L. Morton, W. A. Truhee, W. J. Walsh, E. V. Sedgwick, H. Hillyer, J. G. Arn, J. W. Bunn, B. P. Corey, J. S. Brown, Colonel E. W. Grieves, E. W. Hayes, D. L. Eubank, E. G. Johnson, G. E. McVicar, C. B. Royal, L. H. Palmer, J. C. Sibley, Jr., F. B. Smith, W. O. Taylor, W. F. Walsh, R. E. Webb and J. A. Whalen. Space 34.

Garlock Packing Company, The, Palmyra, N. Y.—Garlock fibrous and metal packings. Represented by H. N. Winner, J. P. Lamdreth, Phil Arnold, T. P. Dunham, W. F. Girten and L. P. Duggan. Space 520.

General Electric Company, Schenectady, N. Y.—Electric locomotive on the track at Mississippi Ave.; on Young's Pier, standard electric equipment for railway shops and service; reversing electric motor planer drive equipment; car wheel lathe control panel; arc welding outfit; five types of motors; three types of flow meters; battery truck crane; type "W" and Mazda lamps; headlights for urban and interurban railway service; Curtis turbo-generator train lighting set; Pullman type tan motors. Represented by C. E. Barry, R. S. Bennett, B. F. Bilsland, W. J. Clark, C. Fair, F. H. Gale, J. W. Ham, J. M. Hollister, W. O. Kellogg, C. B. Keyes, E. E. Kimball, C. D. Knight, R. E. Moore, C. C. Pierce, C. A. Raymond, Frank Rhea, J. Seede, L. W. Shugg, J. O. Weatherbie and R. E. Wooley. Space 350 to 363.

General Railway Supply Company, Chicago, Ill.—Metallic steel sheathing; Resisto insulation; National steel trap door and lifting device; Flexolith composition flooring; National vestibule curtain catches; Eclipse deck sash ratchets; Perfection sash balance; Reliance sash balance; Nation standard roofing; Imperial car window screens. Represented by F. L. Wells, H. U. Morton, W. S. Humes, J. F. Oelerich. Space 564, 565.

Gilbert & Barker Manufacturing Company, Springfield, Mass.—Self-measuring pumps; oil storage systems for railroads; signal oil tanks; lubricating tanks; saturating waste tanks; underground storage systems; gas and oil furnaces. Represented by C. F. Hatmaker. Space 333, 335.

Gold Car Heating Lighting Company, New York, N. Y.—Combination pressure and vapor system; straight vapor system; straight steam system; thermostatic temperature control; wedge lock couplers; pressure regulators; steam traps; quick opening valves; electric heaters; cyclone ventilators; curtain window ventilators, etc. Represented by Edward E. Gold, E. B. Wilson, A. B. Strange, W. H. Stocks, G. F. Ivers, J. M. Stayman, F. A. Purdy, F. O. Bailey, E. J. Ronan, F. H. Smith, A. D. Sturver, J. O. Brumbaugh and F. T. Kitchen. Space 301, 303, 305.

Goldschmidt Thermit Company, New York, N. Y.—All materials and appliances used in welding locomotive frames, driving wheel spokes, connecting rods, mud rings, crossheads and for general repairs in a railroad shop. Metal and alloys free from carbon, particularly samples of ferro-titanium to purify and improve the quality of iron and steel. Materials for welding pipe by the Thermit process. Samples of Thermit, ignition powder and sample welds made by the process on locomotive frame sections, pipe, rails, etc. Represented by William C. Cuntz, F. C. Cohen, H. S. Mann, W. R. Hulbert, H. D. Kelley, William Aldrich and J. G. McCarty. Space 602.

Goodyear Tire & Rubber Company, The, Akron, Ohio—Balata belting; packing; valves; flexible metallic hose; tiling; miscellaneous rubber products. Represented by I. R. Bailey, F. J. Blake, A. N. Canfield, G. D. Pilgrim, L. H. Conger, C. A. Jones and D. R. Burr. Space 28.

Gould & Eberhardt, Newark, N. J.—New 28 inch Invincible shaper embodying many new features with direct connected variable speed electric motor with automatic starter and dynamic brake; 12 inch high duty gear hobbing machine with electric motor drive. Machine will be operated and spiral gears for air brake compressors will be cut on it. A sectional frame of a 16 inch high duty shaper showing inside construction and arrangement of gearing, etc. Represented by H. Ezra Eberhardt and Charles L. Cameron. Space 131.

Gould Coupler Company, New York, N. Y.—Gould simplex system electric car lighting; storage battery; malleable iron journal boxes; freight car couplers; passenger couplers; friction draft gears; cast steel bolsters; cast steel side frames; coupler yokes; Arnold journal box lid. Represented by F. P. Huntley, Geo. G. Milne, W. F. Richards, Dr. C. W. Gould, Clarence E. Rood, Col. Jno. T. Dickinson and Geo. R. Berger. Space 608, 610, 612.

Greene, Tweed & Company, New York, N. Y.—Palmetto packing in braided form for high steam pressures; in twist form for small globe valves, etc.; in sets for Westinghouse and New York duplex air pumps and in sets for locomotive throttle service. Manhattan packing for hydraulic pressures. Favorite reversible ratchet wrench. Represented by L. J. Van De Wall and A. J. Richardson. Space 32.

Greenlaw Manufacturing Company, The, Boston, Mass.—Flexible metallic ball and rotary joints for steam, air or liquids; flexible metallic connections for steam, oil, or air between engine and tender and for steam or air between cars. Represented by H. A. Royce and A. L. Greenlaw. Space 316, 318.

Griffin Wheel Company, Chicago, Ill.—Car wheels for all

classes of service. Represented by C. P. Dennett, C. K. Knickerbocker, H. N. Scott, W. A. Bennett, A. A. Hale and G. D. Casgrain. Space 163, 165.

Grip Nut Company, Chicago, Ill.—Grip nuts; Curran rivet bolts; Jatz door hangers and fasteners. Represented by E. R. Hibbard, J. W. Hibbard, W. E. Sharp, Howard Hibbard, Clif Beaumont and B. C. Hooper. Space 576, 577.

Hale & Kilburn Company, Philadelphia, Pa.—Walkover car seats; reclining car chairs; parlor car chairs; steel car interior finish; steel passenger, baggage and mail car doors; steel passenger car sash; steel mouldings; woven rattan for car seating. Represented by V. von Schlegell, J. G. Bower, A. F. Old, C. W. Laskay, W. F. Cutler, F. F. Robb, F. C. Edson and R. H. Pilson. Space 408, 410.

Hammett, H. G., Troy, N. Y.—Trojan metallic packing; Trojan pneumatic bell ringer; triple valve bushing roller. Represented by H. G. Hammett, E. C. Sawyer and A. O. Van Dervort. Space 424.

Hardy Paint & Varnish Company, Toledo, Ohio.—New System of railroad enamels. Represented by C. J. Pilliod. Space 516.

Harrington, Son & Company, Edwin, Inc., Philadelphia, Pa.—Overhead I-beam track; switch and turntable; peerless hoist; screw hoist; plain and geared travelers to operate on lower flange of I-beam; one 16-32-inch extension bed gap lathe, belt driven. Represented by Roger Sherron, A. M. Harrington, W. J. Somerset and M. W. Christian. Space 149, 151.

Hartshorn Company, Stewart, East Newark, N. J.—Spring rollers for car and vestibule curtains and sash balances. Represented by B. E. Bushnell. Space 515.

Heppenstall Forge & Knife Company, Pittsburgh, Pa.—Pressed driving axles; hammered driving axles; shear knives and die blocks. Represented by L. H. Bowman and E. H. Graham. Space 187.

Hewitt, H. H., New York, N. Y.—Articulated car truck, Model A; articulated tender truck, Model B; articulated car truck and body bolster, showing method of mounting car on trucks without center plates or side bearings; model of steel underframe mounted on articulated car trucks without center plates or side bearings; model of articulated car truck, Model A; model of articulated tender truck, Model B. A hopper car of 100,000 lbs. capacity, mounted on articulated car trucks without center plates or side bearings, will be shown on P. & R. siding at Mississippi Ave. Represented by Samuel J. Sill. Space 177, 179, 181.

Hewitt Rubber Company, New York, N. Y.—Air brake hose, special, mounted with sleeve couplings; air brake hose, M. C. B. standard; air tool hose; steam heat hose; tank hose; washout hose; tiling and matting; sheet packing; rubber belting; crude rubber. Represented by T. D. Hogan and C. M. Bower. Space 183.

Heywood Brothers and Wakefield Company, Wakefield, Mass.—Pressed steel car seats; lined and unlined rattan car seat webbing. Represented by E. C. Lang, Bertram Berry and Scot Wade. Space 588, 589.

Hobart-Allfree Company, The, Chicago, Ill.—Working model—One-quarter size miniature locomotive without boiler, showing piston valve cylinders with compression valves, one side equipped with a Walschaert valve gear, the other side with a Baker valve gear. Sections of the cylinders cut away to show working of the valves. One-eighth size working models piston valve cylinders with compression valves. Represented by W. H. England, F. H. Allfree, F. R. Cooper and B. F. Hobart. Spaces 510, 512.

Hunt-Spiller Manufacturing Corporation, South Boston, Mass.—Hunt-Spiller gun iron in the form of cylinder packing, valve packing, piston heads, eccentrics, side rod bushings, air pump bushings, cylinder bushings, valve bushings, crosshead shoes, eccentric straps, knuckle bushings, air pump packing, driving boxes. Represented by W. B. Leach, F. M. Weymouth, J. G. Platt, A. B. Root, Jr., V. W. Ellet, J. M. Monroe and Frederic Parker. Space 514, 517, 562, 563.

Hutchins Car Roofing Company, Detroit, Mich.—Large half tone picture of Hutchins improved all-steel steel carline roofs. Represented by F. N. Whyte, D. W. Hawksworth, A. R. Wilson, Carter Blatchford and W. D. Thompson. Space 533.

Illinois Steel Company, Chicago, Ill.—Rails; axles; tie plates; base plates; special rail joints, angle bars; spikes; screw spikes, bolts, structural shapes; plates; merchant bar mill material. Represented by D. F. Sawyer and O. H. Baker. Space 418, 546, 547.

Independent Pneumatic Tool Company, Chicago, Ill.—Thor piston air drills, reversible and non-reversible, for flue rolling, reaming, tapping, wood boring, setting locomotive tires, drilling; also quarter drills for drilling, reaming and tapping in close corners; pneumatic grinders for grinding and buffing; one-piece pneumatic riveting hammers; chipping, calking and flue beading hammers; pneumatic staybolt drivers; holders on; hose; couplings and Thor electric drills. Represented by James B. Brady, John D. Hurley, H. F. Finney, George A. Gallinger, John P. Bourke, H. F. Charabono, R. S. Cooper, Walter A. Johnson, Vernon Job, George J. Lynch, C. B. Ross, R. T. Scott, George C. Wilson, F. J. Passino, H. H. Hendricks, W. R. Gummere, F. W. Buchanan and R. A. Norling. Space 583, 585.

Inter-locking Rail & Structural Steel Copmnay, The, Chicago, Ill.—Interlocking rail joint. Represented by H. C. Farson, Jr., F. A. Bross, J. F. Barnhill, C. V. Mead and W. H. Lienesch. Space 374.

International Oxygen Company, New York, N. Y.—I. O. C. system oxygen and hydrogen producing equipment, consisting of 4 I. O. C. cells improved, and electrical equipment; capacity of plant 12 cu. ft. of oxygen and 24 cu. ft. of hydrogen per hour, consuming 8.8 volts by 400 amperes. Purity of oxygen above 99 per cent., hydrogen 99.8 per cent. Represented by E. W. Irwin, A. A. Heller, H. L. Barnitz, I. H. Levin and P. J. Kroll. Space 192.

Jacobs-Shupert U. S. Firebox Company, New York, N. Y.—In booth photographs and literature. On track at Mississippi Avenue, two boilers used for tests at Coatesville, Pa., in demonstrations in 1912. Represented by G. H. Pearsall, C. B. Moore and A. W. Whitford. Space 338.

Jenkins Bros, New York, N. Y.—Brass and iron body globe, angle and gate valves; horizontal, vertical and swing check valves; gate, globe and angle hose valves; steel valves for superheat; traps and gage cocks; "Y" valves for roundhouse and water service; radiator valves; reducing valves; sheet packing, pump valves, gasket tubing and mechanical rubber goods; steam hose gaskets and air discs. Represented by Alfred Engle, B. J. Neely and C. B. Yardley, Jr. Space 604, 606.

Jerguson Manufacturing Company, The, Boston, Mass.—Wiltbonco-style "W" water gages and other Wiltbonco specialties. Represented by Geo. L. Huntress, Jr., and Herbert M. Waters. Space 370.

Jessop & Son, Inc., Wm., New York, N. Y.—Samples of steel; tools manufactured from Jessops steel:—finished saws and saws in the rough; fractures. Represented by John E. Sandmeyer. Space 402.

Johns-Manville Company, H. W., New York, N. Y.—Steel car insulations; pipe coverings; boiler laggings; asbestos materials; moulded and electrical materials; electrical fibre conduit; asbestos shingles; waterproofing; mastic; fire extinguishers; asbestos and regal roofing; packings; brake cylinder expander rings; flexible armored hose; cork; refrigerator car insulation; high temperature and insulating cements; asbestos wood; smoke jacks. Represented by J. E. Meek, J. C. Younglove, G. A. Nicol, P. C. Jacobs, F. J. Horne, J. H. Trent, R. A. Hamaker, H. G. Newman and Geo. Christenson. Space 574, 575.

Joliet Railway Supply Company, Chicago, Ill.—Huntoon L. N. passenger beams with adjustable heads; Huntoon M. C. B. freight beams; Perry side bearings; Joliet roller bearings; types A. B. and C. Hartman centre plates; truck bolster with Hartman centre plates and Perry and Joliet roller bearing. Represented by E. A. Laughlin, C. F. Huntoon, R. F. Schultz, Jos. F. Leonard and F. A. Lester. Space 325.

Jones & Laughlin Steel Company, Pittsburgh, Pa.—Railroad spikes; chain; steel sheet piling. Represented by Roland Gerry, Robert Geddis, J. K. Barker, Frank S. Slocum, G. B. Mitchell and other representatives. Space 407.

Joyce-Cridland Company, The, Dayton, Ohio.—Railroad jacks. Represented by Chas. D. Derby, Russell W. Wallace, W. Irving Clock, F. I. Joyce and Geo. W. Llewellyn. Space 522, 524.

Justice & Company, Philip S., Philadelphia, Pa.—"Reliance" hydraulic jacks; standard locomotive pattern and improved car-box pattern. Represented by Philip J. Mitchell. Space 625.

Kendrick Improved Valve Company, Globe, Arizona.—Two air brake cylinders with train line; two angle cocks; two hose with connections; angle cocks with release ports, releasing pressure in hose and appling brakes. Represented by W. D. Kendrick. Space 372.

Keyoke Railway Equipment Company, Chicago, Ill.—Murray cast steel coupler yokes designed for use with or without coupler key. Represented by George C. Murray and Roy J. Cook. Space 321.

Keystone Drop Forge Works, Chester, Pa.—Keystone connecting link, Keystone safety shackle hook, special drop forgings. Represented by George H. Berlin, Chas. F. H. MacLaughlin and William J. McDevitt. Space 536.

Keystone Lubricating Company, Philadelphia, Pa.—Keystone locomotive driving boxes; locomotive truck boxes; locomotive trailer boxes; removable brasses and hub liners; grease. Represented by A. C. Buzby, H. A. Buzby, L. K. Smith, J. N. Mowery and T. O. Organ. Space 156, 158.

Knight, Inc., John C., New York, N. Y.—Railway safety appliances comprising locomotive train line sustaining valve; train line reducing and safety valve; train line accelerating and brake cylinder sustaining valve; special automatic train signal feed valve; special retaining valve; safety angle cock; train line low pressure safety valve; automatic light and load brake valve; slack adjuster for all types of equipment, steam and electric. Represented by John C. Knight, George P. Smith, Herbert M. Williams, William H. Sauvage and Frank D. Ward. Space 550, 551.

Landis Machine Company, Waynesboro, Pa.—2-inch single head bolt cutter; 1½-inch double head bolt cutter, motor driven; 2-inch stationary pipe die head; 8-inch stationary pipe die head; ½-inch automatic screw cutting die head; 1¼-inch automatic screw cutting die head; ½-inch solid adjustable die head. Represented by Carl F. Meyer, J. W. Willis and J. G. Benedict. Space 121.

Landis Tool Company, Waynesboro, Pa.—16 in. x 72 in. plain grinding machine with gap; No. 3 universal grinding machine; actual demonstration in grinding piston rods, valve yoke stems, etc.; also full line of locomotive parts, finished ground, which can be ground on a precision grinding machine. Represented by T. H. King, Ralph Forthman and W. G. Nevin. Space 139, 141, 143.

Lea-Courtenay Company, Inc., New York, N. Y.—One No. 21 Lea-Courtenay cold metal saw, type T. C. L., fitted with inserted tooth blade, motor driven in operation. One No. 15 Lea-Courtenay cold metal saw, type T. C. L. direct connected to motor. Represented by C. R. Rothwell, Albert G. Lea and J. B. Danolds. Space 157.

Lehon Company, The, Chicago, Ill.—Passenger coach canvas roofing; refrigerator and freight plastic car roofing; insulating paper; sill and floor covering; waterproofed canvas cap strips for metal freight car roofs; roofing for buildings; waterproofed burlap for bridges and subways; paints, etc. Represented by Tom Lehon. Space 18.

Liberty Manufacturing Company, Pittsburgh, Pa.—Cleaners for locomotive arch tubes. Represented by H. A. Pastre and W. A. Darrow. Space 376.

Locomotive Stoker Company, New York, N. Y.—Street locomotive stoker. Represented by W. S. Bartholomew, Clement F. Street, N. M. Lower, F. J. Philbrick, O. B. Capps and R. J. Himmelright. Space 403, 405.

Locomotive Superheater Company, New York, N. Y.—Full size model of Schmidt superheater. Represented by Geo. L. Bourne, R. M. Ostermann, Gilbert E. Ryder, F. C. Schaff, H. B. Oatley, N. T. McKee, W. A. Buckber and W. G. Tawse. Spaces 412, 414.

Lodge & Shipley Machine Tool Company, The, Cincinnati, Ohio.—One 24-inch x 10-feet engine lathe with motor driven selective head, apron control for motor, connected compound and plain rests with four-way tool block, multiple stops for length and cross feeds, pan pump and tubing. One 18-inch x 8-feet engine lathe with motor driven selective head, apron control, turret tool post, rear connected plain rest, multiple stops for length and cross feeds, pan pump and tubing. Represented by J. Wallace Carrel. Space 100.

Lucas Machine Tool Company, Cleveland, Ohio.—Number 31 Lucas Precision horizontal boring, drilling and milling machine with vertical milling attachment; standard Number 33 Lucas Precision horizontal boring, drilling and milling machine. Represented by W. L. Cheney, J. A. Leighton, Jr., and F. P. Sprague. Space 104, 106.

Lunkenheimer Company, The, Cincinnati, Ohio—Regrinding, Renewo and Ferrenewo valves; bronze and iron body globe and angle valves; gate valves; non-return boiler stop valves; lubricators; oil and grease cups; cocks and ground key work. Represented by Lane Thompson and A. S. Phillips. Space 530, 532.

Lutz-Webster Engineering Company, Inc., Philadelphia, Pa.—Lutz compression wrenches for pipe, piston and valve rods, bolts, studs, socket wrenches, etc.; compression drill ratchets; Lutz universal, adjustable, electrical floor and junction box. Represented by P. W. Webster. Space 629.

McClellon Locomotive Boiler Company, Boston, Mass.—Improved form of sectional firebox with stayless sides and crown. Represented by J. M. McClellon and William I. Cantley. Space 186.

McConway & Torley Company, The, Pittsburgh, Pa.—Buhoup flexible truck; Buhoup 3-stem couplers; Pitt couplers; Penn couplers; Jannev X couplers. Represented by Stephen C. Mason, E. M. Grove, Wm. McConway, Jr., H. C. Buhoup and I. H. Milliken. Space 501, 503, 505.

McCord & Company, Chicago, Ill.—Locomotive main valves and driving box lubricators in operation; continuous steel inserted malleable iron pedestal boxes; pinless lid box; lid locked box; double spring high capacity lever draft gear with flexible yoke cast integral; flexible drawbar yoke; bolster spring dampener; the National equalizing journal box wedge; outside metal dust guard. Represented by A. C. McCord, D. W. McCord, Morrill Dunn, J. A. Lamon, R. L. McIntosh, H. S. Whitehair, H. E. Creer and W. J. Schlacks. Space 507, 509.

McCord Manufacturing Company, Detroit, Mich.—Universal weather stripping; gravity wedging sash locks; malleable non-corrosive deck sash ratchets; sash balances; brass adjustable window sash; air brake hose protectors. Represented by August W. L. Hartbauer and Benjamin S. McClellan. Space 511, 513.

McGraw Publishing Company., Inc., New York, N. Y.—Reception space, with copies of Electrical Railway Journal, Engineering Record, Electrical World, Metallurgical and Chemical Engineering, McGraw Electric Railway Manual and Electric Railway Dictionary. Represented by H. M. Wilson, H. W. Blake, F. Kingsley, C. A. Babtiste, W. K. Beard, L. E. Gould, C. A. Henley and J. C. Raymond. Space 7.

Magnus Metal Company, New York, N. Y.—Journal bearings, lead lined; engine bearings; triple-X metal; brass castings; wearing metals. Represented by W. H. Croft, W. S. Bostwick, F. S. Beal, L. C. Dodd and C. A. Lyons. Space 175.

Mahr, J. A., Minneapolis, Minn.—Number I-C steel car repairing burner; Number 1 portable burner; Number 2 portable burner; Number 3 portable burner; Number 5 kerosene paint burner for coach work. Represented by J. A. Mahr. Space 3 Pier end.

Manning, Maxwell & Moore, Inc., New York, N. Y.—Hendey Number 3 geared spindle milling machine; Hendey 16-inch engine lathe; Hendey 24-inch engine lathe; Hendey centering machine; Number 8 Lincoln type miller; LaPointe Number 1 broaching machine; LaPointe Number 3 broaching machine, motor driven; 1¼-inch, four-spindle Gridley turret lathe, motor driven; 4¼-inch Gridley turret lathe, single pattern, motor driven; Cincinnati 24-inch crank planer, motor driven; Cincinnati 32-inch motor driven shaper; Cincinnati 24-inch belt driven shaper; Lea motor driven cold saw; National 1½-inch, ten-spindle motor driven nut tapper; National 1½-inch motor driven double bolt cutter; National 1½-inch motor driven double stay-bolt cutter; National 1½-inch triple bolt cutter; National 1½-inch motor driven quadruple bolt cutter; Bignall & Keeler 2-inch motor driven pipe machine; Dreses 5-foot new heavy pattern motor driven plain radial drill; F. E. Reed 20 inches x 12 feet motor driven engine lathe; F. E. Reed 18 inches x 8 feet motor driven geared head engine lathe; F. E. Reed 14 inches x 7 feet portable engine lathe, motor driven; F. E. Reed 16 inches x 6 feet belt driven engine lathe, with latest attachments; Morse Number 2 universal grinder, motor driven; Morse belt driven Number 1 plain grinder; Morse double wheel wet emery grinder; Hancock locomotive inspirators, lifting and non-lifting types in various forms; Hancock main steam valves in various forms; Hancock boiler check valves; Hancock hose strainers; Hancock stationary inspirators; Hancock ejectors; Hancock boiler washers; Hancock globe and angle valves; Hancock check valves; Metropolitan injectors; H-D ejectors; consolidated locomotive pop safety valves; Ashcroft steam, vacuum and pressure gages; Tabor indicators; Ashcroft pipe fitters tools; Ashcroft paper testers and Ashcroft thickness gages. Represented by A. J. Backbock, James B. Brady, P. M. Brotherhood, J. N. Derby, R. A. Bole, E. D. Garfield, M. A. Sherritt, F. W. Mawby, George E. Neil, R. S. Dean, C. M. Chapman, T. S. Stephens, F. P. Smith, Chas. L. Brown, Jos. H. Bush and John J. Faas. Space 108 to 120 and 124 to 136.

Mark Manufacturing Company, Chicago, Ill.—Cold drawn steel unions; cold drawn brass unions. Represented by Clarence Mark and J. K. Saville. Space 311.

Massachusetts Mohair Plush Company, Boston, Mass.—Car seat railroad and furniture plushes. Represented by W. W. Melcher. Space 22.

Midvale Steel Company, The, Philadelphia, Pa.—33-inch bolted cast iron spoke center engine truck wheel; 36-inch bolted forged steel center coach wheel; 36-inch rolled steel tender truck wheel; 36-inch rolled steel engine truck wheel, 16-inch diameter back hub; 33-inch rolled steel engine truck wheel, 16-inch diameter back hub. Represented by Henry M. Deemer, A. E. Goodhue, C. F. Tietze, M. D. Hayes, W. S. Edger, D. Vincent Foster, G. Aertsen, James Thompson and T. W. Illingworth. Space 640.

Milburn Company, The, Alexander, Baltimore, Md.—Milburn

portable lights for wrecking and construction purposes; oxy-acetylene welding and cutting apparatus; steam acetylene generator for locomotive headlights; Milburn carbide hand lantern for railroad inspection; Milburn home gas machine for lighting isolated stations, freight houses and for signal purposes. Represented by A. F. Jenkins, C. R. Pollard, Charles H. Holder, J. W. McCauley and L. P. Naylor. Space 211.

Monarch Steel Castings Company, Detroit, Mich.—"Lion" M. C. B. couplers. Represented by J. S. Stringham, M. B. Gilberson and N. Macdonald. Space 323.

Moran Flexible Steam Joint Company, Louisville, Ky.—All-metal flexible ball joints for steam, air and liquids; automatic barrel fillers; anti-freezing storage tank valves. Represented by C. H. Jenkins. Space 375.

Murphy Equipment Company, New York, N. Y.—Dump car. Space on exhibit track at the foot of Mississippi Ave.

Nathan Manufacturing Company, New York, N. Y.—Injectors, lubricators; boiler tester; fire extinguisher; angle and globe valves; safety valves; gage cocks; blow-off valves; water gages; low water alarm; coal sprinklers. Represented by Alfred Nathan, Edw. S. Toothe, Otto Best, J. C. Currie, J. S. Seeley, Edw. Laterman. Space 578, 579.

National Graphite Lubricator Company, The, Scranton, Pa.—Graphite lubricator for locomotives; graphite lubricator for stationary engines; graphite lubricator for automobiles. Represented by Lewis S. Watres. Space 308.

National Lock Washer Company, The, Newark, N. J.—Models of car curtains; curtain fixtures; sash locks; sash balances and National lock washers. Represented by W. C. Dodd, F. B. Archibald, C. P. Williams, D. Hoyt and J. H. Horn. Space 527, 529.

National Malleable Castings Company, The, Cleveland, O.—Sharon, Latrobe, Climax and Tower M. C. B. Couplers; National journal boxes; truck side frame; safety car door fastener; car door; hand brake mechanism; brake jaws; dead lever guides; brake levers; Goodman wrecking hook; intermediate engine coupler; engine coupler pocket castings with skein washers and support shelf. Represented by F. R. Angell, Tom Aishton, Chas. A. Bieder, W. E. Coffin, Chas. Gaspar, R. T. Hatch, John H. Jaschka, Geo. V. Martin, J. H. Merrell, Jr., Ben Nields, Jr., J. A. Slater, J. H. Slawson, S. L. Smith, E. O. Warner, G. F. Wilhelmy, L. S. Wright, O. W. Loomis, E. H. Schmidt, J. J. Byers. Space 613, 615.

National Tube Company, Pittsburgh, Pa.—Specialties, etc., reception booth. Represented by G. N. Riley, P. J. Conrath, J. Kelly, J. T. Goodwin, L. R. Phillips and L. F. Hamilton. Space 548, 549.

Newhall Engineering Company, George M., Philadelphia, Pa.—Photographs of wrecking and locomotive cranes, railroad pile drivers, etc.; prints of boiler washout plants. Represented by Wm. J. Brown, W. W. Clements, M. I. Newhall, David Newhall and Wm. Waring. Space 386, 387.

Nickel Chrome Chilled Car Wheel Company, Pittsburgh, Pa.—Broken pieces of nickel chrome wheels; samples showing Brinnell tests; photographs of nickel chrome wheels, giving mileage, etc. Represented by Robert C. Totten. Space 531.

Northwestern Construction Company, New York, N. Y.—Car fenders; check plates; car fuses; electrical connectors; splicing sleeves. Represented by R. C. Wood, W. C. Banks, I. M. Coote and C. W. Scott. Space 302.

Norton Company, Worcester, Mass.—Alundum and crystolon grinding wheels and other abrasive products. Represented by E. W. Dodge, George W. Thompson, Charles H. Norton, C. O. Smith, Hiram Cudworth and Carl F. Dietz. Spaces 142, 144

Norton Grinding Company, Worcester, Mass.—Grinding machinery. Represented by E. W. Dodge, Geo. W. Thompson, Geo. H. Norton C. O. Smith, Hiram Cudworth and Carl F. Dietz. Spaces 142 144

Norton, Inc., A. O., Boston, Mass.—High speed lifting jacks. Represented by H. A. Norton and J. O. St. Pierre Space 586

Nuttall Company, R. D., Pittsburgh, Pa.—Cut gears and pinions, electric locomotive gears, pinions and trolleys; railroad machine tool gears and pinions; flexible couplings; gear cutting machines in operation. Represented by Milton Rupert and Frank M. Erb. Spaces 152, 154.

Okonite Company, The, New York, N. Y.—Car wire. Represented by J. D. Underhill, F. J. White and W. G. Hovey. Space 500

O'Malley Beare Valve Company, Chicago, Ill.—Multiplate globe valves; angle valves; check valves; "Y" body valves; radiator valves; duplex blow out valves, duplex gage cocks; hose valves; special valves. Represented by Thos. O'Malley and Edward O'Malley. Space 210

Oxweld Railroad Service Company, Chicago, Ill.—Oxy-acetylene cutting and welding apparatus. Represented by G. H. Pearsall, C. B. Moore and A. W. Whitford. Space 338.

Pantasote Company, The, New York, N. Y.—Pantasote car curtain material; Pantasote upholstery material; Agasote millboard. Represented by John M. High, William A. Lake and Allan S. Barrows. Space 400.

Parkesburg Iron Company, The, Parkesburg, Pa.—Charcoal iron boiler tubes; safe ends; arch tubes and locomotive superheater tubes. Represented by H. A. Beale, Jr., W. H. S. Bateman, C. L. Humpton, H. C. Hunter, J. A. Kinkead, L. P. Mercer, J. H. Smythe and George Thomas, 3d. Space 388.

Parsons Engineering Company, Wilmington, Del.—Full size model of locomotive firebox in section showing application of Parsons system of combustion. Represented by D. T. Williams, H. Morris, H. K. Mask and J. A. Carey. Space 508.

Paxton-Mitchell Company, Omaha, Neb.—Piston rod and piston packing. Represented by Charles A. Coons and W. M. Leighton. Space 338.

Pearsall Company, The, New York, N. Y.—Tube expanders; drills and reamers; forge rivet sets. Represented by G. H. Pearsall and F. H. Gardner. Space 338.

Pennsylvania Flexible Metallic Tubing Company, Philadelphia, Pa.—All styles of metal hose for wash-out systems and railroad work. Represented by H. A. Ansell, S. H. Collom, Geo. L. MacCabe, O. N. Thornton and P. H. Cumings. Space 312, 314.

Pilliod Company, The, Swanton, Ohio—Model of a locomotive and model of valve gear. Represented by R. H. Weatherly, F. E. Pilliod, R. G. Graham, F. S. Wilcoxen, C. M. Jennelle and K. J. Eklund. Space 556, 557.

Pittsburgh Steel Foundry Company, Pittsburgh, Pa.—Truck bolster and truck side frame. Represented by H. V. Seth and John Allison. Space 611.

Pneumatic Jack Company, Louisville, Ky.—Pneumatic jacks; two-piece flexible ball joints; mechanical grain door. Represented by J. S. Leake and Geo. B. Maltby. Space 365.

Pocket List of Railroad Officials, The, New York, N. Y.—The pocket list of railroad officials. J. Alexander Brown, Harold A. Brown and Chas. L. Dinsmore. Space 7.

Pollak Steel Company, The, Cincinnati, Ohio.—Standard M. C. B. finished axles and locomotive forgings; heat treated axles for locomotive parts; Pollak special heat treated street railway axles bent cold flat under a twenty-ton steam hammer. Standard M. C. B. heat treated car axles bent through 180 degrees under a 250-ton press. Test bars showing fractures and refinement of open hearth heat treated steel through the Pollak special process. Represented by H. S. Buck, J. A. Pollak, B. E. Pollak, Frank W. Graves, W. L. Jeffries, Jr., B. A. Hegeman, Jr., Chas. C. Castle and Harold Hegeman. Space 624.

Pressed Steel Car Company, New York, N. Y.—Photographs of products. Represented by O. C. Gayley, N. S. Reeder, J. F. MacEnulty, J. H. Regan, C. A. Lindstrom, C. E. Postlethwaite, J. H. Mitchell, L. O. Cameron, J. C. Anderson, J. S. Turner, W. H. Wilkinson, M. S. Simpson, H. S. Hammond, G. W. Ristine, H. H. Gilbert and F. L. Johnson. Space 545, 601.

Prince-Groff Company, Camden, N. J.—Pressure locked water gages; "Kwikgrip" pipe wrenches; "Wedglok" track drills. Represented by Sherman W. Prince, Clarence B. Groff and Benjamin F. Waitt. Space 190.

Pyle-National Electric Headlight Company, Chicago, Ill.—Two latest electric headlight equipments, types "E" and "S;" electrically welded headlight case with reflector, together with models and sectional views of turbine. Represented by R. C. Vilas, Wm. Miller, C. P. McGinnis, J. E. Kilker and J. Will Johnson. Space 535, 537.

Pyrene Manufacturing Company, New York, N. Y.—Fire extinguishers. Represented by Edward M. Davidson, George H. Peterson and Thos. W. Areson. Space 208.

Quigley Furnace & Foundry Company, Springfield, Mass.—Powdered coal and oil burning equipment and furnaces. Represented by A. D. Heyl, A. W. Moyer and W. S. Quigley. Space 119.

Railway Age Gazette, New York, N. Y.—Railway publications. Represented by E. A. Simmons, S. O. Dunn, Roy V. Wright, E. A. Averill, E. S. Faust, A. C. Loudon, H. F. Lane, F. W. Kraeger, R. E. Thayer, L. B. Sherman, Henry Lee, F. H. Thompson, H. H. Marsh, C. R. Mills, Walter M. Ford, A. F. Ashbacker, W. D. Horton, H. D. Horton, C. E. Holburn, A. Gegen, I. B. Rines, F. S. Dinsmore and L. G. Dennison. Space 1

Railway & Engineering Review, The, Chicago, Ill.—Publication. Represented by Willard A. Smith, Harold A. Smith, John M. Lammedee, Jos. E. Sample and R. S. Richardson. Space 12, 14.

Railway Devices Company, St. Louis, Mo.—Perfect drop

brake handle. The Iron Horse"; interlox brake mast ratchet and pawl; spiral pipe clamps; Statite force feeders; safety locomotive grease plug; Western angle cock holder. Represented by Louis A. Hoerr, Sterling Campbell and R. L. Langtim. Space 366, 367, 368, 369.

Railway Electrical Engineer, Chicago, Ill.—Convention issues of the Railway Electrical Engineer. Represented by Edward Wray. Space 632.

Railway List Company, Chicago, Ill.—Railway publications. Represented by Wm. E. Magraw and Chas. S. Myers. Space 35.

Railway Materials Company, The, Chicago, Ill.—Exhibition booth. Represented by T. B. Cram, Geo. Hoeffle, E. C. Folsom, Ira B. Lesh and J. F. Schurch. Space 561.

Railway Utility Company, Chicago, Ill.—Utility round and honeycomb types of exhaust ventilators; Utility postal car type of intake ventilators; thermometer control for steam heat valves; thermometer control for hot water heating of private car state-rooms; thermometers for control of electric car heaters, steam hose couplers; automatic locks for freight car doors; electric car cleaners. Represented by J. P. Gallagher, Lee P. Hynes, Wm. J. Pine, E. J. Magerstat and James Denton. Space 617.

Ralston Steel Car Company, Columbus, Ohio.—Steel and composite cars and underframes. Represented by J. S. Ralston, J. E. Tesseyman, F. E. Symons, A. D. McAdam, J. R. Forney, W. F. La Bonta, C. S. Rea, W. T. Sheldon, M. A. Alexander and C. Vance. Space 406.

Reed Manufacturing Company, Erie, Pa.—Machinists vises; pipe tools. Represented by A. M. Johnston, T. O. Raaen and E. C. Barnett. Spaces 382, 384.

Reliance Electric & Engineering Company, Cleveland, Ohio.—Direct current adjustable speed motors operated with automatic starters; alternating and direct current constant speed motors having interchangeable dimensions for the same horsepower and speed; engine lathe individually driven with an adjustable speed motor and automatic starter, motor driven headstock lathe. Represented by H. M. Hitchcock, E. A. Lewis, S. C. Potter, D. G. Darling and A. W. Ray. Spaces 138, 140.

Restein Company, Clement, Philadelphia, Pa.—Locomotive air pump packing; locomotive throttle packing; steam hammer packing; air compressor packing; general line of packings for steam, air, hot and cold water and ammonia; hose for general railroad purposes, including steam, boiler washout, blower and tender hose. Represented by Clement Restein, W. J. Cromie, H. O. Fettinger and Norman B. Miller. Space 16.

Rich Tool Company, Chicago, Ill.—High speed drills; high speed reamers; rivet sets; tungsten valves for gas engines, heavy duty drill press. Represented by Russell Dale, J. G. Kirby, O. F. Schubert and J. A. Elmslie. Space 185.

Richmond Stay-Bolt Drilling Machine Manufacturing Company, Richmond, Va.—One twelve-spindle stay-bolt drilling machine; one six-spindle stay-bolt drilling machine. Represented by K. H. Carper and J. W. Cregar. Space 145.

Rochester Germicide Company, Rochester, N. Y.—Disinfectants; disinfecting appliances; paper toweling; bubbling drinking fountains; floor oils and spray fluids. Represented by C. S. Whitman and C. J. Pearson. Space 385.

Ryerson & Son, Joseph T., Chicago, Ill.—Samples of Ulster special staybolt iron; Ulster engine bolt iron; Loco jacket steel; XX iron; Nikrome steel for piston rods, crank pins, etc. Represented by E. T. Hendee, G. M. Basford, W. H. Eulass and H. A. Gray. Space 176.

Safety Car Heating and Lighting Company, The, New York, N. Y.—Pintsch car lighting equipment; axle driven electric lighting equipment; Pintsch and electric car lighting fixtures; glass and metal illumination reflectors; postal car lighting equipment. Represented by R. M. Dixon, A. C. Moore, J. S. Henry, R. C. Shaal, J. A. Dixon, G. E. Hulse, W. I. Thomson, J. H. Rodger, Wm. St. John, M. F. Elliott, L. Schepmoes, C. B. Adams, W. L. Garland and Geo. H. Chadwell. Space Stairway platform.

Safety Steel Ladder Company, St. Louis, Mo.—All-steel safety ladders for box and other high cars; improved type ladder and brakeman's platform for outside metal-roof cars. Represented by Chas. F. Palmer, J. W. Faessler and W. A. Mitchell. Space 197.

Sargent Company, Chicago, Ill.—Ironclad safety water gage; E. S. E. reflex gage; E. S. E. blow-off valve; E. S. E. water glass cock; Loedige quick acting blower valve. Represented by Frank G. Dunbar and George H. Sargent. Space 306.

Scarritt-Comstock Furniture Company, St. Louis, Mo.—Passenger coach seats; chair car seats; reclining chairs. Represented by C. C. Taylor. Space 20.

Sellers & Company, Incorporated, Wm., Philadelphia, Pa.—Injector models and valves. Represented by John D. W. Clintock, Chas. T. Wilson, Edw. L. Holljes, W. W. Storm and Strickland L. Kneass. Space 623.

Simplex Railway Appliance Company, Chicago, Ill.—In space with the American Steel Foundries. Space 193, 195.

Sprague Electric Works, New York, N. Y.—Sprague steel armored air brake hose; steel armored car heating hose with steel armored fittings; steel armored shop hose; flexible steel conduit, cable and fittings; Greenfield galvanized conduit; electric hoists; electric freight handling trucks; electric fans. Represented by D. C. Durland, H. W. Uhl, C. J. Johnson and J. A. Clifford. Space 330.

Standard Asphalt & Rubber Company, Chicago, Ill.—Durable floors; insulation; water proofing. Represented by Chas. V. Eades. Space 39.

Standard Car Truck Company, Chicago, Ill.—One full sized four-point bearing flat car; also models of trucks, center plates and side bearings. Space on exhibit track at Mississippi Ave. Represented by F. L. Barber, James T. Milner, H. M. Edgerton and Lee W. Barber.

Standard Heat and Ventilation Company, Inc., New York, N. Y.—Car heating apparatus; passenger car ventilators; steam hose couplers; end train line valves; thermo-jet heating systems; Ward Unotherms; Econotherm, yard plugs and car receptacles for charging storage batteries on electrically lighted cars. Represented by George B. Culver, J. F. Deems, Peter Fink, Frank N. Grigg, W. G. Hermsen, Charles E. Lowell, Rolland B. Lowther, C. E. Miller, C. F. McCuen, Lewis B. Rhodes, E. C. Post, Walter B. Van Beuren, John E. Ward and A. L. Whipple. Space stairway platform.

Standard Improved Truck Company, Chicago, Ill.—Steel freight house trucks. Represented by D. P. Jennings and F. A. Guilford. Space 540.

Standard Roller Bearing Company, Philadelphia, Pa.—Annular ball bearings; annular roller bearings; journal roller bearings; roller motor bearings; standard taper roller bearings; roller thrust bearings; ball thrust bearings; roller bearing car journals; Rudge-Whitworth wire automobile wheels; steel and bronze balls. Represented by J. G. Cooley and M. G. Sperzel. Space 170.

Standard Steel Car Company, New York, N. Y.—Reception booth. J. B. Brady, R. L. Gordon and H. G. Macdonald. Space 559.

Standard Steel Works Company, Philadelphia, Pa.—Rolled wheels in five stages of manufacture; steel tired wheels with rolled, cast iron spoke and plate centers; hollow bored driving axles. Represented by Robert Radford, W. H. Pugh, Jr., Charles Riddell, C. H. Peterson, Fred W. Weston, A. Roy Green, Wm. B. Keys and Wm. F. Boyer. Space 9.

Standard Stoker Company, Inc., Wilmington, Del.—Mechanical stoker for locomotives. Represented by J. A. Carey and D. T. Williams. Space 188.

Standard Valve Gear Company, The, Toledo, Ohio.—Standard "B" locomotive valve gear; full size model showing actual construction; quarter size model demonstrating effect of driving axle movement. Represented by Frank Harrison and George H. Hartman. Space 516, 518.

Steel Specialties Company, Boston, Mass.—Wedge washer or nut safe-guard; Corey straightener. Represented by Albert L. Cole and Geo. Louis Richards. Space 194.

Storrs Mica Company, Owego, N. Y.—Mica headlight chimneys. Represented by Charles P. Storrs. Space 587.

Symington Company, The T. H., Baltimore, Md.—Reception booth. Represented by C. J. Symington, W. W. Rosser, T. C. deRosset, R. H. Gwaltney, I. O. Wright, S. L. Kamps, A. H. Weston, D. F. Mallory and B. S. Johnson. Space 570, 571.

Templeton, Kenly & Company, Ltd., Chicago, Ill.—Simplex car, coach, locomotive, track and bridge jacks. Represented by Alfred E. Barron, Arthur C. Lewis and Walter B. Templeton. Space 621.

Titanium Alloy Manufacturing Company, The, Niagara Falls, N. Y.—Titanium treated steel, copper, bronze and brass. Represented by A. C. Hawley and Chas. Vickers. Space 381.

Transportation Utilities Company, New York, N. Y.—Acme weatherproof window; Acme diaphragms; Acme vestibule curtain with revolving shield; Chanarch metal flooring; Flexolith composition flooring; Tuco friction curtain and fixtures; metallic steel sheathing; Resisto insulation; Perfection sash balance; Imperial car window screens; National standard roofing; National steel trap doors; steel car doors; Eclipse deck sash ratchets. Represented by D. W. Pye, W. L. Conwell, H. B. Chamberlain and G. Burgert. Space 564, 565.

Underwood & Company, H. B., Philadelphia, Pa.—Portable cylinder boring bar; portable crank pin turning machine; special portable rotary planing machine; circular planer tool; portable cylinder dome facing machine; hand pipe bending machine. Space 327. H. D. Griffith, D. C. Hitchner and C. O. Ralph. Space 327.

Union Draft Gear Company, Chicago, Ill.—Cardwell friction

draft gear. Represented by J. R. Cardwell, L. T. Canfield, J. W. Hathaway, W. G. Krauser and J. E. Tarelton. Space 409.

Union Railway Equipment Company, Chicago, Ill.—Pries' metal car roof; Union drop brake shaft; Pries' refrigeration syphon system; Pries' brine tank valve. Represented by W. B. Hall. Space 621.

Union Spring & Manufacturing Company, Pittsburgh, Pa.—Kensington all-steel journal boxes; coil springs; elliptic springs; wire springs; pressed steel spring plates; pressed steel journal box lids; steel castings. Represented by L. G. Woods, A. M. McCrea, Chas. S. Foller, Henry B. Darlington, W. F. LaBonta, A. C. Woods, T. B. Arnold, H. F. Ayres and Joseph Wood, Jr. Space 526, 528.

U. S. Light & Heating Company, The, New York, N. Y.—U-S-L axle-driven electric light equipments for railroad cars; axle generators for electric lighting; regulators for electric lighting; suspensions for axle generators; storage batteries for electric lighting of railroad cars; storage batteries for signal service. Represented by J. Allan Smith, A. H. Ackermann, Wm. P. Hawley, W. L. Bliss, Wm. G. Davis, R. S. Bryan, John A. White, C. C. Bradford, L. N. Talkes, W. F. Bauer and W. A. Turbayne. Space 324, 326, 328, 330.

U. S. Metal & Manufacturing Company, New York, N. Y.—Reception booth. Represented by B. A. Hegeman, Jr., C. C. Castle, F. C. Dunham, E. D. Hillman, H. A. Hegeman, H. K. Porter and E. R. Shoenberger. Space 622.

U. S. Metallic Packing Company, The, Philadelphia, Pa.—King type metallic packing for locomotive piston rods, valve stems and air pumps; Leach pneumatic track sander; Gollmar bell ringer; oil cups and braided cotton swabbing. Represented by Morris B. Brewster, John S. Mace, Clarence L. Mellor, Harry M. Wey and Elliott Curtiss. Space 519.

United Engineering & Foundry Company, Pittsburgh, Pa.—Photographs of "High-speed" steam-hydraulic forging presses. Represented by Arnold P. Bark. Space 329.

Universal Draft Gear Attachment Company, Chicago, Ill.—Full sized model cast steel draft arms; full sized model twin spring draft gear with key connected coupler; keyed yokes for friction draft gear; keyed yokes for tandem draft gear; one-piece cast steel riveted type yoke for tandem draft gear; cast steel riveted type yoke for friction draft gear; miscellaneous malleable iron, also cast steel draft plates and lugs. Represented by C. J. Nash and C. C. Kinsman. Space 31.

Valentine & Company, New York, N. Y.—Railway varnishes and colors; signal enamels; Valspar. Represented by Langdon B. Valentine, Irving H. Munford and C. W. Rhoades. Space 580, 581.

Van Dorn Company, W. T., Chicago, Ill.—Steel car end. Space on exhibit track at foot of Mississippi Ave.

Virginia Equipment Company, Toledo, Ohio.—Dust guards for journal boxes. Represented by Lacey Y. Williams, John S. Acklin, Grafton A. Dodd and Harold G. Williams. Space 377

Vixen Tool Company, Philadelphia, Pa.—Vixen files and resharpening machine in operation. Represented by Walter D. Craft, R. H. Anthony, C. M. Zubler and James C. Barr. Space 168.

Warner & Swasey Company, The, Cleveland, Ohio—2A universal hollow hexagon turret lathe on bar work; 2A universal hollow hexagon turret lathe on chucking work. Represented by H. E. Witham, R. G. Buyer and C. J. Stilwell. Space 123, 125.

Waterbury Tool Company, The, New Britain, Conn.—Waterbury hydraulic speed gear for varying speeds and reversing. Represented by H. G. Hoadley, Reynold Janney, R. B. Day and W. W. Marshall. Space 147.

Watertown Specialty Company, Watertown, N. Y.—Automatic cylinder cocks for locomotives; cold water squirt hose; automatic water glass gage cocks. Represented by C. E. Miser and Lewis de L. Berg. Space 320.

Watson Stillman Co., The, New York, N. Y.—Complete hydraulic power plant, consisting of motor-driven pump and hydro-pneumatic accumulator, from which are run one hydraulic broaching press and a new design of hydraulic coupler yoke bearing and riveting press; air engine driven hydro-pneumatic pit jack; Chambers throttle valve with full section model of locomotive boiler and dome showing position of valve in dome; hydraulic jacks and other small tools. Represented by R. Baker, F. H. Clark, R. R. Harrison, P. R. Ketzer, E. A. Stillman, A. L. Stillman, G. R. Smith, F. T. West and C. Wigtel. Space 167, 169, 171, 173.

Welsbach Company, Gloucester, N. J.—Railway station and platform lighting. Represented by Chas. W. Wardell. Space 38.

West Disinfecting Company, New York, N. Y.—Automatic deodorizing machines; fumigating lamps; liquid soap dispensers. Represented by Geo. L. Lord, H. E. Daniels. Space 26.

Western Railway Equipment Company, St. Louis, Mo.—Acme brake slack adjusters; Western sill and car line pockets; Western brake jaws; Acme pipe clamps; Linstrom syphon pipes; Interchangeable car doors; Interchangeable journal bearings and wedges; Hoerr car doors; Security dust guard; Downing card holders; Western bell ringer; car door fastenings; fish hook tie plates; tie dating nails; brake pins; Economy slack adjusters; St. Louis flush car doors; Western flush car doors; Linstrom eccentrics; Republic draft gear. Represented by Louis A. Hoerr, S. H. Campbell and R. L. Langtim. Space 366, 367, 368, 369.

Western Steel Car & Foundry Company, New York, N. Y.—Photographs of product. Represented by O. C. Gayley, J. F. MacEnulty, J. H. Regan, C. A. Lindstrom, N. S. Reeder, C. E. Postlethwaite, J. H. Mitchell, L. O. Cameron, J. C. Anderson, J. S. Turner, W. H. Wilkinson, M. S. Simpson, H. S. Hammond, H. H. Gilbert, F. L. Johnson and G. W. Ristine. Space 545 and 601.

Westinghouse Air Brake Company, Pittsburgh, Pa.—Reception booth. Represented by A. L. Humphrey, E. A. Craig, S. J. Kidder, C. R. Ellicott, F. V. Green, J. B. Wright, W. V. Turner, J. R. Ellicott, C. P. Cass, F. M. Nellis, Robt. Burgess, E. L. Adreon, C. J. Olmstead, C. C. Farmer, T. L. Burton and T. R. Brown. Space 19 to 29

Westinghouse Electric and Manufacturing Company, Pittsburgh, Pa.—Reception booth. Represented by J. C. McQuiston, H. W. Beaumont, H. C. Mode, E. M. Wise, W. H. Patterson, R. F. Moon and R. E. S. Geare. Space 19 to 29.

Westinghouse Lamp Company, Pittsburgh, Pa.—Reception booth. Represented by A. C. Wade, B. Hayllar, Jr., and B. F. Fisher, Jr. Space 19 to 29.

Westinghouse Machine Company, The, Pittsburgh, Pa.—Photographs. Represented by E. H. Sniffin, H. A. Rapelye, L. L. Brinsmade and E. D. Kilburn. Space 19 to 29.

White Enamel Refrigerator Company, St. Paul, Minn.—Bohn collapsible tank. Represented by K. G. Anderson and Frank Gilmore. Space Pier end.

Wheel Truing Brake Shoe Company, Detroit, Mich.—Abrasive brake shoes. Represented by J. M. Griffin. Space 521.

Wiener Machinery Company, New York, N. Y.—Solid steel triple combination punch, shear and bar cutter, type S. C. G. 20; solid steel coping machine, type A 500. Represented by F. H. Scantlebury and Richard B. Fraken. Space 133, 135, 137.

Wiley & Russell Manufacturing Company, Greenfield, Mass.—Staybolt taps; boiler taps; patch bolt taps; machinists' hand taps; machine screw taps; spiral fluted reamers; straight fluted reamers; screw cutting dies; screw plates. Represented by F. O. Wells, F. W. Strecker, F. H. Hoffman and G. W. Snyder. Space 184.

Wilmarth & Morman Company, Grand Rapids, Mich.—No. 3 wet surface grinder, motor driven; style "DX" combination cutter, reamer and drill grinder, motor driven; new Yankee drill grinders, both belt and motor driven; lathe center grinders; combination water tool and drill grinder; Nelson patent loose pulleys. Represented by Chas. E. Meech, Jos. H. Hazley, B. C. Saunders and E. T. Gorham. Space 127, 129.

Wilson Remover Company, Newark, N. J.—Pneumatic apparatus for spraying varnish remover and vacuum process for removing paint and varnish from wood and steel surfaces. Pneumatic rotary brush for removing paint and varnish from steel cars and engine tenders. Wilson railroad paint and varnish removers. Represented by J. Mac Naull Wilson and James Whitney Wilson. Space 202, 204.

Winslow Company, Horace L., Chicago, Ill.—Heating systems; "Okadee" spacialties. Represented by Horace L. Winslow, R. Powell and A. G. Hollingshead. Space 4.

Wood, Guilford S., Chicago, Ill.—Wood's nipple end air brake hose protector; steel freight house trucks. Represented by D. P. Jennings and F. A. Guilford. Space 540.

Yale & Towne Manufacturing Company, The, New York, N. Y.—Improvements in electric hoists; chain blocks and trolleys—moving models; special ammunition handling devices; burglar exhibit; coach door checks applied to car door; signal padlocks; general service padlocks; indicators padlocks; master key locks for dining cars. Represented by C. W. Beaver, A. W. Patterson, Jr., W. A. Hall, W. C. Miner, W. C. Bigelow, H. H. Ricketts and J. F. Stoldt. Space 159, 161, 379.

Zug Iron & Steel Company, Pittsburgh, Pa.—Zug and Sable brands of nigh grade staybolt, engine bolt and high grade forging iron. Represented by George W. English. Space 206.

Railway Age Gazette

DAILY EDITION

Vol. 54. NEW YORK—JUNE 12, 1913—ATLANTIC CITY No. 23b.

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE, BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY, WOOLWORTH BUILDING, NEW YORK.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

United States and Mexico $5.00
Canada 6.00
Foreign Countries (excepting daily editions) 8.00
Single Copies ..... 15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

FOR breadth of understanding and clear, concise expression of the duties of the American Railway Master Mechanics' Association, it would be difficult to obtain a better exposition than in the address of President Crawford. In some respects, it is generally felt that the association has not done all that should be fairly expected of it. That it has accomplished much cannot be denied, but that it should accomplish more is equally true. Mr. Crawford points out a few of the more important subjects that have heretofore been neglected and should now be taken up in an energetic manner. The confusion possible in connection with the selection of a train resistance formula from the thirty-three or more now equally authoritative is indicated and it is suggested that this association should be the one to clear it up by adopting an official formula after a careful investigation. There would seem to be no body of railroad men better suited for this duty. A proper method of determining the capacity of a locomotive in connection with its ability to haul trains is badly needed. This association should also provide that.

IT is the practice of the Master Boiler Makers' Association to ask one or two representative railroad or government officials to address it at each session. At its convention, held last month in Chicago, addresses were made by W. L. Park, vice-president, Illinois Central; C. A. Seley, formerly chief mechanical engineer, Rock Island Lines; Robert Quayle, superintendent of motive power, Chicago & North Western and J. F. De Voy, assistant superintendent of motive power, Chicago, Milwaukee & St. Paul, as well as John F. Ensign, chief inspector, and Frank McNamany, assistant chief inspector, Interstate Commerce Commission, department of locomotive boiler inspection. It was a rather noteworthy fact that each of these speakers took occasion to commend the boiler inspection law and to express satisfaction with its enforcement. It seems that this result is due to a fully digested law, prepared with the advice of practical men, and a spirit of fairness exhibited by both the railroads and the federal inspectors. The enforcement of the law has caused considerable trouble and expense to the railroads at times, but in no case has an appeal been taken from the inspector's ruling, and the good results that have been gained are well shown by Mr. Ensign's annual report. A sharp distinction was drawn by some of the speakers between the boiler inspection law and some State laws, the full crew and headlight laws being mentioned in particular.

IT is no longer a question as to whether or no the mechanical stoker will work, but rather as to how efficiently it will work. We have gone beyond the stage when an experimental device is expected to run without attention or repair, or be condemned, and have taken the stoker to ourselves as a part of the locomotive's mechanism that must be closely looked after and be carefully inspected if it is expected that it will do its work. For a number of years the stoker has been regarded as an excessive consumer of coal; at least, that it showed no economy in fuel consumption. Much of this waste was attributed, and probably rightly, to the ease with which the fireman could put coal into the firebox, but now it seems that the men using the stoker have learned its ways and are saving the coal as they used to save their muscles, and the stoker is showing a saving of fuel consumption as compared with hand firing. Not that there is much, if any, saving on a test between the stoker and hand firing when a first-class man is used for the hand work, and he is on his mettle to do his best, but that when the average performance of the first-class man is compared with that of the average performance of the stoker, the latter is coming out a little ahead. That two diverse types of stokers have been developed to their present stage of efficiency speaks well for the future possibilities, and it looks now as though in the very near future the stoker would be taken as much as a matter of course as a part of a locomotive's construction as the safety valve or the injector, whose development through this same stage of possibility, probability, desirability and necessity some of us can most distinctly remember.

AS was indicated by one of those who discussed the report on mechanical stokers, the fact that the thoughts of most of the speakers took the direction of the possible fuel economies showed conclusively that all doubt is now removed as to the practicability and success of stokers in regular service. The committee's report gave evidence of the same conclusion, so far as the two most prominent designs are concerned. The number now in service and the size of the orders given by individual railroads is further proof of confidence in their satisfactory operation in pooled service. The committee states that a saving in fuel can be expected not only in quantity but in the grade it is possible to use with the stoker. The discussion, however, gave little encouragement for a reduction in the quantity when compared with good hand firing. Various reports of comparative fuel consumption on a large number of locomotives in regular service covering a considerable period seem to indicate but little difference in the quantity consumed when coal suitable for hand firing is used in both cases. In regard to quality, however, there is every reason to expect a material saving, particularly with the scatter type of stoker. Lower grades of coal, not at all suitable for hand firing, are being successfully burned in many instances. In some cases the coal is screened and the lumps

are used for hand-fired locomotives and the slack for the stokers. On the basis of coal burned per ton-mile an hour, the stoker using a grade of fuel costing but half as much as run of mine should show a very handsome saving in cost. It was clearly stated by President Crawford that what should be expected from the stoker is more tons to the train. The problem is not so much how much coal is actually consumed as it is how many tons the locomotive can be made to pull. On some new locomotives now being finished, which in other respects are standard, the diameter of the cylinders has been increased by 2 in. in order to take full advantage of the power the stoker permits the boiler to deliver. Older engines are having the cylinders bored out to increase the diameter by 1 in. for the same reason. The stoker is but a part of the locomotive, and the best locomotive is the one that hauls the most ton-miles an hour. The stoker should be considered mainly from this standpoint. If the maximum work is performed at a lower fuel consumption per unit of traffic handled, it is most satisfying. But if not, the stoker can by no means be considered as failing to meet the real demand.

CO-OPERATE WITH OTHER ASSOCIATIONS.

WITH the possible exception of the Traveling Engineers' Association, the International Railway Fuel Association is, in some respects, the most valuable contemporary of the Master Mechanics' Association among the minor associations in the mechanical field. The work it performs is closely associated with, and ably supplements the activities of, the larger body, and it seems unfortunate that there is not more real co-operation between the two.

At its convention held in Chicago last month, the Fuel Association discussed the features of locomotive design that permit the successful burning of lignite, and it intends next year to discuss the design of front ends, grates and ash pans in general. In past years the Master Mechanics' Association has spent a great deal of time and considerable money investigating these particular features and has produced results of decided value. In view of the many subjects demanding attention, some of which are of considerably greater importance, it is quite proper that this and some other similar subjects should be left to the smaller and more highly specialized associations.

It would seem much better, however, to have the work continued rather than to have it undertaken anew. This could be accomplished by having a representative of the Master Mechanics' Association appointed on the committee of the Fuel or other association that is to take up the work. There is little doubt that such a request from the superior body would be accepted in the same spirit in which it was made. The duties of such a member should be advisory rather than active, and he should report to, and be under the control of his own executive committee. He could make a condensed report of how the subject was presented and the conclusions reached at the following convention. This could profitably be given a short time for discussion, and the members would obtain the benefit of a wider range of work without in any way restricting their energy along lines which they alone are suited to investigate. In fact, if the idea was followed to a logical conclusion, a number of subjects now carried on the list could be transferred and more time given to the broader and more important phases of the motive power official's work which are demanding more and more attention every day. Problems of organization, management, engineering and education are not receiving the attention they deserve from the Master Mechanics' Association, nor will they so long as so much attention is given to subjects which can be practically as well handled by some of the minor associations if the matter were put up to them officially and under the guidance of a representative member on each committee.

While the Fuel Association is taken as an example because it happens that it intends to consider several subjects which have in the past been reported on by committees of the Master Mechanics' Association, the same relations are held by other similar specialized associations. Detailed subjects in connection with locomotive operation might well be referred to the Traveling Engineers' Association; matters pertaining to shop practice to the General Foremen's Association; air brake problems to the Air Brake Association, etc. The regular committee on subjects would be the judge as to which body was best suited to investigate and report.

This is one suggestion as to how closer cooperation between these, at present, practically detached bodies could be accomplished. President Crawford in his address on Wednesday morning suggested another scheme which eliminated any suggestion of influence by the Master Mechanics' Association. The manner of doing it, while important, is subordinate to the fact that something of the kind should be undertaken.

OBJECTIONABLE PUBLIC REGULATION.

NO part of President Crawford's address met with more hearty approval than his forcible references to the great amount of ill-considered and arbitrary railway legislation that still continues to be passed. Formerly such legislation related mainly to rates. Now it relates mainly to physical operation. The mechanical officers recently have felt the effects of much of it. Numerous safety appliance laws, boiler inspection laws, headlight laws and so on have been passed by Congress and the legislature; and in most cases without investigation and knowledge of the conditions to which they were to be applied, or decent consideration of the probable results.

It is not regulation of railway mechanical matters, or any feature of railway operation, that is objectionable. What is objectionable is regulation that disregards experience, flouts expert knowledge and counsel, arbitrarily applies sweeping and uniform provisions to widely diverse conditions, and heavily increases railway expenses without conferring any compensating public benefit. Most of the regulation of operation thus far has been of this character.

One remedy is for railway officers to make more frequent appearances, and present more vigorous opposition, before legislative committees. This they have begun to do through the Special Committee on Relation of Railway Operation to Legislation and its technical sub-committees and state committees. Another step is to get the handling of all such matters transferred from the legislatures to the various regulating commissions. Many of the commissions are imperfect enough; but they are more apt to make intelligent investigations and listen to reason, and less apt to be swayed by political influences, than members of the legislatures.

Most desirable of all is that Congress, by general legislation, shall concentrate in the Interstate Commerce Commission authority to regulate all phases of operation that are properly subject to public regulation at all. Many just criticisms may be made on the past work of the Interstate Commission. But, whatever its shortcomings, the Commission as at present constituted is at once the ablest in personnel, the most expert and the fairest body that ever regulated railways in this country. Within very recent years it has had to handle two important problems directly affecting the mechanical department, those relating to safety appliances, and locomotive boiler inspection. The railways were represented in the negotiations with it by some of their ablest mechanical officers, and, on the whole, the commission's attitude was fair and the policies it adopted not injurious but beneficial.

Regulation by commission has its very bad features; in fact, any sort of government regulation has; but probably it is only through increased regulation of operation by the Interstate Commerce Commission that the railways can escape from the ignorant, arbitrary, nagging and costly requirements that are being so rapidly multiplied by state legislatures and commissions.

TO-DAY'S PROGRAM.

M. M. ASSOCIATION.

The following subjects which were on the program for Wednesday could not be considered on that day because of the extended discussion of the report of the committee on mechanical stokers:

Discussion of reports on:
- Specifications for Cast-steel Locomotive Frames.

Individual papers on:
- Maintenance of Electrical Equipment, by C. H. Quereau.
- Engine Testing Plant, Prof. E. C. Schmidt.

The following is the scheduled program for to-day, which will probably follow the discussion of the above-mentioned subjects:

Discussion of reports on:
- Main and Side Rods.
- Safety Appliances.
- Design, Construction and Maintenance of Locomotive Boilers.
- Steel Tires.
- Minimum Requirements for Headlights.
- Standardization of Tinware.
- Superheater Locomotives.
- Specifications for Materials Used in Locomotive Construction.

Individual paper:
- Three-cylinder Locomotives, by Mr. J. Snowden Bell.

Subjects.

ENTERTAINMENT.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Informal Dance, 9.30 P. M.—Entrance Hall, Million Dollar Pier.

REGISTRATION THIS YEAR.

The enrollment committee, C. B. Yardley, Jr., chairman, has adopted a new system which will very greatly extend the time during which members of the Master Mechanics' and Master Car Builders' Associations may register. The committee has been divided into three shifts, each composed of four members and assigned to duty during certain specified hours of each day. These shifts are so arranged that the work is distributed equally among them and a much more systematic and efficient operation of the enrollment work is expected than has been obtained in the past. Members of the committee have been notified that the following rules have been adopted and will be strictly enforced.

Railway Supply Manufacturers' Association Badge.

M. M. Association Badge.

M. C. B. Association Badge.

Badge for Special Guests.

M. M., M. C. B or Special Guest badges shall not be given to anyone but the rightful owner; no member of the Railway Supply Manufacturers' Association will be permitted to take one for delivery except upon written order from the owner and the receiver must then sign for the badge.

No badge shall be issued to a member of the M. C. B. Association except on the payment of a fee of one dollar; M. M. and Special Guest badges will be issued, free of charge, to those entitled to them until 12 o'clock noon, Saturday, June 14, at which time M. M. badges will be withdrawn and a charge of one dollar made for all Special Guest badges. However, a member of the M. M. Association taking out a Special Guest badge and paying the required fee will be given his M. M. badge free and members of the M. M. Association who are also members of the M. C. B. Association can obtain their M. M. badge by paying for the M. C. B. badge.

A change has been made in the M. M. and M. C. B. badges this year; the celluloid disk has been entirely done away with and the year is included on the enameled disk, directly under the initials of the association; a rectangular piece of metal at the bottom of the disk forms a part of the badge and includes the registration number, as indicated in the accompanying illustration.

SAN FRANCISCO SEEKING THE 1915 CONVENTIONS.

A. M. Mortensen, traffic manager of the Panama Pacific International exposition, formerly with the Southern Pacific Company, is attending the convention in behalf of the great show to be held in San Francisco in 1915. The San Francisco people and the exposition management want the M. C. B. and M. M. conventions in 1915, and before leaving Atlantic City Mr. Mortensen will make an earnest plea and will cordially invite both the railway and railway supply men to journey to the coast in June of 1915.

TRANSPORTATION FOR RETURN RAILWAY TRIPS.

Through Secretary Taylor the Pennsylvania has notified the railroad members of the M. M. and M. C. B. associations wishing transportation home over the lines of the Pennsylvania Railroad or the Pennsylvania lines west of Pittsburgh, that such transportation will be provided, if they hand their names to Secretary Taylor. Owing to the requirements of the law, this transportation must be limited to bona fide railroad officials, and cannot include members from belt lines, car lines, or switching roads operated by industries.

City Ticket Agent Murphy, of the Pennsylvania Lines, Atlantic City, announces that return tickets can be secured and Pullman reservations made through his office, 1301 Pacific avenue.

COUPLER COMMITTEE EXHIBIT.

The coupler committee has an extensive and interesting exhibit just beyond the Convention Hall on the pier. In 1911 this committee was authorized to prepare a standard design of M. C. B. coupler. Since that time it has given considerable attention to studying the weak points of couplers on various roads throughout the country where the service is exceptionally severe, and has worked jointly with the coupler manufacturers in outlining the requirements and specifications for a standard design.

After developing these specifications the different coupler manufacturers were asked to submit designs to meet the requirements. Six companies have designed such couplers, and they are now on exhibition so that the members may examine them carefully and come to some conclusion as to the most desirable design. The companies are the Buckeye Steel Castings Company, American Steel Foundries, Gould Coupler Company, The McConway & Torley Company, National Malleable Castings Company and Monarch Steel Castings Company.

It is also proposed to change the contour in order to strengthen the coupler, and templates are on exhibition showing the changes which are recommended for consideration.

MANUFACTURERS' DINNER TO THE BRAZILIAN MINISTER OF FOREIGN AFFAIRS.

By special permission of the United States State Department, the American Manufacturers' Export Association will entertain His Excellency, Dr. Lauro Muller, minister of foreign affairs for Brazil, on the day of his arrival in New York, June 17. He will be given an automobile trip throughout the city, which will be followed by a luncheon at the Hotel Plaza.

This visit of the distinguished Brazilian statesman will be his first to the United States. Manufacturers of railway supplies will be interested in the entertainment given him by the manufacturers in New York, because some very prominent railway supply men will participate in it and because it will call attention, among other things, to the large and growing market in Brazil for American railway supplies.

It is expected that the entertainment accorded to Dr. Muller in New York will be dignified and in every way suitable to the importance of the occasion. Joseph E. Davis, the new commissioner of corporations of the United States, will be the principal speaker, and there will also be other distinguished speakers. The price of the luncheon per plate will be $8 and reservation should be made immediately, owing to the limited time remaining. The committee in charge reserves the privilege of seating the guests as may seem most advisable.

Among the members of the reception committee are the following men, prominently connected with the railway supply industry: Waldo H. Marshall, president, American Locomotive Co.; C. M. Muchnic, manager foreign department, American Locomotive Co.; Alba B. Johnson, president, Baldwin Locomotive Works; William de Krafft, Baldwin Locomotive Works, A. N. Hargrave, J. G. Brill & Co.; E. J. Buckner, vice-president, E. I. Du Pont de Nemours Powder Co.; Charles Landis, E. I. Du Pont de Nemours Powder Co.; M. A. Oudin, manager foreign department, General Electric Co.; L. D. Albin, Ingersoll-Rand Co.; M. S. Baldwin, Otis Elevator Co.; H. L. Gemberling, Sherwin-Williams Co.; James A. Farrell, president, U. S. Steel Corporation; W. E. Leigh, Western Electric Co., and W. J. Marsden, Yale & Towne Manufacturing Co.

Information Bureau; 11 A. M. Wednesday.

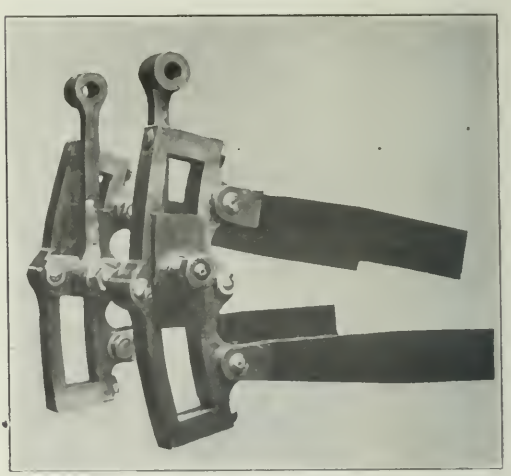
THE ORCHESTRA CONCERT ON THE PIER.

The orchestra concerts yesterday morning and afternoon at the entrance hall of the Million Dollar Pier proved very popular and were well attended. The hall was an attractive place for the ladies to wait while the men were registering.

DUPLICATE PARTS FOR LOCOMOTIVES.

An important feature of the work of any locomotive builder is the furnishing of duplicate or spare parts for locomotives in service. This is particularly true in the case of locomotives operating on short lines or in logging, contracting or other industrial service. In such cases the operating company frequently carries no stock of patterns, and has not the facilities for furnishing spare parts promptly.

It is evidently essential, in work of this kind, that like parts of similar locomotives be made interchangeable, and that duplicate parts be so made that they will be sure to fit the engine for which they are intended. The necessity for this was realized by M. W. Baldwin, founder of the Baldwin Locomotive Works, as early as 1839, and at that time he took steps toward introducing such a system of manufacture. It was not, however, until 1865, that the organization of a department of standard gages was finally completed. This department is in charge of an expert machinist, and it



Duplicate Eccentric Links Furnished Recently for a Locomotive Built in 1867.

maintains all original standard gages and templets, from which duplicates are made for use in the shop. The system insures interchangeability of like parts of locomotives built to the same design. The ordering of duplicate and spare parts at the Baldwin Locomotive Works is handled by the department of repairs, and the work is given preference in order to insure prompt completion. Whenever a locomotive changes hands, or has any modifications made in its design subsequent to its shipment from the works, a record of the fact is kept, if possible. This is an aid in insuring accuracy when furnishing duplicate parts.

The accompanying illustration shows a set of links, with their lifters and eccentric rods, recently supplied for a locomotive built in 1867, in use on the Ironton Railroad. A letter from S. R. Thomas, superintendent, states that the shipment was made exactly two weeks after the order was placed and that all parts fitted exactly. The locomotive to which these links were applied is of the mogul (2-6-0) type, with cylinders 16 in. x 22 in. and 44 in. diameter driving wheels.

MASTER MECHANICS' ASSOCIATION PROCEEDINGS.

Includes the Address of President Crawford and the Reports on Mechanical Stokers and the Revision of the Rules.

The first session of the forty-sixth annual convention of the American Railway Master Mechanics' Association was held at Atlantic City, June 11, 1913. President D. F. Crawford called the meeting to order at 10 A. M. The past presidents of the American Railway Master Mechanics' Association, and the Master Car Builders' Association, and the members of the executive committees of the two Associations were invited to take seats at the front of the hall. The opening prayer was offered by the Rev. Newton W. Cadwell, pastor of the Olivet Presbyterian Church of Atlantic City.

PRESIDENT CRAWFORD'S ADDRESS.

It is with a deep personal appreciation of the privilege and with sincere pleasure that I welcome you to the forty-sixth annual convention of the American Railway Master Mechanics' Association. Today marks the beginning of the

D. F. CRAWFORD,
President, M. M. Association, and Vice-President, M. C. B. Association.

eighth consecutive convention of your Association held at Atlantic City, and I trust that it will prove as profitable, instructive and enjoyable as those which have preceded it.

Permit me to express my gratitude to you for giving me the opportunity of having my name added to that honor roll—the list of presidents of this important association, as well as for the opportunity to perform the pleasant duty of presiding at this convention. You may be sure that I have and will put forth my best efforts to maintain the dignity and effectiveness of our association, which had been so splendidly carried forward by my twenty-nine capable and distinguished predecessors.

The presence of the ladies is appreciated by all of us and I wish to extend to them, and to all of our guests, the most cordial welcome.

There is present today, a gentleman whom we are proud to welcome, and who has been a member of this association since 1907. On account of his residence he might be looked on as a non-resident member. To be with us he has crossed the ocean, and by his presence indicates that it is no longer an estranging ocean, and I am sure you will all join me in offering friendly greetings to our fellow member. I refer to Henry Fowler, chief mechanical engineer of the Midland Railway of England.

The Railway Supply Men's Association has again prepared for your inspection and instruction the splendid exhibit of railway appliances, which we all have become accustomed to regard as a useful part of our convention, and I am told that the number of exhibitors is greater, and the space occupied larger, than at any previous convention.

While these exhibits are of undoubted value to those

T. RUMNEY,
First Vice-President, M. M. Association.

attending these conventions, the difficulty in obtaining sufficient space, and the expense incident to installation, lead me to suggest that the most careful consideration be given by those in authority in the Supply Men's Association, to the question of the wisdom of their further extension.

After most careful consideration of the subject at a joint meeting with the executive committees of the Master Car Builders' Association and the Railway Supply Men's Association, it was decided that the entertainment features of this convention be carried out along the same lines as determined upon for the conventions of last year; namely, that the participants bear their prorata share of the expenses, and that the entertainment be less formal in character than was the practice previous to the 1912 meeting.

In order that the fullest possible opportunity be given for the inspection of the splendid exhibits it was decided to omit from the program, the usual ball game; thus permitting

the members and guests to devote the entire day of Saturday to the exhibits, or to those informal meetings, which are so conducive to better acquaintance, and consequently to the interchange of information, which is difficult to accomplish in the regular sessions. It is sincerely hoped that the entertainment provided will be found agreeable and that every one present will do their utmost to make this meeting pleasant as well as profitable for one another.

There will be no report this year from a committee on consolidation. After several years' consideration of this subject it was apparent that the majority of the members of the association were opposed to the suggestion. While it is true that after forty-five years of good service it hardly seems wise that the American Railway Master Mechanics' Association should lose its identity, I am compelled to say that a closer working arrangement with the Master Car Builders' Association is desirable, and it is thought that the suggestion made by President Bentley in 1912; namely, that the two associations meet in one week, with a joint session on one day, would probably bring about the desired results, without the consolidation of the two associations.

It seems imperative, however, that the Master Mechanics' Association take cognizance of what is being done in the line of work which comes under the supervision of the members of this association, by the General Foremen's Association, Air Brake Association, Fuel Association, and the Society for Testing Materials, and to assist, as far as possible, in making the work of these industrious and capable associations of greater value to the railways and to the public. To this end I suggest that either the Committee on Subjects, or a special committee, review the work done by these associations so that the information obtained may be given to this association, perhaps in the form of an individual paper by a member of the associations named.

Legislative action, both Federal and State, continues to occupy the minds of the railway men of the country, and many of the measures under consideration involve the construction, maintenance and operation of railway equipment. J. Ramsey McDonald says, "Legislation must work with life, not try to tyrannize over it, and life is such a confusing welter of interdependent relationships that legislation very often dislodges an evil from one place only to give it abode in another."

The above is particularly applicable to that legislation which tends to produce rules and regulations which are in conflict with well-known physical and mechanical laws, and impose burdens from which proper returns in safety, reliability and economy cannot be obtained. It is important that this association, and its members, co-operate with the Federal, State and other authorities to bring about a better understanding of the limitations in the construction and operation of railway equipment, so that such future legislation as may be desirable will be in accord with the principles of physics and mechanics, rather than tending away from them as is now too often the case.

Bills have been introduced in the Federal Congress and in several states requiring that locomotives be equipped with headlights of high candle power. I have witnessed several tests of headlights of various intensities, under operating conditions, and cannot refrain from congratulating the association upon its action in the convention of 1912, when you passed the resolution opposing the use or high power headlights on railways with multiple tracks, and with inter-locking or automatic signals. My observations lead me to fear that extending the use of high power headlights will result in more frequent accidents, and consequently, loss of life and damage to property; the danger increasing in relative proportion to the density of traffic, the number of tracks and signals.

Since the convention of 1912 the engineers and firemen's requests for wage increases, and changed working conditions have been settled by arbitration; the former by a Board of seven, with the Honorable Oscar Strauss and Doctor Chas. Van Hise, as chairmen, and the latter by a board of three, as provided for in the Erdman Act, with the Honorable William L. Chambers, as chairman. The proceedings of both of these

D. R. MacBAIN,
Second Vice-President, M. M. Association, and Vice-President, M. C. B. Association.

F. F. GAINES,
Third Vice-President, M. M. Association.

hearings contain much data and information which is of interest and value to the members of this association, and no doubt have been reviewed by all of the members.

During the hearings of the firemen's case frequent reference was made to the proceedings of this association. This should bring home to us the need that the association obtain and promulgate such comprehensive and accurate data on all questions regarding the locomotive and its operation, that its proceedings will be looked upon as the most reliable and authoritative information available on the construction, maintenance and operation of locomotives. It should also provide record of the comparative results obtained with different types of locomotives in different service, under the many varying conditions. The desirability of such authoritative information, representing the consensus of opinion, and bearing the approval of a recognized organization, will be apparent to all who are familiar with the proceedings of the arbitration cases above mentioned.

A number of books and articles have been published recently on Railway Operating Costs; among these the widely distributed book prepared by Messrs. Suffren & Son, from which I quote:

"The members of the Maintenance of Way Association, of the Master Mechanics' and of the Master Car Builders' Associations are in direct control of sixty per cent. of the operating expenses of the railroads they represent, yet the proceedings of their meetings contain no mention of the labor problem. Their entire attention is directed toward the subject of materials——"

"An enormously effective and valuable work could be done through the medium of these associations in the standardizing of equipment. There is no reason why, given reasonable time, a movement for the standardization of equipment could not be carried to its logical conclusion, but for some inscrutable reason the attention of the members has been directed only toward unit designs for small parts. In some instances at least this standardization of parts has been due to the efforts of manufacturers of supplies, rather than the members of the associations."

Also this: "It seems as if the subjects now up for discussion before the various association of railway officials are inconsequential when compared with the more important problems that have been overlooked."

The writer of the above was evidently not aware that very wisely, by common consent in this association, and by prohibition of the by-laws of the Master Car Builders' Association, the very complex problems of labor cannot be discussed. As to the suggestion regarding labor, however, I will offer one thought. The increasing demand for labor in this country will cause to continue the influx of emigrants. Indeed we can look forward to the time when much of the skilled and semi-skilled labor, and all of the unskilled labor, will be of foreign origin.

The majority of these men are, or have the capability of becoming good workmen, but both the employers and employees suffer on account of misunderstandings arising from dissimilar languages. While the situation may be improved by the employment of interpreters there still remains grounds for suspicion. Therefore to meet the condition which will become more and more difficult, it would seem wise to encourage the younger supervising officers of the railways to become proficient in one of the foreign languages; preferably Italian. With this accomplishment that confidence between employer and employee, which is so necessary to success, may be established.

From my experience with the work of the association I cannot but agree with the writer mentioned, that entirely too much attention is devoted to material and consideration of the locomotive as a mechanical device, rather than as an instrument of transportation. The study of the general proportions, the hauling capacity, the adaptability of machine to specific work, obtaining the maximum output with minimum expense is of far more importance to the railways, and to the public, than the study of the smaller details of the

ANGUS SINCLAIR,
Treasurer, M. M. Association.

J. W. TAYLOR,
Secretary, M. M. Association and M. C. B. Association.

machine and the minute variations in the composition of the materials used in its construction.

As to the standardization of equipment, much has already been accomplished; true, largely in the details of construction, but each detail decided upon holds out promise of more readily reaching an agreement on the larger problems.

The reports of the several committees which will be presented during the sessions, you may be sure, represent the results of careful study of the questions, and I am sure they will receive the most thorough and complete discussion, so that there will be added to the records of the association, information of value to all who may have occasion to consult them.

I will not refer to the reports in detail, but desire to call your attention to some points regarding the work of several of the existing committees.

The committee on Smoke Prevention has before it what is perhaps one of the more important questions under consideration by the railways. The public and the authorities of almost every city, and of many towns and villages, are insisting on the reduction of smoke from locomotives, and in some instances legislation, not only requiring the reduction of smoke, but compelling its elimination by substitution of electric power for the steam power is contemplated. It is particularly desirable, therefore, at this time, that this subject receive the greatest possible consideration, and that its discussion will bring out all the available information on the subject.

I also beg to suggest that in view of the importance of this subject that this committee be continued as a standing committee, and authorized to confer and co-operate with the many other associations, technical and civic, engaged in the study of the question. In Chicago, Pittsburgh and many other cities, commissions, each with a large staff of engineers, chemists, physicians, etc., are employed in obtaining information and endeavoring to solve the problem, and the experience of our members should be of value in this work.

It is also recommended that the committee on Specifications for material be made a standing committee. The Society for Testing Materials has given this subject the most careful attention, but it would seem that the requirements of material for a particular purpose could better be determined by the practical experience of the consumer than by the more or less theoretical consideration of comparative results obtained under test conditions. This committee should, of course, confer and co-operate freely with the committees of other associations, and give them a full measure of the results obtained in practice, so that they can be coupled up with the laboratory observations; thus permitting the promulgation of specifications which will not only cover suitable material, but which will insure uniformity in quality by prescribing adequate and decisive laboratory tests.

The Committee on Minimum Requirements for Locomotive Headlights, after full consideration of the subject, has undertaken a comprehensive series of tests, as well as the compilation of existing information on the subject.

When it was suggested that a committee to report on superheater locomotives be appointed, I remember that it was stated that this subject had been fully covered in previous reports. So far from this being the case reference to the proceedings of the Firemen's Arbitration will show that more definite information is necessary, and furnish ample reason for reopening this important question.

As future work for the association I wish to suggest the reopening of three subjects, which have not only been considered by it, but by others. However, when one consults the existing literature, the lack of sufficiently definite information, and the conflict of such as is given, is apparent.

Undoubtedly the members of this Association and the railways would appreciate and find useful more exact and authoritative advice on these subjects.

TRAIN RESISTANCE.

In 1900 the *Engineering News* published a chart on which there was plotted twenty-one separate formulas for determining train resistance. These formulas gave the seeker of information the choice of resistances at a speed of five miles per hour, or from 2.1 pounds per ton to eight pounds per ton, and at a speed of sixty miles per hour, or from six pounds per ton to twenty-nine pounds per ton. In 1903 the number of formulas had increased to thirty-three, with the same limits at five miles per hour, but at sixty miles per hour the range had extended to thirty-one and six-tenths pounds per ton. At speeds between five miles and sixty miles per hour the thirty-three formulas gave every opportunity to exercise a wide individuality in the selection of a resistance.

During the ten years elapsing from the time of thirty-three formulas to date, many more have been developed, but these, rather than assisting, have rendered it more difficult to make a selection. Indeed, a short time ago, in applying one of the most generally accepted and frequently used formulas to actual dynamometer measurement, the drawbar pull determined by the formulas was somewhat over twice the amount shown by the dynamometer as actually used to move the train at the running speed.

There is much data available, and a committee of this association could obtain much more which would enable it to offer to all interested a method and formula which would be sufficiently accurate to be of practical application and value. Why not establish the American Railway Master Mechanic's Resistance Formula?

LOCOMOTIVE LOADING, OR TONNAGE RATING.

At present the railways are giving this subject a great deal of attention, but are using different methods. In the past fifteen years much information has been obtained on this subject, and recently quite a number of highly interesting and instructive articles have appeared on the subject in the technical press.

There is no more important work that this association can perform than to take from the mass of available data, supplemented by such additional records of investigations as may be necessary, and promulgate a thoroughly practical, and at the same time, an accurate method of determining the hauling capacity of locomotives, and train loading that would be suitable for all kinds of locomotives under the varying conditions of service.

Would it not insure to the railways and the public the possibility of that economical operation so greatly desired, and at the same time add to the honor of the association, to devise and approve a method of operation so logical that there could be no question of its general adoption?

STATISTICS.

The use of this word, without giving the statistician his usual rank in comparison with other members of the "Ananias Club," is indeed difficult. I have been so greatly impressed by the use of statistical data by financiers, the Interstate Commerce Commission, Federal and Legislative committees, arbitration boards, and the technical press, that it seems only proper that those statistics which reflect the results of physical action and performance should at least bear some relation to the originating forces, and take cognizance of the potential available, as well as the results obtained.

The expense of owning, maintaining and operating a locomotive, or other power producing device, is much more a function of the potential available than it is of the burden carried. That is to say, the cost of owning and maintaining, and a large portion of the operating costs of a given locomotive is the same whether the load hauled is one car or fifty.

That the so-called tonnage mileage basis does not adequately meet the situation may be shown by a simple illustration: A given locomotive with exactly the same interest, depreciation, maintenance, crew, fuel and operating costs, moving one class of cars, will produce on a certain division, 168,000 lading ton miles, while with another class of cars, the same potential, and with no difference in expense, 216,000 lading ton miles will be produced. If the weight of the car is included, or the gross ton miles, as is the practice on some roads, the total ton miles would be 262,500 and 285,600 respectively.

While it is true that the averaging of many conditions tends to reduce the effect of such variations, it is desirable that some more logical unit than the lading or gross ton mile be considered for making comparisons of owning and operating costs and performance of equipment.

It is certain that there has been and will be many occasions when statistics of this kind, worked up on a uniform basis for all of the railways, would be of service. A committee of this Association could perform a useful service by devising such forms of statistics as would meet the requirements of the railways and others interested in their operation.

Another subject which is always before us is that of fuel economy, both as a matter of saving of expense to the railways, and as a conservation of one of the great natural resources of the country. No more important subject could be given the most careful consideration of this association; perhaps of all, the most competent to deal with it.

Locomotive testing plants are now established at the Purdue University, University of Illinois and at the Altoona shops of the Pennsylvania Railroad. Such of the information obtained at these plants as may be, with propriety, made public, might well be reviewed by a committee of this Association, and, with suitable comments and conclusions, included in the proceedings.

To summarize, it is my idea that the proceedings of the

American Railway Master Mechanics' Association should be a compendium of the existing knowledge covering the entire subject of construction, maintenance and operation of railway locomotives; steam, electric, or any other from which may be devised. For truly we are of those that Mr. Kipling designates as "The Sons of Martha."

"It is their care in all ages to cushion and buffet the shock;
"It is their care that the gear engages; it is their care that the switches lock.
"It is their care that the wheels run truly;
"It is their care to embark and entrain, tally, transport, and deliver duly, the Sons of Mary by Land and Main."

Our association has a membership of 1,074, which is a decrease of eleven members during the past year. Since our last convention Oscar Antz, New York Central Lines; F. M. Gilbert, New York Air Brake Company; Wm. Gill, Iowa Central; W. B. Howe, New South Wales Railway, Australia; C. E. Gossett, Minneapolis & St. Louis; M. A. Malloy, Pennsylvania. J. H. Murphy, Cincinnati, New Orleans & Texas Pacific; J. J. Ryan, Southern Pacific, and A. Forsyth, Chicago, Burlington & Quincy, Active Members; Geo. Richards, Old Colony, now part of the New York, New Haven & Hartford; Amos Pilsbury, Maine Central; Henry Schlacks, Denver & Rio Grande, Honorary Members, and Reuben Wells, Louisville & Nashville, president of this association 1882-1884, have departed this life, and their loss is felt keenly by the members of the association and by their friends.

In conclusion I desire to express my thanks to the officers of the association for their cordial assistance; to the members of the committees, and to those contributing papers, for their efforts in making this convention successful.

On behalf of the association I most heartily thank the Reverend Newton W. Caldwell for his assistance in opening this convention with suitable ceremony; the exhibitors for their labors in producing for us the splendid display of interesting devices; the members of the Supply Men's Association for their untiring efforts in co-operating with us in entertaining the members and guests; the Officials of Atlantic City, who have always received us so kindly, for their courtesy; the Hotel Men's Association, for the ample provision they have made for our creature comforts; and the members of the press, who have done so much for us individually and collectively.

Permit me to express the wish that we all may profit from the reports, papers and discussions, and that the information obtained will be of service to the railways that we represent, and also that we will all enjoy our visit to this beautiful city.

ASSOCIATION BUSINESS.

Secretary Taylor presented his report which showed the present membership of the Association to be: Active, 1,009; Associate, 21, and Honorary, 44, making a total of 1,074. The report of the treasurer, Angus Sinclair, showed a balance for the year 1912, derived from interest on various bonds, of $1,369.32.

The report of the secretary and treasurer was referred to an auditing committee made up of C. H. Rae (L. & N.); E. W. Pratt (C. & N. W.), and J. F. DeVoy (C. M. & St. P.).

Secretary Taylor:—In November, 1891, the Stevens Institute received from this Association $8,000 for the endowment of four scholarships. Under the arrangements made we were privileged to have four students at the Institute each year, free of the regular tuitions. The records show that we have averaged three and one-third per year. The Institute authorities advise that the income from this fund is not only insufficient to support these scholarships, but that something like $2,000 has accumulated against this account. This matter was considered by the Executive Committee, a committee consisting of Dr. Angus Sinclair, G. W. Wildin, and Wm. Schlafge has been appointed to confer with the Institute authorities to see what steps could be taken to perpetuate these scholarships.

The dues for the ensuing year were fixed at $5, per vote as before.

The following communication was read by Secretary Taylor:

The Executive Committee feels that the provisions of the constitution regarding honorary membership are not such as they should be; that an honorary membership in this association means what it says—an honor, a vote of appreciation for long and faithful service. It believes that the limit of five years for active or associate membership does not add anything to such honor. It believes there should be four forms of membership, namely, active, associate, life and honorary. The provisions regarding active and associate membership should remain as at present.

The Executive Committee would, therefore, give notice of the following proposed change in article III, Section 5, to read:

"Members of the Association, active or associate, who have been in good standing not less than ten years, and who, through age or other cause, cease to be actively engaged in the mechanical department of railway service, may, upon unanimous vote of the members present at the annual meeting, be elected life members. The nominations must be made by the Executive Committee. The dues of the life members shall be remitted and they shall have all the privileges of active members, except that of voting.

"Members of the Association, active or associate, who have been in good standing, may, upon the unanimous vote of the members present at the annual meeting, be elected honorary members."

W. C. Hayes (Erie) as a member of the Traveling Engineers was granted the privilege of the floor.

MECHANICAL STOKERS.

Persistent energy in the perfection of the stoker is being rewarded, but it must be conceded that few, if any, devices applicable to the locomotive, having for their purpose the accomplishment of equal efficiency, have carried the difficulties surrounding the successful performance of the stoker, not so much on account of the operation to be performed, but the absence of choice as to arrangement, the absolute limitations in space, and conditions under which the machine must operate.

Within the past few years marked advancement has been made and there is no longer any question but that the stoker is of practical value and a perfectly feasible proposition.

More recent history very strongly points to the inevitable

A. KEARNEY,
Chairman, Committee on Mechanical Stokers.

conclusion that the success of the stoker is not exclusively of mechanical interest, but an operating question as well, and much has been due to the continued solicitude from the viewpoint of capacity, relative consumption, efficiency and operation.

In all the work and experimentation with the various schemes suggested, two distinct methods or principles for stoking a locomotive still characterize the stage of development. In one the coal is delivered to the firebox over the bed of the fire, not unlike hand-firing, which is generally termed the "scatter" system; while the other delivers the coal up through the bed of the fire from underneath and is designated as the "underfeed" stoker. Both methods have their advocates and strong points of defense. Consequently, having before us the results both types have accomplished, it would be unsafe to conjecture which school will ultimately survive. Probably both will continue to advance, but time only can foretell their fate, and which will in the end prove more economical.

The committee is therefore unprepared to even venture an opinion as to which type of stoker is better, as both have their points of advantage. There seems to have been a larger number of designs of stokers attempted which have had the "scatter" system for their basic principle than those endeavoring to develop the "underfeed" machine, and probably because the inventors have hoped to reproduce hand-firing conditions. Many more types have been worked out than now seem to occupy the field, but those that have lived are constructed upon either the one or the other principle, although they may have differed

materially in detail from those that now remain on the market, or have possibly reached the commercial stage of development.

Time seems to have resulted in eliminating many stoker designs, reducing the number mainly to the most prominent, namely, the Crawford, typifying the underfeed; and the Street, representing the "scatter" type. There are, however, two other stokers undergoing development, namely, the Gee and the Hanna, both of the scatter design; and possibly there are many other prospective designs or types which have not yet been presented to the railroads.

The stokers which have undergone some development, and may for that matter still be considered (as it is possible their designers are giving them further study with a view of further improvement, etc.), are the Strouse, Barnum, Hayden, Brewster, Harvey, Dickinson, Erie, Hanna, Gee, Crawford and Street.

The stoker situation, as well as the committee has been able to ascertain, is as follows:

STROUSE STOKER.

Seventy-six Strouse stokers have been built to date and applied to engines on 16 different roads, but on April 1, 1913, none were still in service, so far as known. This design of stoker interferes with the operation of the fire door when it becomes necessary to resort to hand-firing. It is one where all of the coal must be shoveled from the tank into a hopper.

BARNUM STOKER.

Seven Barnum or C. B. & Q. stokers have been built to date by the Burlington; 1 being applied to a switch engine, 1 to a prairie type road engine, and 5 to Santa Fe decapod engines. All of the latter stokers, we are advised, have been taken out of service on account of difficulties experienced in connection with the driving mechanism used with the taper screws in the stoker trough, also on account of the unsatisfactory distribution of fuel where the lower grades of coal were handled.

HAYDEN, HAYDEN MODIFIED, BREWSTER, HARVEY, DICKINSON AND ERIE STOKERS.

Nothing has been done during the past year with the above stokers. That is to say, none of them have passed from the experimental to the commercial stage. The experimental machines which were applied did not wholly meet the requirements of a stoker as viewed by the committee, in that several materially obstructed the fire door, which would interfere with hand-firing should such a course become necessary, and the others have not been sufficiently developed.

HANNA STOKER.

Eighteen or twenty stokers were applied to Mallet, consolidation and Pacific type locomotives on the Queen & Crescent, but it is our information they have all been taken out of service, in addition to the single stokers which were put on several different roads. The exception to the above is the one machine on the Carolina, Clinchfield & Ohio, which is still in service. The one on the latter road, we understand, continues to do good work, and the manufacturers promise to bring out another within a very short time possessing still further improvements.

GEE STOKER.

The Gee stoker is being developed on the Pennsylvania Railroad. Only one of this design has been built to date. It is in service on one of its H-6 consolidation locomotives, and is reported as giving very good results.

CRAWFORD STOKER.

There have been 153 locomotives on the Penna. Lines West equipped with the Crawford double underfeed stoker. There are 140 locomotives on order which will be equipped with the Crawford stoker. The report is that it is probable that larger power built in future will be equipped with this type of stoker. The Vandalia reports 4 Crawford stokers in operation, and the Pennsylvania also has 2 in service, making a total of 159 Crawford stokers in service and 140 on order, or a grand total of 299 stokers.

STREET STOKER.

In May, 1909, a locomotive on the L. S. & M. S. was equipped with the first experimental stoker of the Street design. In 1910 5 more stokers were put in service, 3 of which were placed on the L. S. & M. S., where the first experimental stoker was operated. In the year 1911 7 locomotives on four different railways were equipped. All of the last 7, with but one exception, were provided with coal crushers carried on the tank, and handled run-of-mine coal. All of the machines, we are told, are still in regular service.

In the year 1912 165 machines of the screw-conveyor type were placed in service—70 on one railroad, 50 on another, 40 on another, and 5 on another. Since January, 1913, 7 additional machines were put in service, besides orders were placed for 50 more by one of the above roads, and an additional order was placed for 120 by another road. Thus we find that there have been 189 Street stokers applied to locomotives in service and 173 on order, making a grand total of 362.

It is particularly interesting to note that the Crawford and Street stokers, while representing two distinct types, are developing at about an equal rate, judging from the number of machines which have been applied. The Street stoker has been placed on a larger number of roads, while the Crawford stoker, with the exception of 2, has been confined to the Pennsylvania System. The 2 stokers referred to have been applied, 1 each, to two different railroads.

In Table I is shown a list of railroads which report using stokers, furnishing at the same time the number and type of each machine and the principal dimensions of the engines to which applied. An expression was invited concerning any further application of mechanical stokers, which was replied to as shown.

Checking the number of stokers reported as being in service, we find they include about 189 of the Street pattern. This figure was secured from the Locomotive Stoker company, and as but 165 are shown by the reports from the different roads, we conclude there are some roads using the stoker who have not replied to the circular.

The committee has been able to secure but little information concerning the actual and detailed operation of stokers from roads where they have been installed in any considerable number, however, the reports it has been able to secure have been put together, as shown, in tabulated form. While the information is quite limited, it will no doubt be of some interest.

Table II gives a comprehensive idea of the success with which the Crawford underfeed stokers have been operated on the Pennsylvania. The tabulation covers the performance of the stokers with respect to handling fuel. This information, while serving to show the operation of the stoker, unfortunately does not give the cost of maintenance and the character of its failures.

TABLE I.—RAILROADS REPORTING HAVING STOKERS IN OPERATION, TYPES OF STOKERS AND ENGINES TO WHICH THEY WERE APPLIED.

TABLE II

PERFORMANCE OF THE CRAWFORD DOUBLE UNDERFEED STOKER ON THE PENNSYLVANIA LINES WEST OF PITTSBURGH, INCLUDING ALL TRIPS OF ALL STOKERS FROM THE EXPERIMENTAL INSTALLATION TO FEBRUARY 28, 1913.

Coal Fired by Stoker in Per Cent of Total Coal Fired.	Number of Trips.	Per Cent of Total Number of Trips.
100	19,475	61.0
99	280	0.9
98	416	1.3
95-98	1,530	4 8
90-95	1,847	5.8
85-90	680	2.1
80-85	903	2 8
75-80	1,209	3.8
70-75	379	1.2
Below 70	5.191	16.3
Total	31,910	100.0

Table III has been prepared to show the performance of the Street stoker on Mallet engines of the Norfolk & Western and Chesapeake & Ohio. The Norfolk & Western on the receipt of 40 Mallet locomotives, all equipped with the Street stoker, instituted a systematic record for stoker data, so as to show their complete performance, their failures and responsibility, and cost of repairs, separated for labor and material, both for the stoker as well as the brick arch with which the engines were also equipped. This table, as will be seen, also shows the total number of engine days, or days the engines have been in and out of service.

Talking the average performance of the Mallet engines on the Norfolk & Western up to February 1, 1913, it will be observed that the average number of failures per month was 4½, and the average mileage per stoker failure was 11,679 miles. The average mileage for failures other than those attributed to the stoker was 3,527 miles. The record shows 23.2 per cent. of the total failures were attributed to the stokers.

Another item of interest to which attention might be directed is the cost of stoker and brick arch repairs per 1,000 miles, which, as will be noted, averages $5.34. The Chesapeake & Ohio furnish data showing the performance of 54 stoker-fired engines, covering a period of three months, namely, November and December, 1912, and January, 1913. The average mileage per stoker failure is found to be 4,474 miles, which is lower than the reports received from the Norfolk & Western. It will also be noted that the average cost for repairs per 1,000 miles is higher than indicated in the report from the Norfolk & Western, which might be a natural consequence, since the stoker failures were greater in number per miles service.

The committee sought to establish some data to show the relative fuel consumption in hand-firing as compared with the operation of the stoker, but there seems to have been very little reliable information so far obtained. The St. Louis & San Francisco has furnished a comparison of the coal consumption of the Mallet locomotive hand-fired versus stoker-fired, the runs being made over a district of 119 miles. The report shows that there were a number of delays occurring during the test runs which might to some extent affect the figures.

The information as presented indicates higher economy with hand-fired locomotives. They show an average evaporation of 9.13 pounds of water per pound of coal for four trips, while the stoker-fired engine gave an equivalent average evaporation of 7.88 pounds of water per pound of coal for five trips. No information is given bearing upon the quality, character or heat value of the fuel used during the test, hence it is to be supposed that it was the same for the two tests.

General opinion seems to indicate that there is still some uncertainty as to any saving being accomplished in fuel. Some roads report that hand-firing, if properly executed, shows economy over stoker-firing, while there are just as many to report that the stoker has the advantage; then there are also others who regard it as a stand-off in coal consumption.

It is held by some who have been quite close to the work that under similar conditions there is some economy in fuel to be found with the stoker-fired engine, possibly 5 per cent., and this would seem quite logical, because it is conceded that the stoker burns a better fire, with the scatter type running from 4 to 6 inches in depth, as against 18 or 20 inches hand-fired. Furthermore, with the stoker the fire door is kept closed and the combustion must neeessarily be more complete.

A saving in fuel, it would seem, can be expected, not only in quantity but in the grade it is possible to use with the stoker. Generally speaking, the best results seem to be obtained with the smaller sizes of fuel; in fact, with the scatter type machine, slack or crushed coal is necessary, and probably it can be used equally well with the underfeed machines, but the report is that the Crawford stoker has to date been giving good results with small lump coal. With improved combustion, coals lower in heat value (consequently cheaper in price) can be utilized, adding still further to economy conceded to the stoker.

It has also been observed that when starting out steam can be raised quickly, and probably with advantage as compared with hand-firing.

It seems to be admitted by even expert firemen who have had some years experience hand-firing, that they have derived valu-

able information in hand-firing after handling the stoker and closely watching its operation. With a more perfect combustion there is naturally some reduction in the emission of smoke, or unconsumed carbon, and it is also reported that where the stoker is properly handled it becomes necessary to use the fire hook but very little, if any, on the road, all of which should mean something in the direction of economy.

With reference to the character of coal used on stoker-fired locomotives, we find quite a variety of grades have been reported. In order to compare the different grades Table IV has been prepared, but comments seem quite unnecessary, as

TABLE IV.

Railroad.	Kind of Coal Used.	Per Cent of Ash	Difference in Coal Used on Stoker-fired and Hand-fired Locomotives.
C. C. & O.	Bituminous, coking	7½ to 8.	Same coal used in each case.
Vandalia	Indiana semi-coking, Illinois coal of poor quality.	8 to 12.	Same coal when Indiana coal is used. No Illinois coal used on stoker-fired engine.
C. & O.	Run of mine and nut and slack coal, some coking and some non-coking	12 to 15.	Same coal used in crusher type stokers. Picked, special coal used in conveyor type.

TABLE IV—Continued.

Railroad	Kind of Coal Used.	Per Cent of Ash	Difference in Coal Used on Stoker-fired and Hand-fired Locomotives.
B. & O.	Non-coking	10	Non-coking coal used in stokers and coking coal used in hand-fired engines.
Pennsylvania Lines	Non-coking bituminous from Indiana, Illinois, Pennsylvania and Ohio districts	6 to 16	Same coat used in each case.
B. R. & P.	Very good quality of coking coal.	9 to 11	Nut and a mixture of nut and slack sometimes very fine slack for stokers. Run of mine used for hand-fired engines.
S. Louis & San Francisco.	Non-coking		Same coat used in each case.
Norfolk & Western	Run of mine bituminous	7 to 10	The run of mine coal is screened, the fine slack used on stokers, the lump on hand-fired engines.

a glance at the information is sufficient to show that the successful operation of the locomotive stoker as reported does not seem to be confined to any particular grade or character of fuel.

It is unfortunate that it has been impossible so far to secure definite data for the relative consumption of fuel with the stoker as compared with hand-firing. There are, however, some very elaborate tests under way, but they have not progressed sufficiently to justify reliable conclusions.

The relation of the stoker installation to the amount of tonnage handled, as against hand-firing, was also sought, and in reply to this query, roads using the stoker have expressed themselves as follows:

The Carolina, Clinchfield & Ohio reports heavier trains hauled, but does not say to what extent.

The Vandalia reports their stoker-fired engines consume about the same time on the division, but that a more uniform steam pressure is maintained.

The Baltimore & Ohio reports that it is possible to haul heavier trains with the stoker engines.

The Pennsylvania Lines West of Pittsburgh report 15 per cent. more tonnage hauled with stoker-fired engines on slow freight and on long, heavy grades.

The Buffalo, Rochester & Pittsburgh have not observed any difference between hand-firing and stoker operation.

The St. Louis & San Francisco reports better performance with stoker-fired engines, stating that some firemen are not able to keep up steam on heavy trains on the long runs.

The Norfolk & Western has not recognizeed any difference in tonnage rating between hand-fired and stoker-fired engines, since with but one exception all of their stokers are applied to one type of locomotive. It has been observed, however, that with the stoker operated properly the locomotive can be worked to its maximum capacity without any marked effect upon the steam pressure, which is a distinct advantage.

The Virginian Railway reports some improvement in steaming capacity and tonnage hauled, but does not give amounts.

A review of the reports clearly indicates that while all concede the stoker is capable of handling heavier tonnage, no road is ready to name the amount. Probably if such information had been secured, it might have proven to be widely different on the several roads on account of the existence of widely different operating conditions. The stoker, it is generally believed, is capable of firing a larger amount of fuel and still retain uniformity in its work, from which it follows that higher boiler power is reasonably sure, unless there is a failure from some other cause, but this increased capacity would not be shown in the starting of the locomotive. On the contrary, higher steam pressure maintained would result in higher tonnage, speed if desired, or more work performed by the locomotive.

On some roads where peculiar physical characteristics prevail with respect to ruling grades, etc., it might mean that an engine could be safely given a larger tonnage than had previously been handled, where the ability to start the train from the usual stopping points had not been a controlling factor in determining the tonnage rating.

Therefore, the question resolves itself to one where each road is better able to work out for itself the question of using the stoker with any return after taking into consideration the physical characteristics of the road, size of engines, tonnage now being hauled, and what advantages might accrue. The question is rather one where it must be decided, first, if a more uniform rate of steaming is needed, and what expenditure might be warranted to secure such a condition.

Since with the scatter type of machine the arch brick is regarded as essential, and possibly of equal advantage in other types in the ratio of an engine with or without an arch handfired, it would seem its use may be a prime consideration, since it would seem to have a specific value.

A superheater can be introduced, carrying with it some 10 to 15 per cent. improvement in fuel or steaming capacity; and if still further advantage is desirable and the quality and quantity of fuel to be fired becomes a factor, the use of the stoker will be felt in the production of a uniform steam pressure, with possibly some saving in fuel where the conditions are equal, or higher steaming capacity with higher speed.

Where it is possible to keep the fire door closed, it must follow that the temperature in the firebox is more uniformly maintained, which in turn must result in better service conditions for the firebox, flue sheet and seams, otherwise our theories fall flat. As a matter of fact, observations, though limited, seem to indicate that the life of the flue is being increased, and equal results must necessarily be in store for the flue sheet and the firebox generally, but some allowance should be made for what is accomplished by the arch brick.

Very successful results can be obtained in the operation of the stoker, but some intelligence is necessary to make sure that it is allowed to work efficiently, and one of the most important features to be observed is to prevent the engine from continually popping off, wasting steam and fuel, but even this can be controlled, simply by the manipulation of apparatus requiring no other energy than ordinary attention. No particular effort, as a rule, is required to keep the stoker properly adjusted, working regularly, and free from clogging or disturbance to the uniform supply of fuel to the firebox. In the event of a failure of the stoker mechanism, the fireman, as a rule, can do but very little, except to resort to hand-firing, bringing the engine into terminal, where repairs can be made.

In handling stoker locomotives at terminals, or at ash pits along the road, there is some time to be saved, as the thinner fire can be knocked out or cleaned within ten or fifteen minutes time, as against probably twice the delay in handling a locomotive which has been hand-fired.

There is no doubt but that the maintenance of the stoker, by reason of its increased amount of machinery and working parts, is going to represent an item of repairs; and even if it has been rather low, as has been shown, some alteration in the figures is likely to take place as the stokers become older. It is also true that as the machines are improved and more substantial parts are applied, and greater proficiency in their manipulation is attained, there should be a corresponding improvement in the cost of maintenance. However, such items, including the time required to turn, repair, and otherwise put engines in shape for further service, should receive due consideration in summing up the net advantages derived by the stoker in service.

Reflecting for a moment upon the apparent work and interest manifested in the locomotive stoker, it is believed we must necessarily conclude that although the stoker has not been developed to a state of perfection, it has not only proven to be practical, but has demonstrated by service and endurance tests that it is of value, and that there is a growing field for its use.

In concluding, the committee wishes to show as a feature of this report what it concludes are some of the requirements which should, and in fact are being met in the satisfactory locomotive stoker.

1. It should convey coal from the tank to the firebox with the minimum of physical work on the part of the fireman.

2. It should maintain a maximum steam pressure on the locomotive, and have a margin for additional feeding capacity.

3. It should leave the firebox door, and deck as much as practicable, unobstructed.

4. It should maintain an ideal fire for economic fuel consumption.

5. It should distribute fuel in the firebox in such a manner as to reduce to a minimum any necessity for disturbing the fire by means of the hook.

The report is signed by:—A. Kearney (N. & W.), chairman; J. A. Carney (C. B. & Q.); Geo. Hodgins (Nat. Transcontinental Comm.); and J. M. James (P. R. R.).

DISCUSSION.

W. C. A. Henry, (Penna.): We have been making some road tests with locomotives fired with the Crawford stoker, in comparison with hand-fired locomotives. The object of these tests was to determine the relative maximum capacity of the stoker-fired locomotive in comparison with the hand-fired locomotive, and the relative economy also. The locomotive was of the consolidation type, weighing 250,000 lbs and having a tractive power of 42,000 lbs. The grate area

was approximately 55 sq. ft. Brick arches were not used in any case as the fire box construction was too shallow to permit of their use.

The tests were made with run-of-mine coal which had not been selected in any way. The test-runs were 114 miles in length, and the draw-bar pull was obtained by a dynamometer. It was found that in all instances the stoker-fired locomotive gave a draw-bar pull of from 8 to 10 per cent. greater than the hand-fired locomotive. The hand-fired tests were made under conditions very much more severe than the ordinary working ones. The increased tractive power was due to the fact that the stoker would deliver more coal to the fire-box, than the fireman could deliver, and the fire-box had the capacity to burn it.

In one of these tests we got an average coal consumption of 8,415 lbs. per hour on the 114 mile run. This was for the time the throttle was actually open. In one of the hand-fired trips, we got a combustion rate of 7,146 lbs. per hour, but the fireman was receiving considerable assistance. On the trip having the high combustion rate, stoker-fired, the coal rate per square foot per hour was 152 lbs. It was also found that the equivalent evaporation per lb. of combustible was 5 per cent. greater for the stoker-fired than for the hand-fired locomotive.

Table 11 of the report gives the average of all the stokers since the first one was built, and includes the first one, where, as you all know, a successful trip is exceptional. In the last 60 trips, 59 of them were stoker-fired. One of them was 90 per cent. stoker-fired. The average for the 60 trips was 99.8 per cent. A similar stoker in freight service gives 97.3 per cent. These are all working on their runs and not operated under scientific conditions. The conclusion we feel there is no question that the stoker-fired locomotive will not limit the tonnage like a hand-fired locomotive, whereas it can be used to haul the same tonnage at higher speed. A division with a ruling grade, it will not haul any more but it will haul faster. On a low grade division, the stoker-fired locomotive will probably haul 15 per cent. more tonnage.

Smoke readings were also taken, and showed that a stoker-fired locomotive made one-third less smoke than the other, and at the same time dense black smoke was eliminated.

M. D. Francy (L. S. & M. S. Ry.): The stoker, like any other well designed machine, is capable of doing the work though it requires some expert attention. It is possible with the stoker, as it is with other mechanisms, to overdo it. If the machine is intelligently handled and is properly looked after, it is possible to get 100 per cent. efficiency out of it.

It should be considered the same as any other piece of mechanism that is attached to the locomotive. The stoker I have had experience with I am satisfied can do a little more work than the individual fireman, and I am also satisfied that it can give us as nearly 100 per cent. service as any other piece of mechanism we have attached to the locomotive.

M. A. Kinney (Hocking Valley): The Hocking Valley six months ago, purchased 6 Mikado engines weighing 325,000 lbs. with a tractive power of 60,800 lbs., having 66 sq. feet of grate surface, and equipped with a Street stoker. Our experience showed that the results depended largely on the quality of the coal which could be obtained. We use a large amount of so-called coarse slag, which requires some extra treatment to prepare it for the locomotive. Up to the present time, we are having successful trips with the stoker engines in every case. Tests made with the same engine between hand-firing and stoker firing have not developed any particular efficiency in economy of fuel per thousand ton miles, but as I stated, with the coal we have, we are able to obtain this thousand ton miles at a lower price, and the proposition has become very attractive to us. The mechanical maintenance of the stoker on our road is about the same as is reported by the committee. We have had in every case the best co-operation of the enginemen and firemen, especially the firemen.

D. R. McPain. (L. S. & M. S.): I want to impress every person here with the idea that the stoker is coming mighty fast. There is nothing, in my opinion, which has made any greater strides toward perfection, from the time it was conceived up to the present time, than the stoker. I happened to have the privilege recently of looking at a stoker entirely different from anything which has ever been previously tried, and as far as I can see, it is as free from "bugs" as anything ever was at such an early stage of the game. So that I feel quite assured that at the end of four years more that the stoker will receive a great deal more consideration than it is given now.

Angus Sinclair: I had the privilege within the past month of riding on two locomotives equipped with the Street Stoker. I rode on the fastest freight train I have ever been on, a train weighing 3,500 tons, and which was running 50 m. p. h. for close on to 100 miles. Another engine, with a stoker, ran about the same distance and had a load of 6,000 tons. I watched the operation of the stoker very carefully, and never saw any device of any kind or character that did the work more efficiently. I came to the conclusion that the stoker needs a skilful man to watch it. I think the stoker would fail in the hands of a careless fireman.

F. F. Gaines (Cent. of Ga.): There is no question the locomotive stoker has got to come with the large engines. On the other hand, there is another side to the whole thing which, while not decrying the stoker, I wish to call attention to for a minute. Six years ago, on our own particular road, with the class of power we had at that time, we were at the limit of the ability of the firemen to handle the engine, in fact, the tonnage was controlled by the ability of the fireman to put coal into the engine. Today, with larger grate areas, superheaters and other improvements, we are not only using larger engines with considerably more tractive power, but we are getting over the road more satisfactorily and burning less coal with the larger engines than formerly with the smaller engines, and while the improvements which have been made in the way of superheaters, large grate areas, etc., will draw a well-defined line between the hand-fired and stoker-fired engine, yet there is no question the stoker-fired engine has go to come.

T. N. Cook (Penna): In regard to the attitude of the crews towards the stoker, we have met with coolness and lack of co-operation on the part of the men until they become familiar with the apparatus. At first the enginemen are a little skeptical about the stoker, and it has been remarked with each type of stoker that has been put in service on any division, that there has been a characteristic performance. On the first going in of the stoker we get very good results, and then the results begin to drop down. These results, drawn in the form of a curve, make a big dip at one point, and then when the men get better acquainted with the stokers, the curve begins to rise and we get a greatly increased performance with them.

C. F. Street (Locomotive Stoker Co.): I once asked 15 or 20 firemen who were operating stokers on the Norfolk and Western how they liked the stoker and the universal reply was, "Mr. Street, that machine surely is the firemen's friend," and I understand it is pretty well known on the Norfolk & Western Railway as the firemen's friend. I feel that while the stoker is today doing its work and doing it perfectly satisfactorily, it is still capable of further development, and we expect to continue to develop it, as any other device must be capable of further development.

The thing we are now getting ready to do and are actively devoting our time to, is to find out the reasons why certain variations occur in stoker-firing. We will be able, I feel, to eliminate very many variables which have existed with the hand-firing of locomotives, and that we shall be able to get the problem of firing the locomotive down to a much more scientific basis than it has ever been before.

I think Mr. Kearney's statement that the physical characteristics of the coal, the preparation of the coal, has a greater influence on the operation of the stoker than the heat value of the coal, is one of a great deal of importance. It is not a difficult matter to take coal of any size and prepare it for the stoker. On one test made just a few days ago, we took a tank of coal which was half-bone and half coal. It was so low in heat value that it was impossible to maintain steam pressure with the locomotive standing. The best pressure we could get was about 100 lbs. As soon as we started out, the pressure went up quickly to the maximum, and there was no difficulty in maintaining the maximum pressure on the boiler with the boiler loaded to its full capacity. The ash-pan filled up very rapidly, of course. The coal which was used at that time was an experiment and was not taken as a practical working proposition. I think that that would indicate that the failure of engines from poor coal will, with the stoker, be largely eliminated.

D. Petrescu (Roumanian Government Railroad): I am an engineer connected with the Roumanian Government Railroad, and am very glad to be here with you to-day, and to be present at the discussion of this very important question which has troubled us for some time. The locomotive stoker is a thing which we, in our little country, wanted for our railway development. We use small engines, and had to use imported coal, having to pay very high prices for it. We had great difficulty in running engines with hand-firing. First of all, we could not get firemen sufficiently skilled to handle the coal, and we undertook bringing coal from England and abroad at a cost four times greater than is paid in this country. We found there were two things which we must have in hand-firing, a skilful fireman and a good quality of coal. To secure the last point, we had to pay a very great amount of money. We need big engines, but we found we cannot run big engines with hand-firing, and so we adopted the stoker locomo-

tive, and although it is not paying to-day, yet the results are very promising. By the use of the big engines, we can economize and save something like 25 per cent. in the cost of fuel, compared with the engines which we previously used.

D. F. Crawford (Penna.): The development of the locomotive stoker on the Pennsylvania Lines was brought about by a desire to get more tons per train over the road. I have observed in the annual reports of many of the railroads that tons of train hauled per lb. of tractive power was decreasing as the engines grew larger. I found that locomotives 20 per cent. larger than other locomotives were hauling about the same trains and were not realizing the full 20 per cent. increase in tractive power. The stoker problem to me was one of decreased operating expenses by decreasing the train load for each unit on which we had to pay interest and maintenance charges. The stokers as they were first developed on our lines, were applied to the locomotives as they were. The locomotives had about 55 sq. ft. of grate. It was found that we could burn about 100 lb. of coal per sq. ft. of grate with reasonable economy. It was, therefore, my idea that the locomotives should burn 5,500 lb. of coal per hour instead of about 3,500 lb., as the actual records showed.

The results we have obtained have been so satisfactory and so promising, that we are building 110 locomotives in which we have increased the diameter of the cylinder 2 in. and depend on the stoker to put in enough coal to furnish the necessary steam. The first of these locomotives came out of the works this week.

In some of our experiments, we took one of our Consolidation locomotives and bored the cylinders out one inch, all that the metal would stand. While I am not sure that we will do it, we expect to bore all the rest out to the extent of one inch and get the benefit the increased cylinder area. I am satisfied from the performance of the locomotives on which we have made this change, that we can supply a sufficient amount of coal to take care of the larger cylinders. I see before us a locomotive still larger, that must have a stoker, because it will require so much coal per hour to supply. As evidence of my confidence in what we can do, the ordering of one hundred and ten locomotives, I think is sufficient.

As to the results obtained from the stoker in economy of fuel, I thought a good deal about that, and Mr. Henry has described to you some tests which we have made. Personally I do not put much store on tests. I would like much better to draw my conclusions from the record of a year. We will have on our line probably 300 locomotives equipped with stokers. At the end of one year I will take the fuel consumption of those locomotives and compare it with the fuel used by locomotives not fitted with stokers.

In a careful comparative test with picked men it was found that the hand-fired engines used 16 per cent. less coal than the stoker. I then took ten trips for each of ten firemen and did not weigh the coal, but averaged it up, and had it very carefully estimated; we only got 99 trips, as one trip did not have the necessary tonnage. These were the same firemen that used 16 per cent. less than the stoker used; and on the same run. Those same men then used 16 per cent. more than the stokers. In other words, what we have got to do, in my opinion, in order to ascertain what the stoker will do, is to compare it with the average result obtained by the firemen, and not test results.

We have had very careful records kept of the time required to handle hand-fed and stoker-fed locomotives in the engine houses. There have been variations in the records; sometimes the stoker engines required a little more. In the last week's report, laid on my desk, the stoker passenger engines averaged 12 minutes more in the engine house. Four hundred stoker freight engines were handled in some two minutes less than some 250 hand-fired engines. That means the total time the locomotive was in the engine house for repairs.

As to the mileage made by stoker engines; from our record, we obtained the average mileage of the hand-fired and stoker-fired engines on a division in a given month, and I think the stoker locomotives made about 100 miles more per month than the hand-fed engines. In other words, they were the same. Another month, and it was a little more favorable to the stoker engine. That is, with a number of stoker fed engines, the difference is inappreciable between the time required for handling, and the mileage obtained, between the stoker and the hand-fired locomotive. I think the development of the stoker is not a question of what the fireman can do with a locomotive as it exists, today, nor what he has done with the locomotive, in the past. It is what we are going to do with the locomotive; and what we are going to put behind it in earning capacity for the railways.

C. F. Street: Unless you use the miles per hour for coal, your coal record is absolutely useless. I have seen a stoker-fed locomotive with the reverse lever in the corners working full stroke going 18 m. p. h., and no man or no ten men could keep up the steam on that locomotive working under those conditions. This train of 3,500 tons going at 50 m. p. h. was burning coal and the railway was getting results for that coal. That is your whole stoker proposition. The railroad is built to haul freight, and to get it over the road, and the most encouraging thing to me in this whole proposition is that the train dispatchers are the strongest advocates of the stoker.

H. T. Bentley (C. & N. W.): Ten or twelve years ago they made some experiments on the Chicago & North Western with powdered fuel, and we had several difficulties to contend with. The first was to keep the coal dust in the tank. We used the regular tank, and as we rushed along, the wind blew it all away. We also had coal in the fuel box. I can only say that in a general way we tried it, and we failed.

C. D. Young (Penna.): The Pennsylvania Railroad is arranging at present and has equipped itself to make some powdered fuel tests. This has come up in connection with our various schemes of study of different types of stokers. We have found with certain classes of coal, stokers most satisfactory on other kinds of coal, were not satisfactory; and the result we have had with the overfeed or scatter type has not been sufficiently encouraging to warrant the application of the scatter type. For that reason, we will make some preliminary experiments with powdered fuel on the locomotive type of boiler with the forced draft from a boiler steam supply, but not on a locomotive, in order to establish some data as to the burner and size, to see whether it is practicable to apply other fuel to the locomotive type of box, or to cement kilns, in order to get the desired feed capacity for heavy locomotive use.

We have considerable work with the under-feed or Crawford stoker, which does not use the shaking grates, or those ordinary applied to hand-fired locomotives and in comparing the results obtained, which are not entirely incomparable, owing to difference in size of boilers, it is our idea that the under-feed Crawford type is equally as efficient as the most skillful fireman that we employ. How much that would mean in six months or in one year's operation, we cannot say; but I am inclined to think that if a locomotive equipped with an under-feed stoker can equal the performance of a skilled fireman, you need have no great worry as to its economy. It may be interesting to some members to know what we have accomplished with the Schmidt superheater and the Crawford stoker. This boiler was equipped with a brick arch, and had a very large heating surface, the engine being the largest Pacific type in the country, having 27 in. x 28 in. cylinders. It gave an evaporation of 11.1 lbs. (reading from a curve) at 40 lbs. of coal per square foot of grate area which includes the area taken by the retorts; and equivalent evaporation was 6.7 at 140 lbs. per square foot of grate. At that rate, if we only figure the actual area of the grate bars, the firing rate, instead of being 140, would be 180 lbs. per square foot per hour.

In reviewing this locomotive, it was impossible to compare it with a hand-fed locomotive, as it was the only one of its kind which we had; and, therefore, our conclusions are drawn from the basis, largely, of performance in comparison with other locomotives. I will read you a little, in part, some of the conclusions drawn which bear directly on the questions asked: "A stoker, when applied to a boiler of this size, which is beyond the capacity of the fireman, justifies its application through the fact that the maximum power which the boiler is capable of developing can be obtained."

If we use 5,000 or 6,000 lbs. of coal, and this locomotive is capable of burning 10,000 lbs. per hour, or, say, if a fireman will feed 6,000 lbs. per hour, and the locomotive is capable of burning 10,000 with a stoker, it is then possible for you to obtain the maximum of that locomotive with the stoker, whereas you do not come to 60 per cent. of the maximum with the fireman.

"The application of the stoker is warranted on this locomotive in that at least 50 per cent greater boiler power is obtained than would have been obtained with hand-firing, and its limitation of 5,000 lbs. of coal per hour." That is, assuming its capacity on a run which must be sustained for 2½ and 3 hours, this locomotive then would have 50 per cent greater capacity than on a locomotive with a fireman. If the run was a short one, of say one hour, the figures should be reduced below 50. If a longer run, the stoker would even exceed that record.

"When the active grate area is not reduced by the application of the under-feed stoker, as much boiler power per square foot of active grate can be obtained when the stoker has been applied as when a boiler is skillfully hand-fired." We have proven it, and we know pretty well the characteristics of this fuel on these tests, and we know about what limitations of burning per square foot of grate was, and it

was found the application of the stoker did not reduce the coal per square foot of grate.

"Material reduction in smoke by the use of the stoker through a wide range of power was found possible, and compared with any hand-fired locomotive which has been tested. Excepting at very high rates of combustion, the furnace was found to be practically smokeless."

We then made some tests of scatter type stokers, but the information we have does not indicate that they evaporate as much water as skilled hand-fired, per pound of coal. Most of those tests were not with the latest development of the machine, or with brick arches, and did not represent the figures of present-day practice. It is my idea however, that if we have 15 in. of draft in a smoke-box and attempt to burn by a scatter type of a fine coal, that you will have difficulty in getting the capacity of a given coal we are supplying. I believe the larger development of the machine is in the direction of powdered fuel, and as you approach powdered fuel, it would be possible to obtain your large capacities at high firing rates, and for that reason we are trying to get some data on the necessary principles which must be observed in burning powdered fuel.

REVISION OF STANDARDS.

STANDARDS.

Screw Threads, Bolt Heads and Nuts.

The committee recommends the following changes in proportion of hexagon bolt head:

Present Proportion.	Proposed Proportion.
Rough head = $1\frac{1}{2}$ dia. of bolt + $\frac{1}{8}$	= $1\frac{1}{2}$ dia. of bolt.
Finished head = $1\frac{1}{2}$ dia. of bolt + $\frac{1}{16}$	= $1\frac{1}{2}$ dia. of bolt − $\frac{1}{16}$
Rough h ad = $\frac{3}{4}$ times d a. of bolt + $\frac{1}{16}$	= $\frac{3}{4}$ dia. of bolt.
Finished head = dia. of bolt − $\frac{1}{16}$	= $\frac{3}{4}$ dia. of bolt − $\frac{1}{16}$

Gages for Cast-iron Wheels.

A member suggests that the maximum and minimum flange thickness gages shown on plate 14 should be changed to agree with the gages adopted by the M. C. B. Association in 1912. The committee concurs in the recommendation.

Specifications for Iron Locomotive Boiler Tubes.

A member calls attention to the requirement in paragraph 2 that tubes must be within .01 inch of the thickness specified, and suggests that owing to the difficulties of manufacture of the larger sizes of tubes especially, that this limit be raised.

A member suggests that this gage limit be made 10 per cent. on all sizes of tubes.

A member refers to the requirement in paragraph 6, Expanding Test, in which the tube must stretch to $1\frac{1}{8}$ times its original diameter without splitting or cracking and suggests that this requirement be increased.

These suggestions were referred to the committee on specifications for materials used in locomotive construction.

Specification for Seamless, Cold Drawn Steel Locomotive Boiler Tubes.

A member recommends that the chemical requirements as given in paragraph 1 be changed to:

Carbon, maximum	.15 per cent.
Phosphorus, below	.04 per cent.
Sulphur, below	.045 per cent.

instead of

Carbon	15 to 20 per cent.
Sulphur, below	.03 per cent.
Phosphorus, below	.03 per cent.

The recommendation was referred to the committee on specification for materials used in locomotive construction.

Specifications for Steel Blooms and Billets for Locomotive Forgings.

A member recommends that in revising the records the chemical analysis for steel billets, grade B, as shown in paragraph 5, be corrected to read: Carbon .45 to .55 per cent. instead of .35 to .50 per cent. The recommendation was referred to the committee on specifications for materials used in locomotive construction.

Specifications and Tests for Cast-iron Wheels.

A member calls attention to the fact that the specification for cast-iron wheels calls for a minimum weight of 600, 650 and 700 lbs. respectively, while Plate 14 calls for a minimum weight of 615, 665 and 715 lbs., and suggests that the entire specification should be changed to agree with the M. C. B. Association specifications. The committee notes the inconsistency and recommends the adoption of the M. C. B. Association specification for cast-iron wheels.

A member suggests that the specification for cast-iron wheels should include the 70-ton wheels now being furnished by various manufacturers. The suggestion was referred to the committee on engine tender wheels.

Axles for Locomotive Tenders.

A member suggests that the standards should include a 6-in. x 11-in. journaled axle as it is now being used considerably. The committee concurs in the recommendation and suggests the adoption of the M. C. B. Association axle E.

RECOMMENDATIONS.

Allowances of Engine Mileage.

A member calls attention to the second paragraph of the recommendations adopted in 1872, which recommendation is not now in general practice and should be dropped from the records. "That for engines running local freight trains an allowance of six per cent. to the train mileage be added for switching." The committee concurs in this recommendation.

A member calls attention to the third paragraph of the recommendations adopted in 1872, which recommendation is not now in general practice and should be dropped from the records. "That where engines run empty to exceed one-half mile between where trains are taken or left and the roundhouse, such mileage should be computed, and that for engines running through freight or passenger trains no computation should be made for switching." The committee concurs in this recommendation.

General Questions Regarding the Use of Air Brake and Train Air Signal.

A member suggests that inasmuch as the subject of air brake and train signal instruction is receiving detail and special

W. E. DUNHAM,

Chairman, Committee on Revision of Standards.

attention on all roads, and the general subject is frequently changing, these recommendations should be dropped from the records.

A second member suggests that since the records have not been revised since 1904 they should be revised at once by a joint committee of the M. M. and M. C. B. Associations to bring them up to date.

The committee would refer the two questions to the convention for action.

RESOLUTIONS.

A member suggests that in accord with present practices the word "all" should be inserted in the second Resolution of 1886 before the word "flues" making the resolution read:

"Resolved, That it is the sense of this convention that in practice it is unnecessary to bead *all* flues in the front end." The committee concurs in this recommendation.

A member suggests that, inasmuch as no railways include the weight of the locomotive in ton-mile statistics and very few railways include the tonnage of the caboose, the second Resolution of 1902 should be dropped from the records. The committee concurs in the recommendation.

A member calls attention to that part of the Resolution of 1906 which states that $100 should be the limit distinguishing between running and shop repairs and suggests that in view of the present state of the act this figure is very low. The com-

mittee concurs in the recommendation and would refer it to the convention for consideration.

NEW BUSINESS.

A member suggests the adoption of standard dimensions for flange couplings for injectors, as such couplings have begun to supersede the older forms of screw couplings. The committee concurs in this recommendation and suggests that it be referred to a special committee with instructions to cover the subject of screw couplings as well.

A member recommends for adoption as Standard of:

Specifications for rolled steel wheels as adopted by M. C. B. letter ballot 1912 or specification for solid wrought steel wheels.

Rotundity gage for steel wheels.

Plane gage for steel wheels.

Gage for measuring thickness of rim.

Method of branding steel wheels.

The committee does not concur in this recommendation.

The committee desires to call the attention of the Association to the comparatively few replies to its inquiries as made by circular. With an active membership of more than one thousand, but twenty replies were made. Of these twenty, there were five who made no reply to the direct inquiry as to the extent to which the Standards were used. The remaining fifteen indicated an adherence to the Standards in all details of from 25 per cent. to 100 per cent., very few following in full the specifications as given for materials, alterations more or less extensive being indicated in most cases.

It is also noted that out of the full membership only 180 voted the "Letter Ballot" and several standards were adopted on the approval of only one-eighth of the membership.

The committee, therefore, recommends that:

For the purpose of developing and shaping standards to a suitable form for universal adoption by the members the association should have and use "Recommended Practice."

No standard should be adopted until it has been a recommended practice for at least one year.

A standard should require such a substantial approval of the full active membership and the full railroad representative membership on the basis of one additional vote for 100 locomotives represented as will insure its being generally used.

Whenever the association deems it advisable to alter any present, or prepare new specifications for material in which other recognized societies are interested, that the committee in charge of the work should be instructed to request the coöperation of those societies in preparing the specifications.

The report is signed by:—W. E. Dunham (C. & N. W.), chairman; M. H. Haig (A. T. & S. F.), and A. R. Ayers (N. Y. C.).

DISCUSSION.

The secretary was instructed to make the changes requested; the items involving the appointment of special committees and those to be acted on by the association were left to the incoming executive committee.

J. F. DeVoy, (C. M. & St. P.): I would like to ask what the committee had in mind when it concurred in the recommendation for dropping the specifications for wrought iron axle?

W. E. Dunham: At the present time, iron axles are not bought. We did not believe specifications could be made to cover an iron axle now.

Mr. DeVoy: In view of the explanation, we would object to having it dropped. We want the privilege of using a wrought iron axle in cases of necessity.

Secretary Taylor: Mr. DeVoy will have the privilege of objecting to it in the letter ballot.

F. F. Gaines: One other question I would like to bring up. The committee has turned down the 6 in. x 11 in. journal box. Inasmuch as the Master Car Builders' Association will unquestionably bring out that design before another year passes, I should ask that the committee incorporate the 6 in. x 11 in. M. C. B. in ours. We should also adopt the M. C. B. rolled steel wheel unless there are some substantial reasons for not doing so.

W. E. Dunham: Our reason for holding back on the box for the 6 in. x 11 in. axle was the fact that that is only being developed by the M. C. B. Association at this time, and will be a recommended practice of theirs for at least one year, and we did not believe the Master Mechanics should adopt as a standard what is yet recommended practice. The same applies to the rolled steel wheel.

F. F. Gaines: Everyone is using the 6 in. x 11 in. axle journal, and if we cannot have it as standard practice, we should at least have it as recommended practice.

W. E. Dunham: This association has no recommended practice, and the committee does not feel that it wanted to make it a standard.

William Garstang (C. C. C. & St. L.): I make a motion that no standard of this association be adopted until after it has been given at least one year as recommended practice. (The motion was carried.)

F. F. Gaines: I now make the motion that the 6 in. x 11 in. journal box be adopted as recommended practice, and that the committee conform to the M. C. B. standard as far as they have gone, and include it in their final report. (The motion carried.)

F. F. Gaines: I now make the motion that items suggested by the committee be referred to letter ballot.

J. F. DeVoy: We would like to vote for the motion as it stands, with the exception that article 32 (dropping iron axle specifications) be dropped for the reason that it might be commercially to our advantage to have it in any case.

F. F. Gaines: Mr. DeVoy and everyone has perfect liberty to vote on that as he wishes; but as long as the iron axle has been brought up, I do not think even if the commercial possibility of the iron axle is here, I do not think we should encourage it. I think they are unreliable, and I think we should now discourage their use, as an Association.

J. F. DeVoy: We do not feel this Convention should put its condemnation on that specification which harms no one and does no good. The discussion of the iron axle will take more time than Mr. Gaines or myself will have for the next year. I cannot see what harm there is in leaving it in.

Mr. Gaines' motion was carried.

LOCATION OF PUBLIC STENOGRAPHER.

L. H. Marbel, official public stenographer for the exhibitors and members, is located in the balcony of the pier.

FOUND.

A bar pin has been found on the pier and will be delivered on identification at the office of Secretary J. D. Conway, of the Railway Supply Manufacturers' Association.

MASTER MECHANICS' DANCE.

A social gathering and informal dance was held at 9 P. M. last night at the Blenheim Exchange, Marlborough-Blenheim hotel, following the precedent set last year, and was well attended. The following committee was in charge: Edwin F. Chaffee, L. B. Sherman, H. A. Nealley, E. H. Janes, J. B. Purcell, W. J. Caton, H. O. Fettinger and H. J. Sheridan.

NEW LOCOMOTIVES FOR THE L. & N.

In commenting on the work which is being done at the South Louisville shops of the Louisville & Nashville in Wednesday's *Daily* the statement was made that practically all of the new locomotives for that road are built in its own shops and that they were being turned out at the rate of one a month. This is a grievous error and hardly fair to the L. & N. Just now the rate is one a week, which is far more creditable.

R. S. M. A. NOMINATIONS.

At a meeting of the Nominating Committee of the Railway Supply Manufacturers' Association, held yesterday afternoon, Benjamin A. Hegeman, Jr., now vice-president, was named for president, and J. Will Johnson, chairman of the Exhibit Committee, was nominated to succeed Mr. Hegeman. The Nominating Committee consists of Messrs. Blakeslee (chairman), Nellis, Ostby, Reilly, Johnson, Morton and Dolan, each representing one of the seven geographical districts into which the association is divided.

ENTERTAINMENT COMMITTEE.

The entertainment committee has a meeting every morning except Saturday in the balcony above the registration booth to arrange the details of the day's entertainment program.

NEW HONORARY MEMBERS OF M. M. ASSOCIATION.

At the meeting of the association yesterday the following members were elected to honorary membership: L. C. Noble, a member since 1875; J. S. Cook, a member since 1879; E. L. Weisgerber, a member since 1886; W. S. Morris, a member since 1887 and a past president; A. M. Waitt, a member since 1892 and a past vice-president; E. E. Davis, a member since 1893; C. T. McElvaney, a member since 1893, and E. L. Walton, a member since 1896.

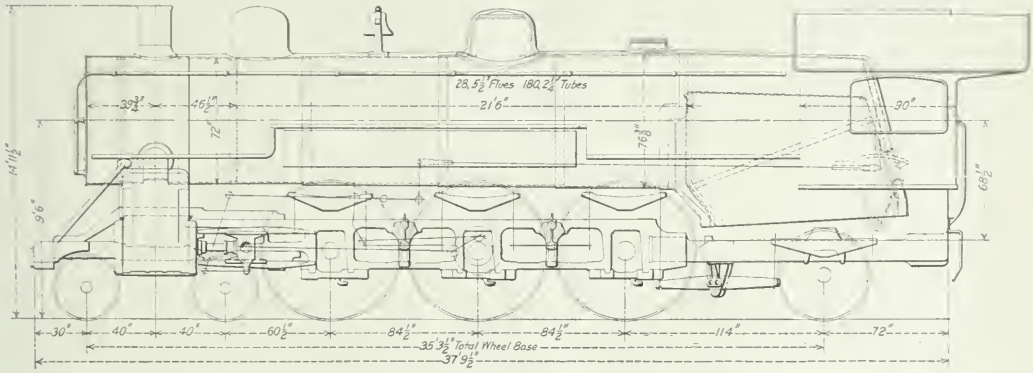
4-6-2 TYPE LOCOMOTIVE FOR THE NEW HAVEN.

The New York, Haven and Hartford recently received, from the Baldwin Locomotive Works, six Pacific type locomotives which develop about 10 per cent. greater tractive effort than the engines of the same type that have been in service since 1907. The new locomotives use superheated steam, and on a heating surface basis, show a superiority of 13 per cent. over the previous design. The tractive effort is 34,600 lbs., and the ratio of adhesions 4.42. The wheel diameter has been increased from 73 in. to 79 in., thus giving the new locomotives an advantage in high speed service. The proportions of the two designs, as far as relative steaming capacity is concerned, are very similar.

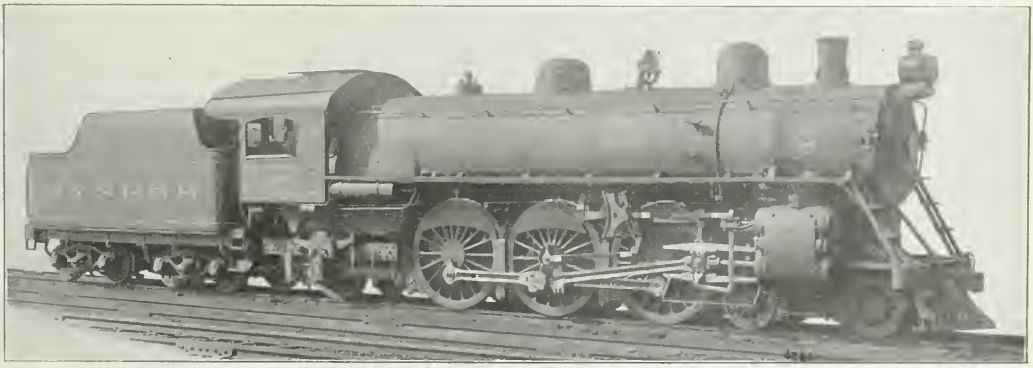
The use of superheated steam in the new engines has necessitated the application of piston valves, in place of the slide valves heretofore employed. The cylinders are fitted with relief and by-pass valves; also with the Wildin automatic valve, developed on this road for admitting a small supply of saturated steam to the cylinders when drifting. The valve gear is of the Walschaert type, the arrangement being generally similar to that used on the previous locomotives. The radius rods are supported directly by the lifting arms of the reverse shaft, instead of being suspended from links, as is frequently done with this form of gear.

The main frames, together with the double front rails and driving pedestal braces, are of vanadium cast steel; the rear frame sections are of forged iron. The pedestal shoes and wedges are of Hunt-Spiller iron. The top and bottom rails of the main frames are braced transversely, mid-way between adjacent driving axles. A vertical expansion plate is bolted to both cross-ties, and is extended upward, forming a support for the boiler barrel. These expansion plates are secured to steel saddle shaped castings which are secured to the boiler shell, and are used instead of the usual T- or angle irons. At the rear end of the boiler barrel is a third expansion plate, and this is bolted to a tie which is placed over the back driving pedestals. A substantial steel casting acts as a transverse brace at the point where the rear frames are spliced to the main frames, and also supports the radius-bar pin for the back engine truck and the carrying-plate for the forward end of the firebox.

The boiler barrel is straight; and the dome is formed from a single piece of flanged steel, 33 inches in diameter and 22 inches in height. All staybolts in the water legs are flexible, and four



Elevation of Powerful Pacific Type Locomotive for the N. Y., N. H. & H.



Superheater Passenger Locomotives, New York, New Haven & Hartford.

rows of flexible bolts support the forward end of the crown sheet. The firebox contains a security sectional brick arch.

The driving and back engine truck axles are of heat-treated, oil tempered steel. Brake shoes are applied to all wheels under the locomotive and tender. The general dimensions, weights and ratios are as follows:

GENERAL DATA.	
Service	Passenger
Fuel	Bit. coal
Tractive effort	34,600 lbs.
Weight in working order	246,200 lbs.
Weight on drivers	153,100 lbs.
Weight on leading truck	49,100 lbs.
Weight on trailing truck	44,000 lbs.
Weight of engine and tender in working order.	365,000 lbs.
Wheel base, driving	14 ft.1 in.
Wheel base, total	35 ft. 3½ in.
Wheel base, engine and tender	63 ft. 4⅝ in.
RATIOS.	
Weight on drivers ÷ tractive effort	4.42
Total weight ÷ tractive effort	7.10
Tractive effort x diam. drivers ÷ evaporating heating surface	815.00
Total evaporating heating surface ÷ grate area	62.80
Firebox heating surface ÷ total evaporating heating surface, per cent.	6.70
Weight on drivers ÷ total evaporating heating surface	45.50
Total weight ÷ total evaporating heating surface	73.00
CYLINDERS.	
Kind	Simple
Diameter and stroke	24 in. x 28 in.
VALVES.	
Kind	Piston
Diameter	12 in.
Lead	5-16 in.
WHEELS.	
Driving, diameter over tires	79 in.
Driving, thickness of tires	3½ in.
Driving journals, diameter and length	10 in. x 12 in.
Engine truck wheels diameter	36¼ in.
Engine truck journals	6 in. x 12 in.
Trailing truck wheels, diameter	51 in.
Trailing truck, journals	8 in. x 14 in.
BOILER.	
Style	Straight
Working pressure	200 lbs.
Outside diameter of first ring	72 in.
Firebox, length and width	108⅛ in. x 71¼ in.
Firebox plates, thickness	⅜ in. & ½ in.
Firebox, water space	F. 5 in. S. & B. 4 in.
Tubes, number and outside diameter	180-2¼ in.
Flues, number and diameter	28-5½ in.
Tubes and flues, length	21 ft. 6 in.
Heating surface, tubes	3132 sq. ft.
Heating surface, firebox	223 sq. ft.
Heating surface, total	3355 sq. ft.
Superheater heating surface	730 sq. ft.
Grate area	53.5 sq. ft.
TENDER.	
Water capacity	6000 gals.
Coal capacity	13 tons

SOCIETY OF RAILWAY CLUB SECRETARIES.

The Society of Railway Club secretaries will hold its annual meeting Saturday morning, at 10 A. M. in Suite 5 of the Marlborough-Blenheim. Presidents and first vice presidents of the railway clubs, being associate members, are to participate.

At the solicitation of friends whose engagements make it impossible for them to attend a social function in the evening, the secretaries have arranged for a luncheon at the Hotel Strand at 12.30 P. M. on the same day instead of an annual dinner as in former years.

Conventionalities.

My, but the missing ladies are numerous!

Mr. and Mrs. Albert C. Ashton and Mother Ashton are staying at the Marlborough-Blenheim.

Have you noticed the information committee badge that Lucian Brown is sporting so proudly?

Mr. and Mrs. W. H. Miner, Chicago, arrived Tuesday by way of New York, and are quartered, as usual, at Chalfonte.

J. H. Mills, master mechanic of the Canadian Pacific at Toronto, Canada, arrived Tuesday afternoon, and is at Haddon Hall.

F. O. Bunnell, Engineer of Tests, Rock Island, Getting Pointers from Frank M. Gilmore, of the E. D. E. Company.

J. C. Kuhns, purchasing agent of the Illinois Central at Chicago arrived on the Special Tuesday, and is stopping at the Dennis.

S. F. Sullivan, H. C. Pierce, R. F. Kilpatrick and E. V. Shackleford, of the Ewald Iron Company, are in attendance at the conventions.

For the first time in many years George Basford is accompanied by Mrs. Basford. They are stopping at the Marlborough-Blenheim.

A. R. Ayers, general mechanical engineer of the New York

H. R. Thomson, Master Mechanic, Newburgh & South Shore.

Central Lines west of Buffalo, is the proud father of a six months' old daughter.

Mr. and Mrs. Charles D. Jenks were among the passengers who arrived Tuesday on the Pennsylvania special from Chicago. They are stopping at the Dennis.

LeGrand Parish motored over with Mrs. Parish from his summer home at Allenhurst, arriving Tuesday afternoon. They are at the Marlborough-Blenheim.

A. E. Manchester, superintendent motive power, Chicago, Milwaukee & St. Paul, and one of the old timers at the conventions, was among the arrivals on Tuesday.

E. W. Pratt, assistant superintendent motive power Chicago & Northwestern at Chicago, arrived with his wife on the Special Tuesday. They are stopping at the Marlborough-Blenheim.

W. English Wilkinson was "all in" yesterday A. M. when he learned that the American team had won the polo match. What we want to know is, was it a bet, or his nationality?

Moses when the light went out was hardly more in the dark than was the enrollment committee on Tuesday evening until O. F. Ostby got busy and illuminated it with two of his lights.

George R. Henderson, of the Baldwin Locomotive Works,

W. H. Lewis, Superintendent Motive Power, Norfolk & Western, Enjoying a Stroll on the Boardwalk.

made his visit to this year's convention brief, leaving last evening.

For the first time as a representative of the Baltimore & Ohio Southwestern, M. J McCarthy, superintendent of motive power, is at the conventions. Mrs. McCarthy and son, William, are with him.

H. M. Perry (who does not think of side bearings when he hears the name of Perry?), one of the old-time master car builders, now mechanical engineer of E. S. Woods & Company, is registered at the Traymore.

Charles J. Pilliod, until recently associated with the Pilliod Bros. Company, has sold his interest in that company and is now representing the Hardy Paint and Varnish Co. He is attending the conventions as usual.

James J. McCarthy, of the Chicago-Cleveland Car Roofing Company, whose activities at these meetings in the past will be remembered, has been detained and will not be here this year.

B. P. Flory superintendent of motive power, New York Ontario & Western, is accompanied by Mrs. Flory again this year. Mr. Flory is president of the Cornell Railroad Alumni Association which holds its annual meeting on Friday evening.

G. I. Evans, of the Canadian Pacific, who is attending the convention, has gained considerably in weight since he laid down the care of the mechanical engineer's office and accepted

F. F. Gaines, Superintendent Motive Power, Central of Georgia.

the responsibilities of superintendent of the locomotive shops at Angus.

A. W. Horsey, formerly mechanical engineer and later master mechanic of the Canadian Pacific, has been on the inactive list for the past two years because of illness. He is attending the convention this year and has almost entirely recovered his health.

A. M. Waitt was seized with an acute attack of roomatism soon after his arrival on Tuesday afternoon. It was due to negligence in not having reserved a room in advance. At last report he was camping on the beach. Taking the mud cure, we suppose.

Thomas Madill, E. M. Richardson, W. B. Albright and E. L.

R. D. Smith, Superintendent Motive Power, Boston & Albany, is in Fine Shape, Thank You!

Graves, of the Sherwin-Williams Company, are guests of the Marlborough-Blenheim during the conventions. Walter H. Cottingham, president of the company, sailed for Europe two weeks ago, to be absent three months.

Clement F. Street is lonely this year. Mrs. Street is not attending the conventions, and his daughter Martha, who has been a regular attendant for several years, was married on June 5 to Henry D. Hooper. Mr. and Mrs. Hooper are now spending their honeymoon in the Adirondacks.

John Purcell, assistant to the vice-president of the Atchison, Topeka & Sante Fe, is attending the convention with Maham H. Haig, mechanical engineer. Mr. Purcell has seldom been known to stray so far eastward, and his friends are wondering how it happened.

T. H. King has recently been placed in charge of general sales for the Landis Tool Company. This in recognition of his many years of specialization on grinding machinery. No one has studied more carefully the conditions existing in railway shops, and his many friends in this field will be glad to hear of his good fortune.

F. S. Anthony, superintendent machinery, Texas and Pacific, Marshall, Tex., and W. E. Maxfield, master mechanic of the same road at Big Springs, Tex., arrived Monday and are stopping at the Traymore. Mr. Anthony stated the thermometer registered 100 deg. in the shade when he left home, and on arrival here he thought he would freeze to death.

C. A. Seley in the Guise of a Supplyman.

Poor penmanship and the traditional intelligent compositor acting in combination converted the exhibit "spaces" on the pier into "shacks" in yesterday's Daily. For the harrowing details see page 1268 of that issue. Needless to say, it was a member of the Hotel Men's Association who protested against the turning of this temple of display into a "shack."

The conventions are unique for Stanley Midgly this year in two ways. This is the eleventh year he has attended them, but the first when he has been unaccompanied by Mrs. Midgly. In addition, it is the first year when he has not come prepared to play baseball. In separating him simultaneously from both his wife and his p'ace at second fortune has dealt rather hardly with him.

When D. F. Crawford, president of the Master Mechanics' Association, registered on Tuesday afternoon, he was much pleased to find that his badge carried the number 29. It seems that when in his younger days, he was attending the Pennsylvania Military Academy he was Cadet No. 29, and since that time he has considered it as his lucky numeral, and as often as possible has selected it as an identification mark on his property.

Only part of the fine coat of sun burn being worn by R. C. Vilas, president of the Pyle National Electric Headlight Company, is due to his enthusiasm for the great game of golf. After having come time ago almost abandoned gasoline automobiles and since then found his way around in an electric, Mr. Vilas recently bought a big locomobile and has been enjoying once more the pleasures of getting away from the boulevards. That explains the rest of the sunburn.

Alex. Turner, president of the Bronze Metal Co., and an

E. W. Pratt of the North Western and J. D. McClintock of Wm. Sellers Co. on the Left.

ex-president of the Railway Supply Manufacturers Association motored down from New York on Tuesday in his new Winton. Mrs. Turner accompanied him, together with Mr. and Mrs. John T. Carroll and Mr. and Mrs. Robert H. Weatherly. Mr. Carroll is Assistant General Superintendent of Motive Power of the Baltimore & Ohio and Mr. Weatherly president of the Pilliod Co. All are stopping at the Marlborough-Blenheim.

There are mighty few people who attend the mechanical conventions who will not be pleased to learn of J. Will Johnson's nomination for vice-president of the Supply Association, for Mr. Johnson had been one of those who have worked mighty hard to make the conventions a success. He served on the entertainment committee from 1905 to 1911. For

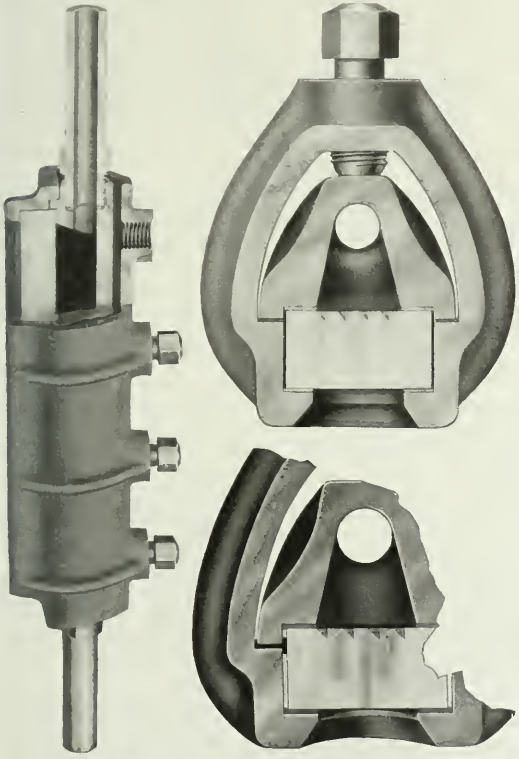
H. T. Bentley of the North Western, and His Daughter Louise.

two years he was chairman of it. Then he was transferred to the Exhibit Committee, and for two years he has been chairman of it. The man who has made a success as chairman of these two committees deserves to be honored by his fellow workers.

IMPROVED KLINGER TYPE WATER GAGE.

An improved design of Klinger type water gage is being exhibited by the Jerguson Manufacturing Company, Boston, Mass., which is claimed to overcome many of the disadvantages of the previous arrangements. This type of gage, in general, has distinct advantages, especially in connection with safety, and it is now being very generally applied to locomotives. This company has manufactured gages of this type since their introduction, and this improved design, which is styled Wiltbonco, W, is the result of a long experience in this field.

The greatest difficulty with this type of gage has been leakage and the breaking of the glasses. In this new design the glass is held by a separate brass back piece which includes the steam and water cavity. This piece is of rigid form, and is held against the glass by four set screws at the



Wiltbonco, W, Klinger Type Water Gage.

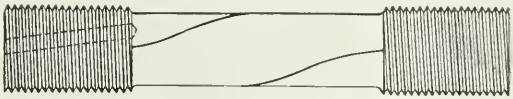
center of the back, giving a uniform pressure on the glass and eliminating most of the breakage of new glasses. Three gaskets are provided to prevent leakage, and each is in a position to do its full duty irrespective of the others. The two gaskets on the front and back of the glass are of fibre, 1-32 in. thick, and the construction allows a liberal seat on the metal. The third gasket is between a lip on the back piece and the main body, and comes at the side of the glass about one-quarter of the distance from the back. This is a 1-16 in. gasket of elastic material and formed so as to seat against the glass as well as between the lip on the back piece and the body. Its shape is shown in one of the illustrations. The introduction of this gasket is one of the principal features of advantage of this new design. Its elasticity is such as to permit any unevenness in the thickness of the glass to be compensated and give an equal pressure on the fibre gasket at the top and bottom throughout the full length, while, at the same time, the elastic gasket will also be steam tight.

Another feature that has received close attention is the matter of weight. The No. 4 size weighs about 5 lbs., which is from 2½ lbs. to 4 lbs. less than previous designs of the same size. In other features the new design is the same as previous Klinger type gages in that the water shows black and steam white, and that the connections are of the proper size and form to allow it to be applied in place of the ordinary round glass without any change in the fittings.

FLEXIBLE BOLT.

The American Flexible Bolt Company, Pittsburgh, Pa., is exhibiting a flexible bolt that involves a new principle in bolt construction. It is designed to withstand bending as well as direct tensile stresses and is especially applicable to boiler staybolts, frog and switch bolts. The latter bolts can also be arranged with some degree of longitudinal resiliency. As will be noted from the illustrations these bolts are not jointed nor are they composed of several parts such as other flexible bolts, but are so made that a considerable degree of flexibility is obtained as compared with the solid bolts, although the completed bolt is of one piece.

The theory on which this staybolt is based is that with a



American Flexible Staybolt Showing Location of Tell-tale Hole.

solid bolt the angular stresses act at a distance equal to that from the center or neutral axes to the outer fiber. With this construction there are two or more neutral axes, spirally arranged, and as these are very much closer to the outer fiber the breaking down stresses are greatly reduced. It has also been noted that when the bolt is vibrated the body portions move slightly on each other and this movment tends to equalize the stresses throughout the cross-section in a manner not possible with a solid cross-section. The most positive proof of the additional flexibility obtained is the difference in power required to vibrate it, as compared with a solid bolt of the same dimensions, whether under load or not.

The method of manufacture is as follows: Two or more

American Flexible Staybolt.

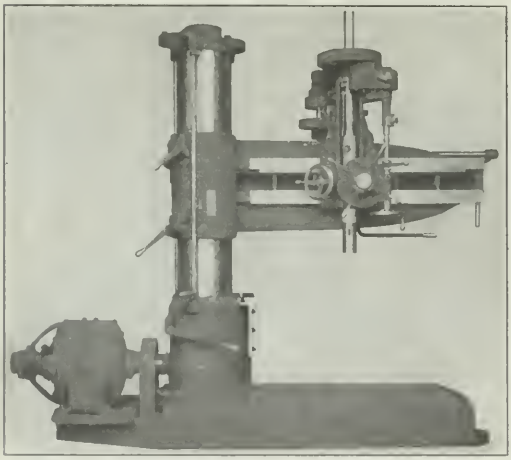
pieces of staybolt iron of the best quality are laid together, ends upset and thoroughly welded. The body between the shoulders is not welded, but is twisted approximately 180 deg. The ends, each 1½ in. long, are threaded with 12 V-threads per inch, accurately to gages as to uniformity; the tell-tale hole, as required by Federal law, is drilled ¼ in. deeper than the requirement. The design of these bolts and the tell-tale hole drilling has been approved by the Boiler Inspection Bureau of the Interstate Commerce Commission. It approximates a rope structure which would be ideal for staybolts if

possible. They are applied to the boiler in the same manner as the solid staybolt, and do not require any special preparation of the boiler. The company will also make solid staybolts similar in outline to the bolt described above, and frog and switch bolts, particularly those for heavy service.

HIGH DUTY RADIAL DRILL.

The 5 ft. radial drill shown in the illustration has been especially designed for using high speed drills. The outer column swings on a fixed inner column reaching nearly to the top, and both are greatly enlarged at the lower end and equipped with a third bearing in the middle which increases the strength and rigidity. The reinforced portion provides means for a large roller bearing to swing on and also for easy and firm clamping; the rollers are taper and of large diameter and no pressure is exerted on them in clamping. The head is provided with bearings of liberal dimensions on the face, and also a third bearing in the rear of the arm, which helps to support the head and prevent undue wear and strain on the rear shaft and the bevel gears and their bearings; it also distributes the torsional strain over the whole arm. The clamping and releasing is done by one lever placed in front of the operator.

Three speed changes are provided, giving 21 spindle speeds



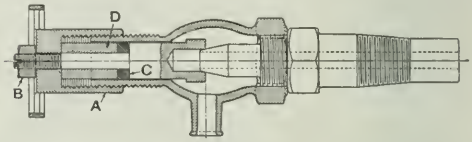
Special High Duty Radial Drill.

which are readily obtained while the machine is running by the operation of a single lever. The driving gear on the spindle revolves on a ball bearing. The feed is geared and has eight changes which can be varied while drilling by a conveniently located handle on the head of the machine. The new automatic stop and depth gage is an important feature. A swinging dog attached to an extension on the spindle sleeve is brought in contact with an adjustable dog on the feed bar. A graduated scale is fixed to this dog and from this the predetermined depth of a hole may be gaged from zero. Several dogs can be put on the feed bar and the swinging dog successively brought in contact with them for different depths.

For use with constant speed motors, a speed variation device is provided which gives seven changes by means of one lever. To overcome the momentum when changing, the machine always runs at the slowest speed by means of a patented, self-releasing over-take clutch; this has nine gears made in large diameters and running in an oil bath. All high speed bearings in the machine are lined with removable phosphor bronze bushings and all other bearings have interchangeable cast iron bushings. This machine is manufactured by the Dreses Machine Tool Company, Cincinnati, Ohio.

"NEVER LEAK" GAGE COCK.

The Nathan Manufacturing Company, New York, has placed on the market a locomotive gage cock which embodies some novel features. The valve has a long conical seat which may be reground and re-cut many times before replacement is necessary, and no movable threaded parts are subjected to the action of steam or water. The movement of the spindle is effected by the threaded sleeve *A*, which moves on the externally threaded neck of the body of the gage cock. There is a slack movement between the handle and the lock nut *B* at the end of the spindle, so that in opening, the sleeve *A* moves slightly without turning the spindle, and when it strikes the nut *B* it pulls the spindle



"Never Leak" Gage Cock.

off the seat without turning it. This prevents the cutting of the seat and at the same time admits of opening the valve with ease. It is also possible to grind in the valve with steam in the boiler by simply moving the sleeve *A* a slight distance back, and turning the spindle around by means of a screw driver placed in the slotted end. This is made possible by the packing *C* which is placed between the shouldered part of the spindle and the sliding cylinder *D*. It is claimed that there is always grit enough in the water to accomplish the grinding without the use of emery or other grinding material.

ARCH TUBE CLEANER.

The importance of keeping the insides of arch tubes clean is fully appreciated by all who have had charge of locomotive maintenance. On account of the size and shape of the tube, however, considerable difficulty has appeared in some bad water districts in properly performing this work. A tube cleaner that has proved successful for this purpose under very difficult conditions is being exhibited by the Liberty Manufacturing Company, Pittsburgh, Pa.

This cleaner is known as the Cyclone arch tube cleaner

Cyclone Locomotive Arch Tube Cleaner.

and is operated by air, steam or water pressure. For water, however, a special design is required. It is of the rotary type carrying a cutter head having either two or three arms, depending on the size of the tube to be cleaned. The motor of the machine consists of an outer casing in which is enclosed a removable hardened steel cylinder; eccentrically mounted in this is the shaft, which has a longitudinal slot in which a pair of semi-balanced blades reciprocate. Provision

is made for taking up the wear in the blades automatically, assuring a tight joint between their edges and the cylinder walls at all times. The air or steam is admitted to the cylinder through longitudinal ports in the walls and since the blades are mounted in the shaft, which is eccentric with the center of the cylinder, the pressure on the blades causes the shaft to rotate and thereby drive the cutter head. The air is conveyed to the machine by an oil proof hose and lubrication is provided by a sight fed lubricator attached to the air supply line. The exhaust from the cylinder requires the air to pass over the bearings both front and rear and in this way they, as well as the cylinder walls, are fully lubricated. This cleaner is operated by from 60 lbs. to 75 lbs. air pressure and consumes from 45 cu. ft. to 50 cu. ft. per minute.

When it is necessary to use steam as motive power a small stream of cold water supplied from a ¾ in. hose, and flowing through the tubes being cleaned, will prevent damage from heat.

The cutter head is attached to the motor by universal joints, and sharpened steel teeth on the end of the swinging arms will loosen and remove all scale on the interior of the tubes. Where the scale is unusually heavy a drill is provided which is rigidly mounted on the end of the revolving shaft.

IMPROVED ENGINE LATHE.

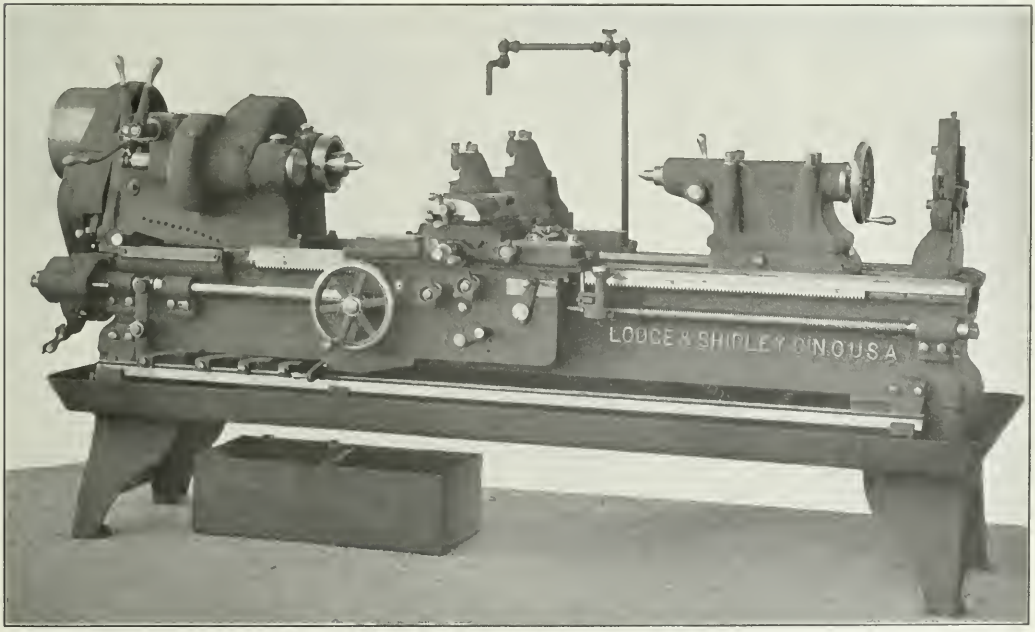
There are several attachments of especial interest on an 18 in. x 8 ft. engine lathe in the exhibit of the Lodge & Shipley Machine Tool Company, Cincinnati, Ohio. One of these is a multiple stop arrangement which provides a combination of adjustable stops for lengthwise and cross feeds, whereby all measurements after the first setting of the tool are obtained mechanically and duplicate parts having two or more diameters and a number of shoulders can be made with entire accuracy and much more rapidly than by former methods. The connected compound and plain rests is another special feature and is particularly desirable for use in connection with the multiple stop. In this construction a second slide carrying a rear tool post and coupled to the compound rest slide is provided. This rear extension is carefully gibbed to the carriage dovetail and is coupled to the regular slide with a tongue and groove. The rear tool block is clamped to the top of this slide by four bolts adjustable along T-slots parallel to the cross slide. This forward and backward movement of the rear tool block allows the positions of the two tools to be regulated so as to minimize the travel of the cross slide to suit the particular work on which the lathe may be engaged.

The connected compound and plain rests in conjunction with the multiple stop are particularly useful for duplicating shafts or castings having several shoulders. A regular lathe tool carried in the compound rest at the front does the turning. After the length feed is automatically tripped and while the carriage is held against the positive stop, which exactly determines the first shoulder position, the cross slide is fed toward the operator withdrawing the front tool from the cut and bringing up the rear tool to quickly square the shoulder and also to neck at that point if the piece is to be subsequently ground. The diameter stop bar is then turned to the next position, the tool stop and the length feed is re-engaged and the next cut forward is started.

Another use of the compound connected and plain rests is to take a roughing cut with the front tool and the finishing cut with the rear tool with one pass of the carriage. The front and rear tools can also be set so as to split the cut and in this way the two tools can travel at twice the speed that a single tool would and yet not exert any more strain on the work.

This machine as shown in the illustration is arranged for belt drive, but the one on exhibition is provided with a motor which drives through a belt. The headstock is arranged to give twelve mechanical speed changes which are obtained through levers located on the front, and either a constant or variable speed motor may be used.

Sixty changes of feed are possible with this tool without taking out or putting on a gear. The change gears are



18 in. x 8 ft. Engine Lathe with Multiple Stop and Compound and Plain Rests with Two Tool Posts.

located beneath the headstock where they are out of the way and protected from dirt and chips. Any change of feed can be made while the lathe is in operation. This company is also exhibiting a 24 in. x 10 ft. engine lathe of similar construction.

GEARED SPINDLE UNIVERSAL MILLING MACHINE.

The Hendey Machine Company, Torrington, Conn., is exhibiting a universal milling machine of a size which has found considerable favor in recently equipped railroad shops. It is provided with an all-geared motor connection, although it can be arranged for a silent chain drive if desired. A reversible motor is used. All feeds are automatic with a travel range in different directions of 30 in. and 10 in. and 19 in. There are 18 changes of spindle speeds provided, all

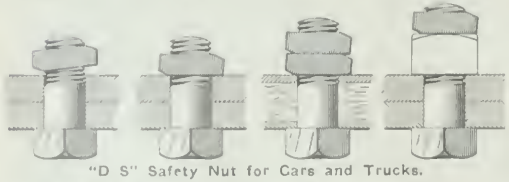
Universal Milling Machine, Motor Driven Through Spur Gearing.

through gearing and the 21 feed changes provide a travel of from $^{3}/_{10}$ in. to 21 in. per minute.

The net weight of the machine complete is approximately 5,000 lbs. It is arranged for convenient operation in every particular and includes all of the latest improvements that have been developed by this company.

"DS" SAFETY NUT.

A new form of lock or safety nut is on exhibition in Space 4 in the main building. It differs distinctly from previous forms of lock nuts and can be used either with or without a standard nut. It consists simply of a thin steel



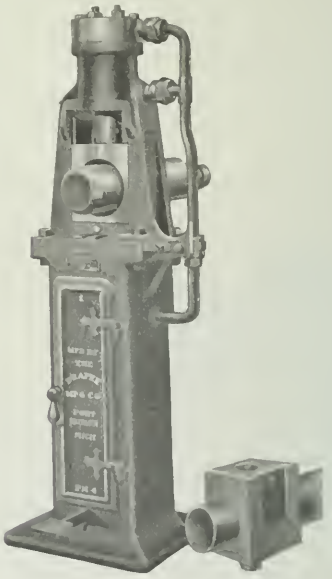
"D S" Safety Nut for Cars and Trucks.

nut with the center line of the threaded opening at a slight angle with face which varies by several degrees from [illegible]. The threads are the same as on a standard nut of corresponding size and it can be run down on a bolt in the usual way.

As will be seen in the illustration the higher side on both faces has been beveled off and when first seated, the nut takes a bearing close to the bolt on one side only. As it is drawn down the sharp edge of the thread at this point enters between the nut below it and the bolt and wedges itself in the thread in such shape that the lower nut is securely fastened. In addition the lock nut tends to assume the horizontal position and in this way grips all of the threads for the full circumference and securely holds itself without in any way damaging the threads on the bolt or the nut. It can be applied either side up and is released by a half turn. The illustration shows several combinations in which it can be used either alone or in connection with a standard nut. It is being exhibited by the Dieter Nut Company, New York.

WELDING SUPERHEATER FLUES.

The pneumatic welding machine shown in the illustration is being exhibited by the Draper Manufacturing Company, Port Huron, Mich., and was designed especially for the welding of superheater flues. The machine is capable, by changing the dies and mandrels, of welding or swedging flues up to 6 in. in diameter. In cases where the welding is done on the large end of the tube the machine requires a set of 5½ in. welding dies and mandrel, and a corresponding set of swedging dies; where the weld is made on the small end, it requires a set of 4½ in. welding dies and mandrel and a set of swedging dies. The manufacturers rec-



Pneumatic Welding Machine for Superheater Flues.

ommend that the first weld be made at the firebox end, the second at the front end and that the third weld be a repetition of the first; and welding the fourth time at the front end, each weld gives a new piece of tube at the part where it is subjected to the greatest heat. A scarfing attachment is also provided for the machine by which both the safe-end and the tube can be scarfed. The machine takes up a space about 24 in. by 36 in., which includes that required behind the machine for the mandrel brackets, so that it can be set very close to the furnace, which is an advantage when handling heavy superheater flues.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,150 copies were printed; that of these 8,150 copies, 6,654 were mailed to regular paid subscribers and 348 were provided for counter and news companies' sales; that the total copies printed this year to date were 206,559—an average of 8,607 copies a week.

VOLUME 54. JUNE 13, 1913. NUMBER 24.

CONTENTS

*Illustrated.

WE publish elsewhere an abstract of a recent article by J. O. Fagan dealing with the labor situation on railroads, and especially with the activities of the legislative representatives of the brotherhoods in promoting train crew and other legislation. Mr. Fagan paints his pictures in broad, long strokes, and therefore they are not always accurate in details. His comments on labor unions sound like criticisms of the unions themselves rather than of objectionable things done by them. The organization of working men is necessary under modern conditions for them to protect and promote their legitimate interests. The trouble with them is that they often seek to promote illegitimate ends or use illegitimate means to promote legitimate ends. Mr. Fagan is also somewhat too severe on public regulation in general, and regulation by the Interstate Commerce Commission in particular. Some regulation of operation is as necessary as some regulation of rates. Since some regulation of operation is necessary, the best body to which to delegate the necessary authority is the Interstate Commerce Commission. The commission often makes mistakes and is sometimes unfair, but it makes few mistakes and is very fair compared with most regulating bodies in this country. However, in its broad outlines the picture Mr. Fagan paints is true to life. It faithfully depicts the power the railway labor brotherhoods have acquired, the ruthless way that power is abused and the public's foolish and harmful attitude of acquiescence in almost everything the brotherhoods demand. However, a change is bound to come. A few years ago the captains of industry were the heroes of every newspaper and magazine writer in the country. Today there is none so low as to do obeisance to a captain of industry. Many of them abused their power, and therefore lost it. The labor leaders are riding for a similar fall. The people of the United States will not indefinitely tolerate the tyranny of labor any more than they will indefinitely tolerate the tyranny of capital.

THERE has been a good deal in the papers in this country and a good deal more in the French papers in criticism of the sale of about $3,000,000 St. Louis & San Francisco bonds through Speyer & Co. to French bankers only a comparatively short time before the St. Louis & San Francisco went into the hands of a receiver. The facts of the case are substantially these: Speyer & Co., in buying the bonds from the railroad company, were under no illusion whatsoever as to the financial condition and future requirements of the property. In reselling the bonds to the large French bankers, they were entirely frank in their representations, and it is safe to say that these bankers and the large investors who bought from the French bankers were fully cognizant of the financial condition of the St. Louis & San Francisco. The American bankers sold the bonds to the French bankers at a very small margin of profit, less than 1 per cent. The French bankers, knowing all the time the exact status of the bonds, sold them to their customers at a profit it is safe to say of over 10 per cent. If any one was not made aware of the risk taken in buying these bonds, it was the small customer of the French bankers. It would seem, therefore, that it is disingenuous, to say the least, for the French bankers to allow the blame for any risk which their customers have unwittingly taken to rest either on American railroads or on American railroad bankers.

IT is interesting sometimes to see just how "new" are some of the problems which those whose duty it is to regulate the operation of railroads are now for the first time confronted with. The latest tentative classification of operating expenses promulgated by the Interstate Commerce Commission provides for an optional charge for depreciation for each one of the material accounts in maintenance of way and structures. Thus Rails includes the cost of material and has the optional further account Rails, Depreciation of. In the 10th annual report of the Little Miami Railroad, abstracts from which are printed elsewhere, which is for the year 1852, the superintendent, W. H. Clement, had occasion to remark:

> The current expenses have been 40 per cent. of the gross receipts, which varies but slightly from last year's results, but we have not, I think, fully provided for depreciation of iron, although perhaps not 20 bars are so worn as to require rerolling, yet a general wear of the surface is going on which in time must absorb the value of the iron. The ties are also decaying, although as yet requiring no renewals. I would suggest the propriety of purchasing iron or of setting aside a fund to purchase it when needed.

Mr. Clement was a practical railroad man and did not deal in theories of railroad accounting. The Interstate Commerce Commission's depreciation "charges" under maintenance of way as now proposed, and under maintenance of equipment, which have been in effect since 1907, are bookkeeping charges only. No actual fund either of money or materials is required. Mr. Clement seems to have been quite unaware that there could be a distinction between a charge for depreciation and an actual

provision for it, and in this opinion he would probably be upheld by a good many practical railroad officers even today.

THE Supreme Court of the United States, in one of the decisions handed down last Monday, annuls an order which was issued by the Interstate Commerce Commission regulating the fare on an electric car line between Council Bluffs, Iowa, and Omaha, Nebraska, holding that, in the law which gives the commission its power, Congress used the term "railroad" in a restricted sense and did not mean to include "local" lines, such as street railroads. In other words, a street car line is not subject to the interstate commerce law, even when it crosses a state line and even when, as in the present case, it runs a part of the way on its own ground, moving cars at high speeds, and is virtually an interurban line, though not a long one. But, surely, such traffic is commerce, and it is interstate; and this decision, like that in the Minnesota rate case, delivered on the same day, seems likely to be notable for the importance of some of the points which it does not decide. The separation of roads, made of steel rails, into three classes, street railways, interurbans and "railroads" has caused much confusion for a dozen years past, and the full text of the present decision will be awaited with interest, for it is time that the questions were settled. Evidently the Supreme Court believes that the duty of settling it, so far as it affects interstate commerce, rests on Congress. As the decision at best will be based on arbitrary grounds, this view has a rational basis. It cannot be assumed that Congress would exclude a street railway on the ground that it is a small affair, for in the District of Columbia it has had no scruples against putting street railroads under the authority of the Interstate Commerce Commission, and has even passed acts directing the commission to take cognizance of the most petty details of car operation; so unless the attitude of congressmen has changed it does not seem likely that they will hesitate to pass a law backing up the commission in the position which it has taken in the Council Bluffs case. That case, decided November 27, 1909, and reported in the Reports, Volume 17, page 239, contains a very full statement of the reasons for and against the different uses of the term railroad and railway, many decisions being cited on both sides of the question of the meaning of "railroad" as used in federal statutes. The commission has for many years held that the term includes electric lines. The Circuit Court took the opposite view, at least so far as to grant an injunction against the commission; and then the Commerce Court (May, 1911.) sustained the commission. Judge Knapp, however, when on the commission dissented, and as a member of the Commerce Court he took no part in the case. The Supreme Court, therefore, has settled numerous delicate distinctions.

THE DECISION IN THE MINNESOTA CASE.

THE first feeling of railway men regarding the Supreme Court's decision in the Minnesota rate case will be one of disappointment. Some of the principal contentions of the expert witnesses and counsel of the railways are emphatically negatived. A closer reading of the opinion may turn this feeling of disappointment into one approaching satisfaction. Several of the principles the railways sought to have established are not upheld. But no principles are established by the decision which in the long run probably can do the roads unjust harm. On the contrary, some of the views expressed are an advance over any uttered by the Supreme Court in any previous case.

There were two vitally important questions involved. One related to the power of the states to regulate rates for hauls beginning and ending within their own border. The other related to the basis on which valuations of railways should be made. As to the first, the railways contended that the power of Congress over interstate commerce was paramount; that Congress by the passage of the Act to Regulate Commerce had asserted its paramount authority; and that therefore any regulation of rates by the states which directly or indirectly interfered with interstate rates was unconstitutional. The state of Minnesota contended, on the other hand, that the states had practically the same power to regulate state rates that Congress had to regulate interstate rates. The Supreme Court holds that under the interstate commerce act as it now stands, the states have full power to regulate intrastate rates, so long as they do not make them confiscatory. But by clear implication it says that the power of Congress over interstate commerce is so completely paramount that it may determine whether any regulation of state rates does unduly interfere with interstate rates, and "may intervene at its discretion for the complete and effective government of that which has been committed to its care." It holds, not that Congress has not the power over state regulation which counsel for the railways have attributed to it, but merely that Congress has not exercised the power. "If this authority of the state (to regulate intrastate rates) be restricted, it must be by virtue of the actual exercise of federal control and not by reason merely of a dormant federal power, that is, one which has not been exerted." The power of Congress in the premises could hardly be more clearly and broadly stated than in the following sentences:

> The interblending of operations in the conduct of interstate and local business by interstate carriers, and the exigencies that are said to arise with respect to the maintenance of interstate rates by reason of their relation to intrastate rates, are considerations for the practical judgment of Congress. If the situation has become such that adequate regulation of interstate rates cannot be maintained without imposing requirements with respect to such intrastate rates of interstate carriers as substantially affect interstate rates, it is for Congress to determine, within the limits of its constitutional authority over interstate commerce and its instruments, the measure of the regulation it should supply.

By this decision the determination of the extent to which the activities of the states in regulating rates should be restricted is found to lie not with the courts but with the people and Congress. Fortunately, there has been for some years a growing recognition of the fact that regulation of railways is a national problem, and that therefore its solution should be left to national action. Therefore it may not be impracticable to secure action by Congress to keep the regulatory activities of the states within reasonable bounds.

The court's attitute toward some of the important points involved in the determination of whether rates are confiscatory is less clear. It repeats its familiar proposition that "the basis of calculation is the fair value of the property used for the convenience of the public." It adds that the ascertainment of that value is "not a matter of formulas, but there must be a reasonable judgment having its basis in a proper consideration of all relevant facts." One of the most warmly debated and most important points regarding railway valuation for rate-making is how land used for right-of-way and terminals should be appraised. Three views have been advanced. Some have contended that land should be appraised at its original cost to the railway. The Minnesota commission, in the valuation on which it based certain of the rates involved in this litigation, held that the proper basis for appraising land used for railway purposes was its present market value. A third view, and the one pressed by the railways in this case, has been that land used for railway purposes should be appraised at what it probably would cost now to acquire it for railway purposes. Experience shows that the cost of acquisition for railway purposes is from 50 per cent. to 1,000 per cent. more than the ordinary market value. The court apparently accepts the view of the Minnesota commission that the correct basis of appraisal is the present market value. The ruling is important. While it does not uphold the railway position, it puts a quietus on the contention that railways are not entitled to benefit by the increment in the value of their real estate.

Another important point decided is that the valuation of the various elements of the property, such as rails, ties, bridges, and so on, should not be based on their cost of reproduction new, but that an allowance should be made for their depreciation after they have been in service and actually have suffered depreciation. It is difficult to escape the conclusion that where depreciation

has actually occurred, it should be allowed for, just as appreciation should be considered where it has taken place.

Both those who have attacked railways and those who have defended them have sometimes taken extreme ground. The Supreme Court has rejected the extreme contention of both and taken middle ground on almost every proposition. While it held that the Great Northern and Northern Pacific had not proved that the rates in question were confiscatory as applied to them, it did not hold as to them that the rates were not confiscatory, and it did find that they were confiscatory as applied to the Minneapolis & St. Louis. As a practical matter, much difficulty and embarrassment are likely to be experienced in applying some of the principles laid down. For example, the Minneapolis & St. Louis, as to which it says the rates are confiscatory, competes at a good many points with the other roads involved, as to which the rates are held to be not confiscatory. The court apparently gives no clue to its idea as to what should be done about rates between competitive points which are on its own findings confiscatory as to some of the competitors, but not as to others. If the latter reduce them, so also must the former, or lose the traffic moved on them.

On the whole, it is probable that when the decision is thoroughly analyzed, it will be found to have advanced the problem of regulation of rates toward a solution which will not be destructive of the rights and interests of railways and which will at the same time be satisfactory to the public. Furthermore, it should always be borne in mind that the courts fix only the minimum below which rates cannot constitutionally be reduced, and that the law makers and public always have it within their power to keep them as much above the limit of confiscation as consideration of the public interests may indicate that they should be kept.

PERFORMANCE OF AUTOMATIC BLOCK SIGNALS.

THE records of the performance of automatic block signals given in this issue of the *Railway Age Gazette*, and in the issue of February 21, contain information of a kind never before published, except in a fragmentary fashion. To railway officers familiar with the operations of the signal department most of the facts given are already familiar, but the information will be found to have interest for these, as well as for others. Automatic block signals now fill an important place in American railroad operation, and the merits of the system, as a means both of economy and of safety, while in a general way well appreciated, are still far too little understood.

The records which we print may be taken as typical in what they show of American practice. Automatic signals depend for their serviceableness on delicate apparatus, requiring the care of well-trained men; and the perfection which is manifest today is the result of a long, slow and costly growth. Bearing in mind this fact, it is matter for decided satisfaction to be able to say that the salient fact observable in reviewing the data which have been gathered in the preparation of these articles is that on American railroads generally the signal system is managed with a high degree of efficiency. The signal apparatus is not perfect, and in the personnel there is room for improvement; but the percentage of faults and failures is exceedingly small; so small, indeed, that, in a sense, the officers in charge have got beyond questions of percentages. One careful and experienced signal engineer, being asked about the percentages of his records, and answering in a way which indicated that he had not compared the records of the different divisions of the road in much detail, explained his position by saying that it was his practice to seek a cure for every individual fault discovered. In other words, his aim is to have the signals operate perfectly, and the fact that there are two faults on one division and one fault, or three faults, on another, is immaterial; all must be attacked. The only standard that can be set up as a goal is theoretical perfection; for any empirical comparison, by records of the past, leads the statistician into such infinitesimal percentages that the mathematical criterion proves worthless. The percentage of dangerous failures is already exceedingly small, but it is to be borne in mind that a single such failure involves the possibilities of results so disastrous that no design of apparatus, quality of moral character, or efficiency of inspection can be deemed satisfactory unless and until it is as good as it is possible to make it.

Another salient fact is the value of records. The fact that statistical comparisons are not so useful as might be desired does not mean that records are useless. They are well worth keeping. Roads which keep partial or imperfect records may not be directly impairing efficiency, but they are neglecting a means of efficiency which is recognized as essential in all matters where the maintenance of high standards is considered necessary. Even if perfection were attained, it would still be desirable to keep on record the affirmative detail evidence of the fact. As long as the service anywhere is anything less than perfect, the records are of some use—at least as a definite premise for comparing the results with the results in former years. Records are necessary for establishing standards of efficiency and for use in correcting neglect or misconduct. The high degree of efficiency of which we have spoken is general, but it would not be safe to say that it is universal. And statistics have a value in spite of the fact that circumstances on one railroad are often so different from those on another that in many elements of the service a satisfactory comparison is out of the question.

Records are especially valuable for measuring the relative efficiency of different kinds of apparatus. The signaling art is still in comparative infancy and is to a considerable extent experimental. Designers and manufacturers have constantly been bringing out new patterns and introducing new principles, while yet their existing apparatus was giving a very good degree of satisfaction and could not be discarded. Though not dangerous, it does keep down the efficiency record; and records should be frequently compared for the purpose of keeping track of the degree of such inefficiency and of the rapidity with which its cause is being eliminated.

Records of signal performance being desirable, the need of uniformity in the records is obvious, and it is to be hoped that the Railway Signal Association will soon agree on a standard to which all railroads can conform. This standard should embrace all features which are essential in an exhibit of efficiency, and also all that are of interest, even though not classed as essential, in so far as they can be included without detriment to the interest of any road and without imposing burdensome labor. In the gathering of material for records, the process, as described in connection with the Baltimore & Ohio—the functions of the engineman, the station telegrapher, the despatcher, and so on—is essentially the same on all the principal roads, except that on some of them it is believed unnecessary to have printed blank forms below the signal supervisor's office. In the final summary record, for a month or a year, uniform arrangement of facts should be considered a fundamental requirement. A number of roads have forms which might readily be adopted, with slight modification, as standards, if only a concerted effort were made to that end. The signal engineer, as a matter of course, should see that adequate measures are taken for the removal of all causes of signal failures, regardless of any minute comparisons with the records of the past; but no one will deny the value of some record, and the criticism of showing too much detail, if it lies against these forms, is one easily met; the discussion of a proper form should begin with one which is too full rather than the opposite.

American railway signal departments may be generally credited with having apparatus, fixtures and appliances of satisfactory design and manufacture. Wherever the kind or quality of any piece or class of material or any mechanism is in any degree deficient, the officers in charge, cognizant of the conditions, will usually be found to be doing whatever is required in the matter of care and maintenance, and to be taking such action, looking

toward replacement, as judicious management demands. To state the case in extreme language, by careful management good service is secured from material not the best. It must be added that in some cases good material gives good service in spite of maintenance seemingly negligent in some respects.

Taking a broad view, it may be said that the signal engineers of the railroads of this country universally aim to establish high standards and to adhere to them. Perhaps the most serious fault among them is delay in effecting improvements which are known to be essential to a satisfactory standard of efficiency. Apparatus which ought to be replaced by improved designs is in some cases tolerated apparently because the danger due to its retention is small. Maintainers not of the highest character for skill and reliability are retained because to secure better men involves a long course of selection and training and, presumably, the payment of higher wages. We speak primarily of the signal engineer, but of course in financial questions his responsibility is not exclusive; his superiors have the ruling voice, and often an overruling voice. Railway signal practice on the great majority of roads can be commended as being characterized by a high degree of efficiency; but railway safety is such a vital matter that high efficiency is not satisfactory; there is still a serious problem in the quest for the highest possible. Perfection is the only true goal.

ADVANCING RATES IN GREAT BRITAIN AND THE UNITED STATES.

WHILE the eastern railways in the United States are seeking approval by the Interstate Commerce Commission of their petition to be allowed to make a horizontal 5 per cent. advance in freight rates, it is of interest to note that the English railways are in a somewhat similar position. A preliminary notice has just been issued on behalf of the railway companies of the United Kingdom to the effect that on and after July 1 their rates for merchandise traffic will, with certain exceptions, be increased by amounts which have been estimated to average 4 per cent. The proposed increases will be passed upon by the Railway and Canal Commission.

There is, however, one important difference between the situation in Great Britain and the United States. It is a practical certainty that the rates of the British railways will be advanced, while there is no such certainty about the outcome in this country. In other respects the conditions in which the English and American roads find themselves are strikingly analogous.

A general railway strike in the United Kingdom in August, 1911, was settled by an arbitration agreement after the intervention of the government for the purpose of putting an end to an industrial dispute which threatened the best interests of the country. The railways agreed to the arbitration program only upon the explicit stipulation that the ministry would recommend to Parliament the passage of a bill giving the railways the right to plead increased labor cost as a valid justification for a reasonable general increase in rates to offset such increases of pay as might have to be granted. The Royal Commission which arbitrated the wage question allowed many increases in wages and improvements in working conditions. The British traders and some representatives of the labor and socialist element put difficulties in the way of the Bill in its passage through Parliament, but it was enacted.

The significance of the promise of the government lies in the fact that by an act of 1894 the railways cannot advance rates above the level of 1892, even up to the legal maxima previously fixed by Parliament, without justifying their action before the Railway and Canal Commission on the ground of an increase in the cost of rendering the particular service involved. Under the legislation recommended by the ministry and recently passed by Parliament the companies will be relieved of the difficult task of distinguishing before the Commission the specific increases in the costs of carrying the various articles, being merely required to show that the cost of handling the entire traffic has been increased to the extent of the wage advance. This, of course, can be easily done.

The action of the British ministry in the crisis that confronted it is a striking example of political opportunism. To keep itself in power it needed labor votes, and it gave the working men an advance in wages. It also promised capital an advance in railway rates, and it acted for the good of the public generally by ending a disastrous strike.

In this country, in addition to various other increases in the cost of operation, such as taxes, advances in the cost of materials, and the additional expenses imposed by legislation, the railways have also been obliged to pay substantial and repeated advances in wages after arbitration practically forced by the government under conditions similar to those which prevailed in England. The Erdman arbitration law, which was passed at the instance of the labor brotherhoods, in no way detracts from their privilege of striking, while it practically forces the railways to submit all demands for increased wages to arbitration by placing them in an untenable position before the public if they refuse. Arbitration proceedings under this act have always resulted in compromise advances in wages which in the past two or three years have added many millions to operating costs. That the railways have been able to stand such increases in expenses for so long has, of course, been due to the general increase in the volume of traffic. The increase in gross earnings is no longer sufficient to offset the increase in expenses, and the railways therefore find themselves in the same position as the British roads.

The outcome in England seems to be a foregone conclusion because the railways are only required to justify increases in rates by increased expenses. In this country advanced rates are required to be reasonable, and the determination of what is reasonable is in the hands of the seven Interstate Commerce Commissioners.

NEW BOOKS.

Proceedings of the Fourteenth Annual Convention of the American Railway Engineering Association. Size 6 in. x 9 in.; 1,491 pages; bound in paper, cloth and half morocco. Published by the American Railway Engineering Association, Chicago. Price: paper, $6; cloth, $6.50, and half morocco, $7.

Although appearing somewhat later than last year, these proceedings are brought out within two and one-half months of the convention, this association being conspicuous for the promptness with which its proceedings appear. The volume this year contains about 250 more pages than that of the preceding year. In addition to the constitution and minutes of the business session, the reports of 21 committees are published. As in past years, most space is devoted to the report on rail, this requiring 410 pages this year and including the revised specifications for steel rails, the annual rail failure statistics and the results of several detailed studies. As in last year's proceedings, the discussions upon these reports are grouped together after the last report to simplify the work of publication. Following these discussions there appear seven monographs covering 304 pages, including "Locomotive Fuel Consumption and the Speed Diagram," by A. K. Shurtleff; "General Specifications for 150-ton, 45-ft. and 60-ft. Track Scales," by H. T. Porter; "Tests of Longleaf Pine Bridge Timbers," by H. B. MacFarland; "Bridges Over Navigable Rivers," by C. E. Smith, and "English Track on the Pennsylvania Railroad," by Jos. T. Richards. The reports included in this volume and the discussions upon them are among the best which have been presented in the history of the association and they will doubtless find a wide demand among others than members. The increasing size of the proceedings from year to year reflects the continually broadening scope of its activities. The innovation first introduced last year of printing the proceedings upon thin paper has been followed again this year. The proceedings are well printed and should make a favorable impression.

Letters to the Editor.

THE WORKING OF THE HINE UNIT SYSTEM.

CHICAGO, ILL., June 6, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

As a matter of justice to the author of the unit system of organization, and to prevent an erroneous understanding in the minds of the multitude of railway officials who are looking for betterments in their organization, it appears a duty to make reply to the article appearing in the *Railway Age Gazette* of May 9, under the caption "A Reverie on the Unit System," by "Observation," and I therefore comment on it seriatum.

It is certainly no reflection on transportation employees to state that there are a great many of them who are derelict in their duty, as it is a well established fact that man in general is as lazy as he dare be, and one of the strong points in favor of the unit system is that it provides ample supervision so that it will not be necessary for one employee to criticize another, or hesitate to point out a duty for fear of retaliation, as scarcely a day passes without some one of the members of the official staff passing over the entire division, and their expanded authority and interest in the division as a whole rather than in their particular department so improves the situation that a better feeling is almost immediately engendered between the various employees.

The unit system is open not only to mechanical men, but to those of other departments, and becomes a part of the process of evolution by placing men gradually in advance positions with added responsibility in order to determine their ability to maintain their equilibrium under greater pressure.

As "Observation" has selected the position of master mechanic from which to draw his conclusions, we will continue to use the master mechanic for illustrative purposes in this article.

The master mechanic is responsible for proper and economical maintenance of the mechanical department, but he is not instructed by the superintendent of motive power (assistant general manager) in any matters, but gets his instructions through the division superintendent to whom he is directly subordinate, and the instructions from the superintendent need no accompanying letter from the president or general manager to strengthen them, as the superintendent and not the assistant reports direct to the superintendent of motive power (assistant general manager), and any difference of opinion is settled between these officers, doing away entirely with the disorganizing feature which formerly existed of passing the word around generally that the master mechanic was in a row with the superintendent and was going to take the matter up with the superintendent of motive power in order to have the division superintendent shown where to "head in." In order to demonstrate the lack of necessity of any subordinate division official communicating with a general officer, the originator of the unit system has omitted the name of general officers from the time card, on the assumption that it is a working time card only, used for the guidance of division employees and that it is not necessary for any division employee to know that a man of higher authority than the superintendent exists.

Under the unit organization, the master mechanic (assistant superintendent) is expected to visit outlying roundhouses as frequently as in his judgment is necessary to regulate mechanical matters, and he is permitted to do this by having a competent man, possibly a mechanical expert, having charge of the superintendent's office, of which he also has become a part, rather than leaving matters in the hands of a chief clerk with no mechanical training. The latter arrangement makes his uppermost thought during his absence from the office the necessity of returning quickly in order that his interests may be taken care of. He is not called to headquarters frequently for conferences, as the superintendent of motive power, having become an assistant general manager, is working under the same system of organization and is passing over the line frequently, discussing these matters on the ground, and with much better results than are possible at headquarters.

By having his office in the building with the superintendent, the master mechanic comes into closer touch with the entire situation, which is materially beneficial to both the company and himself, but there is nothing that demands his visiting the office once each day to handle correspondence, as experience has proven that a great deal of the correspondence formerly needing "personal attention" can, in most cases, be handled equally as well by the man on the "lid," and that a large percentage can just as well be filed (which the chief clerk has no authority to do), as to prolong it indefinitely, with very little to be accomplished except to have the last word, as the organization has now become divisional instead of departmental.

It is a foregone conclusion that the man is qualified to fill the position he is holding, otherwise the appointment would not have been his. The changing of title or issuing of circulars enlarging the scope does not add either knowledge or experience, but it does impress upon those interested the necessity of broadening out, becoming assistant superintendents in the full sense of the word, and this is just what experience has proven.

Under the departmental organization, the master mechanic would, in most cases, be indignant and consider it an encroachment upon his territory and departmental rights to feel that the division engineer, who is, in the majority of cases, an educated, college-bred man, had presumed to incorporate in his vocabulary the term "superheat," and the engineer would be equally as indignant to hear the master mechanic making mention of "superelevation," yet a complete understanding of either subject is easily within reach of the ordinary layman, and it will not be long after the introduction of the unit system until these men will be discussing these subjects and soliciting opinions each from the other on them.

One of the wisest provisions of the unit system is the prohibiting of correspondence between subordinate division officials and the general officers, as no man can well superintend a property when a large portion of his time is taken up trying to keep in touch with what arrangements have been made by his subordinate officers, "shoo-flying" his position and dealing direct, especially when the explanation of the cost of operation is one that he alone is called upon to make.

No conflict of orders or understanding should arise on account of verbal conversation between the master mechanic and the superintendent, for the superintendent is deeply interested in keeping the senior assistant posted on all points, and if these conferences take place at division headquarters, the senior assistant will no doubt be present.

It is presupposed that the organization consists of men who, if called to headquarters to confer on mechanical matters, will understand that it is not "presumably" on mechanical matters, and will not try to use this occasion to get out of their systems the bile that has accumulated on account of the division being run by the superintendent and not by some particular department head.

The above is the unit system as worked out by the originator thereof, and to follow it will increase the efficiency of superintendence at least 30 per cent., and no better proof of this assertion is required than an examination of the operating ratios of the lines now under his charge which will show from 10 per cent. to 20 per cent. less than that of the railroads in general throughout the country.

In presenting his plan, Major Hine, with his usual broad and liberal policy, gave it to the public free of cost, presenting it as a step in the right direction, requesting everyone to study it carefully, note results and improve upon it where possible. This, however, was done only in a very few cases. In some cases a chief clerk was so thoroughly intrenched that it was not deemed wise to displace him, while at the same time it was admitted that he had no qualifications that would permit of his advancement. In others, some of the department heads offered as an

excuse for opposing the organization that their case was so different from all others, and that they would lose their identification by this change in title, yet I believe that it will be conceded that a man who has specialized in any line only to the point where his identity will be lost should his tag of identification in the way of a title be taken away from him, has not advanced sufficiently far to entitle him to much consideration, and the catering to this feeling has brought about a condition on some divisions that would justify the originator in taking determined action to dissociate his name from some abortions which are attributed to his creation.

General officers have in some cases also disliked very much to lose control of their trusted division employees, who had been their watch dogs and in most cases the chief disturbers on the division on which they operated.

The Standard Code is a success, because of its being adopted by nearly all roads; the Interstate Commerce Commission's system of accounting is a success because of the penalty for its violation; the Hine system will be equally as successful when men realize that the railway organization as a whole is of greater moment than their departments, a thing which most men cannot, or will not, see. EXPERIENCE.

CAR UNDERFRAME DESIGN.

SCRANTON, Pa., May 19, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your issue of May 16 you published an article regarding the design of steel underframes for cars by F. F. Gaines, superintendent of motive power of the Central of Georgia. I agree with Mr. Gaines that the best designs have been produced by a process of elimination and substitution, based upon repair track records as well as observation. A great deal of the trouble experienced today is the result of steel underframes built from an engineering or mathematical standpoint. The theory of tying the center sill or member in proportion to the width of its flange may be mathematically correct, but does not prove out in service. It is a common occurrence to find them buckled within 12 in. back of the body bolster. Cover plates unquestionably should be extended through the body bolsters, both top and bottom, as far as the draft rigging will permit, in connection with a wide top bolster plate which will act as a gusset plate as well as assist in carrying the vertical load, thereby protecting the car against lateral stresses and a tendency to break down the center sills at the bolsters. Mr. Gaines' views appear to me to be very sound and worthy of serious consideration in designing steel underframes for freight car equipment.

J. C. FRITTS,
Master Car Builder, the Delaware, Lackawanna & Western Railroad Co.

ENGINEER, ENGINEMAN OR ENGINE DRIVER?

NEW YORK, May 16, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the issue of the 15th inst. of a New York journal, which, by reason of its deliberate and persistent practice in the matter to which I refer, will be recognized without being named, I find a news item, which I abridge as follows:

Prominent Engine Driver a Victim in a Wreck.

Decatur, Ind., Monday. J. Ray Dickerson, engine driver, and Emery Hoole, fireman, both of Huntington, Ind., were killed five miles east of here when an Erie passenger train running on a temporary track ran off the road. No passengers were killed or injured.

"Dickerson, engine driver, was a member of the last Indiana Legislature," etc.

As you are well aware, the Erie does not have any employee known as an "engine driver" in its service, and it is probable that the management of the journal referred to is equally aware of that fact, it having been respectfully informed that no railroad in the United States carries an employee so designated on its pay roll. It, however, not only continues to invariably use this incorrect and unwarranted designation, but also, from time to time, makes a deliberate falsification of facts, by printing interviews with railroad officials, as to accidents, in which, *between quotation marks,* the official is reported as stating that the "engine driver" did thus and so, when, as a matter of fact, he spoke *correctly,* and said either "engineer" or "engineman."

I have no desire to discuss the propriety of terming the runner of a locomotive in the United States, an "engineer," and do not doubt that the term "engineman," which is in general use, is a properly descriptive one. There is, however, no warrant or excuse whatever for the misnomer, "engine driver," and it is moreover, offensive and derogatory, in view of its frequent, and in the case of the journal referred to, apparently *intended* application (like that of the word "greaser" to the former engineer officers of the United States Navy), as a term of contempt. The practice appears to me to be a piece of cheap and sloppy snobbery, and the public should recognize it as such.

J. SNOWDEN BELL.

THE IMPORTANCE OF THE STATION AGENT.

SALT LAKE, Utah, April 25, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The salary of a station agent, a subject treated in your issue of March 28, has seldom received the careful consideration which it demands as a feature of an important branch of the service. Who but the station agent is the direct representative of the company in its dealing with the public, and who has greater power to promote the interests of his company, secure business, and hold it, especially in competitive territory? The rates of pay, except at terminals and cities, have to a large extent been fixed on the basis of labor union demands, with perhaps a compromise, and the result is a schedule that is seldom entirely satisfactory to the men themselves, much less to the company which does not get the benefit which the increased salaries should bring, for the reason that to a great extent "seniority" is of no value as a standard by which to judge of the qualifications or fitness of an agent. This knowledge is only gained by personal contact with the man, observing his dealings with the public, his promptness in answering correspondence, attention to matters involving loss or damage to freight and the general appearance of his office. Superintendents seldom get well enough acquainted with their agents to learn these things. Salaries cannot be equitably based on the amount of a station's earnings, or the percentage of expense necessary to run it, for the reason that one station may handle largely carload lots, while another may handle L. C. L. and transfer; with a much lower revenue, but a greater amount of work. In many cases agents are allowed no latitude in increasing their clerical force when that is necessary to care for increased business. Sometimes after a long and tedious correspondence, during which time the office has become "snowed under," and the force demoralized; and the agent has had to devote his time to detail clerical work, when his services are needed elsewhere, he is grudgingly allowed an extra man.

Pay the agent what he is worth, as measured after acquiring a personal knowledge of the requirements of his station. Get acquainted with him, show him you have a personal interest in him, and make an occasional inspection of his premises. If he is filling the bill he will appreciate the superintendent's visit and be stimulated by it. On the other hand, if an agent is negligent or lacking in energy it is the superintendent's duty to make the visits so as to know the situation at first hand.

F. F. B.

ICHANG RAILWAY, CHINA.—Work on the Ichang railway has never been resumed since October, 1911, when it was stopped on account of the revolution. The completed work on the right of way is now in a deplorable state of disrepair and will have to be entirely renovated when work is once more resumed. The buildings are in fair condition, having been used as barracks.

MECHANICAL STOKERS FROM OPERATING STANDPOINT.

Heavy Trains Are Being Successfully Operated on Four Large Roads by Locomotives Equipped with These Machines.

The mechanical stoker for locomotives has always been considered of more interest to the mechanical than to the operating department, probably because it is purely a mechanical device. Where used it has, however, a very important bearing on operating results. There is no doubt that it has passed the experimental stage and is now on a commercial footing, and that its use will extend rapidly wherever heavy traffic has to be moved. Up to a little over a year ago stokers had been applied experimentally to a few locomotives only; there are now in regular service 342 locomotives equipped with stokers and 313 to be so equipped are on order.

It is not the intention to deal here with mechanical details. It has been through the co-operation of such roads as the Norfolk & Western, Chesapeake & Ohio, Baltimore & Ohio and the Pennsylvania with the stoker manufacturers that the mechanical difficulties have been overcome to a sufficient degree to bring the stoker to its present status, and with a continuance of this co-operation the failures due to mechanical imperfections should be reduced to a minimum in a comparatively short time. Changes in details are being made wherever experience and service indicate that they should be made, but it is unreasonable to expect that mechanical failures will ever be entirely eliminated any more than they are from the locomotive.

There seems to be a difference of opinion regarding the ability of stoker-fired locomotives to haul more tonnage than hand-fired. On the Pennsylvania Lines west of Pittsburgh the tonnage of stoker-fired locomotives on slow freight is increased 15 per cent. over that of the hand-fired locomotives, and the Baltimore & Ohio also states that it is possible to haul more tonnage with the stoker-fired locomotives. Whatever increase in hauling capacity there may be is evidently due to the more uniform steam pressure obtainable where the stoker is used and the ability of the machine to fire in an efficient manner, enough coal to maintain the working pressure under conditions which the average fireman might not meet; for the same reason a better average speed is possible. It is generally conceded that a locomotive can be worked much harder when stoker fired than when fired by hand, as there is no question of the machine being able to supply any quantity of coal that the firebox will burn; the stoker will not, of course, increase the maximum or starting tractive effort.

No definite data is yet available as to any saving in fuel, but it is probable that a saving can be shown, owing to the more satisfactory conditions, such as a lighter fire and the keeping closed of the firebox door; the maintaining of a lighter fire also permits steam to be raised to the working pressure more rapidly than with the deep beds of coal commonly used in hand firing. Moreover the thinner fire saves approximately half the time usually occupied in cleaning and dumping the fires of hand-fired locomotives at terminals or on the road.

On the Pennsylvania system there are 155 stokers of the Crawford underfeed type in use, 153 of these being on the lines west of Pittsburgh. The accompanying table gives a performance record of the latter.

This shows that up to February 28, 1913, the stoker-fired locomotives had made 31,910 trips, of which 19,475, or 61 per cent., were trips on which the stoker fired 100 per cent. of the coal burned; and only 16.3 per cent. of the trips were below 70 per cent. stoker-fired.

The locomotives now equipped with stokers on the Pennsylvania lines west of Pittsburgh consist of 116 consolidation (2-8-0) type, 35 Pacific (4-6-2) type passenger and two six-wheel (0-6-0) switchers. It is probable that all heavy power built for this road in the future will be so equipped, and 140 locomotives are now on order which are to be stoker-fired.

Performance of the Crawford Double Underfeed Stoker on the Pennsylvania Lines West of Pittsburgh, Including All Trips of All Stokers from the Experimental Installation to February 28, 1913.

Coal fired by stoker in per cent. of total coal fired.	Number of trips.	Per cent. trips of total number of trips.

Total	31,910	100.0

On the Norfolk and Western there are in service 40 Mallet (2-6-6-2) type locomotives fitted with the Street stoker. These locomotives have cylinders 22 in. and 35 in. x 32 in., 56 in. diameter drivers, 5,006 sq. ft. of heating surface, 72.2 sq. ft. of grate area and a tractive effort of 73,000 lbs. The weight in working order is 405,000 lbs., of which 337,300 lbs. is on the drivers. Twenty of these locomotives are working on the west end of the Norfolk division between Roanoke, Va., and Crewe, 130 miles; a profile of this section of the road is shown. Freight trains use the belt line around Lynchburg in order to avoid the dip caused by the valley of the James river. There are used at different points between Roanoke and Crewe, 4-8-0 type locomotives as helpers, the class M having a tractive effort of 40,100 lbs., and the class M-2 and M-2-c having a tractive effort of 52,400 lbs. The Mallet locomotives are known as class Z and the tonnage rating for this portion of the road is given in one of the tables.

Estimated Tonnage Rating, Class M, M2, M2c and Z Locomotives, Norfolk & Western (Norfolk Division), Between Roanoke and Crewe.

M	Roanoke to Bonsack	1,600 tons
M2	Roanoke to Bonsack	2,000 tons
M2c	Roanoke to Bonsack	2,200 tons
Z	Roanoke to Bonsack	3,000 tons
M	Bonsack to Blue Ridge	1,000 tons
M2	Bonsack to Blue Ridge	1,250 tons
M2c	Bonsack to Blue Ridge	1,440 tons
Z	Bonsack to Blue Ridge	1,850 tons
Z + M2	Bonsack to Blue Ridge	3,100 tons
Z + M2c	Bonsack to Blue Ridge	3,250 tons
Z + Z	Bonsack to Blue Ridge	3,700 tons
M2	Blue Ridge to Phoebe	1,900 tons
M	Blue Ridge to Phoebe	1,600 tons
M2c	Blue Ridge to Phoebe	2,200 tons
Z	Blue Ridge to Phoebe	3,100 tons
M2	Phoebe to Farmville	3,500 tons
M2c	Phoebe to Farmville	4,025 tons
Z	Phoebe to Farmville	5,100 tons
M	Farmville to Burkeville	2,100 tons
M2	Farmville to Burkeville	2,500 tons
M2c	Farmville to Burkeville	2,800 tons
Z	Farmville to Burkeville	3,700 tons
M2	Burkeville to Crewe	No limit
M2c	Burkeville to Crewe	No limit
Z	Burkeville to Crewe	No limit

The movement of loads in slow freight is east, the traffic being largely coal. The practice followed is to start a Mallet locomotive double headed with a class M-2 from Roanoke yard with a train of 5,000 tons, but when the Mallets are ready and there does not happen to be a full train in the yard they are started with whatever tonnage there is, with or without a helper according to the rating. With 5,000 tons the Mallet and the M-2 locomotives haul the train to Bonsack. From Bonsack to Blue Ridge a Mallet pusher is added to the train and from Blue Ridge to Phoebe the train is hauled by the two original locomotives, the M-2 class being needed for the grade from Posm to Phoebe, where it is cut off and the train proceeds to Crewe with the Mallet locomotive alone with the exception of 16 miles between Farmville and Burkeville, where a class M-2 pusher is used. One of the diagrams shows the record for part of April, 1913, of eastbound trains hauled by Mallet locomotives. This record

covers about two-thirds of the month and is representative of the whole month.

The upper part of this diagram gives the tons in each train and by referring to the two lower parts the total time on the road and the total delay for the same train are obtained. This diagram is compiled from the superintendent's daily reports from which the following extracts are taken as examples:

"Mallet locomotive 1316, 53 loads, 3,708 tons (slow freight) left Roanoke 3:10 a. m., arrived Crewe 4:45 p. m. April 2. Did not have double header from Roanoke to Phoebe, but had pusher from Bonsack to Blue Ridge. Delayed 45 min. at Irving on account engine failing, water valve blowing off. Total time, 13 hr. 35 min."

"Mallet locomotive 1321, 70 loads, 5,017 tons (slow freight) left Roanoke 11:10 a. m., arrived Crewe 10:25 p. m. April 2, M-2 locomotive 1122 double heading Roanoke to Phoebe. Delayed 1 hr. 20 min. at Lowry account broken drawheads and setting 6 cars. Total time, 11 hr. 15 min."

"Mallet locomotive 1320, 52 loads, 3,656 tons (slow freight) left Roanoke 11:15 p. m. April 7, arrived Crewe 1:00 p. m. April 8. Did not have double header, but had pusher Bonsack to Blue Ridge. Total time, 13 hr. 45 min."

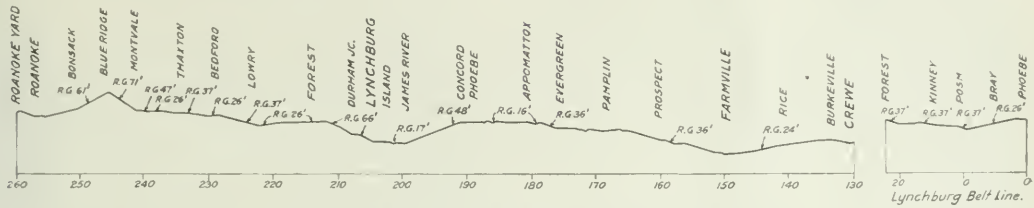
The mileage of the 40 Mallet locomotives during March, 1913, was 80,500, and the total stoker failures was 13, the mileage per stoker failure being 8,115. The total engine failures attributed to the stokers from April, 1912, to January, 1913, both months inclusive, was 45, an average of 4.5 per month, the greatest number for any month being 12 during January, 1913. Of the 45 failures, 14 were due to improper handling, 7 to lack of lubrication, 1 to a hidden defect, 9 to fresh breaks or trouble with the machinery, 5 to shop failures and 9 to the stoker becoming blocked up with wood, etc. In this connection it should be remembered that a failure of the stoker is not necessarily an engine failure, as the fireman may be able to fire by hand. The mileage of the 40 Mallets from April, 1912, to January, 1913, was 525,563, the mileage per stoker failure being 11,679, and per failure other than stoker 3,526. The percentage of the total failures due to the stokers was 23.2.

The Norfolk & Western, in order to obtain small sized coal for the stoker locomotives passes run-of-mine coal over a 2½ in. mesh screen, this being the size of the screen on the stoker feed. The slack and small lumps are then available for stoker use and the larger lumps pass on to another part of the coal chute and are used for hand fired locomotives. This practice provides the latter with a better quality of fuel than they would otherwise obtain.

Record for Part of April, 1913, of Eastbound Trains Hauled by Mallet Locomotives on N. & W. Between Roanoke and Crewe.

On the Chesapeake & Ohio there are in operation 54 locomotives equipped with Street stokers. Of these the greater number are of the Mikado (2-8-2) type, having a total weight of 315,000 lbs., weight on drivers of 243,000 lbs., 29 in. x 28 in. cylinders, 56 in. drivers, 4,052 sq. ft. of heating surface and 66.7 sq. ft. of grate area; their tractive effort is 60,800 lbs. On the Huntington division five of these locomotives are assigned to manifest trains between Russell, Ky., and Hinton, Va., 167 miles, and four are assigned to the same service on the Hinton division between Hinton and Clifton Forge, Va., 180 miles. The rating for manifest trains, eastbound, is 2,500 tons adjusted for a speed of 20 miles per hour, while westbound the lading is of such a character that a tonnage rating is not feasible and a limit of 65 cars is placed on the trains. On the Huntington division

the schedule for manifest trains, eastbound, is 11 hours, and westbound 11 hours, 20 min. The ruling grade in both directions is 0.3 per cent. On slow freight the locomotives operate between Russell and Handley, 94 miles, and between Handley and Hinton, 73 miles, the rating being 6,000 tons. The slow



Profile of the N. & W. Between Roanoke and Crewe, Va.

freight traffic is almost entirely coal, the loaded movement being westbound. Some difficulty has been experienced owing to the Street stoker requiring coal which will pass through the 2½ in. screen of the conveyor, and in the accompanying tables the percentage of failures due to this cause is shown. This trouble can be avoided by supplying either slack or lump coal of the right size. The tables are taken at random.

	Per cent. of coal fired by stoker.	Number of trips.	Per cent. failures from mechanical defects.	Per cent. failures due to coal and screen.

Owing to the washout of the Guyandot river bridge, the Chesapeake & Ohio was operated far below normal during the months of January and February, 1913, and figures for those months are not representative. The table below gives the performance of Mikado locomotives on the Huntington and Hinton divisions during part of March, 1913. The entire train record for the month is not included, but several days were taken at random.

Engine No.	Trip made From	Trip made To	Per cent. of coal stoker fired.	Tonnage.
844	Handley	Russell	100	2,800
818	Handley	Russell	100	3,000
817	Cane Fork	Russell	100	6,000
816	Handley	Russell	100	2,500
813	Handley	Russell	100	4,000
842	Handley	Russell	100	2,500
815	Cane Fork	Russell	100	6,000
824	Handley	Russell	100	6,000
845	Handley	Russell	100	2,500
841	Handley	Russell	100	3,000
843	Cane Fork	Russell	100	6,000
815	Cane Fork	Russell	100	6,000
818	Handley	Russell	100	6,000

The locomotive miles per stoker failure on the Huntington division for March, 1913, were 9,167, and on the Hinton division during the same month there were no failures. For November and December, 1912, and January, 1913, the performance of the entire 54 locomotives was 4,474 miles per stoker failure.

Apart from relieving the fireman from physical exertion, a point upon which the operating officers of the Chesapeake & Ohio lay particular stress is that he is made available as one of the train crew to watch for signals and otherwise assist the engineman. J. R. Cary, general superintendent of the West Virginia general division, which includes the Huntington and Hinton divisions, also emphasizes the fact that the firemen and enginemen have worked heartily with the officers to make the stokers a success. When the stoker-fired locomotives were first placed in service special coal was provided and the road foremen and a few chosen firemen were instructed by experts until familiar with the machines; these men were then available as in-

structors, and as the men became used to the stokers the special coal was gradually eliminated and a return made to the regular coal.

The Baltimore & Ohio has in service 64 locomotives equipped with the Street stoker, 50 of which are Mikados and are operating between Brunswick and Keyser on the Cumberland division, a profile of which is shown. The general dimensions of these locomotives are as follows: Total weight in working order, 282,200 lbs.; weight on drivers, 223,600 lbs.; cylinders 26 in. x 32 in.; diameter of drivers, 64 in.; heating surface, 3,968 sq. ft.; grate area, 70 sq. ft.; tractive effort, 54,500 lbs. There are also in service on the Cumberland division 13 Mallets (0-8-8-0) locomotives weighing 461,000 lbs. and having a tractive effort of 105,000 lbs. This road also intends to apply stokers to 126 additional locomotives.

Officers of the Baltimore & Ohio state that the stoker-fired locomotives are capable of hauling more tonnage and making better speed than those which are hand-fired; this is because of the stoker's ability to supply coal enough to the firebox to keep up the working steam pressure under conditions impossible for the average fireman to meet, as mentioned elsewhere in this article. The stokers are particularly valuable in the summer months, when the heat on these large locomotives becomes very trying to the fireman who has to fire by hand.

The accompanying table gives examples of trains operated on the Cumberland division, with data regarding time made and the labor performed by firemen on stoker-fired locomotives.

Considering the number of mechanical stokers now in use, the service which they are giving, and the number of locomotives which are being so equipped, there can be no doubt as to the future of the device. That it has advanced beyond the experimental stage is certain, and it is more than probable that, with the improvements being made from time to time, the failures will be rapidly reduced to a minimum. It seems to be generally agreed that the stoker will supply any amount of coal which a firebox will consume, and therefore that it will maintain a more uniform steam pressure than can be obtained by hand firing. The question of the larger types of locomotives being beyond the physical strength of a man to fire successfully can be readily settled by the adoption of the stoker, as there is no question as to its ability to do so. In considering the adoption of the stoker it would seem that each road will have to solve the problem largely from a close survey of its own conditions, but wherever heavy tonnage has to be moved over heavy grades by large locomotives there can be little doubt that the stoker can be used to advantage.

Electrification of Russian Railways.—The Russian Minister of Finances has introduced to the Duma a bill concerning the electrification of suburban railway lines.

Arica-La Paz Railway Traffic.—The traffic expected by the management of the Arica-La Paz line is not coming out as readily and as easily as anticipated. The reason for this is doubtless to be found in the rates, which are much higher than those upon the Mollendo route, which is the enterprise of the Peruvian Corporation's Southern line. The Arica-La Paz traffic department has received an intimation from the different mining companies, whose output it was hoped that it might handle, to the effect that the freight rates fixed will force them to continue their shipments via Mollendo. Moreover, the steamship companies have now fixed a much lower tariff rate for all Peruvian ports than for Chilean. The mining companies contend, and with good reason, that no profit can be earned by them under the present conditions on 15 per cent. ore, and that they will have to suspend operations altogether soon in regard to low-grade ores should the price of copper fall still lower. They allege that 8 per cent. grade ore is abundant in the district of Corocoro, and being almost at the surface, it entails very small expense in extraction. The mining of this low-grade ore will, however, depend entirely upon the transportation rates to the coast

W. J. JACKSON.

William J. Jackson, who has been vice-president and general manager of the Chicago & Eastern Illinois, at Chicago, for the past three years, and who was last week appointed one of the receivers of the road, was elected president at the annual meeting on June 5, to succeed B. L. Winchell, who was appointed one of the receivers of the St. Louis & San Francisco. Mr. Jackson has been in the service of the road continuously since 1891, when he became connected with it as assistant local freight agent at Chicago, and has risen by steady promotion to its operating head.

Aside from his work for his own company, in which he has won an enviable reputation for operating ability, Mr. Jackson is, perhaps, best known to the railway world through his work in the important position of chairman of the Special Committee on Relations of Railway Operation to Legislation, which he has held since the death of F. O. Melcher, in January of last year. He was also chairman of the General Managers' Association of Chicago, and of the Association of Western Railways in 1911, and is a member of the important Committee on Relations Between Railroads of the American Railway Association.

W. J. Jackson.

Mr. Jackson is a man who has obtained his present position by persistent hard work and faithfulness, and is another example of the many railway executives who have worked their way to the top only after learning the business from the ground up. He was born at Toronto, Ont., December 28, 1859, of Scotch-Irish parentage. His father was a hardware merchant. After obtaining his education in the grammar and normal schools of Toronto he entered railway service in 1877 as machinist's helper in the Grand Trunk shops at Toronto. After a few months he was transferred to the freight department. For three years he was a freight clerk at Toronto, and for approximately three years more was chief claim clerk of the Chicago & Grand Trunk at Chicago. From August, 1885, to November, 1890, he was general freight foreman, and from November, 1890, to August, 1891, assistant agent of the same road at Chicago. He entered the service of the Chicago & Eastern Illinois as assistant local freight agent at Chicago in August, 1891. In January, 1893, he was made local agent, and from July 5, 1899, to February 1, 1903, he was assistant general superintendent. In 1903 he was promoted to general superintendent; on November 15, 1906, to general manager, and on December 3, 1909, at the time of the separation of the Rock Island and Frisco systems, he was made vice-president and general manager of the Chicago & Eastern Illinois, and of the Evansville & Terre Haute, which has since been absorbed by the C. & E. I.

Both in his work for his own company and as chairman of the General Managers' Association, Mr. Jackson has had a great deal of experience in labor negotiations, for which he has shown marked qualifications, and in 1910 he was appointed by Governor Deneen a member of the Employers' Liability Commission for the state of Illinois. The fact that he has risen from the ranks, together with his naturally kindly disposition and his democratic manner largely accounts for his success in dealing with subordinates, in all ranks, with whom he has always been popular. A very hard worker himself, he requires good service from those working for him, but does so with a consideration that is calculated to inspire loyalty, and it is doubtful if he has ever required any of his subordinates to work as many hours a day or as many days a week as he does himself. In all respects he is a strong man, and his presence in the management, as one of the receivers, with his knowledge of the property and his popularity, gives assurance that the Chicago & Eastern Illinois will continue to be a well-managed institution.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.

The twenty-fourth annual convention of the American Association of Demurrage Officers was held at the Blackstone hotel, Chicago on May 20 and 21. President E. E. Mote, manager of the Pacific Car Demurrage Bureau, San Francisco, presided, and 21 members out of a total membership of 25 were in attendance. After a considerable discussion resolutions were adopted to be referred to the American Railway Association, recommending an increase in the demurrage rate for interstate business throughout the United States from $1 to $3 per car for each day after the expiration of 48 hours free time; the elimination of the average agreement contained in the uniform demurrage rules now generally in effect, which allows time less than 48 hours required for loading and unloading to be used as an offset to time over 48 hours during the same month; also the elimination of the rules providing for an allowance on account of weather conditions after the expiration of free time.

The proposal to advance the demurrage rate was based on the belief of those present that a higher demurrage rate would greatly reduce the detention of cars by consignees, and thereby benefit both railway and shippers by increasing the efficiency of the car supply. It was also believed that a $1 demurrage rate does not approximate the earning capacity of a car at any season of the year. The recommendation was based largely on the experience with a high demurrage rate in California, where rates of $3 and $6 have been in effect for several years on state business, and where the Interstate Commerce Commission has recently allowed an increase of the demurrage rate on interstate traffic to $3.

Other recommendations were adopted providing for minor changes in the rules in the direction of improvement and clarification.

The resolution to eliminate the average agreement was based on the belief, stated frequently in the discussion, that it is taken

advantage of only by large shippers, and is of no benefit to the smaller shippers, besides causing many controversies. The elimination of the weather allowance was proposed on the ground that a free time of 48 hours is reasonable for all who provide proper facilities for loading and unloading, and that it operates as a discrimination in favor of those who do not make adequate provision as against those who do provide proper shelter for their freight. It was also declared that in large terminal districts, such as in Chicago, the weather allowance must be based solely on the word of the consignee, because weather conditions may vary in the territory.

By order of the state railway commission no weather allowance has been made in California on intrastate traffic for several years. President Mote and Secretary-Treasurer A. G. Thomason, demurrage commissioner, Boston, Mass., were re-elected. R. A. Taylor, manager of the Virginia and West Virginia Demurrage Bureau, Richmond, Va., was elected vice-president to succeed W. E. Backensto. It was decided to hold the next annual convention at St. Louis on May 19, 1914.

EXTRACTS FROM THE ANNUAL REPORT OF THE LITTLE MIAMI RAILROAD FOR 1852.*

During the 10 years that our road has been in operation, the number of passengers have increased from 6,400 carried in 1843, when a part only of the track was in use, to 212,687 for the year just finished, the whole number carried in the 10 years being nearly *one million* of persons. . . .

During the 10 years of the operation of our road, but two occasions have occurred resulting in loss of life by passengers; on one of which a passenger was killed by attempting to get upon the train while it was in motion; on the other a passenger persisted in mounting to the roof of a car after being repeatedly warned by the conductor not to do so and without the knowledge of the conductor at the time, and was swept off in passing under a bridge. In the 10 years, and in carrying nearly a million of persons, not a life has been lost by accident to the trains or neglect of persons in our employ. . . .

Our depot arrangements at Cincinnati will be of the most liberal character, and will afford convenient accommodation for any aggregate of business however large which may be concentrated here. To this end we have secured extensive grounds binding upon the river and upon Front street, affording easy access from the streets of the city on one side and from the river for our own landings on the other. Any extent of buildings which may be required for depot and warehouse purposes, with all the facilities for the transportation of every description of railroad business, may be accommodated upon our ground which has been purchased for the purpose. . . .

Of other railroads with which we are or may become indirectly connected, as partakers of the general prosperity attendant upon the successful and harmonious working of a wide-spread system of railroad intercourse, we need only remark in general terms as their progress and statistics are well known. The State of Indiana is becoming rapidly checquered over by railroads, uniting her most distant parts with each other and opening free intercourse between the lakes and Ohio river in one direction, and with Ohio and Illinois in the other. The railroads of Ohio will soon be connected with those of Indiana by means of the Ohio and Mississippi Railroad, the Lawrenceburgh and Greensburg, the Cincinnati, Hamilton & Dayton, and various others. Kentucky, which will soon be connected with our system by tracks leading from Covington to Lexington and to Louisville, is reaching her arms to the south. Through her borders, the connection with Nashville is not far distant and the further connection with the Atlantic Ocean at Charleston and with the southwestern states bordering on the Mississippi, are now within the range not only of probability but of early expectation.

JACOB STRADER, President.

Trains have been run with great regularity and entire safety to passengers with but a single exception. On the 19th of November a collision occurred at the curve one mile above Corwin between the express train bound down and the upward mail train, in consequence of inattention to the rules governing the running of trains on the part of the conductor and engineer of the express train. It appears that on leaving Spring Valley the express train had from 14 to 15 minutes to make Corwin, which, under ordinary circumstances, would have been sufficient, but the train consisted of 12 cars, with which the locomotive could not make the time. The conductor became confused; the train was not stopped as required by the rules applicable to such circumstances, and, in consequence, the collision occurred. No blame attaches to the conductor and engineer of the mail train—Messrs. Fuller and Davis—*they were running in their time, and exercised due care.* I am thus particular in stating the facts as unfounded and injurious charges have been made against them. The conductor and engineer of the express train have been dismissed from the service of the company. One gentleman was severely but not dangerously bruised and two others slightly, in this collision. With these exceptions, as far as known no other passenger has received injury during the year; nor indeed has any passenger lost his life or received serious injury since the opening of the road for travel who has kept himself inside of the passenger cars. Nearly every accident arises from neglect to obey this well-known rule.

*We are indebted to Mr. J. S. May, superintendent of the Buffalo & Susquehanna, for the opportunity to see this report.—Ed.

SPECIAL ACCIDENT TRAINS IN GERMANY.—The Baden State Railways have recently put in service a number of relief or "accident" trains. Each train consists of three cars, namely, an ambulance car, a tool car, and a service car, the last-named being provided for the accommodation of the officials and men engaged, including doctors, members of the mechanical and maintenance of way departments, and a breakdown gang. The trains are stationed at suitable points on the railway, which is divided into special districts for this purpose. The ambulance cars have double sides, roofs and floors, and the space between the double floors is filled with cork in order to reduce noise and to act as heat insulators. They comprise a ward room, surgery, and have an operating table. The tool cars are fitted up with tools and appurtenances, including acetylene flare generators, re-railing devices, and a host of other appliances. The service cars are equipped with separate rooms for officers and men, telephone apparatus, a kitchen, lavatory, etc.

TABLE B.—COMPARISON OF THE COST OF CONSTRUCTION AND OPERATION UPON EIGHT OF THE LEADING RAILROADS OF THE UNITED STATES, WITH THE LITTLE MIAMI RAILROAD, COMPLETED FROM THEIR MOST RECENTLY PUBLISHED REPORTS.

Name of road	Length in miles.	Cost of road and equipment.	Cost per mile.	Receipts from passengers.	Receipts from tonnage, mails, etc.	Total receipts.	Expense exclusive of interest.	Ratio per cent. of exp's to rec'pts.	Cost in cents per mile run.

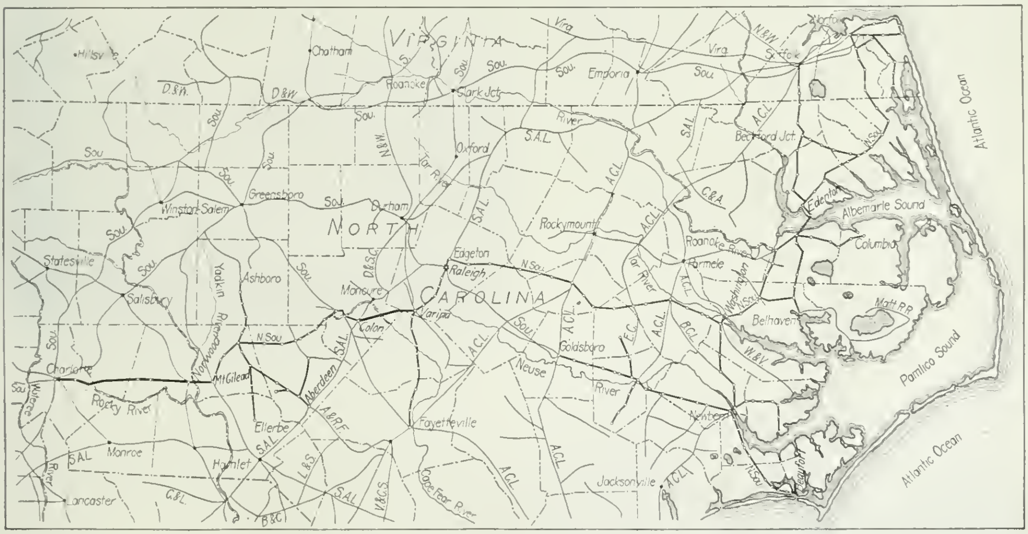
NEW EXTENSION OF THE NORFOLK SOUTHERN.

Consolidation and Connection of Three Short Roads West of Raleigh, N. C., and Construction of New Line to Charlotte.

The Raleigh, Charlotte & Southern, controlled by the Norfolk Southern, was organized in 1911 to operate three recently acquired lines in central North Carolina with an aggregate mileage of 215 miles, and to build about 75 miles of railway to connect these lines with the Norfolk Southern and form an extension to Charlotte. As the system operated at present by the Norfolk Southern is quite compact and only comprises about 600 miles of road, the present project represents an expansion which is important both on account of the mileage added and the new territory which it will develop. If the policy of expansion by consolidation of existing short lines, indicated by this purchase of three small roads soon after the present management took total control of the property, is to be carried out, the large southern roads may soon have another active competitor as pointed out in an editorial in the *Railway Age Gazette* of January 5, 1912.

The three lines consolidated were the Raleigh & Southport, which operated from Raleigh southwest to Fayetteville; the Aberdeen & Asheboro, connecting the two points which give it the name and including a branch to Mt. Gilead; and the Durham & Charlotte, running from Colon to Troy, where it connects with the A. & A. The new company has under construction a connecting line from Varina, just south of Raleigh on the old R. & S., west to Colon, the terminus of the D. & C., a distance of 22.7 miles, and an extension of the A. & A. from Mt. Gilead to Charlotte, 52.7 miles. When these lines are completed, the Norfolk Southern will have a direct through line from Charlotte to Norfolk, which will enable it to compete with the Southern and the Seaboard Air Line for the large amount of traffic originating at Charlotte, which is a town of over 35,000 inhabitants and is known as the best manufacturing center in the state.

The new lines are located with particular attention to the development of the country which they traverse, as the management is convinced from its experience with the line from Washington, N. C., to Raleigh, acquired by consolidation in 1906 soon after its construction, that such development is profitable to the railway. While North Carolina has a comparatively large railway mileage for its population, the average density of population is low, making the mileage per square mile of area in the state comparatively low. Much of the present mileage is not designed to develop the resources of the state but forms part of north and south trunk lines reaching south Atlantic seaports. Of about 40 companies operating in North Carolina, more than half the mileage is held by four companies, the Southern; Atlantic Coast Line; Seaboard Air Line, and the Norfolk Southern. No one of the other companies operates as much as 100 miles of line and a great many of them are purely local enterprises. In order to develop the state, there is an urgent need for more east and west lines to connect the interior points and give them direct communication with the seaboard. The present line of the Norfolk Southern to Raleigh has done much to improve conditions in the eastern half of the state and when the new system west of Raleigh is connected with the eastern lines, it is expected that the development in that portion of the state will be very noticeable. The country traversed by the Norfolk Southern is largely timber land, the lumbering operations furnishing about 50 per cent. of the road's traffic. After the timber is cut, the country settles rapidly, and as the soil is fertile, the farming communities which spring up are very profitable sources of traffic.



Map of Norfolk Southern, Showing New Extension to Charlotte.

The standards of construction on the Norfolk Southern, in common with most of the roads in the southeast, excepting the few main trunk lines, are not high, and the line is capable of handling only comparatively light traffic. But at present it does not meet serious competition and as it has a high ton mile rate it is earning about $5,000 a mile in operating revenue. The completion of the system west of Raleigh should make the operation of the line from Raleigh to Norfolk considerably more profitable than it has yet been.

Since the country west of Raleigh is comparatively rough and the old lines were built to low standards of grade and

curvature, 1.3 per cent. grades are used freely on the new lines and curves up to 5 deg. are common, with some 6 deg. curves in exceptional cases. The grades on the line east of Raleigh are considerably lighter so that all trains will have to be remade at Raleigh. Some revision of the old line from Raleigh to Varina is being made and other improvements may be undertaken later on other portions of the line.

The entire system is single track, the roadbed is dirt ballasted

Typical Corrugated Iron Pipe Culvert with Concrete Head Wall.

and laid with 70 and 80 lb. rails. As drainage is the most essential feature of maintenance on such a line, the location is carefully made to secure the best drainage, ample waterway openings are provided and side ditches are very carefully maintained. Cast iron pipe is used for culverts in sizes up to 36 in., three lines of pipe being laid in cases where the opening furnished by a single or double line is not enough. Corrugated iron pipe is also used in sizes up to 48 in. Concrete headwalls are placed on the corrugated iron pipe and the 42 in. and 48 in. sizes are encased in square concrete boxes having a minimum thickness of 1 ft. over the pipe. The standard headwall for one of these pipe culverts is shown on one of the accompanying photographs.

As Charlotte will be a highly competitive point, a well located

West Bank of Cape Fear River, Showing Forms for Shore Pin, Cable Tower and Pit from Which Puddling Clay Was Taken.

terminal and entrance to the city was essential. This has been secured by paralleling the Southern through the eastern part of the city, enabling the new line to reach the heart of the city through the most important industrial section. There is some local agitation for a union passenger station but no decision has yet been reached in regard to this matter.

On account of the comparatively low standards to which the line is being built and the character of the country through which it runs, the earthwork is not heavy. On the section from Varina to Colon the material is mostly loam or gravel with a little rock, the latter being disintegrated in many cases so as to be soft enough to plow. On the eastern end of the Mt. Gilead to Charlotte section, rock predominates, and on the western end where the work is the lightest, little material but earth is encountered. Steam shovels are used for many of the cuts, but in general these are of the smaller sizes, some as small as 20 tons being used with good results. Wheel scrapers and mule carts are the two most common means of handling the light work. No station work was let, although the character of some of the grading would have suggested that method for similar construction in the north. Apparently, contractors do not find southern labor well adapted to handling these small contracts. Steam shovel cuts are 22 ft. wide with an 18 ft. roadbed, although in many cases this width has been increased to make the quantities balance or to get an easier slope. Some of the rock cuts were allowed to stand at slopes of ½:1, or in some cases ¼:1. Fills are 16 ft. wide.

The maximum haul for material on the Varina-Colon line is about 7 miles and on the Mt. Gilead-Charlotte line about 15 miles. One contractor on the eastern section has tried a 5 ton

Overhead Crossing of the Winston-Salem Southbound near Norwood, N. C.

truck for hauling in material but finds that its services on the hilly country roads at a considerable distance from a garage where repairs can be made is not all that could be wished. The difficulty and expense of getting teams from local farmers, however, makes some other means of hauling almost a necessity at times. Demands for $4 a day for a team are not at all uncommon and teams are often scarce at any price. One of the contractors on the western section tried a traction engine with about the same experience as was had with the motor truck. The time lost by such a machine in this service seems to be a considerable item and on account of the large investment and the capacity which the machine has for work in proper condition, such delays are quite expensive. In one case the traction engine was used to pull a string of narrow gage dump cars running on their own wheels over the dirt roads, partially loaded with coal for steam shovels, provisions for boarding camps, etc. The general contractor on the Varina-Colon work is the Lane Brothers Co., Alta Vista, Va., and on the Mt. Gilead-Charlotte work the Kenefick-Hoffman Co., Kansas City, Mo.

The three most important bridges on the lines are over the Cape Fear river on the eastern section and over the Pee Dee river and the Rocky river on the western section. The Cape Fear river crossing consists of three 150 ft. through truss spans with 1,300 ft. of approach trestle on the east end and 100 ft. on the west end. In common with the other steel structures on this line, the trusses were designed for Cooper's E50 loading. There are two shore piers and two river piers 25 ft. 6 in. x

7 ft. 6 in. and 26 ft. x 8 ft., respectively, over copings. They are of mass design without reinforcements. The sides are battered uniformly ¾ in. per ft., the shore piers being 23 ft. high and the river piers somewhat over 40 ft. The footings of the latter are about 18 ft. below mean low water. The shore piers are supported on 44 piles, spaced 2 ft. 3 in. x 2 ft. 5½ in. The concrete in the footings and body of the piers is 1:3:6 and in the copings 1:1:2.

A very complete concrete plant was installed at this bridge. The river piers were placed inside puddle cofferdams, the clay for puddling being taken from the west river bank. The concrete mixer was located close to the west shore pier, the concrete being carried out to the river piers in buckets supported by a carrier running on an overhead cableway. A trestle was used to carry the puddling clay from the bank to the nearest pier and the cableway for taking it to the second cofferdam. A 1 yd. Smith mixer was installed at an elevation high enough to allow it to dump into the concrete buckets by gravity and at the same time low enough to be fed from the storage piles on the sloping bank back of the plant without materially elevating the aggregates. The concrete buckets were just large enough to hold one batch from the mixer. As the mixer was

Mixing Plant, Engine House and Cable Tower on West Bank of Cape Fear River.

about 40 ft. from the center line of the bridge over which the cable was supported, the buckets were handled from the mixer to the center line on a small car running on a short section of narrow gage track. This car was long enough to hold two buckets side by side so that the empty bucket returning from the pier could be dropped by the carrier on to the car which already carried a full bucket from the mixer. This exchange of buckets could be made very rapidly, thus eliminating practically all loss of time. The empty bucket received from the carrier was filled at the mixer while the other bucket was being emptied at the pier.

The concrete was dumped from the buckets into a square wooden hopper with a chute about 12 in. square, the bottom of which was kept close to the surface of the concrete. The water level was kept low in the dams by operating a centrifugal pump as needed. A foreman and 8 to 10 men were required in the pier to place the concrete and spade back the surface. About 10 men were used to feed the mixer and, in addition to this gang, the shore plant required two men to push the small concrete car between the mixer and the cable; an engineer for the mixer, an engineer for the hoisting engine operating the cableway, and a fireman for the boiler which supplied steam both to the mixer and the hoisting engine.

The Pee Dee river bridge consists of 80 ft. of trestle approach on the east end, eight 110 ft. deck plate girders, 221 ft. of trestle, three 110 ft. deck plate girders and 140 ft. of trestle on the west end. The substructure included 13 concrete piers of the same design as those described for the Cape Fear river bridge, their height varying from about 30 to 35 ft. At low water stages only seven of these piers are in the channel, and as work was begun during the late summer when the water stage was only about 5 ft., it was only necessary to build cofferdams for these seven piers. The cofferdams were built up of Wakefield sheet piling

Coffer Dams for Two River Pins, Showing Material Cableway with Carrier Over Second Pier.

made of 1 in. x 6 in. boards. As the bottom of the river was rock, many loose stones were encountered in placing the piling, and by the use of these small piles the openings left in the walls by the deflection of piles on such rocks were much smaller than would have been the case if the ordinary 10 in. or 12 in. material had been used. In order to avoid delay to the work on account of ice or spring freshets, the concrete was placed in two stages, the top of the lower one being about 8 ft. above the footings,

Pee Dee River from West Bank. Lower Stage of First Two Pins Paced, Work Under Way on Third Pin.

which is well above the water level. It was possible to finish all of the piers up to this 8 ft. level before winter, and the upper portions could then be built regardless of river conditions. A low trestle was built entirely across the river to carry out form material and concrete, the trestle bents being set directly on the rock bottom. For the upper stage this trestle was raised to the full pier height by adding a second deck. The bond between the two stages of concrete was secured by setting irregularly

shaped stones at intervals in the upper surface of the lower stage, allowing them to project from 6 in. to 1 ft. so as to form a firm bond with the new concrete to be set later. A breakwater consisting of a timber crib filled with rock was used to protect the upstream end of each puddle dam.

The concrete, of which about 3,500 yds. were required, was mixed in two plants, one on each shore. Chicago cube mixers of 17 cu. ft. capacity were used, being fed by wheelbarrows and dumped into push cars running out over the trestle. These cars, which were built by the contractor, were designed to hold one batch from the mixer and were equipped with a small end door in the square wooden body through which concrete could be dumped into cross chutes to guide it to place in the piers.

The sand and stone for concrete were secured locally at a considerable saving in cost. Sand was dredged from the river by hand into barges and stored at both mixer plants. At the beginning of the work some rock was shipped in from the nearest stone quarry at a cost of 90 cents per ton f. o. b. at the quarry, 50 cents for freight and 85 cents for hauling from the station to the bridge site, a total of $2.25 per ton or about $3 per cu. yd. Careful inspection of local stone showed that a very hard slate could be secured close to the east bank which broke up very well and made an excellent aggregate for concrete. A quarry was accordingly opened in this material and the rock was broken at the bridge site. The cost of quarrying and hauling to the bridge varied from 75 cents to $1 per yd. and plenty of negro laborers could be secured to break the rock for 75 cents per yd. A force of 25 men would break from 50 to 55 yds. per day, and in some cases an exceptionally industrious man could break as high as 4 yds. a day. The contractors on this bridge were Hancock & McMahon, of Lawrence, Kan.

The Rocky river bridge consists of three 100 ft. deck plate girders with short trestle approaches. The four piers are of the same design as those on the other bridges and are of about the same height as those of the Pee Dee river structure. There were no unusual features in the plant or method of building this bridge.

The new line is expected to be ready for operation this summer. The construction work, including roadbed, bridges and right of way, is being handled by C. K. Conard, construction engineer, the track work being under the supervision of F. L. Nicholson, chief engineer, and D. W. Lum, consulting engineer.

SUPREME COURT DECIDES MINNESOTA RATE CASE.

The Supreme Court of the United States on Monday of this week, in a decision by Mr. Justice Hughes, in the long-pending cases which were brought to test the right of the state of Minnesota to reduce freight and passenger rates, when such reduction would affect interstate rates, upholds the state's power, in this respect, to the extent that, so long as Congress has not taken action on the conflict between federal and state powers, a state may regulate rates freely unless in so doing it reduces revenue to an extent which would amount to confiscation of the carrier's property. The decision is unanimous. As to the Northern Pacific and the Great Northern the reduced rates are by this decision justified, but in the case of the Minneapolis & St. Louis the court holds that the state's action is unwarranted, the rates prescribed being confiscatory.

In their main contention that the rates prescribed by the state commission constituted an interference with interstate commerce, and, to that extent, were invalid, the railroads met with defeat. The Supreme Court upheld the right of the state, intimating that if any correction is to be made it must be done by Congress and not by the courts.

The opinion consists of 31,000 words. The summary of Justice Hughes says:

"1.—The constitution gives congress an authority at all times adequate to secure the freedom of interstate commercial intercourse from state control, and to provide effective regulation of that intercourse as the national interest may demand.

"2.—The commerce that is confined within one state, and does not affect other states, is reserved to the state. This reservation is only of that power which is consistent with the grant to congress. The authority of congress extends to every part of interstate commerce, and to every instrumentality or agency by which it is carried on; and the full control by congress over the subjects committed to its regulation is not to be denied or thwarted by the commingling of interstate and intrastate operations.

"3.—Even without action by Congress, the commerce clause of the constitution necessarily excludes the states from direct control of subjects embraced within the clause which are of such nature, that, if regulated at all, their regulation should be prescribed by a single authority. There is thus secured the essential immunity of interstate intercourse from the imposition by the states of direct burdens and restraints.

"4.—But there remains to the states the exercise of the power appropriate to their territorial jurisdiction in making suitable provision for local needs. The state may provide local improvements, create and regulate local facilities, and adopt protection measures of a reasonable character in the interest of the health, safety, morals, and welfare of its people, although interstate commerce may incidentally or indirectly be involved. Where matters falling within the state power, as above described, are also by reason of their relation to interstate commerce within the reach of the federal power, congress must be the judge of the necessity of federal action, and until congress acts the states may act. The paramount authority of congress enables it to intervene at its discretion for the complete and effective government of that which has been committed to its care, and for this purpose and to this extent, in response to a conviction of national need, to displace local laws by substituting laws of its own.

"5.—State regulation of railroad rates began with railroad transportation. The authority of the state to prescribe what shall be reasonable charges for intrastate transportation is statewide, unless it be limited by the exertion of the constitutional power of congress with respect to interstate commerce and its instruments. As a power appropriate to the territorial jurisdiction of the state, it is not confined to a part of the state, but extends throughout the state—to its cities adjacent to its boundaries as well as to those in the interior of the state. If this authority of the state be restricted it must be by virtue of the actual exercise of federal control, and not by reason merely of a dormant federal power, that is, one which has not been exerted.

"6.—Congress in an act to regulate commerce expressly provided that the provisions of the act should not extend to transportation wholly within one state. Having regard to the terms of the federal statute, the familiar range of state action, at the time it was enacted, the continued exercise of state authority in the same manner and to the same extent after its enactment, and the decisions of this court recognizing and upholding this authority, the court finds no foundation for the proposition that the act to regulate commerce contemplated interference with the authority of the state to prescribe reasonable rates for the exclusively internal traffic throughout the extent of its territory. Neither by the original act, nor by its amendment, has congress sought to establish a unified control over interstate and intrastate traffic; it has not set up a standard for intrastate rates or prescribed or authorized the federal commission to prescribe either maximum or minimum rates for intrastate traffic. The fixing of reasonable rates for intrastate transportation was left by the act where it had been found, that is, with the states and the agencies created by the States to deal with that subject.

"7.—Under the established principles governing state action, Minnesota did not transcend the limits of its authority in prescribing the rates here involved, assuming them to be reasonable intrastate rates. It exercised an authority appropriate to its

territorial jurisdiction and not opposed to any action thus far taken by congress.

"8.—The interblending of operations in the conduct of interstate and local business, by interstate carriers, and the exigencies that are said to arise with respect to the maintenance of interstate rates by reason of their relation to intrastate rates, are considerations for the practical judgment of congress. If the situation has become such that adequate regulation of interstate rates cannot be maintained without imposing requirements with respect to such intrastate rates of interstate carriers as substantially affect interstate rates, it is for congress to determine, within the limits of its constitutional authority over interstate commerce and its instruments, the measure of the regulation it should supply.

"It is the function of the court to interpret and apply the law already enacted, but not, under the guise of construction, to provide a more comprehensive scheme of regulation than congress has decided upon. Nor in the absence of federal action may effect be denied to the laws of the state enacted within the field which it is entitled to occupy, until its authority is limited through the exertion by congress of its paramount constitutional power.

"9.—On the issue of confiscation: The rate-making power is a legislative power and necessarily implies a range of legislative discretion. The court does not sit as a board of review to substitute its judgment for that of the legislature or of the commission, lawfully constituted by it, as to matters within the province of either.

"The question is whether in prescribing a general schedule of rates involving the profitableness of the intrastate operations of the carrier, taken as a whole, the state has exceeded the constitutional limit by making the rates confiscatory. The property of the railroad corporation has been devoted to a public use. But the state has not seen fit to undertake the service itself and the private property embarked in it is not placed at the mercy of legislative caprice. It rests secure under the constitutional protection which extends not merely to the title, but to the right to receive just compensation for the services given to the public.

"10.—In the cases of the Northern Pacific and Great Northern companies, on the examination of estimates of value and methods of apportionment, it is concluded that the proof is insufficient to justify a finding that the rates were confiscatory, and the decrees are reversed, with instructions to dismiss the bill in each case without prejudice.

"11.—In the case of the Minneapolis & St. Louis, it is found in view of the special facts appearing, that the margin of error in the estimates and calculations was not sufficient to affect the result. The decree in that case, adjudging the rates to be confiscatory, is therefore affirmed, with the modification that the members of the railroad and warehouse commission and the attorney general of the state may apply to the court, by bill or otherwise, as they may be advised, for a further order or decree whenever it shall appear that by reason of a change in circumstances the rates fixed by the state's acts and orders are sufficient to yield to the company reasonable compensation for the services rendered."

The opinion discusses at length the principles governing the valuation of railroad property for rate making purposes. It criticises the apportionment of value between interstate and intrastate business on a gross revenue basis; also the apportionment of expenses by regarding intrastate freight business as two and a half times as expensive as interstate. The lower court's theory of arriving at a fair value by finding "the reproduction cost new" is tested by inquiring how this theory worked on the value of the railroad's lands. Justice Hughes declared that the lower court was in error in adding 30 per cent. to the normal value of the land in some instances and 200 per cent. at the big terminals in arriving at what the court considered the "cost of reproducing its property."

In criticizing the apportionment of valuation between interstate and intrastate business on the "gross revenue basis," Justice Hughes said that the division should be made according to the use that is made of the property. He declared that this use could not be measured by the return, when the return itself was in question.

"If the return be taken as the basis," said he, "then the validity of the state's reduction of rates would have to be tested by the very rates which the state denounced as exorbitant." He added that it would not be impossible to ascertain some kind of "use units" by which the property could be divided both between interstate and intrastate business on the one hand and between passenger and freight business on the other. He did not point out what this "unit" would be.

THIRTY-MILE ELECTRIFICATION ON NORFOLK & WESTERN.

The Norfolk & Western has authorized and is proceeding with the electrification of a thirty-mile section of its main line from Bluefield, W. Va., to Vivian, W. Va. The electrified section constitutes practically a separate gathering division for the coal traffic from the Pocahontas region and comprises about 85 miles of track. The division is double track throughout except in the Elkhorn Tunnel and with a large amount of passing sidings and branches into the coal workings. The grades are from 1.5 to 2 per cent. eastbound to and through the summit tunnel, ten miles; thence falling for about a mile and then a ruling ascending grade of about .4 per cent. for twelve miles to the east end of the division at Bluefield. The heavy coal business originates west of the summit and is in large part hauled eastward over these grades. The coal trains are filled out generally to a weight of 3,250 tons and are hauled over the grades at about 7½ miles an hour by three Mallet engines, one at the head end of the train and two pushing.

It is not the intention at present to conduct the through merchandise freight or the passenger service by electricity, the electric service being confined to traffic designated as "tonnage trains" originating on the electrified section. These trains, of 3,250 tons each, will be electrically operated by head engines and pushers at a speed of 13 miles an hour up the heaviest grade. There will be about twenty trains a day, or 65,000 tons.

An overhead electrical conductor will be used, the local conditions precluding the use of the third rail. The characteristics of the current to be used in the locomotives have not yet been decided on as plans and estimates are being made for the use of either alternating or direct current locomotives according to which design proves most adaptable to the service and cheapest in first and operating costs.

Electric power will be generated in a steam power house to be erected by the company at Bluestone, about one-third the way from Bluefield to Vivian. This power house will have an installed capacity at present of 24,000 kw. All work is to be completed for service in the summer of 1914.

It will be seen that the local conditions are especially favorable for electric haulage. The traffic is dense and of heavy train units moving at fairly uniform intervals over a section of the main line, which is practically a separate engine division at present and can be conducted in the same way electrically without increasing the cost of engine service on the other sections of the line. Electric power can be generated at an unusually low cost because of the fact that excellent coal is obtainable at the point of origin. The train service is such that a minimum of electrical equipment can perform the haulage in practically continuous service. There will be fewer engine crews per train than with steam and the speed over the division will be nearly double that possible with the present steam equipment. Elimination of smoke in the Elkhorn Tunnel will be an important incidental benefit from electric operation.

Gibbs & Hill, consulting engineers, Pennsylvania Station, New York City, are the designing and constructing engineers for this work.

LABOR UNIONS AND THE RAILROADS.*

Means Used by the Organizations to Further Their Ends, and Effects of Public Attitude Toward the Situation.

By J. O. Fagan,

Author of "Confessions of a Railroad Signalman," etc.

From the beginning of time society and individuals seem to pass through certain clearly defined changes or stages of progress. In the Middle Ages, for example, the letting of blood was a sort of universal cure-all for every conceivable mental and physical ailment. In the case of a man supposed to be possessed with a devil, they pumped him nearly dry. Under a somewhat similar supposition, this is exactly the case with the railroads today.

Most everybody is taking a hand in the game. Illustrations permeate the railroad business from beginning to end.

For example, it is highly improper for a railroad to pay extravagant prices for sand lots, but in selling to a railroad the question of value cuts a very small ethical figure. It is the same thing with damages, rebates, professional services, and financial behavior in general—a railroad pays through the nose, a private citizen squeezes out his payments through a wringer. The man who would not either intentionally, incidentally, or instinctively demand from a railroad for his land damage, his grass fire, or his internal injury, modestly speaking, say twice as much as he would from his fellow citizen, such a man I say is more worthy of honorable mention than a Chinese ancestor.

Some time ago a farmer sued a railroad on account of the dust kicked up by the trains in passing his homestead. He contracted hay fever, so to speak, and was awarded substantial damages. Again, a young man in a hurry to greet his sweetheart tumbled prematurely off a passenger train running into a station. The result was a sort of twisted nose. By and by the girl "shook him" on account of his strange appearance. Whereupon he sued the young lady for breach of promise, and incidentally, the railroad.

Now, this kind of business is not confined to legislation or juries. It is a state of mind or an atmosphere that calls for reform just as well as do crooked financial operations. In Massachusetts the other day it was discovered that 25 per cent. more people than the total capacity of the train that was concerned in a certain collision had sent in claims and received indemnity.

Now in this sort of hue and cry against railroads for their money or their lives the Interstate Commerce Commission occupies, as it seems to me, a very peculiar and questionable position. As a regulative agent in the matter of rates and so forth it exercises a reasonable and necessary function, but as a railroad manager or assistant manager the commission is a misfit.

The railroads today are suffering from a carnival of fines. If I drive a team up to a street crossing and the policeman gives me the tip and the horse is willing I go ahead. But if the horse happens to drop dead it is not at all likely the policeman will have me up in court for disobedience. But on the railroads you won't get off so easy. You cannot qualify or modify any kind of an interstate commerce law. Neither the elements nor the tremendous intricacy of the railroad business make a particle of difference in the execution of justice as applied to the railroads. Every offense avoidable or unavoidable cries to heaven for a fine. This rigid interpretation of their duty on the part of the Interstate Commerce Commission drives the railroads into the courts at inconceivable expense almost every day in the year to defend their exchequers from unreasonable legislation and overzealous Interstate Commerce Commission inspectors. But the Interstate Commerce Commission is not only unreasonably severe in hunting up troubles and imposing fines, but in its ignorance or neglect of the first principles of management it undermines the very foundation of the business upon which good service to the public is dependent.

Take a very simple and graphic illustration. Some time ago an express passenger train on the New York, New Haven & Hartford Railroad was derailed near Bridgeport, Conn. Fourteen passengers and employees were killed and forty-five passengers were injured in this accident. After a thorough investigation the Interstate Commerce Commission in its report summed up the situation as follows:

(1) This accident was caused by a disregard on the part of the engineman of signals and rules provided by the railroad company to prevent the occurrence of such accidents.

(2) The signals and rules provided by the railroad company for the prevention of such accidents were adequate had they been observed.

(3) The tracks and switches were substantially constructed and safe for the train movement made had the rules been observed.

Here, then, in the words of the report, we have an absolutely sane and safe situation. The obvious duty of the commissioners as public servants was to take up and look into the human or labor side of the problem and to strengthen the management in its efforts to maintain discipline and the proper observance of rules. But no—as a matter of fact this commission representing federal authority is more afraid of the human or the labor problem on railroads than the devil is supposed to be of a tailor. So in recommending preventives for such accidents the commissioners notified the railroad as follows:

That in all situations where accidents are likely to occur through the non-observance of enginemen of signals or rules calculated to insure safety, automatic train control apparatus should be provided to insure that trains will be brought to a stop in case the signals or rules are not properly observed.

Now, every switch, signal and bumping post in the United States is a situation where accidents are likely to and do occur through the non-observance of rules; so you can imagine the expense bill the commission, in dodging the human or labor problem on railroads, carelessly imposes on the management.

Furthermore, railroad managers today are threatened with imprisonment for failure to live up to this and other recommendations of a similar nature. The personnel of the Interstate Commerce Commission, it must be remembered, does not include a railroad manager either directly or indirectly, consequently the railroads are at all times being saddled with experiments, recommendations and orders from inexperienced sources; that is to say, from men who are not daily and unceasingly working out practical railroad problems from the managing side of the business. Here at last, then, we are face to face with the interests of the people in the labor problem on our railroads.

Now, on every railroad in this country there are two great streams or sources, either of influence or authority, by means of which it becomes everywhere possible to move trains, regulate traffic, secure revenue, pay wages and keep the different and complex departments of the railroad business in motion. I refer to the work, function and spirit of the manager and the employee.

Management, of course, should be conducted on business principles; that is to say, as scientifically as possible. But as a matter of fact the managing department on railroads is scientifically conducted only in spots. Management on railroads cannot be scientifically conducted because it is not clothed in any wide or sufficient sense with the necessary authority. In other words, it is actually under the thumb of a number of extraneous influences, such as public opinion, national and state regulation, and many other social and industrial forces which criticise, attack and try to mold it from every conceivable quarter.

But now turning to the other arm of the service on railroads we find labor, as I have said, scientific in every fibre of its trunk and branches, for the very good reason that it has a "What

* Mr. Fagan's article is the New York *Times*, May 25.

to do" and "How to do it" department that has knowingly and very scientifically divorced itself from the outside world. In the history of the American railroads "labor" has never yet received even a jar or a check from public opinion, nor have the public interests been permitted to penetrate its solid and invulnerable front. The implied bargain between the rank and file and the executive department of labor places the latter in absolute and supreme control.

This implied bargain is not an industrial secret. It is to be read in every new schedule that is presented for the manager's signature. Shorn of its frills it reads something like this: "Get the money and shave the conditions." This is the scientific formula behind which is entrenched the solid vote of the rank and file.

The question naturally follows: What kind of people are these millions of highly organized and scientifically generaled railroad men anyway? There can be but one answer. They rank very high, in fact they are among the very best and strongest fellows on earth. Only step outside the charmed circle of the railroadman's organized effort and you may well rub your eyes. True, these results have been obtained partially, at any rate, at the expense of society. Nevertheless, the verdict upon the whole must be: Good for him! He has simply treated his side of the question in a scientific manner. He has taken the scientific cue from Mr. Emerson, Mr. Taylor and Mr. Brandeis, and handled his concerns as these gentlemen in their arguments handle bricks and pig iron, and he has won out.

I have lived among railroad men for something like thirty years. As it seems to me from the educational, social and industrial standpoints, these men have almost, if not quite, solved the problem, as it concerns them, of wages and conditions. At any rate, they have solved the riddle of "What to get" and "How to get it." Industrially they are world wonders. For the ascendency of labor on railroads is complete and the rewards are unlimited. What are known as the full crew bills afford a good illustration of the meaning and extent of this organized power. Some time ago when this legislation was getting under way a conference was held in a well-known manager's office. This manager said to the representatives of railroad labor:

"Look here, you need not go to the legislature for these extra men. Just tell me on what trains in this state or on this system these men are necessary and I will put them on. I will simply take your word for it and we can stop the agitation right here and now."

"Thank you," replied the labor men, "but you don't understand what we are driving at; it may not be necessary on your system, but it is in Virginia, and we propose to standardize legislation just as we have standardized the payroll and the qualifications of the men."

These bills, then, in the different states where they have already become law, compel managers to employ certain men at times and at points when and where they are not actually needed. Now, when a railroad manager puts an extra man on a train when his services are called for, the safety situation is then and there strengthened. But, on the other hand, when blindly he puts these extra men to work on twenty trains when it is only necessary to do so on one of them, as would certainly be the case in Massachusetts, in New Hampshire, and in most of the other states under these laws, the safety situation has actually been weakened in nineteen case out of twenty.

As elsewhere, but particularly on the railroads, a busy and a half-busy man together make a weak combination. When you find two men in a switch tower, on an engine, or on a freight train, doing the work that one man can reasonably handle, under such conditions, I say, look out for an accident. The ideal safety situation, then, is when the worker under proper supervision is kept reasonably busy. Some one should certainly have the authority to weed out of the train service every suspicion of loafing. In these full crew bills and in all other matters relating to service and safety the public is going to reap just what it sows and encourages in legislatures and otherwise.

This, then, is the industrial riddle on railroads and the power behind it which management has to face and overcome. The scientific process from the manager's point of view, as it seems to me, at any rate, is surrounded by a maze of delays, difficulties, and obstructions. His experience, his ability, his public spirit count for very little. A suggestion of his in the public interest may or may not amount to anything. What he can do is already standardized and regulated. What he would like to do is subject to delay and infinite wrangle.

Labor, on the other hand, has a simpler and more effective method of progress. A short time ago we had an illustration in concrete form, the newspaper account of which was as follows:

President Mellen and other officials of the New Haven road have thirty days in which to give answer to the Brotherhood of Railroad Clerks on the pending wage and working rules agreement. Unless the road takes up this question with the clerks before the end of this period, a strike may be forthcoming. The lodges have sent in their ultimatum.

Practically nearly every department in the operating service on all railroads is run by rules and stipulations in this schedule. It covers wages, hours of service, and a host of working conditions. There are probably 1,700,000 employees on American railroads today, and of these at least 80 per cent. are organized and quite aggressive. They are also in most cases working under contracts or schedules which are jealously guarded. These schedules have worked wonders in bettering conditions and making wages higher and fairer.

But as the labor organizations have grown larger and stronger abuses here and there have got into this schedule which are not in the interests of the service or for the good of the public. One can get a good idea of the situation by glancing at the changes that have taken place in signal tower work in my own experience.

When I entered the service the situation was something like this: To begin with, a twelve-hour day and the pay about $13 per week. Besides the lever work, the men were called upon to clean switches, fill and clean about fifty signal lamps, besides the necessary pole climbing in all weathers. Today we attend to the levers and to the train despatchers on the telephone, and that's all. We have an eight-hour day and a flat rate of about $21 per week.

But there is another way of looking at this picture. In times gone by the pay for the "tricks," as they call them, was graded according to the work and responsibility; that is to say, the day man got a little more money than the "middle trick" man, and he in turn got a little more than the night man.

Today the tower is simply looked upon as Class No. So and So. Men, conditions and pay are all on a level, and in our last schedule the day man of thirty years' experience is called upon to change off periodically with the night man in order that the difference, industrially speaking, between the latest arrival and an expert may be utterly obliterated.

Again, time was when, if a towerman was incapacitated for heavy tower work by reason of age or sickness, the superintendent could look over his division and place the man somewhere else, according to the man's ability and merit. Today a night job on a crossing is about all a superintendent can offer such a man. He, the towerman, must remain on his own division in the tower service actually cornered in his little group. There may be a dozen vacancies on another division of the road, but they are not for him and the superintendent cannot help him. Every other avenue of organized labor on the railroad is closed to him in the same way. If there is no vacancy in his little group he can starve.

This situation has been brought about in the interests of the organization as a whole. It is typical of the fate that threatens the very first principles of social and industrial progress which American democracy is supposed to recognize and encourage.

Now, whatever our opinions may happen to be about the merits of the labor situation on the railroads, all will agree that the strike is today the universal weapon for enforcing concessions of any and every description. It is the "only way." In

the home, in the schools, in married life, as well as on the railroads, it matters not which way you look, this universal "holdup" meets you at every turn.

The policy it represents says to the common people, to the great mass of consumers, "Be with us or go hungry;" to the traveler, "Be with us or walk." To the politician as well as to the inoffensive voter it offers an unquestioning alliance or the private life. To employers, managers, inventors, pioneers and capitalists it holds forth no olive branch or alternative. To all non-affiliated industrial units such as these it merely suggests a return to the wood pile.

Under present conditions on railroads surrender under strike threats of this nature means bankruptcy; resistance means stagnation or chaos. What is to be done about it? This is the railroad riddle the people in this country have to face and answer in some way. The situation has recently been amusingly illustrated by the Kansas Legislature in its praiseworthy efforts to straighten out conflicting interests at a railroad crossing. As published in the newspapers, the proposed remedy is as follows:

"A bill is pending in the Kansas Legislature to 'regulate' the movement of trains at railroad crossings. 'When two trains approach a railroad crossing,' says the bill, 'both shall stop and neither shall go ahead until the other has passed by.'"

Such, as it seems to me, is a good illustration of the stagnation which threatens society on account of its spiritless and sentimental handling of the industrial situation. Where I come from there isn't enough moral courage exercised in the arbitration of industrial disputes to spank a two-year old baby.

Now I have followed, or tried to follow, the labor situation on railroads in some of its phases and ramifications from the first appearance of humane public interest in the business clear up to the present overshadowing dilemma of the strike. Looming up in the distance there is a fast-approaching deadlock. As a lasting proposition, regulated management and unregulated labor on railroads are inconceivable. What is needed, then, at the present day, is not less humanity or less justice, but more independence and backbone in public opinion. Freedom of speech in this country is nothing but a national "jolly" so long as people are afraid to spell "labor union" out loud or discuss the industrial situation without locking the door and stuffing the keyhole. As never before in the history of the country, democracy today needs the courage of its convictions. Graft on American railroads is a dying cause; the problems of service and labor are living and growing issues.

No form of socialism or government ownership will ever settle the problem of service on American railroads. People who look upon ideal working conditions and a liberal pay roll as a settlement of industrial unrest are invited to study the situation on our railroads.

God help the government when it is called upon some day to tackle this riddle! In trying to enforce satisfactory service, in trying to adjust the pay roll in the interests of all concerned, in its interpretation of rules and regulations, in its effort to manage the management and protect the interests of the employees, and finally as an arbitrator between conflicting classes and interests government interference on our railroads, so far, is a recognized failure. The blight of political influence and class legislation is over it all.

On the railroads today organized labor has the government, the management, and the people's interests all together on the dead run, and there can be no constructive rearrangement of the situation until the people recognize this primary fact. In all labor questions on railroads, in the very nature of the political situation, the United States government has always been represented by an "olive branch" diplomacy.

All questions of service, management, and the pay roll are now being settled by an appeal to this kind of a tribunal. Every controversy or difference of opinion on the railroads today is finally brought up for mediation under the Erdman act, and these government mediators have laid down the law in such matters very emphatically in something like the following language:

"In the interests of the people, as we think, we have absolutely nothing to do with the right or wrong in these controversies; our business is simply to keep the wheels moving."

This is surely a pretty hard proposition for a manager to buck against when you ask him to be responsible for the safety of the traveling public. And yet this is exactly what arbitration of every description means and has meant to the railroads for the past ten years. So far as the railroads are concerned, arbitration in this country has always had a political "weather eye," and the sooner public sentiment catches on to this fact the better it will be for the interests of the people at large. At the same time I am aware that an ethical awakening in this direction has been the distinguishing feature of the activities of the public conscience during the past year.

For the future, as it seems to me, the prospect is hopeful. The people now want to know the truth about the railroads, and especially about the accident situation. The principle of keeping wheels moving regardless of right and wrong will not satisfy the American public indefinitely. On the railroads today, gentlemen, if you want to shave conditions, swell the pay roll, paralyze the management, and hoodwink the people, all you have to do is to threaten a tie-up. This is neither tradition nor prophecy, but the actual situation at the present day. It seems a pity, however, that it should now be necessary to wreck the railroads in order to get at the truth.

Just at present, then, these railroads need intelligent criticism, and in the matter of service they deserve the moral support of public opinion. The railroads today are being rent asunder by conflicting ideas and conflicting interests. From within and without these forces are working directly and potently against the service. Under these circumstances there can be no solution of industrial or operating problems on American railroads, except through the medium of public opinion exerted along ethical lines.

Reformation on railroads should be constructive and helpful. Every unit of interest should get together on this platform. The actual necessities, financial and otherwise, of the railroads today should rally everybody connected with them to their support.

DOUBLING THE LOAD CAPACITY OF AN OLD IRON RAILROAD VIADUCT.*

In 1888 the Chicago & West Michigan built a wrought iron single track viaduct across the Manistee river about 100 miles north of Grand Rapids, Mich., at a point now known as High Bridge, on the Pere Marquette, which absorbed the old Chicago & West Michigan some years ago. This viaduct is 1,170 ft. long, including 14 tower spans 75 ft. high by 30 ft. long, supporting 45 ft. spans between towers, and one 150 ft. river span across the main channel of the stream. The 30 ft. and the 45 ft. spans were, in the original construction, deck plate girders spaced 8 ft. on centers. The river span consisted of 150 ft. deck trusses spaced 14 ft. on centers. The original structure was designed for a loading about equal to Cooper's E-25. The rolling stock gradually became heavier, so that in later years the bridge was somewhat overloaded. In 1911 it was desired to put E-50 loading on the bridge, which would be unsafe for the old structure. It remained to either replace the structure with a new one, or to reinforce it, and the latter method was elected as being much more economical.

J. F. Deimling, chief engineer of the Pere Marquette, in asking for competitive propositions for the reinforcement, submitted, by way of suggestion, a solution which had been used on the Mill Creek trestle. This consisted of adding a new line of

*Abstracted from a paper by W. T. Curtis, contracting engineer, Wisconsin Bridge & Iron Co., presented before the Western Society of Engineers, Chicago, June 9, 1913.

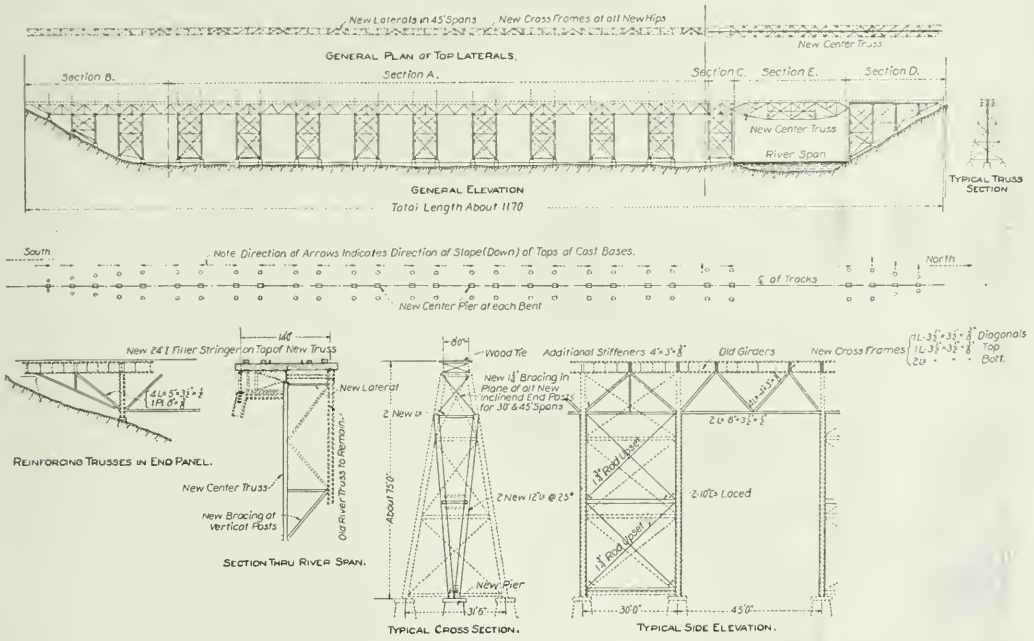
deck plate girders the entire length of the viaduct on the center line of track, these girders being supported on new independent posts at the center of each bent.

This scheme was discarded for the Manistee viaduct, partly on account of greater cost, but chiefly on account of uncertainty of distribution of load among the three girders, as the old girders are only 8 ft. centers, making the ties so short and stiff as to cause a marked degree of indeterminateness of the distribution of the load among the three girders. A further objection was the rocking or tipping effect over the new center girder as a fulcrum under imperfectly adjusted or worn ties, the shortness of the ties magnifying this difficulty. The girders of the old Mill Creek trestle were spaced further apart, which made the new middle girder idea less objectionable in that piece of work. A still further objection to this center girder scheme of reinforcement was the fact that the erection would seriously interfere with traffic during a long period of time.

The scheme finally adopted was proposed by the Wisconsin Bridge & Iron Company, being original with the writer. The fundamental idea of the adopted scheme was to convert the old deck plate girders into deep lattice trusses, of which the old girders would themselves constitute the top chords. This was done by adding a bottom chord about 12 ft. below the girders and introducing a Warren web system between the two chords thus formed. These old deck girders are, of course, stiff enough to resist the bending action of the load, and to deliver these local loads to the panel points of the newly formed truss. In calculation, for safety, the old girders were figured both as single spans between new panel points, and as continuous girders, the worst result being used in all cases. Additional stiffeners were added and cross frames installed.

To carry the excess load from these newly formed trusses to the ground, two new columns are added to each bent, starting at the bottom chord of the new trusses and running on an incline down to a new concrete pier built at the center of each old bent. The two new columns thus form a V and make the remodeled bent consist of two A-frames. This construction has the desired effect of virtually lessening the height of the trestle towers by about 12 ft., for the load is now delivered into the towers at the bottom chord of the newly formed trusses. Furthermore, this system braces the structure longitudinally by virtue of the depth of the new trusses. Also, the new A-frame form of the bents stiffens the structure transversely. The scheme has the further advantage of being capable of field construction with practically no interference with traffic, as the old girders were not disturbed, except for the drilling of holes, etc., in them.

At the river span the system just described could, of course, not be followed, and here a new deck truss 150 ft. long was placed midway between the old trusses. The distance between the old trusses is 14 ft., being thus sufficiently far apart to give longer and consequently more limber ties, permitting of more definite



Elevation and Details of Reinforced Viaduct.

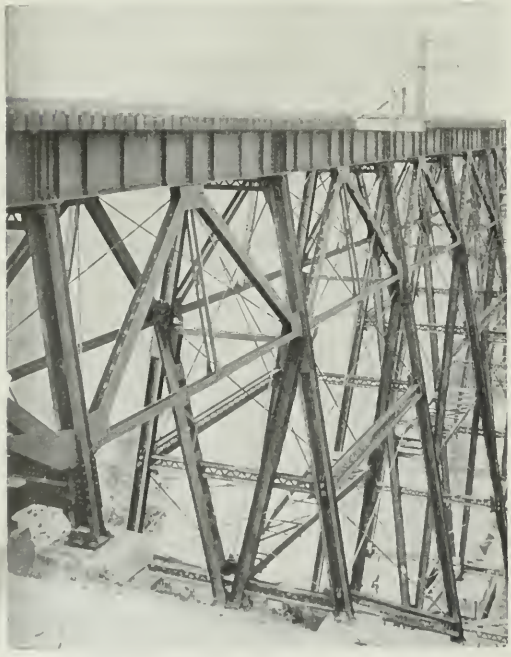
The towers supporting the river span, and the three short spans of the north approach to the river span, were originally built with the deck girders spaced 14 ft. centers, the same as the river span trusses, and we therefore reinforced this small portion of the viaduct by the introduction of a new girder midway between the two old ones, in line with the new river truss and, like the latter, supported by a single new independent straight column at the middle of the old bents.

One source of indeterminateness in both of the schemes seriously considered was the possibility of improper distribution of load between the two old and the one new pier of each bent. This is always true in the case of a continuous three-point-bearing, but there was no alternative in this problem, as there seemed to be no way of getting sufficient bearing in the soil except to introduce the new middle pier. As a partial insurance to a proper distribution of loads on the three piers, the new middle pier was surmounted with an adjustable cast iron base, so simple

in its adjustment that a bridge inspector on his annual inspection can, without any assistance whatever, and with no other tools than a good sized wrench, adjust this shoe to take care of any difference in shrinkage or settlement which may appear among the three piers. The sliding surfaces of these adjustable shoes were coated with a cheap and lasting form of lubricant known as "Velvet No. 2." The wedges provide for a vertical movement of ⅛ in. for a horizontal movement of 3 in. and are controlled by ordinary machine bolts with double nuts. In erecting the wedges, they were set in pairs with the slopes in opposite directions so as to neutralize each other and prevent the entire structure from tending to drift or slide all in one direction.

The new piers were of concrete construction resting on piles, there being 12 piles to each of the standard bents, and 20 piles for the special piers under the new river truss. The piles were driven 35 ft. The piles were so arranged that they could be driven on either side of the old bent without disturbing the old iron work.

The method of handling the pile driver was quite interesting. It had to be moved many times to drive the small cluster of



Details of Reinforced Viaduct, Pere Marquette.

piles at each of the bents, each cluster being split into two groups as divided by the old iron bents which stood on the center line of each pile cluster. The pile driver was handled from the deck of the structure 75 ft above, and was placed at the various points of operation without removing any of the old bracing. This not only saved expense, but was better for the structure. The driver was picked up near its center of gravity, tilted over with its legs uppermost and its nose or top thrust between the bracing rods of the structure to the desired point of setting up. In this way it was moved along from point to point. Very little timber bracing was used at the foot of the driver, which was guyed to the old iron columns of which there were plenty near each set-up. The engine was handled separately from the driver, not being mounted on it. This avoided the necessity of moving the engine as frequently as the driver.

The erection of the steel work was somewhat unusual, and while at first appearing somewhat formidable, it worked out satisfactorily and with reasonable economy, barring delays due to foundation trouble. The old work was mostly field bolted, which made the occasional temporary removing of old members less expensive. The new steel was handled by a derrick car at the beginning of the work, but this method did not prove entirely satisfactory, and was later replaced by a locomotive crane which gave better results.

The river span was erected with very little falsework. The new steel columns were first erected at the ends of this span. Then the top chord was raised and suspended from the old structure with steamboat ratchets, the turnbuckles being placed so as not to interfere with railroad traffic. All new top chord bracing was then placed, this being connected to the old trusses, and all bottom chord bracing removed. The balance of the new truss was then placed with falsework consisting of but a single wood post at either end, and the truss was kept suspended and controlled with 24 turnbuckles until completely riveted.

The cost of the reconstruction was, in round numbers, as follows; these figures including all extras on the work proper and a contractor's profit of 10 per cent., the work having been undertaken on a percentage basis with a fixed maximum limit:

Foundations in place (Ry. Co. furnished gravel free)	$10,200.00
New steel, 455 tons delivered at site (free freight)	22,400.00
Erection of steel (free transportation of men and equipment)	11,300.00
Total cost	$43,900.00

which, on a conservative guess, is only about half what a new structure would have cost.

The old structure weighed 496 tons.

AUTOMATIC BLOCK SIGNAL RECORDS.

In our issue of February 21, page 333, we printed the records of automatic block signal performance on eight railroads, but omitting the names of the companies. All of them are prominent lines, doing a large business; but the names had to be omitted because certain collateral information, which it would be necessary to have if one were to make comparisons, one road with another, was not available. For a ninth road, however, we have a more complete record and the performance of signals on that road, the Baltimore & Ohio, is the subject of the sketch now printed, the facts being given by courtesy of President Daniel Willard.

On the Baltimore & Ohio we find carefully kept and well arranged records. The quality of its signal service is to be classed as good. It cannot be said that the performance of its signals is markedly better than that on other roads, but its recording system is well arranged, and the practice of its signal department is to a satisfactory degree typical of American practice. It is by no means certain that instructive comparisons, as between roads, can at present be made at all except in a very general way. The percentage of failures to perfect signal movements is found to vary so much between different roads similarly situated that it is evident that there are in most cases vital differences in the bases on which computations are made. And, as is obvious to the student of the subject, all mathematical comparisons are of secondary value, for the reason that on all of the principal roads the proportions of inefficiency are measured in hundredths or thousandths of 1 per cent., figures so small that the statistician, looking at percentages alone, would be forced to mark every record substantially "perfect." There are imperfections, but the specialist in percentages is not the one to help in curing them.

The Baltimore & Ohio System, with 5,471 miles of line, including the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, of which 4,805 miles is passenger lines, has 431.82 miles, nearly all of which is double track or with more than two tracks, on which the automatic block system is used. The remainder of its passenger lines are operated under the manual block system. A great many of the automatic sig-

nals have been in service for a period of 12 years, and complete records of the performance of these signals have been kept since the first installation was made.

The sections of automatic signals in operation are indicated in the following table.

Automatic Block Signals—Baltimore & Ohio System.

		Miles.
New York division	Staten Island Lines	20.05
Philadelphia division	Philadelphia to Bay View	90.22
Baltimore division	Bay View to Waverly	4.20
	Baileys to Relay	6.50
	Relay to Washington	29.40
	Washington to Germantown	25.13
	Germantown to Washington Junction	17.15
	Washington Junction to Weverton	10.10
Cumberland division		11.00
Monongah division	Grafton to East Grafton	2.50
Connellsville division		.73
Pittsburgh division	Connellsville to Pittsburgh	57.26
	Goebring to West Pittsburgh	13.77
New Castle division	West Pittsburgh to New Castle Junction	1.99
Chicago division	McCools to State Line	22.40
	Hamler to Standley	10.70
B. & O. Chicago Terminal		15.50

Baltimore & Ohio Southwestern.

Ohio division	Loveland to Oakley	14.10
Indiana division	Oakley to Cincinnati	10.81

Cincinnati, Hamilton & Dayton.

Toledo division		36.30
Indianapolis division		32.01
Total		431.82

The length of track included in the 431.82 miles above mentioned as equipped with automatic block signals is 839.78 miles, there being 67.11 single track, 343.08 double track, 4.80 three track, 16.83 four track. In addition to this there is on the B. & O. System 186.55 miles of road, or 355.17 miles of track in manual block territory, which is protected either by semi-automatic or automatic signals. This mileage is not included under automatic block signal mileage.

The number of signals of the different kinds may be seen from the following statement:

130 Hall Switch & Signal Company's disk type.
180 Hall Switch & Signal Company's electro-gas.
495 Union Switch & Signal Company's style "T."
20 Union Switch & Signal Company's electro-pneumatic top mast.
200 General Electric Company's electric motor.
100 General Railway Signal Company's model 2-A.

Of 1,125 automatic signals now in use on certain divisions, 749 are semaphores moving in the upper quadrant, 246 semaphores of the lower quadrant type and 130 are disk signals. All signaling in the future will be of the upper quadrant type, whether mechanically or electrically operated.

The number of cells of electric battery appears in the inventory as 40,213, which includes not only batteries for automatic block signals, but also a considerable proportion used at interlockings and for highway crossing bells. This total is made up of the following types:

Gravity cells, 6 in. x 8 in.	27,170
Gordon "A"	2,024
Edison "SS"	1,622
Gordon Porcelain No. 3	947
Edison R R	529
B S C O	2,027
Storage	5,337
Dry	557
Total	40,213

Organization of Forces.—The head of the operating organization is the general manager of the road. The signal engineer has charge of new signal work and of changes to be made in existing signal structures, and he passes on standards of design, construction and policy; but he is not in direct authority over the men who maintain the signals and keep them in operation—the supervisors and the maintainers and their assistants. The supervisor reports to the division engineer, who in turn reports to the superintendent. The supervisor has under him maintainers, assisted by batterymen, and he assigns to each maintainer the care of from 15 to 25 miles of road. Maintainers take care of the interlocking as well as of the automatic signals, and the extent of their territory varies in proportion to the amount of interlocking to be cared for. The total number of maintainers on the Baltimore & Ohio, including the Baltimore & Ohio Southwestern and the Chicago Terminal Railroad, is 268. On the Philadelphia division there are 28 maintainers; on the Baltimore division, 37; Cumberland division, 32; on the three divisions centering in Pittsburgh, 82; and on other divisions smaller numbers.

As a means of keeping informed in detail of the work of the supervisors of the divisions and the maintainers, the signal engineer, at frequent intervals, sends out from his office inspectors who visit all divisions of the road and make observations on the work of the men and tests of apparatus, reporting the result of their investigations directly to the signal engineer.

Records.—The success of the maintainer in performing his task of keeping everything in perfect condition is measured by the freedom from unnecessary detentions of trains and from failures of the signals to properly display stop indications at the entrance of every block section at all times when that section is occupied by a train or car, or is unsafe for passage by reason of a broken rail or a misplaced or defective switch. The records of these failures, therefore, constitute a daily index of efficiency.

On receipt of a report of a signal not giving proper indication the despatcher at once repeats the information to the maintainer for the district in which the signal is situated.

The maintainer explains failures and defects by making to his superior, the signal supervisor, a daily report. While explanations of causes of delays are its most prominent feature, this report also serves as a journal of all of the work done by the maintainer, much of which is connected with interlocking signals and has no direct connection with delays to trains. Moreover, this report affects the signal performance record, only to the extent that the maintenance of the apparatus in good order is an element in the safety of trains. It gives information concerning signal failures under the following eight heads: (1) name or character of appliance; (2) train delayed; (3) number of engine; (4) time of delay; (5) number of minutes delayed; (6) time notice received; (7) time maintainer reached the spot; (8) time consumed in repairs. This tabular statement is supplemented by a statement of the nature of the failure, the cause, so far as known, and a memorandum of the material used in making the repairs.

Three times a month the signal supervisor of each division makes a report to his superior, the division engineer in charge of roadway, summarizing the results of the work of the maintainers under his authority. This report shows all failures which have occurred on the division during the ten-day period covered by the report. The division engineer, after reading the report and taking any action thereon which may be required of him, sends it to the signal engineer, retaining a copy in his own office.

These reports, coming to the signal engineer's office from the different divisions of the road, form the basis for the classified record of signal failures, as shown on form 102, below.

For his own information, and for the purpose of making comparisons of the work or the ability of different supervisors, the signal engineer makes this classification for each division of the road and each subdivision; and also, in the case of large interlocking plants, for each plant individually. The sample statement shown below is a copy of the statement for the whole road for one year.

Form 102.—Automatic Signal Failures.
Reported Failures, 1,598; Actual Failures, 1,198.

		Per cent.
Nothing wrong	310	19.40
Short circuits, grounds and crosses	181	11.33
Lightning	165	10.33
Track wet and dirty	93	5.82
Broken wires	91	5.69
Mechanisms defective	81	5.07
Bond wires broken	76	4.76
Track changes	66	4.13
Obstructions dragging from cars or engines	61	3.82
Battery or gas exhausted	53	3.32
Relays defective	48	3.00
Pressure gages defective (electro-gas signals)	44	2.75
Instruments out of adjustment	44	2.75
Train in block*	40	2.50
Light out	37	2.31
Snow, ice and frost	24	1.50
Battery jar broken	22	1.38
Insulation worn out	15	.94
Corroded wires	15	.94
Dirt in mechanisms	15	.94
Defective battery material	13	.81

Repairmen cleaning instruments or renewing battery or wire.	13	.81
Broken rail*	13	.81
Switch left open*	13	.81
Maliciousness	11	.69
Loose connections	11	.69
Derailments*	10	.63
Car outside fouling point*	10	.63
Wires improperly connected	6	.38
Derail left closed*	4	.25
Foreign current	3	.19
Residual magnetism	3	.19
Switch point open	3	.19
Careless operation	2	.12
Trunking and wires burnt	1	.06
Loose wires caught mechanisms	1	.06
	1,598	100.00

*Not chargeable to the signal department. "Obstructions dragging from cars or engines" might fairly have been deducted also.

In addition to the regular daily report, the signal maintainer makes a special report once a month showing the condition of the switch points at all of the interlockings in his territory. A switch point which is more than ¼ in. out of its proper position and yet does not cause the automatic signal to show the stop indication is classed as dangerous. The signal engineer compares the percentages of efficiency of different districts, and in making this comparison of efficiency, a general test is made twice a year of the switches on the whole of the road.

Results.—It will be observed that in form 102 the first item, which includes 310 failures out of a total of 1,598, indicates that the alleged fault in the signal was not discovered. In other words, the maintainer, going to the signal and inspecting it as soon as possible after receiving the engineman's notice, found everything in good order. The signal department also disclaims responsibility for six other items in this list: train in block (40); broken rail (13); switch left open (13); derailments (10); car on side track outside the fouling point and obstruction the main line (10); derail left closed (4). These items, with the 310 first named, aggregate 400 cases which, deducted from the total, leaves 1,198; and 1,198 is the number recorded as the total of failures for the year referred to.

The efficiency of the signals in a given year as compared with another, or on a given division of the road as compared with another division, is calculated by finding the percentage of failures to the total number of signal movements. On the whole road, with an average of 667 signals in service in that year, there were 18,488,870 "perfect signal movements." The number of reported failures was 1,598, and of actual failures 1,198, as above noted. This makes one failure to 15,433 perfect movements. Adding the failures to the perfect movements, we have a total of 18,490,068 cases in which the signals operated or should have operated. The percentage of the perfect movements to this total is 99.99352. The signal department in its records claims an efficiency percentage, however, of only 99.97; the difference between this and the higher figure just given being due to the practice of assuming that a signal wrongfully indicating "stop" delays more than one train. Where the records do not show how many trains are thus delayed, the record is arbitrarily made to show *five* trains. In other words, the detentions, instead of being taken at 1,198, are assumed to be 5,547. The 19 "clear failures" recorded in the 12 months when compared with the total of 18,490,068 occasions when the signals operated or should have operated, works out a ratio of 1 in 973,161.

Cases in which a signal indicates clear falsely—shows "proceed" when the block section is occupied by a preceding train—are indicated in the failure report by the letter *W* (White). The record for the year in question includes 48 cases of this kind five of which were failures of non-automatic signals, and 24 were due to the breaking of glasses at night, the larger portion of which were glasses on non-automatic signals. This leaves 19 false clear indications peculiar to automatic signals and directly chargeable to the automatic signal record. (As regards breakage of glass, there is a simple remedy, the use of colored glasses for all indications.)

The 19 dangerous failures of signal apparatus are recorded as being due to the following causes:

a, Residual magnetism	4
b, Loose screw, aluminum arm	1
c, Battery and relay wires crossed by track repairers	1
d, Relay contacts bent	1
e, Foreign current	2
f, Armature fused by lightning	1
g, Relay contact fused by lightning	1
h, Carbon relay contacts worn	1
i, Rusted shaft	3
j, Water in dash pot	1
k, Dry packing in dash pot	1
l, Retaining mechanism stuck	1
m, Retaining mechanism broken	1

When a false clear indication is reported, the matter is investigated to the fundamental cause. If the supervisor in charge of the division is unable to discover the cause or find any reason for the failure, he reports his conclusion to the signal engineer, who convenes a committee of signal supervisors on the ground for the purpose of making further investigation.

While the causes of these failures were thoroughly investigated and suitable remedies applied, the list as printed can be treated only as suggestive. Six of the cases, items *c, d, h, j, k, l,* were clearly due to faults of care or inspection. Items *b* and *i* also, very likely, represent failures which would not have occurred if the maintainers' vigilance had been perfect. The other items, *a, e, f, g, m,* represent causes which are difficult to guard against without exception. Residual magnetism may be due to the use in relays of iron not properly annealed. In track relays the separating of the contacts is produced by weakening the current, not by cutting it off absolutely; and the difference between the pick-up and the drop-away voltage is small. If a relay gets out of adjustment to such a degree that this difference is too small for safety the trouble very likely is due to the tests of the relay not being made frequently enough.

Foreign currents come mostly from the power lines of electric railways near the railroad. The source being known, trouble from the interfering current is guarded against by introducing duplicate relays or by using alternating current, of distinctive frequency, in the track circuits. Sometimes, however, disturbances occur from some new source which is not easily discovered.

Lightning, with its unknown and immeasurable voltage, is a danger element which, though now well understood, as compared with the meagre knowledge of ten years ago, still baffles the most determined attempts of the signal engineer to make his apparatus wholly immune to its destructive influence. The use of different types of lightning arresters, the shortening of line circuits and other expedients are resorted to, but a comprehensive safeguard, applicable everywhere, under well understood conditions, is yet to be discovered. Fortunately, the more serious atmospheric disturbances of electrical apparatus are in most cases announced by thunder and lightning and the signal maintainer is thereby put on his guard.

Transandine Railway Difficulties.—A further suspension of traffic on the Transandine Railway, Chile, is imminent. It is usually at this period that the snows commence to fall in the upper regions of the Andes, but this year the visitation is a somewhat earlier one than usual. Notwithstanding the utmost precautions taken by the authorities, these interruptions to traffic must continue to take place for many years to come, until, in fact, there has been provided—and that would prove a very costly undertaking—a continuous line of snow-sheds. Even then the dangers of interruption to the traffic would not be at an end, for there always remain the drifts and slides which are bound to interfere with the working of the system. It is doubtful whether the passage of the Andes will ever become as simple a matter as the journey to and from the mountains. Improvements, however, already have been introduced since the occurrences of the past year, and it will be instructive to note to what extent they will succeed in overcoming the delays that ensued in 1912, when traffic was seriously interrupted.

NEW YARDS OF THE CHICAGO & ALTON NEAR CHICAGO.

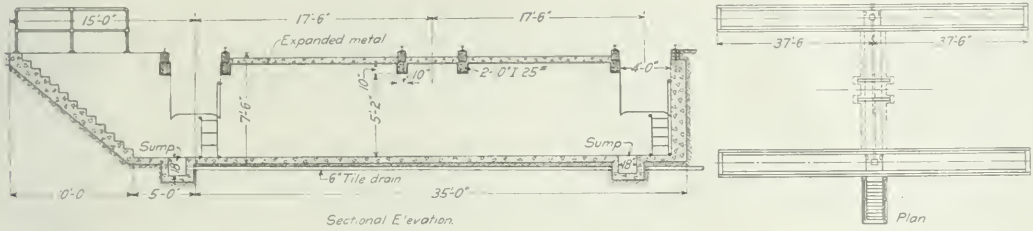
The Chicago & Alton has recently authorized the construction of a new yard along its main line at Glenn, Ill., about ten miles southwest of Chicago and about two miles west of the city limits. This yard is the development of plans inaugurated two years ago when tracks holding about 1,000 cars were built, although the detailed design of the yard has been materially changed since that time. The work now under way involves the completion of these yards to a capacity of 3,700 cars and the construction of an engine terminal including roundhouse, cinder pits, coaling station and auxiliary facilities. Provisions are made in this plan for further additions as required, which will materially increase this capacity.

This yard is intended to relieve the Brighton Park yard, five miles nearer the city, of the classification of main line and interchange business and to permit it to be used for local distribution of freight within the city. The plan also contemplates the construction of two additional tracks between Glenn and Brighton Park yards for slow freight and switch engine movements, and the construction of two tracks for a distance of approximately two miles at the south end of Glenn yard for the easy and convenient movements in and out of this yard of trains. The Glenn yard will be a flat yard, divided into two main portions. The north yard will be devoted largely to interchange business with other roads and will consist of 24 tracks with a capacity of 1,396 cars, in addition to a running track on each side. Eleven of these tracks are already in. This yard will connect directly with the northbound main line at the north end, while access is had to both main lines from the ladder at the south end. The south yard for receiving and making up main line trains will consist of 18 tracks, exclusive of a running track on each side, with a total capacity of 2,045 cars. Thus, the tracks in the south yard have an average capacity of 114 cars—sufficient to accommodate the longest main line train, while the tracks in the north yard are designed for only about half this length because of the inability of some of the other roads to receive trains of greater length than 50 cars in their interchange yards. This south yard is also connected with both main lines by crossovers at the south end of the yard. As shown on the accompanying map, all but six of these tracks are now in.

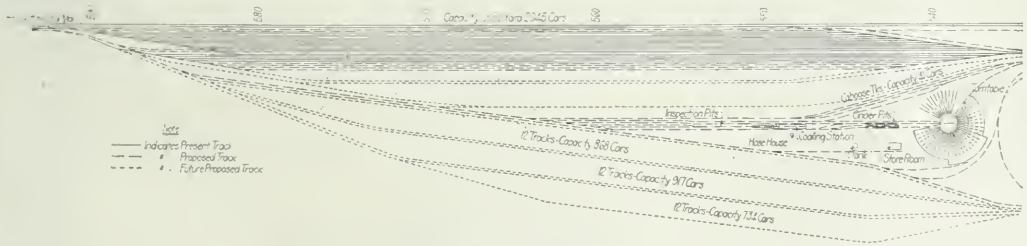
About 350,000 cu. yd. of filling is required for the tracks now being constructed; the average height of fill being about 3 ft. Owing to the swampy character of the ground, this fill is being made with cinders rather than with sand.

One unusual feature in the design of this yard is the wye and loop for turning engines or entire trains, located in the center of the yard just north of the roundhouse. This loop is directly accessible from either end of the yard, or from the main line. The maximum curve is 14 deg. Inside this loop are located 12 repair tracks with a total capacity of 143 cars and four bad order storage tracks holding 104 cars. The tracks are spaced 13 ft. centers in the classification yards with 23 ft. in the repair yard.

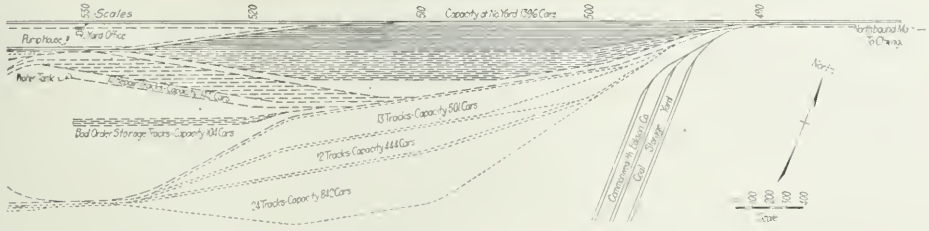
The main structure in the engine terminal is a 30 stall brick



Plan and Section of Inspection Pit.



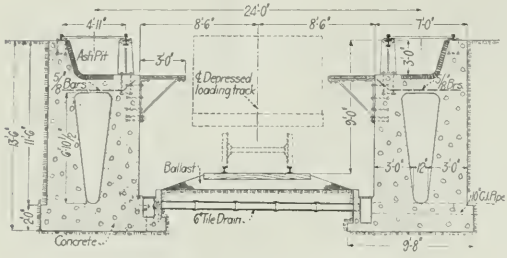
Track Plan of the New Chicago & Alton Yards near Chicago.



Track Plan (Continued).

roundhouse with 100 ft. stalls, 75 ft. engine pits, and a 90 ft. turntable. This roundhouse is located in the center of the yard with entrance from either direction. Ten radial tracks are provided for engine storage opposite the house. This roundhouse is of standard construction with brick floors, hot air heat, boiler washing system, etc. A small annex around the center of the house will contain the boiler rooms, powerhouse, fan house and a small shop for light repairs to locomotives.

A double cinder pit with a depressed track in the center is



Section Through Ash Pits and Loading Track.

located just outside of the roundhouse. This pit will be 200 ft. long, enabling six engines to clinker at one time. The engine tracks will be supported on heavy concrete walls, hollowed out in the center, as shown in the drawing, and filled with sand, to save concrete; the amount of concrete in each wall being reduced by about 100 yd. in this manner. The loading track will be depressed 9 ft. below the engine tracks, and platforms 3 ft. wide will be built out on each side at the elevation of the bottom of the cinder pits, on which workmen may stand while loading the dry sand bin with a capacity of 66 tons. The wet sand bins extend down considerably below the level of the coal chute bin floors to a dryer, provided in the bottom of each bin. The dry sand is elevated by compressed air into the dry sand storage.

Two engine inspection pits each 75 ft. long are located just west of the coal chute. A concrete stairway at the center of the east pit leads down to a tunnel reaching both inspection pits, passing under an intermediate track to connect with the pit on the west. Access to the inspection pits is secured by short ladders leading from the tunnels. It is expected to do much of the routine inspection of locomotives on these pits, relieving the tracks in the roundhouse to this extent.

The construction of these buildings has been let to the George B. Swift Co., Chicago, while all other work, including grading and track laying, is being done by company forces. This work is being handled under the direction of H. T. Douglas, Jr., chief engineer.

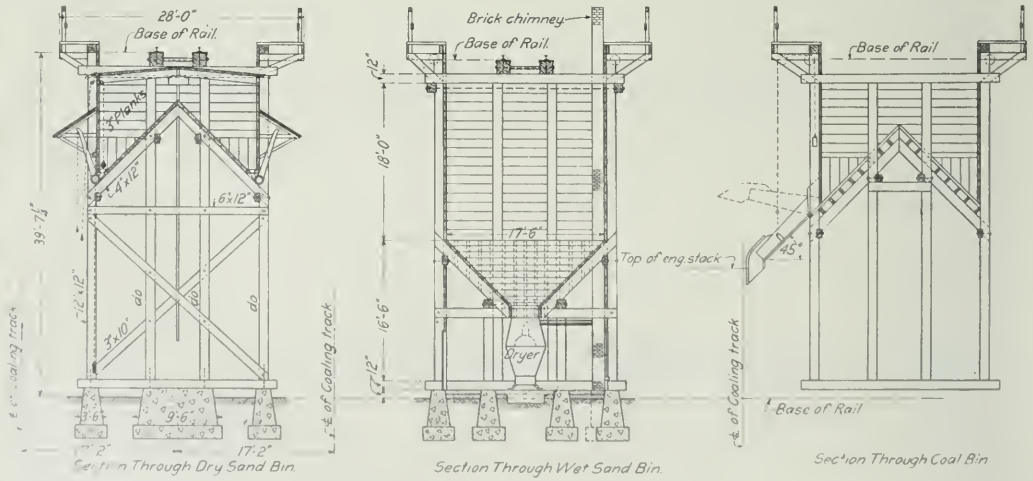
THE PROPOSED ARBITRATION BILL.

The following is the full text, with certain exceptions noted below, of the bill which has been introduced into Congress, providing for mediation, conciliation and arbitration in controversies between certain employers and their employees.

Section 1. That the provisions of this act shall apply to any common carrier or carriers, etc. [same provisions as the Erdman act].

A common carrier subject to the provisions of this act is hereinafter referred to as an "employer," and the employees of one or more such carriers are hereinafter referred to as "employees."

Sec. 2. That whenever a controversy concerning wages, hours of labor, or conditions of employment shall arise between an employer or employers and employees subject to this act,



Sections Through Coal Chute and Sand Bin.

cinders. These platforms will be covered with steel plates nicked with cold chisels to insure safe footing.

The coal chute will be of timber construction throughout with a track reaching the upper deck by means of a framed approach trestle on a 20 per cent grade. Five double bins with a total capacity of 300 tons will be built. Immediately adjoining this on the north end and built as a part of the coal chute with the track above, will be the sand storage consisting of three bins with a capacity of 374 tons of wet sand each, and one double

interrupting or threatening to interrupt the business of said employer or employers to the serious detriment of the public interest, either party to such controversy may apply to the Board of Mediation and Conciliation created by this act and invoke its services for the purpose of bringing about an amicable adjustment of the controversy; and upon the request of either party the said board shall with all practicable expedition put itself in communication with the parties to such controversy and shall use its best efforts, by mediation and conciliation, to bring

them to an agreement; and if such efforts to bring about an amicable adjustment through mediation and conciliation shall be unsuccessful, the said board shall at once endeavor to induce the parties to submit their controversy to arbitration in accordance with the provisions of this act.

In any case in which an interruption of traffic is imminent and fraught with serious detriment to the public interest, the Board of Mediation and Conciliation may, if in its judgment such action seem desirable, proffer its services to the respective parties to the controversy.

In any case in which a controversy arises over the meaning or the application of any agreement reached through mediation under the provisions of this act, either party to the said agreement may apply to the Board of Mediation and Conciliation for an expression of opinion from such board as to the meaning or application of such agreement and the said board shall upon receipt of such request give its opinion as soon as may be practicable.

Sec. 3. That whenever a controversy shall arise between an employer or employers and employees subject to this act, which cannot be settled through mediation and conciliation in the manner provided in the preceding section, such controversy may be submitted to the arbitration of a board of six, or, if the parties to the controversy prefer so to stipulate, to a board of three persons, which board shall be chosen in the following manner: In the case of a board of three, the employer, or employers, and the employees, parties respectively to the agreement to arbitrate, shall each name one arbitrator; and the two arbitrators thus chosen shall select the third arbitrator; but in the event of their failure to name the third arbitrator within five days after their first meeting, such third arbitrator shall be named by the Board of Mediation and Conciliation. In the case of a board of six, the employer, or employers, and the employees, parties respectively to the agreement to arbitrate, shall each name two arbitrators, and the four arbitrators thus chosen shall, by a majority vote, select the remaining two arbitrators; but in the event of their failure to name the two arbitrators within fifteen days after their first meeting the said two arbitrators, or as many of them as have not been named, shall be named by the Board of Mediation and Conciliation.

In the event that the employees engaged in any given controversy are not members of a labor organization, such employees may select a committee which shall have the right to name the arbitrator, or the arbitrators, who are to be named by the employees as provided above in this section.

Sec. 4. That the agreement to arbitrate:

First. Shall be in writing.

Second. Shall stipulate that the arbitration is had under the provisions of this act.

Third. Shall state whether the Board of Arbitration is to consist of three or six members.

Fourth. Shall be signed by duly accredited representatives of the employer or employers and of the employees.

Fifth. Shall state specifically the questions to be submitted to the said board for decision.

Sixth. Shall stipulate that a majority of said board shall be competent to make a valid and binding award.

Seventh. Shall fix a period from the date of the appointment of the arbitrator or arbitrators necessary to complete the board, as provided for in the agreement, within which the said board shall commence its hearings.

Eighth. Shall fix a period from the beginning of the hearings within which the said board shall make and file its award; provided that this period shall be thirty days unless a different period be agreed to.

Ninth. Shall provide for the date from which the award shall become effective and shall fix the period during which the said award shall continue in force.

Tenth. Shall provide that the respective parties to the award will each faithfully execute the same.

Eleventh. [Award binding as in Erdman act.]

Twelfth. May also provide that any difference arising as to the meaning or the application of the provisions of an award made by a board of arbitration shall be referred back to the same board or to a sub-committee of such board for a ruling, which ruling shall have the same force and effect as the original award; and if any member of the original board is unable or unwilling to serve, another arbitrator shall be named in the same manner as such original member was named.

Sec. 5. That for the purpose of this act the arbitrators herein provided for, or either of them, shall have power to administer oaths, etc. [as in Erdman act] and affirmations, sign subpoenas, require the attendance and testimony of witnesses, and the production of such books, papers, contracts, agreements and documents material to a just determination of the matters under investigation as may be ordered by the court; and may invoke the aid of the United States courts to compel witnesses to attend and testify to produce such books, papers, contracts, agreements and documents to the same extent and under same conditions and penalties as is provided for in the act to regulate commerce, approved February 4, 1887, and the amendments thereto.

Sec. 6. That every agreement of arbitration under this act shall be acknowledged by the parties thereto before a notary public or a clerk of the district or the circuit court of appeals of the United States, or before a member of the Board of Mediation and Conciliation, the members of which are hereby authorized to take such acknowledgments; and when so acknowledged shall be delivered to a member of said board or transmitted to said board to be filed in its office.

When such agreement of arbitration has been filed with the said board, or one of its members, and when the said board, or a member thereof, has been furnished the names of the arbitrators chosen by the respective parties to the controversy, the board, or a member thereof, shall cause a notice in writing to be served upon the said arbitrators, notifying them of their appointment, requesting them to meet promptly to name the remaining arbitrator or arbitrators necessary to complete the board, and advising them of the period within which, as provided in the agreement of arbitration, they are empowered to name such arbitrator or arbitrators.

When the arbitrators selected by the respective parties have agreed upon the remaining arbitrator or arbitrators, they shall notify the Board of Mediation and Conciliation; and in the event of their failure to agree upon any or upon all of the necessary arbitrators within the period fixed by this act, they shall, at the expiration of such period, notify the Board of Mediation and Conciliation of the arbitrators selected, if any, or of their failure to make or to complete such selection.

If the parties to an arbitration desire the reconvening of a board to pass upon any controversy arising over the meaning or application of an award, they shall jointly so notify the Board of Mediation and Conciliation, and shall state in such written notice the question or questions to be submitted to such reconvened board. The Board of Mediation and Conciliation shall thereupon promptly communicate with the members of the Board of Arbitration or a sub-committee of such board appointed for such purpose pursuant to the provisions of the agreement of arbitration, and arrange for the reconvening of said board, or sub-committee, and shall notify the respective parties to the controversy of the time and place at which the board will meet for hearings upon the matters in controversy to be submitted to it.

Sec. 7. That the Board of Arbitration shall organize and select its own chairman and make all necessary rules for conducting its hearings; but in its award, or awards, the said board shall confine itself to findings or recommendations as to the questions specifically submitted to it, or matters directly bearing thereon. All testimony before said board shall be given under oath or affirmation, and any member of the Board of Arbitration shall have the power to administer oaths or affirmations. It may employ such assistants as may be necessary in carrying on its work. It shall whenever practicable be supplied with suitable

quarters in any Federal building located at its place of meeting, or at any place where the Board may adjourn for its deliberations. The Board of Arbitration shall furnish a copy of its award to the respective parties to the controversy, and shall transmit the original, together with the papers and proceedings and a transcript of the testimony taken at the hearings, certified under the hands of the arbitrators, to the Board of Mediation and Conciliation to be filed in its office. The clerk of any court of the United States in which awards or other papers or documents have been filed by Boards of Arbitration in accordance with the provisions of the act approved June 1, 1898, providing for mediation and arbitration, is hereby authorized to turn over to the Board of Mediation and Conciliation, upon its request, such awards, documents and papers. The United States Commerce Court, the Interstate Commerce Commission and the Bureau of Labor are hereby authorized to turn over to the Board of Mediation and Conciliation, upon its request, any papers and documents heretofore filed with them, and bearing upon mediation or arbitration proceedings held under the provisions of said act.

Sec. 8. That the award being filed in the clerk's office of a district court of the United States, as hereinbefore provided, shall go into practical operation, and judgment shall be entered thereon accordingly at the expiration of ten days from such filing, unless within such ten days either party shall file exceptions thereto for matter of law, etc. [same as Erdman act].

Sec. 9. [Provisions in regard to receivers same as Erdman act.]

Sec. 10. That each member of the Board of Arbitration created under the provision of this act shall receive such compensation as may be fixed by the Board of Mediation and Conciliation, together with his traveling and other necessary expenses. The sum of $25,000, or so much thereof as may be necessary is hereby appropriated, to be immediately available and to continue available until the close of the fiscal year ending June 30, 1914, for the necessary and proper expenses incurred in connection with any arbitration or with the carrying on of the work of mediation and conciliation, including per diem, traveling, and other necessary expenses of members or employees of Boards of Arbitration and rent in the District of Columbia, furniture, office fixtures and supplies, books, salaries, traveling expenses, and other necessary expenses of members or employees of the Board of Mediation and Conciliation, to be approved by the chairman of said Board and audited by the proper accounting officers of the treasury.

Sec. 11. There shall be a Commissioner of Mediation and Conciliation, who shall be appointed by the President, by and with the advice and consent of the Senate, and whose salary shall be $7,500 per annum, who shall hold his office for a term of seven years; and until a successor qualifies, and who shall be removable by the President only for misconduct in office. The President shall also designate not more than two other officials of the government who have been appointed by and with the advice and consent of the Senate, and the officials thus designated, together with the Commissioner of Mediation and Conciliation, shall constitute a board to be known as the United States Board of Mediation and Conciliation

There shall also be an Assistant Commissioner of Mediation and Conciliation, who shall be appointed by the President, by and with the advice and consent of the Senate, and whose salary shall be $5,000 per annum. In the absence of the Commissioner of Mediation and Conciliation, or when that office shall become vacant, the Assistant Commissioner shall exercise the functions and perform the duties of that office. Under the direction of the Commissioner of Mediation and Conciliation, the assistant commissioner shall assist in the work of mediation and conciliation and when acting alone in any case he shall have the right to take acknowledgments, receive agreements of arbitration, and cause the notices in writing to be served upon the arbitrators chosen by the respective parties to the controversy, as provided for in Section 5 of this act

General News.

Alexander H. Stephens, hitherto district superintendent at San Francisco, has been appointed general superintendent of the railway mail service, in place of Theodore Ingalls.

W. G. Lee, chief of the Brotherhood of Railroad Trainmen, has been re-elected for the ensuing term by a vote of 446 against 394 for A. F. Whitney, who is third vice-president of the brotherhood.

The New York Central has readjusted the pay of telegraphers and signalmen granting increases, dating from May 15, to about seventy per cent. of the men in these departments. The average increase is about 6 per cent.

The Old Time Telegraphers' & Historical Association will hold its 32nd annual meeting at Hotel Cadillac, Detroit, Mich., August 26, 27 and 28. The secretary of the association is F. J. Scherrer, 30 Church street, New York City.

In the Federal Court at Columbus, Ohio, June 5, the grand jury returned 20 indictments against the Grand Trunk Western Railroad, charging illegal reductions in rates for the transportation of coal between Newark, Ohio, and Battle Creek, Mich.

The United States Steel Corporation, in its monthly statement issued this week, reports unfilled orders on its books on May 31 of 6,324,322 tons. This compares with 6,978,762 tons on April 30, a decrease of 654,440 tons, and with 7,468,956 tons on March 31, 7,656,714 tons on February 28 and 5,750,983 May 31, 1912.

The shipments of anthracite coal from the Pennsylvania mines in the month of May amounted to 5,995,742 tons. The Lehigh Valley carried 1,191,632 tons, and the Philadelphia & Reading 1,123,869 tons. The total shipments were about 320,000 tons less than in the same month of 1911. In May, 1912, the movement was very small, operations at the mines having been suspended to a large extent in that month.

The governor of Massachusetts has vetoed the bill passed by the legislature, permitting the New York, New Haven & Hartford to acquire all the electric railways in the state west of Worcester. The governor says that while the bill "purports to provide better transportation facilities for western Massachusetts, in fact it has been skilfully drafted in such manner as to legalize unlawful acts hitherto committed by the railroad companies [the New Haven] without giving any satisfactory assurance that the transportation facilities needed in Western Massachusetts will ever be provided."

A press despatch from Seward, Alaska, says that the rolling stock and rights of the Alaska Northern railway have been turned over to a committee of business men to be operated for the benefit of the community. This action was taken by Chief Engineer Swanitz, because of a demand by the United States for payment of $67,000 mileage tax. The railroad company says Congress expressly relieved the company from paying this tax until 1916. Contributions were made by Seward business men to hire crews and run trains to carry supplies to miners and settlers in the interior. No fixed charge for this service is made, but the committee will accept gifts of money. The Alaska Northern extends from Seward north to Kern Creek, 71 miles.

In his appreciation of safety at grade crossings, Governor Sulzer, of New York, evidently holds the same restricted views as were manifested by two of his predecessors. He has vetoed the appropriation called for by the Public Service Commission for the first district for separation of grades. In this district lie many miles of the Long Island Railroad, in crying need of this improvement. The commission will ask the forthcoming special session of the legislature for an appropriation, especially to enable it to proceed with the work of eliminating crossings on the lines of the Long Island road in Queens Borough. The commission asked the last session of the legislature for $1,500,000 The appropriation bill carried only $350,000, but even this was vetoed by the governor. Since 1911 no money has been appropriated, and as a result elimination work in this district, except as to that ordered prior to that time, is at a stand-still. The commission has held hearings on several groups of crossings which it desires to eliminate and only awaits an appropriation by the state to issue the necessary orders. Among these crossings are 21 on the Atlantic avenue division between the end of the ele-

vated structure and the beginning of the Jamaica improvement The elimination of these crossings will cost about $3,500,000, and the railroad company is willing to supply its half of the cost as soon as the state makes an appropriation.

Ninety-three Miles an Hour, All Day.

A French aviator, Marcel G. Brindejono des Moulinais, on Tuesday last flew from Paris to Warsaw, via Berlin, a distance of 1,500 kilometers (932 miles), in thirteen hours, and, excluding stops, attained an average speed of 93 miles an hour. He accomplished this in the competition for the Pommery cup, for the longest flight across country from sunrise to sunset in one day. The aviator landed at Wanne, in Prussia, at 8 a. m., and at Berlin at noon

A Railroad Number of Leslie's Weekly.

The issue of *Leslie's Illustrated Weekly* for June 5, 1913, may be called a railroad number. The colored picture, entitled "Empire Builders," filling the front page, puts a considerable tax on the railroad man's imagination, in the matter of details, but is possessed of spirit nevertheless. There is a full-page portrait of the late Henry M. Flagler, a page of portraits of railroad officers, and another page of portraits of members of the Railway Business Association. The portraits of railroad officers are quite familiar to the general reader, but those of the supply men are less familiar. They are: S. P. Bush, president of the Buckeye Steel Castings Company; John F. Dickson, president, Dickson Car Wheel Company; T. A. Griffin, president, Griffin Wheel Company; A. B. Johnson, president, Baldwin Locomotive Works; E. B. Leigh, president, Chicago Railway Equipment Company; William Lodge, president, Lodge & Shipley Machine Tool Company; A. H. Mulliken, president, Pettibone-Mulliken Company; E. H. Outerbridge, the Millboard Company; George A. Post, president, Railway Business Association; W. W. Salmon, president, General Railway Signal Company; George T. Smith, president, Joseph Dixon Crucible Company; John F. Wallace, president, Westinghouse, Church, Kerr & Co., and George Westinghouse. These portraits are accompanied by a brief article by Mr. Post, and the portraits and sketches of the railroad officers are accompanied by articles by B. F. Bush, president of the Missouri Pacific, and F. A. Delano, president of the Wabash. There is an article on railroad building in western Canada by J. O. Curwood, one on safety by Homer Croy, and one by E. C. Simmons, chairman of the Simmons Hardware Company, St. Louis, favoring the proposition to allow the railroads to make a small advance in freight rates. Mr. Simmons says that his house ships more goods and pays more freight than any other mercantile house in the United States. The concern has seven houses, and 500 traveling men; and the sentiment and temper of the people is recorded in the head office at least every week. He estimates that his traveling men talk with an average of 5,000 voters every day in the year. He says that the change in public sentiment from its former enmity to railroad interests has been going on four or five years, and that the public mind is still changing very rapidly.

Apropos of Railroad Presidents.

"Be very careful in your investigations of every case presented to you," said a New York judge in impaneling a grand jury recently. "Many a hard-earned reputation has been destroyed by the filing of unnecessary indictments, and the dismissal of the indictment does not remove the stigma upon a person's name." That is good advice for any grand jury anywhere. There is always danger of the thought that "this isn't a trial; it isn't calling him guilty; he'll have his chance later on; we'll indict him on general principles." But it is hard for anyone to undo the damage caused by an unjustified indictment.—*Boston Post.*

Frisco Service Good, and Growing Better.

Thomas H. West and B. L. Winchell, receivers of the St. Louis & San Francisco, have addressed the following circular to the employees:

"It is particularly desirable that every employee upon the Frisco payroll shall impress every patron of the line and the public at large with the fact that the Frisco is a going institution and that it will not stop going.

"The appointment of receivers of the property in no wise affects the day-to-day operations; the Frisco has been endeavoring to give all patrons good service; the same operating and traffic forces throughout will continue to serve the public just as carefully and just as well as in the past; it is even hoped by the receivers that the physical property and the character of the service shall be bettered from time to time.

"The same earnest solicitation by the traffic representatives and the same painstaking care of the business after it has been secured will hold all of our old patrons and bring us others."

Canadian Railway Subsidies.

Details of the subsidies proposed at the present session of parliament by the Canadian Government were given out last week. The Canadian Northern gets $12,000 per mile on 910 miles from Ottawa to Port Arthur, on 260 miles from Edmonton to the British Columbia boundary, and $6,400 per mile for the line from Toronto to Ottawa, 250 miles. The subsidies are to be paid by instalments upon completion of each ten-mile section. The aggregate of the Canadian Northern subsidies at $12,000 a mile is $15,640,000, and of the other on the lower basis, $1,600,000, a total of $17,240,000. A condition is the transfer to the government of $7,000,000 of fully paid-up shares of common stock of the company. The Ontario government is subsidized at $6,400 on the following lines of the Temiskaming & Northern Ontario: North Bay to Cochrane, 258 miles; Englehart to Charlton, 7.8 miles; Cobalt to Kerr Lake, 3.9 miles; Iroquois to Timmins, 33.2 miles; Earlton to Elk Lake, 28.5 miles; Iroquois Falls Station to Iroquois Falls, 7.25 miles; a total of about $2,135,000. Other subsidies at $3,200 per mile are to the Margaree Coal and Railway Company, Orangedale to St. Rose, 46 miles; McIntyre to Caribou, 4 miles; Northern New Brunswick Railway, Drummond and Austin Brook, 16 miles; Tobique and Campbellton Railway, 25 miles; St. John and Quebec Railway, Andover to St. John, 200 miles; Lotbiniere and Megantic Railway, 60 miles; Megantic to International boundary, 35 miles; Little Nation Railway, Thurso to Montebello, 30 miles; Erie, London and Tilsonbury Railway, 35 miles; St. Mary's to Embro, 10 miles; Alberta Central Railway, 70 miles; Kettle Valley Railway, 335 miles; Calgary & Fernie Railway, 100 miles; for bridge over Burrard Inlet, Vancouver, B. C., $350,000; Canadian Pacific Railway, Gimli to Icelandic River, 30 miles. The subsidies are governed by the usual conditions.

Electric Switchers at Harlem River.

The use of electric locomotives in the freight yard of the New York, New Haven & Hartford at its Harlem River terminus in the Borough of the Bronx, New York City, has increased the value of real estate in that vicinity. This we have on the authority of an officer of the road. The discontinuance of the use of steam locomotives for switching has so abated the nuisances of noise and smoke that dwelling houses have been put up, near the freight yards, on land which formerly could not be disposed of for dwelling-house purposes. Steam switching engines have been abandoned also at New Rochelle, Mount Vernon, Woodlawn and Stamford. Within a few months electric locomotives will be used for all purposes on this road between New Haven and New York, which will result in a widespread abatement of the noise nuisance. The Harlem River yard occupies about 275 acres and has 86 miles of track. There are not yet enough electric locomotives in service to do all of the work in this yard in the busiest hours, but the number will soon be increased.

Describing the overhead electric structures in the yard the literary artist of the road says:

Standing on one of the highway bridges which span the yard it looks for all the world as if some gigantic spider had spun his web as a covering for the tracks beneath. This spidery-like structure stretching in all directions as far as the eye can see is whence the smokeless freight yard gets its motive power.

Here and there under the wires as you look down through the meshes of this web below you cars are moving singly and in trains. Not a sound comes to indicate whose hand is doing all this. There isn't a cloud of black smoke rising and spreading out over the yard as is usually the case, to show where the switch engine labors at its task. These cars, loaded with the commerce of the country, are being shunted by some invisible

hand. The only noise from the yards comes from the occasional squeak of a wheel or the coupling of the cars.

But if you watch this scene closely enough you will finally discern through the maze of wires and amid the roofs of the myriad freight cars a queer looking object, a cheese box on wheels, gliding noiselessly about—the electric switch locomotive —"mother hubbards" they call them. It goes about its task without showing any of those signs of distress so common in the steam switch engine, no exhausted breathing, no puffing and panting, no cloud of smoke ascending in the air to mark its location. It seems the embodiment of power and efficiency. The total car movement in this yard averages 5,000 cars a day. In place of the triangle of wires seen on the main line, each track in the freight yard has a single 7/8-in. cable supported from the cable strung between the towers. From this cable is suspended a conductor wire of copper and below this is the contact wire of steel against which the pantagraph runs. At the switches steel deflectors are used to keep the pantagraph running smoothly.

Except at points where they go under the highway bridges the contact wire is 22½ ft. above the top of the rail. This gives about a 2-ft. clearance for the brakeman riding on top of the cars. Out of 500 men constantly at work in the yard not one has been hurt since the electrical operation began. In the Westchester auxiliary yard two electric switch engines are doing the work for which three steam engines were formerly used.

But the saving to the railroad is as nothing compared to the immense civic benefit it has conferred on those communities which were once bothered with smoke and noise, as has been noted above.

The First Step.

Senator La Follette now gives notice that he isn't going to be satisfied with getting the property of the railroads revalued. That's only the first step. Congress must absolutely divorce the transportation business from all other kinds of business. It must put an end to the interlocked directorates. And, thirdly, it must create yet another new federal bureau at Washington, "for ascertaining and standardizing the cost of every element of railroad maintenance and railroad operation."—*Hartford Courant.*

The Safety Propaganda on the Pennsylvania.

General Manager S. C. Long has issued to the Safety Committees of the Pennsylvania Railroad a pamphlet entitled "Hints and suggestions on the prevention of personal injury accidents," which is more comprehensive than anything of the kind which we have seen. At the same time it does not go into detail, and on many points there is no attempt to be specific. The book is for committees and not primarily for the individual employee, and in matters concerning which there is room to pursue two or more courses, the book sets forth general principles only. But, though it does not answer all questions, the pamphlet is to be put into the hands of employees generally. The matter is divided into two general parts—(1) Road and yard conditions, and (2) Shop conditions. Under each of these the subjects are arranged alphabetically. For example, under the head of "right of way" we have bridges, coal wharves, culverts, ditches, etc. Under "operation" the titles are baggage trucks, blue flags, book of rules, bumping blocks, coupling cars, etc. Under the head of "shop conditions" we have 41 titles; air hoists, belt and pulley guards, belt shifters, belting, boring mills, chains, etc.; and in addition there are 14 items under the head of "special safety precautions in shops."

The Freight Rate Question on the Pennsylvania.*

Railroad managers feel, and I believe the business men of the country concur, that the great transportation interests must continue to develop. In passenger service, it is necessary that the public should have the fullest measure of safety and comfort which the railroads can furnish. This means the removal of grade crossings, the installation of automatic signals, and the construction of all-steel cars. All of these things have to be paid for. If the investor will not supply us with new money to finance the improvements which are required, those improvements cannot be made. For these general reasons, the railroads have petitioned the Interstate Commerce Commission to re-open the advance in rates case of 1910.

In so far as the Pennsylvania is concerned, we do not plead poverty or pressing danger. There are many railroad companies, however, to whom this increase is a vital necessity. The position of the Pennsylvania is that an increase is not only warranted but necessary to enable it to continue giving adequate service to the public.

Our company has not been paying large dividends to its shareholders. If all the money which has been put into the property had been supplied by investors, they would today be earning but 4.83 per cent. on their money. At this moment it would be absolutely impossible to find new money if that was all the return that it could be expected to yield.

Though at the moment our company is in strong financial condition, our records show that for several years past certain very definite tendencies have been at work. Our wage payments are now at a rate 37.1 per cent. higher than in 1900. There is a persistent increase in the ratio of cost of operation to earnings. In 1900 (including taxes) 67.73 per cent.; in 1912, 78.09 per cent. This increase in operating expenses is due not only to the increases in wages and taxes, but also to the fact that the railroad is compelled to employ a constantly greater number of men relative to the work to be done. The cost east of Pittsburgh of extra crew laws alone per year is $756,790.

Up to January 1, 1913, and since August, 1906, our company had paid out $10,936,134.90 to comply with new laws, federal and state.

A third tendency is toward an unyielding increase in the cost of capital. This is a tendency noticeable throughout the world. The general interest rate is going up, affecting the price of government bonds and securities of all kinds. Railroads must pay more for their money.

It is evident that we are approaching a danger point. We feel that we ought, as a matter of sound policy, to be permitted to earn a greater margin between income and outgo.

Our company feels that it has a peculiar reason for appealing for co-operation in Pittsburgh. During the seven years succeeding January 1, 1902, the Pennsylvania System expended for improvements in Greater Pittsburgh and vicinity an aggregate of $25,560,000, and your people are now getting the result in ease of traffic movement. During the year 1912, our various companies spent in the Pittsburgh district in round numbers the following sums:

Wages, $25,000,000; supplies and materials, approximating $9,000,000; improvements, $1,000,000; a total of $35,000,000.

Our prosperity is your prosperity, and vice versa. Given reasonable rates, it is to the public's interest that the railroads earn all the money possible with which to give increasingly good service and to pay reasonable dividends.

The case is very simple. There is no mystery about it. It is for the Interstate Commerce Commission to determine the merits of the case, but we feel that the shippers and the public are entitled to know the why and the wherefore of what we are asking the commission to do.

* Remarks by Vice President George D. Dixon before Pittsburgh Chamber of Commerce, June 6.

Railway Terminal Discussion in Chicago.

The Chicago city council committee on railway terminals received an ultimatum last Monday to the effect that the city could approve the new terminal plans in which the Pennsylvania, Burlington, and Milwaukee roads are interested or put up with the inadequate facilities of the present Union Station. This was presented in the form of a statement signed by Darius Miller, president of the Chicago, Burlington & Quincy; A. J. Farling, president of the Chicago, Milwaukee & St. Paul; and J. J. Turner, vice-president of the Pennsylvania lines.

The plans previously proposed, with the exception of the Pond plan, and including the "Wacker" or Chicago plan commission plan, the Hunt plan and the Delano plan, which have been offered as alternatives to the plan of the railways interested in the Union Station, all provide for the occupancy of the territory south of Twelfth street, and between State and Canal streets, by passenger terminals. The following objections were presented against them:

"Unnecessary expense, resulting from the separation of through and suburban facilities.

"Drawbridges in close proximity to the entrance of the stations.

"Excessive grades and curves.

"Elimination of the St. Charles Air Line.

"Undesirable stairways within the stations.

"Complexity in case of the Hunt plan.

"The separation of passenger terminals from the heart of the city by an intervening freight and warehouse zone.

"The covering of streets by terminal stations and approaches, converting them into subways or tunnels."

Almost while this ultimatum was being presented to the council committee F. A. Delano, president of the Wabash, in an address at the City Club said that forceful action by Chicago's city officials will compel the railways to solve the terminal problem in harmony with the city's ideas.

In addition to the railway men mentioned on page 1232 of the *Railway Age Gazette* of June 6, as having presented articles to the Chicago *Tribune* discussing the station problem, articles have been published by the following railway presidents: H. G. Hetzler, Chicago & Western Indiana; H. U. Mudge, Chicago, Rock Island & Pacific; F. D. Underwood, Erie; S. M. Felton, Chicago Great Western; Daniel Willard, Baltimore & Ohio; W. C. Brown, New York Central Lines; W. H. Canniff, New York, Chicago & St. Louis; George W. Stevens, Chesapeake & Ohio; E. Pennington, Minneapolis, St. Paul & Sault Ste. Marie.

National Society for Promotion of Industrial Education.

The seventh annual convention of this society is to be held at Grand Rapids, Mich., October 19-25, inclusive. On Wednesday and Thursday, October 22 and 23, the National Committee on Vocational Guidance, which will hold a joint meeting with the National Society, will hold its annual session.

American Society of Engineer Draftsmen.

The regular monthly meeting will be held on June 19, at 8:15 p. m., at the Engineering Society's building, New York. A paper on arrangement of machines in factories, by S. Warren Potts, will be read, and an illustrated lecture will be given by O. S. Teale on architecture from a phonetic point of view.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass. Convention, May 19, 1914, St. Louis.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York. Annual meeting, October 14-15, Philadelphia, Pa.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—H. G. McConnaughy, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 19, 1913, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June 16, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Summer meeting, June 25-26, Charlevoix, Mich.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCE ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria; 2d Thursday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

At a meeting of the Western Passenger Association last week it was decided to make no reductions from the uniform rate of two cents a mile for a large number of conventions in the western territory this summer. A committee was appointed to consider the adoption of a uniform charge for special trains and special baggage cars.

American Association of General Baggage Agents.

At the annual convention of the American Association of General Baggage Agents held at Colorado Springs on May 21, F. J. Moore, general baggage agent of the New York, Chicago & St. Louis, was elected president; George L. Alley, general baggage agent of the Union Pacific, vice-president, and John E. Quick, Toronto, Ont., general baggage agent of the Grand Trunk, was re-elected secretary and treasurer.

Car Location.

The accompanying table, which is taken from Bulletin 6A of the American Railway Association, gives a summary of freight car location by groups on May 15, 1913.

Car Location on May 15, 1913.

*Denotes deficiency.

How to Feed and Rest Live Stock.

In connection with the enforcement of the twenty-eight hour law, the Bureau of Animal Industry of the Department of Agriculture has made investigation of the feeding, watering, and resting of animals while in the course of transportation. For each 24 hours the ration for horses and cattle should be not less than 1¼ lb. of hay to each hundredweight of animal; for sheep, not less than 1½ lb. of hay to each hundredweight of animal, and for hogs, not less than 1 lb. of shelled corn, or its equivalent. Animals, other than hogs, must be unloaded during each period prescribed by the statute, unless they are in "palace" or similar stock cars. In such cases care should be taken to observe the law. In all cases, if animals are not unloaded, sufficient space to permit all the animals to lie down in the cars at the same time must be provided.

Hogs may be fed, watered, and rested, without unloading, provided (a) the cars are loaded so as to allow all the animals to have sufficient space to lie down at the same time, (b) the trains are stopped for sufficient time to allow the watering troughs to be prepared and to allow every hog time to drink his fill, and (c) care is exercised to distribute properly through each car deck sufficient shelled corn, or its equivalent in ear corn or other grain, for each hog.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 145, giving a summary of car surpluses and shortages by groups from February 28, 1912, to May 31, 1913, says:

"The total surplus on May 31, 1913, was 60,291 cars; on May 15, 1913, was 61,269 cars, and on June 6, 1912, was 89,208 cars. Compared with the preceding period; there is a decrease in the total surplus of 978 cars, of which 114 is in flat, 666 in coal, 748 in miscellaneous, and an increase of 550 in box car surplus. The increase in box car surplus is in Groups 1 (New England Lines), 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 4 (the Virginias and Carolinas), and 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas). The decrease in flat car surplus is in Groups 1 (as above), 6 (Iowa, Illinois, Wisconsin and Minnesota), 7 (Montana, Wyoming, Nebraska and the Dakotas), 9 (Texas, Louisiana and New Mexico), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The decrease in coal car surplus is in Groups 1, 2, 6 and 10 (as

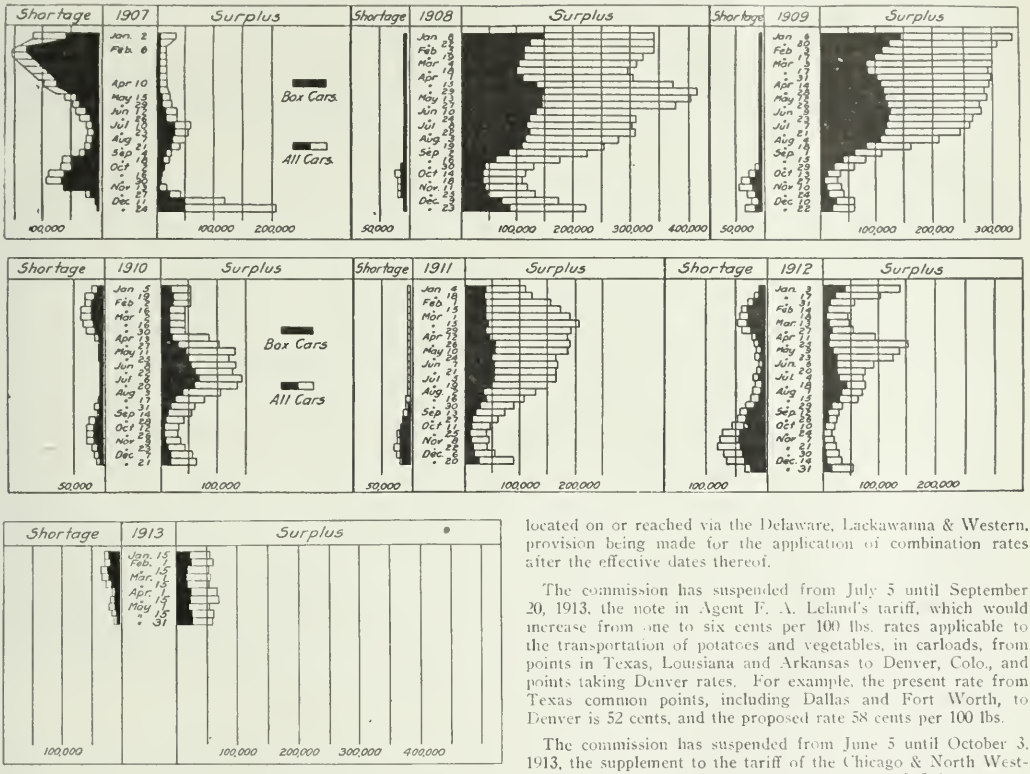
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.

above). The decrease in miscellaneous car surplus is in Groups 3, 4, 7, 8, 9 (as above), and 11 (Canadian Lines)

"The total shortage on May 31, 1913, was 9,383 cars; on May 15, 1913, was 10,975 cars, and on June 6, 1912, was 2,822 cars. Compared with the preceding period; there is a decrease in the total shortage of 1,592 cars, of which 793 is in flat, 1,117 in coal, and an increase of 282 in box and 36 in miscellaneous car shortage. The increase in box car shortage is in Groups 4, 6, 7, and 11 (as above) The increase in miscellaneous car shortage is in Groups 4, 6, 10 and 11 (as above). The decrease in flat car shortage is in all Groups, except 7 and 8 (as above). The decrease in coal car shortage is in all Groups, except 1 and 6 (as above). Compared with the same date of 1912; there is a decrease in the total surplus of 28,917 cars, of which 57 is in box, 335 in flat, 24,184 in coal and 4,341 in miscellaneous cars. There is an increase in the total shortage of 6,561 cars, of which 3,221 is in box, 589 in flat, 2,464 in coal and 287 in miscellaneous cars."

The accompanying table gives surpluses and shortages for the last period covered by the report and the diagram shows total, bi-weekly surpluses and shortages, 1907 to 1913, inclusive.



Car Surpluses and Shortages, 1907 to 1913.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until December 10, 1913, the schedules in certain tariffs, which would advance rates on brooms, C. L., from Chicago and other interstate points to Denver, Colo., and points taking same rates.

The commission has suspended until October 4, 1913, the item in a supplement to Agent F. A. Leland's tariff, which would advance rates on packing house products originating at or destined to points in Arkansas, Louisiana and Oklahoma, through the withdrawal of the fourth class rating thereon.

The commission has suspended from June 5 until July 8, 1913, the schedules in a supplement to Agent W. H. Hosmer's tariff, which would increase rates on grain and grain products, C. L., from certain points in Illinois, Iowa and Missouri to Toronto, Ont. The amount of the increase proposed is 1½ cents per 100 lbs.

The commission has suspended until September 17, 1913, the schedules in certain tariffs, which would increase rates through the cancellation of present joint class and commodity rates between points located on the Morristown & Erie and points located on or reached via the Delaware, Lackawanna & Western, provision being made for the application of combination rates after the effective dates thereof.

The commission has suspended from July 5 until September 20, 1913, the note in Agent F. A. Leland's tariff, which would increase from one to six cents per 100 lbs. rates applicable to the transportation of potatoes and vegetables, in carloads, from points in Texas, Louisiana and Arkansas to Denver, Colo., and points taking Denver rates. For example, the present rate from Texas common points, including Dallas and Fort Worth, to Denver is 52 cents, and the proposed rate 58 cents per 100 lbs.

The commission has suspended from June 5 until October 3, 1913, the supplement to the tariff of the Chicago & North Western, which would increase the present rate of 5½ cents per 100 lbs. on paper, C. L., from Milwaukee and Manitowoc, Wis., to Kaukauna, Wis., to 7½ cents per 100 lbs. From protests made against the proposed advanced rate it appears that a considerable quantity of Manila paper is moved from points in the East through Milwaukee and Manitowoc to Kaukauna, at which latter point it is manufactured into bags, and the through rate on such shipments is based on the rates to Milwaukee and Manitowoc plus the rate involved beyond.

Increase in Sugar Rates Allowed.

In re suspension of advances on sugar from New Orleans and other points in the South to points in Illinois. Opinion by Commissioner McChord:

Proposed increased rates on sugar and other commodities from New Orleans, La., to Sterling, Ill., found not to be unreasonable or unjustly discriminatory. Order of suspension vacated. Sterling is in the northwestern part of the State of Illinois, on the lines of the Chicago & North Western and the Chicago, Burlington & Quincy, a few miles west of the Illinois Central. Traffic from New Orleans generally moves via the Illinois Central to E. St. Louis, Centralia, or Peoria, Ill., where it is turned over to the Burlington. Sterling is in the Dubuque group. Little

reason is given for the establishment of the Chicago rate on sugar from New Orleans to Sterling, the opinion of the principal witness for respondents being that such rate was made in error and was due to the improper publication of a territorial directory. Nevertheless, in 1908 a similar error was made and Sterling taken out of the Dubuque group and given the Chicago rate on coffee, molasses, sirup and rice, the class rates remaining on the Dubuque basis until 1909, when Sterling was given Chicago class and commodity rates generally. This condition obtained until January, 1913, when the rates from New Orleans to Sterling on all classes and commodities were sought to be made the same as Dubuque. To accomplish this a change was proposed in the territorial directory. The effect of this action on the sugar rate to Sterling meant an advance from 23 to 28 cents and on other classes and commodities a somewhat similar increase. No one at Sterling appears interested in any rate from New Orleans other than that applicable to sugar. In defending the advance the burden was assumed by the Illinois Central. It is not contended that the increase was proposed to afford additional revenue, though this, of course, is a collateral circumstance. There is no doubt that the effort to advance the Sterling rate is the result of the Clinton case (Docket No. 4,964); however, it is urged by respondents that the existing rates to Sterling are not only too low, but are out of line with the rates obtaining in this general territory. The few exhibits submitted cannot be said to bear out this contention, and there is substantially nothing to justify passing upon the reasonableness *per se* of the proposed rate. In fact, this is a question with which protestants specifically aver they are not interested, their only complaint being directed to the question of rate relationship. The proposed difference of 5 cents per 100 lbs. against Sterling is a material handicap, considering the fine margin of profit upon which sugar is handled, prices being figured in hundredths of a cent per pound. To put it briefly, we are asked to determine whether Sterling should be in the Dubuque or in the Chicago group. Geographically the Chicago group does not extend west of the Illinois Central except in the case of Sterling, and the proposed change would seem logical. But however logical may be the geographical boundary of a group, it must not give to any point an unreasonable or discriminatory rate. All of these rates reflect the lake-and-rail competition from the east, and compared with the fifth-class rate, to which sugar belongs, the proposed rate is not unreasonable. The protestants in the instant case are not interested in the rates to Clinton, as they experience practically no competition from that point, but are chiefly concerned with the Freeport, Rockford and Peoria rates—the Chicago group. However, where rates are made on the group principle there must necessarily be a demarcating line. It is proposed to have that line follow the rails of the Illinois Central, running north and south through Illinois, and to this limitation there appears no injustice. We cannot find that the proposed rates will unjustly discriminate against Sterling, and, as we do not find the rates to be unreasonable, the order of suspension will be vacated and the investigation dismissed. (27 I. C. C., 122.)

Complaint Dismissed.

Consolidation Coal Company v. Baltimore & Ohio et al. Opinion by the commission:

The complainant made several shipments of coal and contends that excessive charges were exacted as a result of the failure of the carrier to deliver cars of the capacity ordered. In some cases cars of 40,000 lbs. capacity were ordered and cars of 60,000 lbs capacity were delivered. The tariffs of the defendant provided that where cars of greater capacity were delivered than were ordered by the shipper, the minimum of the car ordered would be used unless the actual weight of the shipment was greater, in which case the actual weight would be used. The carriers charged on the basis of the minimum weight of 60,000 lbs although the actual weight was less. The commission decided that this resulted in an overcharge to the shipper and reparation was awarded on these shipments. In another case the tariffs of the defendant provided only one carload minimum on coal, 60,000 lbs. The complainant ordered cars of 40,000 lbs capacity, and received cars of 60,000 lbs. capacity. The commission decided that the shipper could not order cars of less capacity than the minimum prescribed in the tariff and denied reparation on these shipments, although the actual weight was less than 60,000 lbs. (27 I. C. C., 105.)

Cement Rate Reduced.

Oklahoma Portland Cement Company v. Missouri, Kansas & Texas et al. Opinion by the commission:

The complainant contends that Ada, Okla., is discriminated against in favor of Harrys and Eagle Ford, Tex., because the rates on Portland cement from Ada to points in Texas are more per mile than the rates on the same commodity from Harrys and Eagle Ford to points in Oklahoma. The commission averaged the rates from the points in question to ten destinations and found that the average distance from Ada was 194 miles and that the average rate was 19.8 cents per 100 lbs. compared with an average distance from Harrys of 205 miles and an average rate of 15.4 cents per 100 lbs. The defendants feared that if they reduced the rates from Ada to Texas points the Texas Railroad Commission would require them to reduce rates on intrastate traffic. The commission decided that this did not constitute a sound reason for the maintenance of unreasonable interstate rates. The commission ordered that in the future the rates from Ada to Texas points should not exceed for equal distances the rates from Harrys and Eagle Ford to points in Oklahoma. (27 I. C. C., 101.)

Overcharges Collected.

Central Commercial Company v. Louisville & Nashville. Opinion by the commission:

A carload of rosin was consigned from Pensacola, Fla., to the complainant at Chicago. Shortly after the shipment had left Pensacola, the complainant requested that it be diverted to Cincinnati, and this change in destination was effected by the defendant when the car reached Nashville, Tenn. Nashville is directly intermediate to Cincinnati and Chicago, and no additional or out-of-line haul was made necessary by the diversion. The defendant's tariffs provided that shipment would be consigned to new destination, under the above circumstances only on the basis of full tariff rates to and from the point at which the re-consignment was effected. Charges of 44 cents per 100 lbs. were collected, made up of 17 cents to Nashville and 27 cents from Nashville to Cincinnati. The through rate from Pensacola to Cincinnati was 19 cents per 100 lbs., and the complainant contends that the charges collected were unreasonable to the extent that they exceed that rate, plus a reasonable charge for the diversion in transit to Cincinnati. The commission decided that where no additional or out-of-line haul is involved re-consignment and diversion in transit should be permitted on the basis of the through rate from the point of origin to the new destination, plus a reasonable charge for extra services incident thereto, and decided further that the rate charged was unreasonable to the extent that it exceeded 19 cents per 100 lbs., plus a charge of $3 per car for the additional services. Reparation was awarded. (27 I. C. C., 114.)

COURT NEWS.

The Supreme Court of the United States in a decision handed down this week, has decided that the street railway running between Council Bluffs, Iowa, and Omaha, Nebraska, across the Missouri River, is not subject to the act to regulate commerce; and, therefore, that an order of the Interstate Commerce Commission regulating fares on this line is invalid.

The decision of the Supreme Court of the United States in the Minnesota rate cases is reported in another column of this issue. Cases involving questions of the conflict of federal and state authority in the regulation of railroads in other states are now pending before the court, and it is expected that decisions in these will be handed down next week. These cases came from Missouri, Arkansas, Oregon, Kentucky and West Virginia.

Under their contract with the Polk County, Ia., board of supervisors three Council Bluffs attorneys filed suit in the District Court at Des Moines, Ia., last week against the Chicago, Rock Island & Pacific Railroad Company to enforce the collection of $15,559,400 in alleged unpaid taxes. Interest at six per cent. together with a 50 per cent. statutory penalty is demanded. The suit was brought in the name of the county treasurer. The Greater Des Moines committee, fearing that the prosecution of the suit might interfere with the extensive improvements which the Rock Island is contemplating in Des Moines, has started an action against the attorneys to have the contract set aside.

Railway Officers.

Executive, Financial and Legal Officers.

H. C. Hooker, private secretary to President F. D. Underwood of the Erie at New York, has been appointed assistant to the president.

G. H. Parker, general accountant of the Delaware & Hudson, has been appointed assistant to third vice-president, with headquarters at New York.

Alexander Robertson, formerly president of the Western Maryland, has been appointed assistant to the president of the Missouri Pacific, with office at St. Louis.

B. L. Winchell resigned as president of the St. Louis & San Francisco, and the Chicago & Eastern Illinois at the time of his recent appointment as a receiver of the St. Louis & San Francisco.

B. L. Winchell and Thomas H. West, receivers of the St. Louis & San Francisco, announce the appointment of A. S. Greig as assistant to the receivers, with headquarters at St. Louis, Mo., effective June 3.

C. E. Schaff, president of the Missouri, Kansas & Texas, has been elected president also of the Houston & Brazos Valley, the election taking effect on June 1, when the M. K. & T. began the operation of the H. & B. V.

J. T. Morrison has been elected vice-president of the Pullman Railroad Company, with headquarters at Chicago, to succeed Thomas Dunbar, resigned. Mr. Morrison will have charge of all departments, under the direction of the president.

J. H. Hill, manager, secretary and treasurer of the Galveston, Houston & Henderson, has been elected vice-president and general manager. J. E. O'Neill, auditor, has been elected secretary in place of Mr. Hill. Mr. Hill still continues to hold the office of treasurer.

W. J. Jackson, who has been vice-president and general manager of the Chicago & Eastern Illinois, and who was last week appointed a receiver of the company, as mentioned elsewhere, has been elected president, succeeding B. L. Winchell. Alvin W. Krech, of New York, has been elected vice-president.

Operating Officers.

James Bain, superintendent of the Halifax & Southwestern, Bridgewater, N. S., has been made general superintendent, with office at Halifax.

R. D. Purvis, heretofore a chief train despatcher on the Atlantic Coast Line, has been appointed trainmaster of the Georgia & Florida, with office at Douglas, Ga.

F. B. Miller, superintendent of the Denver, Northwestern & Pacific, with office at Denver, Colo., remains in the same position with its successor, the Denver & Salt Lake.

W. M. Tisdale has been appointed a special agent of the operating department, Eastern Lines, of the Grand Trunk, with headquarters at Montreal, Que., succeeding J. H. Hodge, transferred.

H. D. Grout, assistant general superintendent of the Canadian Pacific Atlantic Division, at St. John, N. B., has been appointed acting general superintendent in place of William Downie, who has been granted leave of absence for a year.

R. Armstrong, heretofore superintendent of district 3, Saskatchewan division, Canadian Pacific, at Saskatoon, Sask., has been appointed superintendent district 4 of the Manitoba division, vice F. W. DuVal, transferred. Office at Souris, Manitoba.

F. W. DuVal, heretofore superintendent of district 4, Manitoba division, Canadian Pacific, at Souris, Manitoba, has been appointed superintendent of district 3 of the Saskatchewan division, vice R. Armstrong, transferred. Office at Saskatoon, Saskatchewan.

Michael A. McCarthy, who has been appointed assistant superintendent of telegraph of the Baltimore & Ohio Southwestern at Cincinnati, Hamilton & Dayton, with office at Cincinnati, Ohio, entered the service of the Baltimore & Ohio in July, 1894, as a yard clerk at Cincinnati. The following March he was promoted to despatcher and became chief despatcher in April, 1910. He was again promoted to division operator in March, 1912, which position he held at the time of his recent appointment as assistant superintendent of telegraph as above noted.

J. W. Knightlinger, whose appointment as superintendent of the Louisiana Western and Morgan's Louisiana & Texas Railroad & Steamship Company, with headquarters at Lafayette, La., has already been announced in these columns, began railway work in December, 1892, as messenger and train caller for the Chicago, Milwaukee & St. Paul at Mason City, Ia. Later he was promoted to operator and agent, and in 1894 he went to the Montana Union, where he remained until 1898 as telegraph operator and train despatcher. From the latter date to 1900 he was with the Atchison, Topeka & Santa Fe successively as operator, train despatcher and brakeman. He was then employed by the St. Louis & San Francisco until March, 1903, as telegraph operator, train despatcher and brakeman. The following three years Mr. Knightlinger was with the Union Pacific as telegraph operator, train despatcher and chief clerk to the superintendent. He resigned in March, 1909, to go to the Southern Pacific, and until January of this year was division agent and trainmaster on the Sacramento division, Mountain district. In March he was made assistant superintendent of Morgan's Louisiana & Texas Railroad & Steamship Company at New Orleans, La., which position he held until June 1, when he was appointed superintendent of that company and the Louisiana Western, comprising the Louisiana lines of the Southern Pacific.

J. W. Knightlinger.

F. B. Mitchell, superintendent of the Illinois division of the Baltimore & Ohio Southwestern at Flora, Ill., has been appointed superintendent of the Toledo division of the Cincinnati, Hamilton & Dayton, with headquarters at Dayton, Ohio, succeeding J. J. Corcoran, resigned to go to the Pere Marquette. E. W. Scheer, assistant to the general superintendent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, succeeds Mr. Mitchell. F. D. Batchellor, assistant general superintendent at Cincinnati, has been appointed assistant superintendent of the Toledo division of the C. H. & D., with headquarters at Dayton. J. B. Carothers, who was on the staff of the chief engineer, has been appointed assistant to general superintendent, and Charles A. Plumly, assistant superintendent of telegraph at Cincinnati, has been appointed assistant to the general superintendent of the B. & O. S. W., and the C. H. & D., both with offices at Cincinnati. Michael A. McCarthy succeeds Mr. Plumly.

F. B. Mitchell, who has been appointed superintendent of the Toledo division of the Cincinnati, Hamilton & Dayton, with headquarters at Dayton, Ohio, was born on August 18, 1879, at Cuba, Ohio, and was educated in grammar and high schools. He began railway work on October 23, 1899, as a telegraph operator on the Baltimore & Ohio Southwestern, and later was an operator on the Baltimore & Ohio. From May, 1901, to March of the following year, he was secretary to superintendent of the Baltimore & Ohio Southwestern, and from April to September, 1902, was car distributor of the Chicago Great Western at St. Paul, Minn. He was then secretary to superintendent of the Baltimore & Ohio at Chicago, and from January to December, 1903, was secretary to the general superintendent of the Baltimore & Ohio Southwestern at Cincinnati. He was then car service clerk until April, 1910, when he became assistant train-

master at Seymour, Ind. On March 1, 1912, he was made assistant superintendent at Cincinnati, and one month later was appointed superintendent of the same road at Flora, Ill., which position he held at the time of his recent appointment as above noted.

Edward Waldemar Scheer, who becomes superintendent of the Illinois division of the Baltimore & Ohio Southwestern, with headquarters at Flora, Ill., was born on April 28, 1875, at Zaleski, Ohio, and was educated in the common schools. He began railway work on February 10, 1890, as messenger on the Cincinnati, Washington & Baltimore, and was later a stenographer with its successor, the Baltimore & Ohio Southwestern. In December, 1895, he was appointed chief clerk to division superintendent, and four years later was made secretary to vice-president and general manager. From February, 1906, to June, 1912, he was chief clerk to general manager, and assistant secretary and chief clerk to general superintendent of the same road at Cincinnati; and since June, 1912, has been assistant to general superintendent of the Baltimore & Ohio Southwestern and Cincinnati, Hamilton & Dayton.

F. D. Batchellor, who has been appointed assistant superintendent of the Toledo division of the Cincinnati, Hamilton & Dayton, with headquarters at Dayton Ohio, entered the service of the Baltimore & Ohio in July, 1903, as a member of an engineering corps. He was promoted to assistant engineer of the Indiana division in March, 1911, and was made assistant to the general superintendent, with office at Cincinnati, in December, 1912, which position he held at the time of his recent appointment as superintendent of the Toledo division of the C. H. & D., as above noted.

Charles A. Plumly, who has been appointed assistant to the general superintendent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, with headquarters at Cincinnati, Ohio, has been in the operating department of the Baltimore & Ohio since November, 1887, at which time he entered the service as an operator. He was promoted to despatcher at Chillicothe in June, 1903, becoming night chief despatcher in October, 1905. He was made day despatcher in September, 1907, and in July, 1910, was appointed division operator at Cincinnati. In March, 1912, he became trainmaster at Seymour, Ind., and was appointed assistant superintendent of telegraph of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton in January, 1913, which position he held at the time of his recent appointment as assistant to general superintendent as above noted.

Traffic Officers.

James F. Peters has been appointed general colonization agent of the Marshall & East Texas, with office at Chicago.

W. H. Paul is now general freight and passenger agent of the Denver & Salt Lake, formerly the Denver, Northwestern & Pacific. His headquarters are at Denver, Colo.

T. A. Sherwood, contracting agent of the Wabash at Alton, Ill., has been promoted to traveling freight agent, with office at Memphis, Tenn., succeeding C. L. Montgomery, resigned.

G. A. Deuel, commercial agent of the Texas & Pacific at New York, has been appointed division freight agent, with headquarters at El Paso, Tex., succeeding W. A. Scrivner, resigned.

E. K. Yaeger, soliciting freight agent of the Georgia Southern & Florida at Chicago, has been appointed commercial agent, with office at St. Louis, Mo., succeeding J. P. Higgins, resigned. J. L. Laetch succeeds Mr. Yaeger.

J. C. Eaton has been appointed general agent of the passenger department of the Northern Pacific, with headquarters at Cincinnati, Ohio, to succeed M. J. Costello, district passenger agent, resigned to engage in other business.

T. H. Hopkins has been appointed assistant general passenger agent of the Louisiana Railway & Navigation Co., with headquarters at Shreveport, La.; and J. T. Young has been appointed city passenger agent at 709 Gravier street, New Orleans.

C. E. Spear has been appointed commercial agent of the Southern Pacific at Santa Barbara, Cal., in place of C. C. Chisholm, who has been made district freight and passenger agent at Seattle, Wash. L. H. Schachtmayer succeeds Mr. Spear as commercial agent at Long Beach, Cal., and H. C. Emery takes the place of Mr. Schachtmayer as traveling freight and passenger agent, with office at San Diego, Cal. R. D. Jennings has been appointed traveling freight agent and Guy Hill traveling passenger agent, both with headquarters at Seattle, Wash. C. M. Andrews and A. D. Wick have been appointed traveling freight agents, with headquarters at Tacoma, Wash.

George Z. Philips, whose appointment as assistant general passenger agent of the Seaboard Air Line, with headquarters at Jacksonville, Fla., has been announced in these columns, was born on January 23, 1878, at Washington, D. C., and was educated at High School and at Georgetown Law School. He began railway work on August 15, 1899 as a clerk in the general passenger agent's office of the Southern Railway, and in 1901 became city passenger agent of the Seaboard Air Line at Washington. The following year he was appointed traveling passenger agent at New York, of the same road, remaining in that position until 1908, when he was promoted to division passenger agent, with headquarters at Washington. In 1912, he became general passenger agent of the Baltimore Steam Packet Company at Baltimore, Md., which position he held at the time of his appointment as assistant general passenger agent of the Seaboard Air Line as above noted.

Walter Galt Barnwell, who on June 1, became assistant freight traffic manager of the Atchison, Topeka & Santa Fe Coast Lines, with headquarters at San Francisco, Cal., was born April 13, 1865, at Danville, Que. He began railway work in 1881 as agent and clerk in the office of auditor of freight accounts of the Canada Atlantic, and subsequently from 1884 to 1891 he was agent and division clerk in the superintendent's office of the Fergus Falls and Breckenridge divisions of the Great Northern. He was then with the Southern California until May, 1898, successively as cashier at Redlands, Cal., agent at Santa Ana, Cal., contracting agent and commercial agent. On the latter date he was promoted to general agent of the freight department at Los Angeles, Cal., and in 1900 he was made assistant general freight agent of that road, the Santa Fe Pacific and the San Francisco & San Joaquin Valley, which roads now comprise the Coast Lines of the Atchison, Topeka & Santa Fe. In April, 1905, Mr. Barnwell became general freight agent of the Coast Lines, which position he held until his recent promotion to assistant freight traffic manager, as above noted.

W. G. Barnwell.

Engineering and Rolling Stock Officers.

J. Edgar Johnson has been appointed division engineer of the Pere Marquette at Saginaw, Mich.

J. E. Willoughby has been appointed assistant chief engineer of the Atlantic Coast Line, with office at Wilmington, N. C.

P. H. Cosgrave has been appointed general car foreman of the Oregon Short Line, with headquarters at Salt Lake City, Utah.

George S. McKee has been appointed superintendent of motive power of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex.

D. A. MacMillan has been appointed assistant general air brake inspector of the Northern Pacific, with headquarters at St. Paul, Minn., succeeding J. M. Boyd, promoted, effective June 15.

George Thompson, superintendent of motive power, and L. D. Blauvelt, chief engineer of the Denver, Northwestern & Pacific, with headquarters at Denver, Colo., remain in the same positions with its successor, the Denver & Salt Lake.

E. F. Wendt has resigned as assistant engineer of the Pittsburgh & Lake Erie to become a member of the board of valuation engineers appointed by the Interstate Commerce Commission, as previously announced. A photograph and sketch of Mr. Wendt were published in the *Railway Age Gazette* May 16, page 1065.

Joseph Acker, general car foreman of the Chicago, Rock Island & Pacific at Horton, Kan., has been appointed superintendent of the car department of the Chicago Terminal division, and G. A. Hull, chief clerk to the mechanical engineer, has been appointed assistant superintendent of the car department, both with headquarters at Blue Island, Ill.

Edwin G. Chenoweth, whose appointment as mechanical engineer in charge of car design, of the Rock Island Lines, with headquarters in Chicago, has been announced in these columns, was born on December 18, 1873, at Union City, Ind. He was graduated from Purdue University in 1895, and went with the Erie as special apprentice and machinist, during which time he took a post-graduate course at Purdue University. Mr. Chenoweth later served the Erie as air brake instructor and foreman of the air brake department at Huntington, Ind., until 1901, when he went to the Pennsylvania as a draftsman. He occupied a like position with the Pere Marquette, the Lake Shore & Michigan Southern, and the Philadelphia & Reading, leaving the latter road in 1906, to return to the Erie as mechanical engineer at Meadville, Pa. He was appointed assistant superintendent of the car department of the Rock Island Lines in July, 1912, holding that position until his recent appointment as mechanical engineer in charge of car department work.

Edwin G. Chenoweth

A. M. Turner has been appointed district engineer in charge of construction on the Chicago, St. Louis, Cairo and Michigan divisions of the Cleveland, Cincinnati, Chicago & St. Louis and of the Peoria & Eastern Railway, west, with headquarters at Indianapolis, Ind. W. S. Burnett has been appointed district engineer in charge of construction on the Cleveland-Indianapolis and Cincinnati-Sandusky divisions of the same road and the Peoria & Eastern, east, with headquarters at Middletown, Ohio.

C. A. Henry, foreman of the erecting shop of the Chicago, Burlington & Quincy at Aurora, Ill., has been appointed superintendent of shops at West Burlington, Iowa, succeeding J. A. Carney, who has been appointed superintendent of shops at Aurora, in place of A. Forsyth, deceased. Mr. Carney was educated at Massachusetts Institute of Technology, and his entire railway service has been with the Chicago, Burlington & Quincy, with which road he began work in October, 1891, as laboratory assistant. From December, 1894, to April, 1897, he was engineer of tests, and then for four years was master mechanic of the St. Louis division. In April, 1901, Mr. Carney was made superintendent of the West Burlington shops, which position he held until June 1 of this year, when he was appointed superintendent of the Aurora shops as above noted.

George S. Goodwin, whose appointment as mechanical engineer of the Rock Island Lines in charge of locomotive design, with headquarters at Chicago, was announced in our issue of last week, was born November 9, 1876, at Corinth, Me. He was graduated from Cornell University in mechanical engineering in 1899, having spent summers in railway shop work and specialized in railway engineering during the last year. He entered the service of the Chicago, Milwaukee & St. Paul in June, 1899, as special apprentice at West Milwaukee, Wis. Later he was engaged in special work, test work, drawing room work, etc., and had charge of the company's dynamometer car while doing test work, both on the St. Paul and on foreign lines. In May, 1904, Mr. Goodwin went to the Great Northern at St. Paul, Minn., in the mechanical engineer's office, performing duties along the line of standardization of locomotive and car details and also the design of new equipment. He was made chief draftsman of the Chicago, Rock Island & Pacific at Chicago in January, 1906, at which time the road began to build steel cars instead of wood. He was promoted to assistant mechanical engineer in May, 1910, at Silvis, Ill., which position he held until his recent appointment as mechanical engineer, as above noted.

Purchasing Officers.

F. A. Bushnell, assistant purchasing agent of the Great Northern, has been appointed purchasing agent, with office at St. Paul, Minn.

C. C. Anthony, purchasing agent of the Denver, Northwestern & Pacific, with office at Denver, Colo., remains in the same position with its successor, the Denver & Salt Lake.

OBITUARY.

George B. Francis, M. Am. Soc. C. E., a well known former civil engineer in the railway service, died at his home in New York City, June 9, at the age of 56. He was born at West Hartford, Conn., and was educated at the Hartford High School. He was the first chief engineer of the Boston Terminal Company, and the South station at Boston and the Union station at Providence, were among the most important works carried out by him.

Francis Edward Ward, formerly general manager of the Chicago, Burlington & Quincy, died in Chicago on June 6. Mr. Ward was born July 29, 1867, and was educated at the McGill Model School at Montreal, Que. He began railway work in September, 1881, in the mechanical department of the Grand Trunk at Montreal, remaining with that road until November, 1885, as apprentice clerk and stenographer. In January, 1886, he went to the St. Paul, Minneapolis & Manitoba as secretary to the second vice president at St. Paul, and two years later he became secretary and chief clerk to the president and general manager of the Eastern Railway of Minnesota. Mr. Ward became connected with the Great Northern in January, 1891, and remained with that road for practically 18 years. His first position was that of secretary to the president, and in July, 1894, he was made assistant to the president. From March, 1898, to October of that year, he was general superintendent of the Montana Central, a Great Northern property, and the following month he was made general superintendent of the Great Northern. In 1903 he was promoted to general manager, resigning in October, 1907, to become general manager of the Chicago, Burlington & Quincy lines east of the Missouri river, with headquarters at Chicago. He retired in August, 1912, on account of ill health.

Francis Edward Ward

Indo-Ceylon Railway.—A. Muirhead, agent of the South Indian Railway, has been to Ceylon to confer with the governor on matters connected with the Indo-Ceylon Railway. He has stated that the Indian section of the Indo-Ceylon Railway would be finished by July next. Though the Ceylon section of the railway is being pushed on as expeditiously as possible, it is believed unlikely that the whole work will be completed before November.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Carnegie Steel Company has ordered one 6-wheel switching locomotive from the Baldwin Locomotive Works.

The United States Government has ordered one 4-coupled locomotive from the Baldwin Locomotive Works for the Sandy Hook Proving Ground.

W. R. Grace & Co. have ordered from the American Locomotive Company one 4-wheel saddle tank locomotive. The dimensions of the cylinders are 9 in. x 14 in. The diameter of the driving wheels will be 30 in., and the total weight in working order 27,000 lbs.

CAR BUILDING.

The Chesapeake & Ohio is in the market for 1,000 cars.

SIGNALING.

Signaling for Interurban Lines in Indiana.

The Union Switch & Signal Company has recently taken contracts for the installation of alternating current block signaling in Indiana as follows:

Chicago, Lake Shore & South Bend, Gary to South Bend, 55 miles, single track; 20 passing sidings; semaphore signals, style "B."

Indianapolis, Columbus & Southern Traction, siding No. 6 to siding No. 20, 24 miles, single track. Here semaphore signals will be used at passing sidings and light signals for the intermediate signals, making a total of 26 style "B" one-arm semaphore signals, and 26 light signals.

Louisville & Northern Railway & Lighting Company, Sellersburg to Watson Junction, 3½ miles, single track; four semaphores style "B," and four light signals.

Chicago, South Bend & Northern Indiana, Michigan City to La Porte; 9½ miles, single track, with five passing sidings; signals style "B," one-arm semaphore.

All of the above named roads employ direct current propulsion, with the exception of the Chicago, Lake Shore & South Bend, where 25 cycle alternating current is used. These four contracts cover about 92 miles of track, with 40 passing sidings, and with 160 signals, of which 130 are semaphore type and 30 "light."

Transcontinental Railway, Australia.—Preliminary work, including surveys and excavations, is being rapidly pushed forward on the Transcontinental Railway. Beyond a few miles of sidings at Port Augusta and Kalgoorlie, very little has been accomplished in this direction so far. Many appliances and tools as well as material are arriving, among them being two track laying machines and four rail bending machines imported from the United States. A large number of ties is also in the course of preparation. The water required for locomotives, etc., is presenting a difficult problem to the engineers. Arrangements have, however, been made to put down a series of trial borings in the vicinity of Port Augusta, for the purpose of testing the possibilities of artesian water supply.

Passenger Alarms in Victoria.—During the last few years the Victorian railways have been equipping the passenger cars on express trains and on the principal country lines with passenger communication alarms. The apparatus, which is similar in principle to that adopted by the English railways, is operated by means of a chain running through pipes under the roof of the car, with openings opposite to each compartment. The chain is connected to a rod fixed outside one end of the carriage, and when pulled by a passenger it turns the rod and causes the Westinghouse brake to be applied just sufficiently to call the attention of the guard and driver, but not enough to stop the train suddenly. The chain also turns a red disc which is provided outside the end of the carriage to indicate the compartment from which the alarm has been given.

Supply Trade News.

The Grip Nut Company, Chicago, has moved its general offices from the Old Colony building to 661 and 663 McCormick building, Chicago.

John U. Higinbotham, formerly assistant treasurer of the National Biscuit Company, has been made assistant treasurer of the Detroit Lubricator Company, Detroit, Mich.

The Star Brass Manufacturing Company, Boston, Mass., has opened an office at 6 East Lake street, Chicago. Arthur F. Mundy, western representative, has been made manager of the new office.

The Raymond Concrete Pile Company, New York, has been awarded the contract by the Maryland Steel Company, Sparrow's Point, Md., for the design and construction of reinforced concrete stock bins for its blast furnace at Sparrow's Point.

J. G. Bower has resigned his position as sales manager of the Hale & Kilburn Company, Chicago, to become manager of the New York office of the Buckeye Steel Castings Company, Columbus, Ohio. The New York office of the Buckeye company will soon be opened, but the address is not yet available.

The Quigley Furnace & Foundry Company, Springfield, Mass., has purchased the good will, drawings, patterns and patents of the Rockweli Furnace Company. The Quigley company will make the Rockwell company's full line of furnaces, with the exception of the melting furnaces, portable heaters, rivet forges, etc., which will be marketed by the Monarch Engineering & Manufacturing Company, Baltimore, Md.

The Roberts & Schaefer Company, Chicago, has received a contract from the Denver & Rio Grande to build two large, counterbalanced Holmen type locomotive coaling stations. One will be built at Salida, Colo., and the other at Minturn, Colo. The contract price is approximately $22,500. This company has also received a contract from the Rock Island Lines for a fireproof, counterbalanced Holmen type coaling station to be built at Hulbert, Ark. The contract price of this coaling station is approximately $15,500.

TRADE PUBLICATIONS.

Waterproofing.—The Ceresit Waterproofing Company, Chicago, is distributing a booklet containing numerous illustrations of buildings in all parts of the world on which Ceresit waterproofing has been used. There are also reproduced some letters from engineers from many different countries.

Steel Paints.—"A Test by Technologists" is the title of an illustrated booklet issued by the Lowe Bros. Company of Dayton, Ohio, describing the paint tests on the Havre de Grace bridge of the Pennsylvania, inaugurated in 1906 and now practically completed. In addition to a general statement of the purposes of the test and method of applying the paints, the reports of examinations made by two independent experts are included.

Railway Affairs in Kiukiang, China.—The British Acting-Consul at Kiukiang, in his report on the trade of that place for 1912, states that on the Nan-hsun Railway, to connect Nanchang with Kiukiang, trains now run twice daily each way between Kiukiang and Tê-an-Hsien, a distance of some 35 miles, taking about one and three-quarter hours to complete the journey. No further progress in the construction of this line is to be recorded, owing to an entire absence of funds. In July the railway company drew up a loan agreement with the Toa Kogio Kaisha, a Japanese syndicate, for $2,500,000. Disputes have arisen as to certain terms in the agreement, whereby all contracts were to be in the hands of the syndicate, and as to the mode of paying over the proceeds of the loan. Consequently, only a very small sum has so far been received by the railway company. In the latter part of the year (adds the report) a scheme was published by the provincial government of Kiangsi for the construction of a comprehensive system of trunk railways to cover the province and to connect the capital with important cities in other provinces.

Railway Construction.

Butte-Boise-Winnemucca.—Under this name a company has been incorporated in Idaho with $40,000,000 capital and surveys are being made, it is said, to build from a point nine miles east of Anaconda, Mont., south to a connection with the Gilmore & Pittsburgh at Armstead, Mont., and using that line to Salmon City, Idaho, thence southwest via Challis, crossing the Sawtooth divide, and via Moore's creek and the Boise river canyon to Boise City, thence through Oregon to Winnemucca, Nev., where connection is to be made with the Western Pacific, about 650 miles. It is understood that the Great Northern is back of the project, and that L. O. Leonard, Boise, has been making surveys for such a line in the interest of the Hill Lines.

Chartiers Southern.—An officer writes that contracts for grading and masonry were let on April 21, to Brockelhurst & Potter Co., of Providence, R. I., for the line which is being built from Van Emman on the Chartiers branch of the Pittsburgh, Cincinnati, Chicago & St. Louis, south by the valley of the Little Chartiers Creek to its head, and thence by the valley of Big Daniels Run to Mariana, all in Washington county, Pa. The work is not difficult. It is estimated that there will be about 54,000 yds. of excavation per mile and about an equal amount of embankment work. There will be about 28 bridges from 25 to 90 ft. long, and one tunnel 1,300 ft. J. J. Turner, president, and Thos. H. Johnson, chief engineer, Pittsburgh, Pa.

Chicago, Burlington & Quincy.—Contract has been let to Yale & Reagan, Chicago, for the grading on a new three mile double track low grade line between Kewanee, Ill., and Galva. This work involves the moving of over 400,000 yds. of earth.

Chicago, Milwaukee & St. Paul.—An officer writes that there has been no decision as to building the line from Hutchinson, Minn., to Montevideo, and the present prospects are that nothing will be done.

Cushing Railroad.—Incorporated in Oklahoma to build a 12 mile line, it is said, from Cushing, Okla. The right-of-way has been secured, and it is expected that the line will be completed and put in operation this year. P. Arbon, C. R. Perry, Tulsa, and R. C. Jones, of Cushing, are incorporators.

Duluth & Northern Minnesota.—An officer writes in regard to the proposed line from Two Harbors to the head of the lakes, that it has been decided not to continue the extension of the main line for the present.

Dixie Railway.—A line is being built by the Dixie Industrial Company, of Benson, Ala., it is said, from Benson north to Alexander City, 15 miles. O. J. Pruitt & Co., Montgomery, Ala., have the contract. W. E. Benson, president and general manager, and D. B. McKenzie, chief engineer, Benson.

Fallon Electric.—An officer writes that residents along the route are grading this line. The plans call for building from Fallon, Nev., east to Stillwater, 13½ miles, and from Fallon south to Harrigan, 5 miles. About 4 miles of grade have been completed. The line will traverse a rich farm section to be opened to homesteaders this fall. C. A. Hascall, president, Fallon.

Galveston, Houston & Henderson.—The directors at a meeting in Galveston, last week appropriated $135,000, for improvements, the principal items being new side tracks, of which 10 miles will be laid on Galveston Island and two miles at Texas City Junction.

Guadalupe Valley Traction Company.—This company has filed its charter with the Secretary of State of Texas. It plans to build an interurban electric road from Austin, via Lockhart and Seguin, to San Antonio, about 100 miles. It is understood that surveys are under way. Directors are W. D. Dunlap and Walter J. Crawford of Beaumont, Tex.; E. W. Brown of Orange, and J. M. Abbott and J. M. Abbott, Jr., of Seguin.

Savannah & Southern.—This company, which operates the line from Norden, Ga., southwest to Willie, 13 miles, and 4 miles of other lines, has given a contract, it is said, to build an extension from Norden east to Lanier, about three miles, and work is under way. (March 28, p. 779.)

Railway Financial News

Boston & Maine.—The directors have passed the quarterly dividends. In 1913 the two quarterly dividends of 1 per cent. each were paid. In 1912 the annual dividend rate was 4 per cent. In 1911 5 per cent. was paid. In 1910, 6 per cent. Dividends have been paid since 1893.

Chicago & Eastern Illinois.—The committees formed to protect the interests of the common and preferred stockholders have been consolidated, and this consolidated committee now consists of Alvin W. Krech, chairman, H. H. Porter, W. Emlen Roosevelt, Gordon Abbott, W. Redman Cross, Horace J. Morice and Henry A. Vernet. The election of W. J. Jackson as president is commented on elsewhere, and, in addition to Mr. Jackson, Charles S. Holt, F. A. Hibbert, Chauncey Keep, W. H. Lyford, George H. Porter, H. N. Rose, H. H. Porter, Alvin W. Krech and Henry A. Vernet have been made directors. The *Wall Street Journal* says that the merging of the protective committees insures concerted action of the new owners of the Chicago & Eastern Illinois, and will enable them to secure at least two-thirds and probably a larger percentage of the stock for the cancellation of the contract with the St. Louis & San Francisco.

Chicago, Milwaukee & St. Paul.—Clark, Dodge & Co., New York, have bought from the company and are offering to the public $2,999,500 Puget Sound & Willapa Harbor 5 per cent. 5-year certificates of June 1, 1913-1918 at 98¼, yielding 5.40 per cent. on the investment. These certificates are guaranteed, principal and interest, by the Chicago, Milwaukee & St. Paul and represent ownership of a like amount (total outstanding) of the stock of the Puget Sound & Willapa Harbor. The stock is deposited under a trust agreement, which provides that the St. Paul will buy it at par on June 1, 1918.

Delaware & Hudson.—The New York Public Service Commission, Second District, has authorized this company to issue $2,000,000 first and refund mortgage 4½ per cent. bonds of 1908-1943. The bonds are to be sold at not less than 95, proceeds to be used for additions and betterments.

New York Central & Hudson River.—It is understood that up to the present, holders of about $30,000,000 of the $90,578,000 New York Central-Lake Shore collateral trust 3½ per cent. bonds have given their consent to the New York Central's consolidation plan and have agreed to take new 4 per cent. bonds to be offered in exchange. The consent of holders of 75 per cent. of these bonds is necessary to make the plan operative.

Norfolk Southern.—It is said that Fergus Reid will appeal to the Supreme Court of the United States from the decision of the North Carolina courts dismissing his suit against the Norfolk Southern to prevent the issue of $5,465,000 bonds for the purchase of the Aberdeen & Ashboro, the Raleigh & Southport and the Durham & Charlotte.

Pennsylvania.—Kuhn, Loeb & Company, New York, are offering this company's general freight equipment trust gold certificates to the amount of $19,700,000, the certificates to be issued in about two weeks. These certificates draw interest at the rate of 4½ per cent. and are offered at a price to yield about 5 per cent. on the investment. They mature April 1, each year from 1914 to 1923, inclusive.

Pittsburgh & Susquehanna.—On June 2, L. T. McFadden, chairman of the bondholders' committee and of the reorganization committee, bought in the property at foreclosure sale for $50,000. After the reorganization, it is the intention to rehabilitate the property and continue its operation. The road runs from Fernwood to Phillipsburg, Pa., 16 miles.

Rutland Railroad.—T. C. Delavan, John R. Calder and R. L. Shainwald, composing a preferred stockholders' committee of the Rutland, have sent out a circular letter to preferred stockholders asking for the deposit of stock under a stockholders' agreement, and urging minority stockholders to use every effort to get adequate protection from the court in the case of the New Haven being permitted to buy the majority stock from the New York Central & Hudson River or to prevent its purchase entirely.

Railway Age Gazette

DAILY EDITION

Vol. 54. NEW YORK—JUNE 13, 1913— ATLANTIC CITY No. 24a.

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE, BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY, WOOLWORTH BUILDING, NEW YORK.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN *Vice-President.* HENRY LEE, *Sec'y & Treas.*

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies .....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue more than 9,200 copies were printed; that of those more than 9,200 copies, 7,048 were mailed to regular paid subscribers; 200 were provided for counter and news companies' sales; and 1,700 were printed for distribution at Atlantic City and for use as sample copies.

THE recommendation of the committee on Specifications for Cast Steel Locomotive Frames, that the maximum phosphorus and sulphur content be reduced from .06 to .05 per cent. is in accordance with the best recent practice, which is based on the experience of the majority of steel manufacturers; and the specifications as a whole should tend to the production of a better quality of cast steel frames, with a resultant decrease in the number of breakages. While the adoption of the report as recommended practice will give opportunity for improving the specifications before adopting them as standard. Should any weak point develop, the lack of discussion on the report would seem to indicate a general concurrence in the findings of the committee.

TO those who carefully listened to the address of the president on Wednesday morning and agreed with his suggestions, the report of the committee on subjects must have been a decided disappointment. Mr. Crawford said:

"From my experience with the work of the association I cannot but agree, that entirely too much attention is devoted to material and consideration of the locomotive as a mechanical device, rather than as an instrument of transportation. The study of the general proportions, the hauling capacity, the adaptability of machine to specific work, obtaining the maximum output with minimum expense is of far more importance to the railways, and to the public, than the study of the smaller details of the machine and the minute variations in the composition of the materials used in its construction."

In the recommendations of the committee for subjects to be taken up by special committees, there are but two of the ten that can in any way be considered as coming within this classification. But one of the three subjects for individual papers is of the desired grade and none of the topical discussions. The executive committee should carefully consider the president's suggestions in making the final selection of subjects.

PLAINLY, President Crawford has little respect for some statistics and some statisticians. What conclusions your statistics lead you to depends entirely on the premises you start with and the bases on which you make them. Mr. Crawford is quite justified in insisting on more care and judgment in selecting the premises and bases. Just the same, statistics play a mighty useful part in railway operation. This is especially true in the United States, where the use of statistics for operating purposes has been developed to a high degree. Except in the case of the Northeastern no officer of an English railway can tell how many tons he is hauling on an average per car or per train, simply because ton mileage statistics are not kept. However defective are the statistics kept in this country, the American railway officer can come near as any to telling how much service he is getting out of his equipment. But there is still room for a lot of improvement.

THE advisability of discontinuing the committee on Main and Side Rods may be questioned, as there still seem to be features that require further study and investigation. The committee has restricted its report to the consideration of the rods, but there is a field for investigation regarding the proper design of crank and wrist pins, especially on large power. Special designs of crank pin bearings are now in use on passenger engines and will be more common as this class of power increases in size. The question of the proper unit bearing pressure on wrist pins is also in need of further consideration. There has been a tendency toward keeping the knuckle joints too small on the heavy power. There is also a need for further investigation as to stub-ends. It has been suggested that a specification of the material to be used for rods be included with the standards, together with the allowable unit of stress. A number of roads are still not willing to adopt the high unit recommended in the report of the committee.

MR. QUEREAU'S paper and discussion on the maintenance of electrical equipment should go far to do away with the bugaboo that undoubtedly exists as to the difficulty of the work. It appears that all of the mystifying terms that are so incomprehensible to the average steam railway man, are not to be feared, and that the real work lies in the purely mechanical operations which are familiar, in a general way, to all who have had machine or repair shop experience. The New York Central, Pennsylvania and New Haven have their repair departments organized on a purely mechanical basis. Hence, it follows that others may do likewise and that the superintendent of steam motive power may look with undisturbed equanimity on any proposals to electrify a part or a whole of the lines of which he has charge so far as the maintenance of the new form of equipment is concerned.

THE exhibits are to be open this year, for the first time at Atlantic City, on Saturday afternoon and also on Monday evening. The evening exhibit is in the nature of an experiment to ascertain if the members in any considerable numbers care to spend the evening among the exhibits on the Pier. If it is found that they do, it is quite probable that in future years arrangements will be made to keep them open for two or more evenings. Since all formal evening entertainments have been left off the program this year, there is no especial attraction to take the time and interest of most of the members and guests, and it is believed that they will be glad of the opportunity to more thoroughly and comfortably examine the tools and appliances shown by the supply companies. Even though a man is in attendance during the full sessions of both associations, if he attends the meetings with fair regularity, the actual amount of time available for inspecting the exhibition is very limited when its size is considered. In past years, if a member took an hour off during each sessions and spent all of each afternoon on the Pier, he had but a total of 22 hours to see the exhibits. This year on the same basis, he will have 29 hours. As a

matter of fact this time is reduced by half by the time spent in greeting old friends, committee meetings, other attractions, etc. The regular attendants who have kept in close touch with the new developments each year will find this sufficient time, but the newer members and especially those who are here for but one convention, are compelled to forego full advantage of the opportunity which the supply companies have spent many thousands of dollars to provide. From every standpoint these exhibits are wonderful and full of educational possibilities. It would seem only fair to the men who have provided them that every opportunity be given the members to examine them to their satisfaction. When formal entertainments were provided, it was not feasible to hold evening sessions at the exhibits, but that restriction is not in force now and a chance is being given you to cast your vote for more time to study the latest developments in the motive power and car department fields. If you are in favor, come to the pier Monday evening and show your appreciation of the opportunity.

LOCOMOTIVE TESTING PLANTS.

BEYOND doubt the most valuable information contained in the proceedings of the Master Mechanics' Association is in connection with the work performed on the locomotive testing plants of the Pennsylvania Railroad and Purdue University. In several instances the conclusions reached from tests made on these testing plants have determined the policy of locomotive designers throughout the country. The tests on superheaters and front ends, in particular, have been of inestimable value. The appendix to the report of the committee on superheater locomotives, to be presented on Friday, will undoubtedly be a striking illustration of the value of these plants to the association. It is, therefore, with especial satisfaction that the members listened to Prof. Schmidt's description of the locomotive testing plant recently put in operation at the University of Illinois. This plant is considerably larger than its predecessors and will accommodate the largest size of mallets. It gives the first opportunity for accurately investigating some of the problems peculiar to this type. Furthermore, the plant, being located at a university, will be largely used in investigation of problems that are general in their nature, while the Altoona plant must of necessity be devoted for the greater part of the time to problems peculiar to the locomotives of the Pennsylvania Railroad. The Purdue plant is by its size prevented from undertaking tests on the most modern locomotives.

The Illinois testing plant differs essentially from the others, in addition to its size and capacity, only in the arrangements provided for collecting the sparks. For this purpose a somewhat elaborate equipment has been designed and installed. The loss of heat through the medium of the sparks discharged from a locomotive working at a high rate of combustion is very large, and heretofore considerable difficulty has been found in accurately determining the loss from this source. The information which will later be forthcoming will probably prove of decided value, especially in regard to fuel economy with stokers.

While tests in connection with many features of locomotive operation and design are not to be compared with the results of regular service operation, the character of most of the investigations made on a locomotive testing plant is such that they cannot be made in any other way. The findings in every case should be checked by road work under regular service conditions, but no amount of study of services can develop the basic principles and positive conclusions that can be readily obtained from test plant records. It is quite true, as President Crawford stated, that a few test runs of a stoker locomotive over a particular division and then a few with a hand fired engine over the same district are not to be compared with the comparative record of a year's service of a hundred locomotives of each kind to determine the relative coal consumption. Still a test of both kinds of firing on a locomotive testing plant will develop faults in the design and construction of the machine, quality and preparation of the fuel, and the best method of operating the locomotive that could never be discovered by road work.

The value of the new test plant to the railroads of this country will eventually be beyond calculation and the University and state of Illinois are to be commended for their enterprise and progress and the Master Mechanics' Association is to be congratulated on the fact that it will obtain the benefit of much of the work done on it.

LOCOMOTIVE PROGRESS.

SINCE the last Master Mechanics' convention the progress in locomotive design has been marked by no new, "largest locomotive in the world," but it has by no means been stagnant on that account. In fact, it may finally be found that the progress has been of more far-reaching importance than during any previous equal period. Probably the most valuable work of the year is the awakening to a better appreciation of the possibilities of improved combustion and the ways of taking advantage of it. The publication of the results of the tests on fireboxes at Coatesville forcibly drew attention to the value of that end of the boiler and the opportunities it offered for increasing the capacity of the engine. This was already well understood by some designers, but a general understanding of the possible improvements at this point is but now beginning to develop.

The most striking feature of the year has been the rapid application of superheaters to all classes of locomotives. During the past year there have been over 4,400 superheaters applied in this country. This is practically as many as had been applied altogether up to May 1, 1912 The use of superheaters on switching locomotives is now becoming general, while a year ago it was distinctly experimental. Superheaters have been applied to practically all classes of road engines built during the year and to many of the older engines as they passed through the shop. Considerable progress has been made in overcoming troubles with lubrication, and in a few cases slide valves are being successfully operated with superheated steam. It appears, however, that there is yet something to be learned in connection with the operation of superheater locomotives. There is a strong tendency for some engineers to carry the water too high and thus, either carelessly or thoughtlessly, defeat the economics and reduce the capacity of the locomotive. The water level should be as low, if not lower, on superheater locomotives as on saturated steam ones, and all traveling engineers should thoroughly understand this.

The progress of the mechanical stoker during the year has been continuous, although confined to comparatively few railroads, and, so far as practical, application is concerned, to but two types. Other designs are in the experimental stage, with fair prospects of future success. The possibilities of using cheap fuel with the stoker are opening most attractive prospects in some districts.

There have been no new locomotive types developed in this country during the year, but the status of some of the older types is undergoing a change. The Pacific type is becoming quite popular for high speed freight traffic, and Mallets are being built for switching and hump-yard work in some of the larger classification yards.

There has been a noticeable refinement and improvement of many of the detail parts. New valve gears and better designed parts of the older types are being generally used on new power. The design of driving boxes has been greatly improved in some cases. Power and screw reverse gears are preferred on the larger locomotives. In one case, at least, a power reverse gear has been applied to six-wheel switch engines. New throttle lever arrangements, protected water glasses, safer squirt hose construction and attachment coal pushers in the tender, heat-treated alloy steels for parts subject to excessive strain and improved pipe brackets and similar parts are among the smaller improved features. Feed water heating seems to have made but little progress.

TO-DAY'S PROGRAM.

M. M. ASSOCIATION.

The following subjects which were on the program for Thursday could not be considered and were carried over until to-day:

Discussion of reports on:
Superheater Locomotives.
Specifications for Materials Used in Locomotive Construction.

Individual papers on:
Three-Cylinder Locomotives, by Mr. J. Snowden Bell.

The following is the scheduled program for to-day:

Discussion of Reports on:
Use of Special Alloys and Heat-treated Steel in Locomotive Construction ..... 9.30 A. M. to 10.30 A. M.
Smoke Prevention ..... 10.30 A. M. to 11.00 A. M.
Engine Tender Wheels ..... 11.00 A. M. to 11.30 A. M.

Individual Paper on:
Tests of Superheater Locomotives, by Dean C. H. Benjamin..... 11.30 A. M. to 12.00 M.
Resolutions, Correspondence, etc.... 12.00 M. to 12.15 P. M.
Unfinished Business ..... 12.15 P. M. to 12.30 P. M.
Election of Officers, Closing Exercises 12.30 P. M. to 1.30 P. M.
Adjournment.

ENTERTAINMENT.

Orchestra Concert 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P. M.—Entrance Hall, Million Dollar Pier.

Musicale, 9.00 P. M.—Entrance Hall, Million Dollar Pier.

EXHIBITORS ASKED NOT TO EMPLOY PRIVATE WATCHMEN.

The executive committee of the Railway Supply Manufacturers' Association has passed a resolution asking exhibitors not to employ private watchmen for their booths. The exhibits are given ample protection in accordance with the rules of the association, under the contracts for exhibit space.

INSPECTION LOCOMOTIVE FOR THE P. & R.

S. G. Thomson, superintendent of motive power and rolling stock of the Philadelphia & Reading, advises that a new Atlantic type officers' inspection locomotive has just been completed at the Reading shops and will be on exhibition at the track exhibit, Atlantic City, for the next few days. The locomotive is said to have several unusual features of construction which will be of interest to convention attendants.

RETURN TRANSPORTATION.

Any of the members desiring transportation over the Central Railroad of New Jersey should make application to C. E. Chambers, superintendent of motive power, and the transportation will be arranged for.

LOCOMOTIVE INJECTOR IMPROVEMENTS.

The last annual report of the Department of Locomotive Boiler Inspection of the Interstate Commerce Commission indicated that certain features of the injector and its fastenings were giving difficulty and needed attention. Representatives of the locomotive builders, the manufacturers of injectors and the Locomotive Boiler Inspection Department have held two conferences, one of them taking place in Atlantic City on Wednesday afternoon. The outcome has been the appointment of a committee to investigate the proper material, form, size, etc., of the coupling of the copper pipe to the injector. The most important question to be considered will be whether the method of brazing can be improved to make it satisfactory, or whether it will have to be superseded by some form of flange connection.

FOUND.

A memorandum book and a pair of eye glasses have been found and may be claimed at Secretary Conway's office.

INFORMAL DANCE AT THE PIER.

An informal reception and dance was held last evening at the entrance hall of the Million Dollar pier. The dance attracted a large crowd of the visitors at the convention and was just informal enough to be very popular.

CHROME VANADIUM TENDER WHEELS FOR THE GRAND TRUNK.

The Grand Trunk has specified chrome vanadium steel for 400 tender wheels which it has ordered from the Standard Steel Works and the Carnegie Steel Company, the order being divided evenly between the two companies.

MOVING PICTURES OF FIREBOX TESTS.

Visitors in the main hall on the pier enjoyed a rather interesting diversion while the moving pictures were being shown Thursday morning. Pictures were thrown on the screen showing the explosion tests of the Jacobs-Shupert and radial stay boilers at Coatesville, Pa., last spring. Convention attendants may be interested in knowing that the two fireboxes which were tested are being shown in the track exhibit this year. The moving pictures of the tests will be shown several times a day during the conventions.

COMMITTEES ON OBITUARIES.

President Crawford of the Master Mechanics' Association yesterday named the following committees on obituaries:

Geo. Richards	G. W. Wildin
Amos Pilsbury	P. H. Hammett
Henry Schlacks	Angus Sinclair
Reuben Wells	J. H. Setchel
Oscar Antz	O. M. Foster
F. M. Gilbert	F. M. Whyte
William Gill	G. W. Seidel
H. B. Howe	J. W. Taylor
C. E. Gossett	G. H. Emerson
W. A. Mallay	W. H. Bennett
J. H. Murphy	J. P. McCuen
J. J. Ryan	G. McCormick
A. Forsyth	C. B. Young

MASTER MECHANICS HONOR MEMORY OF HENRY SCHLACKS.

The Master Mechanics' Association, at the meeting yesterday morning, on motion of Angus Sinclair, adopted a memorial resolution on the death of Henry Schlacks, formerly superintendent of machinery of the Denver & Rio Grande, who died in Chicago on May 16, age 73 years, the resolution is as follows:

"Resolved, that this convention expresses warmest sympathy for the widow and family of Henry Schlacks, in the irreparable loss they have sustained in the death of an ideal husband and an affectionate father, which sad event occurred on May 16 last: Also, that in the death of Henry Schlacks, this association has lost a conscientious, hard-working mem-

ber, who performed valuable services to the railroad world in promoting sound railroad engineering."

Mr. Schlacks, who retired from service in 1902, was one of the oldest members of the association. He was the father of Charles H., vice-president of the Western Pacific; Henry J., an architect in Chicago; Joseph T., vice-president of the McCord Manufacturing Company, Detroit, Mich.; William J., with McCord & Company, Chicago; Edward L., in the coal business in Nebraska, and Robert J., manufacturers' agent in Denver, Colo.

THE UNANSWERABLE QUESTION.

How many boards in the Boardwalk?
How many fish in the sea?
How many grains of sand on the beach?
Can you tell that all to me?

The information bureau man
Has an answer for them all,
His head is full of facts like that
Though his figures may be tall.

But there's one thing that stumps him,
Though he does the best he can;
That's where to go on Sunday,
For the very thirsty man.

MUSICAL EVENING.

An instrumental and vocal concert to be held at the entrance hall of the Million Dollar Pier has been arranged by the entertainment committee for this evening. F. Pincus presents Eugene Engel's orchestra in the following program:

1. Orchestra. "Rakaszy" Hungarian March.....*Liszt*
2. La Favorita Quartette.
   (*a*) Puck's Song from "Fairyland"
   (*b*) Come Away Elves " " *Morgan*
   Katherine Rosenkranz
   Julia Z. Robinson
   Henry Hotz
   Anthony D. McNichol
3. Orchestra. Overture Raymond .....*Thomas*
4. Trombone Solo.
   Cujus Animam, from "Stabat Mater" .....*Rossini*
   David Claffy
5. Soprano Solo.
   "One Fine Day," from "Madame Butterfly".....*Puccini*
   Elsa Meiskey
6. Orchestra. Spanish Serenade "La Paloma".....*Yeadier*
7. La Favorita Quartette. "Rigoletto" .....*Verdi*
   Katherine Rosenkranz
   Julia Z. Robinson
   Henry Hotz
   Anthony D. McNichol
8. Orchestra Selections from Opera Traviata .....*Verdi*
9. Harp Solo. (*a*) Mazurka in B-f minor.....*Shuecker*
   (*b*) Serenade .....*Mosykowski*
   (*c*) Raindrops .....*Alvars*
   Helen Reed Alexander
10. Orchestra Overture "Light Cavalry" .....*Suppe*
11. Soprano Solo "Coquette" .....*Leo Stern*
    Elsa Meiskey
12. Orchestra Medley of familiar Home Songs
    "Rocked on the Cradle of the Deep"
    "Miss'es in the Cold, Cold Ground"
    "The Old Oaken Bucket"
    "Blue Bells of Scotland"
    "My Old Kentucky Home"
    "I Cannot Sing the Old Song"
    "Swanee River"
    "Auld Lang Syne"

BOOSTING FOR SAN FRANCISCO.

Under the leadership of A. M. Mortensen, traffic manager of the Panama-Pacific International Exposition, a bunch of Western railroad men is boosting energetically for San Francisco as the meeting place of the conventions in 1915. Among the boosters are J. F. Dunn, assistant general manager of the Oregon Short Line, Salt Lake City; F. E. Davisson, superintendent of machinery of the San Pedro, Los Angeles & Salt Lake, Los Angeles; H. J. Small, general superintendent of motive power of the Southern Pacific, San Francisco; D. P. Kellogg, superintendent of shops of the Southern Pacific, Los Angeles; I. L. Yates, of the Pacific Fruit Express, and S. L. Bean, mechanical superintendent of the Atchison, Topeka & Santa Fe Coast Lines, Los Angeles. J. F. Graham, assistant general manager of the Oregon-Washington Railroad & Navigation Company, Portland, is also expected to join the brigade of Exposition pushers when he gets on the job.

To those who are familiar with the attitude usually assumed toward one another by the cities on the Pacific Coast, the way the railway men from the rival communities are pulling together is beautiful to behold.

Pictures illustrating the attractions of the Panama Canal trip, of the exposition and of San Francisco and the Pacific Coast generally will be thrown on the screen on the pier Monday, Tuesday and Wednesday of next week, and boosting literature will be distributed.

The Exposition offers to guarantee the expense of providing a place for the Railway Supply Manufacturers' exhibit, if the conventions go to San Francisco; and the railway will make a one-way freight rate on exhibits.

RAILWAY CONSTRUCTION IN FORMOSA.—The Daito line, Formosa, was projected for the purpose of developing the eastern side of the island and is to connect Karenko and Bokusekikaku, a distance of 53 miles. The work was started in 1909 and was to be spread over 6 years. The amount appropriated for this construction was $2,128,000. That portion of the line connecting Karenko and Hozan has been completed and opened to traffic, while the remainder is still under construction.

SZECHUAN-HANKOW LINE, CHINA.—In Chengtu a public meeting has been held by the shareholders of the Szechuan-Hankow railway. The shareholders decided to utilize their funds for the construction of lines in connection with the main line. By the order of the Ministry of Communications Mr. Chang Li-ken has been despatched to institute a survey and an estimate of the railway between Shasi and Ichang; Tuan Mu and others are to construct the branch lines from Pinghsiang to Changshu-tung.

CANTON-HANKOW LINE, CHINA.—Another section of the Canton-Hankow line has been opened and it is possible to get as far as Yingtak. There was some delay and difficulty in laying this line along the pass known as the Blind Boy's Pass, because the right of way was very rocky, and there was some tunnelling to be done. But whilst work went on slowly here, farther on the line was pushed forward, so that when this difficult section was conquered, little delay was expected, and so it has turned out. Unfortunately the station at Yingtak is some distance away from the city. It appears that the west river—that is a branch of the North river, not the West river—is the cause of this. In other words, the line had to cross this river, and near the mouth, which is just opposite the city, the river was too wide to be bridged. At any rate it was found to be much easier to run the bridge across farther up the stream, and so the line was carried along some distance from the city. Reports affirm that already the line is popular. The report of the opening of this section of the line goes on to say that before the year has run its course the line will be opened all the way to the district city of Shun Chow. Much of the track is already laid, and it remains only to link up these several sections, whereupon there will be a direct track from Canton to that district city.

MASTER MECHANICS' ASSOCIATION PROCEEDINGS.

Reports on Cast Steel Frames, Rods, Boilers, Tires, Headlights. Care of Electrical Equipment, Engine Testing Plants.

President Crawford called the meeting to order at 9.40 a. m. Thursday.

SPECIFICATIONS FOR CAST STEEL LOCOMOTIVE FRAMES.

In 1904 there was submitted to the association the following specification for cast-steel locomotive frames, as suggested by the committee of steel-casting manufacturers.

MATERIAL.

Carbon ..... .28 per cent.
Phosphorus ..... .05 per cent.
Sulphur ..... .05 per cent.
Manganese ..... .60 per cent.
Frames will be rejected that show:
Less than .20 per cent. or over .35 per cent. carbon.
Over .06 per cent. phosphorus.
Over .06 per cent. sulphur.
Over .70 per cent. manganese.
Tensile strength per square inch, not less than 55,000 lbs.
Elongation in 2-in., not less than 15 per cent.
All frames to be annealed.

The committee has found in its investigation that there is still considerable difference in opinion among railroad officers, steel manufacturers and locomotive builders in regard to the chemical and physical requirements for cast-steel locomotive frames.

CARBON.

The experience of many of our members and some of the manufacturers indicates that better results are obtained if frames are made from a .37 to .40 carbon steel instead of .25 to .28. This gives an increased stiffness and higher elastic limit. Of course, the ductility is reduced, but if the frames are properly annealed a high carbon content should give much better results on the heavy power used to-day. The tests of low carbon steel frames of recent manufacture show carbon content ranging between .24 and .30, with an average of .273. The tests of high carbon steel show carbon between .39 and .42, with an average of .405.

PHOSPHORUS AND SULPHUR.

The general consensus of opinion among all manufacturers and users is that the rejection limit of the phosphorus and sulphur content should be changed from .06 to .05. From the large amount of data available to the committee, the phosphorus content of frames of recent manufacture ranges between .037 to .048, with an average of .0443, and the sulphur content ranges between .022 and .043, with an average of .0305.

MANGANESE AND SILICON.

The manganese content in the old specification was .60, with a rejection limit of .70. It is the usual practice to-day to accept material having .70 of manganese and .20 of the silicon, but it is not the usual practice to specify limits for either of these elements in recent specifications for steel. Manganese usually ranges between .50 and .70. Silicon usually ranges between .24 and .28.

TENSILE STRENGTH.

The specification of 1904 recommends not less than 55,000 lbs. tensile strength. All specifications which have been examined call for not less than 60,000 lbs. tensile strength, many call for 65,000 lbs. while some call for 70,000 lbs. to 80,000 lbs. Many tests in the hands of the committee show tensile strength from 75,000 to 80,000 lbs., and quite a number of them run as high as 85,000 lbs.

ELONGATION.

The 1904 specifications require an elongation of not less than 15 per cent. in 2 inches. The usual practice at the present time is an elongation of 20 per cent. in 2 in. As the carbon content of steel is increased the tensile strength is increased, but the ductility is decreased, and perhaps a better rule to follow is "the per cent. of elongation in 2 in. shall not be less than 1,200,000 divided by the tensile strength." For steel of 60,000 lbs. tensile strength, this gives an elongation of 20 per cent. For steel of 75,000 lbs. tensile strength, the elongation would be 16 per cent.

ANNEALING.

The usual practice in annealing frames is to apply heat slowly, so that all castings in all parts of the furnace are heated to a uniform temperature of 1,5000 degrees, after which the furnace doors may be opened and the furnace and contents allowed to cool.

VANADIUM.

The committee has not deemed it advisable to submit a standard specification for vanadium steel frames at this time.

The following specification for cast-steel frames is recommended:

Castings must be true to pattern and free from flaws, shrinkage cracks, excessive scale or porosity. When patterns are furnished by a railroad company the manufacturer must make sure that the allowances for shrinkage in the patterns agree with his own practice, and castings will be rejected, even when made from railroad company's patterns, which do not conform closely to required dimensions. Frames must be made perfectly straight and in true alignment, both vertically and horizontally. Frames will not be accepted which weigh less than 97 per cent. of the weight specified, and material in excess of 6 per cent. above the specified weight will not be paid for. The specified weight must allow a proper amount for finish, as may be agreed on.

All castings must be thoroughly and properly annealed, and test pieces must be annealed with the castings before they are detached.

Test pieces shall be one inch square, and, when possible, 10 in. long, and must be left attached to each frame. At least two test pieces, one near each end of the frame, shall be provided. The test pieces shall be partly sawed off from the body of the casting so that they can be easily broken off, but shall not be entirely detached by the manufacturers. Both the main casting and test pieces shall be stamped with heat numbers. The finished test pieces for tensile strength test shall be ½ inch in diameter and 2 in. between shoulder fillets.

The material desired has a tensile strength of at least 70,000 lbs. per square inch; elongation, 20 per cent. in 2 in., and an elastic limit of 50 per cent. of the tensile strength.

Cast-steel frames will be rejected which show less than the following requirements:

Tensile strength, minumum.....65,000 lbs. per sq. in.
Elastic limit, minimum.....30,000 lbs. per sq. in.

Elongation in 2 in. shall not be less than a percentage represented by 1,200,000 divided by the tensile strength.

Reduction of area, minimum..... .30 per cent.
Phosphorus, maximum ..... .05 per cent.
Sulphur, maximum ..... .05 per cent.

When high carbon steel frames are specified, the carbon content must be not less than .37 per cent. and the reduction of area not less than 25 per cent.; other requirements as above.

The report is signed by:—C. B. Young (C. B. & Q.), chairman; E. W. Pratt (C. & N. W.); R. K. Reading (Penna.); O. C. Cromwell (B. & O.); C. E. Fuller (U. P.), and L. R. Pomeroy.

DISCUSSION.

G. W. Wildin, (N. Y. N. H. & H.): I move the report be referred to the association by letter ballot.

F. F. Gaines, (C. of Ga.). I second the motion. I presume Mr. Wildin means for "Recommended practice." I would suggest that before the committee send in these Specifications for Locomotive Frames for letter ballot, that they carry out their suggestions in the last paragraph about high carbon content, and include that, as well as the suggestion about the elastic limit and tensile strength, and that they be placed in parallel columns in the final specifications.

(The motion was carried.)

INDIVIDUAL PAPER ON MAINTENANCE OF ELECTRIC EQUIPMENT.

By C H. Quereau.

We all recognize the fact that several important steam railroads, have, to a limited extent, replaced steam locomotives with electric locomotives and multiple-unit cars; and that their successful operation for five or six years and the experience gained during this time makes the subject of the maintenance of electric equipment a live one. The fact that at least six American steam railroads are now using electricity for motive power purposes and the recent announcements of plans for extensive electrification of main lines on western steam railroads suggest the thought that almost any steam motive power organization may be called upon at an early date to maintain electric

motive power and should make this subject of interest to all steam motive power men.

The word electricity naturally raises in the mind of a steam motive power man a suggestion of mystery, something he knows little or nothing about, and, what is worse, he is very apt to conclude he is "too old to learn." It is the object of this paper to try to show there is no more mystery about electricity than about water, steam, coal or other gifts of nature about which motive power men have enough knowledge and familiarity to successfully manage their work; if possible, to remove the natural, but useless, fear of the subject which most of us have.

To those acquainted with the men who are responsible for the maintenance of electric equipment—whether on trolley, interurban or steam railroad lines—it is a matter of common knowledge that those Master Mechanics, General Foremen and Mechanics who have been trained in the Motive Power Departments of steam railroads have somewhat the advantage of those who have not. I have in mind a western mechanic and general foreman whose experience with electric equipment was limited to six months as electric inspectors' helpers, who are eminently successful in maintaining electric equipment. In the case of steam railroads which are electrified, there are decided advantages in using men already in the organization whose characteristics are known, who are familiar with steam railroad policy, methods and requirements and such a plan removes all ground for the possible feeling that electrification will crowd out of their positions men who have served the railroads faithfully and satisfactorily for years. Some knowledge of electricity for such men is certainly necessary, but it is very elementary and simple, preferably practical rather than theoretical, and can be acquired in

C. H. QUEREAU,
Paper on Maintenance of Electric Equipment.

such a short time that the advantages of using men for the maintenance of electric equipment who are already in the steam motive power department very decidedly outweigh the disadvantages due to lack of an extended knowledge of electrical apparatus. This conclusion has been reached after six years' experience in an electric equipment maintenance department on a steam railroad.

I am inclined to believe the greatest bugaboo for the steam motive power man, when considering electrical matters, is the fact that he is not familiar with electrical terms and therefore imagines the whole subject is difficult. When the uninitiated hears or reads of volts, amperes, watts and kilowatts, circuit breakers, contactors and other electrical terms, he finds these words as meaningless as so much Choctaw. As a consequence, he gets no real information or adequate conception of the subject discussed and, perhaps naturally, concludes it must be beyond his powers and altogether mysterious. A little reflection will show him that at one time he was equally ignorant about such commonplace matters as hydrostatic pressure, steam consumption, horsepower, airbrakes and superheaters, and that in all probability it would puzzle him, after years of practical use, to accurately define these terms or even explain to a visitor from Mars what a foot really is, though for all practical purposes he knows each of them thoroughly and never imagines his inability to define technically the words he uses almost hourly is any handicap in successfully holding his job.

I have previously stated that "Some knowledge of electricity is certainly necessary, but is very elementary and simple, preferably practical rather than theoretical." In this connection it should not be forgotten that this paper relates to the maintenance and is not concerned with the design of electric equipment. Experience has shown that the graduate in an electrical course who is employed in maintaining electric apparatus is apt to require wiring diagrams and blue-prints showing the circuits and relations of the apparatus, while the inspector whose training has been wholly practical soon learns by precept and practice that a given symptom is caused by a given defect and does not find it necessary to trace the intermediate steps, but goes at once to the seat of the trouble and removes the cause. For instance, when an electric locomotive loses power when the motors are operated in series parallel, after having operated satisfactorily in series, the embryo electrical engineer is prone to waste time in hunting up wiring diagrams and tracing circuits, while the inspector whose knowledge has been acquired by practical experience knows that either a certain fuse has blown because of an overload, or a certain contactor has failed to operate properly and at once applies the necessary remedy.

It would be unwise to assume from the foregoing that an elementary knowledge of electricity and the ability to read wiring diagram blue-prints are undesirable or unnecessary to anyone employed in the maintenance of electric equipment. Such knowledge is both desirable and necessary, just as much as for steam equipment, but no more. The point is that the average mechanic, without previous electrical experience, does not require any great amount of electrical knowledge in order to successfully compete with an electrician in maintaining electric motive power.

The most helpful illustration to an understanding of electric circuits and diagrams is to think of them as showing a water system. In place of the electric motor put a water motor, and consider the wiring plans as showing the distribution and connections of water pipes. The analogy can be carried farther; the water pressure stands for the voltage and the pounds or gallons of water flowing or available, the amperage of electric current; the horse-power hours of a water turbine are the equivalent of the kilowatt-hours or horse-power hours of an electric motor or generator.

If simple and inexpensive precautions are taken, there is no greater danger in working about electric than steam equipment. No one with ordinary sense and experience would think of putting his bare hand on the unprotected steam pipe of an injector, even though he cannot see the steam flowing through it. There is no greater danger in connection with electric circuits if the same common sense is used. This refers to 600-volt direct current and would possibly have to be modified for materially higher voltages, not to high-tension lines, where the hazard is undoubtedly greater.

The statement is occasionally made that an electric is a simpler machine than a steam locomotive. If this refers to ease of handling and operating or matters requiring the attention of the engine crew, such as injectors, steam pressure and water level, there is no possible doubt the statement is correct, but if it refers to the mechanical simplicity or number of adjustable or moving parts that must be inspected and kept in proper relation, the steam locomotive is very much the simpler. There is, however, this fundamental difference favoring the electric machine: that the moving parts of the control are of very light weight, easily accessible for inspection and repairs and not subjected to nearly as great wear as are the corresponding parts of a steam locomotive.

It will no doubt interest motive power men to know that the shop arrangement and tools for maintaining electric equipment are not essentially different from those they are accustomed to in repairing steam locomotives, except, of course, the electric locomotive has no boiler or tender and it is necessary to provide facilities for rewinding armatures and field coils.

The steam motive power man will no doubt be much surprised when told the electric locomotive requires no shopping for a general overhauling, except for a general painting. This is made possible by having a stock of spare parts, permitting the removal of a defective part from a locomotive, the substitution of a repaired part and releasing the engine, the defective apparatus being repaired at leisure. For instance, a set of driving wheels needing tire turning are replaced by an extra set in good condition, this operation requiring not more than five hours with adequate drop pit facilities. Air compressors, controllers and contactors can be handled in the same way.

The steam locomotive can not be maintained on this plan, as the boring of cylinders and resetting flues make it necessary to shop the engine, withdrawing it from service for a considerable length of time.

It is quite possible the foregoing statements of personal experience and opinions will not prove as convincing as the records made by an electric equipment maintenance department organized by and largely consisting of men whose earlier experience and training were obtained in the motive power department of steam railroads. It seems reasonable common sense will conclude there can be no particular mystery or unusual danger in maintaining electric locomotives when the records for the year 1912, after five years' service, show a cost of less

than 4 cents per mile and an average of 48,271 miles per train detention due to electrical apparatus, with a banner record of 249,423 miles (equivalent to ten times around the world), without a train detention due to the electrical equipment.

DISCUSSION.

C. P. Keiser (Penna. Terminal): On the Pennsylvania, we have two electrified divisions, the West Jersey and Seashore and the Manhattan division, both divisions being operated by steam men. The entire organization, including those in charge of the power houses, substations, transmission lines, and the maintenance of the electrical equipment is under the direction of a master mechanic; that is also true of the third rail. Some may think this is primarily a maintenance of equipment matter, yet we find that the substation and transmission lines and the third rail are so closely allied that they can be handled by one foreman. In fact, in our organization on the Manhattan division, the only additional foreman of department we have, other than what is required on other divisions of the Pennsylvania, is the man who is responsible for the electrical side, that is, the substations and

EXPLANATION OF DELAYS.

Master Control:
2 minutes. "J" switch not operating owing to oil on armature.
2 minutes. Grease on master controller drum.
2 minutes. Broken control battery plate.
3 minutes. Loose master controller finger.
2 minutes. "J" switch sticking; motors not operating in parallel.
1 minute. Bent finger on No. 2 controller plug.
4 minutes. Master controller finger loose.
3 minutes. Bridge relay finger not making contact; small piece of waste found under same.

Motor Control:
6 minutes. Circuit-breaker not resetting owing to glycerine in dash pot gumming, account cold weather.
6 minutes. Due to motorman not using power in proper manner and blowing breaker by notching up too rapidly.
2 minutes. Broken strap connection.
5 minutes. R-5 resistance strap breaking No. 2 motor.

Miscellaneous Electrical:
5 minutes. Shoe cable burning off.

Miscellaneous Mechanical:
8 minutes. Latch on engine coupler opening when starting.
4 minutes. Motor crank disk striking cover (stopped to examine same.).

Brakes:
2 minutes. Brakes failed to release promptly.
4 minutes. Defective air hose.
5 minutes. Loose finger on pilot governor of air compressor.

transmission lines, as well as the third rail, outside of which we have a foreman of our power house, and also a foreman in the shops. The foreman who has charge of the locomotives, and has the maintenance of the multiple unit cars, is a steam man with twenty years' experience in roundhouses and in general locomotive shop practice.

Mr. Quereau has mentioned the article published in the *Electric Railway Journal* on May 15. The total number of detentions due to locomotives in 1912 was 66 minutes, and the mileage was 994,000. Thirty-eight of those minutes were due to electrical causes, and a portion of the detentions on the electrical side were due to improper handling of the locomotives. The delay due to the master control was 19 minutes; motor control, 19 minutes; miscellaneous electrical, 5 minutes; miscellaneous mechanical, 12 minutes; brakes, 11 minutes; so that the detentions are very low. In fact, the electrical side to the repairs to the locomotive is practically nothing. After two and a half years, we have our first armature to rewind or coil to replace. The parts are easily removed and it takes a mechanic but a short time to get the slight experience necessary to make these changes and to know the functions of the various contacts, etc. In fact, our engine men who operate the electric locomotives, after six months, are very familiar with the equipment, and in many cases make repairs out on the road on a failure from loose connections of some sort. On many projects for the electrification of steam railroads, I think it does not require any special organization for taking care of them, that is, of the equipment, the power house or substations.

S. A. Bickford, (N. Y. C.): My experience corroborates Mr. Quereau's statements. He addresses himself to men who have the shaping of the policy of an organization. It might be well to dwell briefly on the organization of the maintenance force. It is true you will need some few men who have had some knowledge of electrical equipment, just as you do in repair shops on steam locomotives where you must have men who have had special training for some particular line of work. After the organization is once started, it can be readily taken care of, just as you take care of your working force in the average engine house. The personnel of the men in the average repair shops for electrical equipment does not differ from that in the repair shop for steam locomotives.

In our entire organization, we do not have what might be known as a technical man, except in the case of those who are there in the capacity of students; they come for the experience they get. Our force is entirely made up from practical men. My personal opinion is that the electrical engineer has up to the present time confined his efforts entirely to the electrification of roads and the design of electrical equipment, and is not so much concerned at the present time about the maintenance. You will need, in addition to these men, a few men who can exercise supervision over the operation and handling of the machine, who are thoroughly familiar with that particular type of equipment. At the present time, the electric locomotive has not reached the high state of reliability and development that car equipments have. This is due largely, I think, to the much increased loads placed upon the electric locomotive over the average car equipment. Each particular type of electric locomotive has its own peculiar weaknesses just as would develop in any machine, and in a high speed express train service, like that which we have on the New York Central, it is important that you have men who are thoroughly familiar with the particular type or the grouping of the apparatus on your locomotive. Aside from that, I do not know that it needs any special training to fit in to successfully meet the problems that are present in handling the electric locomotive, and meet these emergencies as they arise in actual operation.

G. W. Wildin, (N. Y., N. H. & H.): For years the New Haven has had a couple of branches electrified; one is the Nantasket Beach line which operates about three months in the year, and is handled by the master mechanic, along with the steam line, and I never hear from him. We have another line running from Providence to Fall River and Bristol, operating 106 trains a day, direct current, and that is handled by the master mechanic along with his steam operation, both power house and equipment, and there are no complaints about that line.

We have, as some of you know, a very peculiar situation in our electrified zone; we have a very complicated arrangement. Until the first of this month, I did not have full control of the operation of that line, but it was under the control of what we term an electrical superintendent, who kept all the mysteries under his hat, who would tell you nothing, and would do nothing, and consequently we were in a pretty bad fix. We have reorganized the division, placed a master mechanic on it, a man with steam railroad knowledge, and have made him a superintendent of shops to report directly to the mechanical superintendent, and the chief engineer of the power house reports to the mechanical superintendent. The master mechanic handles the outlying shops which you would term round-houses in steam service, and has nothing to do with the main shop or main repairs which are made, but he does make all the running repairs. I have an assistant mechanical superintendent who gives his full time to this end of the work, and who has grown up on the steam lines, and I got him principally because he knew nothing about electricity. What he does learn now will be a real knowledge of electricity. I thoroughly concur in the statement of Mr. Quereau, but I want to go a little further, and say that 99 per cent. of the knowledge required in the operation of electrical service is mechanical knowledge, and one per cent. electrical knowledge. You should not put your electrical equipment in the hands of electricians; if you do, you will be in trouble. It is a notorious fact that they know nothing about mechanical parts, and as long as they keep the copper portions in running order, and a few other electrical parts in proper condition, they think that they are keeping the locomotive up to a standard condition. What you need is good sound sense behind the whole situation, and not very much theory.

President Crawford: Is there any further discussion on

this paper? If not, we will proceed to the consideration of an individual paper entitled "A new Locomotive Testing Plant at the University of Illinois," by E. C. Schmidt, professor of railway engineering, University of Illinois.

LOCOMOTIVE TESTING PLANT.

Professor E. C. Schmidt, of the University of Illinois, presented an extensive individual paper describing the new locomotive testing plant which was recently installed at the University of Illinois. The paper was quite similar to one which was presented at the March meeting of the Western Railway Club, and which was abstracted in the *Railway Age Gazette* of March 28, 1913, page 752.

DISCUSSION.

D. R. MacBain, (L. S. & M. S.): I think the paper just read by Professor Schmidt is one worthy of a great deal of study on the part of the membership, and I believe it is going to be a very valuable document as I feel that the railroads will more that ever in the future avail themselves of the opportunities of testing on such plants; and I move that the Association extend a vote of thanks to Professor Schmidt.

(Motion seconded, stated and carried).

A. W. Gibbs (Pennsylvania): Will it trouble Mr. Schmidt too much to tell us how successful the method of separating the sparks has proven to be? It is not a difficult problem, and as the plant has been running since April, perhaps he could give some information as to how completely that practice serves its purpose, separating the solid matter from the gases.

Professor Schmidt: As far as our experience goes thus far it is successful, as we are trapping either in the duct or in the collector, all the solid matter. We have not, however, run this locomotive up to its capacity. The plant has been in operation only a month ,and is new, and what with interruptions, we have not had more than 10 days' continuous running, so that we are not in position to draw very satisfactory conclusions from the operations, as yet.

A. W. Gibbs: Does any of the dust from the coal sift down onto the roof?

Professor Schmidt: Not so far as we are able to discern. It is discharged 80 feet above the ground, and there might be something get away which we would find. We have means of exploring the stack; there is a manhole in the stack above the separator, which will enable us to explore the gas stream and determine if there is any considerable amount of solid matter which gets away. Thus far we have not done that. The separator to which I refer is of almost identical design and of the same proportions as one used by the Lackawanna, as called to my attention by one of their men located at Scranton. They have had a good deal of experience with that device at that point. For some reason or other they found it necessary to separate the sparks in the gas discharge of the stationary power plant.

President Crawford: We will now proceed to the report of the committee on Main and Side Rods, of which committee Mr. W. F. Kiesel, Jr., is chairman.

MAIN AND SIDE RODS.

The report on the above subject was submitted two years ago, was discussed at the last meeting, and was held over for a year for consideration, to be brought up again at this meeting for possible adoption as a standard. During the past year we have received a number of letters, some containing suggestions, as follows:

As it will be but a short time before heat-treated and alloy steels are introduced, maximum allowable stresses for such materials should be recommended.

That allowable pressure per square inch for pin bearings be specified, and a ratio of length to diameter of pins be established especially for high speed engines.

Offset rods for locomotives with three pairs of drivers sometimes have all of the offset in rod between two drivers, and none between the third and middle driver. It is then not considered necessary that the total offset be taken as leverage for [illegible]

These suggestions have been considered but were not deemed of a nature to require changing or adding to the previous report. Taking them in their order, the committee reports as follows:

We are not yet inclined to give a limit of stress for heat-treated or alloy steels as too little is known concerning such material in actual locomotive service.

The design of pins is necessarily handicapped by the available space; therefore the designer is restricted and must obtain best results regardless of preferred bearing area and desired ratio of length to diameter of pin. Furthermore, the design of pins is not a part of the problem submitted to us.

A general rule for type of offset rods described can not be formulated without danger of having it misapplied. The rule as given may err slightly on the safe side, but can not be misapplied. It is therefore preferable to make no change.

W. F. KIESEL, JR.
Chairman, Committee on Main and Side Rods.

Attention is called to a correction that should be made in the original report:

In Volume XLIV, 1911, page 137, at bottom, a change should be made, as follows:

The minimum area at points indicated by letter "b."

For main rods and main pin bearing of side rods.

A equals. $\frac{Px}{30000b}$

For side rods, except main pin bearing, A equals $\frac{Px}{60000b}$

The report, including the correction just noted, was submitted for adoption as standard practice.

The report is signed by:—W. F. Kiesel Jr. (Penna.), chairman; H. Bartlett (B. & M.); G. Lanza; H. B. Hunt (Am. Loco. Co.), and W. E. Dunham (C. & N. W.).

DISCUSSION.

J. A. Pilcher, (N. & W.): This report has been before the association for two years, if I am correct, and under the resolution passed yesterday, it could now be adopted as a standard.

President Crawford: It could be adopted as "Recommended Practice."

J. A. Pilcher: Isn't it permissible to adopt it after it has been before the association for one year?

President Crawford: The idea is that anything adopted would remain a recommended practice for at least one year. While it is true it has been before the association for two years, it can be adopted today for recommended practice if the association so desires and remain as recommended practice for at least one year.

J. A. Pilcher: I move that this be adopted as recommended practice before the association, and that the committee be discharged. (The motion was carried.)

F. F. Gaines: Last year there was some discussion on this paper relative to the question of why in American practice, the rods are so much heavier than in European practice. I did not believe at the time, and I do not now, that that is the case. I noticed in a recent issue of the *American Engineer*, a gentleman of the Baldwin Locomotive Works has an article on the subject, and he shows that American practice as compared with European practice is quite similar when you consider related parts, the size of the cylinders and the other parts involved.

Henry Fowler, (Midland Railway, Derby, England): I have not it checked, but I should decidedly say yours are heavier when you take that into account. When we purchase rods, they are subjected to very careful heat treatment.

President Crawford: If there is no further discussion on this report, we will take up the next report, which is on Safety Appliances. I am the Chairman of that committee, and the report of the committee is that nothing transpired during the

year which has lapsed since the last convention, for this committee to give consideration.

H. T. Bentley (C. & N. W.): I move that the report be accepted.

(Motion seconded and carried).

President Crawford: The next report is that of the committee, on "Design, Construction and Inspection of Locomotive Boilers" of which Mr. D. R. MacBain, superintendent of motive power of the Lake Shore and Michigan Southern is chairman.

D. R. MacBain: I have asked Mr. Gaines to kindly read the report, as my voice is not in good shape.

MAINTENANCE OF LOCOMOTIVE BOILERS.

The committee reported relative to the maintenance of locomotive boilers, the report on design and construction being presented to the members at the last convention.

ELECTRIC AND OXY-ACETYLENE WELDING.

The committee has investigated the results obtained by electric welding, especially for fire-box work, and has included in the report results obtained by oxy-acetylene process, which is used extensively. Some roads install electric welders in such a location that they can be used in the shop as well as the engine house. The oxy-acetylene can be arranged in the same manner by running pipes from the central plant to any part of the engine house or shop.

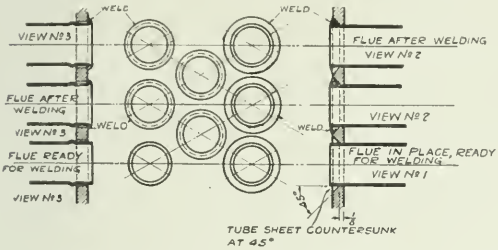

Fig. 1—Methods of Welding Flues.

A complete portable oxy-acetylene cutting and welding outfit is also used in both shop and engine house.

One road, using the electric process, welded beads of small and large superheater tubes, after they had been set in regular manner but they gave trouble on account of leakage. It proved successful where the material of the flue was in good condition. An experiment was made by the same road on three engines omitting copper ferrules and it did not prove successful on account of not countersinking the sheet to allow for welding the bead on the flue.

A road using the oxy-acetylene process has welded in a number of small tubes and omitted copper ferrules; they could not make satisfactory welds with the ferrules. The tube sheet was prepared as shown in Fig. 1. View 1 shows the tubes set ready for welding; the tubes were not expanded in any manner. View 2 shows the tubes after being welded. The tubes are allowed to project far enough beyond the sheet so that when finished the beads are the same size as when beaded in the regular manner. They experimented with flues welded as shown on view 3. Tubes were allowed to extend through the sheet 3/16 in. and were prossered and then welded after which a beading tool was used to smooth up the bead. This set of flues has been in service only a short time, and so far has been satisfactory.

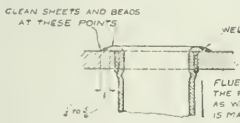

Fig. 2—Welding Flues, Electric Process.

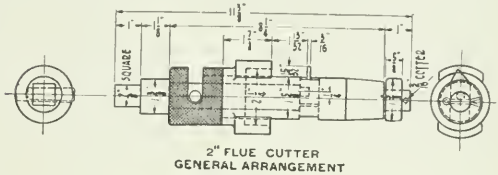
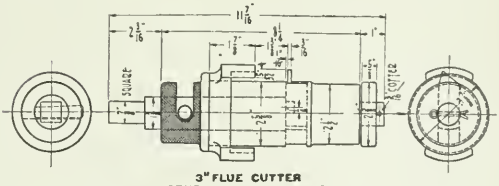
A road using oxy-acetylene process for welding in flues believes that the copper ferrules are not necessary. The flue sheet is prepared as follows: The old flue having been removed, the first operation is to draw the centers of the back and front flue sheets toward each other. The center of the back sheet is drawn forward about 1¾ in., and the front sheet is drawn backward about 1½ in. This is accomplished by applying eleven stay rods distributed in a circle about 2½ ft. in diameter, one of the rods being located in the center. While these rods are under tension the back flue sheet is annealed around the edges by an oil torch. Rods are then removed and there is a permanent dish in the back sheet of about 1¼ in., and in the front sheet 1⅛ in. The holes are then countersunk on the fire side to a depth of ¼ in. with a countersinking tool, the cutting faces of which are at an angle of 90 degs. Flues are then set in place, projecting ⅛ in. beyond the flue sheet, then rolled and ready to be welded. They have not undertaken to weld any large superheater flues.

One road had considerable difficulty with the large superheater tubes in the back flue sheet, and one engine which had a flue mileage of 75,000 miles was brought to the shop and large flues welded with electricity. Nothing was done to flues or beads except to clean them before welding. Metal was built around the bead as shown in Fig. 2, and the weld was made from the edge of the bead to the sheet. The ferrules and flues were prossered and rolled, and have proved so successful that this method was continued. The engine





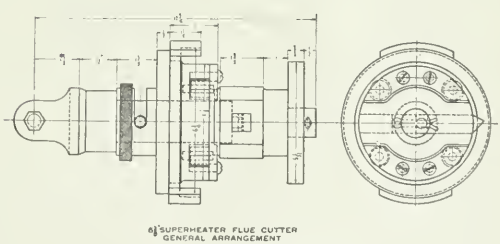


Fig. 3—Flue Cutting Tools.

was placed in service and has made 14,000 miles without giving any flue trouble. On one division they have 96 superheater engines having a total of 3,024 large superheater tubes, all welded, and 24,655 small tubes, of which 3,557 are welded. The total flue mileage of these 96 engines is 1,117,437 miles, and up to date there has not been one case of welded flues leaking. This practice has been extended over the entire road. It is unnecessary to adopt a special method of welding tubes other than what was followed previously for prossering tubes.

Two roads using the oxy-acetylene process chip off the high spots and use an ordinary beading tool; others do not go over flues in any manner. Roads using electricity find it unnecessary to smooth off the welds. The majority of roads which weld in flues use steel safe-ends and no difficulty is experienced. It has been found that it takes about three hours longer to cut out a set of flues which have been welded. In removing these flues no special difficulty has been encountered. Fig. 3 shows tools used in removing flues that have proved very successful.

When flues are welded-in, the maintenance is less than

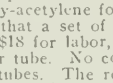
when tubes are prossered. It is unnecessary to give any special attention to welded tubes when boilers are washed. Reports received from different roads indicate that considerable difficulty was experienced in welding flues with the oxy-acetylene process, while the roads using the electric process report very satisfactory results, especially one of the roads that tried out both methods and adopted the electric process. Therefore, the committee recommends electric process for welding flues, and also recommends that flues be set with coppers, prossered and beaded in regular manner before welding, until it is clearly demonstrated that other methods are equally as good or better.

One road using oxy-acetylene for welding the flues reports that it costs, including gas and all work preparing flue sheets and safe-ending flues, an average of 71 cents per flue, and the regular method, which consists of safe-ending and applying coppers and other work for the same number of flues, is 22 cents per flue.

A road using oxy-acetylene for setting the flues, as shown in Fig. 1, reports that a set of welded flues, containing 335 flues, amounts to $18 for labor, $15 for gas, making a total of $33, or $.098 per tube. No coppers are used by this road when welding in tubes. The regular method for the same number of flues costs $25.25, or $.075 per flue. These figures include only such work as necessary to set flues.

A road using the electric process of welding flues reports that the cost of labor complete to weld beads is $.037 per flue. The cost to weld in new flues is $.03 per flue.

A road using the electric process for welding the flues as shown in Fig. 2 reports the cost of welding 34 4½-in.



ELECTRIC WELDED

Fig. 4—Method of Welding Door Sheets to Mud Ring.

tubes and 32 2-in. tubes—labor, $4.12; current, $2; material, $1.25. Total, $7.37. One 4½-in. tube is equivalent to two 2-in. tubes; therefore, this amounts to 100 2-in. tubes costing $.073 per flue. The standard method of setting the flues by the same road, which consists of safe-ending, applying coppers and prossering, is $.089 per flue, and adding the cost of welding ($.073) makes a total of $.162, which is the cost of welding one 2-in. tube, as shown by Fig. 2.

Below is the cost of setting flues by different roads. This cost applies to the old method:

A. $.06 a flue ready for testing, new flues.
B. $.06 a flue ready for testing, new flues.
B. $.14 removing, cleaning, safe-ending and resetting.
C. $.13 removing, cleaning, safe-ending and resetting.
D. $.067 installing copper ferrules, setting flues, rolling front ends, setting and beading firebox end of tube.
E. $.044 per flue for setting tubes only, includes copper ferrules.
F. $.04 per flue for setting tubes only, includes copper ferrules.
G. $.036 per flue for setting tubes only, includes copper ferrules.

From these figures, it appears that the cost of welding flues in accordance with electric process is cheaper than the oxy-acetylene process. It also gives better service. None of the roads are welding-in tubes in the front tube sheet, as it does not seem to be desirable to change the method now used.

Vertical cracks in the side sheets are welded with both oxy-acetylene and electric process. Seven roads get good results with electric process when cracks do not exceed 12 in. in length. Two roads advised very poor success with welding vertical cracks with the oxy-acetylene process. The method used by all railroads is to V out the sheet ⅜ in. to ½ in. at the top and ⅛ in. to 3/16 in. at the bottom.

Cracks in the top of the back flue sheet as long as 38 in. have been welded successfully with both types of welder. The sheet is cut out a few inches beyond the end of the crack to avoid a new crack from starting and is dressed out V shape the same as the cracks in the firebox. Some roads preheat the sheets before welding.

Cracks are successfully welded in the crown sheet with both processes. One road, using oxy-acetylene process for welding cracks in the flue sheet, cut off the forward part of the crown sheet and welded a strip the full width of the crown sheet, about 6 or 8 in. deep. This was done to avoid any new cracks developing at this location. It was found that this gives most serviceable results.

Cracks in the door sheet have been successfully welded with both types, but the oxy-acetylene is preferred, as it gives more satisfactory results. One road preheated sheets before welding.

In preparing firebox sheets for electric welding, the crack is V'd out to an angle of about 65 deg. and the metal is filed bright. For oxy-acetylene it is V'd out to an angle of about 90 degs. and no filing is required; the metal is built up from the fire side of the sheet.

Considerable difficulty has been experienced by roads using both oxy-acetylene and electric welding on account of welded cracks opening up after service from three to eight months. The percentage in some cases, which are few, runs as high as 15 per cent. About 5 per cent. is the average.

It is considered that very good service is obtained in welding cracks and sheets in fireboxes by both processes. Most of the difficulty was experienced in the earlier days when this method was new. The same can be said of new cracks developing adjacent to welded cracks. This trouble is very rare and it is not serious.

Some roads using oxy-acetylene use water on each side of the weld, and others preheat the sheets to take care of the expansion and contraction. Roads using electric welders do not have any special method of taking care of the expansion and contraction.

When welding cracks in the firebox sheets which embrace three or four staybolts, the best practice is to remove the staybolts, whether broken or not, and weld the sheets solid and drill new holes.

When renewing broken staybolts in the vicinity of cracks in the firebox sheet, which have been welded, occasionally a weld will open up due to vibration of hammers used in chipping, calking, or driving up staybolts. These cases are rare, however, and the second weld made usually holds good. To prevent this, some roads endeavor to keep the sheets hot while driving bolts.

Bridges have been welded in both front and back tube sheets with both processes and give fairly good results, although some roads have had difficulties with oxy-acetylene. Sheets in some cases must be preheated before and at the time of welding to take care of expansion and contraction, also to prevent cracking of adjacent bridges. Flue holes are rolled while the sheet is hot.

Full firebox sheets are welded successfully with both types of welders, and in some cases experiments have been made with welding the flange of the flue sheet and the door sheet to the side sheet, omitting the rivets.

One road had a switch engine built at a locomotive works, and all the firebox seams were welded with the oxy-acetylene process. There are no rivets in this firebox except the ones that fasten the box to the mud ring. Engine went into service August, 1912, and has given no trouble with the seams leaking, or otherwise. Three-quarter door sheets have been welded in by one road and the rivets have been omitted where the sheet is welded to the side sheet. Another road

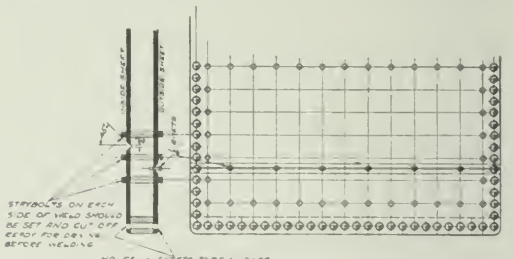


Fig. 5—Method of Applying New Strips Around Bottom of Side Sheets, Throat Sheets and Back Head by Oxy-Acetylene Welding.

reports having welded door sheets from the firebox door down to the mud ring. The rivets were cut out and plugs screwed into rivet holes which were cut off flush with the sheet and welded over as shown in Fig. 4. Fig. 5 shows method of applying new strips around bottom of the side sheet, throat sheet and back head.

One road welded a patch in the side sheet by oxy-acetylene, July, 1909, which was removed March 1, 1913, having made a mileage of 136,980 miles.

Another road, using the electric process, reports that some patches in firebox side sheet fail in from one to three months. Patches in the crown sheet give no trouble. Door-hole collar gives good service, and any patches in the firebox, applied round or oval, will give better service than square ones which are welded on three or four sides.

Another road, to overcome the difficulty they were having with the vertical welding, applied patches, cut diagonally,

Since adopting this practice they have been very successful with the oxy-acetylene. Plugs and sunflowers have been successfully welded with both processes. The plugs were applied in the usual manner and then welded around the edge, the same as welding flues.

There have been cases where staybolt holes and washout-plug holes have become enlarged, and holes, in some cases, especially the staybolt holes, have been welded up entirely, redrilled and retapped for new bolts with satisfactory results. On washout-plug holes patches have been applied 4 or 5 in. in diameter and welded and new holes drilled for the plugs; washout-plug holes have been reinforced around the hole for a distance of ½ in. or more. This work has proved very successful with both types of welders.

Welding of cracks in mud rings have been successfully done with both types of welder. Mud rings have been welded on the firebox sheets at the corners in addition to riveting, to eliminate mud-ring leakage and have proved very successful. Building-up of metal at the mud rings is done by roads with both types of welder and has proved every successful.

The committee feels that there is a field in which each of the two welders, that is, electric and oxy-acetylene, excels the other. For welding seams, cutting out and removing old sheets, the oxy-acetylene excels. For welding flues, short cracks and welding metal, where expansion must be taken care of, the electric welder excels. At engine houses the committee would recommend that electric welders be installed, and at shops, both electric welder and oxy-acetylene process be used, as oxy-acetylene process can be kept busy cutting out and applying new sheets.

BOILER WASHING.

It is the consensus of opinion of the roads reporting that boilers should be washed with hot water. This method avoids sudden change in temperature and by this process the staybolts firebox sheets and boiler being washed clean in a shorter time. Most railroads now install hot water plants when building new roundhouses.

One road reports having a special boiler-washing plant which consists of two washout pits about 150 ft. long. The engines are placed on the pits and connected up to blow-off cock with a high-pressure flexible hose. This is connected to a pipe line which conveys the steam and water into a filtering plant, which consists of three large tanks with a total capacity of about 30,000 gallons. It is equipped with two motor-driven Buffalo turbine pumps, which pump the water out through another line for washing and filling of locomotive boilers. All water used in washing, runs back into the tanks by gravity system and pass through the filtering pits of hard coke, etc., on its way to the tanks. They advise that this plant is very satisfactory, as there is no loss of steam or water from boilers or tenders.

Another road has installed its own system which provides for the blowing off of all water and steam from the boilers to the tank. The foul water from this tank flows off to the sewer. The steam separates and passes to a concrete cistern which is filled with fresh water admitted by a thermostatic control. The steam enters this cistern through two pipes at the top, the pipes extend down close to the bottom of the cistern. At the end of the pipes are 4-in. noiseless heaters. The steam heats the water in the cistern to 140 degs. and when the temperature rises above 140 degs., more water is admitted automatically, the supply shutting off when the temperature reaches 140 degs. The water is then pumped from this cistern to the roundhouse and is used in washing and filling boilers. The exhaust steam from the pumps is piped to the cistern for heating purposes. There are a number of patented systems now on the market.

One road advises that it takes two hours and thirty minutes to wash a boiler with hot water, from the time the locomotive is brought in and placed on the pit, completely washed, replace the plugs and get the engine under steam ready for service.

Some roads have gone so far as to install the hot-water system in old engine houses, where a large number of engines are handled.

When washing with cold water, care should be taken that the boiler is properly cooled before cold water is turned into it. The general practice is to remove two washout plugs in the backhead above crownsheet, connect the cold-water hose to the feed pipe, which allows the cold water to pass through the injectors and boiler check and mix with the hot water in the boiler, thereby allowing the water to escape through the washout holes. By this method the boilers may be fairly well cooled down, and after this has been accomplished all washout plugs are removed, which will allow the boiler to drain itself. With this method it consumes more time than washing out the boilers with hot water. It requires from forty to sixty minutes to cool the boiler down. One road using cold water reports that it takes six hours and twenty minutes to cool a boiler down, wash it, fill it, and fire it up again ready for service.

The washing of a boiler is a local proposition and depends on the water conditions which have to be met; therefore, no hard fast rules can be recommended by this committee to govern the washing of boilers.

After the boiler is washed, the flues are examined carefully and any flues not welded, which show signs of leaking, are gone over with a prosser. Fig. 6 shows a straight prosser used for small and large tubes. These tools are used for re-working tubes.

Some roads prosser full sets of flues every thirty days, using a long stroke air hammer. If leaking between this time they are expanded by a sectional prosser expander, driven to place by a hand hammer or beaded with the air hammer and beading tool. The form of the beading tool must be kept to original dimensions by frequent gauging.

One road takes into consideration the mileage, combined with time element; for example, re-set every four weeks on freight engines that have made 8,000 miles or over, and every six weeks on passenger engines making 6 000 or 8,000 miles.

The flue mileage varies from 40,000 to 60,000 and one road

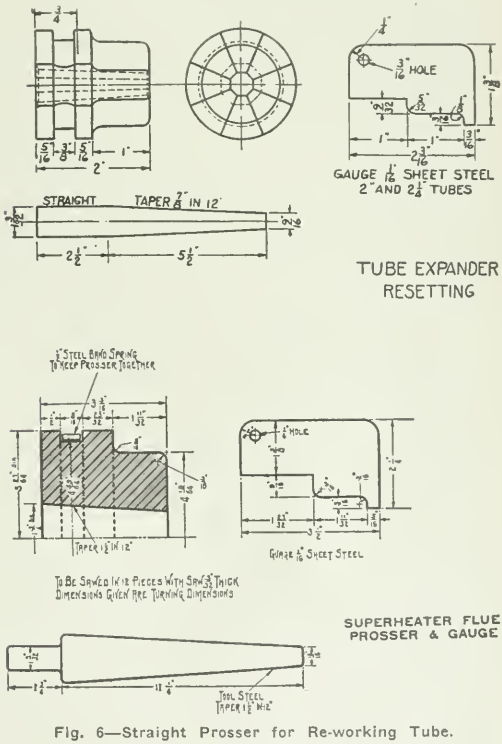

Fig. 6—Straight Prosser for Re-working Tube.

reports having obtained 75,000 miles. No rules can be recommended for fixed flue mileage. This must be governed by local conditions. If flues are welded in, the present indications are that they can be run for three years, which is the limit prescribed by the Federal Rules.

WATER CONDITIONS.

A few roads have what would be called good-water conditions. Practically all roads are using treated water in some form. A few roads are using a boiler compound which is made in stick form about 18 in. long and is applied after the boilers have been washed, through the washout holes and laid on the crown sheet and a few sticks are laid on top of the flues at the rear end. This compound has increased the mileage between washouts over 150 per cent. on a road which has very bad water conditions, and it has been in use almost a year. In addition to increasing the mileage between washouts, it has increased the life of boiler flues.

It is important to keep the arch tubes free from scale, and when washing boilers it is the general practice to use

a Cyclone cleaner through each tube until all scale is removed. The Lagonda arch-flue cleaner is used by a good many roads. The cleaner is started into arch tubes at the boiler head. It is driven by air and a small stream of water is entered through a separate pipe for the purpose of washing down the scale. The cleaner is run through gradually, making sure to remove all of the scale from the arch tubes.

In order to get the most efficiency out of a boiler, it is necessary to keep the flues from stopping up. Some roads blow out flues at the end of each trip, especially on important power. Others blow them out at each washout. The blowing is done with air pressure from 100 to 120 pound , using a ¼-in. pipe for blowing out the superheater flues, and ⅜ to ½-in. for other flues.

All roads, except one, who have a large number of superheaters in service, report no difficulty with the small superheater tubes clogging up on the inside. They found some of the units almost closed up at the return bends, which was caused by the use of too much soda ash and by foaming.

FLEXIBLE STAYBOLTS.

Your committee reported at the convention last year that one of the members applied a full installation of flexible staybolts to a locomotive firebox in February, 1907, with the exception of four bolts under the auxiliary dome, four under the steam turret and eight bolts which go on top of same at back head. February, 1908, engine received general repairs and firebox was in good condition. All caps were removed from flexible staybolts and they were found to be in good condition. April, 1909, it was found necessary to patch the top of the back tube sheet on account of sheet cracking from the hole around the flange; this was done in the engine-house. October, 1909, engine was given general repairs, and by this time the top of back tube sheet had given out in two more places, but as the sheet was in good condition otherwise, it was patched. Three mud-ring corners also required small patches applied. After rattling scale from firebox sheets with large hammer, it was found that forty of the flexible sleeves had cracked outside of the sheet, and on being taken out they were found to be crystallized, but no broken bolts were found. In 1911, engine was again in the shop for general repairs and had all caps removed from flexible staybolts and bolts found to be in good condition. A patch was applied to top flange of flue sheet, half side-sheet seam in firebox was in good condition. In July, 1912, the engine was given general repairs, and at this time it was necessary to apply new back tube sheet; caps were removed from all flexible staybolts and none found broken. Side-sheet seam has never given any trouble and engine has lost no time in roundhouse due to broken staybolts since the box was applied. Mileage up to May 6, 1913, is 398,997 miles.

The application of staybolts with some form of slack, is believed to be desirable as it relieves the firebox of excessive internal stresses which would be brought into play if the bolts are turned up tight.

BRICK ARCHES.

To get the most efficiency out of a brick arch it must be maintained properly and not often disturbed. The general practice seems to be to remove the center row of bricks when it is found necessary to bore or work on flues. Only enough brick should be taken out to enable the operator to get at the tubes. They must be removed as carefully as possible to avoid breakage. Some roads have a special brick-arch man, day and night, at the large terminals to make repairs to arches and to see that they are kept in good condition. Brick arch should be blown off with air by a pipe put in through the firebox door with a tee on the end which will blow the dirt, or a portion of it, to the corners where there is an opening which allows it to fall out on the grates.

The report is signed by:—D. R. MacBain (L. S. & M. S.), chairman; C. E. Chambers (C. of N. J.), T. W. Demarest (Penna.), R. E. Smith (A. C. L.), F. H. Clark (B. & O.), J. Snowden Bell, and E. W. Pratt (C. & N. W.).

DISCUSSION.

H. T. Bentley: I was interested in the different methods of welding in flues and we are just experimenting a little bit, and my impression is that the method shown at sketch *A* is not nearly so desirable as that shown on sketch *B*, for the reason that when you want to remove the flues with the former method, you must have a special tool to get the flue out, whereas by the method shown in sketch *B* you have only to have an air chisel and cut the old portion off flush with the sheet. While I have heard a good many things said in reference to welding the flues in favor of the sketch *A* method, it seems to me to be the longer process, and not as satisfactory as the one shown in sketch *B*. I notice a reference to vertical cracks in side sheet. Everybody seems to think that the welding of a horizontal crack is a better form and will last better than the vertical crack. The committee made the statement that the cracks in crown sheets are successfully welded with both processes. Some time ago we had an electric welding outfit, and the first thing we asked them to do was to weld a crack overhead, and after they worked on it and apparently succeeded (it was in the case of an old fire-box) we got a piece of the sheet and put it on the testing machine and there was no strength in it at all. We got a second electric welder from another form and made a similar experiment with practically the same results, and we finally got a third electric welder and welded a crack in the crown sheet, and this was done very successfully, the strength of the welded part running up to 75 or 80 per cent. of the original strength of the sheet. I am glad to note the committee thinks it is not difficult to weld cracks in crown sheets, because I considered it was one of the most difficult places to weld, especially with electricity.

We welded a large number of sheets in with the oxy-acetylene process, before we went into the electrical process, and I want to agree with the committee in their statement that both the electric and oxy-acetylene processes have their uses. I do not think there is any question that the oxy-aceylene is very much better for certain work than the electric welding process, and that the best thing to do is to have both of the methods available in your shop, and to use the one which will give you the best results in any particular case.

I would like to ask the members if they are having any more trouble with pitted flues than they used to have. At one time, in one of our districts where we used rather bad water, we occasionally found a few flues pitted, but lately we are having a tremendous amount of trouble in this direction, and we are trying to overcome it. Where the flue is not badly pitted, but has a few deep holes, we weld it up with electricity and oxy-acetylene, and apparently these flues are giving good service. I think it might be of interest to find out whether the pitting of flues is more general now than it has been, and if so, how can it be done away with, and what is the method by which to overcome it?

C. L. McIlvaine (Pa.): On the Pennsylvania we experimented in welding the flues with an oxy-acetylene process three years ago. The two holes in the flue sheet were countersunk and there was a number of flues first welded in at various locations, both at the front and back end, the idea being to stay the sheets, after which the remaining flues were welded with the oxy-acetylene process, the operation requiring about two weeks' time. It was very slow, because only one man could work in the firebox, owing to the excessive heat, it being necessary to blow air into the firebox to enable him to work continuously. That experiment proved a complete failure, as did all the experiments with the oxy-acetylene process.

About a year ago, we began using the electric process and had uniformly good results. We made a great many micro-photographs of sample welds of both processes. I have inspected a number of samples of welded flues, etched with micro-photographs, and they show a uniformly better weld is made by the electric process. The oxy-acetylene process usually shows a large amount of oxide and slag included, and these are absent in the electric process. However, unless the electric weld has been properly made, it will be porous, and that emphasizes the necessity of hammering and cleaning the work as we go along. The first locomotive with the welds in has been running for about 15 months, and made about eighty or ninety thousand miles; it is a Pacific type. There has been no leakage except with one tube where it was sweating a little. Five more engines running about eight or nine months averaged about forty thousand to fifty thousand miles each, and they have had no leaks with the exception of one engine which had one tube leaking slightly, due to a pin-hole caused by the fact that the operator did not clean the job while he was doing it. That was corroded slightly, and it was fixed and has not leaked since. We have now running about forty engines with welded flues, of which eleven are saturated and about thirty-three are superheater engines. We find we get as good results with the welding of large flues as we did with small ones. The prospect looks very promising, and with this class of engine, with these long flues which are giving so much trouble, we feel assured that if we have almost one hundred per cent. performance with that class we will have no trouble with any other class.

F. F. Gaines: I would like to ask Mr. Bentley what kind of material he has in his tubes.

H. T. Bentley: Steel.

F. F. Gaines: I think that is the answer. We were using steel flues and having the same trouble. We had pitting, and we stopped steel tubes, and that fixed it up. I experimented a long while with acetylene and we could not do much with it, but we have recently put in an electrical outfit

and have welded some of our large tubes which were giving trouble after one year's service, and now they give no trouble; we are hoping to run them for some time yet. We will take the majority of the engines in for tire repairs and setting, but we will miss the tubes, I think, this time. There is one thing advisable which is not mentioned in the paper, and that is, the use of the sand blast preparatory to welding Unless you get your sheet clean, you will not get a good weld, and the only way to clean it is to do it with a sand blast.

H. T. Bentley: We are using steel flues, but we have been using iron flues also for many years, and I think the iron flues are giving us as much trouble with pitting as the steel flues.

B. P. Flory (N. Y., O. & W.): We have been using the electrical welding process for over a year and a half; we do not use the oxy-acetylene process much now. I have been looking over the paper and I was surprised to learn that some roads have had so much trouble in opening up electrically welded sheets. We have had very little trouble. I remember one of our first jobs having sixty-one cracks in the firebox. We welded it up and it has been in service now over a year and a half and I do not think any of the cracks have opened up. We had the engine in the shop recently and welded up a few more cracks; we have welded the flues in, and so far, have had very good results. We figure that the electric welding process is cheaper than the oxy-acetylene, and also gives better results.

D. R. MacBain: As Chairman of the committee, I deserve very little credit for this paper; the work in compiling the data gathered is entirely due to Mr. Demarest. I want all to understand that, so there will be no wrong opinion.

Now, as to the usefulness of the electric apparatus and the gas apparatus for welding joints, our men on the Lake Shore are well satisfied that each system has its own particular advantage. We were one of the pioneers in gas welding and we have had a great deal of experience, and our men are well satisfied that the electric has its field as well as the gas. We have one of our master mechanics Mr. Foster, here whom I would like to call on to make a few remarks on this subject. He is a pioneer in flue welding on the Lake Shore. He had some engines which were causing trouble and he took them in and welded the old flues in, and had no trouble after that with them for the entire winter.

O. M. Foster (L. S. & M. S.): I suppose the welding of flues is naturally the most attractive use for welding; leaky flues constitute one of the things that has caused considerable trouble. Since we have had the superheaters, while the little flues were always troublesome, the large flues were three or four times as troublesome. We did so much work on the large flues that they deteriorated very rapidly. We started in with a large flue, as they were the things we wanted to get fixed in a hurry. We devoted our attention to welding in old flues, as they were the ones that were making us trouble. We welded the first ones in last September, and today there are 260 superheater engines on the Lake Shore with flues welded in, and few of those engines have full sets welded in. In one case, after welding, we found the engine had to go into the shop in a couple of months and we had enough confidence in the welding to let the engine go through the shop and come out again without touching those flues; and we have not been sorry for it as yet. Of course, the easy thing was to weld the flues as we find them, and our success in doing that suggested naturally some thoughts as to the new installation of the flues. As far as leaking is concerned, it might happen that in one case out of forty there would be a flue or flues that would be spongy, as some one said. That is due to the carelessness of the operator. Sometimes it is necessary to clean sheets stopped up by little pin-holes, sometimes they will take those up themselves, and you do not need to do anything. We use a small hammer under a small tool with a round end on it—that is, it is shaped like the contour of the flue. We use that to shape the flue, knocking off the dirt and scale, and then we take a wire brush and clean it as thoroughly as possible in that manner. I do not think the use of the sand-blast would be advisable as in the hands of a careless operator, it can do a great deal of damage. The results we have in the welding system seem to prove our method as satisfactory, and we get the sheet clean enough for good welding.

In the application of new flues, of which we have done very little, there has been an inclination to counter-bore the hole in the sheet. I think our way is better, because while these are prossered before welding, still it stands to reason that you lose a little. Flexibility there relieves the welding of something it might get if you counter-bore the hole and weld it down; that would make an absolutely rigid condition. Furthermore, it would take more trouble to get that out of the sheet. I am inclined to think that anybody undertaking to weld in flues had better start as we did, to weld in the old beads, and convince themselves as to how they had better go ahead with any new application. We leave the copper in because it was there, and if we make any new installations, we put it in also, because if the weld failed, we would still have the original condition. This has not proved necessary, but I do not know whether or not it will always be necessary to use copper; probably not. We thought, when we welded the flues in the back sheet they would perhaps leak in the front sheet; there has not been anything in that. We have been rather surprised to find the absence of any such difficulty. I believe as a matter of fact, the flues leak less in the front sheets since they have been welded than they did before.

C. E. Chambers (C. of N. J.): We are all pioneers in electric welding. We have had an electric welder in our shop for about a year and four months. Like a washtub, we would not try to keep house without it. We had not welded any flues until this year. We had a superheater engine in service between New York and Philadelphia, and the superheater flues rolled out and gave us trouble. We took the engine into the shop, and welded the flues in with an electric welder, and since that time the engine has been running daily, no attention has been given to the flues and there is no indication of any leakage. At the same time we passed another engine through the shop, a saturated steam engine, and we welded in all of the flues by the electric welder, having gone through the proper process of placing the ferrules and heating, etc., and no work has been done on that engine since that time. We have never experienced any more trouble in welding vertical cracks than in welding horizontal cracks. We have a large number of patches, large and small, and we weld a great number of vertical cracks. We weld a number of crown sheets, making patches of various sizes, and in all instances, this work has proved satisfactory.

E. W. Pratt (C. & N. W.): I want to make a suggestion in regard to flexible staybolts. The report mentions a complete installation of flexible staybolts, in which connection it seems to me that provision should be made for taking up the slack of the front crown bolts, due to the upward movement of the crown sheet. I know of at least one railroad that has a flexible staybolt that permits the cap being removed and this slack taken up, but it seems to me that some bolt of that character should be used more generally if we are to have any strain on the front one or two or three rows of crown bolts. In connection with the welding of the larger superheater tubes it occurs to me that inasmuch as any work that we do on these large tubes is of a more serious character than that on the small ones, we ought to be able to get a longer service than three years out of these large tubes, especially if they are welded in, and notwithstanding the reading of the law, which indicates that all flues must be removed, there is no question in my mind but that the intent of the law is for the internal inspection of the boiler, and in that connection I may say that we have recently had several inspectors from different sections making a thorough inspection of Pacific type locomotives without removing the large superheater tubes. They reported unanimously that non-removal of the large superheater tubes does not interfere with the thorough and complete internal inspection of the boiler; hence, I believe if this matter were taken up in a proper way, and it seemed to be an advantage to the railroads to continue these large tubes in service more than three years, that that might be arranged for.

H. T. Bentley (C. & N. W.): As a matter of information to Mr. Pratt, I will say that we have some engines equipped with flexible staybolts in the crown sheet next to the flue sheet. We took the matter up with the people who furnished the staybolts, which I understood him to stay were originally at the top, and they said that if they furnished that type of staybolt, it was a mistake, because they have a flexible bolt with a screw arrangement on the top which takes up the slack referred to.

D. J. Redding (P. & L. E.): There are two distinct types of welder as I understand it, one being a welder with which you can work only one man, and the other, a multiple unit welding equipment, in which you can work simultaneously four or five or six men, as you may require. I understand that some of the members of the Association have multiple unit equipments. I think it would be interesting to know whether or not they experience any particular difficulty when they come to putting the second, third or fourth man on the welder, and whether they have any trouble in maintaining a uniform voltage for the work. I am also inclined to think that Mr Pratt's difficulty in regard to the upward growth of the flue sheet and the upward motion of the crown sheet will be largely overcome if he welds in all of his tubes, as that growth is largely due to the repeated working of the tubes.

D. R. MacBain: In reply to Dr. Redding's remarks, I have been informed on very reliable authority that there is only

one concern now, practically speaking, which furnishes welding apparatus and they will give you whatever you want, anything from one to six points. We are installing on the Lake Shore a welding outfit that has four points. The difficulty that existed in the past, which was litigation between a couple of the concerns which make welding apparatus, I believe has been practically settled, so that you will be able to get about whatever you want. The Lake Shore has installed a single point machine in a roundhouse, and about the only repairs, as I understand it, that are necessary on a set of welded flues is that occasionally one comes in with a pin-blow out of it, and the man touches it with a needle and closes it, and that does the job. Our experience has been very satisfactory, and I hope that the information gathered by the committee and put in this form will be of some use to the association.

President Crawford: If there is no further discussion on this paper, we will proceed to the next subject which is the report of the committee on Steel Tires, of which L. R. Johnson, of the Canadian Pacific is chairman. In the absence of the chairman, the report will be presented by the secretary.

STEEL TIRES.

The committee reported no change in the specification presented last year, except to add a new sub-clause: (d) The elasticity shall be at least 50 per cent. of the tensile strength.

The committee has discussed the question of using alloy steels, such as chrome, vanadium, etc., but do not feel in a position to express an opinion.

The report was again presented for consideration, and the

L. R. JOHNSON,
Chairman, Committee on Steel Tires.

committee suggested to the association the advisability of appointing a standing committee on "Steel Tires."

The report is signed by:—L. R. Johnson (C. P.), chairman; J. R. Onderdonk (B. & O.); R. B. Kendig (N. Y. C.); R. L. Ettenger (So. Ry.), and L. H. Turner (P. & L. E.).

The report was received and the recommendations made by the committee were referred to letter ballot for adoption as recommended practice, and the question of making the committee a standing committee was referred to the executive committee. There was no discussion.

President Crawford: The next report is that of the committee on "Minimum Requirements for Headlights," of which I am Chairman. The report will be presented by C. H. Rae of the Louisville & Nashville.

MINIMUM REQUIREMENTS FOR LOCOMOTIVE HEADLIGHTS.

The committee appointed to report on the minimum requirements for locomotive headlights has kept in touch with the various tests which have been run on headlights in the past year, but do not feel that they are in position to make other than a progress report at this time.

In 1911 the committee sent out circular of inquiry No. 6, which, among other things, requested an opinion as to the functions of locomotive headlights in which the committee agrees, are as follows:

To warn employees and the public of the approach of a train.

Marker to designate the head end of a train.

To permit the enginemen to observe wayside objects, such as whistle posts, landmarks, etc.

The above requirements can be met by the oil headlight or a light of the same energy as the present oil lamp.

Analysis of the oil headlight and of various tests run in the past year develops the fact that the distribution of the light with the various detail arrangements vary to such an extent that it is impossible to make a simple definition of minimum requirements, i. e., it is impossible to designate the minimum size of reflector and candle-power of the source of light without going into the distribution of the light with the headlight as a whole.

As to high powered lights, as for example, the electric headlights. Tests which have been made in the past year, confirm the conclusion that they are a decided source of danger when used on roads with multiple track and automatic signals; this confirms the resolution adopted by the Association at the 1912 Convention.

The report is signed by:—D. F. Crawford (Penna.), chairman; C. H. Rae (L. & N.); A. R. Ayers (N. Y. C.); F. A. Torrey (C. B. & Q.), and R. Quayle (C. & N. W.).

The report was received and thoroughly discussed, but no definite action was taken, pending the final report of the committee, which will be made by January 1, 1914, and printed and distributed to the members.

President Crawford: We will now have the report of the committee on Subjects, of which George W. Wildin, of the N. Y., N. H. & H., is chairman. The other reports and papers are referred over until tomorrow.

SUBJECTS.

The committee prepared a circular setting forth the subjects which are now before this convention, as well as those which had appeared before the various conventions during the ten years previous—this in order that the members might see exactly what the Association had done and whether or not it was desirable to reconsider any of the subjects.

After receiving various and numerous suggestions and communications, the committee prepared the following program for consideration:

STANDING COMMITTEES.

1. Revision of Standards.
2. Mechanical stokers.

SPECIAL COMMITTEES.

3. Autogeneous welding:
   Covering the investigation of electric, gas in its various forms, Thermit, oil and other special methods of welding, with their limitations.
3. Autogeneous welding.
4. Recommended method of calculating stresses in locomotive boilers.
5. Locomotive, counterbalancing of; does the Rule 1890 meet modern conditions.
6. Maintenance of electric equipment, locomotives and motor cars.
7. Locomotive types.
   Have we reached the limit of Atlantic, ten-wheel and Consolidation types before beginning the development of other and more complicated wheel arrangements.
8. Cylinder lubrication in connection with superheat:
9. Motors for railway shops.
   Various types of both A. C. and D. C., and drives, group or individual—their uses and limitations.
10. Superheater locomotives, with special reference to design of front-end appliances.
11. Proper location and clearances of side bearings on locomotive-tender trucks, both forward and rear.
12. Tonnage rating of locomotives—the most practical method.

INDIVIDUAL PAPERS.

13. Has the increased weight of modern locomotives brought a corresponding increased efficiency.
14. Piston valves, best types and proportions with superheat.
15. The possible reduction of reciprocating parts on a locomotive, with attending results.

TOPICAL DISCUSSION.

16. Packing rings for pistons and valves in connection with superheat.
17. Locomotive frames, material for.
18. Cylinder lubrication, graphite
19. Tools and machinery, the safeguarding of.

SUBJECTS SUGGESTED WOULD BE SUITABLE AND DESIRABLE FOR REPORTS OF COMMITTEES.

Air-brake and signal equipment.
Ash pans, design of.
Boilers, design and inspection of.
Boilers, washing and filling.
Cast iron, substitution of for brass on locomotives.
Cylinders, use of cast iron in.
Educating firemen and engineers, recent method.
Electrification.
Exhaust nozzles.
Fire box arrangement, the best for oil burning locomotives.
Forgings for driving and engine-truck axles.
Flues, standard spacing of.
Fuel economies.
Grates for locomotives.
Headlights.
Locomotives, electric.
Locomotives, design of trailing trucks.

Locomotives, [illegible]
Locomotives, M[illegible]
Locomotive perf[illegible]
Locomotives, [illegible]
Locomotive [illegible]
Locomotives, s[illegible]
Locomotives, three cylinder
Locomotives, unif[illegible] sp[illegible]
Lubrication, [illegible]
Lumber, [illegible]
Metal, excess amount [illegible] of [illegible] g.
Motor c[illegible] N[illegible]
Motors, variable [illegible]
Painting locomotives.
Power vers[illegible]
Repairs, cost of [illegible]
Rods, main and [illegible]
Safety appliances
Safety [illegible]
Shops, electric driv[illegible]
Shops, locomotive [illegible]
Smoke prevention
Stay bolts, flexible
Steel, alloy and heat treated
Tender derailment
Tender, largest capacity [illegible] of two [illegible]
Tinware, design.
Tires—shrinkage, c[illegible] specifications.
Ton-mile statistics
Tool steel.
Tubes, leak in.
Tubes length
Valve gear.
Wheel loads.
Boilers, washing and filling.
Drawbars and buffers.
Examinations, progressive.
Gas producer in railroad shops.
Locomotives, clearing of, safety first
Locomotive coaling stations and ash pits.
Locomotive fuel, anthracite as a.
Oil burning, effects of with and without arch, tubes or superheater.
Safety valves
Tubes, leaks in

The report is signed by:—G. W. Wilden (N. Y., N. H & H.), chairman; A. W. Gibbs (Penna.), and C. E. Chambers (C. of N. J.).

President Crawford: If there is no objection the report will be received and referred to the incoming executive committee. We will now stand adjourned until 9.30 tomorrow morning. The reports on Superheater Locomotives and Specifications for Materials Used in Locomotive Construction, and the paper on Three Cylinder Locomotives are carried over.

Peking Tramways.—It is said that the Peking Tramway Company has raised a loan of two million francs from a French bank.

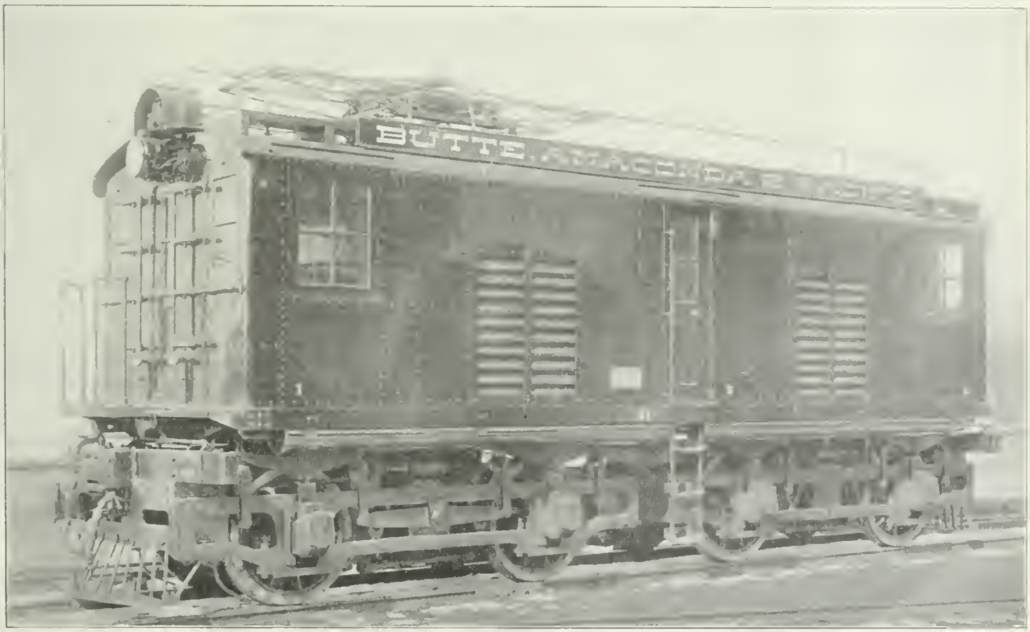
2400-VOLT DIRECT CURRENT LOCOMOTIVE.

Among the most interesting of the track exhibits is an electric locomotive, which is one of an order recently completed by the General Electric Company for the Butte, Anaconda & Pacific. These are the first direct current electric locomotives in this country to use 2400 volts. The traffic on this line consists principally of long trains of copper ore, which are hauled over heavy mountain grades. This service has heretofore been performed by large and powerful steam locomotives. A careful study of all conditions indicated that electric traction could be used to advantage, and the work of conversion has been under way for some time. The plans called for the starting of the electric operation on June 1 of this year.

The section that has now been electrified lies between Butte, Mont., and Anaconda, comprising 30 miles of main line single track, which with numerous sidings, yards and smelter tracks gives a total of about 90 miles, on a single track basis, that have been electrified. The adoption of the 2400-volt direct current system was determined after a thorough study of all local conditions, and it appeared that it gave an opportunity to realize unusual economy, both in initial expenditures and in the cost of operation.

The traffic over this section of the line amounts to practically 5,000,000 tons of freight per year. The trains are nominally made up of 50 loaded steel ore cars, giving a weight of 3400 tons behind the locomotive. These trains will be hauled against a ruling grade of 0.3 per cent. by a locomotive consisting of two units. Single units will be used for making up trains in the yard and for spotting cars.

The initial equipment consists of 17 locomotive units, of which 15 are for freight and 2 for passenger service. Each unit weighs approximately 80 tons and two units, forming a freight locomotive, will be coupled together and operated in the multiple unit system. This combination freight locomotive will haul the full tonnage train at a maximum speed of 15 miles an hour against the ruling grade and at 21 miles



First Direct Current Electric Locomotive in this Country to Operate at 2400 Volts.

an hour on a level tangent track. The passenger locomotives are the same design as the freight except that they are geared for a maximum speed of 45 miles an hour on a level track. A schedule of eight passenger trains, four each way, is maintained and the average train will be composed of a single locomotive unit and three standard steam railroad passenger coaches.

The locomotives are of the articulated, double truck type with all the weight on the drivers. The draft gear is mounted on the outer end of the truck frame, and thus transmits all the pulling and buffing strains directly to the truck frame. The truck frames are formed of heavy steel castings, the side frames being of the truss pattern and connected by heavy end frames and a cast steel center transom. The entire weight is carried on semi-elliptic springs suitably equalized. The two 12 in. steel channels forming the center sills of the center frame have a top and bottom cover plate, thus forming a duct for distributing the air used for forced ventilation of the motors. The air is conducted from the center sill duct through the hollow center pins to the hollow truck transom and thence to the motors.

There is a motor mounted directly over each axle and connected to it by twin gears. The motors are of the commutating pole type wound for 1200 volts and insulated for 2400 volts. A steel pinion is mounted on each end of the armature shaft and meshes with gear mounted on each wheel hub. The gear reduction is 4.84 on the freight locomotives and 3.2 on the passenger locomotives.

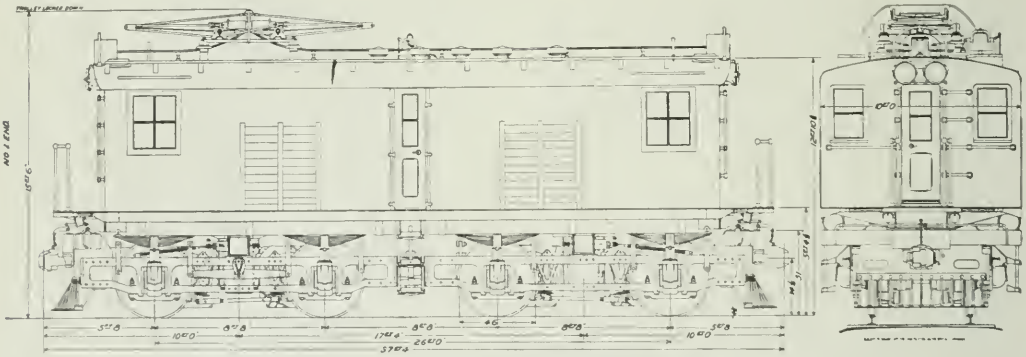
The continuous capacity of each motor is 190 amperes on 1,200 volts under forced ventilation, and 225 amperes on 1,200 volts for the one hour rating. For the double unit locomotive this is equivalent to a continuously sustained output of 21,000 horse power. Air is circulated over the armature and field coils, over and through the commutator, through longitudinal holes in the armature core, and thence exhausted through openings in the bearing head. This method of ventilation circulates a large volume of cool air effectively throughout the motor and keeps all parts at a uniform temperature.

The control equipment is the Sprague General Electric Type M multiple unit control, and is designed to operate the four motors in series and series parallel. The pairs of motors with their respective resistances are all connected in series on the first point of the controller. The resistance is varied through nine points and finally short circuited on the tenth or running point. The pairs of motors are then operated similarly in series-parallel and all resistance is cut out on the nineteenth point, which is the full speed running point. This provides a control with ten steps in series and nine steps in series-parallel.

The transition between series and series-parallel is effected without opening the motor circuit, and there is no appreciable reduction in tractive effort during the change. A switch is provided having manually-operated handles for cutting out either pair of motors, so that the locomotive can then be operated with one pair of motors in the usual way. The contactors are actuated by the 600-volt circuit obtained from dynamotor.

Current is collected by overhead trolleys of the pantograph type. They are pneumatically operated and can be put into service from either engineer's compartment by a hand-operated valve. Each passenger locomotive is equipped with two collectors, and each freight unit with one. A 2,400-volt insulated bus line connected direct to the pantograph is run along the center on the roof of the cab. The bus lines are connected by couplers between the two units of the freight locomotive, so that current is obtained from both collectors, or from a single collector. The collectors and bus lines are adequately guarded by railings. A 600-volt bus line is provided on the passenger locomotives for lighting and a 2,400-volt bus line for heating the passenger coaches.

The air brakes are the combined straight and automatic type. The air compressor is two-stage, motor driven, and has a piston displacement of 100 cu. ft. of air per minute when pumping against a tank pressure of 135 lbs. per square inch. Air is taken from the interior of the central compartment. The compressed air in passing from the low pressure to the high pressure cylinder is conducted through radiating pipes on the roof of the cab. This reduces the temperature and allows condensation of moisture before entering the high pressure cylinder. From the high pressure cylinder it is delivered into four air reservoirs, each 12 in. by 164 in. They are located under the floor of the cab and connected in series, which affords a further opportunity for radiation and condensation.



Elevation of One Unit; Butte, Anaconda & Pacific Electric Freight Locomotive.

The general dimensions, weights, etc., are as follows:

Length inside of knuckles	37-ft. 4 in.
Height over cab	12-ft. 10 in.
Height with trolley down	15-ft. 6-in.
Width over all	10 ft.
Total wheel base	26-ft.
Rigid wheel base	8-ft. 8-in.
Total weight	160,000 lbs.
Wheels, steel tired	46 in.
Journals	6 in. by 13 in.
Tractive effort at 30 per cent coefficient	48,000 lbs.
Tractive effort at one hour rating	36,000 lbs.
Tractive effort at continuous rating	25,000 lbs.

NEW BRAKE BEAM ARRANGEMENT—The Committee on Brake Shoes and Brake Beams is exhibiting in the Buckeye Steel Castings company's booth (603-605) a complete full size truck showing the new arrangement of brake beams. Members should examine this truck before the report of the committee comes up for discussion on Monday.

GRAND TRUNK MIKADOS.

Twenty-five locomotives of the Mikado (2-8-2) type have recently been delivered to the Grand Trunk by the American Locomotive Company and an order has been placed with that company for fifty more of the same design.

The freight traffic on the Grand Trunk has until recently been hauled mainly by Richmond compound consolidation (2-8-0) type locomotives, which have a total weight, including the tender, of 349,800 lbs. and a tractive effort of 34,000 lbs. The Mikados have a total weight, including the tender, of 455,100 lbs. and a tractive effort of 51,700 lbs., an increase in weight of 30 per cent., and an increase in tractive effort of 52 per cent. The Mikado locomotives are at present doing their best work on the Western division which has a number of grades which do not exceed 0.6 per cent. except in one case, where a five mile 0.95 per cent. grade requires helper service. The tonnage rating is shown in the accompanying table. These runs are being made at an average speed for the consolidations of 20 miles per hour, and for the Mikados of 22 miles per hour.

	Miles	Helper Service	Consolidation	Mikado	Increase, Per Cent.
Port Huron

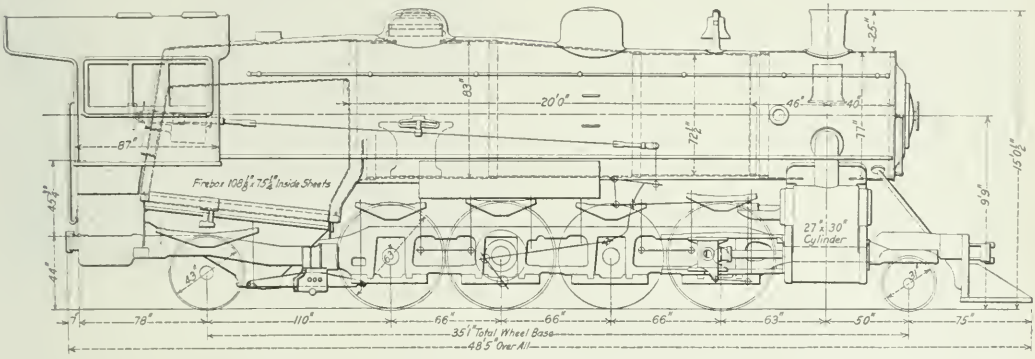
Nichols to Elsdon.....	168.5	None	1700 Tons	2500 Tons	47
Elsdon to Nichols.....	168.5	For 5 Miles	2000 Tons	2800 Tons	40
Nichols to Port Huron..	156.5	None	2000 Tons	2800 Tons	40

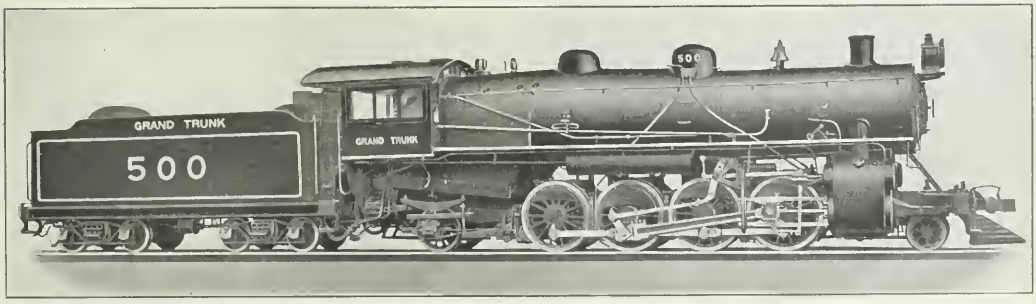
The consolidations use saturated steam and have a total heating surface of 2,952 sq. ft.; the Mikados have an equivalent heating surface (evaporative heating surface plus 1½ times the superheating surface) of 4,776 sq. ft., an increase of 62 per cent. over the consolidations with an increase in the grate area of only 11-½ per cent. The design in general follows the standards of the builders. The boiler is of the extended wagon top type, is 74 in. in diameter at the first ring and 83 in. in diameter outside at the largest course. There are 240 2 in. tubes, 20 ft. long, and a thirty-two unit, Schmidt type, top header superheater. The firebox is 108⅛ in. by 75¼ in. and is fitted with a brick arch, a pneumatically operated fire door and a power operated grate shaker. An interesting feature is the arrangement of the throttle lever support, which combines the lever fulcrum and quadrant support in an integral casting. This makes a saving in the number of parts and also a reduction in the number of holes in the back head of the boiler. The support fits around the stuffing box as a sleeve, and can be turned to any desired angle to bring the lever to a convenient position. The locomotives are also equipped with outside steam pipes, screw reverse gear and self-centering valve stem guides.



Side Elevation Showing Principal Dimensions of Grand Trunk Mikados.

The following table gives a comparison of the principal data with that of the consolidations:

	2-8-2	2-8-0
Tractive effort	51,700 lbs.	33,970 lbs.
Weight in working order	283,000 lbs.	209,400 lbs.
Weight on drivers	213,500 lbs.	183,700 lbs.
Wheel base, driving	16 ft. 6 in.	17 ft. 0 in.
Wheel base, total	35 ft. 1 in.	25 ft. 9 in.
CYLINDERS.		
Diameter and stroke	27 in. x 30 in.	22.5 in. and 35 in. x 32 in.
WHEELS.		
Driving, diameter over tires	63 in.	63 in.
Driving journals, main	11 in. x 20 in.	9½ in. x 12 in.
Driving journals, others	10 in. x 12 in.	9 in. x 12 in.
BOILER.		
Style	Ext. Wagon Top	Ext. Wagon Top
Working pressure	175 lbs.	210 lbs.
Outside diameter of first ring	74 in.	68⅜ in.
Tubes, number and outside diameter	240-2 in.	353-2 in.
Flues, number and outside diameter	32-5¾ in.	
Tubes, length	20 ft.	15 ft.
Heating surface, tubes	3398 sq. ft.	2757 sq. ft.
Heating surface, firebox	215 sq. ft.	168 sq. ft.
Heating surface, total	3640 sq. ft.	2952 sq. ft.
Superheater heating surface	757 sq. ft.	
Grate area	56.5 sq. ft.	50.6 sq. ft.



Mikado Locomotive for the Grand Trunk.

Conventionalities.

Who will wear the Superheater white pants tomorrow?

The good old summer time seems finally to have caught up with the good old winter time.

Mr. and Mrs. George C. Bardon, Philadelphia, who have not missed the conventions in many years, are at the Shelburne.

Mr. and Mrs. Clarence Mark, Evanston, Ill., reached Atlantic City Tuesday morning and registered at the Traymore. This is their first convention.

Phil Arnold, who is attending the conventions, has just been made manager of the newly created railroad department of the Garlock Packing Company.

A Progressive Euchre party was given on Wednesday evening by Mr. and Mrs. W. C. DeArmond at their summer home, 17 S. Providence Avenue, to their friends who are attending these meetings.

H. M. Edgerton, who has recently accepted the position of engineer of the Standard Car Truck Company, is attending the conventions. He is accompanying James T. Milner, vice president.

L. A. Richardson, mechanical superintendent of the Rock Island Lines, Third District, with office at El Reno, Okla., arrived with his wife Wednesday afternoon. They are located at the Dennis.

M. K. Barnum arrived Thursday afternoon. He had expected to attend the opening session but was delayed because of Mrs. Barnum's illness. She is now recovering rapidly from a case of grippe.

G. P. Robinson, assistant chief inspector of the department of locomotive boiler inspection of the Interstate Commerce Commission, is accompanied by Mrs. Robinson this year and expects to remain for several days.

Burton W. Mudge and wife, Chicago, arrived Wednesday afternoon, and are stopping at the Marlborough-Blenheim. This

From left to right, H. Dixon, Supt. of Shops, C. P. R., W. Toronto; J. H. Mills, M. M., C. P. R., Toronto.

[illegible] Burton W. Mudge, Jr., or [illegible]

[illegible] president of the Standard Steel Castings Company, and a member of the Entertainment Committee, has been called to California on business and will not return in time to attend the convention this year.

William Lodge, president of the Lodge & Shipley Machine Tool Company, sailed Wednesday on the Victoria Louise for Hamburg to join the American forces attending the International Convention of Mechanical Engineers.

C. J. Mellin, consulting engineer of the American Locomotive Company, who was not able to attend the convention last year because of very serious illness, is on hand this time and reports that he has completely recovered his health.

J. C. Kuhns, Purchasing Agent, Illinois Central, is Among Our Guests.

Secretary and director of exhibits H. G. McConnaughy, of the American Electric Railway Supply Association, reports an unusually large demand for exhibit space for the convention of the A. E. R. A. to be held at Atlantic City in October.

J. J. Reid, master mechanic of the Delaware & Hudson at Carbondale, Pa., arrived Thursday. The heavy Mallet locomotives on his division are reported to be doing exceptionally good work and he is quite enthusiastic over them.

Greater ingenuity and skill could not have been shown in arranging the steps and floor at the entrance to the pier so as to cause the maximum number of legs and necks to be broken. Have you been tripped up this morning? Everybody else has.

One of the keenest pangs of regret experienced by the convention visitors is due to the fact that no opportunity will be given George Wilden this year to try his luck at knocking a hole in the Bull Durham sign or running bases a la Mallet.

G. S. Allen, one of the oldest members of the M. M. Association, is attending the meetings with his son C. W. Allen. Mr. Allen, Sr., who is now retired was for 54 years in the employ of the P. & R. and was master mechanic at Tamaqua, Pa.

Axel Levedahl, chief engineer of the Independent Pneumatic Tool Company, Aurora, Ill., sailed from New York for a European trip on the "Lusitania" on May 21. While abroad Mr. Levedahl will visit the prominent ship yards and manufactories.

With a patent first issued by the department at Washington for a new wheel press recording gage, J. W. Motherwell, vice president of the Ashton Valve Company, arrived Monday and registered at the Marlborough-Blenheim. He was accompanied by Mrs. Motherwell.

D. J. Redding, assistant superintendent of motive power of the Pittsburgh & Lake Erie, is accompanied this year by Mrs. Redding and their eldest daughter, Agnes. This is the first convention which Miss Agnes has attended and she seems to be enjoying it immensely.

The troubled look in the eyes of O. S. Beyer Jr., of the Rock Island Lines, is explained by the fact that he is trying hard to get a paper on Scientific Train Loading and Tonnage Rating ready in time for the annual meeting of the Traveling Engineers' Association in August.

Charles Harter, mechanical engineer of the Missouri Pacific, received a telegram on his way to Atlantic City advising him that his daughter had been made valedictorian of

John Weigle, Retired Motive Power Department Foreman, Pennsylvania Railroad.

her class. She is thirteen, and just about to graduate from the grammar school to high school.

F. T. Slayton, superintendent of motive power of the Virginian, is in attendance at the convention and has some interesting information concerning the performance of the large Mallets which are giving such an excellent account of themselves in handling heavy trains on his road.

W. H. Fettner, master mechanic of the Central of Georgia at Macon, Ga., is enthusiastic over the results which are being obtained from two small switching locomotives which were specially designed for working over sharp curves and are equipped with the Gaines combustion chamber.

A. M. White, superintendent of the Manchester works of the American Locomotive Company, is attending the conventions this year with Mrs. White. He has not been able to attend very regularly during the past few years, and his many friends will be delighted to see him again.

Postlethwaite was a little late in arriving, but his excuse was most commendable. To begin with, he has a daughter at Swarthmore. Then this year Mrs. Postlethwaite's class at Swarthmore held its twenty-fifth annual reunion. What more natural than that papa should go along to show off?

G. S. Goodwin, mechanical engineer of the Rock Island Lines, is being congratulated because of his headquarters being removed from Silvis, Ill., to the general offices at Chicago. He will have charge of problems of locomotive design, while E. G. Chenoweth, with the same title, will be in charge of car design.

The Atlantic City weather man was slow in finding the ball, but when he connected with it he hit the Bull Durham sign. The first three days of this week were overcoat weather, but nothing could have been finer than yesterday. (P. S. This is written at 11.20 A. M. Thursday, and is subject to change without further notice.)

W. P. Richardson, mechanical engineer of the Pittsburgh & Lake Erie, will be missed from the conventions this year. Among the problems which are keeping him at home is one of trying to adjust the counterbalance of some of the new consolidation locomotives by the use of heavy eccentric weights on the axle.

George H. Cladwell, the Woolworth tower of the Safety Car Heating & Lighting Company, registered at the Shelburne in his latest wardrobe creation of black and white checque. George denies that he is soon to start training for the heavy-weight class, as he cannot possibly reduce without serious inconvenience to himself and his many friends.

Paul T. Warner of the Baldwin Locomotive Works made a hurried visit to the convention yesterday, returning to Philadelphia at night. The company's plants are working at present at almost full capacity. He looked very distinguished in the broad brimmed Panama which he purchased at Kingston while on a recent visit to the Panama Canal.

F. J. Harrison, superintendent of motive power of the B. R. & P., has been detained because of illness in his family, and is not expected to arrive before next Monday. The mechanical department of the B. R. & P. is very proud of the fact that all of its passenger trains are now fitted throughout with all-steel equipment.

H. E. Blackburn, apprentice instructor of the Erie Railroad at Dunmore, Pa., is enjoying a few days at the conventions. He has about 57 apprentices under his charge, giving them instruction in drawing and practical mathematics four hours a week and spending the rest of the time looking after their instruction in the practical work of the shop.

J. B. Kapp, assistant master mechanic of the Pennsylvania Railroad at Oil City, Pa., is among the special guests this year. One not familiar with the location of Oil City on the map might have some difficulty in finding it, but it has the reputation of including between three and four hundred millionaires among its population of 13,000.

W. G. Cook, who is attending the conventions, has recently been made railroad representative of the Garlock Packing Company at Chicago. Mr. Cook was until lately secretary to President Worthington, of the Chicago & Alton, and previously

Chas. H. Cory, Honorary Member Ex-Superintendent of Motive Power, Cincinnati, Hamilton & Dayton.

acted for six years in the same capacity for different general managers of that road. He is staying at the Shelburne.

A. B. Appler, mechanical engineer of the Delaware & Hudson, is getting a great deal of satisfaction out of the fact that his office is now located in close proximity to the new general shops at Watervliet, N. Y. It gives him a good

opportunity of following the work in the mechanical engineer's office into practical service and in studying the results.

The technical term for mistakes in the printing art is the word "bugs." Chairman Yardley, of the Enrollment Committee, found a number of "bugs" in the official enrollment list No. 1, Thursday morning. Mr. Yardley promises a better list in No. 2, and at the same time earnestly requests all members and guests to notify the Enrollment Committee of all errors.

The elimination of the ball game feature from this year's convention program is deeply mourned by D. Schepmoes, the publicity man of the Safety Car Heating & Lighting Company. "Skep," not having been informed about the decision to eliminate this feature, had prepared some printed matter of special interest to the numerous rooters hereabout. We advised him to feed it to some of the suckers in the aquarium.

A. R. Ayers, general mechanical engineer of the New York Central Lines west of Buffalo, attended the scientific management meetings of the Western Economic Society in Chicago a couple of months ago. When asked yesterday as to the practical results which followed he remarked that the road was now putting ball bearings on everything in sight.

Henry Gardner, supervisor of apprentices of the New York Central & Hudson River, reports continued good success with the shop schedule at the West Albany shops and the possibility of extending it to other shops on the system. Mr. Gardner is to present a paper on the subject before the annual convention of the International Railway General Firemen's Association which meets at Chicago next month.

The most frequent visitor at the booth of the *Railway Age Gazette* this year is Bob Alter, of the American Tool Works

Two Master Mechanics of the N. Y. C. & H. R. R.

Company. Every time a high speed tool is smashed on one of his machines it is brought to us for inspection, and judging from the number that we have looked over so far the manufacturers of special tool steels will have to wire back to headquarters for more supplies before the end of the week.

Prof. E. C. Schmidt, of the University of Illinois, is feeling very proud about the Transportation Building and Locomotive Laboratory at the University which recently were dedicated with appropriate ceremony. The University of Illinois is rapidly becoming one of the best equipped in the country for training men for railway work. Dr. W. F. M. Goss, who is so well known to those attending the conventions, was unable to come this year.

The students of the Casino Technical Night School at the works of the Westinghouse Company, Wilmerding, Pa., honored George M. Basford on Tuesday evening, June 3, by presenting him with a diploma which they made themselves and which, as a token of appreciation, proclaimed Mr. Basford a friend of the class. Mr. Basford had previously made the commencement address for the graduating class to an audience of over 1,000 people.

Hiram Hammett is having more than the ordinary number of visitors at his booth this year. The enlarged photograph of the convention attendants at the 1888 meeting of the M. M. and M. C. B. Associations at Alexandria Bay is of special interest because so many of the older members who are still attending the conventions are shown in it. The facial adornments, the hats and general make-up offer a great contrast to those now in vogue.

It is quite safe to say that the man attending the convention who has the longest title is G. P. Robinson, assistant

Left to Right—J. B. Randall, M. M., L. H. & St. L., Mrs. Randall, and Chas. H. Bieder, Nat. Mall. Castings Co.

chief inspector, Department of Locomotive Boiler Inspection, Interstate Commerce Commission. His brother is a close second with the title of supervisor of locomotive fuel operation on the Baltimore & Ohio. In size the brothers are rated in the inverse ratio of the length of their titles, G. P. being the smaller one of the two.

Robert F. Carr, president of the Dearborn Chemical Company, is registered at the Marlborough-Blenheim. On the way to the conventions Mr. Carr, in company with J. D. Purcell, stopped off at New York and witnessed the international polo contest; and it is stated, parenthetically, that although Mr. Carr warmly applauded the well earned victory of the American team his pocketbook was noticed with a crimp in it at the conclusion of the contest.

It is only fair to record that the Information Bureau, a photograph of which was shown in yesterday morning's *Daily*, is in the hands of some lightning change artists, and yesterday presented the appearance of a perfectly good place for obtaining answers to questions. It is provided with time tables, programs, a diagram of the exhibits, etc., and is in charge of a man who is fully competent to furnish information on any subject connected with Atlantic City or the convention.

The genial president of the Railway Supply Manufacturers' Association, Sam Allen, practices what he preaches, but he will not preach—in public. He was invited to speak in behalf of the supply men, at the afternoon services at the Atlantic City Y. M. C. A. next Sunday, but after mature deliberation declined the honor. It is a serious question as to why the honor was declined. Was it Mr. Allen's well-

known modesty or was he afraid of the subject assigned him?

W. H. Cook enjoys the distinction of being the only foreign exhibitor at the conventions, assuming, of course, that our Canadian friends on this side of the water are not classed as foreigners. From such records of the association as it has been possible for us to examine, it appears that he is the first representative from across the water, although we have, of course, had many visitors from foreign lands at all of the conventions. He is representing the Fastnut, Limited, of London, England.
595

J. S. Sheafe, engineer of tests of the Illinois Central, has Mrs. Sheafe with him again this year and is stopping at the Dennis. He is rather hoarse because of his strenuous exertions in May. Early in the month he addressed the Storekeepers' Association on the Effect of Specifications and the Testing of Materials on the Storekeeper's Stock, and later in the month, as chairman of a committee of the Locomotive Fuel Association, he presented a report on the Scaling of Locomotive Boilers.

J. F. Dunn, assistant general manager (mechanical) of the Oregon Short Line, Salt Lake City, is accompanied only by Mrs. Dunn, their daughters having decided not to attend the conventions this year. Mr. and Mrs. Dunn are at the Marlborough-Blenheim. He gives glowing reports of the business conditions and prospects in the territory of the Short Line. This year's crops are extraordinarily promising, and the population of the country is increasing and its development going forward at a rapid rate.

J. F. DeVoy, Assistant Superintendent Motive Power, C. M. & St. P., with E. D. Garfield, of Manning, Maxwell & Moore, at His Right, and an Interesting Background.

The presence of George R. Carr, Chicago, will be missed at the conventions this year by his many friends, who, however, will be pleased to know that on July 15 he will be united in marriage to Miss Katherine Mortensen, Oak Park, Ill. The wedding will take place at the Fairmont Hotel, San Francisco, and extensive preparations are now being made for the happy event in the Mortensen winter home in Pasadena, Cal. On July 16 the newly wedded couple will leave for Honolulu on their honeymoon trip.

G. S. Edmunds, shop superintendent of the Delaware & Hudson at Watervliet, N. Y., reports that the new shops are getting into good working shape and that they are turning out considerably better than one engine per month per pit. Probably the most interesting feature of the new plant is the foundry for steel castings. Many of the friends of Mr. Manning, superintendent of motive power, were skeptical when he decided to build such a foundry, and it is a source of gratification to all the mechanical officers that it is giving such good results.

H. J. Small, general superintendent of motive power of the Southern Pacific, is naturally one of the most enthusiastic advocates of the conventions being held at his home city, San Francisco, in 1915, in connection with the Panama-Pacific Exposition. A Californian now of twenty-five years' standing Mr. Small descants with as much eloquence as a native son on the beauty, the climate and the resources of the Pacific Coast, and is anxious to give all his fellow-mechanical officers and also the supply men an opportunity to know and appreciate them. Mr. Small is staying at the Marlborough-Blenheim.

George B. McGinty, secretary of the Interstate Commerce Commission, and eleven of the boiler inspection force of the

A GROUP OF FEDERAL OFFICERS.

Left to Right—Locomotive Boiler Inspectors J. McManamy, E. N. Weist, and J. M. Hall; Assistant Chief Inspector, G. P. Robinson; Secretary of Interstate Commerce Commission, G. B. McGinty; Chief Inspector, J. F. Ensign; and Assistant Chief Inspector, F. McManamy.

commission, arrived on Tuesday afternoon and are attending the meetings of the Master Mechanics' Association and the exhibit this week. They are staying at Haddon Hall. Secretary McGinty is greatly interested in the exhibit and has a very high opinion of its instructive value. He hopes to remain through part of next week, when he will be joined by a number of the safety appliance inspectors, who are interested in the work of the Master Car Builders' Association. In the party of federal inspectors this week are Chief Inspector J. F. Ensign, Assistant Chief Inspectors G. P. Robinson, F. McManamy, and District Inspectors J. McManamy, E. N. Wiest, J. M. Hall, Scudder, Pfahler, Winterstein and Nicholas. Mr. McGinty has been secretary of the Interstate Commerce Commission since March 5, when he was appointed to succeed John H. Marble, who was made member of the Commission at that time. He was previously for some time assistant secretary of the commission. He is staying at Haddon Hall. The first secretary of the commission, E. A. Mosely, was for years a regular attendant at the conventions. Mr. Marble, it is believed, never was here while secretary, his service in that office being short. Railway men will doubtless join with the *Railway Age Gazette* in hoping that Mr. McGinty will come often and stay long, for nothing can better promote harmonious relations between the railways and the commission than a better acquaintance between those connected with them.

MASTER MECHANICS' REGISTRATION.

Allen, C. W., Shelburne.
Barnum, M. K., Gen. Supt. Motive Power, Illinois Central, Dennis.
Beyer, F. A., General Foreman, Frisco Lines, Haddon Hall.
Bishop, G. C., Supt. Motive Power, Long Island, Haddon Hall.
Brangs, P. H., Traymore.
Brewer, J. W., M. M., Baltimore & Ohio R. R., Dennis.
Bridges, E. A., M. M., Durham & Southern, Silverdale.
Brown, H. M., Shop Supt., Ches. & Ohio.
Butler, W. S., M. M., Ches. & Ohio.
Byron, A. W., M. M., Penna., Chalfonte.
Carey, J. J., M. M., Baltimore & Ohio, Marlborough-Blenheim.
Clark, F. H., Gen. Sup. M. P., B. & O., Marlborough-Blenheim.
Durham, George, M. M., D., L. & W., Traymore.
Elmer, Wm., S. M. P., Penna. (B. & A. V. Div.), Chalfonte.
Endsley, Prof. L. E., Chalfonte.
Ewing, J. J., M. Engineer, Ches. & Ohio, Seaside.
Finegan, L., D. M. M., B. & O.
Fulmore, J. H., M. M., Penna., Pennhurst.
Gill, John, Traymore.
Givin, E. F., M. E., P. S. & N., Monticello.
Greenwood, B. E., Supt. of Shops, Seaboard Air Line.
Hamilton, Tabor, M. M., Cumberland Valley, Chalfonte.
Irvin, I. B., Gen. Foreman, Pitts. Shaw. & Nor., Monticello.
Kadie, C. H., Lexington.
Keenan, C. E., M. M., N. Y. C., Traymore.
Kirkpatrick, James, M. M., Baltimore & Ohio R. R., Shiltz.
Lide, C. D., M. M., Carolina & N. W. Ry., Lexington.
Lovell, A., Traymore.
Miller, E. A., Supt. Motive Power, N. Y., C. & St. L., Traymore.
Miller, S. W., Haddon Hall.
Moll, Geo., M. M., Phila. & Reading, Jackson.
Montgomery, Wm., M. M., Central R. R. of N. J.
Murphy, F. K., M. M., C. C. C. & St. L., Pennhurst.
Murrian, W. S., Supt. M. P., Southern Ry., Shelburne.
Reagan, F. H., Shop Supt., D., L. & W., Marlborough-Blenheim.
Robertson, D. D., M. M., L. V., Traymore.
Rumney, T., Marlborough-Blenheim.
Ryan, P., M. M., L. & N., Sterling.
Searles, E. J., Supt. Motive Power, B. & O., Marlborough-Blenheim.
Slayton, F. T., Supt. M. P., Virginia Ry., Arlington.
Smith, J. L., M. M., Pitts. Shaw. & Nor. R. R., Monticello.
Smith, W. T., Supt. M. P., Chesapeake & Ohio, Dennis.
Sprowl, N. E., S. M. P., Atlantic Coast Line, Chalfonte.
Thomas, I. B., Supt. Motive Power, Penna., Chalfonte.
Thomson, S. G., Supt. Motive Power, Phila. & Reading, Lennox Apartment.
Turner, J. S., Marlborough-Blenheim.
Turth, John A., M. M., Union Pacific, Chalfonte.
Werst, C. W., Works Supt., Sterling.

MASTER CAR BUILDERS' REGISTRATION.

Barnum, M. K., General Supt. Motive Power, Ill. Cent., Dennis.
Beyer, F. A., Gen. Foreman, Frisco Lines, Haddon Hall.
Boutet, H., Chief Joint Inspector, Cincinnati (all lines), Chalfonte
Bridges, E. A., M. M., Durham & Southern, Silverdale.
Byron, A. W., M. M., Penna., Chalfonte.

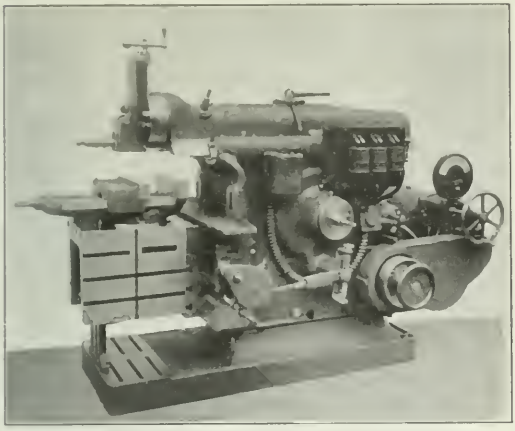
SHAPER FOR HEAVY SERVICE.

A shaper, specially designed for heavy railroad work, is being exhibited by Gould & Eberhardt, Newark, N. J. It is substantially designed and the frame is so constructed that the ways on each side of the ram are solid, insuring rigidity under heavy cuts. The gearing is more powerful



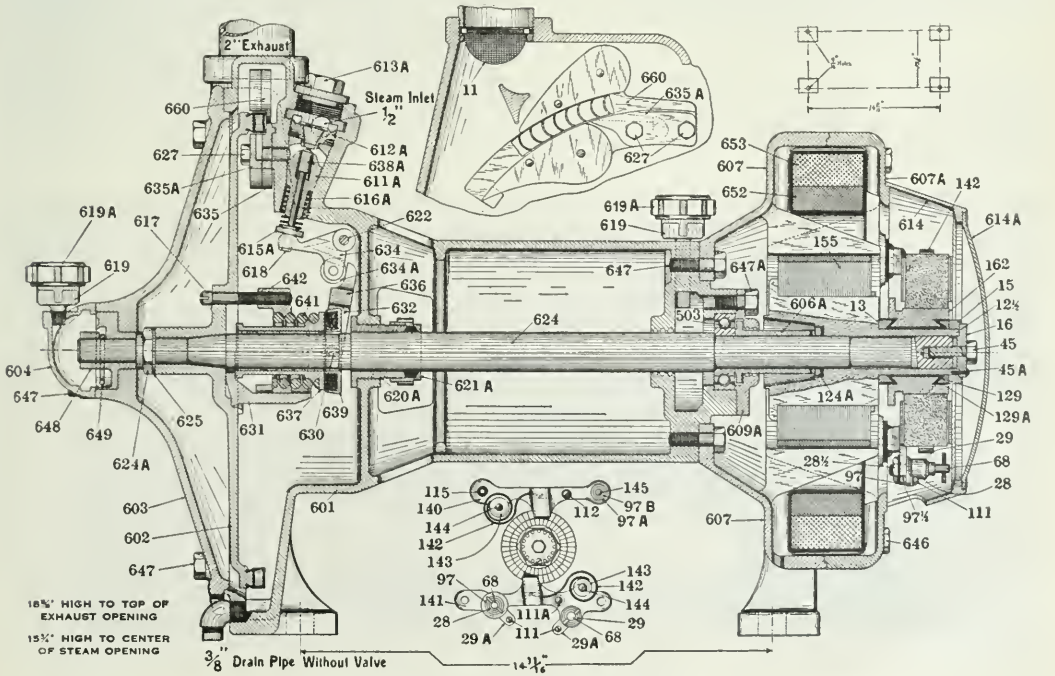
Heavy Duty Shaper.

than that provided in previous machines turned out by these makers and by means of a double train gear drive the machine may be run as fast as 115 strokes per minute.

The shaper is driven by an adjustable speed motor and is equipped with the Electrical Controller & Supply Company's automatic starter and dynamic brake, which enables the operator to start or stop the machine without any friction clutch or brake. The motor arrangement of this equipment is compact and the drive is made through gears from the motor to the machine. A back gear feature, controlled by a lever, is provided and enables the operator to quickly change the speed of the machine to suit his work; there are eight changes of speed for each change of stroke. The cross feed is simple and the amount of feed can be varied while the machine is in motion. The hole under the ram for key-seating shafts has been placed at one side, thus greatly improving and strengthening the machine by making the lever solid and raising the bull gear nearer the ram without changing the lower fulcrum; this adds to the power for heavy cuts at high speed. An oil pocket is provided in the base to catch all drippings and prevent them getting on the floor. The weight of the shaper is 5500 lbs.

PYLE NATIONAL ELECTRIC HEADLIGHT.

The Pyle National Electric Headlight Company, Chicago, is exhibiting its latest improved type E electric headlight. The steam consumption per electric horsepower has been greatly reduced, and the only care required is in the oiling of the turbine end at each strip and the replacing of the carbons. It is only necessary to lubricate the armature bearing once a week. There is no lubrication required on the inside of the machine. The lubrication between the governor sleeve and the governor ring, on which it bears, is accomplished by a composition graphite disc inserted in the ring. The apparatus is so designed that the entire machine may be completely dismantled in eight minutes and re-assembled in the same time. The company has made a special effort to make the machine as simple as possible. The barrel, or main casting, and the turbine yoke are cast in one piece. The generator yoke, or rear field frame, is



Pyle-National Electric Headlight, Type E.

bolted to the barrel, as shown in the accompanying illustration. By removing the front field frame the field coils, armature and all the electrical end of the machine are readily accessible.

The shaft is ground to a fit for the various sleeves placed on it. It runs in a ball-bearing on the armature end and in a brass sleeve-bearing on the turbine end. The turbine end is provided with an oil ring, as shown in the illustration, which keeps the bearing oiled at the various heights of oil in the oil reservoir. The armature bearing is so arranged that any excess oil passing through the bearing will be drained from the casing so that it will not get into the field coils or the armature. The buckets in the turbine wheel are dovetailed into the ring and calked with a copper calking strip, after which they are welded across the top by the oxy-acetylene process. The steam is fed to the valve through a ½-inch pipe and passes through the vanes three times. The machine is regulated to operate at 2,800 r. p. m. by a tension spring governor, which consists of only three parts. This type of governor is used in contrast to the compression type, as it has been found that the turbine shaft will remain in a more perfect balance. The governor is carefully set before the machine leaves the works of the company, and any adjustments that are necessary, due to the wear of the valve, are made in the valve itself. The valve has a lift of only 1-16 in.

The field coils are compound wound, the series and shunt coils being bound together in a compact unit. The brush-holders and springs are so fixed in the casing that they require no attention, except when the carbon brushes have worn away. The generator will take a momentary overload of 100 per cent. From repeated tests it has been found that this headlight will use about 200 lbs. of steam per hour for the full equipment, which is the equivalent of 140 lbs. per h. p. hour. Each machine is given a running test of two hours before it leaves the factory.

REED GEARED-HEAD LATHE.

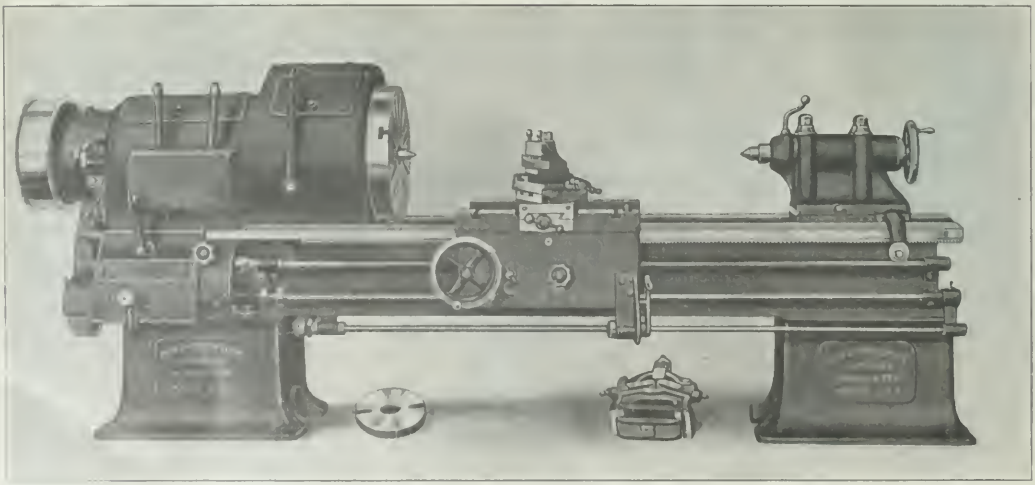
The lathe shown in the illustration is manufactured by the Reed-Prentice Company, Worcester, Mass., and is a 20 in. machine of the geared-head type. There are 13 gears with which 18 spindle speeds may be obtained. Any of these speeds may be instantly obtained and as the gears are always in mesh, it is almost impossible to damage them, the shock when changing speed being taken care of by a friction clutch. This clutch makes it possible to change speed quickly and safely while the lathe is working. A single pulley drive is used, the pulley running on ball-bearings.

The lathe is equipped with a spindle reversing mechanism in the head-stock by which the spindle can be started, stopped or reversed through a handle located at the right-hand end of the carriage. This brings all the necessary changes within control of the operator without his having to move about. The machine is equipped with the Reed quick change gear box which gives 60 changes to both the lead screw and feed rod; all the gears in the front box are made of steel. The reverse lever at the front of the apron moves a double bevel pinion and can be set for feeding in either direction, or in a neutral position which will stop all gearing in the apron. An automatic lock-out connected with the reverse lever makes it impossible to engage the lead screw and the feed rod at the same time; the bearings are all large and well provided with oiling facilities. The lathe can be arranged for motor drive if desired, the motor being mounted on a bracket attached to the rear of the head-stock leg.

HEAT TREATED STEEL AXLES.

The effect of correct heat treatment on carbon steel axles is well demonstrated by the exhibit of the Pollak Steel Company, Cincinnati, Ohio. Two axles of ordinary open hearth steel of 45-point carbon content which have gone through a special process of heat treatment are shown. One is bent cold through 180 degrees by a 250-ton press, while another is bent cold flat on itself under a 20-ton steam hammer, in both cases without evidence of distress or rupture of material.

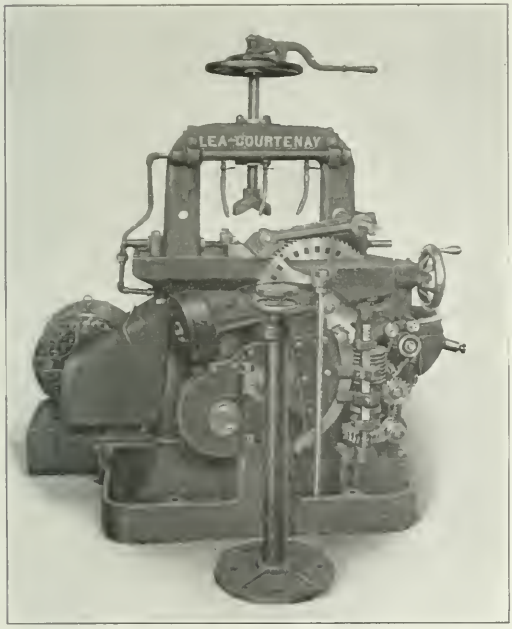
Another unique feature of this exhibit is a half forged car axle, showing half of the axle forged and the other half in the billet state. This gives an excellent idea of how much reduction in forging from the square billet to the finished axle should be given to secure material that has been properly forged.



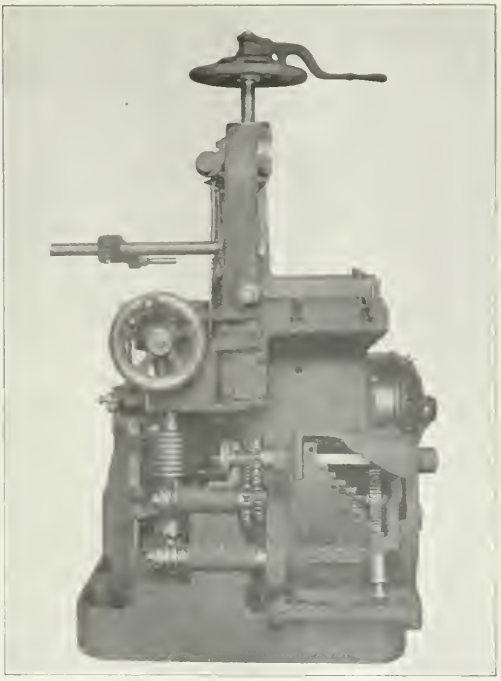
Reed 20-Inch Geared Head Lathe.

COLD METAL SAW.

The Lea-Courtney Company, Inc., New York, are exhibiting two of their sprocket driven cold metal saws, one of which is fitted with an inserted tooth blade. These machines are driven by variable speed motors and the general design is the same in all of the sizes, except the larger ones, where there are some slight differences in the details of the swing arm. The frame is made in two pieces, the upper part being joined to the base at a point slightly above the level of the liquid in the lubricating tank, so as to guard against all leakage, and the two sections are securety bolted together to secure rigidity and correct alinement. The swing arm or saw carriage turns on heavy trunnions, one of which is mounted on the center of the frame and the other is supported on the outside by an outboard bearing over a heavy pedestal. The trunnion next to the frame is fitted with an oilless bearing because its location makes it probable that an operator would neglect to oil it. The saw is fed into the work by means of a heavy quadrant working against a large worm on the vertical shaft. The power is transmitted from the main drive shaft to the sprocket shaft by means of heavy gears. The spur gears are of cast steel and the two bevel gears are planed from a high grade of tool steel. The feed mechanism is the result of much experimenting to eliminate the weaknesses of previous construction. On the No. 21 machine any one of nine different rates of feed can be obtained almost instantly by moving a lever. The feed box is driven by means of a roller chain, taking its power from the main drive shaft of the machine. The capacity of these saws ranges from 3½ in. to 8½ in. on round bars and on square bars from 3½ in. to 8¼ in., depending on the size of the machine.



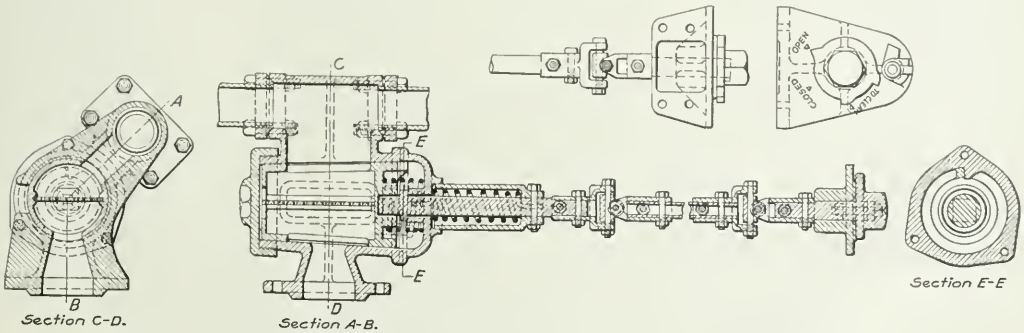
Cold Metal Saw.



Rear View of Lea-Courtenay Cold Metal Saw.

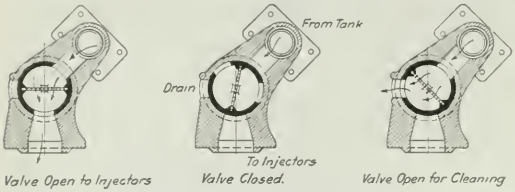
TANK AND STRAINER VALVE.

The device shown in the illustrations is intended to perform the functions of both the tank valve and the injector strainer valve ordinarily used on locomotives. It is operated by a



Franklin Tank and Strainer Valve.

key and is held in an open position by means of a spring; to close the valve the key is turned to the right, this operation closing both ports. In order to clean the strainer the movement of the key is continued to the right until the port from the tank is open and the drain on the opposite side of the screen is also open. In bringing the valve to this position, the screen is reversed so that the flow of water through it is opposite to its normal flow when the valve is in the open position, resulting in a thorough cleansing action on the screen. An indicator is provided from which



Sections Through Franklin Tank and Strainer Valve, Showing Valve Positions.

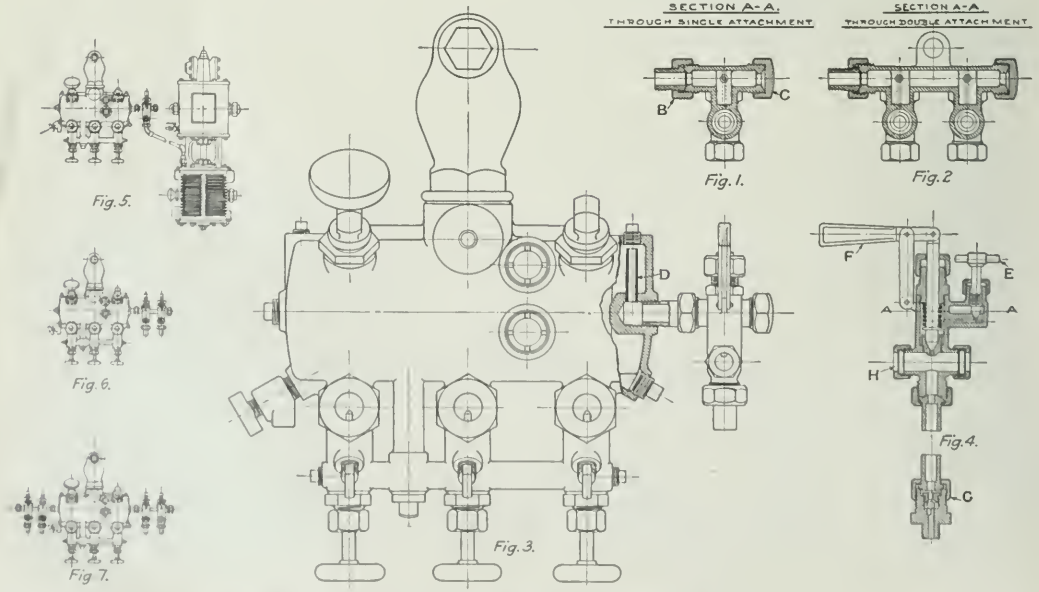
the operating rods extend to the valve, and a dog is placed on this indicator for holding the valve in either the closed or cleaning position. The valve is connected so that it is operated from the outside, making it unnecessary for the operator to go under the tender. It is manufactured by the Franklin Railway Supply Company, New York, and can be used either with the ordinary hose connection, or with the Franklin water joint.

OILING THE AIR CYLINDERS OF AIR PUMPS.

The proper lubrication of the air cylinders of locomotive air pumps is a troublesome problem; very little oil is required, and a surplus causes the cylinder to gum up. Automatic oilers have been tried, and also oiling devices attached directly to the lubricator, but the automatic oilers, as a rule, are very difficult to regulate, and the oilers attached to the lubricators are liable to be left open by the operators and the air cylinder then becomes flooded with oil.

The Nathan Manufacturing Company, New York, has developed a device which, it is claimed, solves this problem in a satisfactory manner. It consists of a chamber connected to the lubricator by means of the union connection *B*, and is so constructed that it may be attached to either side of the lubricator by simply exchanging this connection with the cap *C*. The oil is supplied to the lubricator from the pipe *D*, and the rate of flow is regulated by means of the screw valve *E*. The small passage beneath the valve *E* is filled with oil, and when lubrication of the air cylinder is desired, the operator pulls down the lever *F* for an instant and then lets it go. The valve attached to the lever *F* then closes automatically and it is, therefore, impossible for the operator to leave the valve open and flood the air cylinder with oil. At the point where the usual oiler screws into the top of the air cylinder, a check valve *G* is attached. The arrangement is made either single as shown in Figs. 1 and 4, or double, as shown in Fig. 2. The sight-feed *H* enables the operator to observe the flow of oil. The general arrangement of the attachment is shown in Fig. 5, while Fig. 6 shows a double attachment connected to the right side of the lubricator, and Fig. 7 a double device attached to both sides of the lubricator. It will thus be seen that all possible requirements may be complied with by either a single, one double or two double attachments.

Improved Cast Steel Side Frame.—The Buckeye Steel Castings Company, Columbus, Ohio, has on exhibition a type of cast steel side frame which does away with half the usual number of journal box bolts, and still allows the use of the standard M. C. B. journal box. The two journal box bolts that are used with each truck frame, instead of four, are relieved of much of their work without introducing a special design of journal box or bolt.



Arrangement of Device for Lubricating the Air Cylinders of Air Pumps.

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE that of this issue more than 9,200 copies were printed; that of those more than 9,200 copies, 7,048 were mailed to regular paid subscribers, 200 were provided for counter and news companies' sales; and 1,700 were printed for distribution at Atlantic City and for use as sample copies.

J. SNOWDEN BELL'S paper on three-cylinder locomotives is an historical review of some of the more noteworthy engines of that class. The discussion was brief, presumably because of the lack of experience of the members with that class of motive power. But from what was said, in discussion as well as from the contex and of the paper itself, it appears that the design has much to recommend it, both on the basis of uniformity of turning movement and increased tractive effort without encroaching on the clearance space, as would be done by an increase of cylinder diameter with a two-cylinder machine. The fact that the Philadelphia & Reading has a number of engines of Mr. Taylor's design in satisfactory operation, and that the Midland of England has over a hundred of the Smith locomotives in service and finds that they effect a coal saving as compared with the ordinary locomotive, indicates that there is a basis for the claims of those who are advocates of this design.

IT has been suggested before in these columns that it would be to the advantage of all concerned if the American Society for Testing Materials would keep in a somewhat closer touch with the members of the mechanical associations, before adopting specifications which the latter are to use. This is exemplified, in a small way, by the report on specifications for materials used in locomotive construction, which is merely a report on boiler tube specifications. The specifications of the Society for Testing Materials are not acceptable, as they stand, to the Master Mechanics' Association. Hence, they have been revised, and now it will be necessary for the Society for Testing Materials to either blindly adopt the specifications that were sent to letter ballot yesterday or issue those to which no one will pay attention or use. It emphasizes the necessity of co-ordinating the work of the two associations in the same way that has been done by the Master Car Builders' and the Master Mechanics' Associations, if satisfactory and acceptable specifications are to be obtained.

IT is rather staggering, this talk of a cast iron wheel for tenders of 140,000 lbs. capacity, when we remember how few years ago it was that the car of 60,000 lbs. capacity was thought to be the last word in big cars. The problems involved in the use of such a wheel load, using, as it does, 23,000 lbs. or so per wheel, are by no means easy of solution. Dr. Dudley's suggestion that the coning of the standard wheel is too sharp and throws an excessive load on the inside of the rail head is but one of the points involved. And though the relation of the wheel and rail has been the subject of constant attention ever since the publication of M. N. Forney's historic paper on the subject before the Master Car Builders' Association in the eighties, the question has not yet been settled. And now, with these heavier loads, the cast iron wheel makers are asking for another eighth of an inch of guard rail spacing in order to permit of strengthening the flange. This request has the support of many car builders and, if it is granted, will give a new lease of life to the cast iron wheel. On the score of safety it seems quite feasible to adopt this wider spacing, and it remains to be seen whether or not the American Railway Association will grant the request should the Master Car Builders' Association decide to formally prefer it.

THE American Railway Engineering Association, which meets at Chicago each year during March, conducts its meetings in a way which might be studied with profit by members of the Master Mechanics' and Master Car Builders' Associations. In the first place, the reports are published in the association bulletins which are issued during the year, thus giving the members ample opportunity to thoroughly check over and digest them before the annual meeting. When a report is called for at the convention all the members of the committee, and there are usually eight or ten of them, go to the platform and seat themselves behind a long table which extends practically the full width of the platform. As the convention attendants are all supposed to be familiar with the report the Chairman does not attempt to present it in detail, but places it before the convention with a few brief introductory remarks, unless he has additional information to present which was not incorporated in the printed report. It is then open for discussion, and as various questions or criticisms are brought up, they are referred to the member of the committee who is best able to answer or reply to them. The sight of the committee seated in a long row on the platform is impressive, and one cannot but be struck by the businesslike and earnest way in which the meetings are conducted.

IN view of the general character of the replies to the series of questions sent to the railroads by the committee on the Use of Special Alloys and Heat-Treated Steel in Locomotive Construction it would seem that the convention acted wisely in continuing the committee. The subject is a broad one and while it seems to be the concensus of opinion that the association should have such specifications, the actual preparation of these can well be continued for another year at least in order that the results of further experiments and service may be utilized. Although the discussion of the report was quite limited, it brought out the fact that the use of heat-treated carbon steel in axles has not always produced desirable service results. The Chicago, Milwaukee & St. Paul reported very unsatisfactory service from such axles used under 200 locomotives; on planing down the axles that had failed it was found that cracks began to develop about four inches from the surface and that beyond that the metal could be fractured with great ease. On the Central of Georgia a number of axles failed after from four to six weeks service. In view of these facts it would seem desirable that some steps be taken to determine the cause and remedy

for the trouble and it is probable that the committee has this in mind. The report also brought out the fact that vanadium is being extensively used in locomotive frames.

AFTER all that has been said and written on the subject of smoke abatement and the numerous devices that have been applied to locomotives to prevent the making of black smoke, it is gratifying to learn from the report of the committee on Smoke Prevention that such a simple procedure as the injection of air into the firebox by means of steam jets solves the problem. It was brought out in the discussion of the report that the idea is not a new one, but it is nevertheless so effective that a large number of locomotives operating in the city of Chicago are now equipped with the necessary apparatus and the chairman of the committee, E. W. Pratt of the Chicago & North Western, stated that no one need have the least apprehension about the failure of the jet system to abate the smoke on any locomotive to which it is applied. While the fact of smoke abatement in itself demonstrates that there is more complete combustion, it is particularly interesting to learn that apparently the steam-jet tubes reduce the weight of sparks discharged from the stack and that there is an increase in the equivalent evaporation and a corresponding increase in economy. It was also brought out that the use of the brick arch gave an increase in evaporation of about 8.6 per cent., but the steam jets increase the equivalent evaporation whether a brick arch is used or not.

TESTS WITH SUPERHEATED STEAM.

IN some respects, the appendix to the report of the committee on superheater locomotives, which gives the results of an elaborate series of comparative tests made with otherwise exactly duplicate locomotives, one having a Schmidt superheater and the other without a superheater, on the locomotive testing plant at Altoona, is the most valuable contribution to the proceedings of the Association that has been offered for many years. It forms a book of 192 pages and includes over 100 charts and 30 tables. Conclusive results are given on several features of locomotive design over which there has been considerable difference of opinion. The saving of coal and water by the use of superheated steam is about what has been shown by other tests and by regular service. The increase in the capacity of the locomotive by the application of a superheater has also been generally understood, but it is doubtful if its amount has been fully appreciated. On the other hand, the temperature at various points in the tubes, the most desirable ratio of tube length to its diameter, the pressure and temperature at various points in the path of the steam throughout its course from the throttle to the cylinders, the most desirable point of cut-off, the proper relation of the diameter of the cylinders, the effect of throttling and a number of other similar questions are here, for the first time, answered with confidence.

One of the most interesting results of these tests is the amount of power it is possible to obtain from an Atlantic type locomotive using superheated steam. To be sure this is an exceptionally heavy locomotive, much heavier than could be used on most roads, but it comes as a surprise to find that over 2,200 indicated horsepower can be obtained with a locomotive of this type. Furthermore, the water rate, or pounds of steam used per indicated horsepower hour, at the higher powers is a record for locomotive practice. At 84.4 miles an hour, when the locomotive had an indicated horsepower of nearly 2,000, the water rate was 15.81 lbs. At 1,360 horsepower the minimum coal consumption of 2.29 lbs. per indicated horsepower hour was obtained.

For the conditions on the Pennsylvania a ratio of 100 between the diameter and length of the tubes is recommended, although it is pointed out that the most desirable length of tube depends on how much the designer is willing to sacrifice in boiler efficiency to obtain rapid evaporation. The temperature investigations throughout the length of the tubes showed that there is a rapid drop for a distance of three or four feet from the firebox end, after which the drop is much more gradual until the curve becomes flat toward the smokebox end. There is also a large drop between the temperature of the firebox and just inside the end of the tubes. Firebox temperatures from 2,000 to 2,400 degrees were obtained, while the maximum temperatures in the tubes was from 1,370 to 1,620 degrees. The location of the tube in the boiler has little influence on the temperature. Those at the bottom are as hot as those at the top. The superheater flues were uniformly from 100 to 200 degrees hotter than the tubes, due to the larger volumes of gases passing through them.

The drop in pressure between the boiler and the branch pipe increases regularly with the increase in power and did not exceed 14 lbs. at the maximum. This difference, however, is largely offset by the accompanying increase in steam volume resulting from the increase in superheat and the corresponding decrease in the heat supplied to the cylinders per stroke. At the front return bend of the superheater under conditions of maximum steam flow there is a drop of 4.2 lbs.

An increase in the output of the boiler is accompanied by a direct increase in the amount of superheat in the branch pipe. At horsepowers above 700 there was found an increase of approximately one degree for each increase of 15.3 indicated horsepower. In connection with the finding, however, the report draws attention to other factors which might alter it when applied to other locomotives. It is also shown that the amount of superheat cannot be increased at a given cut-off without an increase in speed. An investigation of the back pressure develops that, for the same work done, superheated steam exhausts with less than half the least back pressure with saturated steam.

Attention was drawn by Mr. Vaughan to two most interesting sets of curves given in the report. These show the coal and steam consumption at various horsepowers for both locomotives and indicate the economy and increased capacity in a striking manner. The fuel consumption at power below 500 horsepower shows little difference in the two locomotives, but from that point the consumption on the saturated locomotive rises very rapidly until it reaches over 5 lbs. at 1300 horsepower, which is the limit of capacity of this locomotive. The consumption in the superheater locomotive, on the contrary, is well below 3 lbs., up to 1400 horsepower, and does not reach 4 lbs. at 1800 horsepower. As regards steam consumption it is shown that one of the causes for the limitations of the saturated locomotive is the increase in the water rate at the higher powers. The contrary is true with superheated steam and it continued to decrease up to the limit of capacity of the locomotive.

From this data conclusions are drawn that the application of the superheater increased the economy of this locomotive from a minimum of 12 per cent. to a maximum of 40 per cent., and that, in addition, a capacity of 30 per cent. greater can be obtained beyond the capacity when using saturated steam. The increase in capacity is about the same as the theoretical increase in the volume of the steam in the two cases. It is the 30 per cent less weight of steam used which in a large measure is believed to account for the economy, as it results in a smaller amount of heat being discharged through the exhaust. A smaller total quantity of heat is supplied and a larger percentage utilized.

The report states that it would seem logical from these economies in water and fuel, that any locomotive which is being converted from a saturated to a superheated steam locomotive should have enlarged cylinders so long as the proper coefficient of adhesions is not exceeded. Such a locomotive will maintain its steam pressure through a wider range of power and there will be less chance of insufficient steam supply at the highest speeds.

TO-DAY'S AND SUNDAY'S PROGRAMS.

SATURDAY, JUNE 14.

Orchestra Concert, 10.30 A. M.—Entrance Hall, Million Dollar Pier.

Orchestra Concert, 3.30 P.M.—Entrance Hall, Million Dollar Pier.

SUNDAY, JUNE 15.

Concert, 11.00 A.M.—Marlborough-Blenheim Hotel Orchestra Jacques Kinsbergen, musical director: Prelude and Intermezzo from Cavalleria Rusticana (*Mascagni*); (A) Ave Maria (*Gounod*); (B) Mighty Lake Rose (*Nevin*); Andante Religiosa (*Thome*); 'Cello Solo; Norwegian Folk Song (*Ole Bull*); Mr. Carl Johner; Serenade, Le Millions D'Arlequin (*Drigo*); Dreams (*Wagner*); (A) There is a Green Hill Far Away (*Gounod*); (B) Pastoral Dance (*German*); Fantaisie Lohengrin (Wagner).

Concert, 8.45 P.M.—Overture Mignon (*Thome*); Piano Solo, A Flat Major Polonaise (*Chopin*); Mr. Joseph Lanin, Fantaisie, La Boheme (*Puccini*); Violin Solo, Gypsy Airs (*Sarasate*), Mr. Jacques Kingsbergen; Cansette (*Schindler*); 'Cello Solo, Antante Cantabile (*Cui*); Fantaisie Faust (*Gounod*).

CONVENTION OF RAILWAY ELECTRICAL ENGINEERS.

The semi-annual meeting of the Association of Railway Electrical Engineers will be held in Atlantic City, June 16, at the Dennis Hotel.

ANNUAL MEETING R. S. M. A.

The annual meeting of the Railway Supply Manufacturers' Association will be held in Convention Hall this morning at 10:30 to elect officers and transact any other business that may come before the meeting.

MUSICALE.

An instrumental and vocal concert was given at the entrance ball of the Million Dollar Pier last evening, by Eugene Engel's orchestra. The committee in charge was composed of Messrs. Sherman (chairman), Toothe, Crowe, Nealley, Sheridan, Chaffee, Fettinger and Landreth.

PURDUE DINNER.

The annual dinner of Purdue men at the convention will be held at the Shelburne Hotel this evening at 6.30. Dean Benjamin and Prof. Endsley will be present and a large number of Purdue men have already signified their intention of attending. All Purdue men are requested to register at the booth of the *Railway and Engineering Review*.

B. & O. CLUB.

The annual meeting of the B. & O. Club will be held in the Park Place hall of the Marlborough-Blenheim hotel at 3.30 p. m. next Monday afternoon, June 16. The hall is on the Blenheim side of the hotel, one can be reached by entering that side, and turning to the right.

The first meeting of the club, called for the purpose of organizing it, was held during the conventions last year. All present or former employes of the Baltimore & Ohio attending the conventions, whether the mechanical department or not, are eligible to membership.

C. F. Giles, superintendent of machinery of the Louisville & Nashville, was elected president and C. L. Sullivan, sales manager of the Cowles-McDowell Engineering Company, secretary last year. A committee composed of S. M. Dolin, American Car & Foundry Company, A. Gordon Jones, General Railway Supplies, and J. Snowden Bell, was appointed to draft a constitution and by-laws. This committee will present its report for action Monday; and officers for the next year will be elected The transaction of business will be followed by a social time.

SUPPLY ASSOCIATION DISTRICT ELECTIONS.

Results of the district elections held Friday for members of the executive committee of the Railway Supply Manufacturers' Association were as follows:

Second district (New York and New Jersey)—C. B. Yardley, Jr., Jenkins Bros. and J. C. Currie, Nathan Manufacturing Company.

Fourth district (Ohio, Indiana and Michigan)—C. F. Elliott, Acme White Lead & Color Works.

Fifth district (Illinois, Wisconsin, Iowa and Minnesota)—Joseph H. Kuhns, Republic Rubber Company.

SOCIETY OF RAILWAY CLUB SECRETARIES.

This paragraph is a reminder to officers of railroad clubs and others that the Society of Railway Club Secretaries has an informal luncheon today at 12.30 P. M. at the Hotel Strand. No invitations have been issued, and the secretaries will be glad to welcome around the board all of their friends who have the time and inclination to participate. The luncheon takes the place of the annual dinner of former years to accommodate those whose time is much taken up in the evening with engagements.

Preceding the luncheon the secretaries will have their annual business meeting in Apartment 5 of the Marlborough-Blenheim.

M. K. BARNUM GOES TO THE BALTIMORE & OHIO.

M. K. Barnum, general superintendent of motive power of the Illinois Central, will go to the Baltimore & Ohio on July 1, to take the office of general mechanical inspector of that road. Thus Mr. Barnum once more becomes associated with Daniel Willard, president of the B. & O., and F. H. Clark, its general superintendent of motive power. When Mr. Willard was vice-president of the Burlington and Mr. Clark superintendent of motive power, Mr. Barnum was general inspector of machinery and equipment of that road, reporting direct to the vice-president.

Mr. Barnum is so well known to those attending the conventions as to make superfluous mention of his many admirable qualities personally and as a railway officer. He first entered railway service on the Erie, and was successively machinist, mechanical inspector and general foreman of that road. He was later assistant master mechanic of the Santa Fe at Argentine, Kan.; superintendent of the Union Pacific shops at Cheyenne, Wyo., and district foreman and division master mechanic of the same road. He has served since then as assistant mechanical superintendent of the Southern, as superintendent of motive power of the Rock Island, in the capacity already mentioned on the Burlington, and as general superintendent of motive power of the Illinois Central.

Mr. Barnum returned to Atlantic City yesterday from New York, where he conferred with President Willard.

LACK OF RAILWAYS IN CHINA.—Neither the province of Kwangsi nor that of Kweichow nor the section of Yunnan supplied by Wuchow has any railways. The existence of a Kwangsi provincial railway company is made known whenever any suggestion is made that foreign capital be employed to build railways in the province; further than that, however, it has accomplished nothing to date. Three lines of railway for Kwangsi have been projected by the Ministry of Posts and Communications, but no one of them has as yet progressed beyond the projected stage.

MASTER MECHANICS' ASSOCIATION PROCEEDINGS.

Reports on Superheaters, Heat-Treated Steel, Smoke Prevention, Three-Cylinder Locomotives, Tender Wheels.

President Crawford called the third session to order at 9.30 a. m. Friday morning.

SPECIFICATIONS FOR MATERIALS USED IN LOCOMOTIVE CONSTRUCTION.

After conferring with subcommittee X of the American Society for Testing Materials, the specifications which follow have been prepared covering lap-welded and steel boiler tubes. These specifications do not differ greatly from those of the American Society for Testing Materials. They have, however, been amplified by including arch tubes and the large superheater tubes, instead of being confined to tubes of 2½ in. in diameter and less. The paragraph describing the method of making the flange test has been introduced, and some other changes of a minor nature made.

The report is signed by:—W. C. A. Henry (Penna.), chairman; H. T. Bentley (C. & N. W.); H. E. Smith (L. S. & M. S.); Frank Zeleny (C. B. & Q.), and A. G. Trumbull (Erie).

SPECIFICATIONS FOR LAP-WELDED AND SEAMLESS STEEL BOILER TUBES, SAFE ENDS, AND ARCH TUBES.

MANUFACTURE.

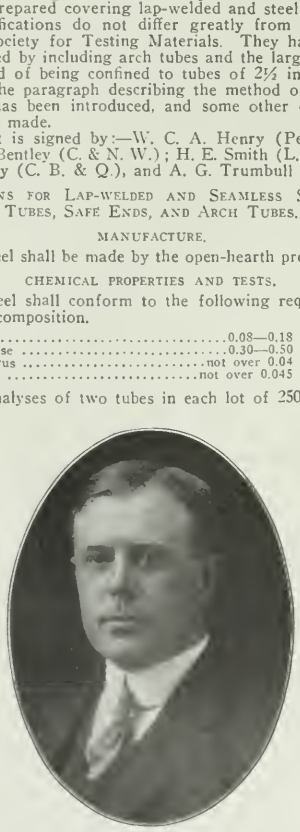
1. The steel shall be made by the open-hearth process.

CHEMICAL PROPERTIES AND TESTS.

2. The steel shall conform to the following requirements as to chemical composition.

Carbon	0.08—0.18 per cent.
Manganese	0.30—0.50 per cent.
Phosphorus	not over 0.04 per cent.
Sulphur	not over 0.045 per cent.

3. (a) Analyses of two tubes in each lot of 250 or less may



W. C. A. HENRY,

Chairman, Committee on Specifications for Materials Used in Locomotive Construction.

be made by the purchaser, which shall conform to the requirements specified in Section 2. Drillings for analyses shall be taken from several points around each tube.

(b) If the analysis of only one tube does not conform to the requirements specified, analyses of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

PHYSICAL PROPERTIES AND TESTS.

4. (a) A test specimen not less than 4 in. in length shall have a flange turned over at right angles to the body of the tubes without showing cracks or flaws. This flange as measured from the outside of the tube shall be ⅛ in. wide for tubes 2½ in. or less outside diameter, and ½ in. wide for tubes larger than 2½ in. outside diameter.

(b) In making the flange test, it is recommended that the flaring tool and die block as shown be used.

5. A test specimen 4 in. in length shall stand hammering flat until the inside walls are in contact, without cracking at the edges or elsewhere. For lap-welded tubes, care shall be taken that the weld is not located at the point of maximum bending.

6. A test specimen 2½ in. in length shall stand crushing longitudinally until the outside folds of metal are in contact, without showing cracks or flaws.

7. Tubes under 5 in. in diameter shall stand an internal hydraulic pressure of 1,000 lbs. per sq. in. and tubes 5 in. in diameter or over, an internal hydraulic pressure of 800 lbs. per sq. in.

8. (a) Test specimens shall consist of sections cut from tubes selected by the inspector representing the purchaser from the lot offered for shipment. They shall be smooth on the ends and free from burrs.

(b) All specimens shall be tested cold.

9. One flange, one flattening and one crush test shall be made from each of two tubes in each lot of 250 or less. Each tube shall be subjected to the hydraulic test.

10. If the results of the physical tests of only one tube from any lot do not conform to the requirements specified in Sections 4, 5 or 6, retests of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

STANDARD WEIGHTS.

11. The standard weights for tubes of various outside diameters and thicknesses are as follows:

Outside Diameter. Inches.	Thickness (Inches). .095 Pounds.	0.110 Pounds.	0.125 Pounds.	0.135 Pounds.	0.150 Pounds.	0.165 Pounds.	0.180 Pounds.
1.75	1.68	1.93	2.17	2.33	2.56	....	....
2.00	1.93	2.22	2.50	2.69	2.96	....	....
2.25	2.19	2.51	2.84	3.05	3.36	....	....
2.50	2.44	2.81	3.17	3.41	3.77	4.09	4.41
3.00	....	3.40	3.84	4.13	4.57	4.93	5.36
3.50	....	....	4.51	4.85	5.37	5.81	6.31
4.00	....	....	....	5.57	6.17	6.76	7.26
4.50	....	....	....	....	6.97	7.64	8.30
5.00	....	....	....	....	7.77	8.52	9.27
5.25	....	....	....	....	8.17	8.96	9.75
5.375	....	....	....	....	8.37	9.18	9.99
5.50	....	....	....	....	8.57	9.40	10.23
6.00	....	....	....	....	9.37	10.28	11.19

12. The weight of the tubes shall not vary more than 5 per cent. from that specified in Section 11.

WORKMANSHIP AND FINISH

13. (a) The finished tubes shall be circular within 0.02 in. and the mean outside diameter shall not vary more than 0.015 in. from the size ordered. The thickness at any point shall not vary more than 10 per cent. from that specified. The length shall not be less, but may be 0.125 in. more than that ordered.

14 The finished tubes shall be free from injurious defects and shall have a workmanlike finish. They shall be free from kinks, bends and buckles.

MARKING.

15. The name or brand of the manufacturer and "Tested at 1,000 lbs." for tubes from 0.125 to 0.180 in., thickness of material, or "Tested at 900 lbs.," for tubes less than 0.125 in. thickness of material, shall be legibly stenciled in white on each tube.

INSPECTION AND REJECTION.

16. The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the tubes ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the tubes are being furnished in accordance with these specifications. All tests except check analyses and inspection shall be made at the place of manufacture prior to shipment unless otherwise specified, and are to be so conducted as not to interfere unnecessarily with the operation of the works.

(a) Tubes when inserted in the boiler shall stand expanding and beading without showing cracks or flaws, or opening at the weld. Tubes which fail in this manner will be rejected and the manufacturer shall be notified.

17. (b) Unless otherwise specified, any rejection based on tests made in accordance with Section 3 shall be reported within five working days from the receipt of samples.

18. Samples tested in accordance with Section 3, which represents rejected tubes, shall be preserved for two weeks from

the date of the test report. In case of dissatisfaction with the results of the test the manufacturer may make claim for a rehearing within that time.

The report was received and referred to letter ballot for adoption as recommended practice.

SUPERHEATER LOCOMOTIVES.

Since the last report there has been an increase in the number of locomotives in the United States and Canada using superheated steam to 8,822, or more than 100 per cent. Reports from the users indicate that they have been uniformly satisfactory. The troubles that were feared with packing and valves, due to the high temperature of superheated steam, have not developed to any great degree, and where there has been any trouble it has been overcome largely, if not entirely, by the use of good material for the parts in question. It is conceded generally that it is necessary to have cylinders, cylinder bushings, valves and valve bushings made of close-grained iron rather harder than is absolutely necessary when using saturated steam, and that iron low in phosphorus and silicon is desirable.

The committee has not been able to determine any definite figure on the comparative cost of maintaining superheated and saturated steam locomotives, but the general concensus of opinion seems to be that the increase, if any, in the cost of maintenance is not going to be of sufficient moment to influence the question one way or the other.

During the year the Pennsylvania Railroad started a series of tests contemplating the comparison of two Atlantic type locomotives, two Pacific and two consolidation locomotives, of modern size, one of each type equipped with Schmidt superheater, and the other using saturated steam. The tests of the Atlantic and Pacific type locomotives have been completed, and copy of report upon the Atlantic type locomotive is given in complete detail as an appendix to this report. The work on the Pacific and consolidation type locomotives is not yet in such shape as to warrant figures being given out, but at least a résumé of the results will be given in next year's report.

The members of the committee concur in the conclusions appended to this test.

The report is signed by:—J. T. Wallis, (P. R. R.), chairman; C. H. Hogan, (N. Y. C. & H. R.); R. W. Bell, (I. C.); Thomas Roope, (C., B. & Q.); W. J. Tollerton, (C. R. I. & P.); H. H. Vaughan, (C. P.), and J. R. Gould, (C. & O.).

[The report of the tests on the Altoona locomotive testing plant on superheater and saturated steam locomotives, which forms an appendix to this report, is too voluminous to be covered here. It will be reproduced more fully in the regular weekly and mechanical editions of the *Railway Age Gazette*. The conclusions of the tests are given below.—EDITOR.]

BOILER.

Previous tests have indicated, and the results obtained with this locomotive confirm the conclusion, that the locomotive boiler surfaces absorb a fixed amount of heat from each cubic foot or from each pound of the gases of combustion flowing past them, and the increase in evaporation is due to the increase in weight or quantity of the gases of combustion, and to no other cause. This being true, the capacity of the boiler is fixed by limitations of combustion upon the grate, and not by a failure of the boiler surfaces to absorb heat.

The limit of boiler capacity with this locomotive was reached at a rate of coal burning of approximately 7000 lbs. per hour, and, therefore, whether or not a stoker is required to efficiently handle this locomotive will depend upon the length of grades to be ascended and the requirements of continual heavy loading.

These tests furnish us with additional information on flue lengths which is of value. The short tubes show an advantage in activity of combustion and also in rapidity of evaporation, with an attending lower efficiency of the boiler, and we conclude that:

(*a*) The most desirable length of tube depends upon how much the designer is willing to sacrifice in boiler efficiency to obtain rapid evaporation with some loss of heat.

(b) There is a rapid decrease of temperature in the tubes for a distance of three or four feet from the firebox end, after which the temperature drop is more gradual until, with this short tube, the curve of tube temperature becomes flat toward the smokehox end, and therefore the heat transfer at the firebox end of this tube is much higher than at the smokebox end.

(*c*) The temperature of the superheater flue is in all cases from 100 to 200 degrees higher than the temperature in the boiler tube. This is probably due to the larger volume of gases passing a hot tube surface, namely, the superheater units.

(*d*) Observations made on other locomotives indicate that there is little if any difference in temperature of flues as far as their location in the sheet is concerned.

(*e*) From the boiler efficiency obtained with this locomotive, the form of the curve of temperature drop in the tubes, and the high smokebox temperature, slightly longer tubes seem desirable.

ENGINES.

For a given cut-off, the water rate decreases with an increase in superheat, the rate of decrease apparently being faster at the shorter cut-offs. For a given water rate the superheat increases with an increase in cut-off, the increase in cut-off causing a higher draft on the fire and an attending increase in power output.

Remembering that 30 per cent. less weight of steam is used when superheating, it is this fact which in a large measure results in a lower amount of heat discharged through the exhaust. A smaller total quantity of heat is supplied and a larger percentage utilized, and therefore an economy is brought about by the reduction of waste heat through the exhaust.

In exhausting steam from a locomotive cylinder it has been found that, for the same work done, less than one-half the least back pressure is required as compared with these cylinders operating with saturated steam.

LOCOMOTIVE.

In Bulletin 19, when discussing the K29 locomotive, conclusion 9 on page 144 was drawn that an economy in water approximately 30 per cent. and in coal of between 20 and 30 per cent. might be expected when using highly superheated steam with a boiler pressure of 200 pounds per square inch. This conclusion is confirmed by these E6's tests, and the additional conclusion seems to be warranted that, when approaching the limit of the saturated steam locomotive, a saving as high as 50 per cent. may be expected, and that the application of the superheater justifies itself by an increased maximum capacity over the saturated steam locomotive of not less than 30 per cent.

If we assume a limit of 1400 dynamometer horse-power for the E6 locomotive, the E6s may be expected to produce 1850 dynamometer horse-power, or an increase of 32 per cent.; this marks the increased power which may be expected by superheating.

The application of the superheater to this locomotive increases its economy from a minimum of 23 per cent. to a maximum of 46 per cent., the economy increasing with the increased power required of the locomotive.

It was found that 30 per cent. higher capacity was derived from the E6s locomotive when using superheated steam than with the same size and type of locomotive using saturated steam.

When conditions are such that the starting of trains, and low speeds up to approximately 30 miles per hour, are not factors in tonnage rating, the application of the superheater to a passenger locomotive permits an increase of rating of approximately 30 per cent. If the starting of heavy trains and low speeds of operation are factors in establishing the tonnage rating, there is nothing in these tests to indicate that the superheater locomotive should have a lower rating than the saturated steam locomotive.

From the results obtained in the tests we believe that any locomotive in being converted from saturated to superheated steam should, with the application of the superheater, have enlarged cylinders, the results indicating that for the purpose of obtaining maximum economy the extent of the cylinder enlargement should be such that the maximum indicated horse-power may be developed at a cut-off not exceeding 30 per cent.

DISCUSSION.

H. T. Bentley, (C. & N. W.): I move that the thanks of the Association be tendered to Messrs. Wallis and Young and the Pennsylvania Railroad for their assistance in giving us this splendid paper. (The motion was carried).

H. H. Vaughn, (Can. Pac.): I think the diagrams showing the coal per dynamometer horse-power hour, and the steam per dynamometer horse-power, calculated with reference to the horse-power, are about the most remarkable illustrations that we have ever had of the gain that is obtained by the attachment of superheater to a locomotive. One of the most remarkable features is the way in which the capacity of the superheater locomotive goes up and the amount of power it can develop, while the saturated steam locomotive comes to an absolute stop at about 1,300 h. p. The curve shows at that point that the engine is simply done, there is no more to it, whereas a superheater steam locomotive of the same size

is still going on and giving increased horse-power as required.

Henry Fowler (Midland Railway, England): Of course, on our side we shall welcome very heartily the free way in which these exhaustive experiments have been presented. It is something that I am afraid we do not develop in the same way on our side of the water, but nevertheless, we shall use them to the same advantage, and we also feel a great indebtedness to the Pennsylvania Railroad, to Mr. Young and also the Master Mechanics' Association. There is one point I would question, and that is when they open the fire-hole door, it appears that the steam pressure went up. I do not know if Mr. Young has any figures to show how the efficiency goes, but it has always been our aim on our side to get the firemen to keep the doors closed, which we believe under ordinary circumstances, is the best condition.

C. D. Young: This is the second application we have made of this principle, and we have noticed the same characteristic when the grate surface is being forced to a burning rate of 135 or 150 lbs. of coal per sq. ft. of grate. With probably 15 in. of draught in the front end, there is an insufficient air-supply through the grate, and therefore it is necessary to supply that air for proper combustion. If the fire door is closed under these high-burning rates with the tremendous draughts, it immediately results in a fall of the steam pressure, due to the failure of the coal to burn. By opening the door wide and permitting the air to pass into the firebox from the door, the pressure is quickly regained. These tests are made for one hour duration, and you can readily understand that under a test of this kind your attention and that of your people is taken up with noting a number of details, and it is impossible to make a close study of the efficiency of the increased quantity of air that comes in at that time. But I am convinced we could demonstrate that our monoxide was running very high until we opened the door, when it would change to dioxide. But these things all happen within five minutes, because if the boiler falls, in steam at 16 lbs. evaporating head, it only takes a very brief time to lose a lb.; and besides, you have little time for your observation.

It is difficult to make an examination of the firebox under conditions of this kind. The box is incandescent, due to the depth and the brilliancy of the fire; and the introduction of the air gives a black cone from the point of entry, indicating quite clearly what it is. There is so much air in the inside of the box that I question very much whether under these forced firing rates, there is any drop in the temperature due to the admission of the cold air. It should be remembered, too, that under these conditions, the evaporation is high—above 14 and 15 lbs. of water to the square ft. of heating surface. The thickness of fire was about 18 in. at the door, to 10 in. at the flue sheet, sloping.

THREE-CYLINDER LOCOMOTIVES.

By J. Snowden Bell.

The three-cylinder locomotive, although originated as early as 1846, and applied in railroad service in 1847, has been confined to a smaller range of actual practice than any other design which differs from the standard two-cylinder construction, and the record of its performance may, perhaps, be considered too limited to determine, with reasonable probability of correctness, whether its advantages are sufficient to recommend its general adoption. It does not, however, involve any error in mechanical principle, nor appear to have indicated objections in practice, and seems to the writer to be of sufficient interest and probable value to warrant a more careful and thorough consideration by locomotive designers and users than it has heretofore received.

[A historical sketch of the origin and development of three-cylinder locomotives, starting with that developed by Robert Stephenson and William Howe in 1846 down to and including those built from the designs of Howard D. Taylor for the Philadelphia and Reading in 1909, was then presented by the author many illustrations being included. An abstract of the remainder of the paper follows.—Editor.]

A design for the application of three cylinders in a locomotive of the Mikado type, proposed by H. S. Vincent of the American Locomotive Company, is illustrated in Fig. 1. The central cylinder is set in advance of the two outside cylinders, on an incline of 8 degs., and its piston is coupled to the pin of a crank on the second driving axle. In order to minimize the inclination of this cylinder, the middle portion of the front driving axle is bent slightly into crank form. The pistons of the outside cylinders are coupled to crank pins on the wheels of the third driving axle. The crank pins are set 120 degs. apart. All cylinders are of the same diameter (23 in.) and the main rods are all of equal length (10 ft. 6 in.). The valve chest of the central cylinder is located on its right-hand side, and is readily accessible, as are also the cross head and guides.

The characteristic feature of novelty of this design consists in a construction of valve gear devised by Mr. Vincent, which operates on a principle which appears to be new, viz.: The actuation of the distribution valves of the central cylinder by what is termed a selector lever, the ends of which are connected to and derive motion from the gears which actuate the valves of the outside cylinders. The resultant motion imparted to the middle of this lever is transmitted to the distribution valve of the central cylinder through rocker arms proportioned to give this valve the same steam distribution action as those of the valves of the outside cylinders. This arrangement will be understood by reference to Fig. 2, and its simplicity is obvious, no independent link, eccentric, or other analogous valve actuating element being required, as the central valve is moved, controlled, and reversed by the same mechanism as the valves of the outside cylinders, through its connection therewith by the selector lever.

Except as to the application of three cylinders and the means for actuating the valve of the central cylinder without an independent valve gear, as above described, the locomotive of this design is of the present standard Mikado type, and is calculated to be of equivalent power to one having two 28-in. cylinders. Its general dimensions are the following: cylinders, 23-in. diameter and 28-in. stroke; boiler, minimum diameter, 84 in.; tubes, 238 of 2¼ in. diameter, and 40 of 5½ in. diameter, 20 ft. 6 in. long; heating surface, tubes, 4,038 sq. ft.; heating surface, fire box, 310 sq. ft.; grate area, 66.5 sq. ft.; tractive power, 60,600 lbs.; weight of engine, total, 332,000 lbs.; weieght on driving wheels, 248,000 lbs.

The high power and speed requirements of modern service have

J. SNOWDEN BELL,
Paper on Three Cylinder Locomotives.

developed the Mallet and Mountain type locomotives, weighing up to 540,000 and 331,500 lbs., respectively, the weights per axle being so great that, in many cases, rails and bridges are strained nearly to the limit of their capacity, and cylinder dimensions being also increased up to the limit of the clearance of some railroads and beyond that afforded on others. As stated to the writer by a locomotive designer of acknowledged high standing and ability, "we have about reached, especially in some of the large Mountain designs, the possibilities of a two-cylinder engine." The destructive effect upon the rails, which increases with the speeed resultant upon the unbalanced vertical force in two-cylinder engines, has long been recognized, and there being apparently no effective means available for neutralizing this effect, there has resulted the arbitrary limitation of static weight per axle to that which, when augmented by the dynamic effect of the excess balance, will not be above that which can be safely carried by the rails and bridges. This limit varies on different railroads, as affected by the solidity of the roadbed and by local traffic conditions.

The most important advantage claimed for the three-cylinder locomotive is the attainment of substantially uniform turning moment, from which there results more rapid acceleration in starting and greatly increased smoothness and steadiness in running; reduced destructive action on rails and bridges; and the exertion of greater tractive power and utilization of a lower factor of adhesion than a two-cylinder engine. The system further affords facilities for providing increased cylinder power, equally divided in a balanced application, at a minimum cost of construction and maintenance, and is adapted for opera-

tion upon the simple, compound, or triple-expansion principle. The necessity of using a crank axle and connections, for the attainment of these results, of course, involves the objection of increased complication and cost, but with the materials and methods now available in the manufacture of crank axles, the objections to this form of driving axle, as compared with a straight axle, are reduced to a minimum, and, as compared with four-cylinder locomotives, a considerable number of which have been constructed, both in Europe and in the United States, the advantage, in point of simplicity and economy, is obviously materially in favor of the three-cylinder locomotive. This is also the case as to structural considerations, there being sufficient space between the frames to provide crank cheeks of ample width, and by reason of its comparatively simple form, the axle can be readily forged in an ordinary railroad shop.

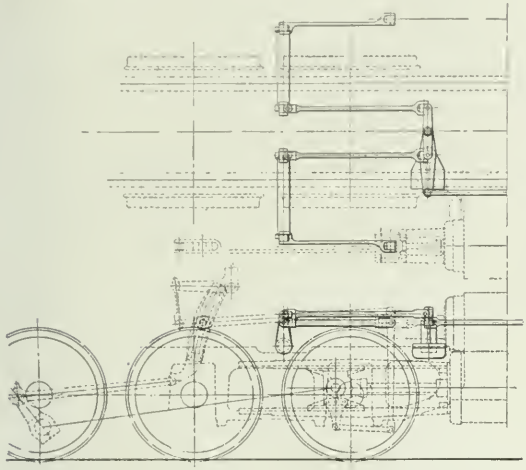


Fig. 2—Valve Gear of Proposed Three Cylinder Locomotive.

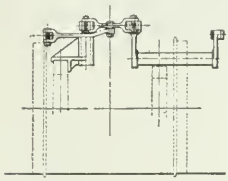
When comparing the difference in dynamic effect on the rail of a modern two-cylinder Mikado type locomotive and an equivalent three-cylinder engine of the same power and type, at a speed of 40 m.p.h., it will be found that at this speed the vertical effect of the unbalanced force for the two-cylinder engine is 8,380 lbs. per wheel, or 67,000 lbs. for the engine, thereby causing a difference in rail pressure of 134,000 lbs. in each evolution of the driving wheels, and while the normal static weight of this engine on driving wheels is 243,000 lbs., at a speed of 40 m.p.h., the effect on the rail becomes equal to a static weight of 310,000 lbs.

With the three-cylinder engine, in which the tractive power and nominal driving wheel weights are identical with the two-cylinder engine, there being no unbalanced weight and consequently no vertical dynamic effect, it would seem entirely possible to operate this engine on a much lighter rail than the two-cylinder engine; or, if the latter requires a rail weighing 100 lbs. per yard, the former can be carried safely on $\frac{243000 \times 100}{310000}$ = 80-lb. rail. If the same weight of rail be maintained, the power and weight on driving wheels of the three-cylinder engine can be increased $\frac{310000 - 243000}{243000}$ = 27.6 per cent., without any greater destructive effect on the rail.

At a speed of 45 m.p.h. a comparison of the turning moments of three-cylinder and two-cylinder engines, the two-cylinder engine having cylinders 28 by 28 inches, and the three-cylinder engine having cylinders 23 by 28 inches, both engines having approximately the same power, show that the curve of combined turning moment for the two-cylinder engine reaches its maximum at a crank angle of about 37 degs., and its minimum at an angle of about 80 degs., with a variation in turning moment of 26,000 lbs. With the three-cylinder engine the maximum occurs at 60 degs., 180 degs., and 300 degs., the minimum at 90 degs., 210 degs., and 330 degs., the difference between the maxima and minima being about 9,000 lbs. This increased uniformity of turning action is clearly beneficial in lessening the racking effect due to sudden and violent reversals of strain in the machinery of the locomotive.



At the instant of starting, or for the first few revolutions when the maximum tractive power is being exerted, the maximum combined turning moment of the two-cylinder engine occurs at a crank angle of 45 deg., while at 85 degs. it has nearly reached its minimum, the total variation in one revolution being about 56,000 lbs., and a variation of 54,000 lbs. occurring while the cranks are turning through an angle of 40 degs. In the three-cylinder engine of equal power the curve of total turning moment exhibits the same characteristics as before; that is, the maxima and minima occur at three points in the crank circle, the amount of variation being 26,000 lbs. It should be borne in mind that these rotative curves represent the steam force only. When moving at high speeds, they would be modified somewhat by the inertia of the reciprocating weights.

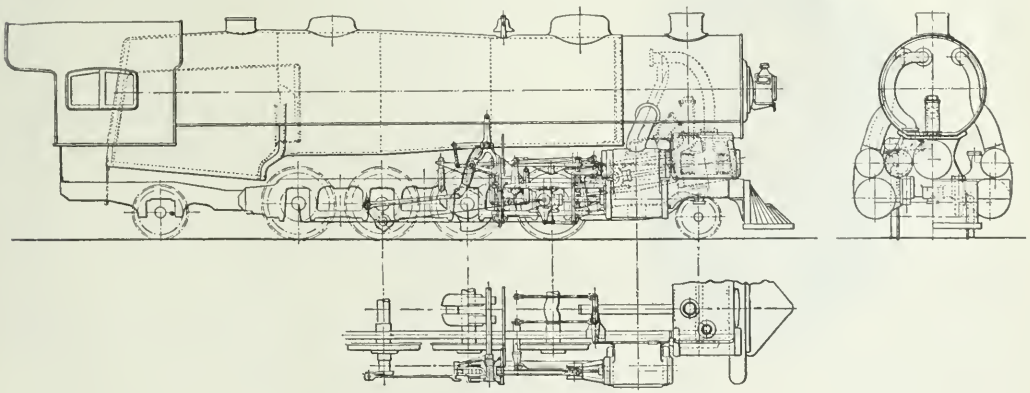


Fig. 1—Proposed Three Cylinder Locomotive.

In the first case the maximum combined turning moment equals 150,400 lbs., and in the second, 131,700 lbs. Slipping will, of course, occur at that point in the stroke where the turning moment is a maximum. Therefore, for the two-cylinder engine, the instantaneous tractive power at the point of maximum turning moment $= \frac{150400 \times 28}{56} = 75200$ lbs. And the

factor of adhesion $= \frac{243000}{75200} = 3.23$. For the three-cylinder engine the maximum tractive power $= \frac{131700 \times 28}{56} = 65850$ lbs. and the factor of adhesion $= \frac{243000}{65850} = 3.68$. It is therefore entirely feasible in a three-cylinder engine of the proportions mentioned, to increase the tractive power $\frac{3.68 - 3.23}{3.23} = 14$ per cent., with no greater liability to slip the wheels than in the less powerful two-cylinder engine having the same weight on driving wheels. This capability permits the designer to take advantage of the increased boiler capacity obtainable on account of the higher rail loads permissible with this type of locomotive.

DISCUSSION.

Henry Fowler (Midland Railway, England): We have 45 three-cylinder compound engines, working perfectly satisfactorily, at 220 lb. pressure, and as compared with our simple engines on similar work. I fancy the gain we have had in coal consumption has been 7 per cent. I would like to say that the Great Central Railway of England has built one of these engines which operates as a switching engine, which works on a hump, and the Northeasternu Railroad Company has in service a considerable number of 3-cylinder superheater engines. The difficulty, of course, with us, is that we have not the room to put the big cylinder on the side, and have to put it in between. I take it that you also will have to come to something of that kind.

A vote of thanks was given Mr. Bell for his paper.

SPECIAL ALLOYS AND HEAT-TREATED STEEL IN LOCOMOTIVE CONSTRUCTION.

The committee sent out a circular of inquiry outlining a series of seventeen questions. Replies were received from twenty-six railroads, which cover an ownership of approximately 25,266 locomotives. From the information received and that which has been in the possession of the committee, it was decided to only make a progress report.

A few roads are using and others are making experimental investigation of heat-treated carbon steel in locomotive frames, main and parallel rods and miscellaneous parts. Five roads are

C. D. YOUNG,

Chairman, Committee on Use of Special Alloy Steels and Heat-Treated Steel in Locomotive Construction.

using heat-treated carbon steel springs, wheels and tires. Carbon heat-treated steel for piston rods, axles and crank pins is the more generally used of the treated steels, and ten roads in all are doing more or less work with this class of material.

The replies as to the use of alloy steels in locomotive construction are so varied that it can only be stated that alloy steels are being used to some extent, and the greatest quantity seems to be confined to locomotive frames, main and parallel rods, piston rods, axles and crank pins, although some roads are using alloy steels for springs. Vanadium is quite extensively used in frame material, eight roads making use of this element. For main rods, piston rods, axles and crank pins both vanadium and chrom-vanadium, with some nickel, are being used, and in spring material some silico-manganese, vanadium, chrom-vanadium and nickel have been employed. Some use has been made of vanadium and chrom-vanadium in cast iron, there being five roads making experiments with this material.

In the use of alloy steels in locomotive frames, five require heat treatment, whereas four do not, and for main and parallel rods, piston rods, axles and crank pins there seems to be about an equal number requiring heat treatment, as compared with those which do not require heat treatment of the material. For tires and springs the majority of the roads do not require special treatment, and for boiler steel, cast iron and miscellaneous parts no treatment is required by any one.

The following chemical requirements for various materials used with heat-treated carbon and alloy steels, seems to indicate tentatively the average existing practice:

PISTON RODS, AXLES AND CRANK PINS.

	Heat Treated Carbon Steel. Per cent.	Alloy Steel. Per cent.
Carbon	.45 to .60	.30 to .40
Manganese	.45 to .70	.40 to .65
Phosphorus, not over	.05	.05
Sulphur, not over	.05	.05
Silicon	.....	.15 to .30
Vanadium, not less than	.....	.16
Chrom	.....	.90 to 1.10

For the physical requirements the practice from the replies seems to indicate the following:

PISTON RODS, AXLES AND CRANK PINS.

	Elastic Limit Lbs. per Sq. In.	Ultimate Lbs. per Sq. In.	Elong. per cent. in 2 In.	Per cent. Reduc. of Area.
Heat Treated Carbon	50,000 Min.	85,000 Min.	22.0	45.0
Alloy	80,000 Min.	100,000 Min.	20.0	50.0

The Pennsylvania Railroad practice for heat-treated carbon steel for piston rods, axles and crank pins is approximate, depending upon the normal carbon of their specifications, namely, heating between 1,500 degs. and 1,600 degs. F. and quenching in water and drawing to a temperature of between 1,050 degs. and 1,150 degs. F., the material not being permitted to get entirely cold between quench and temper.

In a general way the use of heat-treated carbon and alloy steels has resulted in satisfactory service, increased mileage having been obtained from the materials with apparently fewer failures, although in the majority of the cases the material has not been in service long enough to make a fair reply.

Seven roads do not require any heat-treated carbon or alloy steel axles and crank pins to be drilled, whereas four roads are at this time requiring drilling for the proper treatment. Present tendency seems to be toward requiring the drilling of shafts of large diameters.

Most of the members have not found it desirable to use alloy steels and heat-treated carbon steels in designs where excessive vibration or shock is not expected, five roads stating that this is their present practice. One member is using this material for springs, one for side rods and one for all machinery parts for high-speed passenger locomotives.

Heat-treated carbon steel can be obtained at a slight advance in price, whereas alloy steels may be purchased at an increased cost, approximately double that of the plain carbon steel, heat-treated.

The report is signed by:—C. D. Young (Penn.), Chairman; Henry Bartlett (B. & M.); S. M. Vauclain (Bald. Loco. Wks.); H. B. Hunt (Am. Loco. Co.), and J. C. Little (C. & N. W.).

C. D. Young presented the paper closing with the following remarks:

I would like to say with reference to the exhibits, that some of the manufacturers of alloyed steel have called our attention to apparent discrepancies in the replies which the Committee has received, in that all the information they have does not agree with the shipments made to various roads. The question of prices does not seem to be on the same basis, and I would suggest that in the publication of the Committee's report, we omit the appendices, and submit merely the report of progress, so there will be no confusion of facts from the data we received in reply to our circular. I suggest this after taking it up with the members of the committee.

DISCUSSION.

F. F. Gaines, (C. of Ga.): We have had two cases of heat treated axles in less than four to six weeks' service, where the axles broke off in a very peculiar manner, and it seems to me it must be due absolutely to the method of heat treatment, so much so that I would like to know if anyone else has had a similar experience. I have got to the point where I am rather afraid of them.

C. D. Young: I believe if heat treated material is purchased without careful inspection and test, that you are very apt to get even poorer material in the heat treated carbon steel than perhaps in annealed carbon steel, as the punching of a large mass of steel is very severe on the steel structure. If it is not properly and intelligently done, it may make the material poorer than it would be without that treatment, and it would be my suggestion to the members to buy this material on close testing and close observation of the treatment which is being given.

The Pennsylvania Railroad this year is installing a heat-trating plant, and it is our intention to not only subject the punching charges to a specimen test, but also to a drop test on each individual piece, in order to assure ourselves that we have given the proper treatment to the material. We expect to discontinue the drop test if we do not find any disastrous results. There has been quite a good deal of trouble, I understand, from improper heat treatment. Heat treatment will not make poor steel any better, it will make poor steel still worse, but it certainly will improve good steel.

J. F. DeVoy (C. M. & St. P.): The Milwaukee Road has tried to use these axles under about 200 locomotives. I am perfectly free in stating that under no circumstances whatever would I put a so-called heat-treated axle under a locomotive, with the methods as I know them. We have not tried a heat-treated axle, for there is no question in my mind whatever but that the heat treatment known now, will make a good steel about as bad as it can be. We planed the axles that failed down to the centre, and at about 4 in. from the surface on a 12 in. axle, cracks began to develop, and pieces broke off of their own weight. I do not just exactly understand what Mr. Young meant by making a proper inspection. A proper inspection of a heat-treated axle cannot be made for the reason that there is no way of testing them until you have reached a point at least 3 in. in from the outside of the axle.

SMOKE PREVENTION.

Several members of this committee were on a special committee appointed by the General Manager's Association of Chicago to determine the advantages of steam jets in locomotive fireboxes as an aid to smoke prevention, and it was on their recommendation that their report be transmitted to the committee for the use of this convention.

The chairman acknowledges his indebtedness particularly to the President of this Association for his careful test and its valuable deductions, and begs leave to submit it in full.

The report is signed by:—E. W. Pratt (C. & N. W.), chairman; J. F. DeVoy (C. M. & St. P.); W. C. Hayes (Erie); T. R. Cook (Penna.), and M. K. Barnum.

E. W. PRATT,
Chairman, Committee on Smoke Prevention.

SMOKE PREVENTION BY USE OF STEAM JETS.

These smoke-abatement tests were made at the Altoona testing plant of the Pennsylvania to determine the merits and proper application of steam jet combustion tubes in a locomotive firebox for abating smoke, both with and without a brick arch, the special purpose being the development of a specification applicable to locomotives operating in the city of Chicago.

In brief, the results show that if from 4 to 6 lbs. of air per pound of coal fired is delivered over the fire by steam jet tubes, the emission of smoke will be reduced to a very low amount, and that while the brick arch is a benefit, particularly while the locomotive is running, the steam jet combustion tube is of value either with or without a brick arch.

Locomotive No. 7042 (0-6-0) was selected for the tests as being representative of a large class of shifting engines in service in Chicago. The locomotive was equipped with a Security brick arch consisting of six rows of bricks supported on two 3-in. tubes with a 3-in. gap between the flue sheet and the front of the arch, as illustrated in Fig. 1.

The steam jet combustion tubes were applied in accordance with Fig. 1. There were eight tubes along each side of the firebox, six above the fire door on the back head, and four below the fire door. The tubes consisted of pieces of 2-in. boiler tubing, approximately 6 in. long, inserted in place of staybolts, and each tube was provided with a $\frac{3}{16}$-in. steam nozzle connected to a ½-in. steam line. Arrangement was also made to use air in the nozzles in place of steam. The blower was of the double tip nozzle type and is shown in Fig. 2. Steam admission to the blower line was controlled by a quick-opening

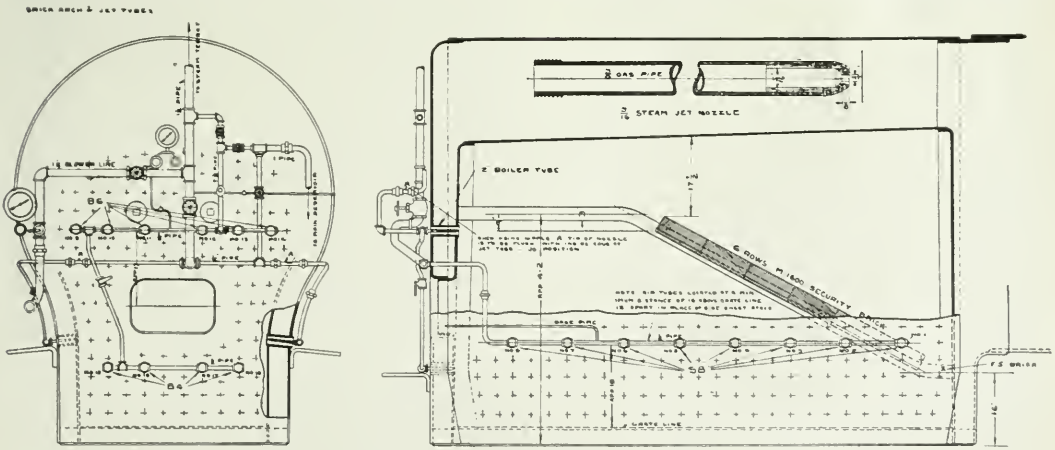

Fig. 1—Arrangement of Steam Jets in Firebox.

flat disk valve, which gave any desired pressure up to a maximum of 130 lbs.

The fire door was equipped with an adjustable damper and deflector. The damper was set with an effective opening of 10 sq. in., and the deflector at an angle of 30 degs. with the door, throughout the tests. The smoke box was of the self-cleaning type, with adjustable lift and deflector.

METHOD OF MAKING THE TESTS.

In order to obtain conditions similar to exacting yard service, the locomotive was run for seven minutes at a drawbar pull of about 15,000 lbs. at 12 m. p. h., and then shut off and allowed to stand for three minutes with the blower on full. The rated tractive effort of this locomotive is 26,517, so that 56 per cent. of the rated tractive effort was delivered, which made the locomotive work very hard. The minimum boiler pressure allowed was 170 lbs., or a variation of ten pounds from the rated pressure of 180 lbs.

While running, careful and uniform firing was insisted upon with a light, sloping fire, but as soon as the throttle was closed the fireman promptly threw a stated amount of coal under the front of the arch, to make plenty of smoke. One, four, none

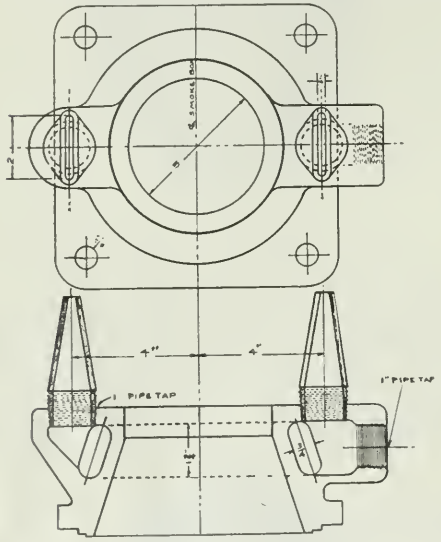

Fig. 2—Double Tip Nozzle.

and six shovelfuls of coal were used for this purpose on the four stops, and is included in the coal used for each test. The standing smoke may be considered as the result of careless firing.

The above cycle of tests was made with each of the various arrangements of steam jet tubes, selected to give data as to the best location of the tubes, the best location of the nozzles in the tubes, and the most desirable amount of air and steam injected by the tubes, with and without the brick arch.

The amount of air entering the firebox through the ash pan, fire door and steam-jet tubes was determined by the use of anemometers.

The sparks discharged from the stack were caught in a spark catcher erected on the roof on the testing plant.

After each set of tests the sparks collected were swept up and weighed. Analyses of eleven representative samples of these sparks were made. Analyses of the flue gas were made from samples representing the average of the running and standing tests for every cycle.

The brick arch was in place on 35 tests and removed for 40 tests. On 7 tests the gap between the arch and flue sheet was closed.

The coal used throughout the tests (except in nine efficiency tests) was furnished by the Superior Coal Company from the Benld Mine in Macoupin County, Illinois, and is representative of the coal used in the Chicago District. The following table gives the two analyses and the corresponding test numbers:

Number of tests	Fixed Carbon	Volatile Matter	Moisture	Ash	Sulphur Determined Separately
25	37.73	37.14	8.99	16.14	6.15
51	37.47	38.41	9.89	12.23	5.57

The noticeable features of this coal are the high ash, sulphur and moisture, which make it a very dirty, clinkering coal, of comparatively low heating value. The calorific values of the two carloads were 11,671 and 12,884 B. t. u. per pound dry coal, respectively.

After the best arrangement of steam-jet tubes, with and without the arch, had been determined, a series of efficiency tests was run at the same speed and cut-off, both with and without the arch, to determine the efficiency of the boiler and locomotive with the steam-jet tubes as compared with the same locomotive without tubes. These tests were run for one hour each.

To determine the merits of the steam-jet tube in abating smoke while a fire is being built in a locomotive, or while building up a fire after the firebox temperature has become very low, a series of firing-up tests was made, using the best arrangement of steam-jet tubes with the arch in place. Starting with a cold boiler, the fire was lighted and built up as rapidly as possible. Continuous smoke readings were made until boiler pressure was obtained.

RESULTS OF TESTS.

There is a great variation in the amount of smoke for a given quantity of air and steam and for a given condition, which no amount of care seems to overcome, and eliminating variable after variable does not appear to change this condition. The general law, however, is clearly defined, the smoke being reduced almost directly in proportion as the total quantity of air and steam above fire is increased until a practical limit of about 190 lbs. per minute is reached, above which it was impossible to go under the test conditions, on account of the locomotive failing to steam. At this point the curves indicate that little further reduction in smoke could be made with increased air and steam above the fire. They indicate that the locomotive would have made from 25 to 30 per cent. smoke under the test conditions with no air or steam admitted through the jets, although 4 tests gave only 13.5 per cent. with this condition, probably because the engine steamed freely enough for the fireman to keep the door open a good deal. The minimum smoke with normal brick arch was 6.5 per cent., or a reduction of about 75 per cent.

The ratio of air to steam seems to be immaterial, although some of the variations can be accounted for by the total pounds of air per pound of coal fired (including ash pan) being greater or less as the case may be, indicating that the quantity of air is the important factor. The jets in the back head above the fire door are apparently superior to the side jets.

In each case a further reduction of smoke was made by filling the gap between the arch and flue sheet.

In the standing tests it was possible to use the maximum amount of air and steam obtainable with the equipment, and accordingly the smoke was still further reduced, with the indication that a further increase of air and steam, above fire, would not be of great benefit. The curves indicate that with no air and steam admitted, the locomotive would have made from 25 to 30 per cent. smoke. The minimum smoke with normal brick arch was about 3.5 per cent., or a reduction of about 87 per cent.

The ratio of air to steam appears important in this case. The tests with no steam, or a ratio of air to steam greater than four to one, fall upon the same curve, but the tests where the ratio of air to steam is less than four to one resulted in a higher smoke reading for the same total weight of air and steam as indicated by the upper curve. This points to the fact that the air injected over the fire is the greatest factor in smoke reduction.

The amount of air injected, per pound of steam, should be increased as closely as possible to a maximum of 25 lbs., to give the best results and at the same time make an economical use of the steam. This means that the quantity of air injected by the steam jets is the valuable factor in smoke reduction, but it is felt that the presence of a small amount of moisture is essential, and therefore the air should be injected by steam jets.

The average smoke results when running, and with and without the brick arch, were plotted against total cubic feet of air per minute above the fire. These curves show substantially the same characteristics as the total air and steam curves, except a sharper break at from 2,000 to 2,400 cubic feet of air per minute, which seems to be the critical point either with or without brick arch. It also appears to be possible to reduce the smoke when standing without the arch to as low a figure as with the arch, when using the jets in the back head above the fire door, although the side jets lose considerable ground without the arch.

The intensity of draft in the front end being the same on all tests except for the variation in steam pressure, the amount or air drawn through the grates is reduced by the amount injected over the fire by the steam jets, the total being constant. This means that the steam jets reduce the firebox vacuum and explains the greatly reduced coal consumption on tests where a large amount of air was injected.

Curves indicate that the greater the total amount of air per pound of coal the less smoke, and that the back head jets are superior to the side jets, although both are capable of reducing smoke to about 0.5 per cent., under the test conditions, when the total air per pound of coal is greater than 13 lbs. and 35 per cent. of it is injected above the fire.

Assuming the locomotive would have averaged 20 per cent. smoke when running without the jet tubes, curves show that when about 4 lbs. of air per pound of coal fired is injected over the fire, this smoke may be reduced to 7.5 per cent., or a reduction of about 62 per cent.

The average smoke when standing may be reduced from, say, 30 per cent. to 4 per cent., or a reduction of about 87 per cent., when 4.5 pounds of air per pound of coal is injected by the back head jets or 5.5 pounds of air by the side jets.

The back head jets reduced the smoke when standing even lower without the arch than with it, although they were not able to do so while running. The side jets show a loss of efficiency both when running and standing.

The brick arch greatly improves the performance of the side jets, which might be expected, since the arch helps the admixture of air and combustible gases and creates a longer flameway, thus making the longest possible passage for the air injected at the sides. The jet tubes on opposite sides were directly opposite each other, so that the columns of air and steam met in the center of the firebox. The back head jets, however, seem to be as good without the arch as with it, and therefore considerably superior to the side jets without the arch.

In general, when the average smoke is reduced, the maximum smoke is also reduced, and that when the average smoke is reduced to 7 per cent. the maximum density of the smoke emitted at any time will not be higher than No. 1 on the Ringelmann scale.

In order to determine if possible whether it was the distance from the flue sheet or the height above the fire that was important, tests were run with the five side jets on either side farthest from the flue sheet in use. The resulting smoke was very high in all cases, indicated that the height above the fire had is the most important feature with the upper back head jets. Referring to Fig. 1, showing the relative position of the jet tubes and brick arch, it is seen that the upper back head jet tubes are practically on a line with the back edge of the arch, and it is highly probable that a large part of the air injected by these jets was drawn over the top of the arch directly into the flues by the draft of the locomotive and never reached the fire at all. This would also account for the fact that these jets with the brick arch gave no better smoke results than without the arch, if as good.

EFFICIENCY TESTS.

Penn Gas coal was used for the efficiency tests, with the exception of 2 tests in order to make the locomotive steam. While Penn Gas coal is a high volatile, smoky coal, the analysis shows practically the same volatile matter as the Illinois coal used in the other tests, with a considerably higher heating value, and it was possible to reduce the smoke to quite as low a figure, so that the results are fairly comparable. One point of interest is that with no jets in use, the same smoke was obtained with and without the brick arch. This was probably due to the fact than on one test without the arch, the fireman was able to keep the door open a good deal after putting in a fire, and again it may be due to the unaccountable variations in smoke.

The curves drawn from the results indicate that, while running, the brick arch is capable of making a 50 per cent. reduction in smoke, irrespective of the steam jets. The upper back head jet tubes are capable of reducing the smoke approximately 60 per cent. without the arch and 70 per cent. with the arch, with approximately 5.5 lbs. of air per pound of dry coal. The two tests made with the side jets did not show that they had very much merit.

ECONOMY OF THE STEAM-JET TUBES.

The results of the efficiency tests show that a reduction of smoke results in an increase in equivalent evaporation and a corresponding increase in efficiency and economy with or without the brick arch, showing that the steam-jet tubes make for improved combustion and economy, rather than simply "whitewash" the smoke. The brick arch itself shows an average increase in evaporation of about 8.6 per cent.

As the smoke is reduced the rate of combustion is reduced either with or without the arch. Since the drawbar horse-power of the locomotive was practically the same on all tests, this seems to be direct economy. But the firebox vacuum is reduced by the air thrown over the fire to reduce smoke and therefore it was impossible to burn as much coal. To be sure, the locomotive steamed and the drawbar horse-power was maintained, but on many of the tests it was necessary to fill the boiler before starting and keep the injector off until the stop, in order to maintain steam pressure within the limit of 170 lbs. This could not, of course, be done with a road locomotive, but it is entirely possible with the majority of shifting locomotives and although the economy shown is not direct, a proportion of it is, because on the efficiency tests the water level in the boiler was maintained at all times, and there was a resulting economy from the use of the steam-jet tubes. In yard service it is probably that a much larger economy could be effected by using the jet tubes to check combustion.

Taking account of the variations in drawbar horse-power, it was also shown that below about 10 per cent. smoke the increase in economy is not so great.

SPARKS.

The average analysis of the sparks discharged on 44 tests (11 cycles), with and without arch, is as follows:

Volatile Matter	Fixed Carbon	Ash	Sulphur Determined Separately	British Terminal Units
12.36 per cent	46.76 per cent	40.88 per cent	2.98 per cent	7810

The average heating value of the Illinois Coal was 12,227 B. t. u. per pound dry coal, hence the sparks had 63.7 per cent. of the heating value of the coal. This may explain the increased economy when using the steam jets, coupled as it is with the reduction of smoke. Allowing for the reduction in smoke by the brick arch, it is seen that the arch does not reduce the amount of sparks discharged, and the indications are that more sparks are discharged with the arch than without it.

FIREBOX TEMPERATURE.

The firebox temperature was uniformly high, no definite relations between it and the amount of air above the fire being apparent, although it is fair to presume that a large amount of air above the fire would reduce the firebox temperature enough to offset the increase due to better combustion. The average temperature of the firebox without the arch was 1,697 degs. F., and with the arch 1,911 degs. F., or an increase of 12.6 per cent.

On the efficiency tests with Penn Gas coal, the average firebox temperature was 1,888 degs. F. without the arch and 2,166 degs. with the arch, or an increase of 15.8 per cent.

BLOWERS.

The operating pressure of the blower was maintained as nearly uniform as possible to make the draft the same for all tests. The maximum pressure obtainable on the blower with full boiler pressure was 130 lbs., and this gave a front-end vacuum nearly equal to that of the 5-in. nozzle under running conditions.

To determine the value and economy of the blower used (see Fig. 2), it was compared with a double-tip stack blower as it was temporarily applied for this test. The tips were arranged so that the tube jets would meet about half way up the center of the stack, and they had precisely the same area of opening as the double-tip blower used in the smoke test. A multiple-tip blower was also compared. All three blowers had the same blower valve and line from the steam turret.

Comparing the blowers according to vacuum and steam consumption, the multiple blower is the most efficient of the three, with the double-tip blower, applied at the nozzle, the next. The objection to the multiple-tip blower is the liability of the tips to become clogged up or broken off.

FIRING-UP TESTS.

Three firing-up tests were made with a cold boiler to determine the efficiency of the steam jets with a low firebox temperature. The following table gives results.

Test No.	Jet Tubes in Use	Time to Obtain Full Boiler Pressure. Minutes.	Cubic Feet of Air per Minute From Jets.	Maximum Smoke No.	Average Smoke in Per Cent.	Corresponding Smoke in Per Cent.
1		68		4	28	25
2	Upper back head	68	1,670	2	20	8
3*	Upper back head	74	1,525	2	16	10

*Double Tip Stack Blower.

The double-tip nozzle blower was used on the first two tests, and the blower was the same on all three. The results show that the steam jets are capable of reducing smoke even when the

firebox temperature is low, but they are not as efficient as when it is high, as might be expected. Hence they would be of service at all times in shifting service, but in greater degree when the firebox temperature is high.

SIZE AND POSITION OF STEAM-JET NOZZLES.

From the results outlined in the previous paragraphs, two things are apparent: First, that a large quantity of air must be injected over the fire by the steam-jet tubes to reduce smoke properly, and, second, that this air should be injected with the least amount of steam practicable. To determine the proper arrangement of the steam-jet tubes to fulfill these requirements, complete air and steam calibrations were made upon ⅛-in., 5/16-in. and ¼-in. nominal diameter steam nozzles in the 2-in. outside diameter jet tube.

It was found possible to move the nozzle from the inner end of the tube to a position 8½ in. from the inside edge, or approximately 2½ in. beyond the outer end of the tube, and in case of the ¼-in. nozzle 3½ in. beyond the outer end, with a continually increasing quantity of air injected into the firebox. Beyond that position the quantity of air falls off, probably due to the greater friction of the steam in the tube and the striking of the outer edge of the jet of steam on the firebox sides. The indications are that the most efficient position is where the jet of steam expands and completely fills the tube just before reaching the inner end of the tube.

The ⅛-in. nozzle is the most efficient of the three, with the 5/16-in. slightly less efficient and the ¼-in. very much less efficient. All three are more efficient as the operating pressure decreases. While the ⅛-in. nozzle is most efficient, the 5/16-in. nozzle is capable of injecting 50 per cent. more air with only slightly less efficiency, and, in general, would probably be the desirable nozzle to use.

CONCLUSIONS.

The steam-jet combustion tube has a decided value in reducing smoke under the widely varied conditions of these tests. The air injected by the tube was found to be the greatest factor in reducing smoke, although a small amount of steam seems essential in smoke reduction. When using steam-jets, injecting air into the firebox, it was apparent that a greater reduction in smoke was accomplished by their use with improper firing as compared with careful firing. The firebox temperature was found to be higher when the arch was in service as compared with the plain firebox, although the data do not consistently show that a reduction in smoke follows increased firebox temperature.

The steam-jet tubes seem to give the best results in preventing smoke when located so that the injected air and steam meet the flame as high as possible above the fuel bed. If the arch is used the best results seem to be obtained when the air passes underneath the arch as high as possible above the fuel bed. The arch gives better results in smoke prevention if it fits tight against the flue sheet. A tight arch, however, has the practical disadvantage of collecting deposits of sparks and eventually closing the lower flues.

An efficient design of smoke-box blower is an important factor in smoke abatement. Air openings in the fire door are of slight assistance in smoke abatement, as they are capable of supplying only about 10 per cent. of the air necessary above the fire and a very small percentage of the total air for complete combustion.

Best results were obtained when from 4 to 6 lbs. of air per pound of coal fired was injected by the steam tubes from a location in the back head above the fire door. It was found on these tests that the total amount of air, including that which was introduced above the fire, should not be less than 13 lbs. per pound of coal for good smoke prevention.

The data seem to indicate that the best results can be obtained when the least amount of steam is injected with the greatest amount of air.

The use of the steam-jet tubes results in considerable economy, and in the efficiency tests an increase in evaporation was obtained.

The steam-jet tubes apparently reduce the weight of sparks discharged from the stack, but the data were not of a character to firmly establish this point

There is a necessity for a quick acting, easily operated valve capable of giving reasonable graduations in pressure.

It was found during the tests that the steam nozzles were being worn by the steam and this accounts for the inability of the steam lines to supply as great a pressure to the jets as desired in some of the later tests. The nozzles were made of brass. The indications are that they should be made of steel and, if necessary, hardened. The 5/16-in. diameter steam nozzle seems to be the desirable one to use in a 2 in. tube

There is noise incident to the use of the steam jet tubes in the most efficient arrangement and if the steam-jet tubes are located in the cab they should be covered with a ⅛-in. cast-iron box provided with cast-iron air intake from a point outside the cab, the air intake being provided with a muffler.

DISCUSSION.

W. H. Fetner (Cent. of Ga.): I notice in the conclusion that the committee states that the best results were obtained when the arch hit against the flue sheet. I have had the same experience, and like your committee have had the experience of being unable to keep the lower flues clean on account of accumulation of sparks. The road with which I am connected, however, has a plan which gives us the benefit of this tight arch without the difficulty of keeping the flues clean, and taking care of the sparks. It is done by the application of a spark-hopper, which enables us to take care of the sparks and get results which we did get from the tight arch. The hopper is located on a casting that is used to support the arch. The arch is similar to the arch used in stationary practice very much now.

T. H. Curtis (communication read by Mr. Taylor): While the human factor, the fireman, is the greatest regulator of smoke-emission, the fact must not be lost sight of that this fireman will produce the best results on locomotives equipped with adequate and efficient appliances.

I suggest that paragraph 65, page 38 (first paragraph under "Sparks" in Abstract) be revised, as its present content is liable to give an erroneous impression. From this paragraph I quote: "Allowing for the reduction in smoke by the brick arch, it is seen that the arch does not reduce the amount of sparks discharged, and the indications are that more sparks are discharged with the arch than without it."

The following burning rates are cited, as the production of sparks is dependent, to an appreciable degree, upon the burning rate per square foot of grate surface per hour and the kind of coal burned. In the thirty-two tests made with the brick arch the maximum rate of coal burned per square foot of grate surface per hour was 87.3 lbs.; minimum 60.1 lbs., average 72.4 lbs. With no arch, for nine tests, the maximum was 75.7 pounds; minimum 63.5 pounds; average 70.1 pounds.

We are fortunate to have data, other than that given in this report, that is of great importance in considerisg the efficiency of the brick arch relative to the abatement of sparks. The tests of Macoupin County, Ill., coal conducted for the General Managers' Association of Chicago showed more sparks produced with the arch than without it, the burning rates for these tests ranging from a minimum of 60.1 to a maximum of 87.3 lbs. of coal per square foot of grate surface per hour. The Chicago Association of Commerce Committee of Investigation on Smoke Abatement and Electrification of Railway Terminals had tests conducted at Altoona, Pa., with ten representative bituminous coals from Illinois, and Indiana. Four of these coals were tested with and without the arch, at a rate of burning of from 30 to 100 lbs. per sq. ft. of grate surface per hour. (Two of these coals were from different counties in Indiana, and the two from different counties in Illinois—Macoupin County being one of them). The averages for these four coals were: At the minimum burning rate of 30 lbs. of coal per sq. ft. of grate surface per hour, the tests showed 40.7 per cent. more sparks with the arch than without it; at the burning rate of 40 lbs. of coal, the tests showed only 7.4 per cent. more sparks with the arch than without it; at the burning rate of 50 lbs. of coal, the tests showed 10 per cent. less sparks with the arch than without it; at the burning rate of 60 lbs. of coal, the tests showed 16.7 per cent. less sparks with the arch than without it; and at the burning rate of 100 lbs. of coal, the tests showed 41.5 per cent. less sparks with the arch than without it. The benefit of the brick arch in the abatement of sparks commences with the burning rate of about 45 lbs. of coal per sq. ft. of grate surface per hour, and increases with the burning rate as shown by the average results from the four coals tested with and without the brick arch.

The finding as to the comparative percentages of sparks emitted with and without the brick arch, in the tests of the four coals, discloses that the results from the brick arch are the opposite of that reported in this report to the American Railway Master Mechanics' Association for burning rates of about 45 lbs. and over.

From the previously mentioned paragraph I further quote: "The average heating value of the Macoupin coal was 12,277 B. t. u. per lb. of dry coal, hence the sparks had 63.7 per cent. of the heating value of the coal."

I beg to suggest that changes and additions be made to this paragraph so as to read: "65. The average analysis of the sparks discharged on 44 tests (11 cycles), with and without arch, is as follows

Volatile Matter	Fixed Carbon	Ash	Sulphur Determined Separately	British Thermal Units
12.36 per cent.	46.76 per cent	40.88 per cent.	2.98 per cent.	7,810

"The average heating value of the Macoupin coal was 12,277 B. t. u. per lb. of dry coal, and the average heating value of the sparks emitted when burning this coal was 7,810 B. t. u. per lb. of dry sparks and therefore, for equal weights of dry coal and dry sparks, the sparks had 63.7 per cent. of the heating value of

the coal. With the weight of sparks ranging from 2 per cent. to 8 per cent. of the weight of the coal, and the B. t. u. of the sparks averaging 63.7 per cent. of the B. t. u. of the coal, the spark loss would range from 1.3 per cent. to 5 per cent. of the heat in the coal. This may explain the increased economy when using the steam-jets, coupled as it is with the reduction of smoke. Allowing for the reduction in smoke by the brick arch it will be seen that the arch does not reduce the amount of sparks discharge, and the indications are that more sparks are discharged with the arch than without it, when burning Macoupin County coal. (The tests with four coals from Indiana and Illinois which were made at Altoona, showed results as to the production of sparks which were in accord with this report, for burning rates under 45 lbs. of coal, and opposite for burning rates of 45 lbs. of coal and over.) From the results of the tests with and without the brick arch in the firebox, it is apparent that the kind of bituminous coal and the rate of burning are important factors in determining the merits or demerits of the brick arch as an appliance for the abatement of sparks."

I would suggest that in the entire report the words "spark" and "sparks" be changed to "cinder" and "cinders" respectively, as the American Railway Master Mechanics' Association's locomotive dictionary gives preference to the word "cinder;" further, Webster defines "spark" as a small particle of fire or ignited substance emitted by a body in combustion, and I do not think the impression should be given that the particles emitted from the stack are ignited.

E. W. Pratt: Several Chicago Railroads have equipped a large number of locomotives in accordance with the recommendation of this report, and found in practice that the suggestions are eminently practical. I would like to call to your attention the following paragraph under recommendations:—"Jet Tubes of a minimum outside diameter of 2 in. should be used and located on the back head or side sheets of the firebox, dependent upon the most efficient location for the specific dimensions and type of firebox under consideration." I read to you recommending them on the back head. The side sheet is recommended by several roads and the results obtained were satisfactory.

In regard to the comments of Mr. Curtis, I want to say that in conducting these tests, it was only natural that all data obtained, whether directly referring to the smoke-tests or not, should be jotted down. That is to say, a particular type of locomotive, particular style of grate area, working at certain intervals and standing at certain intervals. In paragraph 64, on page 38, it says "The percentage of total coal fired which was discharged as sparks is plotted against total pounds of air and steam per minute above the fire and smoke in per cent. when running in Figs. 24 and 25. The curves show that the steam-jet tubes have the same effect on the quantity of sparks discharged as they do upon smoke, and therefore the two are proportional to each other." That was true in this particular test and Mr. Curtis was fearful that some member might read that alone, and read the conclusion in paragraph 103, which calls particular attention to the fact that while the steam-jet tubes apparently reduce the weight of the sparks, the data was not of a character to establish this point.

In paragraph 65, page 38 (second paragraph under sparks in above abstract) speaking of the analysis of the sparks, it states: "The average heating value of the Macoupin coal was 12,277 B. T. U. per pound dry coal; hence the sparks had 63.7 per cent. of the heating value of the coal." That, of course, meant pound for pound—a pound of sparks contained two-thirds of the total heat of a pound of coal.

ENGINE AND TENDER WHEELS.

The committee has made a careful study of the design of solid carbon wheels for engine truck and tender service, as made by the various steel wheel manufacturers, and used by the members of this association.

In reference to the question of working up specifications and designs for chilled cast-iron wheels for 140,000-pound capacity tenders, no action has been taken, as the question of increased thickness of flange and its relation to frog and guard-rail clearance has not been determined upon, and until such time the committee does not feel warranted in recommending a design for this capacity chilled cast-iron wheels.

Recommendation No. 1.

Specification for solid wrought carbon steel wheels for locomotive and tender service:

I.—Manufacture.

Process.—The steel shall be made by the open-hearth process.

Discard.—A sufficient discard shall be made from the top of each ingot from which the blanks are made to insure freedom from injurious piping and undue segregation.

II.—Chemical Properties and Tests.

Chemical Composition.—The steel shall conform to the following requirements as to chemical composition:

	Acid.	Basic.
Carbon	0.60-0.80	0.65-.85 per cent.
Manganese	0.55-0.80	0.55-0.80 per cent.
Silicon	0.15-0.35	0.10-0.30 per cent.
Phosphorus	Not over 0.05	Not over 0.05 per cent.
Sulphur	Not over 0.05	Not over 0.05 per cent.

Ladle Analyses.—To determine whether the material conforms to the requirements specified in Section 11, an analysis shall be made by the manufacturer from a test ingot taken during the pouring of each melt. A copy of this analysis shall be given to the purchaser or his representative.

Check Analyses.—A check analysis may be made by the purchaser from any one or more wheels representing each melt and this analysis shall conform to the requirements specified. A sample may be taken from any one point in the plate or

W. GARSTANG,
Chairman, Committee on Engine Tender Wheels.

two samples may be taken, in which case they shall be on radii at right angles to each other. Samples shall not be taken in such a way as to impair the usefulness of the wheel. Drillings for analysis shall be taken by boring entirely through the sample parallel to the axis of the wheel; they shall be clean from scale, oil and other foreign substances. All drillings from any one wheel shall be thoroughly mixed together.

Limits of Segregation.—The segregation of either element of carbon, manganese and phosphorus must not exceed 6 per

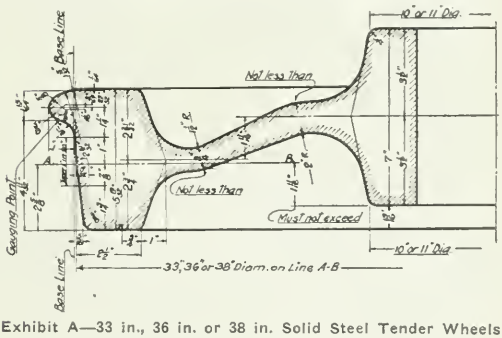

Exhibit A—33 in., 36 in. or 38 in. Solid Steel Tender Wheels for 4 1-4 in. x 8 in., 5 in. x 9 in. and 5 1-2 in. x 10 in. Axles.

cent. of the ladle test of the same melt or any part forming the thickness of the plate and tread and rim of the wheel.

III.—Tolerances.

Wheels should be furnished rough bored and with faced hubs and have a contour of tread and flange as rolled or machined according to M. M. Recommended Practice, Sheet 1, Fig. 1. They shall conform to dimensions specified on

drawings shown on Exhibits A, B and C herewith, within the following tolerances:

Height of Flange.—The height of flanges should not be more than $\frac{1}{8}$ in. over and must not be under that specified, or 1 in.

Thickness of Flange.—The thickness of flange shall not vary more than $\frac{1}{16}$ in. over or under that specified.

Throat Radius.—The radius of the throat shall not vary more than $\frac{1}{16}$ in. over or under that specified.

Thickness of Rim.—The thickness of rim to be measured between the limit-of-wear groove and the top of the tread at the point where it joins the fillet at throat of flange. The average thickness of service metal of all wheels in any ship-

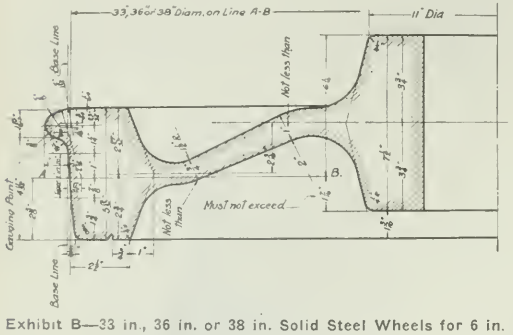

Exhibit B—33 in., 36 in. or 38 in. Solid Steel Wheels for 6 in. x 11 in. Axles.

ment must not be less than $1\frac{3}{4}$ in., measured from the limit-of-wear-groove to top of tread. The thickness of rim should in no case be less than $\frac{3}{16}$ in. under that specified.

Width of Rim.—The width of rim shall not be more than $\frac{1}{8}$ in. less, nor more than $\frac{1}{8}$ in. over that specified.

Thickness of Plate.—The thickness of the plate of the wheel shall not be less than $\frac{3}{4}$ in. at the point where the plate joins the fillet at the rim and not less than 1 in. at the point where the plate joins the fillet at the hub. Intermediate minimum thickness to be proportional.

Limit-of-wear Groove.—The limit-of-wear groove to be located as shown on wheel drawings, M. M. Recommended Practice.

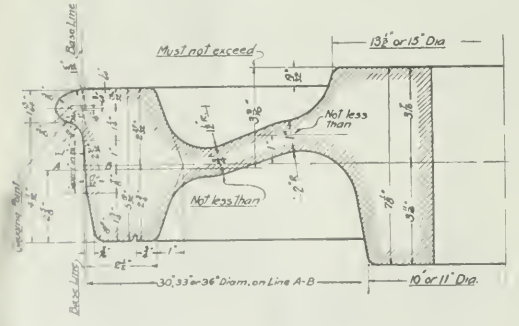

Exhibit C—30 in., 33 in. and 36 in. Steel Engine Truck Wheels.

Diameter of Bore.—The diameter of rough bore shall not vary more than $\frac{1}{16}$ in. above or below that specified. When not specified, the rough bore shall be $\frac{1}{4}$ in. less in diameter than the finished bore, subject to the above limitations.

Hub Diameter.—The hub may be either 10 in. or 11 in. in diameter, as specified for tender wheels and outside hub of engine wheels, and $13\frac{1}{2}$ in. and 15 in. in diameter for inside hubs on engine truck wheels. Maximum variation of $\frac{1}{8}$ in. below. The thickness of the wall of the finished bored hub

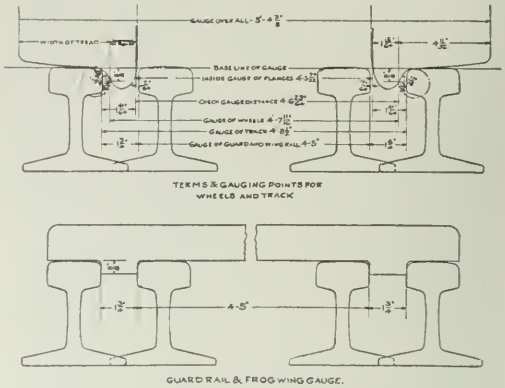

Exhibit Z—Terms and Gaging Points for Wheels and Track.

shall not vary more than $\frac{3}{8}$ in. at any two points on the same wheel.

Hub Length.—The length of the hub shall not vary more than $\frac{1}{8}$ in. over or under that specified.

Depression of Hub.—The depression of the hub must be made so that the distance from the outside face of the hub to the line "AB" shall not exceed $1\frac{11}{16}$ in. for tender wheels on $5\frac{1}{2}$-in. axles and under, and $1\frac{7}{16}$ in. for tender wheels on 6 by 11 in. axles. For engine truck wheels the distance from the

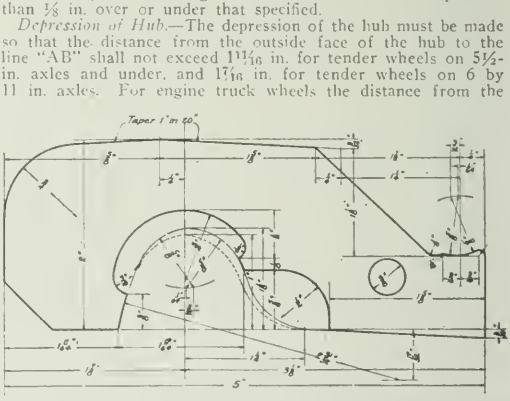

Exhibit W—Maximum Flange Thickness, Height and Throat Radius Gage.

inside face of the hub to the line "AB" shall not exceed $3\frac{9}{16}$ in.

Black Spots in Hub.—Black spots will be allowed within 2 in. of the face of the hub, but must not be of such depth that they will not bore out and give clear metal at finished size of bore.

Eccentricity of Bore.—The eccentricity between the tread at its center line and the rough bore shall not exceed $\frac{3}{64}$ in.

Black Marks on Tread.—The maximum height of block marks must not be greater than $\frac{1}{64}$ in.

Rotundity.—All wheels shall be gaged with a ring gage and the opening between the gage and tread at any one point shall not exceed $\frac{1}{16}$ in.

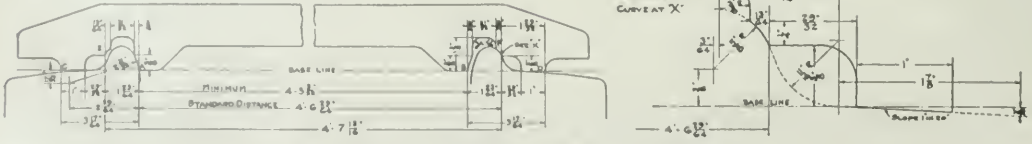

Exhibit X—Wheel Mounting and Check Gage.

Plane.—Wheel shall be gaged with a ring gage placed concentric and perpendicular to the axis of the wheel. All points on the back of the rim equidistant from the center shall be within a variation of 1/16 in. from the plane of the gage when so placed.

Tape Sizes.—Wheels shall not vary more than five tapes under nor nine tapes over the size called for.

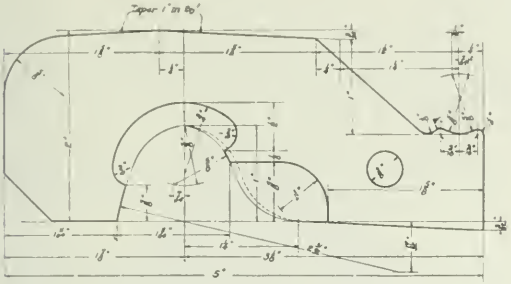

Exhibit V—Minimum Flange Thickness, Height and Throat Radius Gage.

Mating.—The tape size shall be marked in plain figures on each wheel. Wheels must be mated to tape sizes and shipped in pairs.

Gage.—Gages and tape used shall be M. M. Recommended Practice.

IV.—BRANDING.

The name or brand of the manufacturer, date and serial number shall be legibly stamped on each wheel in such a way that the wheel may be readily identified. The tape size shall be legibly marked on each wheel.

V.—FINISH.

The wheel shall be free from injurious defects, and shall have a workmanlike finish.

Wheels shall not be offered for inspection if covered with paint, rust, or any other substance to such an extent as to hide defects.

that the wheels are being furnished in accordance with these specifications. Tests and inspection at the place of manufacture shall be made prior to shipment, and free of cost to the purchaser.

The purchaser may make the tests to govern the acceptance or rejection of material in his own laboratory or elsewhere as may be decided by the purchaser. Such tests, however, shall be made at the expense of the purchaser.

All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

Wheels that show injurious defects while being finished by the purchaser shall be rejected, and manufacturer properly notified.

Samples of rejected material must be preserved at the laboratory of the purchaser for one month from date of test report.

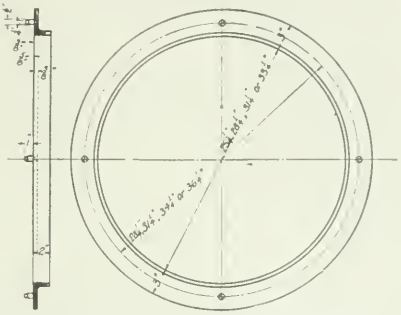

Exhibit R—Plane Gage.

In case of dissatisfaction with the results of the test, manufacturer may make claim for a re-hearing in that time.

It is recommended that the following gages and cuts be adopted as standard and shown in the Proceedings of the association, as follows:

RECOMMENDATION NO. 2.

Standard design for solid steel wheels for engine and tender

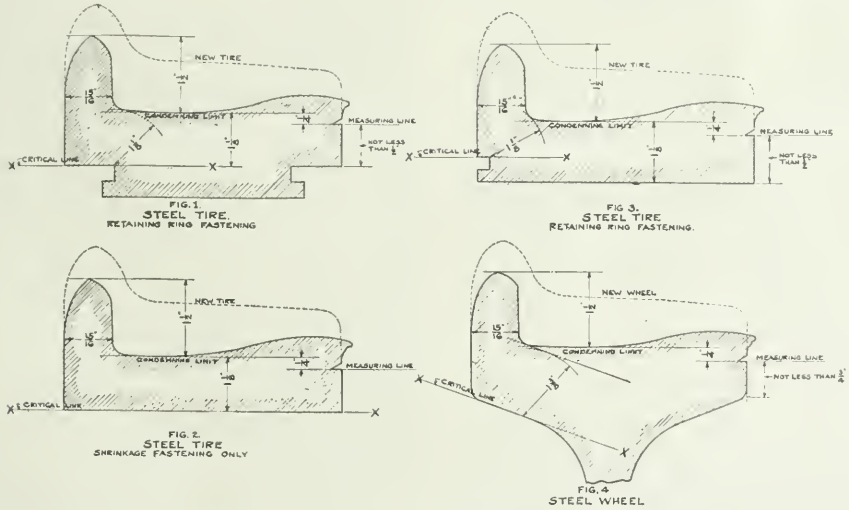

Exhibit S—Limits of Wear.

VI.—INSPECTION.

Inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the material ordered.

The manufacturer shall afford the inspector, free of cost, all reasonable facilities and necessary gages to satisfy him

truck service to be as shown on the following drawings:

33-in., 36-in. and 38-in. solid steel wheel for tenders, 5½ in. axle or under, Exhibit A.

33-in., 36-in. and 38-in. solid steel wheel for tenders, 6 by 11 in. axle, Exhibit B.

30-in., 33-in. and 36-in. solid steel wheel for engine trucks, Exhibit C.

RECOMMENDATION NO. 3.

Terms and gaging points for wheels and track as shown on drawing, Exhibit Z.

RECOMMENDATION NO. 4.

Guard-rail and frog-wing gage shown on drawing, Exhibit Z.

RECOMMENDATION NO. 5.

Wheel-mounting and check gage as shown on drawing, Exhibit X.

RECOMMENDATION NO. 6.

Maximum flange-thickness, height and throat-radius gage for

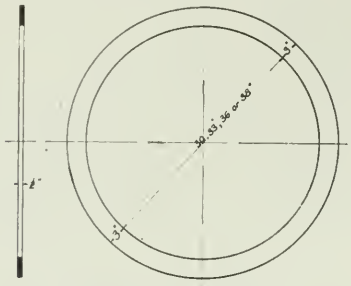

Exhibit Q—Rotundity Gage.

solid steel, steel-tired and chilled cast-iron wheels, as shown on drawing, Exhibit W, to be substituted for maximum flange-thickness gage shown on M. M. Sheet No. 14.

RECOMMENDATION NO. 7.

Minimum flange-thickness, height and throat-radius gage for solid steel, steel-tired and chilled cast-iron wheels shown on drawing, Exhibit V, to be substituted for minimum flange-thickness gage shown on M. M. Sheet No. 14.

RECOMMENDATION NO. 8.

Standard wheel-circumference measure for cast-iron wheels

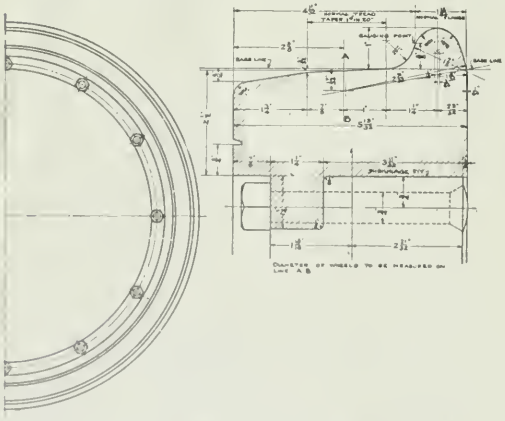

Exhibit L—Tire Fastening for Steel Tired Wheels.

as shown on M. M. Sheet No. 14, to be changed as shown on drawing, Exhibit U. [Not reproduced.—Editor.]

RECOMMENDATION NO. 9.

Standard wheel-circumference measure for steel and steel-tired wheels as shown on drawing, Exhibit T. [Not reproduced. —Editor.]

RECOMMENDATION NO. 10.

Cuts giving minimum thickness or limit of wear for steel tires with retaining-ring fastenings, shrinkage fastening only, retaining ring fastening, solid steel wheels, to be shown as per drawing, Exhibit S.

RECOMMENDATION NO. 11.

Plane gage for 30-in., 33-in., 36-in. and 38-in. solid steel engine and tender truck wheels as shown on drawing, Exhibit R.

RECOMMENDATION NO. 12.

Rotundity gage for 30-in., 33-in., 36-in. and 38-in. solid steel engine and tender truck wheels as shown on drawing, Exhibit Q.

RECOMMENDATION NO. 13.

Gage for measuring steel wheels to restore contour as shown on drawing, Exhibit P. [Not reproduced.—Editor.]

RECOMMENDATION NO. 14.

Limit gage for remounting cast-iron wheels and method of using same as M. C. B. Standard Practice, Sheet 16-A.

RECOMMENDATION NO. 15.

According to specifications for solid steel wheels, Recommendation No. 1, the method of branding solid steel wheels and size of letters for branding to be as shown on drawing, Exhibits N and N-1. [Not reproduced.—Editor.]

RECOMMENDATION NO. 16.

It is recommended that the M. C. B. revised and rearranged specification for chilled cast-iron wheels be substituted for the specifications of chilled cast-iron wheels for tender service, shown in last Proceedings of the M. M. Association.

RECOMMENDATION NO. 17.

Substitute present cuts of 60,000-lb., 80,000-lb. and 100-000-lb. capacity chilled cast-iron wheels with cuts as shown on attached drawing, Exhibits M-1, M-2 and M-3. [Not reproduced.—Editor.]

RECOMMENDATION NO. 18.

Adopt standard tire fastening for steel-tired engine and tender truck wheels, same as shown on drawing, Exhibit L.

The report is signed by:—W. Garstang (C. C. C. & St. L.), chairman; W. C. A. Henry (P. R. R.); A. E. Manchester (C. M. & St. P.); R. L. Ettenger (Southern); J. A. Pilcher (N. & W.) and O. C. Cromwell (B. & O.).

DISCUSSION.

William Garstang (C. C. C. & St. L.): There is a question in regard to the special contour of the wheel. Dr. Dudley, in his research for defects in rails and their causes, is of the opinion that with our one in 20 contour, that the greatest part of the load is carried on the inside of the rail, and due to this it is creating fractures in the ball of the rail which is largely due to the present contour. He suggested that the matter be brought before the convention for the purpose of giving it due and full consideration, and also if it would not be better to go back to our old contour of 1 in 38. I present this matter at this time so that it may be considered with the balance of the paper.

In the second paragraph you will notice that reference is made to cast-iron wheels for 140,000 lbs. capacity. We have on exhibition at this convention, some of the wheels referred to, and I think that it is pretty generally known that there is quite a large number of these wheels now in service. While the wheel is new, and there is no perceptible wear in the tread, the thick flange that appears on these wheels will pass through all frogs and crossings and clearances without interference. But as the tread becomes worn, ⅛ in. or more, there will be an interference. Insofar as I have been able to learn, there have been no bad or serious results which have occurred from that interference. The question is now being considered by manufacturers of chilled wheels and also by the M. C. B. Association, with a view of taking the matter up with the American Railway Association for the purpose of having the clearances, frogs, switches and crossings changed from 1¾ in. as a standard, to 1⅞ in. as may be required. I personally feel that if you can get the American Railway Association to do that, that the cast-iron wheel can be made so as to carry the heaviest load contemplated at the present time with perfect safety.

The report of the committee was referred to letter ballot for adoption of the various recommendations made by the committee as recommended practice.

TESTS OF SUPERHEATER LOCOMOTIVES.

By C. H. Benjamin, and L. E. Endsley.

INTRODUCTION.

The work reported to the association in 1911, showed a comparison of locomotive performance under different degrees of superheated steam. The Schmidt superheater was the last one which was installed. The work this year is a continuation of that accomplished upon the Schmidt superheater and shows the

increased power of the superheater locomotive over the ordinary locomotive when both are using the same amount of coal. Last year a brief statement of the progress of the work was made, but no definite results were given. It was stated at that time that plans were under way to get a larger set of cylinders for the Purdue locomotive. This, however, was not done, and so the report this year only gives the increased power produced by superheating with the same sized cylinder. The work as outlined for the use of larger cylinders remains yet to be carried out at a future time.

Equipment.—The locomotive known as Schenectady No. 2, for the saturated tests, and No. 3, for the superheated tests, was used in all the work. When used with saturated steam the locomotive was in normal condition. When the Schmidt superheater was installed the number of 2-inch tubes was reduced from 200 to 107, and 21 5-inch flues were installed. The original

C. H. BENJAMIN,

Paper on Tests of Superheater Locomotives.

water-heating surface in Schenectady No. 2 was 1,322 square feet. The change in the tubes made necessary by the installation of the Schmidt superheater reduced the water-heating surface to 1,080 square feet. The heating surface of the Schmidt superheater is 324 square feet, making a total water and superheating surface of 1,404 square feet for Schenectady No. 3 after it was equipped with the Schmidt superheater. The nominal dimensions of Schenectady No. 3 as used in the tests with the Schmidt superheater installed are as follows:

Type	4-4-0
Total weight (pounds), about	109,000
Weight on four drivers (pounds), about	61,000
Driving-axle journals:	
Diameter (inches)	7½
Length (inches)	8½
Drivers, diameter (inches)	68.99
Valves (type, Richardson balanced):	
Maximum travel (inches)	6
Outside lap (inches)	1⅛
Inside lap (inches)	0
Ports:	
Length (inches)	12
Width of steam port (inches)	1.5
Width of exhaust port (inches)	3
Total wheel base (feet)	23
Rigid wheel base (feet)	8.5
Cylinders:	
Diameter (inches)	16
Stroke (inches)	24
Boiler (style, extended wagon top):	
Diameter of front end (inches)	52
Number of 2-inch tubes	107
Number of 5-inch flues	21
Length of tubes (feet)	11.5
Heating surface in tubes (square feet)	956.5
Heating surface in fire box (square feet)	123.5
Total water-heating surface (square feet)	1080.0
Length of firebox (inches)	72.06
Width of firebox (inches)	34.25
Depth of firebox (inches)	79
Grate area (square feet)	17
Thickness of crown sheet (inches)	7/16
Thickness of tube sheet (inches)	9/16
Thickness of side and back sheet (inches)	⅜
Diameter of stay bolts (inches)	1
Diameter of radial stays (inches)	1⅛

The Schmidt superheater, as used in these experiments, has the following dimensions:

Outside diameter of superheater pipe (inches)	1¾
Number of double return loops	21
Average length of the pipes in the double return loops (feet)	42.88
Total superheating surface, based on the outside surface of the pipes in square feet	324

The fuel used in all the tests, both superheated and saturated, was Youghiogheny lump. Repeated analyses of this coal show it to have a very uniform heat value.

TESTS USING SATURATED STEAM.

The Tests Involving Saturated Steam, which were used in this report, were taken directly from Tables IV and V in the report of Dean W. F. M. Goss to the association in 1909. All the tests were run at a speed of 30 miles per hour, and steam pressures of 200, 160 and 120 pounds. The conditions of pressure and cut-off under which the tests were run are shown diagrammatically in Fig. 1. The cut-off is determined by the position of

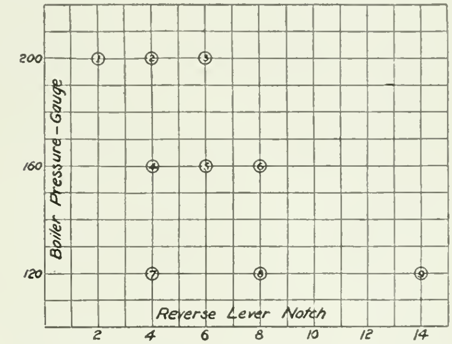

Fig. 1—Showing Conditions of Pressure and Cut-off for the Engine Using Saturated Steam.

the reverse lever in notches. Each circle represents a test, and the number within the circle refers to the laboratory number by which the tests are identified. The results of the tests involving saturated steam are shown in Tables I and II.

Performance of the Boiler.—In the 1909 report of Dean Goss, the relation between the equivalent evaporation per pound of

dry coal and the equivalent evaporation per square foot of heating surface per hour for the locomotive using saturated steam is shown by the equation $E = 11.305 - .221\ H$, in which E is the equivalent evaporation per pound of dry coal and H is the equivalent evaporation per square foot of heating surface per hour. This equation is assumed to represent the evaporative

9	30—14—120	18654	8186	2278	1340	443	3629	30	21.3	4.1	4927	6160	462	3788

efficiency of the boiler when operated under saturated steam. In order to obtain the relation between the equivalent evaporation per pound of dry coal and the rate of firing, an equation was obtained in the following manner: Letting G equal the dry

coal per square foot of grate surface per hour, 1,322 is the number of square feet of water-heating surface, 17 the number of square feet of grate surface, and H and E the same as above mentioned. Now, from the above values, the following equation is true: $1{,}322\ H = 17\ E\ G$, or $H = \dfrac{17\ E\ G}{1{,}322}$

Substituting this value of H in the equation $E = 11.305 - .221\ H$, we obtain the equation $E = \dfrac{3{,}978}{G + 351.9}$

This equation gives the relation between equivalent evaporation per pound of dry coal and the dry coal per square foot of grate surface per hour when using saturated steam. The graphical representation of this equation is shown in Fig. 2.

Performance of Original Locomotive Assuming Irregularities to Have Been Eliminated.—Table II shows the performance of the locomotive, assuming irregularities due to boiler performance to have been eliminated. The results in this table were obtained as follows:

Column XV, which gives equivalent steam supplied to locomotive per hour with feed-water at 60° F., equals pounds of steam supplied to locomotive per hour from original log multiplied by (B. t. u. taken up by each pound of steam minus [60 minus feed-water temperature]) divided by 970.4 (latent heat of evaporation).

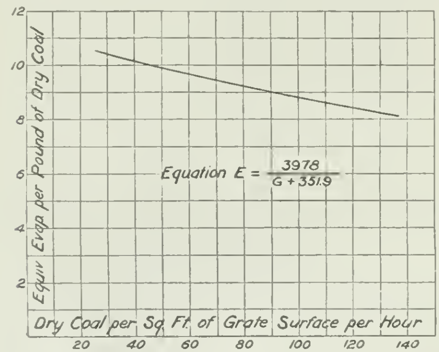

Fig. 2—Showing Relation between Equivalent Evaporation per Pound of Dry Coal and Dry Coal per Sq. Ft. of Grate Surface per Hour for the Engine Using Saturated Steam.

Column XVI, which gives the equivalent evaporation per pound of dry coal corrected by equation, was obtained by substituting the values in column VI, Table I, for H in the equation $E = 11.305 - .221\ H$.

Column XVII, which gives dry coal fired per hour corrected by equation, equals column XV divided by column XVI.

Column XVIII, which gives dry coal per square foot of grate surface per hour, equals column XVII divided by 17 (the number of square feet of grate surface).

Column XIX, which gives dry coal per indicated horse-power per hour, equals column XVII divided by column X in Table I.

Column XX, which gives the equivalent steam per indicated horse-power per hour, equals column XV divided by column X in Table I.

Column XXI, which gives the machine friction in terms of mean effective pressure, was taken from Fig. 13, page 158, of the 1909 report of Dean Goss.

Column XXII, which gives the machine friction in horse-power, is obtained by using the values of M. E. P. of column XXI and the speed in revolutions per minute of the individual test, together with the indicated horse-power constant of the locomotive.

Column XXIII, which gives the machine friction in per cent. of indicated horse-power, equals column XXII divided by column X in Table I and multiplied by 100.

Column XXIV, which gives dynamometer horse-power, equals column X in Table I minus column XXII in Table II.

Column XXV, which gives the drawbar pull, equals column XXIV divided by (.000547 multiplied by the revolutions per minute), in which .000547 is the tractive horse-power constant of the locomotive.

Column XXVI, which gives the coal per dynamometer horse-power per hour, equals column XVII divided by column XXIV.

Column XXVII, which gives the equivalent steam per dynamometer horse-power per hour, equals column XV divided by column XXIV.

TESTS USING SUPERHEATED STEAM.

The tests involving superheated steam, as run on Schenectady No. 3, were at a speed of 30 miles an hour, at the same pressures as were used on the original locomotive—that is, 200, 160 and 120 pounds. The conditions of pressure and cut-off under which the tests were run are shown diagrammatically in Fig. 3, in which the cut-off is determined by the position of the reverse lever notch. Each circle represents a test, and the number written in the circle represents the laboratory number by which the tests are identified. The results of tests under superheated steam are shown in Tables III and IV. It will be seen that the reverse lever was carried to a higher notch than with the saturated steam.

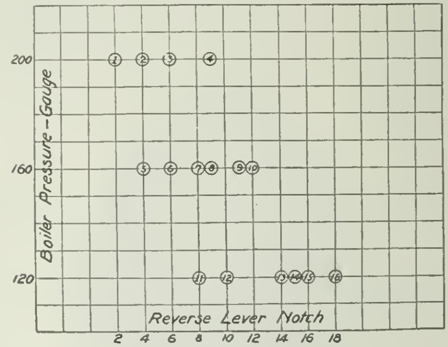

Fig. 3—Showing Conditions of Pressure and Cut-off for the Engine Using Superheated Steam.

Performance of the Boiler.—The equivalent evaporation per square foot of water and superheating surface per hour and the equivalent evaporation per pound of dry coal, Columns VI and VII in Table III, were plotted as shown in Fig. 4. There were sixteen different tests run under superheated steam, and, as shown, each point represents one test. The equation for the line as shown, which most nearly approximates all the points, is $E = 12.443 - .319\ H$, where E is the equivalent evaporation

per pound of dry coal and H is the equivalent evaporation per square foot of water and superheating surface per hour. The area of the heating surface is based upon the interior surface of the firebox and the exterior surface of the boiler and superheating tubes. This equation was derived from all tests at all pressures and therefore fairly represents the average performance of the boiler at any pressure when operated under superheated steam. It is a noteworthy fact that this equation is practically the same as that obtained from the lower rates of firing reported to the association in 1911. The equation for the nine points as obtained that year was $E = 12.450 - .318\ H$. In the same manner as used in the original locomotive, G equals the dry coal per square foot of grate surface per hour, 1,404 the number of square feet of water and superheating surface, 17 the number of square feet of grate surface and H and E the same as before mentioned, the following formula is true: $1{,}404\ H = 17\ E\ G$, or $H = \frac{17\ E\ G}{1{,}404}$

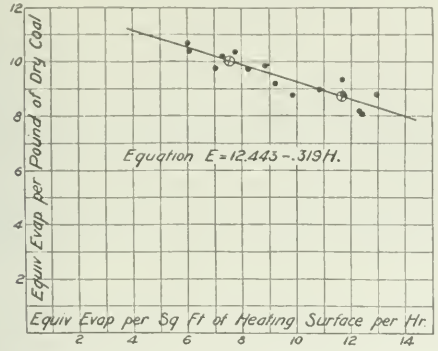

Fig. 4—Showing Relation between Equivalent Evaporation per Pound of Dry Coal and Equivalent Evaporation per Sq. Ft. of Heating Surface per Hour for the Engine Using Superheated Steam.

Substituting this value of H in the equation $E = 12.443 - .319\ H$, we obtain the equation $E = \frac{3{,}221}{G + 258.9}$, which shows the relation between the equivalent evaporation per pound of dry coal and the dry coal per square foot of grate surface per hour when using superheated steam. The graphical representation of this equation is shown in Fig. 5.

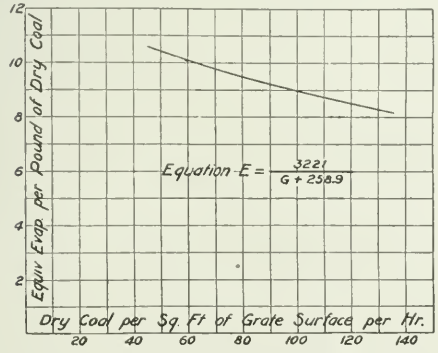

Fig. 5—Showing Relation between Equivalent Evaporation per Pound of Dry Coal and Dry Coal per Sq. Ft. of Grate Surface per Hour for the Engine Using Superheated Steam.

Performance of the Superheated Locomotive, Assuming Irregularities to Have Been Eliminated.—Table IV shows the performance of the locomotive when using superheated steam, assuming irregularities to have been eliminated. The results in this table were obtained from exactly the same tests as those from the locomotive when using saturated steam as shown in Table II, and may be compared with them.

THE INCREASE OF POWER OF THE SUPERHEATER LOCOMOTIVE OVER THE ORIGINAL LOCOMOTIVE WHEN USING THE SAME AMOUNT OF COAL.

Having now obtained the values as shown in Tables II and IV for the two types of locomotives, the curves as shown in Figs. 6 to 9 were plotted. By the use of the equations of the curves in Figs. 2 and 5, the equivalent pounds of steam per pound of coal can be determined for any rate of firing of either locomotive. Also, from Figs. 6 and 7, the equivalent pounds of steam per I. H. P. per hour can be determined for any cut-off, and from the lines shown in Figs. 8 and 9 the mean effective pressure for any cut-off can be ascertained. Now, assuming that the curves as shown in these figures fairly represent the performance of each locomotive, it is possible to obtain the performance of each locomotive at the same rate of firing—that is, burning the same number of pounds of coal per square foot of grate area per hour. Table V shows this comparison of the two locomotives while burning 110, 120 and 130 pounds of coal per square foot of grate.

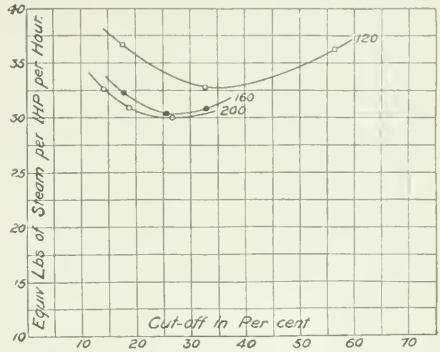

Fig. 6—Showing Relation between Equivalent Pounds of Steam per I.H.P. per Hour and Cut-off for the Engine Using Saturated Steam.

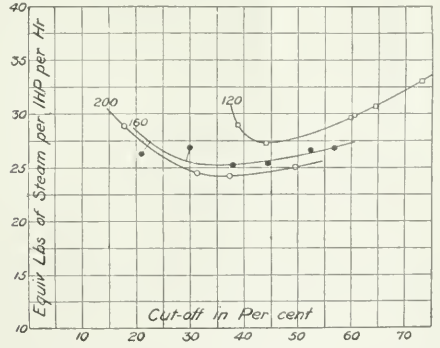

Fig. 7—Showing Relation between Equivalent Pounds of Steam per I.H.P. per Hour and Cut-off for the Engine Using Superheated Steam.

Column I of this table shows the rate of firing per square foot of grate per hour.

Column II gives the steam pressure, the comparisons being made at three pressures, namely, 200, 160 and 120.

Column III gives the equivalent evaporation per pound of dry coal for the original locomotive, and was obtained by substituting the values in column I for G in the equation $E = \frac{3{,}978}{G + 351.9}$

Column IV gives the equivalent evaporation per pound of dry coal for the superheater locomotive, and was obtained by sub-

stituting the values in column I for G in the equation

$$E = \frac{3,221}{G + 258.9}$$

Column V gives the equivalent pounds of steam per hour for the ordinary locomotive, and was obtained by multiplying the values in column I by those in column III and then by 17.

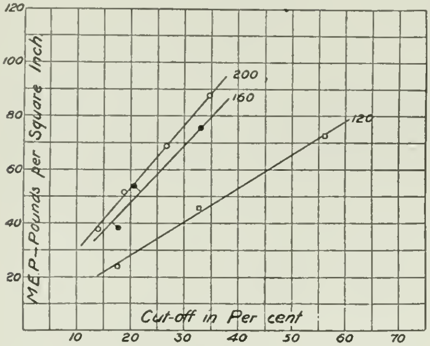

Fig. 8—Showing Relation between M. E. P. and Cut-off for the Engine Using Saturated Steam.

Column VI gives the equivalent pounds of steam per hour for the superheater locomotive, and was obtained by multiplying the values in column I by those in column IV and then by the grate area, which is 17 square feet.

Columns VII to XIV were obtained in a "cut and try" method, which is shown by the following example: When using 110 pounds of coal per square foot of grate area under a steam pressure of 200 pounds, we get at a 48 per cent. cut-off;

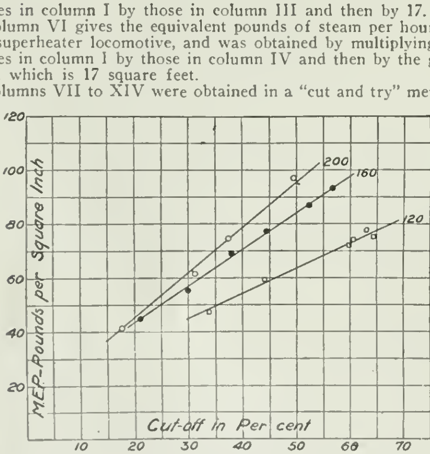

Fig. 9—Showing Relation between M. E. P. and Cut-off for the Engine Using Superheated Steam.

From the curve in Fig. 7, 24.9 pounds of steam per I. H. P. per hour;

130	120	8.25	8.28	18232.5	18298.8	54.9	66.7	35.6	31.8	71.7	81.0	508.2	575.3	13.0

From the line in Fig. 9, 92.2 pounds mean effective pressure.

$$\text{Thus, I. H. P.} = \frac{16325.1}{24.9} = 655.6.$$

Also I H P. = 4 (92.2) (.012144) (146.2) = 654.6.

At 48.2 per cent. cut-off we obtain from the curves in Fig. 7 24.9 pounds of steam per I. H. P. per hour, which gives I. H. P. = 655.6, and from the curves in Fig. 9 92.7 mean effective pressure, which gives I. H. P. = 658.2.

By looking at the above sets of values, it can be seen that at 48 per cent. cut-off the I. H. P. figured from the basis of pounds of steam per I. H. P. is greater than that figured from the basis of the M. E. P., and at 48.2 per cent. cut-off just the reverse is true. Therefore, the proper values must lie somewhere between 48 and 48.2 per cent. cut-off.

The proper value of 48.1 per cent. cut-off was found to give the same I. H. P. figured from the pounds of steam per I. H. P. per hour as figured from M. E. P.; that is, with 48.1 per cent. cut-off, the steam per I. H. P. per hour is 24.9 as obtained from the curve and gives an I. H. P. of 655.6. The M. E. P. at this cut-off is 92.4, and gives an I. H. P. of 656.0. These are so near the same that the 655.8 value was taken as the I. H. P. developed while burning 110 pounds of coal per square foot of grate. The four values mentioned above were used in the tables. The same process was used in determining the values for each line of Table V.

Column XV of Table V, which gives the per cent. increase in indicated horse-power of the superheater locomotive over the other locomotive, when using the same amount of coal, equals column XIV minus column XIII divided by column XIII and multiplied by 100.

DISCUSSION OF RESULTS.

Increased Power Due to Superheating.—It can be seen from Column XV, Table V, that the increase in power due to superheating, when burning from 110 to 130 pounds of coal per square foot of grate surface per hour, varies from 22.6 to 13.0 per cent. Also from the values in this column it can be seen that for any steam pressure the per cent. increase of power decreases as the coal consumption increases, and that for any coal consumption, the increase of power increases as the steam pressure increases.

The Effect of Increasing Size of Cylinder for Maximum Power.—By comparing the values of equivalent pounds of steam per I. H. P. per hour it will be seen that they are considerably larger than the best performance of the locomotive as obtained at a lower cut-off; that is, the cut-off of maximum efficiency for 160 pounds steam pressure is approximately 37 per cent., while the cut-off as obtained under 120 pounds of coal per hour is 55.5 per cent. The relative steam consumption for these two values of cut-off is 25.2 and 26.7 pounds per I. H. P. per hour, respectively. It will be seen that the increase in power to be accomplished by having the cut-off at the proper point to give maximum efficiency is about 5.6 per cent., as is shown in column VIII. That is,

$$\frac{26.7 - 25.2}{26.7} \times 100 = 5.6 \text{ per cent.}$$

In order to show this more clearly, the values in Table VI have been worked out.

Table VI—Superheater Engine 120 Pounds Dry Coal per Sq. Ft. of Grate Surface per Hour.

Steam Pressure	Cut-Off in Percent of Stroke	Equiv. Lbs. of Steam per I.H.P. per Hr.	M.E.P. Pounds per Sq. Inch	Cut-Off at Maximum Efficiency	Equiv. Lbs. of Steam per I.H.P. per Hr. at Maximum Efficiency	M.E.P. at Maximum Efficiency	Percent Increase in I.H.P.	Diam. of Cyl. in inches to give Maximum Efficiency
I	II	III	IV	V	VI	VII	VIII	IX
200	50.9	25.2	96.9	35.0	24.2	70.0	3.97	18.82
160	55.5	26.7	91.5	37.0	25.2	66.7	5.62	18.73
120	65.95	31.1	78.5	44.0	27.3	58.0	12.22	18.62

Columns I, II, III and IV were taken from columns II, VIII, X and XII, respectively, in Table V, at 120 pounds of dry coal per square foot of grate surface per hour. The values in column V, which give the cut-off at maximum efficiency, were taken at the lowest points of the curves in Fig. 7. The values in column VI, which give the equivalent pounds of steam per I. H. P per hour at maximum efficiency, were taken from the curves in Fig. 7 at the points of cut-off shown in column V. The values in column VII, which give the M. E. P. at maximum efficiency, were taken from the curves in Fig. 9 at the points of cut-off shown in column V. The values of column VIII, which give the per cent. increase in indicated horse-power, equals column III minus column VI divided by column III and multiplied by

Table VII.

Steam Pressure	I. H. P. Sat	I. H. P. Sup	Per Cent Increase in I. H. P.
200	567.8	217.0	26.3
160	553.1	689.0	24.5
120	487.2	636.0	30.0

100. The values in column IX, which give the diameter of cylinders necessary to obtain maximum efficiency, equal sixteen times the square root of values given in column IV divided by the square root of values given in column VII. The following sample calculation will show this more clearly. The diameter of the cylinders at present is 16 inches. The ratio of this to the new diameter required to give the same indicated horsepower must be inversely proportional to the square roots of the mean effective pressures. For 200 pounds pressure

$$\frac{X}{16} = \frac{\sqrt{96.0}}{\sqrt{70.0}} = \frac{9.86}{8.38}$$

$$X = 18.82$$

where X is the new diameter of cylinder.

The average of the three values in column IX is about 18¾ inches. Now, if the locomotive were equipped with 18¾-inch cylinders, when using 120 pounds of coal per square foot of grate, the cut-off could be at the most efficient point to obtain maximum power.

Under these conditions there would be an increase in power as shown in Table VII, or, in other words, the increase in power of the superheater locomotive over the other for the 160 and 200 pounds pressure would be about 25 per cent. if the size of the cylinders were increased to 18¾ inches, whereas at present the increase is about 20 per cent.

Table VII, showing the increase of power of the superheater locomotive over the other when using 120 pounds of coal per square foot of grate per hour if the cylinders were increased to 18¾ inches, is given below.

DISCUSSION.

C. D. Young (Penna.): As Professor Benjamin has said, we have both arrived at about the same destination by different means. The facts could not be otherwise, owing to the physical laws with which we were both working. There are two or three points in the paper to which I would like to call the attention of the membership, that in degree only differ from the results which we have obtained. In referring to diagram 5, from which it has been determined what would be the proper size of cylinders, the coal burning rate per square foot of grate when plotted against the equivalent evaporation per lb. of dry coal is slightly higher for the superheated than for the saturated. For example, for 80 lb. rate, the diagram shows it would be in the neighborhood of 9½ for the superheated locomotive, and about 9.3 for the saturated locomotive. All of our experience has indicated that the application of the superheater at a good burning rate, will reduce the equivalent evaporation per lb. of dry coal. In other words, we can expect less efficiency by the boiler alone, whereas the data shows that the superheated steam boiler has higher efficiency than the saturated steam boiler. The diagrams in the Committee's report are 24, where at 80 lbs. the E-6 locomotive gave when superheated, 9.4, and when saturated, 10 lbs. equivalent of water per lb. of dry coal. That has been all the difference we found due to the application of the superheater to the boiler.

All of Prof. Benjamin's tests were run at 30 m. p. h., and I do not think it is fair to make determinations on the results of one speed in the volume of cylinder. A saturated steam engine will give a given water rate at 30 m. p. h. which will probably be comparable with its cylinder volume, whereas at speeds of 60 to 75 m. p. h., you get the best rates from a passenger locomotive; freight at 30 miles, you are only getting the average superheat as compared with about as good as you can get from the saturated steam locomotive; therefore it would be well to consider a range of speed in making your water rates; for if you disregard these, you make the increase too small in the cylinder volume to get the maximum value.

J. E. DeVoy (C. M. & St. P.): We have under consideration the equipping of saturated engines with superheaters, and the opinion we have formed since coming here makes it that it would be better to throw away the present cylinders and increase the diameter of the cylinders, rather than try to say, bore them out one inch.

L. H. Fry: One point Mr. Young made in regard to the efficiency of the saturated boiler as compared with the superheated boiler can be applied to the locomotive. I believe this can be explained by the fact that the superheater boiler takes more air than the saturated boiler. I have followed the Purdue University test and it seems that in this particular engine, the application of the superheater reduced the resistance of the boiler to the passage of the air. The Purdue Superheater engine takes more air than the saturated, while in the Pennsylvania test the reverse is the case.

W. C. A. Henry (Penna.): We have a saturated engine with 20 in. cylinders, and when we apply superheater, I hope to get more fuel economy out of the change. These locomotives are now double-headed to a considerable extent owing to the increase in the weight of trains and fast schedules; so in working up plans, we made new drawings calling for a cylinder of 2 in. greater diameter than the ones that we used before. We hope to realize this increase in starting and in horse-power by so doing.

E. W. Pratt (C. & N. W.): On the North Western we had a number of the Pacific type engines, some of which were saturated and some superheated, and at the present time all the saturated engines have been changed, without enlarging the cylinders. We have not made any careful tests, but the results in operation appear to be a considerable saving of fuel and a livelier engine, by maintaining the same cylinder and fixing the boiler pressure to 185 lbs. In heavy trains, the 2 in. larger cylinder, superheated engine, with less pressure does the business more economically. That is the practical standpoint, covering our experience with over 100 locomotives.

F. F. Gaines: From a preliminary study of the two reports, it is indicated that larger cylinders point to larger economy, and going into that we will find at maximum cut-off we will have an engine with low adhesive factors.

C. D. Young: I think we will establish a diameter; but probably you may, with short-stroke engines, be able to increase the volume by increasing the stroke. That will have to be carefully considered in freight engines where the turning torque enters into consideration. As far as the Pennsylvania is concerned, we are increasing the size of cylinders of our freight engines. The first engine was a Consolidation, which had a tractive power of 42,000 saturated; and we have increased the cylinder size to where we obtain about 51,000 lbs. from the same identical boiler. This has been done entirely by an increase in the diameter of the cylinder. Even on exhaust cylinders this can be done, because our original pins and rods were figured with a sufficient factor to take care of the strength at the starting.

Such an engine has been on our test plant and for a freight engine, has given remarkable water rates. We have run the engine as low as 8 m. p. h., on full gear, on the locomotive test plant, something that we were never able to do before, owing to braking troubles, and at 8 m. p. h., we have developed more tractive power than we calculated for at the start, which is a rather remarkable figure, and we have had sufficient capacity in the boiler to operate it full gear up to something like 13 m. p. h. without affecting the steam pressure whatsoever. At these long cut-offs, the water rate is fairly comparable with the old saturated steam water rate, at the more economical cut-off, and when operating at 25 per cent. cut-off we have got as low as 17.8 lb of water per indicated horse power at slow speed, which shows that the compound superheater is somewhat in the distance.

J. F. DeVoy (C. M. & St. P.): I wish to say a word or two about the factor of adhesion. I believe, and have always thought, that we should take the greatest unit of power out of the locomotives that is possible. We have 80 consolidation engines with a factor of adhesion of 3.91, so that it does not appear to me that we are going to take a very big chance. With an engine built for long grades and sustained effort, we can afford to reduce the factor of adhesion. I am more alarmed about the stress on pins and rods and other things than I am about the factor of adhesion. I am fully convinced that in order to take all the power out of the locomotive that we should take, that we had better consider increasing the size of the cylinders in order to get the best results, so far as efficiency is concerned, and take a chance with the factor of adhesion.

F. F. Gaines: My experience has been that a slippery engine is a costly engine. We have some engines with a factor of adhesion of 3.9, which is around the neighborhood of what Mr. DeVoy speaks of, and we have another class of engines with the same tractive power, but have a higher factor of adhesion, and there is a difference in the maintenance cost of the two types of locomotives; the one with the lower factor of adhesion does slip and wears out the tires and pins and other parts of the locomotive much faster than the heavier engines do, and as a suggestion, possibly, to getting a larger cylinder, I think what might be done would be to block off the reversing lever, so that you could not get the engine down in a corner.

J. F. DeVoy: I wish it to be understood that my opinion is due to the country in which I am engaged in railroad operation.

G. W. Wildin (N. Y., N. H. & H.): There is one point which is brought out, and that is in applying the superheater to your locomotive, you add to the weight of your drivers from 3,000 to 5,000 lbs., which enables you to get a more effective engine by having a larger cylinder. We have some Pacific type engines, with 22 in. x 28 in. cylinders and 200 lb. pressure, which we changed over to superheaters. We retained the pressure and increased the cylinder to 23 in. x 28 in. and we have a 10 per cent. larger engine on the starting capacity and 25 per cent. larger engine on the hauling capacity.

Prof. L. E. Endsley: The design which was brought out

in the last application of the superheater through the Purdue Locomotive, was very carefully worked out so that the reduction in the heating surface made necessary was small in comparison to the size of the firebox. We all know that the firebox does a great deal more work per sq. ft. of heating surface, so that we did not reduce the water-heating surface so very much when we put in the last superheater. By adding the larger superheater with 324 sq. ft. of heating surface, we got a boiler that gave a very high efficiency, possibly higher than you would get today should you redesign any of your present saturated steam boilers. You would not have as much heating surface in your firebox of the boiler today as compared with the Purdue Locomotive. In fact, the last installation as put in with the superheater gave a much higher efficiency of the boiler than on any other superheaters which we have used, and we did not have nearly the total heating surface that we have now.

I do not think you would expect to get any such increased efficiency by the installation in a modern locomotive as Mr. Young described, but it so happened that at Purdue, this engine was built in 1897 for saturated steam and did not have as large a heating surface for the size of the locomotive as you would get today, and that accounts for the increase in the boiler efficiency as compared with the engine of today.

One thing which Mr. Pratt brought out was in relation to the reduction of pressure. I think it is pretty well shown by our tests that the difference in efficiency of the locomotive as a whole between 160 lb. and 200 lb. is small, and that if you do not want to increase the tractive power by increasing the size of the cylinder, you can reduce your pressure and not lose very much in the efficiency of your engine.

Insofar as steam is concerned, these tests were run at 30 m. p. h., that being a speed which gave the minimum steam consumption to the saturated locomotive. In the superheater locomotive, I think you will find, possibly, that it will be about the same.

The boiler efficiency is not affected by steam, it is merely the rate at which you put the coal in the locomotive. If you put it in at a high rate of firing, the efficiency will increase, and if you should attempt to maintain the same cut-off at higher rates, you will increase your coal consumption, and therefore decrease the efficiency of your boiler.

As to the question of added air, I was not able to follow just how we could get more air in. We have practically the same vacuum at the front end, the same area in the flues, practically the same grate areas, and I do not see how we can get any more air through to increase the efficiency. I think whatever increase in efficiency we get in the boiler is due to the firebox, in most of the cases, in both cases, and having enough flue area so that we have a sufficient heating surface. You will not get that in all locomotives, because we are taking advantage of every foot of flue area to get as many flues as we can, today. That was not taken advantage of in the design of the locomotive tested at Purdue under saturated steam.

A vote of thanks was extended to Dean Benjamin and Prof. Endsley for the very competent and able paper which they presented.

CONCLUDING EXERCISES.

The usual resolutions were offered thanking the Railway press in general and the *Railway Age Gazette* in particular for the daily reports of the convention's proceedings.

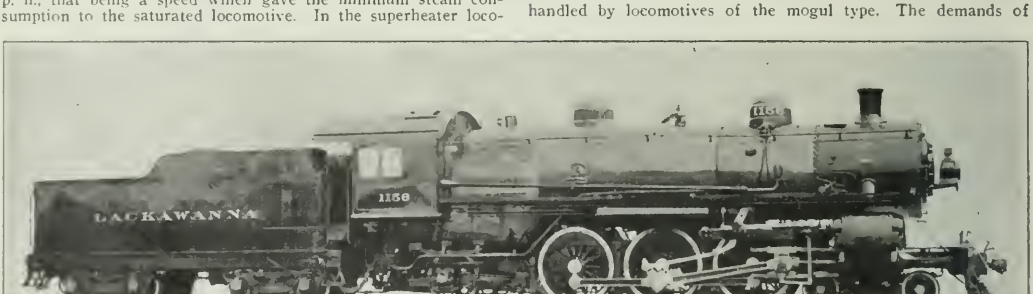
The following officers were elected for the ensuing year: President, D. R. MacBain, (L. S. & M. S.); first vice-president, F. F. Gaines, (Cent. of Ga.); second vice-president, E. W. Pratt, (C. & N. W.); third vice-president, Wm. Schlafge, (Erie), and treasurer, Angus Sinclair. Executive Members for two years: W. J. Tollerton (Rock Island Lines); J. F. DeVoy (C. M. & St. P.), and J. T. Wallis (Penna.). F. H. Clark (B. & O.) was elected for one year.

Scott H. Blewett presented Ex-President Crawford with the ex-president badge.

4-6-2 TYPE FREIGHT LOCOMOTIVE.

With a view of bettering operating conditions and reducing operating costs the Delaware, Lackawanna & Western has introduced several powerful new locomotives in both passenger and freight service. In June, 1912, the American Locomotive Company delivered to this company fifteen Mikado type freight locomotives, having a total weight of 312,000 lbs., and a tractive effort of 57,100 lbs., and seven Pacific type passenger locomotives having a total weight of 284,000 lbs. and a tractive effort of 40,800 lbs. These engines have so thoroughly demonstrated the fact that the most powerful locomotives of approved design are also the most economical, that not only have the Mikado and Pacific type engines been duplicated, but seven of the most powerful Pacific type locomotives have recently been built for use in fast freight service. These new locomotives have a total weight of 286,000 lbs., a tractive effort of 43,100 lbs., and a large and well proportioned boiler.

Previous to their introduction, the fast freight traffic was handled by locomotives of the mogul type. The demands of this traffic are constantly increasing, and fast outgrowing the boiler capacity of this type of locomotive. Hauling capacity depends on sustained tractive effort, which in turn depends on boiler capacity. To this end most careful attention was given to the boiler design in the new power.



Powerful Fast Freight Locomotive; Delaware Lackawanna & Western.

The mogul engines have a total weight, engine and tender, of 303,700 lbs., a tractive effort of 29,480 lbs., and a total heating surface of 2,185. The new Pacific type engines have a total weight, engine and tender, of 455,600 lbs., a tractive effort of 43,100 lbs., and a total equivalent heating surface (evaporating heating surface plus 1½ times the superheating surface) of 5, 292. As compared with the mogul type, this is an increase of 50 per cent. in weight, of 47.8 per cent. in power, and 142 per cent. in equivalent heating surface.

The following table shows the results of a test run between Scranton, Pa., and Hoboken, N. J., a distance of 133 miles. Although the men were not familiar with the new engines,

			Percentages	In favor of	
	2-6-0	4-6-2	2-6-0	4-6-2	4-6-2
lbs. of coal per engine mile.....	108.0	104.02	100	96.3	3.7
lbs. of coal per 1,000 ton miles....	102.8	75.14	100	73.1	26.9
lbs. of coal per 1,000 ton miles hours	15.13	9.81	100	64.7	35.3
lbs. of coal per 1,000 car miles....	3598.9	2509.0	100	69.7	30.3
lbs. of coal per 1,000 car miles hours	534.5	327.9	100	61.3	38.7
lbs. of water per engine mile.....	837	852.9	100	102.0	2.0
lbs. of water per 1,000 ton miles...	796.8	616.2	100	77.3	22.7
lbs. of water per 1,000 ton mile hours	171.3	80.4	100	68.5	31.5
lbs. of water per 1,000 car miles....	27891.5	20573.8	100	73.7	26.3
lbs. of water per 1,000 car miles hours	4142.1	2688.8	100	64.9	35.1

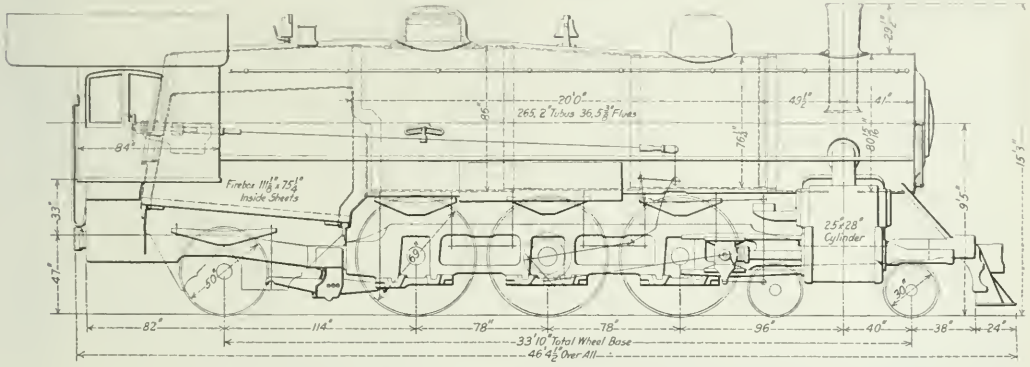
a very decided improvement in coal and water consumption per ton and car mile was obtained. On a train mile basis these new big engines handle their increased train loads on practically the same coal and water consumption as the smaller moguls.

The design is practically a conversion of the hard coal burning Pacific type passenger engine into a soft coal burning Pacific type fast freight engine. The change in fuel necessitated an entirely new design of boiler. With this exception and a reduction of 4 in. in the diameter of drivers and 3 in. in the diameter of the leading truck wheels, it is the same.

free from stoking boxes or operating levers. This valve is designed so that during periods of standing it can be closed and the water in the hose blown back into the tank, thus leaving the hose free from freezing. This was also devised by Mr. Riegel.

In the following table are given the principal dimensions and weights:

Type	462
Service	Fast freight
Fuel	Bit. Coal
Tractive effort	43,100 lbs.
Weight on drivers	186,500 lbs.
Weight on leading truck	49,[illegible]00 lbs.



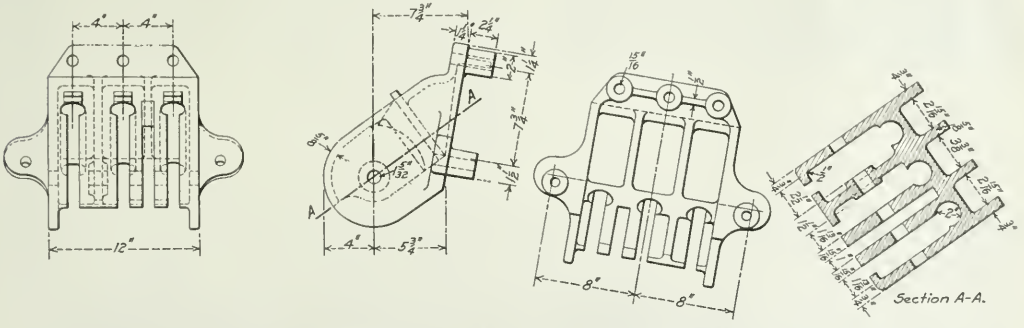
Pacific Type Fast Freight Locomotive; Delaware, Lackawanna & Western.

This means a duplication of almost all the parts that require the most frequent renewals or need to be kept in stock.

The design includes practically all of the improved features perfected by the builders. Among these are: The screw reverse gear, extended piston rods, self-centering valve stem guide, long main driving box, Woodard engine truck, improved outside bearing trailing truck, throttle lever support, and a specially designed draft gear on the engine front end. They also have superheaters, sectional brick arches, and pneumatic fire doors.

The engine decks are provided with a special design of

Weight on trailing truck	50,500 lbs.
Total weight of engine	286,000 lbs.
Total weight of tender	169,600 lbs.
Wheel base, driving	13 ft. 0 in.
Wheel base, total engine	33 ft. 10 in.
Wheel base, total engine and tender	66 ft. 4 in.
Cylinders, diameter and stroke	25 in. x 28 in.
Valve gear	Walschairt
Wheels, diameter of driving	69 in.
Wheels, diameter of truck	30 in.
Wheels, diameter of trailing	50 in.
Wheels, diameter of tender	36 in.
Journals, driving, main	11 in. x 21 in.
Journals, driving others	10½ in. x 13 in.
Journals, truck	6½ in. x 12 in.
Journals, trailing	9in. x 14 in.
Journals, tender	6 in. x 11 in.
Boiler, type	Ex. Wag. top



Riegel Grate Shaker Brackets; Delaware, Lackawanna & Western.

grate shaker brackets shown in the illustration. These are completely enclosed against the dropping of coal and permit the use of the standard tender apron without the necessity of covering the usual openings for the grate shaker brackets. They were designed by S. S. Riegel, mechanical engineer of the railroad.

The tenders are equipped with a low type, quick opening tank well, operating from the ground, and located outside the side sills of the underframe. This keeps the top of the tender

Steam pressure	200 lbs.
Boiler, outside diameter front end	78 in.
Boiler, outside diameter back end	86 in.
Firebox length	111-⅛ in.
Firebox width	75¼ in.
Tubes, number and diameter	265-2 in.
Flues, number and diameter	36-5⅜ in.
Tubes, length	20 ft.
Heating surface, tubes	3769 sq. ft.
Heating surface, firebox	221 sq. ft.
Heating surface, total	3990 sq. ft.
Superheating surface	868 sq. ft.
Grate area	58.0 sq. ft.
Water, capacity of tender	9000 galls.
Coal, capacity of tender	10 tons.

POWERFUL PACIFICS FOR THE ERIE.

The Lima Locomotive Corporation, Lima, Ohio, has recently completed an order of five Pacific type locomotives for use on the New York division of the Erie. These were ordered after considerable experience with experimental engine No. 50,000, built by the American Locomotive Company and purchased by the Erie. The size of the cylinders, length of stroke and diameter of drivers of the new engines are the same as those on No. 50,000, giving them the same tractive effort, *viz.*: 40,630 lbs., but a number of alterations have been made in the boiler. The new design has a firebox 84 in. wide, giving a grate area of 66.6 sq. ft. in place of 59.75 sq. ft. on No. 50,000. The number of tubes has been reduced from 207 to 199 and a straight top instead of a conical type boiler has been specified. The diameter at the front end has been increased from 76⅜ in. to 78 in. but the diameter at the dome is 81¼ in. instead of 87 in. The number of superheater elements is also less, there being 32 in this case as compared to 36 in the experimental engine. In spite of the wider grate the firebox heating surface is less and the total heating surface is 3,813 sq. ft. No. 50,000 has 4,048 sq. ft. evaporating surface.

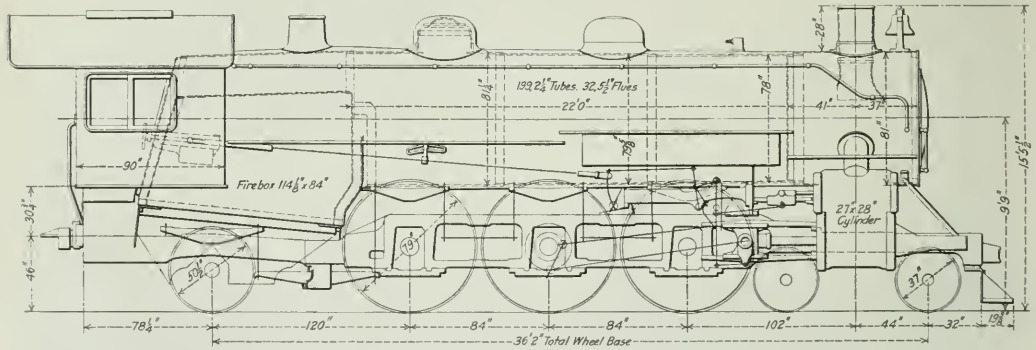
These changes have affected the weights somewhat, but, contrary to what might be expected, it has increased them. No. 50,000 has a total weight of 269,000 lbs. while the new engines weigh 286,825 lbs. in working order. The weight on drivers is 175,725 lbs., an increase of 3,225 lbs. The ratios have also been materially altered as will be seen by comparing the list below and the list published on page 12 of the January, 1912, issue of the *American Engineer*.

The location of the bell ahead of the smoke stack is an innovation that has not been tried before on this railroad. The reason for the change is the belief that a warning can be heard more distinctly when the bell is located in this manner than when it is in the usual position.

The main driving boxes are of the extended design giving a bearing area of 11 in. x 21½ in. The screw reverse gear is used and the locomotives have Baker valve gear. Among the other specialties applied are: Franklin fire door; Chicago flange lubricator; Security brick arch; Ryan and Johnson coal pusher; radial buffers; Leach sanders, Dressel oil headlight; Simplicity bell ringer; Tallmage ash pan; full installation of Tate flexible staybolts; Klinger water gage and U. S. King type piston and valve rod packing. Vanadium steel is used for the frames and rods, and Hunt-Speller iron is employed for piston and valve bushings and rings.

The general dimensions, weights and ratios are given below:

General Data:	
Type	4-6-2
Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Bit. coal
Tractive effort	40,630 lbs.
Weight in working order	286,825 lbs.
Weight on drivers	175,725 lbs.



New Pacifics for the Erie; Designed on the Basis of Experience with No. 50,000.

Weight of engine and tender (loaded)	469,585 lbs.
Wheel-base (driving)	14 ft.
Wheel-base, engine and tender	68 ft. 4⅛ in.
Wheel-base, total	36 ft. 2 in.
Ratios:	
Weight on drivers ÷ tractive effort	4.32
Total weight ÷ tractive effort	7.06
Tractive effort × diameter drivers ÷ heating surface	604
Total heating surface ÷ grate area	57.2
Firebox heating surface ÷ total heating surface, per cent.	5.45
Weight on drivers ÷ heating surface*	33.05
Total weight ÷ heating surface*	53.95
Volume both cylinders, cu. ft.	18.54
Heating surface* ÷ vol. cylinders	286.73
Grate area ÷ vol. cylinders	3.59
Valves:	
Kind	Piston
Greatest travel	6 in.
Outside lap	1¼ in.
Inside clearance	3-16 in.
Lead	¼ in.

Pacific Type Locomotive for the Erie, Built by the Lima Locomotive Corporation.

Cylinders:	
Kind	Simple
Diameter and stroke	27 in. x 28 in.
Wheels:	
Driving, diameter over tires	79 in.
Driving, thickness of tires	4½ in.
Driving journals, main	11 in. x 21-½ in.
Driving journals, others	11 in. x 13 in.
Engine truck wheels, diameter	36 in.
Engine truck journals	6½ in. x 12 in.
Trailing Truck wheels, diameter	50-½ in.
Trailing Truck journals	9 in. x 14 in.
Boiler:	
Style	Straight
Working pressure	185 lbs.
Outside diameter of first ring	78 in.
Firebox, length and width	114⅛ in. x 84 in.
Firebox plates, thickness	⅜ in.
Firebox, water space sides and back	4½ in.
front	5 in.
Tubes, number and outside diameter	199-2¼ in.
Flues, number and outside diameter	32-5½ in.
Tubes, thickness	.125 in.
Flues, thickness	.150 in.
Tubes, length	22 ft.
Heating surface, tubes and flues	3575 sq. ft.
Heating surface, firebox	208 sq. ft.
Heating surface, arch tubes	30 sq. ft.
Total heating surface	3813 sq. ft.
Superheating surface	1002 sq. ft.
Equivalent heating surface	5316 sq. ft.
Grate area	66.6 sq. ft.
Smokestack, diameter	18.5 in.
Smokestack, height above rail	15 ft. 5½ in.
Tender:	
Wheels, diameter	33 in.
Journals, diameter and length	6 in. x 11 in.
Tank	Water bottom
Water capacity	8500 gals.
Coal capacity	14 tons

*Equivalent heating surface equals total heating surface plus 1.5 times superheating surface.

Improved Cast Steel Truck Side Frames.—Many mechanical men have long felt that the cast steel truck side frames, designed with the "I" sections now generally used, do not have sufficient strength transversely. A truck frame with channel sections throughout would be best for taking care of the transverse strains, but the foundry difficulties involved in making side frames of this type have so far precluded their use. However, The Buckeye Steel Castings company, Columbus, Ohio, has developed a side frame with the channel sections throughout so that for the same amount of metal the transverse strength is almost three times that of the "I" section of equal area, and at the same time the vertical strength is not decreased. Samples of these designs are on exhibition in Booths 603-605.

Yeungkong-Kongmoon Line, China.—The progress of this line is being retarded by a quarrel about a bridge over the river between Sanui and Kongmoon. There has been a good deal of delay over the building of this structure, and the train does not run any farther than Kongmoon city, which is some four or five miles away from the terminus; that is, the station at Kongmoon. The river runs through this section. An influential body of men signed a petition, and sent it in to headquarters, Canton, asking that the bridge be not allowed, but the reply was that the company was to set to it that the work of constructing the bridge was put through at once, for it was too late to let the prejudices of the few in the vicinity hinder this important work.

Motor Car Service Proposed in China.—It is proposed to institute motor-car service between Lungchow, China, and Nam Kwan, the present northern terminus of the railway from Hanoi. The commencement of this service would be contingent upon the successful operation of a line of launches between Lungchow and Nanning, and would, it is claimed, constitute, next to the extension of the railway to Lungchow, the best solution of the difficulties that hamper and restrict the trade of the port. The proposed service would handle passengers, light freight and parcels, while the heavier and more bulky cargo would continue to come and go by water. The present existing roads would require only moderate improvement to make them serviceable for motor cars. It is doubtful, however, whether this suggestion will receive any consideration from the people of Lungchow.

Conventionalities.

The fact that there is no ball game today will "bear" the amica market tomorrow.

Ask Burt White of the National Boiler Washer Co. the sequel to the yarn of the Superheater pants?

Lost—Diamond bar pin on the pier during the M. M. dance Thursday evening. Please return to enrollment committee booth.

Mrs. Pateman, wife of "Doc" Bateman, and the two young Docs, Huston and Stanley, are scheduled to arrive on the scene to-day.

E. A. Laughlin, vice-president of the Joliet Ry Supply Co., Chicago, arrived Monday evening and is stopping at the Traymore.

The Davis twins, Nathan H. and Thomas C.—they of steel back fame—spent Friday on the Pier. They are due to return on Monday.

The Superheater white pants had a "day off" yesterday to keep an appointment with the valet. There is some speculation out in the Annex where they will appear next.

On Friday, June 13, 1913, at 9.13 A. M., Chairman Yardley, of the Enrollment Committee, issued M. M. badge No. 313. The next badge issued was a special guests' badge, No. 1313.

Left to right—J. F. Hill, Master Mechanic, Wheeling & Lake Erie, and F. P. Pfahler, Inspector, Interstate Commerce Commission.

One of the first timers is K. C. Gardner, chief clerk in New York of the Pressed Steel Car Company. Not only is this Mr. Gardner's first convention, but it is his initial visit to this seaside resort.

Mr. and Mrs. W. E. Fowler, Chicago, will be missed at the conventions this year. Mr. Fowler was formerly master car builder of the Canadian Pacific. he is now president of the Fowler Car Company.

P. H. Wilhelm, of the Standard Leather Packing Company, accompanied by Mrs. Wilhelm, reached Atlantic City Thursday. This is Mr. Wilhelm's twenty-third M. M. and M. C. B. Convention, without a miss.

George A. Post, president, and E. H. Walker, vice-president of the Standard Coupler Company, arrived yesterday, and are at the Marlborough-Blenheim. Col. Post, who is president also of the Railway Business Association, speaks optimistically as to public opinion regarding railway matters. He believes there has

been a marked improvement in recent years, and that this is going to continue.

Owing to illness in his family it is greatly regretted that J. F. Graham, assistant general manager of the Oregon-Washington Railroad and Navigation Company, could not this year make the trip to Atlantic City.

The friends of S. K. Dickerson, who for so many years was connected with the Lake Shore and was recently made superintendent of motive power of the Big Four, are extending congratulations on the new job.

Among the convention visitors are Mr. and Mrs. D. J. Gilliland. Mrs. Gilliland was formerly known to those attending the conventions as Mrs. W. P. Appleyard. She and Mr. Gilliland were married on June 2.

Mrs. E. M. Grove and Miss Grove arrived Thursday and, with Mr. Grove, are staying at Chalfonte. The family left Pittsburgh together; but Mrs. Grove and Miss Helen stopped off at Philadelphia to visit Mrs. Grove's mother.

S. F. Bowser, president of S. F. Bowser & Co., is attending the conventions for the first time. This is also true of S. B. Bechtel, assistant general manager, and D. A. Correy, manager of engineering sales of that company.

Ex-superintendent of motive power Peter Maher, of the Chicago & Alton, Bloomington, Ill., who has retired from the active field of railroading, will be unable to attend the conventions this year on account of Mrs. Maher's recent severe illness.

Mrs. Robert Radford, wife of the secretary of the Standard Steel Works Company, is spending a few days here. She and Mr. Radford came over from their summer home at Ocean City on Wednesday. Mrs. Radford expects to return to-day.

E. S. Wortham, manager of purchases and supplies of the Chicago & Alton, fully expected to be in Atlantic City at this time and Mrs. Wortham was to accompany him. At the last moment Mr. Wortham was detained by important business.

M. D. Franey, who was recently promoted to the position of master mechanic on the Lake Shore, with headquarters at Elkhart, Ind., is wearing an unusually broad smile, and has made a thorough job of looking over the exhibits on the pier. He left last night.

Alfred I. du Pont, vice president, and Frank L. Connable, general manager, of the du Pont Powder Company, are visiting the exhibits at the invitation of their friend, J. A. Carey, vice president and general manager of the Standard Stoker Company.

John F. Newhouse, Master Mechanic, Kentucky & Indiana Terminal, Louisville, Ky.

W. E. Dunham, Supervisor Motive Power and Machinery, Chicago & North Western.

J. W. Gardner, general manager, Allis-Chalmers Company, is attending the convention this year as a guest of R. D. Smith, superintendent of motive power, Boston and Albany. This is Mr. Gardner's first convention since 1905, when the Association met at Manhattan Beach.

W. J. Frauendiener, superintendent of shops on the Lake Shore at Elkhart, Ind., has his wife with him this year. He is very much interested in the welding of tubes by electricity, which is being very successfully done on the Lake Shore; he was closely connected with the development of this work at the Elkhart shops.

J. M. Hopkins, president of the Camel Company, who is at the Marlborough-Blenheim, is attending the conventions alone this year. Mrs. Hopkins and J. M., Jr., have been traveling for some time, and are still there. They were accompanied on part of their trip by Mrs. Hopkin's father, A. J. Farley, who is well-known to convention visitors.

Mr. and Mrs. Theodore H. Curtis, Chicago, were unable to attend the conventions this year. Mrs. Curtis has been ill, but is rapidly regaining her health. Mr. Curtis was formerly superintendent of machinery of the Louisville & Nashville. He is now mechanical engineer of the Chicago Association of Commerce board of engineers on smoke prevention and electrification.

Allen Sheldon, manager of the Permanent Exhibition of Railway Supplies in the Karper Building, Chicago, is spending most of his time on the pier seeking whom he may devour. Not having decided until the eleventh hour to come to Atlantic City, he suffered the fate of the rest of the delinquents and had to be content with bunking at one of the smaller hotels—The Lexington.

F. H. Reagan, superintendent of the Delaware, Lackawanna & Western shops at Scranton, Pa., spent Thursday and part of Friday at Atlantic City, returning to Scranton by way of Philadelphia, where he expected to make a short stop. The new shops at Scranton are now about two and a half years old and are operating with exceptionally good results.

George W. Lyndon, Chicago acting secretary of the association of manufacturers of chilled car wheels, accompanied by E. C. Edwards, secretary of the Association, arrived Thursday and registered at Haddon Hall. Mr. Lyndon has spent most of his active life with the chilled iron wheel. His contributions to the technical press on the subject are sought by the editors. His knowledge of the properly made iron wheel is most thorough and his published efficiency data on the subject is spark-

D. Petrescu, Inspecting Engineer, Roumanian Government Railway.

ling. It is even said by his friends that he put the "pep" in "pepper."

The photograph in Friday morning's *Daily* labeled "Two Master Mechanics of the New York Central & Hudson River" was not intended as a puzzle picture. In some way the second and third lines of the caption were lost. The two master mechanics were M. H. Strauss, of New Durham, N. J., and W. G. Babcock, of High Bridge, N. Y. Mr. Strauss is the one in the Panama hat.

Gaetano Lanza, professor emeritus, Massachusetts Institute of Technology, attended the convention Thursday morning. Professor Lanza is at present conducting special investigations on crank axle design for the Baldwin Locomotive Works at Philadelphia. He is a member of the committee on Main and Side Rods, and has been an associate member of the Association for a number of years.

A. M. White, superintendent of the Manchester Works of the American Locomotive Company, objects, and very properly, to the statement in Thursday's *Daily* that he has not been able to attend the conventions regaularly in recent years. "As a matter of fact." Mr. White writes to the *Daily*, "I have been in attendance for the past twenty-seven years. My first meeting was in 1872, but being general foreman of a railroad shop who at that time was not eligible as a member, I could attend only as a guest."

President Crawford had a rather disturbing incident happen at his home in Pittsburgh day before yesterday. Mr. and Mrs. Crawford spent the summer months at the Country Club, and received advice by wire that it had been burned to the ground. The garage was also destroyed, but Mr. Crawford's machine was removed without suffering damage. He and Mrs. Crawford went West last night to get things straightened up, but expect to return to Atlantic City on Sunday morning.

Mrs. George M. Basford returned home yesterday to officiate at the laying of the corner stone of the Westchester Woman's Club at Mt. Vernon. This club has a membership of over 450, and has a number of sections which are doing active and progressive work along the lines of domestic economy, child training and other subjects of special interest to women. Mrs. Basford is president of the club and has had an exceptionally good administration during the first year of her term, which has still another year to run. The program of the laying of the corner stone includes the name of only one man, and that is the Mayor of Mt. Vernon. The various addresses, the prayer, etc., will all be made by women. Mrs. Basford—according to G. M.—wishes to have it distinctly understood that she is not a suffragette.

P. P. Mintz is attending his first convention as mechanical engineer of the Lake Shore. He has had all his railroad experience with that road, and during the past year has given a great amount of attention to the problem of locomotive boiler maintenance. Mr. MacBain, the superintendent of motive power, acknowledged his services in connection with the boiler maintenance report at the Thursday morning meeting but the stenographer did not get the spelling of the name quite right, and it was credited to Mr. Demarest in the *Daily* of June 13, page 1355.

George P. Fox, general foreman car department of the New York Central & Hudson River, at West Albany, reports that the new passenger car shop which was placed in operation during the past year is in good working condition. Six new steel baggage cars have been built during the year, and work is now being started on three new all-steel dining cars. The car shops at West Albany are now handling all of the passenger car work on the New York Central & Hudson River and are splendidly equipped for that purpose.

Although Will Johnson remembers his recent trip abroad with a great deal of pleasure (and incidentally Will says he got some orders over there) he declares that his headlight was not to blame for the accident which occurred on the Shanghai-Nanking railway, in China, in which one death resulted. Will says the following official report was made by the station master to his superior officers: (1) The death named—was smashed by the engine on 3-10-13. (2) Has two sons—and—(3) The death without ticket. (4) The death's fault. (5) The death no relative see. (6) The death is deaf and blind. No cannot say what was.

A. M. Waitt, formerly superintendent motive power of the New York Central, was referred to in one of the issues of the *Daily* as a past vice-president of the M. M. Association. He should have been mentioned as a past president, he having held that office in 1901-1902. Mr. Waitt has missed the last four conventions, being abroad a good deal of the time, but he is here this year, and is at the Marlborough-Blenheim. Few men who have been connected with the railways of the United States have had as good opportunities as he to compare their practice with that of the railways of Europe, and he talks very interestingly of the latter. He expects to make another trip to Europe in a short time. Mr. Waitt is one of the comparatively few American business men who have early made a resolution to retire at a predetermined age and have carried it out, and his

J. L. Meehan, Master Mechanic, Ashland Coal & Iron Company, Ashland, Kentucky.

friends are glad to see him at the conventions in which for many years he was an active participant.

John Philpot, foreman of the machine shop of the car department of the New York Central & Hudson River at West Albany, is attending the convention, and expects to return home the latter part of the week. The large amount of all-steel equipment which is being handled at the West Albany shops

C. B. Young, Mechanical Engineer of the Burlington.

has necessitated the addition of a considerable amount of new equipment to the machine shop during the past year. This includes a 10-in. gate shear, plate straightening roll, 5-ft. radial drill, two 21-in. upright drills, one 1½-in. Rich high speed drill, 15-in. throat horizontal punch, 48-in. heavy punch and shear, 24-in. and 36-in. combination punches and shears, and a 3-in. forging machine. Mr. Philpot has been with the New York Central for over 15 years.

E. B. Leigh, president of the Chicago Railway Equipment Company, arrived Friday and is at the Traymore. Arthur

Henry Gardner, Supervisor of Apprentices, N. Y. C. Lines East.

Wyman, assistant to the president of the same company, is expected to arrive this week. Mr. Leigh returned only recently from his vacation. He went from New York by steamer to Texas, and thence to his ranch, which is about 60 miles from San Antonio. Unfortunately, he was able to stay there only two weeks, being called back by a fire in the Franklin plant of the company. He came to Atlantic City by way of New York, where on Tuesday he attended a meeting of the executive committee of the Railway Business Association, of which he is a member. Mr. Wyman was accompanied as far as New York by Mrs. Wyman, and expects after the conventions to return there and go on his vacation.

Professor A. J. Wood, of the Pennsylvania State College, is very enthusiastic over the progress which has been made in railway mechanical work at that institution during the past year. He is accompanied by several of the engineering students who are interested in the railroad course. The college has doubled its attendance in five years, there being now over 2,600 students, a third of whom are in engineering courses. There are about 30 taking the new course in railroad mechanical engineering, the equipment for which is being added to each year. All engineering students of this institution are now required to spend 18 weeks in summer employment by the industries. One railroad has taken on four students for this summer, beginning their special apprenticeship course in this way instead of waiting until after graduation. Professor Wood states that this plan of summer practice is working to the satisfaction of both the college and to the outside interests. The greatest advantage comes

T. E. Hessenbruch, General Inspector, Philadelphia & Reading.

from the discipline received at a period when it counts for the most.

Thomas Aldcorn, general eastern sales agent of the Chicago Pneumatic Tool Company, and Mrs. Aldcorn, celebrated their twenty-fifth wedding anniversary with a dinner at the Marlborough-Blenheim Thursday evening. The affair was a complete surprise to Mr. Aldcorn. Mrs. Aldcorn came down from New York especially for the occasion. The guests present were all connected with the company and included W. O. Duntley, president; Mrs. J. F. Duntley, Miss Blanche Duntley, Fred. D. Johnson, managing director of the company in London; W. P. Pressinger, general manager compressor department; Charles E. Walker, general manager railroad department; C. E. Coates, manager electric tool department; and Mr. and Mrs. J. C. Campbell, Burton H. Tripp, Mrs. L. Summers, Mr. and Mrs. J. W. McCabe, Miss J. McCabe and "Doc" W. H. S. Bateman, C. E. Walker, in behalf of the guests, presented Mrs. Aldcorn with a silver chatelaine bag, and to Mr. and Mrs. Aldcorn a silver service. After Mr. and Mrs. Aldcorn had made appropriate speeches of acceptance, "kiss the bride" was in order. Mrs. Aldcorn faced the ordeal with becoming charmingness.

MASTER MECHANICS' REGISTRATION.

Alling, E. W., M. M., N. Y., N. H. & H., Strand.
Edwards, J. B., Master Mechanic, Col. Newberry & Laurens R. R., Sterling.

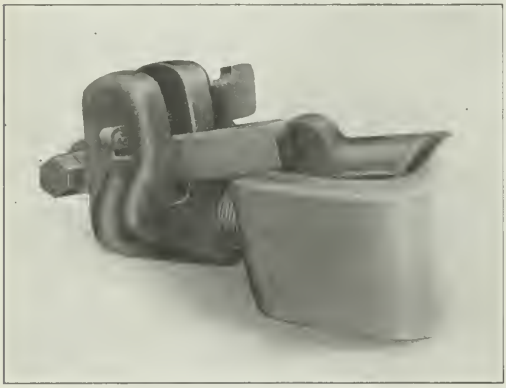
BUDA-ROSS ELECTRIC HEADLIGHT.

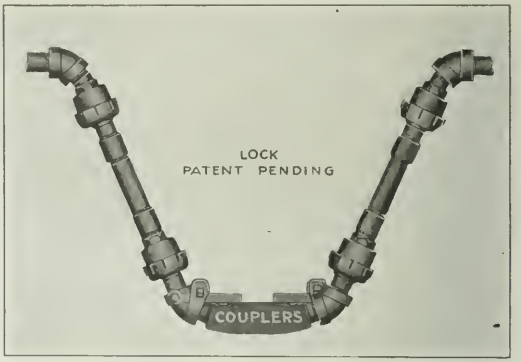
The Buda Company, Chicago, has recently formed a headlight department for the manufacture and sale of the Buda-Ross electric headlight. Mark A. Ross, who has been identified with the electric headlight industry for the past 16 years, is in charge of the department and is assisted by Harry P. Bayley and John Eberhart. One of the new headlights is being exhibited at the Buda Company's booth.

LOCK FOR STEAM HOSE COUPLINGS.

With the high pressures frequently required on the steam heat train line there is an increasing tendency for the couplers to rise from their normal position and leak. The Greenlaw Manufacturing Company, Boston, Mass., is exhibiting a locking device to prevent this trouble. It is shown as applied to the design of flexible metallic hose manufactured by this company and consists of a lever attached to the hose elbow which, when in position, bears firmly on the top of the opposite coupler head. The lever is held in place by a key fitting through a slot above it. When it is desired to disconnect the hose, the key can be quickly released, the lever raised and the coupler head is freed for uncoupling. While this lock is shown in the illustration as in use with two metallic hose, its operation is equally efficient if one is a rubber hose. It is arranged to operate with any type of coupler head.



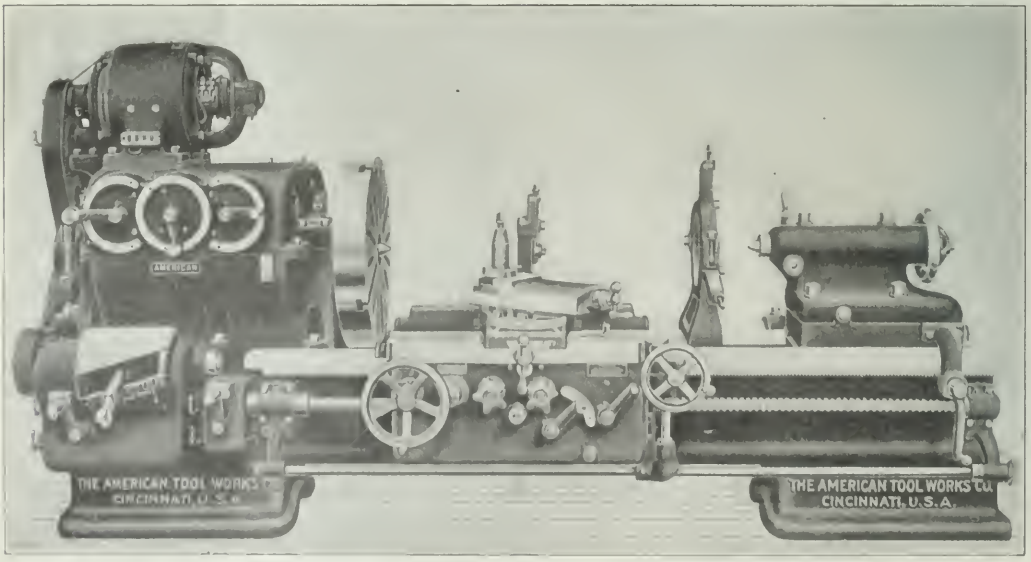
Locking Device for Steam Hose Couplings.



Steam Heat Line Couplings Locked in Place.

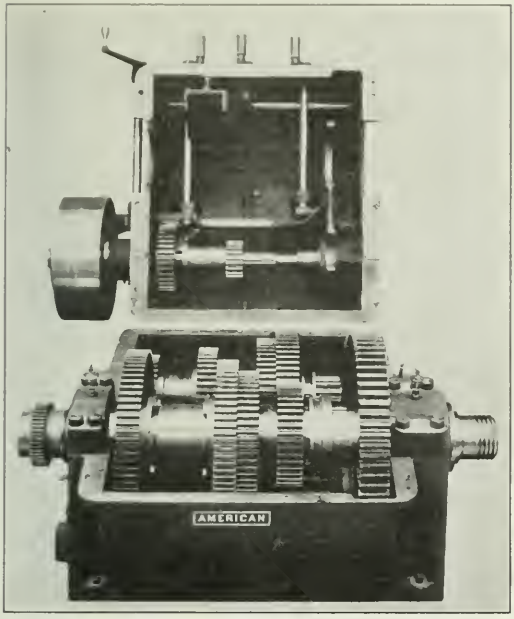
TWELVE-SPEED, GEARED HEAD FOR LATHES.

The American Tool Works Company, Cincinnati, Ohio, is exhibiting a new 12-speed, geared head for application to its 30 in. and 36 in. lathes. This head is of the compound, back-geared type and is furnished for either belt or motor drive. Twelve spindle speeds are obtainable, ranging from 6 to 200 r. p. m., by the operation of levers on the front of the head; an index plate located on the head indicates how to obtain the various speeds. The maximum gear ratio is unusually high, being 43.3 to 1. The head is heavily con-



Heavy Duty 36-in. Lathe Driven Through a Twelve-Speed Geared Head.

structed and an important feature is its simplicity, as only 12 gears are used to produce the 12 spindle speeds. The gears are cut from the solid with special cutters, are of wide face and coarse pitch and are tested for accuracy on special machines; the teeth of the slip gears are machine



Interior of Twelve-Speed Geared Head.

rounded to facilitate meshing. The driving pulley runs on a bronze bushed steel sleeve, thus relieving the driving shaft of all belt strain. The pulley has an improved automatic oiling system and a friction clutch controlled by a drop lever is provided, by means of which the gears in the head can be stopped or slightly moved without interfering with the driving belt, thus permitting speed changes to be easily made. The head-stock can be quickly converted into a motor drive at any time after installation by simply removing the pulley drive unit, placing a motor on top of the head-stock, and connecting it to the driving shaft through a spur gear.

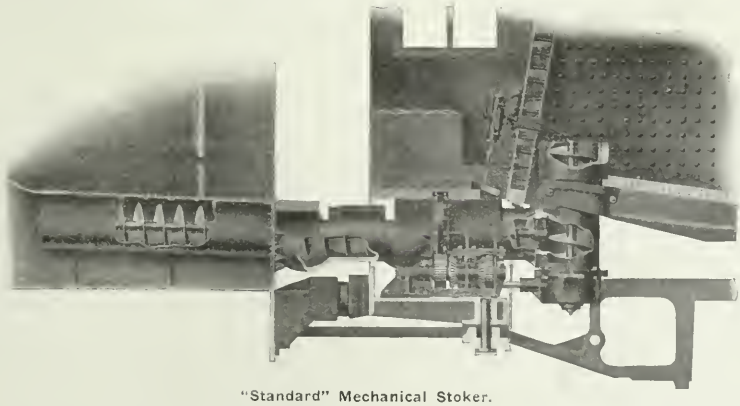
THE "STANDARD" MECHANICAL STOKER.

One of the exhibits that is attracting general attention is a new design of mechanical stoker being shown by the Standard Stoker Company, New York. It provides for conveying the fuel from the tender by means of a screw conveyor located in a trough under the floor of the coal space. This trough is covered by a grating with 6-in. openings and by sectional covers each about 15 in. in length. The conveyor carries the fuel under the deck of the cab and discharges to a similar vertical conveyor which rises through the grates and discharges the fuel at a point about 12 in. above the grate level at the center of the back of the firebox. The section of the stoker projecting above the grates and in the fire bed is protected by a ring of a special quality of iron which has great heat resisting properties. This ring is also further cooled by the admission of exhaust steam from the small engine driving the stoker which is discharged through passages on its interior, emerging at the top. Arrangement is made for the ready renewal of this ring, if it becomes burned, without inconvenience or delay.

Six steam jets from the ends of four small pipes projecting through an opening in the back water leg, distribute the coal from the top of this conveyor to the various parts of the fire bed. These jets are intermittent in their action, being controlled by a specially constructed valve which, by its reciprocation, allows a small amount of high pressure steam to escape through each of the four pipes successively. The pressure in each pipe can be controlled by means of a globe valve, permitting full control of the distribution. The reciprocating valve and its immediately associated parts are the only parts of the stoker that are located in the cab.

The machine is driven by a small reciprocating engine secured to the outside of the frame on the left side of the locomotive immediately under the cab. The main driving shaft from this engine drives a short intermediate shaft, through beveled gears, which is connected by reduction gearing to the conveyors, both horizontal and vertical. An eccentric operated from the main shaft provides a reciprocating motion for the distributing jet control.

An interesting feature of the design is the arrangement for providing a flexible motion in the conveyor trough between the locomotive and tender. This is done by means of a double ball and socket arrangement and the use of universal joints on the shaft of the screw. By this means the horizontal conveyor, complete, is driven from one point which is under the cab deck and convenient for inspection.



"Standard" Mechanical Stoker.

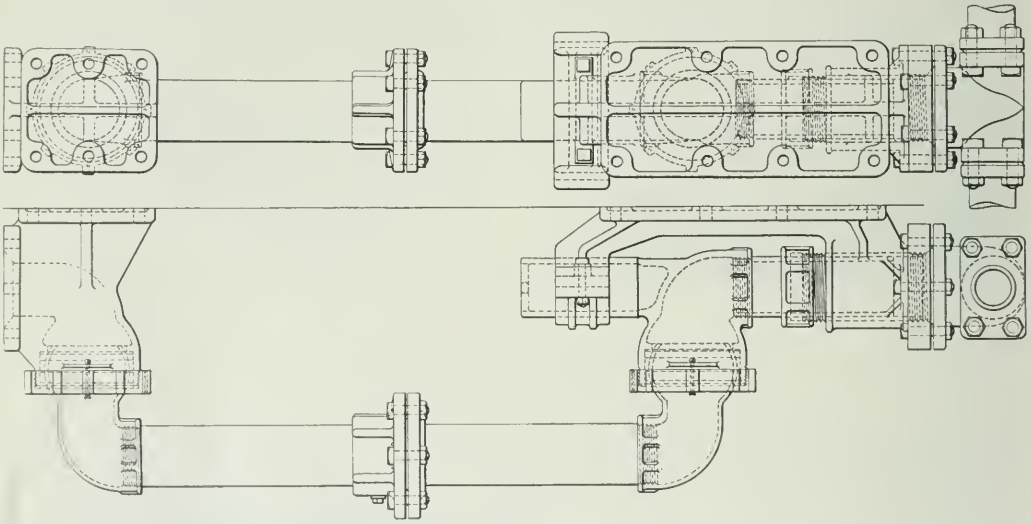
Any coal that will pass through a 6-in. opening, which will permit it to enter between the flights of the conveyor, can be handled by the stoker. Large pieces will ,of course, become somewhat crushed when it is forced to the vertical screw, and

the fuel as discharged from the top will be comparatively small pieces which are easily handled by the steam jets. The intensity of the steam jets is under full control of the fireman.

A stoker of this design is now in experimental use on a large consolidation locomotive on the New York Central & Hudson River. Experience up to the present time has indicated its success.

FRANKLIN WATER JOINT.

The Franklin Railway Supply Company, New York, is exhibiting a flexible metal connection for the injector supply between the engine and tender. This device is shown in the illustration and consists of two ball joints connected by suitable lengths of pipe, one of the joints being rigidly mounted on either the engine or the tender while the other is so mounted as to take care of all movement. Only one of these connections is used on a locomotive, as it is made sufficiently large to supply enough water for both injectors. In order to reduce wear to a minimum, the connection is placed directly under the drawbar, this being the point where the least movement is required. A flanged joint is used to connect the two pieces of pipe through which the water passes between the ball joints. A device of this kind will readily commend itself to motive power officers, particularly on roads which operate in cold climates where much trouble is often experienced with hose connections in the winter months.



Franklin Water Connection for Injector Feed.

SPRAGUE ELECTRIC HOIST.

Some new features in hoist construction are incorporated in the one-ton hoist which is on exhibition in the booth of the Sprague Electric Works. It is equipped with a 1½ h. p. direct current motor and is suspended from a motor driven trolley carriage which runs on the lower flanges of an I-beam. The motor is controlled by means of a special foundry controller intended to give the very slow speeds which are necessary to satisfactory foundry operation; this speed control may also be used to advantage for any work which requires delicate manipulation such as setting driving wheels and heavy castings in lathes. One of the interesting features of the machine is that which provides for the entire mechanism being completely enclosed. There is nothing exposed outside the frame except the wheel which operates the controller shaft, the controller itself, the rheostat and all other parts being completely protected. An automatic safety device prevents the hook from over-running when it reaches the upper limit of its travel. The controller cylinder becomes disengaged from the operating wheel and returns to the "off" position, although the operating wheel may be held in the "on" position. This concentrates all the electrical contacts within the controller itself, eliminating the necessity for additional and external contacts to break the circuit when the limit operates.

OXYGEN GENERATORS.

The use of oxygen in this country for welding and cutting operations is growing at such a rapid rate that the several large companies engaged in making commercial oxygen are having difficulty to keep up with the demand. Compared with foreign countries, however, the consumption of oxygen by railways in this country is comparatively small. It is stated that one railway in France uses over 2,500,000 cu. ft. of oxygen a year and in England practically every railroad has oxy-acetylene or oxy-hydrogen installations in nearly every repair shop.

The future prospects in this direction makes the improved oxygen generating apparatus that is being exhibited by the International Oxygen Company, New York, of special interest at this time. This company has on exhibition its standard type of generator which will produce 3½ cu. ft. of oxygen and 7 cu. ft. of hydrogen a kilowatt hour. The oxygen exceeds 99 per cent. in purity while the hydrogen is practically perfect in regard to purity. The present apparatus shown is a very decided improvement over that exhibited last year and it has been possible to reduce the size of the generator by one-third.

This type of apparatus is entirely automatic in its operation and will operate for days and months without requiring repairs or change of parts, or even to be cleaned. The gases can be carried through a pipe to any part of the shop or yard and the oxygen can be compressed in cylinders for use at distant points, if desired.

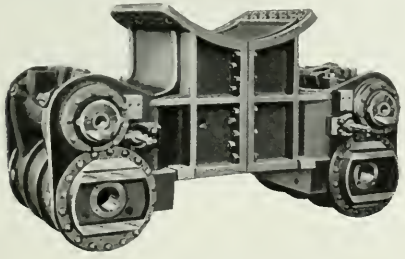
FINISHING TOOL FOR BALL ENDS OF SUPERHEATER UNITS.

After the ball ends of the inner units of superheaters become rusted they are liable to leak and they deteriorate rapidly under the cutting action of the superheated steam if they are neglected. To facilitate the repairs to the ball ends, the Draper Manufacturing Company, Port Huron, Mich., has developed a tool which is shown in the illustration and which it is exhibiting at the conventions. The tool consists of two parts, a cup tool and a ball reamer for the seat and as shown in the illustration, may be operated by a hand brace. It can also be used in a pneumatic drill and it is claimed that it cuts a perfect ball joint and that no special skill is required by the operator to do the work successfully.

Tool for Finishing the Ball Ends of Superheater Units.

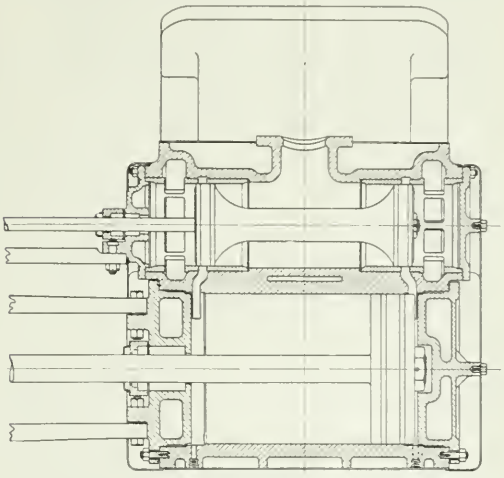
ALFREE CYLINDERS WITH PISTON VALVES.

The Hobart-Allfree Company, Chicago, is exhibiting a ¼ size model of a locomotive equipped with the Allfree cylinders arranged to work with piston valves. The valves on one side of the engine are operated by the Walschaert gear and on the other by the Baker gear to show the adaptability of either gear to the operation of the compression valve. As in previous designs of the Allfree cylinders the main valve controls the admission, cut-off and release in the same manner as in all cylinders, but with an increase in the exhaust lap which holds the steam in the cylinders longer so that more work may be obtained from greater expansion. The compression valve opens for release simultaneously with the main valve which not only permits of more expansion but gives greater freedom of exhaust.

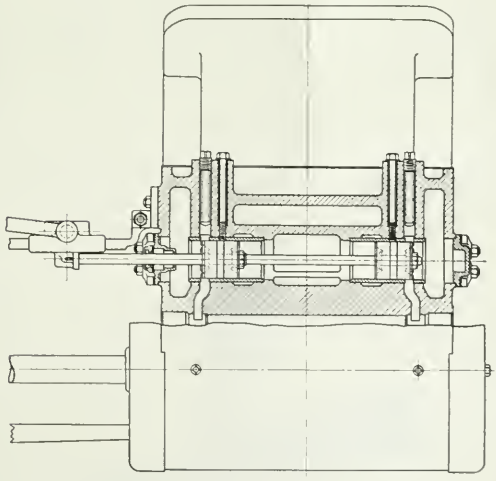


Allfree Cylinders with Piston Valves.

The most important work of the compression valve comes after the main valve has closed. This point is usually the beginning of compression, but the compression valve is timed to remain open after the main valve closes and may be set to give any desired amount of compression without disturbing the events of the main valve. Having compression under control, it is a matter of adjustment to reduce it to only that amount which is necessary as a cushion for the reciprocating parts, when the direction of their movement is reversed. This practically eliminates the effective resistance of compression and the equivalent in power becomes available for drawbar pull. This also permits of reducing the clearance space between the piston and the valves.



Section Through Main Valve, Alfree Cylinder.

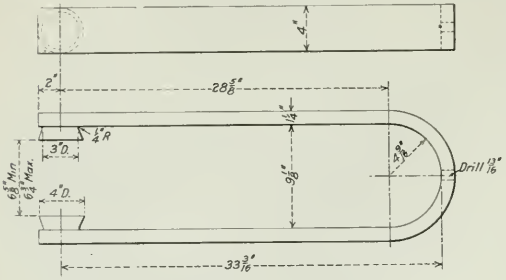


Section Through Compression Valve, Allfree Cylinder.

The use of the compression valve will allow an increase in the ratio of expansion, as the reduced clearance space changes the proportion of the actual volume of steam admitted at any given cut-off. The illustrations show sections through the main valve and the compression valve.

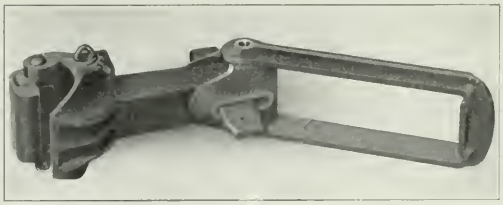
SWIVEL DRAWBAR YOKE.

A recent development in drawbar yokes is being exhibited by McCord & Company, Chicago. One of the illustrations shows a cast steel yoke and its accompanying sleeve keyed



Forged Yoke for McCord Keyed Flexible Drawbar Arrangement.

to a drawbar, while the drawing shows a later development of the yoke in wrought iron. The cast steel sleeve is held to the drawbar by a key and the yoke is so constructed that



Key Attached Swivel Drawbar Yoke.
