(1) The valuation engineer (above mentioned) chairman.
(2) An assistant in charge of accounting and historical features.
(3) An assistant in charge of engineering department features.
(4) An assistant in charge of stock and bond and securities features.
(5) An assistant in charge of "reproduction" cost valuations "to date" and the working up of all other features in a uniform manner.

The great advantage of an organization of this kind lies in the fact that it would insure thorough and authoritative results and would prevent considerable duplication of interdepartmental work involving great expense.

Second, that a national valuation convention be assembled at a very early date, to be constituted somewhat as follows:

(1) One valuation engineer from each railroad system in the country.
(2) The valuation committee of the American Society of Civil Engineers.
(3) A valuation committee of the American Railway Association.
(4) A valuation committee from the American Railway Engineering Association.
(5) A valuation committee from the National Association of Railway Commissioners.
(6) A valuation committee from the Interstate Commerce Commission.
(7) Those private consulting engineers of the country who have been engaged in the valuation of public utilities.

Third, that a committee of seven, to be made up of one member from each of the seven classes of representatives above described, be given the authority to name temporary officers for the convention and to act as a nominating committee during the course of the entire convention.

Fourth, that everyone attending this convention as an accredited representative come prepared to bring up and discuss in concrete form, all questions that have come up in the course of their valuation experience, particularly with reference to desirable methods and organization for the purposes of this national valuation.

Fifth, that committees be appointed or elected for both the purposes of expediting the work of the convention and for continuing the work for which the convention was assembled; these committees to have their meetings stenographically reported and the minutes issued as bulletins not later than one week after each meeting of each committee is held.

Sixth, that at this convention a permanent organization or association be formed and officers elected. This association to convene again in six months, and annually thereafter.

As previously stated, the limitations of this article do not permit of going into many important details, and therefore it has been the aim and purpose merely to point out in a general way a few of the more important and immediate needs of both the railroads and the Interstate Commerce Commission towards working up a satisfactory program for the economical and efficient prosecution of the federal valuation; and it is hoped that these remarks and the resulting discussion and comment will crystallize into some definite and well thought out action.

The above remarks are written with a full realization that the suggestions contained therein will meet with some opposition from many railroad officials, engineers, experts and others, mostly on the ground that they seem rather novel, which to many people is synonymous with the word impracticable. At the same time it is quite certain that there will be as many more

who, because of their more intimate knowledge of the subject, will agree that there is an immediate need for some concerted action somewhat along the above lines. Of this the writer feels convinced, and the conviction is founded on intimate knowledge and experience gained during three years in which he has been constantly in charge of making valuations, explaining them to railroad commissions, taking an active part at valuation conferences, and keeping in touch with the work done by others through the literature on the subject.

Whether the above suggestions meet with favor or with opposition is of relatively small importance. The main object of this article, as stated before, is to bring this phase of the subject before all those who are vitally interested; and it is hoped that it will bring forth discussion which will ultimately tend towards economy and efficiency.

ARBITRATION OF THE FIREMEN'S WAGE CONTROVERSY.

In the arbitration proceedings at the Waldorf-Astoria Hotel, New York, on Thursday last, W. S. Carter, president of the firemen's brotherhood, began his summing up of the case. He said that those eastern railroads which have not yet put the ten-hour day into effect should be made to do so, if for no other reason than that of uniformity.

Referring to the railroads' statement that the granting of the men's demands would standardize the rates of wages for all the firemen on the roads involved, regardless of the roads' ability to pay the increased rates or the efficiency of the individual men, Mr. Carter said: "We do not ask the same rate of wages for all firemen on these 54 roads. Our demands are based on a scale divided into twelve groups asking for a separate minimum rate for each of the classes of service set forth. The groups are so arranged that the men on the larger engines, having a greater productive efficiency, shall be paid a higher minimum rate than the men on the smaller and less productive engines. Thus it cannot be said that we are asking the same rate for the fireman whose labor is not as productive of revenue as his brother fireman whose efficiency and productive ability is much greater. The scale of wages set forth in the demand is classified according to the weight of the locomotive on drivers which we are emphatically of the belief represents in the most practical and fairest way the productive power to the roads."

Referring to the plea of the railroads that they were financially unable to grant the demands, Mr. Carter said: "I don't know of any other class of employers but the eastern railroad managers who would ask their men to work for less because their balance in the bank was decreasing. The poor or small road generally uses a smaller size engine, and the rate which we ask this commission to award us is based on the size of the engine."

The western roads, he claimed, have always been more liberal in their treatment of labor in wage controversies than the eastern roads. "Nobody has said, up to the present time," Mr. Carter continued, "that our demands are excessive, and we think we have been more than fair in asking for rates slightly less than those that are being paid on the western roads. There has been much criticism directed at the Erdman act method of arbitration by the roads on the ground that it generally resulted in a compromise being effected. Gentlemen of the commission, we do not ask for a compromise in this case; we do not want you to split the difference. If we are entitled to all that we ask for give it to us. I trust to the wisdom and justice of this commission."

In concluding the case for the railroads, on Saturday last, Elisha Lee, chairman of the conference committee of managers, said: "Since these arbitration proceedings started, the situation of the railways has undergone great changes. The most startling of these has been through the floods of the Middle West. The entire railway system of Ohio and Indiana was practically put out of business for five days. On the Pennsylvania Lines West of Pittsburgh an aggregate of a mile and a half of steel bridge work was washed away, and we understand the New York Central and Baltimore & Ohio will each have to pay out more than $3,000,000 in repairs to property alone. To repair and replace the railways affected by this disaster will practically wipe out the surplus earnings of many railroads. In other cases dividends will be threatened. The reason is, of course, that all such damage must be retrieved out of current earnings and cannot be charged to capital. There was never a more striking nor more unexpected object lesson of the absolute necessity for a railway company to earn a surplus adequate to protect its credit and enable it to take care of expensive emergencies.

"Since this board was constituted the state of New Jersey has passed a law providing that the cost of all grade crossing removals shall be borne by the railroads alone. To carry the law out fully would cost one company alone $60,000,000—so it has been publicly stated. A few days ago the state of New York passed an extra crew law—and we understand it was supported by our firemen friends—which is expected to cost the railroads of that state some $2,000,000 per year. New Jersey followed suit with a similar law expected to cost about $500,000 per year.

"It has been urged that railway labor should be more highly paid and that to make this possible freight rates should be raised. Without urging the question as to whether the rising costs of materials, wages, and even capital itself, do not justify increasing rates, we can, nevertheless, urge that even this remedy would be no panacea for this circle of increasing railway wages. The move would go on all the stronger. When the public, through commissions, through mandatory legislation or through arbitration under the law, assesses additional payments to be made out of railway revenues, that same public in effect levies an additional tax upon itself—unseen and intangible for the moment, perhaps, but inevitable in its effect. This public little realizes how agencies acting presumably in its behalf are piling up the burdens on the railroads. That public dimly imagines that it is the capitalists of Wall street who are being injured.

"But it is not so. The railway managers of the country are fighting the battle of the public—that public which is entitled to have efficient transportation facilities at reasonable rates. It is entitled to enjoy rates based upon real capital invested. It should pay rates which will yield proper wages to railway labor and a sufficient return upon the capital necessary to provide proper facilities. But this is the fundamental question this board has to answer—it is, indeed, the fundamental problem which the public itself must solve:

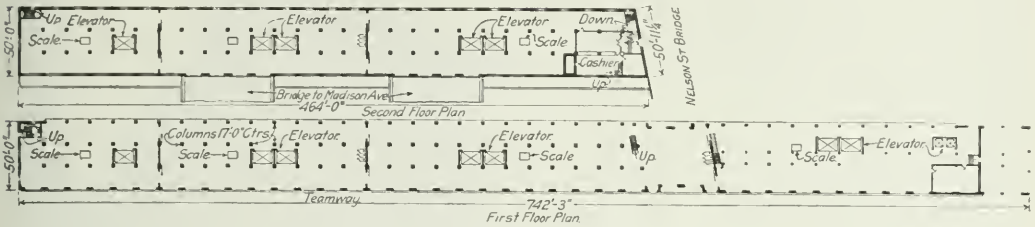
"Shall we, in our desire to escape the rocks of both Scylla and Charybdis, steer far away from the possible payment of undue returns upon railway capital that we may be wrecked through arbitrary additions to railway expenses both by legislation as well as by such movements as this, designed, as we believe, to give a class of men more than their proper share of the funds available for the payment of wages?"

The terms of the award will be made known by April 23.

Rome to Naples Railway.—Works are now in progress on different points of the new line from Rome to Naples through Pozzuoli, which it was decided to construct after the government took over the private railway companies in 1905, in order to do away with the present detour through Frosinome, and ensure better communication between the two Italian cities. The total length will be 133 miles, against 155 miles by the existing route, and the total expenditure involved is estimated at $26,600,000, apart from the $1,600,000 which will be required for improving and transforming the central station which is located at Naples.

SOUTHERN RAILWAY FREIGHT STATION AND OFFICE BUILDING AT ATLANTA, GA.

The Southern Railway has completed an inbound freight station and office building at Atlanta, Ga., which is of the most modern construction. The building extends for two city blocks, being divided in the center by the intervening street. Consequently it has the appearance of two separate buildings, though as a matter of fact the ground floor, which is on the track level, extends continuously through the two blocks. The building extends along Madison avenue, from Mitchell street to Peters street, being divided by Nelson street above the first floor. The section



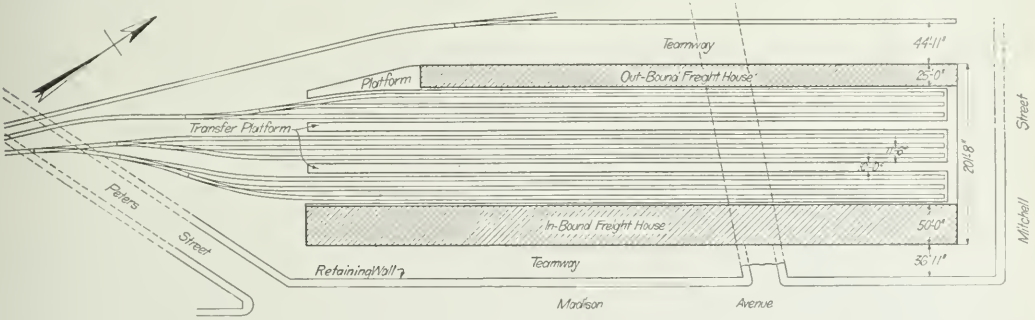
Floor Plans of New Freight Station at Atlanta, Ga.

between Mitchell and Nelson streets is six stories high, and that between Nelson and Peters streets three stories. For convenience the six floor section will be referred to as the office building, and the three floor section as the freight building. Construction work was started on March 21, 1911, and was carried on continuously, the freight building being ready for occupancy on September 1, 1912, and the office building, December 1, 1912. Both sections of the building have been so constructed as to permit the placing of additional floors in the future.

The office building houses the various departments located in Atlanta, including the assistant to president, the assistant freight traffic manager, the general freight agent, the assistant general freight agents, the assistant general passenger agent, the coal freight agent, the live stock agent, the superintendent, and other traffic and operating officers who have been located in different office buildings. The four upper floors furnish space for these offices, while the two lower floors, that on the track level, and that on the street level are used as part of the inbound freight station. The freight building is given over to freight station purposes, with the exception of portions of the second and third floors, which are used for the offices of the local freight agent and the stationery department.

This inbound freight station is used exclusively for the delivery of freight, ample facilities for the reception of freight for shipment being provided by the company's three outbound freight stations, one located just west of the new building and running its entire length, and the others at convenient points for shippers in different parts of the city. The new station is located in the center of the city, close to the financial and the wholesale and retail business districts, and within easy reach of the main lines of electric railway traffic, the office building fronting on the plaza of the Atlanta terminal station. The grades of the several streets leading from the station are low, and the streets themselves are well paved and not overcrowded with street railway tracks, which is in contrast to the conditions which usually surround freight terminals.

Both structures are built in the latest type of fireproofed construction. The freight building is of reinforced concrete throughout—footings, columns, walls, floors and roof. The office building has a reinforced concrete frame, including footings, columns and floors, the space between the exterior columns and around them being filled with pressed brick. All partitions between rooms are built either of concrete, brick or hollow terra cotta tile. In the freight rooms of the freight building there are brick fire walls at intervals of about 150 ft., the few openings in which are automatically closed in case of fire by rolling doors covered with sheet steel, so as to confine any fire which may break out entirely to one compartment. The many doorways in each freight room required for the rapid receipt and delivery of freight are closed by rolling steel shutters, and the transoms above the doors have steel bar frames and are glazed with wire glass. In both buildings all windows which may be exposed to fire in neighboring structures, such as on the track side and on the Nelson street face have steel frames and sash, and are glazed with polished wire glass. The stair halls in the freight building are entirely disclosed by concrete walls, the stairs are of concrete, the doorways have steel frames and the doors are covered with sheet steel. All freight elevator shafts have steel encased sliding doors. All freight rooms have standard fire plugs connected to the fire mains so that although no part of the structure itself



Plan of Southern Freight Houses and Track Connections at Atlanta.

can burn, every precaution has been taken to restrict any fire which may start in the merchandise stored in the buildings to the room in which it started.

The freight building extends from Nelson street viaduct south towards Peters street viaduct for a distance of 464 ft. It has a width of 50 ft., and is three stories high, the total height above the driveway level being about 47 ft. The lowest or first floor is the one on which all freight will be removed from the cars and transferred to drays on the opposite side of the building. On this side a granite paved driveway having a minimum width of 36 ft. extends from Garnet street on the south, under Nelson and Mitchell streets and the Atlanta terminal station to Madison avenue near Hunter street on the north, which will permit the handling of a vast amount of traffic without undue congestion. Freight may also be carried by any one of the five elevators in the building, each having a capacity of 8,000 lbs., to the second floor where two bridges span the low level teamway just described, and enable vehicles to drive up to the building direct from Madison avenue. Each of these bridges has a width of 65 ft. between curbs, and is paved with creosoted wood blocks on a waterproofed concrete floor.

The entire lower floor of the freight building, and about two-thirds of the second floor are to be used for freight rooms, the total area being slightly over 39,000 sq. ft. The local agent's office will occupy the Nelson street end of the second and third floors, an area of 12,600 sq. ft. The stationer will occupy about half of the third floor, and about a quarter of the second floor, an area of about 18,000 sq. ft. The part of the building which is to be used for offices is finished in oak, and has all the equipment found in modern office buildings of the highest class.

The office building is situated between Mitchell and Nelson streets, having a length of 237 ft., a width of 50 ft., and a total height above the teamway paving of a little over 91 ft. The lower or track level floor, and about three-fourths of the second floor are to be used as freight rooms, the remainder of the building being devoted to office use. The floor area for freight purposes is about 19,100 sq. ft., and that for office purposes about 49,000 sq. ft. The equipment of the freight rooms is similar to that in the freight rooms of the freight building, except that there are but two freight elevators in this building. On the second floor there are two bridges spanning the low level teamway and affording a direct connection with Madison avenue, each having a clear width between curbs of 31 ft., or approximately one-half the width of those of the freight building.

The offices on the second to the sixth floors inclusive are reached either by concrete stairs encased in white Georgia marble, or by two passenger elevators. There are 74 rooms on these five floors, the smallest having an area of 63 sq. ft., and the largest 6,570 sq. ft. The offices are finished in oak, with hardwood floors, and most of the rooms are furnished with telephone, bell and fan outlets, there being the usual general equipment of water plugs and hose for fire protection, mail chutes, dumb-waiters and tariff carriers.

These buildings are lighted by electricity, which is also used for operating the elevators, and are heated by steam, both being supplied by the power plant of the Atlanta terminal station just across Mitchell street from the office building. A power plant to serve these buildings was designed and arrangements were being made to construct it at the Peters street end of the freight building, but it was later considered advisable to postpone the work for the present, and obtain the light and heat from the Atlanta terminal company, which now serves the outbound freight house and the transfer sheds of the Madison avenue station.

Mitchell Street End of Office Building.

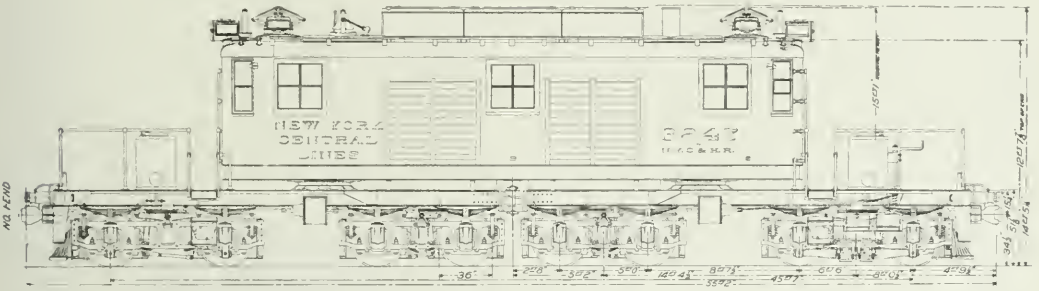
The reinforced concrete of both buildings was designed according to the recommendations of the Joint Committee on Plain and Reinforced Concrete, which are more conservative than the standards used in many examples of this type of construction. The design and construction of these buildings were handled under the supervision of B. Herman, chief engineer of maintenance of way and structures. H. W. Hesselbach was the architect, and H. N. Rodenbaugh, the engineer in charge. R. M. Walker & Co., of Atlanta, were the contractors.

New Inbound Freight Station with Old Outbound Station in Foreground.

ARTICULATED ELECTRIC LOCOMOTIVES FOR THE NEW YORK CENTRAL.

After a series of tests on the Harlem division of the New York Central, an eight motor articulated, 600-volt direct current electric locomotive has been placed in service on the electrified section at New York and an order placed with the General Electric Company for nine others of the same design.

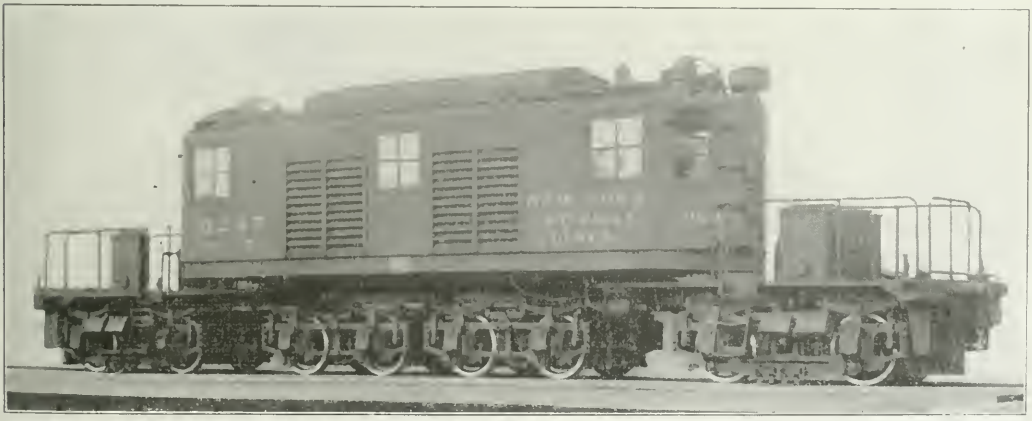
The locomotives in service up to this time on the New York Central's electric zone weigh approximately 230,000 lbs. Those of the new design are considerably lighter, weighing 200,000 lbs., but the entire weight is carried on the drivers while in the older type the weight on drivers was only 140,000 lbs. The new locomotives are designed with a view to continuous high speed, and it is claimed they will exert sufficient tractive effort to haul a train weighing 1,000 tons at 60 miles per hour. In regular service they can develop 1,400 h. p. continuously and as high as 5,000 h. p. for short periods.



Side Elevation of the New York Central's Latest Type of Electric Locomotive.

The original New York Central electric locomotives had a two-wheel guiding truck at either end, with 28,000 lbs. on the axle. There were four pairs of driving wheels, each carrying the armature of a direct current, bipolar, gearless motor. To improve the riding qualities, a four-wheel guiding truck was substituted in a more recent design. A further development in a subsequent type was to increase the distance between the guiding trucks and the rigid wheel base. The riding qualities were improved, but at a loss in the mechanical efficiency of the locomotive; for about 80,000 lbs. were added to the weight on the trucks for the sole purpose of guiding the locomotive. The latest step has been the addition of motors to the guiding trucks so that the entire weight is available for adhesion. A still greater separation of the fixed wheel base and the guiding trucks lengthened the machine so as to necessitate constructing the running gear in two sections, with a spring-connected, articulated joint between the frames. The cab is supported on the two parts of the frame on center pins. Each section is equipped with one rigid and one swivel four wheel truck. The rigid truck is built up of heavy steel castings, the side frames being of a truss pattern. The end frames and center cross frames are steel castings securely bolted to the side frames and supporting the magnet poles. The magnetic circuit of each truck consists of the armatures mounted on the axles, the magnet poles carried on the end frames, the side frames and an additional magnet bar forming a path in parallel with the side frames. The weight is carried on semi-elliptic and coil springs resting on the journal boxes.

The main frame of the locomotive is a box girder built up of 10-in. channels with ¼-in. top and bottom cover plates. It is 36 in. wide and 22 ft. long and is bolted to the top member of the rigid truck, extending forward over the center plate of the leading truck and backward to the hinge which connects the two halves of the frame. The main frames carry in their top plates the center pins which support the weight of the cab. These center pins are hollow and serve as air passages, the box girder acting as a distributing reservoir for the air delivered from the blower in the cab to cool the motors. The construction of the swivel or leading truck is similar to that of the rigid truck, except that it is connected by a center pin to the main frame.



Electric Locomotive with Articulated Frame Connection and Eight Motors.

While the locomotive has a total wheel base of 45 ft. 7 in., the greatest rigid wheel base is 6 ft. 6 in.

The cab is 35 ft. long and 10 ft. wide and is divided into three sections, consisting of a motorman's compartment at either end and a central section containing the air compressors, blowers, contactors and rheostats, grouped so that they are conveniently accessible for inspection and repair. There is a platform on either end of the locomotive, from which access to the cab is obtained through doors. The field poles of the eight bipolar motors are carried on the truck frames, which form the magnetic circuit. There are four independent magnetic circuits in the locomotive corresponding to the four trucks. The magnetic flux path on each truck passes in series through the fields and armature of one motor, through the center transom and the fields and armature of the second motor to the end frame, and then returns to the starting point through the two side frames and a reinforcing magnet bar lying parallel with the frames. The motor is practically enclosed, and the field coils are waterproofed and armored. Each field coil is wound in a brass shell, the windings being in two decks of flat ribbon copper laid side by side. The outside turn is covered with insulation and an armor of sheet steel is clamped over it, filling the space between the sides of the shell in such a way as to protect the windings from water or mechanical injury. End shields are provided for each motor, which render it dust-tight and as nearly water-tight as is possible in a motor equipped with outlets for forced ventilation.

Each motor at its one hour rating has a capacity of 325 amperes on 600 volts, or a continuous rating of 260 amperes on 600 volts under forced ventilation. For the complete equipment of eight motors, this corresponds to a capacity of 13,500 lbs. tractive effort at 54 miles an hour for the one hour rating, and 10,000 lbs. tractive effort at 60 miles an hour continuously. The motors are electrically connected in parallel permanently, in pairs, and the pairs may be connected in three combinations, series, series-parallel and parallel. They are insulated for 1,200 volts, so that if at any future time it should be desired to operate the locomotive on that voltage, the pairs of motors can be changed from parallel to series connections and the same speeds and control combinations obtained as on 600 volts.

The control equipment is the Sprague-General Electric Type M. The external regulating resistance, divided into four parts, is directly connected, each part to a pair of motors permanently grouped in parallel. The pairs of motors with their respective resistances are connected in series on the first point of the controller. The resistance is varied through eight points and finally short-circuited on the ninth or running point. The pairs are then operated similarly in series-parallel with all resistance cut out on the seventeenth point. Finally all of the pairs are connected in parallel with the twenty-fourth step a running point. This provides a control with nine steps series, eight steps series-parallel and seven steps parallel. The transition between series and series-parallel is effected without opening the motor-circuit, and there is no appreciable reduction in tractive effort during the change. The smooth transition between points, both rheostatic and transitional, permits motor operation close to the slipping point of the wheels. The locomotive weight on the drivers is so proportioned that the motors operate safely up to the slipping point, which serves as a limit to prevent overloading the motors. The transition between all four pairs of motors in series to series-parallel is accomplished by short-circuiting two of the pairs of motors during the instant of transfer. The transition between series-parallel and parallel is effected by means of the standard bridge method. The motor cutout switches are connected so that any pair of motors may be cut out of circuit. The locomotive will operate when a pair of motors is cut out with two groupings of the motors, the first with two pairs of motors in series and the second with three pairs of motors in parallel.

For protection against short circuits all the main fuse boxes are of the copper ribbon type, fitted with hinged covers to facilitate fuse renewals. The box is provided with a magnetic blowout, which is energized by the current passing through the fuse. The main fuse boxes are located as near as possible to the overhead trolley and to the third rail shoes in order to protect the wiring circuits near the source of supply. Each pair of motors is locally protected by a fuse box. The main switch is provided with a blowout so that heavy currents may be opened without damage. An ammeter is located at each engineer's position and records the current in the circuit of one pair of motors. The main motor rheostats are formed of cast-iron grids mounted in a frame and insulated in mica. The rheostat boxes are assembled in the monitor deck of the locomotive.

Current is collected by eight underrunning third-rail shoes, or by two overhead trolleys when on gaps in the third rail. The trolleys are of the pantograph type and are pneumatically operated from either end of the cab by a foot-operated valve. The trolley is held in a raised position only while the valve is held open by the engineer's foot.

The blower set for ventilating the driving motors is located

End View of the New York Central's Electric Locomotive.

in the central compartment of the cab and has a capacity of 24,000 cu. ft. of air per minute; it is driven by a series wound motor of the railway type. The air compressor is two-stage, motor driven with a piston displacement of 100 cu. ft. of air per minute when pumping against a tank pressure of 135 lbs. per square inch. The compressed air, in passing from the low pressure to the high pressure cylinder, is conducted through radiating pipes under the platform of the cab. This reduces the temperature and allows condensation of moisture before entering the high pressure cylinder. From the high pressure cylinder it is delivered into a series of four air reservoirs, each 16 in. x 90 in. These are located under the floor of the cab and are connected in series, to afford further opportunity for radiation and condensation. Leach type L double pneumatic sanders are provided and the bell is fitted with the Sampson automatic ringer. All wiring is drawn through conduits and is carefully protected from mechanical injury.

The principal data and dimensions are as follows:

Length inside of knuckle	55 ft. 2 in.
Length over cab	33 ft.
Height over cab	12 ft. 8 in.
Height with trolley down	14 ft. 6 in.
Height with trolley running	15 ft. 1 in.
Width over all	10 ft.
Total wheel base	45 ft. 7 in.
Rigid wheel base	5 ft. and 6 ft. 6 in.
Total weight	200,000 lbs.
Weight per axle	25,000 lbs.
Dead weight per axle	6,395 lbs.

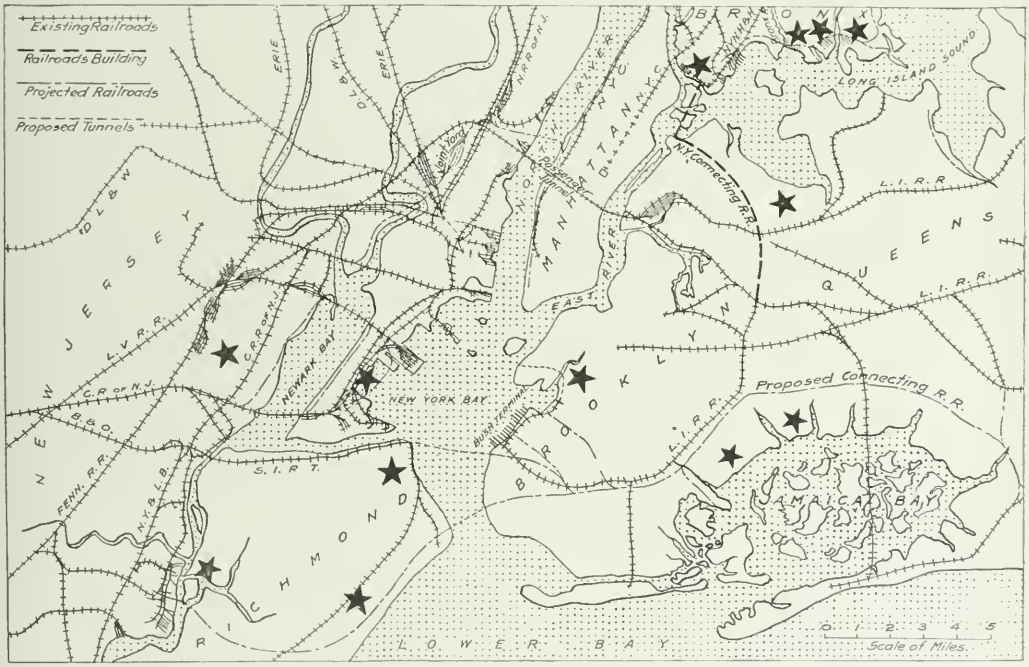
NEW YORK'S FREIGHT TERMINAL PROBLEM.

Necessity for a New Policy, Peculiar Difficulties Encountered and Some of the More Interesting Solutions Offered.

New York has done less to develop its port along modern lines than any other important shipping center in the world and is far behind many naturally inferior ports as regards adequate terminal facilities and cheap and quick means of transportation. The present congestion of traffic and the recognized impossibility of relieving it by the old methods have induced the city and the manufacturers to start a strong movement to bring about the necessary improvements. The difficulty is greatly aggravated by the separation of the port into four parts, viz., the New Jersey section, the Manhattan and Bronx section, the Long Island section and the Staten Island section. Freight communication between these four sections is now only possible by car floats and lighters, and it will not be until they are connected by freight tunnels that the disadvantages of this separation will be entirely overcome.

The situation has been studied and various plans, more or less practicable, have been submitted. The most comprehensive of these was devised by Calvin Tomkins, until recently commissioner of docks for New York City. It provides for the construction by the city of joint railroad freight terminals and warehouses along the east side of the marginal way on the west side of Manhattan, connected by spurs with a proposed four-track elevated railroad which would run along the marginal way to a connection with the New York Central's tracks at Sixtieth street. Tunnels under the North river are also proposed which would connect the mainland with the elevated railroad at some point near Forty-second street. A joint classification yard of large capacity connected with all the New Jersey roads would be built near the entrance to the tunnel on the Jersey side. Until the tunnels were built the cars would be carried by car floats to docks above Twenty-third street, where they would be transferred to the terminals by means of the elevated road, which would be reached by ramps. The plan also includes the construction of tunnels under the Narrows, connecting the borough of Brooklyn with Staten Island, also other terminal developments similar to the Bush terminals at points indicated on the accompanying map by stars.

This plan, if carried out, would give all factories and warehouses in Greater New York direct track connection with all railroads and steamship piers. In its entirety it is on an enormous scale, but it should be remembered that it was not formulated with the idea of showing what was needed in the immediate future, but rather to show the reasonable limit to which the advantages of the port could be developed. The purpose of the plan, therefore, is to indicate along what lines improvements should be made to secure the maximum efficiency for both the present and the future.



Proposed Connecting Railroads and Terminal Development Sites for Greater New York.

The advantages and possibilities of terminal development are just beginning to be appreciated. Terminal charges are absorbed in freight rates, and where the terminal facilities are inadequate and the methods antiquated and costly, the terminal charges constitute a large percentage of the freight rates, particularly on short hauls. Railroads have consistently reduced grades, eliminated curves and increased the efficiency of their motive power and rolling stock to reduce their operating costs, but comparatively little has been done to improve the practices at terminals, a field which offers innumerable opportunities for economy. Aside from establishing direct track connections between all warehouses, factories and transportation lines there is the field of handling freight by means of mechanical devices, which has

been so successfully developed abroad and almost utterly neglected in this country. Adequate terminal facilities constitute a most important factor today in attracting manufacturers to a community. It is of great importance, therefore, if a community is to preserve its manufacturing industries, or to attract others to it, that the costs and delays incident to the handling of traffic at its terminals be reduced to a minimum.

The commercial and industrial supremacy of New York is fundamentally due to its unrivaled harbor and its situation at the end of the only level route from the Mississippi valley to the Atlantic seaboard. The result of these advantages is that as a combined shipping and railroad center it has no equal. Owing to the lack of efficiency of the car float and lighterage systems the disadvantages of its insular position have not been overcome. Under the present arrangement cars are brought from New Jersey to the New York piers in the morning, where they are moored and left until evening to be unloaded and reloaded. The freight from the cars is carried to the piers by hand trucks and piled on narrow platforms. Drays call at the piers to remove or deposit the freight; the space for drays is insufficient and congestion results. Where two car floats are placed end on end the hand truck run is 600 ft. The car floats are pulled out late in the afternoon to catch the evening trains and any freight received after that time must wait over until the next day. The railroads are obliged to hold uncalled for freight 48 hours, and this temporary storage increases congestion. The process is slow and expensive. On a conservative estimate the terminal expenses on traffic from New Jersey amount to about $1.35 a ton.

The problem on the island of Manhattan is not only the most difficult but also the most important. Of all the railroads which reach New York only one, the New York Central, carries freight to its terminals in the city over its own tracks. A very large portion of the west shore of Manhattan is occupied by the terminals and docks of the railroads, which terminate on the New Jersey shore of the North river. This condition has existed for a number of years, and was satisfactory until the growth of railroad and marine traffic necessitated more extensive terminal and dockage space on the water front than was available. This situation made a change of plan imperative. The water front space is the only logical place for the piers of the larger vessels, partly because it is the most convenient for passengers, and partly because the deepest marginal channel runs along the shore. If the steamships were forced away from this locality other channels would have to be deepened at an enormous expenditure and the present deep channel would be wasted because it is not needed for railroad traffic. It is also highly desirable that railroad and shipping terminals be built as near together as possible. To accomplish this Mr. Tomkins suggested that the railroad terminals should be built along the east side of the marginal street. If this idea were carried out the space on the waterfront required by the railroads would be greatly reduced and the sites of their present terminals could be used by the steamship companies. Space on the east side of West street is much cheaper than on the water front, and the increased terminal facilities would permit the roads to handle their freight more economically and with greater despatch.

The terminal buildings would each doubtless occupy a block and the dray approaches and passageways at grade, together with the platforms, would include the entire ground floor; in other words these buildings would be arcaded, standing on columns, and would greatly increase the street surface. The second floor would be on the same level as the elevated railroad and would be used to load and unload freight cars. The third, fourth and fifth floors would be devoted to storage warehouses, and it is planned to use the upper floors for factory purposes. It is believed that the manufacture of many light articles could be attracted from the center of the city to the factories over the terminals on account of the more sanitary conditions and the improved transportation facilities. If this could be accomplished the rentals would serve to reduce the overhead charges. Elevated car yards would be provided adjacent to the terminals for car storage. The joint terminals would be built and owned by the city and rented to the roads. Individual terminals could also be built by the roads at their own expense.

The four-track elevated railroad would extend from Washington market to a connection with the tracks of the New York Central at the yard of that road at Sixtieth street. It would have spur connections with all the railroad terminals and warehouses, and would be used jointly by all the railroads. It would not be connected with the steamship piers, but instead a system of telpherage over the elevated road is advocated to connect the piers with the warehouses on the other side of the street. When this road shall have been built the surface tracks of the New York Central on Tenth and Eleventh avenues and West street, which have proved so dangerous, may be removed. If four tracks are not sufficient to handle the traffic additional trackage up to at least ten tracks may be provided. Mr. Tomkins believes that to keep West street under complete municipal control, and at all times subject to the city's terminal policy, the city should build and own the elevated structure, contracting with the railroad companies through a joint terminal company, organized by the city, in the ownership and control of which the roads should be permitted to participate on terms of equality. Interest and maintenance charges would be recouped by the city from reasonable rental or service charges. In order to encourage commerce the city should not look for more than the return of interest, maintenance and amortization upon its investment. In this way the improvements would pay for themselves, the bonds would be exempted from the debt limit of the city and there would be no public burden. Public ownership is favored because the money can be secured at a lower interest rate, and also because private ownership involves profits over and above interest and amortization charges.

The car floats would have to dock north of Twenty-third street, so that the cars could be transferred to the terminals in that vicinity at grade. Surface tracks would not be permitted on the marginal street south of Twenty-third street, as they would interfere with street uses. Cars destined for the downtown terminals would be sent via the elevated road, which would be reached by means of ramps near the car float docks.

Tunnels under the North river are proposed to eliminate the long carfloat journeys and to establish direct track connection between all the New Jersey roads and all the terminals on Manhattan. Until the passenger tunnels had demonstrated their practicability, freight tunnels were never seriously considered. It was proposed to connect Manhattan with the mainland by a bridge. The relative merits of the two plans are now under consideration, but no definite conclusion has yet been reached. This track connection is now highly desirable and will before long be of paramount importance if the growing traffic of the city is to be handled quickly, and if the advantage of certain roads over others is to be obviated.

The plan includes the construction of a joint classification yard with a capacity of at least 6,000 cars near the entrance to the tunnels on the Jersey side which would be connected with all the Jersey roads by a belt railroad as shown in the map. The tunnels would most probably be built from a point on Manhattan near Forty-second street to the nearest point on the opposite shore. Two single track tunnels would be built first, one tunnel for each direction; and more could be added as needed. Whether the cost of operation of such tunnels would be low enough to warrant their construction has not yet been determined. As New York City could not build them alone the co-operation of the state of New Jersey would have to be secured. Mr Tomkins believes that the tunnels should be built and owned publicly, because of the large initial cost, and that they should be used jointly by the roads on payment of rental charges as in the case of the elevated road. It is proposed to ultimately extend the tunnels under the city and under the East river to a connection with the New York Con-

necting Railroad now under construction. When this road, which is being built by the New York, New Haven & Hartford and the Pennsylvania Railroad jointly, is completed, freight from New England will be carried direct to the Bush terminals at South Brooklyn, from which other roads are easily accessible. This will be a big improvement over the present arrangement which involves a long carfloat journey up the East river. It will be the first and easiest step in the connection of the different sections of the port.

New York is both a commercial and an industrial center. It is commercial in that it establishes a connection between different transportation systems, and it is industrial in that a large amount of its traffic either originates or terminates in the community. It is in this latter capacity that most of the development should be made for the industrial function of the city is of far greater importance than is the commercial function. For this reason the classification yards for through and local freight should be separated, and preference should be given to the latter. No freight that is not destined for New York proper should ever enter the island of Manhattan. Terminals and yards for that class of traffic should be built in the outlying districts where land is cheap and where the cars would not impede the movement of local traffic. The manufacture of heavy articles should be attracted away from Manhattan and for this purpose sites have been selected for proposed terminal developments on the waterfront of the various boroughs of the city. These developments would be similar to the Bush terminals at South Brooklyn, and would afford docks of large capacity, warehouses, cheap land, and adequate railroad connections. The stars on the map indicate the sites of the proposed developments.

Mr. Tomkins' plan is vigorously opposed by the Jersey railroads. They contend that the longer carfloat journey and the additional haul to the downtown terminals over the elevated road would increase rather than decrease their expenses. The economy of freight tunnels has not yet been proved and the railroads are skeptical. Thus far their attitude toward the joint operation of facilities has been entirely hostile. The New York Central now sends a considerable amount of its freight from its uptown yards to its downtown terminals by water, on account of the inconvenience and expense incident to the operation of its surface tracks. This road is therefore subjected in a measure to the same handicaps as are the New Jersey roads, and they assert that if the proposed improvements were effected the New York Central would derive the greatest benefit and that its position would be materially strengthened in relation to them. They also argue that as some of the steamship lines form connections with the southern roads in direct competition with them, this competition would be stimulated to their detriment if those lines were permitted to expand on the waterfront. This is not a very serious objection, however, and could easily be outweighed if the other features included in the plan could be made attractive.

D. C. Willoughby has recently come forward with a plan for the terminal development of the west side of Manhattan, which is apparently very similar to the one just outlined. Instead of an elevated road along the river street, Mr. Willoughby proposes to build a four-track subway, connected with terminals and warehouses on the east side of the street, and with the mainland by tunnels under the North river. Under this plan the improvements would be built and operated by a private company, one-quarter of the profits going to the city and the balance to the company.

The Board of Estimate's committee on terminal improvements has drawn up a plan for the elimination of the New York Central's surface tracks and for the expansion of that road's terminals on Manhattan. This plan is now being considered by the Board of Estimate. It provides for the covering of the Central's tracks above Seventy-second street, the construction of extensive yards between Seventy-second street and Sixtieth street and a subway below Sixtieth street connecting with the several terminals of that road. At the hearing on April 8 this plan met with strong opposition on the grounds that the benefits derived by the New York Central would tend to create a monopoly; also that though the city would have more park space along the upper west side, it would be spoiled by being bisected by the structure covering the railroad tracks. It was urged that the problem below Sixtieth street should not be treated until it was decided what should be done for the New Jersey roads so that a plan could be adopted which would benefit all alike. As the covering of the Central's tracks would interfere with the city's plan for extensive parks along the upper west side it was suggested that the tracks in that vicinity should be sunk so that the park space would not be divided.

W. J. Wilgus, a consulting engineer, and formerly chief engineer of the New York Central, has originated a plan, described in the *Railway Age Gazette* of October 16, 1908, page 1150, which involves radical departures from anything hitherto attempted. Under this plan it is proposed to transfer freight in New Jersey from the large freight cars to small standard gage cars of sufficient capacity to carry the largest pieces of package freight, each equipped with an electric motor. These small cars would then be brought to Manhattan, by tunnel or carfloats, where they would connect with tunnels along the marginal way. About 30 joint terminals would be built, some along the east side of the marginal way and others at the chief distributing points in the heart of the city. The interior terminals would be reached by branch tunnels under the sidewalks connected with the main tunnels along the marginal way. These tunnels would be connected with the New York Central and also with the New York, New Haven & Hartford. This plan would overcome the disadvantage of bringing the large cars to Manhattan terminals, where there would be insufficient yard space to handle them properly. The small cars could negotiate sharp turns, and the feature of individual motors would make them easy to handle. The plan would also eliminate long drayage hauls and the wide diffusion of terminals would reduce congestion in the streets.

Cyrus Miller, president of the borough of the Bronx, has devised a plan for the industrial development of the Bronx, which is worthy of mention. That borough has increased rapidly in population, but is sadly lacking in manufacturing industries. President Miller's plan includes an industrial railroad which would skirt the southern and eastern shores of the Bronx, connecting the New York Central with the various branches of the New York, New Haven & Hartford, including the New York Connecting Railroad. This road would connect with a proposed terminal development at the mouth of the Bronx river on the eastern shore of the borough. Warehouses could be built along the line and factories could be reached by spurs. This road should also be publicly owned, so that its advantages could be availed of on equal terms by all. The water at the mouth of the Bronx river is deep enough to enable large vessels to dock, and docks at that point could be reached via the Long Island sound, thus enabling the ships to avoid the difficulties of New York harbor. When the New York Connecting Railroad shall have been completed the Bronx will have excellent connection with all the railroads reaching New York. This section would be highly desirable for manufacturing purposes if these improvements were completed, because land is cheap and there is a very large skilled labor population in the immediate vicinity from which to draw. Adequate railroad and shipping connections would also be available. At present the majority of the working population of that district spends a considerable amount of time and money in transportation to and from places of business, which in many cases are in lower Manhattan. For this reason work in factories almost at their door should prove highly attractive.

SOUTHERN PACIFIC BRIDGE AT SACRAMENTO.

Double Track, Double Deck Structure with Highway on Upper Level—Believed to Be Heaviest Swing Span Ever Built.

The Southern Pacific has recently completed a bridge across the Sacramento river at Sacramento, Cal., which contains what is believed to be the heaviest swing span in existence. Since about 1864, there has been a bridge across the river at Sacramento, and since 1870 it has been used jointly as a highway and railway bridge, the railway and highway using the same floor until 1895. At that time the bridge which has just been abandoned, was built and the grades separated, the railway using the lower floor of the Howe truss spans and the highway a floor placed on the top chords. This bridge was single track and bottled up the entrance to the large yard at Sacramento, the end of the bridge being only about 400 ft. from the depot. This bridge and the earlier ones were of timber construction on pile piers, the piles being driven about 50 ft. into the river bottom, bringing up on the gravel and boulders that form the bed of the stream below the scour line. In considering the renewal of this bridge, it was decided that every effort should be made to build a permanent structure on which the maintenance would be low, so a traffic agreement was made with the counties of Sacramento and Yolo, and work began in June, 1910.

Sacramento River Bridge from the Sacramento End.

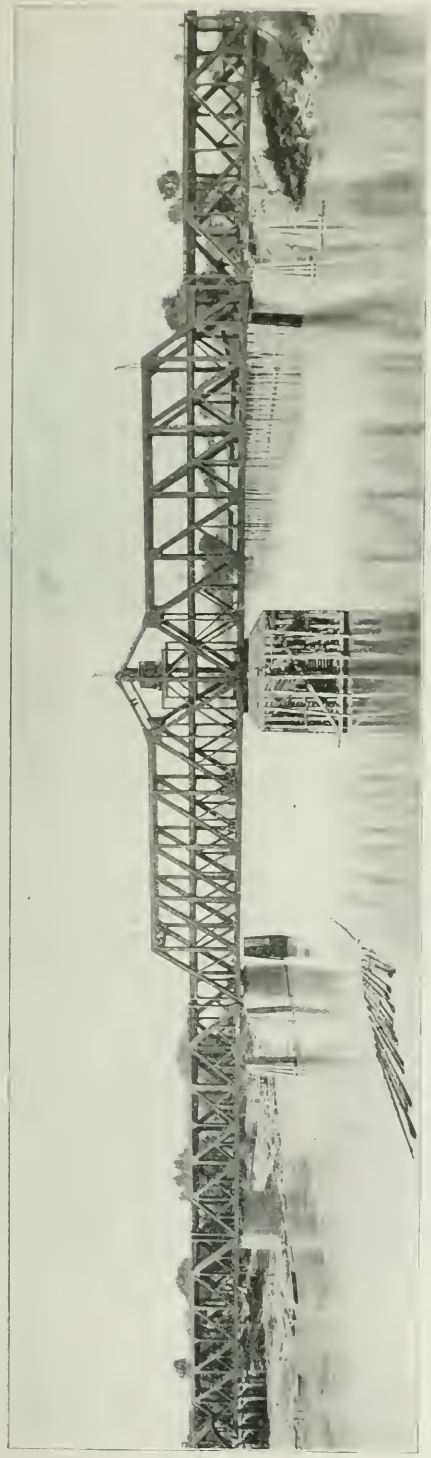
The watershed of the Sacramento is about 27,000 square miles, and the average rainfall is about 30 in., ranging from 18 to 20 in. in the valley to over 100 in. in the mountains. Practically all of the precipitation occurs during a few months in the winter and early spring, so the discharge of the river varies from a minimum of about 5,500 cu. ft per sec to a maximum of about 600,000 cu ft per sec The bed of the river is composed of sand to a depth of about 40 ft., under which is a layer of boulders and gravel to a depth of 26 ft., with finer gravel and streaks of clay beneath Hardpan is found at about 120 ft

The piers were put in by pneumatic process and were carried down to a 15 ft penetration into the boulders and gravel. The pivot pier is 42 ft in diameter, built on an octagon shaped caisson 54 ft. in diameter, and is 84 ft. high. It contains 5,550 cu. yds. of concrete. The caissons for the other piers were 24 ft. x 60 ft., the piers being 9 ft. 10 in., 10 ft. 7 in. and 11 ft. 1½ in. wide at the top and 37 ft. 10 in. long. The abutments were built back of the slope of the levees on pile foundations, with cut-off below low water.

The location of pier 1 was in water about 2 ft. deep and a small clamshell dredge was employed to throw up an island large enough to support the caisson during construction. The caissons for piers 2 and 4 were built on platforms supported on piles driven around the sites of the piers and were lowered into the water by long screws, the water being 8 ft. deep. There was about 7 ft. of water at the site of the pivot pier, and as the caisson was so large, an island was thrown up to support this caisson also, as it was not considered advisable to lower it into the water with the screws. No difficulty was experienced in sinking the caissons, and this part of the work was completed in the low water season from June to December.

The superstructure consists of two 167 ft. double track, double deck, riveted spans; one 394 ft. 10 in. double track, double deck, swing span and one 109 ft. 8 in. double track, double deck span with inclined steel highway approaches at each end on 5 per cent. grades. The swing span is entirely center bearing, and weighs a little over 6,300,000 lbs., the steel weighing 4,820,000 lbs.

The lower floor is designed to carry the Harriman Lines common standard loading on two tracks and the upper floor is designed to carry the highway traffic of 100 lbs. per sq ft., with a concentrated load of a road roller or traction engine weighing 35,000 lbs. on four wheels of 5 ft. gage, with axles 6 ft. apart. The highway is 18 ft. wide, with a 5 ft. sidewalk on each side The sidewalk curbs are 8 in. high, with the corners protected by 3 in. x 3 in. angles anchored to the curb by curved, swedged anchor bolts.



Sacramento River Bridge of the Southern Pacific.

The floor slab and sidewalks are reinforced with triangular mesh wire reinforcement, and the stringers and floorbeams on all parts of the bridge directly over the railway tracks are encased in concrete, except on their bottom flanges. The wearing surface on the inclined approaches is composed of creosoted blocks cut from close-grained red fir and treated by the full cell process.

The concrete slab was finished to a true surface ½ in. low. When set, a layer of dry sand and cement in equal proportions was spread over the slab and struck off with a straight-edge to the proper height to receive the blocks which were then laid on an angle of 67½ deg. with the curb and brought to surface by tamping on a 2 in. plank about 8 ft. long. The surface was then flooded with water and kept wet for several days. An expansion joint 1 in. wide was left at each curb and all joints were filled with hot refined asphaltum. The wearing surface on the level part of the bridge is a 2 in. layer of asphalt bitumen.

The center bearing is a phosphor-bronze disc, 52 in. in diameter and 6 in. thick, placed between the two nickel-steel bearing plates 5½ in. thick. The lower center is of cast steel 9 ft. in diameter and 2 ft. 2¾ in. high, and the upper center is 5 ft. 9 in. in diameter and 1 ft. 8 in. high. The lower center casting rests on a grillage 12 ft. 6 in. square and 4 ft. 4 in. high, built into the pier, the top of the grillage being 3 ft. 8 in. below the top of the pier. This was necessary on account of the limited distance from the top of the pier to the base of rail, which was only 8 ft. 4¾ in. The grillage is built of 24 in. 120 lb. I-beams with 1 in. plates on the top and bottom, one set of I-beams being at right angles to the other, with the spaces between the beams filled with grout.

The top center casting supports three cross girders, which carry the span. These cross girders are 5 ft. 10 in. deep back to back of angles, 38 ft. 2 in. long, with webs 85/8 in. thick, composed of five 1 in., two 1⅛ in. and two ⅝ in. plates stitch riveted together with 1⅛ in. rivets. There are five coverplates 15/16 in. x 27 in. The cross girders are spaced 2 ft. 4 in. center to center and weigh about 105,000 lbs. each. The lower chords butt against these cross girders, diaphragms between them making a continuation of the chord.

The center post rests on top of the cross girders and the inner end posts connect to gusset plates at the foot of the center post. The upper chord bars are 2⅛ in. x 16 in., with a 16 in. pin, there being six bars in each set.

The span was erected with a regular straddle-leg traveler on the permanent draw-rest or protection.

The calculated dead load swing deflection at the ends was 5⅛ in., and as the end wedge uplift is 15/16 in., the eyebars were shortened to take up 4 3/16 in. The span was connected up and riveted with the ends 4 7/16 in. high, and when swung with the entire dead load, it deflected to 47/8 in., or ¼ in. less than the calculated amount.

The ends of the span are raised and locked by a wedge at each corner having a taper of 1 in. in 5 in., the stroke being about 20 in. The center of the span is steadied, but not lifted, by a wedge on each side under the ends of the cross girders having a taper of 1 in. in 10 in., with a stroke of 12 in., and the track rails are raised 8 in., at their ends, by the same machinery.

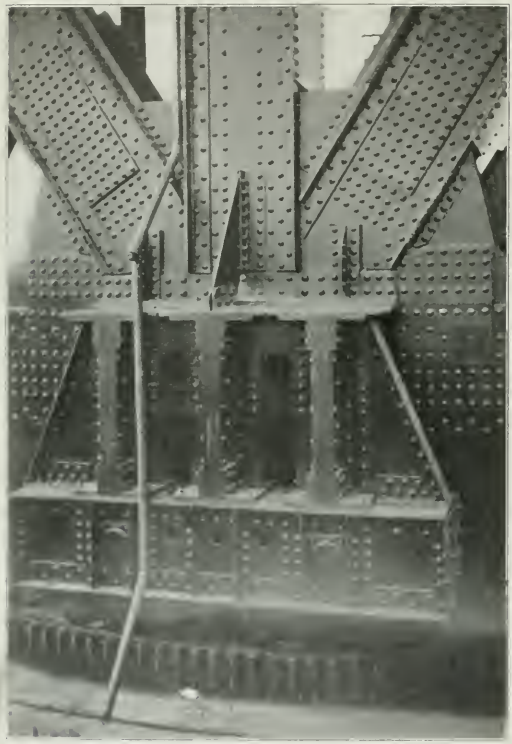
An automatic latch at each end of the span assists in centering the bridge. These latches are withdrawn by power, when the wedges are drawn and the rails lifted, but are disconnected from the other machinery as soon as the span swings a foot or so, and are then ready to drop automatically when the bridge is closed again. The latches are counterbalanced and adjusted so they will not drop, if the span is moving too fast when closing.

The span will open in either direction and the ends are reversible. The span balances very closely, this balance being maintained by 12 balance wheels which travel on a circular track just inside of the rack. Four wheels in equalizing carriages on each side of the span and two fixed wheels under the first floorbeam on each side of the center keep the ends of the span from

tilting too much. A clearance of ⅛ in. is allowed under each wheel, so they carry no weight except the slight amount required to overcome any lack of balance due to wind, etc.

The machinery is operated and the span lighted with 550 volt direct current, which is taken to the top of the pivot pier through a submarine cable, which also contains two wires for a telephone. The terminals are connected to two circular rings made of 50 lb. steel rail which are supported on concrete blocks on the pier, the insulation being a treated wood block 6 in. thick. Street railway contact shoes are fastened to the bridge and slide on the power rails.

The electric current is purchased from the Pacific Gas & Electric Company who have several sources of power, all of which are not likely to be interrupted at the same time. A storage battery of 160 cells has been provided for use in case of power trouble,



Details of Center Showing Heavy Cross Girders.

of sufficient voltage and capacity to swing the bridge four or five times at low speed.

The swinging motors are two series wound, weather proof motors of 75 h. p. mounted on the lower chords, one on each side of the bridge near the center. Each motor is geared through a separate train of gears to two rack pinions, which mesh in a rack with a pitch diameter of 38 ft. 2½ in. The motors and gearing develop a rack pressure of about 300,000 lbs. The center wedges are operated by a 10 h. p. motor and the end wedges by 40 h. p. motors, one at each end of the bridge. All motors have solenoid brakes capable of holding against the full power of the motor. The brakes on the motors operating the wedges are released when the current is applied to the motor and are automatically applied when the current is shut off. The brakes on the swing motors are shunt brakes and are released on the first point of controller, without applying power to the motor. They are held in release after the current is shut off the motor so the bridge can drift as much as is desired.

The controller is of the series parallel type and has the necessary resistance for controlling the operation of both swinging motors. Switches in the base will cut out either motor. The three wedge motors are operated by controllers geared together so as to be operated by one handle. The operator's house is

Upper or Highway Deck.

situated directly over the highway deck at the center of the bridge and from it all movements are controlled. Overload circuit breakers and the necessary fuses are provided, as also are a voltmeter and an ammeter.

An air compressor of 16 cu. ft. per minute capacity supplies air for the signal system and for the whistle which is used to signal boats. This compressor is electrically operated and automatically controlled.

The highway gates are operated by 2 h. p. motors connected

Lower Railway Deck.

with worm gearing to the gate posts. Double-throw switches in the operator's house open and close the gates. These gates are about 14 ft. long. When open they form part of the handrail of the adjacent fixed spans, and when closed swing across the sidewalk and highway away from the swing span. This allows them to be opened toward the swing span and away from any

teams or pedestrians that may stand close to the gates, waiting for them to open.

Electro-pneumatic signals and derails are provided for both tracks at each end of the bridge, the wires being coupled and uncoupled by a connection on the shaft which raises and lowers the rails. The ends of the fixed and lift rails are locked to each other by wedges, one on each side of the fixed rail, which slide on a base-plate with beveled guides. The travel of the wedges is 6½ in., and they are operated by air cylinders electrically controlled. When the wedges are pulled back the lift rails are free, and when pushed forward they engage about 6 in. of the end of the lift rails, making a positive lock. The beveled guides clamp the wedges tightly to the rails. The outer wedge is a little higher than the track rail for a few inches at its center, forming an easer rail to carry the wheels over the gap between the fixed and lift rails.

The bridge is unlocked in about 20 seconds and swung 90 deg. in about 1½ minutes, the entire operation seldom taking more than five minutes. It is opened on an average of about 12 times per day.

The highway deck is lighted by 225 incandescent lamps of 16 c. p. placed in 3-light clusters on lamp posts about 40 ft. apart along each handrail. These lamps are wired in circuits so one, two or three may be lighted at a time.

The American Bridge Company furnished the steel superstructure, the total weight of which is 4,500 tons. The pneumatic foundation work was put in by the Missouri Valley Bridge & Iron Company, the other foundation work, erection, installation of machinery, etc., being done by the Southern Pacific forces.

The structure was designed under the direction of John D. Isaacs, consulting engineer for the Southern Pacific. The foundation, concrete floors, electrical and signal systems, etc., were designed by and the work in the field was performed under the direction of J. Q. Barlow, assistant chief engineer, G. W. Rear, general bridge inspector, being directly in charge.

GOVERNOR CRUCE'S MESSAGE VETOING OKLAHOMA TRAIN CREW BILL.

The legislature of Oklahoma recently passed a full crew bill which Governor Cruce vetoed. The governor's veto message was as follows:

"I have studied this bill from every angle and the more I have studied it, the more I have become convinced that it should not receive my approval. In the enactment of this bill, it is only the railway companies and their employees that have been considered. The thousands of people in this state who travel upon the railroads and ship their products and merchandise over same have not entered into the discussion. This fact, however, must remain after all has been said, for that every dollar of expense placed upon railway corporations in Oklahoma will ultimately be paid by those who patronize the railroads. The cost of putting this bill into operation is estimated by the corporation commission at something like $250,000, while the cost is estimated by the railroad companies at more than $400,000. But whether it be $100,000 or $500,000, that amount in the end will be paid by those who use the railroads. Another thing I have learned to believe is that those who have made a lifetime study of railroad operations are better judges of the proper method of operating them than I am, and I believe that this is equally true when applied to a majority of the members of any legislative body. The trouble in Oklahoma is and has ever been that in dealing with public service corporations we have assumed to know more about how properly to operate them than those who have given the matter careful study. Public service corporations need to be regulated and need to be controlled. Oklahoma has undertaken to do this by the creation of a corporation commission and has clothed that commission with unusual authority in dealing with such matters. That commission, after having studied this question, is better able to place suitable regulations upon the railroads than is the governor or the legislature.

"The practical effect of this bill would be to give employment to a number of railroad men without increasing the efficiency of the service, and would be supplying positions for three men to do the work that can be done by two. It is in entire harmony with the principle that has prevailed in this state of creating an army of officials to do the work that ought to be done by half that number of men. This legislature has set itself to the task of reducing the number of officials drawing salaries from the state, and a Herculean task it is proving. It is certainly inconsistent while trying to curtail the number of useless public officials, to increase the number of appointed employees, who in the end must draw their subsistence from the same source that is now drawn upon by these useless public employees."

THE OTIS INCLINED FREIGHT ELEVATOR.

The three inclined elevators for moving truckloads of freight up an inclined gang plank (from a steamer) which were installed at the Union wharf of the Metropolitan Steamship Company at Boston about three years ago, have not only been the means of a large saving in the cost of handling the cargoes of the vessels using that wharf, but, according to Albert Smith, general agent of the company, there has been a saving of 20 per cent. in the time required to unload the ships. From 1,000 to 1,500 tons of freight is unloaded over the inclines daily, a quantity which previously required the labor of 150 men, which number has been materially reduced. The cost for electric power per month is $30. The machines are only used

Inclined Elevator at Mystic Dock, Boston & Maine Railroad, Boston.

during the periods when the inclines, owing to the position of the ship, are decidedly up-hill, and not when the gangway is level. Mr. Smith estimates that when in operation the three machines carry 125 tons of freight an hour, during a period of five hours each day. The current, at 20 cents an hour, makes the cost of power 1 cent for every six tons of freight moved.

The inclined elevator is simple in construction and operation, and the photographic view illustrates its operation clearly. It may be installed on any shipping platform or gangway, or in any warehouse or freight station to connect one floor with another. The machine consists essentially of an endless chain, of special construction, kept in motion by an electric motor. It is provided on its lower side with malleable iron shoes, which slide in a lubricated steel channel, supported on a wooden

bolster bolted to the incline. The upper surface of the chain is provided with projecting teeth or lugs. These lugs engage the axle of the truck as it is drawn on the incline, and the truck and its load are hauled or, rather, pushed, up by the endless chain. The truck wheels roll on the floor of the incline and, of course, support and carry the load. At the upper end of the incline the chain turns about the driving sprocket and the lugs are disengaged from the axle of the truck, the wheels of the truck at this time being on the horizontal floor. The machine works successfully with either two-wheel or four-wheel trucks. With a two-wheel truck the man goes with the truck, and in practice, he leans back upon the truck handles and is, in effect, pushed up the incline with his load. With four-wheel trucks, it is not necessary to have a man accompany the truck, and with these, capable of carrying much heavier loads, certain installations make use of electric trucks carrying loads of 4,000 lbs. and over.

The motor operating the machine is located on the upper floor at the side of the incline. The main shaft, carrying the driving sprocket which operates the hauling chain, is provided at its outer end with a steel spur gear, journaled so that the gear projects a considerable distance above the floor line. Meshing

Inclined Elevator at the Dock of the Merchants & Miners' Steamship Company, Savannah.

with this gear is a steel pinion mounted on a countershaft, which is journaled on a special bed plate supporting the motor. This countershaft carries a spur gear which meshes with a pinion mounted on the motor shaft. The motor is wound, when so desired, to produce two speeds, one of which gives a speed of travel in the hauling chain of 125 ft. per minute, and the other a speed of 250 ft. per minute. The motor is also provided with a suitable friction brake. When desired, a reversing switch is provided which enables the inclined elevator to be run backwards, for the purpose of carrying loads down the incline. All these operations are under perfect control of the attendant.

The consumption of electric current is relatively small, the friction in the machine being reduced to a minimum. When the elevator is running without its load, the power required to keep it in motion is approximately 2 h. p. When carrying, say, five loaded trucks, which amount in the aggregate to 2,500 lbs., up an incline 50 ft. long, at an angle of 25 deg., the trucks moving at a speed of 250 ft. per minute, the machine is carrying 12,500 lbs. of freight a minute, or 375 tons an hour. To do this, requires a consumption of electric power of about 10 h. p. Assuming a cost of 5 cents per h. p. per hour, for the electric current the total cost to elevate 375 tons is 50 cents. These figures are the result of tests made under actual working conditions. Where it is necessary to meet a variation in the height of vessels due to the rise and fall of the tide, the "inclined drop" is furnished with hinges so that it may be raised or lowered.

The platform type of elevator is a moving incline formed of hard maple treads to which are fastened small leather covered cleats. At the right and the left, that is, at each end of the treads, are projecting lugs which engage steel projections bolted to the bottom of the trucks. With this type, if trucks are not used, packages of merchandise can be laid on the moving platform and carried up or down.

The capacity of a machine of any type varies, of course, according to the speed at which it is driven, the type of truck employed, and the speed at which the truckmen move their trucks. Ordinary hand trucks can be carried about 10 ft. apart. At a speed of 250 ft. per minute, the machine is capable of transporting 1,500 hand trucks an hour. Fully 25 per cent. of the number of truckmen required under old-fashioned methods, can be dispensed with; and the remaining stevedores can individually perform the work of several men working under oldtime methods.

Because of the rapid movement of the inclined elevator and the ease in ascending the incline, the truckman ascends at a trot. With the platform type the attendant rides up with the load if he so desires. When the top is reached he must not slacken, because of the line of trucks behind him. This has a tendency to speed up all the workers and keep them moving at a dog trot, on the levels as well as on the incline. In some instances where the rise and ebb of the tide is very pronounced, the dock elevator has performed its work at a grade of approximately 45 per cent.

Sets of these machines have been installed at the Pequonnock dock, Bridgeport, Conn., owned by the New York, New Haven & Hartford; at Mystic wharf, Boston, of the Boston & Maine; at the Savannah docks of the Merchants & Miners Transportation Company; the dock of the Old Dominion Line, New York, and at other places. The photographic view is typical of all these installations. This inclined elevator is manufactured by the Otis Elevator Company, of New York.

South Manchuria Railway Estimates.—The estimates for the next fiscal year for the South Manchuria Railway have been curtailed by about $1,000,000, some of the new enterprises having been abandoned and some of the new works originally planned to come in the present fiscal year having been put off to the coming year. This leaves approximately $7,000,000 as the estimates for the ensuing fiscal year which will be invested principally in the following undertakings: Improvement of the main line and the Mukden-Antung line; construction of passenger and freight cars; prosecution of Dairen harbor works; widening of entrance to the Kawasaki dock; establishment of an agricultural experiment station at Kungchuling; construction of transfer arrangements between steamer and wharf at Antung; construction of new warehouses at Newchwang, etc.

New Line for Spain.—The Spanish government has approved a project, now well under way, for constructing a 35-mile railway from Huelva to Ayamonte, in the Seville district. As Ayamonte is a frontier town, whence ferries cross the river to Portuguese territory, the projected railway will facilitate access to Portugal and is hoped to shorten to some 18 hours the journey from Seville to Lisbon, via Huelva. It is also supposed that most of the traffic between Portugal and Andalusia will pass over the new line, in addition to many of the tourists who land or embark at Lisbon. The new railway, the complete construction of which is expected to take not more than 20 months, will have nine stations, including the termini. Its estimated cost of construction is about $770,700. The line will run over low, level, marshy land. The road is to be of the 3 ft. 3 in. gage. The projectors of this railway are the Sociedad Espanola de Ferrocarriles Secundarios, with offices in Madrid.

General News.

President B. L. Winchell, of the Frisco lines, traveled 55,394 miles in 1912, and 59,173 miles in 1911. During 1912 he attended seventy-five meetings, which included banquets and conferences.

A bill has been introduced in the Illinois legislature providing that the maximum fare to be charged by any railway for continuous trips within the limits of a municipality shall be five cents.

The conference committee of the railroads, representing the 54 eastern lines, has agreed to confer about wages with committees of conductors and trainmen in New York City on April 22. The conductors and trainmen presented their demands about three months ago. The increases which they want are said to average 15 per cent.

The lower house of the Pennsylvania legislature has passed a bill providing for the establishment of a commission of three citizens to fix the minimum wages to be paid to all women and children who work in industrial establishments in the state; and there are provisions relating to railroad employees, one of which is that every flagman must have had 18 months' experience on trains.

The workmen's compensation bills which were considered by the legislature of Oklahoma at its recent session were all rejected. Faults pointed out by the governor, in the compensation law which is in force in the state of Washington, appear to have made the legislators cautious. The legislature of Indiana also has adjourned without passing any compensation law; and in Missouri the subject has been postponed until the next session of the legislature.

In connection with the reorganization of the operating and maintenance staff of the Dominion government railways, a change has been also made in the system of accounting on the Intercolonial. The system in use on the Canadian Pacific has been adopted, and the accounting will be done by divisions. An accounting staff is being organized at each of the four superintendents' offices, and these offices will report to Moncton, where the accounts for the system will be assembled.

It is announced this week that strikes of track laborers on the Pennsylvania Railroad have been broken, some of the strikers returning to work, and a large number of new men having been employed. Small local strikes in the track department have been reported at Trenton, Philadelphia, Altoona and other places on the main line. The principal trouble appears to have been the influence exerted over the laborers by leaders in strikes at industries near the railroad, which were managed by the "Industrial Workers of the World."

The legislature of Arkansas, which adopted a full crew law some years ago, has this year taken further action for the benefit and protection of the brakemen. At least the brakemen's monthly magazine says that the law is for their "benefit and protection." By an act which goes into effect on May 1, there must be three brakemen in each switching crew at all places where cars are switched, pushed or transferred across public crossings within a city; but the law applies in cities of the first and second classes only, and does not apply to roads less than 100 miles long. The full crew law applying to freight trains has a clause exempting railroads less than fifty miles long, and the penalty, $100 to $500 for each train unlawfully run, does not apply during strikes of men in train service. The full crew law of Arkansas as it applies to passenger trains requires in each crew, a porter and a flagman or a brakeman; but it does not apply to trains of less than three cars.

A "safety-first" rally of employees of the Ann Arbor Railroad was held at Owosso, Mich., last Saturday evening, April 5. The principal speaker was R. C. Richards, general claim agent of the Chicago & North Western, the originator of the safety-first movement. Following the lecture the railroad company gave a dance for the employees and their wives and sweethearts. There were between 900 and 1,000 people at the meeting, of whom at least half were actual employees. Mr. Richards spoke for two hours. He had with him a large number of stereopticon views, vividly illustrating his arguments. Several general officers from Toledo and all of the local officers were present. The train and enginemen, track and shopmen, and station forces of the road have taken a keen interest in the Safety First movement, and an organization of the employees, patterned after the one on the Chicago & Northwestern, was begun about a month ago.

The state of Arkansas is now the most progressive in the union, at least in one respect. The promoters of the anti-tipping propaganda have actually got the legislature to "come across" with a law, and the law is now in effect—except where the customer and the servant conspire to evade it. The act is No. 98, and it makes it a crime to solicit or receive any "gift, compensation, honorarium, or gratuity, commonly known as a tip." A railway or sleeping car company which permits tipping will be guilty of a misdemeanor. It is reported that some dining-car waiters and sleeping-car porters have asked their bosses to transfer them to runs outside of Arkansas. We have no confirmation of this report, though these men have done some audible growling. In other places, however, there is a marked absence of complaint, and it looks as though a large part of those travelers who have been in the habit of giving tips may be waiting for the state to begin some prosecutions before changing their practice.

New York Terminus of the Lehigh Valley.

Beginning May 1 the Lehigh Valley will run its passenger trains to and from Jersey City over the tracks of the Central Railroad of New Jersey, and will use the terminal station of that company, the contract for the use of the Pennsylvania terminal expiring at the end of April. Ferries from the Central of New Jersey station run to Twenty-third street and to Liberty street, New York City. The Lehigh Valley will use its own tracks to a point within about two miles of the Jersey City terminus. Passengers to and from Newark will use the new station of the road in that city, at Elizabeth and Meeker avenues. This station is conveniently reached by street-car lines from Broad and Market streets.

"Make the Railroads Aid Ohio."

The head-line artist has a multitude of sins to answer for. The heading of this paragraph, sent to us by a correspondent, who cut it from the *Kansas City Times*, is an example. Often the head-line editor seeks novelty with such exclusive enthusiasm that he forgets both the facts and the perspective. We hardly expect to reform him; but we sympathize with our correspondent, who says:

This would seem to indicate that the railroads had refused to assist the people of the stricken communities and were withholding offers of aid until compelled to act by state authorities; or that the railways had been temporarily appropriated by the state on account of their (the railways') refusal to lend assistance. The railways are by far the heaviest individual losers in many such disasters; but they are in most instances the first to offer such assistance as is within their power to grant; free transportation for supplies, physicians, etc., and usually substantial monetary contributions. If the people had even a vague idea of the aid extended annually by the railways to charitable causes, they would be amazed. Think of the prompt action of the railways in tendering services and money at the time of the San Francisco fire and of the very recent Omaha tornado.

A Directory of Commercial Organizations.

In response to a senate resolution passed December last, the Department of Commerce has submitted to the senate a list of the commercial organizations in the United States. This record, with a list of agricultural organizations, will be printed for distribution, provision being made for 1,500 copies for the use of the senate. The list of commercial organizations was prepared by the Bureau of Foreign and Domestic Commerce, which for nearly two years has been collecting for use in its own work detailed information regarding such organizations, their functions, membership, income, etc. The information in the files of the bureau at the time the resolution was adopted was supplemented by such additional facts as it was possible to obtain before Feb-

ruary 15, the date on which the list was to be submitted to the senate, and this list when published will record about 3,500 national, nterstate, state, and local organizations.

In the compilation of its information the bureau has utilized various symbols to indicate the field of service and the activities of the various organizations. These symbols have been used in the list submitted to the senate, so that when published it will furnish in a concise manner a complete record of the organizations, their functions, membership, and other details. The information thus compiled constitutes a directory of commercial organizations of the country such as has never before been prepared and it should prove of practical value to business men.

New Railways by Fiat.

The Texas Welfare Commission says that the hour has come when in the name and behalf of Texas and for her prosperity and further progress radical changes for the better must be brought about in the railroad situation. "New lines must be constructed; old lines must be improved; additional yards, terminals, sidings and depots must be constructed. Safety signal devices should be installed; second track should be built; grades should be revised; wooden bridges should be superseded by steel and masonry; heavier rails should be laid." But where is the money to come from? Texas has led the procession in the matter of regulating the railways. Let us now see what success it is going to meet with in securing capital for the railway extensions which "must be built."—*Railway Record.*

The New York Dock Railway.

Subject to the approval of a contract yet to be made, the New York State Public Service Commission for the First district has authorized the New York Dock Railway to issue $500,000 in capital stock, $450,000 preferred, and $50,000 common. The New York Dock Railway was organized by New York Dock Company interests for the purpose of operating a short railroad, which crosses certain streets in Brooklyn, and therefore had to have a franchise from the city. The proceeds of the sale of the new stock will be devoted to the following purposes:

Property to be acquired from the New York Dock Company	$383,100
New barges and lighters	33,300
New railroad construction	22,000
Corporate stock deposited with the city	5,031
Payment to the city for local franchise	5,000
Organization expenses	3,918
Legal expenses	26,905
Working capital	20,746
Total	$500,000

A contract for the transfer of the tracks and property to the New York Dock Railway is at present the subject of public hearings.

New Railroad Laws in Texas.

The legislature of Texas at its recent session passed the following bills affecting railroads:

An act making it a misdemeanor for station agents to fail to bulletin properly the arrival and departure time of passenger trains.

An act authorizing the Missouri, Kansas & Texas to take over and operate several of its subsidiary lines.

An act authorizing the Houston & Texas Central to purchase and operate the Hearne & Brazos Valley.

An act authorizing the Texas & New Orleans to take over and operate the Burr's Ferry, Browndel & Chester.

An act authorizing the St. Louis Southwestern to take over the Stevensville North & South Texas.

An act authorizing the Gulf, Colorado & Santa Fe to take over and operate its Pecos Valley lines.

An act authorizing the El Paso Southwestern to take over and operate the El Paso & Northeastern.

An act requiring railroads to equip all side tracks with derailing devices.

An act providing that no railroad shall build lines within 4,000 feet of the shore line of Aransas Harbor.

An act extending the time for two years in which railroads may complete extensions of their lines, as provided in their respective charters.

A resolution directing the attorney general to investigate the St. Louis Southwestern Railroad's alleged violation of its charter provisions in not building an extension of its Eastern Texas line from Lufkin to Crockett.

Report on Collision at Ford's, La.

The railroad commissioners of Louisiana, reporting on a butting collision, which occurred on the Vicksburg, Shreveport & Pacific near Ford's, February 21, where west bound passenger train No. 5 encroached on the time of east bound passenger train No. 2, say that too much discretion is allowed to employees in the operation of trains. Trains should be operated under positive orders. In other words, "the block system is deemed by the commission to be the safest system of operating trains." It is true, say the commissioners, that the superintendent, in his testimony, intimated that the failure of the employees to obey the rules in this case had shaken his confidence, so that he feared they would not obey the signals of a block system. But, says the report, "this does not appeal to the commission as being logical. There seems to be no dispute on the general proposition that it is safer to operate trains by keeping them a specific distance apart, rather than a specific time apart."

The Grand Trunk in Southern New England.

President E. J. Chamberlin, of the Grand Trunk, last week sent a letter to the governor of Rhode Island offering to give to the state the Southern New England Railroad, the unfinished line between Palmer, Mass., and Providence, R. I., begun by the Grand Trunk, as it now stands; on condition that the state complete the road and agree to one of two ways of operating it. The alternative methods of operation proposed are described as follows:

"First—If the state desires to operate the railroad, we will grant running rights on reasonable terms over the New London Northern from Palmer to Brattleboro, Vt., so as to make the line sufficiently long to constitute an operating division; and we will also make a traffic agreement between the Central Vermont and the state-owned railroad for a division of through rates on a mileage basis with a reasonable additional allowance for terminal charges; or, second,

"The Central Vermont will lease the state-owned railroad for a rental equivalent to 5 per cent. interest on the actual cost to the state of completing the whole line."

The statement adds that the line cannot be completed by the company unless the state becomes the second guarantor of the necessary bonds (as heretofore proposed by Mr. Chamberlin); and that if the state is unwilling to accept the road as a gift and complete it, the contractors will remove their apparatus, and the line will be definitely abandoned about the middle of the present month.

Mr. Chamberlin says that the sum of two and a half million dollars has already been expended on the line and that its completion will require several millions more than was originally estimated.

The services of the Grand Trunk engineers are tendered to the state, which would receive also all plans, surveys and other data used by the company. If the state does not wish to accept the offer, it is asked to consider the earlier request to guarantee the company's bonds.

The Flood Damage.

Accurate accounts of the damage done by the floods of March 25-29, in Ohio, Indiana and adjacent states are still lacking, the work of restoration being the greatest emergency-burden ever experienced by the principal roads in central territory. President Willard of the Baltimore & Ohio has estimated that that company's losses will amount to 2½ to 3 millions of dollars, and the loss of traffic for the last week of March and the first week of April will aggregate two millions. The property loss of all railroads in the territory damaged by the floods of the 25th-27th he estimated at from $18,000,000 to $20,000,000. He said that it would be impossible for the company to make many of the improvements which had been planned. At Zanesville the B. & O. lost a car shop worth about $300,000 and a bridge worth $250,000. The road lost 12 bridges in the flood and had several miles of track completely washed away. Trains were run through from Washington to Chicago, April 4, over its own lines, although it was necessary to detour trains over divisions not or-

dinarily used for this traffic. At Zanesville and on the Ohio River division it took many days to make even temporary repairs. At Hamilton and Dayton the railroad yards were ruined.

The Chesapeake & Ohio was able to run trains east of Huntington, W. Va., by the 4th, but west of there it took until the 6th to restore the tracks to Cincinnati. West of Cincinnati the damage was extensive and the line was not opened till the 9th.

The Pennsylvania lines in Ohio suffered severely. An officer said that the steel bridges lost would aggregate in length about 8,000 ft. A second rain in central Ohio on the 4th caused some washouts, and the Pennsylvania, after using its own line for a short time was obliged again to use the Erie between Akron to Mansfield. A second series of washouts occurred also on the Cleveland, Akron & Columbus. The Pennsylvania's bridges, which were wrecked beyond repair, numbered 14, six of which were large ones. The Cleveland & Pittsburgh was opened through on April 2.

The Toledo, St. Louis & Western was opened throughout its length April 1.

The Wabash seems to have suffered less than the other roads in Indiana, and freight was accepted April 2.

The Largest Ship in the World.

The new steamship "Vaterland" of the Hamburg American Steamship Company was launched at Hamburg April 3, the greatest mass of steel ever put into the water. The vessel's launching weight was 31,000 tons, and her gross tonnage will be over 50,000 tons. She will be 950 ft. long, and 100 ft. wide; and her height, from keel to masthead, will be 250 ft.

This vessel will be 5,000 tons larger than the "Imperator," her sister ship, which has lately been finished, and which will cross the Atlantic next month. The "Vaterland" will not be ready for service until 1914.

All of the three new monster ships of the Hamburg American line will have double steel hulls, the inner "skin" being carried high above the water line. In the "Vaterland" 1,500,000 rivets were used, weighing 1,500 tons. The steel plates were riveted together, and the walls completed, before the port holes were cut. These holes were made by the use of the acetylene torch. These vessels will have search-lights of 80,000 candle power, and the lights will be placed high enough to throw their rays thirty miles out to sea. The "Vaterland" will have 84 life boats, two of which will be equipped with high power motors, capable of towing other boats. These motor boats will have wireless telegraph apparatus, with which messages can be sent 200 miles.

Pere Marquette Investigation.

Newman Erb, chairman of the board of the Pere Marquette, testified before the legislative committee which is investigating the affairs of the road, at Lansing, Mich., on March 28. Among the reasons for the deficit which threw the road into bankruptcy, he mentioned wage increases, bad weather, and disruption of traffic caused by undertaking too many improvements at one time. President Cotter tried to do too much at once in 1911, he said, tearing up too many lines at once and interfering with traffic. He also criticised the men who managed the road during the eight years between his first connection with it, and his second connection as receiver, saying that they "sat like bumps on a log" and made no effort to develop the property. He considered the road to be worth $70,000,000, the amount of its present funded debt, as a future prospect, and expressed the belief that it was not necessary for the stockholders to lose a single cent. With $20,000,000 the road could be made a paying institution in two years under present conditions, and with half that sum in four years. He also cited the gradual reduction in rates from an average of 7.03 mills per ton mile in 1902, to 5.75 mills in 1911, while expenses have been going up at the rate of $1,000,000 a year for wages, $500,000 for materials, and on an average of $280,000 for taxes. If the 1902 conditions had prevailed in 1911, he said, the net earnings would have been increased by $6,000,000. Some of the branch lines are unproductive, and will be for years. The road must be put in condition to handle cheaply long-haul tonnage. If the state imposes no further burdens the Pere Marquette will emerge from its difficulties.

Eugene Zimmerman testified before the commission on April 2. He declared that the Cooley appraisal of $28,000,000 as a replacement value of the road was entirely too low, as was the second appraisal of $34,000,000, and he thought it was worth nearer $70,000,000, but would make no definite estimate without a thorough investigation. He said that Michigan, through its laws affecting railroads, was confiscating them, and that he would not invest a dollar in a Michigan road. Asked if he did not think the people would be willing to give the roads higher rates if the roads demonstrated the necessity, he replied, "No, I don't; lots of the people are not honest." He did not think the state could operate the road successfully, because there would be too much politics in the management and that it would ruin the state. In his opinion the road could be operated at 75 per cent. of its gross earnings, and the latter could be increased from $17,000,000 to $20,000,000. Mr. Zimmerman also, under cross-examination, furnished the committee with a large amount of detailed information regarding the financial affairs of the road and the various sales of its stock.

Pennsylvania Pensions.

The Pennsylvania Railroad has now paid pensions 13 years, and a total of 7,152 men have received payments, through the funds, of $8,368,786, all out of the earnings of the various companies in the System. Of this amount $6,319,902 has been paid on the lines east of Pittsburgh, and $2,048,884 west of Pittsburgh. At the present time there are 3,807 men on the pension rolls. On December 31 last, there were 296 pensioners on the lines east of Pittsburgh more than 90 years of age. The names, occupations, and divisions where last employed of those over ninety years of age were as follows:

Name.	Occupation.	Division.
Micheal Eckerline	Laborer	Altoona shops.
James Kaylor	Blacksmith	Altoona shops.
Elias Griffith	Watchman	Altoona shops.
James L. Shields	Foreman mason	Conemaugh.
David L. Graeff	Machinist	Philadelphia.
Thomas C. Payne	Laborer	Trenton.
Charles Lupton	Car builder	Philadelphia Terminal.
James Gray	Agent	Elmira.
Chas. A. Jefferies, Sr.	Signal repairman	Philadelphia.

The pension amounts to one per cent. of the average salary or wage for the ten years previous to retirement, multiplied by the number of years the man has been in the employ of the company. Employees retire without any obligation whatever to the Pennsylvania Railroad, and many of them engage in outside occupations. This pension plan, inaugurated by Mr. Cassatt in 1899 with much doubt as to its eventual success, is now declared by the officers of the company to have proved to be of immense benefit to a large number of men, and to have contributed enormously to the contentment of the men in the service of the road.

Suit for Southern Pacific Lands.

Julius Kruttschnitt, chairman of the executive committee of the board of directors of the Southern Pacific, testifying at New York City this week in the suit of the government charging fraud in the acquisition of lands by the Southern Pacific in Kern county, Cal., denied the truth of the statement, published last year, on the authority of the attorney general, that officers of the Southern Pacific had known that lands on which the companies sought patent, contained oil. The land in question aggregates 6,800 acres and it has been charged that it is worth $15,000,000. Mr. Kruttschnitt denied emphatically that there had been any fraud or deception in obtaining the patents.

Asked if he considered $15,000,000 a fair value of the lands now he said:

"I don't consider the lands of any value. Were it not for the imputation of fraud in this suit I would favor selling the lands for 15 cents an acre to any person who might be foolish enough to buy the property."

He contended that the lands in 1904 were poor grazing or agricultural lands, as stated in the patent claim.

He admitted that some time previous to the patent of these lands he had been in charge of the oil development work of the Southern Pacific, but he declared he had no information as to the land other than that contained in the official papers and map used in the patent proceedings. He denied the claim made by the government that the Southern Pacific had a thorough examination of the land made before the patent was secured. He said the Kern Trading & Oil Company was a fuel oil development and oil purchasing department of the Southern Pa-

cific. There was no secrecy in connection with its formation.

"We did not consider it oil land in 1903-4," he said, "but some years later 'wildcat' promoters entered this territory, and through their operations the impression was created that the land was generally oil producing. Those fellows had to give up in despair and abandon the fields."

W. N. Mills, special assistant attorney-general, turned to Mr. Kruttschnitt and said:

"Don't you know that there are three valuable gushers now in operation on these lands, producing 1,000 barrels of oil daily?"

"That is news to me," replied Mr. Kruttschnitt. "I am glad to hear it, for if that is so the land has some value."

Railway Club of Pittsburgh.

At the next meeting of the Railway Club of Pittsburgh, to be held April 25, Walter V. Turner, chief engineer, and P. H. Donovan, mechanical engineer of the Westinghouse Air Brake Company, Pittsburgh, Pa., will read a paper on The Effect of Changed Operating Conditions and Modern Rolling Stock on the Brake and What Is Being Done to Make This Money Saving or Money Losing Apparatus as Efficient as Heretofore.

American Society of Engineer Draftsmen.

At the next meeting of the American Society of Engineer Draftsmen, to be held in the Engineering Societies' building, New York, April 17, D. B. Heilman, Mem. Soc. E. D. (Philadelphia & Reading), will read a paper entitled, Teaching Legible Sketching for Shop Plans to the Operating Engineer and Machinist. This lecture will be illustrated by a projectograph.

Railway Signal Association.

The next meeting of the Railway Signal Association will be held at Hotel Astor, New York City, on Wednesday and Thursday, June 11 and 12, the dates having been changed from the tenth and eleventh by a recent decision of the Board of Direction.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Supts.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—C. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The meeting of the Western Classification Committee, which is expected to last for several weeks, was begun at St. Louis on April 1.

F. R. Stevens, agriculturist of the Lehigh Valley, who goes around among the farmers responding to their requests for information, says that he has already traveled in his automobile 20,000 miles on these errands.

The Canadian Pacific has restored the uniform rate of one dollar a day, demurrage, on freight cars, the rates of two dollars and three dollars which have been in force since the scarcity of cars last autumn being now discontinued.

The Grand Trunk reports 3,000 passengers leaving Montreal in the last two weeks in March in eleven special trains, for Ontario and points in Western Canada, all these passengers having come from Europe by way of Portland, St. John to Halifax.

The Southwestern Passenger Association, Western Passenger Association, Southeastern Passenger Association, and Central Passenger Association have authorized a special rate of two cents a mile to St. Louis for the Fourth Annual Peace Congress to be held on May 1, 2 and 3.

"Trade and Traffic" is the name of a new monthly publication, the first number of which has just been issued at Tampa, Fla., by L. T. & B. E. Calkins. A sub-title reads "Finance and Real Estate." The editor has at least two of the essential qualifications; he knows how to write and he is familiar with railway freight traffic.

At Williamsburg, Ky., the Adams Express Company has been fined in court $1,475 on nineteen charges of delivering liquor in territory where its sale is forbidden, the action of the express company being alleged to be contrary to the provisions of the federal law recently passed by Congress, regulating the interstate movement of liquors.

Somebody has figured out that the freight carried through the Soo canal in 1912, 72½ million tons, troubled the waters there about every 15 minutes. The number of cargoes, 20,000, means large ships, 3,625 tons on the average. At that it involves 85 ships a day for the season of 236 days. In 100-ton boats, such as used to be common, it would mean 725,000 vessels a year, 3,060 a year through the season, 180 an hour at the height of trade, or one every 20 seconds. By caravan, five camels to the ton, this would require 364½ million camels a year, or a million a day, or with the restricted season nearly 1.5 million a day. At the busiest there would be 91,125 camels an hour.

The Pennsylvania State Railroad Commission has before it complaints from two teamsters in Philadelphia, who claim that they are discriminated against at the freight houses of the Pennsylvania Railroad and the Philadelphia & Reading, in Philadelphia. One of the two complainants has proceeded against the Pennsylvania, and the other against the Reading; and the Philadelphia Team Owners' Association is aiding the prosecution on behalf of both. It is claimed that freight coming to the freight houses in the cars is piled up indiscriminately and is often so covered by other goods that the teamsters have to waste much time in getting what they want. They demand that the employees of the railroad shall truck the freight to the wagon door. The complaint charges that packages for the large stores which do their own trucking are sorted and placed near the doors where the teamsters can get them easily. It is claimed that tailboard delivery—that is, delivery of the freight close to the point where the wagon backs up—is in vogue in Chicago, Cleveland, Buffalo, Rochester, St. Louis and Minneapolis.

Chicago Street Traffic.

A subcommittee of the Chicago Association of Commerce has submitted to the association a report on the teaming, transfer, express and storage interests of Chicago, in which it is stated that more than 250,000 tons of freight are hauled through the streets of Chicago daily, making a total approaching 100,000,000 tons a year. This represents an annual business of more than $60,000,000, and an investment in excess of $85,000,000. According to the report more than 10,000,000 tons of coal are trucked through Chicago streets annually. Structural steel, brick, sand, ice, general merchandise, produce, packinghouse products and milk, are among the other commodities that are large factors in the total. The number of vehicles registered with the city authorities in 1912 was 80,000, an increase of 11 per cent. The increase in capacity was still greater. Of these vehicles more than 50,000 are horsedrawn wagons and trucks, and 2,790 are automobile trucks. The number of motor trucks carrying less than one ton increased from 922 in 1911, to 1,554 in 1912, while the number carrying over one ton increased from 656 to 1,018.

INTERSTATE COMMERCE COMMISSION.

Fred W. Sweney, of Chicago, has been appointed chief examiner of accounts for the Interstate Commerce Commission, to succeed Charles A. Lutz, who recently resigned to become comptroller of the United States Express Company. Mr. Sweney has been an employee of the commission several years.

The commission has suspended from March 31 until July 29, certain items in a supplement to Agent W. H. Hosmer's tariff, which contain increased rates for the transportation of linseed oil cake and meal and flaxseed screenings from Minneapolis, Minn., and other points to gulf ports.

The commission has suspended from March 31 until September 30, a supplement to the tariff of the Minneapolis & St. Louis, which contains increased rates applicable to the transportation of grain, grain products and seeds from Aberdeen and other stations in South Dakota to Duluth, Minn.

The commission has suspended from March 27 until July 25, an item naming increased rates on flour, in carloads, from points in Kansas and other western states to California terminals, published in supplements to certain tariffs. The present rate from Atchison to San Francisco is 65 cents per 100 lbs., and the proposed rate is 75 cents. An increase of 10 cents per 100 lbs. is also proposed from various other points.

The commission has suspended certain schedules contained in supplements to Agent R. H. Countiss' tariff, which would advance rates on lumber and shingles from Pacific coast points, including San Francisco, to certain points in Colorado, Wyoming and Texas. For example, it was proposed to cancel the present through rate of 50 cents per 100 lbs. on lumber moving from San Francisco to Dalhart, Tex. The combination of local rates applicable would be 30 cents to Los Angeles plus 50 cents from that point to Dalhart, making an advance of 30 cents per 100 lbs. Like advances would result between other points.

Complaint Dismissed.

James J. McLoughlin v. Texas & Pacific et al. Opinion by the commission:

The complainant contends that the rate charged for the transportation of hay from Eudora, Ark., to New Orleans, La., was unreasonable. Reparation was asked. The commission found that the evidence was not conclusive. (26 I. C. C., 307.)

Alfred Struck Company v. Louisville & Nashville et al. Opinion by the commission:

The commission found that the charges on shipments of doors and window frames, set up, from Louisville, Ky., to Galveston and Houston, Tex., Chattanooga and Memphis, Tenn., and Atlanta, Ga., were not unreasonable. (26 I. C. C., 469.)

Memphis Bureau v. Louisville & Nashville et al. Opinion by Commissioner McChord:

The complainant contended that the rate of $1.10 per ton on coal from western Kentucky and Alabama mines was unreasonable to the extent that it exceeded $1.00 per ton. The commission found that the evidence was not conclusive. (26 I. C. C., 402.)

Board of Trade of Cheraw, S. C., et al. v. Seaboard Air Line et al. Opinion by the commission:

The complainant attacks the class and commodity rates from all directions to Cheraw, S. C., alleging that they are unreasonable and prejudicial as compared with the rates to Wadesboro

and Monroe, N. C. The commission found that the evidence was not conclusive. (26 I. C. C., 364.)

Stewart & Clark Manufacturing Company v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

The complainant contends that the rating of double first class on speedometers in western classification was unreasonable. Reparation is asked on shipments in less than carloads from Chicago to San Francisco and Los Angeles, Cal. The commission found that the evidence was not conclusive. (26 I. C. C., 361.)

Wholesale Produce Dealers Association of Brooklyn, N. Y., v. Long Island Railroad. Opinion by the commission:

The complaint attacking the defendant's track-storage charges exacted at certain delivery tracks in Brooklyn, N. Y., was dismissed, the evidence showing that members of complainant association use defendant's cars for warehouse purposes. The charges themselves were not found to have been unreasonable. (26 I. C. C., 413.)

Cal Hirsch & Sons Iron & Rail Company v. Washington, Baltimore & Annapolis Electric et al. Opinion by the commission:

The complainant contends that the rate of 77½ cents per 100 lbs. for the transportation of less-than-carload shipments of school desks and other articles from Annapolis, Md., to East St. Louis, Ill., are unreasonable. The commission decided that the evidence was not conclusive. (26 I. C. C., 480.)

Esson Granite Company et al. v. Southern Railway Company et al. Opinion by the commission:

Between June 24 and July 2, 1909, complainants shipped 43 carloads of granite paving blocks from Granite Quarry, N. C., to Chicago, upon which the defendants charged a joint rate of $3.30 per net ton. The intention of the carriers was to reduce this rate to $3.10 per ton, effective June 24, but the reduction was not accomplished until July 3. Upon a petition alleging that the rate of $3.30 per ton from Granite Quarry to Chicago was unreasonable, the commission decided that the mere agreement of the parties with respect to a rate, or the mere subsequent reduction of a rate, is not sufficient ground for a finding of unreasonableness. (26 I. C. C., 449.)

Reparation Awarded.

The Board of Railroad Commissioners of the state of Montana, in behalf of Frank W. Campbell, v. Northern Pacific et al. Opinion by the commission:

The commission decided that the charges of 65½ cents per 100 lbs. on a carload of emigrant movables from Edmunds, N. Dak., to Shawmut, Mont., were unreasonable, to the extent that they exceeded 51 cents per 100 lbs., and prescribed that rate for the future. (26 I. C. C., 482.)

Capital Electric Company v. Baltimore & Ohio Chicago Terminal. Opinion by the commission:

The commission decided that the rate of 95 cents per 100 lbs. charged by defendants for transportation of a carload of enameled-iron conduit pipe from Harvey, Ill., to Salt Lake City, Utah, was unreasonable to the extent that it exceeded 75 cents per 100 lbs. and prescribed that rate for the future. (26 I. C. C., 472.)

Rates on Hoops Reduced.

Disher Hoop & Lumber Company v. St. Louis & San Francisco et al. Opinion by the commission:

The commission decided that the rate of 6½ cents per 100 lbs. on coiled elm hoops from Chaffee, Mo., to Thebes, Ill., was unreasonable to the extent that it exceeds 4 cents per 100 lbs., and prescribed that rate for the future. Reparation was awarded. (26 I. C. C., 488.)

Minimum Weight Reduced.

Josiah Partridge & Sons Company et al. v. Pennsylvania Railroad et al. Opinion by the commission:

The commission decided that the maintenance of minimum carload weight of 10,000 lbs. on chairs, n. o. s., set up, from Lewisburg, Pa., to Jersey City, N. J., was unjustly discriminatory against complainants and unduly preferential to shippers from other points from which the same commodity is transported under a minimum carload weight of 8,000 lbs., and prescribed that minimum for the future. (26 I. C. C., 484.)

Reconsigning Charges Reduced.

C. C. Justice Company v. Pennsylvania Railroad. Opinion by the commission:

The commission decided that the charge of $5 per car for reconsigning carloads of green tomatoes at Altoona, Pa., was unreasonable to the extent that it exceeded $2 per car, and prescribed that charge for the future. Reparation was awarded. (26 I. C. C., 478.)

Hardware Rates Reduced.

McGregor-Noe Hardware Company v. St. Louis & San Francisco. Opinion by the commission:

The commission decided that the rates for the transportation of less-than-carload shipments of band and boiler iron, corrugated iron, horse and mule shoes, wire, woven-wire fencing, nails and spikes from Springfield, Mo., to certain local points in Missouri and Arkansas were unreasonable to the extent that they exceeded commodity rates formerly in effect, and prescribed those rates for the future. (26 I. C. C., 466.)

Switching Charges Not Increased.

In re switching charges at Sheffield, Minn. Opinion by Commissioner Prouty:

The commission decided that the proposed advance from $3 per car to $5 for switching grain and grain products by Chicago Great Western between the interchange track of the Chicago, Rock Island & Pacific and the mill of protestant at Sheffield, Minn., was not justified, and that a charge of not exceeding $3 might properly be made for the switching of the loaded car and $1.50 for the movement of the empty car. (26 I. C. C., 475.)

Passenger Fares Increased.

In re Fares from Suburban Points on the Washington-Virginia Railway to Washington, D. C. Opinion by Commissioner Prouty:

The suspended tariff increases the passenger fares from stations on the line of the Washington Virginia Railway in Virginia, Petty to Green Valley, inclusive, to points in Washington, D. C., from 10 cents to 15 cents. The commission found that the suspended tariff contained prices for family and commutation tickets which would enable passengers to travel at a lower rate than is possible under the rates now in effect, and that the results of the suspended tariff would probably be to cheapen rather than enhance the cost of transportation. The order of suspension was vacated. (26 I. C. C., 398.)

Joint Rates Established.

Texas Cement Plaster Company v. St. Louis & San Francisco et al. Opinion by the commission:

The complainant alleges that the failure of the Kansas City, Mexico & Orient, and the St. Louis & San Francisco to establish joint through rates on cement plaster from Plasterco, Tex., to destinations on the line of the St. Louis & San Francisco results in unjust discrimination against its product. The commission decided that the defendant should be required to establish joint rates from said point of origin to points on the line of the St. Louis & San Francisco not exceeding those contemporaneously maintained from Acme, Tex., to the same destinations. (26 I. C. C., 508.)

Colorado Passes.

In re issuance and use of passes, franks and free passenger service. Opinion by Commissioner Harlan:

The commission found that with the single exception of the Chicago, Burlington & Quincy, the railroads in Colorado until last November were violating the law respecting the issuance of free passes. Annual system passes were freely issued to persons who had only a nominal connection with the railroads and trip passes for the families of such persons were also furnished. Free state passes were readily granted to prominent interstate shippers, but the occasional shippers rarely received

such favors. Public officials, particularly those who favored the railroads, also obtained passes without difficulty. The commission held that an intrastate pass unlawfully given to an interstate shipper was a step toward the purchase of his traffic. The proper rules restricting the use of the passes were printed on the back of the passes, but the commission decides that as these instruments by which the purposes of the law might be defeated had been voluntarily distributed by the carriers, it was the duty of the carriers to protect its facilities and services against the improper and unlawful use of the passes by proper policing. The railroads had been eager to abolish these practices, but each was afraid to start the movement on account of the loss of traffic which was sure to follow. The Burlington alone broke away; and it did this at a loss, which would have been much greater if its lines had been differently located. The investigation of the commission enabled the carriers to stop these practices without requiring any particular carrier to assume the burden with its shippers of initiating the movement. The carriers readily agreed to conform their practices in the future to the rulings of the commission, and since the investigation was commenced they have taken steps with that end in view. Other reports on this investigation will be issued when it has been determined just how far prosecutions must follow the disclosures. (26 I. C. C., 491.)

Demurrage Charges Properly Assessed.

Leo P. Harlow, trustee, v. Washington Southern. Opinion by the commission:

The complainant contends that the demurrage charges paid upon certain shipments of cottonseed oil consigned to the Cotton Oil Company at Relee, Va., were excessive. Reparation is asked. The complainant is trustee in bankruptcy for the Columbia Cotton Oil & Provision Corporation. This corporation has private tracks at Relee capable of holding about 35 cars, and asked the defendant to store the cars consigned to it on these private tracks in order to avoid demurrage charges. The shipments in question were on order-notify bills of lading. An order-notify shipment is a notification to the carrier that title to the consignment is retained by the consignor until delivery of the bill of lading properly endorsed. Ordinarily the order-notify bill of lading is forwarded to the bank with a sight draft attached for the value of the shipment, and the person notified at destination can only obtain possession of the bill of lading by payment of the draft. The carrier cannot without incurring liability deliver such shipment until the bill of lading is properly surrendered. The delivering carrier did not surrender possession of these cars until the bills of lading for them were surrendered. Neither did it store the cars as requested, for such action might have resulted in the carrier becoming liable to the consignor, and moreover, such delivery would not have stopped the accrual of demurrage charges under the tariff. The commission decided that the delay in presenting the bills of lading was the fault of the bankrupt corporation, and that the demurrage charges were properly assessed. The complaint was dismissed. (26 I. C. C., 511.)

Investigation of Fiber Packing Boxes.

Examiner Boyle, of the Interstate Commerce Commission, began a hearing at Chicago on April 4, in the case of R. W. Pridham Company, of Los Angeles, vs. the Southern Pacific, et al., involving the reasonableness of the eastbound commodity rates out of California which are higher for commodities packed in fiber board boxes than for the same articles packed in wooden boxes. Although the complainant rested his case at the hearing in Los Angeles several months ago, the associations representing the fiber box manufacturers, the wooden box manufacturers, and the users of fiber board containers have filed interventions in the case, and Examiner Boyle stated that it has now assumed practically the attitude of a general investigation by the commission of the entire subject of substitutes for wooden boxes.

Luther M. Walter, the attorney representing the fiber box manufacturers, stated that, except in the rates from California, no discrimination is made between fiber board and wooden boxes. The first witness was J. B. Fellows, president of the Illinois-Michigan Fiber Box Company, who testified at length regarding the history of the development of the fiber package as a freight container, which he was the first to manufacture without wooden edges. His company is now making between 4,000,000 and 5,000,000 boxes a year, and receives no complaints against the fiber box for transportation purposes from its customers. It is decidedly to the interest of the manufacturer, he said, that the box shall be satisfactory, and therefore the product is tested during manufacture every half hour, and no effort is made to market the boxes for the transportation of bulk freight, or for commodities or conditions for which it is unsuited. For the articles customarily shipped in such boxes he considered that fiber made as satisfactory a container as wood, and he promised to submit a list of such commodities.

Several shippers who have used large numbers of fiber boxes strongly defended them as against wooden boxes, except under certain conditions, such as those which must be met by ocean freight that often has to be rehandled several times, and declared the fiber box superior to wood for many kinds of shipments. Photographs taken in warehouses showing the condition of fiber boxes and wooden boxes under various circumstances were introduced in evidence.

STATE COMMISSIONS.

The railroad and warehouse commission of Missouri has rescinded its order dated March 19, refusing to approve Western Classification No. 51 and declaring that Western Classification No. 50 would remain in effect. The reason given is that under the operation of the new law the commission will cease to exist on April 15, and within that short period it will not have time to make such investigation as the importance of the questions involved will require. It is concluded that the matter of the approval or disapproval of Classification No. 51 should be taken up by the new public service commission.

The railroad commission of Louisiana has issued a circular, No. 419, announcing its intention to order the introduction of the block system on all railroads in the state, except those less than 25 miles long, and except those which run only one train a day each way. The circular says that the three important roads in the state which already have block signals are operating their trains under the system "with splendid results." All roads are called upon to send to the commission, before April 30, a statement of what accidents have occurred on their lines during the past five years; a list of telegraph offices with the distances between them, and showing also stations which have no telegraph; also the number of regular trains run each way daily.

The Public Service Commission of Maryland in a case against the Northern Central, decides that a local passenger train, carrying intrastate passengers, may not rightfully be sidetracked to allow an express train, behind time, carrying interstate passengers, to run ahead of it. It was contended by the railroad company that the commission had no right to issue an order that might interfere with the running of its through trains engaged in interstate traffic. The commission took the ground that the schedule for the local train belongs to it when it is running on that time, and not to a belated express train, and, in brief, that the rights of the passenger traveling wholly within the state are equal to those of the passenger from without the state, and that the railroad's time table in this respect is its contract with the passenger.

The Public Service Commission of Missouri.

The law of Missouri abolishing the Railroad and Warehouse Commission, and establishing a Public Service Commission with extensive powers, goes into effect April 15. This law, which was Senate bill No. 1, fills 149 pages, and the powers granted to the new commission embrace apparently everything of a radical nature which is to be found in the laws of New York and the other states which have adopted new statutes concerning transportation and other public utilities during the past few years. Street railroads, gas companies, electric light, water, and express companies, telephone and telegraph companies are dealt with at great length. The term of each of the five commissioners will be six years. They must have been citizens for five years and must be 25 years old. The governor in making appointments designates the chairman. The governor also appoints a general counsel for a term of six years, but the commission appoints its own secretary. The commissioners during their terms are to reside at Jefferson City. Their salaries will be $5,500 each;

that of the general counsel $4,500; and that of the secretary $3,600. The commissioners and their employees are forbidden even to suggest the appointment of any person to a place under any corporation subject to the supervision of the commission. Among the detailed powers granted to the commission is a clause authorizing it to order the construction of side tracks to industries. It may prescribe the time in which express packages are to be received and when delivered, and the limits of delivery territory. The commission may order railroads to provide a suitable car to be used in testing track scales, the expense to be apportioned, by the commission, among the different railroads. The commissioners and their employees may ride on trains and engines by paying fare, and on reasonable notice may have the use of an inspection locomotive, or a special locomotive and an inspection car, once a year. In adjusting rates for passengers or freight, the commission is to "have regard among other things to a reasonable average return on the value of the property used in public service and to the necessity of making reservation out of income for surplus and contingencies." The commission may order the restoration of reduced fare passenger tickets which have been discontinued within five years past. Connecting railroads may be ordered to form through lines, and if necessary the commission may order the construction of a connecting track. The commission may suspend new tariffs, but not for more than 120 days.

No road shall hereafter be constructed across a railroad track, nor a railroad across a public highway, nor a railroad across another railroad, without the permission of the commission; and the commission has the right to refuse consent. The commission may ascertain the value of the property of every railroad, street railroad and common carrier, and may make revaluations from time to time. The commission may order the installation, maintenance and operation of appropriate safety devices, including interlocking and block signals, and to establish uniform or other standards of equipment.

About half of the pages of the law are taken up with provisions relating to gas, electric light and telegraph companies.

The Railroad and Warehouse Commission having been abolished, a new law has been passed, House bill No. 516, creating the office of warehouse commissioner and regulating the inspection and weighing of grain.

COURT NEWS.

In the superior court at Bridgeport, Conn., on Tuesday of this week, Judge Greene began the trial of officers of the New Haven road charged with criminal negligence in connection with the derailment at Westport, October 3, last; Messrs. H. J. Horn, B. R. Pollock, C. N. Woodward and L. J. Carmalt.

The attorney general of Missouri has announced that quo warranto proceedings will be filed in the state supreme court to oust the St. Louis & San Francisco from control of the Kansas City, Clinton & Springfield, a line running from Kansas City to Springfield, on the ground that it is a parallel and competing line.

The Supreme Court of the United States, in the case of McGinnis, a locomotive engineer, killed while running the engine of a train of the Gulf, Colorado & Santa Fe, holds that married daughters of railroad employees may not enjoy benefits under the federal employers' liability law in case of the negligent killing of the father. Justice Lurton, for the court, reversed a verdict of $15,000 awarded the widow and children. The decision holds that the employers' liability law grants benefits only to those who are shown to have suffered loss.

The supreme court of the United States, this week, in the case of the Mine Hill & Schuykill Haven railroad decided that where the property of a corporation is leased to another, and the owning company has no income except the rental, it is not doing business, in the contemplation of the federal corporation tax law, and therefore is not liable to pay the corporation tax. A dissenting opinion was rendered by Justice Pitney, in which Justices Day Hughes and Lamar concurred. Justice Pitney holds that in investing their receipts, the directors of the owning company "do business."

In the county court at Greenville, Ky., last week, forty suits were entered against the Illinois Central seeking damages for the failure of the road to furnish cars to coal operators in Muhlenberg county. The plaintiffs are workmen in the mines and their suits are based on the charge that the company, in failing to perform a public duty, failed in its duty to them, the miners, as members of "the public." The attorney for the plaintiffs says that 1,800 suits will be filed. All of the suits thus far filed are for small amounts, the basis of each claim being that the plaintiff has been deprived of work because of the absence of cars.

The Supreme Court of the United States has reversed the Federal Court in Alaska which annulled five of the six counts of an indictment against the Pacific & Arctic Railway & Navigation Company and others charged with violating the anti-trust law and interstate commerce law, in regard to Alaska transportation facilities. All the counts charged in varying form that the railroad from Skagway to the headwaters of the Yukon had entered into a conspiracy with steamship lines to destroy the competition of independent steamship lines, such as the Humboldt Steamship Company, by charging the independent lines higher rates and refusing to make joint rates with the independents. The Alaska court held that before it could have jurisdiction over the case the alleged discrimination should be passed upon by the Interstate Commerce Commission; but this view is now rejected and the case goes back for trial.

The commerce court has denied the petition of the Atchison, Topeka & Santa Fe asking the court to set aside the order of the Interstate Commerce Commission reducing from $30 to $7.50, the company's charge per car for refrigerating oranges and lemons, where such fruits are pre-cooled and pre-iced by the shipper. The carriers denied that shippers had any right to ice cars, as in so doing they took out of the hands of the carrier a part of the transportation service, the law having declared that refrigeration or icing is an element of transportation. The court finds that the railroads get greater revenue per car, and per ton of load, when the shippers pre-cool and pre-ice the fruit. Transportation is more economical where the fruit is pre-iced, as then the boxes can be packed more closely together in the car. The roads, however, evidently want the privilege of furnishing the ice themselves, though it appears that the commission would probably rule that any such service, performed by the carrier, must be done at cost or a very small advance on cost. The court justifies the commission in holding that the shipper has a right to pre-cool the fruit and pre-ice it, at least until the railroads offer a substitute which would be fairly equivalent in cost and efficiency.

Anthracite Coal Case.

The Supreme Court of the United States in the anthracite coal case, recently decided, has directed that its decree be amended so as to give the district court power to decide whether four certain "65 per cent. contracts" should be excepted from the decision which held that such contracts were void. The Supreme Court held that the contracts whereby the railroad coal companies bought the output of independent operators at 65 per cent. of the price of coal at tidewater, suppressed competition and violated the Sherman anti-trust law.

The Delaware, Lackawanna & Western Railroad, the Hillside Coal and Iron Company, the New York, Susquehanna & Western Coal Company and the Pennsylvania Coal Company maintained that their contracts did not suppress competition.

Justice Lurton, explaining that the court had been asked to exempt five contracts from the effect of the decision, said: "We find there is inadequate evidence before us to pass upon four of these contracts. Therefore we modify the decree so as to allow the District Court to take evidence and pass upon the point. The attorney-general is willing to have the decree amended so as to exempt the contract between the Pennsylvania Coal Company and the Elk Hill Coal and Iron Company. We amend the decree so as to exempt this contract."

Subway for Genoa, Italy.—Genoa is confined to a comparatively narrow territory, between the mountains and the sea, and can only grow at the two ends. Two engineers, E. Ravà and S. Cattaneo, have planned a subway and elevated railway to serve it, from a suburb on the west to one on the east, a distance of a little over 6 miles, about three-fourths of which will be underground. The cost is estimated at $5,000,000.

Railway Officers.

Executive, Financial and Legal Officers.

W. H. Emerson has been appointed acting freight claim agent of the Chicago & Eastern Illinois, with headquarters at Chicago.

C. B. Ferry, assistant secretary of the Chicago, Milwaukee & St. Paul, at New York, has been elected vice-president, with headquarters at New York. Mr. Ferry will also continue to act as assistant secretary.

E. H. McHenry, vice-president in charge of the engineering department of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has resigned, effective May 1.

The following appointments are announced on the Chicago, Milwaukee & St. Paul: G. J. Bunting and J. Welch, assistant general auditors; R. N. Dudley, ticket auditor, and W. M. Harvey, auditor of material accounts; all with headquarters at Chicago.

Carl Remington, assistant to chairman of the Chesapeake & Ohio and the Hocking Valley, at New York, has been appointed secretary of those roads, succeeding James Steuart MacKie, who remains as treasurer of both roads, with headquarters at New York. Mr. Remington has been appointed secretary also of the Missouri, Kansas & Texas.

C. N. Whitehead, secretary and treasurer of the Missouri, Kansas & Texas, at New York, has been appointed assistant to president, with headquarters at St. Louis, Mo. Carl Remington has been appointed secretary, with headquarters at New York, and Frank Johnson, local treasurer at St. Louis, has been appointed treasurer, with headquarters at St. Louis, succeeding Mr. Whitehead, effective April 16.

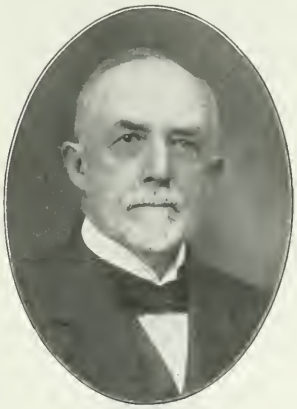
J. W. Taylor, who recently was appointed assistant to the president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, as has already been announced in these columns, has been with the St. Paul road since a boy. He started as a messenger in the office of the car department at Milwaukee, Wis., in 1888. He subsequently filled several positions in the mechanical department until 1904. He then was promoted to general storekeeper, and five years later, in 1909, he was made a division superintendent. The following year, in 1910, Mr. Taylor became assistant to the comptroller, which position he held until March 15 of this year, when he received the appointment of assistant to President Earling, with office at Chicago, as noted above, succeeding E. D. Sewall, who has been elected vice-president.

J. W. Taylor.

Angus Daniel McDonald, deputy comptroller of the Southern Pacific Company at New York, has been appointed vice-president and comptroller, with headquarters at New York, succeeding William Mahl, retired under the pension rules of the company. Mr. McDonald was born on April 14, 1878, at Oakland, Cal., and was educated at various schools and at the University of Notre Dame. He began railway work January 8, 1901, with the Galveston, Harrisburg & San Antonio, and from September, 1904, to November, 1907, was chief clerk in the accounting department of the Southern Pacific Company at San Francisco, Cal. From December, 1907, to November, 1908, he was auditor of the Los Angeles Pacific Company, and then for one year was auditor of the Pacific Electric Railway Company, at Los Angeles. In January, 1910, he was appointed auditor of the Southern Pacific Company, at San Francisco, and three years later was made deputy comptroller at New York, which position he held at the time of his appointment as vice-president and comptroller of the same company, with headquarters at New York, as above noted.

William P. Newton, whose appointment as general auditor of the St. Louis & San Francisco, with headquarters at St. Louis, has already been announced, was born October 4, 1854, at Portersville, Pa. He was educated in private schools and began railway work in May, 1875, with the Leavenworth, Lawrence & Galveston, now a part of the Santa Fe, and the Kansas City, Ft. Scott & Gulf, now a part of the Frisco. From May, 1877, to May, 1879, he was auditor, secretary and treasurer of the Joplin Railroad, now a part of the Frisco, at Girard, Kan., and from the latter date to March, 1881, was traveling auditor for the St. Louis & San Francisco. He was then chief clerk and general bookkeeper until September, 1900, when he was appointed assistant general auditor, which position he held until his recent promotion to general auditor, as above noted.

William Mahl, vice-president and comptroller of the Southern Pacific Company at New York, voluntarily retired on April 7, under the pension rules of the company, after 53 years' continuous railroad service, 31 of which were in the service of the Southern Pacific Company. Mr. Mahl was born in Carlsruhe, Baden, December 19, 1843, and came to America with his parents in 1852. In 1860 he was entered as an apprentice in the shops of the Louisville & Nashville. In four years he became successively a machinist, a draftsman and chief clerk in the mechanical department. From 1864 to 1872 he was auditor and purchasing agent of the Louisville, Cincinnati & Lexington. For a few years he served under Colonel Thomas A. Scott as auditor, purchasing agent and financial agent of the Texas & Pacific. Soon after the panic of 1873 he returned to the Louisville, Cincinnati & Lexington, becoming its general superintendent. In February, 1882, Mr. Huntington called him to New York, where he served successively as general agent, comptroller and assistant to the president of the Chesapeake & Ohio and the Southern Pacific and the various collateral railways, steamship lines and other large interests of Mr. Huntington. After Mr. Huntington's death Mr. Harriman continued and extended Mr. Mahl's functions so as to cover the entire Union Pacific and Southern Pacific systems. He was vice-president and comptroller of both systems from October, 1909, until the Union Pacific and the Southern Pacific were separated under an order of the Supreme Court; and on February 6, 1913, resigned from the Union Pacific.



W. Mahl.

Operating Officers.

M. J. Kelley has been appointed superintendent of the Chicago, West Pullman & Southern, in charge of operating, maintenance of way and of equipment, with headquarters at Chicago.

Arthur B. Shafer, acting superintendent of the New York, Susquehanna & Western, at Jersey City, N. J., has been appointed assistant superintendent of the New York, Susquehanna & Western and the Wilkesbarre & Eastern.

R. H. Tuttle, superintendent of the Arizona division of the Atchison, Topeka & Santa Fe Coast Lines at Needles, Cal., has been appointed superintendent of the Albuquerque division, succeeding E. J. Gibson, resigned to go to another company, and J. A. Christie, trainmaster at Fresno, succeeds Mr. Tuttle.

J. H. Brinkerhoff, heretofore terminal superintendent of the Illinois Central at Chicago, has been appointed general superintendent of the Belt Railway of Chicago. The position of general

manager on the Belt Railway has been abolished, and J. M. Warner, who has been general manager of both the Belt Railway and the Chicago & Western Indiana, will be general manager of the Chicago & Western Indiana. R. W. Stevens, who has been superintendent of the Belt Railway, has been appointed superintendent of the Chicago & Western Indiana, all with headquarters at Chicago.

Charles E. Brower, who has been appointed superintendent of the Atlanta, Birmingham & Atlantic, with headquarters at Fitzgerald, Ga., as has been announced in these columns, was born on August 20, 1873, at Franklinville, N. C. He received a college education, and began railway work in October, 1893, with the Cape Fear & Yadkin Valley, and for six years was in the service of that company, first as a telegraph operator and later as train despatcher. He was out of railway work during the two following years, and then entered the service of the Southern Railway. On July 17, 1902, he was appointed despatcher on the Atlanta, Birmingham & Atlantic, and on March 15, 1906, was promoted to trainmaster, which position he held until his appointment on March 1, as superintendent of the Brunswick division of the same road.

C. E. Brower.

E. Richards, whose appointment as superintendent of the St. Louis Southwestern, with headquarters at Pine Bluff, Ark., has already been announced in these columns, began railway work in 1881 as a telegrapher for the Chicago & Alton. Subsequently he was similarly employed on the Wabash and the Mexican National until 1884, when he went to the St. Louis Southwestern, and remained with that road until 1898, serving successively as telegraph operator, train despatcher, chief train despatcher and trainmaster. From 1899 to 1901 he was general manager of the Louisiana & Arkansas, and during the latter year was a train despatcher for the Chicago & North Western at Boone, Iowa, and chief train despatcher for the Choctaw, Oklahoma & Gulf at McAlester, Okla. Mr. Richards returned to the St. Louis Southwestern of Texas in 1902 as chief train despatcher at Mount Pleasant, Tex., leaving to go with the Louisiana Railway & Navigation Company as trainmaster at Shreveport, La., in 1905. He again became connected with the St. Louis Southwestern in 1907 as assistant superintendent at Pine Bluff, Ark., and was transferred to the Ft. Worth division as superintendent in October, 1912, which position he held until his recent appointment as superintendent at Pine Bluff, as above noted.

E. Richards.

F. J. Easley, assistant general manager of the first district of the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Iowa, has been appointed assistant general manager of the third district, with office at El Reno, Okla., succeeding T. H. Beacom, who takes the place of Mr. Easley. A. T. Abbott, superintendent of the Iowa division, with office at Des Moines, has been transferred to the superintendency of the Des Moines Valley division, with headquarters at Des Moines, succeeding C. L. Brown, assigned to other duties. E. J. Gibson, superintendent of the Atchison, Topeka & Santa Fe at Winslow, Ariz., succeeds Mr. Abbott at Des Moines.

H. J. Curry, trainmaster on the Boston division of the Boston & Albany, at Beacon Park, Allston, Mass., has been appointed superintendent of the Albany division, including the main line and all branches between Springfield, Mass., and Albany, N. Y., with headquarters at Springfield. S. H. Clark, superintendent of the Albany division at Springfield has been appointed assistant superintendent of both the Boston and the Albany divisions, with headquarters at Springfield, and he will have special charge of the examination department, with jurisdiction over both divisions from Boston to Albany. Sheridan Bisbee, road foreman of engines, has been appointed trainmaster at Beacon Park, succeeding Mr. Curry.

Traffic Officers.

John S. Talbot has resigned as general western agent of the Western Maryland at Chicago.

George A. Blair has resigned as general traffic manager of the Chicago & Alton, to become assistant freight traffic manager of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago.

In addition to his duties as mail traffic manager of the Southern Pacific, H. P. Thrall has been appointed inspector of transportation service in its relation to the public, with headquarters at San Francisco.

C. J. Jones, formerly traffic manager of the Copper River & Northwestern and the Alaska Steamship Company, has been appointed general freight agent of the Southern Pacific, with headquarters at San Francisco, Cal.

E. M. Linzee has been appointed milk agent of the Chicago & Alton, with temporary headquarters at Springfield, Ill. As soon as the new station building is completed Mr. Linzee will have his headquarters at Bloomington, Ill.

W. E. Prendergast, assistant general freight agent of the Chicago, Milwaukee & St. Paul, has been appointed general freight agent, with headquarters at Chicago, succeeding H. E. Pierpont, recently promoted to freight traffic manager.

D. W. Agnew, soliciting freight agent of the Georgia Southern & Florida, at Cincinnati, Ohio, has been appointed commercial agent, with office at Valdosta, Ga., succeeding T. J. Cumming, resigned, and C. T. Dabney succeeds Mr. Agnew.

Robert Ralston, soliciting freight agent of the Cincinnati, New Orleans & Texas Pacific, at Cincinnati, Ohio, has been appointed traveling freight agent, with headquarters at Cincinnati, succeeding Harry Langmead, resigned, and George W. Frank succeeds Mr. Ralston.

W. A. Barrows, division freight agent of the Boston & Albany, at Worcester, Mass., has been appointed assistant general freight agent. William Callanan succeeds Mr. Barrows, and J. J. Woodis has been appointed eastbound agent, with office at Boston, Mass.

M. F. Schnell, city passenger agent of the Chicago Great Western at Waterloo, Ia., has been appointed district passenger agent at Des Moines, Ia., succeeding D. E. Peterson, who has been appointed city passenger and ticket agent at that point in place of H. O. Post, resigned to engage in other business.

J. B. Keefe, assistant general freight agent of the Delaware, Lackawanna & Western, at New York, has been appointed industrial commissioner, with headquarters at New York. C. H. Drinkwater, contracting freight agent at Chicago, has been appointed commercial agent, with headquarters at Minneapolis, Minn., succeeding E. H. Eden, deceased, and K. E. Long succeeds Mr. Drinkwater.

F. B. Coolidge, general freight agent of the Wheeling & Lake Erie, has been appointed general coal and ore agent, with headquarters at Cleveland, Ohio, succeeding H. J. Booth, who has

been granted leave of absence. On his return Mr. Booth will take up special duties. R. F. Kelly, general passenger agent, has been made general freight agent also. T. J. McRoberts, chief clerk to the general passenger agent, has been appointed assistant general passenger agent, with office at Cleveland.

Engineering and Rolling Stock Officers.

C. F. W. Felt, who, on April 1, became chief engineer of the Atchison, Topeka & Santa Fe system, with headquarters at Chicago, as already announced, was born April 29, 1864, at Salem, Mass. He was graduated from the Massachusetts Agricultural College in 1886, and began railway work in September of that year with the Atchison, Topeka & Santa Fe Railway. From September, 1886, to October, 1887, he was rodman and later until February, 1888, was bridge engineer. He was then for three months with the Denver & Rio Grande as levelman; from August, 1888, to April, 1889, instrument man for the Arizona & Southeastern, and from the latter date to February, 1890, transitman on the Topolobampo line in Mexico. In April, 1890, Mr. Felt was made resident engineer of the Northern division of the Gulf, Colorado & Santa Fe at Cleburne, Tex., and in July, 1892, he went to the Rio Grande & Southern as office engineer, returning to the Gulf, Colorado & Santa Fe in February, 1893, as division engineer. Three months later he was transferred to Galveston, Tex., as resident engineer, and in September, 1896, he was promoted to chief engineer of the Gulf lines of the Santa Fe at Galveston, which position he held for thirteen years, being advanced to chief engineer of the Eastern and Western lines, with office at Topeka, Kan., in November, 1909. He now becomes chief engineer of the entire system, as above noted.

C. F. W. Felt.

C. A. Seley has resigned as mechanical engineer of the Rock Island Lines, effective May 1, to engage in a manufacturing business, the details of which will be announced later. This closes a career of 25 years of active railroad service. Mr. Seley was born December 26, 1856, at Wapella, Ill., and began railway work in 1879 as a draftsman for the St. Paul, Minneapolis & Manitoba. From 1881 to December, 1886, he was engaged in other work of a mechanical engineering nature, and then until January, 1888, was chief draftsman for the St. Paul & Duluth. The following four years he was with the Great Northern, and in May, 1892, he entered the railway supply business, returning to active railway service in March, 1895, as chief draftsman for the Chicago Great Western. He left the latter road in April, 1899, to become mechanical engineer of the Norfolk & Western, which position he held until May, 1902, when he was appointed mechanical engineer of the Rock Island Lines, with headquarters at Chicago. Mr. Seley has been an active member of various railway associations in committee work, and has served as a member of the executive committee of both the Master Car Builders' and Master Mechanics' Associations for many years. For three years prior to January 1 last he was a member of the sub-committee of mechanical officers of the Special Committee on Relations of Railway Operation to Legislation, which conducted the negotiations between the railways and the Interstate Commerce Commission and the postoffice department on safety appliances, boiler inspection rules and steel postal car specifications. He acted as chairman of this sub-committee most of the time. Mr. Seley was president of the Western Railway Club in 1907 and 1908, and has been chairman of various committees. He is also author of many papers on railway electrification and on car, locomotive and boiler design. His varied experience has built up for him a very large acquaintanceship with railway mechanical officers and railway supply men throughout the country.

C. A. Seley.

A. D. Case has been appointed engineer of structures of the Boston & Albany, with office at Boston, Mass., succeeding W. F. Steffens, resigned.

G. M. Rice, assistant engineer of the Chicago, Milwaukee & St. Paul, Puget Sound lines, has been appointed division engineer at Spokane, Wash., succeeding A. G. Holt, who was recently promoted to assistant chief engineer.

Samuel Lenzner, general foreman in the car department of the Michigan Central, has been appointed master car builder, with headquarters at West Detroit, Mich., succeeding D. C. Ross, and John Otto succeeds Mr. Lenzner.

J. W. Small, formerly assistant general manager (mechanical) of the Sunset-Central lines of the Southern Pacific, has been appointed superintendent of motive power of the Seaboard Air Line, with office at Portsmouth, Va., succeeding A. J. Poole, resigned.

OBITUARY.

John R. McCord, formerly traveling passenger agent of the Cincinnati, Hamilton & Dayton, died on April 2, at Washington, D. C., at the age of 59.

Richard R. Metheany, secretary and auditor of the Grand Rapids & Indiana, died suddenly at Grand Rapids, Mich., on April 7, aged 58 years. Mr. Metheany was born at Lima, Ohio, February 4, 1855, and had been in railway service since 1870, when he began as clerk in the auditor's office of the Grand Rapids & Indiana. From 1877 to October 1, 1895, he was chief clerk in the same office, and on the latter date was made secretary and auditor.

Charles E. Pugh, formerly first vice-president of the Pennsylvania Railroad, from which position he retired on March 1, 1911, under the pension rules of the company, died on March 8, at Old Point Comfort, Va. He was born at Unionville, Pa., on February 25, 1841, and entered the service of the Pennsylvania as agent at Newport, in October, 1859. He served as passenger conductor and train despatcher, and in 1870, was made general agent at Philadelphia. In April, 1879, he was appointed general superintendent of the Pennsylvania Railroad division; and in October, 1882, was made general manager. In March, 1893, he was elected third vice-president; and in February, 1897, second vice-president. This position he held for 12 years, being at the head of the operating department of the road, including motive power. He became first vice-president on March 24, 1909, in charge of the purchasing insurance, real estate and pension departments. He was also first vice-president of the Northern Central, the Philadelphia, Baltimore & Washington and the West Jersey & Seashore; and a director of the Long Island Railroad, and of many other companies in the Pennsylvania system. Mr. Pugh's character may be briefly epitomized by the following extract from a resolution of the directors, published in the *Railway Age Gazette*, when he retired from service: Endowed by nature with a happy combination of firmness of character and a most gentle and lovable disposition, he has ever been held in high esteem as well by the army of employees over whom he exercised authority as by his official associates; and the conspicuous loyalty of his subordinate officers is attributable as much to their personal affection for him as to the esprit de corps which is the stronghold of the Pennsylvania Railroad organization.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Georgia Railroad is in the market for 6 locomotives.

The Wabash has asked authority of the courts to purchase 30 locomotives.

The Lehigh Valley has ordered 25 locomotives from the Baldwin Locomotive Works.

The Grand Trunk has ordered 25 mikado locomotives from the Baldwin Locomotive Works.

The Northwestern of Brazil has ordered 4 mogul locomotives from the Baldwin Locomotive Works.

The Pittsburgh & Shawmut has ordered 5 mikado locomotives from the Baldwin Locomotive Works.

The Boston & Maine locomotive inquiry comprises 20 switching locomotives and 40 Pacific type locomotives.

The New York Central & Hudson River is having 43 consolidation locomotives converted into mikado locomotives by the American Locomotive Company.

The Lake Shore & Michigan Southern is having 14 consolidation locomotives converted into mikado locomotives by the American Locomotive Company.

The New York, Chicago & St. Louis has ordered 8 ten-wheel freight locomotives, 6 switching locomotives, 6 consolidation locomotives, and 3 ten-wheel passenger locomotives from the American Locomotive Company.

The Boyne City, Gaylord & Alpena has ordered 1 six-wheel switching locomotive from the American Locomotive Company. The dimensions of the cylinders will be 18 in. by 24 in., the diameter of the driving wheels will be 50 in. and the total weight in working order will be 106,000 lbs.

The Havana Central, Cuba, has ordered 4 Pacific type locomotives from the American Locomotive Company. The dimensions of the cylinders will be 20 in. by 26 in., the diameter of driving wheels will be 62 in. and the total weight in working order will be 173,000 lbs. These locomotives will be equipped with superheaters.

CAR BUILDING.

The Harriman Lines will soon place an order for 201 passenger cars.

The Chicago, Milwaukee & St. Paul is building 300 ore cars at its shops at Milwaukee, Wis.

The Boston & Maine freight car inquiry comprises 1,500 gondola cars and 4,500 box cars.

The Chicago & Western Indiana has ordered 300 ballast cars from the Haskell & Barker Car Co.

The Chicago, Peoria & St. Louis has ordered 200 box cars from the American Car & Foundry Company.

The Boston Elevated has ordered 30 passenger cars from the Pressed Steel Car Company and 25 passenger cars from the American Car & Foundry Company.

The Wabash has asked authority of the courts to purchase 200 hopper cars, 750 automobile cars, 20 passenger cars, 1,000 steel underframes for box cars, and 1,000 steel underframes for stock cars.

The Norfolk Southern has ordered 300 box cars and 6 caboose cars from the Mt Vernon Car & Manufacturing Company and 100 flat cars from the American Car & Foundry Company.

SIGNALING.

The Canadian Pacific has installed automatic block signals—Hall, three position, upper quadrant—on its line between St. John, N. B. and Vanceboro, Me., 60 miles.

Supply Trade News.

The Watson-Stillman Company, New York, has moved its Chicago office from the Rookery to the McCormick building.

The Pittsburgh, Forge & Iron Company, Pittsburgh, Pa., has moved its Chicago office from the McCormick building to the Railway Exchange.

E. O. Hopkins, of Chicago, general manager of the Indiana Tie Company, and formerly receiver of the Peoria, Decatur & Evansville, died in Chicago on April 3.

A. Otto Hiester, manager of the Buffalo office of the United States Light & Heating Company, and previously with the National Battery Company, has joined the sales force of the Edison Storage Battery Company, Orange, N. J.

A. E. Rosenthal has resigned his position as western representative of the Lima Locomotive Corporation, Lima, Ohio, and the Chicago office of that concern has been temporarily discontinued. Mr. Rosenthal retains his position as president of the National Railway Equipment Company, Chicago.

J. F. Duntley, father of W. O. Duntley, president of the Chicago Pneumatic Tool Company, and of J. W. Duntley, president of the Duntley Pneumatic Sweeper Company, died on April 5 at his residence in Detroit, Mich. He was at one time vice-president of the Chicago Pneumatic Tool Company, and was actively interested in the affairs of the company up to the time of his death. He was 71 years old.

TRADE PUBLICATIONS.

Pneumatic Tools.—The Chicago Pneumatic Tool Company has issued bulletins Nos. 137, 138 and 139, describing various types of the Chicago Giant rock drill and appurtenances.

Coaling Stations.—The Roberts & Schaefer Company, Chicago, published a very attractive booklet illustrating and briefly describing its reinforced, concrete, Holmen, locomotive, coaling stations.

Motor Cars.—The Buda Company, Chicago, has issued catalog No. 184, illustrating and describing the specifications of its various types of motor cars for railroad inspection, section and maintenance service.

Cranes.—The Industrial Works, Bay City, Mich., has published bulletin No. 209, illustrating and describing its wrecking, locomotive, construction and freight cranes, also its transfer tables and pile drivers.

Unions.—The Jefferson Union Company, Lexington, Mass., has published a brief illustrated folder outlining the career of Simon Bolivar, who liberated South America from Spanish control, and concisely describing the success with which Jefferson Unions have met.

Culverts.—The California Corrugated Culvert Company, Los Angeles, Cal., has published a handsome catalog illustrating many installations of its corrugated culverts, and pointing out their advantages. A table showing the capacity of corrugated iron culverts is included.

Car Heating.—The Gold Car Heating & Lighting Company, New York, has published an illustrated book of instructions relating to the installation of steam heat and hot water circulation systems for passenger trains, for use by passenger trainmen, engineers, car inspectors, etc.

Gages.—The Ashcroft Manufacturing Company, Boston, Mass., has published a 128-page illustrated booklet on its steam pressure and vacuum gages, Edson recording gages, Tabor engine indicators, engineering specialties and pipe tools. This booklet includes prices and a convenient index.

Nashville, Chattanooga & St. Louis.—The passenger department of this company has devoted two illustrated folders to interesting accounts of the events which took place along its lines during the Civil War. These folders are intended for those who expect to attend the United Confederate Veterans' Reunion, to be held at Chattanooga, Tenn., May 27-29.

Railway Construction.

Canadian Northern.—The Alberta legislature has been asked to authorize the Canadian Northern Western to construct railway lines as follows. From Taber northeasterly to Consort; from Medicine Hat northwesterly to the Canadian Northern Saskatoon-Calgary line; from the Canadian Northern Saskatoon-Calgary line northerly to the Canadian Northern main line in range 6 or range 9, west 4th meridian; from the Canadian Northern Saskatoon-Calgary line northeasterly to the eastern boundary of the province; from Cardston westerly to the western boundary of the province, and from Metting Creek on the Canadian Northern Vegreville-Calgary line to Wetaskiwin, and thence westerly via Pigeon Lake to the Canadian Northern Strathcona-Pincher Creek line. These lines are in addition to those authorized in the company's charter, which include a line from Edmonton or Strathcona to the western boundary of the province, near the Pine or Peace River Pass, and from a point on the line between Edmonton and Calgary to Rocky Mountain House, thence to the Brazeau and Macleod rivers, and continuing to a junction with the Canadian Northern main line west of Edmonton. M. H. MacLeod, Winnipeg, Man., is general manager and chief engineer.

Canadian Northern Western.—See Canadian Northern.

Canadian Pacific.—On the eastern lines, 14.2 miles of main line, between St. John, N. B., and McAdam, are being relaid with 85-lb. rail, replacing 80-lb. sections, and on 126 miles of branch lines, 72-lb., 73-lb., and 80-lb. rails are being laid, replacing 48-lb., 56-lb., 60-lb. and 62-lb. rails.

According to press reports bids are wanted April 15 for the construction of a diversion of the main line from mile 69 Mountain division, which is one mile west of Six Mile Creek, B. C., to mile 92, two miles west of Cambie. The work includes piercing a long tunnel. The new line is to have easier grades and the summit will be 533 ft. lower than the existing line. In addition, the distance will be shortened three miles; the curvature reduced by 2,356 degrees, and 4½ miles of snow sheds and 2,260 ft. of steel bridges will be eliminated.

Cape Girardeau Northern.—This road has been extended from Coffman, Mo., west to Farmington, 14 miles.

Chesapeake & Ohio.—This company has let a contract for the construction of a 22-mile line down Beaver Creek into Lloyd and Pike counties, Kentucky, through a rich coal and timber section.

Chicago, Milwaukee & St. Paul.—This company has awarded contracts for the grading for second track between Elberon, Ia., and Tama, 16 miles, and also between Dunbar and Capron, to the Walsh Construction Company, Davenport, Iowa. This work involves the handling of about 625,000 yd. of earth. All grading for second track between Green Island, Ia., and Manilla is now under contract.

Edmonton, Stony Plain & Wabamun (Electric).—This company has been granted a charter in Canada to build from Edmonton, Alta., west to Stony Plain, thence to Lake Wabamun, about 45 miles. E. S. McQuaid, president, Edmonton. A. Boileau, Edmonton, is interested. (March 14, p. 529.)

Florida Roads.—We are informed that surveys are being made for a line from Charlotte Harbor, Fla., northwest via Murdock to Venice, about 15 miles. There will be one important trestle on the line. W. J. Bowling, St. Louis, Mo., is back of the project.

Glengarry & Stormont.—The Canadian parliament has been asked to incorporate this company to build railway lines from the Canadian Pacific at St. Polycarp Junction, Que., southwesterly through Lancaster township, Ont., and Charlottenburg township, and Cornwall township to Cornwall. Pringle, Thompson and Burgess, Ottawa, are acting for the applicants.

Grants Pass-Crescent City.—Organized in Oregon with $5,000,000 capital to build from Grants Pass on the Southern Pacific, in Josephine county, Ore., southwest to Crescent City in Del Norte county, Cal., about 100 miles. The incorporators include J. F. Reddy, Medford, W. W. Harmon and L. C. Gilkey, Grants Pass.

Hudson River Connecting.—See New York Central & Hudson River.

Midland Valley.—Financial arrangements have been made, it is said, to build an extension from Wichita, Kan., northwest towards Denver, Colo.

Nashville, Shiloh & Corinth.—Plans are being made, it is said, to build a line to connect Nashville, Tenn., with Corinth, Miss. The route from Nashville will be through the counties of Davidson, Williamson, Hickman, Lewis, Perry, Wayne and Hardin in Tennessee and Alcorn county in Mississippi, about 150 miles. J. H. Carpenter, J. W. Ross, J. B. Walker and G. A. Hazzard are interested.

National Railways of Mexico.—The Durango-Muleros line of the Durango division has been extended from Muleros, Mex., southeast to Mena, 26 miles.

New York Central & Hudson River.—Under the name of the Hudson River Connecting a line is to be built from a point on the New York Central & Hudson River at Stuyvesant, N. Y., thence over a bridge crossing the Hudson river to a connection with the West Shore at Feura Bush. A two-mile branch is to be built from Feura Bush south to another connection with the West Shore, and a second branch is to be built from Stuyvesant to a connection with the Boston & Albany. There will be one bridge in addition to the one to be built over the Hudson river. Stuyvesant is 18 miles south of Albany, and the proposed connection will form an outside route for the heavy movement of freight which now goes through Albany.

Pacific Great Eastern.—This company, which is building from Vancouver, B. C., north to the Grand Trunk Pacific at Fort George, about 350 miles, has plans under consideration, it is said, for eventually extending the line from Fort George through undeveloped portions of northern British Columbia and the Yukon, also through Alaska. (December 20, p. 1235.)

San Antonio, Uvalde & Gulf.—This company has opened for business the Pleasanton-Campbellton subdivision from Pleasanton, Tex., south to Campbellton, 20.6 miles.

South Carolina Western.—An officer writes that work is about finished on a branch from Lydia, S. C., southeast to Timmonsville, about 15 miles. No plans have been made or are contemplated for an extension from Timmonsville south to Olanta.

Twin Mountain & Potomac.—This road has been extended from Burlington, W. Va., to Twin Mountain. (September 6, p. 454.)

RAILWAY STRUCTURES.

Chicago, Ill.—The Baltimore & Ohio has given a contract to James Stewart & Co., New York and Chicago, for the construction of a large grain elevator in the Calumet river district, South Chicago, to have a capacity of 875,000 bushels.

Marquette, Mich.—The Duluth, South Shore & Atlantic has announced that it will build a 15-stall roundhouse and a 75 ft. turntable.

O'Brien, Que.—Bids are wanted by P. E. Ryan, secretary of the Commissioners of the Transcontinental Railway at Ottawa, Ont., on April 30, for building a 12-stall engine house without machine shop at O'Brien. W. J. Press, mechanical engineer, Ottawa, Ont.

Spokane, Wash.—The Spokane, Portland & Seattle has announced plans for the expenditure of $200,000 for roundhouses, car shops and storage tracks.

Sweetwater, Tex.—It is reported that the Kansas City, Mexico & Orient will build a new passenger station.

Winnipeg, Man.—Contracts have been let for bridge construction on the Grand Trunk Pacific from mile 1,094 to mile 1,486 west of Winnipeg at a cost of $2,000,000, as follows: McLellan Creek crossing, 249 ft.; Little Shuswap crossing, 129 ft.; Rau Shuswap crossing, 1,032 ft.; Cottonwood Creek crossing, 129 ft.; Fifty Mile river crossing, 129 ft.; Goat river crossing, 308 ft.; Dome Creek crossing, 129 ft.; Second Fraser river crossing, 689 ft.; Third Fraser river crossing, 968 ft.; Willow river crossing, 459 ft.; Fourth Fraser river crossing, 1,227 ft.; Upper Nechaco river crossing, 642 ft.; Bulkley river crossing, mile 1,481, 254 ft., and Bulkley river crossing, mile 1,486, 364 ft.

Railway Financial News.

Algoma Central Terminals, Ltd.—This company offered in London $2,636,500 first mortgage 5 per cent. 50 year bonds. This makes $5,136,500 bonds of this issue outstanding. The proceeds will be used for the completion of terminal facilities at Sault Ste. Marie and other points.

Boston & Maine.—This company has applied to the Massachusetts railroad commission for authority to consolidate with the Hampden Railroad under an agreement entered into between the two companies on March 14.

Brooklyn Rapid Transit.—Application has been made to the New York Public Service Commission, First district, for authority to purchase, through its subsidiary, the Coney Island & Gravesend $2,583,100 of the outstanding $2,983,900 stock of the Coney Island & Brooklyn, and also to acquire the remainder of the stock in future. The Coney Island & Gravesend also applied for permission to make a mortgage to secure $3,000,000 bonds to purchase this stock.

Cambria & Clearfield.—See Pennsylvania Railroad.

Chicago, Milwaukee & St. Paul.—Holders of the $2,155,000 Milwaukee & Northern first mortgage extended 4½ per cent. bonds, due June 1, 1913, and the $4,003,000 Milwaukee & Northern consolidated mortgage 6 per cent. bonds, due June 1, 1913, are notified that the mortgages securing these bonds will be extended to June 1, 1934, at 4½ per cent. The liens of the mortgages will continue unimpaired, the payment of principal and interest having been assumed by the Chicago, Milwaukee & St. Paul.

This company has sold $30,000,000 general mortgage 4½ per cent bonds to Kuhn, Loeb & Company, and the National City Bank, both of New York. Previous issues under St. Paul's general mortgage have borne interest at the rate of 3½ per cent. and 4 per cent. The bonds are due 1989.

Coney Island & Brooklyn.—See Brooklyn Rapid Transit.

Coney Island & Gravesend.—See Brooklyn Rapid Transit.

Denver Northwestern & Pacific.—The foreclosure sale of this company has been set for April 18.

Laramie, Hahn's Peak & Pacific.—The junior security holders' committee of Boston has provided a plan for the reorganization of this company without foreclosure. This plan provides for the organization of a new company in Wyoming with $2,000,000, 6 per cent. non-cumulative preferred stock and $3,000,000 common stock. Holders of the present $1,000,000 unsecured notes and $430,000 unsecured claims are called upon for a 10 per cent. assessment and will get 110 per cent. in new preferred stock. The preferred and common stockholders are assessed 4 per cent.; the preferred holders getting 54 per cent. in new preferred stock and 50 per cent. in new common stock; and the common stockholders, 4 per cent. in preferred and 20 per cent. in common. Bonds of the old company comprising $240,000 first mortgage 6 per cent. bonds, $1,536,000 first refunding 6 per cent. bonds, $450,000 collateral trust 7 per cent. notes and $500,000 general mortgage 5 per cent. bonds will be left undisturbed. The assessments total $507,000, which is sufficient to take care of the interest charges up to April, 1915, the end of the period which the committee regards as sufficient to demonstrate the working of its plan. It is understood that this plan is acceptable to the senior security holders' committee.

Long Island Railroad.—The New York Public Service Commission, Second district, has approved of the merger by this company of the Oyster Bay Extension Railroad. The latter runs from Locust Valley to Oyster Bay, about 5 miles, and is operated by the Long Island.

Louisville & Nashville.—Kissel, Kinnicutt & Company and Harris, Forbes & Company, both of New York, will shortly offer the unsold portion of a block of $4,500,000 Atlanta, Knoxville & Cincinnati division 4 per cent. bonds, dated April, 1905-May 1, 1955.

Mobile & Ohio.—Holders of the general mortgage bonds will vote on April 23, on the question of authorizing the purchase of the St. Louis & Cairo, now leased, and the making of a mortgage thereon to secure $3,000,000 Mobile & Ohio-St. Louis division 5 per cent. bonds, dated August 1, 1913-December 1, 1927.

New York, New Haven & Hartford.—See New York, Westchester & Boston.

New York, Westchester & Boston.—The New York Public Service Commission, Second district, has authorized this company to issue $6,044,000 first mortgage bonds. Of this issue $1,290,000 bonds are to be sold at not less than par, and the balance at not less than 92. The proceeds of this sale will be used for right of way, stations and construction purposes; also for paying off outstanding notes held by the New York, New Haven & Hartford.

T. DeWitt Cuyler and George F. Baker have been elected directors of this company, succeeding Lewis Cass Ledyard and G. M. Miller, resigned.

Oyster Bay Extension Railroad.—See Long Island Railroad.

Pennsylvania Railroad.—The $165,000 Bells Gap Railroad 6 per cent. bonds due April 1 were paid on and after maturity. The Philadelphia Stock Exchange, on March 25, struck from the regular list $745,000 Cambria & Clearfield first mortgage 5 per cent. bonds due 1941, which have been canceled and destroyed.

The directors of this company have authorized an issue of approximately $45,400,000 common stock. The proceeds will be used to take up $10,222,500 of 3½ per cent. convertible bonds which matured November 1, 1912, and $9,735,000 of collateral trust 4½ per cent. bonds due June 1, 1913. The remainder of about $25,000,000 will be used for equipment and ordinary improvements.

Pere Marquette.—The collateral securing the $8,000,000 five year, 6 per cent. collateral notes, dated March 1, 1911, was bid in by the committee representing $7,944,000 of these notes. The cash distribution which is being made out of the proceeds of this sale applies only to the remaining $56,000 notes, their share being $799.40 on each $1,000 of face value.

St. Louis & Cairo.—See Mobile & Ohio.

Southern Pacific.—See Union Pacific.

Union Pacific.—Attorney General McReynolds, on April 9, disapproved the new plan for the dissolution of the Union Pacific-Southern Pacific merger recently submitted to him by Robert S. Lovett, chairman of the Union Pacific board. The Union Pacific, nevertheless, will submit the plan to the United States court at St. Louis. The plan proposes that the Union Pacific place its $126,000,000 Southern Pacific stock in the hands of a trustee for a limited time, receiving beneficiary certificates for it. The stock would be disfranchised. Stockholders of the Union Pacific would be permitted to buy a thousand shares each.

Wabash.—The receivers have filed in the federal courts application for permission to expend $7,489,500 for improvements, including $3,525,000 for motive power and rolling stock, $1,101,000 for new 100 lb. rails, and $2,954,500 for track elevation and double tracking.

Youngstown & Ohio.—This company, on March 31, paid a quarterly dividend of three-quarters of 1 per cent. on the $1,000,000 5 per cent. preferred stock as compared with 1⅛ per cent. quarterly in 1912, making 4½ per cent during that year.

Rates on Oil in Russia.—In 1910 the rates for carrying petroleum from the oil fields on the Caspian Sea around Baku to the Black Sea port Batum were reduced nearly one-third, from 27 cents to 18½ cents per 100 lbs., avowedly for the purpose of enabling the Russian oil to compete with the Standard Oil Company in the markets of western Europe. Now the Russian ministry of transportation affirms that it has not had this effect; that Russian exports have diminished, while the carriers have suffered serious losses from the reduced rates. Moreover, the ministry is of the opinion that an increase in exports is not desirable, as it tends to increase the cost to Russian consumers; and it favors the restoration of the old export rates. It is reported that the Austrian government takes a similar view of the petroleum production of Galicia, which has become very important of late years, and that it purposes to raise the export rates.

Railway Age Gazette

Including the Railroad Gazette and the Railway Age

Published Every Friday and Daily Eight Times in June, by the SIMMONS-BOARDMAN PUBLISHING COMPANY, Woolworth Building, New York.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 10,300 copies were printed; that of those 10,300 copies, 8,855 were mailed to regular paid subscribers and 150 were provided for counter and news companies' sales; that the total copies printed this year to date were 139,809—an average of 8,738 copies a week.

Volume 54. April 18, 1913. Number 16.

CONTENTS

*Illustrated.

THE Pennsylvania Railroad has in the neighborhood of 3,000 all-steel passenger equipment cars in service—more than any other railroad. The observations of W. F. Kiesel, Jr., assistant mechanical engineer of that road, on the problems of steel passenger car design, which were expressed before the recent New York meeting of the American Society of Mechanical Engineers, and are reproduced on another page, are of more than ordinary interest. The most troublesome questions to be solved are whether the steel cars should be fitted with wood or metal lining, the problem of insulation, and the design and construction of the car to afford the greatest safety to the passengers when accidents occur. While wood interior finish has some advantages the use of metal is to be preferred, as pointed out by Mr. Kiesel and also by Mr. Koch, who read a paper on "Steel Interior Finish." Mr. Vaughan in his paper, which was reproduced in our issue of April 11, also suggested that the tendency in the future would probably be to adopt steel interior finish to a very great extent, and possibly entirely. The steel finish must, of course, be insulated to prevent radiation, and there is still more or less question as to the material to be used for this purpose and its method of application. Steel passenger cars have given a good account of themselves in wrecks, and the most important problem in this connection is the prevention of telescoping. Suggestions as to this were made in two of the papers which are presented in abstract in this issue— one on the "Use of Cast Steel," and the other on "Special Ends for Steel Passenger Cars."

AFTER having been the object of universal anathema all his life the "baggage-smasher" at last has found a friend who understands some of his difficulties. The Interstate Commerce Commission has rendered a decision sustaining with slight modifications the rules adopted by the carriers nearly two years ago, placing restrictions on the use of large-sized trunks and sample cases of the "wardrobe" and other freak types used mainly by traveling salesmen. The commission's order, which probably will be embodied in new tariffs to go into effect June 1, holds that the carriers may reasonably make an extra charge for the transportation of baggage exceeding 45 in. in length and may stipulate that baggage exceeding 72 in. in any dimension will not be accepted for checking; but it reduces the amount of the charge proposed from a rate equal to that for 10 lbs. of excess weight for each inch of excessive length to a rate equal to that for 5 lbs. An unusually vigorous campaign against the new uniform baggage rules adopted by the various railroad passenger associations in 1911 was waged by the commercial interests, including not only the trunk manufacturers, but nearly all houses employing large numbers of traveling salesmen. A great deal of newspaper publicity was inspired for the purpose of making the general public think it was going to be deprived of one of its privileges. The railways were willing to compromise but were insistent as to the necessity of checking the tendency toward large and freak-shaped trunks. The rules which the commission now holds reasonable represent more nearly those on which the railways were willing to compromise, but which the commercial interests would not accept, than those originally proposed, but the justice of the purpose of the rules has been fully upheld. The opinion is by Chairman Clark, who was himself in the train service long enough to understand some of the conditions under which baggage is handled. He not only shows that the personal baggage of the average traveler will be scarcely affected, but that "the questions presented in this case relate not to matters of revenue, but primarily to the physical limitations of the facilities of the carriers for the transportation of baggage, and to the conditions under which men engaged in this branch of the service must work."

IN the settlement of the recent controversy between the New England Telephone & Telegraph Company and its operators, at Boston, the company secured the adoption of an important

principle—that of the deferred payment of wages. The demands which had been made by the operators called for increases in pay, which, it is said, averaged one dollar a week, or, say, $50 a year. The agreement, as published, provides for the establishment of what are called anniversary payments. An operator will receive $25 at the end of her second year of service; $50 at the end of the third year, and of each year thereafter, until the end of the ninth, and then $100 at the end of the tenth, and of each succeeding year. The operators demanded the abolition of the split trick; the company agrees that this shall not be compulsory on any operator after she has served eighteen months. Under the agreement, there will be a permanent "adjustment committee," consisting of three operators and three representatives of the company. Holding back a part of an operator's pay until the end of the year will be a real novelty, well worth the attention of everybody interested in the relation of employer and employee. Probably those women are quite unsophisticated, from the labor leader's point of view; but in agreeing to this new idea they are doing a good thing for themselves, we have little doubt. It is a popular theory that a workman should have all of his pay when he earns it. He very naturally wants it. The labor leader advises his constituents to do nothing to put themselves in the power of the employer. He is jealous of the railway relief associations, and this jealousy has even shown itself in arguments against pensions, paid wholly out of the employer's treasury. But in spite of this theory the lesson of real experience is that every rational experiment in thrift proves highly beneficial to all concerned. Leaving a part of one's pay in the hands of the employer for a year is a practical and useful lesson in thrift. If it binds one to the employer in an unreasonable degree, the unreasonableness can be modified and adjusted. If the employer is at all overbearing or grasping there is little danger, in these days of socialistic state regulation by the state of everything done by a public service corporation, but that his injustice will be quickly punished or corrected. One of the best ways to increase the pay of railway employees, when an increase is justified, or is necessary, would be to put the increase, or a part of it, in the shape of an annual premium. If a manager doubts the wisdom of this, he can begin cautiously, with small amounts. In the railroad world experiments with premiums have been few and comparatively small, but the principle is a sound one. The fact that this idea has been neglected is no discredit to the principle.

GIVING employees of long standing the most favorable hours is another feature of the Boston agreement which should be of interest to railroad men. This clause, translated into terms of the trainmaster's business, would mean that the older freight trainmen, and as many of them as possible, should have regular runs with approximately uniform starting hours, and that the smallest possible number of men should be required to run "first in, first out," never knowing for two days in advance when or where to prepare for the rest-periods. We are well aware that this will seem impracticable, and perhaps even absurd, to every one who looks upon the present freight train practice as right because it is universal; but, nevertheless, there is a principle in the matter of which we shall do well, now and then, to remind ourselves. And the principle which we have chiefly in mind is not that of favoring the older men at the expense of the younger, but rather the fundamental principle of nature that the normal man should have regular habits. In discussing questions of safety we theorize a good deal about the dangers of overwork and the importance of requiring trainmen to keep themselves always in good physical and mental condition; but, in actual practice, the life of the freight trainman is made as irregular as possible. It could not be worse in that respect. It is true that the conductor and brakemen can rest a good deal while on duty, and the fireman can keep awake because his arms and legs have to be kept in motion, but with the engineman the conditions are quite different. Irregular hours are not the greatest evil in the world, and if work time is short enough and rest time long enough adverse conditions can be coped with, after a fashion. But it is well to bear in mind that adverse conditions do really exist and that, if the issue should be raised, the railway manager would be held responsible for them.

THE TRAIN CREW BILL AND RAILWAY ACCIDENTS IN ILLINOIS.

A TRAIN crew bill is pending in the Illinois legislature, and there, as elsewhere, such legislation is being advocated on the ground of safety. The annual report of the Illinois Railroad Commission for the year ending June 30, 1912, comes out opportunely to show how ignorant or dishonest are those who advocate such legislation on any such ground. The commission on page 13 thus refers to the principal cause of railway accidents in Illinois as well as elsewhere: "Of the persons killed during the year *about 75 per cent.* were trespassing at the time of the accident, and of those injured *about 52 per cent.* were also trespassers . . . Responsibility for these casualties is chargeable to the parties injured and to the failure of law-making bodies to provide suitable laws for the punishment of those who use the property of hazardous industries as a public highway. Until some authority is exerted in this direction these casualties will continue."

While special classes, to promote their own supposed selfish interests, and peanut politicians, to get votes, promote various other kinds of measures to impose restrictions and burdens on railroads, the only persons who advocate legislation to stop trespassing are those who know the most about the causes of accidents, namely, the officers of the railroads and the railroad commission. Very little consideration can be expected to be given to trespassing by the law-makers. *Whose votes are to be gained by stopping a mere 75 per cent. of all the fatal accidents on the railways of Illinois?* It may be said that full crew legislation would at least tend to prevent some of the accidents due to other causes. We give below a table stating the causes to which the Illinois commission attributes all the fatalities on railways in that state in the fiscal year 1912:

Fatalities on Illinois Railways in Year Ending June 30, 1912.

Under the head "Other Persons" are included trespassers, and others not either passengers or employees. A vast majority of these "other persons" were trespassers. The man doesn't live who can point out any particular class of railway accidents here mentioned which would be reduced in the slightest degree by the addition of one man, or ten men, to the crew of every freight and passenger train.

It is notable that while the Illinois commission recommends various means of reducing accidents it makes no mention of the desirability of increasing the number of any class of railway em-

ployees. Why not brush aside the hypocritical pretense that train crew legislation is in the interest of safety, and baldly admit that its sole purpose is to increase the number of men that railways must employ? As safety legislation it hasn't a leg to stand on. As a means of ameliorating the condition of working people, something might be said for it, provided the legislation were made broad enough to increase the number of men that all classes of business men or concerns should be required to hire. There are few or no classes of laboring people who don't think they are required to do too much work. If the legislation is intended to promote purely social ends let us be consistent and require not only the number of men that railways must employ, but the number that farmers, merchants, manufacturers, miners, fishermen, housewives and newspaper publishers must employ to be increased.

If requiring the railways to employ unnecessary men is in the interest of progress and will bring the millennium nearer, how much more in the interest of progress, how much more adapted to hasten the millennium would be legislation requiring all classes of employers to increase the number of their employees by, let us say, 50 or 100 per cent.

THE REAL DANGER TO REGULATION BY COMMISSION.

As long as the public tried to control railways and other public utilities merely by inflexible laws interpreted and applied solely by the courts public regulation and its results were not satisfactory. It was long thought that the only alternative to such unsatisfactory control of public utilities was government ownership. Reasoning and experience have convinced many that both unsatisfactory public control and public ownership can be avoided by leaving public utilities under private ownership and management, while having their management and operation thoroughly supervised in the interests of the public by small bodies of experts in practically continuous session. The principal danger to the success of regulation by commission has been felt to be, both by its advocates and critics, that the managements of the concerns regulated would so resist and circumvent the commissions that their efforts to protect the interests of the public would be nullified. But the managements of most public utilities have in recent years been manifesting a disposition to bow to what they have deemed the inevitable. They no longer oppose and resist regulation by commission itself, but merely the minority of requirements and orders which they regard as very unreasonable and unfair.

Experience is showing that the real danger to regulation by commission is the attitude and course of governors, law-making bodies and the public. As has been indicated, the theory on which regulation by commission is predicated is that commissions will be composed of experts, who will be in practically continuous session, and who will, therefore, be best able to solve fairly and salutarily the problems arising out of the relations between public service corporations and the public. In order that opportunity shall be afforded for this theory to be fully tried it is necessary that regulatory laws shall be drafted in broad and general terms and that the duty of enforcing and administering them in detail shall be delegated to the commissions. This enables the commission to consider the circumstances of each case and to adapt its requirements and orders to them. Every law passed, whether by a legislature or Congress, that prescribes in detail the rates that railways or other utilities may charge, or the way they shall be operated, limits the field within which the commission may fruitfully make investigations and exercise its supposedly sound and expert judgment.

Such interference with regulation by commission is constantly going on and seems to be increasing. The people in some states, as in Oregon and Arizona, have fixed classifications and rates by referendum, although these states have commissions created and maintained expressly to deal with such matters and supposed to be competent to do so. The legislatures in many cases have passed laws to fix rates, and in many more recent instances have passed laws prescribing the number of men that the railways must employ, the hours they must work, etc., although in the states where these things have been done there were commissions which, if the theory of regulation by commission is correct, were most fit to deal with the questions involved. The state of New York has two public service commissions composed of five men each who are paid an annual salary of $15,000 a year, a total of $150,000 a year. When a train crew bill was pending in the legislature, and when it was later in the hands of the governor, the railways urged that the question be left to one of these commissions. But the bill was passed and signed. If governors and legislatures are more competent to settle such matters than commissions, it is clearly a waste of public money to maintain the commissions.

One of the necessary effects of interference with the work of the commissions by the public, the law-making bodies, the governors and—if he should interfere—by the president, is to make the concerns regulated lose respect for the commissions. They can hardly be expected to have much respect for them when the public and public officials show disrespect for them. A second effect is to make the commissions lose respect for themselves and to reduce their sense of responsibility, necessary consequences of which must be to make self-respecting and able men unwilling to serve on them, thereby deteriorating their personnel, and to make those who do accept membership perform their duties less conscientiously and thoroughly. A third effect is one already mentioned, namely, the restriction of the field for the exercise of the commission's judgment. Finally, the legislation resulting from such interference is almost certain to be either invalid, or vicious, or both. It imposes requirements and burdens regardless of differences of conditions; and therefore while it may be just as applied to some conditions, it is almost sure to be unjust as applied to most conditions. The purpose of such interferences with regulation by commission almost invariably is to impose some requirement or burden on the concerns regulated which does not commend itself to the intelligence and judgment of the commission. The modern regulating commission is seldom or never unduly favorable in its attitude toward the corporations under its control. When, therefore, it refuses to adopt any form of regulation that may be demanded it usually has very strong reason for believing that to do so would be contrary to justice and to the interests of the public; and if the motive of the promoters of regulation that commissions do not favor be investigated it will very often be found to be a desire to secure some form of special privilege for their own class at the expense of the public.

The function of the regulating commission is, in the interests of the public welfare, to stand between public utility corporations and all other classes, and insist on such relations being established and maintained between them as will best promote the interests of the whole public. The public itself is undermining the commissions, and preparing the way for the failure of regulation by commission, when it lets legislators and governors huckster legislation affecting public utility corporations in exchange for the votes of certain interested classes instead of insisting on the commissions being left free to perform their difficult, onerous and important duties without unnecessary interference.

DELAWARE & HUDSON.

In the annual report of the Delaware & Hudson for the calendar year 1912 President Loree comments on some figures taken from the reports to the Interstate Commerce Commission for all railroads in the United States for the years 1907 and 1911. These figures indicate that the total investment in railroad property devoted to public use was in 1911 $2,044,400,000 in excess of the investment in 1907, and that there was available for interest and dividends approximately $9,000,000 less in 1911 than in 1907. These figures are only available down to June 30, 1911. The Delaware & Hudson's own figures for the calendar year 1912 bear out to quite a remarkable degree the

point that Mr. Loree makes in regard to figures for all of the roads.

In 1912 the railroad department of the Delaware & Hudson earned $22,480,000, or $1,058,000 more than in 1911, but the net operating revenue in 1912 was $8,413,000, or $250,000 less than in 1911 and during 1912 the company spent for additions and betterments $2,927,000, while during that year the amount of stock outstanding remained the same, and at the end of 1912 there was $58,171,000 bonds outstanding, which is less by $204,000 than the amount outstanding at the end of 1911. At the beginning of the year there was $597,000 carried as a special deposit to pay the cost of authorized additions and betterments, which amount was expended during the year, and in addition considerable advances were made to subsidiary and other companies as shown by an increase in bills and accounts receivable of from $2,790,000 at the end of 1911 to $4,118,000 at the end of 1912. Loans payable at the end of 1911 amounted to $900,000, and at the end of 1912 to $3,500,000. Therefore while gross has increased net has decreased, and while investment in property has increased less return has been earned even on the investment at the beginning of the year. The Delaware & Hudson has far better credit, and its earning power in relation to its capitalization is far greater than the great majority of American railroads. Nevertheless investment conditions were such that the company preferred to borrow short time money rather than try to finance its improvements.

The D. & H. operates 878 miles of road, of which 328 miles has second track. Next to the Delaware, Lackawanna & Western it carries a greater proportion of anthracite coal than any other road. Of the total tonnage of revenue freight carried in 1912, 62.83 per cent. was furnished by products of mines, and of this tonnage amounting in 1912 to 12,138,000 tons, 8,010,000 tons was anthracite coal. The Delaware & Hudson is a road having a very heavy freight density, especially when the comparatively small amount of second track is taken into consideration. In 1912 the ton miles of revenue freight carried per mile of road averaged 3,222,000. Like the Delaware, Lackawanna & Western, the Delaware & Hudson gets a good ton mile rate, the average in 1912 being 6.6 mills, comparing the average in 1911 of 6.8 mills.

The passenger business on the Delaware & Hudson does not furnish a very large proportion of total revenue and a very considerable part of it is made up of commutation business. Total receipts from passenger traffic in 1912 amounted to $3,077,000, which is an increase of only about $57,000 over 1911. The revenue from commutation ticket sales alone amounted to $1,194,000 in 1912, which is about $39,000 more than in 1911.

As already mentioned, the total operating revenue increased last year over the year before by a little over $1,000,000, the increase in revenue from coal freight traffic being $499,000, and from merchandise freight traffic $423,000. The total revenue in 1912 from coal freight traffic was $10,346,000, and for merchandise freight traffic $8,477,000. The increase in revenue from freight was due entirely to a longer average haul. In 1912 the total tonnage of all revenue freight amounted to 19,319,000 tons as against 19,888,000 tons in 1911. The average revenue per ton per mile was slightly less, while the average distance each ton was carried was 146 miles, or over 15 miles greater than in 1911. The principal changes in the classes of various commodities carried were a decrease of 1,286,000 in the tonnage of anthracite coal, and an increase of 399,600 in the tonnage of the bituminous coal; an increase of 152,000 in the tonnage of miscellaneous commodities, an increase of 149,000 in the tonnage of lumber, and an increase of 38,000 in the tonnage of merchandise.

The increase in operating expenses from $12,758,000 in 1911 to $14,067,000 in 1912 was due largely to an increase of from $1,489,000 in 1911 to $1,940,000 in 1912 for maintenance of way, and from $7,414,000 for transportation expenses in 1911 to $7,979,000 in 1912. The increase of maintenance of way expenses is due in part to the very severe weather in January and February, 1912, and also in part to charges for maintenance due to a rather extensive program of replacement and strengthening of bridges, trestles and culverts. While, of course, only the replacement value of a wooden bridge, whose place is taken by a permanent structure, is charged to maintenance, and the additional cost to additions and betterments, the replacement of wooden structures by permanent structures adds materially to maintenance costs during the years in which such work is being done. Such a program of betterment, however, should in the long run tend to reduce maintenance charges. As Mr. Loree points out, the increase in transportation expenses resulted largely from the increase in business (ton mileage) handled, although increased cost of fuel also contributed toward added transportation expenses. This increase in transportation expenses was despite an increase of 35 tons in the average revenue train load, the train load in 1912 being 502 tons. The heavier train load was obtained in part through a slightly greater number of loaded cars per train, but principally through better car loading. The average tons per loaded car in 1912 was 25.72, an increase over 1911 of 1.41.

Although the net operating revenues of the railroad department were less in 1912 than in 1911, the profits from the coal mining department offset this decrease—the gross income from the coal department amounting to $1,024,000 in 1912, as compared with $284,000 in 1911—so that the company had a net income of $5,506,000 in 1912 as compared with $5,238,000 in 1911. The regular dividend of 9 per cent. calling for $3,825,000 was declared payable quarterly in 1913.

The following table shows the principal figures for operation in 1912 as compared with 1911:

	1912.	1911.
Average mileage operated	877	877
Coal freight revenue	$10,346,095	$9,847,194
Merchandise freight revenue	8,476,851	8,053,788
Passenger revenue	3,076,507	3,019,230
Total operating revenue	22,380,103	21,421,817
Maint. of way and structures	1,940,352	1,488,757
Maint. of equipment	3,230,742	3,060,739
Traffic expenses	289,754	250,285
Transportation expenses	7,979,041	7,414,071
General expenses	626,889	544,307
Total operating expenses	14,066,779	12,758,159
Taxes	600,940	582,410
Operating income	7,812,380	8,101,248
Railroad operating income	9,081,799	9,476,245
Net railroad income	4,411,863	4,890,578
Gross coal department income	1,023,868	284,219
Net income	5,506,089	5,237,681
Dividends	3,825,270	3,825,270
Surplus	1,680,819	1,412,411

NEW BOOKS.

Book of Standards. National Tube Company, Pittsburgh, Pa. 559 pages, 4 in. x 6½ in. Price, $2.

This book is strictly a pipe handbook, is printed on thin paper so that it is not quite ⅝ in. thick, and is a handy size for pocket use. Several pages are devoted to a descriptive article covering the main process of manufacturing both welded and seamless tubes. There are a number of pages which give weights, dimensions, threads per inch, test pressures, sections of joints, specifications, etc., of the various kinds of pipes and tubings. Several pages describe, illustrate and contain tables in regard to lap-weld and seamless tubes, upset and expanded, wrought pipe bends, butted and strapped joints, etc. Considerable prominence is given to strength of tubes and cylinders under internal fluid pressure and collapsing pressures. Considerable attention is devoted to the mechanical properties of solid and tubular beams, of usual and unusual shapes. Chapters are included giving information in regard to water, gas, steam and air. It has not been the intention to go very deeply into these various subjects, only in so far as they concern tubular products. There is a large collection of tables, such as fifth roots and fifth power, decimals of a foot for each 1/64 of an inch, etc. Several pages are devoted to area and weight factors for tubes and pipes. A table showing properties of tubes and round bars is given with an explanatory article. The Metric system is included with conversion methods for most of the more commonly used measures, including temperatures. A glossary of terms used in the pipe and fittings trade will also be found.

Letters to the Editor.

PROPER BASIS OF STATION AGENTS' PAY.

Rapid City, South Dakota, April 3, 1913.

To the Editor of the Railway Age Gazette:

The editorial in your issue of March 28, relative to the salaries of station agents, is very good, particularly wherein you say that "an efficient agent should have his pay slightly increased every few years."

Having been in the station service for one company for a number of years, I can appreciate very much your statement on this subject. We all admit that the station agent is one of the poorest paid employees, if not the very poorest, in the railroad business. We seldom hear of an agent getting an increase in salary except when it is forced by other organized employees (the telegraph operators). Through the efforts of this organization telegraph operators have from time to time been given an increase and the agents sometimes fall into a slight advance in their salaries, made, perhaps, that the agent's salary may not become smaller than that of an operator in the same office. I have found that very few agents were ever given an increase in pay simply on account of their merits. No matter how popular a man he may have become in the town or city in which he is located, or the amount of business that he may be able to control on account of his personality and acquaintance with his people, we seem to think that the only way in which we can take care of this fellow is to transfer him to some better station. It seems to me that this is all wrong and that it would be a better business principle to increase from time to time the salary of every first class, efficient agent, and keep him where we feel he will do the most good. What does a small increase in salary matter to a railroad company, or any other enterprise, when given to the man who has the stuff in him to get out and grab the business from the other fellow. Of course, I do not believe that a station should pay the same salary to a new man just taking hold, when it has been made vacant by one who has been tried and tested, but when you get hold of the right sort of an agent, try and keep him, if possible, by making it an object for him to stay. I think that when this policy is adopted we shall find the standard of the station agent will be much higher, and better results will accrue to the company.

Regarding the fixing of the number of helpers for a station, you say that "the superintendent must know very much more about the work, at some of his stations, than superintendents usually know." How true this is; and how few superintendents are really familiar with the detail working of a local agency. The percentage of agents who have worked up to a position as superintendent is so small you can hardly see it. It seems to be an established rule that we can make good superintendents out of almost any material except that coming from the station service, and when we find one who has come up from this department there is something extraordinary in the history of his advancement. Now, we all know that, when word is sent along the line to reduce expenses, about the first cut that is made is in the helpers at the stations. How many of the poor under-paid agents have their help cut down to a point where it means that there is absolutely no time for them to be out of their office looking after prospective business; and yet the getting of one shipment might pay the monthly salaries of several helpers.

When we get hold of the right kind of an agent, and the majority in the larger stations are of this sort, the superintendent should keep "hands off" to a great extent, in the hiring and discharging of his help; and when it comes to reducing expenses superintendents should rely more upon the judgment of the local agent, as to whether or not he can reduce his force without materially hurting his business. From my experience I have found that the trouble with the average superintendent is that he is too narrow. That is, he seems to feel that there is really but one department to a railroad and that his—the operating department; that it matters very little how much or how little business his division does if he can simply show a reduction in operating expenses over some other division. It has always seemed to me that the traffic department should also take more of a hand in these matters than it usually does, for I am free to confess that when it comes to the question of looking after the business interests of a railroad the traffic department has little to say. If the operating department thinks that half of a present force can do the work at a strongly competitive station down goes the force, regardless of the amount of business and revenue lost by so doing.

D. H. Crary,
General Manager, Rapid City, Black Hills & Western R. R.

AIR BRAKE HOSE.

Passaic, N. J., March 18, 1913.

To the Editor of the Railway Age Gazette:

At the International Rubber Conference, held in New York in 1912, considerable effort was expended in getting from the chemists and testing engineers of the railroads a thorough presentation of the subject of air brake hose. The success which resulted from this effort may be best judged by those who attended the sessions of the conference.

Several points were, however, brought out, and as these have not appeared elsewhere in print, it may be well to state them here. It was stated that the price of air brake hose was between 35 and 45 cents a foot. One railroad had offered to pay 45 or 50 cents a foot provided the hose lasted proportionately longer. One railroad observed that rubber manufacturers wanted to "land the bid" at any price, and after that the quality was adjusted to fit the price. One manufacturer observed that railroad purchasing agents wanted the "cheapest" hose and that therefore the quality was no object. One railroad observed that the rubber goods manufacturers frequently tried to deliver air brake hose which had been previously rejected because of defects. One chemist stated that there never was any good reason for the rubber manufacturers fighting the "1903 Specifications" except that they desired to manufacture a cheaper grade of hose.

The rubber goods manufacturers' chemists, who posed as experts for the Master Car Builders' Association, have little or no knowledge of the conditions under which air brake hose and steam hose are used. One manufacturer said that if superior air hose were made, he could not find a market for it.

What I wish to show is this: The eight statements quoted above cannot all be totally correct. They are obviously conflicting and it remains for either vendor or purchaser of the material to settle down and arbitrate the matter in a way which will be a credit to both sides. The importance of air brake hose in car equipment is far too great to admit of a trivial discussion of the subject, and our serious minded rubber goods manufacturers should hasten to produce for the railways a material which will give the best service consistent with the price which the railway officers are willing to pay. Two railways, at least, are today obtaining comparative satisfaction by means of carefully drawn specifications, and it might be well for the other larger transportation companies to go at this problem with some of the vim which they have expended on other large difficulties. The tests for bursting, stretching, friction, and (for steam hose) steaming, have put into the hands of the motive power superintendent considerable valuable information, which need only be sorted out and criticised in order to become of immediate use for the preparation of adequate specifications.

Truly the problem of air hose and steam hose presents great possibilities to our railway departments for purchasing and testing, and publication of results obtained will go a long way toward improving the quality of these materials.

Frederic Dannerth,
Consulting Chemist.

MORAL CHARACTER IN THE ADMINISTRATION OF DISCIPLINE.

Chicago, April 11, 1913.

To the Editor of the Railway Age Gazette:

I note an editorial in your issue of April 4—commenting on R. T. Scholes' letter dated February 17, appearing in the same issue. Mr. Scholes is probably not aware that Mr. Kruttschnitt adopted on the Harriman lines a test of employees in advance of "Publicity for Accidents." He fully appreciated that it was as necessary to train the officials as the other employees, if the desired results were to be obtained.

There is in vogue on the Harriman lines and the Illinois Central "surprise" or "efficiency tests," a certain number of which are required to be made by the division officials each month, including the superintendent, and occasionally the general superintendent or general manager. These tests are clearly outlined to cover every phase of train operating conditions, which have to do with safety of trains and the prevention of accidents. The results of these tests reach those highest in authority, not only in regular reports, but in graphic charts showing the comparative efficiency of each division.

In addition to this an expert operating official on the staff of the highest operating official is employed as an inspector of transportation and authorized to make additional tests on any division of the road at any time. He is constantly employed in this capacity, which gives assurance to the management that not only the subordinates, but the officials themselves are complying with the rules and compelling compliance therewith.

The employees do not take kindly to the "surprise tests," but can find no reasonable objection, except that in some cases it is alleged the tests are made hazardous to the engineer by confronting him with a condition which, if real, would mean an accident; for instance, changing the switch lights to show red at a facing point switch on a curve. Confronted suddenly with the seriousness of such a situation, he might be impelled to jump off the locomotive, in the application of the first law of nature—self-preservation. It is entirely unnecessary and unwise to include such conditions in the "efficiency tests." The instructions of the Illinois Central on this subject read in part as follows:

> In no instance must tests be made where there is the slightest risk of creating a hazardous situation, or where undue alarm will be given those concerned, such as turning light on facing point switch, nor should they be made under circumstances which will cause unwarranted delay to the trains, nor subject them to the possibility of break-in-two in starting or severe application of brakes in stopping, for instance, on heavy grades. The location selected should be one where the danger signal can be observed a sufficient distance ahead to make absolutely unnecessary an emergency application of air.
>
> If indecision on part of the crew is causing too much delay, or after proper observance of rule has been rendered, to avoid as much delay as possible, the individual making test should notify the conductor that it is a test and that he may proceed with the train.
>
> Conditions should not be created which are unfair to those being tested. The test reported must be the result of conditions pre-arranged by the individual making same, and not from purely observations on their part of the performance of train and enginemen under circumstances which are otherwise created.
>
> Proper entry will be made on personal record card for failure to comply with the rules as covered in these tests, the severity of such entry depending on the merits of each case.

It seems to me that the much discussed influence of the organizations in resisting discipline, or a disposition on the part of operating officials to "wink at chronic disobedience of exactly the same kind," can very easily be overcome by the use of "efficiency tests" and "publicity for accidents."

There does perhaps exist incompetency on the part of operating officials and a lack of "moral character in the administration of discipline" not however, to any greater extent than in other lines of business, or if you please, in the army. If the discipline of the latter was as loosely administered and dependent on the caprice of the individual who applied it, there would be utter demoralization.

I had occasion some few years ago to be thrown in the company of a general officer, who commanded a department of the United States army. In arranging matters in connection with some army maneuvers I had occasion to ride with him over the road when he observed railroad methods. I was struck with the remark he made one day: "You ought to have fine discipline on the railroad, for the reason that you can get rid of a man who is objectionable. This we can not do in the army. With the officer or private there is a certain *modus operandi* which prevents the elimination of those who do not flagrantly violate the rules of the war department."

There are very few exceptions to the general rule that railroad officials are selected by reason of their experience and capacity for increased responsibility. I will venture the assertion, without fear of successful contradiction, that the moral character and habits of the American railroad officer will rank as high as those of any other country or of the army of this or any other country.

To put forth the difficulty of administering discipline as being the resistance of labor organizations is simply an excuse for those who, for certain reasons, are unable to maintain their discipline. There is no question but what it requires considerable backbone rigidly to enforce the rules. The business conditions of a large part of the state of Georgia were recently thrown into confusion and much time and money was expended by those not connected with the railroad in an attempt to maintain discipline. The final analysis of the case by Governor Brown was to the effect that if a similar experience confronted him again he would use the entire power of the state to support the officials in maintaining discipline.

I think this is the sentiment throughout the country. The difficulty, however, seems to be that for one reason or another unreasonable concessions are made, or the superintendents are not backed up in the application of their discipline, which naturally encourages those who are employed to look after the interests of their constituents—the chairmen of the general grievance committees—to push in further than they know they have a right to go. This is human—"if you give an inch he will take an ell." If, however, properly and justly restrained, there is no difficulty in controlling this situation.

To operate the railroads without rules for the conduct of officials is naturally a difficult matter. The rules of war are very old—the rules of railroading comparatively new. The duties of officials on most roads are at present unwritten laws. As we grow in the refinement of the service, there must be developed certain well defined and standard lines of action. The nearest to those that should obtain among those heretofore evolved are embraced in what follows from Mr. Kruttschnitt's ideas as to the "surprise tests" and "publicity for accidents," both of which tend to impress upon, not only the employee, but also the operating official, his responsibilities.

In the daily application of "surprise tests" there is little hope for the official who is lacking in "moral character in the administration of discipline" to evade his responsibilities. The percentage of efficiency of his division, the individual cases of violations of rules and all of the circumstances connected therewith in the report made of each test, indicate clearly to the managing officer whether the rules are being observed or not.

Notwithstanding all such precautions there will occasionally occur accidents which are deplorable and uncalled for. These can be, in nearly every case, traced to the human equation, the negligence of duty unexpected and hard to account for, the dereliction of duty on part of the men who have perhaps been in service for many years with perfect records. These cases will undoubtedly continue as long as railroads are operated—whether we have automatic signals, interlocking or automatic control. It is human fallibility and is not manifest in railroad work alone. It is the cause of death and injury to people in every walk of life, and seems to have been a chronic trouble of the human family since Mother Eve ate the forbidden apple. It will probably become right again with the millennium.

W. L. Park,
Vice President, Illinois Central.

FREIGHT RATES BY WATER AND BY RAIL.

A Comparison In Which, for the First Time, There Is Available Adequate Data In Regard to Water Rates.

By J. L. Payne,
Comptroller of Statistics of Canada.

Although Canada and the United States have spent hundreds of millions for the development and maintenance of their inland waterways, and these waterways are the mediums for an annually increasing volume of commerce, up to the end of 1912 neither country was in possession of authentic data on which a fair comparison of freight rates by water and by rail could be made. It is all the more astounding that this should be the case in view of the fact that carriers by water have been operating on this continent for two or three centuries. The steamboat antedates the locomotive. The only excuse that could be advanced for this neglect is wholly inadequate, namely, that the inland marine interests of the two countries have never been organized on a reporting basis. If one should quite naturally ask why railways have been compelled to disclose in minute detail all their business operations, while steamboat owners have not been required to make any report at all, I am afraid it would be impossible to give a satisfactory answer.

If today anyone should, quite properly, ask the amount of capital invested in the carrying trade of the Great Lakes—to say nothing about other inland waters—the volume of freight transported annually, the earnings and operating expenses, the number and aggregate tonnage of vessels engaged in this vast service, the number of employees and their yearly remuneration, or for other items of pertinent information, I do not know from what source the answers could be got. They are not available at either Washington or Ottawa. Just why, as has been said, no one can tell. It cannot be assumed there are considerable, much less insurmountable, difficulties in the way. The Interstate Commerce Commission took the matter up three or four years ago, and prepared tentative schedules and classifications; but further steps have apparently been deferred. At all events, statistics based thereon are not at this moment to be had. The officers in charge of the American canal at Sault Ste. Marie have published from time to time figures in relation to the value of freight moved on the Great Lakes, the transportation charges, the ton mileage, and so on; but these figures have been mere approximations, based on other than direct returns of facts. They have no significance under such circumstances.

In this situation the Canadian Department of Railways and Canals decided to make an effort to at least ascertain the freight rates charged by carriers using the waterways under government control, and the task was assigned to me as a part of my regular official duties. An exceedingly limited schedule of questions was prescribed for the year 1912. The operators of steamboats were asked to indicate on each ship's report, delivered at the first canal office reached on a voyage, the rate of freight charged on cargo. As the starting point and destination were also recorded, the ton mileage could be readily figured out, and from all the data thus gathered during the year it would be a simple matter to calculate the average rate per ton per mile. That was the end aimed at. In any case where a vessel owner felt that it would be unsafe to confide such information to the statistical officer at the canal office, it was provided that he might send to Ottawa a periodical statement of his operations—say weekly or monthly. All carriers were also notified that at the end of the season of navigation, and not later than January 15, 1913, they were required to send to the department a report showing: (1) Aggregate tonnage of freight for the year; (2) ton miles of loaded vessels, and (3) gross earnings on freight. Thus one set of figures could be checked against the other.

It was not deemed expedient to ask for more than this at the outset. In the absence of special legislation on the subject, it was felt that any attempt at comprehensive or analytical statistics might lead to delay and resistance. The matter had to be approached in such a way as to win the cheerful co-operation of carriers by water; for it was known that the latter had long realized, for their own purposes, the need of reliable statistics in relation to the waterborne traffic of the Great Lakes. They were quite as much in the dark as was everybody else. Let it be said at once that the methods adopted were successful. The response of ship owners, having regard to all the circumstances, was prompt and candid. If absolutely complete returns were not received, that was wholly due to the short time allowance rather than to reluctance. An immense mass of data was sent in through the daily ships' reports, the periodical statements, and the annual return. All this was tabulated, and has yielded specific information of the greatest value in its bearing on the transportation problems of this continent. It has, at all events, the merit of being original and timely.

In order that the full significance of the information to which allusion has just been made may be appreciated, it will be necessary to have clearly in view the volume and character of the commerce of the international inland waterways of North America—for this matter is of just as much concern to the United States as it is to Canada. The following tabular statement, showing the total tonnage of freight through the American and Canadian canals at Sault Ste. Marie, at five year periods, will be illuminating:

	Tons.		Tons.
1887	5,494,649	1902	35,961,146
1892	11,214,333	1907	58,217,214
1897	18,982,755	1912	72,494,470

It will be seen that there has been an increase of 1,219 per cent. within 25 years; and yet these figures do not include the entire freight business of the Great Lakes. The trade of Lake Michigan, for example, embracing large shipments of grain from Chicago, does not pass through any of the canals, and is therefore not brought into the record. To a very large extent the tonnage just indicated might be regarded as representing the through waterborne business between the head of Lake Superior and eastern ports; and this through business has certain more or less fixed characteristics. The eastbound, or down, traffic is much larger than the westbound, and this fact has an important bearing on the rate of freight per ton per mile. Vessels are ready to carry cargo upbound at an exceedingly low rate rather than travel empty. In 1911—the last year for which full details in that regard are before me—a little over 68 per cent. of all the freight tonnage was eastbound. So far as the Canadian canal at Sault Ste. Marie was concerned, the down cargo represented 83 per cent. of the total—and the Canadian canal, it may be observed, handles 20 per cent. more business than does the American.

It must not be supposed, however, that these percentages in any respect have reference to the nationality of the traffic itself. As a matter of fact, only 10.3 per cent. of all the freight tonnage which passed through the Canadian canal at Sault Ste. Marie in 1912 belonged to Canada. It is not known what was the division at the American canal. A record is not kept of the facts in that relation. Just why, is not known. In 1908 the Department of Railways and Canals began to make a separation of American and Canadian business through all the canals of Canada, and following has been the result:

	Canadian. Tons.	American. Tons.	Total. Tons.
1908	5,012,147	12,490,673	17,502,820
1909	7,378,057	26,342,691	33,720,748
1910	7,883,614	35,106,994	42,990,608
1911	7,792,907	30,237,446	38,030,353
1912	9,376,529	38,210,716	47,587,245

This situation is almost wholly confined to Sault Ste. Marie, where, as has been said, American freight tonnage passing through the Canadian canal in 1912 made up 89.7 per cent. of the total. At the Welland Canal, Canada had 54 per cent. of the aggregate. The St. Lawrence canals, with a gross business of 3,477,188 tons, showed 67 per cent. attaching to Canada. For all the canals of Canada, however, it is a significant fact that more than four-fifths of the gross traffic is distinctly and wholly American.

Coming now to the consideration of the freight rate by water for 1912, it will be convenient—in fact necessary in a large sense—to separate American and Canadian traffic, although the facts will be given with regard to both. It must first be explained, however, that the 9,376,529 tons of Canadian freight indicating in a preceding paragraph was not the net tonnage. That figure represents the aggregate of all the canals and for that reason there is repetition. For example, a cargo from Fort William to Montreal is recorded first at Sault Ste. Marie, then at the Welland, and lastly at the St. Lawrence canals. The actual net tonnage was 6,942,278. Leaving out a salt water canal in Nova Scotia, and a small canal in Manitoba, these figures are reduced to 6,771,920, to which the inquiry of 1912 had reference. Complete returns were received with respect to 6,292,661 tons, or 93 per cent. of the total. It is confidently asserted that the result would not have been materially affected if the remaining seven per cent. had been reported. The ton miles for this volume of business amounted to 3,286,187,160, and the gross earnings to $6,378,893.43. Using these factors, it will be seen that the average receipts per ton per mile were 0.194 cent. The average earnings per ton were 91.04 cents.

The net American business through the canals of Canada in 1912 amounted to 36,840,812 tons, and returns were received covering 26,030,661. Details with regard to several millions of additional tons were sent in too late to be incorporated in the official report. The number of ton miles was 21,799,392,809, and the freight earnings amounted to $14,617,368.60. The average rate on this business was 56.62 cents per ton, and .067 cent per ton per mile.

The first thing to strike the reader will be the very considerable difference between the freight rate on Canadian traffic and on American traffic. The former was 189 per cent. higher than the latter. A statement of the facts will, however, explain this disparity. Of the 36,840,812 tons of American business through the canals of Canada in 1912, no less than 34,079,692 tons consisted of iron ore and coal—the ore eastbound and the coal westbound. The transportation of this ore is not on a commercial basis. It is for the most part done in steamers built for the purpose, owned and operated by the iron interests of Pittsburgh. The maximum freight rate returned for the season was 55 cents per ton. The same vessels carried back coal at 30 cents per ton. These rates were being returned side by side with rates of $1 and upwards per ton on wheat passing over practically the same route. While wheat was earning $2.57 per ton to Montreal, iron ore to Lake Erie ports was earning but 55 cents and upbound coal 30 cents. These figures are sufficient to demonstrate the entirely special character of the ore and coal business. On the other hand, the Canadian traffic was strictly commercial and competitive, therefore, for the purpose of any comparison which might fairly be made between freight rates by water and freight rates by rail, it will be proper to have regard more directly to the results established by the Canadian figures in 1912. It will help to a better understanding of the Canadian waterborne trade to go a little further along, some hitherto unpublished facts with regard to the movement of wheat on the Great Lakes.

Before taking another step, we must pause to see precisely what the rate of .194 cent per ton per mile in 1912 means. If this rate is to be compared with the average rail rate on this continent it must be made clear at once that another very important factor which would swell the total, has been left out of the account. That factor is the government contribution to the inland waterborne business of Canada. This contribution is the interest on the capital cost of the artificial waterways placed at the disposal of ship owners, free of charge, and the annual maintenance of this right of way. The figures are readily available. The canals of Canada cost $103,400,589, and the annual interest charge on that capital sum, at 3½ per cent., would be $3,619,021. The cost of maintenance in 1912 was $1,725,738. The total of these two amounts is $5,344,759. By a simple calculation, it will be seen that this contribution by government was equal to 76.99 cents per ton on the whole Canadian freight tonnage of 1912, or .140 per ton per mile.

The account might be summed up in the following fashion:

	Per ton. Cents.	Per ton per mile. Cent.
Actual freight rate	91.04	.194
Government contribution	76.99	.140
Total	$1.6803	.334

How do the foregoing water rates compare with rail rates? Happily, we are not left to conjecture. The facts in relation to the transportation of wheat between Fort William, at the head of Lake Superior and Montreal, both by water and rail, are definitely known. The average rate on waterborne wheat between these points in 1912 was 5.774 cents per bushel, or $1.92 per ton. To this should be added the contribution by government of .140 cent per ton per mile, equal to $1.72 per ton, making the total $3.64 per ton. The rail rate of the Canadian Pacific Railway between Fort William and Montreal is uniformly $4 per ton, or .402 cent per ton per mile. The average rail rate of all the railways of the West on wheat is not higher. On a longer haul, say from Winnipeg to St. John, New Brunswick, it is even lower; so that the comparison is fair. Thus we have on this statement of facts a water rate of $3.64 per ton as compared with a rate of $4 per ton by rail. That comparison, however, is based on an average water rate on wheat of 5.774 cents per bushel. The maximum water rate for the season of 1912 between the same points was 8 cents per bushel, and at that rate the charges by water were 29 cents per ton higher than were the current charges by rail. A fair conclusion is that, on the whole, the water rate paid by the shipper is lower on certain commodities which are peculiarly suitable for transportation in steamers; but there is not a material difference between water and rail rates when all the facts and conditions are taken into account. The difference in favor of the water rate is created wholly by the fact that a considerable part of the actual cost of transportation by water is paid by the people at large.

It would take up a great deal more space than is at my disposal to give a complete analysis of the waterborne traffic of the Great Lakes in 1912, and to deal comprehensively with the exceptions to the rates just indicated which the inquiry revealed. Those exceptions would carry the water rate both far below the average given and also carry it considerably above. It could easily be demonstrated that as soon as the steamers undertook to transport other than highly specialized classes of commodities—package freight, for example—the charges were close up to the rail rate between the same points, and with the government contribution added were actually higher. While there is keen competition in the carrying trade on inland waters, there was a marked uniformity in the rates which prevailed between given points at the same period. There was, however, a wide variation in the rates at different seasons of the year. For instance, the average rate on wheat between Fort William and Buffalo was 2.719 cents per bushel in May; whereas in December it was 3.905. No such adjustability to the law of supply and demand can be made by the railways. The owners of vessels are not subject to the regulating control of either an Interstate Commerce Commission or a railway commission as are the owners of railways. The steamers may bid for traffic practically as they wish, and there is no limitation to their charges. Of course it is only just to say that 1912 was an exceptionally prosperous year for carriers by water. There have been years when they found it difficult to earn operating expenses, to say nothing about dividends, despite the higher rates imposed by railways.

There can be no question as to the propriety of adding the government contribution, to which allusion has been made, to the actual freight charges on waterborne traffic. If vessel owners had to pay interest on the capital cost of their right of way, and meet the annual operating expenses of that right of way, they would assuredly be compelled to raise their freight rates proportionately. The corresponding charges have to be met by the railways and are reflected in their freight rates. If the railways were exempt from these two calls upon their revenue, they could afford to carry freight at half the current rates and earn a higher net revenue than they now do. Such a statement is too obviously true to call for corroboration or the support of statistical data.

Ship owners, however, have insisted that in fairness the average freight rate charged by railways should also be swollen by the annual interest on the primary subventions given by government to railways. They hold that the cases are parallel in that regard. Let me say at once that my attitude in this matter is absolutely that of the statistician who has been asked to state the facts. It would be highly improper to introduce into the discussion any opinions of my own or to take sides. But frankness compels me to say that the parallel to which carriers by water have called attention is not apparent. If it exists, then no one can say what is the amount involved. Assuming, however, that government has given aid to the railways, without which the rail rates would necessarily be higher, let it be made clear immediately that the account has a countervail. The water rate has been increased to the extent only of the interest on the capital cost of canals and the annual maintenance of these canals. The vast sums expended on harbors, lighthouses, dredging and so on have not been taken into the reckoning, although they are directly connected with inland navigation and have been essential to the shipping trade. The only reason for the exclusion of these large contributions is that the exact amount cannot be ascertained. In other words, the water rate has not been charged with the great cost of terminals and their upkeep, nor the expenditure on other services which the steamer interests would have to provide if government had not already provided them. The aggregate of such outlays would more than offset the aid given by government to railways; so that the case of carriers by water, as regards the freight rate, has not been unfairly presented.

From the comparison which has here been made between water and rail freight rates in Canada, it may be assumed that the former are not lower than the latter when the public contribution is taken into account. Nevertheless, the people of Canada believe in canals and are about to spend fifty or sixty millions for the construction of a new and deeper canal between Lake Erie and Lake Ontario. It may be that this belief on their part is based upon unsound economic premises—for which they may readily be pardoned because of the absence of authentic statistics on the subject—but they are not likely to reverse their judgment when all the facts are clearly before them. Patriotism impels them to stimulate the use of their inland water heritage, which they hold in common with the people of the United States; but back of that is a negative reason which to them is quite as potential. They believe that the development and maintenance of waterways, free of all tolls to shippers, serves as an effective check on railway rates. It may be frankly admitted there is some truth in this assumption; but the open-minded student of transportation problems, with the statistics of waterborne and rail tonnage before him, will not be disposed to attach serious importance to such a view. He will see that the course of commerce is influenced by many other considerations than the immediate cost of moving freight from one point to another. That, however, opens up another field of discussion, having many and varied aspects, which would perhaps carry one away from the somewhat limited subject with which I have been endeavoring to deal in the light of hitherto unavailable facts.

The assumption that carriers by water are in active and constant competition with carriers by rail would seem to rest on a weak foundation. The outstanding phenomenon of the transportation situation on this continent is the relatively gentle rivalry between these interests. Theoretically, the moment the railway rates exceeded the water rates on any particular commodity the flow of traffic would be diverted to the steamers. Nothing of the kind happens, however. The railways appear to be able to charge considerably more per ton per mile than do the steamers without loss of business. But this rule works only one way.

It would also seem to be clear that the steamers can only be certain of cargo when their rates are clearly and substantially below the railway rates. Take the case of wheat coming down by water to Buffalo. At that point the Erie canal ought to pick up all the business it could handle—and, by the way, its capacity is distinctly limited—but it does not get more than a moiety of this export wheat. While the canal rate is, say, three cents a bushel to New York, the railways, charging from four to six cents, get an overwhelming proportion of the traffic. There must be strong reasons for such a condition. Obviously it is to be looked for in factors apart from the freight rate. If the transportation charges constituted the sole consideration it would be impracticable to have a rail rate of half a cent per ton per mile securing 75 per cent. of the traffic between points served also by water while the steamer rate was a quarter of a cent. Since that is precisely what happens every day during the season of navigation, the notion that anything like keen competition is taking place between these two carrying interests is not tenable.

A careful study of waterborne and rail traffic statistics over a period of years has convinced me of three things: First, that the waterways attract only certain bulky commodities as to the transportation of which time is not an important consideration; second, that carriers by water are compelled to quote considerably lower rates than the railways are actually charging in order to make certain of even that class of cargo; and third, that the quotation of these lower rates is only made possible by reason of the government contribution to which I have alluded. Hence it comes to pass that the steamers play an exceedingly useful part in the general scheme of transportation on this continent, handling in swelling volume a more or less specialized traffic, and leaving wholly to the railways the movement of a wide range of other commodities which, by a process of commercial gravitation, falls naturally into the freight car. That, at all events, is the situation as we now have it in North America.

It has been said that a few pertinent and novel facts would be given with respect to the movement of wheat on the Great Lakes. The volume of that movement has been steadily rising for years past. Wheat is peculiarly suitable for transportation by water. It seeks the cheapest outlet to market, although it does not always find it. The popular belief that a fraction of a cent will decide the particular channel which wheat will take is, of course, true when other things are equal. They are seldom equal. If 100,000 bushels of wheat are sold in Winnipeg for delivery in Liverpool by a certain date, the seller is compelled to choose that avenue which will enable him to carry out his contract. He probably has such a contingency in his mind when he fixes his selling price. Hence millions of bushels of export Canadian wheat find their way abroad every year via Buffalo and New York. This occurs even when the freight rate to Montreal is a cent or more per bushel lower—a situation which quite naturally perplexes and disappoints the Canadian people. The causes are to be found in the availability of ocean tonnage at New York, the Atlantic freight rate, and the lower marine insurance at American ports.

Last year 143,075,815 bushels of wheat came down by water from the American and Canadian West, of which 109,842,031 bushels were the product of Canada. A dozen years ago the situation was reversed. The Western States are not necessarily producing less wheat; but they are exporting less. In fact, the day would seem to be near at hand, as J. J. Hill predicted several years ago, when the United States will be importing wheat for domestic consumption. On the other hand, Canadian exports of this commodity are increasing somewhat rapidly, despite a rising home demand. This is due to the filling up of the prairie Provinces with producers. It would be gratifying, and at the

same time a defense of large capital outlay for the development of waterways, if the surplus farm products of the West on their way abroad clung to wholly Canadian channels. They do not, however. In 1912 precisely 50 per cent. of all the Canadian wheat carried by water took, partly or wholly, American avenues. Nearly 46 per cent. went out directly by way of Buffalo. The freight rates on this wheat averaged as follows:

Fort William to Buffalo:	
Per ton per mile	.103 cent
Per bushel	2.863 cents
Fort William to Georgian Bay:	
Per ton per mile	.163 cent
Per bushel	2.629 cents
Fort William to other Canadian ports:	
Per ton per mile	.115 cent
Per bushel	2.384 cents
Fort William to Montreal:	
Per ton per mile	.169 cent
Per bushel	5.774 cents

There is an aspect of this movement of Canadian wheat which is suggestive. In 1912 nearly 21,000,000 bushels were brought from Fort William to ports on Georgian Bay, whence it was carried by rail to Montreal for export, and to other points in Ontario for grinding. The larger bulk was exported. It was ascertained that the combined water and rail rates equaled the all-water rate to Montreal. The steamers got from 2 to 3 cents per bushel, and the railways from 5 to 6 cents, less handling charges. The steamer rate per ton per mile was slightly lower than the rail rate; but the steamers probably earned relatively more on their share of the haul than did the railways on a little longer haul. The point which calls for emphasis is not so much the approximate parity of the water and rail rate in this case as the disposition of large steamers to avoid artificial waterways. This is indicated by the steady increase of the trade to Georgian Bay ports. If that object lesson were lacking, it would still be true that vessel owners have a strong preference for deep water and sea room. Given a long haul in open water, and there is no question whatever that steamers can underbid the railways; but the moment canals or restricted channels intervene the freight rate goes up. And for a sound reason. Time is the controlling factor in the fixing of a freight rate by water rather than distance, and vessels make slow progress through canals and narrow channels. Interruptions and delays are common. The season of navigation on the Great Lakes does not average much over seven months, and during every moment of that time the operating expenses are constant, with the single exception of the quantity of coal being consumed. Hence the faster the vessel moves the larger is the tonnage actually transported, and in the end the net profits for the season will bear a more or less fixed relation to the volume of cargo handled.

ONE WAY OF KEEPING A STRIKE ALIVE.

An apparent effort to revive the defunct strike of the shop organizations on the Illinois Central, which was called in September, 1911, is indicated by a recent exchange of telegrams between Martin F. Ryan, general president of the Brotherhood of Railway Car Men, and officials of the St. Louis Southwestern.

On account of high water in the lower Ohio and Mississippi rivers the tracks of the Cotton Belt were used to detour trains of other roads between Jonesboro, Ark., and the bridge at Thebes, Ill. During the five days, April 6 to 10, a total of 310 trains of seven roads were handled over this single-track line, a distance of 140 miles. On April 8 Ryan sent the following telegram to T. F. Adams, superintendent of motive power of the Southwestern:

"Information has reached my office that Illinois Central trains and equipment are being detoured over the Cotton Belt on account of high water. You, no doubt, are familiar with the fact that all the shop organizations on the Illinois Central are now and have been on strike for several months. Please advise if it is the intention of the Cotton Belt management to require their car men to inspect and repair such Illinois Central equipment as may be detoured over Cotton Belt tracks. An early answer will be appreciated."

The threat manifestly implied in this message was met by President F. H. Britton in a reply to Mr. Ryan on April 10 as follows:

"Your telegram of the eighth, to Mr. Adams, inquiring if it is the intention of this company to require car men to inspect and repair such Illinois Central equipment as may be detoured over Cotton Belt tracks has been forwarded to me. The message indicates that you are familiar with conditions, and it is not necessary that I state that the damage done by flood waters to railroad and other property, including possible loss of life, through the lower Ohio and Mississippi, amounts to a public calamity and that we are detouring, in addition to Illinois Central business, trains of the Mobile & Ohio, Rock Island, Frisco and Iron Mountain, all of whose tracks have been more or less damaged by flood waters, and are thus performing a service of great importance to the public residing along and dependent upon the railroads mentioned for service, and who cannot be reached except through use of our rails. The work is one of public necessity, and we would be derelict in our obligations to humanity were we to decline to flood sufferers or those threatened with disaster the use of our facilities under existing conditions. Illinois Central equipment is, in a sense, our own while on our rails, the service rendered being provided for by reciprocal agreement granting us the use of their rails under similar conditions, and we shall continue to demand of our car men the same service in the matter of inspection and repairs, as with our own."

Mr. Ryan made no reply, but was quoted in the newspapers as saying he had no intention of interfering but had "merely asked for information."

The train movements between the points named during the five days, including those of the Cotton Belt as well as the roads detouring over its tracks, were as follows:

Date.		S. W.	I. M. & S.	C. & E. I.	Frisco.	I. C.	M. & O.	R. I.	Total.

Double-Tracking in India.—Two sections of the Bengal-Nagpur Railway, from Adra to the Jerriah Coalfield, and from Adra to Bankura, are being double-tracked at a cost of about $875,000. An interesting point in regard to traffic operation arises in connection with the doubling of the latter section. For some time congestion on the Adra-Midnapore section has been staved off with difficulty and the company has had the question of improvement under consideration. The present capacity of this section as a single line is 24 daily trains; after considering the probable developments of the early future the company has come to the conclusion that 32 daily trains must be provided for. The first idea was to double the section throughout; careful investigation has, however, shown that by doubling from Adra to Bankura—only one-third of the whole section—the capacity of the section as a whole can be increased to 38 trains. This seems at first sight a most extraordinary result. The explanation, however, would appear to be simple. Loaded trains start off from the coalfield during the night, empties are brought in during the night for loading during the next day. These two streams cross one another continuously for some distance from the coalfield, but at Bankura a point is reached where the downward traffic and the upward traffic are traveling at different hours, and the tendency to congestion is of course materially reduced. It thus comes about, as has been said, that by doubling but one-third of the whole section, its capacity is increased by over 50 per cent.

STEEL PASSENGER TRAIN CAR DESIGN.

Continuation of Account of the New York Meeting of the American Society of Mechanical Engineers Held April 8.

In our issue of April 11 abstracts were given of the papers presented by H. H. Vaughan on the "Introduction to the General Discussion," by C. D. Young on the "Painting of Steel Passenger Cars," and by John A. Pilcher on "Trucks for Passenger Cars." Abstracts of the other papers follow:

PROBLEMS OF STEEL PASSENGER CAR DESIGN.

By W. F. Kiesel, Jr.

Assistant Mechanical Engineer, Pennsylvania Railroad.

The increasing cost of lumber, the desire for longer and stronger cars, and other considerations indicated the desirability of making a determined effort to develop a satisfactory steel passenger car. The object of this paper is to review a few of the problems encountered, beginning with:

Can we afford it, and what will it cost, compared with wooden cars? Tentative designs were prepared and carefully analyzed by a committee of representatives of car builders and railroads. The summary of its report was that at first steel passenger cars would cost approximately 20 per cent. more per passenger than wooden cars of the best existing types, but that the steel cars would probably cost much less to maintain. It also reported that on account of the increased cost of good lumber, and the probable decreasing cost of manufacturing steel cars, not many years would elapse before the cost of steel cars would be no more than, if as much as, wooden cars. At the present time steel cars cost no more than equivalent wood cars.

Shall the cars be all-steel, or steel frame with wood lining? Differences of opinion still exist on this point. Both types of car have been built, and each has strong advocates. In the all-steel car the steel lining may be securely riveted to the framing and adds somewhat to the strength of the complete structure, but as steel is a good conductor it carries away the heat of a body coming in contact with it, and, therefore, will always feel cold, even when the temperature in the car is sufficiently high. Satisfactory results have been realized from the use of a double steel lining between seats, forming a hot-air duct, extending from the heater pipes to the window sill, with outlet through small holes in the lining proper, located immediately below the window sill.

Wood lining requires considerable wood furring, and adds weight to the car without adding to the strength. As the steel frame of a long passenger car may vary as much as ½ in. between extremes of temperature, it is necessary to make allowance in the construction of the wood lining for this variation in length. As a car with metal lining riveted to the framing has the advantage in strength, weight, and cost, it will gain in favor; in fact, it would be at present universally preferred if all railway shops had practical experience with steel lining, and the necessary proficiency and machinery for its manufacture.

Insulation. Three general principles have been used for car insulation: Wood lining; by placing insulating material on the outside of steel lining; by placing insulating material on the outside of the steel lining, and on the inside of the steel sheathing. Experiments have been made also with other methods, such as completely filling the space between sheathing and lining with block magnesia and magnesia cement. The problem that presents itself is: Given a car body with a comparatively smooth exterior surface protected by several coats of paint, double walls, painted on both sides—if of steel—isolated air spaces rather large in volume between the walls, an inside cubic volume in which the air must be continually renewed, and a window surface of about one-third the area of the side walls. When single windows are used the air close to the windows is cold in winter, and warm in summer. Double windows improve the situation materially.

Experiments made to determine the difference between a wooden and a steel coach, with doors and windows closed, standing on a siding exposed to the sun in hot, summer weather, showed a difference of one to two degrees in favor of the wooden coach. One day's readings showed an average of one degree difference in temperature in favor of the steel coach, which had insulation only on the outside of the lining. The results of several years' experience indicate that the lining must be insulated throughout, and, if the spaces between lining and sheathing are properly isolated, little is gained by insulating the sheathing, and more will be gained by the use of double windows. Furthermore, the heat lost in cold weather by conduction through and radiation from the walls, in cars with insulation on the lining alone, is negligible when compared with the heat carried off by adequate ventilation.

Protection and safety of passengers. This problem involves providing adequate strength for carrying the load, also to prevent collapse or crushing in wrecks, and efficient brakes. The laws governing load-carrying strength are well known, but this cannot be said of the laws governing wrecks. Each wreck forms a separate study, and we seldom find two that can be placed in the same class. The study of wrecks, which, unfortunately, do occur, shows that the car underframe must be reasonably strong to resist end strains, that the ends of the superstructure must be reinforced with strong vertical members, and that the car must not collapse when rolled down an embankment. The gradual elimination of crossings at grade has materially decreased the danger of stresses directed against the sides of the car.

Early experience with steel freight cars showed clearly that the men handling cars in yards believed that all cars built of steel could withstand much rougher handling than wooden cars. Although the resultant damage to both kinds of freight cars had its disadvantages, it developed a better knowledge of the relative value of steel and wood in car construction, led the designer to abandon the basis of ultimate strength of the material, and to substitute the basis of elastic limit, and finally to select a ratio of 4 to 1 as the relation of the elastic limit of steel as used in cars to that of good timber. That not all designers of steel passenger cars had the advantage of this knowledge, or profited by this experience, is evidenced by some of the car designs which have been illustrated in the technical papers in the past years and which proved fundamentally defective.

Selecting from the last generation of wooden cars one used in heavy trunk line service, with four 5-in. by 9-in. wooden sills bunched together near the center, and so located as to be nearly uniformly affected by the end strains, steel platforms with draft gear securely attached, and the remainder of the car to correspond, the analysis of its end shock resisting capacity leads to the consideration of the elasticity of the material, the transverse bracing preventing buckling, the concentration of strength near the longitudinal center line of the car, and the reinforcement at the platforms. The wooden car, therefore, meets many of the requirements enumerated before. A corresponding steel car should have a center sill area of 45 sq. in. braced against buckling, a strong and efficient draft gear as a substitute for the elasticity of the wood, and a ratio of 0.04 for stress to end force, the calculations to include consideration of lever arm of force below the neutral axis of the center sills. For lighter service a steel car with a center sill area of 32 sq. in. and a ratio of 0.05 for stress to end force may be considered as a substitute for a wooden car with four 4-in. by 8-in. sills bunched near the center of the car. The use of steel permits a distribution of material to better advantage than is possible with wood. The box girder center construction is continually gain-

ing in popularity; the strong vertical members at car ends, to prevent one car overriding and penetrating the superstructure of another car, are now considered a necessity; and a superstructure, including a roof sufficiently strong to bear the car when turned upside down without collapsing, is very desirable.

Trucks. The impression that cars with six-wheel trucks necessarily have better riding qualities than those with four-wheel trucks has proved to be incorrect. The substitution of four-wheel trucks for six-wheel trucks saves about 18,000 lbs. per car. Increased journal bearing surface obtained by an increase of diameter of journal only is of little or no benefit in preventing hot boxes, because the periphery velocity increases in the ratio of the diameters. The weight per journal should not exceed 1,500 lbs. per in. length. A long spring base, low-lying center plate, and anchoring the dead levers to the car body instead of to the truck frame promote smooth action and easy riding at all times. The equalizing springs should, therefore, be placed as near the journal boxes as possible, or directly over the boxes, and the bolster springs should be on or near the center line of the truck sides. If the dead levers of the truck brake are anchored to the car body, the truck frames have no tendency to tip up when the brakes are applied, and the jarring effect is entirely eliminated. A special axle with 5½-in. by 11-in. journal for passenger cars would be of material benefit, would permit using four-wheel trucks under all coaches and 60-ft. baggage cars, and longer cars with six-wheel trucks would have sufficient margin for the excessive loads sometimes encountered and the danger of hot boxes would be avoided.

ROOF STRUCTURE FOR STEEL CARS.

By C. A. Seley,

Mechanical Engineer, Rock Island Lines.

The advent of the steel car has rather encouraged the use of the oval or round roof, as it is often called, particularly for cars used for baggage, express, and postal purposes. It is cheaper to build and maintain and fulfills requirements for such cars. For passenger cars the clear-story type prevails very generally, as it assists in lighting and ventilation and in decorative effect. The shape of the carlines of either type of roof should be such as to facilitate the fastening of the roof and of the inner ceiling or finish, and between these there should be a generous amount of insulating material to intercept the heat of summer and the cold of winter.

The specification for full postal car construction, which was approved by the Postoffice Department in March, 1912, contains the following paragraphs in regard to the roofs of such cars and is probably as authoritative a statement as there is available. The strength of roofs of some cars that have been rolled over in accidents has been checked against the formula used, and it has been found ample to afford support against serious roof distortion in such cases.

"*General.*—The roof may be of either the clear-story or turtle-back type, depending on the standard contour of the railroad for whose service the cars are built. In the clear-story type, the deck plates shall be in the form of a continuous plate girder, extending from upper-deck eaves to deck sill, and either built up of pressed or rolled shapes, or pressed in one piece from steel plates. The carlines may be either rolled or pressed steel shapes, extending in one length across the car from side plate to side plate, or may extend only across the upper deck. In the latter case the lower deck carlines may be formed by cantilever extensions of the side posts or by independent members of pressed or rolled shapes. In the turtle-back type, the carlines may be of either pressed or rolled shapes, extending in one length across the car between side plate and side plate, or may consist of cantilever extensions of the posts.

"*Carlines.*—The projected area of the portion of roof in square feet, supported by carlines, divided by the sum of the section moduli of the carlines, must not be more than 100.

"*Roof Sheets.*—Roof sheets, if of steel or iron, shall be of a minimum thickness of 0.05 in., and either riveted or welded at their edges."

The design of the roof is also subject to the general paragraphs on stresses and details of the postal car specification. There are several bills in Congress having in view the substitution of steel passenger equipment on railroads for present wooden cars. Should any of these become law, specifications for construction will be necessary, and, as the postal car specification has been approved and adopted as standard by the government, no doubt it will be used as a basis in determining the requirements for other steel passenger equipment cars, not only for the roofs, but for the other features of construction.

SUSPENSION OF STEEL CARS.

By E. W. Summers,

President, Summers Steel Car Company.

Unfortunately the roadways we have to contend with cannot be made or maintained in true alinement. Frost and water make constant changes in the track support. Lateral curvature requires super-elevation of the outer rail. In passing from a tangent to a curve, or vice versa, the tracks under one truck are not in the same horizontal plane with those under the other one. Steel car bodies of the enclosed type, such as box cars, mail, baggage, or passenger coaches, are of rigid construction and have high torsional resistance. A three-legged stool on an irregular floor surface will stand upon all of its legs while one having four legs may carry all of its load upon two diagonal supports.

The use of truck springs helps the illusion that we are distributing the car body load on all of the wheels. The uneven deflection of the springs indicates directly the increased load of one spring over the other. When the track surface is warped more than the total spring travel, the whole load is carried at two diagonal corners, tending to twist the car body. This twisting tendency is constantly changing, first in one direction and then in the other, as the super-elevated rail changes from one side of the track to the other. The effect upon wooden passenger cars is to work the joints loose and cause them to screech and grind like the spokes of a wooden wagon wheel in hot dry weather.

The side bearings of steel sleeping cars pop like sledge hammer blows when the car is taking or leaving a curve. The slight twist in the track surface throwing excessive load upon two diagonal corners of the car causes the bearings to grip and adhere to each other coincident with the slewing of the truck. When the twisting of the truck exceeds the play in the parts around the truck bolster the side bearings let loose and jump with the resulting hammer blows. More efficient roller side bearings may prevent the gripping and jumping, but the uneven load is still present. The twisting effect upon the car body is not removed. Failure in roofs of wooden box cars and the resulting damage to merchandise in transit is due to this constant twist. Roof designers have attempted to remedy this by making the roof flexible and with slip joints. To be consistent they should go further and make the whole car of India rubber. A practical construction for the enclosed type of steel car bodies must and always will be rigid and of high torsional resistance.

The necessity for flexibility between the car body and the trucks, and for an even distribution of the load upon all of the wheels seems not to be fully appreciated as yet, but with each succeeding year wrecks due to broken rails, wheels and truck structure will drive this home. Suspension of steel cars, as has been developed by the writer in the past three years, does permit of a more even distribution of the load upon the wheels than with center-bearing trucks.

[Mr. Summers then explained at length the construction and operation of the balanced side bearing truck, which he has developed. *Railway Age Gazette* readers are more or less familiar with it; a description appeared in the issue of March 22, 1912, in connection with an article on the all-steel box cars for the Bessemer & Lake Erie. It has also been referred to frequently in the controversy on locomotive tender derailments which has been carried on in the columns of the *Railway Age Gazette* during the past six months.]

STEEL INTERIOR FINISH.

By Felix Kocir,

Assistant Mechanical Engineer, Pressed Steel Car Company.

The use of a small amount of wood in the interior finish, as for instance, window sash moldings, seat arm rests, window capping, etc., should not be objectionable as it has certain advan-

tages over steel which are desirable; wood is used for such details to a considerable extent, and hundreds of cars are now in service in which the small amount of wood used in the interior finish cannot be detected except by an expert and such cars are to all intents and purposes fireproof cars, but the aim of many designers has been to elminate the wood wherever possible on account of the many advantages possessed by steel, among which may be mentioned:

(*a*) Steel finish means non-combustion in case of fire.

(*b*) Steel prevents splintering in case of wreck.

(*c*) Steel finish may be easily removed should it become necessary to repaint the car on the inside surface of the steel sheets, as the life of the steel car, to a certain extent, depends on the condition of the paint.

(*d*) Steel finish makes it possible to increase the interior width of the car where outside width is limited. This has been found particularly valuable in designing subway, elevated or suburban steel passenger equipment cars.

(*e*) Steel finish will avoid trouble which may be experienced due to different expansion of materials—steel as compared to wood. This point need not be considered with steel and makes it unnecessary to provide for relief in all members of the finish running longitudinally, such as upper and lower deck sill moldings, etc. In fact, the steel finish has revolutionized to some degree the designs of wood finish in the wooden cars built since steel cars came into vogue. The cars of today are built on more sanitary lines, and fancy moldings, fretwork and carvings have disappeared without losing sight of giving the cars an artistic finish, avoiding thereby lodging and breeding places for all kinds of germs and filth.

(*f*) Steel finish will, by comparison, be cheaper every year for the reason that it becomes more difficult to obtain the right kind of lumber for interior finish, which, of course, means increase in price of wooden cars.

(*g*) It is continuously becoming more difficult to obtain men who have had sufficient experience in applying wood interior finish, whereas it does not take the same experienced men for applying steel finish. A man requires from three to four years' apprenticeship to become an expert in applying wood finish to a car, whereas an average intelligent man who is familiar with tools is able to become an expert in finishing cars with steel finish in from six to twelve months.

(*h*) A more uniform color may be maintained on steel finish than on wood, which comes in different shades, and it is very difficult and expensive to match perfectly all parts in one car with regard to shade without additional expense of glazing. Furthermore, the average life of paint applied to steel finish will be much greater than to wood finish for the reason that wood darkens with age. This, of course, influences the paint which is a disadvantage from the standpoint of illumination. Should it become necessary to repaint a car of wood finish, reworking of the finish by removal of the varnish and scraping is necessary, whereas in the steel finish the scraping is eliminated and the removing of varnish is alone required to be able to repaint the car.

(*i*) Steel finish is of advantage from a building standpoint in the handling and working up of material. Steel details may be worked up to a large extent before they are applied to the cars, which makes it possible to manufacture the interior finish in much less time by the use of more men, than it is possible to employ when applying a wood finish, as only a limited number of men have room to work at the same time in a car when the greater part of the fitting and cutting, etc., has to be done. This has facilitated the establishment of a number of manufacturing concerns who devote their efforts almost exclusively to producing steel interior finishes not only for passenger cars but also for buildings. In addition to these any manufacturing company equipped with the necessary machinery for the making of drawn moldings, breaker presses, and ordinary welding and spot welding machines, is able to handle this class of work for railroads or car builders, who may not have the necessary equipment to do the work in their own shops and prefer to buy the interior finish as they buy other specialties.

All of these advantages are almost exclusively confined to the use of steel or other metals, although a composite material of a wood pulp nature or similar material made fireproof and waterproof by different processes, if applied in a proper way and used for ceilings and below the window sills, is not objectionable, and may be applied in practically the same manner as steel. The advantages possessed by wood over metal as a non-conductor may be very much reduced by the use of proper insulating material correctly applied. The use of proper insulation is, of course, of great importance; manufacturers of that class of material as well as railroads and car builders are giving a great deal of attention to the subject, and the time does not seem to be far distant when steel cars with interior finish of wood will be as scarce as steel passenger cars were ten years ago.

ELECTRIC LIGHTING OF STEEL PASSENGER CARS.

By H. A. Currie,
Assistant Electrical Engineer, N. Y. C. & H. R.

From a standpoint of practical consideration for the welfare of passengers, the lighting plays one of the most important parts; therefore, every effort should be made to arrange the light units so that no discomfort be occasioned, and to install the apparatus and wiring so that operating failures be reduced to a minimum.

The two essential considerations for the designing engineer to keep in mind in laying out his installation are: (*a*) The arrangement of parts in a manner to allow of easy inspection and repair. (*b*) Protection against mechanical injury. Convenience and accessibility of apparatus, fixtures, junction boxes and wiring mean much to the inspector. It is well known that the average inspector will pay little attention to those parts which are difficult of access, and much better inspection work will result where parts are arranged in a get-at-able manner. It is of equal importance that the various parts be protected in such a manner as to avoid all possibility of injury to them while the car is in service.

Axle Generator. It would be a consummation much to be desired if truck designers would provide a generator support built integral with the truck; the requirements are not difficult and it is certain that the generator builders would be glad to make their machines conform to the truck builder's suspension. As the matter is now handled, nothing causes them more delay and inconvenience than obtaining information about the numerous details of truck and underframe construction necessary for making an intelligent layout of the generator suspension.

ELECTRICAL EQUIPMENT ON STEEL MOTOR CARS.

By F. W. Butt,
Assistant Engineer, Electrical Department, N. Y. C. & H. R.

In providing for the electrical equipment on steel motor cars, several important points should be considered. On account of its metallic construction, the car becomes a negative conductor, or, in other words, the car is grounded, and all electrical apparatus must be well insulated against leakage of the electrical current. Switches, circuit breakers, fuses, etc., should be so located that the arc when opening a circuit will not reach the metal structure of the car. In cases where space is limited, and it becomes necessary to locate circuit breaking apparatus in such a way that there is danger of the arc reaching the metal structure, suitable arc shields of non-conducting and non-inflammable material should be used.

In the design of new cars it is sometimes found convenient to locate various members of the structure, especially in the underframe, so that the apparatus may be suspended from them without the use of intermediate supports. This is desirable, as it is often found that many parts may be omitted from the car.

The steel car is safer than cars of wood construction, as there is no danger of bad fires on account of short circuits. Parts of the structure of a steel car will not become alive, as is sometimes found in cars of wood construction.

AIR BRAKES FOR HEAVY STEEL PASSENGER CARS.

By A. L. Humphrey,

Vice-Pres. and Gen. Man., Westinghouse Air Brake Company.

The improvements made in air brakes in recent years, which have made it possible to control the present heavy high-speed passenger trains with approximately the same degree of efficiency as the older forms controlled the equipment of their day, have been based on scientific principles and experience in obtaining reliable information and data. The matter of time of transmission of compressed air was not so important a factor with the shorter trains and slower speeds as it is today, where a train running at 80 miles per hour passes over a distance of 117 ft. per sec.; consequently a few seconds' saving in the time of getting the brakes fully to apply is just so much relative gain in the time and length of stop. With the latest improved pneumatic equipment, the maximum brake cylinder pressure can be obtained throughout a modern train of ten cars in 4 seconds, which is the shortest possible time that this can be obtained by serial quick action through a train of this length. For the purpose of shortening this time serious consideration is being given by some railroad officers to the type of brake equipment used on the New York subway, and known as the "electro-pneumatic," which would not only tend to cut the time of full application in two, but by means of the electric control all brakes are applied simultaneously, which not only assists in shortening the stop but in preventing shocks, etc.

Another equally important factor now coming more prominently into use is the application of brake shoes to each side of the wheel, known as clasp brakes. The virtue of clasp brakes, however, is not so much in the aid they afford in shortening the stop as in the equalizing effects of pressure on the wheels, journal box bearings and trucks, the minimizing of lost motion which affects the brakes through increased piston travel, and the less tendency toward wheel sliding while the brakes are applied.

THE USE OF CAST STEEL.

By C. T. Westlake.

Chief Mech. Engr., Commonwealth Steel Company.

Cast steel as applied to underframes and end frames of railroad cars is the result of careful design, and painstaking and thorough development of the art of casting in sand molds. These large steel castings are made in baked molds, confined in massive metal forms, by a special method that assures positively against swelling due to pressure of the inflowing metal, and yet permits yielding to the pressure of the contracting metal when cooling, so that the castings are very accurate in shape and close to size, and are free from shrinkage stresses.

As recently as 1893, cast steel was comparatively unknown in car construction, and in that year its introduction began in the use of truck bolsters for freight cars. This was followed a few years later by body bolsters or transoms, and it was only after their use on freight cars had demonstrated satisfactorily the reliability of the material and design, that attention was turned to passenger cars. The double body bolster was first to receive consideration for passenger cars, and although, due to casting difficulties, its weight was at first excessive, it was quickly refined and assigned to its proper place with other cast steel articles. It was found to be so much lighter, stronger and permanently effective than the built-up type, by forming a one-piece cradle or support for each end of the car body, that its use soon became almost universal in construction of passenger cars.

As one of the most valuable properties of cast steel is its adaptability to combine a multiplicity of complex parts into a single one of simple form, it was gradually developed from the double body bolster form, first to include end sills, then end and buffing sills, next the end and buffing sills were combined with longitudinal members extending to, and connecting with the double body bolster. Finally these parts, together with many others, were combined into a single simple member at each end of the car underframe, and comprising so many of the fixed parts that it is now only necessary for the car builder to connect them by center girders and to apply draft and buffing gears and the superstructure to complete the car frame.

The ideal underframe should have all connecting members in the same plane so as to avoid buckling due to eccentric loading; it should be so designed that each member will independently perform its individual functions, passing the stresses from one member to the other through the smallest number of properly alined connections; and all should be so arranged in relation to each other as to form one powerful, compact, shock-absorbing element throughout the length of the car. This may be accomplished to great advantage in cast-steel construction since the metal may be properly distributed in proportion to the stresses. The gusset plates may be placed in the same plane as the flanges of intersecting members, and the whole reduced to minimum weight and to the smallest number of parts with practically no joints. It may be molded to any desired conformation, may be shaped to any curve, useful or ornate, without the use of expensive dies, and may be provided with necessary projections joined to the main members by proper fillets. Openings may be provided with finished and reinforced edges, and all parts may be molded to symmetrical, pleasing contour, all edges rounded and a complete, practical, operative device, emanating from a single source furnished to the car builders ready for application.

As the rounding of curves necessitates the use of convex ends to the car body, the central portion of the ends is most exposed and liable to receive initial impacts, and this portion should be made strongest and most capable of properly transmitting the force of impacts to the balance of the frame. The underframe receives the force of end collision as a column load on its longitudinal members, while the end frame receives it as a transverse load on exposed members supported at their ends. As it is impracticable under these conditions to make the end frame equally as strong as the underframe, provision should be made for protecting the end frame against destructive forces. The underframe should be arranged so as to receive the initial impact, and if the encountered force is sufficient to destroy it, it should fail in such manner as to form additional protection to the end frame. This is accomplished in cast-steel construction by arranging the parts of the longitudinal members so that when loaded to destruction by a collision force, the end portions yield upwardly, thus folding the exposed portion of the platform up against the end of the car body, and forming an addition to the end frame to assist in distributing the force to all the longitudinal members of the superstructure. The advantage of this construction has been demonstrated in wrecks when this action has taken place, the safety of passengers being assured, and the property loss kept low.

The cast-steel platform as now provided for blind end cars, comprises the buffing sill having recesses for the buffer foot plates, holes and brackets for the buffer stems, pockets for the buffing device, brackets for safety chains, lugs for draft gear, brackets for drawbar carry irons, anti-telescoping plate, extensions of the center sills and bottom chords of the side sills, all of the double body bolster members including side bearing arches and extending for a distance of over 14 ft. inward from the end of the car to a point considerably back of the truck center, and counting rivets, gusset plates and connecting angles, combining more than 1,000 pieces into a single, powerful, shock-absorbing element of less weight than fabricated material of the same strength.

The cast-steel platform and double body bolster for vestibule cars comprises all the parts enumerated for blind end cars, and in addition, includes the exposed platform longitudinal members, step risers and end sill, measures over 17 ft. in length, is made of a single piece, and is also of less weight than fabricated material of the same strength.

Since the government has taken a hand in the construction of cars used in its service, stronger body end frames are being used, and as the end of the car is the first to encounter end collision forces, it reasonably deserves closer and more careful con-

sideration. Most damage is produced by end collisions and to protect life and property from them, the colliding object must be prevented from entering the car. To accomplish this, the end frame and end portion of the underframe should be constructed so as to distribute the force of collision into all the longitudinal members of the car, passing it into the largest mass, utilizing every particle of available inertia to absorb the force without permitting it to reach and act upon the contents or occupants of cars. The end frame proper should be designed so that when a single member is loaded, all will act with it, and this can be accomplished only by connecting them so as to form a single mass, and best by forming them in a single piece as in cast-steel construction.

In designing the cast-steel end frame we assume it to be a beam supported at its upper and lower ends and loaded at a point about 18 in. above its lower end. We provide connections between the end frame and balance of car frame of sufficient value to develop the full transverse strength of the end frame; the vertical members of the end frame are connected by horizontal members so that in case the end frame is loaded to destruction the connections are sufficient to disrupt all the longitudinal members of the car frame, and when they yield all parts will be forced toward the center of the end of the car and tend to prevent one car telescoping the other.

Cast-steel parts weigh less than built-up members carrying the same load since the metal in castings may be properly distributed in proportion to stresses. In built-up construction the metal overlaps at the joints and this, together with the rivet heads, makes an additional weight which in cast construction is avoided. In the latter, reliance is placed in a single solid member and, as there are no joints, there is no chance of their being imperfect or becoming loose.

The advantage in cast steel to the car builder is also very great. To produce a platform of the built-up type at least eight different classes of material are required. This comes from eight different manufacturers, frequently from as many different points of production, much of it in less than carload lots, and all has to be requisitioned, purchased, received, stored and recorded for use on each particular lot; and in order to reduce storage space and avoid congestion in the car plant, all deliveries have to be carefully and accurately timed, and followed up. Then each material has to be passed through the different departments of the car plant to be cut, shaped, punched, drilled and the same timing and tracing methods used, so as to have all parts completed at the proper time. When cast steel is used but one material is purchased from a single plant, only one piece is handled, that in carload lots, and when it arrives it is immediately ready and available for application without storage or re-handling, facilitating completion of the car by leaving more car plant machinery available for other work.

UNDERFRAMES FOR STEEL PASSENGER CARS.

By J. McE. Ames,

American Car & Foundry Company.

This paper will be confined to underframes of steel passenger cars for through service, or those at least 70 feet long. The natural division of such designs is: (*a*) Underframes designed to carry equally on all sills. (*b*) Underframes designed to carry on center sills only. (*c*) Underframes designed to carry on sides only. (*d*) Underframes designed to carry on sides and center sills.

Each of these types has its partisans and each type is in successful operation today. The first is the type used abroad almost universally and at home for repairs under wooden cars, the bodies of which are too good to destroy but need better underframing. In general the deep side sill has been discarded because of the difficulty of inspection beneath the car. The deep center sill is much in vogue at present because it looks strong, but on a car with deep center sills inspection must be made of the parts attached to the underframe from one side of the car at a time, and the introduction of axle light equipment becomes difficult on account of the interference with the deep sills. Again, to sustain its own weight without deflection on a 60 ft. span, too much weight of metal is required to make such a sill economical.

Of the second type, that is, with the whole weight to be carried on the center sills, a common form has center sills of two special 18 in. channels with ½-in. cover plates top and bottom, all sections extending the full length of the car in one piece. The box girder so formed has a square inch section of 50, and the superstructure load is transferred to these sills by means of four cross bearers, two of which take the place of the body end sills in other designs. There are no side sills as such, the angles simply forming the attachment for the superstructure. The parts are usually assembled with the bottom of the sills upward and allowed to deflect. The girder is then reversed and the camber straightens out by the weight of the metal. The sills are the same depth and section throughout their entire length; with this construction a truck of special design must be used, the center plate of which must be nearer the rail than usual. The weight of the body rests upon the side bearings as well as the center plate. The service given by this underframe has been excellent.

The third type, with all the weight carried by the car sides, has the center sills used only for buffing and pulling. An example which may be referred to has two I-beams running the full length of the car in one piece, with a square inch sectional area of 23. They are held up by the three cross bearers which pass under and are attached to them. There are no side sills, the carrying members being the sides of the car. These members are composed of ⅛-in. plates, about 36 in. deep, stiffened vertically by the window posts and having a 6-in. by 6-in. by ⅝ in. angle at the bottom and an equal square inch section of metal at the belt rail, the two girders having a square inch section of 48 in all. With this construction a substantial body bolster is essential, as the weight must be carried at the bolster extremities. Usually a cast-steel structure, built into the underframe and securely riveted to it, is used, as the weight of the metal may thus be economically distributed. With an underframe of this type there is no trouble due to difficulty of inspection or interference with attachment for axle light or other equipment under the car.

The fourth type is a combination of types *b* and *c*. Here deep center sills are used, having a square inch section of, say, 40 at the center and 39 in cast steel at the draw gear. The side girders have a square inch section of 21 in the two. Most underframes of this type now in service are built with cast-steel and in portions which include in one casting the body bolster, platform, side and center sills extending as far back of the bolster as may be necessary to secure a substantial connection to the center sills proper.

While several of these types have been in service for a number of years the required time has not passed in which to develop structural defects due to unseen causes, such as fatigue of metal, crystallization, etc. If such defects exist they should make themselves known during the next three or four years, if freight construction is any criterion. We know fairly well the behavior of these types under unusual service conditions due to wrecks.

SPECIAL ENDS FOR STEEL PASSENGER CARS.

By H. M. Estabrook,

President, Barney & Smith Car Company.

Notwithstanding the frantic efforts of Congress toward the general adoption of steel passenger cars, it has been stated upon reliable authority that no vestibuled wooden passenger car, in the construction of which was employed the anti-telescoping end framing, in a straight-on end to end collision (although frequently having the ends concaved) has ever had the end crushed in to the extent of the adjoining car body telescoping and entering it.

It is, of course, apparent that the weight of the steel car is much greater than a car of the same size of wooden construction,

and that the wooden car possesses in itself a natural elasticity to absorb buffing shocks such as are produced by collision that the steel car does not furnish. Hence, in the development of the steel car, with the enormous increase in weight of trains and the high speed at which they run, there has been a growing tendency to increase the strength of the structure with the view of making it as nearly indestructible as possible in order to compensate for the absence of elasticity. It is also apparent that, notwithstanding the strength of the structure, if it encountered an opposing force of sufficient magnitude, it might be annihilated, and so this strengthening process and the increasing weight and speed might go on indefinitely without furnishing the result sought for. It is equally true that if the structure is designed for such strength as to be indestructible, when the two opposing forces meet, the movable objects within the cars, which is the human load, must suffer the damage. To avoid this possibility the idea has been evolved to construct that portion of the end of the car between the end of the main body and the vestibule face plates, these members being all such parts as are embraced in the platform, vestibule and hood covering the vestibule, so that it will collapse under a less shock than would be required to crush in the end of the car body itself.

This idea is based on the theory that in a train in which there are, say, ten vestibuled cars, there is the space between the main bodies of each two coupled cars occupied by the platforms and vestibules of approximately 8 ft., or in a ten-car train a space of approximately 80 ft., of shock absorbing space, which, if properly utilized in the instant of collision, would remove to a large degree the shock and resultant damage to the car body itself and likewise lessen the possibility of damage to the persons of the passengers. From this idea has developed what is termed a collapsible vestibule. It is generally conceded that if two vestibuled cars coupled together could maintain their respective horizontal planes at the instant of shock due to collision, there could be no telescoping and that telescoping is due to one car assuming, at the instant of collision, a higher or lower horizontal plane than its adjoining neighbor, causing one to ride the other with the resultant telescoping effects.

It is generally conceded, that in cases of two cars tending to telescope, the point of maximum shock is never over 20 in. above the floor line. In the government postal car specifications, this point has been definitely fixed at 18 in. above the floor line, and with this in view the end posts are reinforced for a distance of about 4 ft. above the floor line by steel angles riveted to the Z-bar end posts.

This collapsible vestibule was described in the *Railway Age Gazette* of January 24, 1913, page 142. In its construction the longitudinal sills and floor members are designed to stop at the end sill of the car body proper, the end of which is sheathed with a heavy steel plate extending in one piece vertically from the roof downward to the bottom of the end sill. If the shock of collision is not entirely absorbed by the vestibule members before the end of the car body proper can be crushed, this plate will tend to pull the roof downward and cause the direction of the oncoming car to deflect obliquely upwards instead of the two cars telescoping. Further to offset the effect, should the two cars change their horizontal planes in collision, pressed steel shapes in the nature of anti-climbers are placed below the buffer beam and platform.

The platform, vestibule and hood members are designed with a view to withstanding all shocks incident to regular service, but in abnormal shocks, such as would result from collision, the rivets connecting the various members would shear off with the exertion of less energy than would be required to crush the end of the car body, thereby causing the vestibule to collapse, absorbing the shock and furnishing a cushion between the two car bodies proper. It is assumed that in case of a collision these would be the only parts seriously damaged, and the car could be repaired and replaced in service with a minimum of expense and delay. The entire collapsible vestibule, comprising the platform, vestibule and hood, is constructed as a unit, detachable and separate from the car body proper and can be applied after the car is built or in the alteration of cars already built and is equally applicable to cars of either steel or wood construction.

The object of the collapsible vestibule is, first, to protect the lives of the passengers and secondly to protect the body proper of the car from serious damage.

THE INTERSTATE COMMERCE COMMISSION.*

By James C. Jeffery.

In 1860, the population of the United States was roughly speaking, 30,000,000, and this population was served by 30,000 miles of railroad. At the close of the Civil War, that great region west of the Mississippi river was as yet untouched, and it was therefore, natural that the railway and financial pioneers of those days should turn their eyes to this virgin territory. In 1869, the first transcontinental line was completed, and by 1871, there were 60,000 miles of road in operation, which by 1888, had increased to 150,000 miles, and was serving a population of 60,000,000. In short, from 1860, to the time of the passage of the first Interstate Commerce Act, in 1887, the population of the United States had doubled, while the railroad mileage had increased fivefold.

The consuming population as well as the producing population of the United States was confined very largely to the regions lying east of the Mississippi, and north and south of the Ohio. These great rivers, with their tributaries, and with the coastwise lines of the Atlantic seaboard, afforded up to this time, almost a sufficient means of transportation to take care of the rapidly growing demands of the country, so that with this large increase in railroad mileage, the carriers by rail were compelled not only to meet the rates of their newly constructed competitors, but also to meet the rates of the long established water carriers, which may be said to have then been at the height of their efficiency. This sudden and enormous expansion in railroad mileage naturally carried with it disastrous effects. The railroad traffic men of the day sought tonnage rather than revenue, with the result that always comes from chasing this elusive rainbow, that is, receiverships. It is needless to say that this competition amongst the carriers was acute to a degree that we of today can scarcely appreciate. A published rate was almost unknown. One shipper had no idea what his competitor was paying, nor did a carrier have any idea what rate its competitor was making. Even rebates were unnecessary, and to put it mildly, the situation was intolerable. The public demanded a remedy, which was presented by Senator Edmunds, in the form of the act to regulate commerce, which was, after going through the various Senate and House committees, approved and passed February 4, 1887. The act was merely a statutory embodiment of what has always been the common law, but which common law had up to this time been rarely enforced, that is, that it is the duty of the common carrier to serve the public by charging not more than a reasonable rate; but furnishing equal service to all, without discrimination; and by giving to the public, adequate facilities. Today, the Interstate Commerce Act, with its various amendments and supplements, seeks but to do these three things.

The act of 1887 failed to accomplish these purposes for the reason that although the five members of the then Interstate Commerce Commission were capable and zealous, yet the inherent weakness was that the congressional act creating it, failed to give the tribunal sufficient power to cure the evils contemplated. Various amendments were made of relatively small importance, until 1906—but in that year the Interstate Commerce Commission was truly vitalized, and in a simple way. Up to 1906, the commission was compelled to go to

*Abstract of an address at the annual banquet of the Transportation Club of Detroit, on February 8, 1913.

court to enforce its own orders. after 1906, a carrier was compelled to go to court, if the orders of the commission were not to be enforced. And at this time, too, the number of the commissioners was increased from 5 to 7. There were numerous changes, and amendments, other than the one referred to, but there can be little doubt that this shifting of the burden of going to court was the revolutionary one. The Mann-Elkins amendment of 1910 made another fundamental change in giving to the commission the right to suspend any new tariff or rate promulgated by the carriers, and the commission under this amendment claims the right to suspend even a reduction in rate, where it thinks such reduction would work a discrimination.

The cumulative effects of the original Interstate Commerce Act, the amendments of 1906 and 1910, together with the United States Supreme Court decisions construing the act, have vested a vaster power in this judico-legislative tribunal of seven men than is known elsewhere in the civilized globe.

While it may be too soon as yet to judge what the ultimate effect of the concentration of this vast power in the hands of these few men will be, still there are certain results that everyone must admit have been gained; a greater stability of rates, which in itself makes the means of transportation more useful, more economical to the shipper; the substitution of a natural and legal competition between the carriers themselves, for an unnatural and illegal competition, and last and perhaps greatest, gentlemen, it has inculcated in the minds of all of us, whether shipper or carrier, a greater respect for the laws on the federal statute books.

The question today has ceased to be, "Will you have an Interstate Commerce Commission of greater or less power?" but is, on the other hand, "Will you have an all powerful commission, or will you have a government ownership of your public utilities, engaged in interstate commerce?" And the day you decide upon government ownership, you have sown the wind from which you shall reap the whirlwind—you have sown the seeds of destruction of our republican form of government, though, the end may be one or three centuries away. Let me paint you a picture. Some future demagogic president of the United States, drunk with ambition to succeed himself; a political machine composed of 3,000,000 to 5,000,000 government-owned railroad employees; the support of capitalistic interests that would come with the disposition in the hands of such a president, of $5,000,000,000 annual income of these railroads. With these tools your demagogic president would become dictator over an empire vaster than Caesar in his proudest moment ever dreamed of.

Industrial traffic men and railroad traffic men have educated this Interstate Commerce Commission to a degree where it is no longer satisfied with the glittering generalities of 20 years ago; where you may no longer speak to it in general terms of economic demands, water competition, and cost of construction. You have educated it to the stage where you must get down to detail; where you must show an actual direct discrimination if you allege it; where you must demonstrate real reasons for your contentions and not endeavor to shroud your position in a mysterious veil of facts and figures that fool neither yourselves, your opponents, nor the tribunal to whom they are presented.

I ask you to pray with me, that the future Interstate Commerce Commissions of the United States may be constituted of the same capable, fearless, incorruptible types of our American manhood that compose it today. The commercial prosperity of the nation depends in no small degree upon this.

New Undertaking of the German Railway Union.—The German Railway Union has appropriated $7,140 for the preparation and publication of a history of locomotive construction, and has engaged a well known Austrian engineer, Dr. Sanzin, to prepare it. It is to be completed within four years.

THE MANAGERS' AND FIREMEN'S BRIEFS.

Final briefs were submitted on Friday, April 11, to the arbitration committee, which has been hearing the firemen's demand for higher wages. The brief of the firemen laid special emphasis on the request for uniformity of wages and conditions on the 52 eastern roads, which are parties to the arbitration proceedings. The firemen point out that in the present arbitration, the board has been unable to determine what has been the increase in wages even on any one railroad, and claim that if for nothing else uniform conditions and wages should be put in force, so that in a future proceeding, similar to the present one, a basis of comparison will be available. Uniformity in rates and rules are necessary and desirable in other industries as evidenced by the peace, contentment and profit that prevail in the mining industry, where uniform rates and rules are in effect, as compared with the instability of prices, discriminations and abuse, and the continuous unrest of employees where uniformity does not prevail. The firemen's brief goes on to say that the industrial advantages of uniform wages and conditions are proven in the printing and building trades, in contrast with the steel and textile trades where ignorance and misery are the standards of labor as shown by the reports on the Lawrence strike.

"Uniformity of rates is the privilege of the railroads, a privilege guaranteed the railroads by federal legislation . . . and by the regulations promulgated by the Interstate Commerce Commission, requiring of one railroad only that which is required of all, thus placing all on an equality under the law.

"Uniformity in rates and rules should not be influenced by the relative wealth of railroads, because in no other trade or industry does the wealth of the employer fix the wage of the employee. The difference in the bank accounts of an employing printer or builder in no way influences the wage of the journeyman printer, the carpenter or brick-layer. The less prosperous railroads profit as greatly by the labors of the locomotive fireman or hostler as do the wealthiest railroad corporations. The productive efficiency of the locomotive firemen is as great on one railroad as another where the same class and weight of locomotive is used, and the financial returns to a less prosperous railroad from a fireman's labor on the same class of locomotive, is sometimes greater than to the more prosperous railroads, because of higher local freight rates." The brief explains that the firemen are not asking for standardization of wages, but are practically asking for a species of piece-work wage, where the fireman is paid more or less in accordance with what he earns for the railroad company. A lower rate is asked for on locomotives where the fireman produces less profit for the railroad.

THE MANAGERS' BRIEF.

The brief for the railroads was submitted by Elisha Lee, chairman of the committee of managers:

In the original demands made upon the railroads the firemen asked that any increase in wages or changes in working conditions secured in this movement be made effective as of July 1, 1912. In answer to this, the chairman of the railroads' committee says that section IV of the Erdman act provides that the award, having been filed in the clerk's office of the circuit court, shall go into effect at the expiration of ten days from such filing.

Both the firemen and the railroads are on record as desiring to invoke all of the provisions of the Erdman act, and to submit themselves unreservedly to its treatment. The railroads now claim that the impossibility of making the award retroactive is determined by the law.

The railroads have taken strong exception to the demands of the firemen that "rates of wages that are higher and conditions of employment that are better than those asked for in the present movement shall remain in effect."

"There can be no justice in retaining 'high spots' unless the board also allows the 'low spots' to remain.

"As long as these conditions exist the labor organizations will continue to formulate extravagant and unwarranted demands,

knowing full well that to them there can be no loss, but on the contrary the chances of gaining something more without jeopardizing any advantage already enjoyed, is an incentive for renewed and continued efforts for adjustments in rates and working conditions."

Mr. Lee then points out that a comparison of the amount of work performed by firemen in 1902 and 1912, and the amount of wages paid to firemen in those years, shows that a fireman's pay has increased in that period more than the amount of his work. The roads also contend that nothing has taken place since the adjustment of pay in 1910 (which was satisfactory to the firemen) to necessitate any further increase, or the establishment of a minimum day's pay for this territory.

In answer to the demand of the firemen that a second man be placed on all engines in through freight service weighing 200,000 pounds or over on the drivers, Mr. Lee says that "the weight on drivers is not a governing factor in itself of the work required of firemen." He claims that the question of giving assistance to the firemen can only be properly disposed of by a study of all facts and conditions surrounding the work of the firemen. He says that great improvements to the engines—which are now being rapidly added to the larger locomotives—are reducing the fuel handled by a fireman to a marked extent, and thus the necessity for either a second fireman or further assistance is diminishing rather than increasing.

More attention is devoted to the demand of the fireman that two men be placed on certain locomotives than any of the other articles under arbitration. The railroads still contend—the following was strongly opposed by the firemen in the open hearings before the arbitration commission—that where conditions warrant giving assistance to the fireman it is proper to use the extra brakeman required by the so-called "Full Crew" laws. Mr. Lee says the Pennsylvania Railroad is doing this now. This extra brakeman, he says, has been forced upon the railroads and as he usually rides in the engine, with no work to do, the railroads have a perfect right to have him assist the fireman or perform any other work that may be necessary to successful operation.

In general, the railroads hold that, owing to the many conditions affecting the work of the firemen, each run or set of runs on the several roads, and divisions of those roads, should be treated independently in considering the question of assistance for firemen.

The firemen, in their original demands asked for standardization of wages and working conditions in the Eastern District, but excepted from this demand for standardization, higher rates of pay and better working conditions than those asked for. The railroads claim that standardization is not only wrong, but in some instances absolutely unjust, because: It fails to recognize dissimilar physical characteristics on different parts of the same road. It fails to consider the varied traffic conditions represented by volume of business on different roads or parts of the same road. It fails to recognize the differences in wages paid labor in other employments in different localities embraced within the limits of the district covered by the lines involved. It fails to recognize that a wage scale should at least bear some relation to the ability of the road to pay, as may be reflected in the earnings, which factor more or less reflects the character of the service required of the employee. Standardization is inconsistent with Article 9 of the Firemen's Demands, to the effect that existing rates of compensation that are higher and better working conditions shall not be disturbed.

As proof of this Mr. Lee quotes President Carter of the firemen's organization, who said:

"I will confess that on some roads it is not as hard to fire as on other roads, because of the character of the track and the character of the machine."

In summing up the brief says that "to grant the firemen their demand for annual increases to pay of 35.5 per cent would have a direct and undoubtedly irresistible influence toward bringing about large additional increases in other classes of railroad employees." In this connection attention is called to the recent history of wage demands in the eastern territory.

"Early in the year 1910 the conductors and trainmen made certain demands for increased wages, which were finally disposed of by granting adjustments covering a large part of the territory, either through mediation, arbitration, mutual understandings, or a general advance. Later, the firemen received like adjustments, and still later the engineers' wages were also adjusted.

"In the early summer of 1912 the engineers again made further demands, which were finally arbitrated, when they were granted certain increases throughout the territory. Now the firemen are here again, and the conductors and trainmen have already made further demands, and are now urging the railroads for prompt action. How long such demands, which up to the present time always have resulted in additional burdens on the finances of the railroads, can continue without impairing the credit of the railroads depends very largely on the decision in the case of the firemen."

GREATER EFFICIENCY IN SAFETY WORK.

By George Bradshaw.*

Much has been deserved and much said in praise of the "Safety First Movement." In principle the movement is sound and it has passed the experimental stage. In fact, so much intrinsic merit does it possess that, though it has been tested only in a loose and imperfect manner, most favorable results have been obtained. On some roads the personal injury record has been reduced 10, 20, 30 and even 40 per cent. For this, railroad officers and employees are entitled to much credit; but they will not be entitled to the greatest commendation till they have succeeded in preventing the very highest percentage of accidents that can reasonably be prevented—and 40 per cent. is not the highest. We must not be content with half a loaf.

The favorable results obtained under present methods which, I repeat, are loose and imperfect, are due in no small degree to the interest that always attaches to a new proposition. That interest, in the case of "Safety First," has extended to enthusiasm because of the high and noble sentiments to which the work of accident prevention appeals. But the time will come, perhaps is now appearing, when the novelty of the thing will wear off. It will then be a routine matter of operation and we shall have to depend for results upon correct principles and efficient methods of organization.

I believe it is entirely practicable to reduce the personal injury record 75 per cent. How? By simply applying and carrying out the safety first idea to its logical extent. Do not get the impression that I am about to launch into a description of some gloriously ideal state. Enthusiastic as we may become in our efforts to prevent injuries, we must always bear in mind that we "have got to run the road" and that safety must be wedged in with efficiency of operation. It cannot be allowed to crowd it out.

A Department of Safety.

There should be created on every road having any considerable mileage, a safety department, in charge of a man specially qualified for the work, who should have the title, pay and authority of vice president, and be responsible only to the president. Considered either from an economic or a humane standpoint, there is no position more entitled to such confidence and reward. Safety is not and will not really be first until some president makes it so by placing the work of accident prevention upon the high plane its importance justifies. "Safety First" was started at the bottom, and its full force has not yet reached the top. The president who first in truth and in fact really establishes safety first on his line will become known both as a benefactor and a breaker of records in reducing operating expenses.

*Safety Engineer, Railroad and Industrial Corporations, Highland, N. Y.

Complaint is made—and justly made—against drastic legislation, some of which—as for instance, the recent full crew acts—is little short of an outrage. But is not this about the logic of the situation? The record shows a high percentage of accidents which, from an operating standpoint, it is reasonable and practicable to prevent. That much must be admitted, and the fact that we have prevented a fair ratio of accidents can not be pleaded as a justification for not preventing all that should reasonably be prevented. Rather do the results obtained serve to turn the spot light on the greater results possible to obtain. One thing is certain, preventable accidents must be prevented. Public opinion—the court of last resort—has entered this decree. Are they going to be prevented as the result of legislation or by the voluntary effort of railroad officers? One or the other. Legislators, generally speaking, are making an honest effort to solve the problem. The trouble is they don't know how to solve it. Railroad officers know how to solve it, but they are not doing it. Some, it is true, have made an excellent beginning, but none have gone far enough and some of the largest systems, in spite of all the demonstrated merit of the safety first campaign, have done practically nothing. The public is apt to classify all the roads with those which are conspicuous by what they have not done.

The vice-president in charge of safety should have authority over all departments in matters pertaining to safety. It may perhaps be objected that this would interfere with departmental affairs; but let us face the situation squarely. Departmental affairs need interfering with to such reasonable extent as may be necessary to prevent preventable injuries; because it is these same "departmental affairs" that are responsible for the record of one employee injured every four minutes and one killed every two hours and forty minutes from one end of the year to the other, not to mention passengers, trespassers and others. Besides, these affairs are being most seriously interfered with, right now, and that by a class of men who do not know what they are doing, but who are no less determined to do something—our friends, the legislators. Would it not be better to have them interfered with by one of our own number who understands the problem?

But such organization would not interfere to any undesirable extent in matters affecting output or efficiency of operation. Note the qualifying clause: *in matters pertaining to safety.* These are mostly details and for that reason are overlooked by the heads of departments, who are kept too busy with problems of efficiency to give serious and prolonged attention to matters relating solely to safety. For example, 40 to 50 per cent. of the injuries received by shop employees are eye injuries caused by flying sparks, dust, metal chips, etc. That record has been going on for years. No superintendent of motive power ever did anything to prevent, or perhaps ever gave a serious thought to any systematic means of preventing this class of injuries until a "safety man" found that they could be almost entirely prevented by the simple means of wearing proper goggles. Now, the wearing of goggles is solely a matter of safety, separate and apart from efficiency, and all such matters should be decided directly and finally by the officer in charge of the safety department.

The trouble at present with the safety first campaign is that it is wholly an easy-going scheme of co-operation. But co-operation is not a universal virtue. Even if every one were disposed to co-operate, much valuable time and energy are wasted in enlightening and convincing every member of the compact to the co-operating point. One man—the right kind of man—should be given authority and held responsible for the prevention of injuries. Of course, this power in the hands of the wrong kind of man might cause trouble, but the same is true of power vested in the head of any department.

Of course, the general manager is supposed to see accident reports and to apply preventive measures. But, as a rule, he never sees reports of other than the most serious cases. The daily grind of accident reports which make the big total at the end of the year and which present the serious problem for consideration in any systematic plan for accident prevention, he never sees except through the seasoned judgment of a fifteen dollar-a-week clerk. True, such reports are referred by the clerk to the heads of the various departments. That is just where they should not be referred, because the head of a department where an accident occurs is responsible actually or technically, for the accident in the first place, and we should not expect him to sit in judgment on his own cause and give a fair trial. Even if this were not true, the limit placed upon him in incurring expense is an insurmountable obstacle to his efforts. If the superintendent of motive power has to be everlastingly pleading for appropriations sufficient to keep engines in running condition, he is not going to borrow trouble by asking for funds to construct safeguards. If the chief engineer is allowed barely enough help to keep the track in such condition that the cars will stay between the engine and caboose, it is safe to say that his forces will not be worked overtime cleaning up yards of rubbish or in removing dangerous side and overhead obstructions. They simply do what any one would do under the circumstances—"keep in the clear" from the man above and take chances of accidents occurring. I am now referring, not to collisions, wrecks and derailments, but to the ordinary every-day accident occurring here, there and yonder every hour of the day and night.

THE CENTRAL OR GENERAL SAFETY COMMITTEE.

The division and shop safety committees, composed of officers and employees, afford a most practicable means of conducting safety work, but, in my opinion, the committee idea should not be carried beyond divisions and shops. The central or general safety committee is a cumbersome and ill fitting wheel in the safety machine and should be taken out. Such committee has no authority and no responsibility. Every subject for its consideration must be handled in one of two ways. It must be referred to the member to whose department it relates and his opinion concurred in by the other members, in which case there is no advantage in having a committee decision, or it must be decided by vote of the various members, each guided by his own judgment, which results in the head of one department, as a member of the committee, determining action upon matters within another department. The principle is wrong whichever way you apply it. Of course, such a committee generates a certain amount of interest in accident prevention and fosters a spirit of co-operation. It serves to keep alive—sometimes barely alive—on the altar the sacred fire of safety. But this article relates to *greater efficiency* in safety work.

THE NEED.

The need is for a practical and easy working method of getting results. The greatest obstacle in the promotion of safety has always been departmental restrictions, and the central safety committee simply adds another obstacle. From its very nature, it is a machine of deliberation and delay. What is needed is action. The problem is not complicated. Let me illustrate. The roof of a roundhouse becomes weakened and is in need of braces and supports to keep it from falling. The foreman reports the condition to the master mechanic, he to the division superintendent, who directs the division engineer to give the matter the necessary attention. The latter investigates and reports that the cost of repairs will require special authority. The ball of red tape is then unwound till it reaches headquarters, 500 or 1,000 miles away, where it is strung in, out and around two or three offices, and in six months it gets back to that particular roundhouse, provided the tape doesn't get broken and the ends lost. This was an actual case; and what really happened was that the roof fell in and injured two men while departmental routine was being observed to the extent necessary to get the carpenters at work. I do not contend that the roundhouse foreman should have arranged directly for the repairs (except in a case of great emergency), but if there had been on that road a vice-president in charge of safety to whom the roundhouse foreman could have reported the condition by wire, that officer would have directed the head of the proper department to make the repairs at once, and they would have been made. Two personal injuries would

not have occurred and it *would not have cost any more* to make the actual repairs through this channel than to make them by the more circuitous route.

From the standpoint of efficient work in preventing accidents, the trouble with existing methods is this: The men who have authority to "do things" are too far from the scene of action, and have too many other and more pressing duties. The men who are "on the ground" are not vested with authority, and when it comes to getting authority (for safety purposes) there are too many references, too much circumlocution and too many obstacles.

The "Safety First Movement" is a beacon light leading to the haven of safety. But its rays come to us over a broad expanse of troubled waters beneath whose surface there are rocks and shoals to be avoided. While we are on a good ship it must be remembered that she will not steer herself.

PICKED UP ON THE ROAD.

By Gulf.

Certainly the superintendent who tries to get his trains over the road on time is up against it hard when he encounters the indifference of his men. Where discipline is lax or impossible to maintain, the men dawdle in their work and the maintenance of the schedule is out of the question. To point the statement I was on a local the other day that was scheduled at 26½ miles an hour, with stops every 3 miles. It carried express matter for small villages averaging eight or ten packages for each stop. Yet on that schedule the train lost 18 minutes in 45 miles, simply because of the long station delays. The expressmen handled their freight with the deliberation of government employees. They gossiped and used up the seconds faster than the enginemen could make them up. They knew that the train was late, delayed by them and by others of their kind and by other trains in the opposite direction that had probably been held up in the same way. A little hustle, a little springing to the work, a little interest in the reputation of their road, would have kept that train on time over the whole run, and saved a corresponding amount of despatcher work. But how to get that hustle, that springing, that interest; ah, that is the question that involves the effort that must be constant, personal and unremitting.

* * * * *

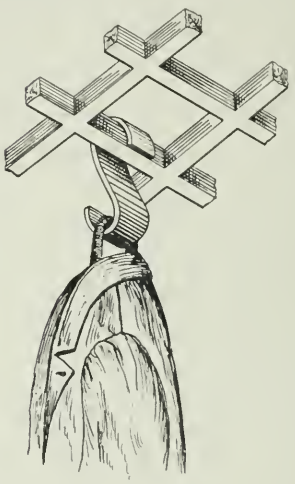
Does it just happen so, or is it the rule? I mean about library and observation cars. Why does it happen that they are not only the worst riding cars on the train, but that their riding qualities are so decidedly bad that one can only read in them at the sacrifice of comfort and eyesight. It would seem that of all cars, especial care should be taken to have these ride easily and without the jar that is warranted to ruin the best of eyesights in the briefest of times. Again, I would like to ask, is it the location on the train that produces the effect? Is it the weight of the car? Has it just happened so with me, or is it just pure carelessness on the part of the builders or designers?

* * * * *

I know of a road that has a line that ought to be a heavy travel route, between large centers of industry, but it isn't. Its cars are well equipped and comfortable, barring the parcel rack which lacks just an inch of being what it ought to be. The reason why it is not a great route is due probably to the fact that its time table and train performances do not agree. There are other competitive routes, so I never travel that way if I can avoid it. That there must be thousands of others like me, there is no doubt, for I can count personal acquaintances by the score that feel and act as I do. I recently made a hundred and fifty mile trip, in spite of myself, and shared with two others a new, freshly carpeted, gas lighted car. Our combined fares would hardly have paid for the light, heat and lubrication, to say nothing of the power to haul the car. Now the foolishness of this, as it seems to me, lies in the ostrich-like hiding of the head, and thinking that it pays to publish a fast schedule that cannot be run. If the managers of that road would be honest with themselves, and simply open out their schedule, and make it what they can run by, the added income would more than pay for the balm for their dethroned pride in their fast traffic that exists only on paper.

* * * * *

I have taken occasion from time to time to comment on the insufficiency of many of the parcel racks in coaches and have suggested that the long rack introduced many years ago on the New Haven about filled the bill for convenience and comfort. But it never occurred to me that it was necessary to read a lecture on the necessity of making it strong enough to carry its load. It seems, however, that such is the case. I traveled in a car the other day in which the racks were all right in appearance, but no one was allowed to put a dress suit case in them lest they break down. There were thirteen other passengers and the rack contained six hats, a lady's jacket and a small parcel; while on the floor jammed in between the chairs and the windows, were ten dress suit cases. The question is, if you are going to have a rack why not make it strong enough to do its work? There are also some cars with racks not only too weak to hold the dress suit case, but with no hook for the coat. This latter inconvenience can be remedied by carrying an ordinary picture hook, such as goes over mouldings, and catching one hook in the grid of the bottom of the rack, while the other will serve to take the loop in the collar of the coat.



Coat Hanger.

AXLE LIGHTING EQUIPMENT.

A new axle lighting outfit involving a number of radical departures has been developed by the Electric Storage Battery Company, of Philadelphia, Pa. The dynamo is of the Rosenberg type which has been extensively used abroad, modified, however, to give constant voltage characteristic rather than constant current. The field excitation is controlled by a Wheatstone bridge combination of circuits without any moving parts or contacts. The inherent characteristic of the Rosenberg type of machine, which gives the same polarity for either direction of rotation, eliminates the necessity for any pole changer. The variation in voltage is reduced to narrow limits and no lamp regulator is required. The system adjusts itself automatically to different conditions of load produced by variations of schedule or by change of season, so that no manual adjustment is required to meet these different service conditions. At the same time useless overcharge of the battery is eliminated, establishing conditions favorable to long battery life. The Atchison, Topeka & Santa Fe, after a test of this system, has ordered 62 sets. The equipment which was tested has now made over 60,000 miles without a failure.

Maintenance of Way Section.

THE word "efficiency" has been much misused and made to cover many theories within the past two or three years. Nevertheless it expresses a condition toward which all enterprising and ambitious railway officers are striving. In the bridge, building and water service departments, excellent opportunities are afforded for those in charge to make very favorable showings. The labor employed is of a higher standard than in other branches of the maintenance department, the work is scattered over a wider area, and the variety of duties is greater. All of these conditions afford opportunity for the economical handling of forces and the development of special methods. The routine repair and renewal of bridges under traffic introduces one type of problems, while the construction of a new bridge presents others of a somewhat different nature. The building or repair of station or yard buildings gives rise to still another class of problems. The installation and maintenance of water stations is a smaller but nevertheless important field, where efficient methods are to be found to as great an extent as in any other department. These indicate a few of the numerous fields covered in the next contest on "Efficient Methods in the Bridge, Building and Water Service Departments," which closes April 25. Contributions describing the organization, distribution and management of regular and extra gangs, special methods or kinks developed in the construction or repair of any structures, and, in fact, any means tending to promote efficiency in these departments will come within the limits of the contest, including, as it does, all work ordinarily coming under any of these departments. Special attention will be given by the judges to data regarding the actual results secured by the means described, so that all information of this nature should be included. Prizes of $25 and $15 will be paid for the two best contributions, while our space rates will be paid for all others accepted and published. All contributions should be sent to the Civil Engineering Editor of the *Railway Age Gazette,* Transportation Building, Chicago, and must be received before April 25 to be considered in the award.

THE lack of definite information regarding the service obtained from the various materials and tools used in maintenance work is often a serious handicap when ordering additional supplies. On many roads little attempt is made to collect such data unless it refers to some new device which is being tried out experimentally. Much of the material used today is to a large degree standard, and is made by a number of firms. In such instances the quality and the price are the two things to be considered. Where the quality is the same, the price will, of course, determine where the purchase shall be made, but very frequently the materials vary in quality, and then comparative data regarding service is of much assistance in deciding intelligently which material is the most economical to purchase. Generally this data is not available, and as a result the material which is cheapest in first cost often is bought, even though it may be more expensive in the end, because the officer doing the buying knows that he cannot intelligently defend the purchase of the higher priced product even though he may be convinced in his own mind that it is the cheaper. It is for this reason that the manufacturers so often complain that little but first cost is considered by railways. The supervisor to whom the materials are furnished takes little interest in their relative service. He, or his superiors, may watch the results in a general way and draw their own conclusions, which may, or may not, be shown to be correct when analyzed with the actual data. Service statistics can be readily collected if the higher officers make it a point to gather this information and impress its value upon their subordinates. The collection of such data need not extend over the entire system, but if several of the more progressive supervisors are selected who will watch the results fairly and with interest, the sum of their observations will be fairly close to the truth. With such data at hand the officer specifying the material, whether he be the engineer maintenance of way or the purchasing agent, can select it to better advantage and know that he is getting the best for the money.

THE building of a hump yard with a capacity of 6,000 cars and provision for increasing this to 12,000, is an indication of the favor with which this type of yard construction is looked upon by the Canadian Pacific. The operation of hump yards is not an experiment on this road, as one has been in service for a number of years in the city of Winnipeg and a smaller yard in Fort William was rebuilt for classification by gravity in 1911. While hump yards in this country have been almost confined to a few large companies, of which the Pennsylvania Railroad is notable, in recent years numerous smaller yards have been built, such as the Centralia yard of the Illinois Central, the Mannheim yard of the Chicago, Milwaukee & St. Paul, the Silver Grove yard of the Chesapeake & Ohio, and the Louisville yard of the Kentucky & Indiana Terminal. The question of the relative economy of hump yards and flat yards is by no means finally settled in favor of the former, however, as is shown by the recent construction of the Proviso yard of the Chicago & North Western as a flat yard having a capacity of 6,000 cars. The construction of the Clearing yard near Chicago for interchange between roads entering from the east, south and west, has apparently been justified by the decision to operate this yard and the work which has been started on its reconstruction and enlargement (see *Railway Age Gazette* of March 21, 1913). This yard is unusual not only because it will be, so far as is known, the largest hump yard in existence, having a capacity of 12,000 cars, but also because of the number of tracks over the hump. Even the largest hump yards have been built heretofore with a single track over the hump, but at Clearing four tracks are operated over the single hump, two in each direction. The two yards at Winnipeg are probably the most northerly hump yards in service, making the conditions for the successful operation of this type of construction particularly adverse. From the hump grades adopted, however, the weather in this locality during the winter months apparently has little more effect on the operation than that in our northern states. The accelerating grade on the hump in the old yard at Winnipeg was 3.7 per cent. for a horizontal distance of 300 feet. This grade has been increased since the construction of the yard and the operating department still reports that under some conditions it is not steep enough. The grade adopted for the new yard is 4 per cent. for a horizontal distance of 75 ft.

THE importance of the careful classification and distribution of second hand rail in the economical prosecution of maintenance work is not always realized. It too frequently happens, as pointed out elsewhere in this issue, that the higher officers confine their attention to the manufacture and inspection of the rail up to the time it is received, and then leave it to the care of subordinate officers. While the careful study of the manufacture of rail is vitally important and worthy of all the attention given it, the possibilities for economy or confusion in the handling of relaying rail would seem to justify the careful supervision of some person having jurisdiction over the entire system. The uniform classification of rail released from main tracks is essential so that an officer making a requisition for rail of a certain grade for a definite purpose may know that he will receive rail suited to his needs. On some roads where the classification of released rail is left to the individual roadmasters there are al-

most as many different standards of classification as there are roadmasters. Under such conditions rail may be shipped to work which is entirely unfit for the purpose desired, resulting in delay and expense, or the material may be better than actually required, and if used deprive some other work of the material. Equally important with the uniform classification of material is the careful arrangement of a schedule of relaying operations so that the work may proceed smoothly from main line to secondary line and then to branch line, without delay either to men or material. Obviously, rail cannot be laid on branch lines until it is released from main lines, and any delay in laying new rail on the main lines will affect the operations of the entire season. Likewise, if rail is not used promptly after release, the work on the branch lines will be carried unnecessarily late into the fall, thereby delaying ballasting and other operations on these lines. The proper time to remove rail from the main line to secure its greatest total service is another point to be considered. On most roads with a large proportion of branch line mileage it is not advisable to allow rail to remain in the main line until it is unfit for further service. Indeed, not infrequently the demands for rail for branch line use govern relaying operations on the main line. Closely allied with the handling of rail is the gradual elimination of odd sections. Most roads in this country have absorbed at one time or another numerous small roads, and in this way have come into possession of a varied assortment of rail sections. Obviously, these sections must be continued in use until the material is ready for the scrap pile. While all new material is bought to the prevailing standards of the system fastenings, switches, etc., must still be kept in stock for all the various sections as long as they are used. While the difficulties incident to this condition can be minimized by confining the various odd patterns to certain divisions, they can only gradually be entirely eliminated. Thus, while the entire subject is largely one of details, these details are important, and if proper attention is given to them important economies can be effected.

THE VALUE OF A PROGRAM OF WORK.

THERE is no branch of the railway service in which the value of a systematic program of work is greater than in the maintenance of way department. While the duties in many other departments are largely the same from month to month, in the maintenance department, from its very nature, certain work can be done to the best advantage at certain definite times of the year, and if it is not done, not only is it not done as well as it could be, but the schedule of all following work is deranged.

The year's work in the maintenance department really begins with the opening of spring, and therefore spring should be the starting point of a schedule or program. While realizing the value of such a program in the abstract, many supervisors and other officers in direct charge of maintenance fail to definitely apply the principle of it to their own duties. On nearly all roads the budget of expenditures has now been decided on and the local officers know the amount of work they will be called upon to do during the year. If a schedule is arranged immediately upon receipt of the budget, material can at once be ordered to be delivered at the various places on definite dates determined on in such a way that the forces can proceed from one piece of work to another with the minimum delay. By keeping his program clearly before him, the supervisor can transfer his forces from place to place with little loss of time in moving.

One disadvantage of not providing a supervisor with statements of the cost of his work from day to day is that he does not then realize the amount of the unproductive time for which the company pays and therefore does not realize the importance of keeping this to a minimum. An advantage of a systematic program of work which is intangible but nevertheless important, is the effect upon the foreman and men. Nothing tends to break the spirit of a foreman in his work more than to be transferred from point to point at the will of the supervisor to the detriment of his efficiency. The efficient supervisor will not only arrange the general details of the work for his foremen to the best advantage, but will encourage the individual foreman to do the same thing within his gang. The average section or extra gang suffers a great deal of lost motion which can be converted into productive effort under the proper supervision. The poorer the class of labor employed, the greater becomes the necessity of guarding against such lost motion. By outlining his work with the foreman the supervisor can encourage him to feel his responsibility.

Another phase of the subject which promises to become very important this year is the necessity of securing the most from the labor, for the supply bids fair to be considerably below the demand. In former years when labor was more plentiful it was possible for a road to neglect its work in the early part of the season and make up for the delay by putting on larger forces later. The experience of last year indicates that in future work left undone in the spring will either remain undone or will interfere with other work. As important as a definite program has been in the past, it is becoming a necessity under present conditions. A supervisor can ill afford to allow the time of his men to be consumed unproductively when he probably will not have enough of them in any event to do all that is necessary.

THE LESSONS OF THE RECENT FLOODS.

THE floods of the past three weeks in Indiana, Ohio and neighboring states have commanded the attention of the people of the entire country, but their significance to the railways in the territory affected has not been realized by the public. The immediate effect has been to make it necessary to concentrate all the resources of these roads in the way of construction materials, equipment and labor, in the flooded districts to restore the tracks as rapidly as possible. The second effect has been to place a very heavy financial burden on the railways in question, the loss to them in property only in the state of Ohio alone being estimated, after a careful inspection, at $10,000,000.

The promptness with which the railways have met the emergency is best evidenced by the fact that in spite of the great damage done the main lines were in most cases reopened for service within a few days and nearly all tracks were reopened within two weeks. This has required the prompt assembling of thousands of men from a wide area, the gathering of hundreds of car loads of piling and other bridge timber, stone and other filling material, etc., and the collection of many pile drivers, derricks and other equipment with their crews. The mobilization of these forces, which were brought together hurriedly, without any warning or preparation, into a working organization, has called for a high degree of ability and efficiency. Nor is the experience of the past few weeks exceptional, for other emergencies have been dealt with as skilfully by the railways. Our readers are familiar with the situation that developed in southern California a few years ago when, after all other resources had failed, the Southern Pacific successfully took charge of the problem of returning the Colorado river to its proper channel after it had flowed for some time into the Imperial valley and threatened the destruction of the entire valley. A more recent instance of the same nature is that of the closing of the crevasse in the levee at Beulah, Miss., within the past few weeks. After unsuccessfully attempting to return the flood waters to their proper channel, the government called for the assistance of the Illinois Central. This road placed its construction equipment and men at the service of the government with the result that this crevasse now bids fair to be permanently closed.

Obviously the financial loss suffered by the railways in such disasters must be made good from their earnings. Within recent years the tendency has been to greatly curtail earnings and, as a result, when such unusual conditions develop, the money intended for improvements must be diverted and used to tide over the emergencies. President Willard of the Baltimore & Ohio is

quoted as saying that it will be necessary to use a very large part of all the funds intended for betterment work on that system this year in the reconstruction of its damaged lines. The loss suffered by the roads is not confined to the actual damage to their property, but an even larger loss results from their inability to handle traffic while their tracks are out of service, and also from the decreased business, originating within the flooded territory for several months. In considering how much railways should be allowed to earn the public and public authorities are apt to overlook emergencies such as these which come at irregular intervals, but which must nevertheless be provided against.

The ultimate effect of such a policy of regulation as is now being followed is to force the weaker roads into the hands of receivers when such disasters occur. Several receiverships during 1912, for example, were in a large measure brought about by the severe weather of the winter of 1911-12. It is to be hoped that the heavy damages incurred by the roads in the recent floods will impress upon those having to do with the regulation of railways the necessity of allowing the roads to earn enough to enable them to accumulate funds to tide them over emergencies, which always have come, and which always will come.

NEW BOOKS.

Proceedings of the American Railway Bridge & Building Association. Paper bound, 6 1/4 x 9 in., 330 pages. Published by the American Railway Bridge & Building Association, 226 W. Jackson Boulevard, Chicago. Price, $1.

This volume contains the proceedings of the twenty-second annual convention of this important railway organization, held at Baltimore, Md., October 15-17, 1912. It contains the reports of eight committees on the following subjects: Fire resisting paint; derricks and other appliances for handling material in supply yards; concrete tanks; stand pipes and reservoirs; reinforced concrete culvert pipe; the construction and maintenance of long pipe lines for water supply, intakes, pump pits, reservoirs, etc.; turntables; painting of structural iron or steel for both bridges and buildings, and relative merits of brick and concrete in railway buildings and platforms. The discussions of the various reports appear in full with the reports. The reports included in these proceedings are among the most valuable ever presented before the association, those on concrete tanks, reinforced concrete culvert pipe and turntables being especially good. The report on turntables is one of the most complete discussions of this subject which have been prepared, and there has been a wide demand for it in advance of the publication of the proceedings. Dealing with subjects of particular importance to the railway officer having in charge the supervision of bridges and other structures, these proceedings will prove a valuable reference book for those directly in charge of such departments.

Earthwork Haul and Overhaul. By J. C. L. Fish, Professor of Railroad Engineering, Leland Stanford University. Size 6 in. x 9 in., 165 pages, 66 illustrations, cloth binding. Published by John Wiley & Sons, New York City. Price $1.50.

The author of "Earthwork Haul and Overhaul," has had in mind, in the preparation of the book, a number of different classes of readers, including railway engineers, contractors, computers, teachers and students. The material is divided into two parts, the first including seven chapters, covering such subjects as the mass curve, computation of the center of mass, overhaul, free-haul and crosshaul, and the computation of overhaul by eight methods for two different cases. Part II is devoted to "The Economic Distribution of Material Along the Profile," and discusses at length the economic balancing line for mass curves. An incidental feature of the book which has merit is the brief statement at the head of each chapter as to the contents of that chapter, enabling the reader to locate rapidly the material in which he is interested.

Letters to the Editor.

PLACING STONE BALLAST IN ONE LIFT.

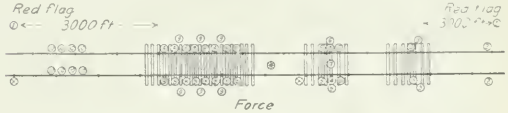
Brewster, N. Y., March 1, 1913.

To the Editor of the Railway Age Gazette:

The method which I have used when making a raise of from 10 to 12 in. in one lift, with stone ballast, was described in the *Railway Age Gazette* of May 17, 1912. Since the publication of this article I have received many inquiries regarding this method and desire to bring out a few points which may not have been made sufficiently plain in the article referred to.

The purposes of the system outlined are, first: to haul and unload the stone so that it will be put under the track the day on which it is received and unloaded; second, to distribute the men in the gang in such a way as to check their work, and, third, to keep the track in such line and level at all times that slow orders will not be necessary. While the cost of train service in order to arrange the work in this manner may be a little above the ordinary charges, this is more than regained by savings made by the track gangs.

Assuming that one mile of track is dug out by the stone ballast gang, the gravel being removed from between the ties to within 2 in. of the bottom, the track thus skeletonized, but not otherwise disturbed, is perfectly safe. A tie gang follows this skeletoning gang, renewing any defective ties, putting on



No. 1 Flagmen	No. 8 Tampers with spades

Number of men 48	Total force 51

Distribution of Ballast Gang.

tie plates and regaging the track. As soon as enough track is thus prepared a train of stone is unloaded in quantities sufficient to raise the track the full height. This can be done by repeated dumping and plowing out. After the last dumping the ballast should be plowed from the ends of the ties and the men can then start in lifting the track, the gang being distributed as shown in the accompanying chart.

The forward jacks keep from 1½ to 2 rail lengths ahead of the rear ones, which pull the track up out of the freshly unloaded stone slightly above the finished grade. The two men marked (3) working at the ends of the ties, spade the stone roughly under the joint ties, the greatest part of the stone running down under the ties of its own weight. Tampers follow the rear jacks, spading the stone in under the tie and as far under the rail as they can reach. Immediately behind them are other men forking in ballast for them, who also carry sledges for tapping the ties down until they are level and at the proper elevation determined by the foreman and the levelman. Then, most important of all, come the tampers using spades and accompanied by forkers with ballast forks, who bring the ballast in to them. Each group of four tampers is numbered 1, 2, 3 or 4, and these numbers are marked on each half rail on the track being raised, or on the adjacent track. Each gang then tamps the half rail marked with its number and moves forward. In this way the work of each group can be noted and no confusion results. The lining gang follows up, keeping the track in perfect line as the work progresses.

Flags are put out in both directions as prescribed by rule

books and all trains are flagged while the lifting is in progress, but when trains are seen approaching, or when any regular train is due, a proper run-off is made. When everything is known to be in safe condition the train is signaled to proceed at the usual speed. Under ordinary traffic conditions and with the force of men outlined on the chart, from 800 to 1,000 cu. yds. of stone can be put under the track in the manner described in from 4.5 to 5 hours. The gang then goes back and tamps for 18 in. alongside the rail on each side, trims up the ballast and then goes ahead and digs out for the following day's work. Where necessary, the track can be kept filled in lightly close up to the tie gang.

A regular section force following up the lifting gang 8 to 10 days later does not find as much work to do as in an ordinary spring surfacing. A very light back fill, which is dressed down by the stone gang at the rate of a mile a day, completes the operation.

Among the advantages of this method are that the men always see the end of the day's work in advance, and therefore work to better advantage; the foreman of the gang is at all times engaged in directing his men and managing the work rather than in personally raising and lining, and no delay to trains is necessary.

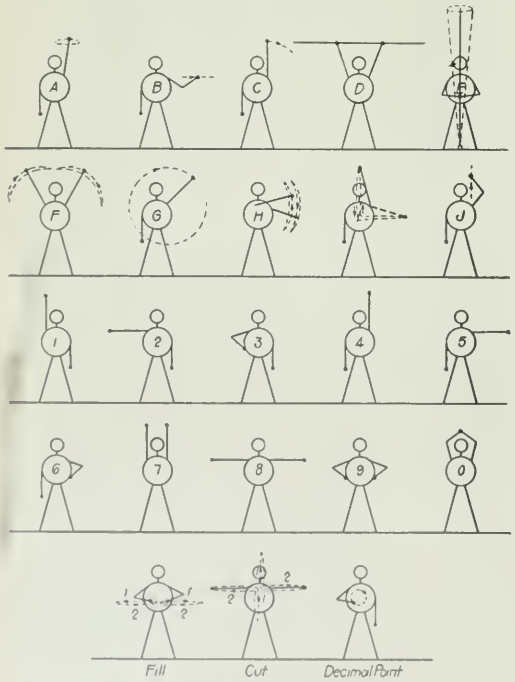
A. M. Clough,
Supervisor, New York Central & Hudson River.

HAND SIGNALS FOR FIELD PARTIES.

Kansas City, Mo., March 20, 1913.

To the Editor of the Railway Age Gazette:

The accompanying set of hand signals for use in field work may add something to the recent discussion on this subject



Hand Signals for Field Parties.

which has appeared in your columns. (See *Railway Age Gazette* February 21, 1913, page 351, and March 14, 1913, page 491.) The number signals are practically the same as those shown in Fig. 2 in your issue of March 14. It should be noted that in this system the vertical arm signals are used for the straight line numbers, 1, 4 and 7. In addition to the numbers, I have used signals for fill, cut and decimal point, which are attempts to make with the hands and arms, a minus, plus and point, respectively, as shown in the illustration. For additional transit party signals I have used those lettered A to I. The significance of these signals is as follows: A, "Rod up or give line." Wave a small horizontal circle high overhead with hand or rod. B, "Move to right or left." Move hand at shoulder height in direction required, slightly for a small, arm length for a big move. C, "Plumb rod to right or left." Extend arm vertically and swing slowly in direction required. D, "Set a hub or give a turning point." Hold any visible object horizontally overhead with both hands. E, "Set on this." With point of rod on tack, swing top of rod in small circle. F, "All right or go ahead." A half circle swing of one or both arms overhead. G, "Come to point signaled from." A full circle swing with either arm. H, "Go back." Face to the right of man signaled to, wave both arms up and down, raising one while dropping the other. I, "Can't get you." Describe an "L" or inverted "T" by a vertical motion followed by a horizontal motion of the arm. For a level party the same signals are used and in addition the one shown as J, "Move target up or down." Move hand up or down in direction required. Motion of hand only means move 0.01 of a foot, half arm 0.1, and full arm 1.0 ft.

It often becomes desirable in field work to send messages which are not covered by ordinary field signals. For this purpose I have used the number signals for code signaling by dividing the alphabet into three frames of nine letters each, the letters in each frame being numbered consecutively from one to nine, and each frame being given a distinguishing signal. The following chart shows the use of this code:

Frame Name.	Frame Signal.	Letter Numbers. 1 2 3 4 5 6 7 8 9
R(igid)....	Hold arm rigid in number signal position for a moment	a b c d e f g h i
S(wing)...	Wave small circle twice with arm extended in number signal position.....	j k l m n o p q r
P(unch)...	Punch into number signal position three times	s t u v w x y z "

The ninth signal in the third frame is the letter repeater or ditto signal. The hip signals in the swing and punch frames are replaced by corresponding signals with the arms extended vertically downward. The abbreviation msj is used for "message." A space between words is indicated by zero, and the end of a sentence by zero ditto. To use this code in the field it is only necessary to recognize the number and frame signals, messages being recorded by number and frame and worked out afterwards from a table similar to the one shown above. For example, "bring up hubs" would be received as follows:

29957	37	8321	9
0	0	0	
rsrsr	ps	rprp	p

Robert S. Beard.

[Since the publication of the hand number signals used on the Burlington lines west, it has been brought to our attention that this particular set of signals was devised to require the use of only one arm and hand. With this system, a rodman may hold his rod with one hand and give all necessary signals without changing his position, or in difficult locations, such as hanging on a bridge, on the side of a canyon or up in a tree, the signals can be given as readily as where both hands are free.—Editor.]

New Railways in Central Africa.—The contract between the Nyasaland Protectorate and the British Central Africa Company for the extension of the Shire Highlands Railway has been signed. The Nyasaland government guarantees 4 per cent. for a period of ten years on $2,000,000, and it is understood that a new company is to be formed. A large tract of rich and populous country will be opened up by the construction of this extension.

NEW CLASSIFICATION YARD AT WINNIPEG.

Canadian Pacific Is Now Building the First Section of a Gravity Yard Designed for Twelve Thousand Cars Ultimate Capacity.

The old classification yard of the Canadian Pacific for the Winnipeg district is just west of the passenger station in the heart of the city, and on this account, further expansion to care for the constantly increasing freight traffic has not been possible. The congestion in this yard, especially during the movement of grain from the western provinces to the lake ports during the fall has been a serious problem for several years. In order to relieve this situation and to provide for further increases in traffic, it was decided to build an entirely new yard near Winnipeg, which would handle all the classification of through business and would be so located as to be capable of expansion to almost any desired extent. The location selected for this yard is about five miles east of the city and just east of Whittier Junction, where the old main line to Molson by way of East Selkirk joins the line commonly known as the Molson branch, over which the main line traffic to the east is routed at present. The new yard lies between these two lines, its eastern end having connection with the Molson branch and the western end with the main line.

Filling for the Eastbound Hump.

A careful study of the requirements for a complete yard development in this vicinity was made by representatives of Westinghouse, Church, Kerr & Company in conjunction with the engineers of the Canadian Pacific, and as a result of this study, plans for an initial development to care for present demands of traffic and a maximum development to provide for expansion in the future were prepared. It was planned to have at least a portion of the yard in service in time to relieve the congestion during the grain rush last fall, but the unusual shortage in labor during the season made the accomplishment of this purpose very difficult. It is expected that the initial development will be completed during the present season. The yard that is being built at present, shown by solid lines in the accompanying drawing, provides the follow capacities:

Westbound receiving yard	20 tracks	1,440 cars
Westbound classification and departure yard	20 tracks	1,440 cars
Eastbound receiving yard	20 tracks	1,440 cars
Eastbound classification and departure yard	20 tracks	1,440 cars
Westbound hold yard	5 tracks	325 cars
Eastbound hold yard	5 tracks	325 cars
Westbound caboose yard	4 tracks	24 cars
Eastbound caboose yard	4 tracks	24 cars
Repair yard	12 tracks	180 cars
Transfer yard	4 tracks	125 cars
Icing yard	4 tracks	140 cars
Cold storage yard		40 cars
Total car capacity		6,943 cars
Engine yard		24 engines

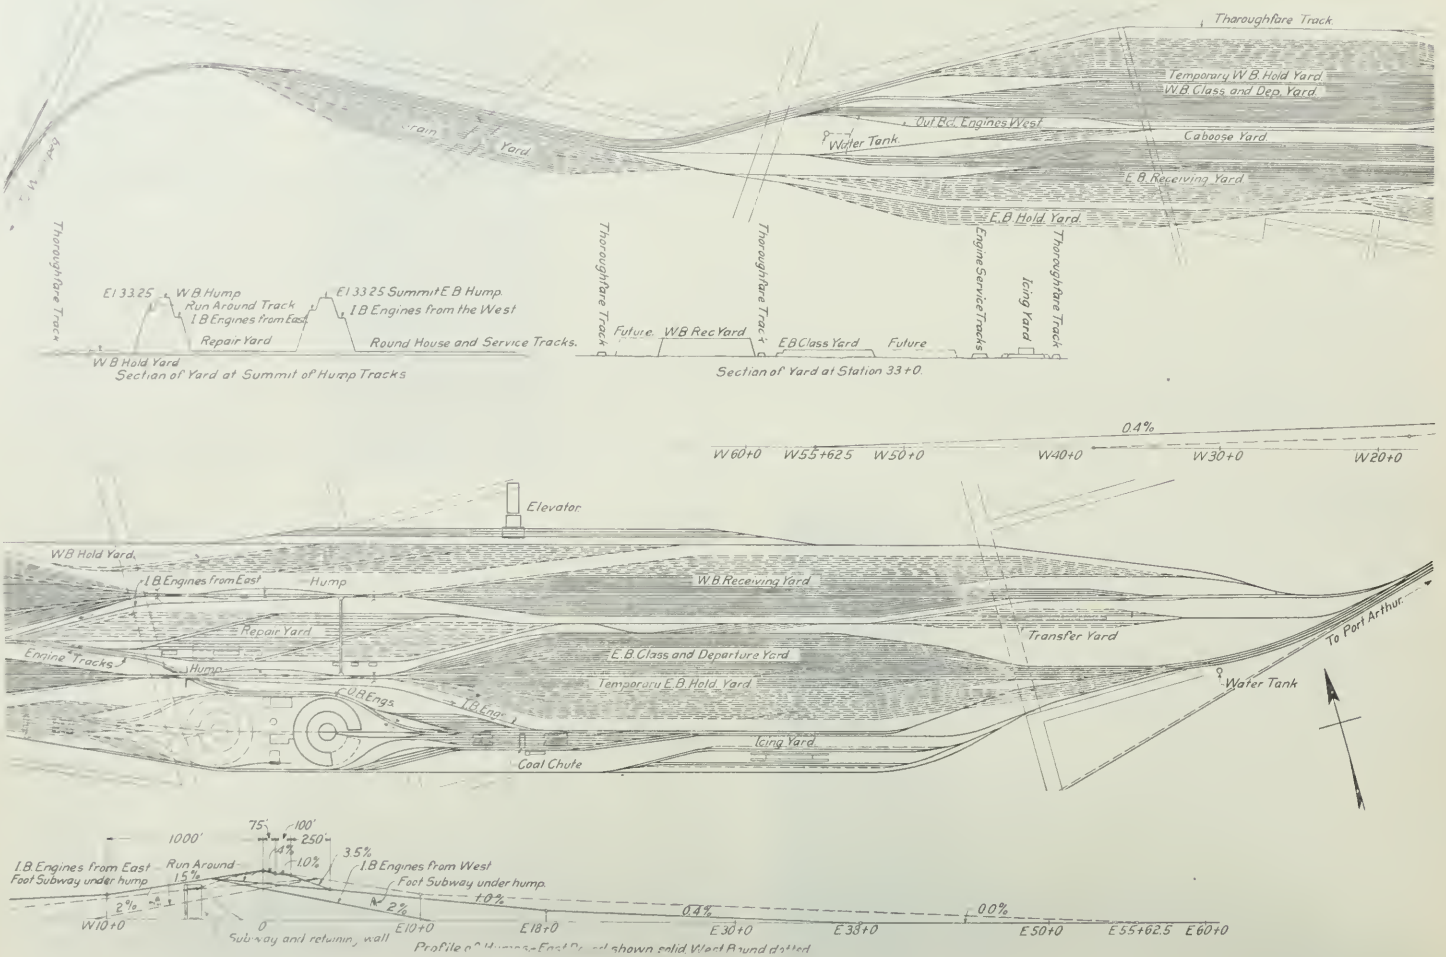
The maximum development which is shown by dotted lines in the drawing provides for the following capacities:

Westbound receiving yard	30 tracks	2,090 cars
Westbound classification and departure yard	40 tracks	2,740 cars
Eastbound receiving yard	30 tracks	2,090 cars
Eastbound classification and departure yard	40 tracks	2,880 cars
Westbound hold yard	24 tracks	600 cars
Eastbound hold and grain yard	24 tracks	1,160 cars
Westbound caboose	7 tracks	40 cars
Eastbound caboose	7 tracks	40 cars
Repair yard	32 tracks	410 cars
Transfer yard	8 tracks	225 cars
Icing yard	6 tracks	200 cars
Cold storage yard		80 cars
Total car capacity		12,555 cars
Engine yard		48 engines

The cars will be classified by gravity over separate humps for eastbound and westbound business. The hump profile, shown in the accompanying drawing, shows steep grades at the hump, which experience with the operation of hump yards in northern latitudes has proven to be essential during the winter months. In the yard which the Canadian Pacific is now operating in Winnipeg, the hump has been raised once and operating men still complain that in some cases it is necessary for the hump engines to push the cars down the grade. As shown in the profile, runaround tracks are provided at both humps to allow movements to be made between the receiving and departure yards without pushing over the hump. Additional tracks on a lower grade are provided for incoming engines to reach the engine terminal after cutting off from their trains in the receiving yards. The yard is designed to allow facility of movement between the various parts and an ample number of thoroughfare tracks has been provided. The repair yard is located between the humps and the engine terminal is adjacent to the eastbound hump. This arrangement allows the hump tracks to be carried straight into the classification yards and utilizes the space between the humps to good advantage. It also serves to bring all the buildings into a very compact group.

The engine terminal which is being built to serve the initial development of the yard, includes a 30-stall engine house of brick on concrete foundations, having a 100 ft. turntable, a machine shop to care for running repairs, a power house, a boiler shop, store building, concrete cinder and inspection pits, a coaling station of the T. W. Snow Construction Company's design, coaling on four tracks with provision for an extension to a fifth track, and a 60,000 gal. water tank. The water supply for this terminal is secured from the Red river through a 12 in. pipe line about four miles long. A pumping plant and continuous water softening plant has been installed at the river. The plans for the maximum development of the yard call for the extension of the present engine house to 55 stalls and the building of a second engine house adjacent to it, also of 55 stall capacity, the building of a freight car shop and a woodworking shop along-

Forms for Concrete Grain Storage Bins with Jacks Used in Raising Forms.



Plan, Profile and Cross Section of Canadian Pacific Yard Near Winnipeg.

side the blacksmith shop which is now located in the repair yard, and the addition of the necessary cinder and inspection pits, coaling stations and water cranes.

The construction of the yard will require about 2,500,000 yds. of filling material for the initial development. The yard is located on a level prairie, and no excavation is required except for the buildings. The maximum fill under the humps is about 38 ft. Gravel is being used for the fills, which is secured from a company pit at Moose Nose, about six miles east. It is excavated with a 90 ton Bucyrus shovel equipped with a five yard dipper, and is hauled to the yard in 60 12 yd. Western air dump cars and 60 16 yd. cars by eight standard gage locomotives. The contractor's equipment for the work also includes a Jordan spreader and a Brown hoist locomotive crane for use in the material yard. The line between the yard connection and the gravel pit was double-tracked in order to facilitate the handling of the 20 or more gravel trains which were operated each day. The operation of these trains on the main line was safeguarded by issuing train orders for each one and placing a pilot on each engine. In making the fill for the yards, trestles were built under the humps and in all fills exceeding 12 ft. The trestle under the hump was built to the grade of the runaround track and the additional material was placed by raising tracks on this fill. For the yard tracks, the fill was started under the track in the middle of the yard and this embankment was widened on both sides by spreading and shifting tracks. No system of cross drainage was laid in the construction of these yards, but in each of the streets crossing the site of the yards, which were closed when construction work began, a culvert was laid. In order to secure an outlet for this drainage, a 24 in. sewer almost four miles long was built. If any difficulty is experienced with the drainage, it is possible that a system of subsurface cross drainage will be installed.

Stock Piles, Cement Houses, Mixer Plant and Distributing Tower at Elevator.

The yard tracks are laid with soft ties untreated and new second grade 85 lb. rail on ladders and humps and relaid 75 lb. and 85 lb. rail for yard and thoroughfare tracks. All switches will be tie plated. No. 7 turnouts will be used with 1 deg. curves beyond the frog point.

Four subways will be built under the humps, three for footways and one for two engine tracks. The latter structure is being built on a skew of 52 deg. 29 min., requiring an unusual design of abutments and retaining walls, which is illustrated in the accompanying drawings. As shown in these drawings, the abutments are offset between tracks forming square bridge seats on which are carried deck plate girders. The span is 63 ft. face to face of abutments. Reinforced concrete is used for these abutments, and in order to insure stability, a system of concrete struts or tie rods, shown in the plan, was included. The footings are supported on wooden piles spaced about 3 ft. x 3 ft. 6 in., with a row of batter piles 3 ft. apart driven under the toe of the retaining wall. The batter piles and the front rows under the abutments are 30 ft. long, the others 25 ft. long.

In connection with the yard there is being built a transfer elevator served by four tracks alongside the westbound receiving yard. This elevator has a capacity of 1,000,000 bushels, and is being built of reinforced concrete throughout. It will be possible to receive, clean, and load out 12 cars an hour at this elevator, and to dry 1,000 bus. of grain an hour. The storage capacity will be secured by 140 cylindrical concrete bins so that the individuality of grain passing through the elevator can, to a large extent, be maintained. The general arrangement of the plant provides for the possible increase of capacity to 15,000,000 bushels. The elevator machinery will all be electrically operated.

In the construction of this elevator an extremely complete and well designed concrete mixing plant was used. Two 28 cu. ft. Smith mixers were installed alongside the building with towers equipped with elevating buckets and distributing spouts. Narrow gage tracks, on which were operated 1 yd. dump cars, connected these mixer towers with the material piles alongside the standard gage spurs and cement houses, each of the latter having a capacity of 1,500 bbls. In operating the mixer plant a narrow gage car was filled with a specified amount of aggregate at the material piles and pushed up to the cement house in front of which was a platform level with the top of these cars. Here the required amount of cement for the aggregate contained in the car was dumped and the entire mixture was pulled up an incline to a platform above the mixer from which the charge could be placed in the mixer. The mixer dumped into the elevating bucket, which was of a capacity sufficient to hold the entire mixer batch and which was dumped into a hopper feeding the distributing spouts by a man stationed at the top of the tower. The construction of the head houses and bins required from 16,000 to 18,000 yds. of concrete. With each of the plants described, it was possible to place about 250 yds. in a ten hour shift and the average was not less than 200.

A special jack for raising the forms used in construction of the cylindrical storage bins was developed by the contractors, and has now been made standard by them for this work. This jack is shown in the accompanying photograph. It consists of two 6 in. x 6 in. timbers placed over a section of the form about 4 ft. high and rigidly connected to it. These timbers are yoked together at the top, and through this yoke extends a 1 in. rod about 8 ft. long, the lower end of which can be brought to bear on the finished concrete when it is desired to raise the form. By operating the screw in this yoke the entire form is raised, the downward thrust being carried by the hardened concrete. Four of these jacks are commonly used on a tank of 14 ft. 4 in. diameter. The lift is ordinarily 12 in., although sometimes the forms are moved for distances not exceeding 4 in. This work was handled by the Barnett & McQueen Company, Minneapolis, specialists in elevator construction.

The contract for grading, track laying and subway construction was let to Foley Brothers, Welch & Stewart. The grading and track laying was sublet to the John Marsch Construction Company. The engine house and other buildings in the yard were contracted for by the Lyall Mitchell Contracting Company. The work was handled under the general supervision of J. G. Sullivan, chief engineer, and Frank Lee, principal assistant engineer. W. D. Pender was in direct charge of the work.

New Line in the Uganda Protectorate.—The 47-mile Jinja-Kakindu Railway from Jinja, on Lake Victoria, to Kakindu, toward Lake Kioga, was formally opened for freight traffic on January 1. This railway will form an important link in the rail, river, and lake service between Cairo and Mombasa.

THE FOREMAN PROBLEM.*

By A. Swartz,

Engineer, Maintenance of Way, Toledo Railways & Light Co., Toledo, O.

A track foreman today must be better educated than he was years ago. His duties require that he be in closer touch with the public at large, as well as better informed on the laws of different states which require things of railways that years ago were not thought of. As the territory east of the Mississippi river becomes more thickly populated, the source of supply of section foremen naturally decreases, for the average young man today looks upon this position as a menial one. This is a wrong view of the matter, for it is only a question of time before railways will pay salaries more commensurate with the ability demanded of the section foreman. It is therefore necessary to interest young men in this question, and it is possible to do this if roadmasters will take the trouble to visit small towns on their division, trying to find young men who, if they see before them in two or three years a position which will give them $65 to $75 per month can be talked into going on the section.

It is necessary, however, to have on each section a leading man, who is paid from 10 to 20 cents per day more than the rest, because of his trustworthiness and capability. This man should be allowed ten hours pay per day all the year around, and if extra time is to be put in, he should be given a chance for the extra money. A foreman who is properly talked to is usually very glad to help a young man and teach him how to run a section gang, as well as to take care of all reports necessary. One of the duties of this first man should be to handle the gang and reports, under the supervision of the foreman. A good class of young men to interest, are the teachers of country schools. They are generally educated enough, and know the people in their district well enough to become good foremen, provided of course they are physically able to carry on the work. One of the greatest hardships for a section foreman, is his reports. They scare the ordinary individual, even though for a man of ordinary education they are very simple to make. The prevalence of foreign labor on railways today requires a man who has a great deal of patience, which is generally one of the perquisites of a school teacher, and this surely is more marked in a man with a fair education. Foreign labor will, if handled with discretion, do good work, but if handled by a strong-minded, uneducated person, will not give good results.

There is a great deal of responsibility attached to a foremanship, which requires an honest man. The average foreigner is not, in the writer's opinion, the proper man to trust with such responsibility, although there are cases where Italians or other classes of foreign laborers have been developed into very fair track foremen.

It has been the practice on the Erie, with which I served until recently, to give the leading man more pay than the rest of the laborers. The roadmasters themselves, watch this matter closely and keep in touch with such men. When extra gang work is at hand, these men are placed in charge of a small squad doing the more unimportant work and their results are watched. In this way it is easy to see whether the man will make a fit foreman or not, for in no other place will a man's patience be tried as with an extra gang. A division engineer should know these men just as well as his roadmasters, so that the question which is so vital to him may be properly taken care of.

One of the things which will help educate foremen is for the railway to develop certain rules or practices which can be put in a printed form and distributed to the foremen. The first man should have access to these forms so that he may become acquainted with the practices and rules of the railway for which he is working. This naturally results in a uniformity of practice over the entire road, so that the foreman or a first man may be transferred to any section, taking up the work where it was left off, and under ordinary conditions be sure of the men working for him being able to carry on the work without any very great change in the method. Meetings should be held occasionally to see if the men themselves have developed any ideas which would be well to use on the whole system or on one particular division.

*[illegible] in the contest on The Foreman Problem, which closed March [illegible], 1913.

ABSTRACT OF ENGINEERING ARTICLES SINCE MARCH 14.

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the regular weekly issues of the *Railway Age Gazette* since March 14, 1913:

Important Improvement Work on the C. M. & St. P.—A typical example of the double tracking and grade revision which is being undertaken on a considerable mileage of central western roads is that of the C. M. & St. P. on its Hastings and Dakota division. The most unusual feature of this work was the very extensive use of drag line excavators. The engineering features of this improvement work were described and illustrated in the issue of March 21, page 673.

New Classification Yard at Chicago.—Plans have just been announced by the Belt Railway of Chicago for enlarging the clearing yard to a capacity of 12,000 cars, which will make it, so far as is known, the largest hump yard in the world. The plans for this enlarged yard were given in the issue of March 21, page 679.

Report on Glen Loch Derailment.—An abstract of the Interstate Commerce Commission report on the derailment of a passenger train on the Pennsylvania Railroad at Glen Loch, Pa., which includes the recommendations of the commission's representatives as to inspection of steel bridges, was published in the issue of March 28, page 747.

Economical Limits of Grade Reduction, by Walter Loring Webb.—This paper presented a very complete discussion of the factors entering into an analysis of train resistances and their respective importance. It was published in the issue of March 28, page 750. An editorial commenting on this subject appeared in the same issue, page 740.

A Novel Design for a High Abutment.—An unusual design for an abutment on the Lehigh Valley, which is known as a pier abutment, was described by E. F. Ackerman, assistant engineer, in the issue of March 28, page 759.

The Sand Patch Tunnel Improvements.—The construction of a new double track tunnel on the Baltimore & Ohio at Sand Patch, Pa., which was complicated by two disastrous slides over the existing single track tunnel, was described in the issue of April 4, page 789.

The Design of Concrete or Reinforced Cross Ties.—Paul M. La Bach, assistant engineer, Chicago, Rock Island & Pacific, Chicago, presented a discussion of the mechanics to be considered in the design of crossties in a letter to the editor published in the issue of April 11, page 828.

National Valuation Convention Urged.—A discussion by H. Bortin, in which concerted action by the railways was urged to make the appraisal of railways economical, intelligent and just, was published in the issue of April 11, page 836.

Southern Railway Freight Station and Office Building at Atlanta, Ga.—The design and construction of a large modern freight station on the Southern Railway was described and illustrated in the issue of April 11, page 839.

The Southern Pacific Bridge at Sacramento.—An unusual swing span has been built by the Southern Pacific over the Sacramento river, Sacramento, Cal. It is a double track, double deck structure with a highway on the upper level, having a concrete floor under the highway. It is believed to be the heaviest swing span ever built. The structure was described and illustrated in the issue of April 11, page 846.

The Otis Inclined Freight Elevator.—A description of the inclined elevators for moving truck loads of freight from a steamer to the Union wharf at Boston, Mass., including the amount of freight handled in the last three years and the cost of power, was published in the issue of April 11, page 849.

Indian Railway Needs.—The Indian press is urging the necessity of encouraging feeder railways. If all feeders and branches, and, where possible, extensions, were financed by private enterprise, then the whole, or almost the whole, of the railway budget could be devoted to the needs of the open lines. The composition of the present railway board is blamed for the difficulties at present attending the promotion of these schemes, and the solution suggested is the appointment of a single railway controller, attaching to the post a salary sufficient to attract a first-class man, as is done with the finance member, and giving him the full status of a member of the Executive Council.

DESIGN AND MAINTENANCE OF TRACK TANKS.*

Discussion of the Location, Length and Width of Troughs, the Two Types of Heating Systems and Roadbed Drainage.

By George W. Vaughan,
Engineer Maintenance of Way, Exterior Zone, New York Central & Hudson River.

The railroads of England felt the need of supplying water to moving trains as far back as the middle of the nineteenth century and for this purpose J. Ramsbottom invented an outfit, including a track tank between the rails and a scoop on the locomotive tender, in 1861. The track tank or trough was of cast iron, in lengths of about 6 ft., these sections being bolted together by means of flanges and the ends separated by strips of vulcanized rubber. It has been supposed that this was the first track tank ever put in service, but a few years ago F. W. Webb, chief mechanical engineer of the London & Northwestern, claimed that they were introduced on that road in 1857, and that he was engaged in preparing the first equipment.

The first track tank in the United States was built at Montrose, between New York and Albany, on the Hudson division of the New York Central & Hudson River, and was put in service in 1870. It was for the use of the fast Saratoga trains at that time and was supplied with water by a hand pump, no provision being made to prevent freezing, as its use was discontinued in the winter. William Buchanan designed the first scoop, then called a "jerk water." It was attached back of the rear trucks and the conductor pipe was placed back of and outside of the tender tank. The first track tank on the Mohawk division was installed at Palatine bridge about 1889, and the first one on the Western division at Churchville in 1892. They were first installed on each of the four main line divisions of the Lake Shore & Michigan Southern in 1893, and at Forks Creek, Tilbury and Waterford on the Michigan Central in the same year.

The use of track tanks on the main division of the New York Central Lines has now become quite general. There are 14 on the New York Central & Hudson River, between New York and Buffalo, 10 on the Lake Shore & Michigan Southern, between Buffalo and Chicago, and 14 on the Michigan Central, between Buffalo and Chicago, so that trains can now run from New York to Chicago without making a single stop for water, except at the terminals, where the locomotives are regularly changed.

LOCATION.

Track tanks are generally used on lines and divisions where traffic is dense. From 25 to 50 per cent. of the water supplied is usually wasted by the engine scoops forcing it over the sides and ends. It is, therefore, essential that they be located where the supply of water is abundant, and since on account of the large waste the ground under them will be continually soaked, they should be placed on ground that can be thoroughly and quickly drained.

They can be operated and maintained on light curves, the Philadelphia & Reading having one, a large portion of which is on a 2 deg. curve, but they give much better satisfaction and are cheaper to install and maintain on tangents. The grades approaching them must be such that all trains which are to take water can attain a speed of at least 25 miles per hour before reaching them and, for the same reason, they should not be near stations, yards, railroad crossings, drawbridges, etc.

TYPE.

Many roads followed the early practice of making the tanks of cast iron and bolting the sections together. The Chicago, Milwaukee & St. Paul had such a tank in use until recently between Chicago and Milwaukee. The general practice now is to make the tank of sheet steel or iron, 3/16 in. to ¼ in. in thickness, bent to the desired form. In England many of them are supported on wooden stringers fastened to the ties, the top edge of the tank being bent over and bolted to the top of the stringers, but in this country they are usually supported directly on the ties, angle and half-round irons being riveted to the upturned sides and top edge to furnish stiffness and a means of attachment by spiking or otherwise to the ties.

The new standard of the New York Central & Hudson River deviates essentially from general practice, in that, instead of the customary plate turned up to form the sides, it has two channels, with flanges turned in, which form the sides, and a flat plate which forms the bottom. It has the following advantages: It is cheaper to construct, considering the same dimensions and weight of material. The bottom of the troughs wear out much more quickly than the sides, on account of being scraped by the scoop, and this type permits the renewal of the bottom separately, thus saving considerable on repairs. Repairs are made more easily.

DEPTH.

The Midland Railway of England has on its locomotives an adjustable scoop which is lowered on approaching track tanks to a fixed point ½ in. below the top of the rail. The track is depressed at the trough, 6 in., the grade at the beginning and end being 1 in 360, so that the scoop dips automatically into the trough about 3 in. This arrangement permits the trough to be made as deep as desired, without even cutting into the ties.

In America the bottoms of the hopper cars, the brake rigging and other apparatus does not have as great a clearance as in England, and it is not considered good practice here to allow anything between the rails that projects above the top of them. This fixes the upper limit for the top of the track tank.

The ties under the troughs are usually 8 in. thick, and it is not considered safe to dap them more than 2¼ in. This fixes the lower limit for the bottom of the tank. The tanks, after a time, become somewhat uneven, often varying in height ½ in. or more. It is not practical, therefore, with a 6 in. rail to increase the depth of the tank beyond 7½ in. or 8 in. The general practice is from 6 in. to 7½ in.

Adjustable scoops are arranged so that they cannot be lowered beyond a certain point, that point being determined by the requirements of any particular railroad. The pins and bearings of the scoop, also the bearings and tires of the tender wheels wear appreciably, making a difference in adjustment sometimes as much as ¾ in. The springs under the tender become weaker with age, allowing the tender, with the scoop, to sag. Therefore, unless the adjustment is watched closely and carefully regulated it is apt to vary considerably.

The height of the tender and scoop will sometimes vary an inch or more between light and loaded conditions. Tests show that the pressure of the water against the scoop when traveling at speeds from 40 to 60 miles per hour, will pull the tender down from ½ to 1 in., while at speeds from 25 to 40 miles it will be affected very little. Therefore, when a scoop is lowered into a trough it is necessary to allow for a possible variation in elevation of about 2 in.

It is desirable to adjust the scoop high enough so that it will not scrape the bottom of the trough. The troughs, after a time, become uneven, making it difficult to maintain the water level less than an inch from the top. Observations indicate,

*Abstract of Appendix A of the Report of the Committee on Water Service, American Railway Engineering Association.

and it is generally conceded, that the scoop, under all conditions must dip at least 2 in. below the surface of the water, in order to deliver an adequate supply into the tender tank. To meet all these conditions it is evident the track tank must be made as deep as construction considerations will permit.

Therefore, a depth of 7½ in. should be used if a track tank of the usual type is adopted, or a depth of 7 in. if a type similar to the New York Central & Hudson River standard is adopted, so as to use a standard channel.

WIDTH.

The most usual width of track tanks is 19 in. This gives about the least clearance permissible in this country, as American scoops are generally from 12 to 13 in. wide, and allowance must be made of about 2 in. on either side for swaying. The Midland Railway of England uses tanks 17¾ in. in width, but their scoop dippers are only 10 in. wide. Tanks with widths all the way up to 29 in. are being used in this country.

The only reason of any consequence for employing an inside clearance greater than 19 in. is to create sufficient storage capacity so that water may be scooped by the second engine of a double header, or by a second train following the first so closely that enough time has not elapsed for the refilling of the tanks. On the other hand, the use of the wide tank is objectionable, as experience indicates that with it considerably more water is wasted by the splashing of the scoop, and this is especially true when the scoop is adjusted too low, as is often the case.

The Pennsylvania Railroad made some exhaustive tests in 1906 with its standard scoop, which showed that when the locomotive was traveling at 40 miles per hour, which is considered the most economical scooping speed, 75 per cent. more water was wasted with a 29 in. trough than with one 19 in. wide. The results of the 1910 tests by the same road indicate that, with the narrow trough, the waste is much less at all scooping speeds. It requires more steam to prevent the wide tank from freezing, the difference being about in proportion to the surface exposed. It is stated by some authorities that the difference is even greater than the proportions of exposed surface would indicate.

The New York Central & Hudson River made some tests in 1910 on a 27 in. trough, which showed that the amount of water taken by the second engine of a double-header was approximately 25 per cent. of the amount taken by the first engine, in the same distance, each scooping at the same time. When double-headers are used, generally the engineers arrange that one will take water for the first half of each trough, and the other for the second half, and, of course, with wide troughs the second gets some additional water, while the first is scooping, but this small extra amount can be more economically supplied by using a narrow tank and increasing its length. This will increase the first cost and the cost of maintenance a very little, but will reduce the expense of operation quite a little, on account of the reduction in waste of water, which in turn will reduce the cost of maintaining the roadbed. It is customary to place at least three inlets in each trough, so that they may be refilled quickly. Enough additional inlets may be installed at very little expense to accomplish the refilling in as short a time as it is practical to operate one train after another, so there is no excuse for putting in a wide tank to enable the operation of trains following each other closely. It follows, therefore, that a width should be adopted that will provide an inside clearance of 19 in.

LENGTH.

The length of existing track tanks varies from 1,300 ft. to 2,500 ft. The standard lengths adopted by some railroads are as follows:

New York Central & Hudson River	1,400 ft.
Pennsylvania	1,400 ft.
Midland Railway of England	1,643 ft. 6 in.
Michigan Central	1,800 ft.
Lake Shore & Michigan Southern	2,000 ft.

The last-named road has installed some 2,500 ft. long in order to furnish an adequate supply for heavy freights and double-headers, but on account of the difficulty in maintaining such a long pan level, it found it advisable to cut the length down to 2,000 ft., which appears to be about the practical limit.

The most desirable length for any road must be determined by a consideration of the usual train tonnage, the grades and the distance between track tank stations, which in turn is generally governed by the available supplies and convenient locations.

Some observations were taken on the New York Central & Hudson River, where the grades are moderate, in 1910, which show that heavy passenger trains of eight to twelve cars consume from 80 to 100 gal. of water per mile, and that freight trains of about 50 loaded cars consume from 110 to 130 gal. per mile. Other observations taken by the same road during a test, show that its standard scoop will normally deliver into the locomotive tank about 230 gal. per 100 ft. scooped at usual speeds.

The large locomotives have water reservoirs with capacities ranging from 7,000 to 8,000 gal., which is sufficient to carry a heavy freight train at least 50 miles. On the New York Central & Hudson River the divisions where track tanks are used are from 140 to 150 miles long, and the track tanks are from 20 to 40 miles apart, the average distance being about 30 miles. Trains will, therefore, consume from 2,500 to 4,000 gal. of water, on the average, for a division in going from one track tank to the next.

The pans being 1,400 ft. long, permit scooping for a distance of 1,300 ft., and in that distance the scoops will deliver 3,000 gal., which equals the consumption in the majority of runs. In the case of those trains consuming upwards of 4,000 gal., it may be stated that the reserve supply in the locomotive tank at the beginning of the run will supply the deficiency. The conclusion is therefore reached that the present standard length is sufficient, except on rare occasions, under adverse conditions, and when double-headers are used. The proper length under other conditions could be determined in the same manner.

END SECTIONS.

Track tanks are generally none too long to furnish an adequate supply, and frequently enginemen, trying to get all the water possible, will leave the scoop down so long that it hits the end of the trough. Sometimes this occurs at night, when the markers have been extinguished accidentally or otherwise. Therefore, in order to avoid the cost of repairs, and more especially to prevent interruptions to the service, it is desirable to construct the end sections so that the scoop will ride over them without inflicting damage.

The incline plate of the Pennsylvania is very short, constructed on an eased curve and is backed by wood. That of the Lake Shore & Michigan Southern is extremely long and solidly constructed. Those used on the Michigan Central, the Philadelphia & Reading, and the New York Central & Hudson River are of medium length, the first two being backed with wood and the last backed with plates of iron at the lower end and stiffened by angles throughout the remainder.

Every one of these examples is reported to be giving excellent satisfaction and there appears to be little to choose between them. It would, therefore, seem advisable to adopt a straight incline of medium length, say, 10 ft., the trailing incline to be of the same length so that traffic may be reversed when desired. The plate should be ½ in. in thickness and backed with hardwood or stiff angle irons.

ROADBED AND DRAINAGE.

Every railroad that operates track tanks in a cold climate realizes how difficult it is to dispose of the water spilled from scooping quickly enough to prevent it from freezing and heaving the roadbed, and throwing the track out of alinement. In the first place, the plant must be located where drains and ditches can be constructed that will carry away the water

quickly and thoroughly. In the second place, the roadbed must be built up or constructed in such a way as to prevent, as far as possible, the water from seeping down through it, and so that the water may be carried away over a surface or paving that will not be easily washed out, to properly constructed and located surface drains, ditches, catch basins, subsurface drains or tunnels, or some combinations of these arrangements.

It is regarding these details that the practices of various railroads differ. The Lake Shore & Michigan Southern has developed its drainage system further than most companies. They cover the ballast between the tracks with heavy flat stones and grade them to catch basins about 55 ft. apart. This paving prevents the ballast from being washed out and drains the water quickly into the catch basins. Subsurface tile drains, extending longitudinally between the tracks, carry the water from the bottom of the catch basins into underground transverse tunnels, spaced about 333 ft. apart.

A considerable percentage of the spill always soaks through the ballast between the ties and between the paving blocks. If the subgrade is not of a character to readily dispose of this, a layer of slag 2 ft. in depth is placed below the ballast. This allows the water to find its way gradually to the catch basins and subsurface longitudinal drains, which are laid with open joints.

The New York Central & Hudson River also lays a graded stone pavement between the tracks, but instead of removing the surface water through catch basins and subsurface drains, they install transverse surface box drains every 50 ft., which are very effective for this purpose, and have the advantage of being easily kept open in winter. They install graded trenches filled with cobbles under the pavement longitudinally between the tracks and place transverse subsurface tile drains every 100 ft. This arrangement very readily removes the water which finds its way through the pavement and ballast.

No figures were available to show the comparative cost of the two schemes; however, the cost of the former should certainly exceed that of the latter considerably, the amount depending somewhat on local conditions. It is pointed out that the tunnels serve the double purpose of providing an outlet to the drainage system and an accessible conduit for the water pipes, but the water pipes can be installed and maintained easily without the tunnels, so that most of this cost should be charged up to the drainage.

It would seem that this layout should be provided with the means to more readily dispose of the surface water in winter, when the catch basins become frozen over, by the addition of transverse box drains on the surface at each catch basin.

The New York Central & Hudson River Railroad layout disposes of the surface water quickly and is easily kept open in winter. It will dispose of the subsurface water more quickly than the other scheme and is preferable, as it will cost less to install and maintain.

STEAM AND WATER PIPING.

The water in all track tanks on the New York Central Lines must be heated in winter to prevent it from freezing, the amount of heat required depending upon the temperature of the supply and the atmosphere, the amount of water surface exposed, the frequency of scooping and the method of applying the steam to the water. The character of the heating system determines to a large extent the arrangement of water supply piping, necessitating a consideration of both piping systems at the same time.

Modern installations comprise in general one or more water pipes, extending nearly the full length of the troughs, with several branches connected to trough inlets. The supply is controlled by automatic valves actuated by a change in level of the water in the trough. If water is supplied through an inlet faster than it can flow along the trough by gravity, it will overflow at that point, causing considerable loss without increasing the rate of filling. This restriction is modified somewhat by the use of baffle plates in the inlet boxes or by dividing the inlet, discharging the water from the two sides of the pan instead of from the bottom; but, at best, the rate of flow is limited, and it is necessary to provide three or more inlets to each trough, the number depending upon the desired rate of filling.

At Herkimer, on the New York Central & Hudson River, where the troughs are 1,400 ft. long and 27 in. wide, and supplied by three inlets each, tests showed that after an engine had scooped full length, the pan would refill in from four to six minutes, the time depending upon the adjustment of the valves and somewhat upon the wind. After one engine had scooped full length, a second engine following in one and one-half minutes took one-half of a normal supply, and in three minutes a full normal supply. The reason a full supply could be obtained before the trough was entirely refilled was due to the fact that the scoop was given a deeper immersion than necessary, taking in more water when the trough was full than it could deliver into the tender.

There does not appear to be much data available regarding the rate of refilling troughs, but our observations indicate that with the inlet valves adjusted to give the maximum permissible rate of discharge and with the inlets spaced about 450 ft. apart, the trough will refill quickly enough to enable trains to get a full supply when operated on a three-minute headway, which meets all practical requirements.

There are in general use two methods of applying steam to the water to prevent it from freezing, known as the "direct" and "circulatory" systems, respectively. The former requires one or more pipe lines extending the full length of the troughs, with branches at frequent intervals, discharging steam through small nozzles directly into the bottom or sides of the trough. There is always more or less surging of the water in the trough, due to scooping and refilling and to the action of the wind, so that, with the nozzles spaced at intervals of 33 ft. (as in the New York Central & Hudson River standard), the heat is very evenly distributed. It is, therefore, unnecessary to maintain the temperature of the water at any point much above the freezing point, which insures a minimum loss of heat, due to exposure to the atmosphere. The steam pipes, whether laid below or above ground are thoroughly covered to prevent loss of heat from that source as much as possible.

The circulatory system, as used at various places, differs somewhat in the details, but its application on the Lake Shore & Michigan Southern, is typical, and is probably more perfectly developed there than anywhere. The standard, which applies to troughs 2,000 ft. long, shows a 4-in. water main for each trough extending nearly the full length. These are called circulatory pipes, and each has seven connections with its trough, three connections being inlets and four outlets, the inlets and outlets alternating. Steam is discharged into each inlet connection by means of ejectors, so that the water is forced to circulate while being heated.

The distance between inlets and outlets is about 333 ft., and when the trough is full it is not permissible to maintain a much greater depth at the inlet than at the outlet; the rate of circulation is therefore limited, and it is found necessary in severe weather to maintain a temperature at the inlet of about 60 deg. Fah., in order to prevent the water from freezing at the outlet. Accordingly, the loss of heat due to exposure to the atmosphere is much greater than when the direct heating system is used.

The troughs must be watched closely, when scooping is not frequent, in order that any ice which may happen to form can be promptly removed, otherwise the ice will impede circulation, allowing a considerable section of the trough to freeze up quickly, with no means of thawing it out. After scooping the trough is refilled by means of automatic valves at each inlet connection, the water being supplied through a separate water main, which extends to each inlet pit.

It would appear that, under similar local conditions and re-

quirements, the circulatory system would necessitate more piping, and, as the loss in heat must be greater, a larger boiler plant would be required, each condition operating to increase the cost of installation and maintenance. The fact that more heat is required would also cause the cost of operation to be greater. If it was desired to multiply the number of inlets, the difference in cost of installation would be increased, while the difference in cost of operation would probably be decreased, as it would not be necessary to heat the water to as high a temperature.

CONCLUSION.

Track tanks should, preferably, be located on tangents and where good drainage can be provided, also where good water is abundant, and at sufficient distances from stations and all other facilities which would permit trains attaining a speed of at least 25 miles per hour. Modern power equipment is capable of hauling an enormous tonnage, and the tendency is to still further increase the size and capacity of locomotives. Therefore, in order to avoid the necessity of unreasonably increasing the water tank capacity of engines, the distance between trough stations should not exceed 40 miles, unless other controlling conditions require it.

The design of the power plant required cannot be outlined in detail for standardization, because this depends much on local conditions. Boiler capacity of 100 h. p. will, in general, heat about 7,000 sq. ft. of water surface in troughs, by means of direct heating system, sufficiently to prevent the water from freezing during the most severe weather encountered on the New York Central Lines. Accordingly, four standard troughs, as recommended, would require about 220 h. p. of boiler capacity for heating purposes.

Duplicate pumps should be installed to insure continuous service. The capacity of each pump should, in general, be about double the average hourly consumption of the plant. A boiler capacity of from 40 to 80 h. p. will be required for pumping. Pumping may be dispensed with when a good supply of water can be obtained by gravity. Sometimes the water is obtained from deep wells and can be most advantageously elevated into the storage tanks by means of the air lift, compressors in this case replacing the pumps. Usually water from deep wells is comparatively warm, so that, if scooping is frequent, very little heat is required to prevent freezing.

Some scoops are very inefficient, and it would seem reasonable to expect that the best could be improved. The design of the scoop used on the Lake Shore & Michigan Southern appears to be the best of any used on the New York Central Lines. Any improvement in the efficiency of the scoop not only reduces the cost of operating the plant and the cost of maintaining the roadbed, but is equivalent to increasing the capacity of the track tanks. There also appears to be a greater opportunity to economize in this way than in any other in connection with the operation of troughs. It is, therefore, recommended that the design of the scoops be given further consideration.

RECOMMENDATIONS FOR STANDARD PRACTICE.

The trough should be 2,000 ft. long, 7 in. deep, and having a width that will provide an inside clearance of 19 in. It should consist of two standard 7 in., 9.75-lbs. channels, with flanges turned in to form the sides and a flat plate ¼ in. thick and 23¼ in. wide, riveted to one flange of each channel, to form the bottom. The ties should be dapped 2¼ in. to receive the trough. This can be done safely and is sufficient to maintain the top edges of the trough below the top of the usual 100-lbs. rail, when the trough has become somewhat uneven, as it always does after it has been in service for a time.

The end sections should be constructed with the bottom plate inclined at an angle so that the length of incline will be 10 ft. The plate should be ½ in. thick and secured to the side channels by angles riveted to each. The beginning of the incline where the scoop would first hit should be backed by an iron wedge and the balance backed by hardwood.

The direct heating system is advised. Since the headway of trains is being considerably reduced, five inlets to each trough should be provided in order that it may be refilled quickly enough. Five inlets in connection with the circulatory system would render the cost of installation excessive.

AN INTERESTING METHOD OF BRIDGE RENEWAL.

The Chicago, Rock Island & Pacific replaced a single track through truss bridge over the Cedar river near Moscow, Iowa, with a double-track deck plate girder structure during last season, without interruption to traffic and without the use of any falsework for supporting the superstructure. This bridge is on the main line from Chicago to Omaha, which has been double-tracked for several years as far as Iowa City, Iowa, with the exception of this bridge. Traffic on this portion of the line is so heavy that delays at the bridge have been frequent and the necessity for adding the second track had become very urgent. The old structure was not designed for present loadings and in considering the plans for double-tracking, it was thought advisable to replace it with one of heavier design. It is interesting to note that the new bridge is the fourth at this location, the three previous structures having each been in service for 20 years. The first bridge was built in 1852, being a wooden truss structure. It was replaced by an iron bridge in 1872, and that in turn by a steel truss bridge which has now been removed after 20 years' service.

Erecting Down Stream Line of Girders.

Building Substructure for New Deck Girder Structure.

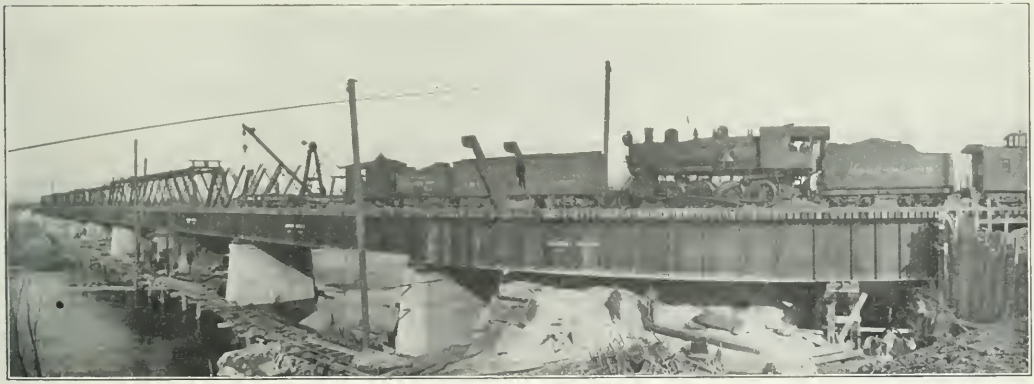
The old bridge consisted of five latticed through trusses of the following lengths starting from the west end: 150 ft. 11⅞ in., 155 ft. 8¾ in., 156 ft. 7⅛ in., 174 ft. 11⅞ in., and 155 ft. 5¼ in. As the old stone piers remodeled in 1892 were still in good condition, it was possible to use them as part of the substructure of the new bridge, and as the river is shallow at this point and the foundations comparatively good, it was decided to shorten the span lengths by building intermediate concrete piers between

the old ones in order to use deck plate girders for the superstructure. It was desired to lengthen the bridge somewhat at the east end so that a new abutment had to be built, and as the span lengths could not be economically adjusted to use the easterly pier, the one abutment and the adjacent pier were removed and one 90 ft. and four 77 ft. 9 in. girders resting on the new abutment and four new piers were used to replace the easterly two truss spans. The next two spans were replaced by four 77 ft. 9 in. girders and the remaining span by two 75 ft. girders. The west abutment and the three old piers that are used in the new structure had to be remodeled and extended to carry the double-track, and seven new concrete piers and one new abutment were built. These new piers and the abutment required 4,500 cu. yd. of concrete. The piers are carried down from 7 to 15 ft. below the bed of the stream, far enough in all cases to place the footings a sufficient distance below the top of the bed of blue clay to prevent damage from scour. The footings are supported on piling in all cases. The piers are from 30 to 35 ft. high, the difference in elevation between high and low water being about 15 ft.

The alinement of the present single track was adopted for the new westbound track, the second track being added on the down stream side of the structure. In order to keep traffic moving during the reconstruction of the bridge, the old structure was retained in service and operated as a gauntlet track during the building of the piers and the erection of the girders under the new down stream track. The traffic was then turned over this track, which was operated as a single track, while the old trusses were dismantled and the new girders erected for the westbound track. The substitution of a deck structure for a through, made necessary a raise in grade of nearly 6 ft. in order to use the same piers. The approach fill for this higher level was made on the eastbound track by temporarily moving the old trusses nearly 3 ft. up stream and the location of the new second track about the same distance down stream. This gave a distance between track centers of about 18 ft., which allowed the fill to be made for the new approach without blocking the operated line. The length of this approach was kept as short as possible by using a very steep runoff. The girders for the down stream track were placed by a derrick car working along that track, beginning at the west end. When this line of girders was completely erected and the approach at the east end connected up, traffic was turned over this track during the dismantling of the old truss and the erection of the new girders for the up stream track.

This replacement of through trusses by deck girders was handled by a method developed during the previous season for a similar bridge over the Iowa river near Columbus Junction, Iowa. (See *Railway Age Gazette*, January 19, 1912.) Beginning at the east end, as many rivets as could be spared from the floor system of the truss were cut out in advance. Two steel beams with steel pins from which block and tackle could be suspended, were then placed across the top chords of the old trusses near the ends of the girders to be placed. The girder span was riveted up and brought out to place on two flat cars which were spotted directly above the final location. The block and tackle from the overhead beams were hooked to the ends of the girders, the lines from these blocks were attached to a flat car next to the engine, which then moved slowly forward, lifting the span clear of the cars. The cars were pushed out of the way, and while the girders were held suspended by the engine, the floor system of the old bridge was removed so that the girder span could be lowered into place by the engine. After the placing of the girders, the derrick car dismantled the old trusses, working from the east end. The accompanying photographs show the three stages of the work, the first near the beginning of the construction of the new piers, the second near the end of the construction of the down stream track, and the third beginning to dismantle the old trusses after the erection of both lines of girders. About 700 tons of old steel were removed, and about 1,015 tons of new steel placed.

This work was handled under the general direction of J. B. Berry, at that time chief engineer of the Chicago, Rock Island & Pacific, and since made assistant to the president. I. L. Simmons, bridge engineer, had charge of the design and erection, and C. E. Ziegenbein handled the field work. The Cedar Rapids Construction Company had the contract for the substructure; the American Bridge Company fabricated the superstructure, and the erection was done by company forces.



Dismantling Old Trusses After Completion of Erection of New Girders.

THE FOREMAN PROBLEM.*

By James Ryan,

Supervisor, Chicago & Eastern Illinois, Villa Grove, Ill.

The prevalent idea that when a man is a track laborer he is down about as far as he can get and takes that work as the last resort, should be dispelled. The best place to attract native labor to the track is on the sections outside of terminals, and the inducements needed are good wages and steady work. Men should be picked from such places because at the terminals the men are always looking to the better positions in the transportation or mechanical departments, and it is generally necessary to hire foreigners as common laborers.

To keep a supply of foremen one man should be picked on

*Received in the contest on The Foreman Problem, which closed March 25, 1912.

each section and paid about 25 cents more per day than the laborers. These men in the absence of the foremen should make all reports, keep the books and take charge of the work. Put these men in extra gangs as assistant foremen to familiarize them with handling large numbers of men on construction work; give them a few months as time-keepers and then about six months in the busiest yard. When placing them on sections, put them where they join old experienced foremen so that in doubling up sections experienced foremen will always be present and the new men can learn from them.

Native labor should always be paid more than foreign, and the companies should be careful to avoid the native laborers getting the idea that foreign laborers are better paid and often furnished fuel and house of some sort. When other departments are increased, do the same with the trackmen, and you will have more satisfied men. The further education of foremen should be accomplished by having them in every three months to explain the work and reports to them. In sections of the country where native labor is scarce the foremen should be paid higher in order to get English speaking men if at all possible.

PROTECTION OF MEN IN THE MAINTENANCE OF WAY DEPARTMENT.*

By B. A. West,
Roadmaster, Atchison, Topeka & Santa Fe, Pueblo, Colo.

We have what is known as a "Safety Habit" organization on the Santa Fe, with local organizations on each division, with representation from the maintenance of way department. At this time the largest percentage of our track laborers are of foreign birth, which is accountable, to a large extent, for the large proportion of personal injuries to our employees. With this class of labor, no amount of experience or foresight on the part of the foreman or roadmaster will entirely prevent accidents, but this condition calls for intelligence, coolness and eternal vigilance on the part of the supervising officers and foremen.

In selecting foremen for work trains or extra gangs, I endeavor to secure those whom I know to be competent, careful and fully aware of the responsibilities which are attached to these positions. In this country they must have a knowledge of the Spanish language, must know how to handle men and be able to instruct them how to use the various tools. They must carefully inspect tools and cars to discover and remove any defective material. The foremen, as well as the roadmaster, must make it a practice to show new men the proper way to handle the tools, and especially how to place and drive spikes, as an inexperienced or careless spiker is almost as dangerous as a machine gun in a crowd of men. Whenever one has to use inexperienced men as spikers, they should be placed by themselves where there is no danger of flying spikes hitting other men.

While it is a difficult matter to handle men who do not understand our language, and probably do not comprehend a word one says, much can be accomplished by being patient and persevering and giving many object lessons. A foreman who has no sympathy for the man who does not speak "United States," and cares little whether these men are crippled or not, should be promptly discharged.

Among the most common forms of carelessness are running hand cars in foggy weather or at night, going through deep cuts on curves, and crossing long trestles where the view is obstructed, without flagging; overloading hand cars with men or running them at too high speeds, etc. In handling rail or other heavy material, it is advisable not to allow talking by any one but the foreman. Whenever it becomes necessary to use a red flag, a man should be sent who can speak English, or if there are none such in the gang, the man sent should carry a note from the foreman telling the nature of the obstruction and where it is to be found. Each engineman stopped by this flagman should be required to sign the note before proceeding.

In operating hand cars I have found it advisable to limit the number of men on one car to 10, including the foreman, and one man should always ride backwards in order to watch for trains coming from the rear. Racing should never be permitted, and where there is more than one car they should be run at least 200 ft. apart.

Track jacks should never be placed on the inside of the rail and they should always be set vertically to avoid throwing the track out of line. The man operating the jack should be fully instructed regarding its working, so that it can be removed quickly if necessary.

All material, tools, hand cars, etc., should be placed far enough from the track so that they will not be struck by passing trains. In this country, with almost continual winds, it is necessary to exercise great care to keep frogs, switches, guard rails and flangeways at crossings free from drifting sand and debris, for frequently accidents result from lack of attention here.

Work about steam shovels is dangerous at best, and especially so if blasting has to be resorted to. The foreman, as well as the train and enginemen must be very careful to avoid injury to laborers for the risks from an unexploded shot, from material falling, and from working about trains is great.

The maintenance of way employee is subject to special risks when working about wrecks. At such times he must go regardless of weather conditions and remain until the line is open for traffic. A foreman should be very careful never to send a man to work under or around cars unless they are well blocked to prevent their overturning upon him. It is also essential that the work is well lighted at night to prevent the men stumbling over objects in their way. The most intelligent men should be used in more dangerous places because of their ability to comprehend the danger and to avoid too great risks.

In handling outfit cars for extra gangs I have found it advisable, where possible, to place these cars on tracks that are not used or to spur them out. All bunk and commissary cars should open from the side opposite the main line or passing tracks so that there will be no danger of train employees falling over steps or rubbish at the camps. In this way the cars will also present a neater appearance from the main line. Where cars are liable to be moved at any time, men should not be allowed to sleep under them or to make swinging beds on the truss rods. No wood or other material should be allowed to be stored under the cars where it might fall onto the track during the movement of the cars.

*Abstract of a Safety paper read October 25, 1912.

COMBINED SIGNAL AND TRACK MAINTENANCE.

The Chicago & Alton has just combined the maintenance of track and automatic signals on 30 miles of its heavy traffic main line between Bloomington, Ill., and Odell. In this experimental plan the position of the signal maintainer who in the present organization has supervision over the signals on about 15 miles of line, is abolished and the work divided between the section foremen on the individual sections. The division supervisor of signals will continue to have the same duties as formerly, and will instruct the section foremen in all details relating to the maintenance of signals. The pay of the section foremen has been raised from $60 to $70 per month, and it is expected that in this way a better class of section foremen will be obtained, while at the same time, the performance of the signals will be improved, owing to the concentration of all duties affecting them under one foreman.

CLASSIFICATION OF SECOND HAND RAIL.

Outline of Method Used for Grading and Handling the Many Weights and Patterns of Relaying Rail on a Large System.

By Jay See.

The economical distribution and handling of second-hand rail on large systems is a matter that requires close attention, and presents an opportunity for much waste or saving. The rail question has been very prominent for the past few years, the glare of talent, however, being focused upon the material until it is purchased and in service. The inspection and distribution of rail released in relaying is left to the judgment of men in subordinate positions on many railroads. It is to the handling of this rail that the following pertains:

Most large railroad systems have resulted from the combination of small independent lines, by virtue of which there have resulted properties, with a variety of standards for buildings, bridges and track materials. With the demands of increased business, many buildings and bridges are found to be inadequate, and are then replaced by others of the adopted standard for the larger system, the salvage in either case being of comparatively little value, as the materials recovered are seldom used again in the same sort of construction. With rail, however, the conditions are somewhat different. When the requirements of service demand heavier steel, the lighter rail released in relaying is transferred to secondary main and branch lines, is used to repair rail of the same weight still in service, or, is used for passing and industry tracks, and it is repeatedly transferred and relaid until it is only fit for scrap.

On many railroads 15 to 20 different rail sections are now maintained, and the reduction of the number of these various sections to two or three adopted standards is a gradual and slow process. Such plans are being rapidly followed, however, permitting a smaller stock to be carried on hand for repairs and renewals. The section of rail that it is desired to discontinue must be maintained in branch and yard service until it is worn out and frogs and switches used in such lines are, in many cases, manufactured from such rail released from track, this being the only source from which suitable rail can be obtained. Railroads also purchase the standard A. S. C. E. or A. R. A. sections that correspond very closely to the obsolete sections in their tracks. This rail is also sometimes used for the manufacture of frogs and of switches, which makes the reclaiming of the obsolete rail for the purpose unnecessary.

The necessity for establishing a standard for the classifying and grading of rail released in relaying is apparent on most railroads. By so doing they get the maximum service there is in the rail, and a service that uses and disposes of the rail to the very best advantage.

More or less loss and delay is experienced on account of the shipping of rail unsuitable for the purpose for which it is to be used, from one end of the system to the other. This rail is usually inspected and graded by division roadmasters, but more frequently by some of their men. In shipping rail to the "other fellow," or, off their territory, the division men generally do not give it as close inspection as if it were intended for their own use. Sometimes they intentionally "unload" on other divisions, particularly if they are a long distance away.

It is also found that there are as many different ideas as to what constitutes a number one rail as there are roadmasters. In order to avoid such difficulties as these one of the larger western railroads has rail inspectors that inspect all second-hand rail recovered in relaying. These men are sent out from the office of the engineer of maintenance of way and assist the division men in inspecting, classifying and recording all rail released in relaying, thus securing more uniform rail classification. The following instructions are the basis on which this rail is inspected:

RULES FOR CLASSIFYING AND INSPECTING SECOND-HAND RAIL.

A second-hand rail is any rail irrespective of grade or quality that has been used in track.

All rail released by relaying will be classified and marked, according to the grade, in one of the following seven classifications:

Number one—marked by one strip	1
Number one saw—marked by one strip and dash	1—
Number two—marked by two strips	11
Number three—marked by three strips	111
Number three saw—marked by three strips and dash	111—
Scrap—marked by cross	×
Reclamation rail—marked by circle	O

Number one rail is second-hand rail suitable for renewals in main tracks; also rail that can be used for the manufacture of frogs, switches, etc. Number one rail must be 24 ft. or over in length for use in main lines. Calipered rail from the rail saw will grade as number one.

Number one saw rail is second-hand rail which, after sawing, will produce a number one rail as outlined above. Generally the only defect is that of batter.

Number two rail is second-hand rail suitable for renewals and repairs in passing tracks, thoroughfare tracks in yards and other similar tracks. It is usually physically defective rail, although serviceable. Number two rail must be 18 ft. or over for use in passing tracks.

Number three rail is second-hand rail suitable for use in industry and storage tracks, less important yard tracks, mine spurs and tracks that engines do not frequent.

Number three saw rail is second-hand rail that requires drilling, sawing or other labor before it can be used in track—generally the result of broken rails. Number three saw rail will produce, after sawing, number one or number two rail.

Scrap rail is second-hand rail which it is impracticable to use again in track on account of its physical condition.

Reclamation rail is rail that has failed on account of some physical defect within the period of five years from the date of the brand on the rail.

All rail under 15 ft. in length, regardless of grade or quality, is considered scrap and should be so classified. This rail is so classified on account of a ruling of the auditor.

Number one rail may be any length over 24 ft. It must be of sound steel, free from physical defects, straight as to line and surface, full drilled and in shape for repairs or renewals in main tracks. Number one rail shall not have a top surface wear of over 1/16 in., or a side surface wear of over 3/32 in.; measurements to be made at the center of the surface considered. It shall not have a batter of over 1/32 in.

Number one saw rail is rail that is defective only as to batter, and which after sawing will produce a number one rail, as outlined above.

Number two rail is so classified for the following causes and defects: wear on any surface of over 3/32 in., measurement to be made at the center of the surface considered; rail thrown out of line mechanically by the use of a Jim Crow or rail bender; rail that has been used on curves of such a degree that necessitates their being curved before use; rail badly pitted, burnt or with any perceptible head flaw; rail with slight metal flaw, but not ragged or saw edged; rail line and surface bent, but still usable; rail, flange broken, with only one piece broken from the base, such piece to be not over 30 in. in length, or nearer than 36 in. to the end of the rail; rail battered, the end

showing no other defect; batter limited to ¼ in. in excess of top wear; rail broken, but spliced with angle bars. The short pieces must be over ten ft. in length; rail curve worn to such an extent that it cannot again be used for main line repairs; limit of wear ten per cent. of area of head.

Number three rail is so classified for the following causes and defects: Rail badly curve worn when wear of ball exceeds ten per cent. of area of head; rail that has a ball wear on side of ball of ¾ in. and top wear ⅜ in.; rail with excessive metal flaw, ragged; rail with base broken in more than one place; rail with batter exceeding ¼ in. and which would produce, by being sawed, a number two rail; any rail that can be used without additional labor for sawing and drilling, but which would otherwise be scrap.

Number three saw rail is so classified for the following causes and defects: Rail full length, damaged, line or surface bent, from which can be recovered by sawing a number one or two rail full length for track use, or a piece of steel six ft. in length or over, to be used for the manufacture of frogs and switches; broken base rails with over one piece broken from base, but from which there can be recovered by sawing a number one or two rail over 15 ft. in length; rail battered ¼ in. or more at end; split end or split head rail, where observed conditions are not such as would indicate defective steel throughout the entire

View of Rail Yard.

rail; rail that has any defect that would prevent its use in track, but from which, after being sawed and drilled, there can be recovered a number one or two rail over 15 ft. in length.

Scrap rail includes all rail less than 15 ft. in length regardless of quality. It is rail so physically defective that it cannot be classified in any of the grades above outlined.

All rail must be inspected before and after relaying; before it is marked or finally classified.

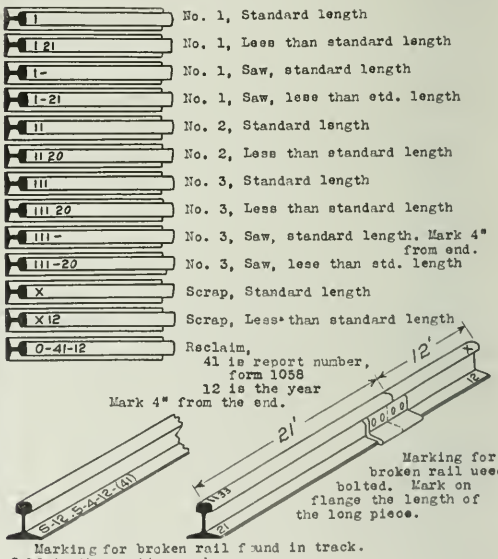
On the preliminary or first inspection made before the relaying begins rail inspectors must observe the condition of the rail as to curve, side and top wear, batter, head flaws and condition of line and surface. Only such rail as will grade number one is to be marked at this time; marking to be done by crayon on the gauge side of the web near the end of the rail. A preliminary report of the first inspection must be sent to the engineer maintenance of way in order that he may be advised as to probable amount of suitable relaying rail that will be recovered.

On the final inspection, after the rail has been released from track, the rail inspector must personally inspect the base of all rail which, on first inspection, was classified as number one, and know that such rail is physically sound steel. At this inspection all rail is to be finally marked on the ball with white paint. On all rail less than the standard length of 30 or 33 ft., according to the weight, the length shall be marked on the ball in addition to the classification marking; standard marking to be as shown on the accompanying chart.

Reclamation rail is rail that shows physical defects on final inspection. It can only be so classified when the relaying is done within a period of five years from the date of the brand on the rail. Such rails are to be marked and reported consecutively—the reports and rail numbers to correspond. On the ball of this rail should also be marked the month and year found.

Rail that is to be transported from any job of relaying to another territory and there relaid in the same position that it originally occupied in track will be called "pedigreed" rail. Inspectors will mark the line rail on the ball, with consecutive odd numbers; the gage rail with the even numbers, marking the number on each end of each rail. "Pedigreed" rail must receive the same final inspection as number one rail; to insure its being physically sound.

Inspectors will be furnished with a copy of the estimated amount of relaying to be done. They must keep an accurate



Methods of Marking Rail.

record of all rail released from any relaying they inspect; this record to show the grade and class of rail recovered. Final reports are to be sent to the engineer maintenance of way and division superintendent, showing accurately the amount of rail of each classification.

The rail inspectors will be supplied with calipers, straight edge, tallies, wedges, etc., as may be necessary. On preliminary inspection five track miles, and on final inspection, two track miles of rail will be considered a day's work. Accuracy is to be given preference at all times.

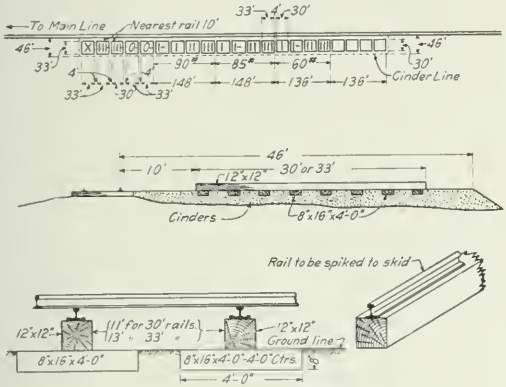
Without some standard system of rail classification, the inspection of rail released will be more or less superficial, ball inspection being the usual limit. This naturally allows many dangerous and defective rails to find their way again into main line track and has been known to result in serious derailments. It is also impossible to properly grade rail in any other way. Oftentimes a division officer will classify rail improperly and ship the wrong rail from his division, resulting in considerable loss for

handling and hauling it a considerable distance, before finding that it is unfit to use for the purpose intended. Cases are known where as a small job of relaying was being done the roadmaster would select good rail released, and use it "up the line" to repair rail of the same weight, releasing a poor grade of rail, and shipping it to some order he was holding. By the above system of inspection this is avoided and rail is of the same grade over the entire system.

A rail yard was built on each division, generally at headquarters, in which is stored all rail recovered from repairs and relaying, except that which is sent to the saw or the scrap, which is sent to the general storehouse. These yards are built at some permanent location, and each weight and class of rail is piled separately.

All sets of skids are given pile numbers, beginning with pile No. 1 for scrap. All rails are piled flush, the same end of all rails on all piles being marked; that is all marking of each pile is at the same end, and all piles in the yard are marked at the same end. Rails are not "balled in." No. 3 saw rail may be mixed in piling, but all other rail is kept separate.

The reclamation rail is piled separately only one tier high, and in consecutive order, according to reported failure. The number three saw rail is piled separately as to classification only, no effort being made to keep separate the various weights. All rail that is to be sawed is generally sent to the rail saw at once.



Layout of Rail Yard with Details of Skids.

The division superintendent makes a monthly report of the rail on hand available for shipment, showing the weight and grade. Its disposition is handled by the engineer maintenance of way, who orders it from one division to another, or for use on the division, as required. He has in his possession, at all times, the information as to the grade of rail available, so that he can dispose of it to the best advantage. By having these rail yards located on each division much of the rail recovered in relaying, which is to be used on that division, can be stored there with a minimum haul until it is required for A. F. E. work.

The usual allowance of one rail every track mile for main line, and one rail every odd track mile for branch lines and yards is all the "inactive stock" that is held on the various divisions. All other rail on the division is shown "available for shipment," either at division rail yards or at the saw mill yard, giving resource to the maximum amount of repair material.

In traveling over almost any railroad one can observe more or less rail distributed along the line, and at section tool houses. The amount of money invested in this one track supply alone is indeed large. Section foreman sometimes "like the crow" hide the material for "future use" which, in the majority of cases, never occurs.

The scheme for the handling and inspection of rail, as outlined above, is very simple, but must be followed closely. Its simplicity may commend it. This plan, however, was not produced on first trial, but is the result of experience and trials.

The reasons for its application are that it allows an easy and accurate invoice by auditors; assures physically sound rail for relaying and repairs on main lines; classifies all rail so that the best distribution can be made according to the use for which the rail is required; keeps all rail at headquarters as "active stock," available for use at all times; permits grading the rail the same the system over; and reduces the haul of a large amount of rail off the division until it is assigned to some particular work.

"SAFETY FIRST."*

By E. B. Fithian,

General Roadmaster, Missouri Pacific, Little Rock, Ark.

Very few railway men who have given thought to the injuries that occur to maintenance of way employees will take exception to the statement that at least 50 per cent. and possibly 70 per cent. of such injuries are due either to the carelessness of the employees themselves, or to the improper supervision of the foreman directly in charge of the men, who does not observe closely the action of his men and enforce the rules of common sense and of the company. This condition particularly exists in the south where a large per cent. of the section laborers are negroes, and who, unfortunately, do not receive the consideration that they should at the hands of their foremen.

The remedy is to make the laborers and foremen realize the tremendous number of maintenance of way employees injured and then impress them with the fact that their own self-preservation depends on the observation of the rules of the company, and of common sense. The laborers who are constantly changing and of various nationalities, are hard to interest in the subject, and it requires time and persistent effort to attain the object desired. They have to be reached through the foreman and this means that the efforts should be concentrated on him.

The foremen, as a rule, are men who have been in the service for years. Most of them can be readily interested in any subject that will advance the interest of themselves and the company. They are particularly loyal to their roadmaster or supervisor, and will be constantly on the alert to make the subdivision on which they are located, the banner subdivision. The best way to interest foremen is collectively, and a meeting once in two months, or possibly oftener, at some convenient point, will bring out ideas and stir up a rivalry that will result in untold benefit to all concerned.

A careful record should be kept of the number of injuries in each gang of section men and carpenters, with the cause of the injury. This record should be bulletined each month and issued before the meeting of the foremen, so as to bring out the discussions. Where foreigners are employed to any extent, these reports or bulletins should be written in languages that can be read by all the laborers. There is no better place to post a report than on a bulletin board, protected if necessary, outside of the tool house where the laborers are sure to have time and sufficient light to read it.

Finally, we should not overlook the necessity of providing the very best sanitary conditions in connection with our camps. The greatest enemy that the soldier has to meet and conquer is sickness resulting from unsanitary conditions of the camps. Similar conditions at times surround our camp outfits and too often these are overlooked. The roadmaster and foremen should take a particular interest in each individual camp, arousing in some way a rivalry among the camps, to have each outdo the others to win some praise or comment from superior officers as one of the best camps. This condition can probably be best secured if closer supervision of the camps is given by the division officers and surgeon, with periodical inspections, without notice when the inspections are to be made.

*Received in the Safety contest, which closed October 25, 1912.

1913 A. R. E. A. COMMITTEE ASSIGNMENTS.

Complete List with Names of Members Appointed and Subjects Assigned for Investigation and Report This Year.

The new committees selected by the Board of Direction of the American Railway Engineering Association, together with the subjects assigned to the various committees for study during this year are as follows:

COMMITTEE I.—ROADWAY.

1. Report on and recommend unit pressures allowable on roadbed of different materials, conferring with Committee on Ballast.
2. Report on tunnel construction and ventilation.
3. Economics in roadway labor.

W. M. Dawley, Erie, chairman; J. A. Spielmann, B. & O., vice-chairman; Ward Crosby, C. C. & O.; W. C. Curd, M. P.; Paul Didier, B. & O.; R. C. Falconer, Erie; S. B. Fisher, M. K. & T.; Frank Merritt, G. C. & S. F.; F. M. Patterson, C. B. & Q.; W. D. Pence, Univ. of Wisconsin; A. C. Prime, P. R. R.; M. J. Corrigan, B. & O.; H. J. Slifer, Cons. Eng.; J. E. Willoughby, Caribbean Constr. Co.; W. P. Wiltsee, N. & W.; L. M. Perkins, N. P.; E. G. Ericson, P. L. W.; L. G. Morphy, B. & A.; W. H. Petersen, C. R. I. & P.

COMMITTEE II.—BALLAST.

1. Further investigation of proper depth of ballast of various kinds to insure uniform distribution of loads on roadway, conferring with Roadway Committee.
2. Revise ballast sections with particular reference to the use of a sub- and top ballast.
3. Investigate methods of cleaning stone ballast and obtain cost of same by various methods.

H. E. Hale, M. P., chairman; J. M. Meade, A. T. & S. F., vice-chairman; L. W. Baldwin, I. C.; D. P. Beach, P. L. W.; W. J. Bergen, N. Y. C. & St. L.; A. F. Blaess, I. C.; T. C. Burpee, Intercolonial; O. H. Crittenden, I. & G. N.; F. T. Darrow, C. B. & Q.; J. M. Egan, I. C.; T. W. Fatherson, C. R. I. & P.; H. L. Gordon, B. & O.; G. H. Harris, M. C.; C. C. Hill, M. C.; S. A. Jordan, B. & O.; William McNab, G. T.; A. S. More, C. C. C. & St. L.; J. V. Neubert, N. Y. C. & H. R.; S. B. Rice, R. F. & P.; E. V. Smith, B. & O.; F. J. Stimson, G. R. & I.; S. N. Williams, Cornell College.

COMMITTEE III.—TIES.

1. Report on the effect of design of tie-plates and track spikes on durability of ties.
2. Continue study of the stresses to which cross-ties are subjected, and determine size required.
3. Report on economy in labor and material effected through use of treated ties compared with untreated ties.

L. A. Downs, I. C., chairman; G. W. Merrell, N. & W., vice chairman; H. W. Brown, P. L. W.; W. J. Burton, M. P.; E. D. Jackson, B. & O.; H. C. Landon, Watauga & Yadkin River; F. R. Layng, B. & L. E.; E. R. Lewis, D. S. S. & A.; R. J. Parker, A. T. & S. F.; J. G. Shillinger, Rutland; G. D. Swingly, B. & O.; D. W. Thrower, I. C.; H. S. Wilgus, P. S. & N.; Louis Yager, N. P.; E. C. Young, N. Y. P. & N.; A. M. Acheson, M. K. & T.; C. C. Albright, Purdue Univ.; O. P. Allee, Fort Smith & Van Buren, S. B. Clement, Temiskaming & Northern Ontario.

COMMITTEE V.—TRACK.

1. Continue study of main line turnouts and crossovers.
2. Report on the economics of track labor.
3. Study the relation between worn flanges and worn switch points, with a view to correcting the cause and decreasing the number of derailments due to the combination of a worn switch point and worn flanges on wheels.

J. B. Jenkins, B. & O., chairman; G. J. Ray, D. L. & W., vice-chairman; Geo. H. Bremner, C. B. & Q.; Garrett Davis, C. R. I. & P.; J. M. R. Fairbairn, C. P. R.; T. H. Hickey, M. C.; E. T. Howson, *Railway Age Gazette*; J. R. Leighty, M. P.; C. Millard, C. G. W.; P. C. Newbegin, Bangor & Aroostook; H. T. Porter, B. & L. E.; W. G. Raymond, State Univ. Iowa; S. S. Roberts, Cons. Eng.; L. S. Rose, C. C. C. & St. L.; H. R. Safford, G. T. R.; C. H. Stein, C. R. R. of N. J.; F. S. Stevens, P. & R.; H. M. Church, B. & O.; J. F. Hughes, C. R. I. & P.; A. H. [illegible], K. C. T.; [illegible], A. T. & S. F.; F. B. Oren, I. C.; Raffe [illegible], Cons. Eng.

COMMITTEE VI.—BUILDINGS.

1. [illegible] design of inbound and outbound freight [illegible].
2. [illegible] the advantages and disadvantages of the various designs of [illegible].
3. [illegible] of heating, lighting and sanitary provisions for [illegible] stations.

[illegible], chairman; M. A. Long, B. & O., vice-chairman; G. W. [illegible], B. & O.; [illegible] P. Carey, B. & M.; D. R. Collin, N. Y. C. & H. R.; [illegible], C. G. W.; C. H. Fake, M. R. & B. T.; [illegible], N. Y. & [illegible]; G. H. Gilbert, O. & C.; A. T. Hawk, C. R. I. & P.; H. A. [illegible]; W. [illegible], P. R. R.; O. P. Chamberlain, [illegible]; W. [illegible], G. T. R.

COMMITTEE VII.—WOODEN BRIDGES AND TRESTLES.

1. Complete report on formulae for use in determining the strength of sheet piling.
2. Complete report on the use of guard rails for wooden bridges and trestles.
3. Report on relative economy of repairs and renewals of wooden bridges and trestles.

I. L. Simmons, C. R. I. & P., chairman; W. S. Bouton, B. & O., vice-chairman; H. Austill, Jr., M. & O.; F. E. Bissell, A. C. & Y.; E. A. Frink, S. A. L.; E. A. Hadley, M. P.; H. S. Greenwood, C. N.; A. O. Ridgway, D. & R. G.; H. S. Jacoby, Cornell Univ.; P. B. Motley, C. P. R.; W. H. Hoyt, D. M. & N.; D. W. Smith, H. V.; W. F. Steffens, C. & O.; H. B. Stuart, G. T. R.; F. J. Bachelder, B. & O.; J. E. Barrett, L. & H. R.

COMMITTEE VIII.—MASONRY.

1. Report on waterproofing of masonry and bridge floors, including methods, cost and results, with definite recommendations.
2. Report on the effect of concrete structures of rusting of the reinforcing material.
3. Report on the principles of design of plain and reinforced concrete retaining walls, abutments and trestles.

G. H. Tinker, N. Y. C. & St. L., chairman; F. L. Thompson, I. C., vice-chairman; R. Armour, G. T.; C. W. Boynton, Universal Portland Cement Co.; T. L. Condron, Cons. Eng.; J. K. Conner, L. E. & W.; W. A. Clark, D. & I. R.; Frank Taylor, C. P. R.; G. W. Hegel, C. J.; L. J. Hotchkiss; R. L. Humphrey, Cons. Eng.; J. H. Prior, C. M. & St. P.; F. E. Schall, L. V.; G. H. Scribner, Jr., Contr. Eng.; A. N. Talbot, Univ. of Illinois; J. Tuthill, K. C. T.; J. J. Yates, C. R. R. of N. J.; John C. Beye, C. R. I. & P.

COMMITTEE IX.—SIGNS, FENCES AND CROSSINGS.

1. Continue the investigation of ways and means for securing a proper quality of fence wire to resist corrosion and secure durability.
2. Concrete and metal for signs and signals as compared with wood.
3. Concrete and metal as compared with wood for fence posts.

C. H. Stein, C. R. R. of N. J., chairman; G. E. Boyd, D. L. & W., vice-chairman; R. B. Abbott, P. & R.; J. A. Stocker, T. & O. C.; H. E. Billman, M. P.; Maro Johnson, I. C.; E. T. Brown, B. & O.; J. T. Frame, C. G. W.; C. M. James, A. C. L.; L. C. Lawton, A. T. & S. F.; A. C. Copland, C. & O.; F. N. Crowell, P. L. W.; Arthur Crumpton, G. T.; L. E. Haslip, B. & O.; G. L. Moore, L. V.; J. B. Meyers, B. & O.; C. H. Splitstone, Erie; W. F. Strouse, B. & O.; W. D. Williams, Cin. Nor.; B. M. Cheney, C. B. & Q.

COMMITTEE X.—SIGNALS AND INTERLOCKING.

1. Report on economics of labor in signal maintenance.
2. Formulate and submit requisites for switch indicators, including method of conveying information on condition of the block to conductor and engineman.
3. Investigate and report on automatic train control.

Thos. S. Stevens, A. T. & S. F., chairman; C. C. Anthony, P. R. R., vice-chairman; A. H. Rudd, P. R. R.; Azel Ames, Cons. Eng.; H. S. Balliet, N. Y. C. & H. R.; W. B. Causey, C. G. W.; C. A. Christofferson, N. P.; C. E. Denney, L. S. & M. S.; W. J. Eck, Southern; W. H. Elliott, N. Y. C. & H. R.; G. E. Ellis, K. C. T.; M. H. Hovey, Cons. Eng.; A. S. Ingalls, L. S. & M. S.; J. C. Mock, Detroit River Tunnel Co.; F. P. Patenall, B. & O.; J. A. Peabody, C. & N. W.; W. B. Scott, S. P.; Edwin F. Wendt, P. & L. E.

COMMITTEE XI.—RECORDS AND ACCOUNTS.

1. Make a comprehensive study of the forms in the Manual which were adopted a number of years ago, and bring forms up to date.
2. Continue study of the economical management of store supplies.
3. Recommend feasible and useful subdivisions of I. C. C. classification account No. 6, with a view of securing uniformity of labor [illegible].
4. Study the subject of reports required by National and State Railway Commissions.

M. C. Byers, G. N., chairman; J. H. Milburn, B. & O., vice-chairman; J. M. Brown, C. R. I. & P.; W. A. Christian, C. G. W.; G. J. Graves, A. T. & S. F.; J. D. Hill, I. & N.; Henry Lehn, N. Y. C. & H. R.; O. K. Morgan, C. C. & O.; F. Ringer, M. K. & T.; Guy Scott, P. L. W.; W. S. Danes, Wabash.

COMMITTEE XII.—RULES AND ORGANIZATION.

1. Review rules and instructions heretofore adopted by the Association and recommend such changes and additions thereto as may seem desirable.
2. Formulate rules for the guidance of field parties
   (a) When making preliminary surveys for railroad location.
   (b) When making location surveys.
   (c) When in charge of construction.

E. B. Brooke, B. & O., chairman; F. D. Anthony, D. & H., vice-chairman; J. B. Carothers, B. & O.; S. E. Coombs, N. Y. C. & H. R.; C. Dougherty, O. & C.; K. Hanger, C. R. I. & P.; F. F. Robinson, B. R.

A. [illegible] Jos. M[illegible]ler, C. C. C. & St. L.; B. Her[illegible], Southe[illegible]; E. I. Re[illegible], L. V. R. P. B[illegible]k, K. & M.; C. E. Lin[illegible], N. Y. C. & H. R.

COMMITTEE XIII.—WATER SERVICE.

1. Report on the design and relative economy of track pans from an operating standpoint.

2. Report on water treatment and result of study being made of water softeners from an operating standpoint.

3. Report on recent developments in pumping machinery.

J. L. Campbell, E. P. & S. W., chairman; A. F. Dorley, M. P., vice-chairman; C. C. Cook, B. & O.; E. G. Lane, B. & O.; R. H. Gaines, F. C. S.; W. I. R[illegible]hbock, W. & L. E.; A. Mordecai, Cons. Eng.; W. A. Parker, St. J. & G. I.; W. S. Lacher, C. M. & St. P.

COMMITTEE XIV.—YARDS AND TERMINALS.

1. Report on typical situation plans of passenger stations, of both through and stub types, with critical analysis of working capacity, and include a review of the different methods of estimating their capacity.

2. Report on developments in the handling of freight by mechanical means.

3. Report on developments in the design and operation of hump yards.

4. Report on track scales.

C. H. Spencer, Washington Term., chairman; E. B. Temple, P. R. R., vice-chairman; W. G. Arn, I. C.; H. Baldwin, C. C. C. & St. L.; G. H. Burgess, D. & H.; A. E. Clift, I. C.; H. T. Douglas, C. & A.; A. C. Everham, K. C. T.; D. B. Johnston, P. L. W.; H. A. Lane, B. & O.; G. P. Johnson, D. T. & I.; L. J. McIntyre, N. P.; B. H. Mann, M. P.; A. Montzheimer, E. J. & E.; L. S. Seddon, S. A. L.; E. E. R. Tratman, *Engineering News*; W. L. Webb, C. M. & St. P.; J. G. Wishart, C. R. I. & P.; R. Ferriday, C. C. C. & St. L.; E. P. Weatherly, K. C. T.; C. C. Wentworth, N. & W.; H. J. Pfeifer, T. R. R. A. St. L.; G. H. Herrold, Department of Public Works, St. Paul, Minn.

COMMITTEE XV.—IRON AND STEEL STRUCTURES.

1. Report on the methods of protection of iron and steel structures against corrosion.

2. Study the design of built-up columns, co-operating with other investigators and committees of other societies.

3. Report on design and length of turntables.

4. Report on the relative economy of various types of movable bridges for varying lengths of spans.

A. J. Himes, N. Y. C. & St. L., chairman; O. E. Selby, C. C. C. & St. L., vice-chairman; J. A. Bohland, G. N.; A. W. Buel, W. M.; Charles Chandler, I. C.; C. L. Crandall, Cornell University; J. E. Crawford, N. & W.; J. E. Greiner, B. & O.; W. H. Moore, N. Y. N. H. & H.; A. F. Reichmann, American Bridge Co.; G. E. Tebbetts, K. C. T.; L. F. Van Hagen, Univ. of Wisconsin; F. O. Dufour, Univ. of Illinois; C. E. Smith, M. P.; I. F. Stern, Cons. Eng.; F. E. Turneaure, Univ. of Wisconsin; A. W. Carpenter, N. Y. C. & H. R.; W. R. Edwards, B. & O.; A. R. Raymer, P. & L. E.; William Michel, H. V.

COMMITTEE XVI.—ECONOMICS OF RAILWAY LOCATION.

1. Continue the study of analyses of operating accounts affected by changes in the physical characteristics of location with special attempt to reach as early as possible some approximate values for gradient, distance, rise and fall, and curvature, in order to assist the field engineer with reference to the questions of relative values of location.

R. N. Begien, B. & O., chairman; C. P. Howard, Cons. Eng., vice-chairman; A. K. Shurtleff, C. R. I. & P.; F. H. Alfred, P. M.; A. C. Dennis; F. W. Green, L. & A.; P. M. La Bach, C. R. I. & P.; F. W. Smith, C. C. C. & St. L.; H. J. Simmons, E. P. & S. W.; W. L. Webb, Cons. Eng.; M. A. Zook, Cons. Eng.; J. F. Burns, L. & N.; E. C. Schmidt, Univ. of Illinois; L. C. Hartley, C. & E. I.; J. G. Sullivan, C. P. R.; C. W. P. Ramsey, C. P. R.; J. deN. Macomb, A. T. & S. F.

COMMITTEE XVII.—WOOD PRESERVATION.

1. Continue investigations of the merits as a preservative of oil from water gas and the use of refined coal tar in creosote oil.

2. Continue the compilation of available information from service tests.

3. Continue the investigation of the proper grouping of the different timbers for antiseptic treatment, conferring with Committee on Grading of Lumber.

4. Report on methods of accurately determining the absorption of creosote oil.

Earl Stimson, B. & O., chairman; E. H. Bowser, I. C., vice-chairman; H. B. Dick, B. & O. S. W.; C. F. Ford, C. R. I. & P.; V. K. Hendricks, St. L. & S. F.; G. E. Rex, A. T. & S. F.; C. M. Taylor, P. & R.; Dr. Hermann von Schrenk, Cons. Eng.; T. G. Townsend, Southern; Jos. O. Osgood, C. R. R. of N. J.

COMMITTEE XVIII.—ELECTRICITY.

1. Continue the consideration of the subject of clearances.

2. Report on the effect of electrolytic action on metallic structures and the best means of preventing it.

3. Continue the preparation of a standard specification for overhead transmission line crossings.

4. Continue the investigation on electrolysis and insulation.

5. Report on maintenance organization with relation to track structures.

Geo. W. Kittredge, N. Y. C. & H. R., chairman; J. B. Austin, Long Island, vice-chairman; D. J. Brumley, I. C.; R. D. Coombs, Cons. Eng.; A. O. Cunningham, Wabash; L. C. Fritch, C. G. W.; George Gibbs, Long Island; G. A. Harwood, N. Y. C. & H. R.; [illegible] B. Katte, N. Y. C. & H. R.; C. E. Lindsay, N. Y. C. & H. R.; W. S. Murray, N. Y. N. H. & H.; A. F. Robinson, A. T. & S. F.; Frank Rhea, General Electric Company; J. W. Reid, C. & A.; J. R. Savage, Long Island; M. Schreiber, Public Service Railway; W. I. Trench, B. & O.; H. U. Wallace, Northern Colorado Power Company; A. G. Shaver, C. R. I. & P.; Walt. Dennis, C. R. I. & P.

COMMITTEE XIX.—CONSERVATION OF NATURAL RESOURCES.

1. Continue the study of tree planting and general reforestation.

2. Continue the study of coal and fuel oil resources.

3. Continue the study of iron and steel resources.

William McNab, G. T., chairman; C. H. Fisk, Cons. Eng., vice-chairman; R. H. Aishton, C. & N. W.; M. Burpee, Bangor & Aroostook; F. F. Busteed, C. P. R.; A. W. Carpenter, N. Y. C. & H. R.; W. A. McGonagle, D. M. & N.; G. A. Mountain, Canadian Railway Commission; W. L. Park, I. C.; G. H. Webb, M. C.; R. C. Young, L. S. & I.

SPECIAL COMMITTEES.

Grading of Lumber.

1. Continue the collection of current specifications, grading and inspection rules for maintenance of way timber and lumber, not heretofore reported on, and present same for all classes of maintenance of way timber and lumber, which will conserve the interests of railways and be acceptable to manufacturers' associations; conferring with committees of this association and with other organizations whose work is affected.

2. Prepare standard specifications for timber for treatment, conferring with Committee on Wood Preservation.

Dr. Hermann von Schrenk, Cons. Timber Eng., chairman; B. A. Wood, M. & O., vice-chairman; W. McC. Bond, B. & O.; D. Fairchild, N. P.; R. Koehler, S. P.; A. J. Neafie, D. L. & W.; W. H. Norris, Me. C.; J. J. Taylor, K. C. S. R.; R. C. Sattley, C. R. I. & P.

Uniform General Contract Forms.

1. Continue the study of general contract forms, including forms for bonds and proposals.

W. G. Atwood, L. E. & W., chairman; C. A. Wilson, Cons. Eng., vice-chairman; J. C. Irwin, Cons. Eng., B. & A.; C. Frank Allen, Mass. Inst. of Technology; E. F. Ackerman, L. V.; Thos. Earle, Pennsylvania Steel Company; J. P. Congdon, Cons. Eng.; R. G. Kenly, M. & St. L.; E. H. Lee, C. & W. I.; C. A. Paquette, C. C. C. & St. L.; H. C. Phillips, A. T. & S. F.; J. H. Roach, L. S. & M. S.; C. A. Wilson, Cons. Eng.; H. A. Woods, G. T. P.

FLOOD DESTRUCTION ON THE BALTIMORE & OHIO.

The damage done to the railways in Ohio, Indiana and adjacent states by the floods following the storms of the last week in March have been covered from week to week in these columns. A brief description of the organization now engaged in the reconstruction of the damaged lines of the Baltimore & Ohio—one of the principal sufferers—will indicate how this emergency has been met by the various railway systems. In less than two weeks' time, train service has been restored on nearly all the lines affected and much headway has been made in permanently rebuilding the damaged lines.

After a careful inspection of the devastated territory by Daniel Willard, president; A. W. Thompson, vice-president, and Francis Lee Stuart, chief engineer, it was estimated that the damage to the Baltimore & Ohio lines will reach $2,500,000 to $3,000,000, and that the damage in Ohio alone will be between $1,500,000 and $2,000,000. From their observation of the condition of other lines, they estimated that the damage to all railways in Ohio may reach $10,000,000. This inspection showed that in addition to many miles of track covered with water and broken by washouts, 12 bridges on the main line of the Baltimore & Ohio were put out of service, including those over the Muskingum river at Zanesville, Ohio, and at Marietta, Ohio, over the west fork of the White river at Washington, Ind., over the big Miami river at Lawrenceburg, Ind., over the little Miami river at Hamilton, Ohio, over the east fork of the White river at Brownsville, Ind., and over the Blue river at Morristown, Ind.

Immediately upon receipt of information regarding the extent of the floods, an emergency organization was effected in both the operating and engineering departments. Portions of the lines which had been damaged were temporarily divided into separate divisions with despatching organizations and division officials in charge. These local organizations were maintained until repair

work was gotten under way, when the division organizations were restored.

The resources of the entire system were placed at the disposal of the affected lines. By the time the water receded enough to enable work to be done, 6,000 laborers with camp trains, tools, equipment and commissaries were waiting at various points between Parkersburg, W. Va., and Pittsburgh to enter the flood districts. Large forces were also gathered west of the trouble. Eighteen pile drivers were immediately put in operation, six of these machines having been secured from western railways. Divers were employed to examine the abutments and piers of the damaged bridges, as well as those that remained intact. The reconstruction work has been pushed night and day, pile drivers, derricks, steam shovels and other equipment being operated in double shifts.

The work of reconstruction has been divided into districts, being placed in charge of different officers of the engineering staff as follows: Paul Diddier, principal assistant engineer, Pittsburgh, in charge of Zanesville territory and rebuilding Zanesville bridge; A. M. Kinsman, engineer of construction, Cincinnati, in charge of the Indiana division, B. & O. S. W., west from Cincinnati; J. T. Wilson, district engineer, Baltimore, in charge of the B. & O. S. W., east from St. Louis; L. G. Curtis district engineer, Chicago, in charge of the Indianapolis division, C. H. & D., including Hamilton yards and bridge; J. B. Carothers, special engineer, Baltimore, in charge of the Columbus district; F. E. Lamphere, assistant engineer, Chicago, in charge of the Louisville district and Lawrenceburg bridge; B. R. Hundley, assistant engineer, Chillicothe, Ohio, in charge of the Chillicothe district and yards; and Claude Brown, assistant engineer, Chicago, in charge of the Toledo division, C. H. & D. and Dayton district. Plans for new bridges and buildings and the repair of existing structures are being made under the direction of W. S. Bouton, engineer of bridges, and A. M. Long, assistant to chief engineer.

In order that no time shall be lost in the replacement of bridges options were immediately taken on bridge steel, and contracts have already been let for the rebuilding of the bridges at Zanesville, Hamilton and Lawrenceburg, while other contracts will be placed as soon as possible for the remaining structures. Further contracts have already been let for a retaining wall to protect the railroad tracks at Kent, Ohio, where a heavy washout occurred, and for rebuilding the outbound freight station which collapsed at Dayton.

CARE IN TRACK WORK.*

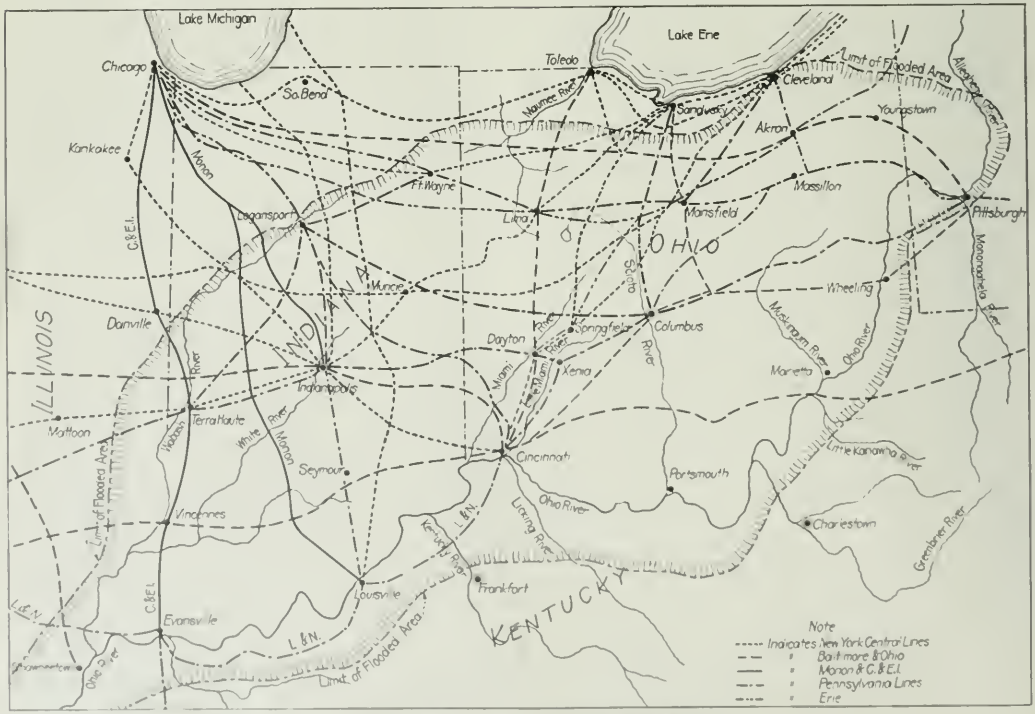
By John A. Johnson,

Section Foreman, Peninsula Division, Chicago & North Western.

In hiring men a track foreman should make a special effort to impress upon them the necessity for carefulness and thoughtfulness during their service, and explain very plainly the dangers and accidents that will result from recklessness. Safety demands this. When foremen must employ foreigners, they should see that the men are first supplied with a book of rules and regulations pertaining to the work on or about the track, that they may become thoroughly acquainted with their duties. If foremen were allowed to pay their men wages that are paid other laborers locally, the present demand for foreigners who speak and understand little or no English would be reduced, and thereby make safer conditions in districts of three or four tracks.

Before starting out for work a foreman should make sure that his hand car is in a good and safe condition, and when

*Received in the Safety contest which closed October 25, 1912.



Principal Main Lines in the Flooded District.

going to and from work should never allow his men to place a track jack or a water keg on the front end of the car. He should also see that the necessary tools are placed so as to leave a clear and safe footing, and never under any circumstances, allow men to jump off and on the car while it is in motion.

During the daily work of laying or digging out ties, for instance, the foremen should watch that their men do not pile the gravel too high in the center of track, for an engine striking the piles might throw the gravel and stones with sufficient force to injure men standing near by. They should also see that tamping bars and track picks are not left in an upright position on the shoulder of the track while trains are passing, and should never let men work with defective tools. When a train is approaching, foremen should see that their men leave their work in time to reach a safe distance from the track. In unloading track material, such as rails and ties along the track, great care should be taken to leave a proper clearance, especially at switches. These are simple ideas, but if lived up to, many injuries and accidents will be avoided.

RAIL LAYING.*

By Engineer.

The most active season for track work should be the months of May and June. Probably more work per dollar can be obtained during the month of May than during any other month in the year. The weather is usually good; the temperature is such that men can work in comfort; they are usually willing to work and need money more than later in the season, and they have not reached the restless stage that comes with hot weather, when they desire to change their jobs and ask for higher pay. Of late, each year has seen this benefit of an early start more clearly recognized, one of the western roads having 3,800 men in extra gangs at work on April 1, this year, besides increasing the regular gangs. The additional labor required on account of the recent floods is likely to add to the expected scarcity of help during the present year.

The most important work under way in May is rail relaying. Methods of doing this are almost as varied as there are roads in the country. It may be done by large or small gangs. Where there is a large mileage to be relaid a large gang will be found more economical. It should be composed of chosen men, who as far as possible should be of large size on account of the character of the work. Seventy-five or 80 men is not too many to make rapid progress.

The gang should have a competent foreman with about three assistants, one to handle the men preparing for the rail laying, one to supervise the throwing of the rails out and in, and one to follow behind the rail laying with men finishing up. The foreman should have general supervision and should see that the parts of the gang are varied as the work may necessitate. As curves, switches, crossings, difference in men and other causes make one part of the work go faster than another, the men should be transferred accordingly.

The following arrangement of a gang has been found fairly typical and can be varied from at will: eight men pulling spikes, four men taking out bolts, two men putting in tie plugs, 12 men adzing ties, four men placing tie plates, 16 men handling rail, one man cleaning ties and one inserting shims, eight men bolting up rail, 14 men spiking and gaging the rail, two men distributing spikes and bolts and two men putting on rail anchors. These, with two water boys, would make up a gang of 80 men with foremen. A gang of this size properly officered and well housed should relay over a mile of track complete per working day, including unbolting the old rail ready to pick up, but not including any surfacing or tie spacing.

*The third of a series of articles on timely maintenance topics. The first appeared on page 351 of the issue of February 21 and the second appeared on page 498 of the issue of March 14.

Adzing is a very important detail of rail relaying, as on this depends the support of the rail on the ties and its degree of slant or cant. Ties should be adzed to a true plane, so that the tie plates on the rail may lay perfectly flat and bear on the tie over their entire area. If the rail is to be canted this may be accomplished by the tie plate or by adzing. Canting the rail is not a universal practice and with the heavy rail is not as necessary as formerly.

Spikes should be pulled on the inside of each rail only, except where the size of rail is changed when it may be necessary to pull three rows. Where possible bolts should be unscrewed, but frequently they will be found so rusted that it will be necessary to break them off. The practice of oiling bolts at intervals to prevent rusting is becoming more frequent, and where this is done no trouble will be found in removing the nuts.

The best method of spacing the rail to insure the proper expansion at the joints is to use steel shims, although many roads still use wooden shims, in spite of their objectionable features. With the heavy rail now in use, the amount of expansion can be cut down very much from what was formerly the practice, a reduction of ½ in., the expansion formerly provided for 65 lb. rail, being sufficient for 90 lb. rail.

Rail gangs should always be supplied with switch points, so that the track may be quickly closed for use without any rail cutting. On sharp curves the rail should be curved before laying either in the rail yard before shipment or by a small gang working ahead of the rail gang.

There are two methods of laying rail. One is to throw out a long string of rail on one side and throw in a string behind it, connecting up the new string before the old one is taken out, but this has the disadvantage that the expansion is lost in throwing in the new rail. The most generally adopted method is to throw out a string on one side and insert the new rails one at a time with the proper expansion. The laying on each side should as far as possible be carried along together, but this cannot always be done on account of curves, switches and traffic considerations.

In order to save handling when laying, the rail should be unloaded in the proper place when it is taken off the cars. Rail should never be thrown or dropped from the cars, but should be handled by an unloader of some kind, and so placed that it will have to be moved a minimum distance by the rail laying gang. If the gang has to carry the rail one-half length or more it lessens the amount of work they can accomplish very materially. Some roads have extra gangs and train crews especially organized and held for this work, who become skilled in it.

All material should be delivered before it will be needed, so that there will be no delays on account of a lack of material. A rail laying gang costs approximately $150 per day. An hour's delay means $15 lost, and ten minutes' delay $2.50 wasted. It is not uncommon to find rail laying gangs out of spikes or bolts, or tie plugs, which is usually a result of expensive carelessness on the part of somebody.

When a rail laying machine is used the number of men in the rail laying portion of the gang may be reduced accordingly. These machines are of recent invention and some of them are of advantage in handling rail, especially as the rail relaid is gradually becoming heavier every year.

Cutting new rail should be avoided as far as possible. Short rails should be used on the inside of curves to make the joints space properly, and can also be used between switches in station grounds. Second quality rails should not be placed in main tracks but in yard tracks and in leads or running tracks.

Rail taken up out of the track should be classified before being picked up by men specially trained, so that there will be no variation in the rail of any given quality over the road or system. After marking it should be picked up by an unloading machine or derrick, and the rail of each kind and quality loaded in lots by itself. This avoids much re-handling in the

rail yards if the rail is sent in for sawing or for distribution to other points.

It is customary on many roads to follow the rail laying gang closely with surfacing gangs, whose duty is to re-adjust the ties at the new joints and to surface the track in finished condition. However, this is not always done, and it is an open question as to whether it is not better to use stronger joints and lay the new rail without regard to where the joint comes on the ties, as is being done by some roads with very heavy traffic. Although this may be said to be in an experimental stage, it has several advantages, one of which is that it costs much less money and another that rail laying can go on in all seasons of the year, winter as well as in summer. If rail can be laid in the winter it is out of the way of other work, and gives an opportunity to employ men at a time when work is slack and they are easily obtained. It is also much easier to obtain and hold good men when they can have employment the entire year. Eliminating the spacing of ties saves disturbing the bed and does away with much of the consequent surfacing throughout the season. On the other hand, it requires a heavier and stiffer joint, as there is unquestionably a greater strain on the joint than when ties are spaced for it.

Rail laying should be pushed at this season of the year not only because it is a large and important part of track maintenance work, but also because much other important track work cannot be done until after the rail laying is out of the way. Ballasting must wait, tie renewals cannot be made, while surfacing also cannot be done.

THE GALESBURG TIE PLANT OF THE C. B. & Q.

The Chicago, Burlington & Quincy has given much attention during recent years to the subject of timber preservation and now operates two treating plants with a combined rated capacity of 2,800,000 ties. The first plant was built at Edgemont, S. Dak., in 1900, and was moved the following year to Sheridan, Wyo., where it is still located. Two retorts with an annual rated capacity of 800,000 ties are operated at this plant, all timber treated being pine cut locally in that vinicity. In 1907 a second plant with three retorts and a rated capacity of 1,200,000 ties was built at Galesburg, Ill., and has been in continuous operation of the largest commercial or railway plants in the country in output of treated material.

The annual requirements of the Burlington are now about 3,000,000 ties. The capacity of the Galesburg plant as now enlarged is 2,500,000 ties, based upon treating red oak. However, as about 40 per cent. of the material treated at this plant previous to the enlargement consisted of piling and lumber, it is anticipated that only about three-fourths of the ties required will be treated at the two plants combined. All ties treated at Sheridan are used on the lines west of the Missouri river, while over 305,000 ties were also shipped to the same territory from

Fig. 2—General View of Treating Plant.

the Galesburg plant last year. Nearly all the ties treated at Galesburg come from the south; the larger proportion coming from the Tennessee and Green river countries in Tennessee and Kentucky, and being delivered to the Burlington at Metropolis, Ill., on the Ohio river. Some ties are also secured at St. Louis and locally along the line. Of the ties handled at Galesburg last year, 60 per cent. were red oak, 26 per cent. short leaf pine, and

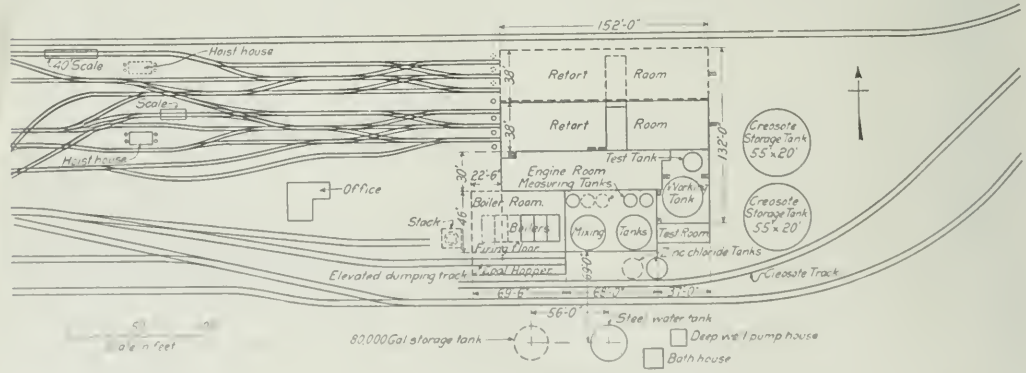


Fig. 1—Plan of New Facilities at Galesburg Tie Plant.

10 per cent. cypress, while the percentages of red oak and short leaf pine ties received the preceding year were 74 and 12, respectively.

The type of construction originally adopted in the Galesburg plant and which has been followed in the additions, is reinforced concrete throughout. Provision was made for future additions when the plant was originally constructed, so that the enlarge-

ment made the past year was carried on without interfering with the operation of the existing plant. The facilities added last year are shown clearly by the dotted lines in the accompanying drawing. The principal additions were in the retort room, which was doubled in size, and in the boiler room, where provision was made for three additional boilers, although only two are installed at the present time.

While concrete has not been generally adopted in the construction of wood preserving plants largely because of its increased cost, it adapts itself readily to this work. Although no attempt was made to bring out pleasing architectural details in the Galesburg plant, the building presents a neat appearance, especially in view of the purpose for which it is intended. With concrete floors and walls, the plant can be readily kept clean, as the oil will not penetrate it as it does timber, and it is, of course, fireproof.

The roof is of reinforced concrete slab construction 5 in. thick, waterproofed with Ceresit, the slabs being supported on concrete walls and pillars. Two skylights are provided in the new addition to assist in lighting the interior. The new retorts are of the same size as the original ones, namely: 132 ft. long by 6 ft. 2 in. in diameter, and will hold 16 trams of ties or an average of 1,952 cu. ft. of timber in one charge. The new retorts vary from the old ones in that swinging doors are provided at each end so that access to the retorts may be gained at either end in case of an accident. Only one door will be used except in such cases. The steel steam pipes within the retorts have also been replaced with cast iron, as it has been found that the solution used in the card process attacks either steel or wrought iron. Similar substitution is being made in pipe lines carrying the treating solution throughout the building as fast as they require renewal.

Two 80,000 gal. working tanks were replaced with steel tanks of the same dimension, and these tanks, in common with three 10,000-gal. measuring tanks previously installed and two new ones, were housed over to protect the tanks and to prevent the loss of heat during the winter. A new shallow well was dug to replace a deep well, the water from which had caused some trouble in the boilers. A 125-ft. Wiederholt concrete stack was built just outside of the boiler room, this type of stack being lined both outside and inside with tile and the area between these tile faces being filled with concrete. The inside diameter of the stack is 8 ft. 10½ in. at the bottom and 6 ft. 6 in. at the top.

During 1912, 10,914 cars of material of all kinds were handled in and out of the Galesburg tie yard. In the three retorts 623,926 oak and 303,942 soft wood ties were treated last year. Approximately 1,375,000 ft. B. M. of decking and sills for stock cars, 5,000,000 ft. B. M. of switch ties and 141,776 lineal ft. of

Fig. 3—Retort Room with Doors Open—Two New Retorts on Left.

Fig. 4—Creosote Storage Tanks.

Fig. 5—Looking Down Loading Platform Toward Treating Plant.

piling were also treated in addition to considerable quantities of wood blocks and other miscellaneous material.

In loading ties for treatment they are grouped into three classes based upon their moisture content, and these classes are further subdivided into No. 1, No. 2 and No. 3 ties, according to their condition. Class A ties are those absorbing less than 22 per cent. by volume of preservatives and include principally oaks, hickory, beech, hemlock and tamarack. Class B ties are those which absorb from 23 to 30 per cent. by volume of pre-

Fig. 6—Piles Stored in the Yard.

servatives, and include hard maple, ash, sycamore and Douglass fir. Class C ties are those absorbing over 30 per cent. by volume of preservatives, and include elm, the pines, maple, birch and cypress. For Class A ties a mixture of 77 per cent. of 5 per cent. zinc chloride solution and 23 per cent. of creosote is injected at a pressure of 175 lbs. per sq. in. For Class B ties a mixture of 81 per cent. of 4 per cent. zinc chloride solution and 19 per cent. of creosote is injected at a pressure of 150 lbs. per sq. in., and for Class C ties a mixture of 85 per cent. of 3 per cent. zinc chloride solution and 15 per cent. of creosote is injected at a pressure of 125 lbs. per sq. in. The No. 1, No. 2 and No. 3 ties are for main line, branch line and side track use, respectively. Only ties of one general class are

Fig. 7—View in Tie Yard Showing Method of Stacking Ties.

treated in one retort, while each tram contains only ties of the same class and number.

Practically all material is handled at this plant by piece work, including such heavy material as piling, which is loaded with cranes. In unloading ties from the car to the pile and in loading them from the pile to the tram, each man works alone, while in unloading ties from the tram into a car after coming out of the retort, two or three men work together and divide their earnings equally. All the men, however, are carried individually on the pay roll. A foreman is assigned to each class of work, who sees that the work is done properly and who keeps a record of the work done by each man. One Browning crane and two small steam shovels rebuilt into cranes assist in loading piling, some switch ties and all other heavy lumber. Piece work rates are applied here as in the other part of the yard, except that the crane engineers are on a monthly basis. All foremen are also paid on a monthly basis. The piece work rates vary with the kind of wood carried, a higher price being paid for heavy hardwood than for lighter soft woods. No variation is made, however, for the height of piles, these depending largely upon the condition of the yard and the amount of room available. From 80 to 100 men, mostly Austrians, are employed in the yard. For the month of February, 1913, 96 per cent. of all unskilled labor was paid on the piece work basis. The average cost of unloading the ties from the car to the pile last year was $0.708 per hundred, of loading from the pile to the trams $0.666 per hundred, and of unloading from the trams into cars after treatment $0.596 per hundred.

To provide against delays at the retorts, sufficient trams have been provided to keep all the retorts going 48 hours if the loading in the yard should be stopped for any reason. While this number of trams is larger than usually found in plants of this size, sufficient ties are thus continually loaded to enable

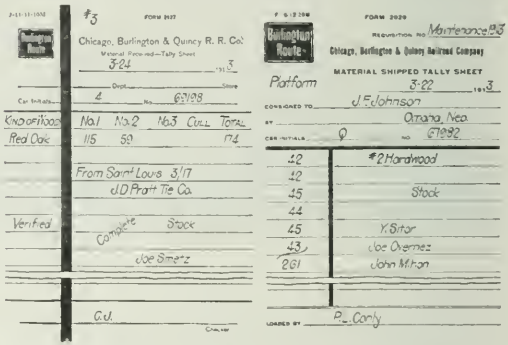

Fig. 8—Forms for Keeping Records of Shipments.

the plant to operate full time even though the weather may be such as to prevent the men from working outside. In this connection it is interesting to note that there were only 284 retort hours delay last year from all causes, including charging the retorts and repairs, in comparison with 22,423 retort hours actually operated, or 1.25 per cent. delay. The plant is closed on Sundays and holidays, but operates 24 hours per day otherwise throughout the year.

The tie yard covers 95 acres, and is provided with 10 standard gage tracks connected to ladders at each end, permitting cars to be set in or pulled out with the minimum interference. This yard layout was described in detail in the *Railway Age Gazette* of February 16, 1912. All switching is done with a small standard gage locomotive which also places the loaded trams in front of the retorts. The trams are drawn from the retorts to the loading plant by a cable wound on a drum at the end of this platform.

In loading out switch ties on requisitions where material is loaded for more than one station, care is taken to load the sets complete with those for the station nearest Galesburg on the top, unless a reverse order is specified on the requisition. The top layer for each station is marked with the requisition number, station and number of pieces, and the material for each station is separated from that for other stations by strips laid crosswise on the car. In this way the material for each station can be unloaded without any rehandling and without the necessity of getting the shipment confused. No car is loaded for points on more than one division. A rule recently put into effect also requires that all requisitions for switch ties must state specifically the numbers and lengths of each size of ties

required, instead of simply ordering a set complete, as was frequently done previously.

To simplify the clerical work incident to tracing and answering inquiries about the large number of shipments into and out of this yard, a card system has been adopted in which cards printed in red are used for inbound shipments and cards printed in black for outbound cars. On these cards is placed a complete record of the shipment. The sample card shown for outbound shipment, for instance, gives the kind of ties, method of loading, number of ties in each tram loaded and the names of the men loading the car. Two cases are provided in the office for filing the cards by the last two figures, each case having 100 pigeonholes. Horizontally, the pockets are numbered from 1 to 10 for the last figure, and vertically from 1 to 10 for the next to the last figure. In this way a full record of the shipment can be readily secured when the car number is known.

This plant is operated under the direction of J. H. Waterman, superintendent of timber preservation of the Chicago, Burlington & Quincy, and A. Meyer, supervisor of the Galesburg plant. W. T. Krausch, engineer of buildings, was in charge of the design and construction of the additions to this plant.

TABLE FOR ESTIMATING COST OF TRACK.

The accompanying table is in use on the Morgan's Louisiana and Texas road for making quickly approximate estimates for the cost of building short spur tracks or sidings. Frequently an estimate for such a track is demanded of a roadmaster without

Statement Showing Figures and Method of Approximating The Cost of a Spur Track or Siding.

Table 1 showing cost of installation of switch and lead for weights of rail varying from 50 to 90 lb. Total length of lead.

Weight of Rail	Cost of Lead 176' Long
90 lb.	$529.47
80	456.80
76	422.33
75	427.33
61½	348.41
60	344.36
56	329.77
50	298.31

Table 2 showing cost per track foot of track for different weights of rail using 8 and 9 ft ties

Wt of rail	Cost per Track ft using 9 Ties	Cost per Track ft. using 8 Ties
90 lb.	$1.616	$1.529
80	1.470	1.383
76	1.424	1.337
75	1.405	1.319
61½	1.260	1.174
60	1.237	1.150
56	1.166	1.080
50	1.120	1.030

Note: Labor and 8% for incidentals and use of tools was included in the above

Table 3 Total Yardage For 100 Ft. of Track 16 Ft Crown

Fill	6" Fill	1 Ft Fill	1½ Ft Fill	2 Ft Fill	2½ Ft Fill	3 Ft Fill	3½ Ft	4 Ft	5 Ft	6 Ft	7 Ft Fill	8 Ft Fill
Cu yd	31	65	101	141	183	228	275	326	435	556	687	830

Cost of grading and team work will vary from 18 to 25 cents per yd Train haul 40 cts

Illustration.

To find the Appx cost for Construction of a 600 ft Spur Rail in Main Line 76 lb Spur to be of 60 lb Steel (Switch and lead will always be same weight as in main line) Main Line

76# rail ← 176' → ← 424-60# rail →

From Table 1: 76 lb Lead cost $422.33
Track 600 ft long minus 176 ft for lead = 424' ft of 60 lb. Steel
From Table 2 1 ft. of track 60 lb Steel and 8 ft. Ties Cost $1.150
424 ft. @ $1.15 = $487.60 Cost of 60 lb. Track.
Yardage Assuming an average of 1 ft fill @ 20¢ per yard
from Table 3 1 ft fill = 65 cu. yds. 600 ÷ 100 x 20 = $78.00 Total cost of Grading
∴ Total cost of track $422.33 + $487.60 + $78.00 = $987.93

Cost of Miscellaneous Items which may be added to Estimate

In block signal territory $100.00 is to be added to estimate for the installation of each switch Ordinary pile trestle figured at $15.00 per lineal ft Creosoted pile trestle figured at $27.00 per lin ft. Ordinary pit cattle guards figured at $75.00 each Creosoted pit cattle guards figured $95.00 each. Crib cattle guards figured at $40.00 each.

Cost per ft for Ordinary Wooden Boxes		Cost per ft for Creosoted Wooden Boxes	
1x2 Box	$1.00 per Lin Ft	2x2 Box	$1.60 per lin. ft
2x2 "	1.50 " " "	2x3 "	3.00 " "
2x3 "	2.50 " " "	3x4 "	3.45 " "
3x4 "	3.00 " " "	4x5 "	4.54 " "
4x4 "	3.75 " " "		

$1.500 for Add 25.00 Wing 32.50 Walls

$2.000 for Add 30.00 Wing 30.00 Walls

Telegraph Poles: Cost of moving 1 to 5 poles $20.00 per pole; " " " 5 to 10 " 15.00 " "; " " " 10 or more 10.00 " "

sufficient time to enable him to consult with the engineer. The accompanying table based upon the cost of material on this road is sufficiently accurate for all practical purposes. If more detailed figures are required, it would, of course, be necessary to make a survey on the ground. This table was prepared by John H. Gardiner, to whom we are indebted for this information.

General News.

The Colorado legislature has defeated a full crew bill, and also an anti-pass bill.

The Chicago & Eastern Illinois was fined $10,000 in the federal court at Chicago on April 9 for 100 violations of the federal hours of service law during the month of November, 1912.

Senator Cummins, of Iowa, has introduced in Congress a bill forbidding carriers to limit their liability for loss of freight as one of the considerations imposed for making reduced rates for transportation.

The number of pensioners on the lines of the Pennsylvania Railroad system who are over ninety years old is nine, as indicated by the list of names printed in our last issue. The number of pensioners more than eighty years of age is 296.

The legislature of the state of Washington has passed a law making it a misdemeanor for trespassers to enter a railroad right of way on which more than one main track is in use. The bill was introduced by a senator who was formerly a Northern Pacific conductor.

The first conviction under the law recently enacted by Congress providing the penalties for stealing, or attempting to steal, from freight cars containing interstate shipments, is reported from St. Louis, where Philip Nagle was found guilty in the United States district court and sentenced to a term of five years in the federal prison at Fort Leavenworth.

A bill has been introduced in the Illinois legislature to amend the present union station statute adopted in 1874, to provide that companies formed for the purpose of building union stations may be organized with a capitalization not to exceed $50,000,000. The present limit is $3,000,000. The bill was introduced in the interest of the proposed new stations in Chicago.

The government has begun suit in the United States district court at Columbus, Ohio, against the Union Depot Company of Columbus; the Baltimore & Ohio, and the Cleveland, Cincinnati, Chicago & St. Louis for violation of the hours of service law. The suits call for penalties aggregating $97,000, and the cases apparently refer to the work of telegraphers in offices where the nine-hour limit is or should be applied.

The New York State College of Forestry, Syracuse, cooperating with the New York Central & Hudson River, is to plant trees on fifteen acres of the railroad company's experimental farm at North Chittenango, N. Y., with a view of finding out the best kinds of wood to grow in that locality for use as ties. The New York Central uses annually about 3½ million ties in its tracks in the state of New York, and the object of the College of Forestry is to see if some of the millions of dollars now sent to other states and countries for sleepers cannot be kept in New York.

At the trial of Messrs. Horn and other officers of the New York, New Haven & Hartford for manslaughter, at Bridgeport, Conn., on Tuesday of this week, President Charles S. Mellen and Vice-President E. H. McHenry, who were present in court, were indicted on charges of manslaughter, and were held in $5,000 bail each. These indictments, issued by the court in connection with the derailment at Westport, last October, appear to be a result of the dissatisfaction of the state's attorney with the progress of his cases against the four men who had been previously indicted. The despatches indicate that none of the trials will be again taken up until some time in May.

Senator Gronna has introduced in Congress a bill to amend the interstate commerce law by empowering the Interstate Commerce Commission to regulate the speed with which freight shall be carried. There is a clause requiring twenty miles an hour to be maintained with live stock. For unreasonable delays the carrier may be penalized to the extent of the losses caused by the delays, and, in addition, five dollars per car per hour. Representative Lafferty has introduced in the House a bill extending the authority of the Interstate Commerce Commission in Alaska, and instructing the War Department to build a railroad in Alaska from Controller Bay to the coal fields on Bering river.

Car No. 999 of the Erie, the business car of President Underwood, has been equipped with six telephones for speaking between the different parts of the car—the staterooms, the observation-room, the stenographer's desk, and the kitchen. The telephones are hand sets made by the Western Electric Company. Being held in the hand, the vibration of the wheels on the rails has no disturbing effect on the telephones. For calling, buzzers are used, each telephone having a set of call buttons arranged on a dial plate. The car has connections by which its occupants can converse over outside telephone lines when the car is standing at a station, calls being made by an interrupter, operated from a battery. Other business cars on the Erie are to be equipped with telephones.

Steel Corporation's Unfilled Tonnage.

The report of the United States Steel Corporation shows that the volume of unfilled tonnage on March 31 was 7,468,956 tons, compared with 7,656,714 tons at the end of February, a decrease of 187,758 tons. On January 31, the unfilled tonnage was 7,827,368 tons; on December 31, 1912, 7,932,164 tons; and on March 31, 1912, 5,304,841 tons.

Derailment on the Central Vermont.

In the derailment of a special passenger train on the Montreal-Chambly line of the Central Vermont, in Quebec, last Sunday afternoon, the fireman and six passengers were killed and 15 persons were injured. The derailment occurred about four miles from St. Lambert and 16 miles from Montreal. The train carried several hundred passengers, guests of a real estate company returning to Montreal. It is said that the speed of the train was not over 30 miles an hour. The cars were so crowded that many persons were standing on the car platforms, and it was mostly among these that the fatalities occurred. The cause of the derailment is reported as defective track. The engine was running tender first.

Derailment at Tula, Mexico.

Press despatches of April 20 report the derailment of a passenger train on the Mexican Central near Tula, state of Hidalgo, April 10, in which 20 passengers were killed and 40 injured. It is said that the derailment was due to excessive speed and that the engineman ran at unsafe speed around a curve, because of the importunities of the passengers, who feared an attack of the rebels who are fighting the government.

Railway Museum at the University of Illinois.

For some months past the railway engineering department of the University of Illinois has been collecting pictures, relics and models illustrating the historical development of the railroad and representing also current practice. This material forms a permanent exhibit in the new Transportation building, and it will be added to from time to time. A very generous response to requests for such material has been made by railway officers and by manufacturers. Other persons having interesting material of this sort are invited to contribute if they feel so disposed. Everything put into the collection will be well cared for and it will be of general benefit. Communications may be addressed to Prof Edward C. Schmidt, Urbana, Ill.

Latest Phase of Railway Regulation in Texas.

The suit instituted by the attorney general to prevent the carrying out of the provisions of the consolidation bill passed by the legislature is most unfortunate. That the bill was overwhelmingly and imperatively demanded by the people is true beyond all question. The consolidation affected the people living in all the territory from Wichita Falls to Waco, and from Waco to Trinity, and from Trinity to Beaumont and Port Arthur. The people demanded that the bill be passed, and their servants obeyed their behest.

While the governor was opposed to the bill from the first, he was justified in submitting it to the attorney general for his opinion as to its constitutionality, and when that opinion was adverse he was justified, on that ground, in vetoing it; hence the governor may be eliminated from the equation. The attorney general is now responsible for the stay of building railroad connections sorely needed.

As the completion of the Panama canal draws near, all the great trunk lines are making every possible effort to get to tidewater, and the people in Texas are profoundly interested. The people have the unrestrained and unrestrainable right to say what railroads they want and where they shall be built, and neither the attorney general nor any other man has the right to seek to thwart their purposes.

Conceding that the constitutionality of the law is debatable, every doubt should be resolved in favor of the will of the people. The action of the attorney general has very much the appearance of trying to get even with the legislature because it disregarded his opinion by passing the bill over the gubernatorial veto.

Who is going to be harmed by giving the state new lines of railway? What evil can follow upon allowing a great railway system to get in touch at tidewater with the commerce of the world? Why should not the people of the imperial realm of the Northwest. . . .

The home town of the attorney general is indebted for the larger part of its gratifying growth to the very railroad whose progress into other fields he now seeks to obstruct. It has spent millions of money in Texas. It asks the privilege of spending millions more, but now one man, who was nominated by the very narrowest of margins, rises to say, "The people be damned. I will not permit their commands to be executed." How long will the people stand such trifling with their wishes? —*Houston Chronicle.*

Headlight Laws.

The legislature of Colorado has passed a bill requiring all locomotives to be equipped with headlights of not less than 1,500 c. p. Headlight bills have also been passed at this session by the legislatures of seven other states—Nevada, Vermont, North Dakota, Iowa, Oregon, Missouri and Minnesota. The Nevada, Missouri and Minnesota bills provide for 1,500 c. p.; the North Dakota bill for 1,200 c. p., and the Vermont bill leaves the determination of this point to the railroad commission. In Oregon and Iowa the laws provide that the light shall be sufficiently strong to enable the engineman to see a person on the track at distances of 800 and 1,100 ft. respectively.

Pere Marquette Investigation.

President S. M. Felton, of the Pere Marquette, resumed his testimony before the legislative committee that has been investigating the affairs of the road at Detroit on April 10. He produced statistics regarding operating expenses and revenues to show that passenger rates under the 2-cent fare law are not sufficient to provide for satisfactory service, and declared that it should be self-evident that in a state like Michigan, with a population of only 40.2 per square mile, the density of passenger traffic must be less than in states where the population is much greater. He pointed out that in Pennsylvania, with a population of 171 per square mile, the courts had decided the 2-cent fare law unconstitutional, and that in New York, with a population of 191 per square mile, Governor Hughes had vetoed the 2-cent fare law. He said the Pere Marquette's passenger business, which yielded $4,023,039 in 1912, would have yielded $741,677 more under the old rates. For 1912 the earnings from passengers, mail, express, baggage, parlor and chair cars, and miscellaneous passenger service revenues, were $4,946,796, while the expenses properly charged against this service were $5,283,198, a cost per passenger mile of 2.35 cents. The average fare was 1.79 cents per passenger mile. He thought the rate should be advanced to 2½ cents a mile.

On April 11, W. D. Trump, manager of the Detroit Terminal Railroad, and formerly general superintendent of the Pere Marquette, was a witness before the committee. He testified in detail regarding various expenditures and improvements made during his connection with the road, saying that the property had not been properly maintained in recent years. In one year, he said, no new steel was laid, and some of the rails had been in the track for 30 years. He was inclined to criticise the financial management of the road, and declared that much of the money spent was wasted. He criticised the purchase of the Chicago, Cincinnati & Louisville, and the extension to Chicago.

He disagreed with President Felton's figures regarding the expenses of the passenger service, saying he believed it was profitable to the company, even with the 2-cent fare.

Several shippers testified regarding the quality of the service rendered by the Pere Marquette.

Chicago Council Renews Electrification Agitation.

At the first meeting of the new city council in Chicago on April 14, a committee on railway terminals, consisting of 15 aldermen, with Ellis Geiger as chairman, was appointed to deal with such subjects as electrification of railway terminals and the location of proposed new passenger stations. One of the first ordinances introduced at the meeting was one to require the railroads to use electric power or other power that will not produce smoke on their terminal lines in the city by July 1, 1914. It was referred to the new committee. An ordinance providing for the discontinuance of the use of steam locomotives within the city has been lying dormant with the committee on Local Transportation for about two years, the agitation for electrification having practically ceased following the appointment of a committee of the Chicago Association of Commerce, which has been making a thorough investigation of the subject. The resolution was introduced on the alleged ground that the investigation is being unduly protracted.

St. Louis Railway Club.

At the meeting of the St. Louis Railway Club, held April 11, J. R. Cavanagh, superintendent of freight transportation, New York Central Lines, made an address on Car Efficiency.

Association of Railway Electrical Engineers.

The annual convention of the Association of Railway Electrical Engineers will be held at the hotel La Salle, Chicago, October 18-24.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

A press despatch from Albany says that the Erie Canal will not be opened until June 1, much damage having been done by floods at Vischer's Ferry. The Champlain Canal will be opened for traffic May 15.

The meeting of the National Industrial Traffic League called for April 15, was postponed on account of the meetings of the Western and Southern classification committees and flood conditions along the Ohio river and its tributaries.

Following the recommendation of the governor of New Hampshire, the legislature of that state has considered a report from a special committee proposing a scheme for the regulation of railway rates during the next two years; and has instructed the committee to reconsider its action, and to report a measure giving the Boston & Maine more liberal terms.

As a result of arrangements made by the Illinois Central, it is announced that a monthly steamship service between New Orleans and Argentine will be started on June 15, by Andrew Weir, of London, making connections with all lines entering New Orleans. The ships for the service will be of over 8,000 tons capacity. The first boat will be berthed at New Orleans on June 15, and will sail on June 30.

Motion pictures showing the effects of the recent floods at Dayton, O., were presented at an entertainment given by the Traffic Club of Chicago on April 10. The pictures were described in a lecture given by H. F. Miller, business manager of the Chicago Association of Commerce, who was in charge of the relief work of the association in Ohio, and who obtained the pictures during the first week of the flood.

The Chicago, Burlington & Quincy has established on the first floor of its new general office building at Chicago, a permanent agricultural exhibit, consisting chiefly of samples of products of Nebraska, Colorado, Wyoming and Montana. Lectures on farming in these four states will be given from time to time by prominent agricultural experts. James J. Hill attended the opening of the exhibit on April 10.

The Board of Estimate and Apportionment, New York City, has taken action to acquire, on behalf of the city, extensive tracts of land for terminal facilities along the shore of the East river, south of the Brooklyn bridge, the purpose being presumably to provide for the barges which will carry freight through the Erie canal after it has been enlarged. The property named in the resolutions of the Board of Estimate is valued at $1,182,200.

Following the announcement, last week, of the decision of the Interstate Commerce Commission, concerning the issuance of free passes to shippers in Colorado, it is now definitely stated that the commission asked for the indictment of the Colorado Fuel & Iron Company, the Victor American Fuel Company, the Colorado Porcelain Cement Company, the United States Porcelain Cement Company, the Great Western Sugar Company, the Colorado & Southern Railroad Company, and the Denver & Rio Grande Railroad. The commission says that the Atchison, Topeka & Santa Fe for about ten years resisted the movement to give passes to influence traffic, but finally, because of the persistency of its competitors, it deliberately resorted to the means practiced by them for stimulating the good will of shippers. The commission suggests that the courts should be more severe in dealing with these offenses against the law.

The Pennsylvania announced on Monday of this week that all of its lines in Ohio and Indiana which had been damaged by the recent floods had been rebuilt so that regular trains would be restored; though for a time through cars would be operated subject to delay. On Thursday of this week the company announced the re-establishment of regular freight service throughout its lines. The Illinois Central resumed through passenger traffic by way of Cairo on the 12th, except that the Panama Limited was not restored, through travel being almost suspended in the Southern states because of the general flood conditions in the Mississippi valley. Through traffic was suspended on the Illinois Central for ten days—April 2 to 11, inclusive. The Cleveland, Cincinnati, Chicago & St. Louis began running passenger trains to Cincinnati last week by using the line of the Detroit, Toledo & Ironton from Springfield to Washington, C. H., and the Baltimore & Ohio thence to Cincinnati. The Chesapeake & Ohio was re-opened for traffic through to Chicago on the 10th.

The New York, New Haven & Hartford announces that arrangements have been made for the prompt transmission of information concerning delayed trains to offices of the company at New York, New Haven, Providence, Boston, Hartford, Springfield and Worcester. In New York City the information will be recorded at Room 3624, Grand Central Terminal. For the benefit of passengers who may wish to find this room, it may be remarked that this number means room 24, in corridor 6, on the third floor. Anything happening to a train which will delay it for more than 30 minutes will be at once reported by telegraph to these centers of information. If a train is likely to be more than one hour late, the fact will be noted at the bulletin board in the Grand Central Station concourse with a note that detailed information can be had by going to the room upstairs. If there should be an accident causing injury to passengers, the names of the injured persons would be sent as early as possible to the information rooms. These special information bureaus will also keep informed concerning sleeping cars which are delayed and are attached to other than their regular trains.

Car Location.

The accompanying table, which is taken from car location bulletin, No. 4-A of the American Railway Association, gives a summary of freight car location by groups on March 15, together with surpluses and shortages on the same date.

Car Location on March 15, 1913.

*Denotes deficiency.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 141, giving a summary of car surpluses and shortages by groups from December 20, 1911, to April 1, 1913, says: The total surplus on April 1 was 68,792 cars; on March 15, 1913, 57,998 cars; on March 27, 1912, 52,682 cars. Compared with the preceding period; there is an increase in the total surplus of 10,794 cars, of which 5,411 is in box, 1,156 flat, 2,342 coal and 1,885 miscellaneous cars. The increase in box car surplus is in all groups, except 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 9 (Texas, Louisiana and New Mexico). The increase in flat car surplus is in groups 1 (New England Lines), 7 (Montana, Wyoming, Nebraska and the Dakotas), 8, 9 (as above), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The increase in coal car surplus is in all groups, except 3 (Ohio, Indiana, Michigan and western Pennsylvania), 8 and 10 (as above). The increase in miscellaneous car surplus is in groups 1 (as above), 6 (Iowa, Illinois, Wisconsin and Minnesota), 7, 8, 9 and 10 (as above).

The total shortage on April 1 was 10,804 cars; on March 15, 1913, 20,223 cars; and on March 27, 1912, 33,974 cars. Compared with the preceding period; there is a decrease in the total shortage of 9,419 cars, of which 5,601 is in box, 629 in flat, 2,376 in coal and 813 in miscellaneous cars. The decrease in box car shortage is in all groups, except 2 and 8 (as above). The decrease in flat car shortage is in all groups. The decrease in coal car shortage is in all groups, except 3, 9 (as above), and 11 (Canadian Lines). The decrease in miscellaneous car shortage appears in groups 1, 3 (as above), 4 (the Virginias and Carolinas), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 6, 9 and 11 (as above).

Compared with the same date of 1912; there is an increase in the total surplus of 16,110 cars, of which 8,362 is in box, 7,669 in coal, 2,318 in miscellaneous and a decrease of 2,239 flat cars.

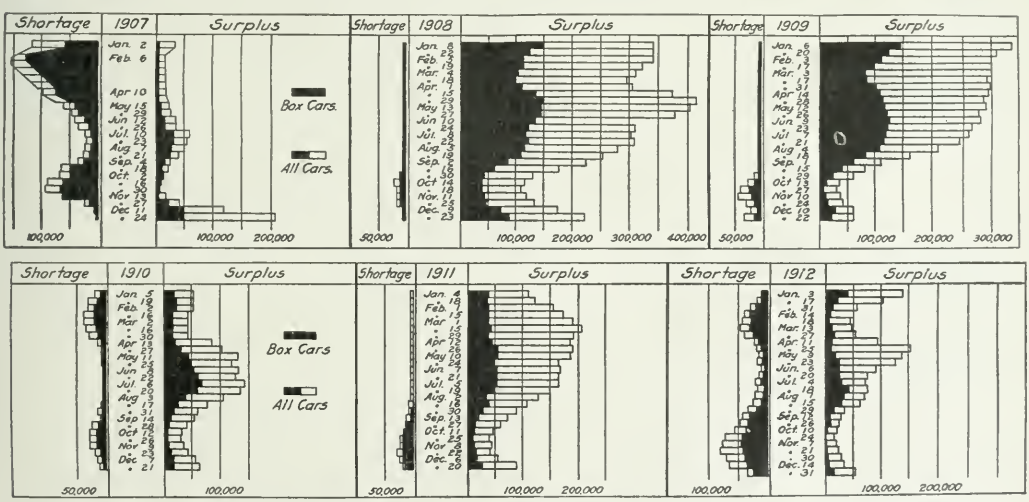
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

There is a decrease in the total shortage of 23,170 cars, of which 12,363 is in box, 6,759 in coal, 4,371 in miscellaneous and an increase of 323 flat car shortage.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

Car Balance and Performance.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association in presenting statistical bulletin No. 142 covering car balances and performances for December says:

The miles per car per day, for December was 24.4 compared

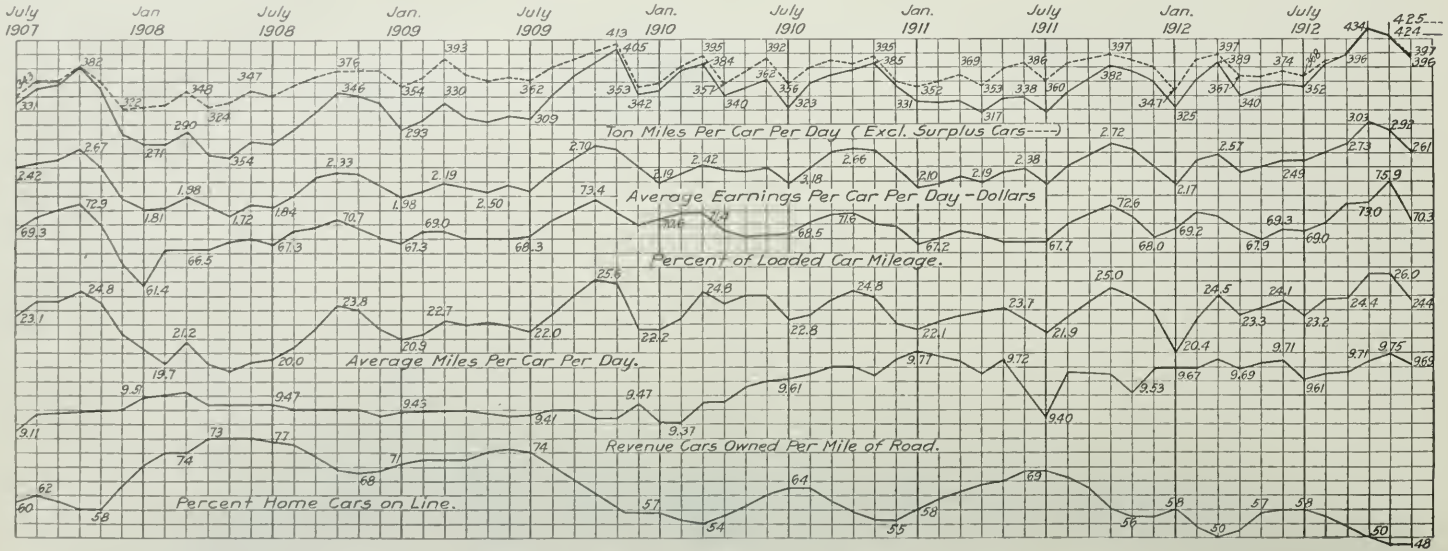
*Denotes deficiency.



Freight Car Mileage, Earnings and Performances, 1907 to 1912.

with 26.0 for November. This figure for December, 1911, was 23.4.

Ton miles per car per day was 396, this figure for November was 424. This is an increase of 9.70 per cent. over the figure for December, 1911.

The proportion of home cars on line was 48 per cent., maintaining the same figure as in November. This figure for December, 1911, was 56 per cent.

There is a decrease of 5.6 points to 70.3 per cent. in the percentage of loaded car mileage compared with November, 1912 The per cent. of loaded car mileage in December, 1911, was 68.0 per cent.

The average earnings per car per day of all cars on line were $2.61, compared with $2.92 in November, 1912. This is an increase of 9.21 per cent. over the earnings for December, 1911, which were $2.39.

The table on page 914 gives car balance and performance in the month covered by the report, and the diagram shows car earnings and car mileage and different car performance figures monthly from July, 1907.

Wells-Fargo Conferences.

Under the administration of B. D. Caldwell, who came to it in October, 1911, as president, Wells Fargo & Company has entered upon a pretty thorough scheme of reorganization. Mr. Caldwell's long experience as a railroad man has stood him in good stead in facing the situation of the express business at a particularly difficult time in its history. Without any great disturbance of the personnel of the system he has brought to his aid a number of railroad men who have been instrumental with him in the important work of bringing Wells Fargo & Company in line with the best transportation practices of today.

One of Mr. Caldwell's innovations has been the holding of a conference semi-annually of his heads of departments and chiefs of staff. While this had been done to some extent before, he has made the conferences institutions of great service to the company. The most recent of these was held in St. Louis during the week beginning Tuesday, April 8. To it came all Wells Fargo officers from general superintendents up and a complete discussion was held of the various routine as well as special topics affecting express companies at the present time. Wells Fargo & Company is a keen believer in the efficiency of committee work, and this conference saw the appointment of many committees which will report to the next gathering of a similar sort. These committees are charged with study of and recommendation upon operating problems and problems relating to the public efficiency of the company. The management of Wells Fargo & Company has the idea that the working of the express could and should be utilized to a large extent in an improvement of the movement of food products. It believes that the express can be a large agent in the expedition of perishable food between the grower and the various markets, and so a real factor in a possible solution of the cost-of-living problem.

Of the general value of these conferences there is little doubt in the ranks of Wells Fargo & Company. It is difficult to operate any transportation organization employing some thousands of men and covering a large territory, but when that organization embraces 36 states, some 90,000 miles of steamship and railroad lines, and has its executive offices in New York, with its operating headquarters at both Chicago and San Francisco, these difficulties multiply. To talk over personally, with the men of this company, the many problems that confront them was what Mr. Caldwell sought in inaugurating these conferences, knowing that a general discussion held well to the point is far more valuable than any amount of correspondence upon a topic. The conferences which he has now so well inaugurated have already proved themselves worthy of the time and effort they require.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until June 20 the supplement to the tariff of the St. Louis & San Francisco, which increases rates for the transportation of potatoes, in carloads, from points in Oklahoma to points in Colorado from 4 to 14 cents per 100 lbs.

The commission has suspended until July 26, certain schedules published in a supplement to the tariff of the Kansas City Southern, which proposed to increase rates on lumber from points in Missouri, Oklahoma and Arkansas to Des Moines, Iowa, one cent per 100 lbs.

The commission has suspended from May 1 until July 8, the tariff of the Wabash, Chester & Western. This tariff proposed to advance rates on flour in carloads, from Chester and other stations in Illinois to Paducah, Ky., from 9 cents to 10½ cents per 100 lbs.

The commission has suspended from April 1 until July 17, the supplements to Agent C. J. Pierce's tariff, which would cancel joint through rates on news printing paper from stations located on the Grand Trunk to points on the Bangor & Aroostook routing via the Maine Central.

The commission has suspended from March 31 until September 30, certain schedules in supplements to the tariffs of the Southern Railway and the Norfolk & Western, which would advance rates on furniture from High Point, N. C., and other stations to Boston, New York, Philadelphia, Baltimore and other points.

The commission has suspended from April 1 until July 30, certain supplements to Agent William Cameron's tariff, which contain increased rates on bituminous coal and bituminous coal briquettes, carloads, from Illinois mines to St. Louis, Mo. The proposed advance amounts to 5½ cents per net ton from all mines.

The commission has suspended from April 9 to October 9, certain schedules in Agent R. H. Countiss' tariff, which contain advanced rates for the transportation of lumber, shingles and other articles subject to lumber rates from stations located on the Washington Western in the state of Washington to eastern destinations.

The commission has suspended until July 30 the schedules in certain tariffs, which would increase switching charges for the movement of cars containing coal and coke over the Chicago & North Western from junctions with connecting carriers to Ravenswood, a station within the switching limits of Chicago. The increase would amount to approximately 15 cents per ton.

The commission has suspended from March 27 until July 25, a supplement to the tariff of the Chicago, Milwaukee & St. Paul, which proposed to increase rates on wheat, flour, corn, rye, oats and barley from Spencer, Iowa, and other points to Sioux City, Iowa, and intermediate points, the increases ranging from 1 to 6.2 cents per 100 lbs. on wheat and flour, and from 1.05 to 7.65 cents per 100 lbs. on other grain.

The commission has suspended until July 30 the supplement to the tariff of the Delaware, Lackawanna & Western, which would cancel commodity rates applicable to the transportation of butter and cheese, any quantity, from points on the Cincinnatus branch to New York and other points, leaving in effect class rates, which would result in advancing rates on butter 5 cents, and on cheese 1 cent per 100 lbs.

The commission has suspended from April 1 until July 30, a provision changing the classification of bridge iron and bridge material in carloads, from Class N to Class I, Note 28, contained in a supplement to the Southern classification. The proposed change would increase as much as 200 per cent. rates applicable to the commodity in question moving over the lines of the Louisville & Nashville. For example, the present rate from Memphis at Athens, Ala., is 11 cents, and the proposed rate 33 cents per 100 lbs.

The commission has suspended until July 17 certain tariffs, which would cancel all joint rates between points on the lines of certain eastern roads, the Grand Trunk and points located on the Bangor & Aroostook on shipments routed via the Maine Central, which action is understood to be the result of a dispute between these carriers over a proper division of the through rates in effect. On and after the dates above named the use of combination rates, as provided for in the suspended tariffs, would have resulted in an advance in all class and commodity rates, varying in amount according to the commodity and length of haul.

The commission has suspended until August 4, the schedules in the tariffs of certain boat lines which proposed to add to the list of articles the transportation of which is prohibited, butter,

eggs, fresh meats and live or dressed poultry. The tariffs of the carriers involved name class and commodity rates from Duluth and other upper lake ports to Buffalo and interior eastern points, including Boston, New York and Philadelphia, reached by lake and by lake and rail, and the proposed change would compel shippers to forward the commodities above specified via all rail routes. The present lake and rail rate on eggs from Duluth to New York is 65 cents per 100 lbs., any quantity, and the all-rail rate for the same commodity between the same points is $1.09 in carloads and $1.12 in less than carload quantities.

Commodity Rates Increased.

Corporation Commission of Oklahoma v. Abilene & Southern et al. Opinion by Commissioner Clements:

In the original report the commission decided that the defendants' class and commodity rates from Oklahoma into Texas were unreasonable and unjustly discriminatory. The commission did not at that time prescribe any reasonable rates for the future, but held the case open for the parties to submit a proposed scale of mutually satisfactory class rates, if such a scale could be agreed upon. A conference was held, but the parties failed to agree. The commission in this report prescribed reasonable rates for the future. (26 I. C. C., 520.)

Improper Charges Assessed.

C. C. Follmer & Co. v. Canadian Pacific et al. Opinion by the commission:

The complainant shipped a carload of shingles weighing 40,800 lbs. from Abbottsford, consigned to itself at Menasha, Wis. The shipment moved via the Canadian Pacific and the Minneapolis, St. Paul & Sault Ste. Marie. It was loaded in a Canadian Pacific 36 ft. car, but before reaching Menasha, was reloaded by the Soo line into two smaller cars. Upon arrival at Menasha, the shingles were re-consigned as one shipment to Rochester, N. Y., and were carried forward in the two cars via the Soo line to Manitowoc, Wis., and thence via the Pere Marquette and the New York Central & Hudson River to the destination. From Abbottsford to Manitowoc charges were assessed on the actual weight of the shipment, but from Manitowoc to destination they were assessed on a weight of 27,300 lbs. for the first car, and on a minimum weight of 24,000 lbs. for the second car. The complainant contends that the charges were unreasonable to the extent that they exceeded a through rate of 80 cents per 100 lbs. based on the actual weight of the shipment. The commission found that there was no through rate applicable to this shipment, but decided that the intermediate rates were improperly assessed, and also that the Soo line was not justified in transferring the shipment from one to two cars and charging for more than the actual weight of the shipment. Reparation was awarded. (26 I. C. C., 512.)

Texas Common Point Case.

In re investigation and suspension of advances in rates by carriers for the transportation of certain commodities between certain stations located in Texas Common Point territory, and St. Louis, Mo., and other points. Opinion by Commissioner Harlan:

The defendants desire to reduce the extent of the Texas Common Point territory by excluding certain towns near the western border, including Sweetwater, Big Springs, San Angelo, Brady and Ballinger. The only reason given by the defendants for this move is that Amarillo, Tex., which competes with the towns just mentioned, and which is located just west of the Texas Common Point territory, now takes higher rates than Texas common points, with the result that Amarillo is discriminated against in favor of the towns above mentioned. The defendants contended that the loss of revenues attending lowering of their rates by putting Amarillo in common point territory would be substantially greater than the gain resulting from raising the rates of the points in question by excluding them from common point territory. The commission decided that the defendants had not justified the proposed increased rates. The traffic of the towns in question has grown rapidly, they have assisted the defendants in new construction, and in some cases the short line mileage is less now, than when those towns were first put in common point territory. If the defendants want to narrow the boundaries of the common point territory, they must do so in fair regard to the rights of the communities, which they propose to exclude, in their relation to the communities which would remain in the territory. The merchants and shippers of Amarillo urge that the boundaries of the common point territory be extended to include Amarillo. The commission found that if this were done, it would not be long before common point territory would cover the entire state of Texas, which was not desirable, and therefore decided not to grant the plea of the Amarillo shippers in full. The commission decided, however, that the defendants should be required to carry out the suggestion, at one time practically agreed upon, of giving Amarillo rates upon certain commodities on a parity with common point rates. No order was deemed necessary. (26 I. C. C., 529.)

Pig Iron Rate Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of pig iron from points in upper Michigan and Minnesota to Kansas City, Mo., and other destinations. Opinion by Commissioner Harlan:

The tariffs under suspension would raise the rates on pig iron from Duluth, Ashland and other points in Minnesota, Wisconsin and the northern peninsular of Michigan to a territory of distribution in which Kansas City and Omaha are the most important markets. To Kansas City and Omaha, the proposed schedules provide rates of $4.16 and $3.58 per ton respectively, in place of the present rates of $3.08 and $2.50. The Lake Superior Iron & Chemical Company has recently greatly improved its plants at points from which it is proposed to increase the rates. This company contends that these improvements were made with the understanding that the rate adjustment would not be changed and claims that the proposed rates would seriously injure its business. The commission decided that an investment made in an industrial enterprise in reliance upon an existing rate or relation of rates, cannot act as a hindrance to the re-adjustment of the rate structure if it is found to be unreasonable. The commission decided further that the present rate might be properly advanced, but that the proposed advances would be excessive. The commission ordered that in future the rate to Kansas City should not exceed $3.58 per ton, from Duluth, Ashland, Chocolay, Manistique, Newberry and other points involved; and that the rates to Omaha from those points should not exceed $3.08 per ton. (26 I. C. C., 284).

Crushed Stone and Sand and Gravel Rates Reduced.

Waukesha Lime & Stone Company v. Chicago, Milwaukee & St. Paul et al. Opinion by the commission:

In this case the complainant contends that the rates on sand and gravel, crushed stone and lime from Waukesha, Wis., to Chicago, are unreasonable and discriminatory. The Chicago, Milwaukee & St. Paul charges 2¼ cents per 100 lbs. on sand and gravel and 3½ cents per 100 lbs. on crushed stone from Waukesha to Chicago, 106 miles. The Chicago & North Western charges 4 cents per 100 lbs. on sand and gravel, and 3½ cents per 100 lbs. on crushed stone between the same points, 105 miles. The commission found that the complainant was discriminated against in favor of certain competitive points as regards the rates on sand and gravel and crushed stone. Crushed stone is more valuable than sand and gravel and therefore should take a slightly higher rate. The commission ordered the defendants to establish a rate of 2 cents per 100 lbs. on crushed stone in carloads and 1¾ cents per 100 lbs. on sand and gravel in carloads from Waukesha to Chicago. Reparation was denied. All the defendants charge 6 cents per 100 lbs. on lime between Waukesha and Chicago. The commission decided that this rate was not shown to have been unreasonable or discriminatory, and dismissed the complaint against it. (26 I. C. C., 515.)

COURT NEWS.

The decision of the Texas State Railroad Commission imposing a fine of $14,000 on the Missouri, Kansas & Texas for violation of the law requiring passenger trains to be run within thirty minutes of their regular time has been reversed by the Court of Civil Appeals. The court holds that the trains which were the subject of the commission's action were engaged in interstate traffic, and therefore the commission had no jurisdiction over them for the purpose of issuing an order of this kind.

Railway Officers.

Executive, Financial and Legal Officers.

M. W. Wells, hitherto general superintendent of the Chicago, Terre Haute & Southeastern, has been appointed assistant to the president, with headquarters at Chicago.

J. G. Wilson, who has been assistant interstate commerce attorney of the Harriman Lines at Chicago, has been appointed interstate commerce attorney of the Southern Pacific Lines, with headquarters after May 1 at New York.

Clark B. Ferry, whose election as vice-president and assistant secretary of the Chicago, Milwaukee & St. Paul, with headquarters at New York, has been announced in these columns, was born on May 18, 1859, at Bethel, Conn. From 1868 to 1873 he was a student at the Trinity Institute, Tivoli, N. Y., and in 1875 he graduated from Essex Hall Institute, Orange, N. J. On June 30, of the same year, he began railway work as a clerk with the Chicago, Milwaukee & St. Paul, and has been in the continuous service of that road ever since. In January, 1883, he was elected assistant secretary, and on April 8, was elected also vice-president of the same road, with headquarters at New York, as above noted.

C. B. Ferry.

H. L. Ingersoll, assistant general manager of the New York Central & Hudson River at New York, has been appointed assistant to senior vice-president of the New York Central Lines, with headquarters at New York, and will perform such duties as may be assigned to him by the senior vice-president.

Operating Officers.

J. C. Barton, trainmaster of the Atchison, Topeka & Santa Fe at Pueblo, Colo., has been transferred to Las Vegas, N. M., in a similar capacity, in place of E. Dowling, promoted.

The authority of D. E. Spangler, superintendent of transportation of Norfolk & Western, with headquarters at Roanoke, Va., has been extended over the Williamson & Pond Creek.

Ira L. Burlingame, for the past eight years general superintendent of the Terminal Railroad Association of St. Louis, has been appointed general manager, succeeding to part of the duties of President W. S. McChesney, Jr.

J. H. Rightmeyer, formerly trainmaster of the Illinois Central, at Waterloo, Iowa, has been appointed superintendent and car accountant of the Kentucky & Indiana Terminal Railroad, with headquarters at Louisville, Ky., succeeding T. H. Hayden, resigned, effective April 15.

H. E. Jones has been appointed assistant superintendent of the San Antonio & Aransas Pass, having supervision over the lines east and north of Yoakum, Tex., with headquarters at Yoakum. F. T. Bowles, assistant superintendent, with headquarters at Yoakum, will have supervision over the lines west of Yoakum.

D. H. Ryan, chief dispatcher and trainmaster of the Canadian Pacific at Brownville Junction, Me., has been appointed assistant superintendent District 1, Atlantic division, with office at St. John, N. B., succeeding W. B. Brown, transferred, and A. C. Brady, has been appointed assistant superintendent, District 2, Eastern division, with office at Montreal, Que., with special jurisdiction over station staffs and service.

Henry J. Curry, whose appointment as superintendent of the Albany division of the Boston & Albany, with headquarters at Springfield, Mass., has been announced in these columns, was born in March, 1877, at Grand Pre, Nova Scotia, and began railway work in March, 1893, with the Dominion Atlantic Railway as operator and agent. In May, 1896 he left that company to go to the Boston & Albany as an operator, and ever since has been in the continuous service of that road. In November, 1901, he was made train despatcher, and in August, 1907, became chief train despatcher at Boston, Mass. He was promoted to trainmaster with headquarters at Beacon Park, Allston, Mass., in March, 1910, which position he held at the time of his recent appointment as superintendent of the same road as above noted.

Arthur Bointon Shafer, whose appointment as assistant superintendent of the New York, Susquehanna & Western, and the Wilkesbarre & Eastern, with headquarters at Jersey City, N. J., has been announced in these columns, was born on April 19, 1871, at Milford, N. J., and was educated at the high school of his native town. He began railway work as an operator on the Lehigh Valley in August, 1888, and from January, 1890, to September, 1891, was operator on the Belvidere division of the Pennsylvania Railroad. He was then for about one year agent of the Lehigh & Hudson. From October, 1892, to October, 1894, he was operator and agent on different roads, and then went to the New York, Susquehanna & Western, and the following year was appointed train despatcher, becoming chief train despatcher in September, 1904. He was later trainmaster on the Wilkesbarre & Eastern, and now becomes assistant superintendent of the New York, Susquehanna & Western, and the Wilkesbarre & Eastern as above noted.

Willis E. Morse, who has been appointed general manager of the Denver, Northwestern & Pacific, with headquarters at Denver, Colo., was born September 27, 1864, at Belvidere, Ill. He received a high school education and attended Wayland University one year. He began railway work in December, 1881, as a telegraph operator for the Chicago & North Western, and the following two years he filled various positions in the station service. From 1884 to 1889, he was train despatcher, and in the latter year was promoted to trainmaster, which position he held for four years. He was then made assistant superintendent, and from 1897 to January, 1906, was superintendent of various districts. On the latter date Mr. Morse was appointed general superintendent of the lines east of the Missouri river, and on November 1, 1910, he became assistant general manager, with headquarters at Chicago, resigning in March, 1912, on account of ill health. In a recent item regarding Mr. Morse's new position his name was incorrectly given as William E. Morris.

W. E. Morse.

Traffic Officers.

T. B. McGill has been appointed contracting freight agent of the Union Pacific, with headquarters at Chicago.

Martin L. Schultz has been appointed commercial agent of the Missouri & North Arkansas, with headquarters at Chicago.

L. J. McFaul has been appointed district freight and passenger agent of the Southern Pacific, with headquarters at Salt Lake City, Utah.

George B. Hugel has been appointed soliciting freight agent of the Denver & Rio Grande and the Western Pacific, with headquarters at Chicago.

A. Engelhardt has been appointed traveling freight agent of the Delaware & Hudson Company, with office at Pittsburgh, Pa., succeeding Gordon Edwards, resigned.

F. H. Erhart has been appointed traveling freight agent of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Kansas City, Mo., in place of H. W. Rogers, deceased.

R. H. Crozier has been appointed assistant general passenger agent of the Spokane, Portland & Seattle, Oregon Electric, Oregon Trunk and United Railways, with headquarters at Portland, Ore.

C. M. Agnew, traveling freight agent of the Southern, with headquarters at Kansas City, Mo., has been transferred to Omaha, Neb., as commercial agent in place of J. R. L. Wulff, promoted.

W. J. Berger, city passenger agent of the Chicago, Burlington & Quincy, at New York, has been appointed general agent of the passenger department, with headquarters at New York, succeeding to the duties of W. J. O'Meara, deceased, who was eastern passenger agent.

C. J. Jones, who, on April first, became general freight agent of the Southern Pacific, with headquarters at San Francisco, Cal., began railway work in 1880 with the Burlington, Cedar Rapids & Northern at Muscatine, Iowa, as a telegraph operator and clerk in the local freight office, after completing a high school course. He went to the Arizona & New Mexico in 1883 as trainmaster and agent at Lordsburg, N. M., and entered the service of the Southern Pacific in 1887. He was employed by that company as local agent and trainmaster at various places until 1901, when he was appointed district freight and passenger agent at Sacramento, Cal. Two years later he was made freight agent at the San Francisco local station, and in 1904 he was promoted to assistant general freight agent. He left the Southern Pacific in 1910 to accept the position of traffic manager of the Alaska Steamship Company and the Copper River & Northwestern, with headquarters at Seattle, Wash., and now returns to the Southern Pacific as general freight agent, as above noted.

C. J. Jones.

Engineering and Rolling Stock Officers.

W. R. Roof has been appointed engineer of bridges and buildings of the Chicago Great Western, with headquarters at Chicago, succeeding C. Chandler.

The headquarters of W. L. Kellogg, superintendent of motive power of the Missouri, Kansas & Texas, have been transferred from Parsons, Kan., to Denison, Tex., effective April 8.

A. P. Walker, assistant division engineer, Ontario division, of the Canadian Pacific, at Toronto, Ont., has been appointed division surveyor, Ontario division, with office at Toronto.

N. E. Brooks, division engineer of the Canadian Pacific, at Calgary, Alta., has been appointed engineer maintenance of way, Western lines, with headquarters at Winnipeg, Man., in place of R. C. St. John.

Edward A. Park has been appointed superintendent of motive power and equipment of the Peoria & Pekin Union, with headquarters at Peoria, Ill. The position of master mechanic, held by J. W. Hill, is abolished.

J. R. Greiner, general foreman of the Cincinnati, Hamilton & Dayton, at Lima, Ohio, has been appointed master mechanic of the San Pedro, Los Angeles & Salt Lake, with headquarters at Milford, Utah, succeeding T. M. Vickers, resigned.

L. F. Lonnbladh, formerly superintendent and chief engineer of the Tennessee Central, has been appointed engineer maintenance of way of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., to succeed F. Ringer, promoted; effective April 10.

A. M. Lupfer, chief engineer of the Spokane, Portland & Seattle, the Oregon Trunk and the Spokane & Inland Empire, will also have jurisdiction over the Oregon Electric and the United Railways, with headquarters at Portland, Ore., succeeding L. B. Wickersham, who has been appointed chief electrical engineer of the two latter roads, with office at Portland, Ore.

R. A. Rutledge, assistant chief engineer of the Gulf, Colorado & Santa Fe, at Galveston, Tex., has been appointed chief engineer, Eastern lines of the Atchison, Topeka & Santa Fe, with office at Topeka, Kan., succeeding C. F. W. Felt, promoted, and F. M. Bisbee, principal assistant engineer at La Junta, has been appointed chief engineer Western lines, with office at Amarillo, Tex.

C. Chandler, engineer of bridges and buildings of the Chicago Great Western, has been appointed assistant bridge engineer of the Illinois Central, with headquarters at Chicago, succeeding M. Johnson, promoted, effective April 15. Mr. Chandler was born September 30, 1875, at Bushnell, Ill., and attended Swarthmore College, 1892-1896. He began railway work July 15, 1897, as draftsman in the bridge and building department of the Illinois Central. In 1902 he was made chief draftsman of that road, which position he held until December 1, 1910, when he resigned to become engineer of bridges and buildings of the Chicago Great Western. He now returns to the Illinois Central as assistant bridge engineer, as above noted.

William Frederick Steffens, whose appointment as assistant chief engineer of the Chesapeake & Ohio, the Chesapeake & Ohio of Indiana and the Hocking Valley, with headquarters at Richmond, Va., has been announced in these columns, graduated as a civil engineer from the Massachusetts Institute of Technology in 1898. The same year he entered the service of the New York, New Haven & Hartford as structural draftsman, and left that company in 1901 to go with the Erie as transitman. From November, 1901, to November, 1905, he was with the New York Central & Hudson River, first as draftsman and structural designer, and subsequently as assistant engineer. He was then for about four years engineer of bridges and buildings on the Carolina, Clinchfield & Ohio. In December, 1909, he was appointed engineer of structures of the Boston & Albany, which position he held at the time of his recent appointment as assistant chief engineer, as above noted.

Daniel Joseph Brumley, whose appointment as engineer maintenance of way of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Chicago, has already been announced in these columns, was born March 19, 1865, near Belmore, Ohio. He was graduated in civil engineering from the Ohio State University in 1895, and began railway work in June of that year as assistant section foreman on the Louisville & Nashville at Evansville, Ind. From August to December, 1896, he was with the Columbus & Hocking Coal & Iron Company as assistant engineer at New Straitsville, Ohio, and during the two succeeding years he was successively assistant supervisor of the Louisville & Nashville, at Belleville, Ill., section foreman at Evansville, rodman at Louisville, Ky., and assistant engineer at Clarksville, Tenn. He was then on December 3, 1898, transferred to the chief engineer's office at Louisville as assistant engineer, and in April of the following year was made assistant engineer of that road, with headquarters at Louisville. He left the Louisville & Nashville in September, 1901, to go to the Mexican National as roadmaster at Laredo, Tex., but returned to the former road one month later as roadmaster at Elizabethtown, Ky., where he remained until October, 1904. On the latter date he was appointed division engineer of the Indianapolis Southern at Indianapolis, Ind., and in March, 1905, was made principal assistant engineer of the Illinois Central, the Yazoo & Mississippi Valley and the Indianapolis Southern, with headquarters at Chicago. In June, 1910, he became engineer of construction of the two former roads, which position he held until his recent promotion on April 1 to engineer of construction, as above noted.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Grand Trunk has ordered 50 mikado locomotives from the Montreal Locomotive Works.

The Florida East Coast is said to have ordered 24 Pacific type locomotives from the American Locomotive Company. This item has not been confirmed.

The Peking-Kalgan Railway, China, has ordered 4 Mallet locomotives (2-8-8-2) from the American Locomotive Company. The dimensions of the cylinders will be 18½ in. and 29 in. x 22 in., the diameter of the driving wheels will be 42 in., and the total weight in working order will be 300,000 lbs.

The Buffalo, Rochester & Pittsburgh, as mentioned in the *Railway Age Gazette* of March 28, has ordered 12 mikado locomotives and 3 Pacific type locomotives from the American Locomotive Company. The specifications and special equipment for these locomotives are as follows:

	PACIFIC.	MIKADO.
Simple or compound	Simple	Simple
Weight on drivers	165,000 lbs.	218,000 lbs.
Total weight	262,000 lbs.	277,000 lbs.
Diameter of cylinders	24½ in.	26½ in.
Stroke of pistons	26 in.	30 in.
Diameter of drivers	73 in.	63 in.
Type of boiler	Extended wagon top	Extended wagon top
Working steam pressure	200 lbs.	180 lbs.
Heating surface, tubes	3,391 sq. ft.	3,391 sq. ft.
Heating surface, arch tubes	30 sq. ft.	30 sq. ft.
Heating surface, firebox	204 sq. ft.	204 sq. ft.
Heating surface, total	3,625 sq. ft.	3,625 sq. ft.
Tubes, number	240	240
	32	32
Tubes, outside diameter	2 in.	2 in.
	5¾ in.	5¾ in.
Tubes, length	20 ft. 0 in.	20 ft. 0 in.
Firebox, type	Radial stayed	Radial stayed
Firebox, length	108 in.	108 in.
Firebox, width	75¼ in.	75¼ in.
Firebox, material	Open hearth steel	Open hearth steel
Grate area	56½ sq. ft.	56½ sq. ft.
Tank capacity for water	9,000 gals.	9,000 gals.
Coal capacity	15 tons	15 tons

SPECIAL EQUIPMENT.

Axles	Open hearth steel
Bell ringer	Hammett
Boiler lagging	Franklin sectional magnesia
Brakes	Westinghouse—American
Brake beams	Waycott
Brick arch	American Arch Co.
Couplers	Sharon
Driving boxes	Lawrenceville Bronze Co.
Headlight	Pyle electric on the Pacifics
Headlight	Dressel on the mikados
Injector	Nathan Monitor
Piston and valve rod packings	"King"—U. S. Metallic
Safety valve	Consolidated
Sanding devices	Leach
Sight-feed lubricators	Nathan
Steam gages	Ashcroft
Steam heat equipment	Safety Co. on the Pacifics
Superheater	Schmidt
Tires	Midvale
Valve gear	Walschaert
Wheel centers	Cast steel

CAR BUILDING.

The Grand Trunk has ordered 2,000 box cars from the Pressed Steel Car Company, and 1,000 box cars from the Western Steel Car & Foundry Company.

IRON AND STEEL.

The Pennsylvania Lines West have ordered 1,400 tons of bridge material for replacements.

General Conditions in Steel. Consumers are holding off in expectation of lower prices following the tariff revision. Orders have consequently been light but specifications continue heavy. The damage to the industries by the flood is being rapidly repaired, and full resumption of activity in the flooded district is expected within a week. A considerable volume of tonnage will be necessary to replace the bridges destroyed by the flood. In most cases the old structures are being replaced with better ones.

Supply Trade News.

The Gould Coupler Company has moved its New York offices from 341-347 Fifth avenue, to 30 East Forty-second street.

Hiram J. Slifer, a consulting civil engineer, specializing in steam railway practice, has moved his office to the Rookery, Chicago.

The Western Railway & Mill Supply Company, San Francisco, Cal., which makes and sells railway supplies, has changed its name to the Edward S. Sullivan Company.

The two Chicago plants of the Allis-Chalmers Company were bid in for $1,000,000 by the purchasing committee of the reorganized company at a judicial sale held in Chicago on April 8.

The Horace L. Winslow Co., contractors and heating experts, have recently found it necessary, on account of expansion resulting from increase of business, to move into new and larger offices at 990 Old Colony building, Chicago.

The Yale & Towne Manufacturing Company, New York, has moved its general offices from 9 Murray street, to 9 East Fortieth street, New York. The new building, built and owned by the company, is twelve stories high and occupies a plot 50 ft. by 100 ft. The entire ground floor will be devoted to exhibit rooms.

Charles Robbins, manager of the industrial and power department of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., with office in Pittsburgh, has been made assistant sales manager, with office at East Pittsburgh. J. M. Curtin, assistant manager of the industrial and power department has been made manager of that department, succeeding Mr. Robbins.

During the week of April 7 the heads of departments and managers of various offices of Robert W. Hunt & Co. met with the firm at the general office in Chicago in annual conference. Papers on the various methods of conducting the work of inspection and testing were discussed, and on Thursday and Friday a party was taken on inspection trips to Gary, South Chicago and Buffington.

The Dearborn Chemical Company, Chicago, is building a reinforced concrete manufacturing plant at Toronto, Ont., at a cost of about $100,000. This plant, which will be completed during the coming summer, will have railroad connection with both the Canadian Pacific and the Grand Trunk. A. W. Crouch will have charge as vice-president and general manager, with office in Toronto. Mr. Crouch has for the past eight years been district manager of the company, with office in Pittsburgh, Pa.

The Kennicott Company, Chicago Heights, Ill., has been awarded the John Scott legacy medal for its water weigher or measuring device. The medal was awarded by the city of Philadelphia upon recommendation of the Franklin Institute for promotion of the mechanic arts. The award was made after a thorough investigation "in consideration of its novelty, its simplicity of design, and its accuracy as a water measuring device." The principle of the operation of the weigher is described in bulletin No. 38, issued by the company.

TRADE PUBLICATIONS.

Dump Cars.—The Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio, has published an attractive folder entitled Some Snap Shots, illustrating the operation of its automatic, air, dump cars. The booklet also tells how rapidly and simply these operations are accomplished.

Steel Sash.—The David Lupton's Sons Company, Philadelphia, Pa., has devoted catalog No. 7 to detailed descriptions and illustrations of its products, including steel sash for side walls, steel partitions and doors, Pond continuous sash, Pond operating device, rolled steel skylight, hollow metal windows, etc.

Concrete Posts.—The National Reinforced Concrete Corporation, of San Francisco, has issued an illustrated folder devoted to its reinforced concrete hollow and solid poles and posts for electric lighting, fencing, telegraph, telephone and trolley wires. The pamphlet includes illustrations and descriptions of various installations of these posts.

Railway Construction.

Abilene & Southern.—Plans are being made to build an extension, it is said, from Hamlin, Tex., northwest to Matador, through the counties of Stonewall, Dickens and Motley, about 100 miles. Later it is planned to further extend the line from Matador to a point on the Forth Worth & Denver City, probably at either Clarendon or Claude. Col. Morgan Jones is in charge of the preliminary work of this prospective extension. Large bonuses in aid of the project are being raised in the towns and rural communities along the route.

Birmingham-Tuscaloosa Railway & Utilities Company (Electric).—An officer writes that the plans call for building from Birmingham, Ala., southwest via Bessemer to Tuscaloosa, 54 miles. Contract for the work has been given to the Tidewater Construction Company, Birmingham. As soon as the location is made, grading work will be started. It is to be a high speed electric line for freight and passenger service. The Tuscaloosa Belt Railway, operating 14 miles of track in Tuscaloosa is now being reconstructed, the work includes filling in the old trestles and reducing the grades and curves. It is to form part of the through line. C. R. Carter, C. S. Gannon and W. S. Adams, are incorporators. (March 28, p. 779.)

Brule Lake.—Incorporated in Alberta, Canada, to build from the Grand Trunk Pacific east of Brule Lake, at mileage 994, southeasterly to township 49, range 26, west of the 5th meridian. The provisional directors include G. G. S. Lindsay, Toronto, Ont.; S. R. Woods, O. M. Biggar, S. W. Field and J. T. J. Collison, Edmonton, Alta.

Campbellford, Lake Ontario & Western.—See Canadian Pacific.

Canadian Northern.—Application has been made by this company for permission to build a branch from mileage 111.89 on the Oak Point branch, in Manitoba, through sections 29, 32 and 33, township 26, and sections 16, 15 and 22, township 27, range 7, west principal meridian.

Canadian Pacific.—The Canadian parliament has extended the time for building the Campbellford, Lake Ontario & Western. The route is south from Glen Tay, Ont., to the Lake Ontario shore, thence west parallel to the Grand Trunk on the north side via Port Hope to Agincourt. The entire line is under contract, and track laying will be started this month.

Chesapeake & Ohio.—An officer writes that a contract has been given to the C. D. Langhorne Construction Company, Beaver, Ky., to build the Elkhorn & Beaver Valley from Beaver Creek station on the C. & O.'s Big Sandy district to the mouth of Steels' Creek, through Floyd county, Ky., 21 miles. (April 11, p. 863).

Chicago, Milwaukee & St. Paul.—An officer writes that the line which has been under construction for about a year from Plummer, Idaho, to Bell, Wash., about 20 miles, is expected to be finished this season. H. C. Henry is the contractor.

The Priest Rapids line of the Puget Sound Lines, extending southeast from Beverly Junction, Wash., has been opened for freight traffic to Hanford.

Cumberland & Shippensburg (Electric).—An officer writes that a contract will be let in the near future to build from Chambersburg, Pa., northeast to Shippensburg. There will be two steel bridges on the line. P. M. Mahon is president, Chambersburg.

Delaware & Hudson.—See Watervliet, N. Y., under Railway Structures.

Gulf, Florida & Alabama.—An officer writes that work on the twenty-mile extension on the northerly end, for which a contract was recently let to J. P. McCarthy & Company, of Gainesville, is expected to be completed and the section open for operation by August. On the completion of that work, the company expects to build a fifty-mile extension to a connection with the Mobile & Birmingham branch of the Southern at Pine Hill. On the latter section there will be some fairly heavy steam shovel work, involving the handling of about 1,250,000 cu. yds. There will also be a bridge at a point five miles from Pine Hill over the Alabama river, involving some heavy sub-structural work. (March 7, p. 759.)

Lewiston-Clarkston Valley (Electric).—An officer writes that the plans call for building from a point in Idaho west via Lewiston to Clarkston, Wash., and then south to Asotin, about 12 miles. In addition there will be an 8-mile branch southeast from Lewiston to Lewiston Orchards. Track has been laid on 6,000 ft. F. L. Sturm, president, and P. T. Oehler, chief engineer, Lewiston.

Montezuma San Juan Southern.—We are told that this company will ask for incorporation soon to build about 200 miles of railroad from a point near Dolores, Colo., south via Cortez and Mancos, and along the La Plata river via Fruitland, N. Mex., thence across the Indian Reservation to a point at or near Grants, N. Mex., where a connection is to be made with the Santa Fe line. The route is through a flat country, with the exception of a 20-mile section over the continental divide. The company expects to develop a traffic in coal, live stock, potatoes, fruit and lumber. Emil Stein, Durango, Colo., and W. A. Venter, New York, are interested. Roy F. Goodman is chief engineer.

Norfolk & Western.—The extension of the Dry Fork branch, from Canebrake, W. Va., to a connection with the Clinch Valley district, at Cedar Bluff, Va., 15.84 miles, was opened for operation on April 15.

Palatka-Hastings Interurban.—A franchies has been given to this company, it is said, to build a 10-mile line from Palatka, Fla., northeast to Hastings. C. A. DuPont, president, Palatka.

Pigeon Valley.—Incorporated in Wisconsin, with headquarters at Pigeon Falls, Trempealeau county, to build from that place to Hay creek, in the town of Bridge Creek, Eau Clair county, 20 miles.

Portage Radial Railway & Canal.—Incorporated in Manitoba, Canada, to build from Portage la Prairie to Winnipeg, and from Portage la Prairie to Delta, with branch lines; also a canal from Lake Manitoba through Portage la Prairie to the Assiniboine river. The provisional directors include: W. Richardson, H. Stephens, F. G. Taylor, Portage la Prairie; B. L. Grant, St. Francois Xavier; A. H. Oakes, Winnipeg, Man.

Riviera Beach & Western.—An officer writes that construction work is about finished on this line from Riviera, Tex., east through a farming district, to Riviera beach on the Gulf coast, 9.7 miles. At Riviera a connection is made with the St. Louis, Brownsville & Mexico. Steam is used as the motive power for freight traffic, and gasolene motor cars for passenger traffic. T. F. Koch, president, Houston, and M. W. Jones, general manager, Riviera.

Salem, Falls City & Western.—A bridge over the Willamette river at West Salem, Ore., has been completed and put into service, thereby connecting up the line recently completed from Dallas to Salem, Ore.

Seaboard Air Line.—The extension from Mulberry, Fla., east to Bartow is open for business, and through trains are now in operation between Bartow and Tampa.

Shenandoah Valley (Electric).—Final surveys are being made, it is said, in Berkeley and Jefferson counties, West Virginia, and in Frederick and Clark counties, Virginia, for an electric line to be built this spring. Surveys at Martinsburg and near that place have been completed. C. W. Watson, of Fairmont, is back of the project.

Taber Transit.—Incorporated in Alberta, Canada, to build from section 31-9-16 west of the 4th meridian, northwesterly to section 12-10-7, with branches to section 33-9-17 and section 7-10-7; and a second line also from section 31-9-16 north and northeasterly to Bow City, Alta. The provisional directors include: J. F. Kramer, V. O. Eastland, Calgary, Alta.; C. D. Holder, Dunmore; J. Schissil, Canmore; W. E. Bullock, F. Barton, Taber, and E. S. Kramer, Philadelphia, Pa.

Tuscaloosa Belt.—See Birmingham-Tuscaloosa Railway & Utilities Company.

Wetaskiwin, Yellowhead & Pacific.—Incorporated in Canada to build from Wetaskiwin, Alta., west along the Saskatchewan and the Brazeau rivers to the Yellowhead Pass, thence south to Revelstoke, B. C., about 500 miles. The names of the incorporators are not given.

Willapa Bay & Eastern.—Incorporated in the state of Washington with $2,000,000 capital, and headquarters at Seattle, to to build from Lincoln Creek, in Lewis county, Wash., west to a point near South Bend, thence along the North river to the O-W. R. & N., at South Bend. The incorporators include W. H. Bogle, F. T. Merritt and C. P. Bissitt.

RAILWAY STRUCTURES.

Charlestown, W. Va.—An officer of the Norfolk & Western writes regarding the report that a station is to be built at Charlestown, that the company has bought land as a site, but has not yet decided when the station will be built.

Chicago, Ill.—The Baltimore & Ohio has let a contract to James Stewart & Company, New York and Chicago, for the construction of a grain elevator in the Calumet river district at South Chicago, to have a capacity of 875,000 bushels. The elevator will have a steel frame and be fireproof throughout, and will be erected on concrete foundations. The work house will contain 55 bins, with a capacity of 250,000 bushels, and there will be 70 storage bins with a capacity of 625,000 bushels. There will be three receiving elevators in the building, three shipping elevators, two cleaning elevators and a screening elevator. It is planned to begin work at once in order that it may be completed in time to receive this year's crop.

The Chicago & Alton has let a contract to George B. Swift & Co. for a 30-stall roundhouse, a coal tepple and ash pit at Glenn Yards, Chicago.

Del Rio, Tex.—Plans have been prepared for a new 18-stall roundhouse and repair shop.

Green Bay, Wis.—The Chicago & North Western will build a new 40-stall engine house, brick power house, store and oil houses, mechanical coal chute, water tank, ice house, and other buildings in connection with track changes and other improvements, to cost approximately $350,000 in all.

Muskegon, Mich.—The Pere Marquette is planning to build a new two-story freight house.

Pine Hill, Ala.—See Gulf, Florida & Alabama under Railway Construction.

Watervliet, N. Y.—The report of the Delaware & Hudson Company for the year ended December 31, 1912, shows that during the year a program was inaugurated covering extensive bridge renewals and betterments to make all bridges capable of carrying heavy engines. Part of the work was completed in 1912, and will be continued throughout the years 1913 and 1914. During the year there were completed and put in operation the shops and terminals at Watervliet; cold storage plant at Glenville; roundhouse and coaling facilities at Carbondale, Pa.; grade reduction and change of line Oneonta, N. Y., to Nineveh; one mile of double track north of Binghamton, N. Y., and a large number of spur tracks and sidings. New passenger stations were built at Lake George, N. Y., and at Dennemora, and the freight house facilities at the latter place were improved. Work is now under way on an under-crossing, including solid floor three track through girder bridge, 78 ft. long, at Slingerlands, N. Y.; a concrete over-head bridge, concrete cattle pass and approaches, at Bainbridge, N. Y., and an over-crossing at Robinson street, Binghamton. Substantial improvements in the station and yard layout at Sidney, N. Y., have been started. The improved facilities at this place will be used jointly by the D. & H. Co. and the New York, Ontario & Western. The freight house at Green Island is now being enlarged and additional tracks constructed.

Wichita, Kan.—The Atchison, Topeka & Santa Fe is planning to begin work shortly on a 12-stall roundhouse and shops.

Better Roads in Argentina.—A considerable amount of work has been carried out by the Argentine road commission during the latter half of the calendar year of 1912 improving the access to the stations within the district reached by the Buenos Aires Great Southern. This has proved of great benefit in connection with the cartage of the crops.

Railway Financial News.

Baltimore & Ohio.—The syndicate which underwrote the $62,250,000 convertible 4½ per cent. bonds which were offered to stockholders at 95½ has been dissolved and members are at liberty to dispose of their bonds.

Chicago, Milwaukee & St. Paul.—The $30,000,000 4½ per cent. bonds which were sold by the railway company to Kuhn, Loeb & Co. and the National City Bank, both of New York, as mentioned in these columns last week, is being offered to the public by the bankers at 99½. These bonds are secured by a direct mortgage on 6,315 miles of first track and on terminal properties in Chicago, Milwaukee and other cities and on the entire equipment of the company. The general mortgage bonds are secured by an absolute first mortgage on 3,753 miles of road, including the main lines entering Chicago and Milwaukee.

The total general mortgage bonds outstanding, including prior liens, are at the average rate of $22,193 per mile on the 6,315 miles of road on which they are secured. Of the total authorized issue of $150,000,000 general mortgage bonds, there are outstanding $8,950,000 3½ per cent. bonds; $48,841,000. 4 per cent. bonds; $9,852,000 bonds in the treasury; $52,357,000 bonds reserved to retire prior liens and the $30,000,000 now being offered. The bonds are a legal investment for savings banks in New York, Massachusetts and Connecticut.

Delaware & Hudson.—See editorial comment on this company's annual report.

Denver & Salt Lake.—C. E. Mitchell & Co., New York, are offering $488,000 Equipment Trust 5 per cent. notes, dated March 1, 1913, at prices for different maturities to yield about 5⅜ per cent. on the investment. The Denver & Salt Lake is the successor company to the Denver, Northwestern & Pacific. Title to the equipment purchased under these notes remains with the trustee of the notes.

Detroit Southern.—The Protective Committee representing the Ohio & Southern division first mortgage bonds, has adopted a plan of reorganization subject to the lien of this mortgage, and it is understood that more than 92 per cent. of the bonds outstanding under this mortgage have been deposited with the committee.

Under the general plan of reorganization provision is made for raising the sum of $2,247,500 of new money to provide funds for payment of receivers' certificates and indebtedness of the receiver chargeable against the Ohio Southern division, cost of contemplated betterments to the railroad and its equipment, working capital, etc. This amount shall be raised by requiring the holders of the present $4,495,000 of outstanding Ohio Southern division mortgage bonds to purchase the following amounts of securities of the new company: Adjustment mortgage, 5 per cent. 40-year gold bonds, $2,247,500; preferred stock $4,495,000, and common stock $2,247,500. Each holder of an Ohio Southern division mortgage bond, par value $1,000, will thus be required to pay $500 in cash and receive therefor $500 in new adjustment mortgage bonds, $1,000 in new preferred stock and $500 in new common stock.

It is proposed that the new company shall authorize the following securities: (1) $1,500,000 first mortgage 5 per cent. 40-year gold bonds, dated July 1, 1913 (2) $2,250,000 adjustment mortgage 5 per cent. 40-year gold bonds, dated July 1, 1913, on which the interest is cumulative, with the provision that there is to be no right of foreclosure for non-payment of interest until maturity of the principle. (3) $4,500,000, par value preferred stock, entitled to non-cumulative dividends of 4 per cent. per annum. (4) $4,500,000 par value common stock.

Grand Trunk Pacific.—Stockholders have authorized a further issue of $25,000,000 debenture stock.

Howard G. Kelly has been elected a director, succeeding F. H. Fitzhugh, resigned.

Houston & Texas Central.—The Texas legislature has authorized this company to consolidate with it the Hearn & Brazos Valley, which runs from Hearn to Stone City, Texas, 19 miles.

Hearn & Brazos Valley.—See Houston & Texas Central.

Long Island Railroad.—A. J. County, assistant to the president of the Pennsylvania, and Percival Roberts, Jr., have been elected directors, succeeding James McCrea and Charles E. Pugh, both deceased.

Minneapolis, St Paul & Sault Ste. Marie.—The Michigan Railroad Commission has authorized this company to issue $2,703,000 consolidated mortgage, 4 per cent. bonds to pay for 135 miles of new road which has recently been built.

Missouri, Kansas & Texas.—H. E. Andrews, president of the New York State Railways, and F. H. Davis, of Hawley & Davis, New York, have been elected directors, succeeding A. A. Allen, until recently president, and A. W. Smithers, resigned.

See comments made by the Houston *Chronicle* on the merger bill passed by the Texas legislature reprinted in general news.

New York Central & Hudson River.—This company has sold in London £2,000,000 ($10,000,000), one-year, 5 per cent. notes on a basis, according to the *Commercial and Financial Chronicle*, of 5⅜ per cent.

Oklahoma Central.—The sale of this road, which is in the hands of the receiver, has been ordered by the United States District Court for October 9.

St. Louis Southwestern.—The Texas legislature has authorized the consolidation of the Stephenville, North & South Texas with the St. Louis Southwestern.

See comments of the Houston *Chronicle* printed elsewhere.

Southern Pacific.—This company has asked authority of the California Railroad Commission to issue $10,120,000 4½ per cent. Equipment Trust certificates.

Charles W. Harkness and L. E. Loree, president of the Delaware & Hudson, have been elected directors, succeeding C. H. Kelsey and George B. Leighton.

Texas & Pacific.—See an item in regard to merger bill passed by the Texas legislature, reprinted in another column from the Houston *Chronicle*.

DISBUSAEMENTS:

Sixty-two locomotives acquired		$1,546,678.57
Five Milk Cars acquired	$17,000.00	
One Gas-Electric Car acquired	25,075.00	
One Pintsch Gas Transport Car acquired (including accrued interest)	2,500.00	
Two Gasoline Tank Cars acquired	1,700.00	
One Snowplow acquired	5,040.42	
Fifteen Cabooses acquired	10,500.00	
		61,815.42
Three hundred and six (306) The D. & H. Co. First Lien Equipment Bonds purchased and retired (including accrued interest)		312,170.64
Securities and Cash in hands of Trustees		1,441,303.05
Total		$3,361,967.68

In accordance with the ordinance passed May 9, 1899, and amended at the annual meeting of stockholders held on May 10, 1910, there was accumulated in the Coal Department Sinking Fund $285,486.35. Of this amount $11,780.04 was applied toward the cost of coal lands purchased in the Wyoming section of Pennsylvania, and the balance was applied to the advances to The Schuylkill Coal & Iron Co. and the Shanferoke Coal Co. for the acquisition of anthracite coal lands in Schuylkill County, Pennsylvania.

DIVIDENDS.

On December 18, 1912, a dividend for the year 1913, upon the outstanding $42,503,000 of Capital Stock of the Company, at the rate of nine (9) per cent. upon the par value thereof, and amounting in the aggregate to $3,825,270, was declared out of the earnings for the current and preceding years, payable as follows:

Two and one-quarter (2¼) per cent. upon the Capital Stock, in favor ooly of the stockholders of record upon February 25, 1913, and payable March 20, 1913.

Two and one-quarter (2¼) per cent. upon the Capital Stock, in favor ooly of the stockholders of record upon May 28, 1913, and payable June 20, 1913.

Two and one-quarter (2¼) per cent. upon the Capital Stock, in favor only of the stockholders of record upon August 28, 1913, and payable September 20, 1913.

Two and one-quarter (2¼) per cent. upon the Capital Stock, in favor only of the stockholders of record upon November 27, 1913, and payable December 20, 1913.

COAL MINING DEPARTMENT OPERATIONS.

During the year 1912 there were mined 6,438,555 gross tons of anthracite coal out of a total of 63,610,578 tons, including product of washeries, produced in the region. The amount produced by this Company is 842,384 gross tons less than for the year 1911, due to the suspension of work at the collieries from April 1st to May 21st inclusive, account of strike of employes.

As a result of the suspension above referred to, a joint sub-committee was appointed representing the Mine Workers on the one hand and the Anthracite Coal Operators on the other, which negotiated an agreement governing the relations of employes and employers in the Anthracite Region. This agreement provides that the terms and conditions awarded by the Anthracite Coal Strike Commission and supplemented by the agreements subsequent thereto shall be continued for a further period of four (4) years, ending March 31, 1916, except in the following particulars, to wit:

(a) The contract rates and wage scales for all employes shall be increased ten per cent. over and above the contract rates and wage scales established by the Anthracite Coal Strike Commission as effective April 1, 1903. The provisions of the sliding scale are by mutual consent abolished.

(b) All contract miners and laborers when working on consideration shall be paid not less than the rate paid Company miners and laborers at the mine where the work is being performed.

(c) There shall be an equitable division of mine cars as set forth in the award of the Anthracite Coal Strike Commission and the decisions of the Conciliation Board; and further, the rates paid by any contract miner to his employes shall not be less than the standard rate for that particular class of work.

(d) At each mine there shall be a grievance committee consisting of not more than three employes, and such committee shall under the terms of this agreement take up for adjustment with the proper officials of the Company all grievances referred to them by employes who have first taken up said grievance with the foreman and failed to effect proper settlement of the same. It is also understood that the member of the Board of Conciliation elected by the Mine Workers organization or his representatives may meet with the Mine Committee and Company officials in adjusting disputes. In the event of the Mine Committee failing to adjust with the Company officials any grievance referred to them they may refer the grievance to the members of the Board of Conciliation in their district for adjustment, and in case of their failure to adjust the same, they shall refer the grievance to the Board of Conciliation for final settlement, as provided in the Award of the Anthracite Coal Strike Commission and the agreements subsequent thereto, and whatever settlement is made shall date from the time the grievance is raised.

(e) Contract miners shall have the right to employ check weighmen and check docking bosses, as provided by the award of the Anthracite Coal Strike Commission and the decisions of the Board of Conciliation, and when so employed their rights shall be recognized and they shall not be interfered with in the proper performance of their work; provided they do not interfere with the proper operation of the colliery. Check weighmen and check docking bosses shall be elected by contract miners in meeting assembled specifically for that purpose, and for such term as said miners may determine, and the chairman and secretary of said meeting shall certify such election to the mine foreman.

(f) For the purpose of facilitating the adjustment of grievances Company officials at each mine shall meet with the Grievance Committee of employes and prepare a statement setting forth the rates of compensation paid for each item of work under the provisions of this agreement, and certify the same to the Board of Conciliation within sixty days after the date of this agreement.

There are items other than change in the wage schedule which tend to cause the cost of producing coal to increase from year to year,—shafts and slopes are sunk deeper, tunnels are extended, and the mined-out area increases, all of which lengthen the haul of coal in mine cars, requiring increased transportation facilities, increase the area to be drained of water, thus calling for more pumping facilities, increase the area to be ventilated, thus requiring enlarged ventilating appliances; and with it all requires more employes.

The thicker veins are gradually being worked out, so that an increased proportion of coal is coming from thin veins, and, in mining these, sufficient headroom must be provided to enable the miners to take out the coal, so that often an amount of rock greater than the body of the coal must be taken out.

There has been a steady increase in the percentage of steam sizes to the total production—increasing from 27.3 per cent. in 1901 to 38.63 per cent. in 1911. This has not resulted from decreased efficiency in mining, but on the contrary is due to improved cleaning appliances which enable the producer to prepare for the market small sizes which formerly went into the culm banks. It is also due, in part, to a conservation of the natural resources, in that the producer is now mining from the thinner veins, while formerly the mines were abandoned after the coal was taken out of the thicker veins, and by reason of cave-ins, which occurred after the coal from the thicker veins was mined, and which prevented the securing of a safe roofing, it became impracticable to subsequently mine the coal in these thinner veins.

The cost of production per ton of fresh-mined coal applies equally to all sizes, whether it be chestnut—the most valuable—or birdseye—the least valuable. In arriving at the cost per ton, a ton of birdseye coal is as much a divisor as a ton of chestnut coal. Inasmuch as the greater proportion of the increase in coal production has been in the smaller or less valuable sizes, such increased tonnage has contributed to keeping the average cost per ton of all sizes less than it otherwise would have been, but at the same time the increased resulting product is one of which the greater proportion is less valuable than the cost to produce it.

Taxes have been increased, so that they are about four times in excess of the amount paid in the year 1901, and this notwithstanding the constant decrease in the unmined coal remaining in the ground. This increase is equivalent to three and thirty-eight hundredths cents per ton on the normal output.

Thus since the adjustment of the wage schedules and the sales prices of coal following the strike of 1902, there has been a constant increase in the cost of producing coal from year to year, due to the causes mentioned which was not counterbalanced by any changes in prices which were made during that period, so that the operating costs of producing coal of this and subsidiary companies, including taxes but excluding sinking fund for depletion of the coal lands, were higher in 1911 than in 1901 by $0.5575 per ton; while, on the other hand, if all of this product had been sold at Tidewater (the prices prevailing there being a fair indication of the fluctuations in prices which might take place in any other market), the increased price return of 1911 over that of 1901 would have been $0.4318 per ton. That is, the increased cost of production exceeded the increased price return by $0.1257 per ton and made it impossible to earn a fair return on the investment. Therefore, some increase in the market price of coal was necessary even though no increase in wages had occurred.

Assuming that in the year 1912 the mines had been operated under normal conditions, but with the increase of $0.0808 per ton in the cost of mining under the new wage scale with an increase of $0.0338 per ton in taxes, and with the increase of $0.25 per ton in the market price of pea coal and larger sizes, and with no change in the market price of the smaller sizes (thus making an increase in the average market price per ton of all sizes of $0.1913), it would have resulted in an increase over the year 1901 of $0.6559 per ton in the cost of production and an increase of $0.6231 per ton in the market price—indicating a decreased return to the producer of ($0.0328) three and twenty-eight hundredths cents per ton.

Construction was continued during the year on the new colliery at Archbald, Pa., which, it is expected, will be completed and placed in operation in the Spring of 1913.

During the year the facilities were increased to correspond with the requirements of the mine working and development work continued in order to maintain the output.

The charges therefor to Extraordinary Expenses of the Coal Mining Department amounted to $857,975.42, as against $823,654.71 in 1911, as follows:

New Colliery at Archbald, Pa	$280,321.97
Sinking Shafts and Shaft Improvements	107,884.91
Tunnels and New Openings	83,892.24
New Engines, New Boilers, Boiler Houses and Fittings	69,965.30
Rope Haulage, Slopes, Planes and Ropes	59,892.04
Concrete Barns, etc.	58,220.19
New Pumps and New Pump Rooms	44,216.49
Electric Plants and Machinery	43,122.89
Tracks, Compressors, etc.	41,359.36
Other New Buildings	14,753.63
Improvements to Breakers and Washeries	7,196.78
Conveyors	1,028.46
Miscellaneous	46,121 16
Total	$857,975.42

RAILROAD DEPARTMENT.

OPERATING REVENUES.

The total increase in Revenues from operations was $1,058,286.12.

The Revenue from Coal Freight traffic increased $498,901.29, of which approximately eighty per cent. was from bituminous coal. Notwithstanding the suspension of coal mining operations in the early part of the year and decrease of 1,285,711 net tons of anthracite coal carried, there was an increase of 55,345,183 in the total anthracite ton miles.

The Revenue from Merchandise traffic increased $423,062.90, the Revenue from Passenger traffic increased $57,277.54, and the Revenue from Miscellaneous sources increased $79,044.39.

OPERATING EXPENSES.

The total increase in Operating Expenses was $1,308,619.26. Maintenance of Way and Structures increased $451,595.56; Maintenance of Equipment increased $170,003.13; Traffic Expenses increased $39,468.78; Transportation Expenses increased $564,969.82, and General Expenses increased $82,581.97.

The ratio of Operating Expenses to Operating Revenues in 1912 was 62.57 per cent., as compared with 59.56 per cent. in 1911. The increase was partly due to the complete shut down of all of the anthracite mines from April 1 to May 21, 1912, pending a settlement of the wage dispute, which caused a substantial reduction in the Company's revenues for those months, while it was impossible to decrease the expense proportionate with the loss of traffic.

In January and February, 1912, the weather conditions were unusually severe and resulted in increased operating costs.

The increase in the Maintenance of Way and Structures Expenses was chiefly due to an increase of $191,984.09 in Rails, Ties and Other Track Material; also, to an increase of $187,941.28 in Bridges, Trestles and Culverts which was made necessary by addition and betterment work inaugurated to provide for use of heavier power.

The increase in the Maintenance of Equipment Expenses was due to an increase of $130,468.00 in Locomotive Repairs and an increase of $60,169.42 in Freight Train Car Repairs—the Locomotive Repairs resulted from 595,558, or 4.44 per cent., more miles run by locomotives, and an increase of 5 per cent in the tractive power of locomotives repaired—the Freight Train Car Repairs resulted from an increased cost of material for repairs and 4,081,505, or 7.58 per cent., more miles run by freight train cars.

The increase in the Transportation Expenses resulted largely from the

increase in business handled. The increased price of fuel resulted in an additional cost of $139,803.65; the increased wages paid to engineers amounted to about $18,000, for the last eight months of the year, under the arbitration award, the increase in Personal Injury Claims paid amounted to $39,695.17, although the number of settlements was less, thus showing the effect of legislation and agitation respecting employers' liability.

Early in the year 1912, the Brotherhood of Locomotive Engineers in behalf of the engineers employed on fifty-two railroads in the eastern section of the United States presented a concerted request to the managements of these railroads for a general increase in wages and for certain modifications in the rules governing their employment.

The matters in dispute were finally submitted to a Board of Arbitration of seven members, one selected by the railroads, one by the Brotherhood of Locomotive Engineers, and the other five were selected by a committee consisting of the Chief Justice of the United States, the Presiding Judge of the Commerce Court, and the United States Commissioner of Labor.

The Arbitration Board fixed the minimum rate for engineers in passenger service at $4.25 for 100 miles or less; miles made in excess of 100, pro rata. Overtime to be computed at 20 miles per hour; paid for at the rate of 50c. per hour. Overtime computed on the minute basis.

The minimum rate for engineers in freight service was fixed at $4.75 for 10 hours or less, or 100 miles or less; miles made in excess of 100, pro rata. Overtime in freight service computed on the basis of 10 miles per hour, and paid pro rata on the minute basis. 25c. per 100 miles or less to be added for local freight service, to through freight rates, according to the class of engines. Miles over 100 will be paid pro rata.

The minimum rate for engineers in switching service was fixed at $4.10 per day, 10 hours or less to constitute a day's work; all time over 10 hours to be paid pro rata; overtime computed on minute basis.

The Arbitration Board also established awards covering Electric Service, Belt Line or Transfer Service, time Engineers are held away from Home Terminal, time of beginning and ending of a day, Initial Terminal Delay, and Final Terminal Delay.

The awards were made effective as of May 1, 1912, except the award covering "Held Away from Home Terminals" and the award covering "Final Terminal Delay" which took effect November 1, 1912. The awards will terminate on May 1, 1913.

The Brotherhood of Locomotive Firemen, the Order of Railway Conductors, and the Brotherhood of Railroad Trainmen, on behalf of all the men engaged in engine and train service, other than the locomotive engineers, have presented a concerted request to the managements of the railroads in the eastern section of the United States for a general increase in wages and for certain modifications in the rules governing their employment. The demands of the firemen are equivalent to about thirty-five per cent., and those of the conductors and trainmen to ten per cent., of the present rates of pay.

An Arbitration Board has been selected under the provisions of the Erdman Act, for the consideration of questions involved in the demands of the Brotherhood of Locomotive Firemen. The demands of the Order of Railway Conductors and of the Brotherhood of Railroad Trainmen will be taken up for discussion by the General Managers' Association of New York, immediately after the Firemen's wage schedule has been disposed of.

ADDITIONS AND BETTERMENTS—ROAD.

A program has been inaugurated covering extensive bridge renewals and betterments in order to make all bridges on the line capable of carrying E-5 engines, the heaviest of the consolidation type. Part of this work was completed in 1912, resulting in charges to Additions and Betterments of $20,564.17 and to Operating Expenses of $123,363.07. The program calls for a total estimated expenditure of $414,308, of which $100,640 is chargeable to Additions and Betterments. The work will continue throughout the years 1913 and 1914.

During the year there were completed and put in operation the shops and terminals at Watervliet, N. Y., the coal storage plant at Glenville, N. Y., the round house and coaling facilities at Carbondale, Pa., the grade reduction and change of line Oneonta to Nineveh, N. Y., and the mile of double track north of Binghamton, N. Y., mentioned in previous Annual Reports.

New Passenger Stations at Lake George and Dannemora, N. Y., have been constructed and the freight house facilities at the latter place improved.

There is being constructed at the present time an under-crossing, including solid floor, three track through girder bridge 78 feet in length, at Slingerlands, N. Y.; a concrete overhead bridge, concrete cattle pass and approaches, at Bainbridge, N. Y.; and an over-crossing at Robinson Street, Binghamton, N. Y.; all of which is being done in accordance with the orders of the Public Service Commission of the Second District, State of New York.

Substantial improvements in the station and yard layout at Sidney, N. Y., have been undertaken. When completed the improved facilities will be used jointly by this Company and the New York, Ontario & Western Railway Company.

The freight house at Green Island, N. Y., is being enlarged and additional tracks constructed, to care for the increasing traffic at that point.

ADDITIONS AND BETTERMENTS—EQUIPMENT.

As mentioned in the 1911 report, there is under way the work of equipping freight cars with steel underframes. There was expended on this work in 1912 $334,594.70. The program for 1913 contemplates the applying of steel underframes to 200 box cars of 60,000 lbs. capacity; 400 coal cars of 80,000 lbs. capacity, and 200 coal cars of 60,000 lbs. capacity, at an estimated cost of $369,600.

There were received during the year the three Mallet Articulated Compound Locomotives, the twelve Class E-5 Consolidated Locomotives, the five new Standard Steel-Underframe Milk Cars, the one Passenger and Baggage Gas-Electric Car, and the fifteen four-wheel Caboose Cars which were ordered in 1911; and, in addition there were acquired one Snow Plow, two Gasoline Tank Cars, and one Pintsch Gas Transport Car; all of which were paid for from funds accumulated under the First Lien Equipment Trust Indenture.

During the year 1912, the Board of Managers authorized the acquisition of fifteen Class E-5 Consolidated Freight Locomotives, and one 100-Ton Wrecking Crane; one Bridge Erecting Car and Trailer with the necessary equipment, for 1913 delivery; all of which will be paid for from funds accumulated under the First Lien Equipment Trust Indenture.

The total expenditures during the year on account of Additions and Betterments to the Company's Railroad (and including expenditures on account of the items mentioned above) amounted to $2,927,057.72, details of which are as follows:

ROAD:		
Right of Way and Station Grounds	$44,660.86	
Widening Cuts and Fills	9.26	
Protection of Banks and Drainage	3,875.51	
Bridges, Trestles and Culverts	22,457.64	
Increased Weight of Rail	47,990.51	
Improved Frogs and Switches	202.00	
Track Fastenings and Appurtenances	10,061.51	
Additional Main Tracks	4,368.50	
Sidings and Spur Tracks	434,255.36	
Terminal Yards	8,525.6	
Fencing Right of Way	3,393.17	
Elimination of Grade Crossings	7,089.16	
Block and Other Signal Apparatus	16,880.18

Total for Year		608,300.59
Grand Total 1912		$2,927,057.72

The Wilkes-Barre Connecting Railroad Company has been organized to construct a line of railroad which will effect a connection between the Pennsylvania Railroad and the lines of this Company near Wilkes-Barre, Pa. The capital stock of the new Company is owned jointly by the Pennsylvania Railroad Company and The Delaware and Hudson Company.

ALLIED STEAM RAILWAYS.

The Greenwich and Johnsonville Railway Company shows an increase in Operating Revenues for the year 1912 of $8,333.42 as compared with the previous year. The Operating Expenses show an increase of $3,643.80. The Net Income for the year was $25,824.12, an increase of $8,756.30 over 1911.

The Quebec, Montreal and Southern Railway Company shows an increase in Operating Revenues of $25,466.20 for the year 1912 as compared with the previous year. The Operating Expenses increased $16,109.96. The Net Income, independent of interest charges due The Delaware and Hudson Company, amounted to $156,378.98, an increase of $19,559.18.

The Napierville Junction Railway Company shows an increase in Operating Revenues for the year 1912 of $12,400.11 as compared with the previous year. The operating Expenses show an increase of $11,089.12. The Net Income amounted to $19,416.44 or 3.23 per cent. on the Capital Stock outstanding. The Operating Expenses increased by reason of the severe weather conditions in the early part of the year; also by extensive repairs to locomotives. Personal injury claims also increased $5,000.

ALLIED ELECTRIC RAILWAYS.

Increases in Net Operating Revenues were as follows: United Traction Company, $18,721.66; Hudson Valley Railway Company, $11,713.41; Schenectady Railway Company, $35,321.44. The Net Operating Revenues of the Troy and New England Railway Company and the Plattsburgh Traction Company decreased $2,578.61 and $2,598.37, respectively.

Dividends of 4 per cent. for the year 1912 were declared on the Capital Stock of the United Traction Company; 6 per cent. on that of the Schenectady Railway Company; 3 per cent. on that of the Troy & New England Railway Company, and 5 per cent. on that of the Plattsburgh Traction Company.

The United Traction Company has completed the work inaugurated in 1911 of placing feeder wires under ground. A high tension transmission line from Mechanieville Power Plant to North Albany, a distance of 17¾ miles, has been constructed, affording the Company direct transmission of current from the Mechanieville Power Plant to its various transformer stations at Albany and Troy, N. Y. The tracks have been extended on Ten Broeck Street, Albany, N. Y., Mill Street and Pawling Avenue, Troy, N. Y., for a distance of 6,054 feet, 1,450 feet and 2,692 feet respectively. During the year seventeen 16-ft. cars were lengthened to 21 feet, increasing the seating capacity from 22 to 28 passengers, or 27.3 per cent.; and three 18-ft. cars were rebuilt and lengthened to 21 feet, increasing the seating capacity from 24 to 28 passengers, or 16.7 per cent.

The Hudson Valley Railway Company has purchased three new passenger cars for use in interurban service between Albany and Warrensburg, N. Y., each with a seating capacity of 52 passengers; and has completed the work of paving Broad Street, Schuylerville, N. Y. The work of paving Lawrence Street, Glen Falls, N. Y., with asphaltic concrete pavement will be completed early in 1913.

ALLIED BOAT LINES.

The Operating Revenues of The Champlain Transportation Company show an increase of $5,359.85 and the Operating Expenses show an increase of $4,373.80 as compared with the year 1911, making an increase in Net Operating Revenue of $986.05 for the year.

The Operating Revenues of The Lake George Steamboat Company show an increase of $5,254.98 and the Operating Expenses show an increase of $16,917.36 as compared with the year 1911, making a decrease in Net Operating Revenues of $11,662.38 for the year.

The Operating Expenses increased by reason of the increased cost of fuel and food supplies and extraordinary repairs to boats of The Lake George Steamboat Company.

The new motor boat "Mountaineer" was completed during the year at a cost of $15,565.21.

Work is in progress on the new shops at Shelburne Harbor, Vt. There was expended on same $15,874.73 during the year.

HOTELS.

Extensive improvements have been made to the Fort William Henry Hotel, consisting of fitting up the Pergola and Bridge for shops and stores, making an addition to the kitchen, building a toboggan slide and hockey rink, and constructing a sewage system.

The Fort William Henry Hotel was open in 1912 from January 1st until October 20th and again opened for the winter season on December 20, 1912.

The Hotel Champlain was opened June 14th and closed September 29, 1912.

Both hotels experienced a successful summer season and notwithstanding the moderate winter weather the Fort William Henry Hotel is showing an improvement in business this winter as compared with the winter 1911-1912.

LITIGATION.

In the suit instituted by The Ticonderoga Railroad Company against this Company, mentioned in the annual reports of 1909 and 1910, the New York Court of Appeals has decided that this Company owes no present duty to The Ticonderoga Railroad Company, except to report the results of this Company's operation of the Ticonderoga Railroad, and to continue the annual payments heretofore made.

In other respects the situation of the litigated matters mentioned in the recent annual reports of the Company remains unchanged.

GENERAL REMARKS.

The Interstate Commerce Commission has proposed rates to be assessed by Express Companies on interstate merchandise express traffic, which would cause losses estimated at 25.2 per cent. of the gross revenues therefrom, and which would correspondingly reduce the express revenues of the Railroads. A hearing before the Commission on the proposed rates will be held during the year 1913, and data is now being prepared which it is believed will clearly indicate the injustice of making any general reduction, and that, at most, changes should be made only in such individual rates as may be necessary to bring them into harmony with the general schedule.

By an Act of Congress a Parcels Post was established on January 1, 1913, whereby packages not exceeding eleven pounds in weight may be forwarded as United States Mail. A large percentage of small packages formerly carried by express will probably be forwarded by mail.

The Post Office appropriation bill which became a law March 4, 1913, provides, that on account of the increased weight of mail resulting from the establishment of the Parcels Post, the Postmaster General is authorized and directed to weigh the mails, beginning September 1, 1913, and to readjust compensation from the date of the commencement of such weighing. It provides, also, for the discontinuance of the transportation of second class matter in freight trains. No provision has been made for compensation to the Railroads for the additional mail carried by reason of the Parcels Post between the date of its establishment and the date of the weighing.

While the increased mail pay resulting from the re-weighing of the mails will largely offset the loss in express revenues of the Railroads, it will not compensate them for the increased labor in handling the mails—the Railroads being obligated to handle, without compensation, all mail at transfer points, and also between the depots and post offices in all cities and towns where the distance does not exceed 80 rods.

Shortly before the close of the year the Interstate Commerce Commission announced its intention to make an investigation of all rates, rules, regulations and practices governing the transportation of anthracite coal. Inasmuch as anthracite coal constitutes over forty per cent. of the total tonnage handled by this Company, it is deeply concerned in the outcome of the proposed investigation.

In view of the constantly growing expense of operation, due to the demands of labor, to the increased cost of material, and to the new Federal and State laws, which to a large degree needlessly and unreasonably increase the number of employees—and with no corresponding increase in the freight rates—the following table indicating the investment which all of the carriers reporting to the Interstate Commerce Commission have made in property devoted to public use and their return on the total investment and on the new money going into the property since June 30, 1907 (the date the new Operating Expense accounts of the Interstate Commerce Commission became effective), is of especial interest:

	†1911.	1910.	1909.	1908.	1907.
Cost of Road and Equipment	$14,984,796,837	$14,387,816,099	$13,609,183,515	$13,213,766,540	$12,940,379,220

†Although the 1911 Report has not been published, we were able to get the information by sending a representative to the Commission. The 1912 figures, although in the hands of the Commission, have not been compiled, so that 1911 is the latest information available.

*Decrease.

NOTE.—The following amounts were deducted from the 1907 figures shown in the Interstate Commerce Statistics, as they represent the figures for switching and terminal roads; while subsequent reports of the Commission excluded such roads and the data is unobtainable: Road and Equipment, $90,065,108; Earnings from Operation, $18,310,520; Operating Expenses, $11,117,613; Taxes, $672,362.

It will be noted that the investment in Road and Equipment increased approximately $273,000,000 in 1908, $395,000,000 in 1909, $779,000,000 in 1910, and $592,000,000 in 1911, so that on June 30, 1911, the investment in the property devoted to public use was, $2,044,417,617 in excess of the investment on June 30, 1907.

Comparing with 1907, there was available for interest and dividends aproximately $119,000,000 less in 1908, $43,000,000 less in 1909, $52,000,000 more in 1910, and $9,000,000 less in 1911.

In other words, the year 1910 was the only year in which the railroads received any return on the new money going into their property devoted to public use, and in that year they received only 3.56 per cent. on the increase of $1,447,436,879 in the cost of Road and Equipment on June 30, 1910, as compared with the cost on June 30, 1907, while in no year did the rate of return on the total investment equal the 5.82 per cent. earned in the year 1907.

It will be noted that the taxes for the year 1911 increased approximately $3,000,000, or .9 per cent over the year 1907.

The necessary annual increases of capital investments by railroad corporations of the character above indicated must be largely made through new issues of long term securities. Such securities will hereafter be placed with some difficulty at such rates of interest as the companies can afford to pay, unless there can be secured to the carriers a fair rate of return upon the cost of the improvements to their properties.

By order of the Board of Managers

L. F. LORILLARD,
President.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies .....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,100 copies were printed; that of those 8,100 copies, 6,651 were mailed to regular paid subscribers and 348 were provided for counter and news companies' sales; that the total copies printed this year to date were 147,909—an average of 8,701 copies a week.

Volume 54. April 25, 1913. Number 17.

CONTENTS

*Illustrated.

WHILE day work and piece-work systems of payment for shop and engine house employees have been used almost exclusively by American railways, a few roads have experimented with and, in one or two cases, have used more or less extensively different types of premium or bonus systems. That piece-work or special methods of wage payment have proved more productive and efficient than the day work system is largely because of the fact that to successfully introduce and maintain them it has been necessary for the management to study and plan the work more carefully to eliminate useless moves and lost motion, and to closely check the output of each individual, both as to quantity and quality. As the earnings of the men under these systems are dependent on having good facilities and a convenient and plentiful supply of material, abuses of this sort, which have been overlooked under the day work system, have been forcibly brought to the attention of the officers in charge by the workmen. Assuming that an equal amount of attention is given to these matters under the day work system, and that care is taken to study the characteristics of each man so that he can be assigned to that class of work for which he is best suited, it is doubtful if any of the systems are more efficient than day work; in fact, the results obtained on at least two roads of which we have a knowledge would seem to prove this to be true. The rather unique method of developing this truth, as outlined by B. B. Milner in the article on "Fundamentals of Wage Payment," which appears in another part of this issue, is worthy of most careful study by those interested in the problem of the payment for labor, and this is particularly true of the suggestion as to the advisability of basing the compensation on a time element only, rather than on a combination of time and rate elements, as in piece-work.

GOVERNOR MAJOR, of Missouri, in signing the train crew law in that state, not only put into effect a measure which railway officers declared would increase railway operating expenses without increasing the safety of transportation, but he gave out a statement in which he took the cheerful view that the measure would increase safety and reduce operating expenses! The railways really need more employees, the governor said, in order to operate more economically. The implication, of course, is that the governor knows more than the officers of the railways, not only about how to deal with accidents, but also about how to deal with expenses. Mr. Major is a country lawyer, who during most of his career has practised politics as much as law. He has served in the state senate, and been attorney-general of Missouri. Neither in his private practice nor in his public career has he given tokens of surpassing ability; he has had no experience in railway affairs; yet according to his statement he must have a most intimate, thorough and profound knowledge of railway operation. "The trouble in Oklahoma," said Governor Cruce in vetoing the train crew bill in that state, "is and has ever been that in dealing with public service corporations we have assumed to know more about how to operate them than those who have given the matter careful study." Governor Cruce could learn from Governor Major that in a few minutes' consultation with the legislative representative of the organized voting power of a labor brotherhood a truly great statesman can learn more about how to run a railroad than has been learned in all their years of study and experience by all the operating officers of all the railroads in the United States.

AT the meeting of the Central & Western Association of Car Service Officers in Chicago last week, a recommendation was adopted and referred to the Association of Transportation & Car Accounting Officers, that cars found to be unserviceable beyond repair shall be destroyed by the road in whose possession they are at the time, credit being given to the owner for the salvage, instead of being sent home to be scrapped. A similar proposition has been under consideration by the Master Car Builders' Association. The discussion at the meeting of the Car Service Officers left no doubt in the minds of those present that such a rule is in the interest of better railroading. W. E. Beecham, car accountant of the Chicago, Milwaukee & St Paul, told of a St. Paul car which left that road on October 4, 1909, and arrived home on February 13, 1913, seventeen months after it had been reported in an unserviceable condition by the Central of Georgia, although a home route card had been promptly issued. When the car reached the rails of the St. Paul it was at once sent to the Milwaukee shops to be scrapped. The Central of Georgia's connection refused to accept it, and after various delays it drifted from one road to another until it finally wound its weary way to the scrap pile over more than a score of roads without hav-

ing performed any service of value to any of them. Others at the meeting related instances of "cripples" that had caused accidents not only serious in themselves, but resulting in serious delays to traffic. Last year the Master Car Builders' Association adopted a rule increasing the repair allowances, which was intended to reduce the number of bad order cars in service by making it more attractive for railways to repair foreign cars. This having been done it would seem to be a wise move to go a step farther, and provide that when cars finally get into a condition beyond repair they shall no longer be allowed to cumber the tracks and trains during the long period which is likely to be required to get them home.

WHILE the construction of the new line of the Lackawanna north of Scranton, Pa., is of much interest from the engineering standpoint, because of the very heavy construction work and the large structures involved, it is of even greater interest as illustrating the expenditures which a road with a heavy traffic and ample financial resources will make to decrease the cost of operation. The Tuckhannock viaduct is of great interest to engineers, particularly because it will be the largest structure of its type ever built, but it is of even greater interest as forming part of a plan to secure an improved line. As indicated in another column, this new line was very carefully located, the rate of increase of both freight and passenger traffic being studied and the cost of handling the present and future traffic over the present and proposed lines being very carefully compared. That this study showed that the interest on the cost of construction would be more than offset by the decrease in operating costs is evident from the authorization of the construction. The large decreases in distance, ruling grades, rise and fall, and degrees of curvature, are not an indication of poor location of the old line, but rather of the character of the country through which the line passes and of the money which is being spent to secure these improvements. It is interesting to note that these savings in distance are being made in spite of the fact that the Lackawanna is already the shortest line between Buffalo and New York. While the Lackawanna's financial position makes it more practicable for it to do work of this kind than for most roads, the expenditure of such sums as are required on the recently completed Hopatcong-Slateford cut-off, and on this more recent one, enables it to increase its already large net earnings. The work is a good example of the intensive development of railway facilities and the improvement in operating conditions which has become more marked within recent years. Improvements of this nature, the example of making which is first set by the roads which are the strongest financially, are gradually undertaken also by other roads which are not so strong but which must meet the competition of the strong roads.

THE members of the South Dakota Railroad Commission are curious about the salaries paid to railway officers. Curiosity about other people's incomes is not confined to them. It is very common. Few of us can deny having some of it. The South Dakota commissioners are contriving means for gratifying theirs. They have ordered the railways in that state to furnish statements of the salaries of all their officers. Doubtless the South Dakota commissioners expect to find that the salaries paid are so extravagant that some judicious reductions of them would make possible large reductions in freight and passenger rates. The impression that the railways pay out a large part of their earnings in "fancy" salaries is not confined to South Dakota. If the statesmen of that and other commonwealths will turn to the statistics of the Interstate Commerce Commission for 1910, page 44, their interest in the subject will be much quickened. They will find there that the total salaries of all officers of the railways of the United States are but 3.4 per cent. of the total wages paid to railway employees. If they will look farther in the same statistics they will find that all official salaries in 1910 were but 2 per cent. of total operating expenses, and but 1.3 per cent. of total earnings. If, therefore, all official salaries were abolished, and other things remained equal, freight and passenger rates might be reduced by the large amount of 1.3 per cent. If the commissioners really want to reduce expenses let them tackle the wages of employees. The wages paid to train employees—engineers, firemen, conductors and other trainmen—in 1910 were eight and a half times as great as the salaries paid to all officers. The wages of shop employees—machinists, carpenters and other shopmen—were over six times as great as the aggregate salaries of all officers. Therefore, a 6 per cent. reduction in the wages of train employees, or a 7½ per cent. reduction in the wages of shop employees, would be equal to a 50 per cent. reduction in the salaries of all officers; and surely the commissioners would not curtail official salaries more than 50 per cent., for the average salary of general officers in 1910 was only $3,277 a year, and of other officers only $2,076 a year. Each of the foregoing somewhat surprising statements the South Dakota commissioners and others interested can verify by consulting the aforementioned statistics of the Interstate Commerce Commission. Obviously, if the commissioners desire to make attacks on railway expenditures that will have some perceptible tendency to reduce rates they should direct their efforts against the wages of employees, which are over 60 per cent. of railway operating expenses, as compared with but 2 per cent. for the salaries of officers. And it is confidently predicted that this is exactly what the commissioners will not do.

GOOD LOOKS AND GOOD CONDUCT; THEY SHOULD GO TOGETHER.

"JACKING UP" train and station employees is a means of discipline which is still practiced to a considerable extent. The true theory is that high standards should be prescribed and then the employees be so regularly and constantly required to square their conduct with the rules that anything like a big change in conduct, such as the jacking-up process implies, would be unnecessary and unheard of. But for various reasons the maintenance of high standards often becomes impossible, at least for a time. In real life, our theories are all the time getting buried out of sight, and we work along on what is really a low standard.

These reflections are suggested by the fact that a certain general superintendent has issued a circular calling on his trainmen to carry out the rules of courtesy, efficiency and neat appearance. The emphasis is placed on the last of the three items. It is often said that the way to have trainmen who will maintain a neat appearance is to hire men who appreciate neatness without being told. Men who like to keep their shoes clean and black, and their faces properly shaved; who wear modest neckties and do not chew either tobacco or gum, do not come to the trainmaster in droves. And if the trainmaster takes his passenger men from the freight force he has never-ending perplexities.

The standards of the superintendent, whose efforts to put his trainmen in Class A 1 are of the periodical kind, manifesting themselves only once or twice a year, hardly merit approval. Nevertheless, it is to be admitted that the time when a brakeman puts on a new uniform is a good time to get him to improve himself in other respects, and we shall therefore make no apology for preaching politeness at the time when spring suits and the spring timetables are in preparation. The essential thing is to attain to a proper standard; the time is not so important. The time to make any improvement is *now*, unless there are good reasons for delay.

The circular, however, is an ineffective means for the purpose under consideration. Assuming, at the outset, that the trainmaster loves neatness and knows the methods of securing obedience, the simple and obvious way to make a hundred trainmen neat is for him to go out among them so frequently

that disregard of his orders, because of his apparent indifference, shall be out of the question. The superintendent must face the fact that this may mean more trainmasters. Not only must the man who disciplines the brakemen (and conductors, station agents, baggage agents and porters) have time to see and talk with the men; he must have time to talk with some of them an hour at a time, privately. Many a good conductor whose uniform is discreditable could be made permanently passable, and perhaps satisfactory, by a confidential interview—and in no other way. Moreover, the trainmaster who has to take up this question after a long period of neglect of the matter must for a time give it his chief attention. An important task seldom gets done unless a competent man gives his main energies to the job. In this case the personal attention of the officer is particularly necessary because so much of the work to be done is not susceptible either of being reduced to writing or of being delegated or managed at second hand. The newness of a necktie or the age of a pair of trousers in many cases cannot be approved or disapproved except by personal inspection.

And in putting out money to pay an assistant, while the trainmaster thus neglects his other duties, the superintendent must consider the pay of the trainmaster himself. In many cases he ought to have an increase of 25 to 50 per cent.—if he fills the bill. If he is not worth that much more than the best-paid conductor or engineman, it is to be questioned whether the place is well filled.

Neatness of appearance should be dealt with, not as a thing by itself, but along with politeness and efficiency. There is a decided advantage in having a subject which is big enough to justify a serious talk, discussion or lecture. Putting these three features together accomplishes that object. As an illustration, take the case of a brakeman dealing with an ill-tempered passenger who asks an unreasonable question. To be efficient, the brakeman must be able to give a fair reason for being unable to answer the question. To be polite when the passenger is not polite will test his ability as a competent passenger trainman. To be neat in his appearance is particularly necessary in this case, because when a passenger is unreasonable in his demands it is important, as a matter of simple business policy, to leave him no justification at all for his unreasonableness. A trainmaster who has occasion to instruct a trainman in a case of this kind quite likely may find it worth while to spend a half hour on it; and as soon as the trainman has gone out he will do well to put his lecture or interview in writing, to be promulgated for the benefit of other trainmen. Why should not information of this kind be given out by means of the stereopticon? One of the most useful things done by the Safety Committee on the New York division of the Pennsylvania is the display of printed rules on the screen at evening meetings. The same process is available for any topic.

Another road recently has taken action on this subject. It is one terminating in New York, and its announcement says that "in order that the general appearance of the men on its trains shall be in keeping with the conduct required of them, provision has been made for regular inspection of their uniforms and general appearance, the aim being to make the road the best in the country in this respect." This statement, in its language, is so very like one which was made by the Pennsylvania about 35 or 40 years ago that one is tempted to observe that in the race to become "the best road in the country" this latest entrant has a severe handicap. However, there is no need of taking a very long time in the process. Great things have been done in two years, where superintendents and all concerned put their energies into the job. The word "inspection," in this announcement, serves as a reminder that on a large road an inspector not subordinate to the division superintendent can do useful work. Few trainmasters are so efficient that a spur of this kind will not benefit them. The competent trainmaster should not object to such "surprise checking" any more than an honest conductor should object to the means taken to detect the dishonest. Moreover, the general superintendent needs the report of one man who knows the conditions on all divisions. Many things in discipline can be dealt with properly only by a man who is entirely removed from the field of possible sympathy.

Is all this worth while? Railroad managers seem, in many cases, to deem it worth while only occasionally. But every road aims to give the best service—in all that that term implies—at a few places; at least at the larger terminals. The public, however, asks for good service everywhere; and every superintendent who persistently aims to give it everywhere finds a marked satisfaction in doing so.

THE PRUSSIAN-HESSIAN STATE RAILWAYS.

THE Prussian-Hessian railway system is the largest government owned and operated system in the world. Therefore, its organization, physical structures and operation, service, rates and financial results are of unusual interest. The paper presented to the New York Railroad Club last week by Professor W. J. Cunningham, of Harvard University, an abstract of which is published elsewhere, is a very complete and satisfactory description and discussion of the Prussian-Hessian system. Professor Cunningham concludes that "state ownership of railways in Prussia is successful and that the railways are operated with reasonable efficiency." Most well informed people will agree with him. He adds, "it does not at all follow that government ownership in this country would be equally successful." Most well informed people will agree with him on that, too. As Charles Francis Adams said 30 years ago, "In applying results drawn from the experience of one country to the problems which present themselves in another, the difference of social and political habit and education should ever be borne in mind. . . . A country with a weak or unstable executive or a crude and imperfect civil service should accept with caution results achieved under a government of bureaus."

The bane of public management in democratic countries is the use of political influence to promote the interests of sections or classes whose interests are opposed to those of the public. The electoral arrangements in Prussia, as well as the railway organization, are such as to keep political influence at a minimum. The Prussian parliament has a House of Lords, which is entirely non-elective and chiefly hereditary, and a House of Representatives. In each representative district the people are divided into classes according to their wealth; an arrangement under which 15 per cent. of the people in numbers have two-thirds of the political power. The railway employees belong to that 85 per cent. of the people who have only one-third of the effective voting power. Besides, they are not allowed to organize, and it is only by organization that they could make themselves felt. The minister of public works, the head of the railway administration, is appointed by the kaiser for life, and, therefore, parliament could not turn him out of office if it wanted to. Also, the railway employees are recruited from the army, where they have learned to submit to discipline, and are subject to a discipline on the railways hardly less rigorous than that in the army. Another important point is that the Prussian state mileage is not one-tenth that of the railways of the United States, and is spread over a territory only half the size of Texas.

The Prussian freight service, all things considered, probably is not so good as that of either England, France or the United States. The movement of goods is relatively slow, the regulations to prevent claims stringent, the demurrage rules very strict and often made more so in periods of car shortage; and car shortages are large and not infrequent. While the railways of England and the United States give shippers 48 hours free time in which to unload cars, those of Prussia never give more than 24 hours, usually not more than 12, and often reduce the

time below this. The demurrage rates, allowing for the differences in the capacities of cars, are substantially higher than in England, and from three to five times as high as in the United States.

The Prussian passenger service will compare with any in the world. The trains are not so fast as in England, France or the eastern part of the United States, but are more regularly on time. In frequency of passenger train service the British roads are first and the Prussian roads second. The Prussian trains, and especially their fourth class compartments, are more likely to be crowded than those of any other leading railways.

Professor Cunningham refers to the remarkably good record of the Prussian lines for accidents. They are superior in this respect to the railways of the United States. But this cannot be attributed to government management, nor indeed to the Prussian scheme of operation, for the record of the English roads and of the five large French private roads, are fully as good as that of the Prussian roads, while the record of the French state railways is very bad. In the year ended June 30, 1910, the Prussian-Hessian roads made the remarkable record of killing only two passengers in collisions and derailments, but in the calendar year 1909, the British roads, with a larger mileage and more trains, made the still more remarkable record of killing only one passenger in a train accident. The accident records of the British, French and German roads are so much better than that of the railways of the United States for the following reasons: First, their physical properties are in safer condition chiefly because a great deal more money has been invested in them. Second, the railway employees in both countries are more careful, discipline being rigorously enforced by the management and governments. As Professor Cunningham points out, in Prussia in 1910 132 employees were prosecuted criminally for infractions of the rules, 81 being given court sentences. Third, in Europe there are stringent laws against trespassing on railway property, which are enforced. The possible trespassers on the railways of a country include its entire population. The population of the United States is somewhat over twice that of Prussia-Hesse, while the number of trespassers killed on our railways is about 28 times as great as on the railways of Prussia-Hesse.

The average passenger rate of the Prussian-Hessian railways is only 46 per cent. of that in the United States and is less than that of any other railways in the world except the state railways of Belgium. The average rate is not so low, as Professor Cunningham shows, because the absolute rates are so low, but because 89 per cent. of the passengers carried travel on the extremely low third and fourth class rates, the service for which is inferior, while only 10 per cent. travel second class and only a trifling number first class. Furthermore, the density of passenger traffic in Prussia is over five times as great as in the United States, and three and a half times as great as in Interstate Commerce Commission Group 2. On the five large French private lines, whose density of passenger traffic is about two-thirds that of the Prussian roads, the average passenger revenue per mile is from 1.11 cents to 1.25 cents. The average rate per ton per mile in Prussia is much higher than in the United States, and after full allowances for differences in conditions, it is relatively higher. The density of freight traffic in Prussia in 1910 was 1,150,400 ton miles per mile and on the five French private roads only 819,055 ton miles per mile; and the average rate per ton per mile in Prussia was 1.248 cents, and on the French private roads from 1.18 to 1.46 cents.

It is generally considered that the Prussian roads are the most economically operated railways in Europe. It is very questionable if they are as economically operated as the five large French privately owned roads, with which they may most fairly be compared. The average passenger journey in Prussia in 1910 was 14 miles and on the French private roads 22 miles. The average passenger density of the Prussian-Hessian roads was 693,921 passenger miles, and that of the French private roads 436,000 passenger miles. The average haul per ton on the Prussian roads was 68 miles, and on the French private roads 96 miles. Both the passenger and the freight hauls in Prussia are shorter, but this disadvantage is offset by the greater densities of both freight and passenger traffic. While the total units of freight and passenger traffic per mile on the French private roads were 68 per cent. as great as on the Prussian roads, their operating expenses per mile were only 60 per cent. as great, the operating expenses per mile of the Prussian roads being $14,866 and those of the French private roads $8,889. The operating ratio of the French private roads was 55½ per cent., while that of the Prussian-Hessian state roads was 67.27.

As Professor Cunningham points out, the financial results on the Prussian-Hessian roads are very good, and they were able in 1910 to turn about $50,000,000 into the public treasury. This is about 9½ per cent. of their gross earnings—in other words, of what they collected from the public in rates. The taxes paid by the railways of the United States in the same year amounted to $99,423,112, or 3.7 per cent of their gross earnings. The Prussian railways are the only government railways that regularly have net earnings in excess of the interest on their indebtedness.

While, as Professor Cunningham says, the experience of Prussia is not an argument for government ownership in the United States, it does teach one important lesson. Government railway management in Prussia is efficient because it is backed by an efficient government, is not subject to political influence and usually puts national above class or sectional considerations. Any government that is to be successful in the operation of railways must follow the example set by Prussia in these respects. No democratic government ever has done this, and it is questionable if any ever will or can do so.

NEW BOOKS.

The Earning Power of Railroads. By Floyd W. Mundy. 528 pages. The Guenther Publishing Company, 18 Broadway, New York. Price, $2.

The 1913 edition of this manual, like the previous editions, gives a large range of statistics showing mileage, capitalization, tonnage, earnings, etc., of the American railroads in comparative tables covering 10 year periods. The value of the book lies quite largely in the wide scope of the figures given. In addition to the figures for certain physical characteristics of the roads and earnings there are tables showing dividend records, bonds outstanding and in addition a short history of each property. The author is a member of James H. Oliphant & Co., New York.

In making use of the comparative tables for the ten year period, it should be borne in mind that since 1907 the railroads have followed the methods of accounting prescribed by the Interstate Commerce Commission, which was quite different in many instances from the methods in use previous to that time. Comparisons, therefore, between 1912 figures and 1902 are not always accurate. If this fact is not lost sight of then, the ten year tables are very handy and serve a useful purpose.

Engineer's Handbook on Patents. By William Macomber. Bound in flexible leather, 288 pages, 4½ in. x 7 in. Published by Little, Brown & Company, 34 Beacon street, Boston, Mass. Price, $2.50.

The author is a lecturer on the law of patents in the Cornell University law school, and the book is intended as a text book rather than a treatise on the subject. It includes chapters on: What is a patent, the nature of an invention, what is patentable, patentable novelty, the obtaining of patents, claim construction, infringement, patent litigation, and property rights. The book is written in clear and concise language, with a minimum of legal phraseology, and is accompanied by an extensive index for ready reference. Intended especially for engineers, it is equally valuable for inventors and manufacturers.

THE PRUSSIAN-HESSIAN STATE RAILWAYS.*

An Instructive Description and Discussion of Their Management, Service, Rates and Financial Results.

By W. J. Cunningham,
Assistant Professor of Transportation, Harvard University

Altogether there are about 34,500 miles of state-owned railways, and 2,200 miles of private-owned railways, in Germany. Of the state-owned mileage Prussia has 23,335, or slightly more than two-thirds. Bavaria comes next with 14.1 per cent. Then comes Saxony with 5.1 per cent.; then respectively Alsace-Lorraine with 3.6 per cent.; Baden with 3.1 per cent.; Mecklenburg with 2.0 per cent.; and Oldenburg with 1.2 per cent. In Prussia-Hesse, the private-owned mileage is 6 per cent. of total. The private railways, however, are comparatively unimportant and are controlled by the government almost as completely as the railways of the states. They are obliged not only to conform to the state traffic regulations but as well to adopt the rules and standards set by the government for the same class of state-owned railways.

STATE OWNERSHIP.

If we may accept as true the statements of the early advocates of state ownership for all of the railways, the greed, selfishness and arbitrariness of the private railway companies were the causes which led to their ultimate absorption by the states. The results, however, were not unprofitable to the shareholders.† Widespread complaints crystalized into a common demand for government ownership, and the movement had a peerless leader in Bismarck. The causes of dissatisfaction then remind us of those now advanced so hysterically by those in New England who wish to bring about state ownership of the Boston & Maine.

In order to summarize the reasons which impelled Germany to give up private ownership, we can hardly do better than to quote from Bismarck's speeches in Parliament.‡ He protested that the railways must not be allowed to act the part of Providence and alter the natural laws of supply and demand; they must not be allowed to dominate trade and industry; they must not be allowed to grant preferential treatment and discriminate in favor of the large shipper at the expense of the small trader; they must not be allowed to overcharge on non-competitive traffic in order to recoup themselves for losses on competitive business; they must not be allowed to grant passes and rebates to the favored few. In brief, the arbitrariness, the egotism, and the discrimination of individuals must be checked. Instead, a policy must be substituted which under state ownership should bring about uniformity of charges, equality of service, protection of public interests, and the establishment of a just, diligent and able railway administration actuated solely by considerations of the general good of the country.

Many reasons other than those quoted from Bismarck's speeches are given as the real object of government ownership. It is commonly believed that military reasons were dominant, that the government in its consistent policy of preparedness for war desired absolute control of all transportation facilities. Taking the view of economists of high standing in Germany, it appears that the real and controlling reason was economic. The object was not to make the railways a means of state power, nor of revenue, but to make them a means of traffic subservient to the economic interests of the nation; to substitute the state for private enterprise as the guardian of the commercial interests of the community.**

It is proper to add that when the nationalization project was before Parliament, Bismarck promised substantial reductions in rates. These promises, no doubt, were made in good faith, but subsequent political exigencies have caused their repudiation. The railways of Prussia as now administered, make large profits, and they apparently could afford to place freight rates on a lower basis and still continue to take care of renewals and betterments. They continue to earn a large surplus and every year they turn over a substantial part of it to the state to be used for the general budget. In the year 1910, the net earnings in Prussia were 6.48 per cent. on the capital investment of $114,000 per mile of line (nearly double our average capitalization) and out of $170,000,000 net revenue, $50,000,000 was devoted to other than railway purposes. The patrons of the railways, therefore, particularly the freight shippers, have reason to complain that they are taxed for the benefit of the community at large.

ORGANIZATION.

At the head of the railway administration of Prussia, is the minister of public works, who is appointed by and may be removed only by the king. Changes in this office are very infrequent. The minister and his councillors correspond roughly to our board of directors or executive committee and chairman; but the several councillors are railway experts, and each devotes his attention to the department in which he has specialized.

The ministry deals only with general matters of policy and standards. The active administration is left to the local directorates, of which there are 21. The average mileage per directorate is 1,116. At the head of each directorate is a president, who reports to the minister of public works. The president of a directorate corresponds in a general way to our general manager, but he has control over every department on his division, including not only maintenance and operation, but also traffic, accounting, finance and construction. It will be seen, therefore, that the Prussian operating unit—the directorate—is the highest type of the divisional system of organization. Below the president the organization becomes departmental, and the lines of authority and responsibility are tightly drawn.

While the principle of local autonomy in the operating of each directorate is carefully guarded, it has been found advantageous to concentrate a few functions exclusively in one of the several directorates, the one so selected to act in that particular matter for all other directorates. Besides, there is a central office in Berlin, which is rated as a directorate (making 22 in all) and attends to certain specified activities for the system as a whole. In some respects the president of the central office resembles our superintendent of transportation, but the former has wider jurisdiction, including that of our purchasing agent.

Associated with the administration are two kinds of advisory or consulting bodies: (1) advisory councils, local and central, established by law; and (2) voluntary traffic and operating unions. The advisory councils are composed of representatives of the government, and delegates from boards of trade, industry and agriculture, as well as representatives of the railway administration. The administration is obliged to consult with

*An abstract of a paper presented before the New York Railroad Club, April 18, 1913. Prof. Cunningham spent three months in the summer of 1912 in Germany, and his discussion is based on personal observations and a study of official publications.

†In nearly every case the states paid more for the railways than the sums for which they were capitalized. In Prussia this excess averaged about 8 per cent. over the capitalization. Payments were made in 3 per cent., 3½ per cent. and 4 per cent. government bonds.

‡Contemporary Review, February, 1907, pp. 174-192.

**Professor Hermann Schumacher before Royal Economic Society, London, January, 1912.

these advisory councils on all matters affecting rates or public service. They have no actual power to compel the railway administration to accept their recommendations, but, like the findings of the Massachusetts Railroad Commission, their recommendations are equivalent to commands. The jealousies of sections usually prevent any tinkering with tariffs, even when the administration might be willing to make a reduction which would benefit certain communities. To illustrate, the German policy would not permit California to compete on equal terms with Florida for the New York fruit market. Florida's natural advantage in being nearer the New York market would be guarded.

The advisory councils, on the whole, are to be commended, both in their negative and positive results. Through them the industrial, agricultural, and trade bodies are the arbiters of their own interests in transportation, and all persons affected by railway rates and rules of service have an opportunity to be heard before any change can be made in existing tariffs or regulations.

The American railroad man who visits behind the scenes on the Prussian railways is struck by the absolute impersonality of the organization. Authority flows from the office, and respect is accorded to the office, rather than to the man who happens to fill it. The personality of an official, which is so important here, has practically no play under the Prussian organization. Letters or instructions emanate from the directorate, and may bear the signature of any one of the officials, but in the name of the directorate.

DISCIPLINE.

It is well known that practically all of the railway employees of Prussia have served in the army. When they enter the railway ranks from the army, certain credits are allowed for their military service, and certain positions are reserved for army men. This military experience shows its influence on their deportment and discipline in railway service. There is a noticeable orderliness and precision about everything connected with German railways. In respect for authority and strict observance of the rules, the German railway employee has no superior. The traveler will not fail to notice the red-capped station master standing at attention on the station platform as the train passes through each station. He will also find the senior signalman, gatemen, and other employees connected with train service always in evidence, standing like sentries as the train passes. The operating official, while riding over the line, can thus take a census of all employees in positions of responsibility. When he alights at a station his rank is at once recognized. The station master immediately salutes and gives a verbal report of the situation at his station. If the official goes into a signal tower, the signalman in charge salutes and reports. If he goes into an engine house, the foreman salutes and gives a brief report of the work in progress.

The formation of railway labor unions in Prussia is forbidden by the railway administration. The employes have associations, but inasmuch as the railway officers are *ex officio* members, and take a fairly active part in the proceedings, these associations bear little resemblance to our railway brotherhoods.

The high order of discipline and rigid observance of rules which follows their system of ample and constant supervision bears fruit in their remarkable immunity from train accident, and in the small number of passengers and employees killed or injured. Differences in the manner of compiling accident statistics make comparisons with this country difficult. It is possible, however, to make a comparison of injuries in train *collisions and derailments*, since the classification is the same in both countries and the statistics are made up on the same basis. In 1910, only 2 passengers lost their lives in collisions and derailments on Prussian railways. In that year they handled 1,083,882,279 passengers. In the same year the United States, with ten times the railway mileage, transported 971,683,199 passengers (112 million less than Prussia). But it must be borne in mind that our passengers traveled farther. In Prussia the average passenger journey is 14 miles; here it is 33 miles. Consequently our railways produced more passenger miles, although they handled a smaller number of passengers. Looking at it one way, it is fair to the United States to compare injuries to passengers on a basis of passenger miles. Viewing it from another angle, it may be said that collisions and derailments will tend to vary with the train miles rather than with the number of passengers. We will make the comparison on the two bases:

Passengers and Employees Killed and Injured in Collisions and Derailments, 1910.

Item.	Prussia-Hesse.	United States.
Passengers carried one mile (millions)	15,688	32,338
Total revenue and non-revenue train miles (thousands)	298,584	1,276,025
Passengers killed in collisions and derailments	2	127
Passengers injured in collisions and derailments	349	6,499
Employees killed in collisions and derailments	13	608
Employees injured in collisions and derailments	162	5,201
Passenger miles per passenger killed (millions)	7,844	255
Passenger miles per passenger injured (millions)	45	5
Total train miles per passenger killed (thousands)	149,292	10,048
Total train miles per passenger injured (thousands)	856	196
Total train miles per employee killed (thousands)	22,968	2,099
Total train miles per employee injured (thousands)	1,843	245

Attention is again drawn to the fact that the foregoing tabulation includes only the injuries in *collision and derailments*. Injuries in other train accidents, falling from moving cars, highway crossing collisions, trespassing fatalities, suicides, etc., are not included in the figures for either country. Those for this country are sufficiently familiar to us. The small number of accidents to trespassers is noticeable.* In Prussia the laws prohibiting trespassing are strictly enforced and the railway right of way is carefully guarded. Those who trespass assume a high risk of arrest, since the tracks are well patroled. All persons detected are arrested, fined or imprisoned. The fact that 14 trespassers are killed daily on the railways of the United States,† although given wide publicity, has thus far made little impression on our city and county authorities.

The poor accident showing in this country is largely due to the inherent tendency of the American railroad man to take chances. In Prussia, the railway employee is more deliberate in action, and his military training gives him greater respect for the rules. It may be, too, that the methods there employed to investigate accidents and mete out punishment to the careless, have a direct bearing on their remarkable immunity from casualty. Discipline for infraction of the rules is severe. Guilty employees are not only reprimanded, suspended, fined, or dismissed, but in flagrant cases they are imprisoned. In 1910, there were 132 cases of criminal prosecution, and 81 employees were given court sentences.

COMPENSATION OF EMPLOYEES.

Turning now to the question of salaries and wages, it is interesting to note that in 1910 the average yearly wages of the Prussian railway forces, including all officials as well as workmen, was only $380 per employee. The official statistics show that the average number of "rest days" per month was 3.44 for all employees whose duties require any Sunday work. This gives an average of 324 working days, and an average daily compensation of $1.17. The writer has not sufficient information to hazard a guess as to how much more should be added to that average to allow for the supplementary allowances. He believes, however, that it is within the bounds of reasonable accuracy to say that the gross income of the Prussian employee is just about one-half the average wages of the American railway man. The general average for this country in 1910 is given by the Interstate Commerce Commission as $2.14 per day, excluding officials, but the accuracy of the figure is open to question because of differences in methods employed by different railways in compiling the basic figures. It must be remembered, however, in making comparisons between the two countries, that the cost

*Killed 180; injured 145.

†In Prussia, one trespasser was killed every second day.

of living is considerably lower in Prussia, and the purchasing power of the dollar is correspondingly greater.

An examination of the list of salaries, etc., shows that the financial reward for the officials is striking in its moderation. The presidents of the various directorates receive but $2,900 per year and a free dwelling. The honor and prestige which go with the position are rated high and evidently compensate for the lack of salary. His assistants, in addition to free dwellings, are paid $1,000 for the first three years, and a small amount is added every three years until they reach the maximum of $1,720, after 18 years of service.

On a road mileage basis Prussia has 21 employees per mile. The average in group 2 of this country is 16 per mile, and in the whole United States 7 per mile.

PHYSICAL CHARACTERISTICS.

Turning now to a consideration of the physical characteristics of the Prussian railway system as it is today, we will first examine its trackage facilities. Serving as it does such a thickly populated district (about 300 per square mile) and having such dense traffic (as will be apparent from the figures to be presented later) we naturally expect to find the lines well equipped with multiple running tracks. Nearly one-half of the system has two or more tracks. In group 2 of the United States (comprising the railways of New York, New Jersey, Pennsylvania, Maryland and Delaware) the territory in this country which comes nearest to resembling Prussia in population and railway development, the percentage of two or more running tracks is practically the same as in Prussia, but in the United States as a whole, only 10.5 per cent. of the railways have two or more tracks. The comparative figures which follow may be of interest:

Track Density in Prussia-Hesse and United States, 1910.

	Prussia-Hesse.		Group 2; U. S. A.		United States.	
Trackage—	Track miles.	Per Ct. of road miles.	Track miles.	Per Ct. of road miles.	Track miles.	Per Ct. of road miles.
Single track	23,364	100.0	23,815	100.0	240,831	100.0
Second track	9,807	42.1	7,609	32.0	21,659	9.0
Third track	44	0.2	1,284	5.4	2,206	0.9
4 or more tracks	119	0.5	941	4.0	1,489	0.6
Yards and sidings	15,287	65.4	16,101	67.6	85,582	35.5
Total trackage	48,621	208.2	49,750	209.0	351,767	146.0

The Prussian roadbed, particularly on the main lines, is well built and well maintained. Steel rail, of design similar to ours, and weighing 91 lbs. per yard is now standard, but the greater part of the mileage still has the lighter rail, averaging between 70 and 75 lbs. per yard. Crushed stone and gravel predominate as ballast, the former being generally used on the important lines. Their standard roadway section for single track main lines calls for a width of 19 ft. across the top of the subgrade, 9 in. of ballast, and 13 ft. across the top of the ballast. Multiple tracks are spaced 11½ ft. on centers.** Tie plates are used on all lines of heavy traffic and screw spikes are standard everywhere. About 31 per cent. of the mileage is laid with metal ties of the inverted trough type, and practically all wood ties are creosoted. The average spacing of ties is 28 in. from center to center, and their length runs from 9 ft. on main lines to 7½ and 8 ft. on branch lines. The use of the metal tie has not become a settled policy and there is much discussion in Germany as to whether it is really superior to the treated wood tie when all factors are considered.

Station, siding and yard facilities at many points, particularly near the frontiers, seem entirely too generous for the regular freight and passenger traffic. The explanation lies in the possible need of these facilities for the handling of troops and military supplies. All freight cars are stenciled to show capacity not only for freight but also for men and horses. A timetable for military operation is ready for use on short notice, and in the event of war, the trains for troops, horses, guns and supplies would take precedence over all other traffic.

The passenger stations in the cities, particularly the stations built within the last 15 years, are imposing in design, generous in size and trackage facilities, and well equipped to take care of the needs and comfort of the maximum traffic. The Hamburg main station is a good example. Those at Cologne, Frankfort, Darmstadt and Halle are notable. The latest and most magnificent, as well as the largest station in Europe, has just been completed in Leipsic at a total cost of upwards of $40,000,000. It has 22 tracks under one train shed. In Berlin there are several large stations to serve the different lines radiating therefrom, but there is no central or union station. All the Berlin passenger stations are connected by the north and south rings—belt lines which carry an enormous passenger traffic. Conditions on these belt lines, which intersect both the business and residential sections, seem ideal for electric operation, but the service is still steam operated, although electrification has been under consideration for several years.

In the freight classification yards we find occasional use of the "hump" in switching. A good example is seen at Wustermark, near Berlin. There are separate humps for each direction, and besides the well laid out yards, there is an admirably designed freight transfer station of concrete construction. The light cars are very easily handled over the hump. The writer observed a 48 car train classified in 12 minutes, each cut averaging about two cars.

The frequency of fixed signals and signal cabins is noticeable. All are of the manual or manual control type. The Germans do not take kindly to automatic signals. They prefer to rely upon the signalman. When asked why they do not consider the adoption of the automatic signal, which has been developed here to such a high degree of perfection, they usually turn the conversation to train accidents and inquire why it is that America has such an unenviable record in that respect.

The official statistics show that Prussia has 40,916 home signals (1.7 per mile of line) and nearly 15,000 distant signals. There is one interlocking cabin for every 5¾ miles. Grouping together all signal towers, cabins, and block stations, there is one for every one-half mile of line. On 2,800 miles of line where speed restrictions apply, automatic speed recording devices are installed alongside the track, and the records are carefully checked to insure strict adherence to the rules.

LOCOMOTIVES.

The Prussian passenger locomotive on through trains is considerably lighter than ours, but there is not as much difference as is generally supposed. In that class of service the Atlantic and 10-wheel type predominate. A large proportion of all locomotives is of the compound type. Germany is the home of the superheater and nearly all engines are equipped with the device, as well as feedwater heaters, draft regulators, screw reversing gear, and other appliances which are not common here. The interior of the cab, especially in those equipped also with cab signals, seems somewhat complicated to the American observer.

The tank locomotive, which is comparatively light, appears to be the favorite in local passenger service. Freight locomotives vary in size, but most of them are little more than half the size of our freight locomotive. With the small freight cars and light grades of the main lines, the length rather than the weight of the train is the controlling feature, and heavy engines are not needed. In southern Germany, however, where the grades are heavier, there are many locomotives which in weight and power compare favorably with those of the American consolidation type.

In 1910, Prussia had 19,670 locomotives of all kinds. This is an average of 84 locomotives per 100 miles of line. The average for the United States in the same year was 25, but in group 2 it was 57. The average weight of all Prussian locomotives, including tender, was 59 tons. For the United States, the average weight was 73 tons, exclusive of tender. Without knowledge of the weight of the tender, and the proportion of tank locomotives in each country, it is impossible to make an

**The Prussian car is narrower than the American car.

exact comparison, but in the judgment of the writer, it is close to the mark to say that the Prussian passenger locomotive is about two-thirds the size of the American passenger locomotive, and the Prussian freight locomotive about one-half the size of ours.

The cost of maintaining locomotives in Prussia in 1910 averaged 4.8 cents per mile, which indicates commendable efficiency even when due allowance is made for their small size. Failures are infrequent and the locomotives generally have the appearance of being well maintained. The Prussian policy differs from ours in that they expect and obtain a comparatively long life from their locomotives. The average life of all locomotives in 1910 was 10.2 years. One was 40 years old; 10 were 37 years old; 9 were 35 years old; 10 were 33 years old. One-quarter of the entire equipment ranged from 10 to 20 years in service; 45 per cent. ran from 5 to 10 years; and 22 per cent. had an average age of less than 5 years. The average mileage per locomotive in 1910 was 25,600. The same average for this country was approximately 29,100.

The Prussian statistics showing the performance of locomotives (and in fact all of their statistics) are remarkably complete. Among other things they give the number of days all locomotives were in service, the per cent. of time in actual use, and the per cent. of time they were in the shops for repairs. They were actually used in train service 32.79 per cent. of their time; 18.91 per cent. of their time was spent in the shops for repairs; leaving 48.3 per cent. of the time when they were idle in or near the engine house. The high proportion of time idle is accounted for by their policy of single crewing. When not single-crewed, it is the general practice to assign one engine to two crews. Enginemen are required to do much of the light running repairs themselves, and on single-crewed engines the fireman is required to report at the engine house two hours in advance of leaving time, in which to kindle the fire and get up steam. At the end of the trip it is his duty to clean the fire and do other work which here is done by the engine house forces.

Careful attention is paid to fuel economy, and premiums are paid to engine crews for economic results. The writer did not personally secure any detailed statistics on this feature of operation, but the figures given recently in the *Railway Age Gazette* (January 3, 1913) by H. W. Jacobs, throw light on the subject. Mr. Jacobs compares the performance on a division in Prussia with a division of an American railway with somewhat similar service.

PASSENGER CARS.

The passenger cars of Prussia conform to the usual European design of separate compartments. The older type, used exclusively in suburban and local service, has doors on each side of each compartment, and when the train is in motion the only means of communication between cars or between compartments of different classes is by the running board on the outside of the car. This, of course, is used only by the trainmen and by them rarely.

Altogether there are 51,703 passenger, baggage and mail cars in Prussia, or 222 per 100 miles of line. In group 2 of the United States the passenger train car density is 52; in the United States as a whole, 20. Of the Prussian equipment 68 per cent. have side entrances and 32 per cent. have end doors and vestibules. The latter are used almost exclusively in through trains. More than half of the passenger cars have 3 axles, one under each end of the car and one under the center; 33 per cent. have but two axles; and the remaining 13 per cent. are of the modern type for the best trains and have four or six axles. Averaging all passenger train cars, the number of axles per car is 2.72. The older type of two or three axle car with side doors is very small and weighs about 20 tons. The modern corridor car, with four or six axles, is 60 ft. long, 9 ft. wide, and weighs from 45 to 55 tons. The capacity of the car depends mainly on the dissection of the compartments. There are four classes. First-class compartments seat four passengers (two per seat); second-class, six passengers; third-class, eight passengers. Fourth-class compartments are much larger, but only a limited number of seats are provided for the first comers —the other passengers stand. As a rule, those who stand in fourth-class compartments far outnumber the fortunate few with seats.

First-class compartments correspond with our parlor cars; second-class cars are as comfortable as our best modern coaches; third-class accommodations are considerably worse than our poorest and oldest day coach, or perhaps a shade better than our colonist car. The seats in third-class cars are not upholstered. With four passengers per seat all occupants are crowded. We have nothing that compares with fourth-class. Very few passengers use first-class compartments. Most of the well-to-do and tourists travel second-class. A traveler who wishes to economize may ride third-class for short distances without much discomfort, if the train is not crowded, but he must be in hard straits indeed to economize by riding in fourth-class cars. Nevertheless, as will be pointed out later, 46 out of every 100 passengers use fourth-class accommodations.

FREIGHT CARS.

The average capacity of all Prussian freight cars in 1910 was 15.7 tons. Practically all of them have but two axles. Only one-third are fitted with brakes of any kind and only a very few of these with air brakes.* Automatic couplers have not been adopted, although used experimentally. The standard box car of Prussia is 26 ft. long and has a capacity of 16.6 tons. Coal cars run in capacity from 22 to 40 tons, but those of the higher capacity are relatively few. The dead weight of the standard box car is 10.7 tons, or 65 per cent. of its capacity.

It is not to be assumed that Prussia is to be charged with shutting its eyes to the apparent economies in the use of the large capacity car. As a matter of fact, the peculiar conditions of the traffic there (as in England) seriously minimize the advantageous use of cars of the American type. The distinctively retail character of the freight shipments makes it difficult under present conditions for shippers to avail themselves of the special rates applying to the carload minima of 5 and 10 tons, and they are obliged to enlist the services of *spediteurs* (forwarding agents) who undertake to consolidate the freight of various shippers so as to obtain the carload rates. Small lot shipments predominate, and the immense quantities of bulk freight offered to the railroads of this country are not seen in Prussia. Much of the low-grade freight moves there by river or canal.

Another factor which influences freight car design, and which affords an example of the penalties of standardization, is the axle load limit, which is set at 31,000 lbs. Prussia is party to the rolling stock agreement between the several European nations which use the freight cars of all subscribers in common, much as the railways of the United States make common use of their freight cars. The design of cars for such joint use must necessarily conform to the clearances and track limitations of the weakest link in the chain. Italy happens to be that link, and sets the maximum axle load for the other systems which are parties to the agreement. The maximum axle load in the United States is approximately double that of the European railways. This feature, however, does not prevent the use of heavier equipment when confined exclusively to the Prussian rails. They are adding to their heavier equipment each year and are experimenting with cars of the American type. For transporting machinery and heavy guns from the Krupp works at Essen, flat cars of very high capacity are utilized. The largest has 16 axles and has a capacity of 85 tons.

The total number of freight cars of all kinds in Prussia in 1910 was 415,797, or 1,782 per 100 miles of line. The freight car density of group 2 in the same year was 2,168; and for the entire United States, 887. The number of cars, however, is not the true index. Their capacity must be considered. Ex-

*About 86 per cent. of passenger cars are fitted with air brake.

pressed in terms of capacity per 100 miles of line, Prussia had 28,000; group 2 had 78,048; and the United States had 31,932.

TRAIN SERVICE.

In speed of passenger trains Prussia is somewhat behind England and France. The fastest train in Prussia makes the run of 178 miles between Berlin and Hamburg at an average speed of 55.2 miles per hour. The next fastest train is between Berlin and Halle, 100 miles, at a speed of 54.9 m. p. h. There are several other through trains which average over 50 m. p. h., and the average schedule speed of all through trains is given in the official statistics as 40 m. p. h. With the exception of a few of our limited trains, and the Camden-Atlantic City trains, the Prussian speeds are equal to those of this country. There are several trains, for instance, which for similar distances and a similar number of stops, make somewhat better time than the 5-hour limited trains between New York and Boston. The Prussian trains, too, are almost invariably on time.

We will now undertake a consideration of the traffic characteristics and first examine the statistics of train mileage, and passengers and tonnage handled. As already stated, the number of passengers handled in Prussia exceeds the total number handled in the United States. We are therefore prepared to find a very dense passenger train mileage per mile of road. Freight traffic is also dense in the industrial regions of western Prussia, but when averaged for all of Prussia the figures are not so impressive. A comparison of traffic and train mile density is shown in the following table:

PASSENGER MILES, TON MILES, TRAIN MILES AND OPERATING REVENUE PER MILE OF LINE, 1910.

Item—	Prussia-Hesse.	Group 2.	United States.
Passenger miles per mile of line	693,921	314,187	138,169
Ton miles per mile of line	1,150,490	2,797,011	1,071,086
Operating revenue per mile of line	$22,144	$24,619	$11,553
Passenger train miles per mile of line	7,741	*5,515	*2,787
Freight train miles per mile of line	4,824	*4,832	*2,286
Total revenue train miles per mile of line	12,565	10,347	5,073
Average passengers per train mile	87	63	56
Average revenue tons per train mile	236	502	380

*Special train miles included in passenger; mixed train miles in freight.

The significant facts in the above comparison are that in revenue passenger mile density the United States as a whole has only 21 per cent. of the Prussian density. Group 2, which has the greatest passenger traffic of any group in the United States, has 45 per cent. of the Prussian passenger density. In ton mile density, however, the United States is almost as much as Prussia, and group 2 exceeds Prussia in that respect by 140 per cent. The Prussian passenger trainload is considerably heavier than ours, but the majority of the passengers ride in the third and fourth-class cars, already described. In freight-trainload, however, Prussia is conspicuously low. Its average is less than half the trainload of group 2, and about two-thirds that of the whole United States.

PASSENGER TRAFFIC AND RATES.

The German statistics of traffic are available in great detail, and we are able to analyze the receipts and averages for each class of passenger and freight. To show the results for the passenger service, the following summary is inserted:

DIVISION OF PASSENGER TRAFFIC, PRUSSIA-HESSE, 1910.

Class—	Per Ct. of passengers carried	Per Ct. of passenger miles	Per Ct. of passenger revenue	Average revenue per passenger	Average revenue per passenger mile	Average miles per passenger
First class	.14	.89	2.94	$2.65	2.89c	92
Second class	9.66	11.00	18.56	.25	1.49	16
Third class	43.66	39.51	41.65	.12	.93	13
Fourth class	45.51	44.59	35.09	.10	.69	14
Military	1.03	4.01	1.76	.22	.39	56
Total	100.0	100.0	100.0	.13	.88	14
Tickets sold at reduced rates —season tickets, workmen's, school tickets, etc. (included in above)	55.46	26.75	14.53	.03	.38	7

The preponderance of the third and fourth-class traffic, and the exceedingly small number of first-class passengers, are noticeable. The astonishingly low average passenger mile rate (8.8 mills) loses much of its value for purposes of comparison with this country because it includes such a relatively large number of passengers who travel in the inferior class compartments. The returns include also the traffic on passenger belt lines in Berlin and the electric railway between Hamburg and Altona. Both of these lines carry a heavy traffic, which is essentially the same as is handled by the subways and elevated railways of New York, Chicago or Boston.

In second-class compartments, which come nearest to our day coaches, the Prussian average revenue was 1.49 cents per mile. Our average in the same year for all passenger traffic was 1.938 cent. The Prussian first-class corresponds to our parlor cars. Their average receipts for that class were 2.89 cents per mile, which is substantially above our average, even when the Pullman car fare is added. For instance, the regular fare from New York to Boston is $4.75. Add $1.00 for parlor car seat and we have an average rate of 2.47 cents per mile.

In passing, attention should be called to the fact that there is no free baggage allowance in Germany. Passengers may take a generous amount of hand baggage with them in the compartments, but trunks and other similar baggage must be registered and transported in the baggage car. The baggage tariff is on the zone principle. For example, the charge for the first zone (1 to 15.5 miles) runs from 5 cents for 44 lbs., to 14 cents for 165 lbs. For the fourth zone (95 to 124 miles) the charges are 12 cents and 71 cents respectively. For the sixth zone (158 to 186 miles) the charges are 12 cents and $1.07. To illustrate further, by again using the New York and Boston journey, the additional cost of a trunk weighing 150 lbs. would, under the Prussian tariff, be $1.43, which is equivalent to adding 0.61 cent. per mile to the price of the ticket.

The Prussian statistics show, however, that relatively few passengers carry other than hand baggage. Altogether in 1910, the railways transported 820,000 tons of baggage. This is an average of 1½ lbs. per passenger. The revenue from baggage was $4,370,000, or 27 cents per 100 lbs. The average distance carried was 65 miles. Each 100 lbs. of baggage, therefore, cost the traveler 41 cents for each 100 miles transported. Baggage charges made up 3 per cent. of the total passenger revenue.

Before leaving the passenger service, mention should be made of the practice of selling *"bahnsteig"* (platform) tickets which permit the friends of incoming and outgoing passengers to meet or part with them on the station platform at the car door. These tickets, which cost 10 pfennig (2.4 cents) are procured through slot machines. They are punched by the gateman when the holders pass through the gate to the platform, and are collected when they leave the platform. In 1910, 31,000,000 of such tickets were sold (85,000 per day) and they yielded a revenue of $735,000. This, of course, is clear profit.

FREIGHT RATES.

It is much more difficult, if not hopeless, to make any intelligent comparison of freight rates, because of the fundamentally different conditions. In the first place, we must recognize in the case of freight rates, as well as in passenger rates, wages, and cost of operation, that the purchasing power of money is greater in Prussia. How much greater, it is impossible to state with accuracy. In discussing comparative wages, the writer gave as his estimate that the cost of living in Berlin is from 60 per cent. to 66 per cent. of the cost in Boston.

In the second place, the policy of the government is to develop the traffic on the rivers and canals, and to prevent the railways from competing with the waterways. Thus, the lower grade commodities and other freight which will stand the slower movement go by water, under a subsidy, since most canals and improved waterways do not yield enough in tolls to pay for interest and maintenance. The proportion of water-borne tonnage at low rates is, therefore, much higher in Prussia than in the United States, and the Prussian ton mile rate is based on a much higher proportion of high grade commodities moving under the higher rates.

In the third place, there are no express companies in Ger-

many, and with the exception of the smaller packages, which may go by parcel post, this class of goods moves under the high class rates in freight cars.

In the fourth place, the average distance per shipment is just about half that of this country, consequently the element of terminal expense for each ton-mile is greater. The terminal expense, which is a large part of the total expense of moving traffic, is not affected by the length of the haul. It is just the same for a haul of 68 miles (the average Prussian haul) as for 138 miles (the average for the United States). The importance of this factor may be appreciated when it is realized that each ton of freight is handled through a terminal twice in Prussia to once in this country, since the average haul in this country is twice that of Prussia.

In the fifth place, the Prussian freight shipments are distinctly retail in character.

On the other side of the comparison, it should be noted that the conditions surrounding the process of shipping are more burdensome to the shipper. It is difficult to collect claims. Their movement is slower than ours. There are many complications in regard to classifications and tariffs, and the demurrage regulations are severe. In time of car shortage*** the free limit is reduced from the normal period of one day, to 12 hours, 8 hours, and even to 6 hours. The normal charge per day is 48 cents for the first day over the free period, 72 cents for the second day, and 95 cents for every additional day. The low capacity of the cars is to be borne in mind when comparing these demurrage conditions with ours. Besides this, there is a slight charge for the necessary printed forms. For instance, bills of lading cost $2 per 1,000. Again, when open cars are used, and covering is necessary, a charge is made for the use of the tarpaulin sheets which protect the freight. For distances of 63 to 125 miles, the minimum charge for two sheets is 72 cents.

No two persons, equally qualified to express opinions on the subject, will agree upon the weight to be given to the various factors, and any attempt here to devise a unit of comparison would only lead to profitless discussion. The writer will, therefore, leave the subject for each to form his own conclusion from an interpretation of the following statistics showing the freight traffic in Prussia in 1910; but will venture as his opinion in passing that freight rates are on the whole somewhat too high. The large surplus which is turned over to the state each year certainly is not made from the transportation of passengers. Freight shippers by rail are being indirectly taxed for the benefit of the state at large; while shippers by water have the benefit of state subsidies which come from the public at large—a conflicting situation.

It is commonly believed by those who advocate government ownership of railways that the Prussian freight tariff is the essence of simplicity, and if adopted here, would afford the solution to all of our freight rate problems. They are told that the Prussian rate is divided into two elements: (1) the terminal charge, and (2) the movement charge; the former graded for zones of 10 km. up to 100 km. (62.1 miles) and the latter graded for zones of 50 and 100 km. up to 500 km. (310 miles). This is correct so far as it goes, but there are so many exceptions to the zone tariffs that most of the seeming simplicity disappears. It is a common complaint among German shippers that the tariffs and shipping regulations are so complicated that they require experts to unravel them, and in the main they depend upon forwarding agents (*spediteurs*) to attend to all details of shipping for them. The exceptional tariffs which correspond to our commodity tariffs cover 61 per cent. of the ton mileage, and have the lowest ton mile rate of 0.9 cent. Express freight takes the highest ton mile rate of 5.41 cents, and the average for all classes of freight is 1.248 cent per ton mile. The average for this country is 0.76 cent per ton mile, or 61 per cent. of the Prussian average. We have a few railroads, however, with a ton-mile rate which equals or exceeds that of Prussia. Usually, where that conditions obtains, it will be found that the freight traffic is largely local, or contains a relatively large amount of merchandise or other high-grade freight to which high-class rates apply, and also that the proportion of coal, iron, grain and other bulk freight moving under low commodity rates is relatively small. Such is the case on the New York, New Haven & Hartford.

CONCLUSION.

The writer's conclusion is that it is futile to attempt any exact comparison either of freight rates, passenger rates, expenses, or net returns in terms of percentages or of ratios of one country to those of the other country. When social and economic conditions are so essentially dissimilar, it is impossible to find a measuring stick which will permit us to gage the relative reasonableness of rates or the relative efficiency of operation. The real question is, "How well does the transportation system of each country measure up to the requirements of that country?" The answer must necessarily be based on opinion rather than on fact. In both countries we find those who praise and those who criticize the railways. But considering the Prussian situation alone, it seemed to the writer, from personal observation and study on the ground, that state ownership of railways in Prussia is successful and that the railways are operated with reasonable efficiency.

If it is granted that Prussia has met with substantial success in owning and operating its railways, it does not at all follow that government ownership in this country would be equally successful. That subject justifies a complete paper in itself, and we can do no more than touch upon it here in closing. Suffice it to say that nowhere are conditions more ideal for government ownership than in Prussia. It has a strongly centralized government. The administrative head of the railways—the Minister of Public Works—is appointed by and responsible to the king personally. Changes in that office, or in fact in any of the high offices, are infrequent. Civil service principles apply in the promotion of officials as well as of workmen. Military discipline obtains throughout the entire army of employees. It permeates the whole social organization of the country. The administration appears to be entirely free from graft. Little is heard of political patronage. In fact, government service there is regarded as highly honorable service.

Can we say as much for this country? Is our public service elevated to such a plane that we can safely trust it with the great enlargement of power which would come with government ownership of railways? Are we sufficiently insured against "pork barrel" methods of making and disbursing the budget? Are we sure that the quality and efficiency of service would not be lowered rather than improved?

He who would answer these questions in the affirmative is indeed an optimist!

Brazil Railway Improvements.—A report on a journey to Southern Brazil in October, 1912, by Sir W. Haggard, says that the main improvement to which the Brazil Railway Company is directing serious consideration, is the straightening of numerous winding curves—which is particularly needed between Itararé and Ponta Grossa—and the process has already been completed on the Paraná line. "Of three such lines constructed prior to their being taken over by the Brazil Railway Company, the Sorocabana and Paraná are undoubtedly," says the report, "the more prosperous, and the section of the Sao Paulo-Rio Grande over which we traveled must for the present come in a bad third. The paucity of population all along this line was obvious. We traversed great distances without seeing more than small isolated huts. Whenever we were in the proximity of a town the settlements visibly increased, and some serious attempt had been made at cultivating the soil, but the main problem which the company have to solve, and which they have already attacked, is the remedying of this want of labor."

***The car shortage becomes acute every fall and seriously affects the mining and manufacturing districts of Westphalia. In last December the shortage was 1[illegible],000 cars in the Essen Ruhr district.

NEW D. L. & W. LINE NORTH OF SCRANTON, PA.

Radical Improvement Being Made in Grade and Alinement from Clark's Summit to Hallstead. Several Unusual Structures.

The Lackawanna now has under construction a new line between Clark's Summit, Pa., and Hallstead, 41 miles, which involves some very heavy work and several structures of unusual size.

The accompanying profile shows the present and proposed grades on the main line between Scranton, Pa., and Elmira, N. Y. This part of the road is a portion of the main line between New York and Buffalo, and freight trains operate between the above two points as terminals. Prior to 1910, all coal and dead freight was switched at Hallstead, Pa., 48 miles north of Scranton. Turn-around runs operated between the Kingston, Taylor and Scranton coal districts and Hallstead, thus providing tonnage at the latter point for filling out west bound trains, and the extra power necessary to handle trains over the heavy grades east from Hallstead. Crews also operated between Hallstead and Syracuse, and Hallstead and Utica. This operation required a yard and terminal facilities at Hallstead, including engine house, coaling station, ash pits, etc., and necessitated a considerable delay to all through trains.

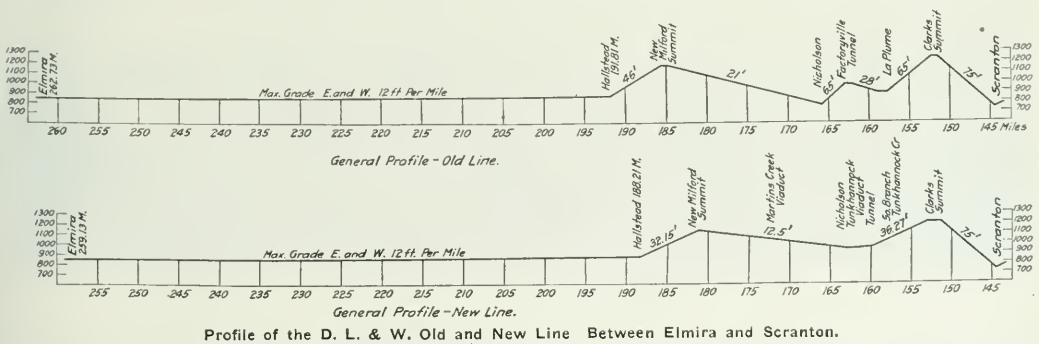
During 1910, a hump yard was completed and put in operation on the Keyser Valley branch, at Scranton, to make up coal and dead freight trains for movement both east and west out of Scranton. A large engine house, coaling station, ash handling plant, equipment for minor repairs, etc., were built in connection with the hump yard. The coal from the various mining districts is handled by special crews to the receiving yard above the hump. Trains are now run through between this yard and Elmira, Syracuse and Utica, with no long delays other than that required to clean ashes and take coal at a new plant built for this purpose at Binghamton, and eliminating the delay to road crews at Hallstead.

After ascending from Scranton to Clark's Summit, a distance of seven miles, on grade of 75 ft. to the mile, the present line descends to the south branch of the Tunkhannock creek at La-Plume on a grade of 65 ft. to the mile, then ascends on a 28 ft. grade to the Factoryville tunnel. This tunnel is 2,200 ft. long and passes through the ridge between the south and main branches of Tunkhannock creek. West of the tunnel, the line again descends on a 65 ft. grade to the Tunkhannock creek, at Nickolson, then ascends along the east bank of Martins creek to New Milford Summit on a 21 ft. grade. From New Milford Summit to Hallstead, the line descends along Salt creek to the Susquehanna river on a grade varying from 30 to 47 ft. to the mile.

Practically 50 per cent. of the line between Clark's Summit and Hallstead is curved, and many of the curves are between four and six deg. The total curvature in this distance of 43 miles is 3,940 deg. None of the grades above mentioned are compensated for curvature. From Hallstead west to Elmira the controlling grade is approximately 12 ft. per mile, in either direction.

A glance at the profile will readily show that a great amount of pusher service is necessary, both east and west, between Hallstead and Scranton in order to handle the tonnage in one train which can be handled by one engine between Hallstead and Elmira.

It was desirable to relocate, if possible, so as to eliminate all west bound pusher grades west of Clark's Summit and to reduce the east bound grades so that any class of engine in this service can handle its regular tonnage for the line west of Hallstead, east bound east of Hallstead, by means of a pusher of the same class. By a comparison of the tonnage handled on other parts of the road with similar operating and physical conditions, it was found that the east bound grades should be reduced to 36 ft. per mile, if possible. Two deg. was fixed as the maximum allowable curvature. With the above basis as a guide, the new line, now under construction, was finally decided upon after a series of surveys extending over a period of three years. About 300 miles of preliminary line were run, and four different lines were located. The country through which the line passes is quite rough



Profile of the D. L. & W. Old and New Line Between Elmira and Scranton.

and the general direction of the streams is at right angles to that of the line. Their beds are from 300 to 700 ft. below the surrounding hills. As no government contour maps have been made of this territory, the work of locating was extremely tedious.

On the new line, the main branch of Tunkhannock creek is crossed about 240 ft. above the bed of the stream; the south branch of Tunkhannock creek and also Martins creek are crossed at a height of about 150 ft. The south branch crossing will be made by a fill, containing about 1,600,000 cu. yds. At the Martins creek crossing the new line passes over the present line 88 ft. above on a three-track concrete viaduct, 1,600 ft. long, composed of two 50-ft., two 100-ft. semi-circular arches, and seven 150-ft. three centered arches with a rise of 59 ft.

The Tunkhannock creek viaduct is to be a double track structure, 2,375 ft. long over-all, and, as above stated, will have a maximum height of 240 ft. above the bed of the creek. There will be two 100-ft. semi-circular abutment arch spans and ten 180-ft. semi-circular arch spans. All piers are to be carried to bed rock, which varies in depth up to 95 ft. below the surface of the ground.

It was only decided to use concrete structures for these two viaducts after a very careful and extended study of the problem. Bids were secured on several styles of steel structures and, while those acceptable in design were somewhat less expensive

when first cost only was considered, they were less desirable when maintenance and other important items were taken into consideration.

The tracks will be carried through the divide between the south and main branches of Tunkhannock creek by a tunnel, 3,600 ft. long. This tunnel will have 50 ft. air shafts for ventilation.

The accompanying table gives a brief comparison of the physical characteristics of the old and new line.

Old Line-New Line Savings.

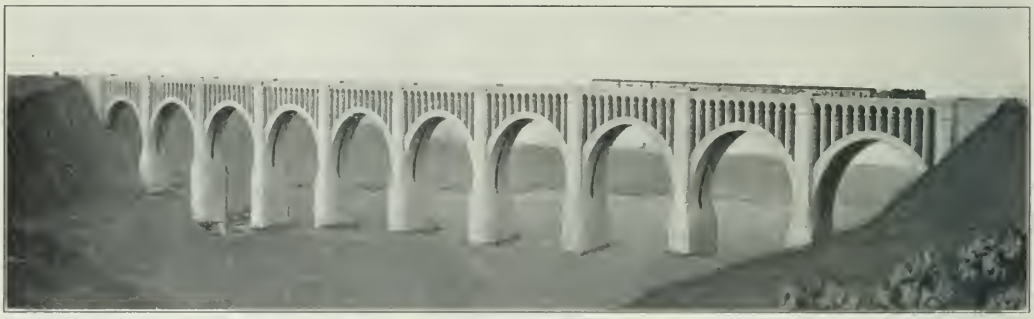
	Old	New	Saving
Length of line	43.2 miles	39.6 miles	3.6 miles
Maximum grade eastbound (uncompensated)	1.23%	.68%	.55%
Maximum grade westbound (uncompensated)	.52%	.237%	.283%
Rise and fall	553	226	327
Maximum degree curvature	6° 22′	*3° 00′	3° 22′
Total degree curvature	3,940	1,500	2,440
Degrees per mile	96	36	50

*Very few curves exceed 2 deg. on the new line.

Space will not permit an elaboration on the method used in calculating the amount of money which could be spent in reconstructing this line so that the decreased cost of operation and maintenance, due to reduction of distance, elimination of curvature, rise and fall and reduction of gradient would meet the interest charge. However, among the items taken into consideration in this computation were the total cost of operation and maintenance for the year 1910; the total train miles, exclusive of work train mileage, for 1910; the cost of operation and maintenance per train mile; the average yearly increased cost of operation and maintenance per train mile from 1900 to 1910 = 4.4 per cent.; the average yearly increase in net tons of freight handled 1900 to 1910 = 7.425 per cent.; the average yearly increase in passengers carried 1900 to 1910 = 8.2 per cent.; the total net tons of manifest freight moved over the territory in question for 1910 (east, 1,324,907; west, 592,713); the total net tons of all classes of freight moved over the territory in question for 1910 (east, 3,134,688; west, 6,967,269); the total number of freight cars moved over the territory in question in 1910 (east, 188,237 loads, 122,919 empties; west, 143,279 loads, 123,146 empties); total tons east, 8,306,003; total tons west, 12,060,973; passenger and milk trains, east and west bound (= 26), total reduction of distance, elimination of curvature (total degrees); elimination of rise and fall, and reduction of gradient.

In further considering the advisability of relocating the line, consideration was given to the fact that an additional third track would soon have to be constructed along the present alinement, especially on the heavy grades. Furthermore, there are on the present line 22 public highway crossings at grade, all of which would have to be eliminated in the near future, some of them at a very considerable expense.

The contracts for the entire work were let about a year ago. The road is being constructed for three tracks between Clarks Summit and New Milford, excepting at the tunnel and on the Tunkhannock viaduct. From New Milford to Hallstead, two new tracks are to be built for east bound movement. The present two tracks, with some slight revision in alinement, will remain for westbound movement. The entire line will be constructed without any highway crossing at grade.



Model of Tunkhannock Creek Viaduct.

THE DEMANDS OF THE TRAINMEN.

The joint committee of one hundred, representing the trainmen and conductors on the eastern railroads, began conferences on April 22 with the committee of the managers. Elisha Lee, chairman of the managers' committee, presided, and the spokesmen for the trainmen and conductors were William G. Lee, president of the Brotherhood of Railroad Trainmen, and A. B. Garretson, president of the Order of Railroad Conductors.

The demands of the trainmen are as follows:

Article A. On runs of 155 miles per day or over the pay of passenger conductors on steam or electric trains to be 2.90 cents per mile; baggagemen 1.87 per mile; flagmen or rear brakemen 1.80 per mile; brakemen 1.74 per mile.

Article B. On runs of less than 155 miles per day the pay of passenger conductors to be $4.50 per day; baggagemen $2.90 per day; flagmen or rear brakemen $2.80 per day; brakemen $2.70 per day.

Article C. Passenger trainmen on short turn around runs, no single trip of which exceeds 80 miles, including suburban and branch line service, shall be paid overtime for all time actually on duty or held for duty in excess of eight hours (computed on each run from the time required to report for duty to end of the run) within ten consecutive hours, and also for all time in excess of ten consecutive hours, computed continuously from time first required to report until final release at end of last run; and such will be computed for each employee on the basis of overtime worked or held for duty at the following rates:

Conductors	45 cents per hour
Baggagemen	29 cents per hour
Flagmen or rear brakemen	28 cents per hour
Brakemen	27 cents per hour

(a) All other passenger trainmen shall be paid for overtime on the speed basis of twenty-five miles per hour, computed from the time required to report for duty until released at end of last run. Overtime will be computed on the basis of actual overtime worked, or held for duty, at the pro rata rate.

(b) Regularly assigned passenger trainmen who are ready for service the entire month and who do not lay off on their own accord shall receive the following minimum sums, exclusive of overtime or extra service, for the calendar months:

Conductors	$135.00
Baggagemen	87.00
Flagmen or rear brakemen	84.00
Brakemen	81.00

(c) When regular passenger men lay off of their own accord or are held out of service extra men will receive the same com-

pensation regular men would have received and the amount to be paid the extra man shall be taken from the amount the regular man would have received had he remained in service; the sum of the payment to men who may be used on the run equalling the monthly guarantee.

Article D. Reductions in crews or increases in mileage in passenger service from assignments in effect November 1, 1912, will not be made for the purpose of offsetting (or having the effect of offsetting) these increases in wages.

Article E. The increases herein requested to apply to all rates for special or incidental service or for classes of service not named herein as specified in the individual schedules.

Article F. Through and irregular freight service to be paid as follows: Conductors, 4.18 cents a mile; flagmen, 2.88 cents a mile; brakemen, 2.78 cents a mile; runs of 100 miles or less either straightaway or turn around to be paid for as 100 miles.

Article G. Way freight, pickup or drop, mine and roustabout service shall be paid as follows: Conductors, 4.84 cents a mile; flagmen, 3.31 cents a mile; brakemen, 3.21 cents a mile; runs of 100 miles or less either straightaway or turn around to be paid as 100 miles.

Article H. Work, construction, snowplough, circus or wreck train crews shall be paid as follows: Conductors, $4.50 a day; flagmen, $3.10 a day; brakemen, $3 a day; 100 miles or less, ten hours or less, shall constitute a day's work, overtime to be paid as time and one-half.

Article I. In all freight, mixed and mine service, including pusher or helper service, 100 miles or less, ten hours or less shall constitute a day's work; on all runs of 100 miles or less overtime shall be paid for all time in excess of ten hours, and on runs of over 100 miles overtime shall be paid for the time used in excess of the time necessary to complete the trip at an average speed of ten miles an hour. The working time of trainmen shall begin at the time they are required to report for duty and do report; and shall continue until they are relieved from duty at end of run. Overtime shall be computed for each employee on the basis of actual overtime worked or held for duty and be paid for at the rate of fifteen miles an hour for the class of service performed.

Article J. The same percentage of increases as herein given in through freight service to be given also in milk, helper and all other classes of service, whether special or incidental, as specified in the individual schedules.

Article K. Regularly assigned way freight, wreck, work and construction crews who are ready for service the entire month and do not lay off of their own accord will be guaranteed not less than 100 miles or ten hours for each calendar working day, exclusive of overtime. (This to include legal holidays.)

Article L. Deadheading in freight or passenger service to be paid for at full rate for the class of service in which regularly engaged. Trainmen running with light engine or engine and caboose will be paid through freight rates.

Article M. Unassigned freight crews held at other than their home terminals longer than twelve hours will be paid at the rate of ten miles per hour at the through freight rates for time so held, time to be computed from the time crews go off duty until one hour before the departure of the train on which they resume duty.

Article N. Time and one-half will be paid to crews handling double headed trains of two engines; if more than two engines are used, or if either or both of the engines used in double headed trains are of the Mallet type, double time will be paid.

Article O. The Chicago standard rates of pay to govern all yards; ten hours or less to constitute a day's work. Overtime to be paid as time and one-half, and be computed for each employee on the basis of actual overtime worked or held for duty, actual minutes to be counted. (The above rule does not apply to roads having a shorter workday.)

Article P. Upon roads having a better basis for a day's work or for payment of overtime or other rates or allowances in passenger, freight, yard, mixed, work train service or other service the adoption of the foregoing rates and rules shall not operate as a reduction thereof.

CENTRAL & WESTERN ASSOCIATION OF CAR SERVICE OFFICERS.

The Central & Western Association of Car Service Officers held its annual meeting at the Grand Pacific hotel, Chicago, on April 17, with President E. E. Betts, superintendent of transportation of the Chicago & North Western, in the chair. A recommendation of the committee on office methods and accounting, providing that when a car is reported in an unserviceable condition and beyond repair the road in whose possession it is shall be required, with the consent of the owner, to destroy it and credit the owner with the salvage, was adopted and referred to the Association of Transportation & Car Accounting Officers, as were several other recommendations providing for minor changes in rules.

There was a long informal discussion of the proposed abolition of the per diem reclaim rule by the American Railway Association of July 1, which has been postponed for six months. Representatives of switching roads present were strongly opposed to the abolition of reclaim for the reason that no substitute is offered, and that the amounts paid for per diem would be a direct loss. Several important switching roads, including the Terminal Railroad Association of St. Louis and the Belt Railway of Chicago, had decided to withdraw from the per diem rules agreement before it was decided to postpone the change. Considerable discussion ensued as to whether the present rules should be retained, providing for a reclaim of per diem for an arbitrary number of days to be determined for each local territory, or whether it should be based on the number of days actually required by each road. It was asserted that the principal purpose in the abolition of the rule was to prevent the payment of virtual rebates to short industrial roads by allowing them a reclaim for a larger number of days than they usually pay per diem for, and that this abuse could be eliminated if the reclaim were based on the actual average requirements of individual roads, instead of an average for each territory. It was decided to appoint a committee of three to consider the subject and report at the next meeting in Chicago on November 13. Officers were elected as follows:

President, D. C. Fredericks, car service agent, Chicago, Peoria & St. Louis.

Vice-president, E. T. Kennan, auditor and car accountant, Indianapolis Union.

Secretary, W. E. Beecham, car accountant, Chicago, Milwaukee & St. Paul.

Treasurer, F. M. Luce, superintendent of car service, Chicago & North Western.

Mr. Beecham and Mr. Luce were re-elected. J. R. Pickering, superintendent of car service of the Chicago, Rock Island & Pacific, was elected a member of the executive committee for three years.

Passenger Traffic on the Buenos Ayres Great Southern, Argentina.—The number of passengers carried during the last half of 1912 by the Buenos Ayres Great Southern were 13,313,689, compared with 12,000,440 for the corresponding period of 1911, an increase of 1,313,249, or 10.94 per cent.

New Mileage in Argentina.—During the last half of the calendar year of 1912, 89 miles of extensions were opened to traffic by the Buenos Ayres Great Southern. These extensions comprise one from Juancho to Vivorata, 49 miles; Barrow to Juan E. Barra, 37 miles, and an extension of the quarry line at Tandil, 3 miles. The total length of the system on December 31, 1912, was 3,574 miles.

NEW DELAWARE RIVER BRIDGE OF THE P. & R.

Double Track Concrete Arch Structure Now Being Completed at Yardley, Pa.—Construction Plant Installed by Contractor.

By Edwin Chamberlain,
Assistant Engineer, Philadelphia & Reading.

The Philadelphia & Reading has almost completed the construction of a double track concrete arch bridge on the New York division across the Delaware river near Yardley, Pa. The new bridge is parallel to and 35 ft. down stream from the old structure which it will replace and which will be dismantled after the new bridge is put into service. The old double track bridge which is made up of seven pin connected and two deck plate girder spans, carrying two tracks, was built jointly by the North Pennsylvania Railroad and the Delaware & Bound Brook Railroad. It was erected in 1875 and opened for traffic in May, 1876, since which date it has been in continuous service. It was, however, strengthened in 1883 by an addition of 50 per cent. to the trusses and 100 per cent. to the floor system by the introduction of a middle truss.

Fig. 1—Yardley Bridge Looking from the Downstream Side.

The new bridge consists of 14 arches, 11 of which have a span of 90 ft. 9 in. and three 85 ft. 11 in. The total length between ends of abutments is 1,445.5 ft. The bridge is built on a rising grade to the eastward of 0.22 per cent., and is 33 ft. wide from out to out of coping, with tracks 13 ft. center to center. The base of rail is about 70 ft. above low water in the river and about 80 ft. above bed rock. The intrados of the arch ring is five centered, having a rise of 35 ft., a crown thickness of 3 ft. 6 in. and a radial width at the junction of each arch, over the piers, of about 13 ft. 6 in. Two lines of reinforcing rods are embedded in the arch rings, one line at the intrados and the other at the extrados, each being ¾ in. square twisted and spaced 7 in. center to center. These were tied in with transverse rods ½ in. square and spaced 3 ft. apart.

The piers are of the type shown, the center or abutment pier having a width of 20 ft. and the intermediate piers a width of 10 ft. at the springing line. The ends are symmetrical in plan, having cut water extensions, the up-stream noses of piers 2 to 11 inclusive being protected by bent plates 18 in. by ½ in. anchored to the pier by 12-in. by ¾-in. round swedged bolts. The side and end faces of the piers have a batter of ½ in. to the foot. This section is capped by a coping course 11 ft. wide and 2 ft. thick, the top of the coping being about 4 ft. below the springing line of the arch.

The spandrel walls are designed as gravity sections and are also reinforced with twisted vertical rods ¾ in. square and spaced 4 ft. center to center. The pilasters are carried about five ft. above the base of rail and extend beyond the face lines of the arches, providing refuge bays at the track level. With the intermediate concrete posts and two lines of 4-in. galvanized iron pipes they form a very substantial and effective railing. Embedded in each of the spandrel walls is a four-way vitrified clay conduit with manholes placed at frequent intervals to carry the telephone and telegraph wires, instead of attaching them to the outside of the bridge.

The drainage is taken care of by means of an 8-in cast-iron pipe, extending from the valleys over the piers to the soffit of the arch. The spandrel filling is composed entirely of one and two man size stone carried to the sub-grade of the roadbed. The water-proofing of the arches is composed of five layers of felt protected by a layer of hard bricks thoroughly mopped, applied to the tops of the arches between the spandrel walls, flashed up about 12 in. along the inner faces of the spandrels except directly over the piers where the flashing extends four ft above the tops of the arches. All vertical expansion and horizontal construction joints are protected by a single layer of prepared burlap 12 in. wide thoroughly mopped with asphalt compound. This burlap is carried under the coping at all expansion joints.

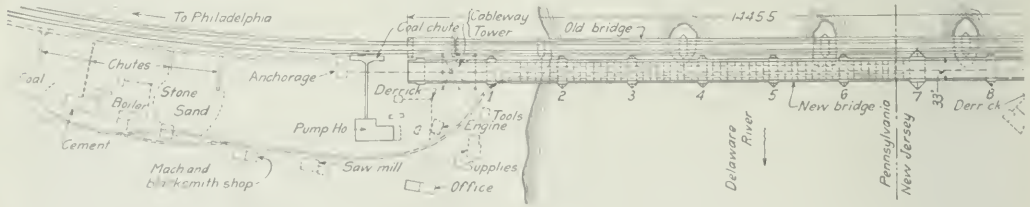


Fig. 2—Plan of Bridge Over the Delaware River on the Philadelphia & Reading, Showing Contractor's Plant.

The contract for the work was let to the Talbot Construction

Co., of New York, in April, 1911. Included with the river bridge contract was the extension of the masonry at the bridge crossing the tracks of the Pennsylvania and the feeder of the Delaware and Raritan canal, made necessary by the change in alinement across the river. On May 15 the contractors began to assemble their plant in preparation for starting the work, but it was nearly two months before they were prepared to make a start on the foundations in the river and on July 21 the first concrete was deposited on bed rock for the foundation of pier No. 2.

PLANT.

The contractors decided to conduct the work from both sides of the river and for this purpose duplicate plants were installed near each end of the bridge as shown upon the accompanying plan. The materials used in the Pennsylvania half of the bridge were shipped over the Reading to a siding at the elevation of the main tracks and dumped from the cars into chutes, by which the sand and pebbles were conveyed to storage piles, and the cement to storehouses at the base of the main track embankment. The height of this embankment, about 45 ft., afforded almost unlimited capacity for the storage of materials at practically no additional cost for rehandling. The cement house, with a capacity of 14 cars, had a narrow gage track laid on the floor, upon which a car containing a skip holding 50 bags was operated to serve the mixer which was about 100 ft. distant. This skip was hoisted from the car to the charging platform by the supply derrick which delivered the pebbles and sand to the mixer bins.

The mixing plant on the New Jersey side of the river was located along the Pennsylvania, over which all the materials for this half of the bridge were shipped and delivered to a siding leading to the mixing plant and storage piles. A derrick operating a clam-shell bucket unloaded the cars and delivered the concrete materials either to the mixer bins or to storage piles. The mixing plants were similar in construction and of the enclosed cube type sufficiently elevated on a timber framework to dump the mixture into cars or into buckets on flat cars. The mixers were belt connected to horizontal steam engines. Above the mixers were the measuring and supply bins, the latter having two compartments, one for stone with a capacity of 22 cu. yds. and the other for sand with a capacity of 14 cu. yds. The water for mixing was supplied through the main shaft of the cube, which is hollow and connected to the supply tanks, the amount being regulated by the number of turns made.

The capacity of the mixers was about 25 batches of 1.6 cu. yds. each per hour, but this speed was not attained at any time during the work. The transportation facilities were the limiting features and while they handled 20 or 22 batches per hour for one or two hours, the average for the day would fall to about 15 or 16 batches per hour. The distance from the mixers to the work hindered more rapid progress.

The construction work on the Pennsylvania side of the river was carried on from a temporary pile trestle, built on the center line of the new bridge and reaching to the middle of the river at pier 7, the piers being numbered from the Pennsylvania side. This trestle was composed of five-pile bents spaced about 10 ft. between centers and capped with 12-in. by 12-in. timbers, with 3-in. by 12-in. cross bracing. The stringers generally were of 12-in. by 16-in. timbers upon which were placed 3-in. by 12-in. planks to which the rails were spiked. This trestle supported a 20-ft. gage track for the operation of a steel traveling crane, which was used in placing the coffer dams, in excavating the pier foundations and in placing the concrete from the flat cars into the foundations or forms. It also supported a narrow gage track used in transporting concrete, etc., by small locomotives from the mixing plant, located about 500 ft. back from the shore.

On the New Jersey side construction was handled by a series of stiff leg derricks, placed south of the bridge and midway of the piers, so that each derrick served two piers. These derricks were used in handling the excavation and in placing the materials in the piers. A temporary trestle, about 1,200 ft. long, carrying a narrow gage track, extended from the mixing plant into the river to a point between piers 8 and 9. The piers were completed to the springing line of the arches from the river trestle and stiff leg derricks.

On the Pennsylvania side the work of completing the piers began with pier 7, and as each succeeding pier was completed it was necessary to abandon the river trestle between the completed piers. While this part of the work was progressing a cableway was being installed on the center line of the bridge with towers 125 ft. high. The Pennsylvania tower was located between the west abutment and pier 1 and the New Jersey tower between pier 13 and the east abutment, making a clear span of 1,320 ft. The towers were built of long leaf yellow pine lumber and were supported on concrete foundations. They were composed of eight 12-in. by 12-in. posts to a height of 78 ft., and four posts for the remainder of the distance to the top. The bracing was of 3-in. by 12-in. material throughout. A saddle of three 12-in. by 14-in. by 6-ft. oak timbers at the top supported the cable. A total of about 28,000 ft. b. m. of lumber was used in each of these towers. The main cable was 1¾ in. in diameter and was made up of six strands of 19 wires each, of plow steel with an ultimate stress of 112 tons. The cable was supported on an A-frame at the center pier, dividing it into two spans, each of which was operated by a 50 h. p. double cylinder, double friction drum hoisting engine made by the S. Flory Manufacturing Company, Bangor, Pa. The cableway was used for the re-

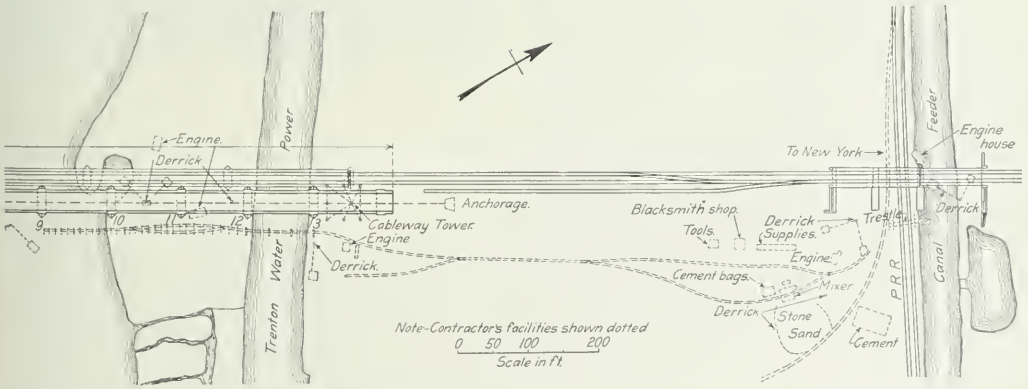

Fig. 2—Plan of Bridge Over the Delaware River on the Philadelphia & Reading, Showing Contractor's Plant.

mainder of the concrete work above the springing line of arches and in placing the forms and centers.

In building the spandrel walls the steel traveling crane was used in connection with the cableway, operating from a track built on the completed arch rings; drop bottom buckets of 1¾ cu. yd. capacity were used throughout the work. A portable steam saw mill manufactured by the American Saw Mill Company, of Hackettstown, N. J., carrying a 44-in. circular saw, was installed by the contractors, and proved of great economy in resawing the heavy lumber required in the early part of the work into smaller sizes for use in the pilaster and spandrel wall forms.

FOUNDATIONS.

The foundations for the abutments and piers were all carried to bed rock, although the abutments were originally designed to be built on concrete piles driven to rock. This construction was

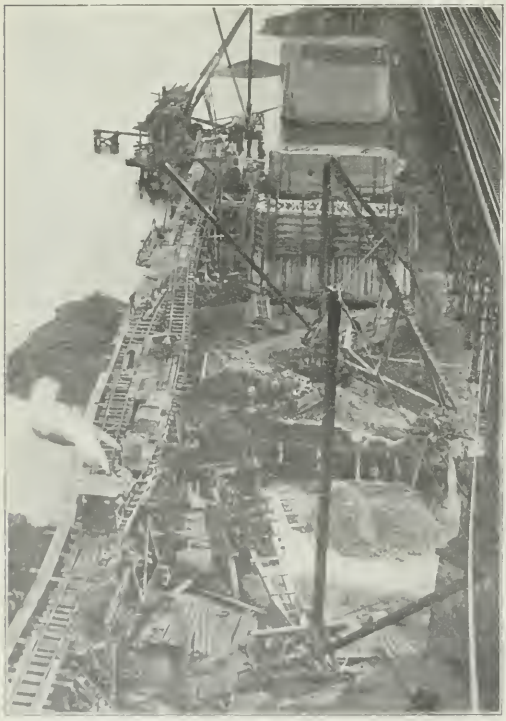

Fig. 3—General View of Work on the New Jersey Side.

adopted on account of the proximity of the new abutments to those of the old structure and the fact that the west abutment was founded about 30 ft. and the east abutment about 20 ft. above the rock. About 30 piles were driven to the gravel under the west abutment and in each case it was impossible to penetrate further. The piles were badly broomed at the ends and several were broken and sheared off below the surface. It was therefore deemed unwise to proceed with this construction and arrangements were made to excavate to rock. For this purpose 40 ft. lengths of Lackawanna steel sheet piling, with ⅜-in. webs, were successfully driven to rock on the outside lines of the abutment. The south half of the abutment was first completed to provide means for bracing the old masonry during the construction of the north half. This method of carrying on the work is shown in the accompanying drawing. Before making the excavation trestle bents were placed under the present tracks in order to relieve the old masonry as much as possible.

A slight settlement of about four inches was noticed in one end of the old abutment, but nothing more serious resulted. A great deal of water was encountered in the excavation and much

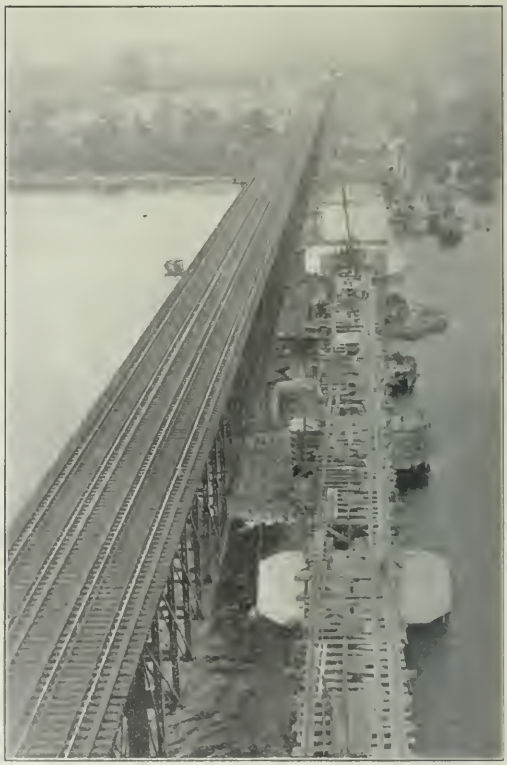

Fig. 4—General View of Work on the Pennsylvania Side.

of it had to be raised about 42 ft. One 10-in. and one 6-in. centrifugal pump were used in unwatering the excavation. These were set about 18 ft. above the bottom and the discharge was piped about 24 ft. to the top of the excavation.

No attempt was made to drive concrete piles at the east abut-

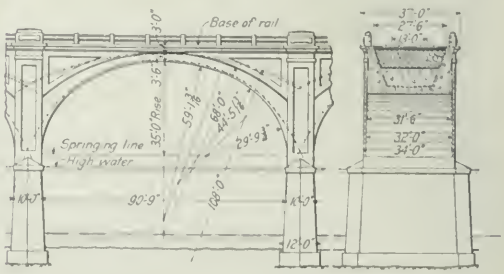

Fig. 5—Elevation and Section of 90 ft. 9 in. Arch of Bridge.

ment and the same method of construction was used as at the west abutment to carry the foundation to bed rock. Steel sheet piling of the Lackawanna pattern 12¾ in. wide with ⅜-in. web

and 18 ft. long was used for all the coffer dams in the river.

The wooden piles for the construction trestle were driven so as to provide anchorage for the 12-in. by 12-in. timber templates, placed near the water level, around which the steel piling was driven. These templates corresponded to the outside lines of the masonry, the ends being made semi-circular, to form a continuous line of locked sheet piling. The piling was set up against the

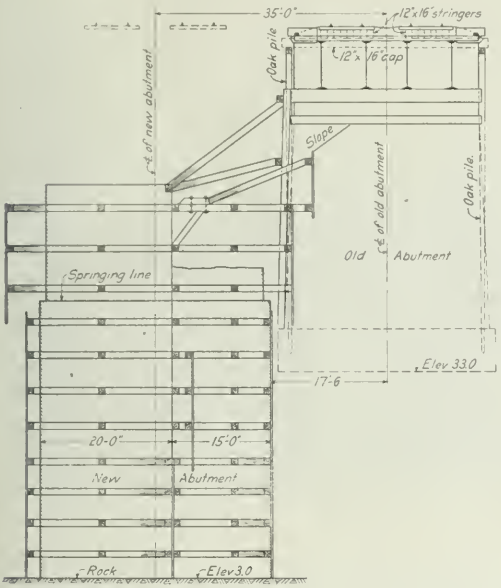

Fig. 6—Method of Supporting Old Pier During the Construction of the New One.

timber template, which also served as wales, by the traveling crane or a stiff leg derrick and was then driven to rock by means of a "New Monarch" steam hammer having a steam cylinder 6¼ in. by 14 in. and weighing about 4,200 lbs.

The material in the river bed overlying the rock was a heavy gravel, sand and boulders for an average depth of 8 ft. The depth of water at the summer stage ran from zero to 6 ft. Most of the unwatering of the coffer dams was done with two 6-in. pumps. Some difficulty was experienced at first in lowering the water, as a depth of several feet of water was in direct contact with the outside of the piling, causing considerable leakage into the dam. This was checked by placing burlap bags filled with earth against the outside of the piling, which proved very effective. Long wire rods were also used to puddle the gravel and silt along the outside of the joints, which assisted very materially in closing up any leaks through them.

The excavated material was placed on the outside of the dams, which also aided in reducing the leakage. As the excavation progressed additional timbering and bracing were placed to support the sides of the dam. Although the piles in many instances penetrated the top strata of the shale rock 12 to 18 in. a great deal of water came into the dams at the bottom of the piling and interfered with the placing of the foundation concrete. The dams were about 24 in. wider than the neat foundation lines of the piers and this space was taken advantage of in leading the water around the outside of the concrete to the pumps at the end of the dam. This was accomplished by leaning a form of two planks in height against the steel sheet piling leaving a space of about 12 in. at the bottom for the excess water.

Sufficient 18 ft. steel piling was purchased to cover five dams, or about 11,466 lineal ft. The first driving of five coffer dams, required about 11,100 lineal ft. The second driving of five dams required 10,980 lineal ft. and the third driving 11,460 lineal ft., or a total for the work of 33,600 lineal ft., showing that most of the piling received was used three times. With the exception of a section of the dam at pier 13 which was allowed to remain to protect the bank of the Trenton Water Power canal, all the 18-ft. lengths of piling were recovered. The loss to the contractor by reason of the steel splitting open, bending or otherwise becoming damaged so as to be worthless for further use, did not exceed five per cent. of the total, so that of the 637 pieces brought on the work 600 were recovered and were available for use on other work.

FORMS.

Great care was exercised in the construction and bracing of the forms and no materials were spared in their design, the justification for which is shown by the very small percentage of failures during the work. These were very slight and of minor importance, although a failure in any of the umbrella forms might have been disastrous. As it was, no movement has been noticed during construction.

The forms for the piers were made up in sections measuring about 12 ft. x 16 ft. They were composed of 8-in. x 10-in. horizontal timbers, spaced about 2 ft. center to center, well bridged, with two thicknesses of 1-in. by 8-in. boards, placed diagonally, for the lagging. Upon the face of the lagging was tacked No. 22 galvanized sheet iron. These forms were assembled on the shore and placed in position with the derricks. They were held in position with ¾-in. rods and 4-in. by 6-in.

Fig. 7—View of Piers and Umbrella Forms.

spreaders across the pier. Attached to the ends of the rods were wrought iron swivels, receiving the square nuts of stub bolts, which passed through the forms to outside waling pieces. The stub bolts extended several inches into the concrete and were removed to release the forms, leaving the bolt holes in the concrete to be closed with mortar. This avoided the necessity of cutting bolts and kept all iron well back from the face. The forms were adjusted to line at the top by turnbuckles at-

tached to the 2-in. by 2-in. by ⅜-in. angle iron cross braces which were anchored into the lower section of concrete previously placed.

The ribs for the umbrella forms were composed of two pieces, 2 in. by 8 in., spaced about 2 ft. center to center, with 8-in. by 10-in. wales, spaced about 4 ft. center to center and secured to the ribs with ¾-in. iron stirrups. The lagging was of 2-in. by 6-in. timbers. Practically the same method of inside bracing was used as for the main pier forms, except that it was heavier and closer together.

The main centers had a clear span of about 70 ft. and were made up of seven ribs supported at the ends on inclined timber bents resting on the coping of the piers and suspended from the umbrella arches by means of seven 1½-in. rods passing through the concrete to the back of the arch. The coping of the piers was reinforced with T rails to take the thrust of the loaded centers. At the middle the centers were supported by timber towers measuring 21 ft. by 33 ft. at the base and founded upon 14 timber piles. Four sets of oak wedges were used under each rib, the ribs being built in half sections for ease in erection. All the forms and arch centers were of short leaf yellow pine and were designed by the contractors. The concrete in the bridge was of two classes, 1:2:4 and 1:3:6 mixtures. A 1:2:4 mixture was used in the first 4 ft. of the foundations. From this point to the springing line of the arches the mixture was 1:3:6. The arches and spandrel walls were of 1:2:4 mixture. Embedded stones were allowed in the foundations and piers, but not in the arch rings or spandrel walls. One or two man size stones were used for this purpose, procured from a local quarry for the New Jersey side of the bridge and limestone for the Pennsylvania side. The quantity of stone used varied in different portions of the work, depending upon the convenience to the stone piles and the ability of the derricks to handle the concrete and place it in the forms as fast as it reached them from the mixer. As it was necessary to use the same derrick for both concrete and

Fig. 8—Looking Upstream, Showing Arch Centering and Forms.

Fig. 9—Arch Centers and Falsework.

Fig. 10—Spandrel Wall Forms.

stone, the stone was placed when convenient, the concrete having the preference. The coping was composed of a 1:3:6 mixture and the railing posts of a 1:2:4 granolithic mixture. The stone for the posts was of ¼-in. size trap rock, cleaned of dust.

Dragon cement was used throughout the structure and every car received at the work was sampled and the sample forwarded to the company's laboratories at Reading, Pa., for testing. The following table shows the average result of 40 tests:

Residue, No. 100 Sieve. Per Cent.	Residue, No. 200 Sieve. Per Cent.	MgO. Per Cent.	SO_3 Per Cent.	Specific Gravity.	Initial Set. (Hours)

6.43	O. K.	472	698	357

The sand used for the concrete in the Pennsylvania side of the bridge was a well graded bar sand dredged from the Delaware river near Burlington, N. J. That used for the New Jersey side was a bank sand from Birmingham, N. J. Freight rates influenced the contractors in using the two different sands. The following tables show analyses of the sands:

	Tensile Strength (1-3 Mortar) Ottawa Sand. 7 days. (Lbs.)	Sample. 7 days. (Lbs.)	Per Cent. Ottawa Sand. 7 days.	Voids.	Weight per cu. ft. (Lbs.)	Per Cent. Silt.

While the specifications called for crushed stone to be used in all concrete, the contractors were allowed to use river pebbles

Fig. 11—Waterproofing Over Arches and Brick Covering.

for the Pennsylvania side of the structure. These were well graded in size from ¼ in. to 1¼ in. Crushed stone was used for the New Jersey side ranging in size from 1¼ in. to a small percentage of dust, being the run of the crusher.

CONCRETE SURFACE AND CONSTRUCTION.

In constructing the piers and the umbrella sections the work was so arranged as always to stop the day's work at the inner edge of a triangular wooden fillet or scoring, 1½ in. wide, in order to hide as far as possible any irregularity on the surface. The sections between scorings were so designed as not to be more than the day's capacity of the mixing plant and also with a view of avoiding night work.

On the face of the pilasters and umbrella sections, the scoring was closer together than on the piers and coincided with the scoring of the arch rings. There were 18 of these in the umbrella section, and the arch ring between the umbrella sections was divided into 35 voussoirs by the scoring. Fillets were used at the exposed corners of all contraction joints and on all salient corners.

The exposed faces of the concrete throughout the structure were spaded, with the exception of the railing posts, which were bush-hammered. The spading against the metal lining of the forms produced a very smooth and uniform surface. The specifications called for a granolithic finish throughout, to be scrubbed and washed, exposing the grit, or to be bush-hammered if the contractor so desired. The change in the specifications to a spaded face was granted at the solicitation of the contractor, who agreed to give a finish equal to the granolithic finish in appearance and uniformity of color and surface.

In building the umbrella sections they were carried up in sections corresponding to one or more of the face scorings. The arch ring was divided into six large sections or voussoirs, three on either side of the key and the key section, which was about two ft. wide. Two opposite sections amounted in contents to about 10 hours run of the mixing plant. Corresponding with the joints between the ring sections, were vertical joints through the spandrel walls extending through the coping, providing weak joints in case of any tendency to open up on account of shrinkage or temperature changes. Tongued and grooved joints were used in every case. In order to prevent the bonding of one section with another and to form a cushion between them, corrugated asbestos boards were placed on the faces of the joints. In the joint at the junction of the spandrels and pilasters a double thickness of boards was used.

As the main centers were designed for a loading equivalent to a thickness of the showing ring, the entire ring for this thickness was first completed and keyed up, after which the haunching was placed. This was kept 2½ ft. back from the showing face, thus bringing the extradosal joint between the spandrels and arch ring at the top of the projection of the rings.

The skewback for the main arch ring was formed by the radial line passing through a point on the intrados, 15 ft. measured horizontally from the center of the piers. The portion of the arch below this skewback—called the umbrella—was constructed as a part of the pier. The sections of the ring were built in pairs one on each side of the crown, in order to balance the horizontal thrust on the centers. They were constructed continuously from start to finish, so as to avoid any intermediate joints. Fortunately nothing occurred to prevent the carrying out of this method.

The turning of the arches began with the arch adjacent to the center pier after the centers for four arches had been placed in position. The first two voussoirs cast were those at the crown of arch 7. The next pair placed were those at the crown of arch 6. This was done to weight down the centers at the middle and also to obtain the maximum settlement in the centers at this time. In arch 6 it was done to add weight to its center that it might better take any horizontal thrust while the sections at the skewback of arch 7 were being placed. This rotation was carried through the construction of all the rings. The haunching was not placed until the key section had received a hard set. The centering was required to be maintained under the completed arch ring for at least 30 days.

In framing the centers they were given an additional height

at the crown of about 1¾ in. above the plan height to allow for any compression in the centers and in anticipation of some settlement after they were struck. Levels were taken on the centers before and after completing the crown sections; on completion of the haunch blocks; on completion of the key; and before and after striking the centers. The greatest deflection was at the time of completing the crown sections, which ran from .05 to .13 ft. In the first centers that were built an attempt was made to obtain the additional height at the crown by manipulating the wedges, but this proved unsatisfactory. The remaining centers were then framed so as to give the required 1¾ in. additional height at the crown. Most of the arches deflected so as to be about ¼ in. below the plan elevation at the crown after striking the centers and four were ¼ in. higher.

The spandrel walls were completed after the centers were dropped. On account of the liability of a side movement in the spandrel walls during construction the coping was not constructed until after the spandrels for each arch had been entirely completed and the concrete had received a set. The posts for the railing were all cast in place. The total quantity of concrete of all kinds in the bridge is 34,670 cu. yd., made up of the following materials, viz.:

Cement	42,363 bbls.
Crushed stone and pebbles	37,172 tons
Sand	21,954 tons
Imbedded stone	2,558 tons
Steel reinforcement	262.5 tons

The total area of surface to be waterproofed will amount to about 42,000 sq. ft. and the stone spandrel filling will amount to about 7,500 tons. There were used for construction purposes about 1,400,000 ft. b. m. of lumber, 800,000 ft. of which was required for the centering of the arches.

The construction work was carried on under the direction of the Philadelphia & Reading, William Hunter, chief engineer, the writer being in direct charge.

CONDITION OF SAFETY APPLIANCES.

The following data as to the condition of safety appliances is taken from a report to the Interstate Commerce Commission made by H. W. Belnap, chief inspector of safety appliances. It was accompanied by several tables which are not reproduced. One of them showed in detail a statement of all penalties, exclusive of costs, which have been collected under the safety appliance, hours of service and ash pan acts, as of November 1, 1912. It shows that a total of $259,900 has been collected from 204 roads for violations of the safety appliance law, an average of $1,274 per road. For violation of the hours of service law $40,921 has been collected on account of trainmen, $11,715 on account of telegraphers, and $500 because of failure to file reports. For violations of the ash pan law $3,400 has been collected.

The following extracts are quoted from Mr. Belnap's report: In submitting the data showing the condition of safety appliances in general for the past fiscal year, I have the honor to report an apparent increase in the number of defects noted as to freight equipment and locomotives and a decrease as to such defects in passenger equipment. This increase, however, with respect to freight cars and locomotives is due to the fact that the report for the fiscal year ending June 30, 1911, comprehended only 83 days of defects, whereas this report covers inspections made pursuant to the commission's order of March 13, 1911, and includes an aggregate classification of 230, or an increase of 147 different kinds of defects. The decrease in the number of defects reported as to passenger cars shows a high degree of efficiency in the maintenance of safety appliances on this character of equipment.

The number of defects reported on freight and passenger cars and locomotives is 73.45 per thousand inspected, while the number of such cars and locomotives found to be defective is 61.45 per thousand inspected. Defective lock blocks represent the greatest of defects under the heading "couplers and parts," there being 1,993 such defects out of a total of 3,000 coupler defects reported. The uncoupling chain is the most prolific cause of defects to uncoupling mechanisms, as out of a total of 4,071 defects of this character 2,324 cover defective chains. As to the 16,442 defects to air brakes, 9,774 such defects were due to air brakes being "cut out" and inoperative, or to the fact that there was no stenciled date to indicate that the cylinders and triple valves had been cleaned within a year. Under the heading "handholds" a total of 3,917 defects were reported, of which 2,409 were missing handholds. The most numerous of the defects to running boards consist in the insecurity of the running board brace, 1,209 out of a total of 2,174 defects to running boards being of this character.

It is to be particularly noted that out of a total of 4,965 defective hand brakes reported, 2,630 were caused by the cotter key or ring at the bottom of the brake shaft being missing. The foregoing instances are enumerated for the purpose of showing that the great majority of the defects reported comprehend a comparatively small number of appliances, and it is believed that if the railroad repair men would familiarize themselves with the defects, especially those just indicated, and would make a special effort to reduce the number of such defects, a very short period of time would suffice to bring about a much improved condition.

The committee appointed by the Master Car Builders' Association, for the purpose of adopting a standard coupler, is conducting an investigation with a view to securing a coupler which will combine the maximum of efficiency with a minimum number of parts, of simple construction and easily repaired. When this committee shall have designated a coupler, if the carriers will adopt it as the standard coupler, the number of defects to couplers will be reduced to a minimum. The Master Car Builders' Association is to be commended for its action in this matter, as the adoption of a standard coupler will tend not only to reduce the number of accidents resulting from defective couplers, but should ultimately redound to the material advantage of the carriers themselves from the standpoint of economical maintenance.

It is recommended that the commission take such action as will require the carriers to report semiannually the progress made in the equipment of freight and passenger cars with the new standards. From information thus far received it is apparent that unless this work is greatly expedited it will not be completed within the time required by the commission's order.

In many instances our inspectors have found that the only test made of the efficiency of the train brakes is one intended to show that the air is working throughout the train line. Under such a system of inspection the train crew has no means of knowing the actual condition of the air brakes. Such practices cannot be too severely condemned, as the several trains on any railroad are not independent in point of movement and safety, but are interdependent, and whatever brings delay or disaster to one train, or results in disabling one of its operatives, impedes the progress and imperils the safety of other trains. Our inspectors have frequently made terminal tests which disclosed the fact that the proportion of operative air brakes on trains about to leave their terminals was less than the percentage required by law. Had these trains, in fact, left their terminals in that condition, our inspectors, in the performance of their duty, would have been compelled to file evidence of such violations of the law for prosecution. However, the train crews being present at the time such inspections were made, and realizing the imminent danger to themselves and to opposing trains, the matter was promptly reported to the officials in charge, by whom the necessary repairs were ordered. In such instances inspectors have occasionally been charged with holding the train and causing delays. In this connection it should be understood that inspectors always make their terminal tests in conjunction with the train crews and at the same time, thereby causing no direct delays, and they have in no instance held a train longer than was necessary to make the test, which ordinarily consumes only 5 or 10 minutes. A terminal or standing test of power brakes should be made on all trains before permitting them to leave their terminals. This method of inspection cannot be too highly

recommended as a means of ascertaining the true condition of air brakes.

The question as to the right of a railroad to handle equipment defective in the matter of safety appliances has occasioned more controversy than any other part of the act of April 14, 1910. This portion of the law, however, will receive judicial interpretation within the next few months, as a number of cases involving the handling of chained-up cars, and cars with defective safety appliances hauled out of repair points for the purpose of repairs have been filed for prosecution in the several judicial districts.

The impression seems to obtain very generally that inspectors have the authority to shop cars if they should find that any of their safety appliances are defective. This is an error, and is without foundation, as none of our inspectors has ever ordered a car to be taken out of service, regardless of the number or the serious nature of its defects. The law merely authorizes inspectors to make inspections and to file evidence with the commission of any violations of the law with come within their personal knowledge.

In conclusion, it may be observed that in view of the large number of appliances covered by our present system of inspection, the splendid showing made by the majority of the railroads in the maintenance of those valuable safeguards is truly gratifying.

DEPUTY INTERSTATE COMMERCE COMMISSIONERS PROPOSED.

T. J. Norton, general attorney of the Atchison, Topeka & Santa Fe, in a letter to the *Traffic World*, advocates the creation of deputy Interstate Commerce Commissioners to hold hearings in various places throughout the country, to relieve the Interstate Commerce Commission of many of the details for which it is now responsible, and to hear minor cases subject to appeal to the commission. Mr. Norton's letter is as follows:

"While so many others are expressing their views as to how the burden upon the Interstate Commerce Commission may be lightened, I should like to offer an opinion based upon many years of practice before that body. I do this because I think some of the plans suggested would needlessly unsettle conditions which have grown stable and which should not be disturbed. When a practice has become settled and well understood by all concerned it is not wise, just because some little alteration may be necessary, to change it fundamentally, any more than we should pull a house to pieces when we find it necessary to cut a new window or to make some other change suggested by trial.

"My idea is that by one short paragraph of amendment to the interstate commerce law all that is now lacking in a well-ordered and well-tried system can be provided.

"No one acquainted with the work of the Interstate Commerce Commission can doubt for a moment the pressing need of giving relief to that body. It has to look after the details of many informal cases in which important contentions are disposed of without formal trial. It makes rulings in response to almost countless inquiries by mail. It has passed up to it for examination the enormous trial records of a multitude of cases. In addition to its work in looking after litigated business, it is required by Congress to give effect to the safety appliance laws, to investigate and keep a record of all accidents, to effectuate the medals of honor act for the recognition of those who endanger their lives in saving others in time of wreck or disaster, to enforce the hours of service law and the ash pan law, to regulate and supervise the transportation of explosives, to effectuate the boiler inspection act, to supervise the charges and practices of the Lake Erie and Ohio river ship canal, to carry out the purposes of Congress in the supervision of traffic through the Panama canal, and finally, to supervise the classifications and rates under the act establishing a parcel post.

"Clearly that is as much as one body should be called upon to do, if not more than it can handle.

"Those administrative matters render it impossible for the commission to give the time and reflection to important litigated cases which it would give to them in other circumstances and which they certainly should have. In addition to this the commissioners would like to try more cases than they do instead of assigning them to examiners. Assuredly the litigants would be greatly pleased to have more of the larger cases tried by the commissioners themselves.

"Another thing taking the time of the commission is the oral arguments of cases, which now occupy something like one-half of each month. Formerly oral arguments were few; but it is now believed by both the commissioners and the parties that, in view of the congestion described, the best presentation of the subject calls for oral argument, for otherwise some of the commissioners might not become fully acquainted with the case. There are general conferences several days each month, and there are also numerous special conferences. How give relief?

"Let Congress create deputy commissioners to sit throughout the country somewhat as district judges hold court, with authority to try cases and decide them and with the right of the losing party, if he believes that he has not received his due, to appeal to the central commission at Washington, that appeal to be based on exceptions to the findings of the deputy commissioner as not being supported by the evidence, thus giving a trial *de novo* on the facts. The central body would go over the record as criticized by the appellant, and would either affirm the order of the deputy commissioner or else enter such order as it might deem appropriate. My observation has been that the dissatisfaction of both the shippers and the carriers has been with respect to the inability of the parties to get further hearing on the facts. Under late decisions the shipper cannot go up from the commission even on the law. Bills have been introduced in Congress to alter this condition. But there will not be any law to speak of in these cases after there has been a thoroughgoing trial on controverted facts. An important case tried by a competent deputy commissioner and then reviewed by the central commission would be decided as nearly right as men could expect to have a case of disputed facts determined. Of course only the heaviest cases would ever go above the deputy commissioner. The findings of the deputy commissioner who heard the witnesses would be very suggestive and serviceable to the central commission, and the commission would in all probability smooth out many irregularities passed up by the deputy commissioner, so that finally we should have the best conclusion that could be expected.

"Such a plan would not only remove from the back of the commission as it exists now a great part of the enormous work attendant upon litigation, but it would also conduce to more thorough trials, which means more satisfactory work to all concerned, to the commission as well as to the litigants.

"The deputy commissioners should be well paid. The salaries should be such as to invite thoroughly competent men to seek the places. They should either know the leading rules of evidence or else the commission should formulate a code for their guidance, for the laxity in this regard has become intolerable and grossly expensive to the parties. Besides, the late decisions governing the review of evidence by the courts makes necessary a reasonably close adherence to the law of evidence. In some traffic centers more than one deputy commissioner would be required. Chicago might need two or three. Just how many would be necessary and where they should best be stationed would be determined shortly by experience.

"This improvement could be provided for by a single short paragraph and without any change in the substantive law as it stands today. Let the president or the commission appoint the deputy commissioners for a statutory term and let them be assigned by the chairman of the commission to duty in the parts of the country where they may be needed. We shall then have better trials, an opportunity for review, which is now practically denied to both shippers and carriers, the benefit in the more important cases of the more thorough consideration of the central body, and altogether a disposition of this business with a care more nearly commensurate with its importance to the litigants and to the country."

FUNDAMENTALS OF WAGE PAYMENT.

**All Systems, Properly Administered, Are Equally Effective—
The Time Element Is All-Important Under Any System.**

By B. B. Milner.

Frequent argument that there exists such a great difference in the efficacy of various wage payment systems as factors in efficient management, warrants the following, which has been written with the idea that a more definite understanding of the very simple relations which exist between the basic elements concerned in the various systems of labor payment and which can so readily be obtained, will show: (1) that the selection of the type of wage system is not so vital as very popularly supposed and argued; (2) that under uniformly efficient administration the differences between them are more largely imaginary than real; (3) that, under any system of labor payment, efficient management and administration involves constant attention to important elements common to any of the many systems.

In the consideration of labor costs three elements are fundamental and inter-dependent; namely, the labor cost of production per operation (identical with the workman's earnings per operation); the rate of the workman's earnings per hour, and the time consumed per operation. These will hereafter be referred to as "Cost," "Rate" and "Time," respectively. The time consumed per operation should be understood as that of, not the unusually skillful and rapid workman, nor the one lowest in the scale of skill and speed who is qualified to satisfactorily perform the work, but of an average workman who occupies a position

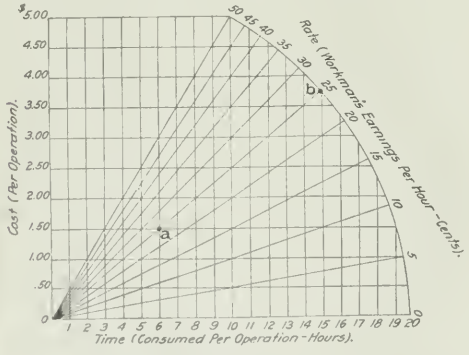

Chart 1.

between these two extremes. The relations existing between the elements, cost, rate and time, are expressed algebraically by the following equation:

$$\text{Cost} = \text{Time} \times \text{Rate}$$

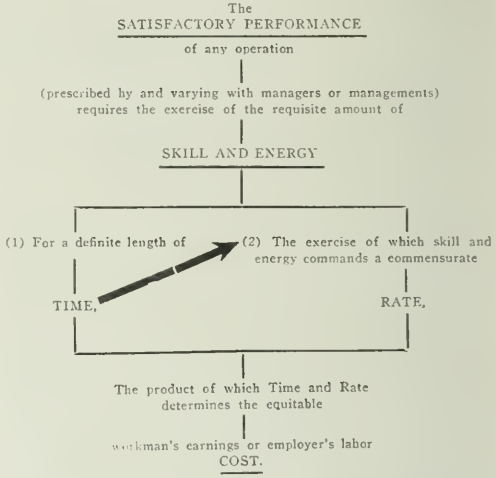
so simple in application that, having given any two, few workmen are unable to determine the desired third. The same relations may be represented advantageously by Chart 1, which geometrically interprets the equation:

$$\text{Rate} = \frac{\text{Cost}}{\text{Time}}$$

obtained from the first equation by transposition and division of both its members by "Time."

Within the range of values exhibited by the three scales, having given any two of the elements (Cost, Time and Rate), the third may be immediately found therefrom. For example, a workman's rate of earnings per hour may be immediately determined as 25 cents, when he has earned $1.50 in six hours, by locating the point of intersection *a* of the lines representing the given cost and time and following the rate line from this common point of intersection to the rate scale at *b* where the desired rate will be indicated as 25 cents per hour. Similar charts for any range of cost, time and rate values may, of course, be easily constructed.

In order to be more specific, throughout the following discussion, we will assume an operation, the "satisfactory performance" of which requires ten hours of time, and for which the "commensurate rate" is 30 cents per hour as shown by Chart 2. The following graphical statement defines the relative meanings attached to the terms satisfactory performance, skill and energy, etc.:



The day work wage line of Chart 3 is the locus of all points on the chart representing the relations existing between time, cost and rate, under the day work system. Note that the cost (per operation to the employer) rises and falls with increases and decreases in time (consumed per operation) and that the (employees) rate (of earnings per hour) remains constant at 30 cents an hour for all values of cost and time.

The employer was opposed in stimulating his employees to the point of satisfactory performance by the ordinary worker's tendency to do no more than actually required of him. This tendency was aggravated under the day work system by the fact that the employee does not participate in the profits accruing from increased output as evidenced by the uniformity in the employee's rate of earnings per hour. The employer therefore conceived the idea of paying for labor by the piece, expecting therefrom a considerable reduction in his labor costs, which he may have thought or known were high and, at the same time, relief from having to so closely supervise his workmen in order to obtain a satisfactory performance.

The piece-work wage line of Chart 4 is the locus of all points in the chart representing the relations existing between time, cost and rate under the piece-work system. Note that the cost per operation to the employer remains constant at all values of the employee's rate of earnings per hour and time consumed per operation, and that the employee's rate rises and falls with decreases and increases with the time consumed per operation.

The labor cost per operation to the employer is uniform, and all profits accruing from increased output revert to the employee,

being reflected by variations in his rate of earnings which follow directly the increases or decreases in output. The employer was not disappointed in what piece-work actually did for him, and was largely relieved of the necessity of crowding workmen because of their being now personally interested in their own output. We would actually expect that the output of the workmen should now have been limited only by their capacity, but conditions soon developed which materially affected the actual output of piece-workers and necessitate qualification of the statement that the piece-work system has been satisfactory. These apparently unforeseen factors affecting the output have been two, namely, (1) the decreasing amount of effort which workmen will exercise as their rate of earnings increase (in accordance with the economic law of decreasing returns under which, after a certain amount of energy has been expended and a corresponding compensation earned, the workman's desire to earn decreases at a rate varying with the personal characteristics and the needs of the individual); and (2) the possibility of readjustment or cut in the piece-work price as the result of high earnings. The workmen soon learn by experience or are taught by their fellows that this readjustment of a piece-work price is apt to follow any demonstration that a lower price will still permit the earning of wages much above that usually paid similar labor.

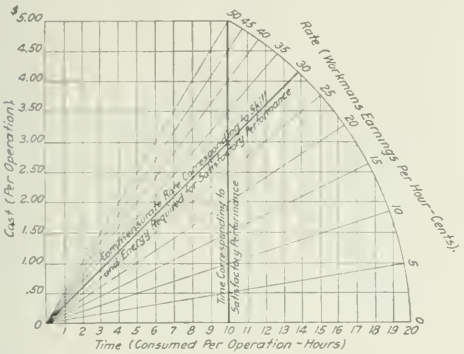


Chart 2.

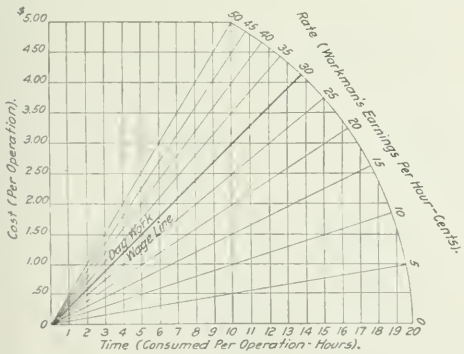

Chart 3.

The zigzag line of Chart 5, *a b a' b' a'' b''* shows graphically the usual history of piece-work operation where the prices originally quoted were too high, and have resulted in earnings higher than those commensurate with the skill and energy required for the satisfactory performance of the operations. Successive demonstration of that fact has resulted in piece-work price adjustments (reductions) at points *b* and *b'* until the final price may be so low that it will not pay a satisfactory wage, that is, commensurate with the skill and energy which must be exercised to satisfactorily perform the operation. However, very early in his piece-work experience the workman learns that, by exceeding a certain rate of earnings, i. e., the "commensurate rate," he exposes and demonstrates the equity of a lower piece-work price and that it is therefore to his personal interest, in the effort to obtain as high a wage as possible with the minimum amount of exertion, to guard and protect his piece-work price from any cutting readjustments, by limiting his output to that which will,

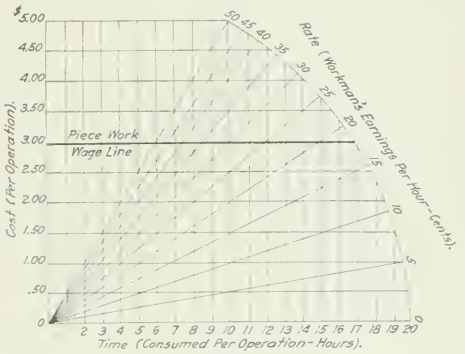

Chart 4.

at the prices quoted, pay him a rate commensurate with the skill and energy which he is expected to exercise.

The difference between Charts 5 and 6 is that the zigzag line *a b a' b' a'' b''* of Chart 6, interprets the performance of experienced piece-workers who so limit their output that their earnings at no time exceed the commensurate rate.

The difficulties outlined as having been experienced with piece-work operation and having made of it "high priced day work," are ultimately most largely dependent upon inability or failure to locate accurately the time actually required for satisfactory performance and to use it and the commensurate rate as the basis of the piece-work price originally quoted.

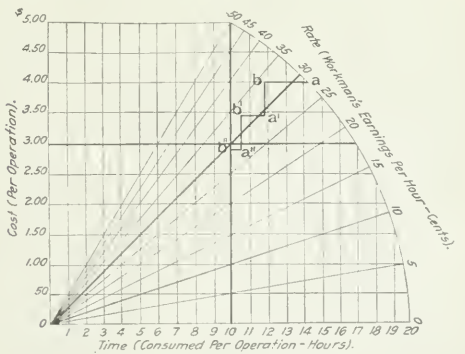

Chart 5.

Any system of labor payment should be based upon the payment of an honest wage for honest performance, and a definite understanding should exist between employee and employer that the employer expects the skill and energy required for the satisfactory performance to be honestly exercised. For this he expects to pay a commensurate rate of earnings. On the other hand, the employee will certainly expect to receive the commensurate rate for satisfactory performance regardless of the

system of labor payment under which the work may happen to be performed. Consistent with this a satisfactory piece-work price (Cost) must equal the product of Time (actually required for satisfactory performance) and Rate (commensurate with the degree of skill and energy required for satisfactory performance), and it should be definitely understood that changes in piece-work prices can only be justified by, and must be expected to follow, changes in either or both of the co-ordinate component elements, i. e., time (a function of methods and conditions under which the operations are performed) and rate.

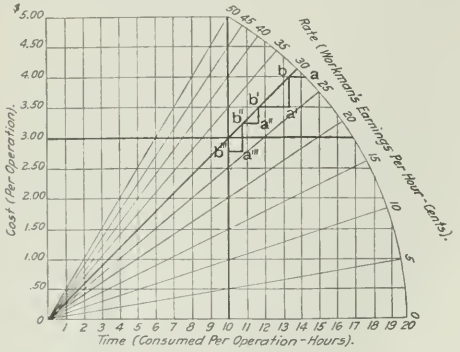

Chart 6.

Such understandings and methods of procedure consistent therewith should more nearly bring for the piece-work system that which was expected of it, viz.: (1) a lower labor cost, (2) an output limited more nearly entirely by the employee's individual capacity, and for him, (3), a rate of earnings proportional to his output and considerably higher than paid under the day work system as usually administered.

Chart 7 shows clearly the relations existing between the piece and day work systems when the conditions referred to have been fulfilled, the shaded portions of the chart representing the labor

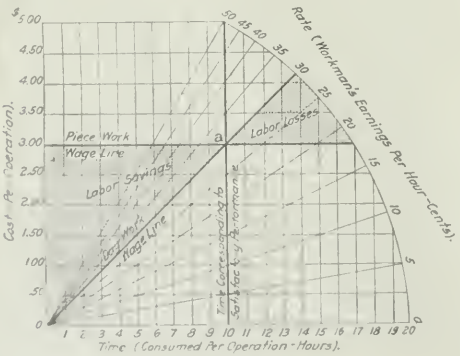

Chart 7.

savings and losses accruing from increasing or decreasing output above or below that represented by satisfactory performance. Note that, for time corresponding to satisfactory performance under either piece work or day work, cost and rate are identical and that, under the day work system, all labor savings resulting from increased output revert to the employer by whom all labor losses resulting from decreased output are assumed and that the employer's rate remains constant, while under the piece work system all labor savings resulting from increased output revert to the employee by whom all labor losses resulting from decreased output are assumed, the employer's cost remaining constant. Under no system of labor payment does cost per unit of output regularly increase with increases in output or decrease with decreases in output; likewise, under no system does rate decrease with increases in output or increase with decreases in output. The piece-work and day work systems represent then extremes of liberality and exactitude toward the employee at his varying rates of output; in other words, no system is more liberal to the employee where output is high, or more exacting where output is low, than piece-work and, on the other hand, no system is

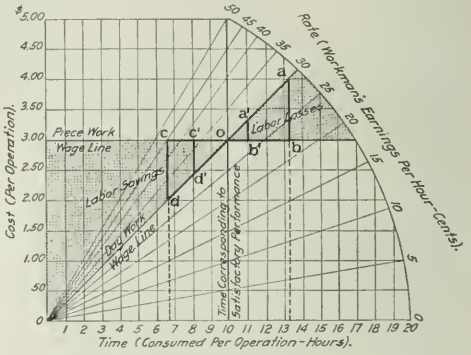

Chart 8.

more liberal to the employee where output is low or more exacting where output is high than day work.

Between the two extremes represented by day and piece-work, there are many systems, premium, bonus, profit sharing, etc., which may be generally classed as "divisional" because of being, in a way, compromises under which the labor savings and losses resulting from increased or decreased output are divided between the employer and employee. They were suggested largely because of unsatisfactory results obtained from piece-work operation, and, though the introduction of the divisional systems

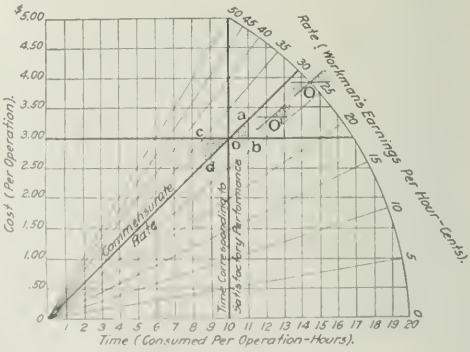

Chart 9.

did not in itself cure the difficulties with piece-work, it did immediately relieve somewhat the "thorn in the side" of the employer by returning to him a portion of the labor savings which were usually large. Their introduction has, however, almost without exception, been accompanied by better management which would have, by itself, removed some of the basic difficulties with previous day or piece-work operation.

Two triangles *a b c d* are shown on Chart 8, within which the performance of all except the most unusual workman will fall; in fact, if satisfactory performance is well determined and

defined, we may safely reduce these triangles to *a' b' o c' d'* and say that these two small triangles contain that portion of the chart within which all our operations should fall. Since the workman must be paid the commensurate rate for satisfactory performance, regardless of the system of wage payment under which he may happen to work, the wage lines of all systems must pass through the point *o* and lie wholly within the triangles referred to, which, as previously stated, bound the extremes of liberality and exactitude represented by the piece and day work systems. It now becomes apparent that, under uniform

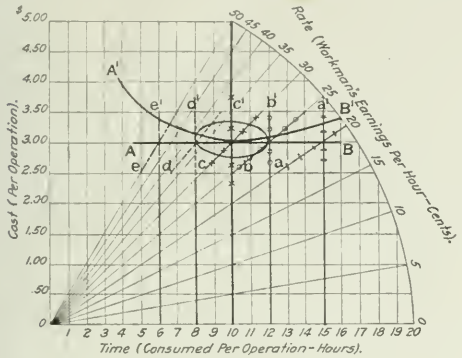

Chart 10.

degrees of management efficiency the actual differences due to variation in wage systems are relatively small and that the large variation in the efficiencies of operation under them must be due to variations in the efficiency of methods and management under which they are administered.

The greatest difficulty with operation under the piece-work and all other systems, including day work, has been inability or failure to locate the time corresponding to or actually required for satisfactory performance, the result being that operation has, instead of being within the field bounded by the

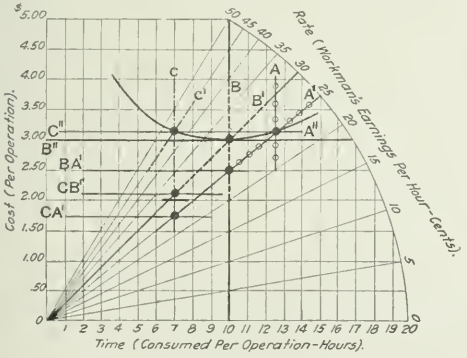

Chart 11.

triangles referred to above and connected at the common point *o*, been within the triangles connected at some other point such as *O* or *O'* of Chart 9, the location of which is based on a time much in excess of that actually required by satisfactory performance. Workmen do not usually co-operate in (and frequently openly oppose) the movement of the respective pairs of triangles and points corresponding to *O* and *O'* to their proper position at *o*, which movement is, of course, made through some such path as *a b a' b' a'' b''*, etc., of Charts 5 and 6.

The equity of operation from the standpoint of both employee and employer is therefore largely based on the proper determination of the time corresponding to satisfactory performance and of the commensurate rate. But satisfactory performance varies with the personnel of the management. Various managers or managements will require varying degrees of output. Yes, but to each definition of satisfactory performance there corresponds a certain degree of skill and energy which must be exercised for a certain amount of time, and the exercise of that degree of skill and energy will command a certain rate. Assume that such a time and rate be that represented upon Chart 10 by time and rate lines *c'* and *c*. A less time represented by *d'* will command a higher rate assumed as *d*, likewise time represented by time line *c'* will command a still higher rate assumed as represented by rate line *e*. Greater amounts of time represented by time lines *b'* and *a'* will command correspondingly lower rates, represented by rate lines *b* and *a*. According to assumptions made, the line *AB*, the locus of points at which time lines and corresponding rate lines intersect, is the horizontal straight cost line definitely located by intersection of any time line and its corresponding rate line.

But by considering conditions represented at the extended extremities of the line *AB*, we will readily see that if the line is to be the locus of points at which time lines and corresponding rate lines intersect, each extremity will be above and farther and farther removed from the straight line *AB*, originally considered, as we recede from the time corresponding to satisfactory

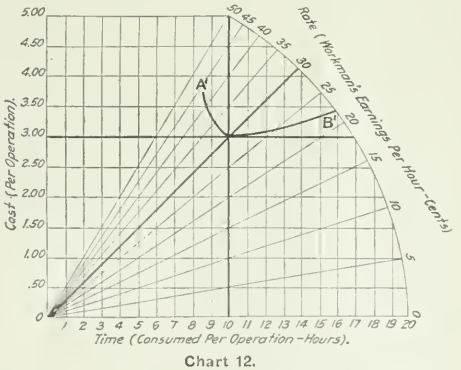

Chart 12.

performance. Considering the right extremity extended, by continuing the lowering of the rate, we will approach at a rate which does not command the exercise of a sufficient amount of skill and energy to ever satisfactorily perform the operation in question. Under such conditions the time and cost both approach infinity. On the other hand, if we continue lowering the time, we approach a time within which it is impossible to satisfactorily perform the operation. If it is possible, however, to satisfactorily perform the operation in the reduced time, an amount of skill and energy will be required, commanding a rate much higher in proportion than the resulting reduction in time.

The extremities of the locus considered are, therefore, removed an infinite distance from the time axis and the locus itself is not the straight line *AB*, but a convex downward curve which may be represented by *A' B'*. That portion of this curve which represents actual operating conditions lies, or should lie, within a comparatively small portion of the chart, as that shown bounded by an ellipse, and very nearly coincident with the straight line *AB* originally considered. We may legitimately assume then that within the field covered by actual operation and practice, a single piece-work price may be determined upon the basis of, and is equitable (that is, will pay a wage commensurate to the skill and energy actually exercised) for any of the various outputs developed by various workmen who may be engaged upon the operation.

However, it should be remembered that there is an output

(time) and a corresponding commensurate rate under which cost (equitable piece-work price) will be a minimum; and one of the problems of management is to locate as nearly as possible that time and rate resulting in minimum cost and to so balance the classes of forces used with the operations to be performed, that they may be perfomed at a minimum cost and at the same time satisfy workmen by reason of their having received, "a fair day's pay for a fair day's work." This means plainly that forty-five cent labor should not be used upon twenty cent work.

Under piece-work operation, the problem as actually presented, is, having given a workman with previously fixed rate (commensurate with his skill, energy, experience and other factors which may have a bearing upon his value to the service) and operating conditions, to establish a piece-work price. The employer must retain a responsibility for the methods and conditions under which the operations are performed and must require the operator (1) to perform the operation according to prescribed methods and (2) to actually exercise an amount of skill and energy commensurate with his rate, upon the basis of which together with the determined time, a piece-work price will be subsequently established.

While the complimentary times and rates actually selected as bases for the piece-work price determination must be consistent and correspond one with the other, it is not necessary that the rates and corresponding times used in establishing piece-work prices for the same operation, be the same in different shops or even in the same shop. It should be remembered, however, that there is a rate and corresponding time at which the cost will be a minimum located by the lowest point of the curve *A' B'* of Chart 10.

Referring to Chart 11, for example, the higher time *A* is represented as corresponding to the lower rate *A'* and locating an equitable cost or piece-work price *A''*. In like manner a lower time *B*, and a corresponding higher rate *B'*, locates a cost or piece-work price *B''*, and a still lower time *C*, with the corresponding higher rate *C'*, locates also a cost or piece-work price *C''* coincident with that located as *A''*. The difference, however, between either *A''* or *C''* and *B''* appears to be practically negligible. We have here presented in *A*, *B* and *C* and *A' B'* and *C'* three of many complementary times and rates determining practically the same cost or piece-work price, and the question of which of these should, or can, with best advantage, be used very naturally arises.

Concretely put, a 30 cent man may perform an operation satisfactorily in ten hours, a 43 cent man should perform the operation in less time or about seven hours, while a 25 cent man will probably consume twelve hours. The cost of the operation, the equitable piece-work price, will in either case be three dollars.

The time consumed in the satisfactory performance of an operation under given conditions, ten, eight or twelve hours, can only be determined from a direct or indirect time-study; a very elastic term covering all degrees of precision and exactitude, from that involved in gathering the information upon which to base a rough estimate of the time required for a day workman to mow a lawn, to that referred to by some as of the "blood-drawing type," involved in the determination of the working schedules in some trades and shops which requires the most minute stop-watch data. Workmen object to the latter, especially until such time as all conditions of shop operation have been reduced to a degree of precision somewhere nearly consistent therewith.

In most piece-work shops there are two actually existent or implied rates, one the regular day rate, used when a workman is working under the day work system, and another a piece-work rate which it is expected the workman will earn when working on a piece work basis. The latter is most frequently used as the basis of establishing piece-work prices and is usually 25 per cent to 35 per cent higher than the former. The usual practice under which piece work prices are established by the use of the latter high rate, necessitates a closer time study and the use of the lower time corresponding to a performance commensurate with the higher rate. It is thought, however, that, because the more minute and close the time-studies are made, the more objectionable they become to workmen, it is better to use the lower (day) rate and the correspondingly higher time for the basis of prices, with the understanding, that while the operations of workmen are under observation for the collection of data to be used in establishing a piece-work price, they will be expected to exercise an amount of skill and energy commensurate with the lower (day) rates which are to be combined, with the correspondingly high times determined by means of the observations made, in the formation of the piece-work price.

Special objection should be expected when for one reason or another the degree of skill and energy required by the pace set under the time-study exceeds that for which rates (those upon which piece-work prices are based) are commensurate; in other words, by reference to Chart 11 again, the combination of time *B* and rate *A'* will result in a piece-work price *B A'*, $2.50, much lower than either *A''*, *C''* or *B''*; likewise the combination of time *C* and rate *B'* or *A'* will result in a piece-work price *C B'*, $2.10, or *C A'*, $1.75, both of which are much lower than the practically identical piece-work prices *A''*, *C''* or *B''*, originally referred to. The results of any attempt to get $3.00 worth of work done for $2.50, $2.10 or $1.75 should be apparent.

We have attempted to show that:

(1) The satisfactory operation of piece-work or any reward system of labor payment is most largely dependent upon careful consideration and equitable selection of the co-ordinate basic elements, time and rate.

(2) The selected times and rates must mutually correspond.

(3) After such selection the differences in the various reward systems are of minor importance.

(4) Small differences actually existing are most favorable to the desirable employee and least favorable to the slower undesirable employee under the piece-work system.

Day-work, the original system of labor payment, must continue to be used for by far the largest percentage of work done, and the application of reward systems must be restricted to such operations as permit of convenient and accurate measurement of output, which is more or less largely under the control of the workmen.

The non-use of a reward system of payment does not obviate the necessity of giving the time element of wage payment attention; in fact, although not used directly in the determination of wages, some shops, among them a few operated by railroads, keep accurate records of output based upon time elements determined for those operations to which reward wage payment might be applied, which are very instrumental in the maintenance of high shop labor efficiency. It is unquestionably more difficult to maintain shop efficiency under exclusively day-work, without the co-operation of workmen occasioned by reward payment, but it is being done, and with excellent results, with the assistance of individual output records.

We desire, however, to call attention to the fact that the amount of skill and energy which may be profitably exercised upon a given operation is limited and that surplus skill and energy, especially the former, will result in a corresponding increase in output. In other words, instead of assuming the very gradually rising slope shown by the Charts 10 and 11, for the left hand portion of the loci of the intersection of corresponding times and rates, the curve will rise very abruptly from the point of intersecting time and rate corresponding to and commensurate with the maximum amount of skill and energy which can be profitably exercised upon, or is required by operation. The employment of higher skilled labor upon the operation will very rapidly increase the cost, with very slight increase in output as shown by Chart 12. The curve *A' B'* is that of an operation the satisfactory performance of which requires a degree of skill and energy commanding a rate of about 30 cents an hour, at which rate the cost will be approximately $3.00 per operation. A higher rated workman, say one of 50 cents per hour instead of 30 cents, upon the same work will require a higher

piece-work price, say of approximately $5.00 instead of $3.00, because his additional skill cannot be profitably employed upon the operation in question. So it is that piece-work prices established are usually those which will pay to the highest rated workman who may be profitably employed upon the operations covered, a wage consistent with their skill and experience. The result is that the higher-priced workmen, employed upon lower-classed work, must receive higher piece-work prices to enable them to make wages commensurate with their skill and at the same time will be over-paid from the standpoint of the labor cost of the work they turn out.

The dissatisfaction, or at least, the confusion which frequently results, under the piece-work system, from workingmen of varying skill and experience upon the same operations for the same piece-work rate, therefore, suggests many advantages in a separation of the time and rate elements, or rather, the discontinuation of their combination in piece-work price, and the quotation of the time element only (invariable as between men) instead of the piece-work price, one element of which is the rate which should measure the workman's value (his skill, length of service, etc.). The rate element (workman's rate) should remain fixed for any workman regardless of work upon which he may be engaged and should be paid him for a fixed amount of time for each satisfactorily completed operation. It is believed that such separation will eventually become generally adopted (though probably not for a number of years).

Summarizing we have attempted to show that:

(1) Time is the all-important element under any and all systems of labor payment.

(2) With proper attention to the time element and otherwise efficient administration, the differences between the various systems of wage payment are of minor importance.

(3) Piece-work, with its advantages over other reward systems, in simplicity, minimum accounting, etc., should be used where a reward system of payment is applicable.

(4) Adjustments of methods, as are necessary to get a purely time basis by quotation of time elements instead of piece-work process, should be considered and furthered as opportunity offers.

CHICAGO & NORTH WESTERN DEMONSTRATES SMOKE ABATEMENT DEVICE.

The Chicago & North Western made a demonstration run Tuesday, April 15, for the benefit of various railway officials and press representatives, from Chicago to Proviso, testing out a device for smoke abatement on locomotives, recommended to the railways about Chicago by the General Managers' Association. Some months ago O. Monnett, smoke inspector for the city of Chicago, called the attention of the General Managers' Association to the fact that there were wide differences of opinion among the railroads as to the most efficient locomotive smoke preventing device—each road maintaining that the devices used by it were the best.

The General Managers' Association accordingly appointed a special committee consisting of representatives of the mechanical departments of the Pennsylvania, Chicago & North Western, Chicago, Burlington & Quincy, Chicago, Milwaukee & St. Paul, and the Chicago & Western Indiana Railways, which committee was asked to make comparative and efficiency tests of the several smoke preventing devices. Extensive tests were made on the Pennsylvania Railroad's testing plant at Altoona, the results of which will be presented before the Master Mechanics' Association at its June convention. In brief, it was found that either the double or multiple tip blower nozzles should be used; that the grate should have not less than 30 per cent. air opening; that sufficient air tubes should be provided above the fire, so that a total of 2,000 cu. ft. of air per minute could be supplied by means of steam jets, the nozzles of which shall be located 8½ in. from the inside ends of the tubes; that the brick arch prevents more smoke while the locomotive is running than when standing, and that such an arch gives the best results when fitted tight up against the flue sheet; that there is advantage in a large quick-opening blower valve.

The test run was made with an 18 in. x 24 in. superheater 6-wheel switch engine equipped in accordance with the above recommendations. The trip out to Proviso was made with a train of about 1,000 tons gross, and the results obtained were considered very satisfactory by all observers, there being practically no smoke thrown from the stack throughout the whole trip. On reaching Proviso some severe tests were made on the device. It was cut out of service and the engine was allowed to smoke as badly as possible, then when being put into service again it was found that the smoke could be eliminated in from five to seven seconds. On the return trip a trainload of over 1,200 tons was hauled, a part of the distance being up a grade of 32 ft. per mile, no objectionable smoke being emitted from the engine at any time. The smoke density to Proviso was 4.6 per cent., and from Proviso 4.3 per cent.

In addition to the above mentioned test committee the General Managers' Association appointed a standing committee consisting of M. K. Barnum (chairman), Illinois Central; H. T Bentley, Chicago & North Western, and E. F. Jones, of the "Belt" Railway. This committee developed the plan for the "Railroad Smoke Inspectors' Association of Chicago," which was organized on January 2, 1913, for the purpose of bringing about the thorough interchange of thoughts and ideas between the smoke inspectors employed by the various Chicago railroads, and to utilize the inspectors for the joint benefit of all lines by requiring them to report cases of emissions of dense smoke, whether made by locomotives of their own company or by those of any other railway coming under their notice, thus bringing about increased efficiency in this line of work.

This association holds a meeting every alternate Friday, and the co-operation secured in this manner has done much in the way of reducing smoke on the part of the railroads in this district. The number of smoke inspectors on Chicago railroads has been increased from 32 to 41, making the number of locomotives in daily operation in Chicago per inspector employed, 40 as against formerly 52. The chairman of this association is J. H. Lewis, Chief Smoke Inspector of the Chicago, Burlington & Quincy, and the chairman of the Executive Committee is C. W. Corning, Chief Smoke Inspector of the C. & N. W. Ry., with C. P. Burnalle, Chief Smoke Inspector of the A. T. & S. F., as the secretary.

The railroad smoke conditions in Chicago today as compared to the smoke densities in other cities and towns where no smoke ordinance is in effect is as follows:

Nashville, Tenn.	30 per cent.
East St. Louis	40 per cent.
Peoria	30 per cent.
LaSalle	30 per cent.
Down Town Chicago	6 per cent.

In 1910 the smoke density of down town Chicago was 23 per cent., which figure represents the density for South Chicago today. Intermediate sections of the city show a density of 12 per cent., showing that the effort of supervision in the down town section has had the effect of reducing the smoke density to a point which was thought absolutely impossible two or three years ago.

Algeciras Railway, Spain.—It is said that this line will shortly be taken over by the Andalusian Railways, on terms of purchase which it is believed are very favorable to the former. The line runs from Algeciras, the Spanish port for Gibraltar, to Bobadilla, the junction for Malaga, Granada Seville and Cordoba, and its acquisition by the Andalusian Company will give the latter practically a monopoly of traffic in the southeastern corner of Spain, as well as the exclusive entry into the three important ports of Cadiz, Algeciras and Malaga.

THE INADEQUACY OF RAILWAY MAIL PAY.

Facts Presented Before Congressional Committee by W. A. Worthington Showing Unfairness of Compensation to Railways.

The accompanying charts illustrating graphically the tendency of railway mail pay in comparison with the other expenditures and receipts of the post office department, and with the receipts from other classes of traffic and the operating expenses of the railways during recent years were presented by W. A. Worthington, vice-president of the Southern Pacific, at a hearing in Washington on March 27, before the Joint Congressional Committee on Postage on Second Class Mail Matter and Compensation for the Transportation of Mails. The charts were submitted incidentally to a presentation of facts regarding railway mail pay which Mr. Worthington made on behalf of the Southern Pacific Company.

Fig. 1 shows the percentage of total postal receipts which the railroads of the United States have received for each year from 1900 to 1911, inclusive, and the percentage of the total

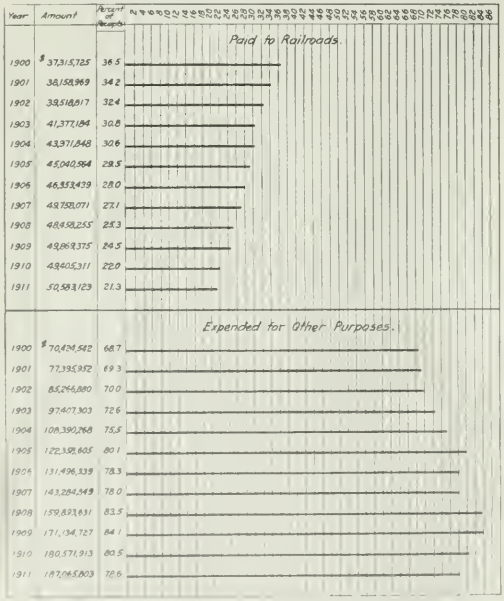

Fig. 1—Percentage of Total Postal Receipts Paid to the Railroads and Expended for Other Purposes.

postal receipts which have been expended for other purposes, as shown by post office department annual reports. In looking over the operations of the post office department it will be observed that in the ten years from 1901 to 1911, the receipts have more than doubled, and the following statement shows what a small percentage of this large increase in receipts went to the railroads:

	1911	1901.	Increase, 1911 over 1901.	Per Cent.
Postal receipts	$237,879,823	$111,631,193	$126,248,630	113
Postal expenditures				
To railroads	$52,583,123	$38,158,969	$13,424,154	33
Other purposes	187,065,803	77,395,952	109,669,851	142
Total	$237,648,926	$115,554,921	$122,094,005	106
Surplus	$230,897			
Deficit		$3,923,728		

The figures show that out of the total postal receipts of $112,000,000 in 1901, $38,000,000, or 34 per cent, went to the railroads, while out of the $126,000,000 increase in 1911 over 1901 only $12,000,000, or less than 10 per cent, was paid to the railroads. As the volume of service rendered by the railroads in hauling tonnage increased very much in proportion to the receipts, they received only about one-third as much for the added traffic since 1901, as they received on the total traffic of

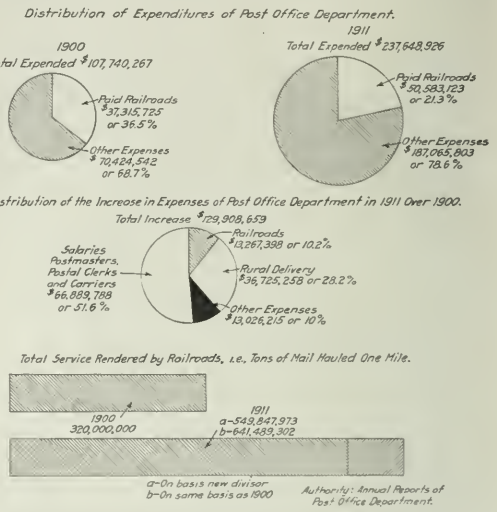

Fig. 2—Post Office Department Statistics.

ten years ago. This saving to the government, however, was more than offset by the increased expenditures of the post office department for other purposes, which, while only $77,000,000 in 1901, were $187,000,000 in 1911. In other words, of the total postal receipts of 1901, 69 per cent. was expended for purposes other than railroad compensation, while of the increase since

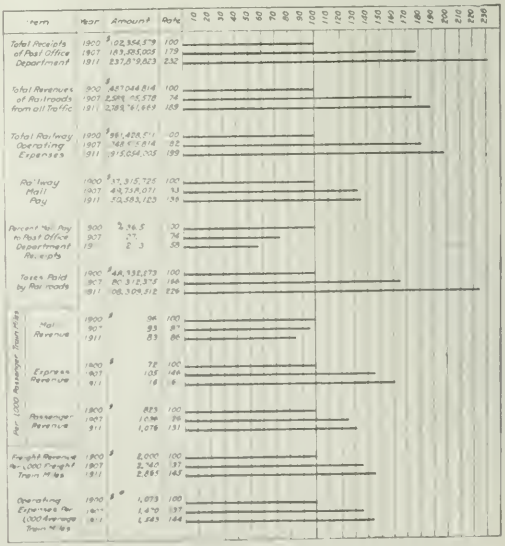

Fig. 3—Statistics of Railway Mail Service and Other Classes of Traffic Covering All Railroads.

1901, amounting to $126,000,000, 87 per cent was expended for other than railroad transportation.

Fig. 2 shows a distribution of expenditures of the post office department for the years 1900 and 1911 as between railroad and other expenditures; the relative service rendered by the railroads in these two years was doubled for an increase of only a little more than one-third in compensation.

Fig. 3 illustrates graphically for the years 1900, 1907 and

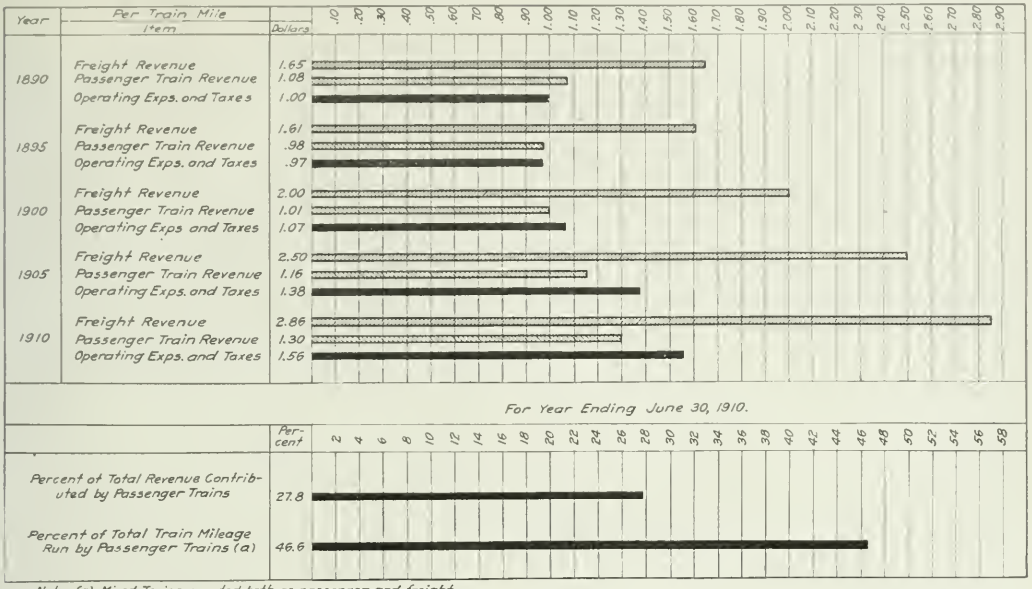

Fig. 4—Trend of Revenue from Passenger and Freight Trains and Operating Cost per Train Mile for All Railroads, Covering a Period of Twenty Years.

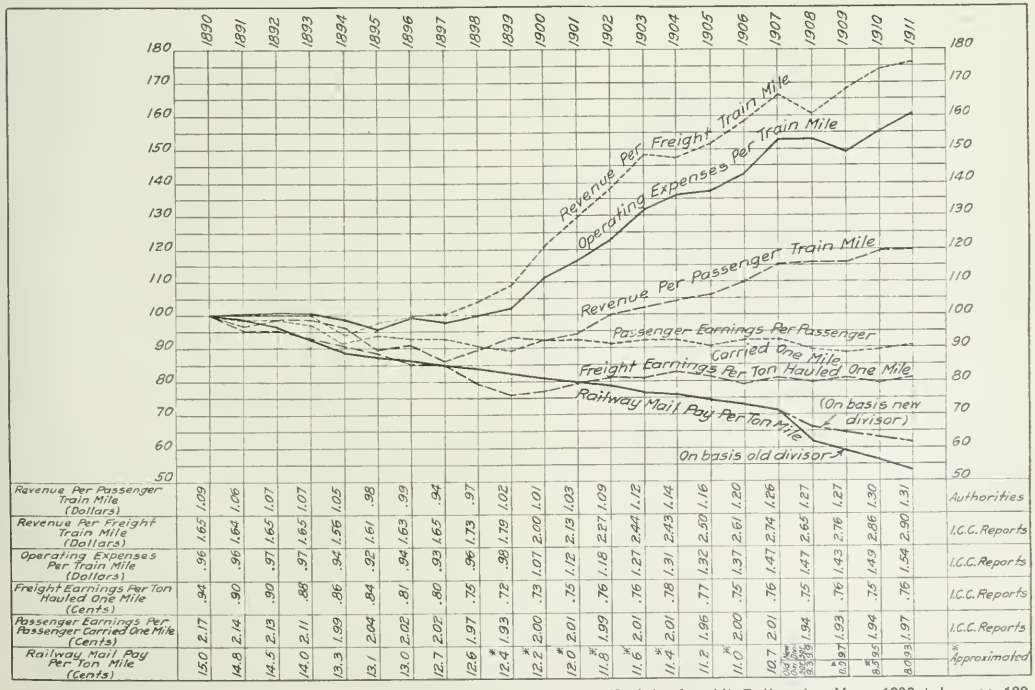

Fig. 5—Relative Revenue per Unit of Traffic from Mails, Passengers and Freight for All Railroads: Year 1890 taken as 100.

1911 the great increase in receipts of the post office department as compared with the increase in total railroad revenue, in total operating expenses, and in taxes paid by the railroads, and as compared with the relatively small increase in the railways' compensation for carrying the mail. It also shows per 1,000 passenger train miles run on the railways of the United States that from 1900 to 1911 there was a decrease of 14 per cent. in mail revenue, compared with an increase of 31 per cent. in revenue from passengers, 45 per cent. in revenue from freight, and 61 per cent. in revenue from express. During the same time railway operating expenses per 1,000 train miles increased 44 per cent.

This figure strikingly illustrates the slight extent to which the railways have shared in the available greater revenue of the post office department and the actual decrease in payments for carrying mail in proportion to the volume of passenger train service. As is well known, railway wages are very much higher than formerly, prices of material have advanced, the cost of building steel mail cars and operating them is much greater than formerly, yet railway mail pay per unit of traffic has been very greatly reduced during the past 10 or 15 years in the face of changes in industrial conditions that should have increased it.

Fig. 4 illustrates changes that have taken place in railway freight revenue, passenger train revenue, and railway operating expenses and taxes per train mile in 1895, 1900, 1905 and 1910 as compared with 1890. The statistics show there is little for the railways in passenger train service as a whole, and least

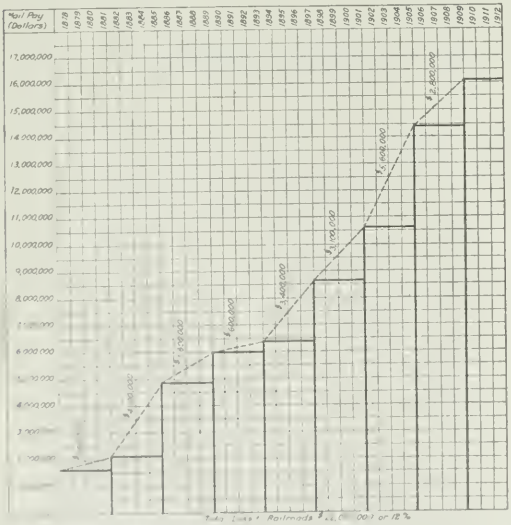

Fig. 6—Diagram Showing Loss in Mail Revenue to Railroads by Weighing Mail Quadrennially Instead of Annually in I. C. C. Groups 7, 8, 9 and 10.*

of 8% in the handling of the mail. This chart also shows that for the year ending June 30, 1910, although 46.6 per cent. of the total train mileage was run for passenger train service, only 27.8 per cent. of the revenue was contributed by the service devoted to passenger trains.

Fig. 5 shows for the railroads of the United States the relative revenues per unit of traffic from mails, passengers and freight during the past 21 years, the year 1890 being taken as the basis of 100. The great increase that has taken place in the last 21 years in railway operating expenses as compared with the

* Group 7 includes Wyoming, North and South Dakota and Colorado. Group 8 includes Missouri, Arkansas and Louisiana, Texas and Mexico. Group 10 includes Washington, Idaho, Utah, Nevada, Arizona and California.

pay received for carrying the mails is graphically illustrated. The cost of operating railways per train mile during this period increased over 60 per cent., the railway revenue per passenger train mile increased 20 per cent., the passenger earnings per passenger carried one mile decreased slightly, and the railway mail pay per ton mile of mail was nearly cut in two, using the same divisor throughout the period. The ton mileage rate for mails was obtainable up to and including 1898 from a statement of Prof. Henry C. Adams in 1899 before the commission to investigate the postal service. In order to secure later figures, ton mileage on all the mail routes was compiled for 1905, 1907, 1908 and 1911, figures for other years being approximated, as the decline in railway mail pay under the automatic operation of the law is fairly uniform.

Fig. 6 illustrates graphically the fairness of the railways' re-

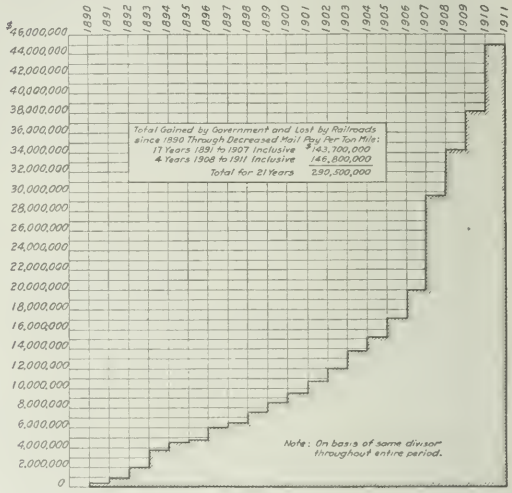

Fig. 7—Annual Gain to Government and Loss to the Railroads Since 1890 Through Decreased Mail Pay per Ton Mile Through Automatic Operation of the Law and Because of Other Reductions by Government Authority Commencing in 1907.

quest for annual instead of quadrennial weighing. It shows for the western states the results of weighing from 1878 to date, the heavy line indicating the actual payments and the dotted line the amounts to which the railways believe they were fairly entitled, the triangles formed between the heavy lines and dotted line representing the losses to the railroads through annual weighing, these losses being expressed in figures on the chart. The growth in the western group of states was no doubt greater in proportion than in the rest of the country, but the chart is presented to illustrate the service rendered by the railroads for which they contend they received no compensation whatever.

Fig. 7 illustrates graphically the gain to the government and loss to the railroads by years since 1890 through decreased mail pay per ton mile on account of the natural or automatic operation of the law and because of other reductions made by governmental authority since the beginning of 1907. This chart shows that the amount of these reductions for the 17 years from 1891 to 1907, inclusive, was $143,700,000, while for the four years from 1908 to 1911, inclusive, it was $146,800,000, or a total for the 21 years of $290,500,000. These figures are obtained by applying the average rate per ton mile effective in 1890 to the traffic handled in subsequent years, the difference between the amount so obtained and the actual compensation representing the amount saved to the government and lost to the railroads through reduction in rates per ton mile. It also demonstrates

that the government was sharing quite generously in reduced rates through the automatic operation of the statute without making the additional reductions by governmental authority commencing in 1907, when it is considered that through most of this period the railroads were contending with higher operating cost per traffic unit due to causes beyond their control. It further demonstrates that the present law has been a most favorable one to the government, having secured greater reductions for carrying mail than have been made for any other class of railway traffic.

FIREMEN'S ARBITRATION AWARD.

The award of the arbitrators between the eastern railroads and the Brotherhood of Locomotive Firemen and Enginemen was filed April 23, 1913, and in accordance with the provisions of the Erdman act will take effect ten days later. The first part of the report follows in part, but the award is given in full.

THE ARBITRATOR'S REPORT.

Some time about the middle of 1912, the Brotherhood of Locomotive Firemen and Enginemen, through its duly accredited officers, in support of the demands of the firemen and hostlers presented a request on behalf of all of such employees for an increase in wages, and for sundry improvements of the rules controlling their conditions of service. As early as July 1, a meeting was held between the committee representing the firemen and the conference committee of managers of the railroads in New York, and subsequent to that date a number of other similar meetings were held, and much correspondence engaged in. The firemen were represented in these conferences by W. S. Carter, president, and other officers of the brotherhood, and the railroads were represented by Elisha Lee, chairman of the conference committee of managers, and other gentlemen associated with him on the committee.

After numerous conferences and the exchange of proposals, the parties to the controversy were unable to agree and jointly asked Martin A. Knapp, presiding judge of the United States Commerce Court, and Charles P. Neill, commissioner of labor, to mediate the differences between the firemen and the railroads in pursuance of the provisions of the Erdman act, but they were unable to compose the differences, and the entire correspondence covering the negotiations between the brotherhood and the railroads, together with a historical statement thereof, was published over the signatures of the officers of the brotherhood and the question of a strike was submitted to the firemen employed through the territory covered by the railroads party to the controversy; a strike vote was taken, the total number of votes cast in the strike vote being 33,916, of which 32,918, or 96.5 per cent., were cast for the strike. This created a situation full of serious possibilities, not only to the parties immediately concerned, but in a much wider sense to the general public, and which seemed to be equally appreciated by the representatives of the brotherhood and the railroads.

Immediately following the counting of the strike vote further conferences were held between the conference committee of managers and the brotherhood representatives, but as they were still unable to agree upon a settlement, the president of the Brotherhood of Locomotive Firemen and Enginemen invoked the assistance of Martin A. Knapp, presiding judge of the United States Commerce Court, and G. W. W. Hanger, acting commissioner of labor, to mediate the differences between the firemen and the railroads, in pursuance of the provisions of an Act of Congress concerning carriers engaged in interstate commerce and their employees (commonly known as the Erdman act, approved June 1, 1898). Messrs. Knapp and Hanger promptly responded to this request for mediation. Their efforts at mediation did not accomplish a settlement of the controversies, but resulted in an agreement between the parties to adjust their differences by arbitration, under the provisions of the Erdman act.

The railroads appointed as their arbitrator William W. Atterbury, of the Pennsylvania Railroad, and the brotherhood appointed as its arbitrator, Albert Phillips, of Sacramento, Cal. The two arbitrators thus chosen, having failed within five days after their first meeting for that purpose, requested the presiding judge of the United States Commerce Court and the acting commissioner of labor to appoint a third arbitrator. William L. Chambers, of Washington, D. C., was appointed as such third arbitrator on March 3.

The board of arbitrators appointed as above, held its first meeting at the Waldorf-Astoria hotel, New York, on Monday, March 10, 1913. William L. Chambers was elected chairman and H. S. Milstead was appointed temporary secretary and subsequently his appointment was made permanent. Sessions of public hearings were held daily, with the exception of Sundays, from March 10 to and including the fifth day of April, 1913.

The first session of the board was occupied by a statement of the chairman of the board, followed by an opening statement on behalf of the brotherhood by W. S. Carter, its president, this being followed by the statement of Elisha Lee on behalf of the railroads. Employees from many different lines of railroads throughout the territory covered by them were called on behalf of the firemen, and in connection with their testimony given on the stand, some fifty odd printed exhibits were presented by Mr. Carter.

The railroads called perhaps an equal number of witnesses and filed a large number of exhibits. It is probable that no such elaborate or valuable statistical matter was ever submitted in a similar arbitration before. At the conclusion of the public hearings and after oral arguments covering several days, printed briefs were filed by the respective parties, which have been of great assistance to the board in reaching its conclusion.

The railroads involved in this concerted arbitration comprise practically all that part of the United States east of the Mississippi and north of the Ohio and Potomac rivers. The trackage of these railroads is approximately 70,000 miles of main line, being something more than one-fourth of the entire trackage of the United States. These railroads represent practically forty per cent. of the total capitalization for all railroads in the United States; they carried about forty-seven per cent. of the ton miles and about forty-three per cent. of the passenger miles of all railroads of the United States.

The firemen employed on these railroads number in the neighborhood of 31,000 for the year 1912, and the wages for the year 1912 was approximately $29,000,000. These figures indicate, with some degree of certainty and emphasis, the magnitude of the problem and the far-reaching character of the controversies submitted for the arbitrament of this board. Reference must be had to the three printed and bound volumes of evidence taken on the stand, comprising more than two thousand pages, the four volumes of printed exhibits, comprising perhaps as many more pages in the aggregate, and the exhaustive briefs of counsel, in order to form a due estimate of the comprehensive and difficult task undertaken, the conclusions of which by the board are now stated.

The award made by the board is as follows:

THE AWARD.

Article 1: Ten hours or less, or one hundred miles or less, shall constitute a day's work in all classes of service, except as otherwise specified. The time for which firemen will be paid shall begin at the time he is required to report for duty, and end when the engine is delivered at the point designated.

Article 2: The following rates of wages per day shall be the minimum rates paid in all classes of service on all railroads, parties to this arbitration:

(a) Passenger Service.

Weights of Locomotives in pounds on Drivers.	
Less than 80,000 lbs.	$2.45
80,000 to 100,000 lbs.	2.50
100,000 to 140,000 lbs.	2.60
140,000 to 170,000 lbs.	2.70
170,000 to 200,000 lbs.	2.85
200,000 to 250,000 lbs.	3.00
250,000 to 300,000 lbs.	3.20
300,000 to 350,000 lbs.	3.40
All engines over 350,000 lbs. on drivers.	3.60
Mallet engines regardless of weight on drivers.	4.00

Freight Service.

Less than 80,000 lbs.	$2.75
80,000 to 100,000 lbs.	2.85
100,000 to 140,000 lbs.	3.00
140,000 to 170,000 lbs.	3.10
170,000 to 200,000 lbs.	3.20
200,000 to 250,000 lbs.	3.30
250,000 to 300,000 lbs.	3.55
All engines over 300,000 lbs. on drivers	4.00
Mallet engines regardless of weight on drivers	4.00

Where two firemen are employed on a locomotive as a result of the application of Article 6 hereinafter, the rates of pay to each fireman shall be as follows:

Weight on drivers, 100,000 up to 250,000 lbs.	$2.75
Weight on drivers, over 250,000 lbs.	3.00

(b) Switching Service.

Switch engine firemen on locomotives weighing less than 140,000 lbs. on drivers, per day of ten hours or less	$2.50
Switch engine firemen on engines weighing 140,000 lbs. or over on drivers, per day of ten hours or less (excluding Mallets $4.00)	2.60

(c) Hostlers.

Hostlers, per day of ten hours or less	$2.40
If hostlers are employed in handling engines between passenger stations and roundhouses or yards, or on main tracks, they will be paid, per day of ten hours or less	3.25
If men are employed to assist hostlers in handling engines between passenger stations and roundhouses or yards, or on main tracks, they will be paid, per day of ten hours or less	2.50

(d) Helper on Electric Locomotive.

The term "helper" will be understood to mean the second man employed on electric locomotives, and he shall receive in passenger service, per day of ten hours, or less, one hundred miles or less	$2.50
In through freight per day of ten hours or less, one hundred miles or less	2.80
In switching service, per day of ten hours or less	2.50

All working conditions applicable to steam locomotive firemen in steam service will apply to helpers in electric service.

(e) Firemen on locomotives in pusher and helper service, mine runs, work, wreck, belt line and transfer service, and all other unclassified service will be paid through freight rates according to the class of engine.

(f) Firemen in local freight service will be paid fifteen cents in addition to through freight rates according to class of engine.

(g) For the purpose of officially classifying the locomotive, each railroad, party to this arbitration, will keep bulletins posted at all terminals showing accurately the weight on drivers of all engines in its service.

Article 3: (a) Overtime in all classes of service, except passenger, will be paid for pro rata on the minute basis. Except as otherwise specified ten hours, or one hundred miles will be the basis for computing overtime. Miles and hours will not be counted together; when miles exceed hours, miles will be allowed, and when hours exceed miles, hours will be allowed.

(b) Overtime in passenger service (except suburban service) will be paid at the rate of thirty cents per hour on the basis of twenty miles an hour, computed on the minute basis. Five hours or less, one hundred miles or less, to constitute a day's work.

(c) On short turn around runs, no single one of which exceeds eighty miles, including suburban service, overtime shall be paid for all time actually on duty, or held for duty, in excess of eight hours (computed on each run from the time required to report for duty to end of that run) within twelve consecutive hours; and also for all time in excess of twelve consecutive hours, computed continuously from the time first required to report to the final release at the end of the last run. Time shall be counted as continuous service in all cases where the interval of release from duty at any point does not exceed one hour.

Article 4: No initial terminal delay is allowed beyond that involved in the rule that pay shall begin in all cases at the time fireman is required to report for duty, but final terminal delay after the lapse of one hour will be paid for at the end of the trip, at the overtime rate, according to the class of engine, on the minute basis. For freight service final terminal delay shall be computed from the time the engine reaches the designated main track switch connecting with the yard track. For passenger service final terminal delay shall be computed from the time the train reaches the terminal station. If road overtime has commenced terminal overtime shall not apply, and road overtime shall be computed to the point of final release.

Article 5: Firemen in pool freight and in unassigned service held at other than home terminal, will be paid continuous time for all time so held after the expiration of eighteen hours from time relieved from previous duty, at the rate per hour paid him for the last service performed. If held fourteen hours after the expiration of the first twenty-eight hour period, he will be paid continuous time for the next succeeding ten hours, or until the end of the twenty-four hour period, and similarly for each twenty-four hour period thereafter. Should a fireman be called for duty after pay begins, his time will be computed continuously.

Article 6: When a second fireman is deemed necessary on any engine or assistance is deemed necessary on any engine where one fireman is employed, the matter will be taken up with the proper officials by the Firemen's Committee. Failing to reach a settlement the matter shall be referred to an Adjustment Commission, to be composed of five persons, two of whom are to be chosen by the railroad, two by the Firemen's Committee, and one to be selected by the four thus chosen, who shall be the chairman of the commission. Should the four men fail to agree upon the fifth, then three days after the last of the four is selected, the fifth man shall be named by the presiding judge of the United States Commerce Court. If, for any reason, the selection of the fifth man cannot be made by the presiding judge of said court, he shall be named by the United States district judge of the district in which the controversy may have arisen. All expenses incurred in connection with the settlement of such matters shall be borne equally by the two parties to the controversy.

Article 7: Firemen will be relieved of cleaning engines. Lubricators will be filled, headlights, markers and other lamps cared for (including filling but not lighting), and all supplies placed on engines at points where roundhouse or shop force are maintained. The firemen shall not be relieved of responsibility of knowing that engines for which they are called are properly equipped for service.

Article 8: Firemen tied up between terminals on account of the hours of service law, will be paid continuous time from initial point to tie-up point. When they resume duty on a continuous trip they will be paid from tie-up point to terminal on the following basis: For fifty miles or less, or five hours or less, fifty miles pay; for more than fifty miles up to one hundred miles, or over five hours, and up to ten hours, one hundred miles pay; over one hundred miles, or over ten hours, at schedule rates. This provision does not permit the running of firemen through terminal or around other firemen at terminals, unless such practice is permitted under the pay schedule.

Article 9: The earnings of firemen in any class of service shall not be diminished by the provisions of this award; and if the rates that were higher or the conditions that were better antecedent to this award are necessary to guarantee this requirement they shall be maintained. Neither shall the earnings of the firemen, in any class of service, be increased above what the higher rates of pay and the conditions that were better antecedent hereto guaranteed him, by a combination of the rates herein established with the conditions of service antecedent hereto, or vice versa.

It is not intended that any of the terms or provisions of this award shall debar committees from taking up for adjustment with the management of the respective railroads any questions or matters not specifically covered herein.

Article 10: This award shall take effect at the time and in the manner provided by the act of congress entitled "An Act Concerning Carriers Engaged in Interstate Commerce and Their Employees, Approved June 1, 1898." All parties to this arbitration having stipulated in writing, and incorporated in the record an agreement, extending the time within which the award may be made and filed, from the second day of April, 1913, to and including the twenty-third day of April, 1913, the arbitrators now, on this twenty-third day of April, 1913, signed this award without dissent in any particular to any of its provisions by any one of them, and have required the secretary to attest the same.

General News.

At a "Safety rally" of employees of the Buffalo, Rochester & Pittsburgh at DuBois, Pa., on the 12th, three thousand persons were preesnt.

A controversy between the International & Great Northern and its firemen has been settled by an agreement on new working conditions and slight advances in pay, affecting about 300 men.

Twelve experienced dining car conductors have been brought from England to work on the Canadian Pacific. One of the twelve was for eight years in the service of the Central South Africa Railway.

The Brotherhood of Railroad Trainmen has presented to the railroad commission of Louisiana a petition asking that changes be made in the rules issued by the commission relating to the duties of flagmen.

A jury in the federal court at Minneapolis has awarded H. W. Otis, of Willmar, Minn., a judgment of $50,000 against the Great Northern Railway on account of the loss of a leg while coupling cars equipped with an old style coupling where there should have been an automatic coupler.

The new federal law prescribing severe punishment for stealing from freight cars engaged in interstate commerce has been made the subject of a placard, which has been issued by the general manager of the Pennsylvania Railroad and posted in all stations of the road.

The Missouri Pacific and the Denver & Rio Grande have reduced the running time of passenger trains between Denver and St. Louis by about three hours. The new passenger train put in service on April 20, leaves Denver at 11:55 a. m. and arrives in St. Louis at 7:25 p. m. the next day.

At a recent meeting of representatives of various commercial clubs in Kansas and Colorado a committee was appointed to ask the Atchison, Topeka & Santa Fe to electrify its lines west of Dodge City, Kan., using power developed from the Arkansas river, and to sell a part of the current to farmers for use in irrigation.

The latest achievements of the aviators have included a flight of 250 miles into the Sahara Desert by four aeroplanes of the French army, and a tour by two men, in a single machine, which covered parts of England, France, Belgium and Holland, the whole trip taking only four hours and seven minutes. The distance traveled was 245 miles, and the crossing of the English Channel is treated as merely an incident of the flight.

William H. Schroeder, the engineman who was at fault in the collision at Corning, N. Y., last July, and who was not prosecuted, has been reindicted, apparently in consequence of the charge made by President Truesdale, of the road, and published in the newspapers, that the failure to punish Schroeder was because of some bargain between the friends of the engineman and the officers of the law.

Mayor Harrison, of Chicago, has taken some of the life out of the agitation for electrification of the Chicago railway terminals, which was revived last week by the appointment of the city council committee on railway terminals, and the introduction of a resolution providing for immediate action on the question, by announcing that he will endeavor to have the council settle the questions of telephone and electric light regulation, and also the local transportation question, before taking up electrification.

A bill has been introduced in the Canadian Parliament to regulate changes of railway terminal and division points. It proposes that a railway shall secure the approval of the Railway Commission before changing a terminal or divisional point; and that when such a change is made employees forced to move to another town shall be compensated for their loss by the railway company; and in case of dispute the amount to be paid by the road shall be fixed by the Dominion Railway Commission.

The elaborate report on the financial condition of the New York, New Haven & Hartford, which has been made to the Interstate Commerce Commission by its accountants and examiners has been the subject, during the past week, of a public hearing in Boston, presided over by Commissioner C. A. Prouty. Officers of the New Haven, and also of the Boston & Maine were questioned, and Mr. Brandeis, appearing as counsel for a Boston merchants' association, was allowed to cross question. The counsel for the New Haven protested that the government's report was being made public, and the officers of the road questioned concerning it, before they had had an opportunity to examine it.

There is a bill before the New York legislature, No. 1897, introduced by Mr. Cronin, providing that motormen of multiple-unit electric trains shall have had at least one year's experience on a steam or electric railroad, and must be familiar with train rules, train orders, standard code signals, etc. If this bill should become a law it would produce on the electric zones of the New York Central and of the New Haven and on the Interborough Rapid Transit Lines in New York City the same conditions that prevailed in Yonkers, N. Y., a few months ago, when, because of a strike of motormen, the street railroads were tied up absolutely, an ordinance of the city forbidding the employment of inexperienced men as motormen.

Governor Major, of Missouri, has signed a bill requiring foreign railway corporations operating in the state to incorporate in Missouri, and also the full crew law, requiring three brakemen on all freight trains of 40 cars or more, and a flagman and a brakeman on all passenger trains of six cars or more. In a statement regarding the incorporation law he states that it cannot be applied to roads now operating in the state, but only to those which seek to enter the state in the future. In a statement regarding the full crew law he says that the increase in the length and speed of trains and the volume of traffic without any increase in the number of men handling such trains, "no doubt accounts for the increase in the number of men killed and injured, and our increased number of wrecks and tieups. The addition of one man on these long trains would give better facilities for detecting defects and inspecting the condition of the train while in transit, thereby reducing the chances of wrecks and tieups."

The "New England Conference on Transportation," organized at the suggestion of the governor of Massachusetts, met in Boston last Wednesday, and discussed the general proposition of uniform railroad legislation with the Massachusetts legislative committee on railroads. Representatives were present from all the New England states except New Hampshire. The meeting was called by Gov. Baldwin, of Connecticut, chairman of the Conference. The states were represented as follows: Maine, F. W. Cram, C. H. Osgood; Vermont, William B. Howe, Percival H. Clement; Massachusetts, Marcus P. Knowlton, Francis T. Bowles and the Governor; Rhode Island, William C. Bliss and Marsden J. Perry; Connecticut, George M. Woodruff and Costello Lippett. A temporary organization was effected by the selection of Percival Clement as chairman and Francis T. Bowles as secretary. These with Mr. Cram were made a committee to confer with President Wilson and the governors of the New England states in regard to the scope of the work desirable for the Conference to undertake, and to report at a meeting to be called by the temporary chairman.

Locomotive for University of Illinois Testing Plant.

The first locomotive to be tested in the new locomotive laboratory of the College of Engineering of the University of Illinois arrived on April 11. The locomotive is an Illinois Central large, modern freight engine, No. 958, lent to the university temporarily for testing purposes. It is of the consolidation type, eight driving wheels coupled. Its total weight, with the tender, is 182 tons, with 100 tons on the driving wheels.

Telephones in the Floods.

The remarkable usefulness of the telephone in the distressing conditions that prevailed in Ohio and Indiana during the last week in March is known to all readers. The emergency work done by the different companies would make a story filling a volume. The Bell companies, all working in unison with the parent company in New York, not only utilized all of their ordinary resources, by no means small, but also spent thousands

of dollars on special transportation and extra work in shops, and in the field. The Western Electric Company shipped 125 tons of telephone cable to Ohio, from New York City, by express. A trainload of poles was shipped from the company's yards in Michigan. The shops at Hawthorne, Ill., were at once put to running 24 hours a day, and shipments from the warehouses at Hawthorne and other cities were started by passenger train within a few hours after the flood became dangerous. The company at once ordered from the Pacific coast 50,000 cross-arms, and material for indoor facilities was drawn from the company's reserve stocks at Boston, New York, Philadelphia, Richmond, Atlanta, Kansas City, St. Louis, Minneapolis and Dallas. The sleet storm of February 20 already had brought a demand on the Chicago shops for over 200 tons of copper wire, besides large quantities of office hardware. To Dayton alone 5,000 telephone sets were shipped, and 40 private exchange equipments. At Dayton and other cities, where the telephone exchanges, being in the second or third stories of buildings, were able to continue in operation even after the streets were flooded, operators were taken to and from their work in boats. The American Telegraph & Telephone Company lost 4,000 poles in the floods, and the Western Union 8,000. These figures gives some little idea of the losses of wires and the labors of the linemen.

A Condensed Analysis.

It seems very simple to see the trains run in and out of the station; to order the freight car and send the grain to market; to telegraph to the city for supplies, and in 24 hours have them delivered. But it is not so simple as it seems, and there is danger today that the next great uplift in business will find the railroads sorely taxed to furnish the transportation needed for the commerce of the country. Why? Because a misdirected public opinion is demanding rates too low, taxes too high, wages too high, service too elaborate; and there are not cents enough in the dollar to meet all these obligations and still permit the business to be attractive enough so the man with the dollar will invest it. Our American railroads have done good work, and can do better, and it is to the farmers' selfish interest to see that they are so treated that they will be ready at all times to handle business. To be ready requires constant expenditure.—*Leslie's Weekly.*

Proposed Utility Commissions in Illinois.

A joint committee appointed by the Illinois legislature two years ago has submitted a report recommending a single state commission to regulate all public utilities in this state, and strongly opposing the proposal for separate commissions for the state and for the city of Chicago. The report severely criticises the handling of questions of public utility regulation by the city of Chicago in recent years, and also objects to separate commissions on the ground that two commissions would inevitably lead to conflicts in authority. A bill introduced in the legislature to carry out these recommendations provides for a state public utility commission of five members at a salary of $10,000 each, two to be appointed from Chicago, and one each from northern, central and southern Illinois, with broad powers over all utilities except steam railroads, which are to be left for the present under the jurisdiction of the present railroad and warehouse commission. Governor Dunne's bill providing for a state public utilities commission, and giving Chicago and all other cities having a population of over 25,000 the option of regulating their own public utilities or delegating this power to the state commission, has also been introduced. The administration bill abolishes the present railroad and warehouse commission. A third bill has been introduced on behalf of the minority of the joint committee, which would create a state commission and a separate commission to handle Chicago affairs, the Chicago commission to be appointed by the mayor.

Rigid Rules.

The Pennsylvania Railroad has established a rule which will debar from employment in its dining car and restaurant department any person with even a tendency toward a communicable disease. There is to be a quarterly physical examination of every employee who has anything whatsoever to do with the preparation or serving of food; dishwashers, kitchen helpers, cooks and waiters; and only with a 100 per cent. report can they remain in the service. The further precaution is taken of debarring these defectives from employment in places where linens and tableware are kept. At "lay-over points" for dining car stewards, waiters and cooks, special lodgings are provided, with clean linens, clean beds and every sanitary protection. These lodgings are inspected by the superintendent of dining cars and restaurants, by service inspectors, and by medical examiners of the company.

The Three-Dollar Demurrage Rate.

With the successful results of a high charge for demurrage on freight cars in California our readers are well acquainted. Within the last few months a rate of $3 has been charged on interstate as well as intrastate shipments, and the change, as was to be expected, has proved of marked benefit. Mr. Mote, manager of the Pacific Car Demurrage Bureau, prints a letter from J. P. Thomas, agent of the San Pedro, Los Angeles & Salt Lake, at Los Angeles, telling of the improvement as follows:

"When this $3 rate on interstate cars became effective, our yard efficiency was almost immediately increased because of the tendency on the part of consignees to dispose of shipments immediately upon arrival, instead of allowing them to be placed on the hold-track. This largely decreases the average number of switching moves on cars and thereby lessens not only the congestion in the yard, but the danger of damage to cars and contents by continued switching.

"I find that we also have less disputes with consignees as to the correctness of demurrage charges, doubtless due to the fact that the higher rate tends to the keeping of more accurate records by consignees. Station and yard employees are very much gratified with the results."

Chicago Switchmen's Controversy Settled.

The controversy between the yardmen and the railways in the Chicago district regarding wages and working conditions, was settled on April 17, by a compromise reached after several weeks of negotiations conducted by Commissioner of Labor Neill, and his assistant, G. W. W. Hanger, under the mediation provisions of the Erdman act. Although the railways conceded most of the demands of the men, the agreement omits the rule on which they had most strongly insisted, providing for the payment of time and a half for overtime, Sundays and holidays. The concessions gained by the men include an increase of wages for a number of men in "backup" service—backing passenger trains to and from train sheds—a rule giving yardmen a right to handle milk runs in the Chicago switching district, compensation for time on account of attending investigations and re-examinations, a concession of 30 minutes in the starting time rule, one day's pay for yardmen when called and not used, and other minor provisions regarding employment.

Fast Handling of Emergency Order for Levee Protection.

At noon on Monday, April 7, the Carnegie Steel Company, of Pittsburgh received an emergency order for 500 tons of U. S. steel sheet piling, to be forwarded to New Orleans, to reach that point not later than April 17, for installation in the LaFourche District for the protection of the levees.

The order was the result of a decision to take precautionary measures in anticipation of what extraordinarily high water might cause, on the part of the Texas & Pacific and New Orleans & Northeastern railroads, acting in conjunction with the commissioners of the LaFourche levee district, and Captain Sherrill of the U. S. engineer corps, the government officers having arranged to drive the sheet piling with their apparatus immediately on arrival. Owing to extraordinary efforts put forth by the makers of the steel and the carriers which transported it, the date set was anticipated by three days, a remarkable achievement on the part of the railroads, particularly between Pittsburgh and Cincinnati, considering the soft condition of the tracks, bridges, and culverts, owing to recent floods.

The rolling was begun at midnight April 7, and proceeded with continuously until Wednesday night, April 9. The piling, after rolling, was promptly cut and punched, and loaded into a special train of 12 cars, consisting of steel gondolas and steel underframe gondolas of the Baltimore & Ohio. Cars were

previously carefully inspected while empty, and the last car of the train was weighed at the Hayes Yard of the Union Railroad at 11.50 a. m. Thursday, April 10; delivery was made by the Union Railroad to the Baltimore & Ohio at Port Perry Transfer, at 12:18 p. m., after which the train was switched to the Glenwood yards of the Baltimore & Ohio, and another minute examination made of the cars under load, so as to avert any possible transportation danger to the equipment, owing to the fast running required. The train was then promptly despatched by the Baltimore & Ohio, reaching Benwood, W. Va., at 10 p. m. Thursday night, April 10, and immediately delivered to the Ohio River division of the Baltimore & Ohio for movement thence to Parkersburg, at which point it arrived at 5:22 a. m., Friday, April 11. It was transferred at once to the higher line of the Baltimore & Ohio Southwestern, leaving at 6:30 a. m., April 11, which line brought the train into Cincinnati at 2:45 a. m., Saturday, April 12. Prompt transfer at Cincinnati was made to the Queen & Crescent route, but here a delay of several hours ensued, necessitating revision of part of the lading in order to avert danger while crossing the Ohio river, as it was not known to what extent, if any, the floods might have weakened the bridge. The train finally started towards New Orleans at noon Saturday, April 12, on a schedule that approximated 20 miles an hour, to complete the last leg of the journey, 836 miles (out of a total journey, from point of origin to destination, of 1,236 miles). Birmingham, Ala., 481 miles out, was passed at 8 o'clock Sunday morning, April 13, and at 3:30 p. m. the train passed Meridian, Miss., 200 miles from New Orleans, reaching the last named city at 3:15 a. m., Central time, Monday, April 14.

Thus, the order was received, executed, loaded, shipped and delivered at destination in less than one week from the time it was received, under all the adverse conditions and circumstances that presented themselves. Owing to wash-outs on the B. & O. regular route to Cincinnati, an alternate route via Benwood and Parkersburg had to be selected, lengthening the distance to Cincinnati approximately 40 miles, and the movement of the freight was necessarily slow at times, because of soft track and other conditions, due to the floods.

New Harriman Dissolution Plan.

Robert S. Lovett, chairman of the executive committee of the Union Pacific, appeared before Circuit Judges Sanborn, Hook and Smith at St. Paul, Minn., on April 21, and presented a motion for an extension of time in the Union Pacific-Southern Pacific dissolution proceedings until July 1, together with a revised plan for the separation of the roads. The motion was taken under advisement following the receipt of a telegram from the attorney general declaring his acquiescence in the plan for the extension. A synopsis of the new tentative plan was given out, including the following points:

"The amended plan in brief is that the entire $126,650,000 in Southern Pacific stock to be distributed shall be deposited with a trustee and disfranchised while so held; that certificates of interest shall be issued by the trustee against said shares, which shall carry no voting right and which shall be exchangeable for Southern Pacific shares held by the trustee only on the filing of an affidavit by the applicant for such exchange, showing that such applicant does not own 1,000 shares or more of Union Pacific stock, and that these certificates of interest shall be offered for subscription and purchase to all Union Pacific stockholders at a distribution ratio of not less than 38 per cent.

"The largest Union Pacific stockholders (368 in number, according to the September stock list, which was before the Supreme Court) are by this amended plan excluded from the acquisition of any of the Southern Pacific shares to be distributed. They may purchase their ratable shares of the certificates of interest, but they cannot themselves convert the certificates of interest into the deposited shares.

"Even if it be assumed that any concert of action by the 21,782 holders of Southern Pacific stock, resulting in a control of the elections of the Southern Pacific company, were possible, the effect would not be to continue the previous combination. These 21,782 holders, assumed to be able to control the Southern Pacific company by the holding of virtually 46 per cent. of its stock, are not in control of the Union Pacific Railroad Company and are not able to elect its directors, since the aggregate holdings of Union Pacific stock amount to only 37.2 per cent. of the Union Pacific stock, and as the remaining 368 stockholders hold 62.8 per cent., they naturally represent the controlling interest of the Union Pacific company.

"The certificates of interest acquired on the open market will still be subject to the condition that they cannot be converted into stock by any Union Pacific shareholder holding 1,000 shares or more."

After this plan had been informally submitted a statement was given out by the court as follows:

"Circuit Judges Sanborn, Hook and Smith are not concerning themselves regarding the sale of Central Pacific stock, as this phase of the situation was not mentioned in tentative plan, but are confining their attention to the disposition of the $126,650,000 of Southern Pacific stock which is now unlawfully held by the Union Pacific Railroad Company.

"In this connection the following suggestions have been submitted by the judges to counsel for the Union Pacific, and also to District Attorney Houpt, of St. Paul, representing the government for Attorney-General McReynolds, as a guidance in future dissolution plans:

"1. Any plan for disposing of the $126,650,000 of Southern stock owned by the Union Pacific company should have regard to the amount of Southern Pacific stock already owned by Union Pacific stockholders, so that the present holdings of these stockholders as a body shall not, by the affirmative action of this court, be increased to the point of practical control of the competing company.

"2. In the memorandum of March 1, 1913, submitted by counsel for the Union Pacific Company, to a very large extent the 23,000 individual stockholders of the Union Pacific are also included among the 15,000 stockholders of the Southern Pacific Company.

"3. It was intimated at a time when it was supposed that Union Pacific stockholders did not hold more than $50,000,000 of the stock of the Southern Pacific Company that not more than $40,000,000 of the Southern stock should be transferred to Union Pacific stockholders. It now appears that the stock books of the two companies of February, 1913, show that 4,440 Union Pacific stockholders also own $92,162,400 of Southern Pacific stock, exclusive of the $126,650,000 of stock involved in this suit. Among these 4,440 stockholders are brokerage concerns whose principals are undisclosed, but if they were excluded the fact would still remain that individual Union Pacific stockholders own a very large amount of Southern Pacific stock.

"In view of these facts it seems that the disposition of as much as $40,000,000 of Southern Pacific, with voting power to the stockholders of the Union Pacific might give practical control of that company to Union Pacific stockholders and the question of what amount, if any, of the Southern Pacific may be safely transferred to them is suggested for an argument and consideration."

A New Cunarder Launched.

The Cunard steamship Aquitania was launched at Glasgow last Monday. The Aquitania is the largest steamship ever built in Great Britain, about 47,000 gross tonnage. The vessel is 901 ft. long and has engines of more than 70,000 h. p. It is expected that her speed will be about 23 knots, considerably less than that of the Lusitania and the Mauretania. The Aquitania will have a double skin throughout the vulnerable part of the vessel, the two skins being separated by a space of about 15 ft.

A. R. E. A. Rail Committee.

Last week we published on page 902 a list of the names of the members appointed for A. R. E. A. 1913 committee assignments. The data for the rail committee was not then available and is as follows:

COMMITTEE IV.—RAIL.

1. Recommend standard rail sections.
2. Continue investigation of rail failures and deduce conclusions therefrom.
3. Continue special investigation of rails.
4. Make comparative study and report on designs for joints, and recommend standard spacing for bolt holes and spike slots.

J. A. Atwood, P. & L. E., chairman; W. C. Cushing, P. L. W., vice-chairman; Chas. S. Churchill, N. & W.; R. Montfort, L. & N.; E. B. Ashby, L. V.; A. S. Baldwin, I. C.; M. L. Byers, D. & H.; F. A. Delano, Wabash; P. H. Dudley, N. Y. C.; S. H. Ewing, P. & R.; L. C. Fritch,

C. G. W.; C. W. Huntington, C. R. R. of N. J.; John D. Isaacs, S. P.; Thos. H. Johnson, P. L. W.; Howard G. Kelley, G. T.; C. A. Morse, C. R. I. & P.; Geo. W. Kittredge, N. Y. C. & H. R.; J. P. Snow, Cons. Eng.; A. W. Thompson, B. & O.; R. Trimble, P. L. W.; M. H. Wickhorst; G. M. Davidson, C. & N. W.; A. H. Hogeland, G. N.; H. B. MacFarland, A. T. & S. F.; C. F. Lowcth, C. M. & St. P.; Geo. W. Vaughan, N. Y. C. & H. R.

Western Railway Club.

An invitation of Dr. W. F. M. Goss, dean of the College of Engineering, and director of the Engineering Experiment Station of the University of Illinois, to the members of the Western Railway Club to attend the formal dedication of the new transportation building, the locomotive laboratory, and the mining laboratory, on May 9, has been accepted by the club, and arrangements are being made for a special train if a sufficient number of members signify their intention of going. The dedicatory programme includes many distinguished speakers representing the railway and mining interests of the country. The locomotive testing plant will be in full operation, and special tests will be conducted. Practically all of the technical organizations of the state have been invited to participate in the exercises.

The Railway Safety First Association.

The chairmen of the safety departments of thirty-four railways met in Chicago last Monday for the purpose of organizing the Railway Safety First Association, the purpose being to establish an association in which shall be represented all railroads in North America on which safety departments have been or shall be organized. A. W. Smallen, chairman of the general safety committee of the Chicago, Milwaukee & St. Paul was chosen chairman of a committee to effect a permanent organization. It was voted to ask the American Railway Association, at its meeting next month, for recognition by that association.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, June 11-12, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Merchants' Association, New York City, has moved its offices from 54 Lafayette street to the Woolworth Building, 233 Broadway.

Ralph C. Richards, general claim agent of the Chicago & Northwestern, addressed the Traffic Club of Chicago at its monthly luncheon on April 22, on the subject of "Safety First." Hon. B. H. Meyer, of the Interstate Commerce Commission, also gave a short talk.

Beginning on June 1 tickets between St. Paul and Minneapolis and the Pacific coast both over the Northern Pacific and the Great Northern, will be made optional via Duluth with stopover privileges. The change is made after considerable agitation by the Duluth commercial interests, who have also been trying to persuade the roads to run through passenger trains to the coast from Duluth.

J. S. Marvin, traffic manager of the National Association of Automobile Manufacturers, has addressed a letter to railway officers throughout the country, complaining that special cars for automobile shipments after being unloaded are too frequently used as ordinary box cars and retained in local service, or reloaded and routed at variance with railway rules and without regard to the requirements of the automobile industry. He urges special attention to keeping these cars in the service for which they are intended.

About 70 manufacturers and shippers of Chicago have arranged a special train containing exhibits of their products, which is being sent out through the territory tributary to Chicago for the purpose of trade promotion. The train consists of six exhibition coaches, two sleepers and a diner. Stops of from one to three days will be made in each city, and the public will be invited into the train, where the exhibits will be explained by representatives. The first trip is to be through Indiana, and will cover seven weeks, during which 28 cities will be visited.

The Queen & Crescent Route, when the recent floods interrupted service on all the direct lines, put on through sleeping cars between Cincinnati and New York, running them on the "Carolina Special" via Harriman Junction, Knoxville and the Southern Railway. By this route a large number of passengers were carried to eastern points. The distance is 1,142 miles, or 391 miles greater than by the direct route. The Ohio river at Cincinnati on April 1, reached a stage of 69.8 ft., but the Queen & Crescent maintained freight and passenger traffic with the South without interruption. When the high water made the use of the regular passenger station impossible, a temporary station with a platform was established on McLean avenue, which withstood the highest stages of water.

A new plan of improving the relations between railways and shippers was inaugurated by officers of the Southern Pacific, the St. Louis & San Francisco, the Texas Midland and the Pacific Fruit Express, at Houston, Tex., last week. The shippers were invited to attend a meeting of railway officers presided over by F. M. Lucore, assistant general manager of the Sunset-Central Lines, to discuss such subjects as the movement and distribution of empty cars, through schedules to St. Louis, Kansas City and Chicago, terminal changes and car inspection, icing arrangements, re-consignments, arrival notices and tracers. The railways have usually held such meetings to make plans for the movement of the fruit and vegetable crop, and it was decided to make the meeting an open one, in order that shippers might see what efforts were being made in their behalf, and to allow them to participate.

Chairman Mayfield, of the Texas Railroad Commission, and Commissioner Watson, of the Oklahoma commission, recently addressed letters to the Interstate Commerce Commission asking an investigation of the action of the Southwestern Passenger Association in refusing a special rate of one cent a mile on account of the Confederate veterans' reunion to be held at Chattanooga. The railways announced a rate of two cents a mile. Commissioner Clements replied that the Commission felt it "could hardly with propriety undertake to influence the carriers to make lower rates in any instance than they could lawfully be required to do; for, while the carriers may, under the law, as they often do, establish special fares for attendance on conventions, reunions, etc., we did not feel justified in urging them to do so, for the reason that it is our duty to pass upon the question of reasonableness of rates, fares and practices of the carriers and the lawfulness thereof."

The bi-monthly dinner and business meeting of the Traffic Club of Pittsburgh was held on April 14 at the Hotel Schenley. The feature of the program was a series of moving pictures entitled "Mine to Molder," presented by Henry B. Yergeson, of Rogers, Brown & Co. The pictures portrayed the various stages in the movement of iron ore from the mines in the Lake Superior region through the various processes to the finished rail in the plant of the Lackawanna Steel Company. At the conclusion of the entertainment features a business meeting was held and a nominating committee was appointed to select candidates for the offices of the club to be voted on at the annual election in June. The committee includes: G. G. Herring, general agent, Southern Pacific; F. A. Ogden, division freight agent, Jones & Laughlin Steel Company; C. L. Cordes, division freight agent, American Steel & Wire Company; Robert Main, division freight agent, Canadian Pacific, Soo Line; L. C. Bihler, traffic manager, Carnegie Steel Company; C. S. Belsterling, traffic manager, American Bridge Company; J. C. Kimes, commercial freight agent, Baltimore & Ohio.

Federal versus State Authority.

In the Supreme Court of the United States last Monday, Assistant Attorney General Denison asked permission to file a brief, amicus curiae, in the pending state rate cases. Similar questions are involved in cases pending before the Commerce Court. There are forty-five cases, including the Minnesota case, and the government asked simply for leave to file the brief which it has filed before the Commerce Court in the Houston East & West Texas et al vs. United States, and Texas & Pacific vs. United States (the Shreveport cases). Mr. Denison said: "As cause for this motion it is shown that the above mentioned cases involve some of the fundamental points at issue in the state railroad rate cases. The questions have been argued before the Commerce Court, but have not been decided by that court, and it is hardly expected that they will be decided until this court has passed upon the matter." The question is "whether a state may deliberately shut out interstate commerce by the adroit manipulation of intrastate freight rates; and whether, where this manipulation results in a discrimination against the interstate shipments, the Interstate Commerce Commission may correct it." The court granted the government's application; which is supposed to mean the indefinite postponement of a decision in the cases.

Of the forty-five cases pending, the most important is the "Minnesota rate case," based on the railroads' dispute of the order by the Minnesota commission, in 1907, calling for a reduction in certain freight rates of as much as 25 per cent., and supplemented by an act of the Minnesota state legislature ordering further reductions. The roads contended, among other things, that the new rates would make impossible a fair return on the invested capital and that thereby the state tariff, through rendering non-remunerative the rates for traffic within the state, threw a burden on interstate traffic, which made it impossible for the companies to observe the federal Interstate Commerce Commission's orders without loss.

In September, 1910, a special master in chancery appointed to take testimony reported in favor of the railways on both points. In April, 1911, Judge Sanborn approved the master's decision, incidentally holding that 7 per cent. net income on the approved value of a railway's property was not more than a fair return. Later in 1911 the case went to the United States Supreme Court on the appeal of the State of Minnesota. In April, 1912, a brief was filed with the Supreme Court by Governors Harmon of Ohio, Hadley of Missouri, and Aldrich of Nebraska, protesting against Judge Sanborn's decision, on the ground that if sustained it would subordinate state rights to railroad rights, and would involve the destruction of the state's control over its own internal affairs.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended from March 31 until September 30, certain tariffs which propose to cancel joint rates in connection with the Chicago, Zeigler & Gulf.

The commission has suspended from April 17 until August 15, the supplement to the tariff of the St. Louis, Rocky Mountain & Pacific, which contains schedules withdrawing the present through joint rates applicable to the transportation of bituminous coal from mines located on the St. Louis, Rocky Mountain & Pacific in New Mexico to points in Oklahoma, Nebraska, Kansas and other states located on the Rock Island Lines, and providing that on and after April 17, 1913, combination rates will apply. This results in advances ranging from 50 cents to $2.50 per ton.

The Interstate Commerce Commission will hold a public hearing on proposed amendments of or additions to its regulations governing the transportation of explosives and other dangerous articles in Washington, D. C., on May 26. Prior to the date of hearing, it is understood that Col. B. W. Dunn, chief inspector of the Bureau for Safe Transportation of Explosives, will prepare and distribute printed copies of proposed changes and additions to the regulations. All parties who desire to suggest changes, should submit them at once to Col. Dunn, as well as to the commission.

The commission suspended from April 15 until April 30, certain items contained in the tariff of the Oregon-Washington Railroad & Navigation Company, which would cancel through joint rates applicable to the transportation of wool and mohair, c. l., from points in Oregon, Washington and Idaho routed via Wallula, Wash., the Northern Pacific and eastern connections to Chicago, New York, Boston and other points. Tariffs of other carriers canceling through rates via Spokane, Denver and certain other western gateways were suspended until the same date by orders previously entered in same docket.

The commission has suspended from April 12 until August 9, the supplement to the tariff of the Pennsylvania Railroad, which contains schedules advancing rates for the transportation of petroleum and its products, in carloads, from Emlenton, Pa., and a number of other points located on the Pennsylvania Railroad north of Pittsburgh and south of Franklin, Pa., to Detroit, Mich., Milwaukee, Wis., and other points of destination. The advances range from ½ to 2 cents per 100 lbs. Complaint was made that the proposed rates would create a discrimination in favor of Franklin and Oil City, more distant points, from which no increase in rates is proposed, and from which similar traffic would move at lower rates, via Emlenton and the other points affected, to the same destinations.

Commissioner B. H. Meyer began a hearing at Chicago on April 21, on a complaint filed by the Chicago Board of Trade against the Illinois Central, Atchison, Topeka & Santa Fe, Chicago & Eastern Illinois, Wabash and Chicago & Alton, alleging failure on the part of these roads to absorb the switching charges and to apply Chicago rates to and from Chicago points on grain as on other commodities. The complaint grows out of the reciprocal switching agreement which was put into effect in Chicago two years ago as the result of a long series of conferences between the carriers and the shippers, which failed to provide for the absorption of switching charges on grain, coal, coke and live stock, because the five defendant roads would not agree to the plan. In other respects the plan was allowed to go into effect after a hearing before the commission with the thought that the agreement might at a later date be extended to cover the commodities excepted.

Complaint Dismissed.

Merchants' Freight Bureau of Little Rock, Ark., v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Clements:

The commission decided that the rate of 17 cents per 100 lbs., for the transportation of cement from Kansas Gas Belt points to Little Rock, Ark., was not shown to be unreasonable (26 I. C. C., 543.)

McKnight Keaton Grocery Company v. Chicago, Milwaukee & St. Paul et al. Opinion by the commission:

The complainant contends that the rate of 49½ cents per 100 lbs. for the transportation of cheese in less than carloads from Plymouth, Wis., to Cairo, Ill., is unreasonable. The commission found that the evidence was not conclusive. (26 I. C. C., 563.)

Board of Improvements, Waterworks District No. 1, Fort Smith, Ark., v. St. Louis & San Francisco et al. Opinion by Commissioner Clements:

The commission decided that the rate of $6.85 per net ton for the transportation of cast iron pipe and connections from Chattanooga, Tenn., to Fort Smith, Ark., was not shown to have been unreasonable. (26 I. C. C., 541.)

Chamber of Commerce, City of Augusta, Ga., v. Buffalo, Rochester & Pittsburgh et al. Opinion by Commissioner Clements:

The commission decided that the rate of 37 cents per 100 lbs., for the transportation of apples, potatoes, cabbage and onions from Rochester, N. Y., to Augusta, Ga., was not shown to have been unreasonable. (26 I. C. C., 559.)

Board of Improvements, Waterworks District No. 1, Fort Smith, Ark., v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Clements:

The commission decided that the rate of 15 cents per 100 lbs., for the transportation of cement from Kansas Gas Belt points, Ada, Okla., Bonner Springs, Kan., and Sugar Creek, Mo., to Fort Smith was not unreasonable. (26 I. C. C., 539.)

Goldfield Consolidated Milling & Transportation Company v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

In this case the complainant contends that the rate of $2.08 per 100 lbs., for the transportation of cyanide of potassium in carloads from San Diego, Cal., to Goldfield, Tonopah and Millers, Nev., is unreasonable to the extent that it exceeds $1.16 per 100 lbs. Reparation is asked. Prior to January 2, 1911, this rate was $2.37 per 100 lbs. The commission decided that as the present rate was considerably lower than when the complainant's industries were established, and as the traffic of the commodity in question was light and the earnings of the principal defendant were small, no change should be made in the rate in question. (26 I. C. C., 567.)

Ash Lumber Rate Reduced.

J. R. Shoupe & Company v. Trinity & Brazos Valley. Opinion by the commission:

The complainant contends that the rate of 42 cents per 100 lbs., for the transportation of ash lumber in carloads from Jackson, Tex., to St. Louis, Mo., is unreasonable to the extent that it exceeds 19 cents per 100 lbs. Reparation is asked. The commission found that the present rate was excessive and decided that as a rate of 24 cents per 100 lbs., would yield a revenue of about 5 mills per ton per mile, it would be just and reasonable. That rate was prescribed for the future. Reparation was awarded. (26 L. C. C., 570.)

Through Routes and Joint Rates on Grain Established.

Omaha Grain Exchange v. Chicago, Burlington & Quincy et al. Opinion by Chairman Clark:

The complainant seeks the establishment of a through route and joint rates from points on the line of the Great Northern between Great Falls and Billings, Mont., to Omaha, Neb., via Billings, over the lines of the Great Northern and the Chicago, Burlington & Quincy, not exceeding the rates from the same points to Minneapolis over the Great Northern. The commission found that the rates on grain from the points of origin in question to Omaha were at least 9.1 cents per 100 lbs. higher than to Minneapolis. The commission decided that a through route and joint rate should be established from stations on the Great Northern, Great Falls—Billings line, Hesper to Spion Kop, inclusive, not higher than the rates from the same points to Minneapolis via the Great Northern. As the Great Northern could secure a longer haul by establishing a through route and joint rates to Omaha via Sioux City, that company may apply for an amended order, although the latter route is considerably longer than the route via Billings.

The complainant also seeks the establishment of a through route and joint rate via Billings and Omaha to Chicago with transit privileges at Omaha, which shall not exceed the through rate from the same points of origin to Chicago via Minneapolis, with transit privileges at Minneapolis. The commission denied this prayer. (26 I. C. C., 553.)

Axle Grease Rate.

Marshall Oil Company v. Chicago & North Western et al. Opinion by the commission:

The defendants permit the shipment in mixed carloads at carload rates of practically all products of petroleum except axle grease. The complainant contends that the exclusion of axle grease from the mixed carload privilege is unreasonable. The commission decided that the provision of the defendants' tariffs excluding axle grease from the products of petroleum that may be transported in mixed carloads at carload rates, while similar products are given this privilege, resulted in discrimination and ordered the defendants to remove this discrimination. (26 I. C. C., 575).

Rate on Common Brick Reduced.

Collingwood Brick Company et al. v. Pere Marquette. Opinion by the commission:

In this case the complainant contends that the rate of 70 cents per ton on common brick between Toledo and Detroit is unreasonable to the extent that it exceeds 60 cents per ton, the rate in effect prior to May 21, 1911. The commission decided that the present rate was unreasonable, and ordered that in future the rate of 60 cents per ton should apply. (26 I. C. C., 572.)

Rate on Butchers' Blocks Reduced.

National Refrigerator & Butchers' Supply Company v. St. Louis, Iron Mountain & Southern et al. Opinion by the commission:

The complainant contends that the rate of 43 cents per 100 lbs., for the transportation of butchers' blocks in less than carload lots from Whitewater, Mo., to Memphis, Tenn., is unreasonable to the extent that it exceeds the rate from St. Louis, Mo., to Memphis; also that this rate was in conflict with the fourth section in that it exceeded the rate from Whitewater to New Orleans, La. The defendants tried to justify this violation of the fourth section on the ground that the lower rate from St. Louis was forced by water competition; also that Whitewater was nearer the source of raw material. The commission found that on traffic to New Orleans Whitewater was accorded the same rate as St. Louis. The commission decided that the rate charged the complainant on its shipments from Whitewater to Memphis was unreasonable to the extent that it exceeded the rate from St. Louis to Memphis, and prescribed that rate for the future. Reparation was awarded. The application of the defendants for relief from the fourth section on this traffic was denied.

The complainant also contends that the rate of 49½ cents per 100 lbs., for the transportation of butchers' blocks in less than carloads from New Memphis, Ill., to Memphis, Tenn., was unreasonable to the extent that it exceeded a rate of 30 cents per 100 lbs. The commission found that no through rate was applicable to the shipments and that the lowest combination of intermediate rates was 39.1 per 100 lbs. The commission decided that there had been an overcharge on these shipments, but that the rate of 39.1 cents per 100 lbs. should not be changed. The complainant contends that the defendants violated the fourth section of the act by charging a rate of 30 cents per 100 lbs., for the transportation of butchers' blocks to Memphis from St. Louis, Bellville and Nashville. The commission decided that the rate complained of was not unreasonable and that the defendants were justified in violating the fourth section because of water competition at St. Louis and rail competition at Bellville and Nashville. The defendants were ordered to refund the overcharge on the shipment from New Memphis, Ill., to Memphis, Tenn. (26 I. C. C., 525.)

Rates on Grain Not Changed.

Board of Trade of the City of Chicago v. Illinois Central. Opinion by Chairman Clark:

There is an established relation between the rates on grain in carloads from Omaha, Neb., to Chicago and the rates on the same commodity from Omaha to New Orleans, La., for export. In 1912 the Omaha-New Orleans rate was reduced, but subsequently restored, without any change in the Omaha-Chicago rate. During the existence of the reduced rates to New Orleans, a complaint was filed alleging that the resulting adjustment was discriminatory against Chicago in favor of New Orleans, and also that the rates from Omaha to Chicago were unreasonable in themselves. The commission decided that the restoration of the old rate from Omaha to New Orleans had removed the discrimination complained of, and also that the rates from Omaha to Chicago were not shown to be unreasonable in themselves.

The complainant also urged the commission to determine what would be a reasonable rate from Omaha to Chicago as compared with rates from Omaha to New Orleans, should the latter again be reduced. The commission decided that in this case where only one carrier operating over only a part of the through route to the Atlantic ports was defendant, it could not determine the question of differentials in a general adjustment of rates. The commission decided further that if the rate from Omaha to New Orleans were again reduced it could be suspended pending investigation. (26 I. C. C., 545.)

Transfer of Shipment Permitted.

Dubuque Shippers' Association v. Chicago & North Western et al. Opinion by the commission:

The complainant requests the commission to require the defendants to forward a carload of package freight, originating each day at Dubuque, Ia., without transfer at Galena, Ill., to destinations on the line of the Chicago & North Western in Wisconsin. For several years a merchandise car of less than carload shipments, destined to points on the Chicago & North Western, between Galena and Madison and Woodman, has been loaded each day by the Illinois Central at Dubuque, and moved over that company's line to Galena, where it was accepted by the Chicago & North Western just as received and immediately forwarded to the destinations. Recently the Chicago & North Western has refused to forward the car as received from the Illinois Central and insists on transferring the packages and rearranging them in its own cars at Galena, which results in a delay of from 24 to 48 hours. The Dubuque shippers compete with shippers at other points, so this delay constitutes an important factor in the competition. The defendant's reasons for not accepting the Dubuque car without transfer are the large number of claims for shortage and damage to consignments; the presence of packages for which there was no billing; bad billing; lack of checking at Galena; and indiscriminate loading instead of station order loading, resulting in delays to the train. The commission found that a carrier should not be required to accept a carload of miscellaneous freight from another without checking the contents, so as to discover the quantity and kind of goods for which it becomes responsible. Neither should the defendant be denied the right of transferring the packages to other cars, so as to arrange them in convenient order for delivery. The complaint was dismissed. (26 I. C. C., 565.)

STATE COMMISSIONS.

The South Dakota Railroad Commission has asked railways in the state to file a statement showing the salaries paid to officers.

The Illinois Railroad and Warehouse Commission has entered an order allowing an increase in the switching rates on coal in the Chicago district by the Chicago, Milwaukee & St. Paul, but the commission holds that other roads must not increase their coal rates on this account to exceed the rates allowed by the commission in August, 1911.

The Illinois railroad and warehouse commission has ordered the Chicago & Alton to stop its Chicago-St. Louis fast trains at East St. Louis. Heretofore many of the trains have been entering and leaving St. Louis by the Merchants' bridge, thus avoiding the city of East St. Louis. It is said that the East St. Louis Commercial Club will seek another order directing other roads to stop their eastbound trains from St. Louis at East St. Louis.

COURT NEWS.

In the United States court at Boston, April 16, a fine of $5,000 was imposed on the New York, New Haven & Hartford for granting illegal concessions in the price of transportation of milk from certain points in Connecticut to Boston.

Railway Officers.

Executive, Financial and Legal Officers.

C. S. Sikes, auditor of traffic accounts of the Pere Marquette, has been appointed auditor, with headquarters at Detroit, Mich. During the absence of the comptroller, his duties will be performed by Mr. Sikes.

W. L. Maury, who has been auditor of the International & Great Northern since 1888, has been appointed consulting auditor, a newly created office. W. J. Werner, assistant auditor, succeeds Mr. Maury as auditor, with headquarters at Houston, Tex., and the former position is abolished.

Operating Officers.

George F. Dickson, trainmaster of the Georgia & Florida, at Douglas, Ga., has been appointed superintendent, with office at Douglas, succeeding D. F. Kirkland, resigned to accept service with another company.

J. J. Breheny, trainmaster of the Colorado division of the Chicago, Rock Island & Pacific, has been appointed trainmaster of the Kansas division, with headquarters at Herington, Kan., in place of C. I. Kerr, deceased.

The headquarters of the following officers of the Long Island Railroad have been transferred from Long Island City, N. Y., to Jamaica: H. W. Thornton, general superintendent; J. B. Austin, Jr., superintendent; W. L. Jarvis, steam passenger trainmaster; H. E. Lewis, chief despatcher; J. M. McGee, assistant trainmaster, and R. W. Farrell, superintendent of station service.

A. G. Wells, general manager of the Atchison, Topeka & Santa Fe Coast Lines, has been granted a six months' leave of absence, and I. L. Hibbard has been appointed acting general manager, with headquarters at Los Angeles, Cal. J. R. Hitchcock, superintendent of the Los Angeles division at Los Angeles, Cal., has been appointed acting general superintendent, with office at Los Angeles, in place of I. L. Hibbard. J. B. Galivan, trainmaster at San Bernardino, Cal., succeeds Mr. Hitchcock as acting superintendent of the Los Angeles division. A. R. Woods has been appointed acting trainmaster of the Second district, Albuquerque division, with office at Winslow, Ariz., in place of E. E. McCarty, who has been appointed acting trainmaster at San Bernardino in place of Mr. Galivan.

Ira L. Burlingame, who on April 14, was made general manager of the Terminal Railroad Association of St. Louis, as has already been announced, was born September 6, 1862, at Franklinville, N. Y., and was educated at Ten Broek Academy. He entered railway service in 1879 as a telegraph operator for the Ohio & Mississippi, and from 1883 to 1895 was a train despatcher on that road. He was then for nine years trainmaster of the Baltimore & Ohio Southwestern, and in December, 1903, left that road to go with the Terminal Railroad Association of St Louis as assistant superintendent. He was superintendent of that association from March, 1904, to November, 1905, and on the latter date became general superintendent, from which position he is now promoted to that of general manager, as above noted. Mr. Burlingame assumes part of the duties heretofore performed by President and General Manager W. S McChesney, Jr., who relinquished the duties of general manager, and recommended the election of Mr Burlingame to that position.

I. L. Burlingame.

Edward James Gibson, whose appointment as superintendent of the Iowa division of the Rock Island Lines, with headquarters at Des Moines, Iowa, has been announced, was born February 9, 1865, in Perry county, Indiana. He received a common school education, and began railway work in 1878, with the St Louis, Kansas City & Northern, now the Wabash, as a telegraph operator. From 1880 to 1886 he was agent for the Missouri, Kansas & Texas, and the following three years was train despatcher on the Fremont, Elkhorn & Missouri Valley. Mr. Gibson went with the Atchison, Topeka & Santa Fe in April, 1889, with which road he remained until April 3, of this year, when he resigned to become superintendent of the Iowa division of the Rock Island Lines, as above noted. While with the Santa Fe he was train despatcher, chief train despatcher and superintendent, having been in Mexico on the Sonora road five years, from 1896 to 1901, when that road was owned by the Santa Fe. His last position was that of superintendent of the Albuquerque division, with headquarters at Winslow, Ariz.

E. J. Gibson.

Frederick J. Hawn, who recently became superintendent of the Fort Worth division of the St. Louis Southwestern, and superintendent of the Dallas Terminal & Union Depot Company, with headquarters at Mt. Pleasant, Tex., was born June 15, 1863, at Stevens Point, Wis. He was educated in the public schools and began railway work in 1877, with the Wisconsin Central. He remained with that road until September, 1898, serving in many capacities, including call boy to chief despatcher, some years in the mechanical department, and as brakeman and conductor, until September, 1894. He was then appointed trainmaster, leaving the Wisconsin Central in 1898 to go with the Great Northern. On the latter road he was successively assistant superintendent of the Cascade and Montana divisions, and superintendent of the Breckenridge division. Mr. Hawn became connected with the St. Louis Southwestern in 1903, and was made superintendent of transportation, with headquarters at Tyler, Tex., on February 17, 1907, which position he held until his recent appointment as superintendent of the Fort Worth division, as above noted.

F. J. Hawn.

Traffic Officers.

Opie Reid has been appointed traveling freight agent of the Rock Island Lines, with headquarters at Lake Charles, La.

T. Kight has been appointed traveling freight agent of the Gulf, Colorado & Santa Fe, with headquarters at San Antonio, Tex.

W. E. Robinson has been appointed freight solicitor of the Star Union Line at Indianapolis, Ind. in place of Volney E. Huff, promoted.

John J. Morton has been appointed acting assistant import freight agent of the Canadian Pacific, with office at Chicago, effective May 1.

G. S. Hinkle has been appointed freight scheduling agent of the Southern, with office at Huntsville, Ala., succeeding G. W. Lewis, transferred.

C. A. Lindsey, formerly assistant general passenger agent of the Colorado & Southern, has been appointed city passenger agent of the Denver, Boulder & Western at Denver, Colo.

R. F. Fox has been appointed traveling passenger agent of the Colorado & Southern, with headquarters at Denver, Colo., succeeding W. T. Spicer, resigned to go with the Missouri, Kansas & Texas at Dallas, Tex.

J. I. Hazzard, formerly general agent of the El Paso & Southwestern System at St. Louis, Mo., has been appointed general western agent of the Western Maryland at Chicago, succeeding John S. Talbot, resigned.

C. J. Heller, traveling passenger agent of the Wabash, with headquarters at Denver, Col., has been appointed general agent at that place, succeeding J. D. Lund, who has been transferred to Cincinnati, Ohio, as commercial agent in place of George A. Rump, deceased.

J. R. L. Wulff, commercial agent of the Southern at Omaha, Neb., has been transferred to Kansas City, Mo., in a similar capacity in place of P. J. Tapp, deceased. C. M. Ross, assistant chief clerk in office of general freight agent at Memphis, Tenn., has been appointed traveling freight agent, with headquarters at Kansas City, succeeding C. M. Agnew, promoted.

Engineering and Rolling Stock Officers.

R. R. Black has been appointed roadmaster of the Atchison, Topeka & Santa Fe at Rincon, N. M., in place of C. L. McCallister.

L. C. Maxwell has been appointed engineer maintenance of way of the Algoma Central & Hudson Bay, with office at Sault Ste. Marie, Ont.

W. S. Basinger has been appointed division engineer of the Southern Kansas division of the Atchison, Topeka & Santa Fe at Chanute, Kan.

W. D. Manchester has been appointed chief engineer of the Manistee & North Eastern, with headquarters at Manistee, Mich., succeeding J. J. Hubbell, deceased.

T. R. McLeod, master mechanic of the Halifax & Southwestern at Bridgewater, N. S., has been appointed master mechanic of the Canadian Northern Ontario, with headquarters at Parry Sound, Ont., succeeding C. L. Webster, resigned.

W. H. Alderson, heretofore chief draftsman in the bridge department of the consulting engineer's office of the Union Pacific and Southern Pacific in New York, has been appointed bridge engineer of the Oregon-Washington Railroad & Navigation Company, with headquarters at Portland, Ore., effective April 23.

R. J. Gatewood, division engineer of the Atchison, Topeka & Santa Fe at San Marcial, N. M., has been transferred to the New Mexico division in a similar capacity, with headquarters at Las Vegas, N. M., succeeding T. A. Williams. W. J. Lank, division engineer of the Pecos division, with office at Clovis, N. M., succeeds Mr. Gatewood, and J. W. Walter has been appointed acting division engineer of the Pecos division in place of Mr. Lank.

Samuel Lenzner, who has been appointed master car builder of the Michigan Central, with headquarters at Detroit, Mich., as has been announced in these columns, was born June 30, 1861, at Lancaster, N. Y. He has been with the Michigan Central since July 12, 1886, when he began railway work as a coach carpenter. In September, 1889, he was made foreman of the cabinet department, and in March, 1909, was advanced to general foreman of the car department, which position he held until his recent promotion on April 1, to master car builder, as above noted.

F. L. Thompson, who, on April 1, was appointed engineer of construction of the Illinois Central, as has already been announced, was graduated from the University of Illinois in civil engineering, with the degree of B. S., in 1896. He entered the service of the Illinois Central June 18 of that year as chairman on the reconstruction and lowering of the tracks on the lake front in Chicago, and later was made rodman and inspector on the concrete work. From February of the following year to February, 1898, he was rodman at Vicksburg, Miss., on the work of removing a 700-ft. tunnel and making it an open cut and had charge of a concrete arch and building of a large freight house. He was then until January, 1900, rodman and assistant engineer on surveys and on grade reduction work, Fulton to Memphis, and from the latter date to August, 1901, assistant engineer in charge of grade reduction and double track work, Wickliffe to Fulton, Ky. He was subsequently for six months in charge of double track and grade reduction work from Irvington to Carbondale, Ill., and from February, 1902, to February, 1903, was assistant engineer in the chief engineer's office at Chicago. The following eight months he was acting roadmaster of the Chicago division, being transferred to the Louisville division as roadmaster in October, 1903, and remaining in that capacity until January, 1907, when he was made assistant engineer of bridges. On July 1, 1910, he was promoted to engineer of bridges and buildings, which position he held until his recent appointment as engineer of construction, as above noted.

F. L. Thompson.

OBITUARY.

Jeremiah J. Coakley, superintendent of the Terminal Railroad Association of St. Louis, and the St. Louis Merchants' Bridge Terminal Railway, died in St. Louis, Mo., on April 21, aged 54 years. He had been with the Terminal association for 35 years.

Frank D. Tracy, real estate and tax agent of the Chicago & Alton, died suddenly in Chicago on April 18, aged 71 years. Mr Tracy had been connected with the Chicago & Alton for 40 years.

Henry C. Dickson, traveling passenger agent of the Delaware, Lackawanna & Western, with headquarters at Chicago, died suddenly in that city on April 16, aged 50 years.

Mileage of the Buenos Ayres Great Southern, Argentina.—The average number of miles of line operated during the last half of the calendar year of 1912, including the lines operated under agreement, were 3,510 miles compared with 3,343 miles for the corresponding period of 1911.

Railway Mileage in Uruguay.—The total length of the standard gage lines in Uruguay is 1,533 miles, of which 1,031 miles are under late guarantee. The operation of the guaranteed railways during 1912 has resulted favorably and the outlook for the future is also promising. During 1912, 56 miles of new line were added to the mileage of guaranteed railways. The net receipts of the year were $1,221,022 compared with $1,082,728 in 1911. The guarantees paid by the state amounted to $750,737 or $[illegible] less than the full amount for which it holds itself responsible. The gross receipts of all the railways amounted to $[illegible], of which passenger traffic contributed $1,808,166, freight $[illegible] and miscellaneous and baggage $454,664. Operating expenses amounted to $1,715,379, leaving a net profit of $[illegible].

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Seaboard Air Line is understood to have placed its order for locomotives. Details will not be available for several days.

Bertron, Griscom & Company have ordered one consolidation locomotive from the American Locomotive Company. The dimensions of the cylinders will be 20 in. x 24 in., the diameter of the driving wheels will be 52 in., and the total weight in working order will be 138,000 lbs.

The Taupo Totara Timber Company, of Australia, has ordered one Mallet (2-4-4-2) locomotive from the American Locomotive Company. The dimensions of the cylinders will be 10 in. & 16 in. x 23 in., the diameter of the driving wheels will be 32 in., and the total weight in working order will be 66,000 lbs.

The Imperial Taiwan Railway, Formosa, has ordered one Pacific type locomotive from the American Locomotive Company. The dimensions of the cylinders will be 18½ in. x 24 in., the diameter of the driving wheels will be 63 in., and the total weight in working order will be 137,000 lbs. This locomotive will be equipped with a superheater.

CAR BUILDING.

The Missouri Pacific is in the market for 1,000 forty-ton stocks cars.

The Harriman Lines have ordered 201 passenger cars from the Pullman Company.

The Northern Pacific has ordered 12 postal cars from the Pressed Steel Car Company.

The Baltimore & Ohio is expected to place an order for 72 passenger cars immediately.

The Illinois Central has ordered 800 furniture cars, 500 refrigerator cars and 500 stock cars from the American Car & Foundry Company.

The Grand Trunk has ordered 1,000 additional box cars from the Pressed Steel Car Company, and has ordered 3,000 freight cars from the Canadian Car & Foundry Company.

The Seaboard Air Line has ordered 500 box cars from the Pressed Steel Car Company, 250 flat cars from the American Car & Foundry Company and 250 hopper cars from the Standard Steel Car Company.

IRON AND STEEL.

General Conditions of Steel.—The volume of orders in the steel industry continues to be light but specifications are heavy and the mills are operating at as near their full capacity as possible. The Steel Corporation has enough orders on its books to keep its mills operating at full capacity until about November 1. The corporation is having difficulty in producing sufficient billets for its own consumption and has recently had to buy nearly 50,000 tons of billets in the open market. Prices are high and there is no prospect of any change in the immediate future. The contracts which are being filled at the present time were booked at current prices, so the earnings from now on should be larger. It is estimated that the earnings of the Steel Corporation for the first quarter will be in the neighborhood of $37,000,000, compared with $17,826,973 earned in the first quarter of 1912. The flood will not seriously affect the earnings of the steel companies, as the loss in production will be offset to a large extent by the new orders for replacement.

New Line for India.—The frontier 2-ft. 6-in. railway on the right bank of the Indus will shortly be opened from Bassnu to Kalabagh, and is being extended to Tank.

Supply Trade News.

The Grip Nut Company is moving its Chicago office from the Old Colony building to 661-663 McCormick building.

Westinghouse, Church, Kerr & Company, New York, has moved its general offices from 10 Bridge street to 37 Wall street.

The National Railway Equipment Company, Chicago, has moved its offices from the McCormick building to 661 People's Gas building.

The Union Spring & Manufacturing Company, Pittsburgh, Pa., has moved its New York office from 149 Broadway to 50 Church street.

W. F. Hebard has been appointed district sales agent for the electric truck department of the Buda Company and for the Canton Culvert Company, with headquarters at 1200 Karpen building, Chicago.

J. J. Hubbard has been made resident manager of the Federal Signal Company, Albany, N. Y., with office in New York, and J. W. Hackett has been made sales engineer of the same company, with office in New York.

Edward C. Meeker, assistant eastern purchasing agent of the Pullman Company, Chicago, with office in New York, died at his home in Brooklyn, N. Y., on April 19, at the age of 47. Mr. Meeker had been with the company for 30 years.

Andrew Thompson, general manager of the Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., will hereafter have charge of the sales of that company. A. C. Hawley has been made representative of the company for the Pittsburgh district, with office in Pittsburgh, Pa.

The Davis-Bournonville Company, New York, maker of oxy-acetylene welding and cutting apparatus, has moved its general offices from the West Street building, New York, to its demonstration plant at Marion Station, Jersey City, N. J., and has moved its New York office to the Hudson Terminal building, 30 Church street. The Chicago office of the company has also been moved from 515 Laflin street to the Monadnock block.

TRADE PUBLICATIONS.

Boring Heads.—Marvin & Casler Company, Canastota, N. Y., has published an illustrated booklet describing its Offset boring heads.

Ventilators.—The Gold Car Heating & Lighting Company, New York, has published a small illustrated folder describing its curtain window ventilators, which are designed to give fresh air without draughts.

Cleaning Locomotive Arch Tubes.—The Lagonda Manufacturing Company, Springfield, Ohio, has published a brief illustrated folder describing its special devices for cleaning locomotive arch tubes by air and steam.

Headlights.—The General Electric Company, Schenectady, N. Y., has devoted bulletin No. A-4061 to illustrations and descriptions of its electric arc headlights. This bulletin supersedes this company's previous bulletin on this subject.

Watthour Meters.—The Sangamo Electric Company, Springfield, Ill., has devoted bulletin No. 35 to its type D and D-4 direct current watthour meters. This bulletin is very thorough in its descriptions and illustrations of these meters. Prices are included.

Bangor & Aroostook.—The passenger department has issued an illustrated booklet of 160 pages, entitled "In the Maine Woods." The booklet is devoted to the hunting, fishing and camping in the region, and also includes a section devoted to the agricultural possibilities of Maine.

Motor Cars.—Mudge & Company, Chicago, has issued an unusually attractive catalogue, No. 101, describing and illustrating inspection motor cars, section motor cars, the Au-Tra-Kar, and railroad motor car accessories. The catalogue contains unusually clear illustrations and specifications, together with descriptions of the service given by various types of cars.

Railway Construction.

Baltimore & Ohio.—This company has recently given contracts for building a 11 mile low grade double-track line to be known as the Magnolia cut-off between Orleans Road, W. Va., and Little Cacapon, on the east end of the Cumberland division. The improvement will cost about $6,000,000, and owing to the heavy character of construction the work will be extended over a period of about two years. The work is to be divided into eight sections, and contracts have been let as follows: Sections 2, 3 and 4 to H. S. Kerbaugh, Inc., New York; sections 5 and 7 to Bennett & Talbot, Greensburg, Pa., and section 6 to Smith, McCormick Company, Easton, Pa. Contracts for sections 1 and 8 have not yet been let. The work includes piercing a tunnel about 3,000 ft. long, with three smaller tunnels. The construction of the new line will involve several changes in the present double-track line and between Orleans Road and the present location of Doe Gully tunnel, which is to be eliminated and converted into an open cut, the old line will be raised to make a four-track line. Between Doe Gully and Hansrote the present line will be relocated to eliminate curves. The old line will also be relocated to some extent at Paw Paw.

Bruce Mines & Algoma.—See Lake Huron & Northern Ontario.

Charleston, Parkersburg & Northern.—An officer writes that contracts will be let during the next three months to build from Parkersburg, W. Va., south via Rockport, Sandyville, Ripley, Fairplain, Kenna, Sissonville, and Guthrie to Charleston, about 75 miles. Maximum grades will be 2 per cent., and maximum curvature 6 deg. There will be five 60 ft. girder bridges, also five trestles 2,000 ft. long, with an average height of 30 ft., and five trestles to have a total length of 5,500 ft. The company will use gasolene motor cars for passenger traffic. K. B. Stephenson, president, and R. R. Cutler, engineer, Citizens Trust & Guaranty building, Parkersburg.

Chicago, Milwaukee & St. Paul.—The Puget Sound & Willapa Harbor has been incorporated in the state of Washington with $2,500,000 capital, to build from Helsing Junction, Wash., southwest to Raymond on Willapa harbor, 47 miles.

Cincinnati, New Orleans & Texas Pacific.—Double track between Greenwood, Ky., and Cumberland Falls, 4.44 miles, has just been put in service, making a total of 87.41 miles of double track now in operation on this road. Second track is now being constructed between Erlanger, Ky., and Williamstown, 29.6 miles, and work is about finished on 2 miles between Citico, Tenn., and Boyce. (June 21, p. 1589.)

Great Northern.—A contract has been given to Grant Smith & Co., it is said, to pierce a 1,200 ft. tunnel through the Cascade mountains in the state of Washington.

Grand Trunk Pacific.—According to press reports, a contract has been given to T. Daly, Montreal, Que., by the general contractors of the section of the National Transcontinental from Levis, Que., to the New Brunswick boundary for the completion of that section.

Gulf, Texas & Western.—An officer writes regarding the report than an extension is to be built from Seymour, Tex., west, that the company contemplates such an extension, but has not yet decided when the work will be carried out. (April 4, p. 821.)

Houston & Texas Central.—Work will soon be begun, it is said, on an extension from Llano, Tex., northwest to Brady, about 60 miles.

Intermarine Railway & Navigation Company.—The Manitoba legislature has authorized the construction of this line. The projected route is from a point near the head of Lake Winnipeg northeasterly for 122 miles to a junction with the Dominion government railway to Hudson Bay at mile 191 from Pas, Manitoba. The provisional directors include W. J. Robertson, P. J. Gordon, W. D. Boyd, K. Clemes, C. F. Just, Winnipeg, Man.

Lake Huron & Northern Ontario.—This is the new name of the Bruce Mines & Algoma, which built a 17-mile line from

Bruce Mines, Ont., on Lake Huron north to Rock Lake. A bill is before the Ontario legislature permitting the new company to buy land, and to build an extension. The plans call for a line having a total length of 325 miles. M. J. O'Brien, Pembroke, Ont.; W. H. Hewing, Montreal, Que.; J. J. Gartshore, Toronto, Ont.; H. A. Appleton and G. P. McCallum, Sault Ste. Marie, Mich., are back of the project.

Lake Winnipeg & Nelson River.—Incorporated in Manitoba to build from Township 48, range 14, west 1st meridian, northeasterly to Township 56, range 11, thence northerly to the south of Burntwood lake, with branches to the Nelson river, in Township 62, range 2; in Township 72, range 1, and Township 68, range 5. The provisional directors include J. B. Henderson, G. G. Lennox, H. G. Holman, J. E. Kyle, J. Scott, Winnipeg, Man.

Lehigh Valley.—Bids have been asked for building an extension of the Seneca Falls branch from Seneca Falls, N. Y., east to Cayuga Junction.

Lomax Terminal.—Incorporated in Illinois, with $25,000 capital and office at Lomax. The company plans to build from Nauvoo, Hancock county, northeast to Stronghurst, Henderson county, about 30 miles. The incorporators include W. T. Love, J. F. Smith, H. W. Beardsley, C. H. Kisner and L. O. Beardsley, all of Lomax.

New York Connecting.—The contract for the towers above the bases of the Hell Gate arch bridge at New York, has been let to Snare & Triest, New York City.

Puget Sound & Willapa Harbor.—See Chicago, Milwaukee & St. Paul.

Southwestern of Alabama.—An officer writes that the plans call for building from Montgomery, Ala., southwest via Hayneville, Snow Hill and Camden to River Ridge, about 107 miles. It is undecided when contracts to build the line will be let. About 12 miles of track has been laid. W. S. Richardson, Montgomery, is president.

Texas Roads.—Plans are being made by Jesse Gandy, Broken Bow, Neb., and associates, it is said, to build from San Antonio, Tex., southeast via Mathis and to Aransas Pass, about 150 miles.

Virginia-Carolina.—According to press reports work is now under way on a 9-mile extension. The road is now in operation from Abingdon, Va., east via Damascus to Konnarock, 31 miles. It is expected that the company will ask for bids soon, for work on an additional 45 miles south toward Boone, N. C. The line may be eventually extended further south to Blowing Rock.

RAILWAY STRUCTURES.

Altoona, Wis.—The Chicago, St. Paul, Minneapolis & Omaha has begun work on a new 32-stall roundhouse, machine shops and other improvements.

Beaumont, Tex.—The Texas & New Orleans has begun work on new machine shop buildings and other improvements, to cost about $40,000.

Fayetteville, N. C.—The Atlantic Coast Line will build a steel bridge, it is said, over the Cape Fear river near the present single-track bridge. Contract is reported let for the concrete work to W. Z. Williams & Co.

Lexington, Ky.—According to press reports the Louisville & Nashville will build a freight house, and is making plans for putting up a roundhouse, shops, etc., in Lexington.

Michigan City, Ind.—The Chicago, Indianapolis & Louisville has prepared plans for improved terminal facilities, including a new passenger station and a new freight house.

New York.—See New York Connecting under Railway Construction.

Somerset, Ky.—Important improvements in the Ferguson yards near Somerset, Ky., are to be made by the Cincinnati, New Orleans & Texas Pacific. The work includes an extension to the yard, building additional storehouse and repair track capacity, and the installation of a number of modern appliances.

Railway Financial News

Meridian & Memphis.—This company, which is building a line from Meridian, Miss., to Union—40 miles, and has 10 miles completed, has made a mortgage securing an issue of $800,000, 30 year, 5 per cent. bonds.

Missouri, Kansas & Texas.—Speyer & Co., New York, are offering $19,000,000 two year 5 per cent. secured notes dated May 1, 1913, at 98 yielding 6⅛ per cent. on the investment. This is part of a total authorized issue of $25,000,000. The $19,000,000 notes are issued now against deposit of $24,516,000, Missouri, Kansas & Texas consolidated mortgage 5 per cent. bonds of 1910-1940, the issue of which has been authorized by the public utilities commissions of Kansas and Missouri. The proceeds of these $19,000,000 notes are to be used to retire $17,500,000 5 per cent. notes maturing May 1, 1913, and for other corporate purposes. The remaining $6,000,000 notes are reserved for issue against the deposit of an additional amount of consolidated mortgage bonds, taken at 77½ per cent. The average annual surplus of the Missouri, Kansas & Texas Railway System for the five fiscal years ending June 30, 1912, after providing for all fixed charges, taxes, rentals, etc., amounted to $1,108,381. For the eight months ended February 28, 1913, the surplus of the Missouri, Kansas & Texas, after providing for all fixed charges, taxes, rentals, etc., was $2,693,120, an increase of $2,321,367.50 over the same period of the previous year. From July 1, 1912, to March 31, 1913, the operating revenues (partly estimated) of the system amounted to $25,251,139.84, an increase of $3,239.461 over the same period of the previous year.

New York Central & Hudson River.—J. P. Morgan has been elected a director, to succeed his father, J. P. Morgan, deceased.

New York, New Haven & Hartford.—J. P. Morgan has been elected a director to succeed his father, J. P. Morgan, deceased.

Seaboard Air Line.—The *Commercial Financial Chronicle* says that negotiations are pending for the purchase by the Seaboard Air Line of the North & South Carolina. The North & South Carolina runs from Hamlet, N. C., to Georgetown Junction, S. C., 79 miles.

Southern Pacific.—Of the $10,120,000 equipment trust certificates, the issue of which has been approved by the California Railroad Commission, $5,000,000 are to be sold in the near future. Kuhn, Loeb & Company, New York, have underwritten these notes.

See new plan for sale of Southern Pacific stock by Union Pacific in General News.

Union Pacific.—See new plan for sale of Southern Pacific stock in General News.

Baghdad Railway, Asia Minor.—After having come to a full stop for so many years at the end of its first 124-mile section, the Baghdad Railway is now beginning to make rather good progress. From the engineering standpoint, the most difficult part of the scheme is the construction of the line across the Taurus Range, and although the actual mountain section is not yet in hand, a good deal of approach work on each side has already been finished. On the southern side, the approaches include the little railway from Mersina to Adana, via Tarsus which has now been incorporated in the Baghdad undertaking. The works are already so far advanced that on the completion of the Taurus mountain section and the bridging of a short gap to the west, through railway communication will be given from Scutari to the Holy Land, via Aleppo and Damascus. Advantage is being taken of the section already open to shorten the journey between Baghdad and the Syrian coast, motorboats having now been placed on the Euphrates to run to and from the present railway terminus. This has led to the shortening of the journey between Baghdad and the coast by one-half, the time being eight and a half as against the former 17 days.

Railway Age Gazette

Published Every Friday and Daily Eight Times in June, by the
SIMMONS-BOARDMAN PUBLISHING COMPANY,
Woolworth Building, New York.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,050 copies were printed; that of those 8,050 copies, 6,601 were mailed to regular paid subscribers and 350 were provided for counter and news companies' sales; that the total copies printed this year to date were 155,959—an average of 8,664 copies a week.

Volume 54. May 2, 1913. Number 18.

CONTENTS

WHILE it would hardly be proper to say that Prof. Ripley represented the critics of the railroads in the discussion at the Economic Club dinner, he did represent the "outside" thinking public. This fact, that he is in no sense an advocate for the railroads, combined with the deep study that he has devoted to the present problem of the relations between the railroads and the country as a whole and with the unusual clear presentation of the subject which he gave, made his convictions impressive. These convictions were that railroads must in the near future be permitted to raise some of their rates and furthermore that if the roads went about it in the right way the Interstate Commerce Commission would permit substantial rate increases. A railroad man with just as deep convictions as Prof. Ripley would have seen a great many difficulties in the way of any specific proposal to remedy existing conditions. The very fact that Prof. Ripley was not intimately familiar with the more minute details of railroad operation and of the difficulties and obstacles involved in any change, made his presentation of the subject all the clearer. In a case such as this it is easily conceivable that the man who is in daily contact with the facts and the practical details is too close to the question he is studying at least to make a clear presentation of the problem as a whole and possibly even to himself grasp the problem in its broadest aspects, and for this reason especially Prof. Ripley's discussion, printed elsewhere in this issue, should be of unusual interest to railroad men.

FROM time to time in the past two weeks more or less incoherent accounts of the hearing held by Commissioner Prouty in regard to the New York, New Haven & Hartford, have appeared in the daily newspapers. It has not been so much that the papers have tried to present a one-sided view of the hearing, as it is that as yet only one side of the case has been presented, and the case is a very complicated one. If expert accountants spent two months trying to get some clear idea of the New Haven's affairs from its books, it is hardly to be wondered at that even Commissioner Prouty has found the statements of witnesses and the addresses of counsel at times almost incomprehensible. The papers that have attacked Mr. Mellen have laid great stress on the accounts that have been carried in his name. In justice to President Mellen it should be said that it is not at all unusual in banking and stock transactions, or as far as that is concerned in the transfer of real estate, to make transactions in the name of an individual, although that individual may simply represent his company or firm and have no personal or private interest in the transaction whatsoever. The New Haven's side of the controversy has not been heard. Regardless of whether or not there is a satisfactory explanation for the numerous involved transactions through the mazes of which the New Haven's affairs have been conducted in the last four or five years, the method of bookkeeping and of conducting the corporate affairs of a railroad company is a survival—not of the fittest—of methods that should have been abandoned along with rebating and other now discredited practices.

A CHICAGO newspaper published the other day a cable despatch, announcing that the Prussian parliament had decided to electrify the belt lines of the Berlin City Railway, encircling that city. The article began with the words, "Berlin is about to set Chicago a big example," the implication being that it was going to set Chicago the example of electrifying the terminals of its steam trunk lines. The fact is, that the Berlin lines in question connect the various stations and suburbs of the city, and in respect of traffic and other conditions are comparable with the Chicago elevated lines rather than with the steam railways, with their network of freight tracks and yards. It would have been more accurate to have said that the conversion of the elevated roads in Chicago and New York from steam to electric traction set Berlin an example which it is following at this late day after years of consideration. The Chicago newspapers that have been insisting on the expenditure of hundreds of millions for electrification in that city might find a "big example" suggested in a paragraph of the despatch referred to which reads, "There are some objections to the scheme to pay for the initial cost of electrification by a slight increase of fares, but the newspapers of Berlin point out that the quicker and cleaner service will be worth the fractional higher cost." The newspapers of American cities usually provide for the cost of electrification by the simple expedient of doubling the volume of the traffic. Apparently in extenuation of the attitude of the Berlin papers we are told that fares in Berlin "now are low. For less than five cents one can ride three or four miles." Suburban fares on the Chicago steam roads are at rates as low as this, and on the more comparable elevated lines one may

ride eight or ten miles for five cents. Possibly American railways are less in need of examples than some American newspapers.

THE report of the chief inspector of locomotive boilers for the year ending June 30, 1912, showed that of the 856 accidents reported, resulting in 91 deaths and 1,005 injuries, 243 accidents, or over 28 per cent., were due to defective squirt hose and connections and caused 245 injuries; while 165, or over 19 per cent., were due to burst water glasses, which resulted in one death and 168 injuries. The department of locomotive boiler inspection of the Interstate Commerce Commission has been giving special attention to bringing about better conditions in this respect and is receiving hearty co-operation from most of the railroads, many of which have taken active steps in the matter in connection with the safety first movement. The Lake Shore & Michigan Southern Mikado locomotives, described on another page of this issue, are not only of special interest because of their being the heaviest of their class of which we have a record, but because they are equipped with a device for taking cold water from the tender tank for wetting down the coal, thus eliminating danger from squirt hose and connections, which take the hot water direct from the boiler and often burst, scalding the enginemen. The details of this device are not yet available for publication, but it is one of several schemes which are being developed to eliminate the necessity of conducting steaming hot water through ordinary rubber hose, which soon becomes defective. The locomotive also has a new type of water glass shield fitted with two heavy glass plates, set at an angle of 45 deg. with each other, so that both the engineman and fireman may easily see the water glass without inconvenience. The shield entirely surrounds the water glass and is fitted with a large pipe at its lower end, through which the broken glass, steam and hot water may be conducted down and outside of the cab if the water glass breaks. Many of the shields now in use are defective because, although they may protect the enginemen from flying glass, the escaping steam and hot water is liable to injure the fireman, particularly when he attempts to close the lower water glass cock after the glass has broken. Another interesting innovation, from the standpoint of boiler inspection, is a manhole located a short distance back of the dome, which makes it possible to enter the boiler without removing the throttle standpipe, which is necessary when the inspector enters through the dome.

CONCENTRATING AUTHORITY TO REGULATE IN THE INTERSTATE COMMISSION.

THERE are certain features of current railway regulation that are discouraging to those who want to see it made both effective and fair. The tendency of the people and state legislatures to interfere unduly and unwisely with the work of regulating commissions and its effects were touched on recently in these columns (April 18, p. 867). There are other aspects of the situation that are encouraging. The most important is the trend of legislation and the decisions of the courts toward concentrating authority in the federal government, and especially in the Interstate Commerce Commission.

The earliest regulation of any importance related to rates. Numerous state legislatures passed laws requiring wholesale reductions in them. The courts at first held that this action was final, and could not be reviewed, however unreasonable. The courts subsequently reversed their attitude, holding that the determination of the reasonableness of rates was essentially a judicial function, and that they could and would prevent the law-making bodies from fixing rates that were confiscatory. Another long step was taken when it was held that a state could not regulate interstate rates, even if it nominally restricted its regulation to the part of the hauls within its borders. A few years ago the question was raised whether a state could reduce rates applying entirely within its borders if the necessary effect would be to cause reductions of interstate rates or discrimination against interstate commerce. In the Minnesota rate case Judge Sanborn of the United States Circuit Court held that such state regulation was invalid, being an interference with interstate commerce. In a case brought by Shreveport, La., the Interstate Commerce Commission held similarly, ruling that when the railways accepted low rates from points in central Texas to points in northeast Texas, prescribed by the Texas commission, it was their duty to make corresponding interstate rates from Shreveport to the same points in Texas; and the Commerce Court has just upheld this ruling. This means if the Supreme Court also so holds, that railways must either litigate unreasonably low state rates prescribed by state authority or so adjust their interstate rates as not to discriminate against interstate commerce. If the railways must face this dilemma there is no doubt as to which horn of it they will take. It seems to be the disposition of Congress to turn the entire work of federal regulation of rates over to the Interstate Commerce Commission, which means, in view of these decisions, that, broadly speaking, the commission has control of all rates, state as well as interstate.

The decisions involving regulation of rates are precedents for cases involving regulation of operation. In some instances the courts already have held invalid state regulations of operation which interfered with federal regulations. For example, the Minnesota reciprocal demurrage law was nullified on the ground that it was an interference with interstate commerce. The states in the exercise of their police power can impose many requirements on railways in the interest of public safety which affect interstate commerce. But it does not follow that they can pass in the pretended interest of safety any kind of legislation they may choose. If state legislation is merely nominally designed to further safety, and is really in purpose and effect not safety legislation at all, and interferes with interstate commerce, there can be little question that the courts can nullify it. This is especially true if it not only interferes with interstate commerce, but interferes with regulations of such commerce that have been adopted by Congress or by the Interstate Commerce Commission. For example, the full crew laws that are being passed in the various states are nominally intended to promote safety. They have, however, little or no tendency to do this, while they are an obvious and direct burden on interstate commerce, increasing, as they do, the cost of carrying it on. It seems possible, therefore, that the courts might hold them invalid even in the absence of train crew legislation by Congress, and quite probable that they would be held invalid if Congress should legislate on the subject.

Federal legislation requiring increases in the size of train crews regardless of local conditions would be as undesirable as like state legislation. But federal legislation giving the interstate commission jurisdiction over the matter might be desirable. The commission could then exercise its reasonable judgment in determining in what, if any, circumstances, more men ought to be employed; and the unreasonable state legislation on the subject probably would be made to nullity. Indeed, it probably is desirable that the Interstate Commerce Act should be so amended as specifically to give the commission the same kind of authority over operation that it has over rates – that is, authority, when, after investigation, it finds particular conditions of operation or service unreasonable, to correct them. This would protect employees and the public, and at the same time wipe out much existing undesirable state legislation. Certainly it is much more desirable that authority over railway operation and service should be concentrated in the Interstate Commerce Commission as authority over rates is being than that state legislatures, and in some cases commissions, should continue to regulate operation and service in the unwise and harmful way that they are doing now.

The already heavy duties and responsibilities of the interstate commission, and the further increases in them that seem probable, give timely interest and importance to the suggestion made by T. J. Norton, general attorney of the Santa Fe, that Congress shall "create deputy commissioners to sit throughout the

country somewhat as district judges hold court, with authority to try cases and decide them, and with the right of the losing party, if he believes that he has not received his due, to appeal to the central commission at Washington." (*Railway Age Gazette*, April 25, p. 951.) Another suggestion which has been made is that the state commissions should be correlated with the Interstate Commerce Commission. The trouble with the latter plan is that the state commissions frequently seek to promote local, at the expense of national, interests. Deputy interstate commerce commissioners would know local conditions and give due consideration to them, but would not try to subordinate national interests to them. Railway regulation is a national, not a local, problem; and regulation of both operation and rates should be on national lines. This will be best secured by concentrating the regulating authority in the Interstate Commerce Commission.

THE FIREMEN'S INCREASED WAGES.

THE locomotive firemen of the eastern roads have secured by the arbitration award, which was published last week, rather more than what the roads were willing to give them before they reached the deadlock where the controversy was referred to arbitrators. A well-informed railroad officer estimates that they have not got much more, and his estimate appears to be as accurate as can be made at the present time. The actual money to be paid, to the firemen, as figured out by a number of roads, will be around 8 per cent. greater than before. Every manager's estimate is of limited value, except for his own information, because the old rates are so varied and the changes are so complicated that an average, which is all that anybody offers, gives no measure of the justice of either the old or the new rate for any specific job. The gross increase in payrolls, including additional helpers required by the award, and very large increases to hostlers in some instances, will in many cases probably amount to a good deal more than 8 per cent. On the Erie the estimated gross increase will be 13 per cent.; and the Erie has been paying pretty good rates.

For one of the least complicated examples we may take that of the Delaware & Hudson, where the estimated total addition to the payrolls of firemen will be about 8½ per cent., and where the rates per 100 miles are as below:

Passenger Firemen.

Weight, thousand lbs.	Present Rate.	New Rate.	Increase.
80	$2.40	$2.45	$0.05
80 to 100	2.40	2.50	.10
100 to 140	2.40	2.60	.20
140 to 170	2.40	2.70	.30

Freight Firemen.

Weight, thousand lbs.	Present Rate.	New Rate.	Increase.
80 to 100	$2.60	$2.85	$0.25
100 to 140	2.85	3.00	.15
	2.60	3.00	.40
140 to 170	2.85	3.10	.25
170 to 200	2.85	3.20	.35
200 to 250	3.00	3.30	.30

The largest aggregate increase in this list will be in the item where freight firemen receive $3.20 a day, an increase of 35 cents, there being 101 engines in this class. The enginemen's award resulted, on the Delaware & Hudson, in a gross increase of 4½ per cent., a larger increase probably than on most of the stronger roads, as the D. & H. has a large proportion of short passenger runs.*

The salient features of the present award are that the firemen's minimum rates—those for the smallest engines—are somewhat above 60 per cent. of the rates paid to enginemen; that where there is more coal to be shoveled, the pay is increased, the increase being adjusted according to the weight of the engine (on drivers) and that the basis of payment for overtime is made simple and uniform.

The firemen's award, aside from the differences made in the rates to adjust the pay to the amount of coal shoveled, follows pretty closely the enginemen's. For the enginemen the arbitrators made the highest existing minimum the universal minimum; a decision which bore hardest on the smaller roads, the high minimum being already in force on the stronger ones. Engine men wanting rates above the minimum, whether for seniority or severer work or responsibility, were given nothing (except a guarantee that high rates already in force should not be reduced); and were left to settle with the roads individually. The firemen for their extra physical work are treated liberally. The weight on an engine's drivers is not an exact measure of the coal used, but it is probably near enough to work out with substantial equity as between different engines, so far as concerns any differences due to size of cylinders or of driving wheels; though there are cases where engines fitted with firebox arches, superheaters or other recent improvements are decidedly easier to fire than are lighter engines, not having the improvements on which the pay will be less. The man working the hardest will receive the smallest wages.

The demand for a second fireman on large engines was not settled. Every such question must be settled with each road on its merits. The Pennsylvania has for a number of years managed this matter rationally by having the front brakeman (qualified for promotion to the position of fireman and accorded his right of seniority for such promotion) take the place of the fireman over certain sections of the road, say one or two hours at a time as the up grades may make necessary. At the outset neither of the two brotherhoods interested accepted this arrangement very cheerfully, but the plan seems to have worked pretty well, and there does not appear to be any reason why it should not be adopted generally. On slow freights the front brakeman for long stretches of time has nothing to do but ride, and he usually rides in the engine cab. An extra fireman simply puts in a fourth man where there is none too much room for three. The question of the second man is pretty sure to lose its importance as the mechanical stoker comes gradually into use; and as the economy of large engines is now everywhere appreciated, it is to be expected that large engines—and mechanical stokers—will become more and more numerous.

As has been observed already the percentage of increase in total payments either to enginemen or firemen, is a figure relatively of little significance to the outsider because of the wide differences in the items which make up the average; but there is one marked difference between the enginemen's case and the firemen's, which is due to the length of time over which the increase applies. The enginemen were awarded rates in November which dated from May 1, thus giving many individuals hundreds of dollars in back pay. The firemen asked and expected ten months' back pay but did not get it, the arbitrators adopting the view presented by the railways that, under the law, the decision could not be made retroactive. This makes a difference of from 10 to 50 per cent. in the gross burden, according to the length of time that the arbitration stands. For example, assume that the present decision stands for four years, a road paying $1,000 a month additional, will thus be expending, as a result of this award, $48,000; but if the award had begun to run from last July the total would have been $58,000. Or, to put it in another way, if the $48,000 equals 10 per cent. increase from the present time, the setting back of the date would have changed it to over 12 per cent.

One significant clause in the present decision which did not appear in the enginemen's or in any previous arbitration is that in Article 9, to the effect that a fireman's earnings shall not be increased (above the higher rates of pay and conditions hitherto in effect and now guaranteed to him) by a combination of the new rates with the old conditions, or the old rates with the new conditions. A man, for example, who gets $3.60 for a run which ordinarily takes about 10 hours, with extra pay after 12 hours, will continue to receive $3.60, though the new rate for the run will be $3, with overtime after ten hours; but if the man continues to enjoy the old mileage rate, he must also submit to the old time limit; he must continue to work the 11th and 12th hours without overtime pay.

The firemen's settlement now reinforces the enginemen's in confirmation of the principle that a road making scanty profits,

*The result of the present increase on one of the larger roads is noticed in another column.

or even one doing business at a loss, must pay as good wages as a more prosperous line. The fundamental principle that the roads shall act together and shall recognize the brotherhoods as authoritatively representing their employees is also further entrenched. These points settled, arbitration must become more and more common, for each controversy becomes of such magnitude that no railway officer and no labor leader will take the responsibility of abating his demands, except under the most thorough investigation of facts and the most strenuous efforts at impartiality that it is possible to secure.

The firemen's problems were in a sense easy because, to so large an extent, the basis of their settlement could be found in the enginemen's agreement. (*Railway Age Gazette*, November 29, 1912, page 1039.) For this reason the weaknesses of the Erdman law do not specially stand out in this case. But those weaknesses still exist, and the duty resting on Congress to cure them is as grave as ever.

THE NEED FOR CONCERTED ACTION REGARDING VALUATION.

A GREAT part of the public regards the railways of the United States as a big trust. Many people think that regarding matters affecting only the railways of a particular territory all of the railway managers in that territory stand and work together; and that likewise in matters affecting all of the railways of the country all the railway managers get together and present a united front. No view could be more incorrect. No class of men in the same line of business differ more or find it harder to pull together than railway managers. This is chiefly due to competitive rivalries both between individuals and between the railways they represent. Only when confronted with strong necessity can the railways be brought to work harmoniously together, and even when the need for close co-operation between them seems obvious and great, they often pull apart and work at cross purposes. One of the classic examples was the way they handled the rate advance cases. Not only did not the eastern and western roads present a united front, but even roads in the same territory presented their cases to the commission on conflicting and mutually destructive theories. It was largely due to the bungling failure of the railways to get together in the handling of these cases that they completely lost both of them. This is pretty generally admitted now by railway officers. It is unfortunate that in spite of their great ability, the hindsight of many railway managers, like that of many other people, is often much better than their foresight.

Never has there arisen in this country any matter more imperatively demanding constructive and concerted action by the railways than the valuation of railway properties that has been provided for by Congress. There is hardly a point regarding the subject of valuation of railways on which there is an approach to agreement by engineers and economists. Many people think that the valuation should be based entirely on the cost of reproduction, but there is no general agreement as to what factors should enter into the cost of reproduction, as to how they should be ascertained, or as to the weight that should be given to each of them. There are varying opinions in regard to the unit costs that should be used, as to the way in which the right of way should be appraised, as to the amount that should be allowed for depreciation of the track and equipment on account of its use, as to the amount that shall be allowed for appreciation because of subdivication and adaptation of roadbed, and so on *ad infinitum*. The way that these various questions are settled will affect by hundreds of millions, if not actually by billions of dollars, the total amount of the valuation. Again, some people contend that no weight should be given to the intangible values of railways, while others contend that great weight should be given to them, and the way this question is settled will also affect the valuation as a whole by an enormous sum. The purpose of valuation is the same as to every railway. The principles on which, and the methods according to which, the valuation of all the railways should be made are the same. Therefore, it would seem that it should be possible for the managers of all the railways, through some organization created for that purpose, to work out a harmonious, unified plan to present to, and urge upon the attention of, the Interstate Commerce Commission.

It is not conceivable that the commission would make any objection to this being done. On the contrary, it would seem that the commission should welcome such action by the railways, for it would greatly simplify the commission's work. That some such concerted action by the railways themselves is desirable and would be advantageous, seems clear. Every railway manager concedes that the railways as a whole have lost heavily in the past by not hanging together when it was important that they should do so. There is no reason for thinking that working at cross purposes, or without a well defined plan or a good organization to carry it through will have any better results in this instance than it has had in others. There will be a scheme of valuation adopted and carried out. If the railways act harmoniously together they doubtless can exert much influence on the formulation and execution of that scheme. If they do not do so they will have mighty little influence on either its formulation or its execution.

The executives of a large number of railways met in New York last week and discussed what attitude the railways should assume and what action they should take. The meeting resulted in the appointment of a committee whose functions and duties have not been clearly defined. It is to be hoped that this is the first step toward harmonious, unified and organized action, and is to be followed by the appointment of a strong working committee. Ever since the Esch-Townsend bill was presented in Congress the record of the railways in dealing with proposed regulation has been very largely one of discord, bungling and defeat. Surely past experience contains a lesson that should be applied in handling this enormously important matter of valuation.

NEW BOOKS.

Valuation of Public Service Corporations; Legal and Economic Phases of Valuation for Rate Making and Public Purchase. By Robert H. Whitten, Ph.D. 798 pages, 5¾ in x 9¼ in. Buckram. Published by the Banks Law Publishing Company, New York. Price, $5.50.

The subject with which this book deals is at present one of leading public interest and importance. Its interest and importance have been much increased by the legislation providing for a valuation of all of the railways in the United States by the Interstate Commerce Commission. The work deals chiefly with the legal and economic phases of valuation, although it touches on pertinent engineering matters.

The three main purposes for which valuations of public utilities may be made are to furnish bases for taxation, for the regulation of rates and for public purchase. It is valuation for the latter two purposes that Dr. Whitten chiefly discusses. He believes there is a very close relationship between valuation for rate purposes and for public purchase. He recognizes the fact, however, that in a valuation for public purchase the net earnings must be given much weight, while valuation for rate purposes is really to determine, not what the commercial value of a property is, but to a large degree, what it ought to be, and that, therefore, it is desirable to treat valuation for the two purposes separately.

The book covers quite thoroughly the views expressed by valuation engineers and in the opinions of commissions and courts regarding the various factors that should be included in valuations and the weight that should be given to them. Among the important points treated are the weight to be given to the cost of reproduction and to actual cost; the proper methods of appraising lands; the consideration to be given to land donated

or acquired without cost; to value added by expenditures from earnings, to adaptation and solidification, to physical depreciation to going value, and to franchise value; the rate of return that should be allowed, etc.

Dr. Whitten's expressions of opinion on disputed points indicate that he believes that valuation for rate purposes should be made and the percentage of return fixed on bases which officers of public utilities would consider unfair to their companies. Doubtless his connection with one of the public service commissions of New York has influenced his attitude. The Wisconsin Railroad Commission, which has won an enviable reputation for fairness and effectiveness, has generally followed a less restrictive policy than Dr. Whitten seems to favor. The same thing may be said of the New York Public Service Commission for the Second District and of the Washington Railroad Commission. However, while Dr. Whitten himself favors a policy of regulation that would be likely to hamper more or less the development of public utilities, his book, as has been indicated, fully presents the views of the authorities. It is, in fact, an interesting and valuable work, and deals very satisfactorily with the legal and economic aspects of valuation. The last chapter contains an excellent bibliography.

The Biographical Directory of the Railway Officials of America. 1913 Edition. Compiled and edited by Harold Francis Lane, associate editor of the *Railway Age Gazette*. 623 pages, 7 in. x 9 in. Published by the Simmons-Boardman Publishing Company, New York, and distributed by the McGraw-Hill Book Company, 239 West Thirty-ninth street, New York. Cloth. Price, $4.

The 1913 edition of the Biographical Directory is the seventh in a series begun by the Railway Age Company in 1885 for the purpose of furnishing a concise record of the railway history of the men who build, control and carry on the operation of the railways of North America, arranged alphabetically for personal reference, rather than under the titles of their companies. Previous issues have been published in 1885, 1887, 1893, 1896, 1901 and 1906, and the book is too well known to require extended description. It has come to be recognized as an indispensable reference book in every railway library as the only comprehensive history of the professional careers of American railway officials. On account of the large number of changes in railway personnel that have come about in the seven years since the last edition was published the present edition, in which the sketches are brought up to March 1, should be especially valuable.

The first issue, in June, 1885, contained 3,764 names, not all of them accompanied by a personal record, requiring 276 pages. The present volume includes over 4,200 personal histories, occupying 623 pages. Each successive volume has shown many new officials added and many old names removed by death or retirement from railway life, and while there are many names in the 1913 edition that were also included in the first edition in 1885, the records for 1913 will be found to be largely those of men not named in the volume for 1885—many of them not even in the 1906 edition. A new generation has come into command of our railways.

Over four hundred sketches which were included in the preceding volume, for 1906, have been eliminated on account of death and many more on account of retirement from service or for other reasons, while more than 1,500 new sketches have been inserted. Many of these are of young men who have come to official rank since the last edition was published and there also appear a number of sketches of railway officials of extended service who had hitherto failed to furnish the necessary data. Included in this volume are the names of many men who have left important positions in railway service to engage in other business, but whose railway record still continues to be a matter of general interest. The policy has been continued of republishing sketches of former railway officials now retired where there is evidence that they are living.

As in the 1906 edition biographical sketches of the members of the Interstate Commerce Commission and of many of the state railway commissioners are grouped in alphabetical order at the end of the volume.

Letters to the Editor.

CAR UNDERFRAME DESIGN.

Pittsburgh, Pa., April [illegible], 1913.

To the Editor of the Railway Age Gazette:

I have just read Mr. LaBach's article on horizontal bracing of a car, and following his line of argument may say that tender frames are often braced by diagonal members, also passenger cars. Freight car underframes with very few exceptions are considered sufficiently stiffened by the floors of the car, be it composite or steel. This is economical construction, inasmuch as the floor is necessary anyhow.

The general question of resistance of the car towards longitudinal shocks is not receiving the attention that it should. Suppose a car, weak in that direction, fails in a long train. It will naturally cause a wreck and suffer damage, but what is more significant, all the other cars, weak or strong, will suffer likewise. Therefore, all the cars offered in interchange should be made of a certain standard strength. We have standards and specifications for bolsters, wheels, arch bars, axles, bolts, brake beams, couplers, hose, and dozens of other details, but we have none for the car itself. Occasionally we hear persons advocating a standard car for all the roads, and rightly too, but until such a time we should have specifications covering the minimum strength longitudinally so as to make the trains of a uniform resisting strength.

This in turn would also protect the car trust companies more than heretofore, as a car of a certain capacity would then represent a more fixed value. At the present time possibly no two opinions would agree as to longitudinal strength required.

In the vertical direction, i. e., the carrying strength, we are somewhat better off, but even here rigid specifications as to maximum fiber stresses under certain maximum conditions are badly needed.

A. Stucki.

CAPITALIZING BRAIN AND BRAWN.

Baltimore, Md., January 8, 1913.

To the Editor of the Railway Age Gazette:

Those who own and operate our railroads, particularly the men who hold the strings to the treasury and by their skilled diplomatic financiering can induce bankers and investors to furnish millions of dollars to readily redeem maturing obligations or pay for necessary improvements, are up against a most perplexing problem which will test their ingenuity. I refer to the investment of the surplus earnings of all railroad employees; that is, the creation of a means to protect them against loss of their savings by unfortunate speculation.

The statement may surprise some people, but it is nevertheless true, that many railroad employees are often prey for the unscrupulous stock promoter, the land and loan shark, and other rainbow fortune builders who believe that the railroad field has a perpetual crop of "Easy Marks" who can be fleeced with impunity.

The nature of the railroad man's daily occupation often makes him the "good fellow" who usually gets "bit," because he is too big hearted to turn down an acquaintance who he believes is doing an honest business. It is most regrettable that these "philanthropic investments" frequently prove to be "nightmares," and not alone affect the railroad man who is the unfortunate, but also cause hardship to his family or those dependent upon him.

It is a well-known fact that millions of dollars are set aside or are being accumulated by the railroads in insurance, pension, savings and other funds for the benefit of their hundreds of thousands of employees, which is commendable. But there is evidence to show that the surplus earnings of employees are not always diverted in the right direction, where profits would replace losses.

By protecting the interests of employees railroads are assured

of greater efficiency in work performed, and employees generally become more contented. It requires wisdom—unusual tact—to guide the welfare, comfort and health of employees, perhaps to as great a degree as to guarantee safety to the traveling public, and the railroad management that can accomplish this task without causing unnecessary friction will carry the banner of prosperity for all time.

Various schemes to accomplish this work have been suggested at different times, but as a rule the men who guide the destiny of our railroads have been too busy with other duties pertaining to the physical improvement of the roads to devote careful thought to this problem the solution of which should be mutually beneficial. It is to the credit of a few of our railroad presidents that they seem willing to give the matter the attention it deserves, and it would not be surprising to learn that some plan will be adopted in the not distant future whereby railroad employees may invest their surplus earnings with security, perhaps in the stock or bonds of their employing railroad, payment for same to be made in instalments and at a convenient ratio to their salaries. Large corporations in other industries have adopted the "profit-sharing" idea with success, so why should not the railroads?

Chas. C. Schnatterbeck.

THE CRIME OF 45.

Iowa, April 26, 1913.

To the Editor of the Railway Age Gazette:

Twenty years ago the question of tramp railroad men, particularly enginemen and trainmen, had become serious so far as it affected the standard of efficiency. Railroad managers seeking a remedy for the trouble looked to European railroad practice, but in doing so failed to realize the difference in conditions and that as the United States became settled and railroad construction materially decreased, the conditions prevailing here would, to a great extent, right themselves. It was simply a question of wanderlust and new territory and a demand for men which made it an easy matter to satisfy the craving.

While the establishment of pension funds by European railroads naturally induced men to remain with one railroad during their working life, the establishing of these benefits were not brought about by conditions similar to those existing in the United States, for the reason that the average European, particularly the Englishman, seldom has more than one trade, business or profession at his fingers' end; has no new country at home to explore and almost invariably remains with one employer as long as it is possible for him to do so.

American railroad managers considered they had the solution to their troubles in the pension fund and to a great extent they undoubtedly had and nothing but good would have resulted had they been content to adopt the European system without trying to make it effectual by arbitrary age limit rules. In England the rules of the pension fund in effect on most railroads provide, or did provide at the time they were established, that new men under 21 years of age, or men over 47 were not entitled to the benefits of the fund, and consequently would not be admitted to membership. We, wiser in our generation than the Britisher, conceived the idea of making the pension scheme complete and binding by also establishing an age limit rule—not a limit of age at which a man would be barred from participating in the benefits of the pension fund, but a limit of age at which we would take from him the undeniable right to work and support his family—hence the age limit rule, written and unwritten, now in effect on many of the larger and standard railroads of this, God's country.

Is this rule, in its application to the individual, just or unjust? Does the arbitrary application of the rule increase the standard of efficiency and is it a humane rule to enforce against labor?

The age limit rule practically says that no inexperienced man over 36 years of age, or experienced man over 45 years shall be employed. In other words the enforcement of this rule implies that an inexperienced man at 36 years of age, or over, is not considered good material for training, and an experienced man at 45 or over, should he unfortunately be seeking railroad employment, is not a desirable man to employ.

On the other hand should an inexperienced man between the age of 33 and 36, or an experienced man between 42 and 45, obtain employment it is, according to pension fund statistics, considered they will, provided they remain physically fit, render good service up to 65 or 70 years of age. In other words the factor in deciding a man's fitness is not his age, but whether he happens to be employed or unemployed at a certain age.

The rules of the pension fund, by fixing the age at which a man retires at 65 or 70, lead us to assume that statistics show that an experienced man can give good service up to, at the least, 60 years of age; yet the application of the age limit rule means to those seeking employment that notwithstanding their years of experience, at 45 years their services are no longer required by railroads. In the absence of a knowledge of the principles underlying these rules, it would appear that it is a crime to be 45 years of age and the unpardonable sin to be seeking employment at that age.

All sensible men will admit that a man should before reaching the age of 36, know what trade, business or profession he wishes to engage in; consequently the rule relative to the hiring of inexperienced men does not inflict much, if any, hardship on that class seeking employment, but to say that a man at 45 years of age, with perhaps twenty or twenty-five years' practical experience to his credit, able to pass physical and other examinations, cannot give equally as good, if not better service than the inexperienced man hired at the age of 33 or 34, is asking us to believe that which our experience and common sense tell us is not true.

Pension funds, relief departments and civil service rules have and always will prove a boon to the rank and file of American railroad men. They provide against old age and sickness; have helped increase the standard of efficiency of service; have in many instances advanced men, due to seniority in service, when under old conditions with no civil service rules, their fitness would be doubted. It is, however, a question whether these funds and the application of civil service rules encourage and promote individuality and initiative—individuality and initiative which have produced a score or more American railroad presidents and managers to whom the world takes off its hat. Pension funds and civil service rules make capable men, loyal men, and men who stick; but that these benefits and rules stand for individuality and initiative is open to question.

If equity is a law in our hearts and its proper object is to secure the rights of humanity decided by the consciousness of right and wrong, let us by every rule of equity wash out the crime of 45 before it becomes a question of man's inhumanity to man. Let us judge the fitness of men by their mental and physical condition instead of by an arbitrary age limit rule.

Equity requires us to do to others what in similar circumstances we would expect from them.

Buenos Ano.

Oil Fuel in India.—India, like the rest of the world, is suffering from an increase in the price of everything, including coal. Hence locomotive engineers there are considering the use of oil, and the adoption of oil-engine locomotives has been seriously put forward in connection with the operation of the waterless track over which the Trans-Persian Railway would have to pass. This, however, is very much in the future, but there are still many places in India where oil fuel would be seriously worth consideration. In order to test the matter thoroughly, the Indian government will soon carry out an important series of trials on the North Western Railway, and has made a contract for the supply of about 7,000 tons of oil for the purpose. Six engines will be fitted in the first instance, and carefully trained crews employed so as to ensure a proper comparison between the practical values of Bengal coal and Persian oil under regular service conditions.

ARE OUR RAILROADS FAIRLY TREATED?

A Discussion Before the Economic Club In Which the Bankers, the Public, the Railroads and Labor Were Represented.

The last dinner of the season of the Economic Club of New York was held on April 29 and the subject for discussion was "Are Our Railroads Fairly Treated?" The speakers were W. C. Brown of the New York Central, F. A. Delano of the Wabash, A. B. Garretson of the Brotherhood of Railroad Conductors, B. F. Bush of the Missouri Pacific and Prof. Wm. Z. Ripley of Harvard University. James Speyer, president of the club, made a short introductory talk in which, although he did not attempt to finally pass upon the question presented for discussion, he indicated clearly that in his opinion—that of a banker financially interested in thousands of miles of railroad—the railroads are not being treated in such a way as to induce new capital to seek investment in their securities.

Mr. Brown, viewing the question as a railroad president, spoke of the necessity for further investment in American railroads and outlined clearly how pressing were these necessities.

Mr. Garretson discussed the question from the point of view of organized labor, with a breadth of judgment, however, that is his own. He presented figures which he said were those on which the ordinary workingman on a railroad based his opinion as to whether or not the owners were receiving a fair return on their investment. According to these figures, the return on the investment in railroad property, and by this Mr. Garretson apparently meant dividends paid on railroad stocks, had increased very much faster during the past decade than had the rate of expenses of the roads, or than had the rate of investment of new capital. Mr. Garretson pointed out that the employees, and more particularly the railroad conductors, knew what was going on in the management of the properties, knew if the management was using improper methods and he made a strong plea that railroad managements do nothing which they could not give full publicity to. He closed his address by saying that in his opinion the dual control and dual regulation of railroad operation and activities by the states and the federal authorities was wrong in principle and put a hardship on the railroads that was wholly unfair and oppressive. He stated emphatically that in his opinion railroads could only be regulated fairly and properly by the federal authorities and the interference in this regulation by states was an unmixed misfortune.

Abstracts of Prof. Ripley's, Mr. Delano's and Mr. Bush's remarks follow:

PROF. RIPLEY'S ADDRESS.

The most striking feature of the railroad problem in 1913 is the contrast with conditions ten years earlier. Instead of unexampled prosperity, a period of great financial depression in transportation business has supervened. In place of practical domination in the economic life of the country, the carriers now seem to be more or less at the mercy of circumstances. Organized labor under threat of general strikes has forced substantial concessions both in wages and conditions. The carriers have acquiesced manfully in the mandate of the people that they shall be subject to public control. But they find themselves now by the pressure of increasing costs of operation and of ever greater demands from the public for more and better service, practically compelled to throw themselves upon the mercy of the Interstate Commerce Commission for relief. This relief is demanded, not alone in the interest of investors, but in order that much needed improvements and extensions commensurate with the development of the country may be made. It is a self-evident proposition that unless the railroads are prosperous and protected in the exercise of their property rights, a healthy growth of transportation facilities cannot be had. Adequate service and the convenience of the public require that the present plight of the railways should receive the most earnest consideration.

Railway net income which culminated in 1910 has now declined from that level by about one-eighth, despite a considerable increase in gross earnings. The latest evidence shows a halting and uncertain movement. This condition of affairs makes it practically impossible for the carriers to raise funds by the sale, even of bonds, except at high rates of interest. Further continuation of hand-to-mouth financing by issuance of short-term notes is fraught with danger. A menace to continued prosperity also is the successful pressure of the railroad brotherhoods for substantial increases of wages.

Under ordinary circumstances relief might be had from three directions, greater economy and efficiency, a substantial growth of traffic, or an increase of rates.

Economy and greater efficiency of operation, as a remedy for deficiency of revenue, played a large part in the rate advance cases of 1910. But it is clear that railroads, as a field for the introduction of scientific management methods, are considerably handicapped. Rigid rules of the railway brotherhoods are difficult to overcome. The wide geographical extension of operations renders detailed superintendence impossible. And the steadily increasing demands of the public for more and better service, regardless of cost, hinder the introduction of many plans for more scientific operation. On the whole, American railroads are operated at the high level of efficiency. Certain economies ought, nevertheless, to be effected. Among these should be a careful revision of purchasing department methods. Laxity and private profit ought to be rigorously excluded. Every advantage should be taken of the open market regardless of financial affiliation with the large industrial combinations. This point was especially referred to in the eastern rate advance cases of 1910. Contracts with private car and express companies ought to be reduced to the lowest possible figures, so that all suspicion of favoritism should likewise be eliminated. With houses thus set in order, the roads should be able to present a strong case for efficiency. They need fear no comparison with any other country in the world.

Increase in tonnage, as a remedy for the existing distress, promises less relief than might have been expected five years ago. This follows naturally from the rise of operating costs already mentioned. But it is also established by the clear demonstration that after a certain point of traffic congestion has been reached immediate, general and extraordinary outlay of capital is necessary in order to handle further increments of tonnage. Unless earnings, therefore, are sufficiently ample to permit of large annual improvements out of income, the demand for new capital seems bound to outrun the earning power.

It is apparent from the foregoing statements that relief can be afforded for the present crisis in a large way only by the sanction by the government under the new powers of control exercised since 1906-10, of a general increase of rates chargeable for service. Experience of the last ten years emphasizes the point that such relief can scarcely be afforded piecemeal. The growing unity of interest of all carriers arises, not only out of the close interrelation of rates all over the country under the stress of commercial competition, but also because of the practical standardization of the largest item in railway expenses, namely, the outgo for wages under pressure from the railroad brotherhoods. It would appear therefore that in place of attempts, road by road, to raise rates on individual commodities, what is needed is the formulation of a carefully prepared plan of more general revision.

A substantial increase of revenue by means of higher freight rates seems, then, inevitable. But the failure to secure the approval of the Interstate Commerce Commission in 1910, instead of being discouraging, should point out the way for the future. The commission at that time promised to consider similar proposi-

tions in future without prejudice. They have, as a matter of fact, since 1910 permitted more raises of rates than they have denied, as shown by the following statement:

Proposed advances approved	66
Proposed advances approved in part	18
Proposed advances disapproved	60
Proposed advances voluntarily withdrawn	18

And then in addition to these cases of suspension, thousands of increases have been allowed to take place without interference. For New England, thus far, not a single proposed increase has been permanently prevented; and an aggregate increase of charges of over $3,000,000 has actually occurred since 1910. The policy of the carriers should be to cease crying "Wolf," thereby arousing distrust among investors, and to go confidently forward and prepare a strong and logically defensible schedule of advances to present to the proper authorities.

In the upward revision of rates the representatives of shippers should be consulted, as was recently done in the increase of transcontinental rates, just sanctioned by the commission. Many favors to the trusts which now exist through unduly low rates on such commodities as sugar, copper, cattle and beef and steel products should first of all be corrected. Despite the great rise in prices, rates on many of these trust-made commodities are no higher than they were in 1900. All suspicion that interlocking directorates have perpetuated these unreasonably low freight rates should be met. The relation between rates to large cities and industrial centers, as compared with local charges, needs attention also. If the railways come with clean hands, well ordered houses and a proper scheme of increases, the Interstate Commerce Commission can scarcely fail to recognize the justice of their demands.

Positive remedial legislation in the interest of railroads, as distinct from mere administrative sanction of rate increases, is distinctly demanded also by the situation respecting arbitration of wage disputes. The Erdman Act of 1898 is notoriously unfair to the carriers, leading, as it always does, to a compromise decision rather than to a settlement upon the merits of the case. This results from the fact that the entire responsibility for the final decision rests upon the third member of the arbitration board representing the public, as distinct from the other two representatives of the carriers and their organized employees respectively. The law should be amended to provide for a commission in part composed of permanent government experts, the remainder of its membership being made up of members chosen to represent directly the three parties in interest, the railroads, the employees and the public. But the public representation should at all times out-number that of the carriers and the operatives. Only thus, by a massing of responsibility in strictly impartial hands, may decisions be expected on the real merits of the case.

MR. DELANO'S ADDRESS.

"Are Our Railroads Treated Fairly?" Although that question is the subject of our debate, it is not my intention to attempt to answer it. I shall make an effort to tell briefly the history of the situation and describe the present conditions, and let you decide for yourselves, from the facts.

The first steam railroads were built scarcely more than 80 years ago. As you all know, in no country of the world has their growth been as rapid as here, and nowhere else has so much been accomplished by private enterprise. During the first 60 of these 80 years every possible encouragement was given to the promoter and investor to build into new territory or to duplicate existing lines. The evils which flowed from excessive railroad building and over speculation in railroad construction cannot be laid wholly at the door of the railroad men of the time, but must be shared equally by the general public, for everything was done to encourage the last of construction. Full and complete dependence was placed upon the competitive theory. And yet, through all this period, in spite of all the glowing prospectuses of the promoters of the day, it was recognized that investments in railway securities were hazardous. Forty and fifty years ago the interest rates on railway bonds were 7 to 10 per cent., and this, with discounts and stock bonuses given, brought the net interest burden upon the railroads to fully 10 per cent. Usually neither the states nor the communities gave any guarantees whatever. On the other hand, there was no intimation that profits would be limited to what the courts now call "a fair rate of interest on the investment." The reasonable expectation of the investor was that, while some of these investments might prove disastrous, they might prove very profitable.

Towards the end of this first 60-year period, the evils of the competitive system began to make themselves felt, and public opinion demanded remedial legislation. Briefly stated, those evils were excessive discrimination between communities and even between individuals. The first important legislative effort at a remedy was the passage of the Interstate Commerce law, 25 years ago. Since that time, especially within the last 20-year period, there has been a constantly growing public sentiment of hostility towards the railways. I shall make no attempt to justify the acts of the railways during these first decades of development, although I think much might be said on that score. Any student of the question can readily see that the conditions were the natural result of the method. Communities everywhere did all they could to get the railroads competing with each other, in order to secure by this very competitive system discrimination in their own favor; large industries in their own sphere did the same thing, and the reaction finally came when there were not enough favors left to go around. Communities and individuals who got less than they thought they ought to get began to raise objections to the system which they had themselves helped to create.

Briefly, then, the history of the railroads has been:

First. Sixty years of rapid extension and competitive building, leading to intense strife for traffic, encouraged in every possible way by the communities.

Second. Growing dissatisfaction with the railroads during the latter part of this period.

Third. An entire change of policy in the last 20-year period, compelling an entire readjustment by the railways.

This latter phase is the one in which we are particularly interested today. It is not necessary to tell a body of business men or economists that readjustment is the most difficult problem which business has to encounter. We have a good example of that in the tariff question. Many of us favor a decided reduction of the tariff, but even the most ardent believer in a tariff for revenue rather than a tariff for protection can see the immense difficulties of readjustment when it is remembered that wages and all the methods of manufacture have been predicated on one set of conditions and must be rudely or quickly readjusted to another set of conditions. In this period of readjustment the railroads have also been confronted by the swelling tide of dissatisfaction which has shown itself chiefly in an unfriendly, if not hostile, public opinion. It may be said that in the 60 years of our growth we "sowed the wind" and are now "reaping the whirlwind," but in any fair review of the facts I think it will have to be acknowledged that the whole community shared in bringing about this result.

The greatest difficulty the railways have today arises from the fact that the policy of the country as a whole is inconsistent and unsettled, for, while the federal and state governments have emphatically adopted the theory of the regulation of rates, public opinion and the law still retain the theory of the competitive system. In other words, the community as a whole seems unwilling to trust the regulation theory or else wants to get all the advantage of both theories.

The plea of the railroad man to-day is that either he be let alone to work out his own salvation under the competitive system, or that the country shall acknowledge that the competitive system is so objectionable in some of its results that

we must rely solely on federal and state authorities to pass upon or fix rates. Someone will say this is a plea for "pooling," and the evils of the old "pool" days will be recalled; but that is not the contention. The claim is that if we must submit to the regulation of rates, then we should be free to make binding agreements between ourselves in respect to rates, time schedules, terminal allowances and multitudinous matters in connection with our public duties, subject always to full and complete publicity and the approval of the state and national authorities.

The hostile public opinion to which I have already referred has borne down upon the railroads in numerous exactions of law, sometimes veiled under the guise of the necessities of public safety, but more often nothing more nor less than in the spirit of retaliation against the railroads. Unfortunately, too, during the latter portion of the period of which I am speaking, much of this legislation has been fathered by labor organizations among our own employees who, instead of being loyal to their employers, are actually "lobbying" against us. I am not saying this in unfriendliness to labor men, but because I feel that I must in this discussion talk plainly and not mince matters.

I shall attempt a brief review of some of this legislation that you may have the matter clearly before you:

Legislation for the Two-Cent Fare Law.—The net effect of this legislation has been a severe impairment of railway passenger earnings.

Postal Legislation.—Great reductions in the compensation by the government to the railroads for carrying the mails have been made, until this service on many railways is done at an actual loss and at the expense of other business.

The Hours of Service and Safety Appliance Laws, although adding to the burdens borne by the railways, were so obviously regulations intended to promote safety that I mention them not in complaint, but only as a matter of record.

The Boiler Inspection Law.—The ostensible object of this law was to promote the safety of engineers and firemen, but its effect has been very much more far reaching. The fact that the inspectors ordinarily use discretion and common sense in administering the law, that they do not always enforce its provisions to the letter, is the only reason that it is operative at all; but that is poor satisfaction to the railroad official.

Electric Headlight Laws.—In a number of states electric headlight laws have been enacted, ostensibly for the protection of the locomotive engineer and the traveling public, but really for the promotion and benefit of an electric headlight corporation, in the official ranks of which members of the Brotherhood of Locomotive Engineers are prominent. This is certainly not a creditable record for an organization which is justly proud of its long reputation for honorable dealing and conservatism. These state laws in many cases do not require a headlight of adequate candle power, for by specifying an electric light or very high candle power, they exclude equally effective acetylene headlights, although it is a notorious fact that these have proved simple and satisfactory in service on automobiles all over this and other countries.

The So-Called "Full-Crew" Laws.—I need hardly tell a New York audience about these laws. They are among the most unjust exactions which railroads have ever had to face. Several years ago the federal government required the railroads to equip all their freight cars, as well as passenger cars and locomotives, with air brakes, and stipulated that the speed of trains should be entirely controlled by the locomotive engineer. Now comes this organization of trainmen, boasting a membership of over 200,000, and under an offensive and defensive alliance with the other railroad organizations, having the tacit support of all, and by means of its lobbies and pre-election pledges, is trying to compel the railways to employ unnecessary men. The object of this trainmen's organization is purely selfish. Its members realize as well as every employer or economist that wages are controlled in the long run by demand and supply; that by compelling the railroads to employ this additional brakeman on every train, they will increase the demand and help to exhaust the supply; thus influence wages.

The results of these changes in policy and the enforced readjustments are beginning to be apparent. They should have your consideration, for they are of immense importance

First of all, it is very clear that the period of railroad building and extensions is over. A great deal of capital is needed and will be used in completing and improving existing railroads and in adding to their equipment and facilities; but the period of building extensions into new territory is over, because there is no encouragement to the investor.

Second, the railroads' cost of living has gone up enormously in the last twenty years. Staple necessities, such as fuel and ties, have increased very largely in cost, and at the same time the standards of service which the public demands have greatly risen. In order to increase their efficiency, railroads have been compelled to use larger locomotives, increase their tons per train; this in turn has created a demand for larger and stronger cars, heavier rail, better roadbed, and so on.

Another important point is that in recent years the general rate of interest has risen. It has risen against the railways as well as against other borrowers, and, therefore, to raise adequate capital the railways must pay, and must, therefore, earn a larger return on capital than formerly was necessary. Railways which a few years ago could sell 3½ per cent. bonds at par cannot now sell 4½ per cent. bonds at par. The net earnings of the railways have not increased in proportion to the increase in the amount that they must pay to get new capital or to refund old securities.

Third, every new public demand of the federal or state government or the municipality puts a burden which is especially heavy to bear by the railway company with small resources. It is perfectly clear to railroad men that the day of the small railroad has absolutely gone. A railroad of less than 500 miles which is not an adjunct to an important mining or manufacturing concern has little show for existence. Although public opinion more or less resents the great railroad corporations and the excessive centralization of authority incident to these large corporations, yet it is perfectly clear that the many exactions of law to which I have briefly referred have had much to do with bringing them into being. In the battle for existence only the strongest have been able to survive.

Fourth, it has been sometimes pointed out that poverty and wealth are largely comparative terms; and certainly this applies to railway corporations just as much as to individuals. The plea of the relatively poor corporation for an advance in rates is unheeded. Our commissions think only of the profits which our richest corporations will make by reason of a possible advance. The fact that the richest corporations represent relatively small proportion of the total mileage; that they are rich by reason of fortunate chance or extraordinary foresight; that many of them are corporations which went through a long struggle in their early history and only after bankruptcy were put upon a paying basis, is forgotten. The very complexity of all these questions points clearly to the principle that the public should more and more depend on expert knowledge in the regulation of the railways, and not attempt this regulation by annual legislative enactments.

Fifth, the greatest hope of the railways and the public in the future lies in intelligent regulation. Railway officers whom I meet and talk with do not in the least fear the results of regulation by commissions free from political pressure, with a fair knowledge of the facts. Our experience is that these commissions, as they come to know the problem better, are more and more willing to understand the railroad man's point of view, and, as we think, deal fairly with us. One of the great troubles is that while the public and the legislatures have created these commissions on the theory that they will

be most competent to solve the problems of public regulation, the public and legislatures will not refrain from interfering with the work of the commissions. In many states the legislatures or the people by referendums have adopted laws to reduce rates or impose unreasonable restrictions or burdens on the railways when the legislation was openly opposed as unreasonable, unjust and harmful by the commissions. The public shows too much of a disposition to disregard injunctions of experts to be fair and moderate, even when they proceed from its own experts, and to trust and follow only those public men who advocate radical and even violent measures. We are not blind to the danger which lies in the public clamor for better service and more exacting requirements. It sometimes seems as if every man's hand were against us, and as if few men in public life could be found to possess the requisite courage to withstand the pressure; but my opinion is that while the public is slow in making up its mind, it finally comes to a right conclusion and the reaction is all the more effective when it does come. The time is sure to arrive when the public will see that if there isn't a fair profit in railway operation the development is bound to cease, because capital will seek other and more gainful occupations.

MR. BUSH'S ADDRESS.

As to how the railroads can secure the money necessary to make the improvements and extensions to efficiently provide for the carriage of the existing and increasing traffic, so that all lines of industry may develop and operate to full advantage and our vast tide of commerce still further expand and flow unrestricted to its final haven, is "The Railroad Problem."

As the conditions are today, by reason of not having the means at their command, the railroads, with few if any exceptions, cannot give proper movement to the large volume of existing traffic. This was likewise true in 1906, 1907, 1910 and 1912. The transportation facilities are not keeping pace with the increasing traffic requirements.

Legislation of the most onerous character has in recent years been enacted by federal and state authority, entailing numerous expenditures without any compensatory provision, many of the acts being entirely without beneficial results to the public and only an economic waste. Three or four bills now being urged upon Congress are estimated to involve an expenditure by the railroads within the next four years of nearly a billion and a half dollars.

These many expenses over which the railroad manager has no power of control have steadily increased the unit cost of operation, and as the unit of compensation for transportation service is regulated by federal and state authority, and is more often reduced than advanced, it follows that the unit of profit is steadily decreasing. If these two opposing units of conditions, cost and compensation, are allowed to continue in their course, it means they will meet in time and all profit will be expunged.

It may be thought, however, that the revenue derived from the increased business will more than offset the increased expense. Such is the view of the ordinary layman who has given the matter only cursory study. If the roads were not working to their full capacity—that is, if they had unused engines, cars, tracks and terminal facilities, they could to some degree for a time offset the increased expenses by additional earnings, but when as in 1906, 1907, 1910 and 1912, they were burdened with business beyond their capacity, the excess entails an expense much greater than the average cost.

The Interstate Commerce Commission in 1907 declared that the inadequacy of transportation facilities was alarming, yet when the railroads sought to advance their rates in 1910 to enable them to make better provision for the public demands and establish a higher financial credit the commission would not sanction the advance. The earnings of the roads for the two following years, 1911 and 1912, increased $11,054,000, but the operation, expenses and taxes were swelled $98,544,000, leaving a less net revenue for 1912 than for 1910 by $87,490,000. This loss was equivalent to the impairment of their ability to raise over $2,187,000,000 at 4 per cent.

It is a mistaken conception, though one generally prevalent, that the railroads are over-capitalized and seek to obtain exorbitant rates from the public to pay interest on the excessive capital. The fact is that the physical properties of the railroads could not be duplicated today for anything like the present capitalization. The money of the owners which has not been capitalized, that has been expended on the roads from year to year since their pioneer days, in betterments and improvements, roadbed, equipment and their accessories, has long since absorbed any water there may have been in the securities.

I believe that it can truthfully be said that the causes of complaint in the past against the railroads have been entirely eliminated.

Shippers naturally endeavor to get the lowest rates possible, and from the standpoint of their individual interests they believe that unjust inequalities exist in rates, although such inequalities may be the result of inexorable economic laws beyond the carrier's power to control. In the adjustment of these differences between markets or rival communities, the decision of the commission is almost invariably in the direction of reducing the higher rates to the lower level. In this way there is a constant nibbling at the rate fabric which ultimately will prove as injurious as a wholesale reduction.

The census shows that notwithstanding the large increase in the capital of manufactures of 105 per cent., the net return to the owners on the total of twenty and one-half billions was over 12 per cent. Yet on the railway capital there was nothing paid on three and one-half billions, and less than 5 per cent. on seven and one-half billions. The services of the railroads make secure the most liberal returns on the enormous capital of fifty-nine and one-half billion dollars invested in these two industries, and therefore the manufacturers and farmers should willingly aid in an effort to get the transportation rates advanced. It is of paramount importance to their own continued welfare that they exert themselves in that direction.

The marvelous resources and latent strength of this country are in many respects scarcely trenched upon. Of the total land area of the country 46 per cent. is in farms, and of this land in farms only 54 per cent. is improved. Only 25 per cent. of our great domain is producing anything of value. My friend, ex-Governor Hadley of Missouri, when in office, stated in a public address that the development of Missouri's natural resources had scarcely begun; that there were three counties in the state which had no railroads and seven counties with less than twenty-five miles; and that of the forty-four million acres of land in the state more than one-half had never been touched with a plow. A like statement is applicable in many of our western and southern states. The opening up and cultivation of these undeveloped lands by the building of railroads would give a further impetus to general trade and industry.

There are vast mining lands with their hidden treasures yet awaiting development. The completion of the Panama canal will open to us more directly the trade of the Orient and western South American countries with their hundreds of millions of beings whose wants may be supplied with our merchantable wares.

In all these we have a magnificent vista of possibilities which portends the continual upward trend of our trade and commerce with its concomitant of future steady employment for our people —the desideratum of all governments. The illimitable prospects betoken its continuance if ample provision is made for transportation.

Now, with the present traffic of the railroads reaching the stupendous figures of over 293 billions of units of service, what will the future increase mean if kept up in the ratio of the past?

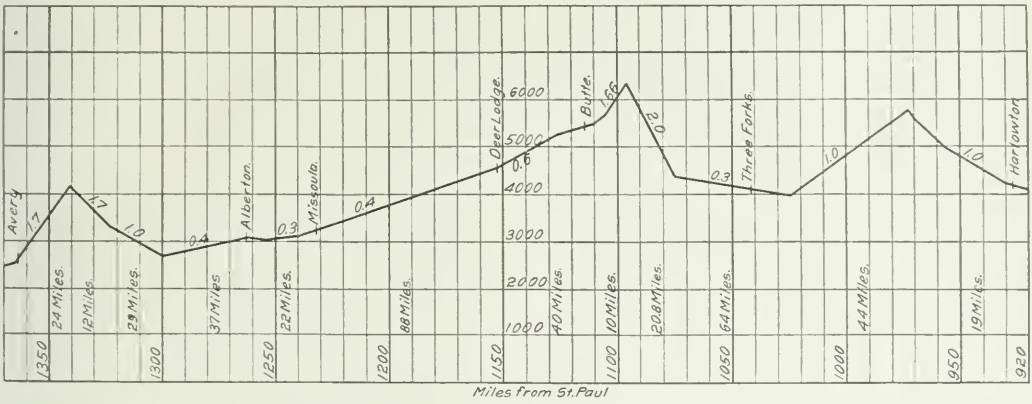
You all know something of the capacity of the New York Central Railroad, and the magnitude of its operations and transportation facilities. Four per cent. of the volume of traffic now annu-

ally moved by our railways would at the present day tax the full capacity of that road, working day and night for one year. The commerce is increasing on an average of 8 per cent. and more per year, and notwithstanding that one-half of this yearly increase would tax the capacity of one of the first railroads in the land, no provision is being made and no provision can be made under the rates now received for transportation service for the proper and safe conduct of this prospective traffic.

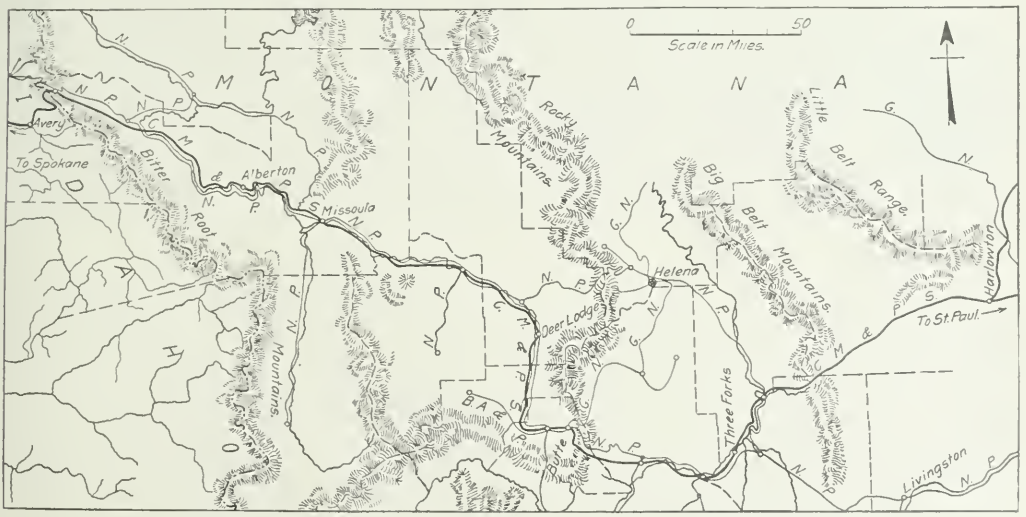
Can the railroads meet this serious situation with which they are confronted? Yes, if allowed to charge a fair compensation for their services. The railroads now receive on an average per mile seven and a half mills for hauling a ton of freight, and less than two cents for carrying a passenger. If this average compensation could be increased even one mill, or the equivalent of the price of a postage stamp for twenty miles service, it would extricate them from all further trouble and anxiety. It is scarcely conceivable that such a slight advance would injuriously affect any trade, industry or person, yet it would be the means of conferring untold benefits upon the entire business interests of the country.

C. M. & ST. P. ELECTRIFICATION THROUGH THE ROCKY MOUNTAINS.

Announcement was made in the *Railway Age Gazette* of January 10, 1913, of the plan of the Chicago, Milwaukee & St. Paul to electrify that portion of its main line to the Pacific coast between Harlowton, Mont., and Avery, Idaho, a distance of 440 miles, and of the granting of a permit by the government to the Great Falls Power Company to construct a transmission line across public lands to carry power for this electrification. Engineers of the electrical manufacturing companies are now working on plans for this installation, and expect to complete them by the middle of 1914. It is estimated that it will require two and one-half years to finish the actual construction work after this. This is the first electrification project proposed where entire engine districts will be covered, and for this reason the operation will be watched with much interest.



Profile of C. M. & St. P. Line Which Is to Be Electrified.



Location of That Portion of the C. M. & St. P. Which Is to Be Electrified.

Between Harlowton and Avery, three mountain ranges, the Belt, Rocky and Bitter Root, are crossed. The maximum grade westbound is 2 per cent. for 20.8 miles on the eastern approach

to the Rocky mountains, and the maximum grade eastbound is 1.7 per cent. for 24 miles approaching the St. Paul pass tunnel through the Bitter Root mountains. The hardest problem, however, is considered to be presented by the continuous grade of 1 per cent. for 44 miles ascending the western slope of the Belt mountains. One of the conditions imposed upon manufacturers is the construction of locomotives which will pull trains of 2,500 tons up this grade at 20 miles per hour, the heavier grades being operated with pusher locomotives as at present. The necessity for operating the motors at the maximum capacity for this distance is a problem that has not been presented in connection with other work of this nature, and its successful solution will mark an important advance in this field.

In addition to the main line, about 10 miles of side and yard tracks will be electrified, these tracks being mainly located in the freight yards. Besides the yards at Harlowton and Avery, terminals are now operated at Three Forks, Deer Lodge and Alberton. These yards are all small, as trains of 1,700 tons are now hauled across the three ranges with Mikado and Mallet engines without breaking up. Also, as Butte and Missoula are the only cities of importance along this line, comparatively little local traffic originates here, the traffic being almost entirely through business. One important advantage expected from the proposed electrification will be the practical elimination of the intermediate yards at Three Forks and Alberton, as it is planned to run the electric locomotives continuously over two of the present engine districts, or about 220 miles, changing crews midway. In this way the two intermediate yards will be required only for the storage and repair of bad order cars and other minor purposes.

While contracts have been made for the power, the details of the development are still unsettled, depending largely upon the type of installation adopted. Power will be derived principally from Great Falls and Thompson Falls, although these plants are connected with a number of others. The number of points of delivery of power to the line and their location are also dependent upon the exact sources of the power and the type of construction adopted.

VALUATION OF RAILWAYS BY THE GOVERNMENT.

At a meeting of railroad presidents in New York City April 24, Samuel Rea, president of the Pennsylvania Railroad, was chosen chairman of a committee of 18 members, representing the principal railroads of the country, to consider what action should be taken in relation to the act of Congress empowering the Interstate Commerce Commission to make a valuation of the property of all railroads doing interstate business, which act became effective May 1. The members of the committee have not all been finally selected, but there will be seven to represent eastern railroads, seven, the western roads, and four, the southern.

Appointments by the Commission.

The Interstate Commerce Commission has announced the names of the men who have been selected to lay out plans for the work of valuation as noted below. The commission, in its statement, says:

"The first important step will be the selection of a board of engineers who will assist the commission in formulating plans, and who will have direct charge of carrying out those plans in different portions of the country. These engineers will be selected from widely separated localities and from different lines of work and environment, but in each instance exclusively on the basis of individual merit and with due consideration of experience. This board will meet in Washington and proceed immediately, in cooperation and conference with the commission, to outline plans for the engineering features of the work.

"Each member of the commission will participate actively in the preliminary work until all the more important questions of methods and principles which can at this time be determined have been settled, and will keep in the same close touch with this work throughout its continuance.

"The tentative valuations reached by the commission must be submitted to the carriers, to the department of justice, and to the governors of states in which the properties are located, and to such additional parties as the commission may prescribe. In case of protest against a tentative valuation the commission will proceed to hold hearings at which testimony by the most competent of men will be presented, supported by briefs, and, doubtless, by oral argument, prepared and presented by able counsel.

"The commission will select an advisory board of three, composed of men fully competent to advise on the many and large questions presented at the outset and which will arise as the work progresses. Aside from those above referred to, all who are employed in the valuation work will be selected through the medium of the Civil Service Commission. As soon as the working plans have been approved by the commission, forces will be organized for early active operations in the field, and as soon as the work is started along satisfactory lines, the forces will be multiplied and the work be pressed on the most extensive scale feasible, and consistent with efficiency.

"The engineering problems are, from the viewpoint of physical work, the most extensive and will therefore have to be pushed more aggressively during the early stages of the valuation work. Running parallel with that work and supplementary thereto, financial, statistical and economic studies will be taken up. These studies will be begun by parts of the present organization of the commission, supplemented from time to time by such additional help as is found necessary. No doubt many men will be employed in the different branches of this work, but none will be taken on until the need for his services is present.

"A division of valuation has been created which will probably not be fully organized until the field work has made substantial progress. This division will probably be the center of the valuation work after the original inventory has been completed, and in the making of the original valuation it will assist wherever experience shows that it can be advantageously used, and in that way the permanent organization will be developed. Certain sections in the division of valuation will be under temporary supervision of chiefs of existing bureaus; in other words, the commission intends to develop the new organization from its present organization, the members of which are known to the commission and have been thoroughly tried out."

The valuation work will be directed, along lines previously approved by the commission, by Commissioner Prouty.

Three days after the issuance of the foregoing the commission announced the names of the five men selected for the board first above mentioned. They are the following:

R. A. Thompson, now employed in valuation work by the California state commission, and formerly employed in like work by the Texas commission. The California commission has agreed to release Mr. Thompson.

Prof. W. D. Pence, chief engineer of the Wisconsin Railroad and Tax Commissions, and who has for some time been in the employ of the Wisconsin commissions in valuation work.

J. S. Worley, Kansas City, Mo., a consulting engineer in private practice, who has had experience in valuation work.

Howard M. Jones, Nashville, Tenn., a consulting engineer in private practice, and who has had much experience, and who is especially familiar with bridge engineering.

E. F. Wendt, Pittsburgh, Pa., president of the American Railway Engineering Association, and assistant engineer on the Pittsburgh & Lake Erie.

The commission hopes to arrange to have an army engineer added to this board.

Proposed Spanish Railway Construction.—A Spanish newspaper calls for tenders for the construction of a railway line from Barbastro to Boltana, 14 miles. Electric power may be used if necessary. Proposals are also requested for the concession of a railway from Betanzos to Ferrol in the province of Corunna, Spain.

POWERFUL MIKADOS FOR THE LAKE SHORE.

They Are the Heaviest of Their Type and Include Several Interesting Improvements in the Design of the Details.

Heavy freight service on the Lake Shore & Michigan Southern has been handled by superheater consolidation locomotives; after a careful study of the situation it was decided to order twenty Mikados from the American Locomotive Company. Although the tractive effort has been increased but 22½ per cent., as compared with the consolidation locomotives, the tonnage rating for main line work gives the new Mikados 4,300 lbs., while the superheater consolidation locomotives are rated at 3,200 tons. This is an increase of nearly 35 per cent.

The new engines have a total weight of 322,000 lbs., and with a

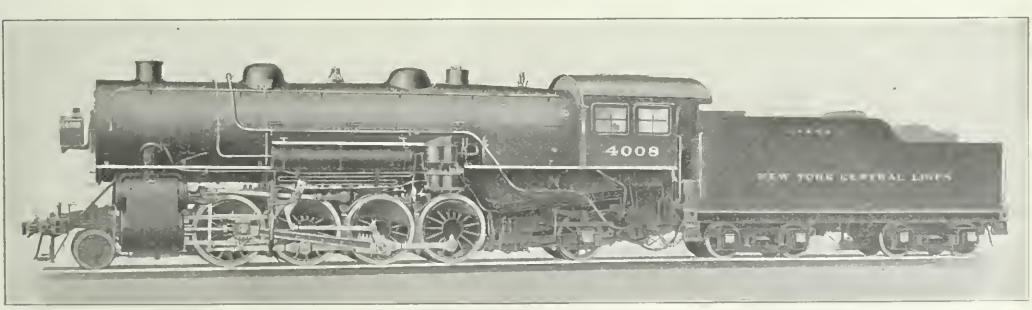
Profile of Line from Carson to Coalburg, Ohio.

steam pressure of 190 lbs. the tractive effort is 56,000 lbs. It is the practice of this company to use a fairly high ratio of weight on drivers to tractive effort (4.37 in this case), for the purpose of giving ample adhesion when the tires have been worn nearly to the limit. The importance of this feature will be readily understood when it is considered that if the tires are worn 2 in., thus reducing the diameter of the wheels by 4 in., and if at the same time the cylinders have increased ½ in. in diameter, the tractive effort will be raised to nearly 62,000 lbs. This reduces the factor of adhesion from 4.37 to 3.95.

An idea of the power of these locomotives can probably best be obtained from a knowledge of the trains they are hauling on the road. A profile of the section between Carson and Coalburg, Ohio, is shown in one of the illustrations. The maximum grade for the direction in which the test runs were made is 16 ft. to the mile. The average train for three runs over this section contained 100 cars having a tonnage of 6,345 tons and was hauled at an average speed, excluding delays, of 14.58 miles per hour. These, of course, are test runs, but a comparison of the tonnage rating of these locomotives and the consolidations in regular service over various divisions, shows what they are doing in every day work. The consolidations with which they are to be compared have a total weight of 239,500 lbs., of which 214,400 lbs. is on drivers. The tractive effort is 45,800 lbs., the cylinders are 25 in. x 32 in., steam pressure 200 lbs. and the drivers 63 in. in diameter. They are equipped with superheaters having about 600 sq. ft. of superheating surface and the evaporating heating surface of the boiler is 3,023.1 sq. ft. On the eastern division out of Collinwood, the consolidations have a tonnage rating of 3,200 tons, while the Mikados are given 4,300 tons. Out of Seneca, the consolidations have a rating of 2,600 tons, while the Mikados are given 3,500 tons. On the Franklin division, out of Youngstown, the consolidations are given 3,400 tons and the Mikados 4,300 tons, while on the Toledo division the consolidations have 3,000 tons and the Mikados 3,500 tons.

In addition to the increase in power which would be expected with a larger engine, there has also been a notable economy of coal and water. Records taken from the Eastern and Michigan divisions give a somewhat unfair comparison which, however, indicates what may be expected under ordinary operating conditions. The average for three trips of a superheater consolidation locomotive having a total weight of 241,000 lbs. showed that it burned 15.9 tons of coal per trip of about 130 miles when hauling a 60-car train of 2,335 tons. This makes 8.17 miles per ton of coal, or 19,100 ton-miles per ton of coal. The average of three trips over the same division with a Mikado was 12.85 tons of coal when hauling a train that averaged 70 cars of 3,203 tons. This is 10.1 miles per ton of coal and 32,400 ton-miles per ton of coal.

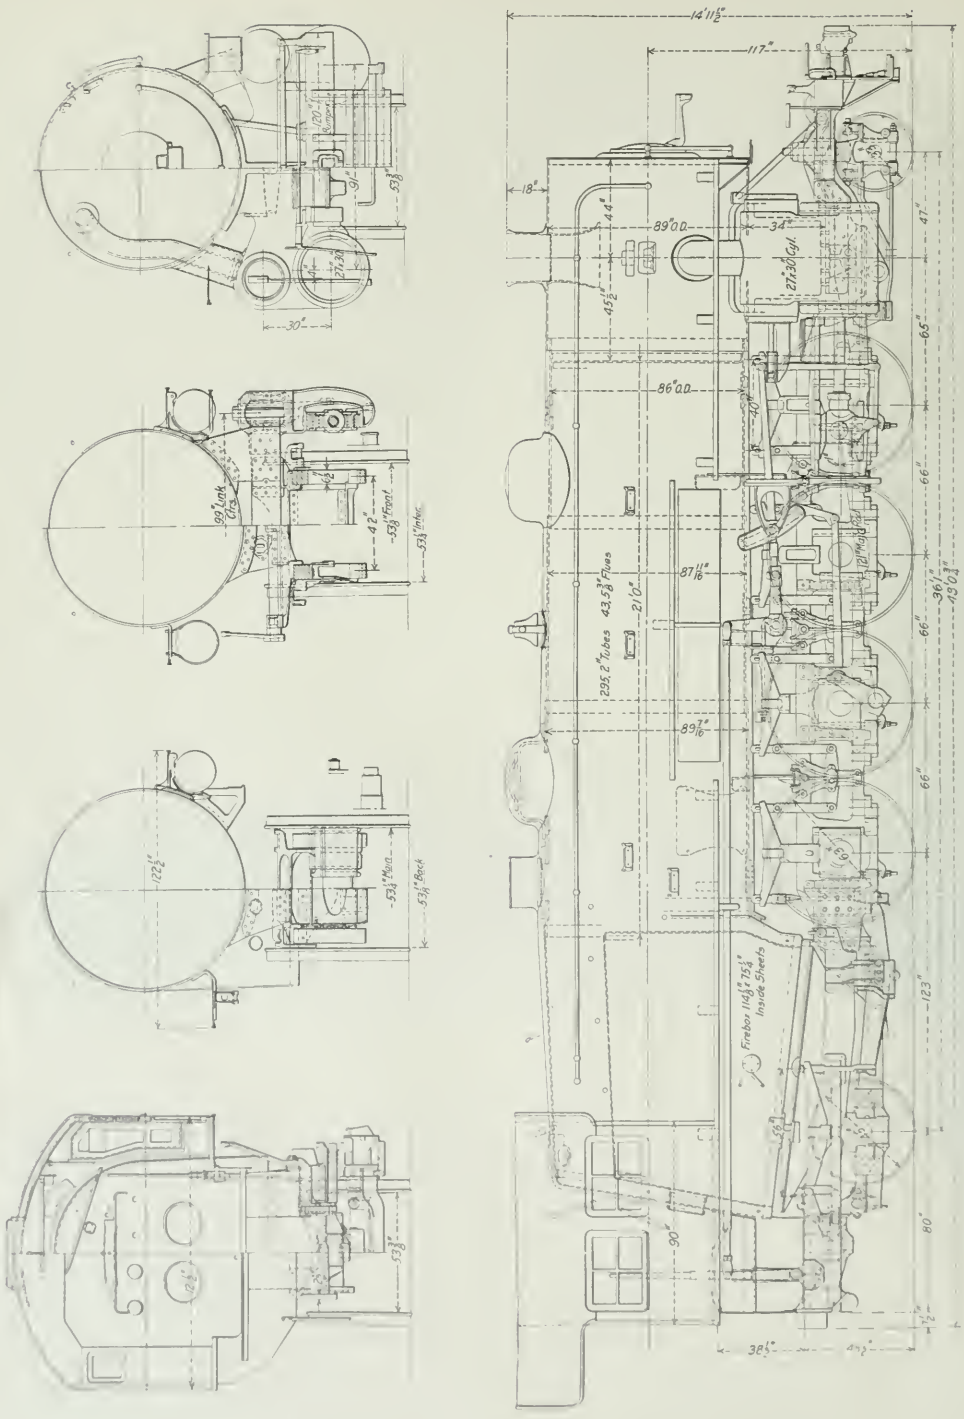
A number of new features of a minor, but important, nature have been included in the design, some of them being used on this locomotive for the first time. They include the MacBain auxiliary lubricator valve, Franklin pneumatic fire doors, feed water connections, cold water sprinklers, radial buffers, a special design of pipe clamp, a new water glass shield, and very long main driving boxes.



Heaviest Mikado Locomotive; Lake Shore & Michigan Southern.

Vanadium steel is used for the main frame, driving springs, piston rods, main and side rods, driving axles, trailer springs and main rod straps, as well as for the links, link blocks, pins and bushings in the motion work of ten of the locomotives. The cylinders are also made of cast iron with a content of vanadium alloy.

The firebox is of a normal radial stay arrangement, with two fire doors, and does not include a combustion chamber. Two inch tubes, 21 ft. in length, are used. The superheater elements are included in forty-three 5⅜ in. superheater flues. An inspection manhole, 16¼ in. in diameter, is located just back of the dome and about 2 ft. ahead of the back tube sheet. The cover plate of the inspection manhole carries the safety valve. The stringent requirements of the boiler inspection law make it necessary to frequently enter the interior of the boiler and since, when this is done through the ordinary dome, it requires

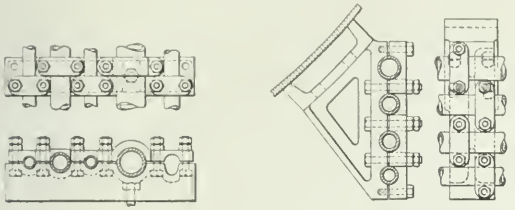


Heavy and Powerful Mikado (2-8-2 Type) Locomotive for the Lake Shore & Michigan Southern.

the removal of the throttle stand pipe, this auxiliary manhole is an improvement that is welcomed by the inspector.

Five of the engines are equipped with the O'Connor type of fire door flange and all have a full installation of flexible staybolts with the exception of six longitudinal rows of button head radial stays at the top of the crown sheet. There are four 2 in. combustion tubes placed in each side water leg. These permit air to enter the firebox over the top of the fuel bed and thus promote combustion.

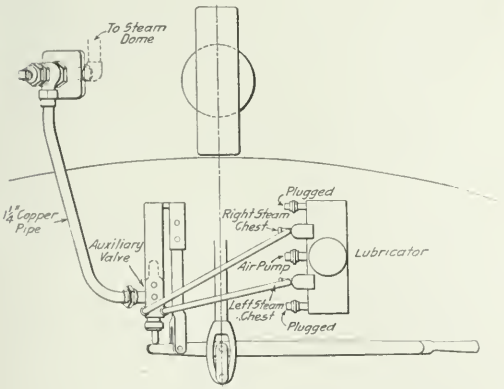
Vanadium cast iron is used in the cylinders, which are cast integral with the saddles and are interchangeable, right and left.



Ayers Pipe Clamp.

Both the cylinders and valves are bushed with Hunt-Spiller gun iron and the piston and valve packing rings and the crosshead shoes are made of the same material.

The locomotives are equipped with an arrangement for forcing the oil through the feed pipes when the throttle is open that was designed by D. R. MacBain, superintendent of motive power. It employs a valve that is held seated by a spring and is so located and arranged that its extending stem will be forced inward by an extension on the throttle lever when the latter is open. This unseats the valve and allows a passage for steam directly from the boiler to the oil pipes leading from the lubricator to each cylinder. It insures the proper lubrication of both

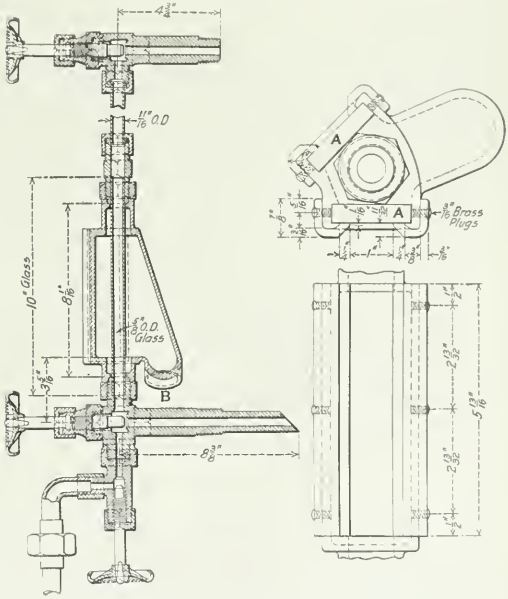


MacBain Auxiliary Lubricator Valve.

cylinders as soon as the throttle is open, but when the latter is closed the lubricator will feed in the ordinary way only.

Special designs of pipe clamps have been prepared by A. R. Ayers, general mechanical engineer of the New York Central Lines West of Buffalo, which not only hold them firmly in place but provide a separate clamp for each pipe so that one may be removed without disturbing the others. The arrangement is most substantial and the pipes will not be subjected to the vibration which so often leads to failure at the joints. Furthermore, the pipe fitters have a definite alignment to work to, as the piping is laid out in the drawing room, and each pipe is in a definite place and can only be attached in that place. This not only makes the work much easier for the pipe fitters, but prevents them doing their work in a haphazard manner.

A new design of water glass shield has recently been made standard on this road. It completely encloses the water glass, the only outlet being at the point marked *B* in the illustration, from which a pipe leads downward through the floor of the cab. There are two glass plates marked *A*, which are 1 13-16 in. x 6 in. x 13-32 in. and are set at an angle of 45 degrees to each other in the shield. This shield completely protects the water glass from danger of accident by external means and also prevents any accidents in case the glass should break of itself, as the steam and water will pass down through the outlet pipe to the outside of the cab and there will be no opportunity for small pieces of glass to fly. As will be seen, it offers no obstruction to the ready application of a new glass when necessary.



Water Glass Shield Used on the Lake Shore Mikados.

General dimensions, weights and ratios of these locomotives are shown in the following table:

General Data.

Tractive effort	56,050 lbs.
Weight in working order	322,000 lbs.
Weight on drivers	245,000 lbs.
Weight on leading truck	27,500 lbs.
Weight on trailing truck	49,500 lbs.
Weight of engine and tender in working order	477,800 lbs.
Wheel base, driving	16 ft. 6 in.
Wheel base, engine and tender	68 ft. 10½ in.

Cylinders.

Kind	Simple
Diameter and stroke	27 in. x 30 in.

Valves.

Kind	Piston
Diameter	16 in.
Greatest travel	7 in.
Outside lap	1 in.
Inside clearance	0 in.
Lead	5/16 in.

Wheels.

Driving, diameter over tires	63 in.
Driving journals, main, diameter and length	11½ x 22 in.
Driving journals, others, diameter and length	11 x 12 in.
Engine truck wheels, diameter	33 in.
Engine truck journals	6 x 12 in.
Trailing truck wheels, diameter	45 in.
Trailing truck journals	8 x 14 in.

Boiler.

Working pressure	190 lbs.
Outside diameter of first ring	86 in.

Firebox, length and width	114⅛ x 75¼ in.
Firebox plates, thickness	⅜ and ½ in.
Firebox, water space	4½ in.
Tubes, number and outside diameter	295 2 in.
Flues, number and outside diameter	43 5⅜ in.
Tubes and flues, length	21 ft.
Heating surface, tubes	4,494 sq. ft.
Heating surface, firebox	246 sq. ft.
Heating surface, total evaporating	4,730 sq. ft.
Superheater heating surface	1,065 sq. ft.
Grate area	59.6 sq. ft.
Smokestack, height above rail	14 ft. 11½ in.

Tender.

Frame	Cast Steel
Wheels, diameter	36 in.
Journals, diameter and length	5½ x 10 in.
Water capacity	7,500 gals.
Coal capacity	12 tons

TRAIN ACCIDENTS IN MARCH.[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of March, 1913:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
†14.	Union Pacific	Gothenberg.	rc.	P. & P.	4	13
22.	Chi., M. & St. P.	Haskell, Mont.	bc.	F. & F.	0	5
23.	Kanawha & M.	Kanauga.	bc.	P. & P.	0	12

Derailments.

Date.	Road.	Place.	Cause of Derailm't.	Kind of Train.	Kil'd.	Inj'd.
3.	Texas & Pacific	Finlay, Tex.	b. rail.	P.	0	8
5.	Central Georgia	Athens.	unx.	F.	0	2
9.	Louisville & N.	White's.	eq.	P.	0	6
14.	Chic., M. & St. P.	Hokah, Minn.	washout.	P.	1	1
15.	Lake Shore & M. S.	Toledo.	unx.	F.	1	1
15.	Atlanta, B. & A.	Warm Springs.	d. bridge.	P.	2	0
18.	Minn. & St. Louis.	Marshalltown.	unx.	P.	0	14
18.	Georgia S. & F.	Bonaire.	b. rail.	P.	0	6

3.	Penn.	Rahway.	boiler.	P.	1	1
29.	Texas & Pacific	Handley.	boiler.	F.	1	2

The trains in collision at Gothenberg, Neb., on the 14th were eastbound passenger trains No. 12 and No. 4. No. 4 was standing at the station and was run into at the rear by No. 12. The collision occurred at 3:37 a. m. in a blinding snow storm. Four passengers were killed and 11 passengers and two trainmen were injured, the killed having all been in the sleeping car at the rear of train No. 4. The line at this point is equipped with automatic block signals, and the signal west of the station is situated 1,100 ft. in the rear of the point where the train was standing. Train 12 had disregarded a distant signal as well as the home signal 1,100 ft. back of the standing train.

The trains in collision on the Chicago, Milwaukee & St. Paul, at Haskell, Mont., on the 22d of March, were westbound freight No. 75 and eastbound freight No. 76. The trains were not running very fast, but both engines and several cars were damaged. Five trainmen were injured. The men in charge of the eastbound train had overlooked a meeting order received at Drummond, the next station west of Haskell.

The trains in collision at Kanauga, Ohio, on the 23d, were northbound passenger No. 5 and southbound passenger No. 2. Train No. 5 entered the main track when the switch was set against it, and got in the way of No 2. Eight passengers and four employees were injured, none of them seriously.

The passenger train derailed near Finlay, Tex., on the morning of the 3d, was a westbound special carrying members of the Chicago Grand Opera Company. Eight employees were slightly injured. The passengers were severely shaken, but none seriously injured. The cause of the derailment was a broken rail.

The train derailed at Athens, on the morning of the 5th, was an eastbound freight. The caboose and three cars fell through a trestle bridge about 45 ft. to the bed of the river below. The conductor and one brakeman were injured.

The train derailed near White's Station, Ky., on the 9th, was northbound passenger No. 38, drawn by two engines. Three cars were ditched and overturned. Six trainmen were injured, but the passengers all escaped serious injury. The cause of the derailment is believed to have been the dropping of brake rigging of the tender of one of the two engines.

The train derailed near Hokah, Minn., on the morning of the 14th, was eastbound passenger No. 8. It was running slowly, but the fireman was killed. The engineman was injured, but no other person was hurt. The train ran off the track at a point where the roadbed had been undermined by a heavy shower. The surface looked all right to the track watchman. No trouble had been experienced at this place before.

The derailment at Toledo, Ohio, on the 15th, occurred in the yard at Air Line Junction about 4 a. m. A switching engine jumped the track while running at moderate speed. The engineman jumped off and was killed, and the fireman jumped off and was badly injured.

The train derailed near Warm Springs, Ga., on the 16th, was westbound passenger No. 23. The engineman and fireman were killed. The engine and first car fell through a trestle bridge which had been weakened by a flood.

The train derailed near Marshalltown, Ia., about 3 a. m., on the 18th, was the northbound Twin City Limited, and three passenger cars were overturned. Two of these cars took fire, and were burnt up, but not until all passengers had got out of them. Twelve passengers and two trainmen were injured. The cause of the derailment was not determined. The train was running on straight track at about 48 miles an hour.

The train derailed at Bonaire, Ga., on the 18th, was the northbound Dixie Flyer, and three sleeping cars and one passenger car were ditched. The train was running at moderate speed and only six persons were injured. The cause of the derailment was a broken rail.

The train derailed near Sudduth, Ill., on the night of the 20th, was a northbound passenger, and three passenger cars were ditched. Twelve passengers and four trainmen were injured. Two of the cars took fire, but the flames were quickly extinguished by the express messenger, A. D. Campbell, with a fire extinguisher. The accident was due to a broken rail, eight ft. of which broke into many pieces. The fault was piping. The rail was 70-lb., made in 1890.

The train derailed at Memphis, Tenn., on the night of March 23, was northbound passenger No. 4, and one trainman was seriously injured. The two engines attached to the train were overturned. None of the passenger cars went off the track and no passengers were seriously injured. The cause of the derailment was sand, washed on the track at a point where tracks were being elevated.

The train derailed near St. Paul, Ind., on the 25th, was a westbound passenger, and the cause was the unprecedented flood prevailing at that time, which had caused a bad washout. The train was running slowly, but the engine and one car fell into Hog Creek. The passengers and trainmen escaped with slight injuries.

The train derailed near West Liberty, Ohio, on the morning of the 25th, was an express of the Pennsylvania Lines which had been sent over the C. C. C. & St. L., because of a break in the track of the Pennsylvania. The cause of the derailment was the unprecedented flood prevailing in the Mad river at that time. The train was running at low speed, the engine backing. The derailment occurred at a bridge which was in position, though one abutment had been washed out. A sleeping car

[1]Abbreviations and marks used in Accident List.
re, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

next to the engine was partly submerged. The passengers in this car, and also the trainmen, had narrow escapes from drowning, the engine having been entirely submerged, but all came out with their lives and with only slight injury.

The train derailed at Brighton, Ohio, on the 25th, was an eastbound freight. The cause of the derailment was the unprecedented flood which prevailed at that time, and which had caused the failure of a trestle bridge. The engineman, fireman and one brakeman were killed.

The train derailed near Alderney, Mo., on the night of the 26th, was westbound passenger No. 1. The fireman was killed, and the engineman and four other persons were injured. The cause of the derailment was a landslide in a cut, which occurred at the moment the engine passed.

The derailment at Yosts, N. Y., on the 30th, was occasioned by the unusual floods prevailing at that time. The accident was reported in the *Railway Age Gazette* of April 4, with an illustration.

The train derailed on the Boston & Maine near East Putney, Vt., on the 30th, at 4:25 a. m., was one of the Central Vermont, consisting of a locomotive and a caboose. Both the engine and the caboose fell into the Connecticut river and the fireman was drowned. Six other trainmen escaped with slight injuries, although some of them narrowly escaped drowning. The cause of the derailment was the undermining of the roadbed by high water.

The train derailed at Bagley, Mich., on the night of the 30th, was an express train running south. The engine and first three cars were ditched. Three trainmen and two passengers were injured. The derailment was caused by a broken rail.

The train derailed near Conover, N. C., on the morning of the 31st, was westbound freight No. 73. The engine was overturned and the engineman, fireman and conductor were killed. The cause of the derailment was a broken rail. It was broken into 17 pieces. The fault was a transverse fissure.

The locomotive which was wrecked by the explosion of its boiler at Rahway, N. J., on the 3d, was that of a westbound special passenger train. The engineman and fireman were injured, the former fatally.

The locomotive of a freight train was wrecked at Handley, Tex., on the 29th by the explosion of its boiler. The engineman was killed and the fireman and one brakeman were injured. The cause of the explosion was low water.

Canada.—A passenger train of the Wabash was derailed at Cayuga, Ont., on the third of March, and five passenger cars fell down a bank. The number of passengers injured was twelve or more.

Electric Car Accidents.—Of the accidents to electric cars reported in the newspapers as occurring in the United States in the month of March, three are charged with fatal results. In a collision at Sunbury, Pa., on the sixth, a motorman was killed. In a derailment at Cincinnati on the 12th, one person was killed and eight injured; and at Youngstown, Ohio, on the 13th, a street car which was run into by a locomotive was wrecked and one person was killed and 25 were injured.

Need of Railways in India.—The northeastern districts are the wealthiest in Eastern Bengal and have up to the present time been sadly neglected in the matter of railway communications, the only railway being the Dacca Mymensingh branch of the Eastern Bengal State Railway, which does not adequately meet their wants. The whole district is under extensive jute cultivation, and it is with the object of securing this traffic that both the Eastern Bengal and the Assam Bengal railways are putting forward extensive proposals for feeder lines. By the construction of the Singhjhaai Fulchari branch the Eastern Bengal Railway has already entered the district, and contemplates another branch from Serajgunj to Sara, which will give a more direct route to Calcutta on the completion of the Sara bridge, a much needed improvement.

AN ELECTRIC ROCK DRILL.

In the construction of the Duluth, Winnipeg & Pacific, between Virginia, Minn., and Duluth, which was completed last year, a 469 ft. tunnel was driven through a very hard grade of stratified rock known as dacite. The drilling in this rock was successfully handled by 8 electrically driven rock drills made by the Fort Wayne Electric Company, Ft. Wayne, Ind. These drills are of the rotary hammer design, the drill mechanism consisting of two parts, a revolving helve containing the hammers and the chuck mechanism for holding and rotating the steel. Within the helve are two chambers in each of which a solid steel hammer floats freely. As the helve revolves the hammers are thrown outward by centrifugal force, and at each revolution, strike a blow upon the projecting head of the drill steel cap which transmits the force of the blow to the drill steel. The hammer helve revolves at a speed of 850 r. p. m., each

Electric Drill Working from a Tripod.

hammer delivering a blow at every revolution. The retention of the drill steel is effected by a heavy worm gear reduction driven from the helve shaft.

It is necessary in all hammer type drills to employ some method for removing the cuttings from the hole that is being drilled. A simple method of effecting this purpose is used with this electric drill, the drill steel being designed with spiral threads to act on the principle of the spiral conveyor. These veins or ribs, which give it an auger-like appearance, have nothing to do with the drilling, their sole function being to remove the cuttings from the hole.

New Locomotive Shops for Victoria.—The Victoria railway commissioners have decided to build locomotive workshops at Bendigo and Ballarat. The preparation of the plans is being expedited and tenders will shortly be called for the work. The approximate cost of the equipment at each workshop will be about $140 000. It is believed that the work will be rapidly pushed to completion.

WEIGHING METHODS ON AN EASTERN TRUNK LINE.

The defects in the present methods of weighing carload freight and in the installation and maintenance of track scales have been given much prominence within the past year. In view of the faulty conditions which have been exposed on several roads, the description of the organization and method of handling the scales and weighing on an eastern trunk line, as presented in one of the hearings before the Interstate Commerce Commission, will show what some roads are doing and may serve as a guide for other roads which have not devoted as much study to this subject.

All matters pertaining to scales and weighing are under the direction of a special officer, who reports to the general superintendent of transportation. This officer has a staff composed of four special inspectors, and a scale inspector for each of the six grand divisions, four of whom in turn have assistant inspectors. The duties of the special inspectors are not primarily to test scales, but to investigate complaints on the ground when necessary, to see that scales are properly maintained and operated, and that instructions with regard to weighing are carried out and to check L. C. L. freight. Irregularities noted by these inspectors are reported through the officer in charge of scales and weighing to the division superintendents for correction, or if of sufficient importance, are taken up with the general superintendent.

The scale inspectors have charge of new installations, and all renewal and repair work on their respective divisions, which work is done by the division forces under their direction. The cleaning and routine inspection of the scales is done by forces under the control of the division superintendent, who are instructed in their duties by the scale inspectors.

Programs of proposed scale expenditures are prepared by the officer in charge of scales and weighing, and submitted to the engineer of maintenance of way for approval. All requisitions for scale material and plans for installation and renewal of scales are approved by the officer in charge of scales and weighing, subject to the final approval of the engineer of maintenance of way. New scales are installed by forces under the division engineer, supervised by the scale inspector. The general instructions for the installation of a 50 ft., 150-ton, suspension platform track scale, which is standard for new installations on this road, provide that the scales be supported on concrete piers and walls of modern approved design. Special attention is given to keeping all pits as dry as possible, and where the scales are installed under conditions where seepage of water through the walls may occur the outside of the walls is waterproofed. Also at points where there is not sufficient fall from the pit for drainage, sumps are provided outside of the pits at an elevation such that the pits will drain into them. A scale shop is maintained for the purpose of making all necessary scale repairs; this shop being in charge of a competent scale mechanic as foreman.

Careful attention has been paid to the securing of accurate test weights. A 50-lb. weight and other smaller weights of tobin bronze verified by the government Bureau of Standards at Washington, to within Class A tolerance, form the basis from which other weights have been scaled. A two section track scale of 100,000 lb. capacity and sensitive to 1 lb. has been installed on a concrete foundation inside of the scale shop. This scale has been sealed by test weights to the weight of the heaviest test car. Six all-metal scale cars varying in weight from 30,000 to 50,000 lbs. each are tested on this scale approximately every 60 days.

The practice is to test the track scales owned by the road, as well as those owned by individuals located along its lines whose weights are accepted for billing, with one of these scale test cars approximately every 60 days. After the scale has been adjusted by sections to the weight of the scale car, it is also tested with a loaded car on the scale with the test car wherever the length of the scale permits. A number of scales have also been tested within the past year with two test cars of different weights. In addition to the tests with the scale car, the instructions also provide that a test shall be made each week by weighing a heavily loaded car with a short wheel base on each end and on the center of all track scales. When the scale is equipped with an automatic recording attachment, the car is weighed standing on the trip end of the scale and also in motion with the automatic attachment connected. A daily test is also made in the same manner on each scale equipped with an automatic recording attachment. Complete reports of these tests are made to the officer in charge of scales and weighing. If they show an error above a reasonable tolerance the scale inspector makes an immediate inspection and tests the scale with the scale car if necessary. To check the work of weighmasters it is required that five cars weighed on certain scales be weighed on a certain number of other scales each month and the results reported to the officer in charge of scales and weighing.

The general rules for the installation, maintenance and use of scales are printed, framed and posted at each track scale on the system so that all employees concerned may be familiar with them. These rules outline the methods of ordering and making repairs, the use of the scales, dead rails, methods of weighing in motion, making tests, etc. Whenever a part is broken, the weighmaster advises the superintendent and also the officer in charge of scales and weighing, giving the location and number of the scale and the name and number of parts broken. A complete record of all scales on the system is kept by the officer having jurisdiction over scales and weighing, and upon receipt of this information repair parts may be sent at once if kept in stock or the scale ordered sent to the shops if it cannot be repaired on the ground.

Rules governing the weighing of carload and less-than-carload freight have been covered in two circulars; one relating to the weighing of property, except coal and coke, and the other to the weighing and waybilling of coal and coke. These circulars have been issued to all agents interested, and not only contain in

coal and coke circular also provides rules for re-consignments, waybilling, deliveries, etc.

The feature of these circulars which deserves special attention is the method of insuring that cars will be weighed and the weights properly reported. Both circulars contain charts indicating at what scales freight from each station shall be weighed, and the forwarding agent is required to insert the proper scale station on waybills accompanying each shipment, making him

tination unweighed must be reported to the superintendent if they have passed a scale station en route.

Coal and coke shipments are forwarded from mines or ovens on a scale card, shown as form 423, which is made out by the shipper and serves the purpose of a shipping order. This card is either tacked on the car or given to the conductor and authorizes the movement of the car from the mine or oven to the scale station. After the car is weighed at the scale station, the weights are inserted on the card, or where an automatic weighing machine is installed, are stamped directly on the scale card. A combined card and revenue waybill form 402 is made up from the scale card, and the latter is systematically filed as a permanent record.

The card and revenue waybill provides for the movement of the car from the scale station to destination, and is the only waybill made. The part which goes with the car is of cardboard, while the copies to be distributed to others interested are made on thin paper, all being written at the same time on special typewriters which have been provided. A special carbon paper is used to prevent blurring of waybills.

A few carload commodities, such as lime-stone, are handled in the same manner as coal and coke, but for most carload merchandise shipments, card waybill form 115 is made up by the originating agent, showing all information except the weight. This is attached to the merchandise scale card, form 121, printed on blue paper, which form is also filled out except the weight. This is a distinctive form and insures the car being weighed at the proper scale station. The originating agent also makes out a revenue waybill, leaving the weight blank, which is either forwarded by mail to the scale station or attached to the card waybill. When a car is weighed at the scale station, the weights are inserted on the card waybill and scale card, and a correction is issued by the agent at the scale station, a copy being attached to the revenue waybill, and both sent to the agent at destination. Copies of the correction are also sent to the forwarding agent, auditing department, and others interested, while the merchandise scale card is also returned to the forwarding agent. A distinctive feature of both the card waybill and the revenue waybill is the information showing how the weight has been obtained and when weighed on railroad scales, where the service was performed, and the date, with the signature of the weighmaster.

The investigation of weight discrepancies and claims is handled through the scale department, which form its record of railroad scales, conditions surrounding the weighing, and the facilities for expert investigation of shippers' and consignees' scales, tends to thoroughness and consistency. The handling of all matters pertaining to scales and weighing in one department results in closer supervision, and any defects are discovered promptly and remedied.

THE VALUE OF COST STATISTICS.

In an informal talk before the Traffic Club of Chicago on April 22, Commissioner B. H. Meyer, of the Interstate Commerce Commission, discussed the subject of cost data in connection with some evidence presented before him at a hearing on Chicago grain switching rates, in which he spoke in part as follows:

"It is an old, long-drawn-out controversy, this question of cost and its significance. But if I, as a member of the Interstate Commerce Commission, could have before me just those facts and traffic data which appear in this proceeding, and which I imagine some of the witnesses have been grouping, it would be of very material assistance. And I wish to suggest whether it might not be a good thing for us to put aside, for a moment at least, all preconceived notions as to the significance and value of that kind of data, and re-examine that old question of cost and see whether there is not something there that may be of value to us. I am not talking about the man who says cost makes rates. I assume that any one who is very familiar with the subject won't talk that kind of thing. At any rate, I have never heard that that was a debatable question. But isn't this one of the questions: Has cost anything to do with these controverted matters that come before the Commission, and that you gentlemen are busy in presenting? And if cost has anything to do with them, let me have it. I imagine no one will say cost has nothing to do with them, and the only alternative then is, let us all arrive at the facts and use them like intelligent men. Let us not make all the analogies we can, but let us use the data intelligently.

"And the same with traffic statistics. We are constantly in need of definite information regarding the volume of movement between certain points. Now, in any event it is a tremendous task, and it may be a very expensive thing, to get those statistics. I feel—and I am sure my colleagues feel the same way about statistics that involve excessive cost—that the expense of collecting them may be in excess of their value. But if we can get these things they will be of very great assistance to us. We will develop in every railway property, in every railway business, a sober statistical and traffic consciousness which will serve you traffic men and you attorneys, and possibly also you operating men."

TWO COMMERCE COURT DECISIONS.

Shreveport Case.

*Decision by Presiding Judge Knapp.**

The question to be decided in this case has been so thoroughly discussed by the commission, and kindred questions have been so fully considered in various cases recently decided or now pending in other courts, that little can be profitably said beyond a statement of our conclusions.

There is no dispute about the material facts, and they are easily comprehended. The interstate rates of petitioner from Shreveport, La., to Dallas, Tex., and intermediate points on its line, are very much higher in proportion to distance than the state rates of petitioner from Dallas to the same intermediate points in the state of Texas. For example, the rate on farm wagons from Shreveport to Marshall, a distance of 42 miles, is 56 cents per 100 lbs., while the rate from Dallas to Marshall, a distance of 147 miles, is only 36.8 cents. Under such an adjustment of freight charges it is obvious that Shreveport is severely if not fatally handicapped in its competition with Dallas for the trade of the intervening territory, most of which is situated in the state of Texas. It appears that operating conditions are substantially the same throughout the entire line and in both directions between these two cities, and petitioner makes no claim that the disparity in rates can be justified by differences in the cost of transportation. Indeed, it seems to be conceded—and certainly no other inference is permissible—that the rate situation here in question would clearly constitute undue prejudice to Shreveport and undue preference to Dallas, within the meaning of the third section of the act, provided that section be applicable, if the intrastate rates from Dallas, like the interstate rates from Shreveport, were voluntarily established by the carrier. But while the discrimination in fact against Shreveport is admitted, the contention is made that as matter of law it is not and cannot be undue, or otherwise in violation of the act, because the intrastate rates in question are made by authority of the state of Texas and the petitioner is under legal compulsion to observe them. In other words, it is insisted that a violation of the third section cannot be predicated upon a rate relation, however unjust, which is brought about, not by the voluntary action of the carrier, but by the command of a state which the carrier is constrained to obey.

In this suit the order of the commission is sought to be set aside only so far as it affects commodity rates, and the commission has found, in effect, that petitioner's interstate commodity

*Though this decision is abstracted the original language is preserved insofar as possible.

rates from Shreveport to these Texas destinations are reasonable rates for the service rendered. From this finding, in connection with other facts stated, it seems necessarily to follow that the intrastate commodity rates of petitioner from Dallas to the same destinations, which the Texas commission has prescribed, are materially less than petitioner is justly entitled to charge; and this involves the further consequence that the Texas commission, by imposing upon petitioner lower rates than it should rightfully receive, has placed an undue burden upon interstate commerce, and thereby obstructed the freedom of its movement. If this is a correct analysis of the situation, as is virtually admitted, it can hardly be doubted that the action which produces such a result, whether intended or otherwise, is in derogation of the power and authority of congress under the commerce clause of the constitution.

The right of a state to control the movement of its internal commerce and the instrumentalities employed in such movement is not unlimited, as the supreme court has repeatedly declared. In the first case which involved the scope and meaning of the commerce cause, *Gibbons* v. *Ogden* (9 Wheat., 1), the line of demarkation between state and federal power was defined by Chief Justice Marshall. His definition has been uniformly accepted and the language itself quoted with approval in a number of cases.

In the light of these decisions, and many others of similar import, it seems clear to us that congress is invested with ample power to prevent or remove such a discrimination as is here considered. This is not seriously disputed by petitioner, but the contention is pressed that congress has not exerted its power, even if the power be possessed, to the extent necessary to reach this particular kind of discrimination, and therefore the commission's order should be set aside because in excess of its authority.

The power which congress has exercised in this regard finds expression in the third section of the act to regulate commerce, as follows:

> That it shall be unlawful for any common carrier subject to the provisions of this act to make or give any undue or unreasonable preference or advantage to any particular person, company, firm, corporation, or locality, or any particular description of traffic, in any respect whatsoever, or to subject any particular person, company, firm, corporation, or locality, or any particular description of traffic, to any undue or unreasonable prejudice or disadvantage in any respect whatsoever.

It would be difficult to frame a more comprehensive and unqualified declaration. It applies to all interstate railroads and makes unlawful every act which operates to the undue prejudice of any locality. Taken by itself, the paragraph quoted brings within its condemnation the rate adjustment here involved. And it would follow from this view of the section that the commission had authority to correct the ascertained injustice by making the order sought to be enjoined. The opposing view is based upon two general grounds which present the real controversy in this case.

In the first place, it is said that the provisions of the third section, above quoted, are to be read in connection with the proviso in the first section, and that this proviso defines and limits the power which congress intended to exercise by expressly excluding transportation "wholly within one state." In other words, the proviso is claimed to be an exception which exempts from regulation under the act the rates on intrastate traffic, and therefore deprives the commission of authority to found a violation of the statute upon the relation between state and interstate rates, no matter what may be the effect of that relation upon the movement of interstate traffic. The proviso reads as follows:

> Provided, however, that the provisions of this act shall not apply to the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property wholly within one state and not shipped to or from a foreign country from or to any state or territory aforesaid.

The intent and meaning of this proviso has been quite fully discussed by this court in *Denver & R. G. R. Co.* v. *Interstate Com. Com'n* (195 Fed., 968), and a conclusion therein reached substantially adverse to the contention here considered.

Adhering to the views then expressed we hold that this proviso is a mere disclaimer of any intention on the part of congress, in enacting the act to regulate commerce, to exceed its constitutional power, and that it was not designed to limit or confine the power which congress could exercise—and, in our opinion, has exercised—in respect of such matters as are here in dispute. If this construction be correct, it follows that the proviso in no way prevents the application of the third section to the facts of this case, and therefore it was within the authority of the commission to make the order in question.

It is argued in the second place, as above stated, that the "undue preference" and "undue prejudice" which are declared unlawful by the third section of the act, as that section has been construed by the supreme court, can be predicated only upon the voluntary action of the carrier, and therefore the lower rates from Dallas than from Shreveport are not in violation of the third section, whatever may be the resulting disadvantage to Shreveport shippers, because such lower rates are not voluntarily accorded but are imposed upon petitioner against its will by the Texas commission.

The petitioner called attention to a paragraph in *East Tenn. &c. Ry. Co.* v. *Interstate Com. Com'n* (181 U. S., 1, and cases there cited) to show that carriers are not responsible if discriminations result from conditions wholly beyond their control. The case referred to envolves the long and short haul clause and the decision has no bearing on this case.

This of course does not meet the argument that petitioner is under compulsion as respects the state rates in question and therefore not chargeable with any violation of law because those rates are relatively much lower than its interstate rates from Shreveport. In the last analysis this claim of coercion would seem to beg the question to be decided, since it assumes that petitioner is bound at all events to observe the rates fixed by the Texas commission, although the order sought to be enjoined justifies the application of higher charges. But if the action of the Texas commission regarding these interstate rates is in derogation of the regulating power of congress, the petitioner is not bound by that action, but has the right to readjust its schedules in conformity with the order of the Interstate Commerce Commission.

In the report upon which that order is based the commission has found that the local rates here involved were imposed by the Texas commission for the purpose of favoring the industries and communities of that state. Indeed, the evidence is said "to demonstrate that Texas has a policy of her own with respect to the protection of home industry, which has been made effective by consistent and vigorous action on the part of her commission." And in this policy, as is further found, the petitioner and other carriers in like situation have apparently acquiesced. This plainly means, nor is it seriously disputed, that these Texas rates were prescribed not with reference to their intrinsic reasonableness, or on the basis of just compensation for the service rendered, but with the undisguised intention of giving preference and advantage to the dealers of that state as against their competitors in Louisiana and other states. As Commissioner Lane puts it, "the Texas commission is acting *in loco parentis* to the jobbing interests of Texas." It also means, as the record indicates, that the rates so established have been accepted by petitioner without more, at most, than a perfunctory protest.

In view of these uncontradicted facts we are constrained to reject the plea of compulsion, not merely or mainly because petitioner has assented to the protective policy of the Texas commission, but because that policy directly affects other states and the flow of commerce from those states, and thereby encroaches upon the field in which federal authority is exclusive and supreme. To hold otherwise in this case is virtually to admit that the purpose of the federal act may be thwarted and its operation made ineffective by the laws and administrative effort of the state of Texas. The effect of this action by the Texas commission is not merely incidental and unimportant, but direct, substantial, and to an extent prohibitive. In our judgment it is a

positive interference with interstate commerce, which congress alone has power to regulate, and constitutes a violation of the law which congress has duly enacted. To say that conditions thus arising do not offend the federal law and cannot be corrected by the commission appointed to administer that law is to say in effect that state authority is superior to federal authority when they come in conflict, whereas the reverse proposition has been repeatedly and invariably affirmed by the supreme court of the United States.

It is not claimed that the precise question here presented has been passed upon by the supreme court, but in various decisions of that court principles have been laid down which seem to us clearly applicable if not controlling. Paragraphs were cited from the *Eubank* case (184 U. S., 36); *Pullman Company* case (216 U. S., 65); *Southern Railway* case (222 U. S., 23); *Pennsylvania Railroad* case (139 Fed., 81) following the *Illinois Central* case (215 U. S., 452).

It is true that the laws and orders involved in these decisions pertain to the physical operation of interstate railroads and not to the relations between state and interstate rates; but in our opinion the underlying question is essentially the same in both classes of cases, and the doctrine of the supremacy of federal authority should have the same controlling application in the latter as in the former. If state regulation under state laws, respecting such matters as safety appliances, car distribution and the like, must be subordinated to and may be virtually annulled by national regulation under the national laws now in force, there is even greater reason for asserting the sufficiency of the existing acts of congress, and the authority of the tribunal by which they are administered, to remove such a palpably unjust and injurious discrimination in freight charges as is here presented, although that discrimination is caused by the action of a state commission. This is not to interfere with any power of regulation which a state may rightfully exercise, which does not "affect other states," or materially impede the flow of commerce from one to another, but to give complete and adequate potency to the law which congress has enacted in pursuance of its plenary and exclusive power to regulate commerce "among the several states." The *Shepard* v. *Northern Pac. Ry. Co.* case (184 Fed., 795), was also referred to.

It is the duty of an interstate railroad so to adjust its schedules that all dependent shippers and communities, regardless of imaginary state lines which may divide them, shall be able to use its facilities on relatively equal terms; and the Interstate Commerce Commission, in our judgment, is empowered by the present law to enforce the performance of that duty as occasion may require. Indeed, we see no escape from multiplied difficulties arising under our dual form of government, except by broadly defining the constitutional power of congress and its exertion, and by upholding the full application of that law to such controversies as the one here considered. We are therefore in accord with the views of Commissioner Lane, speaking for the majority of the commission, as expressed in the following extracts from his report:

> An interstate carrier must respect the federal law, and if it is also [illegible] it must respect that in so far as it can without [illegible] its obligations under the national authority. Before us [illegible] discriminate directly against interstate traffic. [illegible] that all they have done was to obey the orders of a state [illegible] against which they were helpless. They appealed [illegible] to this commission. When the state of Louisi[illegible] makes [illegible] to this body these carriers [illegible] of their rates other than that here [illegible] gateway—[illegible] even in [illegible] While the Texas commission [illegible] for its own state cities, [illegible] that the carriers [illegible] into and within Texas [illegible] claiming that not to have adopted it [illegible] the state authorities. Such con[illegible] The interstate carrier which [illegible] that makes against the inter[illegible] with its eyes open and fully [illegible]

The Interstate Commerce Commission investigated the complaint filed with that body on behalf of the shippers and dealers of Shreveport. In its report of that investigation, and upon proofs that seem to permit no other conclusion, the commission found the act of unjust discrimination as alleged, and duly made an order requiring its removal. The commission also found by necessary inference that the interstate commodity rates in question were not unreasonable, and this in effect sanctioned the continuance of those rates. It is likewise a necessary inference from the report and order that the unlawful discrimination against Shreveport, so far as commodity rates are concerned, was caused by the imposition of intrastate rates which are lower than petitioner is justly entitled to charge. This being so, it follows that petitioner is at liberty and has the right to comply with the commission's order by making a proper increase of its Texas rates. Indeed, since its interstate rates are not excessive, such an increase appears to be the only method of compliance which would be just to both shipper and carrier.

When this order was made it had the effect, in our judgment, of relieving petitioner from further obligation to observe the intrastate rates which the Texas authorities had prescribed. The petitioner was no longer under compulsion in respect of those rates. Whether petitioner should have applied to the courts for relief in the premises, basing its application upon the commission's order and the rights of petitioner thereunder, or could advance its Texas rates in the first instance, relying upon the order as a defense against any prosecution under Texas laws, is not for us to determine. It is sufficient to hold, as we do, that petitioner cannot resist the order on the ground of involuntary action, because the effect of that order was an exemption of these intrastate rates from Texas authority.

As was suggested at the outset, the general question here involved has been presented in numerous cases, more or less closely allied, and is perhaps the most conspicuous and important subject of current litigation. In the course of that litigation every decision of possible bearing has been repeatedly cited and every opinion critically examined, whilst the ablest lawyers in briefs and at the bar have exhausted the resources of argument. We can add nothing to what has been so often said, and deem it unnecessary to extend the discussion. In our judgment the order in question was within the authority of the commission and ought not to be set aside.

The petition will therefore be dismissed.

Judge Mack, concurring, said in full as follows:

I agree that an intrastate rate voluntarily established by the railroads may be the basis for an order of the Interstate Commerce Commission declaring such a rate to involve an undue prejudice as against an interstate rate and requiring that the two rates be equalized.

I fully agree also that congress has the constitutional power and may by proper legislation grant to the Interstate Commerce Commission authority to prevent undue prejudice in interstate commerce resulting from a rate not in the true sense voluntary, and irrespective of whether it be interstate or intrastate.

In view, however, of the passage cited from E. Ry. Co. vs. Interstate Commerce Commission, 181 U. S. 1, and of the decision of this court in Atchison, T. & S. F. Ry. Co. v. U. S., 191 Fed. 856, now pending on appeal in the supreme court, I am of the opinion that the Interstate Commerce Commission under the legislation now in force cannot base such an order upon a compelled rate, whether interstate or intrastate, and whether compelled by competition, by statute, by court decree or by the order of a commission.

In my judgment, the Texas state rates cannot be treated by the Interstate Commerce Commission as if they were absolutely null and void, even though upon direct attack in the state or federal courts they would be nullified and their enforcement permanently enjoined as infringing upon the exclusive power of the federal government to regulate interstate commerce. In the absence of a judicial decree temporarily or permanently sus-

pending the force and effect of the Texas rates, the railroads would be compelled to obey them, just as the railroads and the public are required to observe interstate rates duly made and published by the railroads, even though they be such as would be set aside for unreasonableness, unjust discrimination, or undue prejudice on direct attack before the Interstate Commerce Commission.

The order of the Interstate Commerce Commission therefore gives only an apparent but not a real alternative, either to raise the Texas rates or to lower the interstate rates; in effect it compels the reduction of the interstate rates to a point far below what the Commission itself considers a reasonable rate, at least until a court of competent jurisdiction shall have enjoined the enforcement of the Texas rates.

If the Texas rates here in question must necessarily be held to be involuntary and compelled, I should be of the opinion that the order of the Interstate Commerce Commission must be set aside.

Inasmuch however as there seems to be some basis, though slight, for the view that the failure of the railroads to attack the Texas rates was due to their voluntary or negligent acquiescence therein, and that therefore these rates may be said to have been not compelled but voluntary in the sense of having been voluntarily assented to instead of having been actively attacked, and inasmuch as the conclusions of my brethren are based in part at least upon this view, I concur for this reason only in upholding the Commission's order.

Anthracite Coal Case.

*Decision by Judge Hunt.**

The Lehigh Valley Railroad Company, petitioner herein, prays for a decree enjoining an order of the Interstate Commerce Commission reducing the rates on anthracite coal from the Wyoming region in Pennsylvania to Perth Amboy on New York harbor.

The United States and the Interstate Commerce Commission and the intervener have moved to dismiss the petition for lack of equity.

Two principal contentions are advanced by petitioner: First, confiscation; second, lack of substantial evidence before the Commission on which to rest the conclusion reached. Petitioner argues that (*a*) the order of the Commission compels the carrier to operate its entire plant for a return of less than four per cent. upon its value, and (*b*) that the order deprives the carrier of its right to receive for transporting tidewater coal an amount sufficient to cover operating expenses, depreciation and a reasonable compensation for the use of that portion of the facilities used in handling tidewater coal.

Reducing essential facts to a narrow compass, we find that the order of the Commission affects the traffic on 165 miles out of a total of 1,407 miles of petitioner's railroad, and about 2,000,000 tons of anthracite coal out of a total anthracite coal tonnage of over 11,000,000 tons; that the anthracite tonnage involved is four fifty-sevenths of the entire freight traffic of the petitioning road; and that the effect on the gross income of the road, which is $36,000,000, when measured by the traffic of the year prior to the making of the report of the Commission, was to make a reduction of $247,000.

The argument is that the order reduces the annual return from $12,500,000 to $12,050,000, which is less than four per cent. of the value of the petitioner's road, which, as stated by the petitioner, is $312,500,000, and that the loss of income brought about by carrying out the order cannot be made up from rates on other traffic because such other rates, so far as applicable to anthracite, are as low as they can consistently be put. The assumption is that the Commission cannot and would not approve of any increases in other anthracite rates, while rates on commodities other than coal are for the most part joint rates covering competitive traffic, which are made under such circumstances that larger divisions cannot be obtained and that it is beyond the petitioner's power to increase materially its revenue from those sources.

Where the tariffs are constructed by the carrier and, after full hearing, an individual rate is found to be unreasonable and an order is made by the Commission which reduces such individual rate merely to a point where such reduction will reduce the total income of the carrier to four per cent. approximately, the carrier has no case of confiscation *prima facie*, but must prove that its rates other than the one involved in the order are in fact reasonably high and cannot be advanced above the point fixed by the tariffs it has filed. The courts cannot lay down any general rule as to what shall constitute confiscation with reference to railroad rates where the facts, as in this case, show a profit of approximately four per cent. The just compensation secured by the constitution does not mean a guarantee to a carrier as against the public of any fixed percentage of profit upon an investment.

The total anthracite coal tonnage, or 11,000,000 tons, represents 47 per cent. of the gross earnings of the road; and inasmuch as but 2,000,000 tons of anthracite are affected by this order, it becomes evident that the order of the Commission affects only two-elevenths of 47 per cent. of the total revenues of the road, or two-elevenths of $15,000,000, representing the revenue derived from coal traffic.

At once the inquiry arises whether the rates upon the balance of the traffic of the road are reasonable, and whether the proportion of the petitioner's other earnings, the 53 per cent. in bearing its fair share of the expenses of the road? How can the court say that the reduction of the particular rate complained of to a point admittedly not below cost of service and some substantial profit is confiscatory merely because it will reduce the gross income? Investigation into the proportions borne by other rates would have to be made to arrive at a just conclusion.

The allegations that the rates as fixed by the order are not and will not be sufficient to pay the cost of conducting the assembling, transporting, storing, and transshipping "and a just or fair return upon the value of that proportion of petitioner's property used in said service," fail to state grounds for equitable relief when they are put alongside of the further allegation that the rates fixed by the Commission cover the cost of service in transporting coal from the Wyoming district to Perth Amboy, which is 90 cents per gross ton, and that the average of the rates allowed by the Commission as applied to the traffic for all sizes of anthracite coal affected is $1.35 per gross ton, with depreciation cost of 10 cents on the facilities. This is an admission that the profit left above the cost of service is sufficient to yield an annual return on the value of that portion of petitioner's facilities employed in that particular traffic, which, though less than six per cent. on the value—not specifically stated—of the facilities employed, is at least of such a substantial margin as to prevent a conclusion that petitioner's property is being taken without just compensation.

Other averments of the bill to the effect that the Commission excluded and refused to consider facts and circumstances that ought to have been considered, or that the rates prescribed were fixed arbitrarily and are not just and fair, fall when we examine the report of the Commission which is before us, disclosing that evidence relevant to the issues which the petitioner raised herein, except those matters which it is alleged accrued since the report was made, was considered.

We have given careful attention to the briefs and arguments made by counsel, but do not find any well-founded reason for interference with the action of the Commission.

The motions to dismiss are granted.

New Construction in Uruguay.—Work continues on the Tres Arboles to Piedra Sola branch, the 36 miles of which will be completed this year. Construction of the line from La Paloma to Trienta y Tres was commenced by the Uruguay Railway in November, 1912.

*The decision is abstracted but the original language is preserved insofar as possible.

WELDON VIADUCT OVER THE ROANOKE RIVER.

A Steel Structure 3,688 Ft. Long Built by the Atlantic Coast Line on a Piece of New Main Line in North Carolina.

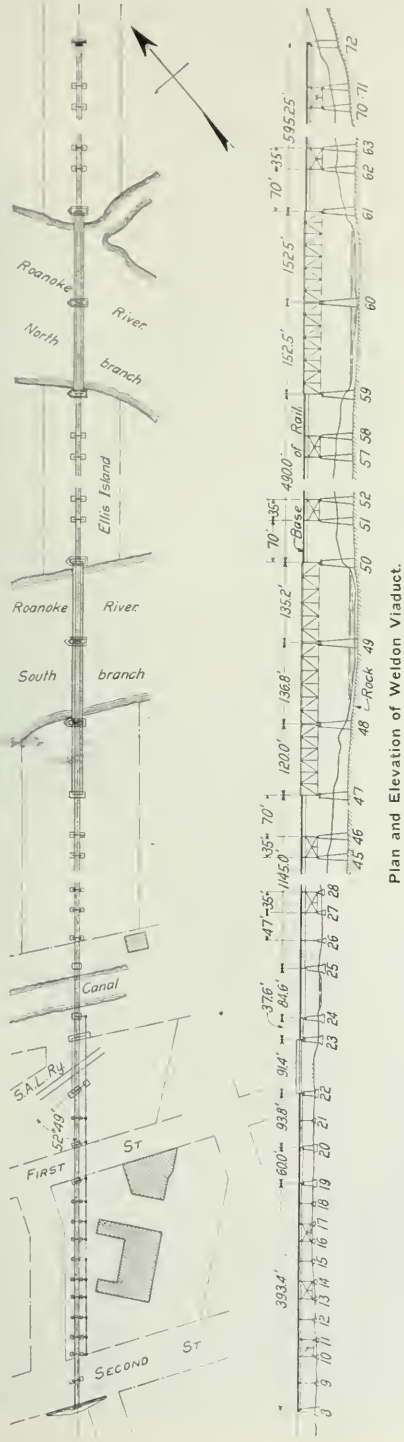
The Atlantic Coast Line has recently completed and put into operation three and one-half miles of new main line between Gary, N. C., and Weldon, 80 miles south of Richmond, Va., the principal feature of which is the Weldon viaduct across the Roanoke river.

In former years the old Petersburg Railroad, which connected with the Wilmington & Weldon Railroad at Weldon, crossed the Roanoke river on a bridge of its own, but this was destroyed and an agreement was entered into with the Seaboard & Roanoke Railroad whereby, instead of rebuilding, the Petersburg Railroad would operate over the tracks of the former from Gary, N. C., into Weldon, to the Wilmington & Weldon connection. In later years, the Seaboard & Roanoke was absorbed by the Seaboard Air Line and the Petersburg Railroad and the Wilmington & Weldon became a part of the main line of the Atlantic Coast Line, but the same joint operating arrangement was continued until 1909, when it was decided, by mutual agreement, to terminate it.

In determining the best location for the Atlantic Coast Line's new line, consideration was given to the interchange of passengers, baggage, express and freight with the Seaboard Air Line at Weldon, the avoidance of a grade crossing with the Seaboard and grade highway crossings in the town of Weldon, the danger from high water in the Roanoke river and the reduction of maximum grades. A line which had been surveyed some years before was adopted without change, as the only undesirable feature it contained was the arrangement for exchanging passengers, baggage and express at different levels, and this could not be avoided without sacrificing the other advantages. A new union station, ordered at this time by the State Railroad Commission, was given equal consideration with the rest of the work and located where the exchange between the two roads could be handled with the least trouble. The line adopted is above grade through the town of Weldon and over the Seaboard tracks with undergrade highway crossings at First, Second, Third and Sixth streets. It is double-track except through the viaduct section and has a maximum grade of 0.5 per cent. The depot was located in the angle of intersection of the two roads on the level of and parallel to the Seaboard tracks, with a stairway and electric baggage and express elevator to the Atlantic Coast Line platform above, on which will eventually be placed enclosed waiting rooms and an umbrella shed.

Weldon Viaduct Showing Web Struts Connecting Pedestal Piers.

The gauntlet and all switches in main line tracks, at the south end of the Weldon yard, are controlled by a 30-lever electro-mechanical interlocking plant of the latest type, located at the



Plan and Elevation of Weldon Viaduct.

south end of the yard. All home signals are semi-automatic, power operated, of the three position upper right-hand type. Movements from stop to caution are controlled by electric levers built above and interlocked with the mechanical levers. The movement from caution to proceed position is automatic, and is governed by the indication of the first signal in advance. All other units are pipe connected. Approach, and home indicators, to announce the presence of trains on main line tracks; back, approach, and route locking are employed. The tower and lead-out are supported on a concrete foundation and steel frame, thus eliminating all wood. The interlocking is being installed by company forces.

The viaduct is a steel structure 3,688 ft. long with separate girder spans over Third and Sixth streets. It is carried on concrete masonry, is designed for Coopers E-50 loading, and is built in accordance with the Atlantic Coast Line's standard bridge specifications. The line is tangent and the grade level throughout the steel work with the base of rail 29 ft. 6 in. above the top of the masonry across the river bottom, and 30 ft. above extreme high water. From the north end southward the steel work is arranged in a viaduct section 595 ft. long of alternate 35

Portion of Weldon Viaduct Showing Steel Work for Station Platform.

ft. tower and 70 ft. intermediate spans across the bottom land; two 152 ft. 6 in. riveted deck truss spans across the north branch of the river; 480 ft. of 35 and 70 ft. span viaduct across Ellis Island; two 136 ft. 6¾ in. and one 120 ft. riveted deck truss spans across the south branch of river; 1,145 ft. viaduct across the bottom lands; an 84.6 ft. deck plate girder across the canal, a 37.6 ft. deck girder span to the north abutment of the Seaboard crossing; one 91.4 ft. through plate girder over the Seaboard tracks; 93.8 ft. of viaduct; one 60 ft. deck plate girder over First street, and 393.4 ft. of viaduct to the south line of Second street. The viaduct south of the canal is arranged with one 30 ft. girder on a tower and two 35 ft. intermediate girders with a single bent between. The train platform extends from the south bank of the canal to the south side of Second street, 676 ft. It is 14 ft. wide and is carried on the track girders on one side and a row of posts on the other. This construction is shown in one of the accompanying cuts. The total weight of the steel work is about 2,500 tons. It was erected throughout with a derrick car.

The masonry through the town and to a point north of the canal, was founded on a hard, sandy clay and the remainder of it, across the river bottoms and the river piers, was carried to rock, which was about 40 ft. below the surface at the deepest place. This was necessary, as nothing was found above the

rock that would safely carry the load, and permanent moisture was too low down to enable piles to be used with advantage. The river piers and some of the pedestals are accordingly about 60 ft. high, and the latter, on account of their height, were designed with webs connecting each pair of pedestals. To secure the necessary lateral stability for these piers it was deemed advisable to connect them together from a point 10 ft. below their tops down to the foundation. For this purpose concrete web struts, reinforced with old rails, were built connecting each pair of pedestals. This method was decided upon to avoid the expense of building massive piers up to the top, which would have involved a large volume of useless concrete While the continuous pedestals would have been sufficiently stable for the imposed load, it was considered expedient to provide for the impact caused by heavy masses of drift which might come during heavy freshets, at which times the water rises to a level about 4 ft. below the top of the masonry. The reinforced webs are amply strong to meet these conditions and their use effected a considerable saving in cost. The main body of the masonry throughout is a 1-3-5 concrete, with copings and back walls of 1-2-4 and the total structure contains about 17 000 yds. of concrete.

The work was done under the direction of E. B. Pleasants, chief engineer of the Atlantic Coast Line Railroad.

GASOLENE MOTOR CAR FOR INTERURBAN SERVICE.

The Holton Interurban, Redlands, Cal., has placed in service a type M-6 gasolene motor car made by the Hall-Scott Motor Car Company, San Francisco, Cal. This is the second Hall-Scott motor car purchased by this company, one having been placed in service about two years ago. The power plant consists of a six-cylinder gasolene engine of 150 h. p. capacity, with a speed range of from 4 m. p. h. to 60 m. p. h. in four stages in either direction. This flexibility of speed control will permit of yard switching and of the handling of one or more trailers, dependent, of course, on grade conditions.

The car is of steel construction, the steel body, trucks, gasolene motors and driving mechanism being designed and built in the builders' factory at West Berkeley, Cal. It is 60 ft. long over end sills and has a seating capacity for 64 passengers in the main passenger compartment. The baggage room is 16 ft. long and is equipped with lift wall seats for eight additional passengers. Baggage and mail may also be carried in the engine room, a space 12 ft. long x 3 ft. wide being available for that purpose. The total weight of the car is 67,850 lbs.

During the first three months of service this car made an average of 75.6 miles per day. The following table gives the operating cost during this time.

Results of Operation for Three Months Ending February, 1913.

	1912.	1913			Average cost for car operating under
	December	January	February	Average	ordinary conditions
No. miles traveled	2,238	2,458	2,138	2,278	.....
No. miles traveled per day	72	79	76	75.6	.....
Gallons gasolene used	767	785	725	759	.....
Gallons gasolene used per mile	0.342	0.319	0.339	0.333	.....
Cost gasolene per gallon	0.23	0.215	0.215	0.22	0.10
Cost gasolene per mile	0.079	0.068	0.073	0.074	0.033
Total cost gasolene	$176.41	$168.77	$155.87	$167.02	$75.90
Gas engine oil used	26	37	24	29	.....
Cost gas engine oil per mile	0.006	0.0078	0.0058	0.0066	0.003
Cost gas engine oil per gal.	0.52	0.52	0.52	0.52	0.40
Engine oil per mile	0.011	0.015	0.011	0.012	.....
Total cost engine oil	$13.52	$19.24	$12.48	$15.08	$11.60
Machine shop bill	33.35	31.90	27.15	30.80	.....
Cost repairs per mile	0.0149	0.013	0.0126	0.0135	0.0135
Cost operators per mile	0.089	0.081	0.093	0.087	0.087
Total operative cost per mile	0.189	0.169	0.184	0.181	0.1385

Operator's cost figured on basis of $125.00 per month for motorman.

Operator's cost figured on basis of $75.00 per month for conductor.

Note that cost of gasolene and oil is excessive on account of the car being operated so far from distributing points for oil and gasolene. The last column at the right shows the operating cost for the car on the basis of Eastern prices for oil and gasolene.

The engine is mounted directly on the center sills of the car underframe. The clutch is of the contracting band type. The transmission is hung on the forward axle of the rear truck, and the axle is driven through a train of bevel and spur gears of hardened forged steel. The operating levers are placed on the right hand side of the car in a position convenient for the operator, being similar in their functions to automobile practice. The circulating water is cooled by a radiator placed directly in front of the car, which provides a positive thermo-syphon circulation of the water and a ready means of completely draining the whole circulating system. A cooling fan is placed directly back of the radiator.

Gasolene Motor Car for the Holton Interurban.

The car is equipped with the Westinghouse automatic and straight air brake systems; a double-cylinder water cooled air compressor directly driven from the main engine; and an electric generator, also driven from the main engine, which charges the storage batteries for lighting and starting the main engine

BROWN HOISTING MACHINES AT BALTIC STREET, BROOKLYN.

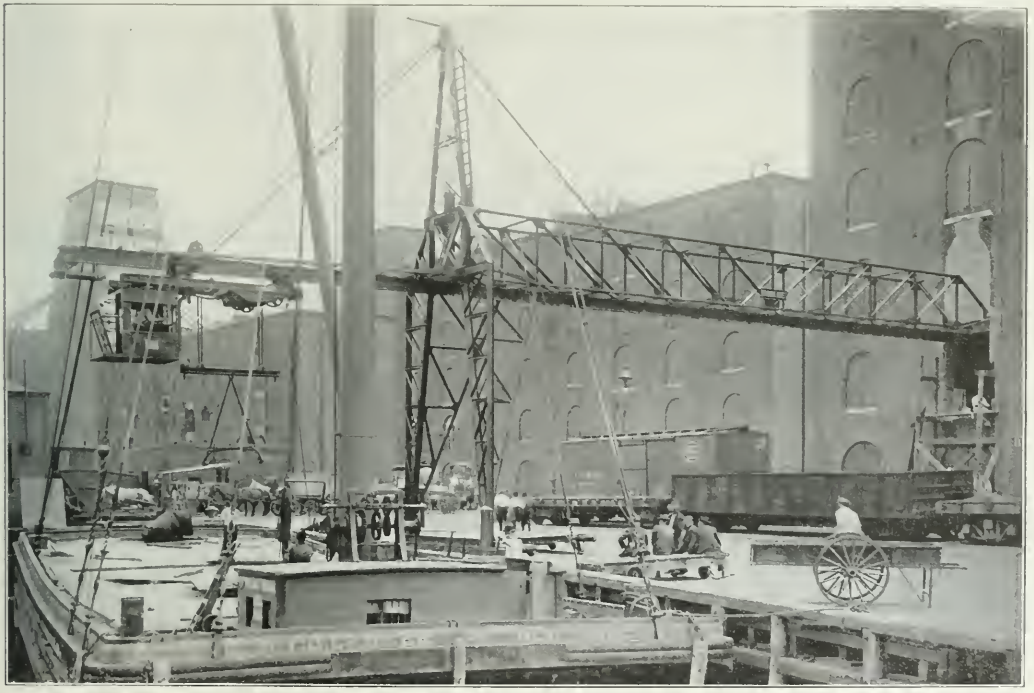
The New York Dock Company has installed "Brownhoist" rapid freight handling machinery at its docks at the foot of Baltic street, Brooklyn, N. Y., for moving freight to and from lighters, wagons, warehouse, freight house, railroad cars and delivery trucks. The company's docks extend along the Brooklyn shore of New York Bay for about 2¼ miles, the property covering 300 acres, entirely occupied with warehouses and railroad tracks. The company has its own system of railroad tracks which extend along the entire water front. The only connection with the different railroads is by car ferries. There are 27 piers, but none of the railroad tracks run out on to the piers.

The handling machinery is used in connection with warehouse No. 117, which is used for sorting and storing the export and import freight. The machinery consists of a single runway bridge on the wharf, a double runway bridge over the railroad yard and reaching the freight house, two 1-beam tracks through the warehouse connecting the single and double runway bridges, and two man trolleys. The tracks on the two bridges consist of 15 in. I-beams, and there is a continuous I-beam track from the wharf, through the warehouse to the freight house, on which the man trolleys travel.

The single runway bridge, shown in one of the views extends from the warehouse door to the face of the dock, a distance of 70 ft. spanning two tracks and the wharf. It has a raisable apron, 28 ft. long, which reaches out over the water. By means of a counterweight and a hand winch, this apron is raised to allow the lighters to dock. This apron constitutes an extension of the I-beam track so that the trolleys can run out over the boats with their loads. Just within the door of the warehouse the track branches into two tracks, running to the rear of the warehouse. There they turn to the right, and pass by an elevator and out in the rear. The I-beams are suspended from the ceiling in the warehouse by patent hanger bolts, and are bolted together by patent joining plates.

The man trolleys have a capacity of 2¼ tons each. Each trolley is suspended from two 4-wheel trucks by swivel and pin connections and it rounds curves of 15 ft. radius. The hoisting motor is carried on the front of the trolley and is geared to two hoisting drums. The limiting height of hoist is 30 ft. The trolley has a hoisting speed of 50 ft. a minute, with full load, and 120 ft. per minute with no load, and has a traveling speed of 450 ft. per minute with full load and 550 ft. per minute with no load. Each trolley is equipped with a hand traveling brake, and with an automatic safety mechanical brake, as well as a solenoid brake used in hoisting. The mechanical friction brake operates only on the downward direction of the load, and the solenoid brake operates when the hoist motor is not being driven. The load can be held at any desired height by means of these two hoisting brakes. The current, 220 volts, D. C. is obtained through spring collectors with bronze collector wheels, which run on a copper trolley wire strung along the I-beam tracks.

For carrying the freight 12 special 2-ton Brownhoist trucks are used. These are best shown in the second illustration. The truck is equipped with ball bearing wheels, two 15 in. wheels at one

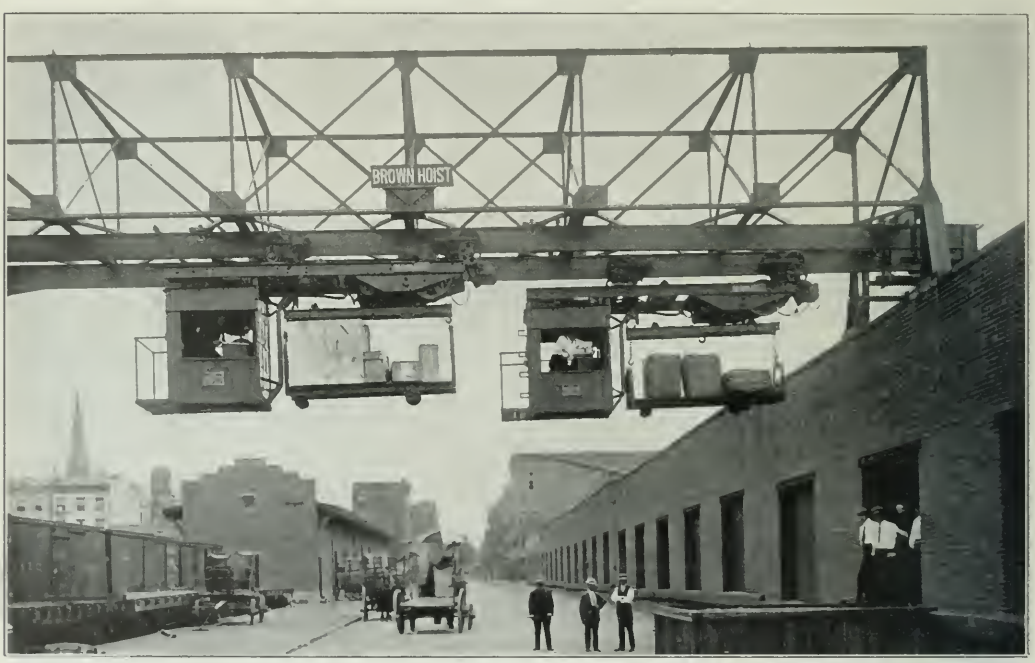


"Brownhoist" Freight Conveyors, Brooklyn, N. Y.

The Load is a Sheet of Metal.

end and two 2-wheel swivel casters at the other end. Each truck is 8½ ft. long by 3½ ft. wide over all. In warehouse 117, the trolleys work in conjunction with the elevator and with a chute which runs from the top floor down to the second floor. If a trolley has a truck loaded with freight which is to be stored for several days, it takes it into the warehouse and deposits it at the door of the elevator. The truck is pushed onto the elevator and carried to one of the four floors above. When taken out, the freight, if not fragile, and if of small size, is sent down the chute to the second floor of the building and there loaded on wagons.

The plant is not running to full capacity, but so far the equipment has replaced 12 men. The trolleys handle all the freight as fast as it can be delivered to them, whereas heretofore some



Double-Track Freight Conveyor, New York Dock Company.

shipments suffered delays. The equipment has eliminated the congestion of wagons on the dock.

This equipment was built and installed by The Brown Hoisting Machinery Company of Cleveland.

PICKED UP ON THE ROAD.

By Gulf.

Few people who travel in Pullman cars find the toilet conveniences quite up to the standard of convenience to which they are accustomed at their homes or their hotels. The wash and dressing room is the smoking compartment, and is crowded, and not a thing to be desired at the best. Every morning, in every sleeping car there is some man or men, who after dressing deliberately and from a curious choice sit down and remain there to look out of the window and watch the proceedings. They are unmitigated nuisances and very much in the way. It is therefore, respectfully suggested to the Pullman Company that they have signs made and the porters instructed to hang them in the toilet rooms every morning. The signs might read to the effect that, "Gentlemen who have finished their toilet are requested to leave and not occupy seats in this room until the other passengers have finished their toilets." In the ladies' room they might post a sign saying that, "Ladies are requested to remember that others are waiting while they are occupying this room." If this should only occasionally cause the would-be washroom observer to get out it would be a boon to the rest of the travelers.

Speaking of the amenities of the toilet room leads me to comment upon another matter where dumb example seems to be making an impression. Most men make quite a muss in and about the basin in the course of their ablutions. It is evidently quite impossible for the porter to follow each one and clean and wipe the stand for the man to come, so the passengers must do this for themselves. It is a rather disagreeable and repulsive job to clean up after the other fellow, while one's own pollutions can be wiped away quite complacently. Thoughtful gentlemen, therefore, wipe up and leave the premises clean and ready for occupancy by their successors while many others are following suit from mere shame-facedness. It is a growing custom and one which, it is to be hoped, will in a few years become so universal that to omit it will cause comment.

* * * * *

It does not always seem to be lack of ability of the engines to run at speed. But there is always a hot box or dirty coal, or station delay, or a freight train in the way, or a rail up, or some trifle that is just enough to cause a hesitation or stop that means the sending back of a flagman, and then waiting to call him in. On the trip referred to, out of four station stops, two were of such duration that the flagman's recall had to be sounded. It is a pity, and one wonders whether the management is in a trance, or dreaming over its schedule of what might happen, but rarely does.

General News.

A bill requiring separate cars for negroes has been reported unfavorably by a committee of the Illinois senate.

A new law in Pennsylvania, signed by the governor April 25, requires railroads to pay their employees twice a month.

Telegraph operators on the Erie are taking a vote on a proposal to strike for increases in wages said to average 12 per cent.

The Southern Railway has supplied all its passenger conductors with collapsible paper drinking cups, which are to be furnished free to passengers who ask for them.

The Denver & Rio Grande has refused a demand from representatives of its blacksmiths, machinists, boilermakers and sheet metal workers for increases in pay ranging from 7 to 13 per cent.

A bill has been introduced in Congress, by Representative Wallin, of New York, which would require all railroads to issue interchangeable mileage books, good on all railroads, at two cents a mile, with no time limit.

The Canadian Pacific, in co-operation with the provincial Department of Agriculture, is planning to run a "Better Farming Special," beginning in May and making a tour through the province of Ontario extending over about two months.

According to press reports officers of the Great Northern have been inspecting the site of a hydro-electric power plant on the Chelan river in Washington, with a view to possible extension of the electrified zone through the Cascade mountains.

The Missouri Pacific has increased the pay of blacksmiths from 2 to 12 cents an hour and has granted increases averaging 2½ cents an hour to boilermakers, machinists, machinists' helpers, painters and carmen. This is the result of conferences covering seven weeks.

In the United States district court at Indianapolis, April 20, the Michigan Central was fined $5,000 on two indictments charging the granting of unlawful reductions in rates to Chapin & Company, grain shippers of Milwaukee. The shippers also have been indicted, but have not yet been tried.

Warrants charging embezzlement have been issued for Edward F. Young, treasurer of the Chicago, Terre Haute & Southeastern Railway, with office at Chicago. Mr. Young is said to have disappeared from his office on April 22, leaving his accounts in such shape as to indicate a considerable shortage.

Starting from Biarritz, France, on the border of Spain, on the morning of April 27, E. F. Guillame flew in an aeroplane nearly 1,000 miles, across France to Kollum, Holland, making the trip in about 24 hours and stopping only twice. The stops were for fuel, one at Bordeaux and the other near Paris.

One hundred and twenty complaints charging violations of the federal hours of service law have been filed in the federal court, at Detroit, Mich., against the Grand Trunk. Twelve complaints have been filed against the Michigan Central, charging violation of the laws regulating the transportation of livestock.

The New York, New Haven & Hartford announces that its five hour trains between New York and Boston, three each way daily, have been on time or nearly on time, on every trip, except ten, since February 1. When these trains are late more than thirty minutes in reaching destination, each passenger is paid a rebate of $1. Seven of the ten delays occurred in February.

Employees of the New York Central Lines in and around Cleveland, Ohio, attended a "Safety First" meeting on April 23. Addresses were made by M. A. Dow, general safety agent of the New York Central Lines; F. H. Wilson, assistant general superintendent; Frank V. Whiting, general claims attorney; D. R. MacBain, superintendent of motive power; F. B. Cook, superintendent, and several employees.

Governor Cruce, of Oklahoma, has signed a bill passed by the legislature, authorizing the state corporation commission to fix new passenger rates. An article in the state constitution originally fixed the passenger rate at two cents per mile. Since the two cents a mile rate has been enjoined, in the case now pending before the Supreme Court, it is said the commission proposes to fix the rate at 2¼ cents. A bill fixing the rate at 2¼ cents was vetoed by the governor.

Press despatches of April 30 report that in the states of Sonora and Sinaloa, Mexico, the rebels who are fighting the government have taken complete control of the railroads, and are running trains to suit themselves, collecting revenue and using it to support their rebellion. The lines of the Southern Pacific between Nogales and Guaymas, 265 miles, and between Guaymas and Ouliacan, 332 miles, are said to have been thus confiscated. Officers of the road have been ousted and the repair of tracks is neglected.

A committee of the lower house of the Pennsylvania legislature has presented a favorable report on a bill providing that no person shall be employed as conductor on any railroad in the state unless he has been engaged in train work 18 months; and that no one shall be appointed to the position of engineman unless he has been employed as fireman for 18 months (on some road) or on the same road for three months prior to his appointment. The Pennsylvania Railroad has issued a circular calling attention to the oppressive character of the proposed law. In the preamble it is described as an act to promote the safety of the traveling public, but its purpose, of course, is to make difficult or impossible the operation of a railroad, in case of a strike of trainmen, except by making terms with the strikers.

Louis D. Brandeis, the most prominent lawyer for the critics of the New York, New Haven & Hartford road, is the subject of an advertisement, filling a half page or more, which President Charles S. Mellen has published in the Boston newspapers. Mr. Mellen quotes records to show that in 1892 Mr. Brandeis was a member of the firm of Warren & Brandeis, who prosecuted a suit in court against the New York & New England Railroad to restrain the directors from declaring a dividend, which suit was abandoned after the price of the railroad company's stock had been forced down in the market. The railroad company averred that the prosecution was inspired by Austin Corbin and was malicious, and this averment seems not to have been challenged. Mr. Mellen was general manager of the New York & New England at that time.

Norfolk & Western Valuation.

Vice-President N. D. Maher, of the Norfolk & Wesern, announces that Charles S. Churchill, chief engineer; W. S. Battle, Jr., general claim agent and J. M. Rodgers, statistician, have been assigned to special duty as a Valuation Committee for the purpose of devising a plan of valuation of the company's property in accordance with the new federal law, and afterwards carrying on the work. The work of this committee, says Mr. Maher, is a stupendous task and will require a long period; therefore the regular duties of the officers named will be taken up by Joseph E. Crawford, acting chief engineer, J. B. Baskerville, acting claim agent and W. B. Moss, acting statistician, whose appointments take effect May 1.

Trespassers on the New Haven.

The New York, New Haven & Hartford, which for years has been attempting to abate the trespassing evil, is making renewed efforts to decrease accidents of this character. The company is asking the active co-operation of the cities and towns along its lines, and an order has just been placed for 10,000 additional warning signs to be posted on the highways. School superintendents are being requested to caution their pupils of the dangers of playing around the tracks. For many years the efforts of the company's officers have been centered upon the magistrates and prosecuting officers of the towns and cities, but, as elsewhere, the magistrates are loath to prosecute this class of offenders. On the New Haven the records show that the company is troubled with an extremely small number of tramps. The most difficult problem is that of the small boy or young man who for one reason or another "jumps" a freight train or tries to "beat" his way. Despite the fact that the road maintains a corps of special agents, under the supervision of a competent officer, and the large number of arrests

that have been made, the company has not had the success wished for in preventing trespassing of this character. There are 207 of these special agents. Unlike most other roads, the agents of the New Haven are not permitted to accept fees for making arrests, and therefore are not under the temptation of bringing charges against people unjustly.

Officers of the road say that they are much annoyed by that particular type of trespasser, the small boy of reckless proclivities who, in riding on a coal car, throws pieces of coal at signals. A little severity may be the means of preventing that boy and perhaps other boys from being seriously injured or even killed at some later date, and stringent enforcement of the law is the most humane method of dealing with the question. The trespasser who uses the rights of way of the railroad in going to or from work represents every walk of life and an accident resulting in his death is often a serious loss to the community in which he lives. It is almost impossible to obtain a conviction of this type when he is arrested. In some towns the railroad tracks are almost considered a public highway and hundreds use them every day to and from business. The company in such places has ordered an extra number of signs to be displayed warning trespassers that they are forbidden to use the tracks or remain on the premises; but these signs are often destroyed or defaced. Even fences are useless in such places as they are torn down at the first opportunity. Cases of sawing down iron fences are not unfamiliar.

United States Steel Corporation's Earnings.

The report of the United States Steel Corporation for the quarter ended March 31, 1913, shows that the total net earnings were $34,426,801, after deducting all expenses incident to operation, including those for ordinary repairs and maintenance of plants, and fixed charges of subsidiary companies. This compares with $17,826,973 earned in the corresponding quarter of 1912 and $23,519,203 in the same quarter 1911. The earnings for the first quarter of 1913 showed a decrease of about $500,000 from the last quarter of 1912, and were not as high as was expected. The surplus for the quarter was $7,369,600 as compared with a deficit of $6,292,134 for the corresponding quarter of 1912, and a surplus of $31,155 for the corresponding quarter of 1911. The net earnings for the months of the first quarter of 1913 were $11,342,533 in January, $10,830,051 in February and $12,254,217 in March.

Barney & Smith Car Company and the Recent Floods.

The Barney & Smith Car Company, Dayton, Ohio, on April 21 resumed operations after the temporary shutting down of its plants owing to the damage done by the floods. Operations were at a standstill for about six days during the high water, but a large force of men has been at work continuously for the past two or three weeks, cleaning up the plant and putting it in working order. It will not be possible to make a correct estimate of the loss for several weeks. None of the cars under construction at the plant at the time of the flood was ruined and all such cars will be cleaned, finished and shipped within a short time. The supply of lumber floated away, but only for a short distance, and has since been re-claimed and re-piled. No difficulty was experienced in securing men, teams and supplies to put the plant in working order. The men were paid in cash, so that the trouble of cashing checks would be avoided. It is expected that the plants will be operating at full capacity in a few days.

Baltimore & Ohio Losses by Floods.

The Baltimore & Ohio announces the restoration of its line across the Miami river at Lawrenceburg, Ind., 25 miles west of Cincinnati, and the resumption of through trains over all of the company's lines. The bridge at Lawrenceburg was 1240 ft long and 820 ft of the steel structure was carried away. The total property loss to the Baltimore & Ohio by the floods of a month ago is now estimated at $3,000,000. About 500 miles of track was badly damaged and twelve important steel bridges were destroyed or disabled. The total length of these bridges was about 4,000 ft and the length of wooden trestles destroyed was about four miles. The work of restoration carried on during the past month has engaged the services of about 8,000 men, using 18 pile-drivers and numerous steam shovels and other machines. At many places work was carried on both day and night.

The Pennsylvania's Flood Losses.

President Samuel Rea says that the estimated cost of the damage to the Pennsylvania Lines West of Pittsburgh caused by the recent floods will be $3,610,000. Twenty-four bridges were destroyed and fifty were damaged, covering a total of about a mile and a half of track. The cost of replacing and repairing these bridges will be about $1,145,000. It was necessary to build temporary trestle work equivalent to 4.28 miles of track at a cost of about $362,000.

The length of road requiring repairs amounted to 163.39 miles, affecting 218 miles of track; estimated cost $1,587,000.

Adding the cost of damage to stations, equipment, telegraph lines and other property, the total loss on all Pennsylvania Lines amounts to $3,610,000, as above stated, divided among the various companies as follows:

Pennsylvania Company	$1,640,000
Pittsburgh, Cincinnati, Chicago & St. Louis	1,600,000
Vandalia	342,000
Grand Rapids & Indiana	28,000
	$3,610,000

In his statement Mr. Rea says:

"The above items of expenditure, under the rules of the Interstate Commerce Commission, are charged to operating expenses, but not compulsorily included in the year incurred.

"These losses take no account of the reduction in revenue for March and April due to the very serious interruption of traffic.

"The officers and employees have done remarkably efficient work in restoring the lines to service. Immediately the seriousness of the storm damage was known, the company placed all its facilities at the command of the state authorities of Ohio and Indiana for the relief of the afflicted area.

"No event in the history of railroading in this country has shown more convincingly the necessity for the railroads to be permitted to earn sufficient revenue not only to make reasonable return on invested capital, but also to have a surplus sufficient to meet emergency expenditures like these and to improve the properties in those respects which, even if not adding to gross revenue, make the lines better adapted to withstand the ravages of storm and flood and the better able to perform their duties to the public with efficiency and satisfaction."

Dedication of New Buildings at the University of Illinois.

The new Transportation building and the Locomotive and Mining laboratories of the University of Illinois, at Urbana, Ill., are to be dedicated on May 8, 9 and 10. An extensive program of addresses on various departments of engineering endeavor has been arranged. The program for Thursday, following an informal reception, include an address by J. G. Pangborn, special representative of the Baltimore & Ohio. On Friday morning there will be a railway conference in the Transportation building, at which the following addresses and discussions will be presented:

"Modern Problems of the Steam Railroad," B. A. Worthington, president Chicago & Alton; "Modern Problems of the Electric Railway," W. B. McKinley, president Illinois Traction System; "Modern Problems of the Manufacturer," Charles B. Moore, vice-president Jacobs-Shupert United States Firebox Company, and G. R. Henderson, mechanical engineer, Baldwin Locomotive Works.

"The Changing Character of the Problems of the Railroad," D. F. Crawford president American Railway Master Mechanics' Association; Albert Reichmann, president Western Society of Engineers; T. H. Goodnow, president Western Railway Club; F. H. Clark, past-president Master Car Builders' Association.

"Proper Aims in Training for Railway Service," H. G. Hetzler, president Chicago & Western Indiana.

"Vocational Education in Connection with Railroad Work," W. L. Park, vice-president Illinois Central.

"How Can the Technical School Help in the Solution of Railway Problems?" Robert Quayle, general superintendent motive power Chicago & North Western.

"Research as a Factor in Railway Administration," Samuel O. Dunn, editor *Railway Age Gazette*; H. E. Chubbuck, vice-presi-

dent and general manager Illinois Traction System; C. B. Young, mechanical engineer of the Chicago, Burlington & Quincy Railroad.

In the afternoon will be held the formal dedicatory exercises in the University auditorium. A congratulatory address will be delivered by President C. H. Markham, of the Illinois Central. The program also includes a mining conference on Friday and Saturday, including addresses by a number of men prominent in this industry, and addresses will be given by the governor of the state, and officers of the university. On Friday afternoon there will be an inspection of the Transportation building, the Locomotive laboratory and the Mining laboratory.

Increases in Firemen's Pay.

The award of the arbitrators on the wages of the firemen of the eastern railroads as given out last week, resulted, on one of the larger roads, in changes of from 5 cents to 55 cents per 100 miles in the pay of road firemen, as shown in the following statement:

"Passenger firemen (approximately 600 men) who formerly received $2.40, $2.45, $2.50 per 100 miles will now receive $2.45, $2.50, $2.60, $2.70, $2.85 per 100 miles. In other words the increases range from 5 cents to 35 cents per 100 miles, the average being 23½ cents per 100 miles.

"Freight firemen (approximately 1,000 men) who formerly received $2.70, $2.85, $2.95 and $3 per 100 miles will now receive $3, $3.10, $3.20 and $3.30 per 100 miles in through freight service, and $3, $3.15, $3.25 and $3.35 and $3.45 in local freight service. In other words the increases range from 5 cents to 55 cents per 100 miles, the average being 33 cents per 100 miles. This does not include firemen on Mallet engines who have been receiving $3.20 and under the award will receive $4, an increase of 80 cents per 100 miles.

"Switch firemen (approximately 600 men) who formerly received $2.35 and $2.50 per day of 10 hours, will now receive $2.50 and $2.60 per day of 10 hours. Twenty-two per cent. of the switch firemen will get no increase under the award; 64 per cent. will get increases of 1 cent an hour and 14 per cent. will get increases of 1½ cents per hour.

"Miscellaneous service, such as pusher and helper and work train service, by reason of the application of through freight rates to this service, receive increases somewhat larger than the increases accorded the employees in other grades of service. The number of firemen performing this character of work is approximately 125. The increases in pusher service range from 25 cents to 95 cents per day of 10 hours, and in work train service from 15 cents to 80 cents per day of 10 hours."

Report of Legislative Committee on Pere Marquette.

The joint committee of the Michigan legislature, which has been investigating the management and affairs of the Pere Marquette, submitted its final report on April 24. The committee expresses the opinion that the flat two-cents-a-mile passenger rate is too low for branch lines, and also that the freight rates are inadequate. A readjustment of the rates by the Interstate Commerce Commission is recommended. The committee believes that "the present management under the receivership is capable and is doing its utmost to improve the service, and should be given a reasonable opportunity to demonstrate whether the road can be made to earn its fixed charges. If it fails to do this, a reorganization must be had on a basis that will be assigned." The committee finds that there has been mismanagement of the property under former administrations, and says it has not had time to demonstrate what is needed to make the Pere Marquette the railroad the state requires, but is inclined to believe the receivership will afford opportunity to find out just what the property can be made to do.

With reference to "watered bonds," which formed an important feature in the inquiry, the report said:

"Your committee is satisfied that the money represented by the funded debt of approximately $70,000,000 has been paid into the Pere Marquette corporation; that all the bonds are honest; that none of them is watered, and that the persons owning them have honest claims against the Pere Marquette on account of said bonds."

B. & O. Club.

The B. & O. Club was organized at Atlantic City, N. J., June 17, 1912, as was mentioned in the Daily edition of the *Railway Age Gazette* of June 18, page 1459, to promote friendship between the persons now or heretofore employed by the Baltimore & Ohio. The organization committee, S. M. Dolan, American Car & Foundry Company, St. Louis, Mo., chairman, will be prepared to submit for ratification the constitution and by-laws at the next annual meeting, which will be held at Atlantic City during the time of the conventions of the M. M. and M. C. B. associations next June. Charles L. Sullivan, Cowles-MacDowell Engineering Company, Chicago, is secretary.

Railway Development Association.

The annual meeting of the Railway Development Association will be held on May 6 and 7, at the Tulane hotel, Nashville, Tenn. The meeting will be devoted to matters of interest to the industrial, immigration, and agricultural departments of the railways, and the program will include discussions on the following subjects: Efficiency of Centralized Power Plants; Agricultural Development; Reclamation of Wet Lands by Drainage, and Immigration Matters. William Nicholson, industrial agent of the Kansas City Southern, is secretary.

American Railway Association.

The spring meeting of the American Railway Association will be held at the United Engineering Society building, 25 West Thirty-ninth street, New York City, on Wednesday, May 21.

Reports will be presented by the committees as usual, including one from the joint committee on automatic train stops; transportation of explosives and other dangerous articles; the committee on electrical working and the committee on nominations. A second vice-president is to be elected.

Railway Business Association.

The Railway Business Association has moved its offices from 2 Rector street to suite 739, 30 Church street, New York.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS. E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.. 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago. 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—F. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Supts.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association. F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Transportation Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Dispatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo, first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah. 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago. 1st Monday in month, except July and August, Chicago.

Traffic News.

Most of the ports on the south side of Lake Erie are reported as congested with coal, large shipments having been made from the mines while vessels on the lakes are unable to go out because of ice in parts of the lakes.

The Texas railways have issued Texas joint passenger tariff No. 1 quoting one-way fares between all points in the state, taking effect on May 1. The tariff represents two years of work and contains 379 pages and approximately 20,000 rates. The cost of compilation of the tariff is estimated at $18,000.

"A legislative commission" in North Carolina has requested the railways of the state to reduce freight rates generally 25 per cent. The commission conferred with officers of the railways at Raleigh last week and the railways made a tentative offer to reduce rates five per cent., but this was not at all satisfactory to the representatives of the law makers. They have asked the railways to reply at once to the 25 per cent. proposition.

The grand jury in the United States court in New York City is investigating charges of extensive fraud in the collection of damage claims from railroads for alleged losses of eggs. The frauds, according to the reports, have been prosecuted by consignees in collusion with inspectors who have reported eggs as broken when they were whole. The reports say that one railroad has paid out $80,000 on these claims during the past year, over and above its freight receipts on eggs.

At Washington last week the Interstate Commerce Commission heard the complaint of the "National Baggage Committee," claiming that excess baggage rates throughout the country are unreasonably high. On the baggage of a passenger over and above 150 lbs., a charge of 16½ per cent. of the first-class passenger fare is made. This extra baggage rate was increased about four years ago from 12½ per cent. of the passenger fare. The complainant asks to have the old rate restored.

Officers of the railroads in Official Classification territory are discussing the propriety of laying before the Interstate Commerce Commission new freight tariffs, making general increases of about 5 per cent. over present rates; and the presidents of the principal companies are said to have had conferences on the subject; but the publication of items in the daily newspapers, for which no railroad officer will formally vouch, is the only tangible news thus far made public. Mr. Rea of the Pennsylvania, and Mr. Willard, of the Baltimore & Ohio, are spoken of as leaders in the movement, but neither of them has made any definite statement.

The Northern Pacific, on April 27, put in service a new passenger train between Duluth and Staples, Minn., for the purpose of giving Duluth a direct connection with the North Coast Limited the fast train to the Pacific coast. The train will carry observation and dining cars, and will leave Duluth at 10 a. m., arriving at Staples in time to connect with the North Coast Limited. Returning the train will leave Staples at 7:05 p. m., arriving at Duluth at 11:45 p. m. The Duluth commercial interests have been agitating for better connections with the through trains from the Twin Cities for a long time, and the new train represents an effort on the part of the Northern Pacific to meet this demand.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 141-A, giving a summary of car surpluses and shortages by groups from January 3, 1912, to April 15, 1913, says:

The total surplus on April 15 was 70,715 cars; on April 1, 68,792 cars; and on April 11, 1912, 94,943. Compared with the preceding period; there is an increase in the total surplus of 1,923 cars, of which 1,636 is in coal, 690 in miscellaneous, and a decrease of 299 in box and 104 in flat car surplus. The increase in coal car surplus is in groups 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and Western Pennsylvania), and 7 (Montana, Wyoming, Nebraska and the Dakotas). The increase in mis-

cellaneous car surplus is in groups 1 (New England lines), 2 (as above), 4 (the Virginias and Carolinas), 7 (as above), and 11 (Canadian lines). The decrease in box car surplus is in all groups except 2, 4, 7 and 11 (as above). The decrease in flat car surplus is in all groups except 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 6 (Iowa, Illinois, Wisconsin and Minnesota), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 9 (Texas, Louisiana and New Mexico).

The total shortage on April 15, 1913, was 13,217 cars; on April 1, 10,804 cars; and on April 11, 1912, 15,554. Compared with the preceding period; there is an increase in the total shortage of 2,413 cars, of which 131 is in box, 738 in flat, 796 in coal and 748 in miscellaneous cars. The increase in box car shortage is in groups 1, 3, 4, 7, 8 (as above). The increase in flat car shortage is in groups 3, 4, 6, 8 (as above), 10 (Washington, Oregon, Idaho, California, Nevada and Arizona), and 11 (as above). The increase in coal car shortage is in groups 1, 4, 5, 6, 8 and 10 (as above). The increase in miscellaneous car shortage is in groups 1, 4, 8 and 10 (as above).

Compared with the same date of 1912; there is a decrease in the total surplus of 24,228 cars, of which 1,717 is in flat, 26,955 in coal, 684 in miscellaneous, and an increase of 5,128 in box car surplus. There is a decrease in the total shortage of 2,337 cars, of which 2,465 is in box, 1,474 in miscellaneous, and an increase of 628 in flat and 974 in coal car shortage.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

CAR SURPLUSES AND SHORTAGES.

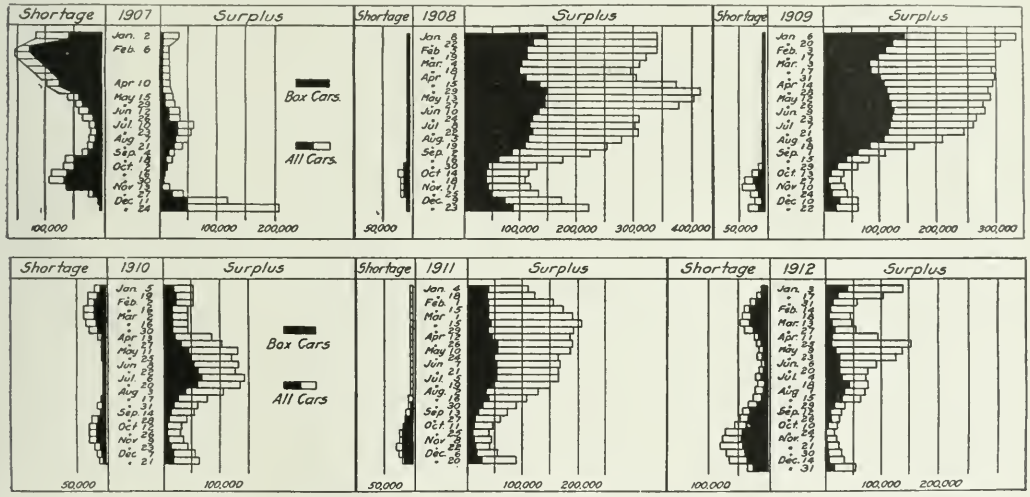
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

Summary of Revenues and Expenses of Steam Roads in February.

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for February are as follows:

The month of February contained 28 days in 1913, while in 1912 it had 29 days. As a consequence all returns for February, 1913, shown in the aggregate and per mile of line, other things equal, would be one twenty-ninth, or nearly four per cent. less than in February, 1912. This fact should be borne in mind while studying the February comparisons in this summary.

The railways whose returns are included in this bulletin operate 221,970 miles of line, or about 90 per cent. of the steam railway mileage in the United States. Total operating revenues

for the month of February, 1913, amounted to $225,376,930. Compared with February, 1912, the total operating revenues show an increase of $13,686,777. These total operating revenues per mile of line amounted to $1,015 in February, 1913, and $964 in February, 1912, an increase of $51, or 5.3 per cent. Freight revenue per mile increased 4.7 per cent. and passenger revenue per mile 5.1 per cent.

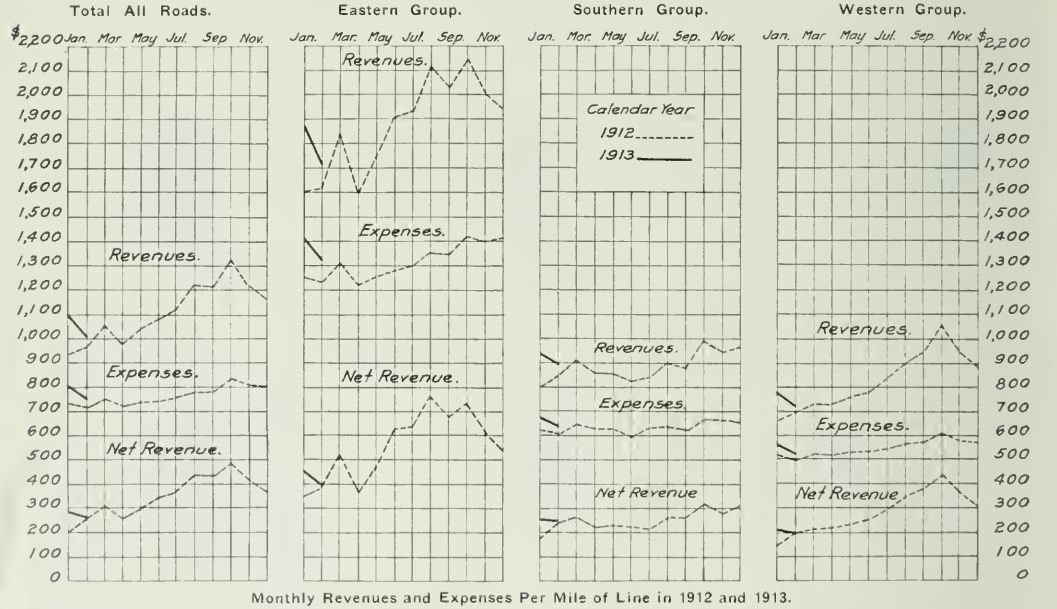
Operating expenses amounted in February to $167,759,591. This was $11,764,165 more than for February, 1912. These operating expenses per mile of line amounted to $756 in February, 1913, and $710 in February, 1912, an increase of $45 per mile, or 6.4 per cent. All the five primary operating expense accounts showed increases per mile over 1912.

Net operating revenue amounted in February to $57,617,339. This was $1,922,612 more than for February, 1912. Net operating revenue per mile of line amounted to $260 in February, 1913, and $254 in February, 1912, an increase of $6 per mile, or 2.4 per cent.

Taxes for the month of February amounted to $10,218,528, or $46 per mile, an increase of 5.7 per cent. over February, 1912.

Comparison of the returns for the eight months of the fiscal year with those of the corresponding months of the previous fiscal year reveals an increase in total operating revenues per mile of 10.2 per cent., an increase in operating expenses per mile of 9.1 per cent., and an increase in net operating revenue per mile of 12.5 per cent. This net operating revenue per mile of the eastern railways increased 10.3 per cent. as compared with the corresponding period of the previous year, that of the southern railways increased 5.9 per cent. and that of the western railways increased 17.1 per cent.

When the returns for the two months of the calendar year 1913 are compared with those of the corresponding months of 1912, they show an increase in total operating revenues per mile of 11.1 per cent., an increase in operating expenses per mile of 8.6 per cent., and an increase in net operating revenue per mile of 19.1 per cent. This net operating revenue per mile increased 16.5 per cent. in the eastern district, as compared with the corresponding period of the previous year, increased 23.0 per cent. in the southern district, and increased 20.7 per cent. in the western district.



Monthly Revenues and Expenses Per Mile of Line in 1912 and 1913.

Operating income amounted in February to $212 per mile of line, and in February, 1912, to $208. This was an increase of $4, or 1.8 per cent. Operating income for each mile of line for each day in February averaged $8 and for February, 1912, $7.

The operating ratio for February was 74.4 per cent., which is comparable with 74.0 per cent. in January, 1913, and 73.7 per cent. in February, 1912.

The railways of the eastern district show an increase in total operating revenues per mile of line as compared with February, 1912, of 6.4 per cent., the railways of the southern district an increase of 5.9 per cent., and the railways of the western district an increase of 4.4 per cent. Operating expenses per mile increased 7.6 per cent. on the eastern railways, 6.1 per cent on the southern railways, and 5.6 per cent. on the western railways. For the eastern railways net operating revenue per mile increased 2.6 per cent., for the southern railways it increased 5.4 per cent., and for the western railways it increased 1.2 per cent. The increase in taxes per mile was 4.6 per cent in the eastern district, 7.4 per cent in the southern district, and 6.6 per cent. in the western district. Operating income per mile increased 1.3 per cent. in the east, 5.5 per cent. in the south, and 0.9 per cent. in the west.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1912 and of the calendar year 1913 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:

Per Cent. of Total Operating Revenues.

	February.		Fiscal year ended June 30.		Calendar year ended Dec. 31.	
	1913.	1912.	1912.	1911.	1912.	1911.
Maintenance of way and structures	11.7	10.9	12.7	12.9	12.8	12.7
Maintenance and equipment	18.0	17.3	15.8	15.5	16.0	15.7
Traffic expenses	2.2	2.3	2.2	2.2	2.0	2.1
Transportation	39.8	40.5	35.9	35.5	35.5	35.4
General expenses	2.7	2.7	2.5	2.5	2.4	2.5
Total operating expenses	74.4	73.7	69.1	68.6	68.7	68.4

Car Location.

The table on page 1009, which is taken from Car Location, bulletin No. 5, of the American Railway Association, gives a summary of the location of freight car equipment by groups on April 1, together with surpluses and shortages on the same date.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until August 16, certain tariffs, which proposed to cancel through joint class and commodity rates from and to stations located on the Kansas City & Memphis and points located on or reached via the St. Louis & San Francisco, providing that combination rates apply, which would result in material advances.

The commission has suspended from April 15 until August 13, the supplement to the tariff of the Chicago, Rock Island & Pacific, which contains schedules advancing rates on wheat and corn, in carloads, from Omaha, Neb., and other Missouri river points to certain stations in Wisconsin, viz., Mann, Spencer, Unity, Colby and Abbottsford.

The commission has suspended until August 13, certain schedules in supplements to Agent W. H. Hosmer's tariff, which proposed to increase rates on building stone in carloads, seven cents per 100 lbs. from Sandstone and Banning, Minn., to Kansas City, Mo., and other destinations. The present rate is 12 cents, and the proposed rate 19 cents per 100 lbs.

The commission has suspended from April 25 until August 23, the item in a supplement to Agent F. A. Leland's tariff, which would advance the rates on grain products from 22 stations in southern Illinois, including such points as Evansville, Murphysboro, Sparta, Waterloo, etc., to points in Texas. In most instances the advance is 7 cents per 100 lbs.

Minneapolis & St. Louis west of Hanley Falls, Minn. via Minnesota Transfer and the Chicago, St. Paul, Minneapolis & Omaha were not unreasonable or discriminatory. The order of suspension was vacated. (26 I. C. C., 595.)

Lake-and-Rail Class Rates from Pennsylvania Points.

In re investigation and suspension of advances in class rates from points in Pennsylvania and New York to St Paul Minn., and other destinations. Opinion by Commissioner Harlan:

The commission decided that the advances in lake-and-rail class rates from points in trunk-line territory to the Northwest through the Lake Superior ports had not been justified. The carriers were ordered to cancel the suspended tariffs. The contention of the carriers that they are relieved of the burden of proof because the proposed rates, while advances over those now in effect, are on a lower level than the one in effect on January 1, 1910, was not sustained. (26 I. C. C., 669.)

Rates on Paper Labels Reduced.

Pacific Creamery Company v. Southern Pacific et al. Opinion by the commission:

The defendants apply to the transportation of paper labels in less than carloads via rail and water from New York to Creamery, Ariz., their first-class rate of $3.50 per 100 lbs. The commission decided that this rate is unreasonable, and that for the future the rate on this commodity between the points in question should not exceed the rate contemporaneously maintained on

*Denotes deficiency.

The commisison has suspended from April 14 until June 20, certain items in a supplement to the tariff of the Chicago, Milwaukee & St. Paul which would cancel milling-in-transit privileges at Minneapolis, Minn., and a number of other milling points, applicable upon wheat and coarse grain originating west of the Missouri river when the milled product is destined to certain stations in Wisconsin.

Lake-and-Rail Rates from Central Freight Association Territory.

In re investigation and suspension of advances in class and commodity rates from points in Trunk Line and Central Freight Association territory to Minneapolis, Minn., and other points via rail and lake. Opinion by Commissioner Harlan:

The commission decided that the advances in rail-and-lake rates from central freight association territory to the northwest through the Lake Superior ports had not been justified. The carriers were ordered to cancel the suspended tariffs. (26 I. C. C., 671.)

Rates on Grain Products Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of grain, grain products and seed between Aberdeen, S. Dak., and other points, and Duluth, Minn., and other points via Chicago, St. Paul, Minneapolis & Omaha Line. Opinion by Chairman Clark:

The commission decided that the withdrawal of joint rates on grain, grain products and seed from certain stations on the paper wrappers or printed wrapping paper. Reparation was awarded. (26 I. C. C., 578.)

Class Rates to Watertown, South Dakota.

In re investigation and suspension of advances in class rates by carriers from Chicago, Ill., St. Louis, Mo., and other points to Watertown and other stations in South Dakota. Opinion by Commissioner Clements:

The commission decided that the proposed advance in class rates from Chicago, Peoria, St. Louis and points taking same rates, to Watertown and other destinations in South Dakota were not unreasonable or unjustly discriminatory. The order of suspension was vacated. (26 I. C. C., 635.)

Furniture Rates in the Northwest.

In re investigation and suspension of advances in rates by carriers for the transportation of furniture in carloads from Burlington, Iowa, Port Washington, Wis., and other points to St. Paul, Minn., and other points. Opinion by Commissioner Meyer:

The respondents propose to advance commodity rates on furniture, including the general mixture of furniture, church and school furniture, and opera seats, and chairs and cribs in carloads from and to points in Wisconsin, Illinois, Indiana, Iowa and Missouri, to and from St. Paul, Duluth and Winona, Minn., and points taking the same rates. Comparisons are made of present and proposed commodity rates with third-class rates, with rates on light and bulky articles similar to furniture, with

furniture rates in other parts of the country, and also comparisons of the minimum revenue per car resulting under these various rates at their specific minimum carload weights. The commission decided that the equipment required to move furniture under commodity rates involved, at the comparatively high minimum of 20,000 lbs., is more expensive, and the greater weight of the loaded cars entails greater transportation costs, than under class rates at the comparatively lower minimum of 12,000 lbs., hence the earnings per car should be somewhat larger under commodity rates than under class rates. A moderate advance in the commodity rates may be justifiable.

The tariffs disclose a number of Wisconsin producing points from which no advances are proposed corresponding to those in question, thereby disturbing the established adjustment between producing points.

Should further investigation show that, under published rates, St. Paul will be discriminated against through loss of territory naturally tributary to it as a distributing center, carriers will be expected to remove the discrimination.

Carriers should withdraw suspended tariffs and file new tariffs in harmony with this report and with a view of removing discriminations and inconsistencies pointed out. (26 I. C. C., 655.)

Concentration of Cotton at Memphis, Tenn., and Blytheville, Ark.

In re investigation and suspension of the withdrawal of rules governing concentration and reshipping of cotton and cotton linters at Memphis, Tenn. Opinion by Chairman Clark:

Certain large cotton dealers having erected a cotton compress at Blytheville, Ark., the respondent proposes to establish rules requiring compression at Blytheville of the cotton grown in an important district from which cotton has moved to Memphis for compression. The commission decided that if shipments moved on original contract for carriage from points of origin to final destinations, and the carrier performed itself all the compression on its lines, there could be no objection to the location of its compresses at such points as it might select with a view to economies in transportation and conservation of equipment. Under similar conditions of shipment the situation would be much the same if all the compression were performed by commercial compresses owned and operated by those who had no interest in the cotton.

Where cotton is not shipped from point of origin under a contract for through shipment to final destination, but where the transportation charges are assessed to the compress point, and from the compress point to final destination, and subsequently adjusted to the basis of the through rate from point of origin to final destination, with carriers' right of compression in transit, a rule which requires compression at the compress of one who is the owner of or interested in cotton grown in that district and compressed at the same point, is not free from unjust discrimination or undue preference.

Where the rates provide carriers' right of compression in transit the carrier pays for the compression, and the one who is employed to perform the compression becomes the agent of the carrier and as such necessarily gains knowledge as to the business and shipments of his competitors, probably in contravention of the provisions of section 15 of the act.

The territory which respondent's suspended tariff proposes to make tributary to Blytheville only should be open via respondent's lines to both Memphis and Blytheville.

The suspended tariff must be canceled, and new rules in accordance with the commission's findings must be established. (26 I. C. C., 585.)

STATE COMMISSIONS.

The Railroad Commission of Louisiana has issued an order prescribing a distance scale of freight rates on fruits and vegetables.

The Texas Railroad Commission has issued a new tariff of freight rates on crushed stone, sand, paving clay and analogous articles, involving reductions varying from 10 to 15 per cent.

The Louisiana State Railroad Commission has ordered that all passenger cars shall be thoroughly cleaned and disinfected at the end of each run, or, in the case of certain short runs, at least each day. The order says that "coaches in service shall be kept as clean as possible without disturbing passengers."

The New York State Public Service Commission, Second district, acting in accordance with a law which has been passed by the legislature this year has assumed authority over baggage and transfer companies. In accordance with this law baggage and transfer companies are subject to regulation in regard to rates, service and capitalization, as are steam railroads.

The Louisiana State Railroad Commission, at the request of the brotherhoods of conductors and of trainmen, has modified its order No. 1517 regulating flagging. Flagmen must be examined once a year, instead of every six months; and where a man cannot read and write, the examination need not be in writing. An employee must not be promoted to the position of flagman until he has served as brakeman or switchman for six months; provided that on a freight train he may serve as both brakeman and flagman if he has had thirty days' experience as flagman.

The railway commissioners of Canada have ordered the express companies to submit at once new tariffs reducing by 20 per cent. the rates on merchandise in the prairie and mountain sections of the dominion. The commission desires to have the new rate prepared so that the tariffs can be published by July 15. In eastern Canada the commissioners found that the business of the Canadian Express Company, which does most of the business in that part of the Dominion, had been much less profitable during the past year than prior to that time. The cost of service has increased and the compensation paid to the Grand Trunk Railway has been made larger. On account of the reduction in profits the board will defer action in relation to that company.

COURT NEWS.

Unsecured Creditors Given New Rights.

The Supreme Court of the United States by a vote of five to four, in a suit against the Northern Pacific, lays down the rule that stockholders and bondholders in a corporation cannot defeat the claims of unsecured creditors by reorganization plans, if the creditor shows the proper diligence in presenting his claim.

The decision, by Justice Lamar, is concurred in by Justices McKenna, Day, Hughes and Pitney. A dissenting opinion was read by Justice Lurton and concurred in by Chief Justice White and Justices Holmes and Van Devanter. Justice Lurton characterized the majority opinion as "alarming."

The case involved a claim of more than 25 years' standing, in which Joseph P. Boyd was the creditor. The original claim was for $23,675, but it grew to $71,000, with interest and costs.

The judgment now affirmed is against the Northern Pacific Railway Company, which took over the Northern Pacific Railroad Company under a reorganization plan. The Northern Pacific Railroad Company was held as the debtor on account of its acquisition of the Cœur d'Alene Navigation Railroad Company, against which the claim was made originally. The case was admitted to be a test case.

Two questions were involved. One was whether or not Boyd, the creditor, had been diligent in prosecuting his claim, and on this the court divided. The majority opinion held that he had been unusually diligent, while Justice Lurton, for the minority, characterized his methods as "sluggish." The other question was whether the transfer of the property of the old Northern Pacific Railroad Company, when it was an insolvent concern, to the reorganized Northern Pacific Railway Company could defeat the claims of unsecured creditors if they were non-assenting. The majority opinion holds that "as against the non-assenting creditors such a sale is void in equity regardless of the motive with which it was made."

Justice Lamar held that the transfer of the property to the reorganized company "was not a moral fraud, but the decree by which stockholders of the old company secured an interest in the new company does not necessarily operate against unsecured creditors of the old company."

The minority opinion holds that the objects of securing a receivership and a sale and reorganization of a great property that has become insolvent would be defeated if the rule laid down by the court is to be applied in the future.

Justice Lamar declared that "stockholders cannot defeat unsecured creditors by transferring property from themselves to themselves."

Railway Officers.

Executive, Financial and Legal Officers.

F. W. Meyer has been appointed auditor of the St. Joseph & Grand Island and the St. Joseph Terminal Railroad, with headquarters at St. Joseph, Mo., succeeding S. G. Danforth, acting auditor, who has been assigned to other duties.

W. S. Battle, Jr., general claim agent, and J. M. Rodgers, statistician of the Norfolk & Western, at Roanoke, Va., having been assigned to special duties J. B. Baskerville has been appointed acting general claim agent and W. B. Moss has been made acting statistician. See an item in General News.

Operating Officers.

William Doherty has resigned as assistant general manager of the New Orleans, Texas & Mexico and the St. Louis, Brownsville & Mexico at Kingsville, Tex.

A. S. Johnson, freight agent of the Terminal Railroad Association of St. Louis, has been appointed superintendent, with office at St. Louis, Mo., succeeding J. J. Coakley, deceased.

D. F. Kirkland, superintendent of the Georgia & Florida at Douglas, Ga., has been appointed superintendent of the Birmingham division of the Atlanta, Birmingham & Atlantic, with office at Manchester, succeeding C. B. Wilburn, resigned.

Traffic Officers.

W. L. Donaldson has been appointed westbound agent of the freight department of the Lehigh Valley, with office at Chicago.

B. B. Hickman has been appointed freight agent of the Terminal Railroad Association of St. Louis, at St. Louis, Mo., succeeding A. S. Johnson, promoted.

A. B. Schmidt has resigned as general agent of the passenger department of the St. Louis & San Francisco at Chicago to become traffic manager of Sears, Roebuck & Company, of Chicago.

Engineering and Rolling Stock Officers.

A. J. Wharf has been appointed chief engineer of the Peoria & Pekin Union, with headquarters at Peoria, Ill., to succeed W. E. Emery.

W. C. Steffa has been appointed superintendent of car service of the Chicago & Alton, with office at Chicago, succeeding E. M. Stanton, resigned.

J. W. G. Brewer, superintendent of shops of the Baltimore & Ohio at Mount Clare, Baltimore, Md., has been promoted to assistant district superintendent of motive power of the main line district, with headquarters at Baltimore. P. Coniff, master mechanic at Cumberland, succeeds Mr. Brewer. T. R. Stewart, master mechanic of the Riverside shops, Baltimore, has been transferred to Cumberland in the same capacity, succeeding Mr. Coniff. J. Kirkpatrick, master mechanic at Newark, Ohio, succeeds Mr. Stewart. J. F. Bowden, master mechanic at Garrett, Ind., succeeds Mr. Kirkpatrick. F. W. Rhuark, master mechanic at Lorain, O., succeeds Mr. Bowden, and J. A. Anderson, general foreman, has been promoted to master mechanic at Lorain, succeeding Mr. Rhuark.

Leon F. Lonnbladh, who recently was appointed engineer maintenance of way of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., was born December 7, 1877, at Boras, Sweden. He was graduated from the Boras Technical College, Sweden, in June, 1898, and began railway work the same month as assistant engineer of the Boras-Herrljunga Railroad in Sweden. From September, 1898, to May, 1899, he was an assistant engineer on various railroad surveys and locations, and from the latter date to September of that year was locating engineer. He was then until April, 1902, successively assistant engineer, resident engineer and locating engineer on construction of the Ystad-Brosarp Railroad in Sweden. In June, 1902, Mr. Lonnbladh became office engineer for the Tennessee Construction Company, and in December of the following year was made assistant engineer of the Tennessee Central Railroad. From August, 1904, to December, 1905, he was successively engineer of construction and chief engineer of that road, when he left to go to the Southern as assistant to the chief engineer of construction. In February, 1907, he was appointed principal assistant engineer of construction of the New Orleans, Texas & Mexico and the Beaumont, Sour Lake & Western. From January 1 to July 1, 1908, he was in charge of location work, and on the latter date was made chief engineer of the Tennessee Central; in October, 1912, he was appointed superintendent also, which positions he held until he resigned April 1 to go to the Missouri, Kansas & Texas as engineer maintenance of way, as above mentioned.

J. R. Greiner, whose appointment as master mechanic of the San Pedro, Los Angeles & Salt Lake, with headquarters at Milford, Utah, has already been announced in these columns, was born February 15, 1881, at Circleville, O. He received a high school education at Delaware, Ohio, and began railway work March 1, 1900, as an apprentice with the Cleveland, Cincinnati, Chicago & St. Louis at Delaware. In April, 1904, he went to the Cincinnati, Hamilton & Dayton as machinist at Indianapolis, Ind., and in September of that year was transferred to Lima, Ohio, in a similar capacity. From January, 1905, to December 28, 1907, he was employed as machinist by the Mobile, Jackson & Kansas City at Mobile, Ala.; Norfolk & Western at Portsmouth, Ohio; Cleveland, Cincinnati, Chicago & St. Louis at Delaware, and the Cincinnati, Hamilton & Dayton at Lima. He was then made roundhouse foreman of the latter road at Toledo, Ohio, and was promoted to master mechanic at Lima in March, 1911, which position he held until the office was abolished on January 1 last. Mr. Greiner then became connected with the National Boiler Washing Company at Chicago, leaving that firm to go with the San Pedro, Los Angeles & Salt Lake as master mechanic, as above noted.

U. R. Greiner.

OBITUARY.

E. B. Wakeman, who was superintendent of the Minneapolis Union Railway from April, 1895, to September, 1904, died on April 20 at Hollywood, Cal.

John H. Weller, formerly superintendent of the Dayton & Michigan, now the Toledo division of the Cincinnati, Hamilton & Dayton, died on April 22, at his home in Dayton, Ohio, at the age of 83. His death was due to paralysis and to the effects of his exposure for several days without food or warmth during the recent floods in southern Ohio.

A. W. Quackenbush, formerly master mechanic of the Quincy, Omaha & Kansas City, died in Kansas City, Mo., on April 19, aged 68 years. Mr. Quackenbush began railway work in 1862 and, after completing an apprenticeship as machinist with the Hudson River Railroad, he filled various positions as foreman of machine shops and master mechanic on various eastern roads until 1880, when he went to the Wabash, St. Louis & Pacific as master mechanic. From January, 1887, to July, 1889, he was general master mechanic of the Wabash Western and then until December, 1892, was superintendent of machinery of the Chicago & Alton. He was superintendent of motive power of the St. Louis, Cape Girardeau & Ft. Smith from July, 1893, to October, 1899, when he became superintendent of motive power and rolling stock of the Omaha, Kansas City & Eastern, the Omaha & St. Louis and the Kansas City & Northern Connecting railroads. Subsequently he was made master mechanic of the Quincy, Omaha & Kansas City, successor to the former roads, which position he held at the time of his retirement from active service in February, 1911.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Southern Railway is in the market for 45 locomotives.

The St. Louis & San Francisco is in the market for 30 locomotives.

The Seaboard Air Line has ordered 40 Pacific type locomotives from the American Locomotive Company, 5 switching locomotives from the Baldwin Locomotive Works.

The Cape Girardeau Northern, Cape Girardeau, Mo., has ordered 2 mogul locomotives from the American Locomotive Company. The dimensions of the cylinders will be 18 in. x 24 in., the diameter of the driving wheels will be 54 in., and the total weight in working order will be 113,000 lbs.

The Cuba Railroad has ordered 14 ten-wheel freight locomotives and 1 ten-wheel passenger locomotive from the American Locomotive Company. The freight locomotives will have 18 in. x 24 in. cylinders, 52 in. driving wheels, and in working order will weigh 129,000 lbs. The passenger locomotive will be equipped with a superheater, will have 21 in. x 26 in. cylinders, 68 in. driving wheels, and in working order will weigh 137,000 lbs.

CAR BUILDING.

The Wabash is making inquiries for 1,000 box cars. This road did not apply to the courts for permission to buy more equipment as was recently mentioned in these columns.

The Erie is in the market for 1,000 refrigerator cars.

The Southern Railway is in the market for 1,800 freight cars.

The Illinois Central has ordered 18 coaches, 6 postal cars, 13 combination mail and baggage cars, 3 dining cars and 3 express cars from the Pullman Company. Of this order, 8 coaches, 3 express cars and 3 combination mail and baggage cars are for the Central of Georgia.

The Grand Trunk, mentioned in the *Railway Age Gazette* of April 18 and April 25, as having placed large orders for freight cars both in Canada and in the United States, has placed orders as follows: 3,000 box cars, Western Steel Car & Foundry Company; 1,000 drop-bottom special service cars, Pressed Steel Car Company; 2,000 box cars, Canadian Car & Foundry Company; and 2,000 box cars, Eastern Car Company. This item supersedes the two items above mentioned.

IRON AND STEEL.

General Conditions in Steel.—The volume of orders for new business has been extremely small during the past week, but the mills continue to operate at almost full capacity and specifications are heavy. Prices are high and consumers appear to be holding off in expectation of reductions. The orders placed by the railroads are very small indeed, and the volume of orders pending is light. A heavy increase in orders for freight cars is expected in the near future to enable the railroads to handle the heavy fall traffic.

Yard Lighting at Melbourne, Australia.—Among the improvements which the scheme for the electrification of the Melbourne suburban system will introduce, will be the illumination of the station yards and semaphores. Provision has been made for the lighting of the whole of the yards in the suburban area by current generated at the railway department's own power station. At present a number of the stations are lighted with primitive kerosene lamps. The annual cost of lighting all the stations and yards with these lamps and with electric current bought from a private source within the suburban radius is estimated at $75,000. It is estimated that this sum will be considerably reduced when the complete scheme of electric lighting is carried out.

Supply Trade News.

H. B. Kraut, of the export department of Joseph T. Ryerson & Son, Chicago, will sail for Europe on May 6, in the interests of the company's foreign business.

Francis T. West, northwestern sales agent for the American Iron & Steel Manufacturing Company, has removed his office from The Rookery, to 1547 McCormick building, 332 South Michigan avenue, Chicago.

E. R. Schoenberger, formerly connected with the Griffin Wheel Company, Chicago, has been made manager of the western railroad department of the U. S. Metal & Manufacturing Company, New York, with office in Chicago.

Raymond J. O'Brien has resigned his position in the railway engineering department of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., to accept a position with Gibbs & Hill, consulting engineers.

The Union Spring & Manufacturing Company, New York, mentioned in the *Railway Age Gazette* of April 25 as having moved from 149 Broadway to 50 Church street, has not made this change, but is still located at 149 Broadway.

H. Martin Gower, formerly in charge of the apprentice work on the Canadian Pacific, has accepted a position in charge of the railway department of the A. R. Williams Machinery Company of Winnipeg, Ltd., with headquarters at Winnipeg, Man.

W. W. Coleman, who has for the past five years been in the estimating department of the Union Switch & Signal Company, Swissvale, Pa., with office in New York, has resigned that position to go to the Edison Storage Battery Company, Orange, N. J., as sales engineer.

C. Wadsworth has established an office at 961-3 Woodward avenue, Detroit, Mich., as manufacturers' agent for the purpose of representing manufacturers of contractive machinery and materials of construction, making more or less of a specialty of municipal equipment and supplies.

The Standard Asphalt & Rubber Company has received an order for Sarco waterproofing for nearly 1,000,000 sq. ft. of surface on subways and viaducts on the lines of the Kansas City Terminal Railway leading to the new Union station. This is in addition to a previous order for nearly 700,000 sq. ft. of surface on the Union station.

J. Allan Smith, vice-president and general manager of the United States Light & Heating Company, New York, has been made president of that company, succeeding D. W. Pye, resigned. Charles A. Starbuck, vice-president of the same company, resigned that position to become chairman of the board of directors. Frank P. Frazier, a director of the company, was made a vice-president. William P. Hawley, manager of the New York office, was made a vice-president, and A. H. Ackermann, assistant general manager, was made general manager.

Willard Doud on April 1 resigned his position as shop engineer of the Illinois Central to engage in special work on industrial engineering projects as consulting engineer with office at 15 West Kinzie street, Chicago. For the past 11 years Mr. Doud has been engaged in railroad work, principally in the design, construction and supervision of railroad shops and power plants. In 1902, after a course in mechanical engineering at the University of Illinois, he entered the employ of the Kenefick Construction Company, Kansas City, Mo., which was engaged in railroad construction work in the Indian Territory. In 1904 he resigned his position with that company to enter the mechanical department of the Kansas City Southern as machinist helper, with office at Pittsburg, Kan., later serving as draftsman and chief draftsman with that company. In 1905 he was made draftsman of the Chicago, Burlington & Quincy, and after two years, shop engineer. While with the Burlington, Mr. Doud had general supervision over the mechanical end of shop improvements, and supervised the electrification of the West Burlington, and the old Havelock shops, and also had charge of the construction work of the new Havelock shops. In February, 1911, he went to the Illinois Central as shop engineer, which position he retained until April 1, as mentioned above.

Railway Construction.

CAROLINA & GEORGIA.—A contract has been let for building this line, and work will be started by May 15. The capital stock is to be increased from $100,000 to $2,500,000, and a bond issue of $2,000,000 has been authorized. The line between Augusta, Ga., and Columbia, S. C., 75 miles, is expected to be finished during 1914. Both steam and electricity may be used as the motive power. G. E. Shand and James U. Jackson, Augusta, may be addressed.

CHAMBERSBURG & SHIPPENSBURG (Electric).—Bids are wanted until May 12, for the grading, track laying and ballasting, also for the masonry and culverts, from Red Bridge Park, Franklin county, Pa., to Shippensburg, Cumberland county, Pa., about 8.4 miles. T. M. Mahon, president, and J. G. Schaff, secretary, Chambersburg. (April 4, p. 821.)

FAIRMOUNT & VEBLEN.—An officer of this company, which was organized last year, writes that financial arrangements have been made and contracts have been let to Whittier & Brolander, to build about 46 miles of railway from Veblen, in Marshall county, S. Dak., east, thence north to Fairmount, N. Dak. There will be three trestles on the line, and the grading involves handling a total of about 500,000 cu. yds. The company expects to develop a traffic in grain, lumber, stock and dairy products. J. Rosholt, president, and J. S. Thomas, chief engineer, Minneapolis, Minn. (December 27, p. 1288.)

FALLON RAILROAD (Electric).—This company has been organized in Nevada, with a capital of $300,000, to build from Fallon, Nev., northeast to Stillwater, about 15 miles. A. R. Merritt, president, and C. A. Hascall, general manager.

INTERURBAN RAILWAYS.—A franchise has been granted this company in Slidell, La. Application will soon be made for a charter to build a line to connect New Orleans, Slidell and Covington. Gas-electric cars will be used for the motive power. J. Blythe and T. S. Ranlett are interested.

KANSAS CITY, MEXICO & ORIENT.—Work on the extension from Fort Stockton, Tex., to Alpine, 63 miles, has been finished, and this section is now open for business.

KETTLE VALLEY.—According to press reports bids will be asked for in about one month to build a section between the summit of the Hope mountains down the valley of the Coquehalla river, west to Hope, B. C.

LANCASTER & CHESTER.—An officer of this company which operates a line from Chester, S. C., to Manchester, 29 miles, writes regarding the report that an extension is to be built, that the company will increase its capital from $50,000 to $500,000, and the line may be extended.

LAKE ERIE & NORTHERN (Electric).—This company has started work on the line from Galt, Ont., south via Brantford to Port Dover, and several miles have been cleared between Paris and Galt, and grading has been started between Paris and the Harrisburg line of the Grand Trunk. Work is also to be started at once on the section between Waterford and Simcoe. The company plans to have all the grading work finished by November 1, and to have the track laying completed between Brantford and Galt by October 15. The track laying to Port Dover is expected to be completed by May, 1914. John Muir, president; W. P. Kellett, chief engineer, Brantford. (August 30, p. 409.)

NEW BRUNSWICK ROADS.—Application has been made for a charter in New Brunswick to build from Bristol, N. B., east to a point on the National Transcontinental (Grand Trunk Pacific) at Juniper brook. D. H. Lamont, J. McIntosh and R. Ronald, Glassville, are back of the project.

OKLAHOMA ROADS (Electric).—Plans are being made, it is said, to build from Pryor creek, Okla., east to Salina, and to Locust Grove, about 22 miles. J. A. Quinn, Pryor, may be addressed.

PARIS & MOUNT PLEASANT.—This company has just finished the extension from Bogata to Mt. Pleasant, 32 miles. It is understood that work on the extension northwest from Paris to Atoka, Okla., and to the Lehigh coal fields, about 60 miles, will soon be started. (January 3, p. 39.)

PENNSYLVANIA RAILROAD.—Contracts have been let to the James McGraw Co., Philadelphia, and to the Duquesne Contracting Company, Pittsburgh, for a revision of nine miles on the Buffalo division between Glynden, Pa., and Corry.

An officer writes that the improvements contemplated at Erie, Pa., consist of changes in yard tracks in order to handle the increasing lake traffic. The plan provides for an increase in storage tracks for east-bound and west-bound Anchor Line business. In addition, a run-around track will be constructed at the ore pier in order to give a continuous movement to empty cars in and loaded cars out.

PIGEON VALLEY.—An officer writes that the plans call for building from Pigeon Falls, Wis., to Hay creek in the town of Bridge Creek, about 20 miles. A preliminary survey has not yet been made. H. A. M. Steen is president, Northfield. (April 18, p. 925.)

SAN BENITO & RIO GRANDE VALLEY.—Financial arrangements are said to be made for building an extension north from Alton, Tex., to San Antonio, about 250 miles, also for an extension east via San Benito to Point Isabel on the Gulf coast. The company was authorized some time ago to issue $10,000,000 of bonds to provide for the proposed extensions. (November 29, p. 1064.)

SANTA ROSA, PALMA & ALBUQUERQUE.—Organized in New Mexico to build from Santa Rosa, N. Mex., west to Albuquerque, about 125 miles. To provide for making the necessary surveys and other preliminary work $25,000 has been subscribed by residents of Santa Rosa.

SHENANDOAH VALLEY (Electric).—An officer writes that contracts will probably be let in two months to build from Williamsport, Md., southwest via Hedgesville, W. Va., thence south via Martinsburg and Charlestown, to Winchester, Va., about 60 miles. Gray Silver, president, Martinsburg, W. Va., and Dudley D. Britt, chief engineer, Clarksburg. (April 18, p. 925.)

RAILWAY STRUCTURES.

ALBERT LEA, MINN.—It is reported that the Minneapolis & St. Louis is planning to expend $300,000 for a new station, freight depot, offices and yards at this point.

FORT WORTH, TEX.—The St. Louis Southwestern will begin the construction of extensive new freight terminals within the next 60 days, including a warehouse and a bridge over the Trinity river.

LACKAWANNA, N. Y.—See Rochester.

MONTREAL, QUE.—The Canadian Pacific has given a contract to D. G. Loomis, it is said, for putting up a one-story addition, 150 ft. x 600 ft. at the Angus shops.

NORTH BAY, ONT.—The Canadian Pacific has started work, it is said, on the construction of additional shops at North Bay, to cost $249,000. A large erection shop will be constructed, and another large building will be used for car construction and repairs.

OTTAWA, ONT.—The Canadian Northern will put up a roundhouse and car shops, it is said, at Ottawa.

ROCHESTER, N. Y.—An officer of the Buffalo, Rochester & Pittsburgh writes regarding the reports that a new warehouse is to be built at Rochester, that it is undecided when the building will be put up, as the plans have not yet been completed. Work has been started on a combined passenger and freight station at Lackawanna, to be of frame construction, 20 ft. x 63 ft., and to cost $6,200. The work is being carried out by the company's men.

SOMERSET, PA.—The Baltimore & Ohio has plans made for building the new passenger station at Somerset. It is to be a two story stone structure, 28 ft. x 92 ft., to cost $30,000. (March 14, p. 481.)

THIEF RIVER FALLS, MINN.—The Minneapolis, St. Paul & Sault Ste. Marie has prepared plans for a new passenger station.

TORONTO, ONT.—The Canadian Northern has decided to establish yards and extensive shops at Leaside.

Railway Financial News.

Alabama, Tennessee & Northwestern Railway.—This company has been organized to take over the Alabama, Tennessee & Northwestern Railroad, the Tombigee Valley and the Mobile Terminal & Railway. The company has an authorized issue of $25,000,000, 30 year first and refunding mortgage bonds of which $2,000,000 have been issued and deposited to secure $1,000,000, 3 year, 6 per cent. notes due May 1, 1916. These notes have been bought by F. J. Lisman & Co., New York, and are being offered to the public. The reorganized company operates about 225 miles of railroad running from Mobile, Ala., to Reform on the Mobile & Ohio.

Birmingham & Northwestern.—Wells, Humphrey, Nichol & Ford, Detroit, Mich., are offering $450,000, 6 per cent. collateral notes maturing in three years at par. The notes are guaranteed principal and interest by the Mercantile Trust Company, Jackson, Tenn., and are secured by $800,000 first mortgage bonds and all of the common stock of the B. & N.

Boston & Maine.—It is understood that plans are being discussed for the issue of equipment trust certificates amounting to in the neighborhood of $9,000,000. If these plans are carried out the proposed sale of $7,500,000, 4½ per cent. debentures will be indefinitely postponed.

Denver, Laramie & Northwestern.—According to the *Wall Street Journal*, negotiations for the sale of this property which is now in the hands of the receiver, to one or two eastern syndicates are now under way.

Lake Shore & Michigan Southern.—Morgan, Grenfell & Co., London, have bought from the company and resold in London £2,000,000 ($10,000,000) 1 year notes dated May 15. The notes were sold to the public on a 5¼ per cent. basis.

Laramie, Hahns Peak & Pacific.—The bondholders' protective committee has asked first mortgage bondholders to give their consent to the issuance of $315,000, 2 year, 6 per cent. receiver's certificates. The committee offers to buy the January 1, 1913, certificates of all of the bondholders who consent.

New York Central & Hudson River.—J. P. Morgan & Co., New York, have bought from the company and resold $10,000,000, 1 year, 5 per cent. notes. This is in addition to the £2,000,000 ($10,000,000) notes recently sold in London.

New York, New Haven & Hartford.—See brief comment on the hearing before Commissioner Prouty in the editorial columns.

Tennessee Central.—H. C. Pierce, testifying in a suit in St. Louis on April 25, said that in assuming the liabilities of the Tennessee Central, which is now in the hands of a receiver, he had obligated himself to about $4,000,000.

Union Pacific.—The attorney general has filed in the Supreme Court a brief in regard to the extensions of time in the Union Pacific tests. This brief says in part, "Under the peculiar circumstances shown I am of the opinion that to extend the time during which a plan for disposing of the Southern Pacific stock in question may be presented until July 1, 1913 may be greatly to the public's interest . . . but I emphatically oppose any extension beyond that date and with equal emphasis oppose an order granting the District Court power to enlarge such time as it may decide."

Union Pacific in its answer to the attorney-general's objections says:

"All actual control by petitioners over the management of the Southern Pacific has been terminated and the stock of the Southern Pacific held by petitioners is disfranchised. The public interests will not, therefore, be affected in the slightest degree by any delay in the ultimate disposition of said stock.

"The control of this court over its decree and mandate will terminate on the adjournment of the present term. Upon the expiration of the term at which a decree is entered, such decree passes beyond the court and cannot be corrected, modified or set aside. In view of the exceptionally large amount of stock to be disposed of, the manifest difficulties of the problem, the collateral objects of the government as indicated by the first plan submitted to the District Court, it would seem to be most unfortunate to permit this case to get into a condition in which neither this court nor the District Court would have power to extend the time for working out a satisfactory plan for dealing with the complex situation.

"The only adequate relief which can be afforded by this court is either an extension of time for a long period, or, as prayed in the pending motion, a modification of the mandate committing the matter of time entirely to the discretion of the District Court."

Wabash Pittsburgh Terminal.—See Wheeling & Lake Erie.

Wheeling & Lake Erie.—The reorganization plan—independent—which has been prepared by Daniel B. Ely & Co. provides for the consolidation of Wabash Pittsburgh Terminal and the Wheeling & Lake Erie under the name of the Wheeling, Lake Erie & Pittsburgh. Under this plan the new company would have an authorized issue of $100,000,000 first and refunding 5 per cent. 50-year bonds, secured by a mortgage on the entire property of both companies, subject only to $20,113,867 underlying liens. Of these bonds $30,000,000 would be issued at once and in addition there would be issued an undetermined amount of bonds stamped non-cumulative for seven years to pay off the debt to the Wabash. The new company would have $25,000,000 first preferred non-cumulative 4 per cent. stock, $12,000,000 second preferred 4 per cent. non-cumulative stock and $22,500,000 common stock held under a 10 years' voting trust. The total amount of capital required is $25,500,000, of which $20,370,000 is to be raised through the sale of notes secured by the $30,000,000 new first and refunding bonds and the remaining $5,130,000 to be raised by what amounts to an 11 per cent. assessment on the holders of Wabash-Pittsburgh first mortgage bonds and all three classes of Wheeling minority stock.

Proposed Spanish Railway.—Proposals are requested by the Ministerio de Fomento Seccion de Ferrocarriles, Madrid, Spain, for the concession and construction of a railroad from Avila to Salamanca by way of Penaranda de Bracamonte, about 75 miles. This road will connect with the Northern Railway at Avila. Tenders must be submitted to the ministry by June 25, 1913, accompanied by $18,000 cash. A further guaranty of $180,000 is required within 15 days after the granting of the concession, this latter sum to be returned on completion of the work.

A Railway "Cruise" in Spain.—The Madrid-Caceres-Portugal & Western Railway announces an excursion on somewhat novel lines, with the idea of introducing tourists to the little known but interesting country between Madrid and the Portuguese frontier. A special "cruiser" train, consisting of parlor, sleeping, and restaurant cars, will leave Venta de Banos on May 22, for Leon, Astorga, Salamanca, etc., and at various points along the line, motor cars, carriages, or mules, will be provided, and excursions will be made to places of interest outside the railway zone, rejoining the train, which will thus serve as a sort of traveling hotel, at some other station further along the route. The travelers will in this way be able to visit places quite off the beaten track with the assurance of being able to get back each night to a comfortable dinner and bed in what is practically a private car. The excursion will take 11 days, and the number of passengers will be limited to 30.

Coal Consumption on Superheater Engines.—Vincent L. Raven, chief mechanical engineer of the North-Eastern Railway of England, in a recent address stated that in 1911 the North-Eastern designed and built 20 express locomotives for the heavy main-line express trains between York and Edinburgh. Ten of the engines were of the ordinary type with a pressure of 180 lbs. to the sq. in. and having 15½-in. cylinders. The other 10 were equipped with superheaters and had a pressure of 160 lbs. to the sq. in. and 16½ in. cylinders. At the end of the year 1912 it was found that the coal consumption for the ordinary engines averaged 47.8 lbs. per mile and for the superheater engines it averaged only 38 lbs. per mile, showing a saving of 9.8 lbs., or 20 per cent. per mile. Not only was there this economy, but it was found, after 18 months' trial, that the boilers of the superheater engines were in better condition than were those of the ordinary type. These results were so gratifying, added Mr. Raven, that they were extending the practice with regard to new engines and in many cases where reboilering was done.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,000 copies were printed; that of those 8,000 copies, 6,551 were mailed to regular paid subscribers and 346 were provided for counter and news companies' sales; that the total copies printed this year to date were 163,959—an average of 8,629 copies a week.

Volume 54. May 9, 1913. Number 19.

CONTENTS

*Illustrated.

THE first cost of applying air brakes to freight cars has been very large, but its advantages are so fully understood that no one would for a minute question the advisability of having the cars so equipped. It is rather surprising, however, that after applying such an expensive apparatus so many of the roads fail to appreciate the necessity of seeing that it is maintained in such a condition as to insure a high degree of efficiency in service—and this is all the more important, since long heavy trains have become so common. That careful attention to the upkeep and condition of the air brake apparatus will be amply repaid is indicated by the paper on "Undesired Quick Action," which was read before the Air Brake convention at St. Louis on Tuesday morning, and which is reproduced in another part of this issue. The actual damage to the cars by such failures is important, but not nearly so much so as the resulting delay to the movement of trains and the added cost of wages to the train and engine crews. The draft gears, underframe, and superstructure of freight cars have been greatly strengthened in recent years to guard against failure, but it will be folly to carry this beyond a certain point, because of the added weight of the equipment. Every reasonable means should thus be taken to guard against failure of the air brakes and the abuse of the equipment.

THE Interstate Commerce Commission has made a good start in forming its organization for the valuation of railways. It is announced that the work will be in general charge of Commissioner Prouty. Five of the engineers who are to have charge of the engineering work have been selected. They are R. A. Thompson, W. D. Pence, J. S. Worley, Howard M. Jones and Edwin F. Wendt. Mr. Thompson is now chief engineer of the California commission, and was formerly chief engineer of the Texas commission. The fact that he was formerly connected with the Texas commission is not apt to give railway officers a favorable opinion of his fairness, but his attitude at times was decidedly more fair than that of the commission. Mr. Pence has been professor of railway engineering of the University of Wisconsin and chief engineer of the state commission for seven years, and has had charge of the commission's valuation work; and the Wisconsin commission's valuations, as well as its work as a regulating body in general, have usually been ably and fairly done. Mr. Wendt has been in railway service throughout his active professional career, is assistant engineer of the Pittsburgh & Lake Erie, and was this year elected president of the American Railway Engineering Association. His election as president of this great engineering organization is a sufficient indication of his standing as a railway engineer. Mr. Worley is a consulting engineer at Kansas City, and Mr. Jones a consulting engineer at Nashville. It is announced that an army engineer also probably will be appointed. If the rest of the personnel of the commission's organization is as good as the part already announced it will command and deserve the confidence of railway managers and the public.

THE mechanical department officers of a trunk line were surprised to find a number of years ago that the engine failure records showed a greater number of failures during the hot summer months than during the winter season. Special efforts had always been made to prevent failures during the severe winter weather and the men were kept keyed to a high pitch in their efforts to reduce them to a minimum. When the warmer weather set in and the elements were more favorable, the men gradually relaxed in their efforts to prevent failures and accidents. Special steps were made to overcome this tendency and as early as January and February the officers started to emphasize the necessity of guarding against failures when the warmer weather set in and the operating conditions were more favorable. The results were remarkable; the failures were very much less in number than for a corresponding period during the previous years. The same thing is undoubtedly true of accidents, and those who are in charge of "safety first" movements and boiler inspection will do well to agitate this matter at the present time with a view of reducing such accidents during the coming summer. In this connection the number of accidents reported to the division of locomotive boiler inspection of the Interstate Commerce Commission for each month during the year ending June 30, 1912, is of interest.

1911.		1912.	
July	100	January	70
August	92	February	73
September	52	March	81
October	68	April	51
November	64	May	74
December	58	June	73

These figures must not be taken as conclusive, because it is quite probable that due to misunderstandings the railroads did not report all of the accidents that they should when the law first went into effect in 1911. It would appear, however, that the

number of accidents during July and August is considerably higher than for the other months of the year, and it will be interesting to see whether this condition still exists when the next annual report is made.

THE LABOR LOBBY.

ADMIRATION for the ingenuity of the legislative lobbies of the labor brotherhoods in devising bills to strengthen the position of labor in dealing with the railroads, and for their skill in getting legislatures to pass them, grows apace among those who follow their activities. No argument based on facts, reason or the public welfare has been sufficient to keep numerous legislatures from passing, and governors from signing, train crew bills. The demonstration that practically their only effects were to increase the number of employees and the amount of the operating expenses of railways has been impotent when it has encountered the argument that the labor organizations have the votes. These ingenious and skillful lobbyists are also actively pushing other classes of bills which are equally pernicious. One class of them is designed to make it impracticable for the railways to get men to fill the places of those who quit in case of strikes. These usually take the form of requirements of a specified length and character of experience as a prerequisite for holding certain positions. They are put forth as measures to promote safety, but their real purpose is to prevent the railways from resorting to the employment of strikebreakers.

Just how sincere is the solicitude of the brotherhoods' lobbies for safety is indicated by recent experience with a measure to prohibit trespassing in Texas, where, as elsewhere, a large majority of all the people killed on railways are killed while trespassing. It had been thought the bill would pass. Then some influence suddenly caused a loss of interest in it, and it was shelved. Inquiry developed the fact that the brotherhoods, whose support had been counted on, had instead offered opposition. Their *volte face* was caused by the discovery that, as, in case of a strike their members would cease to be employees, under the proposed legislation they would lose their right of access to railway property, which might hamper some of the ingenious practices resorted to where strikes are on, such as throwing emery dust into the bearings of a locomotive, or soap into the boiler!

Another example of the brotherhood lobby's interpretation of "safety first" is afforded by a bill recently introduced in the New Jersey assembly, providing that where tests of apparatus are to be made in connection with the operation of trains previous notice shall be given in writing to the engineman. This would effectually stop "surprise tests" to determine if signals are being obeyed, by taking out the "surprise." Such tests have proved one of the most effective methods of preventing accidents, because they cause employees to be careful in the observance of signals and orders, and if it be considered desirable to stop them a much better and safer method than that provided by this bill could be adopted. This would be to require enginemen and other employees to give railway operating officers notice in writing when they are going to disobey a rule, order or signal.

The effective power of reiteration and continuous pressure has undoubtedly assisted the passage this year of some of these so-called safety bills that in past years have aroused little interest among the legislators. According to press reports the brotherhoods are knocking at the doors of the California assembly with a bill of a kind which appears to be new. It provides that railways before "docking" or discharging an employee for wrongdoing or violation of orders on the evidence of "spotters" shall give the accused a chance to reply to the "spotter" face to face. This opprobrious word "spotter" is simply a synonym for detective. The railways, in the interest of good discipline, have found it necessary to employ detectives to learn whether their conductors are collecting and reporting fares properly and whether their engineers are drinking, just as they have found it necessary to conduct surprise tests to make signal indications effective, and just as the government finds it necessary to employ inspectors and examiners to see that the railways themselves obey the laws passed to regulate them. Naturally "spotters," detectives and examiners are not popular in railroading or elsewhere. The honest, careful man resents espionage, and the dishonest or reckless one resents it even more. As the "spotter" is employed on only a single road he must work incognito to be of any value. Even under present conditions the men are apt to identify him, when it is necessary to transfer him to some other division or discharge him entirely. If required to support his charges openly he would become a marked man. The spotter once spotted would not longer spot with success. He would be about as valuable to his employer as the surpriseless surprise tests provided for in that New Jersey bill.

Bills such as those in New Jersey and California here referred to are extreme, but they are hardly worse than many measures which have been promoted by the labor lobbies in the past and actually passed by legislatures. The railway employees of the United States rank above the average of our citizenship in intelligence, sobriety and public spirit. Many persons doubtless have wondered why they support measures, few of which are meritorious, most of which are against the public interests, and some of which are almost idiotic. A very large proportion, and probably a majority, of the members of the brotherhoods really do not favor the legislation pressed in their names. But labor policies, like political policies, are dictated by the most active and aggressive, not by the most numerous, and once they have been decided on a brotherhood member who opposes them finds things disagreeable for him, if he does not lose his brotherhood membership. The kind of methods used by the labor lobbies to get the measures they favor passed is indicated by the following from a statement issued by the lobby at Springfield, Ill. on May 3 and published in the morning newspapers of May 4:

> International officers of the railroad men are on their way to Illinois to assist the representatives (in other words, the lobbyists) in their attempt to persuade the lawmakers to "do it now." . . . The proposed law known as the full crew act is in the Senate sub-committee. The Brotherhood of Railroad Trainmen has more than 10,000 members in the state and is backing the measure. For a second choice they will support a car limit bill for freight trains, and as this will appeal to the public it may be the compromise decided upon. . . . The situation is increasing in tenseness every day. A few railway employees are trying to ride the top rail of the fence and still touch ground on either side. *These the railway brotherhood officers are threatening with dire penalties for insubordination.* (The italics are ours.) A. D. Burbank, representing the trainmen's union, speaks very hopefully of the outlook, and, as he is one of the big five—Culp of the Engineers', McCarthy of the Firemen's, Carroll of the Conductors' and Connors of the Switchmen's—besides having the united support of the American Federation of Labor, the prospects of several measures backed by the united labor lobby seem to be very good. "If we don't get a part of our proposed legislation there will be 20,000 railroad men on the warpath in this state," said Mr. Burbank, "and they won't be after me, either."

The meaning of this is quite clear. First, the labor lobbies do not deny, but flaunt, their activities. Second, members of the brotherhoods who oppose legislation favored by them are threatened with dire punishment. Third, the lobbyists represent—or represent that they represent—several thousand votes, and will see that they are used against legislators who don't vote for the legislation the lobbyists demand. It is notable that there is not a syllable in the statement to indicate that it is even pretended that the bills being backed by the lobby are being pressed in the interest of the public welfare. Every one of them, if passed, would increase railway expenses, not for the benefit, but in the long run, to the detriment, of the public. In view of this fact the question arises as to why there has been so much agitation against lobbyists representing railways and other corporations, while so much tolerance is accorded to lobbyists representing railway brotherhoods. Certainly there is significance in the difference between the reception accorded in these days of reform to labor lobbyists with votes at their back and to representatives of railways with nothing but arguments to offer.

The railways formerly sometimes protected themselves against unfair legislation by buying up strike legislators with passes and

cash. They recently have been trying to prevent such legislation solely by publicity and fair arguments. These honest and decent methods have in many instances proved ineffective when matched against the railway labor lobby backed by organized voting strength. Is it possible that developments are going to prove that those are right who contend that the only weapon corporations can use effectively against the bribing power of organized votes is the bribing power of cash? The universal presence of the labor lobby, and the results it has been getting are some of many striking evidences of the degraded level to which American state legislatures have sunk, in spite of all the reform talk and agitation of recent years.

PROPOSED RATE ADVANCES ON EASTERN ROADS.

IN its decisions two years ago denying the general advances in rates the railways then sought, the Interstate Commerce Commission intimated that if changes in conditions showed the railways really needed larger earnings it would let them take the action necessary to secure them. It is now announced by President Willard of the Baltimore & Ohio that the eastern roads will soon ask the commission to permit an increase of 5 per cent. in all their freight rates.

A good many things have happened within the last two years which affect the situation of the railways, and which may influence the attitude of the commission. The net operating income per mile of the railways of the entire country in the year ended June 30, 1910, was the largest in history. The commission referred to this in its decisions, and expressed not only the hope, but the opinion, that they would be still larger the next year. The opinion expressed proved incorrect; the hope was not realized. Operating income—which is what the carriers have left after paying expenses and taxes—was less in the fiscal year 1911 than in 1910, and less in the fiscal year 1912 than in 1911. In its annual report for 1911 the commission made comparisons between the earnings of railways operating 239,483 miles in 1910 with the earnings of the same roads in 1911. The operating revenues of these roads declined from $11,636.21 per mile in 1910 to $11,588.19 in 1911, and their net revenue from outside operations from $11.09 per mile to $8.52 per mile. Meantime, their operating expenses increased from $7,711.19 per mile to $7,957.56 per mile and their taxes from $437.70 per mile to $448.58 per mile, causing a decline in operating income from $3,498.41 per mile to $3,191.36 per mile. As to the eastern group of railways, the same report showed that the operating income of those earning more than $10,000,000 per year declined from $299,591,499 in 1910 to $266,623,158 in 1911, although the mileage included in 1911 was over 500 miles greater than that included in 1910. In its annual report for 1912 the commission gave some comparative figures for 1911 and 1912. These, instead of relating to practically all the railways of the country, covered only those earning in excess of $1,000,000 per year. The operating revenues per mile of these roads, whose mileage in 1912 was 219,373 miles, increased from $12,547.33 in 1911 to $12,601.14 in 1912. Meantime their net revenue from outside operations decreased from $5.82 to $2.22; their operating expenses increased from $8,603.16 to $8,707.82; taxes increased from $484.21 to $532.92; and their operating income decreased from $3,465.78 to $3,362.62. The same report shows that between 1911 and 1912 the operating incomes of railways in eastern territory earning more than $10,000,000 gross increased from $268,233,349 to $273,449,158, while meantime their mileage increased over 750 miles; this increase was far too small to offset the decrease in 1911.

It will be seen that the reductions in the net revenues of the railways have been chiefly due to increases in their operating expenses; and, of course, the increases in operating expenses have been chiefly due to increases in wages, with which the country is familiar. Some of the largest wage increases were made in 1910, but did not produce their full effect on expenses until 1911. Among those occurring in 1910 were the increases in the wages of conductors and trainmen, concerning which the president of the Brotherhood of Railroad Trainmen said in his report to the tenth biennial convention of that organization, "Conservatively estimating, the increases in the pay of conductors, trainmen and yardmen in the East as a result of this movement will approximate $30,000,000 per annum." The wages of engineers have been increased since then; increases in the wages of firemen are going into effect; and now the Brotherhood of Railroad Trainmen is back asking for additional increases in the wages of its members which, it is estimated, would amount to $17,000,000 per year.

Some other causes also have operated strongly to increase the expenses of many roads. Among these have been the extreme weather of the winter of 1911-1912; and the violent and widespread floods of the springs both of 1912 and 1913. It may be said that these conditions were but temporary; but the railway business is a peculiar business in which "emergencies" and "special conditions" are constantly developing, and in which, therefore, if the properties and service are to be kept up, provision for "emergencies" and "special conditions" must constantly be made in the form of earnings. The increases in taxes, as figures given above indicate, have been equally formidable in proportion. For 239,483 miles of line taxes amounted in 1910 to $104,821,374.70, or $437.70 per mile. For only 219,372.87 miles they amounted in 1912 to $116,909,458.76, or $532.92 per mile. There has been a change in the tendency of earnings since the beginning of the present fiscal year. In the eight months ending February 28 the total operating revenues of the railways of the country earning more than $1,000,000 a year increased 10.2 per cent.; the total operating expenses 9.1 per cent.; taxes 5 per cent., and operating income 13.9 per cent. In eastern territory the increases were, in operating revenues, 10.7 per cent.; in operating expenses, 10.8 per cent.; in taxes, 3.5 per cent.; in operating income, 11.3 per cent. But since the period covered by these increases the eastern roads have experienced the bad floods which have cost millions; advances of wages have been granted to their firemen, and the legislatures of a number of states have been passing "full crew" and various other laws tending to increase operating expenses. Furthermore, it will be noticed that the percentage of increase in operating expenses in eastern territory, even during the months of the present fiscal year preceding the floods, was slightly greater than the percentage of increase in operating revenues. The showing made during these eight months as compared with the same months of last year is distinctly better than will be the showing made during the entire fiscal year, as compared with the last fiscal year.

Return on capital must, of course, be paid from net operating income. While net operating income was decreasing in 1908 and 1909 as compared with 1907, and in 1911 and 1912 as compared with 1910, the demands on it were increasing. The rate of interest that railways as well as other concerns must pay has continued steadily to advance. A few years ago old railways with good credit could borrow capital at 3 to 4 per cent. The Baltimore & Ohio is an old road in the heaviest traffic territory in the country; it is now exceedingly well managed; yet when it recently made an issue of bonds it had to fix the interest on them at 4½ per cent. and even then could not get par for them. Other strong railways that have tested the market either to refund old obligations or to raise new capital have had even worse success. As to stocks, some of the most reliable 6 per cent. dividend payers are quoted only around par, and others proportionately much lower. A new issue usually depresses the market; all of which means that few even of the strongest railways could issue stock on a 6 per cent. basis. While the railways meet such difficulties, and even impossibilities, in raising capital at rates which they can afford to pay, the public need for them to make improvements and extensions for which the raising of new capital is necessary grows more imperative. There was a congestion of traffic and a large car shortage last fall; and the situation would have been worse if weather conditions had not been almost ideal for handling business in the fall and far into the winter. The car shortage of 1912, though relatively small, was

warning to prepare against a large one like those of 1906 and 1907. Extensive and costly improvements also are needed to make the railways as safe as the public welfare demands.

When the question of rate advances is presented to the Interstate Commerce Commission the point whether the railways are as economically operated as they should be may be raised again. Clearly, however, the burden of proof will be on those who may charge that this is not the case; and if ever there was a time when they could not sustain that burden the present is that time. In the railway, as in nearly every other industry, there are concerns that are not as well managed as they might be. But it is certain that never in the history of the railway industry in the United States have the railway managers as a whole tried harder to operate economically than during the last two years. They cannot be blamed for the principal increases in expenses, namely, the advances in wages, as they have strenuously opposed every one of them, and have made only those held to be reasonable by arbitration boards, most of them organized under the Erdman Act. Congress recently has passed a law providing for a valuation of railways, the main purpose of which is to ascertain whether the earnings of the railways are reasonable. It will be several years before this valuation is completed. It would seem, therefore, that the rate question should be decided for the present regardless of the valuation matter. The commission has been able to decide without the aid of a valuation that many rates were too high. Doubtless it will continue to be able to do so between now and the time the valuation is finished. If it can determine without the aid of a valuation that rates are too high, it can also determine without the aid of a valuation whether they are too low.

The advances proposed differ in a very important respect from those proposed a few years ago. The eastern roads then tried to advance class rates and some commodity rates, the argument made being that not only did the railways need more money, but that the rates in question were too low compared with other rates. The new plan is that all freight rates shall be advanced 5 per cent. Which of these plans is the more equitable depends on whether the existing relationships between rates in general are or are not fair. The commission by refusing to permit advances in specific rates in the previous case, and by its work of adjusting the relationships between rates over a period of many years, is almost estopped, it would seem, from holding that the present general relationship between rates is not fair. If the present general relationship between rates is fair, and the railways are entitled because they need more earnings to an advance in rates, then a proportionate advance in all rates would be the fairest. An advance of 5 per cent. in freight rates would increase the earnings of the eastern railways about $50,000,000 a year. The burden imposed upon shippers and consumers would be relatively small compared with the advantage that would accrue to the railways. Of course, however, the real question is not how little or great the additional burden imposed on shippers and consumers would be, but whether in the interest of the public as a whole it is desirable that the earnings of the railways should be increased by the means and to the extent suggested. It is inconceivable that if concerns in any other line of industry could make the same showing regarding proposed increases in their prices that the railways can make regarding the proposed increases in their rates, anybody would question the reasonableness of the proposed increases in prices.

RIGHT OF TRACK IN LARGE STATIONS.

STATIONMASTER STICE, of Terre Haute, Ind., has the courage of his convictions. When he sees a brakeman (of a passenger train) standing on the track in the trainshed of a union station (where all trains stop), holding a red flag in his hand, he thinks it looks foolish. He said so in connection with the investigation of a collision which occurred at Terre Haute last January, as reported in another column of this paper. Such protection, under such circumstances, looks foolish to many other people, also; and it will be worth while to consider the reasons for Mr. Stice's view.

The government report says that since the collision the Vandalia road has ordered that the flagging rule be observed in Terre Haute union station. The general practice at Terre Haute heretofore seems to have been the same as at most large trainsheds where the block system is not in force. Every movement was supposed to be made with speed under control, and flagging was neither required nor carried out. But, if Mr. Belnap's report gives all the facts, the specific fault was that this practice was based on tradition and not on a formal rule; and therefore the engineman who came in at 20 miles an hour did not break any definite speed regulation. The relative rights of No. 8 and No. 20 at 1:42 p. m. on that piece of track are not clearly explained. Ordinarily, No. 8 arrives 10 minutes ahead of No. 20, and leaves 45 minutes behind it. If No. 8 is customarily set off to make way for No. 20 it has apparently no right to return to the main track until No. 20 has passed; or until its leaving time (1:45) has arrived. However, this question is not, perhaps, of much importance, except to show, by its peculiarities, the futility of trying to provide in a satisfactory way for movements at large stations except by one of the two simple methods; either the space interval system, constantly enforced, or the universal requirement that speeds shall always be under control.

Why does the spectacle of a man with a flag in a trainshed "look foolish"? For one thing, because not once in a hundred thousand times will a man performing such a function at such a place prevent a collision. Mr. Stice may not have formulated his thought in terms of percentages, but everybody will agree with him that a precaution which seems so needless always has been and always will be extremely difficult to enforce; so difficult, indeed, that the only rational course is to adopt some other means of protection. The best course is the block system. The New York Subways adopt that, even to the extent of introducing a block system in which the signals are located less than 150 ft. apart. But even without the block system flagging at a large station looks foolish. Everybody agrees, in principle, that responsibility should not be divided. Why do we not more generally adopt the principle? It is a reasonable rule that trains shall always be moved in a large station with speed under control and the whole responsibility be made to rest on the engineman. Such a rule has been in effect for years at many places. The report of the Terre Haute collision indicates that, in fact, it was in force there, though it was not in the book; and that the engineman who allowed himself to take a great risk when a cloud of steam fell across his path, would, on a moment's reflection, admit that he was breaking an important unwritten rule. He seems temporarily to have followed the unwritten rule of 40 years ago that nothing may ever get in the way of a fast express. According to the testimony concerning the practice in that trainshed, he must have known that a flag was never to be expected there, whatever the obstruction might be; and he would have to admit that a train, or a car or an engine might get in the way, even of No. 20.

Flagging at large stations looks foolish because usually it is so difficult to estimate what needs to be done in a given case. With speeds of all trains very low the flagman need not go far from his own train. He estimates how fast an expected train will be moving. If he be instructed not to give himself that liberty, then he must go the maximum distance that may be necessary for safety. This often means ten times farther than is really necessary in the particular case if the approaching engineman is on the lookout. But flagging, to be entirely adequate, implies the use of torpedoes in addition to the flag. The constant use of torpedoes cannot be tolerated in and around large stations, especially where there are street crossings as at Terre Haute; and so we come back to the standard rule, to protect "when the conditions require it." Many of the considerations here mentioned, or suggested, apply on the open road, as well as at large stations. In probably 99 per cent. of a passenger train's stops, the flagman need not start back inside of the first

30 seconds in order to comply with the rule; and in a large percentage of them he need not start within 60 seconds. In a good percentage probably he would be complying with the rule if he did not start for two minutes. But the individual flagman must himself decide these questions of seconds in each case, and, naturally, he gets down on the ground with his flag. Being in that position—not running back—he *seems* to be neglecting his duty; as he is if the conditions are such that he really ought to go back. That flagging often looks foolish—or, at least, illogical or inconsistent—will be generally agreed. And when our education is more nearly completed we shall agree that, although it is necessary in the absence of the block system, it is foolish as compared with the use of the block system. One well known railway manager, who used the block system throughout his line in 1885, said that it was "a crime" to run a road without it. That, perhaps, was extreme language, and he seems to have held views far in advance of his time; but how far?

The Terre Haute collision calls to mind numerous collision reports of 25 years ago, in England. The Board of Trade at that time had to secure the adoption of the block system by persuasion, the compulsory law not having been passed. Every now and then a collision would happen in a large station, and the investigation would show that, as at Terre Haute, the block system was in operation at all other parts of the road except in and near the station. The English inspector in his mild and cautious dignity would report that "the company are of opinion that they cannot work the block system in large terminals." Nevertheless they did finally do it. The difficulties, in reality, were small; but they were larger in some ways than they are now. At the present day the question of almost satisfactory signaling at a large passenger station is only one of money.

NEW BOOKS.

Steel Rails. By William H. Sellew, principal assistant engineer, Michigan Central Railroad, Detroit, Mich. Cloth, 550 pages, 7¼ in. x 10½ in., 361 illustrations and 33 folding plates. Published by D. Van Nostrand Co., 25 Park Place, New York City. Price $12.50.

In view of the widespread discussion of the steel rail problem during the past two years, this book is most timely. It is a valuable addition to the literature of the subject with which it deals. Unlike most books treating of the rail problem, it is prepared more from the standpoint of the active railway man than of the metallurgist, and discussions of the intricate details of steel manufacture are written for men familiar with the subject only in a general way. The book is prepared upon a broad basis, and contains much valuable information regarding the important conditions affecting the service of rails.

In the first chapter the development of the steel rail is traced from the period of the iron rail to and including the adoption of the recent American Railway Association sections. The second chapter is devoted to the pressure of the wheel on the rail and analyzes the speeds and weights of modern locomotives and the effect of their motion, flat spots, etc., upon the rail. Photographs of and data regarding much of the recent equipment are also included. The third chapter discusses the supports of the rail, including reference to the more important concrete and metal ties. The fourth and fifth chapters are devoted to the stresses in and the strength of the rail, respectively, and are largely mathematical in their nature. There are 136 pages devoted to the influence of details of manufacture upon the rail; the chemical composition, mill practice, and other influencing factors all being discussed. In chapter seven are given comparisons of the leading American specifications with representative American and British specifications. The forms recommended by the Rail Committee of the American Railway Engineering Association for the various rail records are given in an appendix, with 33 plates showing standard rail sections, locomotive diagrams, and other important details.

The book should prove a valuable reference work for railway men interested in its subject. It is clearly printed on heavy paper with many excellent photographs and drawings.

The Special Law Governing Public Service Corporations. By Bruce Wyman, Professor of Law in Harvard University. Two volumes, 6¼ in. x 9½ in., 1517 pages. Published by Baker, Voorhis & Co., New York. Price $12.50 for the two volumes bound either in leather or buckram.

There was a time when the law pertaining to railways and other public service corporations was of interest only to their law departments. That time has passed. The public regulation of this class of concerns has come to exercise a controlling influence over their ideals and methods of management. The extent to which public regulation ought to be carried is a question of economics. The extent to which it has been and can be carried is one of law. Interest in the latter phase of the subject is no longer confined to the law departments. Those who are interested in it naturally are prone to seek knowledge about it. Therefore, there is a very large number of persons besides lawyers, who nowadays are more or less keenly interested in the law of public service corporations. Professor Wyman's elaborate work on this subject is intended primarily for lawyers. There is no doubt of its comprehensiveness and authoritativeness from the lawyer's standpoint. At the same time it will be found of value to all who are interested whether as lawyers, economists, business men, or statesmen, in the general subject of regulation of concerns devoted to a public service. Professor Wyman's writings, in other works as well as this one, show that while he is first a lawyer, he is also an economist and in the best sense of the word, a publicist.

In his preface Mr. Wyman dwells on the clear distinction between the laws of public and of private callings. He says, however, that as time goes on he finds himself among the conservatives. He believes that the state should as far as possible confine itself to regulation, "leaving the companies to work out their own problems of management. . . . There should be swift reparation provided for any individual who has suffered harm. . . . When the state goes farther and attempts to dictate as to the policies which the companies shall adopt it usually goes too far. Legislation going to this extent really crosses the line which divides state control from state operation. The next step would be government ownership with its unknowable consequences."

While Professor Wyman makes very clear the difference between the law of public and of private callings, he gives a much broader application to the former than many writers. He takes the position that "whether a business is public or not depends upon the situation of the public with respect to it"; that any business which becomes practically a monopoly becomes affected with a public interest; and that when this situation develops the industry becomes subject to the law of public service corporations, even though prior to the establishment of monopoly in it it was not subject to that law.

The work is too comprehensive to admit of anything approaching a thorough review of it here. Among the chapters which will be especially interesting to our readers are those dealing with the general subject of regulation of public service, which includes a discussion of the general theory of rate regulation, of the proper basis of capitalization, and of the rate of return on capital to which public utilities are entitled. The methods of fixing and regulating the rates of public utilities, including railways, are quite fully discussed; and chapters included in the general discussion of "Prevention of Discrimination" relate especially to railway rates. The last chapter deals with the constitutional phases of public regulation, and in the Appendix are given the Interstate Commerce Act, the act creating the Commerce Court, the Elkins rebating law, the Expedition Act, forms for proceedings before regulating commissions and forms for proceedings involving orders of commissions. The work is one which might well be given a place in the library of every lawyer, economist and journalist interested in the general subject of public regulation.

Letters to the Editor.

"BARGAIN FESTIVALS" AND OTHER THINGS.

Chicago, Ill., April 28, 1913.

To the Editor of the Railway Age Gazette:

The article printed in your issue of March 7 entitled, "When Accidents Are Not Accidental," and the reference to it in the editorial of April 4 should cause some managers to meditate a little. The cause of some causes of accidents is here clearly set forth. When general officers subvert the authority, and necessarily, also, the prestige, of the division officers, by reversing their decisions on discipline they set in motion a cause which surely has an effect. What is said in regard to unfit officials, and the resulting unfit men is equally significant. Mr. Brandeis could get a large part of his "million a day" saving out of this one leak.

"Superintendent," in his recital of the effect of frequent changes in managements, is true to life. I served in an official capacity on different western roads for several years. A management lasted from one to four years. Each manager had his followers, with which he filled the official positions, and a large per cent. of these men simply stayed to live, and lived to stay. Their chief interest seemed to be to hang on as long as their chief did. Happily, this condition has changed for the better; yet there is still room for improvement.

I served under one superintendent who was an old switchman and yardmaster. He could not see very much good in a man who did not at least appropriate a part of the vernacular of the tough switchman, including the "cuss" words, and who did not also have time to listen to him as he frequently expatiated on how he had handled great yards and terminals on other roads, and to laugh at his coarse and vulgar stories. I served under another who was an office man, and so aristocratic that he seldom got down close enough to the men to know what was really going on.

The practice of reinstating men dismissed for just causes should be abolished absolutely. This problem is strictly up to the managers. To get the best results the discipline should be as rigid as it is in the army.

On some roads at the present time the feeling among the men is that if worse comes to worst and a man is discharged, the local or general chairman of the brotherhood will get him back. It is obvious that in this situation the local railroad officers are greatly handicapped. As a matter of fact, the carelessly inclined element are taught by this very procedure that the trainmaster and the superintendent are too severe, or inconsiderate; or that they are incompetent. This is anything but an incentive to loyalty. General officers who have not had to deal with the rank and file, possibly for years, cannot be in touch with the many occurrences which demand the infliction of discipline; and even if they were, the basis of a punishment includes a man's past conduct and habits. A most serious mistake is made when they reinstate men on leniency pleas, or otherwise.

Exchanges which are made between the general officers of the brotherhoods and the railway managers in their annual adjustment meetings, when reinstatements are made and the employees' records are cleared of certain marks, to quiet or offset requests and demands for increases in pay and changes in working conditions, constitute a serious weakening influence. These bargain festivals have become so common on some roads, that when other means fail the men look forward more or less confidently to finally gaining their point at the yearly conference. In some quarters the men have succeeded so well that the word "discharged" is, to them, more or less of a misnomer. The brotherhoods have succeeded so well along these lines that they actually trump up grievances and make outrageous demands with no other end in view than effecting such deals.

I admit that a man not in the ranks, or in very close touch, can form only a very vague conception as to how this reinstating evil subverts the local officers' authority and prestige. Only the officer who has power, as well as character and ability, can win loyalty, and thus enforce discipline. Loyalty is a reciprocal proposition; only loyalty can win loyalty.

Unfitness of officers, which is one result of frequent changes in management, is alone responsible, more than any other thing, for the hold that the labor organizations have on the roads. This view is confirmed by the tight grip that the brotherhoods have on the roads where changes in management have been frequent. And this is perfectly natural. Frequent changes indicate a lack of stability; and stability is absolutely essential to good management.

Local Officer.

A REVERIE ON THE UNIT SYSTEM.

Texas, March 11, 1913.

To the Editor of the Railway Age Gazette:

It is not with an idea of criticising the unit system of operating railroads that I comment on it, as it is my opinion that if carried out in accordance with the ideas of the originator of the system it would be an advanced step in modern railroading. Mr. Hines abolishes the different titles formerly attached to the officers of the mechanical department, such as master mechanic, traveling engineer, resident engineer, etc., and clothes them with the title of assistant superintendent, thereby increasing their responsibility as officers of a railroad so that when they are traveling over the line they have the authority to correct any discrepancy or dereliction of duty on the part of station agents, train crews, maintenance of way employees, etc., which is a long stride in the right direction.

I do not wish to cast a reflection on transportation employees; unfortunately a few are inclined to be derelict if it is known that no one in authority is around to check their movements without fear of retaliation. For instance, the conductor may know the station agent or other employees are lax in their duties, causing inconvenience and delay. He may catechise or threaten to report the derelict, but through fear of retaliation, such report does not reach the proper officer. The conductor may be ever so attentive to his duties, not giving the slightest opening for retaliation, but his reputation as a fellow employee is at stake. Hence the authority of the master mechanic over the transportation employees while out on the line is of intrinsic value to the company.

The originator says his system opens a vast field of opportunity to the mechanical man making it possible for him to aspire to the most exalted position within the gift of a railroad. He is given the title and authority of an assistant superintendent, which is similar to putting a gyroscope engine in operation on a mono-rail. If his construction is correct he will be able to maintain his equilibrium if his gyrations are not interfered with. He is in charge of the mechanical department and responsible for its proper and economical maintenance. He is instructed by the superintendent of motive power (assistant general manager) strengthened by a copy of a letter from the president and general manager to the superintendent of motive power, to devote most of his time at the shops. He is expected to visit the several roundhouses on his division at least two or three times each month and regulate all mechanical matters. He is called to headquarters several times each month to confer on mechanical matters. His shop office is moved to the superintendent's office, which may be some distance from the shop, where all matters are handled and file records kept in conjunction with the superintendent's file, thus maintaining one file. He is expected to visit this office at least once each day and handle all correspondence requiring his attention.

All these duties he can perform if he is qualified for the position he is filling. He will be able to give valuable service to the company other than his regular duties as master mechanic while out on the line or in the superintendent's office by way of advice and instructions to subordinates, and if he is a reasonably close observer he will learn many things pertaining to the duties

of assistant superintendent and become enlightened along such lines to the extent of fitting himself for promotion in case of a vacancy. His technical knowledge as a mechanic would be valuable to him as a superintendent, at least such is my understanding of the intentions of the originator of the unit system, and if the master mechanic is lucky enough to be on good terms with and shows a willingness to be subordinate to the superintendent there is no good reason for his failure. If conditions are otherwise and the orders he receives from the superintendent of motive power conflict with those received from the superintendent, making it impossible for him to obey all orders, some one must expect to go on the shelf, although conditions may be unavoidable by one of the three parties. As a rule the "under dog" is the victim.

The unit system provides that there must not be any correspondence between the general officers and the subordinate officers of the superintendent. All correspondence emanating from the general office must be addressed to the division superintendent, he in turn sending such correspondence to the assistant whom it interests, who will reply permitting the senior assistant to sign it "for and in the absence of the superintendent," thereby precluding all possibilities of the issuance of conflicting orders. This rule is infallible if lived up to. However, we must not lose sight of the fact that there are a great many verbal conferences between the assistant superintendent (mechanical) and the superintendent, also with the superintendent of motive power when the assistant is called to headquarters to confer (presumably) on mechanical affairs. If the division superintendent and the superintendent of motive power are inclined to be congenial all will go well and the unit system will be carried out successfully harmoniously and economically. Observation.

CAR WHEEL FAILURES.

Chicago, April 21, 1913.

To the Editor of the Railway Age Gazette:

Our purpose is to set forth facts with reference to an article published in the *Iron Age* under date of March 6, page 588, under the caption, "An Increase in Number of Car Wheel Failures." The article referred to is based upon accident bulletins of the Interstate Commerce Commission, and after summarizing the derailments due to broken flanges and burst wheels states:

> The necessity of bringing the quality of the chilled iron car wheel to a proper basis is emphasized today as it has never been, and the makers and users should get together and try and find means of improving the quality of car wheels to make them equal to present service conditions.

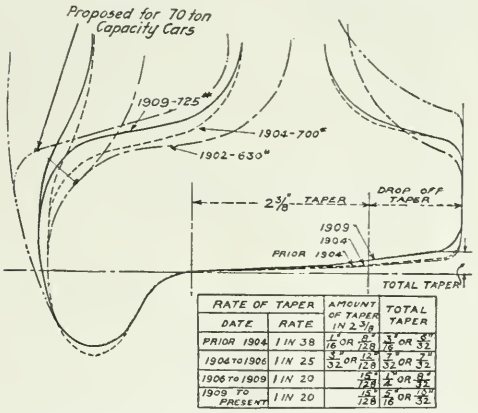
Apparently the writer does not know that the Association of Manufacturers of Chilled Iron Car Wheels, representing 95 per cent. of the wheels manufactured in the United States, and the Master Car Builders' standing committee on car wheels have been closely associated since the year 1909 for the express purpose of improving the quality of the chilled iron wheel.

Previous to the year 1909, individual wheel makers had made improvement in their patterns and product, but no concerted action had been taken until the year 1909, when standard wheels for the three classes of cars of 30, 40 and 50-tons capacity were submitted by the manufacturers and approved by the Master Car Builders' Association. Before these three standards were adopted there were as many different patterns as there were manufacturers, and many railroads had standard patterns of their own. The standards recommended were not in general use until the year 1911, because the Master Car Builders' Association gave the manufacturers a sufficient time to adjust their equipment to the new standards.

In analyzing the derailments caused by broken flanges and burst wheels for the purpose of determining what progress has been made in the quality of the the chilled iron wheel, we must consider the dates that the wheels were cast, and not charge all the failures during the year 1912 against the product of that year. This is the only proper basis upon which to proceed.

In determining the percentages of derailments of cars due to broken flanges and broken wheels, the number of failures in any one period cannot be consistently compared with another unless the number of wheels in service is considered, and it is manifestly unfair to state that during the period of 1902-3-4 there were 1,070 derailments, and during the period of 1910-11-12 there were 1,827, and figure an increase of 70 per cent., as was done by the above mentioned writer. In 1902 there were 1,500,000 freight cars in service, representing 12,000,000 wheels; in 1910 there were 2,133,000 freight cars in service, representing 17,068,248 wheels—an increase of 40 per cent. in the number of wheels in service; and this increase represents wheels serving under heavy capacity cars.

The Chilled Iron Car Wheel Manufacturers, in conjunction with the Master Car Builders' Association, have made greater progress in the chilled iron wheel industry since the year 1909 than has ever been made, and when consideration is given to the vast increases in car capacity, and the resultant increases in rail and axle during the last decade, and the slight increase in the weight of the wheel, it will be found that the chilled iron wheel has not only met every condition of service imposed for the past 52 years, but the record will show that the derailments due to broken flanges and burst wheels are actually decreasing. The



RATE OF TAPER		AMOUNT OF TAPER IN 2 3/8	TOTAL TAPER
DATE	RATE		
PRIOR 1904	1 IN 38	1" OR 6" / 16 OR 128	3" OR 8" / 8 OR 32
1904 TO 1906	1 IN 25	3" OR 9" / 32 OR 128	3" OR 7" / 32 OR 32
1906 TO 1909	1 IN 20	19" / 128	1" OR 9" / 4 OR 32
1909 TO PRESENT	1 IN 20	19" / 128	2" OR 8" / 8 OR 32

Changes Made in Flange and Tread Sections of Car Wheels Since 1904.

following table shows the changes that have been made in developing the 10-ton car to the 50-ton car:

Weight, increase in car capacity	400 per cent.
Weight, increase in rail	100 per cent.
Weight, increase in axle	149 per cent.
Weight, increase in chilled iron wheel	38 per cent.

One part of the chilled iron wheel that has not received due consideration is the flange. In an editorial in *Harper's Weekly* (industrial series), December 28, 1912, appears the following: "It is a curious fact that in this matter of flanges the cars of today are no better off than were the cars that carried soldiers and supplies to the battlefields of the Civil War."

This condition is not because the wheel makers have not been fully alive to the situation, but because they have been restricted in improvements due to the supposed limits of track clearance. The accompanying illustration will show such improvements in the flange as have been made since 1904. This indicates a slight increase of metal in the back of the flange in 1904, as the weight of the wheel increased from 630 lbs. to 700 lbs. It will also show that during 1909 a further increase was made, starting at a point slightly below the base line and extending around the flange and back of the tread, producing an increase in tread thickness and increasing the weight to 725 lbs. These slight changes, together with a reduction in the height from 1⅛ in. to 1 in., are the only improvements made in the flange, and it must be remembered that the capacity of the cars has increased from 10 tons to 50 tons. This was all we could get, but not as much of an increase as we wished to make in order to increase the factor of safety.

We are still trying to improve the flange, but cannot go further until such a time as the railroads will approve of a design similar to that shown in the illustration for a flange for 140,000 lbs. capacity cars. When this is done flange failures will be reduced to a minimum.

The flange of the wheel exercises the important function of guiding the trucks and, in going around curves, it is the flange that takes up the lateral thrusts of the car by being forced against the rail, and the contact between wheel and rail produces wear in both. A flange, therefore, does not improve in strength with age, and the longer it is used the more the wear, and the thinner and weaker it becomes. The imperative necessity of careful inspection follows, so that a wheel may not be allowed to wear in the flange beyond the condemning limit.

Many times in looking for the cause of a derailment a wheel will be found with a broken or chipped flange, and this cause is readily assigned, whereas, as a matter of fact, the flange may have been chipped or broken after it left the track, or through poor track, faulty truck construction, etc. We know of cases where a broken flange was reported as the cause of a derailment, and upon investigation we have found that the flange had been worn beyond the condemning limit. Many derailments are reported to the Interstate Commerce Commission caused by sharp flanges climbing the rail in going around curves, or passing crossings, frogs, or switches.

Let us examine the record of broken flanges for the year 1912, as compiled from the Interstate Commerce reports:

Year Cast.	Broken Flanges.	Year Cast.	Broken Flanges.
1898	2	1908	12
1899	9	1909	13
1900	4	1910	16
1901	7	1911	2
1902	12	1912	2
1903	10		170
1904	8	No record of year cast	457
1905	16		
1906	23	Total reported	627
1907	34		

As will be seen, we have a record of 170 wheels out of a total of 627 reported broken, or 27 per cent. The service is from one to twenty-four years, and the average life of all the 170 wheels is over six years.

As a flange is at its best when first put into service, it will be interesting to note the comparatively few failures for wheels cast during the years 1910-11-12. The total breakages of flanges in the three years amounted to 20 wheels. The report shows that during the year 1910 there were 16 breakages, only two in 1911 and two in 1912. As we only have a record of 27 per cent. of the broken flanges during this period, and as this record shows 16 wheels were cast in 1910, it would be reasonably fair to assume that the balance of the wheels (if tabulation could be made) would bear relatively the same proportion of breakages—therefore, we can assume that if we had a complete record, there would have been broken approximately 60 wheels cast in 1910. During the year 1910 there were in service over 2,000,000 freight cars, and there were running over 16,000,000 chilled iron wheels. This would represent one wheel broken for every 266,000 wheels in service. If we take the total breakages, which are reported as 627, and consider the number of wheels running, we will find that there is one breakage for every 25,000 wheels in service and the broken flange wheels which we have tabulated from the Interstate Commerce Commission reports show an average of six-and-a-half years' service. Surely this is not an alarming condition when we take into consideration that a very large percentage of those broken were of the old design and plainly show abuse due to sticking brakes and excessive wear.

Broken wheels are the result of temperature stresses arising from brake friction, and show conclusively that the metal has not been proportioned to the stress. In designing any structure, a unit of material is used to resist a unit of stress, and when all service conditions are known it is a simple matter to proportion the metal to fully meet them. If wheels were designed to meet the most severe service conditions instead of average conditions, there would be no broken wheels.

We will now analyze the report of broken wheels. Our record, as compiled from the Interstate Commerce Commission report, shows the detail of 109 broken wheels as to years cast, name of maker, etc. There were 229 breakages for which we could obtain no record. An analysis of the 109 wheels reported is shown in the following:

Year Cast.	Broken Wheels.	Year Cast.	Broken Wheels.
1889	1	1908	5
1892	1	1909	9
1897	1	1910	14
1899	1	1911	10
1900	5	1912	7
1901	3		109
1902	8	Broken and loose tires on engine drivers	19
1903	9	No record of year cast	229
1904	4		
1905	6	Total	357
1906	12		
1907	13		

It will be observed that the broken wheels, like the broken flanges, are distributed over a period of years, starting with the year 1889, and the average service of all wheels broken is over six years. The cause assigned for the breakage of 52 wheels out of the 109 reported by the Interstate Commerce Commission is "brakes sticking."

Fifty per cent. of the broken wheels were caused by "brakes sticking," and 90 per cent. of the broken wheels occurred in the mountainous regions of the East and West, where the maximum of brake resistance is required in descending grades. A large number of these wheels plainly show improper usage. For example:

A 625 lb. wheel designed for a car having a light weight of 28,000 lbs., as required in the M. C. B. standards, would be called upon to resist a normal heat stress resulting from 19,600 lbs. brake pressure when the train is braked at 70 per cent. of the light weight of the car.

A 625 lb. wheel for a car having a light weight of 50,000 lbs. braked at 80 per cent. would have to resist an abnormal stress of 40,000 lbs. brake pressure, or 150 per cent. greater stress demanded from the same weight of wheel.

It is no common thing to find 625 lb. wheels under cars weighing from 45,000 lbs. to 50,000 lbs.; in fact, many 60,000 lbs. capacity cars weigh light more than 100,000 lbs. capacity cars. Still, the wheels designed for 100,000 lbs. capacity cars weigh 100 lbs. more than those designed for 60,000 lbs. capacity cars, this additional metal being distributed in the plates of the wheel, which increases the strength and furnishes greater resistance to sticking brakes. The heat developed by excessive brake application is what causes wheels to break.

The Master Car Builders' in their 1912 Proceedings recognized the question of establishing the maximum braking power as well as gross load for each design of wheel, and called particular attention to the trouble experienced in using 625 lb. wheels under 60,000 lbs. capacity cars, having tare weight of 40,000 lbs. to 47,000 lbs., such as refrigerator cars, etc.; if their recommendations are followed broken wheels will be practically eliminated.

If we take the entire number of chilled iron wheels broken during the year 1912 and base these breakages upon the number of wheels in service, we will find there is, comparatively, one broken wheel for every 50,000 wheels in service.

The commerce of the country is dependent upon the chilled iron car wheel. It has successfully resisted the attacks of over half a century. It is the standard wheel for rail-borne traffic, and its universal use is an acknowledgment of its efficiency. It possesses the ideal structural advantages of hard tread, soft plates and soft hub, and each part of the wheel is so well fitted for the service demanded that it is no wonder that it has survived such a long period of use. It carries the car structure and contents all over the country, and because an occasional wheel breaks it does not follow that the wheel is to blame, because anything can be broken by abuse, and no one will deny that the chilled iron wheel has a tremendous burden to bear. The chilled iron wheel now carries over 500,000,000,000 tons one mile each year.

George W. Lyndon.

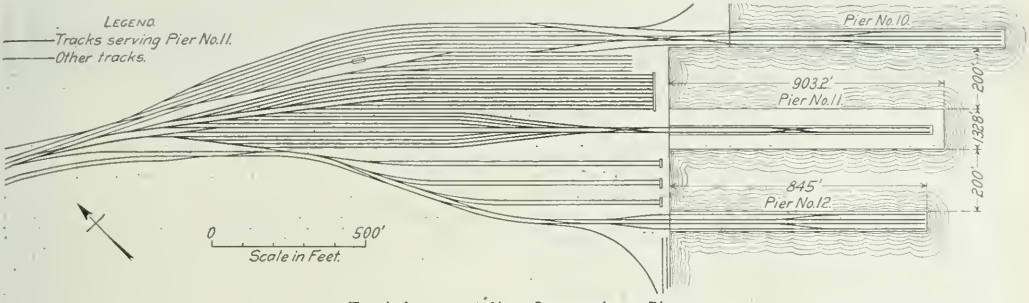
NEW FREIGHT PIER AT COMMUNIPAW, N. J.

A Modern Fireproof Structure of Concrete and Steel Construction for the Reception and Storage of Export Business.

The Central Railroad of New Jersey completed early last year a new covered freight pier of permanent construction to be known as pier No. 11 in its freight terminals at Communipaw, N. J., on the west side of the Hudson river opposite New York and just across the channel from Ellis Island. The new pier adjoins pier No. 10 and is reached on the water side by two 200 ft. slips with a depth of 22 ft. at mean low water, and on the land side by a double track line from a storage yard adjacent to the piers. The tracks leading out onto the pier are laid in a track well along the center of the pier, which is depressed so that the car floors are level with the deck of the pier. The new pier is 902 ft. 2 in. long by 132 ft. 10 in. wide. The substructure consists of creosoted pile bents which support a concrete deck slab floor. The superstructure is of steel frame with corrugated iron siding.

In addition to the tracks mentioned, there are 10 stub tracks provided for storage.

The pile bents in the substructure of the pier are placed 9 ft. center to center. The intermediate bents consist of 30 piles each and alternate bents located under the columns of the superstructure have 38 piles. Every tenth bent has a double row of piles containing 60 in all. Each alternate one of these double bents has the piles cut off 6 in. above mean low water and capped with two 12 in. by 12 in. timbers to carry a reinforced concrete fire wall 18 in. thick at the bottom and battered to 12 in. thick at the top extending up to the concrete floor slab to which it is bonded. These fire walls divide the wooden substructure into five sections. The remaining double bents which alternate with those carrying the fire walls have 6 in. by 12 in. sheathing between the rows of



Track Layout at New Communipaw Pier.

As the piers are perpendicular to the tracks in the main yard, it is necessary for economical operation to locate small storage yards near each pier to store the cars intended for that pier. It is somewhat difficult to get a good track layout on account of this condition. The new yard serving pier No. 11 has been laid on a fill made from the dredgings from the channel and slips. The yard includes 10 tracks, each about 950 ft. long connecting with two ladders, five tracks leading from each ladder. These ladders are continued to form a double track lead into the pier. Double crossovers are provided between these two lead tracks just off the end of the pier and at a point about midway on the pier. These crossovers allow very free movement of cars to or from the pier without disturbing other cars that may be unloading. Loaded cars come into one of the five track yards and the empties are pulled off of the pier into the other set of five tracks.

piling extending from the low water line up to the deck. As piles can only be driven a short distance at the site of the pier, the bents are thoroughly braced both transversely and longitudinally.

The corners of the piers at the sea end are protected by cluster piles cut off 9 ft. above mean tide or 1½ ft. above pier level. Two anchor cribs are provided, one at the sea end and one near the middle of the pier. These cribs cover four bents and are the full width of the pier. They were built in place after the piles within their area had been driven and were sunk by being loaded with stone. The bulkhead wall at the shore end is of concrete carried on a timber bulkhead. The bearing piles are of creosoted yellow pine 14 in. in diameter, 2 ft. from the butt and 7 in. in diameter at the point. The cluster piles are of untreated white oak 16 in. and 7 in. in diameter. All other timber in the sub-

Sea End of New Pier.

structure except the low water bracing, longitudinal and diagonal bracing and fender timbers is creosoted.

The entire deck covered by the shed is of concrete. The space outside of the shed, which is 4 ft. wide on the sides and 8 ft. wide on the sea end, is of 4 in. planks. The track well is 24 ft. wide and is depressed 5 ft. The tracks are laid on 12 ft. centers. The platforms on each side of the track well are 50 ft. wide, being sloped 6 in. away from the track well. The floor slab is 7 in. thick and is supported on eight longitudinal concrete girders on each side of the track well. These girders are 1 ft. 6 in. deep and vary in width from 9 in. to 14 in. They are laid directly on the caps of the pile bents and are reinforced with rods, some of which are trussed over the bents and others continuous in the lower plane. The girders are anchored to the caps by 22 in. dock spikes driven about 10 in. into the caps before casting the girders. The slabs are reinforced with No. 38 triangular mesh bent up to the top of the slab over the girders. The slab on each side of the track well is divided longitudinally by a continuous expansion joint over one of the girders. The reinforcement in that girder is divided so that the joint is continuous through the slab and the girder. Transverse expansion joints are spaced 54 ft. apart and are of similar construction.

The slab in the track well has a minimum thickness of 16 in., being crowned in each panel for drainage. A minimum thickness of 6 in. of ballast is used under the track ties. A vertical slab 5 in. thick is placed along the sides of the track well, having steel fire doors at intervals to allow access to the timber substructure. The floor slab is designed for a live load of 500 lbs. per sq. ft. and the track slab for a live load of 1,300 lbs. per sq. ft. The concrete in the slabs is a 1 : 2½ : 5 mixture with a surface coat of cement and trap rock screenings in a 1 : 2½ proportion.

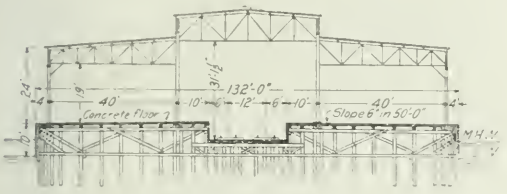
The columns and trusses of the superstructure are spaced 18 ft. center to center, all sections being built up of plates and angles. There are four rows of columns, the central span between columns being 44 ft. and the spans on each side being 40 ft. The trusses and columns are designed for an assumed roof loading as follows: dead load, 22 lbs. per sq. ft.; live load, 50 lbs. per sq. ft., and wind load, 30 lbs. per sq. ft. of horizontal surface. The steel frame is covered with galvanized corrugated iron to a height of 17 ft. 5 in., the upper portion of the side wall consisting of continuous steel sash 5 ft. 10 in. high. A similar continuous sash in the monitor deck is provided with an operating device to allow for ventilation of the building. The roof is carried on channel purlins and is covered with 5 ply felt, tar and slag laid on a 1 : 12 pitch. Ventilators 2 ft. in diameter are located along the monitor deck at intervals of 18 ft. The doors on the sides and the sea end

Exterior of Pier from Shore End.

Interior of Pier Showing Track Well, Platforms and Steel Superstructure.

are 12 ft. 5 in. wide and 11 ft. 5 in. high, the two doors on the shore end being each 14 ft wide by 22 ft. high. All doors are of steel frame construction with corrugated iron covering and are arranged to slide vertically, being counterweighted to make their operation easy. The doors on the side are arranged in pairs 18 ft. center to center, the pairs being spaced 54 ft. center to center. There are three ladders on each side of the building, allowing access to the roof. Copper downspouts at intervals of 36 ft. are provided to carry off the drainage.

The inside walls in the freight room between doors are protected by 2 in. by 8 in. spruce guard planks 10 in. center to center. At the shore end of the pier a supply and store room, boiler room, coal room, toilet and locker rooms are provided and two scale pits 4 ft. by 6 ft. in area are located at convenient points on the pier. The offices are located on a second floor in the first three panels of the superstructure at the shore end. The floor of this second story is laid on trusses supported from the columns, the



Typical Cross Section of Pier.

floor level being 19 ft. 9 in. above the pier level. A concrete slab is laid on these trusses which is covered by yellow pine flooring in the offices. The ceiling of the offices is hung by rods from the roof purlins. The space on this second floor is divided into a general office, record room, foreman's office, corridor and toilet. It is reached by two stairways and is lighted by skylights and side windows. A speaking tube and two bill elevators connect the general office with the main floor.

This pier was built under the direction of J. O. Osgood, chief engineer, Central Railroad of New Jersey, and A. E. Owen, principal assistant engineer, to whom we are indebted for the above information. The contract was let in three parts; the timber substructure being built by George Spearin, New York; the concrete deck by Henry Steers, Inc., New York, and the steel superstructure by the Hay Foundry & Iron Works, New York.

New Line for Peru.—The government of Peru has now accepted the proposal to extend the railway at present operating between Tambo de Mora and Chincha to the districts of Castrovirreyna and Huancavelica, a concession having been granted to the Tambo de Mora Railway Company, a locally-owned enterprise, to construct the line which it is allowed to operate for a period of 90 years, after which the whole concern falls into the possession of the government without the payment of any indemnity to the company.

MALLETS ON THE NORFOLK & WESTERN.

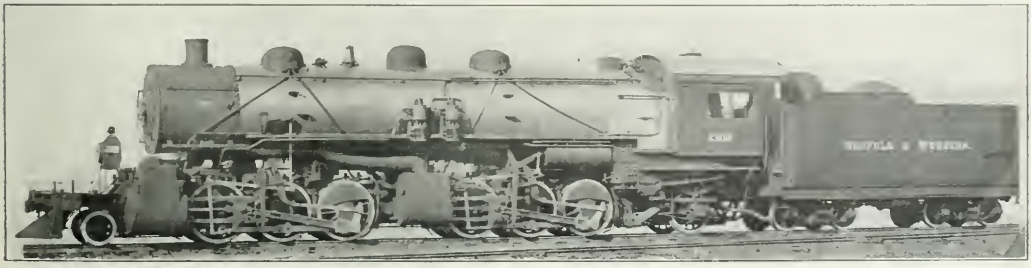
For the year ending June 30, 1912, the average revenue tons lading per freight train mile on the Norfolk & Western was 692.43, an increase of 7.75 per cent. over the preceding year. In connection with the development of heavier train units on that road ten Mallet locomotives were introduced in May, 1910; five of these were of the 0-8-8-0 type, and five were of the 2-8-8-2 type. In 1912 forty Mallets of the 2-6-6-2 type, built by the American Locomotive Company, were introduced and forty more are now in process of building. The addition of the trucks was made in order that the boiler capacity might be made larger, thus increasing the sustained capacity of the locomotives, which is necessary where they are used in road service, as the case on the Norfolk & Western.

In ordering this equipment, it was the purpose of the Norfolk & Western officials, not so much to dispense with the pusher service, as to increase the maximum train load over the division. On the Pocahontas division, between Eckman, W. Va., and Bluefield, five 0-8-8-0 type, five 2-8-8-2 type, and fifteen of the new 2-6-6-2 type Mallets are being operated in both head end and pusher service.

On the Radford division, between Bluefield and Roanoke, Va., five of the new 2-6-6-2 type Mallets are being operated in road service. This division is 105 miles long and includes a forty-mile grade of 0.4 per cent. and a ten-mile grade of 1.0 per cent. With the help of a pusher service on this ten-mile 1.0 per cent. grade the Mallets have increased the train tonnage from 2,800 to 4,000 tons.

The remaining twenty of the new 2-6-6-2 type Mallets are being operated in road service on the west end of the Norfolk division, between Roanoke, Va., and Crewe, a distance of 130 miles. Because of especially favorable terminal as well as road facilities, these Mallets are doing their best work on this division. Before the installation of the Mallets the tonnage on the division was handled by 4-8-0 type locomotives, having a total weight of 260,000 lbs., 220,000 lbs. being on drivers, and having a tractive effort of 52,500 lbs. Leaving Roanoke with a 3,500-ton train, which was the rating, two of these 4-8-0 type engines were at the head end. At Bonsack, Va., a 4-8-0 type locomotive was put behind the train to push it to Blue Ridge. At Blue Ridge, Va., the helper was cut out and returned light to Bonsack to await another eastbound train. From Blue Ridge the 3,500-ton train, with the two engines in the lead, proceeded to Phoebe, Va. At Phoebe the lead engine was cut out and the train and the one engine continued to Crewe. The one 4-8-0 type engine readily hauled the 3,500-ton train over this portion of the road, except that at Farmville, Va., it was assisted over the short grade by another 4-8-0 type engine.

At present, starting out from Roanoke with a 5,000-ton train, one of these Mallets is in the lead, double-headed by a 4-8-0 type locomotive. These two engines pull the train from Roanoke to Bonsack, a distance of 9 miles, made up of broken grades. At Bonsack another of the Mallets is put behind the train and pushes it to Blue Ridge, a distance of 6 miles. From Bonsack



Mallet Locomotive of the 2-6-6-2 Type as Used on the Norfolk & Western.

to Blue Ridge there is a ruling grade of 1.2 per cent. At Blue Ridge the pusher cuts out and returns to Bonsack light. From Blue Ridge the two engines in the lead haul the train to Phoebe, a distance of 56 miles from Blue Ridge. This 56 miles is made up of broken grades, but includes a 0.5 per cent. grade 8 miles long. At Phoebe the leading 4-8-0 type engine is cut off and waits for a westbound empty train, helping as a double-header back to Roanoke. From Phoebe, therefore, the one Mallet or through engine hauls the train to Crewe, a distance of 59 miles of broken grade, with the exception of the 16 miles from Farmville to Burkeville. This 16 miles is made up of a continuous grade of 0.45 per cent. and a 4-8-0 type engine is used as a pusher. This means that on the Radford division train loads have been increased 79 per cent., and on the Roanoke division 43 per cent. Fifty-seven locomotives have been supplanted by these forty Mallets, and a reduction of 25 per cent. has been effected in the number of freight trains operated over the divisions.

The boiler of the 2-6-6-2 type locomotive incorporates a combustion chamber 78 in. long. This allows the firebox to be brought back of the rear driving wheels, thereby making it possible to obtain a good depth of throat sheet, without excessively increasing the length of tubes. As a result a throat sheet 18 1/16 in. deep is obtained with a tube length of 24 ft. High temperature superheaters and brick arches are used. Fifteen engines are equipped with Walschaert and twenty-five with Baker valve gear. All the engines have Street stokers. Reversing is effected by means of the builders' hydro-pneumatic reversing gear, which not only renders the operation of the engine easier than that of the ordinary simple engine, but allows the use of steam with a full throttle and the cut-off arranged at the most economical point. The builders' latest style of outside bearing trailing truck is used. This was also used on the Chesapeake & Ohio Mallets, and is similar in design to that successfully applied to a number of recent Pacific type locomotives. With the exception of the case above mentioned, the type of leading and trailing trucks applied to Mallet locomotives by the American Locomotive Company has been the radial swinging bolster type with journals inside of the wheels. The outside bearing truck used gives a wider supporting base and tends to add to the stability of the locomotive.

The American Locomotive Company's system of compounding, including intercepting valve, was also applied. With this system it is possible to increase the power of the engine about 20 per cent. at critical moments, by admitting live steam to all cylinders. At the same time, the intercepting valve so controls the pressure of the live steam entering the receiver pipe that equal work is done in all four cylinders.

Following are the principal dimensions, weights and ratios of the new 2-6-6-2 type locomotives:

General Data.

Type	2-6-6-2
Service	Freight
Fuel	Soft coal
Tractive effort working compound	72,800 lbs.
Weight on drivers	337,300 lbs.
Weight, total engine	405,000 lbs.
Weight, total engine and tender	563,000 lbs.
Wheel base, driving	10 ft. 0 in.
Wheel base, rigid	10 ft. 0 in.
Wheel base, engine	48 ft. 10 in.
Wheel base, engine and tender	79 ft. 3½ in.

Cylinders.

Kind	Compound
Diameter and stroke	22 in. and 35 in. x 32 in.

Wheels.

Driving, diameter	56 in.
Driving journals	10 in. x 12 in.
Truck, diameter, front	30 in.
Truck journals	6 in. x 10 in.
Truck, diameter, back	44 in.
Truck journals	8 in. x 14 in.

Boiler.

Type	Conical connected
Working pressure	200 lbs.
Diameter, front	83⅞ in.
Diameter, back	96 in.
Firebox, length and width	108⅛ in. x 96⅛ in.
Tubes, number and diameter	243 2¼ in., and 36 – 5½ in.
Tubes, length	24 ft. 0 in.
Combustion chamber	78 in.
Heating surface, tubes	4,655 sq. ft.
Heating surface, firebox	343 sq. ft.
Heating surface, arch tubes	25.4 sq. ft.
Heating surface, total	5,023.4 sq. ft.
Superheating surface	995 sq. ft.
Grate area	72.2 sq.ft.

Tender.

Wheels, diameter	33 in.
Journals, diameter and length	5½ in. x 10 in.
Water capacity	9,000 gals.
Coal capacity	14 tons

PROPOSED INCREASE IN FREIGHT RATES.

The committee of the railways in Official Classification territory, Messrs. Willard, Rea and Brown, has announced that the application of the roads to the Interstate Commerce Commission for authority to increase freight rates will be made in the shape of a petition for the re-opening of case No. 3400, which was heard and passed on by the commission in 1910. The proposition, in 1910, was to increase the so-called class rates and a few of the commodity rates. It proved impossible to accomplish anything on this basis and the present proposition is for a small advance on all rates. Numerous complaints which have been made during the past two years have shown that the relation of rates between localities is of greater importance to the public than the actual rate per se. The officers of the railways believe that with the increase in expenses which has taken place within the past few years, the margin of profit is now so small that an increase of 10 per cent. in all freight rates would be justified; but it is desired to cause the least possible disturbance of commercial conditions, and therefore only 5 per cent. will be asked for at this time. Some commodity rates are very low, and it has been urged that these ought to be raised; however, this cannot be done without the co-operation of the shippers with the railroads and with the assistance of the commission.

"Since the previous hearing (1910) the railroads generally have expended large sums for equipment and additional facilities, and while there has been some response in the way of increased gross revenues, the surplus income after paying charges and dividends, has been so narrowed as to not encourage the further expenditures required to keep the railroads abreast with the growing demand of the business of the country. Unless the carriers are enabled to increase their revenue in some manner—and the plan above proposed seems likely to meet with less opposition than any other—their ability, already limited, to provide such additional equipment and facilities as will be necessary to take care of the growing demands of the country will be very seriously impaired."

Self-appointed spokesmen for shippers have already given notice in New York, Philadelphia, Chicago and other cities, that the application of the railways will be opposed.

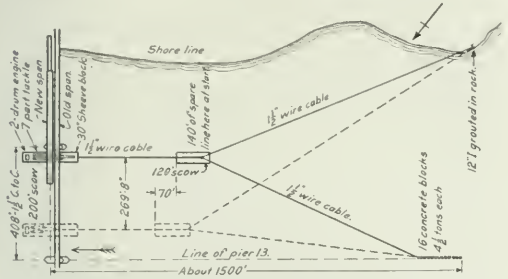
Amazon-Pacific Railway.—The Amazon-Pacific Railway, Peru, which is expected to do so much towards improving the foreign as well as the interior trade of the republic of Peru, is about to actively start upon its construction. Work will be commenced upon the Goyllarisqisga section, which is one of the most picturesque as well as one of the most important.

Brave Railwaymen Rewarded in England.—At a meeting of the London & North Western board of directors, three men—Hugh Roberts, dock-gateman at Garston; Harry Holley, signalman at Ringstead; and Thomas George Cowell, junior porter at Northampton Castle, received the thanks of the board and checks for conspicuous acts of bravery. At Garston docks Roberts, who could not swim, let himself down by a rope and rescued a woman who had fallen into the water between a ship and a quay. Signalman Holley rescued a man who fell into Ringstead locks, and who died after being brought out; and Porter Cowell jumped into the Nene river while it was in flood and rescued a man who had fallen in.

ERECTING THE ST. LAWRENCE RIVER BRIDGE.

Conditions Made It Advisable to Use a Very Small Amount of Falsework in the Erection of the Superstructure.

The Canadian Pacific bridge over the St. Lawrence river in the suburbs of Montreal, which was built as a single track structure including eight 240 ft. deck truss spans, two 270 ft. flanking and two 408 ft. channel spans, has just been replaced by two lines of single track spans supported on the original piers and on four intermediate piers which were built in the four northerly spans. The reconstruction of the piers and the general plan of erection of the superstructure were described in the *Railway Age Gazette* of October 11, 1912. At the bridge site, the river bottom is very rocky; and the water is from 5 to 40 ft. deep, with a current of about 8 miles an hour, making it advisable to



Anchorage of Scows for Launching Channel Spans.

erect the new superstructure with the use of a very small amount of falsework. The detailed erection methods are included in the present article.

The eight new 120 ft. spans which replace the four 240 ft. spans on the northern or Montreal end, were erected successively from the shore on 115 ft. falsework spans consisting of steel trusses 10 ft. deep, weighing about 10,000 lbs. each. These trusses were handled by two traveling cranes moving on the old superstructure and working only between regular trains. From four to five days were required for the erection of each new 120 ft. span. After they were erected, permanent track was laid on them and

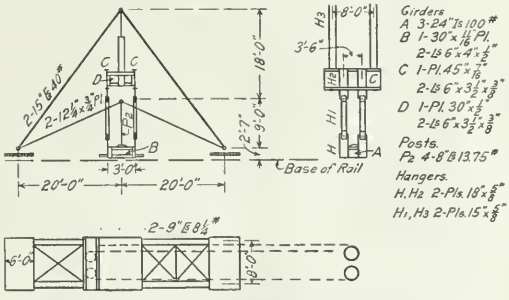
Launching Second Channel Span.

the traveling cranes first removed the down stream falsework truss in each span, after which the up stream trusses were pushed transversely under the structure to the position formerly occupied by the other trusses and were in turn removed by the cranes.

After the erection of the eighth 120 ft. span, traffic was shifted over the new superstructure, thus releasing the northerly four 240 ft. spans which were removed by traveling cranes moving on them; the steel being carefully disconnected so as to make it available for re-erection elsewhere.

The four 240 ft. spans on the down stream side between piers 7 and 11 were erected on 120 ft. falsework trusses supported on falsework towers. These trusses were erected in the northerly half of each span. The bottom chords of the new spans were assembled on them in position and riveted up complete, the section of chord which spanned between the end of the falsework and the next pier in advance having strength enough to be self-supporting for the clear distance of about 120 ft. The center panels of the new trusses were erected on the bottom chords over the center falsework tower, then one adjacent panel was erected on the bottom chords beyond the falsework tower, after which the northerly end of the span was erected over the falsework trusses and finally the erection of the span was completed from the center to the forward pier and the falsework trusses and towers removed. The maximum depth of water in which these falsework towers were built was about 18 ft. The falsework trusses for each span were erected in about one-half day and the erection of one 240 ft. span was completed by 30 men in 11 days. The field riveting was done by an additional force of 10 four-man gangs, using pneumatic hammers.

The two 270 ft. flanking spans on the down stream side of piers 11-12 and 14-15 were erected on two spans of the 120 ft. falsework trusses. These trusses were supported near the piers



Distributing Truss for Shore End of Channel Span.

on transverse trestle bents and at the center of the span on falsework towers resting on the rock bottom.

As the water under the two 408 ft. channel spans was about 40 ft. deep and it was necessary to keep the stream open for navigation, these spans could not be erected on falsework. As the location is an extremely windy one, and it was impossible to tie to the old structure in the erection of the new, due to the fact that the old spans were loaded to their allowable maximum by the traffic passing over them, erection by the cantilever method seemed inadvisable. It was therefore decided to erect each 408 ft. span on the adjacent 270 ft. flanking span with three of its nine panels overhanging the river and to launch them endwise into place.

These spans were erected by a top chord traveler moving on a track laid on the upper chords of the large trusses. When moving, it was supported on wheels and when lifting steel it was blocked up at the forward end just ahead of the wheels. The traveler was of the derrick type with a 50 ft. and a 20 ft. boom, the latter being hung in the center of a swinging "A" frame held in place by stiff back ties connected to the base of the frame by pins which could be shifted so as to keep the "A" frame vertical as the traveler moved over the curved top chord.

When a span was completely erected it was raised off the blocking and the forward end carried on a special scow on which

was built a wooden tower. A distributing truss resting on three pairs of shoes supported the rear end over the deck truss. The total weight of one of these spans, including the traveler, was 2,730,000 lbs. The load on the scow was 1,855,000 lbs., and that on the trusses 885,000 lbs. As this load on the approach truss had to be carried by the floor system, it was necessary to distribute it over about 40 ft. of length to prevent the overloading of the stringers and floor beams. It was also necessary to support the rear end of the truss in such a manner as to allow the outer end, carried on the scow, to move slightly in a vertical and considerably in a horizontal direction. This was accomplished by the use of a disk bearing placed on the center line of the bridge, which was suspended from the top of two pairs of inclined struts hinged to sliding shoes at their lower ends. These struts were kept from spreading by tie bars attached to the lower ends of the struts and set at such an angle that the vertical component of their stresses equaled one-third of the vertical component of the stresses in the inclined struts. These tie bars were connected at their intersection to a vertical strut also hinged to a shoe. By this arrangement the total load was distributed over six shoes with a fairly equal proportion of the load on each one and considerable freedom was allowed the shoes to accommodate themselves to any unevenness of the track.

The inclined struts used in this distributing truss were composed of two 15 in. 40 lb. channels and the tie rods were made up of two 12¼ in. x ¾ in. plates. The bearing for the load was secured by a system of built up girders which were hung from the connection of the struts by hangers made up of 15 in. x ⅝ in. plates. The center post below the connection of the tie rods is made up of four 8 in., 13.75 lb. channels. The three pairs of shoes slid on two lines of four rails each, laid on the deck of the approach truss 8 ft. center to center.

The supporting scow was 200 ft. long, 37 ft. wide and 10 ft. deep, having four steel trusses running the full length with steel latticed cross frames at about 8 ft. intervals. The sides, bottom and deck were of 4 in., British Columbia fir. Heavy timber keelsons and deck stringers were placed between the longitudinal trusses. These scows were built in halves and were used for other purposes until required for launching the spans, when they were joined by bolting together the projecting ends of the longitudinal trusses. Three light wooden longitudinal bulkheads were put in to hold the water in case the scows should rock when being placed under the bridge or under water ballast. To distribute the load on the scow, four 100 ft. plate girders were used to support timber falsework with steel bracing reaching up to the under side of the trusses. Two centrifugal pumps, two valves for flooding the scows and a valve between the two halves of the scow to regulate the height of the bow and stern were provided. There was also a hoisting engine at the stern to handle the anchor lines.

The main scow supporting the truss was anchored by a 1½ in. cable to a second scow 120 ft. long located about 500 ft. up stream. This scow in turn was anchored by 1½ in. wire cables to special anchorages. The extreme width of the river made it impossible to locate these anchorages on the shores and two of them had to be provided in the river bed. These were composed of 16 concrete blocks weighing 4½ tons each threaded on a 1½ in. plow steel cable with heavy double 6 in. pipe 12 in. long between each to allow the blocks to conform to the uneven bottom. These anchors were placed about 1,500 ft. above the bridge and in line with the two outer piers supporting the main channel spans. After the laying of these anchorages, cables were taken to the opposite piers and heavy strains put on them to set the anchorages firmly in the bottom. A third anchorage was provided on the shore, consisting of 12 in. "I"-beams grouted into the rock at the edge of the water.

The cable connecting the upper scow to the anchorages were fastened to a special stubbing post on the scow. The length of the cable to the center anchorage remained fixed, the transverse movement of the scow being secured by paying out the cable to the side anchorage, and allowing the scow to revolve about the middle anchorage as a center. This caused a movement down stream of about 70 ft., which was taken up in the cable connecting the two scows so as to prevent the scow supporting the span from moving down stream. It was found that the anchor lines worked a little unevenly, the steel cable sticking on the stubbing post and paying out by jerks, but as ample provision had been made for movement of the outer end of the span, no harm was done.

The bridge was moved by a 65 ton Lidgerwood unloader located on the deck truss just back of the rear end of the long span in the position occupied during erection. Steam was furnished to this unloader by a locomotive adjacent to it. Power was applied to the long span through girders thrusting against the two center shoes under the distributing truss, the purchase of the hauling lines being carried around sheaves in these girders, to and around sheaves placed at the outer end of the 270 ft. span. The girders carrying these sheaves butted

Deck of New Bridge Showing Track on Which Span Was Moved.

against the sliding track so as to keep the stresses developed by the frictional resistance to moving out of the approach spans and the distributing truss.

Experiments to determine the friction against sliding were made which showed about 13 per cent. Power was provided to overcome a friction of about 25 per cent., but judging by the ease with which the Lidgerwood moved the spans it looked as though 13 per cent. was about the amount which actually existed. As it was impossible for the distributing truss to act during the last 20 ft. of travel, wedges were driven between the center shoes and the end floor beam when the forward shoe of the distributing truss reached the end of the deck truss. For the remaining 20 ft. of travel the whole load was thrown on this blocking. The end panel of the floor was reinforced to carry this load.

Three hours were consumed in moving the first span and about two and one-half hours for the second, the latter being inclusive of the time required to allow eight trains to pass, to adjust the anchor and to dismantle a part of the sliding

frame to allow it to pass the hauling sheaves during the last 20 ft. of travel. The net moving time was only 28.5 min. It was decided to operate the bridge as a double track structure during the winter in order to accommodate the heavy railway traffic at this season. Later the up stream track will be temporarily closed while the two up stream channel trusses are dismantled and the two new ones replacing them are erected in the same manner as described for the two down stream trusses.

The reconstruction of this bridge is being handled under the direction of P. B. Motley, engineer of bridges of the Canadian Pacific, and J. M. A. Fairbairn, assistant chief engineer. The superstructure was fabricated and erected by the Dominion Bridge Co., Montreal.

CONDUCTORS' AND TRAINMEN'S DEMANDS.

The committee of managers of the eastern railroads on May 1 refused to grant the increased pay asked for by the conductors and brakemen, and issued a notice declaring the case to be more important than that of the engineers and the firemen combined. Some 100,000 conductors and trainmen on forty-three roads demand an additional $17,000,000, or 20 per cent. per annum, though their wages were increased by $30,000,000 per annum in 1910.

The committee's letter to Messrs. A. B. Garrettson of the conductors, and W. G. Lee of the brakemen, was in substance as follows: The increase demanded would be equivalent to placing on these properties a lien of $425,000,000 of 4 per cent. securities, which would have preference over first mortgage bonds. If the railroads are forced to pay extravagant wages to men in train service, the burden must fall on the public, from which the roads must secure revenue.

"Already the traffic of a growing country has overtaxed the existing facilities; and the heavy burdens incurred through ill-advised legislation, such as extra crew bills—for which the Brotherhood of Railroad Trainmen is alone responsible—forcing on the railroads and consequently on the public, needless expenditures of millions of dollars annually, or the large financial outlay the roads are compelled by law to make for improvements which produce no revenue, such as the grade crossing bill of New Jersey, and the additional burden of previous wage increases, are making it impossible for many of the roads to provide those facilities which prudent foresight demands, and which the interests of the public require.

"In making demands for extravagant wages—wages entirely out of accord with the railroads' obligations as a whole—railway employees apparently act on the assumption that a strike that would tie up traffic would never be permitted by the public. They seem to think that if a strike is to be avoided, the railroads must give way—that the public will force them to give way, believing that arbitration must take place, and that in the end the splitting of differences between what they demand and the wages they receive will result in their favor. In other words, the employees have everything to gain and nothing to lose.

"The ability of the railroads to meet the recurring demands for increased wages is measured by the net results of their operations and the sum of the obligations which they must meet to maintain their solvency. The reduction of the net revenue by the constantly increasing expenses of operation have so narrowed the margin which is essential to the solvent existence of many of the roads that further increases in operating costs are viewed with grave concern. The railroads reiterate their statement made to the engineers, that this headlong movement towards financial disaster cannot proceed unchecked.

"The conductors and trainmen in the eastern district have practically uniform wages and working conditions, and the wages now paid are liberal. As positive proof of this we need only call to your attention the fact that they were fixed by E. E. Clark, former president of the Order Railway Conductors, and P. H. Morrissey, former president of the Brotherhood of Railroad Trainmen, who acted as arbitrators in the New York Central controversy in 1910. The method of settlement under which those wages and conditions were adopted was agreed to only after representatives of the employees had declined to accept mediation or arbitration under the federal law, arbitration by a board composed of members of the Public Service Commission, Second district, state of New York, or arbitration by a board composed of the presidents of the chambers of commerce of three prominent cities of the state of New York, or in fact, arbitration of any form. Therefore, to avoid suspension of traffic, and the hardships and inconveniences which would result, representatives of the New York Central offered the only method of settlement that the representatives of the employees would accept.

"To prevent strikes on their lines, practically all of the railroads in the eastern territory in 1910 accepted the Clark-Morrissey award. The wages and working conditions of the conductors and trainmen, fixed by the New York Central award, are probably more favorable than those of any other class of railway employees; and further, to quote the well-considered language of the Interstate Commerce Commission, 'railroad labor, certainly organized railroad labor, is probably as well paid, and some say better paid, than labor of other kinds upon the average.'

"As showing the increased cost to the eastern railroads of these adjustments in 1910, we need only quote the statement made by the president of the Brotherhood of Railroad Trainmen in his report to the tenth biennial convention of that organization: 'Conservatively estimating, the increase in the rates of pay of conductors, trainmen and yardmen in the East as a result of this movement will approximate $30,000,000 per annum.' No conditions of work have arisen since the application of the Clark-Morrissey award that would warrant any increase in wages or changes in working conditions.

"In view of the fact that the present rates of wages are liberal, and in many cases excessive, the committee, acting in the interest of owners of railroad securities, in the interest of all railroad employees—in the interests of the public as a whole—must decline your request."

The next day after receipt of this letter Messrs. Garrettson and W. G. Lee offered to arbitrate under the Erdman act; but that the managers declined to do, reiterating the statement that no conditions have arisen since 1910 to warrant any increase in wages or changes in working conditions. They added:

"As to arbitration under the law, it was only at the urgent request of the representatives of the government, and under the strongest protest the managers were able to voice, that, feeling that some adjustments of pay were due the firemen, they agreed to arbitrate the firemen's wage controversy under the Erdman act. At that time we put the public on notice as to the crisis that would confront them when the conductors and trainmen made similar demands.

"You have followed the example of the engineers and the firemen, and have proposed to arbitrate 'under the law,' though practically all the leaders of railway labor organizations recognize the defects of the present law by joining in an effort to have it amended."

Continuing, the letter recounts the objections to the Erdman act, and ends with a refusal to accept the brotherhoods' proposal.

The brotherhoods announced that they would proceed to take a "strike vote."

RAILWAYS IN TRIPOLI.—The Italian minister for the colonies has under consideration projects for the construction of the following railways: (1) From Tripoli to Homs and Misurata; (2) from Tripoli to Zuarah as far as the Tunisian frontier; (3) and from Tripoli to the Oasis of Ghadames.

REPORT ON TERRE HAUTE COLLISION.

The Interstate Commerce Commission has issued a report, made by Inspector Belnap, on the rear collision of passenger trains on the Vandalia at Terre Haute, Ind., January 8, when five persons were killed and twelve were injured. Eastbound train No. 8 was standing at the station and No. 20, following, came on at uncontrolled speed and ran into the rear of the standing train. The accident occurred in the middle of the day and ordinarily the engineman of the approaching train would have seen the standing train, but steam from locomotives standing at the west end of the train shed cut off his view. There is no block system in effect through the station; and, apparently, the only rule which would limit the speed of a train coming into the station is a municipal ordinance making the limit twenty miles an hour within the city limits.

Train No. 8 is scheduled to arrive in Terre Haute at 12:45 p. m., and to stop there one hour; at 1:45 it is due to start east. Usually the cars are set off on a siding, but in this case the train arrived 46 minutes late, and it remained on the main track. Train No. 20 is due to arrive at 12:55, but on this day it was late and arrived at 1:42; and No. 8 was struck three minutes before it would have departed. The engineman of No. 20 admitted that he did not think of No. 8 and did not know what its leaving time was. No. 8 was not protected by a flag and it does not appear that any trains are thus protected at this station; and Mr. Belnap says that the direct cause of the collision was the failure of the conductor of No. 8 to protect his train, knowing that No. 20 was due. The engineman of No. 20 is also declared to have been directly at fault, for not having his train under complete control, his view into the train shed being obscured. Stationmaster Stice said there were no rules requiring flagging in the station, and he had received no instructions on the point; being a union station, where everybody stops, he held that every train should approach the station under control. Another road which crosses the Vandalia at the east end of the station has a rule requiring protection by flag when trains are standing at the station. Stationmaster Stice admitted knowledge of this rule, but said that where a trainman stood in a union station with a flag in his hand, it looked foolish to him. Since this collision the trainmaster has been instructed to enforce the flagging rule at Terre Haute union station to the same extent as at other places on the road. The inspector concludes with the statement that enginemen could be warned on approaching the station by means of a fixed signal located [at a point named] west of the station; and he says that there should also be a very material decrease in the speed at which trains are permitted to run approaching the station.

TRAFFIC THROUGH THE SAULT STE. MARIE CANAL.

The annual statistical report on lake commerce passing through the canals at Sault Ste. Marie, Mich., and Ontario during the season of 1912 has been issued by Lieut. Col. Mason M. Patrick, of the U. S. Army Corps of Engineers. The total freight traffic through both the American and Canadian canals, of 72,472,676 short tons for the season of 1912, shows an increase of 36 per cent over the previous year. All items of freight show an increase except coal, salt, copper and building stone. The season of navigation continued for a period of 7 months and 26 days. The traffic through the American canal was 45 per cent. of the total freight and 55 per cent. of the total net registered tonnage, while the traffic through the Canadian canal was 55 per cent of the total freight and 45 per cent. of the registered tonnage.

The following general summary shows the principal statistics of the traffic through both canals:

Total freight carried, tons	72,472,676
Total tons net register	56,736,807
Total mile-tons	60,242,833,014
Total valuation placed on freight carried	$791,357,837
Total amount paid for freight carried	$40,578,225
Total number of registered vessels using canals	853
Total number of passages by unregistered crafts carrying freight	535
Total valuation placed on registered vessels	$138,546,300
Total number of passengers transported	66,877
Average distance freight was carried, miles	831
Average cost per ton for freight transportation	$0.56
Average cost per mile per ton, mills	.67
Average value per ton of freight carried	$10.92
Time American canal was operated, days	237
Time Canadian canal was operated, days	240
Freight carried by—	
Registered vessels, tons	72,300,591
Unregistered vessels, tons	172,085
American vessels, per cent	94
Canadian vessels, per cent	6
Passengers carried by—	
American vessels, per cent	32
Canadian vessels, per cent	68
Average number of vessels passing per day—	
Through Poe lock	39
Weitzel lock	27
Canadian lock	33
Poe, Weitzel and Canadian locks	95

Of the total traffic 55,377,687 short tons was eastbound, and 17,094,989 was westbound. The transportation charges, including loading and unloading, on freight passing through both canals were:

Articles.	Quantity.	Rate per unit.	Amount.
Coal ..... Short tons...	14,931,594	$0.30	$4,479,478.20
Flour ..... Barrels	8,652,153	.20	1,730,430.60
Wheat ..... Bushels	174,086,456	.025	4,352,161.40
Grain, other than wheat.. Bushels	69,024,546	.025	1,725,613.65
Manufactured iron ..... Short tons...	629,060	2.00	1,258,120.00
Pig iron ..... Short tons...	25,832	1.00	25,832.00
Salt ..... Barrels	660,991	.10	66,099.10
Copper ..... Short tons...	116,954	1.45	169,583.30
Iron ore ..... Short tons...	46,303,423	.45	20,836,540.35
Lumber ..... M. ft. B. M..	667,542	2.65	1,768,986.30
Silver ore ..... Short tons...	.....	....	.....
Building stone ..... Short tons...	2,282	1.50	3,423.00
General merchandise.... Short tons...	1,664,783	2.50	4,161,957.50
Total			$40,578,225.40

The total expenditures for operating and repairs on the American canal for the year 1912 are given in the report as follows: Operating, $71,135.66; repairs, $81,061.68; total, $152,197.34. The cost per freight ton was 4.64 mills.

The following table of yearly summaries since 1887 shows the steady increase in the volume of the traffic:

Year.	Total freight. Short tons.	Valuation of freight.	Freight charges.	Average haul. Miles.	Freight charges per mile-ton. Mills.	Value of American craft.	Value of Canadian craft.
1887	5,494,649	$79,031,757	$10,075,153	811.4	2.3	$17,684,550	$2,089,400
1888	6,411,423	82,156,019	7,883,077	806.4	1.5	20,381,100	1,514,300
1889	7,516,022	83,732,527	8,634,246	790.4	1.5	25,328,600	1,597,600
1890	9,041,213	102,214,948	9,472,214	797.2	1.3	27,857,700	1,777,800
1891	8,888,759	128,178,208	9,849,022	820.4	1.35	31,947,300	2,119,500
1892	11,214,333	135,117,267	12,072,850	822.4	1.31	36,220,100	2,108,700
1893	10,796,572	145,436,957	9,957,483	831.9	1.1	39,017,400	2,115,700
1894	13,195,860	143,114,502	10,798,310	821.1	.99	41,124,200	1,959,800
1895	15,062,580	159,575,129	14,238,758	830.0	1.14	40,858,800	2,037,000
1896	16,239,061	195,146,842	13,511,615	836.4	.99	43,006,200	2,135,300
1897	18,982,755	218,235,927	13,220,099	841.3	.83	42,375,700	2,001,400
1898	21,234,664	233,069,740	14,125,896	842.6	.79	45,199,800	2,491,900
1899	25,255,810	281,364,750	21,959,707	827.2	1.05	65,000,520	3,369,600
1900	25,643,073	267,041,959	24,953,314	825.9	1.18	66,116,583	3,618,576
1901	28,403,065	289,906,865	23,217,974	823.3	.99	57,244,200	3,311,900
1902	35,961,146	358,306,300	26,566,189	827.4	.89	67,205,000	3,792,400
1903	34,674,437	349,405,014	26,727,735	835.6	.92	68,252,800	6,384,500
1904	31,546,106	334,502,686	21,552,894	843.5	.81	63,789,300	5,377,100
1905	44,270,680	416,965,484	31,420,585	833.3	.85	73,211,300	5,429,000
1906	51,751,080	537,463,454	36,666,889	842.4	.84	88,392,000	6,140,500
1907	58,217,214	569,830,188	38,457,345	828.3	.80	102,525,500	7,918,000
1908	41,300,557	470,141,318	23,903,244	842.0	.69	101,643,000	10,054,000
1909	57,895,149	626,104,173	36,291,948	809.0	.78	116,192,000	10,707,000

1911	53,477,216	595,019,844	29,492,196	826.0	.67	109,336,000	12,211,500
1912	72,472,676	791,357,837	40,578,225	831.0	.67	125,618,800	12,927,500

Paraguayan-Brazilian Connection.—The connecting up of Brazil and Paraguay by railway is to be further assured by running a line from the capital of Paraguay, Asuncion, northeasterly to the Paraguayan-Brazilian frontier, where it will cross the Paraná river. From that point it is proposed to connect with the Transcontinental Brazilian line, which again connects with the main Brazilian system at Itapetininga.

PRINCIPLES OF ELECTRIC RAILROADING.*

Second Article. Formulas Developed for Calculating the Amount of the Forces of Inertia, Gravity and Friction.

By C. L. de Muralt,
Professor of Electrical Engineering, University of Michigan.

In the first article of this series (*Railway Age Gazette*, April 4, 1913), we reviewed in a general way the laws which underlie all movement of trains on tracks.

We found that to move any railroad train we must apply a force of sufficient magnitude to overcome the combined influence of what might be termed three great natural forces, namely, (1) inertia, (2) gravity, and (3) friction. We will now proceed to calculate the amount of each of these three forces.

INERTIA.

We defined inertia as the force of the mass, which tends to prevent any change in speed, be it increase or decrease. To overcome inertia we must supply a force which is proportional to the weight of the train and also to the rate at which the speed is to be changed. This may be expressed as follows:

$$f_1 = 100\ W\ A, \qquad (1)$$

where W represents the weight of the train in tons, A the rate of acceleration—or retardation in the case of braking—in miles per hour during one second, and f_1 the force in pounds which it takes to accelerate—or retard—the weight W at the rate A.

The mathematical proof of this equation is comparatively simple. We may start from the familiar physical relation that force equals mass times acceleration:

$$f_1 = m\,a.$$

Inasmuch as mass equals weight divided by the acceleration due to gravity, we may write

$$m = \frac{w}{g},$$

and inasmuch as g has been determined to be roughly equal to 32.2, the above formula becomes:

$$f_1 = \frac{w\,a}{g} = \frac{w\,a}{32.2}$$

where f_1 is in pounds if w, the weight, is in pounds and a is the change of speed in feet per second per second.

If we change to the more usual units of tons and miles per hour, this equation becomes:

$$f_1 = \frac{2{,}000\ W \times 5{,}280\ A}{32.2 \times 3{,}600} = 91.1\ W\ A,$$

where W is the weight of train in tons and A the rate of acceleration in miles per hour per second.

This gives us the force in pounds, which is required to overcome the inertia of the train, on the assumption, however, that the motion of the train is a motion of the train as a whole and that there is no relative motion between any of its individual parts. In reality this is not so. The wheels and axles and other similar parts have a rapid rotating motion in addition to their forward motion. They act as so many flywheels and they require the expenditure of a certain amount of additional energy to get them to turn.

The amount of this energy, or for that matter the amount of energy in any rotating body, is determined by finding the weight of the body and the position and velocity of its center of gyration. The latter is the point at which we may imagine the whole mass of the rotating body concentrated, and any given force would produce the same velocity of rotation as it does in the actual body. It is needless here to go into detail as to how the radius of gyration is determined. Suffice it to say that for car wheels it is somewhere near 0.7 of the actual radius of the wheel, for locomotive wheels about 0.8, and for the rotating part of electric motors about 0.6. In round numbers we may say without any great error that the rotative energy of these parts is on the average equal to about one-half of the energy due to their forward motion ($0.7^2 = 0.49$).

If we compare the weight of wheels, axles, etc., with the total weight of the cars and locomotives, we find that the rotative energy will add to the energy of the train as a whole, from 5 per cent. in the case of a heavily loaded train to 12 per cent. in the case of an empty train, or about 9 per cent. on the average. To take account of this rotative energy we must therefore increase the amount found above for $f_1 = 91.1\ W\ A$ by about 9 per cent. This gives us the formula: $f_1 = 100\ W\ A$, which was to be proven.

Thus we have the simple rule that it takes 100 lbs. to accelerate one ton at the rate of one mile per hour per second; and the total force required in any case can be readily and accurately calculated by multiplying the weight of the train in tons by the rate of change of speed in miles per hour per second and by 100.

For instance, let us take a train which weighs 400 tons, and let us assume that it is desired to bring this train up to a speed of 30 miles per hour in 60 seconds. This corresponds to an average acceleration of 0.5 miles per hour per second, and the average force which we must apply to overcome inertia during the acceleration period is:

$$f_1 = 100 \times 400 \times 0.5 = 20{,}000\ \text{lbs.}$$

GRAVITY.

It is not much more difficult to calculate the force necessary to overcome gravity. Whenever a grade is encountered, we must lift the train through the vertical distance represented by the grade. Grades are nowadays generally expressed in per cent., meaning, that there is a rise of p feet for every 100 ft. horizontal length of line. If the grade should be given as x feet rise per mile, all we have to do is to divide x by 52.8 to obtain p, the rise per 100 ft. In Fig. 1 let the force OW represent the weight W of the car O. It acts vertically downward, but may be considered as resolving itself into two component forces, the force $F_g = OG$ acting parallel with the rails and tending to produce motion down the grade, and the force $F_n = ON$ acting normal to the rails and representing the pressure of the wheels on the rails. Force F_n is absorbed by the rails. Force F_g is the force which must be overcome and which we are trying to calculate. It is geometrically evident from Fig. 1 that, on account of the similarity of the triangles ABC and WOG, the force $F_g = OG$ bears the same ratio to the weight $W = OW$ that the rise BC does to the length of line AB. On any ordinary railway grade the horizontal distance AC is not sensibly different from the length measured along the surface of the rails AB. For a 3 per cent. grade, for instance, the length measured horizontally, AC, is to the length measured along the slope, AB, as 100 to 100.045. Hence it is customary

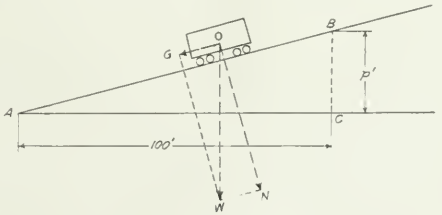

Fig. 1.

and proper to assume $AC = AB$. Therefore we have, approximately:

$$\frac{F_g}{W} = \frac{BC}{AC}$$

$$\text{or: } F_g = W \times \frac{BC}{AC}$$

If we let the horizontal distance $AC = 100$, and the height $BC = p$ = rate of grade or rise in per cent., then we have:

$$F_g = W \times \frac{p}{100}$$

This means that for every foot rise in 100 ft. length, and for every ton train weight, we have to exert a force equal to the one hundredth part of a ton to lift the train up the grade. Changing to the more usual unit of pounds we have:

$$f_g = 2{,}000\ F_g = 2{,}000\ W \times \frac{p}{100}$$

$$\text{or: } f_g = 20\ W\ p, \qquad (2)$$

where W represents the weight of the train in tons, p the grade in per cent. (feet rise per 100 ft. length) and f_g the force in pounds which is required to lift the weight W up the grade p.

Thus we find that, to calculate the force which it takes to lift a train up a grade, we simply multiply the weight of the train in tons by the rate of the grade in per cent. and by 20.

For instance, to take a train of 400 tons up a grade of 2 per cent., it requires to overcome the force of gravity a force:

$$f_g = 20 \times 400 \times 2 = 16{,}000 \text{ lbs.}$$

FRICTION.

To calculate the force which is necessary to overcome friction is slightly more involved. This is because the amount of this force depends on various factors which are subject to considerable variation. For instance, we all know that the friction inside a bearing is different when the bearing is hot from what it is when it is cold. We also know that the friction between wheels and rails depends on whether the rails are laid on a tangent or in a curve, and whether they are dry or moist, or covered with sleet or snow or wet leaves, etc. The friction between train and surrounding air varies according to whether it is a calm day or there is a heavy wind in favor or against the train. Then we have differences due to the effect of variations in speed, load, temperature, size and form of cars, length of train, etc. From all this it would appear that the best we can expect to do is to estimate the friction as accurately as possible for the various conditions or combinations of conditions. This has been done by a great many investigators, but it must be admitted that to this day no entirely satisfactory solution has been found which is applicable to all cases.

It seems to be pretty well established, however, that there are essentially two parts to train friction. One part increases directly in proportion with the train weight; the other part is independent of train weight, but increases with the number of cars that go to make up the train. This can be expressed in a formula as follows:

$$f_t = x\,W + y\,n,$$

where x and y are factors, the value of which has yet to be determined, W stands for the train weight in tons, and n for the number of cars in the train. Inasmuch as the number of cars is equal to the train weight divided by the average weight per car, we may write:

$$n = \frac{W}{W'},$$

where W' represents the average weight per car, and the above formula then becomes:

$$f_t = x\,W + y\frac{W}{W'} = W\left(x + \frac{y}{W'}\right),$$

which simply means that, instead of saying that there are two parts to train friction, one proportional to the train weight and the other to the number of cars, we may say that friction as a whole is proportional to the train weight, but a portion of it varies in direct proportion to the train weight and another portion varies inversely as the average weight of each car. The two ways of expressing it mean the same thing, and they both relate to the well recognized fact that in certain of the items which go to make up train friction we find train weight as the dominant factor, while in others the composition of the train is all-important, and the latter items are much larger if the total train weight is made up of a great number of empty cars, than if it represents a small number of heavily loaded cars. This was well recognized by the American Railway Engineering Association, when it adopted at its annual meeting in 1910 the following formula for train friction:

$$f_t = 2.22\ W + 121.6\ n.$$

This formula is based on the assumption that the friction of the train is uninfluenced by any change in speed. As a matter of fact, the association in establishing this formula, had in mind freight trains running at speeds between 7 and 35 miles per hour, and it is quite likely that within these limits the variation in the amount of friction, if any, is very small and its numerical value very hard to establish.

If we wish to have the formula applicable to higher speeds as well, then the influence of change in train speed upon train friction should have due consideration. The writer, after a careful and laborious study of all available test data, has come to the conclusion that the following simple formula represents average conditions in this respect fairly well:

$$f_t = \left(2 + \frac{V}{10}\right) W + 90\ n = W\left(2 + \frac{V}{10} + \frac{90}{W'}\right) \qquad (3)$$

where, if V represents train speed in miles per hour, W weight of train in tons, n number of cars, and W' average weight per car in tons, f_t will be the total train friction in pounds. Values established according to this formula check fairly well with values obtained according to the formula of the American Railway Engineering Association for speeds between 5 and 20 miles per hour. For higher speeds formula (3) gives more conservative values.

Whichever formula is used, it is necessary to realize that there are still some conditions which may influence the value of train friction and which are not particularly covered in either formula, such as condition of cars, condition of track, weather, etc. Variations of this sort it is impossible to determine mathematically. Any formula for train friction must be assumed to apply to cars in good average condition, track of good average first-class construction and reasonably good maintenance, and fair wind and weather. For special deviations from these assumptions special allowances must be made.

When trains are first started their friction is likely to be considerably greater than is indicated by the above formula. It may under adverse conditions run up as high as 40 lbs. per ton train weight. But trains are started by increments so that starting friction rarely becomes a limiting factor, especially not, because stops are not usually made on ruling grades.

The effect of curves, however, upon train friction is of sufficient importance to be carefully considered in this connection. In modern railway practice, curves are generally compensated by a reduction of grade so that the locomotive effort is the same on the curve as on the tangent. A compensation of 0.035 per cent. per degree of curvature seems to give the best average results. If curves are thus compensated then there is no necessity for considering any addition to train friction on their account. Curves that are not compensated are assumed to add 0.7 lbs. per ton train weight to the train friction for every degree of curvature, and the train friction as obtained by formula (3) should be increased by that amount.

Thus, for instance, a train composed of 50 cars of an average weight of 40 tons per car, running at a speed of 20 miles per hour through an uncompensated curve of 4 deg., will have a total train friction on the level of:

$$f_t = 2{,}000\left(2 + \frac{20}{10} + \frac{90}{40} + 4 \times 0.7\right) = 18{,}100 \text{ lbs.}$$

In the following articles we will show how the above formulas are used in making comparative power calculations for steam and electric operation.

ANNUAL MEETING OF THE AIR BRAKE ASSOCIATION.

Proceedings for First Two Days, Including Papers on Undesired Quick Action and Operation of Long Freight Trains.

The twentieth annual convention of the Air Brake Association was held in St. Louis, May 6-9, W. J. Hatch, of the Canadian Pacific, presiding. The meeting opened with a prayer by Rev. C. E. Jenney, and the association was welcomed to the city by T. H. Rogers, secretary to the mayor.

President Hatch spoke of the part the air brake played in the economical and safe operation of trains, advocating the testing of air brakes as soon as the train arrives at the terminal; he also recommended the installation of yard testing plants. Speaking of air hose failures he raised the question as to whether or not it would be practical to limit the life of a hose, rather than have it fail in service, causing train delay. The secretary's report showed 788 members and a cash balance of $2,619. About 220 members registered the first day.

An informal meeting was held Tuesday afternoon for the discussion of topics of interest not included in the program. E. F. Kearney, general superintendent of transportation of the Missouri Pacific, addressed the convention Wednesday morning. Wednesday afternoon was given over to an informal talk by Walter V. Turner of the Westinghouse Company, who spoke on topics suggested by the members in attendance.

UNDESIRED QUICK ACTION.

A paper on "Undesired Quick Action, Its Prevention and Remedy," was presented by C. N. Remfry, of the Duluth, Missabe & Northern. He told of the difficulties that had been experienced by that road, which has 7,000 ore cars and 2,000 freight cars. The ore cars do not leave the system, and are therefore under the company's observation during the entire year. They are in service during the open season of the Great Lakes, which is approximately from April 15 to November 30. At the close of the season the brakes are cleaned and lubricated. Each ore car will average one round trip of 190 miles every 24 to 36 hours, and is examined by air brake inspectors after each trip. The terminal yard at Proctor, Minn., has 97 tracks, all of which are piped with air test lines. Sufficient air capacity is provided to charge 5 trains at once to a pressure of 90 lbs. The cars are braked at 95 per cent. on a 50-lb. brake cylinder pressure.

Prior to and including the year 1906 the triple valves were cleaned on the cars by removing the triple cap and check valve case, wiping the parts as clean as possible, and oiling the slide valve and slide valve piston. This method would give satisfactory results until warm weather, when the undesired quick action would develop on nearly all trains. It was believed that the accumulation of rust in the pipes and the ore dust working into the pipes would cause the triple to stick enough to hold the pressure until it became great enough to move the piston to the emergency position. With this idea in view the triples were given a much more thorough overhauling and the pipes were hammered and blown out, but in the following year the trouble was worse than ever. Drawbars were pulled out and the equipment became more or less weakened, putting about 20 per cent. of the cars out of commission. At the end of the season, however, the triple valves seemed to be in as good condition as when the brakes were cleaned. A large number of the triple valves were then sent to the Westinghouse works at Wilmerding, Pa., for closer examination.

As a result it was decided to only blow out the air pipes, to give special attention to the cleaning of the triple valves, to use gasolene instead of kerosene in the cleaning, and to lubricate the slide valves with a high grade of fine dry graphite, and the triple piston with a good grade of grease or oil. This gave the desired result, and at the end of the 1909 season there were only six cases of the undesired quick action. In each of these six cases it was found that oil on the slide valve caused the trouble. The following table shows the effects obtained by using the dry graphite:

Year.	* Trains south with loads.	* Trains north with empties.	** Emergency trains reported.	Cause.
1907	6,878	6,672	375	
1908	4,021	3,897	4,021	
1909	5,946	5,625	6	Found lubricant on slide valve in each case.
1910	5,929	5,653	0	Mechanical defect. Wings of slide
1911	3,092	2,898	1	valve riveted too tight, causing
1912	4,536	4,347	0	graduating valve to bind.

* Hill trains not included.

** Trains developed undesired quick action more than once during the trip. No record kept of the number of times undesired quick action took place. No record kept of the cars in each train. It is assumed that a large percentage of the trains contained almost the same identical cars, therefore it is safe to say that list includes trains which developed this trouble several times but on different trips.

Trouble was also experienced because of the brake cylinder lubricant becoming thinner in summer, due to the heat. This has been overcome by the use of the emery brake cylinder lubricant, which was adopted as standard after 1910.

Discussion.—This is one of the most important matters related to train operation, as the undesired quick action of the triple valve causes train detentions, a decrease in the safety of train operation and a considerable increase in the cost of equipment maintenance, due to the general weakening of the equipment, drawbars pulling out, etc. It was stated that there were no less than 42 contributary causes to undesired quick action.

Other roads using graphite on the triple valve slide valve could not report as great a reduction in the undesired quick action as did Mr. Remfrey in his paper. This was due to the fact that Mr. Remfrey's cars were always under his direct supervision and that on the ore trains no foreign cars were used. Another reason for Mr. Remfrey's success was that throughout the whole scheme of air brake maintenance the utmost care was used, his road believing that money spent in that way was well invested. Many experienced difficulties with dry graphite, on account of surplus oil in the brake cylinder working back on the slide valve and of water in the train pipe getting on the slide valve. This was shown by W. V. Turner, of the Westinghouse Company, to completely nullify the effect of the dry graphite, for, as stated, the advantage of the dry graphite was to allow the air to percolate through the graphite, thereby reducing the pressure of the valve on its seat and allowing it to start with a less difference in pressure between the auxiliary reservoir and the train pipe. It seemed to be the consensus of opinion that the utmost care must be taken in air brake maintenance and that dry graphite was a very great help in reducing the undesired quick action.

OPERATING LONG FREIGHT TRAINS.

F. B. Farmer, Westinghouse Air Brake Company, presented an interesting and instructive paper on "Starting, Running and Stopping Long Freight Trains," which included valuable instructions to engineers of freight trains. An abstract of the paper follows:

Next to safety comes the less spectacular, but very potent, argument of needed economy in cost of transportation. An editorial in the *Railway Age Gazette* of February 7, 1913, says: "From 65 to 80 per cent. of the damage to freight cars is caused by defective draft gears," basing this on a statement by a master car builder of a large road. Part of this damage is caused in train handling, and while inherently weak draft gear and gear allowed to leave terminals in a defective condition contribute to break-in-twos, yet, as good handling will, even under such adverse conditions, avoid many failures that occur, the opportunities for improvement are obvious.

Passenger train handling must not, and usually will not, be

neglected because the errors are generally observed and complained of. This is much less true of freight train handling, yet note what authorities have to say about the earning capacity of the humble freight car. While the editor of a prominent technical paper estimates the average earning power of a freight car as $2.50 per day, J. M. Daly, general superintendent of transportation of the Illinois Central, in a committee report on "How to Secure Maximum Use of Freight Cars" (*Railway Age Gazette*, October 11, 1912), gives the following:

"The freight car today is the best asset of the railroad. It earns 75 per cent. of our gross revenue, and during the busy season is, without doubt, the best freight solicitor we have. The earning capacity of each freight car on the Illinois Central per day is $2.34. Eliminate Sundays, holidays and bad-order cars and confine it to the busy season, and its gross earning capacity is about $3.85 per day, the net revenue being about $1.15 per day. Five years ago the presidents of five of the largest systems made a thorough investigation covering the cost per day of cars. It was found at that time to be 42 cents and had for several years increased approximately two cents per day per annum. At that rate, cars today cost the owner 52 cents per day, covering interest and repairs."

On an earning value of $3.85 per day a delay of thirty minutes each day to a 60-car train would total $144 per month. This considers but one train delayed by a break-in-two or other cause, yet often others are delayed by it. This $144 is merely the loss of possible earnings. There is also the direct loss due to the damage done, time of crews, extra fuel burned, etc. Railways are run for profit, but with legislative restrictions, increased taxes and higher costs for material and labor this end is steadily becoming more difficult to attain. Hence, we who are paid to contribute to this needed result should endeavor to do our part well. Our efforts, then, should be toward keeping trains moving toward destinations without damage. That this may be done, and safely, requires, of course, some standing time for testing and repairs, but this merely emphasizes the need of avoiding unnecessary damage and delay.

Air Brake Instruction.—The instruction facilities of an air brake instruction car, including the instructor, are of value in so far as they contribute to safer, more expeditious and more economical train movement and no farther. The instructor, to succeed, must realize, and ever keep in mind, that the air brake is a *means* and *not* an *end;* that it is to promote train movement as far as is compatible with safety and economy; that this is obtained largely in train handling (starting, running and stopping), and that all instructions on train handling should be based on the fundamental and all-important fact that with draft rigging in fair to good condition no damage in train handling (not including switching) will follow if the slack is not allowed to run in or out harshly. All instruction on train handling must be based on and tied to train slack control, must teach engineers the various causes for slack running in and out, and how to use the brakes, the steam and the sand to prevent harsh slack action. If the instructor does not include the proper use of steam and sand he has left an unfinished job. The same is true if he fails to teach all concerned that slack must be pulled out to enable car inspectors to locate some draft gear defects, or if he fails to teach car men what draft gear defects are contributing unduly to break-in-twos.

The fundamental need, train slack control, is simple, but its accomplishment is not, and the instructor who can and does teach engineers how to attain the desired end is their and the company's man; he has realized the main object of his position. The instruction car work is merely the beginning, and if it is not followed up by individual instructions and observations on the road the results will be disappointing and out of proportion to the time expended. If either must be slighted it should be the car instructions.

Break-in-Two Records and Investigations.—Break-in-twos afford the best measure of the quality of train handling. Without reasonably accurate and complete records of every break-in-two officials are working largely in the dark, and accurate and complete reports are impossible without suitable forms. The importance of investigations and the necessity for suitable report forms are indicated in the following extract from a committee report made at a meeting of operating officials of the Illinois Central by J. L. East, agent of the loss and damage bureau: "The matter of rough handling of trains can be readily corrected if those connected with the transportation department holding supervisory positions will follow up closely with their superior officers any rough handling of trains coming under their observation in a sufficiently perceptive manner, to enable proper investigation of each specific case. It should be possible to surround this whole question of rough handling of trains on road, as well as in terminal yards, with such close and constant supervision through the co-operation of the entire division staff, as to make possible a thorough investigation of at least the majority of cases of rough handling occurring on any division. This is a matter of the most importance, and there is no question but that a great improvement in the way of reducing claims can be made."

The superintendent should receive a monthly tabulation of break-in-twos and should compare months on a train-mileage basis so as to note promptly and take action on any decreased efficiency. This tabulation is made up easily by the receiving clerk making entry on a suitable form as each report passes through his hands, requiring but a few minutes per day at the most, yet permitting of a tabulation ready for copying on the first of each month. A copy to the general superintendent allows him to compare months for each division and different divisions. On at least one large road the general manager takes personal interest in the monthly tabulations.

Train Handling.—Draft rigging in fair to good condition is not pulled out. It is either driven in or jerked out, both implying a severe blow. The severity cannot be judged by any shock felt by those riding trains, particularly the engineer of a heavy locomotive. Engineers who do not understand this are prone to attribute resulting failures to the condition of the draft rigging instead of to their handling. Another over-worked explanation for draft gear failures is "old defect." Many of such should be called ancient defects. Not infrequently it is an original one in an old coupler.

Records show, regarding break-in-twos with ordinary freight trains of from 1,700 to 2,400 tons, that 20 per cent. to 25 per cent. occur within five cars from the engine; about 40 per cent. between the engine and tenth car, and 60 per cent. to 65 per cent. between the engine and twentieth car, conclusive proof that it is the harsh running out or pulling out of slack at the head end that does most of the damage in train handling.

Australian Railways Gage.—A conference of the chief engineers of the Commonwealth and state railway departments in Melbourne has urged the immediate adoption of a uniform 4 ft. 8½ in. gage throughout Australia. The estimated cost of carrying this into effect is $185,000,000.

Train Robberies in France.—As the result of a series of recent robberies from trains on the Paris, Lyons and Mediterranean, the police of Lyons and Dijon have lately been carrying out researches, which have just led to the arrest of five men and a woman, who are now accused of complicity in an organized series of daring thefts. Their *modus operandi* is said to have been as follows: All the robberies were committed at a place between Allerey and Chalon, where the trains run at reduced speed. One or more members of the gang would board the train at this point, entering a baggage car or freight car, and throw out valuable merchandise to a waiting confederate on the line. Among the stolen property found in the houses of the arrested persons were some 600 lbs. of silks and other textile goods, and quantities of brandy and absinthe. There were also discovered lithographic presses for the production of forged postage stamps and railway tickets.

DOUBLE TRACKING ON THE NASHVILLE, CHATTANOOGA & ST. LOUIS.

During the last two seasons the work of double tracking the Chattanooga division of the Nashville, Chattanooga & St. Louis Railway between Chattanooga and Stevenson, Ala., a distance of 38 miles, has been actively pushed. The Southern railway uses the tracks of the Nashville, Chattanooga & St. Louis from Stevenson to Chattanooga and the Alabama Great Southern also uses these tracks for six miles from Wauhatchie to Chattanooga. The combined service of these three roads has amounted to considerably over 50 trains a day. During the season of 1911 several sections of double track were put in service between Chattanooga and Shellmound, and this portion of the line was otherwise improved, as described in the *Railway Age Gazette* of November 17, 1911. One of the most interesting features of this work was the cutting out of service of a single track tunnel at the summit of Raccoon mountain, which had been built to carry slides over the track. In widening banks for the double track during the season of 1911 considerable slag from nearby blast furnaces was used. In one place where the line is located on a very precipitous slope between the Tennessee river and Raccoon mountain, this slag fill could not be kept from sliding because the footing at the river bank had

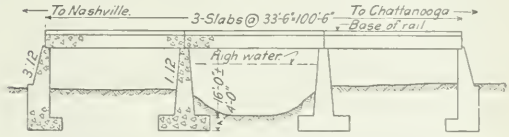
Typical Concrete Box Culvert on the N. C. & St. L.

given way. Having dumped considerably more material than should have been necessary for the bank widening, and the fill still showing tendencies to slide, it was decided to adopt some unusual measures to stop the trouble. A section of 4 in. pipe, 6 ft. long, was tapered to a 1 in. point and a number of 1 in. holes were drilled throughout its length. This pipe was then driven down through the slag. Another section of pipe was connected to its upper end and the driving was continued as long as possible, usually until the pipe had penetrated from 15 to 18 ft. When possible, the pipes were driven in vertically, but in a number of cases where it was easier to drive them on an angle, this was done. After the pipes were driven the driving cap was removed and additional joints screwed on with a 45 deg. elbow and a very thin grout was poured in from a high elevation so as to give hydraulic pressure. The grout was thus forced out through the holes in the pipe. As the pouring proceeded the pipes were withdrawn and a very solid core of cemented material was left. The fill so treated varied in height up to 50 ft., but the treatment was applied only to a strip extending entirely across the foot of the slide Since the application of the grout, no further trouble has been experienced.

The work during the past year included double tracking and grade reduction between Stevenson and Shellmound. At Stevenson, on a section about two miles long, the southbound grade which begins at a stopping point for all trains, was reduced from 1.1 per cent. to 0.3 per cent. At Carpenter an undulating grade of 1.1 per cent. was reduced to a 0.5 per cent. grade for a distance of about three miles. Between Bridgeport and Bolivar, a new location has been made which will effect a reduction in grade and improve the alinement.

The Stevenson grade revision covering a distance of about two miles involved the lowering of the main track through two summits a maximum of 12 ft. and the raising of one sag a maximum of 10 ft., it being necessary to remove about 80,000 yds. of material. A steam shovel and 6, 8 and 12-yd. dump cars pulled by standard gage engines have been used by the contractor in handling this material. The material was principally red clay with some slate and a little solid rock.

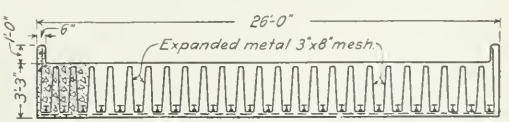
The new line between Bridgeport and Bolivar is about five



Longitudinal Section of Concrete Slab Bridge.

miles long and involved the handling of approximately 400,000 yds. of material; 50,000 of which were borrow. Two chert cuts in this section offered the only serious problem. This material could not be handled economically by a steam shovel without blasting. During the early stages of the work before the contractor had secured his supply of explosives, an attempt was made to handle it without blasting, the result being that a 70 ton shovel wore out a set of dipper teeth every day in handling about 250 cu. yds. In starting one of the deep cuts in this material an attempt was made to handle the upper portion with a team outfit in order to get the shovel in on a grade over which the cars could be handled. This failed, however, as it was impossible to plow the chert with a six mule team. It was finally necessary, in order to open up this cut, to make a light cutting with a steam shovel, wasting the material on the sides, then back out and start in again on a grade which would allow the loading of cars alongside the shovel. The cuts in this material were made about 40 ft. wide and no attempt was made to slope them, the width being sufficient to allow the sloughing which will occur. One of the reinforced concrete underpasses on this new line is shown in an accompanying cut.

The grade reduction at Carpenter required the handling of about 200,000 yds. of material, about half of which was from



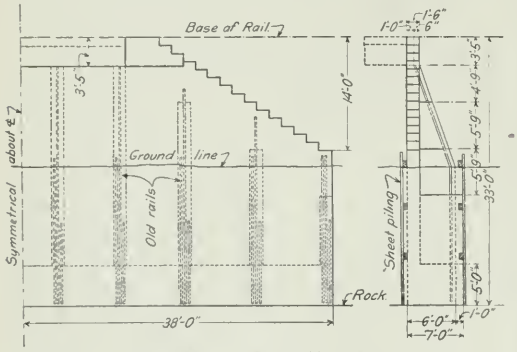
Detail of Slab.

borrow and was used in making a fill of maximum height of about 24 ft. The material was handled by a steam shovel into four yard cars pulled by dinky engines.

The standard roadbed width on this work was 33 ft. in both cuts and fills, slopes being 1½ to 1 for fills and 1 to 1 for cuts. The track is laid with 85-lb. rail on oak ties, tie plated. The ballast is rock.

Concrete slab bridges have been used in a number of locations on this road which have a reinforcement not commonly used. As shown in the cross section of one of these slabs, reproduced herewith, this reinforcement consists of old 80-lb. rails spaced 12½ in. center to center with their heads down and two inches above the bottom of the slab. Around these rails is bent a continuous sheet of expanded metal 3 in. x 8 in. mesh, and below the rails is placed a flat sheet of the same reinforcing

material. One of these bridges with clear spans of 31 ft. 6 in. has been built over Widow's creek, the slabs being built 33 ft. 6 in. long, allowing the use of 33 ft. rails without cutting. The depth of these slabs, 3 ft. 3 in., is somewhat less than the common practice in slabs of equal span reinforced with rods and stirrups. The three 33 ft. 6 in. slabs 26 ft. wide used on this bridge required 420 sheets of expanded metal 5 ft. x 10 ft. 8 in. weighing 0.6 lb. per sq. ft., and 75 pieces of second-hand 80-lb. rail. In one of these bridges a reinforced concrete abutment with reinforced buttresses was used, the design of which is shown in the accompanying drawing. The wall of the abutment is only 1 ft. 6 in. thick, each of the buttresses being the same thickness. Four of these buttresses are carried up to the bridge seat, the other six being of lesser heights, depending on the



Details of Buttressed Abutment.

height of the wing wall. The reinforcement consists of three rails of 40 lb. or 58 lb. weight in each buttress.

Plans have been made and the contract let for a new viaduct over Running Water creek, a short distance out of Chattanooga, which will be 120 ft. high and 1,100 ft. long. The viaduct will be for double track, with ballasted deck, and will require about 2,000 tons of steel.

The improvement work on the Nashville, Chattanooga & St. Louis is handled under the direction of Hunter McDonald, chief engineer; C. H. Johnson, engineer of construction, and R. M. Milan, resident engineer. J. L. Albus is the designing engineer.

THE PUBLIC SERVICE COMMISSION OF WEST VIRGINIA.

The act of the last legislature of West Virginia, creating a public service commission, goes into effect this month; and it is expected that the governor will appoint the commissioners within a week or two. There are to be four commissioners, with salaries of $6,000 each, and the term of service will be eight years. Not more than two shall belong to the same political party and one member must be a lawyer of ten years' experience at the bar. The act applies to all common carriers, telegraph and telephone lines, gas companies, electric light companies, hydro-electric companies, etc. The sections of the law are not so numerous as in those of New York, Missouri and other states, but its framers evidently intended to cover about everything which is included in the longer statutes referred to. Every railroad must permit track connection with industries and with other carriers. Among the powers of regulation of operation, that to require a safe number of men in the crew of a train is specifically mentioned. In the distribution of cars and in making rates, fair treatment must be accorded "tap lines," but nothing out of the main line rate is to be allowed a shipper for the use of "plant facilities."

The commission is to "collect full and complete information" of the value of all the property owned and controlled by a public service commission, once a year, and furnish the same to the Board of Public Works, for use in assessing taxes. A new tax is laid on public service corporations in the shape of a special license fee, the amount of which is to be apportioned to the value of the corporation's property; and the tax, in the aggregate, must produce a revenue of $60,000 a year, which is appropriated for the support of the commission. Any violation of the new law will make the guilty officer, agent, employee or stockholder liable to fine and imprisonment.

THE NEW YORK, WESTCHESTER & BOSTON'S TICKETS.

The New York, Westchester & Boston, running from New York City to White Plains and New Rochelle, now carries about 7,000 passengers a day, and the business is increasing.

Passengers carry their tickets with them into the cars, but the conductors make no collections and the tickets are deposited in a box on leaving the train. This ticket system, long in use in London and other European cities, has proved very satisfactory on the Westchester, and it may now be called a naturalized American institution. By a change, which was adopted on April 1, northbound tickets are made much larger than the southbound.

The passenger purchases a ticket for his destination at the ticket office and passes through a turnstile when he enters the train platform. On reaching his destination he is required to drop his ticket in the collection box in charge of the agent or station "guard," as he passes through the exit-gate. To provide against over-riding, the line of road is divided into zones and a color scheme makes it evident at once whether or not the correct ticket is being dropped in the box. Only one ticket is sold to a passenger and this ticket is good only on the date stamped on its back. A stamp of special construction is used which also cancels the ticket, showing that the passenger has passed through the turnstile to the train. Only two forms of tickets are used, a card local for single trip and a 60-ride monthly commutation form.

In the first issue, when the road was opened, the tickets were of one size, the color designating the zone into which the ticket was valid for passage. It was found, however, that there was some possibility of manipulation under this arrangement and to prevent the misuse of single tickets the two sizes were adopted. A southbound ticket is of the usual size, 2¼ in. x 1¼ in., while northbound tickets are twice that size. Each zone is also designated by two distinct colors, one for southbound and the other for northbound tickets. For example; the color designating the New York zone southbound is red and single tickets for southbound passage to stations in that zone are printed on red cardboard. The color designating New York zone northbound is white, and single tickets for northbound passage to stations in that zone are white.

In a few instances where a given fare carries the passenger over split zones the tickets are printed in two colors. This system is not complicated, and has worked out well. Passengers like it. The daily commuter also, who holds a monthly ticket which is punched when he goes through the turnstile and is shown to the guard at the exit-gate, enjoys the arrangement as the conductor does not interfere with his reading of the newspaper.

The occasional passenger who holds a short ride ticket is quickly noted and is referred to the ticket office at the destination station where he must buy a ticket representing the difference in the amount paid for the ticket which he holds and the amount due the company for the distance which he has ridden.

The distinctive colors used are red, green, gray, pink, blue, white and yellow. It is evident that if in the collection box in which red tickets only are received a white ticket is dropped, it is quickly noticed and the guard calls the passenger's attention to the error

Ticket agents have hand punches for the purpose of punching season tickets and for emergency use in case the punch in the stamp should get out of order. Each single-trip passenger must buy a ticket each time that he enters the train, tickets not being sold for future use. If a foreign ticket, money or other valuable article should be dropped into a ticket box, the agent drops into the box a memorandum explaining the fact, and then the person who has made the mistake can recover his property when the receiving box is opened. Agents make up a record of ticket sales every two hours. The ticket agent keeps a record in his office of the names of persons who have bought commutation tickets and the dates on which the tickets expire. This record is examined daily.

The New York, Westchester & Boston was opened May 29, 1912. Trains now run through to and from Harlem River on the New York, New Haven & Hartford, so that the lines operated aggregate about 21 miles, and over two hundred trains are run each day. The company has recently made an arrangement with the Adams Express Company for express service over its lines. The passenger trains consist usually of one or two passenger cars; but separate trains are run for express service, leaving the New York and the White Plains termini four times a day.

A large proportion of the passengers on the company's trains pay only five cents fare, this rate being the limit within the city of New York, and also within the city of Mount Vernon. Some of the higher fares have been materially reduced within the past few months, and the round trip rate from New York City to White Plains is now only fifty cents.

The company does a limited freight service, using the station of the New Haven road at the New York terminus and having stations of its own at Wykagyl, Heathcote and White Plains. Freight is moved at night, the tracks being well occupied with passenger traffic in the day time.

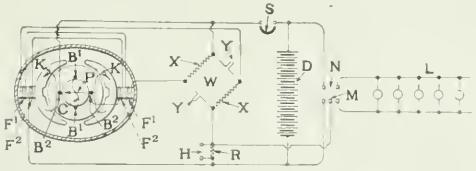
Provision is made in the passenger tariffs for taking ordinary baggage at the express stations and at all of the stations between Mount Vernon and White Plains. Baggage is not carried free and the tickets bear a notation that they are good for the passage of the passenger without baggage. The road is in the main a "commuters'" railroad, and most of the trains consist of one or two passenger cars and nothing more. But the four trains are run for express matter, as above noted, and on these baggage is accepted. The passenger fares are very low and for baggage a charge is made. A large proportion of the passengers pay only five cents for their rides, this being the limit for single fares within the city of New York, and also within the city of Mount Vernon. The minimum charge for 150 lbs. of baggage is ten cents; from Harlem river to Mount Vernon it is 20 cents; and to White Plains, 25 cents.

AXLE LIGHTING SYSTEM.

The Atchison, Topeka & Santa Fe is introducing an axle lighting system, after a test, which has been in process of development by the Electric Storage Battery Company, Philadelphia, Pa., for a number of years. It automatically adjusts the output of the dynamo to the requirements of the service, and gives the battery the slight amount of overcharge required to keep it practically full and in good condition, but no more, producing conditions of operation ideal for maximum battery life. Should the battery become discharged by a prolonged stop with the lamp load on, its charge will be rapidly restored during the subsequent run. Should the car be transferred from a daylight run to one requiring considerable artificial lighting, the output of the dynamo will increase to meet the changed conditions of service. This is all accomplished automatically without manual adjustment of any kind.

The dynamo is of the Rosenberg type, which has been used abroad in axle lighting for a number of years, but has been redesigned to operate in connection with a constant voltage regulator. Current in the primary field winding F^1 produces a small primary field flux represented by the arrow P, which induces a small electromotive force between the short circuited brushes B^1 and a flow of current through the short circuit connection C. This current, flowing through the armature winding, produces by armature reaction the secondary or principal field flux, which does not pass through the frame of the machine, but is confined to the heavy pole shoes and the armature as shown by the arrows K. This latter flux produces the electromotive force at the principal brushes B^2, which are connected to the external circuit, a series field winding F^2 in this circuit serving to balance the armature reaction due to load. An important advantage of this type of machine lies in the fact that it generates the same polarity with either direction of rotation, thus requiring no pole changer.

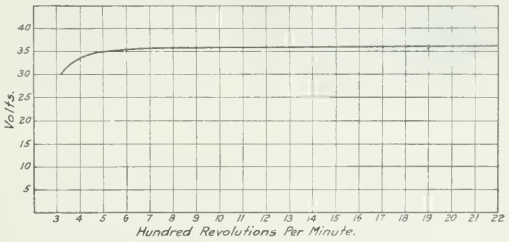
The primary field winding F^1 is connected across opposite



Wiring Diagram for E. S. B. Axle Lighting System.

junction points of the Wheatstone bridge W, the other two junction points being connected respectively to the positive and negative terminals of the machine. This bridge is designed to give the constant voltage characteristics above mentioned. It includes fixed resistances X in opposite branches and iron wire ballasts Y in the other two branches. The latter, on account of their high temperature coefficient, have a practically constant current characteristic under operating conditions. This combination of circuits produces a field excitation continually diminishing with increase of speed. The resulting speed voltage characteristic of the dynamo is shown in one of the illustrations.

An automatic switch S connects the dynamo to the battery D when the voltage of the former is slightly above that of the latter and opens when the output of the dynamo drops to zero. The knife switch N connects the lamp circuit L to the battery.



Speed-Voltage Characteristics of Axle Lighting Dynamo.

The voltage of the dynamo is fixed at a point slightly above the floating voltage of the cells, thus insuring that the battery is always fully charged. The difference between this voltage and that of the battery on discharge is, however, so small and the change from one to the other so gradual that no lamp regulator is required.

Should it ever be found necessary to give the battery a high voltage charge, this may be done during a daylight run by means of the fixed resistance R, normally short circuited by the switch H and also by the clip M on the main lamp switch. When both of these switches are open, the voltage of the dynamo is raised by an amount determined by the value of the resistance R. Whenever lights are required, the closing of the lamp switch N short circuits the resistance R, reducing the voltage to normal

and eliminating the possibility of excessive voltage at the lamps. During five months of continuous operation of a demonstration equipment, no occasion for such a high voltage charge has arisen.

A $50,000 FREIGHT PLATFORM.

The Studebaker Corporation has lately completed at its Detroit factory a loading platform, for shipping automobiles over the Michigan Central, at which 200 freight cars may be loaded in a day, from six to eight automobiles in a car. This structure has been built at an expense of $50,000 to do away with annoying delays which were unavoidable under former conditions. The platform is about 500 ft long, and is roofed over; and there is a track on each side of it. The Michigan Central tracks having been raised to cross above transverse streets, the sidings are also maintained at the upper level, about 20 ft. above the natural surface, and automobiles are raised to the platform on elevators, which take two at a time. The location of one of the elevators is shown in the illustration.

Loading Platform—Studebaker Automobile Works, Detroit.

A "Double-Deck" Load of Automobiles.

The Studebaker Corporation gives us the following notes:

The easy times when the railroads could take the automobile shipments from Detroit by diverting a few furniture cars from Grand Rapids are long since past. All the trunk lines have been forced to invest heavily in special box cars to handle the 300,000 automobiles now shipped from Detroit annually. Solid trains of automobile cars are of frequent occurrence in long hauls. In the spring of 1912, the Detroit manufacturers were forced to store thousands of cars, on account of the overwhelming demand for transportation facilities, and every warehouse in the city was filled. Several factories were forced to use circus tents, and police were called out to quell disturbances caused in the yards when gangs from rival factories fought over box cars.

Formerly, completed automobiles were driven up an inclined plane, under their own power. The new plan boldly abandoned this idea. The automobiles are driven to the elevators, two at a time, and lifted on the elevator to the platform at the level of the floors of the box cars. Loading is carried on day and night by large crews. During the last two months, 200 a day of the Studebaker cars have often been loaded, this in addition to the automobiles shipped from Studebaker's siding in the western part of the city, which connects with the Wabash.

One of the elevators in the new platform connects with the warehouse where parts, advertising literature and miscellaneous shipments are boxed and placed on small trucks. The trucks are elevated to the platform and the goods loaded into cars.

As a track breaks through the platform at one point a rolling bridge, actuated by an electric motor, is used as a movable platform, being run to one side, to clear the tracks, when the switching engine has to place or withdraw cars.

Traffic Manager George Sherman, of the Studebaker Corporation, says that the advantages of the platform, direct and indirect, have been fully up to expectations. "The most helpful feature is the pleasant relation it has cemented with the railroads. They have lost no opportunity to show how they appreciate our efforts toward added freight car efficiency. We have always been able to get freight cars this spring. Sometimes they were not available for the hauls we wanted most, but we seldom ask to have any car diverted from its home route. There is sometimes a tendency for the manufacturer and the railroad to work at cross purposes. We have found that the ideal situation is one in which shipper and the railroads work in harmony, anticipating each other's wants and spending money, when needed, to smooth out the rough spots."

The view showing the interior of a freight car illustrates how automobiles are loaded "double-deck" to economize room on long hauls. From six to eight automobiles, knocked down, are thus loaded into a single car. They are raised to the upper part of the freight car by means of a chain and pulley and then supported by timber framework. The wheels are taken off and packed in racks on the floor. By thus filling a car nearly or quite to its space-capacity the shipper is able in all cases to put in the weight called for by the tariffs.

Railway Construction in the Congo.—A new line which will have an important bearing on the Congo trade is that proposed between Brazzaville, the capital of French Equatorial Africa, on Stanley Pool, and Pointe Norie on the Atlantic seaboard. Sanction for its construction is now being asked and its completion could be effected in eight years. There are now 788 miles of railway open in the Congo.

General News.

The New York State Public Service Commission, first district, has rescinded its order, issued some months since, authorizing the construction of a moving sidewalk beneath Thirty-fourth street, New York City.

The Erie Railroad estimates that full crew laws will cost it $447,180 yearly. The Erie works under such laws in New Jersey, Pennsylvania, Ohio and Indiana, and there will be one in New York after September 1.

A fire in the stock yards of the Michigan Central at Detroit, Mich., on Sunday last destroyed the stock pens, the feed houses and other property, including 250 sheep. Estimated loss $195,000. It is believed that the fire was of incendiary origin.

In the freight yard of the New York Central at Weehawken, N. J., on the evening of May 5, a fire, which is said to have been caused by defective insulation of electric wires, destroyed three lift bridges and a float loaded with freight cars, together with other property aggregating a loss of over $200,000.

Six suits charging violations of the law regulating the transportation of cattle were filed against the Chicago, Rock Island & Pacific at St. Louis last week, together with two suits against the Chicago Great Western, four against the Illinois Central, and one against the Chicago, Burlington & Quincy.

The Minneapolis, St. Paul & Sault Ste. Marie has announced a plan for the organization of a co-operative association among employees, to be open to any who have been in the service of the company for six months or longer, under which employees will be allowed to set aside a portion of their earnings to be invested in securities of the company.

J. D. Farrell, president of the Oregon-Washington Railroad & Navigation Company, has issued a circular including the following: "Absolute freedom of action in political matters is the right of every employee, and the officers, heads of departments and foremen of this company will not attempt to influence the vote or action of any employee in any election."

The Duluth & Iron Range has offered 33 litigants in the White Iron Lake fire case, a lump sum of $24,750 in settlement of their claims for damages sustained in a fire during 1910, for which the railroad was charged with responsibility. The offer was accepted, and it was announced that the attorney representing the litigants will receive $8,250, and the litigants an average of $500 apiece.

The arbitration committee of the Master Car Builders' Association held a meeting at Chicago on April 29 and 30, to consider proposed changes in the code of interchange rules submitted, at the request of the executive committee, by individuals and committees representing the various railway clubs. The final consideration of the rules was postponed to an adjourned meeting on May 8.

The attorney general of Texas, at the request of the railroad commission, has submitted an opinion as to the responsibility of tram or logging roads not incorporated under the railroad incorporation laws, but owned and operated by private individuals or corporations, when they accept freight for transportation. The road is charged with a public use, and therefore is subject to regulation by the commission.

Kansas City Southern passenger train No. 5 was held up early on the morning of May 2 by two men who boarded it as it was leaving the station at Kansas City. The robbers obtained about $1,500 in money and jewels from the passengers. Jesse E. Short, of Joplin, Mo., one of the passengers, exchanged shots with one of the robbers and was dangerously wounded. One robber was also struck by a bullet, but both escaped.

The senate of the Illinois legislature has passed, by a vote of 38 to 6, a bill prohibiting the issuance of passes for transportation within the state, except to persons who would be entitled to free transportation under the provisions of the pass section of the Interstate Commerce law. According to a press report, John G. Drennan, district attorney of the Illinois Central, "startled legislative circles" by announcing that the railways were not opposing the passage of an anti-pass bill by the house.

Railroad officers in St. Louis, following a conference held on Tuesday last, announce that they are going to circulate petitions for a referendum on the Missouri full crew law, which was passed by the last legislature. Under the constitution of Missouri, it is now practicable to secure the suspension of this law until a vote of the people can be taken, in November, 1914, if five per cent. of the voters in eleven congressional districts can be got to sign the petition for a popular vote on the question. The railroads say that the enforcement of the full crew law in that state will cost $700,000 a year.

The Chicago, Rock Island & Pacific, and the Missouri Pacific have granted an increase in wages and a reduction of working time to their shop employees, in an agreement which went into effect on May 1, following conferences with representatives of the shop craft unions. Men who have been working ten hours a day were granted a nine-hour day, and on the Rock Island were given an increase of two cents an hour. On the Missouri Pacific the increase is 1½ cents an hour. Boilermakers, machinists, blacksmiths, sheet metal workers, carmen, painters and their helpers are affected. Negotiations for an increase for the shop men employed on the Kansas City Southern and the Missouri, Kansas & Texas are pending.

Congressman Broussard of Louisiana has introduced in the House a bill designed to perpetuate and improve the commerce court. The bill proposes to give the court power to review orders of the Interstate Commerce Commission, both negative and affirmative, so that a shipper will have the same facility of appealing to the court as do the carriers at present. It is proposed that three judges of the court shall constitute a quorum and that appeals from the courts of Porto Rico, the Philippine Islands and the Canal Zone shall go to the commerce court instead of directly to the supreme court of the United States. Changes are proposed in the procedure before the court in cases where the government is the defendant.

The board of management of the Intercolonial Railway of Canada is to be dissolved forthwith, and the management of the road placed in the hands of a single commissioner, F. P. Gutelius. David Pottinger, the veteran manager at Moncton, will retire on full superannuation. The other members are A. W. Campbell, chairman; F. P. Brady (general superintendent); E. Tiffin (traffic manager); and J. B. T. Caron (general solicitor). Mr. Campbell is the deputy minister of railways and canals, and as such will continue his work at Ottawa. Mr. Gutelius was formerly superintendent of the Canadian Pacific, at Montreal, but for the past year has been engaged in an investigation of the construction of the Trancontinental Railway.

The treasurer of Polk county, Iowa, has made a demand on the Chicago, Rock Island & Pacific Railroad, an Iowa corporation, for alleged unpaid taxes for five years, together with interest at 6 per cent., aggregating $15,559,440. This demand was authorized by the county board of supervisors, who also entered into a contract with the law firm of Kistle & Wright, of Council Bluffs, to bring suit in the district court against the corporation to enforce the collection of the money. According to the contract the attorneys will receive 40 per cent. of all the money they collect. The matter was brought before the board of supervisors by the two attorneys, who appeared unexpectedly at a meeting of the board and stated that after a year's work they had secured sufficient facts and figures to show that the company had withheld from taxation property worth $160,000,000. They asked for authority to institute proceedings against the company, and submitted a contract allowing them 50 per cent. as a fee. This was finally reduced to 40 per cent. A member of the board of supervisors is quoted as saying that the board has no proof whatever that the company has failed to schedule its property.

New York Workmen's Compensation Law.

The legislature of New York, which adjourned last week, passed a law providing for the payment of compensation for injuries to workmen in the principal industries. An employer will have a choice of four methods of providing for his employees in case of accident; by a state insurance fund to which he would contribute; by insurance in casualty companies; by

joining a mutual employers' insurance company; and by assuming the liability himself, provided he gives to the state insurance department satisfactory evidence of his financial ability. The law is in some respects like that of New Jersey, but the percentage of wages used in calculating the basis of compensation is 60 per cent. As in New Jersey, an employer who does not take action under the law is deprived of the usual defenses when sued under the common law by an injured employee. Casualty insurance men in New York City estimate that at present employers in New York State pay out annually $15,000,000 either for insurance premiums or in the shape of payments in cases which are settled under the common law; and it is believed that under the new law they will expend more than three times the sum named.

A Ten Dollar Suit in the Supreme Court.

The Missouri, Kansas & Texas Railway of Texas has appealed to the Supreme Court of the United States in a suit brought against it by L. C. Cade, a track repair laborer, the question at issue being a statute of Texas which allows attorney's fees on claims for labor which are not paid within thirty days. In Cade's case, a claim for $10, the attorney's fees amounted to about $9, whereas the costs of the court were only 50 cents. The case comes direct from the court of the Justice of Peace in Oak Cliff, Dallas county. The railroad fare of one attorney from Dallas to Washington is over $40.

The railroad company contested Cade's claim, first on the ground that it did not owe the money and second on the ground that the provision for attorney's fees conflicted with Article 14 of the federal constitution. Appeal was taken direct to the United States Supreme Court, for the reason that for cases of this kind there is no appeal in the state courts from the decision of the Justice's Court. The grounds of unconstitutionality under the federal constitution made it possible to appeal to the highest court of the land.

The Western Union on the L. & N.

The latest phase of the litigation between the Louisville & Nashville and the Western Union, which has followed the action of the L. & N. in 1911, in ordering the telegraph company to vacate its right of way, is a suit begun by the road against the Western Union in the Circuit Court at Knoxville, Tenn., demanding $600,000 as compensation. The judgment is sought for rental of the right-of-way. For forty years the Western Union leased pole and wire privileges from the Louisville & Nashville. In August, 1911, the road notified the Western Union that it would have to remove its lines at the expiration of the lease, and gave 3½ months in which to remove poles and wires. This was not done and the railroad has now brought the suit for $600,000. This is estimated as rental at the rate of $100 per mile for 4,521 miles, with a charge for renting wires to the Southern Bell Telephone Company. The alleged telephone arrangement is declared to have been entered into surreptitiously. The sum named includes also additional charges for railway stations in which Western Union operators are located. In some states through which the L. & N. extends it is provided by statute that when a tenant holds on after expiration of a lease he is liable for double the rental value. All these considerations, the railroad claims, bring the amount for which judgment should be rendered up to $600,000.

Investigation of the New Haven Road.

Commissioner Prouty continued through last week his hearings in Boston, held for the purpose of giving critics of the New York, New Haven & Hartford a chance to publicly study the statements which the commission has made up from the company's records of the past ten years, and this week, beginning on Wednesday, held another hearing at Washington. At Boston the purchasing agent of the road was questioned about contracts for coal and for cars. On Thursday President Mellen made a statement, taking about three hours, but he was not put under oath. He said that items on the records showing an apparent profit to himself in transfers of stock represented payments, approved by the directors, made by him to political campaign funds, notably $50,000 to the Republican presidential campaign in 1904. To the charge that John L. Billard made excessive profit in connection with the acquisition of the Boston & Maine, Mr. Mellen replied that Billard's transactions were not yet closed. The purchase of the New York, Westchester & Boston was decided on by others than Mr. Mellen; he, personally, was not in favor of it. He was in favor of selling steamers to C. W. Morse, but was overruled. Critics claimed that the recent sale of the company's parlor and sleeping cars to the Pullman Company was a bad bargain, but Mr. Mellen gave figures to show that it was a good one.

American and German Practices Compared.

In the discussion of Professor Cunningham's paper before the New York Railroad Club, April 18 (*Railway Age Gazette*, April 25), Arthur M. Waitt, formerly chief mechanical officer of the Lake Shore and the New York Central, declared that most of the large railways in the United States are under-officered; and that detail work is not adequately supervised. Too much detail is imposed on the heads of departments, and they are left with insufficient time for getting into close touch with the territories they manage. Mr. Waitt's observations cover 25 years' service on American roads, and 10 years since, in which he has been free from any direct alliance with them—this 10 years embracing many visits to Germany. He makes no question that in this country an insufficient force is provided to collect and collate data and to make comparisons and analysis of the results of management. Complaints and special inquiries from railroad and government officials require unusual efforts and expenditure of time to the detriment of other necessary and important routine work. There is a tendency also for higher supervising and administrative officers to interfere in matters for which they are not technically trained.

"In recent years heads of departments are too frequently made to be mere puppets, trained to jump when the strings are pulled, and they are not given that sense of personal responsibility and authority which develops strong and reliable men. This unfortunate condition is passed down the line and results in a weak organization.

"One noticeable feature to the discredit of our American railways is seen in the general character of the passenger stations in this country as compared with those in Germany. In nearly all of the large cities in Germany the railway stations are models of neatness, comfort and convenience, and even the stations at small towns and villages are neat, well constructed and ornamental to their surroundings. In fairness it must be said that in this country we have a few of the finest examples in the designs of railway stations to be found in the world. But unhappily these notable examples are the exception rather than the rule.

"A more generally satisfactory passenger service would be given in this country by the gradual introduction of classified passenger service not only in standard railway service but also in the subway and elevated service in our large cities, where the conditions of mixed classes is at frequent times almost unbearable. In America we compel the man with the small wages to accept and pay for the higher class of accommodations and furnishings that are demanded by those of more ample means. As a result the poor man feels, justly, that he is overcharged and the well-to-do man or woman feels indignant at being compelled to submit to the unsatisfactory conditions."

The Useless Railroad Valuation.

The act of Congress requiring the Interstate Commerce Commission to make a valuation of railroad property takes effect on May 1, and the leading railroad officials of the country have appointed a committee of eighteen, to devise a mode of procedure for the companies in doing their part. Five years is the time estimated as necessary for this investigation, and the cost has been estimated at $6,000,000, but that must be the cost to the government, and it will entail a great deal of expense to the railroads. That oppressed beast of burden, "the public," for whose benefit the work is supposed to be done, will have in the end to pay the entire bill and will find the benefit to be naught. It requires little imagination to form an idea of this "job," which will give extra employment to many, and entail corresponding expense, in the service of both the government and the railroads. A multitude of details about organization and financing issues of securities, expenses, gross and net earnings, etc., are to be ascertained. Many of the "elements" and factors which are to be sought for will be impossible of ascertainment, because

records have disappeared and no account of them has been kept As to "other elements of value," what are they? There is value for a railroad in its advantages of location, the development of the country through which it passes, the enterprise and ability of its management, the "good will" of a successful business. Are these things to be ascertained and set down for all common carriers subject to the Interstate Commerce act, with "an analysis of the methods of valuation employed and of the reasons for any differences between such value and each of the foregoing cost or present value"? If not, what is the use in requiring them to be ascertained and reported separately, with such analysis?

But suppose this herculean task to be accomplished, and suppose the result to represent a reasonable approximation to accuracy, what then? The statistics and statements would be imposing and bewildering in volume and magnitude, but would they be worth all the trouble and cost? Of what use would they be to the government? There would be no end of variations and differences in the ratio of capital to value, and much depends upon what the values were and are which are properly to be represented in capitalization. Every expert student of the subject knows that for the purpose of fixing of rates the volumes of the commission's report would be utterly useless. Other factors determining the charges which railroads are entitled to make for their service would so far outweigh anything that could be deduced from this mass of material that no account could be made of it. It would be a monument of wasted effort.—*Journal of Commerce (New York).*

Waiting at the Window.

It frequently happens that just when a ticket agent is busily engaged totaling up a report or doing some other important work that cannot well be interrupted for the moment a patron comes to the window. If he is not recognized at once, he becomes impatient and proceeds to get irritated. A pleasant word from the agent will often set the party at ease and retain his good will, while silence on the part of the agent may result in a loss of business, later if not then. Everybody dislikes being unnoticed. A smile and a cheery word always wins.—*Louisville & Nashville Passenger Bulletin.*

Air Brake Association Exhibits.

Following is a list of the exhibitors at the annual meeting of the Air Brake Association, which is now in session at St. Louis, Mo. The proceedings for the Tuesday and Wednesday meetings are reported on page 1033 of this issue.

Adreon Manufacturing Company, St. Louis, Mo.—Security angle cock holders and Security back-up valve. Represented by D. R. Niederlander, E. L. Adreon, Jr., and Wm. A. Vincent, Jr.

American Air Brake Company, St. Louis, Mo.—Automatic slack adjuster, "American" locomotive driver brake, and "American" locomotive truck brake. Represented by the Westinghouse representatives.

American Brake Company, Chicago.

American Piston Company, Indianapolis, Ind.—Piston rod packing, air pump packing and cab valve packing. Represented by V. D. Morrison and A. H. Schlaegel.

American Steel Foundries and the Simplex Railway Appliances Company, Chicago.—Ajax, Hercules and Vulcan brake beams. Represented by W. E. Fowler, Jr.

Ashton Valve Company, Boston.—Duplex and triplex gages, inspector's test gages, rear end protected dial gages, locomotive steam gages, dead weight tester, inspector's boiler test pump, air pump piston swabs, wheel press recording gages and locomotive safety valves. Represented by J. F. Gettrust.

Canadian Westinghouse Air Brake Company, Hamilton, Ont.—Represented by A. B. Brown and J. H. Reed.

Crandall Packing Company, Palmyra, N. Y.—Packings. Represented by F. E. Ransley.

Crane Company, Chicago.—Valves and air brake fittings. Represented by G. S. Turner.

Detroit Lubricator Company, Detroit, Mich.—Detroit locomotive lubricators. Represented by A. D. Homard.

Joseph Dixon Crucible Company, Jersey City, N. J.—Air brake graphite grease, air brake graphite, etc. Represented by L. H. Snyder.

Emery Pneumatic Lubricator Company, St. Louis, Mo.—Emery brake cylinder lubricant, Emery pneumatic lubricator. Represented by E. A. Emery and G. L. Janis.

Garlock Packing Company, Palmyra, N. Y.—Air pump packing. Represented by Philip Arnold, J. E. Hillerman and H. J. Ramshaw.

Gold Car Heating Company, New York.—Steam couplers, filling valve, and Non-return check valve. Represented by Mr. Ivers.

Greene Tweed & Company, New York.—Palmetto packings. Represented by L. J. Van De Wall.

H. W. Johns-Manville Company, New York.—J. M. air brake expander rings, J. M. flexible metallic hose gaskets, and packings. Represented by J. E. Meek, J. Trent, G. Christianson, C. Murphy and J. C. Jacobs.

The Leslie Company, Lyndhurst, N. J.—Steam hose regulator. Represented by S. I. Leslie and J. I. Cizek.

McQuay-Norris Manufacturing Company, St. Louis, Mo.—"Leak-Proof" piston rings. Represented by W. K. Norris, E. H. Hill and F. J. Goedeike.

Marvin Manufacturing Company, Franklin, Pa.—Air brake compound, anti-friction triple valve oil. Represented by T. G. Averill.

Nathan Manufacturing Company, New York.—Bullseye lubricator, Simplex and Monitor injectors. Represented by Otto Best and J. S. Seeley.

New York Air Brake Company.—Represented by Mr. LaQuade.

New York & New Jersey Lubricant Company, New York.—Non-fluid oil and air brake lubricant. Represented by J. H. Bennis.

Pyle National Electric Headlight Company, Chicago.—Model of type E turbo generator and lamp. Represented by C. P. McGinnis.

Standard Heat & Ventilation Company, New York.—Full line of steam heat equipment, including starting valves, regulator valves, train line valves, steam hose couplers, steam gages and car ventilators. Represented by George B. Culver.

United States Metallic Packing Company, Philadelphia, Pa.—King (type U. S.) air pump packing. Represented by M. B. Brewster and C. L. Mellor.

Westinghouse Air Brake Company, Pittsburgh, Pa.—Literature and chart racks. Represented by E. L. Adreon, R. E. Adreon, S. J. Kidder, F. M. Nellis, C. P. Cass, C. W. Townsend, C. H. Beck, F. B. Johnson, F. B. Farmer, H. H. Burns, S. H. Mills, A. Hartenstein, L. B. Wilcox, W. M. Sleet, E. H. Dewson, W. V. Turner, J. Wright, A. L. Berghane, R. Cunningham, J. Hume and D. M. Lewis.

Guilford S. Wood, Chicago.—Nipple end hose protector, Monogram angle cock holder and Sheafe coupler.

International Railway Fuel Association.

The fifth annual convention of the International Railway Fuel Association will be held at the Hotel Sherman, Chicago, May 21-24. On Wednesday, May 21, after addresses by the president and by R. H. Ashton, vice-president of the Chicago & North Western, and Francis S. Peabody, president of the Peabody Coal Company, there will be a paper on Standard Form of Contract Covering Purchase of Railway Fuel Coal, and one on Sub-Bituminous and Lignite Coal as Locomotive Fuel, which will be followed by discussions.

On May 22 there will be a paper and a discussion on Location, Construction, Development and Operation of a Bituminous Coal Mine, and the Report of Standing Committee on Firing Practice.

On May 23 there will be a paper and a discussion on Self-Propelled Railway Passenger Cars, and on Modern Locomotive Coaling Station: Its Design, Construction, Operation and Maintenance.

On May 24 there will be a paper, followed by a discussion on Scaling of Locomotive Boilers and Resultant Fuel Loss, the report of standing committee on Constitution and By-Laws, report of special committees, election of officers and the report of the executive committee on Selection of Subjects Presented at the Current Meeting for Discussion, with Recommendation on Subjects for Future Presentation.

A record attendance at the convention is expected, as 135 new members have been added since the convention in 1912.

Railway Storekeepers' Association.

The tenth annual convention of the Railway Storekeepers' Association will be held at the Hotel Sherman, Chicago, May 19-21. The subjects of the papers to be presented include: Reducing Inactive and Disposing of Obsolete Stock; Rolling Mills at Railroad Scrap Docks; What Effect, if Any, Has a Well Organized Stores Department on the Operating Cost of a Railroad?; Specifications for and Testing Materials and Effect on Storekeeper's Stock; Ice, Proper Method of Storage, Disbursement, Shrinkage and General Handling on Railroads; Standard Store House; Standard Stationery Store House; Standard Supply Car; Standard Scrap Dock and Reclaiming Machinery. Reports will be received from the committee on Recommended Practices, the committee on Accounting, the committee on Piece Work, the committee on Standardization of Tinware, the committee on Stationery, the committee on Uniform Grading and Inspection of Lumber, the committee on Scrap Classification, and the committee on Membership. A special committee has been appointed to prepare and submit for adoption a book of Standard Rules Governing Store Department Practices.

Convention Special to Atlantic City.

Following its usual custom for the accommodation of delegates to the conventions of the Master Mechanics' and Master Car Builders' associations at Atlantic City, the Pennsylvania Lines will provide a special train, to be known as the "Master Mechanics' Special" leaving Chicago at 3 p. m. on Monday, June 9, and reaching Atlantic City about 2 o'clock the following

afternoon. The summer tourist fare from Chicago to Atlantic City, good to return within 30 days, will be $29.25 for the round trip.

Trade Press Convention.

The eighth annual convention of the Federation of Trade Press Associations will be held at Hotel Astor, New York, September 18-20. William H. Ukers, editor of the *Tea and Coffee Trade Journal*, has been made chairman of the committee on arrangements and is preparing a program which will provide papers and addresses on topics of interest to manufacturers, sales managers and advertising men, as well as to the trade paper editors and publishers. Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums.

American Society of Mechanical Engineers.

The Spring meeting of the American Society of Mechanical Engineers will be held in Baltimore, Md., May 20-23, at the invitation of the Engineers' Club of Baltimore and local members of the society. A bulletin has just been issued giving the program for the meeting and information regarding hotel accommodations and transportation.

Central Railway Club.

At the next regular meeting of the Central Railway Club, to be held at the Hotel Statler, Buffalo, N. Y., May 9, B. H. Mann of St. Louis, signal engineer of the Missouri Pacific and president of the Railway Signal Association, will present a paper dealing with the Signal Department on Railroads.

Third International Congress of Refrigeration.

The finance committee of the American Association of Refrigeration is charged with the duty of raising a guarantee fund of $100,000 for the Third International Congress of Refrigeration, to be held in Chicago in September, 1913. Contributions are asked from all companies interested.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andrucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City. Annual convention, October 18-24, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 25 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—P. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Sunset Central Lines, International & Great Northern, Texas & Pacific, and St. Louis, Iron Mountain & Southern have announced that they will allow rates of one cent a mile for the reunion of the Confederate Veterans at Chattanooga, Tenn. The roads originally declined to make rates lower than two cents a mile.

Two hundred and fifty fruit growers of Arkansas held a meeting last week and appointed a committee to protest against the new demurrage rules of the Arkansas Railway Commission. One of the rules passed gives the railways authority to store shipments at the expense of the owners after a demurrage charge of $13 has accumulated against a car.

The Long Island Express Company will on June 1 go out of business, the Long Island Railroad having made a contract with the Adams Express Company to do the express business on the company's lines. The growth of Long Island has created a demand for through express rates and facilities which can be furnished much better by a large company; and the large number of offices maintained by the Adams in New York City will enable that company greatly to improve the local service.

Car Balance and Performance.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 144, covering car balances and performances for January, 1913, says:

The miles per car per day for January decreased .1 points to 24.3, compared with December, 1912, but increased 3.9 points over January, 1912, which were 20.4.

Ton miles per car per day were 392, compared with 396 for December. This is an increase of 20.62 per cent. over the figure for January, 1912, which was 325.

The proportion of home cars on line was 51 per cent., compared with 48 per cent. in December, 1912, and 58 per cent. for January, 1912.

There is a decrease of 1.8 points to 68.5 per cent. in the percentage of loaded car mileage compared with December, 1912. The per cent. of loaded car mileage for January, 1912, was 69.2 per cent.

The average earnings per car per day of all cars on line were $2.45, compared with $2.61 in December, 1912. This is an increase of 12.90 per cent. over the earnings for January, 1912, which were $2.17.

The table on the next page gives car balance and performance in the month covered by the report, and the diagram shows car earnings and car mileage and different car performance figures monthly from July, 1907.

INTERSTATE COMMERCE COMMISSION.

Cottonseed Rate Reduced.

Louisville Cotton Seed Products Company v. Louisville & Nashville et al. Opinion by the commission:

The rate charged by the defendants for the transportation of cottonseed in carloads from Memphis, Tenn., to Louisville, Ky., was found to be unjustly discriminatory to the extent that it exceeds the rate on cottonseed oil. (26 I. C. C., 607.)

Refrigeration Charges Increased.

In re investigation and suspension of advances in refrigeration charges between points located on the Kansas City Southern Railway; the Arkansas Western Railway; and the Texarkana & Fort Smith Railway, and to and from points on connecting lines. Opinion by Commissioner Clements:

Under a rule in trans-Missouri circular 1-B the carriers absorb icing charges on perishable commodities when 10,000 lbs. are offered upon payment of less-than-carload rate. The Kansas City Southern proposes in its individual tariff under suspension to withdraw from participation in that rule, which action will increase charges via its line to the basis of the carload rate as freight plus a separate charge for refrigeration. The commission decided that the proposed action was justified and the order of suspension was vacated. (26 I. C. C., 617.)

Rates on Rough Plow Handles Reduced.

G. A. Kelly Plow Company v. Texas & Pacific et al. Opinion by the commission:

The commission decided that the defendants' rates on rough plow handles from Fort Smith, Ark., to Longview, Tex., were unjust and unreasonable to the extent that they exceed by more than 3 cents per 100 lbs. the rates on hardwood lumber, and prescribed those rates for the future. Reparation was awarded. (26 I. C. C., 581.)

Rates on Asphalt and Asphaltum.

In re investigation and suspension of advance in rate by carriers for the transportation of asphalt and asphaltum, from points in Kansas to St. Louis, Mo., and other points. Opinion by Commissioner Clements:

The commission decided that the proposed advances in rates on asphalt and asphaltum from points in Kansas to St. Louis, Mo., and other points had not been justified and ordered the carriers to cancel the suspended tariffs. (26 I. C. C., 614.)

Rates on Sand to Houston, Tex.

In re investigation and suspension of advances in rates by carriers for the transportation of sand and gravel from points in the state of Louisiana to Texas points. Opinion by Commissioner Harlan:

The commission decided that the increased rates on sand and gravel from Anchorage, La., to Houston and Beaumont, Tex., and from Kinder, La., to Houston were not unreasonable, but the rate from Kinder to Beaumont was excessive. The order of suspension was vacated, but the defendants were directed to establish a reasonable rate from Kinder to Houston. (26 I. C. C., 677.)

Rates on Steel Window Sash Reduced.

Goldfield Consolidated Milling & Transportation Company v. Chicago & Erie et al. Opinion by the commission:

The commission decided that the charges for the transportation of a carload of steel window sash from Youngstown, Ohio, to Goldfield, Nev., at a combination through rate based on Sacramento, Cal., were unreasonable to the extent that the portion of the through rate from Sacramento to Goldfield exceeded the rate contemporaneously in effect from and to the same points on wooden window sash in carloads and prescribed that rate for the future. Reparation was awarded. (26 I. C. C., 605.)

Ground Iron Ore Rates Increased.

In re advances on ground iron ore from points in Alabama, Georgia, and Tennessee to Boston, New York, Philadelphia, and other points. Opinion by Commissioner Marble:

The commission decided that the withdrawal of commodity rates on ground iron ore in carloads from certain Alabama, Georgia, and Tennessee points other than Chattanooga to the north Atlantic ports, leaving in effect higher class rates, was justified, but that the proposed advance in the all-rail and rail-and-water rates on ground iron ore in carloads from Chattanooga to New York and Boston was not justified. An order was entered in accordance with this decision. (26 I. C. C., 675.)

Attempt to Close Route Frustrated.

Southwestern Missouri Millers' Club v. St. Louis & San Francisco et al. Opinion by Commissioner Prouty:

Millers at Springfield, Mo., and at various other points upon the St. Louis & San Francisco between Springfield and Bridge Junction, Ark., obtain their wheat west of Springfield, grind it in transit, and ship the product, among other distributions, to points on the Rock Island road between Bridge Junction and Little Rock, Ark. In the past rates from this originating territory to all points between Wister, Okla., and Bridge Junction have been the same and have applied either via Wister or via Bridge Junction. Upon the expressed intention of the defendants to close the route via Bridge Junction, the commission decided that the Bridge Junction route should be maintained with respect to the territory involved, except that lying south of Monett, Mo.; that is, from all territory which can be reached at practically the

CAR BALANCE AND PERFORMANCE IN JANUARY, 1913.

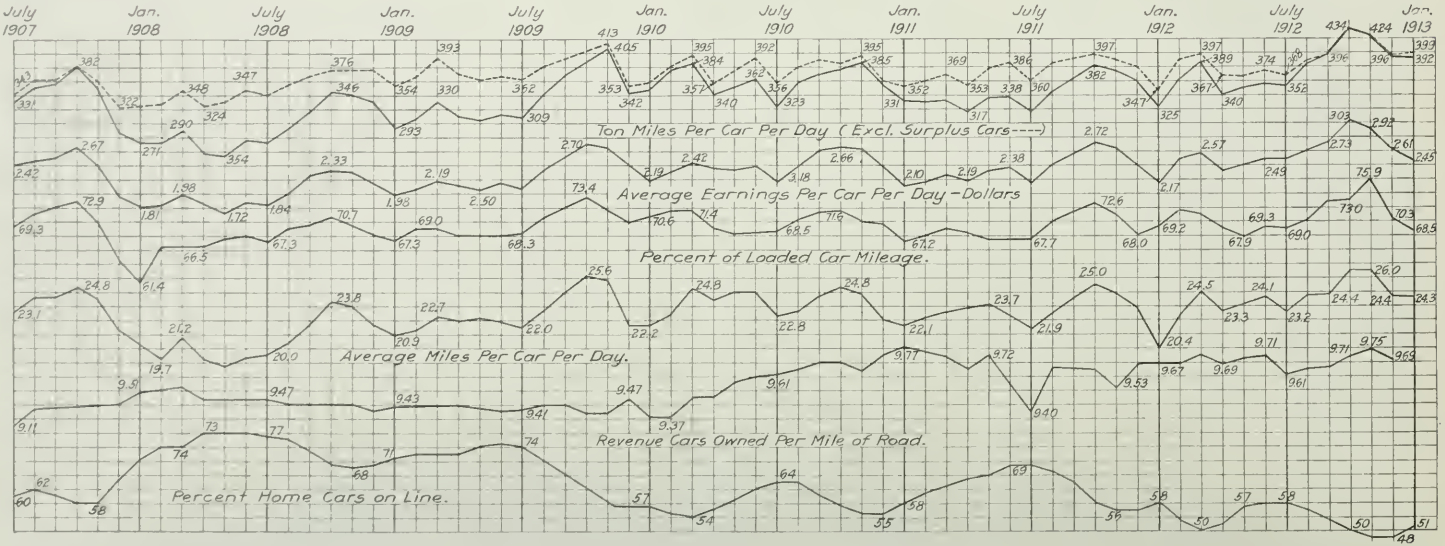
*Denotes deficiency.



Freight Car Mileage, Earnings and Performance, 1907 to 1913.

same length of haul through Bridge Junction as through Wister. No order was made but the decision will be regarded as an order. (26 I. C. C., 630.)

Reparation Awarded.

West Virginia Rail Company v. Baltimore & Ohio et al. Opinion by the commission:

Part of the traffic involved moves from points of origin in West Virginia to destinations in the same state, passing in transit about 1,500 ft. through the state of Kentucky. The commission decided that this traffic is subject to the act to regulate commerce, and that the rates for the transportation of steel rails in carloads from Huntington, W. Va., to points on the Norfolk & Western in West Virginia and Virginia were unreasonable. Reasonable rates were prescribed for the future. (26 I. C. C., 622.)

Relief from Fourth Section Denied.

Janesville Clothing Company v. Chicago & North Western et al. Opinion by the commission:

The complainant attacks as unreasonable and unjustly discriminatory the defendants' rates for the transportation of cotton piece goods from various southern producing points to Janesville, Wis., as compared with the lower rates to Madison, Wis., to which Janesville is intermediate. The commission decided that the complainant is not shown to have been damaged by a violation of sections 1, 2, or 3 of the act, as alleged. The petition was dismissed. The maintenance of lower rates for the transportation of cotton piece goods from southern producing points to Madison, Wis., than to Janesville, Wis., the intermediate point, was not justified by the carriers, and relief from the provisions of the fourth section of the act was denied. (26 I. C. C., 628.)

Joint Rates on Coal Established.

Sheridan Chamber of Commerce v. Chicago, Burlington & Quincy et al. Opinion by Commissioner Meyer:

Complaint was made of the rates on coal from Sheridan, Wyo., to points in Nebraska and South Dakota on the line of the Chicago & North Western and the Chicago, Milwaukee & St. Paul, and to points east and west of Billings, Mont., on the line of the Northern Pacific. Comparisons are made of distances and rates from Sheridan, Hudson, and from Illinois and Indiana coal fields to points of destination on the Chicago & North Western herein involved. Similar comparisons are made of distances and rates from Sheridan, Roundup, Mont., and from Illinois coal fields to points of destination on the Chicago, Milwaukee & St. Paul herein involved. Sheridan mines are at a disadvantage of from 85 cents to $1 in competing at points on the Northern Pacific with the mines located on that railroad. The commission decided that the great discrepancy between the rates from Sheridan and from Hudson to the same points of destination on the Chicago & North Western and between rates from Sheridan and Roundup to the same points of destination on the Chicago, Milwaukee & St. Paul cannot be justified on the ground that the movement from Sheridan involves a two-line haul.

Where the physical connection between connecting carriers is as simple as in these small western towns, involving no expensive terminal service, the additional cost due to the switching movement is very small, so small in fact that it may not properly be made the basis of an additional charge for a two-line haul of substantial length.

The facts demonstrate the necessity of promulgating rates which will allow this coal to find a market in the territory described. In order to accomplish this there must be a free interchange of traffic at reasonable joint rates.

Joint rates should be established from the mines at Sheridan to certain points on the Chicago & North Western, which should in no case exceed the rate from Hudson, Wyo., to the same points of destination, except that the rate to common points of the Chicago, Burlington & Quincy and the Chicago & North Western need not be changed.

A joint rate should be established from Sheridan to Chamberlain, S. Dak., not to exceed that from Roundup to Chamberlain and this rate should be carried back as far as Okaton, S. Dak.

A differential of 25 cents is a reasonable allowance for the difference in the distance from Sheridan and from the Northern Pacific mines to certain points of destination within 500 miles of Sheridan. As the distance to points of destination increases, the differential between the rates from Sheridan and from Red Lodge should be further contracted, so as not to exceed 15 cents to points between 500 and 600 miles distant and not to exceed 5 cents to points between 600 and 700 miles distant. To points over 700 miles distant the rate from Sheridan should be the same as the rate from Red Lodge. (26 I. C. C., 638.)

STATE COMMISSIONS.

The Illinois Railroad and Warehouse Commission will hold a meeting at Chicago on May 14, for consideration of a docket of petitions for additions and changes in the Illinois commissioners' classification.

The Missouri Public Service Commission has called upon the railroads of the state to furnish it with their tariffs of passenger rates preliminary to an investigation of the reasonableness of the present rates.

The Atchison, Topeka & Santa Fe has filed an application with the Kansas Public Utilities Commission for an order increasing the minimum weight for a carload of grain from 24,000 lbs. to a figure nearer the capacity of the cars generally used.

Joseph L. Reilly, who has been secretary of the Railroad Commission of Indiana, has been appointed secretary of the new Public Utilities Commission, which succeeded the old commission on May 1. It is reported that the new commission proposes to adopt as many of the rules and methods of the Wisconsin commission as can be adapted to use in Indiana.

The Indiana Railroad Commission has issued an order in the case of the Winona College of Agriculture against the railways of the state, prescribing a schedule of distance rates on crushed limestone for use as fertilizer, effective June 15, which materially reduces the present rates. The new scale ranges from 35 cents per ton for distances under 10 miles, to $1.40 per ton for distances between 325 and 350 miles.

The Oregon Railroad Commission has issued an order calling upon the Southern Pacific, the Portland, Eugene & Eastern, the Salem, Falls City & Western, the Oregon Electric, the Oregon-Washington Railroad & Navigation Company, the Walla Walla Valley Traction Company, and the Pacific Railway & Navigation Company, to appear on May 14 and justify present regulations with relation to block signals, passing tracks, switching and the general control and operation of trains.

COURT NEWS.

Judge Reiter, of the Lake County Circuit Court of Indiana, has overruled a demurrer of the Grand Trunk in a suit brought by the railroad commission to recover $10,000 as penalty for failure to observe the order for the installation of block signals.

The Supreme Court of Wisconsin in a suit against the Minneapolis, St. Paul & Sault Ste. Marie, has dismissed the appeal of John D. Langowski from a decision by the circuit court. Three years ago the plaintiff and his family while out walking on Sunday had strolled out on a trestle over the Wisconsin river, near Stevens Point, when a passenger train came along. In their excitement Mrs. Langowski jumped and was killed upon the rocks below, and her son and husband were injured. The husband brought suit against the road to recover damages, and the circuit court dismissed the complaint.

Lands in Oregon aggregating 2,373,000 acres, held by the Southern Pacific by virtue of grants made by Congress to its predecessor, the Oregon & California, in 1866 and 1870, were declared forfeited to the United States government in a decree issued by Judge Wolverton of the United States district court, at Portland, Ore., on April 29. The decree was based on the ground that the railway company violated the terms under which the grant was made regarding the sale of lands to settlers, by not selling the lands to actual settlers at $2.50 an acre, by selling lands at a higher price than $2.50 per acre, and by selling more than 160 acres to one person. The case will be appealed to the higher courts.

REVENUES AND EXPENSES OF RAILWAYS.

Railway Officers.

Executive, Financial and Legal Officers.

L. C. Everett, general auditor of the Bangor & Aroostook at Bangor, Me., having resigned, A. W. Grindle has been appointed acting general auditor, with office at Bangor.

J. T. Ehricht has been appointed auditor of the Wichita Valley with headquarters at Wichita Falls, Tex., succeeding W. C. Logan, resigned to accept service with another company.

W. A. Colston, commerce attorney of the Louisville & Nashville, at Louisville, Ky., has been appointed general solicitor, with headquarters at Louisville, succeeding A. S. Brandies, deceased.

The officers of the Alabama, Florida & Southern are: E. L. Marbury, president; W. S. Wilson, vice-president and general manager, and W. F. Bray, auditor and traffic manager, all with offices at Malone, Fla.

The East Tennessee & Western North Carolina has taken over the Linville River Railway, and the officers are now as follows: Edgar P. Earle, president; A. Pardee, vice-president, and John S. Wise, secretary and treasurer.

Thomas J. Freeman, president of the International & Great Northern, and operating vice-president of the Texas & Pacific, has resigned as vice-president to become general counsel of the latter company, the vice-presidency of which will be assumed by E. F. Kearney, general superintendent of transportation of the Missouri Pacific at St. Louis, Mo.

Vice-president A. R. Whaley of the New York, New Haven & Hartford, and the Central New England, is now in charge of the engineering, construction and maintenance department of these companies, in addition to his duties as head of the operating department. Vice-president E. H. McHenry, who has been in charge of the engineering, construction and maintenance department, has resigned, as heretofore announced, and he retired from the service of the company May 1.

Operating Officers.

John W. Hoffman has resigned as general manager of the Missouri, Oklahoma & Gulf.

W. A. Durham, assistant general manager of the Missouri, Kansas & Texas, with headquarters at St. Louis, Mo., having resigned, the position is abolished.

John McNaughton has been appointed trainmaster of the Erie Railroad and the New Jersey & New York, with office at Jersey City, N. J., succeeding H. R. Cole, transferred.

D. Sullivan, formerly division superintendent of the Missouri, Kansas & Texas, has been appointed general superintendent of the Apalachicola & Northern, with headquarters at Port St. Joe, Fla.

D. C. Frederick, car service agent of the Chicago, Peoria & St. Louis, has been appointed superintendent of transportation, with headquarters at Springfield, Ill., succeeding W. D. Danley, resigned.

J. H. Clark, assistant superintendent of floating equipment of the Baltimore & Ohio at New York, has been appointed superintendent of floating equipment, with headquarters at Baltimore, Md., succeeding Walter Aneker, deceased.

James D. Beaver, trainmaster of the Pittsburg, Shawmut & Northern at St. Marys, Pa., has been apopinted assistant superintendent, with office at St. Marys, and James T. Colbert has been appointed trainmaster, with office at St. Marys Junction.

W. H. Averell, assistant general superintendent of the Baltimore & Ohio at Pittsburgh, Pa., has been transferred to a position with the same title at New York, and has also been appointed general superintendent of the Staten Island Railway Company and the Staten Island Rapid Transit Railway Company, B. & O. lines operated on Staten Island. A sketch of Mr. Averell's railway career was published in the *Railway Age Gazette* of July 26, 1912, page 181.

L. J. Ferritor, superintendent of the Scranton division of the Delaware, Lackawanna & Western at Scranton, Pa., has been appointed superintendent of the Buffalo division, with office at Buffalo, N. Y., succeeding M. H. Cahill, resigned, and P. N. Place has been appointed acting superintendent of the Scranton division, with office at Scranton, succeeding Mr. Ferritor. A portrait of Mr. Ferritor and a sketch of his railway career were published in the *Railway Age Gazette* of January 17, 1913, p. 128.

Traffic Officers.

W. K. Cundiff, assistant general passenger agent of the Union Pacific System at Omaha, Neb., has been transferred to Kansas City, Mo., in a similar capacity.

Edward Briggs, general agent of the Wheeling & Lake Erie, at Cleveland, Ohio, has been appointed assistant general freight agent, with office at Cleveland.

Harry J. Flynn has been appointed soliciting freight agent of the St. Louis Southwestern, with office at Louisville, Ky., in place of C. C. Rockenbach, transferred.

J. W. Overman has been appointed traveling freight agent of the Toledo, St. Louis & Western, with headquarters at Kansas City, Mo., in place of E. C. Ferguson, promoted.

Emil J. Bauer has been appointed manager of lighterage and foreign freight departments of the Erie, with headquarters at New York, succeeding Arthur J. Grymes, resigned.

Marshall Taylor has been appointed city ticket agent of the Chicago, Milwaukee & St. Paul, at Portland, Ore., in place of J. O. Thomas, resigned to engage in the real estate business.

W. H. Saunders, traveling traffic inspector of the Cincinnati, New Orleans & Texas Pacific at Cincinnati, Ohio, has been appointed soliciting freight agent with headquarters at Cincinnati, succeeding W. S. Logan, transferred, and C. J. Scherer succeeds Mr. Saunders.

A. B. Day, traveling passenger agent of the Delaware, Lackawanna & Western at Buffalo, N. Y., has been transferred in the same capacity to Chicago, succeeding H. C. Dickson, deceased, and F. S. Clark has been appointed traveling passenger agent at Buffalo, succeeding Mr. Day.

Owing to the resignation of George A. Blair as general traffic manager of the Chicago & Alton, until further notice C. A. King, freight traffic manager, will have charge of freight traffic, and George J. Charlton, passenger traffic manager, will have charge of passenger traffic, both with headquarters at Chicago.

George H. Clark has been appointed division freight and passenger agent of the Ottawa division of the New York Central & Hudson River extending from Tupper Lake, N. Y., to Nyando, with headquarters at Ottawa, Ont. This new division was formerly the New York & Ottawa Railway. Mr. Clark also retains the position of general freight and passenger agent of the Ottawa & New York, which is the Canadian end of the New York Central line to Ottawa.

Engineering and Rolling Stock Officers.

Arthur N. Carver has resigned as division engineer of the San Benito & Rio Grande Valley at Mission, Tex.

H. E. Myers has been appointed shop superintendent of the Lehigh Valley, with headquarters at Packerton, Pa.

Charles Boertman has been appointed superintendent of shops of the Pere Marquette at Saginaw, Mich., in place of George Hilferink.

K. A. Dunphy has been appointed resident engineer of the Canadian Pacific, District No. 2, Alberta division, with headquarters at Calgary, Alta., in place of J. Robertson.

W. W. Morrison has been appointed assistant signal engineer of the Electric Zone and the Electric division of the New York Central & Hudson River, succeeding R. C. Johnson, resigned.

T. M. Vickers, formerly master mechanic of the San Pedro, Los Angeles & Salt Lake, has been appointed general foreman of the Oregon Short Line at Pocatello, Idaho, effective May 1.

Joseph E. Crawford, bridge engineer of the Norfolk & Western at Roanoke, Va., has been appointed acting chief engineer, succeeding Charles S. Churchill, assigned to special duty.

T. J. Burke, division engineer of the Lehigh Valley at Auburn, N. Y., has been appointed division engineer on the Mahanoy & Hazleton division, with office at Hazleton, Pa., succeeding J. A. Zehner, resigned.

K. B. Duncan, office engineer of the Atchison, Topeka & Santa Fe, at Topeka, Kan., has been appointed engineer of the Gulf, Colorado & Santa Fe, with office at Galveston, Tex., succeeding R. A. Rutledge, promoted.

B. C. Martin, resident engineer of the New York Central & Hudson River at Utica, N. Y., has been appointed assistant district engineer, Hudson division, with headquarters at Poughkeepsie; and G. F. Chisholm, resident engineer at Rome, succeeds Mr. Martin.

W. B. Willis has been appointed assistant division engineer of the Monongah division of the Baltimore & Ohio, with headquarters at Grafton, W. Va., succeeding H. F. Kloss, transferred, and D. W. Whisner has been appointed supervisor of subdivision No. 11, with headquarters at Clarksburg.

W. S. Murray, electrical engineer of the New York, New Haven & Hartford at New Haven, Conn., has resigned, and has formed a partnership with E. H. McHenry, under the firm name of McHenry & Murray, engineers. Mr. McHenry resigned as vice-president of the New Haven on May 1. (See an item in Supply Trade News.)

H. W. Wagner, principal assistant engineer Western lines of the Atchison, Topeka & Santa Fe at Amarillo, Tex., has been appointed engineer of the Western lines, Northern district, with headquarters at La Junta, Col., succeeding F. M. Bisbee, promoted, and N. R. Cullings has been appointed engineer of the Western lines, Southern district, with headquarters at Amarillo, Tex

C. M. Nye has been appointed principal assistant engineer of the Great Northern, with headquarters at St. Paul, Minn. Oscar S. Bowen, resident engineer at Spokane, Wash., has been appointed resident engineer at Seattle, Wash., in place of R. L. Beaulieu, and will have jurisdiction over the Western district. The jurisdiction of P. S. Hervin, resident engineer at Great Falls, Mont., has been revised to cover the Montana and Butte divisions and the Central district. The positions of assistant chief engineer at St. Paul and resident engineer at Spokane are abolished. H. S. Wollan has been appointed acting resident engineer at Superior, Wis., with jurisdiction over the Lake district. The jurisdiction of H. F. Hamilton, resident engineer at St. Paul, has been revised to cover the Eastern district. The effect of the changes is to make the jurisdiction of the four resident engineers correspond with that of the general superintendents to place their headquarters at the same places.

Purchasing Officers.

C. C. Colley has been appointed purchasing agent of the Louisiana Railway & Navigation Company, with headquarters at Shreveport, La., in place of G. E. Smith, resigned.

Special Officers.

C. E. L. Bergstrom has been appointed assistant industrial commissioner of the Erie, the New York, Susquehanna & Western, the New Jersey & New York, and the Chicago & Erie, and H. M. Andrews has been appointed general land and tax agent, succeeding Harrison Williams, resigned, both with headquarters at New York.

OBITUARY.

George E. Chase, Southwestern passenger agent of the Chicago, Milwaukee & St. Paul at Kansas City, Mo., died on May 3, aged 45 years.

G. Asheton Carson, president of the Catawissa Railroad, a subsidiary of the Philadelphia & Reading, died recently at Philadelphia, Pa., at the age of 66.

Maurice Dunnean, roadmaster of the Chicago, Rock Island & Pacific, at Goodland, Kan., was killed when a work train was wrecked near Colby, Kan., on May 1.

J. C. McCabe, general freight agent of the Chicago, Rock Island & Gulf, with headquarters at Ft. Worth, Tex., died in that city on May 3, aged 61 years. He began railway work in 1876 and had been connected with the Rock Island system since 1881, successively as traveling freight agent, commercial agent and second assistant freight agent of the Chicago, Rock Island & Pacific, general freight agent of the Chicago, Rock Island & Texas, and since December, 1903, general freight agent of the Chicago, Rock Island & Gulf.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

THE VANDALIA has ordered 4 Pacific type locomotives from the American Locomotive Company.

THE SOUTHERN PACIFIC has ordered 5 mikado locomotives from the Baldwin Locomotive Works.

THE SEABOARD AIR LINE, mentioned in the *Railway Age Gazette* of May 2 as having ordered 40 Pacific type locomotives from the American Locomotive Company and 5 switching locomotives from the Baldwin Locomotive Works, has ordered 35 freight Pacific type locomotives and 7 passenger Pacific type locomotives from the American Locomotive Company, and 5 switching locomotives and 1 dummy motor from the Baldwin Locomotive Works.

THE ATLANTA & WEST POINT has ordered 2 Pacific type locomotives and 1 six-wheel switching locomotive from the American Locomotive Company. The Pacific type locomotives will be equipped with superheaters and will have 24 in. x 28 in. cylinders, 73 in. driving wheels, and in working order will weigh 257,000 lbs. The six-wheel switching locomotive will have 19 in. x 24 in. cylinders, 52 in. driving wheels and in working order will weigh 119,000 lbs.

THE BESSEMER & LAKE ERIE has ordered 8 consolidation locomotives and 4 Pacific type locomotives from the American Locomotive Company, and 2 consolidation locomotives from the Baldwin Locomotive Works. The eight consolidation locomotives will have 22 in. x 30 in. cylinders, 54 in. driving wheels and in working order will weigh 205,000 lbs. The Pacific type locomotives will be equipped with superheaters, will have 24 in. x 28 in. cylinders, 73 in. driving wheels and in working order will weigh 232,000 lbs.

THE NEW YORK CENTRAL LINES have ordered 35 mikado locomotives, 33 Pacific type locomotives, 23 eight-wheel switching locomotives, 20 six-wheel switching locomotives and 3 Mallet (0-8-8-0) locomotives from the American Locomotive Company, and 10 six-wheel switching locomotives from the Baldwin Locomotive Works. These locomotives will be allotted as follows: New York Central & Hudson River, 20 Pacific type locomotives; Lake Shore & Michigan Southern, 20 eight-wheel switching locomotives, 5 Pacific type locomotives and 3 Mallet locomotives; Michigan Central, 25 mikado locomotives, 20 six-wheel switching locomotives, 8 Pacific type locomotives and the 10 Baldwin switching locomotives; Cleveland, Cincinnati, Chicago & St. Louis, 10 mikado locomotives; Toledo & Ohio Central, 3 eight-wheel switching locomotives.

CAR BUILDING.

THE CHARLOTTE HARBOR & NORTHERN is in the market for 35 phosphate cars.

THE HAVANA CENTRAL has ordered 50 gondola cars from the Pressed Steel Car Company.

IRON AND STEEL.

GENERAL CONDITIONS IN STEEL.—The steel companies are receiving new business at the rate of between 75 and 80 per cent. of actual production. A further reduction in the volume of unfilled tonnage in the current month is therefore expected unless the buying movement shows a decided improvement within the next two or three weeks. As the mills are still operating at almost their full capacity, the steel manufacturers are not disposed to make any reductions in prices to stimulate the buying movement. Consumers are holding off in expectation of lower prices when a large percentage of the orders now on the books has been worked off. The orders on the books at present are sufficient to keep the mills operating at their present rate for the next five or six months. The earnings in the current quarters should be larger than in the first quarter, as the average price on steel deliveries will be slightly higher.

Supply Trade News.

The Standard Coupler Company, 2 Rector street, New York, has moved its general offices to 30 Church street, New York.

George W. Craven, manager of the Chicago office of the C. & C. Electric Company, New York, has been made manager of the welding department of that company, with headquarters at Garwood, N. J., succeeding George A. Hills, resigned.

The firm of Burton W. Mudge & Co., railroad supplies, of Chicago, has changed its name to Mudge & Company, railroad specialties, and the general offices in Chicago have been removed from the Peoples Gas building to the Railway Exchange.

W. S. Murray has resigned as electrical engineer of the New York, New Haven & Hartford, and has formed a partnership with E. H. McHenry, who recently resigned as vice-president of the New Haven, under the firm name of McHenry & Murray, engineers. The firm will specialize in railway electrification work, including plans, estimates, construction and operation, and will handle work of this character for the New Haven.

The Davis Brake Beam Company has been formed by H. H. Weaver, of Johnstown, Pa., and his associates, and has taken over the control of the Davis Solid Truss Brake Beam Company, Wilmington, Del., maker of the Davis solid truss brake beam, pressed steel journal box lids and other railroad specialties. As soon as a suitable site is secured, the works will be brought to the Pittsburgh district, possibly some place near Johnstown. The new plant will be considerably larger than the present one. F. R. Weaver is manager.

Adolphus Bonzano, pioneer bridge builder and inventor of the Bonzano rail joint and other railroad appliances, died at his home in Philadelphia, Pa., on May 5, at the age of 83. His death was directly attributable to a serious fall sustained by him about two months ago. Mr. Bonzano was born at Ehingen, Germany, on December 5, 1830. He received a classical and engineering education, both at Ehingen and at Stuttgart, Germany. In 1850 he went to Philadelphia, Pa., to perfect himself in the study of the English language. In 1851 he went to Springfield, Mass., where for the following four years he served as apprentice, machinist and draftsman for the American Machine Works. In 1855 he went to New Orleans, La., to take charge of the erection of engines and other machinery. After a short time he went to Detroit, Mich., where he was engaged until 1860 as superintendent of the Detroit Dry Dock Iron Works, which was later transformed into the Detroit Bridge & Iron Works, one of the earliest bridge building plants in this country, of which Mr. Bonzano, was appointed superintendent of construction. In 1868 he went to Phoenixville, Pa., where with Thomas Curtis Clarke and others, he formed the firm of Kellogg, Clarke & Company, bridge builders. Mr. Bonzano was a member of this firm and also chief engineer. In 1870, the firm was succeeded by Clarke, Reeves & Company, Mr. Bonzano continuing as chief engineer. In 1884 this firm was dissolved and was succeeded by the Phoenix Bridge Company, of which Mr. Bonzano was made vice-president and chief engineer. In 1893 he resigned this position and opened an office in New York with T. C. Clarke as consulting engineers. After the death of Mr. Clarke in 1898, Mr. Bonzano retired from active business to devote himself to the invention of railroad and other appliances. Among the most prominent bridges designed by Mr. Bonzano are the Pecos viaduct on the Southern Pacific in Texas, the Kinzua viaduct on the Erie and the Chesapeake & Ohio bridge at Cincinnati.

Adolphus Bonzano.

Railway Construction.

Alabama, Florida & Southern.—This road is now in operation from Ardilla, Ga., on the Atlantic coast line south to Malone, Fla., 15 miles.

Beloit, Clinton & Delavan Interurban.—An officer writes that contracts will be let soon to build from Beloit, Wis., northeast through Shopiere, Clinton, Allen's Grove and Darien to Delavan, 22½ miles. About one-half of the right of way has been secured. There will be two steel bridges about 100 ft. long, also a power house. The company has under consideration the question of constructing a dam to secure water power. Charles F. Lathers, Beloit, may be addressed.

Benewah Valley.—An officer writes that the plans call for building from a point on the Chicago, Milwaukee & St. Paul at St. Maries, Idaho, southwest to Desmet, about 25 miles. The prospects of building the line are good, but it has not yet been decided when contracts for the work will be let. Maximum grades will be 2 1/10 per cent., and maximum curvature 16 deg. Maurite I. Parker, St. Maries, may be addressed.

Canadian Northern.—An officer writes that a 4.15-mile spur is proposed to be built for the Manitoba Gypsum Company at mile 111.89 on the Oak Point branch in Manitoba. (April 18, p. 925.)

Chicago & Alton.—Work has just been started on some heavy grade reduction between Atlanta and Lawndale, Ill. The work includes the handling of about 1,000,000 cu. yds. of earth and will be done with company forces.

Clay Line.—Incorporated in Alberta, to build a railway from sec. 2, tp. 11, range 6, northerly to sec. 2, tp. 12, range 6, west of the 4th meridian, thence to Medicine Hat, Alta. The provisional directors include: H. O. Knowles, S. G. Bannan, L. Hunt, Medicine Hat.

Dominion North Western.—The Canadian government has incorporated this company to build from Regina, Sask., west to Tuxford, on the Canadian Pacific, thence to Red Deer, Alta., with a branch through Battleford, Sask., to Fort McKay. M. J. O'Connor, Ottawa, Ont., is interested in the project. (December 20, p. 1235.)

Houston & Texas Central.—Work on the cut-off building from Stone City, Tex., southwest to Giddings, about 40 miles, it is expected will be finished and the line opened for traffic in a few weeks. (September 20, p. 559.)

Intermarine Railway & Navigation Company.—An officer writes that the prospects of building this line are good and that bids will probably be let in the spring of 1914. The projected route is from a point near the head of Lake Winnipeg, Man., northeasterly 122 miles to a junction with the Dominion government railway to Hudson bay, at mile 191 from Pas. The company expects to use both steam and electricity for the motive power, and to develop a traffic in grain, timber, fish, furs and merchandise. W. S. Boyd, acting secretary, 715 Somerset Block, Winnipeg. (April 25, page 973.)

Lehigh Valley Transit Company.—This company is planning to construct cut-offs and make other improvements to reduce the running time from Allentown, Pa., to Philadelphia. Bids have just been asked for double-tracking a 14-mile section from Lansdale north to Soudertown. Work is now under way on the construction of the $500,000 high-level concrete bridge to connect Allentown with South Allentown. It is expected that the bridge will be ready for operation some time during this coming fall.

Lorain, Ashland & Southern.—This company has given a contract to McArthur Bros. for the completion of the 65-mile line from Ashland, Ohio, to Custaloga on the Ft. Wayne line of the Pennsylvania Railroad, with a belt line 8½ miles long in Lorain. The contract is for a section of 23 miles. The remaining 42 miles is already in operation. Bonds will be issued to cover the cost of the new construction, which it is expected will be finished by October 1. Joseph Ramsey, Jr., president. (January 10, p. 87.)

Menzies Bay Railway.—This company, which is a subsidiary of the Ross McLaren Lumber Company, Vancouver, B. C., pro-

pose to build a railway on Vancouver Island, to open up its timber lands.

NEW YORK CENTRAL & HUDSON RIVER.—An officer writes that grading work is now under way for five miles of double track on the Pennsylvania division near Lawrenceville, Pa. It is expected that the track laying will be carried out in July.

NORTHERN PACIFIC.—According to press reports surveys have been made for a line from East Grand Forks, Minn., north to Drayton, N. Dak.

OREGON ELECTRIC.—An extension of this road from Gray, Ore., west to Corvallis, 5 miles, has been opened for business.

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—An officer writes that the Oregon Eastern, on which work was started some time ago, has track laid on 36.73 miles of the first section of 80 miles building from Vale, Ore., west. The Utah Construction Company, Ogden, Utah, has the contract. The plans call for building from Vale via Harper, Junctura, and Riverside to Arden, 140 miles; from Arden west to Odell (or Crescent), 147 miles additional has been located. There will be 19 steel bridges having a total length of 4,835 ft. and 72 trestles, also two tunnels to have a total length of 2,618 ft. At Harper a station is to be built. (See Oregon Short Line, January 19, 1912, p. 132.)

OREGON EASTERN.—See Oregon-Washington Railroad & Navigation Company.

PEORIA, CANTON & GALESBURG.—Incorporated in Illinois with $2,000,000 capital stock. The plans call for building from Peoria, Ill., west to Farmington, 25 miles, and thence northwest to Galesburg, an additional 25 miles. The directors include J. A. Lyon, H. Clark, W. B. Coleman, G. C. Powers and G. T. Page.

PRYOR-SALINA & EASTERN (Electric).—We are told that a line will be built from Pryor creek, Okla., east to Salina and to Locust grove, about 22 miles, but it has not yet been definitely decided when contracts will be let. There will be one steel bridge. The company expects to develop a traffic in hay, fruit, farm and dairy products. J. A. Quinn, Pryor, is the promoter. (See Oklahoma Roads, May 2, p. 1013.)

SAN ANTONIO, UVALDE & GULF.—The Pleasanton, Campbellton sub-division has been extended from Campbellton, Tex., to Whitsett, 8.2 miles. (April 11, p. 863.)

SAN LUIS CENTRAL.—An officer writes that the plans call for building from Monte Vista, Colo., north to Center, 12 miles. A grading contract has been given to A. H. Smith, Pueblo, Colo., and the work is now under way. Track has been laid on one mile. There will be about eight small bridges and several culverts. The R. E. McGiegar Construction Company, Monte Vista, are the engineers. The plans include building a station and a roundhouse. The company expects to develop a traffic in sugar beets, potatoes, live stock and other farm products.

TEXAS ROADS (Electric).—Financial support is said to have been secured to build a line from Texarkana, Tex., west via New Boston and DeKalb to Clarksville, about 60 miles. F. W. Offenhauser and associates of Texarkana are back of the project.

ULSTER & DELAWARE.—The right of way of the line between Cold Brook, N. Y., and Stony Hollow, about 14 miles, having been taken by the State of New York for the New York City water supply, the line of the railroad has been relocated to the northward. The relocated line will be put in operation June 1; with the following new stations: Woodstock, 10.15 miles from Kingston Point, and Ashokan, 16.17 miles from Kingston Point. The stations abandoned are West Hurley, Olive Branch, Brown's, Brodhead's Bridge, Shokan and Boiceville.

VIRGINIA-CAROLINA.—An officer writes that contracts were to be let on May 5, and the work started at once on a 40-mile extension in addition to the 8 miles for which a contract was let in December of last year to the Callahan Construction Company, Knoxville, Tenn. The plans call for building from a point in Washington county, Va., near the mouth of Green Cove creek, southeast through Ashe county, N. C., to Jefferson, thence southwest to Todd. The company expects to develop a traffic in lumber, iron ore and fruit. (April 25, p. 974.)

VIRGINIA ROADS.—An officer of the Lyndhurst Lumber Corporation, Richmond, Va., writes that work is under way on a line from Lipscomb, Va., on the Norfolk & Western southeast via Sherando to a point beyond that place. The company is carrying out the work with its own men, and about 2.75 miles of track has been laid. G. S. Briggs, president.

WATERLOO, CEDAR FALLS & NORTHERN (Electric).—An officer writes that the company is building from Waterloo, Iowa, to Urbana in the same state, and 17 miles of this line between Waterloo and LaPorte City has already been constructed and is now in operation. The 20 miles from LaPorte City to Urbana is under construction, and the company expects to lay track on this section during July and August. R. A. Elzy, Marshalltown, has the contract for the grading work. The Gould Construction Company, Davenport, has the contracts for wooden and concrete bridges and the Sims Wet Process Concrete Company, Cedar Falls, has a contract for the fencing. The track laying is being carried out by the company's men. The first 24 miles is along the Cedar river valley; the maximum grade being .3 to 1 per cent., and on the balance of the line it will be 1 per cent. equated for curvature. The grading work involves handling about 15,000 cu. yds. a mile, about 4 miles of the line being rock work. The maximum curvature is 5 deg. There will be about 17 creosoted ballasted deck pile trestles, 20 concrete bridges and culverts, varying from small box culverts to a nine span concrete arch bridge 630 ft. long over the Cedar river. The company has finished work on a six span arch bridge 420 ft. long over the same river near Waterloo. The most important station is at LaPorte City, and other station buildings include brick structures, 22 ft. x 100 ft., containing sub-station, office, waiting and freight rooms. (November 29, p. 1064.)

RAILWAY STRUCTURES.

ALLENTOWN, PA.—See Lehigh Valley Transit Company under Railway Construction.

BLOOMINGTON, ILL.—The Chicago & Alton has appropriated $987,000 for the erection of new shops at this point. This is in connection with an extensive program of improvements at Bloomington, a part of which has already been completed. A roundhouse and additional yards have been built, a passenger station is now under construction, and additional yard tracks are contemplated.

SUDBURY JUNCTION, ONT.—An officer of the Canadian Northern Ontario writes that contracts have been given to Foley Bros., Cincinnati, Ohio, for the concrete substructures, and to the Canada Foundry Company, Toronto, Ont., for fabricating and erecting the steel superstructures of the following deck plate girder bridges: Over first crossing of Goose river, 80-ft. span, to cost $14,080; second crossing of the same river at mile 171.7 from Sudbury Junction, two 60-ft. spans, to cost $14,128; Kabinakagami river at mile 286, one 40-ft., one 50-ft., and three 70-ft. spans, to cost $37,950, and over Little Jackfish river, half-through girder, 63-ft. span, to cost $12,511. The paint used on the bridges was: Shop coat, Sherwin Williams' Metallastic brown, and field coats, Wasatch structural. (February 21, p. 374.)

TORONTO, ONT.—An officer of the Canadian Pacific writes that in connection with the grade separation work at North Toronto, the company is building a five track viaduct about three and a half miles long, including new terminals, etc. At the present time five subways are under construction by contract, and five additional subways will probably be under construction soon, also the erection of the new union station at Yonge street. The work is being carried out jointly for the Canadian Pacific and the Canadian Northern. (March 7, p. 461.)

VAN BUREN, MAINE.—Application is being made to the Canadian parliament to vest in the Van Buren Bridge Company, which has been incorporated in the state of Maine, the charter rights of the Restigouche & Western Railway (now the International Railway of New Brunswick), to build a bridge over the St. John river, between St. Leonards, New Brunswick, and Van Buren, Maine. A. E. McKenzie, Campbellton, N. B., is solicitor for the applicants. (January 24, p. 191.)

WATERLOO, IOWA.—See Waterloo, Cedar Falls & Northern under Railway Construction.

Railway Financial News

Ann Arbor.—J. S. Bache & Company, New York, and others have purchased $750,000 one year 6 per cent. notes dated May 1. These notes are secured by $1,250,000 5 per cent. extension and improvement bonds and by 465 steel-underframe box cars and other property. The proceeds of the notes were used to retire $600,000 notes and $23,000 equipment obligations due May 1, and the remaining $127,000 will be used for general purposes.

Boston & Maine.—The directors have postponed until June any action regarding a dividend on the common stock.

Canadian Northern.—This company and its subsidiary, the Canadian Northern Branch Lines Company, will on June 2 apply to the Canadian railway commission for a recommendation to the governor general for the sanction of the amalgamation of the two companies.

Canadian Northern Branch Lines Company.—See Canadian Northern.

Cassville & Western.—This property will be sold at auction in Cassville, Mo., on May 17; upset price $45,000. The road runs from Cassville to Exeter, Mo., 4½ miles.

Denver & Salt Lake.—See Denver, Northwestern & Pacific.

Denver, Laramie & Northwestern.—Judge Allen in the district court on April 17 denied the petition of the Electrical Properties Company for an injunction restraining the sale of $254,000 of the company's bonds deposited as collateral. The court stated that the company may soon be solvent and the interests of the stockholders and bondholders should be protected.

Denver, Northwestern & Pacific.—This property was sold to the reorganization committee for $3,000,000, the upset price, at the foreclosure sale in Denver on April 28. It has subsequently been turned over to the new company, the Denver & Salt Lake.

Erie.—Application will soon be made for permission to issue $5,000,000 equipment certificates.

Grand Trunk Pacific.—This company recently offered in London £2,000,000 ($10,000,000) 4 per cent. debenture stock at 87 through Glyn, Mills, Currie & Company. This stock ranks on an equal basis with the £5,136,980 ($25,684,900) 4 per cent. debenture stock outstanding.

Hudson & Manhattan.—Application will be made to the New York Public Service Commission, First district, for permission to make two proposed mortgages, one to the Central Trust Company, New York, as trustee, to be known as the first lien and refunding mortgage, and the other to the Guaranty Trust Company, New York, as trustee, to be known as the adjustment income mortgage. The first lien and refunding mortgage is to secure a bond issue not exceeding $65,000,000, and the adjustment income mortgage is to secure an issue of bonds not exceeding $33,574,000. All of the adjustment income bonds and $37,035,000 of the first lien bonds are to be issued at once. The proceeds will be used to acquire $67,148,000, 4½ per cent. first mortgage bonds and for general purposes.

Interborough Rapid Transit.—An extra dividend of 2 per cent. has been declared on the stock.

Laramie, Hahns Peak & Pacific.—The bondholders protective committee, of which Alexander J. Hemphill is chairman and Lewis B. Franklin, 140 Broadway, is secretary, has issued a circular dated April 24, 1913, urging the holders of the first mortgage bonds, not to deposit such bonds with any committee at present, but to approve an issue of $315,000 receivers' certificates which shall be a first lien on the entire property. The funds which would be derived from this sale are urgently needed for current expenses, new equipment, etc. If this permission is not given, application will be made to the circuit court of appeals, which, in the opinion of the committee's counsel, has power to make these certificates a first lien ahead of all other mortgages, in spite of any objections that may be made. The circular points out that the opposition of the holders of the first mortgage bonds to this issue would only result in a delay of about one year in the issuance of the certificates. The committee will purchase the coupons for interest due January 1, 1913, on all first mortgage bonds, the holders of which consent to this issuance, and also agrees that the coupons so purchased shall be made subordinate in lien to the lien of all future maturing coupons and to the lien of the principal of the bond.

Louisville & Nashville.—Brown Bros. & Company and Potter, Choate & Prentice, both of New York, have sold $6,500,000 equipment series A 5 per cent. certificates at par. These certificates are dated June 1 and will mature in semi-annual installments of $325,000 each from December 1, 1913, to June 1, 1923, inclusive. They are secured by equipment costing $7,226,420.

Pennsylvania Railroad.—See West Jersey & Sea Shore

Pere Marquette.—The U. S. circuit court of appeals for the sixth circuit on April 29 affirmed an order made by the U. S. district court at Detroit in May, 1912, authorizing an issue of $3,500,000 receivers' certificates. The sale of the certificates has not yet been arranged.

Southern Pacific.—See Union Pacific.

Union Pacific.—The Supreme Court on May 5 extended the time in which this company was to dispose of its Southern Pacific stock from May 12 to July 1, thus only partly complying with the request of the Union Pacific attorneys for an indefinite extension of time.

Wabash.—The receivers, acting under the instruction given by Judge Adams in the federal court at St. Louis on April 26, made no provision for the principal or interest of the $5,000,000 4½ per cent. notes due May 1. The committee representing a majority of this issue calls for the deposit of the notes with May coupon attached at U. S. Mortgage & Trust Company, New York. The committee consists of John W. Platten, chairman; Otto T. Bannard and Henry R. Ickesheimer and Calvert Brewer, 65 Cedar street, New York, secretary. The committee has arranged with the depositary to advance to depositing note holders who desire it, the amount of the interest coupon due May 1, 1913.

West Jersey & Sea Shore.—The stockholders have approved the 999 year lease of the property to the Pennsylvania Railroad, that company guaranteeing 6 per cent. dividends on the outstanding stock of the West Jersey & Sea Shore. The lease will take effect July 1, 1913.

Railway Concessions and Speculators in Argentina.—There will be no more railway concessions granted in Argentina to irresponsible speculators—that is to say, to that vast number of individuals who have applied for and been granted concessions for lines which they never had the remotest intention of constructing. The idea has been to put up to a fictitious value the land through which the supposed railway would pass; and therein lies the rich profit of the Argentine speculator. From first to last within the past few years the congress has, upon the recommendation of successive ministers of railways, granted over one thousand different concessions to this undesirable class of exploiter.

Indian Railway Troubles.—The Indian government has been blamed for the late period of the financial year, when the sums allotted to various works are finally determined. This makes it difficult to spend the money in time as far as major orders for materials are concerned. But agents in India, through whom the orders are sent for the great variety of minor articles required on railways, complain that officers leave their orders to the last moment, and then pester the agents with complaints for late deliveries—oblivious, apparently, that their urgent commands are not the only urgent ones that have to be fulfilled by the home manufacturers. This same foresight would remove many of the complaints of car shortage from shippers. If only they would lay in a stock of coal, instead of ordering it in driblets, they would not be disappointed in their deliveries when the railways require their cars to carry wheat and other commodities which pay higher rates, and which, moreover, are perishable.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies .....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 10,200 copies were printed; that of those 10,200 copies, 8,746 were mailed to regular paid subscribers and 350 were provided for counter and news companies' sales; that the total copies printed this year to date were 174,159—an average of 8,708 copies a week.

Volume 54. May 16, 1913. Number 20.

CONTENTS

*Illustrated.

THE maintenance of a certain device on a locomotive costs 2.6 times as much per mile on one road as it does on another in the same territory and operating under similar conditions. The design of the apparatus and the service to which it is subjected is much the same on both roads. On the one which has the low cost of maintenance the percentage of the cost charged to labor is about 80 per cent., and that to material about 20 per cent. On the other road the labor charge is approximately 35 per cent., and the material charge 65 per cent. The conclusion is obvious. The first road watches its equipment closely and adjusts or repairs the various details as soon as they show signs of wear or failure; the other road lets things go until it is almost impossible to operate the locomotives without repairing them. A superintendent of motive power was criticized because his locomotives looked so much better than those of his neighbors, the inference being that he wasted money to keep them clean. Investigation showed that his unit costs were lower than those on the other roads—apparently because in keeping the locomotives clean and neat defects were discovered and remedied before they reached a serious stage. It is a short-sighted policy that will permit a piece of equipment, known to be in defective condition, to run until it actually fails, possibly causing a tie-up on the road, and costing many times what it would to have maintained it in good condition.

A LETTER, commenting on the work of the government safety appliance inspectors, was published in our issue of February 7, 1913, page 237, in which the following statement was made:

"Recently the equipment in the yards of a western railway was inspected by a government safety appliance inspector. The inspection occupied one hour and was finished at 9 a. m. After it was completed the inspector was asked if he intended to inspect the equipment in the yards of another railway located in the same town, and about fifteen minutes' walk from the yards in which the inspection had just been made. He replied that the inspection of one yard was considered a day's work in government service, and that no inspector went over more than one yard in one day; he would, therefore, save the other yard for another day's work."

This letter was sent to us by a correspondent on a western road with the understanding that his name should not be used in connection with it. The letter was used as copy for the printer and has since been lost, or destroyed, together with other copy, which it is our practice to hold for only a week or two after the date of publication. The Interstate Commerce Commission has asked us to furnish it with the name of the writer of the letter or of the inspector referred to. This we are unable to do. We, therefore, take this opportunity of complying with the following request of the commission: "The commission feels, however, that you should either furnish the name of the writer of the article or that of the inspector, or else publish in the *Railway Age Gazette* a statement to the effect that when the commission called attention to this article and asked for the name of the writer that the party in question refused to make his name known or to furnish the name of the inspector involved, thus affording the commission no opportunity whatever of proving or disproving the charges made by him, such statement to be given the same publicity as was the article which has resulted in this correspondence."

ILLINOIS is one of the states which still have no anti-pass law. An anti-pass bill is now pending in the state legislature. Doubtless the railways of Illinois should have combined to stop the giving of state passes before this. There are two reasons why they have not done so. One is that so long as the giving is not illegal there will always be a few railway men who will be disposed to continue it in the hope that it will have some tendency to mitigate the severity of railway regulation. The second reason is that as long as the issuance of passes is legal many legislators and other public officials will insist on having them and will resort to all sorts of blackmailing devices to get them. In many cases they obtain them not only for their

own use, but that of others. The story is told of a certain representative of the people of Illinois who a short time ago gave a card party at which the prizes were passes over different railways. The issuance of passes costs the railways a good deal of money. Of much more importance is its demoralizing influence on public affairs. There is an impression that railway officers are opposed to anti-pass legislation. This as to most railway officers is entirely erroneous. The giving of passes is far less frequently an attempt on the part of the railways at improper influence than a successful attempt on the part of those who receive them at blackmail. However, regardless of who wants to give passes or who wants to get them, their issuance for any purpose or to any class not specified in the Interstate Commerce Act ought to be prohibited by statute in every state. In fact, probably the exceptions in the Interstate Commerce Act itself are too broad and numerous. This corrupting and debasing influence ought speedily to be forever removed from our commerce and politics.

SOME extremely insignificant cases are submitted to the Interstate Commerce Commission, and yet it is its duty to treat such cases as though they were of real significance, to carefully weigh the evidence and to have the decisions printed and distributed broadcast. On another page is abstracted a decision dismissing a complaint in which the complainant sued for a refund of certain drayage charges amounting to $2.50. No precedent was involved which would have a bearing on future outlays of a similar nature, and the injustice of the complaint would be palpable to any school boy. The commission is now performing an invaluable service to the country by handing down decisions in an ever-increasing number of important cases. It is compelled to work at high pressure, and any time spent on cases such as the one above mentioned represents a total loss. The commission's time is valuable and should be jealously guarded. The common courts, through long experience, have found it necessary to protect themselves against absurd suits by charging the loser with costs, but where a complainant before the Interstate Commerce Commission retains its own counsel at an annual salary, the cost of a suit is practically nil, so there is nothing to deter him from filing a complaint, however unreasonable. The commission is essentially a free court, but it should be protected from abuse. The plan for deputy interstate commerce commissioners, outlined in the *Railway Age Gazette* of April 25, page 951, would shield the commission from all save the weightiest cases, but does not provide for the exclusion of obviously unreasonable complaints. Hitherto the number of such cases before the commission has not been large, but it is likely to grow, and the sooner this growth is checked, the better. Though it would not be desirable to make losers of bona fide cases pay the cost, there should be some provision for summarily dismissing unworthy complaints without printed reports, for printed reports in cases of this nature seem to dignify them beyond their just desert. It might also be found advisable to impose fines upon such complainants, leaving it to the commission to decide which cases should be treated in this manner.

THE state's attorney at Bridgeport, Conn., who secured the indictment of President Charles S. Mellen of the New York, New Haven & Hartford on a charge of manslaughter in connection with the derailment which occurred at Westport on that road, last October, announces that the trial will be begun May 27, and that "it will be finished in less than three weeks." Such a trial would be an outrage. The indictment itself is an outrage; but mere indictments are reported so frequently that the spectacle of innocent persons stigmatized by "true bills" has become too common to attract much notice. An indictment is an easy means by which a prosecuting officer, when worried, excited or actuated by political motives, can appease public sentiment until the public—and he, himself—can cool down. No sane magistrate or attorney expects to promote justice by prosecuting a railway president for manslaughter when an engineman makes a mistake. The "friends of the people" who are simultaneously investigating, prosecuting and persecuting Mr. Mellen could be granted all their contentions in this case—that the officers of the road ought to have provided different crossovers, or fireproof cars, or should have had a better qualified engineman, etc.—and still they would have no sufficient ground for the manslaughter charge. The connection between the accident and the causes alleged is so slight and ill-defined that no case could be made which would convince a reasonable jury; for reasonable criminal convictions are based on direct and proximate, and not on utterly indirect and remote causes. Moreover, criminal trials of this sort which have produced any good result are so hard to find that their value, even in the abstract, is very doubtful, if not entirely lacking. Even if it were admitted, for the sake of argument, that a prison sentence would be a just punishment for the railway president who does not follow the acts of his vice-president, general manager, general superintendent, division superintendent, trainmaster or roadmaster and inspector, in sufficient detail to know when a mistake was made in choosing or training a locomotive runner, or in laying tracks, or in issuing speed regulations, there would still be two important questions to answer: (1) whether courts ever impose punishments on a basis like this in other affairs, and (2) whether any useful remedial results have ever been secured by criminal prosecutions for railway disasters due to high speed. With no exceptions of importance, the answers to both would have to be in the negative. A president is, indeed, responsible for the general policy of his company, but no evidence at all has been produced to substantiate the loose claims that the Westport wreck was due to any fault of general policy—unless it be the opinion of Inspector Belnap relative to short crossovers, full stops and automatic train stops, which is without backing from any real engineering authority. The fact is that Mr. Mellen must be tried in Connecticut for causing a collision, just because the accident happened at a time when he was being blamed for problematical freight-rate sins in Rhode Island; and that is not in the interest of good government. What would be the verdict of the ordinary jury if an engineman, a member of a labor union, were tried for manslaughter in a case like this, even though the accident were directly due to failure on his part to obey the rules or orders of his superiors? Judging from the past, the sympathies of the jurymen would set him free. The present prosecution is too plainly actuated by politics, or vindictiveness, or both.

SOME DISPUTED POINTS IN RAILWAY VALUATION.

1.—Right of Way.

THE valuation of railway properties as a basis for rate regulation and taxation has come into great prominence within late years. The agitation of the matter has culminated in the recent passage by Congress of the law providing for a valuation of the railways of the entire country. This action has made the subject one of great importance. Railway officers are confident that the valuation, if fairly made, will prove a means of convincing the public that the railways as a whole are not, as so often charged, over-capitalized. At the same time great care must be taken to see that the work is properly and thoroughly done along lines which will be sustained in the courts.

In the field of the public utilities, enough valuations have been made to enable many of the underlying principles to be established, either by general agreement or by decisions of the courts. Because of the much more limited number of railway valuations that have been made there is a much wider divergence of opinion among both railway men and regulating

authorities regarding many of the important principles and methods.

Six states, Michigan, Wisconsin, Minnesota, Washington, South Dakota and New Jersey, have completed valuations of the railways within their borders since 1900, while Nebraska and Kansas are at present making them. Massachusetts has also made a valuation of the properties of the New York, New Haven & Hartford, while Washington has made a separate valuation of the Spokane & Inland Empire System. The purpose of the valuations in Minnesota, Washington, South Dakota and Nebraska has been the regulation of rates. The New Haven valuation in Massachusetts was made to determine the reasonableness of the capitalization of that road. In Wisconsin the valuation has been used for both taxation and rate regulation. In some few cases the railways themselves, in connection with rate cases, have made valuations in a thorough manner, while in others they have made what have been little more than inventories of their physical properties.

The degree to which the purposes of the valuations have influenced the methods adopted is more or less problematical, but the fact is that wide differences of opinion exist as to the bases on which valuations should be made. One of the most important of these differences of opinion relates to the way that right of way should be appraised. Two prominent conditions have to be considered, the appreciation of railway property in common with other land, especially at terminals, and the greater expense incurred by railways than other purchasers in securing land. The railways have acquired land by gift, by purchase in the ordinary way and by condemnation. Some economists and regulating authorities take the position that the appraisal of land should be based on its original cost to the railway. The question of what weight should be given in a valuation to the increase in the value of a railway's land was raised by the Burlington in the Western rate advance case. Commissioner Lane, in the commission's opinion in that case, did not directly say that the full increase in value of the land should not be considered, but did strongly intimate that it ought not to be. In the valuation in Minnesota the state commission prepared two land appraisals, one showing what it would cost the railways to acquire property for railway purposes at the time of valuation, and the other what it would now cost to acquire it for other than railway purposes, the former being practically $32,000,000, or 1.77 times greater than the second. The commission favored the latter, or present value of the land for general commercial purposes. In New Jersey the valuation was made under an old taxation statute which stipulated that the value of the land be considered without any reference to its use, any additional value arising out of its use for railway purposes being included with intangible values. In Michigan, Washington, Wisconsin and Nebraska, comparisons of large numbers of purchases by railways and by private parties alongside railways were made and the ratios of these purchase prices were applied to the railway right of way, these ratios varying from 15 per cent. in cities in some instances to as high as 1,000 per cent. in rural districts where the value of the land for farming purposes was low. In the Minnesota rate case Judge Sanborn, of the United States Circuit Court, overruled the Minnesota commission, and held that the valuation should have been based on what it would now cost the railways to acquire the land for railway purposes.

The extent to which property held for future use should be included in an appraisal is undetermined. Nearly all roads have acquired property for future development which is at present not essential for the operation of the road, but which may be in future. In Washington all land not likely to be used for railway purposes in the near future was eliminated from consideration, and in this way property belonging to the Northern Pacific and valued at over $15,000,000 was excluded. Similarly, in Nebraska where the Union Pacific owns a right of way 400 ft. in width nearly across the state, the commission has included only a width of 200 ft. in its valuation.

How important is this question of the proper way to appraise land values is indicated by a statement regarding a single road, the Burlington, which was made by the Interstate Commerce Commission in the Western rate advance case. "Out of the difference between the original investment of $258,000,000 and the estimated present value of $530,000,000 it has been estimated that the increase in land values amounts to approximately $150,000,000." The estimated increase in land value was over $15,000 a mile for the entire property.

THE CHANGE IN PUBLIC SENTIMENT IN THE SOUTHWEST.

THERE appears to be a slow but quite real change for the better in the public relations of the railroads in the southwestern states. The most marked change is in Texas. Not only was there no anti-railroad legislation enacted in that state last year, but one bill of a good deal of importance to some of the roads in that state—the bill permitting the merger of certain roads—was passed by the legislature over the veto of the governor. In Oklahoma a full crew bill was defeated, and in Missouri the prospects are good for obtaining a referendum vote on the full crew bill that was enacted by the Missouri legislature. This attitude towards full crew bills in the southwestern states is in marked contrast to the actions of the politicians in New York and New Jersey.

Credit for this more far seeing policy towards railroads in the southwest is due first of all to the Commercial Secretaries' Association of Texas. This body, with the best interests of their state clearly before them, and firm in their conviction, have fought popular prejudice and narrow self-interest, and have today achieved results that are in a considerable measure contributory towards the remarkable present prosperity of Texas.

The daily newspapers have also helped in the work of education. This is of importance, because the newspapers both lead public thought and are a reflection of it.

There is also a certain element among the orders of railroad employees who are frankly recognizing how closely identified their own interests are with the success of their employers. This is possibly more noticeable in Kansas than in Texas, but is a distinctly hopeful sign. The situation in regard to personal injury claims in the southwest is still unqualifiedly bad. Public sentiment towards claims brought by employees against railroad companies for alleged injuries is as lawless as that of the average traveler towards United States custom house declarations. About the only thing that the railroads can do is to spend time and money in making their equipment technically, as well as practically, safe and to keep watch on chronic injury-suffering employees and weed them out of the service.

The citizens of the southwest are free spenders, they know good service and are generally willing to pay for it; their homes are well built, their hotels far above the average, and when they go to Chicago or New York they demand and are not afraid to pay for the best. The attitude of Texans towards their railroads was not so much a contradiction of this appreciation of good service, as an anarchistic disregard for vested interest. As they themselves, however, acquire wealth their respect for property rights is increasing. There is also a growing understanding of the vital connection between all other property values and railroad property values.

Texas is prosperous to an extent never before equalled. Crop prospects are good, building in the cities is active to a remarkable extent, and all classes of people are sharing to a greater or less extent in the fruits of the development of the country. If, therefore, the change in the attitude towards railroad improvement and possible future profitable operation is a lasting change it may well be that business men as well as railroad men of the southwest have this further important basis for prosperity over and above good crops and high prices.

Letters to the Editor.

SLOVENLY WHISTLING.

Oakland, Cal., May 10, 1913.

To the Editor of the Railway Age Gazette:

I have read with interest the article on "Slovenly Whistling" in your issue of March 28. But alleviating the sufferings of the public is not the only issue. The proper use of the whistle signals as prescribed by the book of rules is also important. Their strict observance is a matter of safety, and yet less attention is paid to their frequent misuse than to any other infractions of the rules. The engineman should use judgment in sounding the whistle, taking into consideration the distance the sound is to be carried. Each blast should be as plain as print, with proper spaces between blasts; the longer the distance to be carried, the longer should be the space. The flagman whom he is calling in may be out around a curve behind a hill, and if the blasts are not properly spaced, the echo of one runs into the other, and what the flagman hears is one long blast of the whistle. If a flag is ordered out before the train comes to a stop, as frequently happens, if an unexpected stop is made, especially if on short time ahead of a superior train, the whistle signal for sending out a flag should again be clearly and distinctly sounded after the train stops. If it be a long train, or even one of moderate length, the grinding of the brakes, when applied, may prevent the flagman at the rear from hearing the first signal. If the signal is sounded before the train comes to a stop, it should always be sounded the second time. How frequently on a passenger train when the air-whistle signal has been sounded for the engineman to stop at the next station, the conductor hears one long blast, the result of improper spacing. A passenger train crew running with an engineman who habitually misuses whistle signals, might misunderstand or fail to heed a call, for brakes, should such a contingency arise. There should be a vigorous campaign on the proper use of whistle signals on every railroad in the country. Use the whistle as sparingly as is consistent with safety, but use it correctly. Despatcher.

FUNDAMENTALS OF WAGE PAYMENT.

New York, April 30, 1913.

To the Editor of the Railway Age Gazette:

In your issue of April 25 the very interesting article by Mr. Milner on the "Fundamentals of Wage Payment" treats the subject in an exceedingly able manner but omits some of the important fundamentals and makes one error of considerable weight.

Mr. Milner treats the subject from the standpoint of mathematics and pure logic, while other items must be considered. One very important one is the nature of the business. A method of wage payment that would be perfectly satisfactory on work performed exclusively by hand would be entirely unsatisfactory when applied to machine operations. The equipment necessary for carrying on an industry and the resulting burden charge is of vital importance and must be considered when determining methods of wage payment.

The human element and the vagaries of the human mind must also be considered, and the method of payment must appeal to the workman so that he is stimulated to steadily increase his output up to the maximum attainable. This element is at the foundation of the bonus methods of payment and is largely responsible for their success. For some strange reason the human being is so constituted that he will go after a time record where he will take a little interest in a mere money record. A workman will brag all over a shop that he "beat a schedule," whereas one seldom mentions making a large day's pay.

The neglect of the above considerations and the lack of knowledge of "all methods of wage payments" led Mr. Milner into the error of stating: "Under no system of labor payment does cost per unit of output regularly increase with increases in output or rate, but decreases in output."

One very large plant in this country whose burden charge far overbalances the labor cost uses a piece-work method wherein the price per piece increases with the output. The rate per piece increases within regularly defined limits as follows: 10, 10.5, 11.0, 11.5, 12.0 cents per piece and upwards. This method has proved very satisfactory from the standpoint of both the company and the workmen.

A number of concerns, both in this country and abroad, use a method of bonus payment which increases the cost per piece with increased output. The method used runs about as follows (using Mr. Milner's 10-hour and 30-cent rate):

Time.	Cost.	Rate.
10 hours	$3.00	$0.30
8 hours	3.20	.40
6 hours	3.60	.60

Here again the results obtained are satisfactory from every point of view. However, such methods would not prove at all satisfactory under different conditions and, as stated before, in determining methods of wage payment *all* the elements must be considered. C. J. Morrison,

Chief Engineer, Froggatt, Morrison & Co.

DESIGN OF UNDERFRAME FOR CARS.

Savannah, Ga., April 26, 1913.

To the Editor of the Railway Age Gazette:

Every once in a while some one attempts to show how to design a steel underframe for cars from a strictly theoretical standpoint, and to show that existing designs are too heavy and that better results with less weight can be obtained by a better, or more scientific distribution of metal.

As a matter of fact, the best designs of steel underframes have been deduced by a process of elimination and substitution based upon the repair track records. The earlier designs, produced from a strictly engineering standpoint, soon developed unexpected weaknesses, and showed a decided lack of a sufficient "factor of ignorance." The stresses which car underframes are subjected to under a severe impact do not readily yield to mathematical analysis, and it is the unfair usage of this nature that we must provide for in our design, and not the normal, measurable stresses.

The communication on page 786, of your issue of April 4, is interesting from a strictly engineering standpoint, but the design is not desirable from past experience. The metal in the center sills required for load and buckling in a vertical plane will be amply sufficient for all buckling stresses in a horizontal plane if the center sills, which are generally composed of two parallel members, have a riveted cover plate. This will not require any more material, if as much, as the diagonal bracing suggested, and involves much less labor in the assembling of the underframe. It is also much cheaper to repair in case of partial destruction in wrecks.

Referring to Fig. 5, the two diagonal compression members shown at the ends are of little or no use, other than bracing the car against a cornering blow. The buckling stresses from compression are distributed by the coupler to the draft sills, well back of the end sills in all types of well designed friction gear, unless in a collision, when the horn of the coupler may come solid on the end sill. Even under this condition, with the tying at the body bolster the center sills should be stiff enough to take a blow between end sill and body bolster that will shear the rivets in the draft sill splice, without buckling. A blow sufficient to shear the rivets at the splice is a destructive blow, and its effects should be dissipated before reaching the body bolster, the damage being confined to as small an area as possible to facilitate repairs. The diagram, to be consistent, and to provide for these conditions, should show compression struts in the panels immediately behind the body bolsters.

The best design of underframe is a matter of vital interest to all mechanical officers of railroads, as well as to car builders, and it would be of interest to have the opinion of others on this matter. F. F. Gaines,

Superintendent Motive Power, Central of Georgia.

MILEAGE OF RAILROAD BLOCK SIGNALED.

Government Report Showing Not Only a Large Increase in Mileage but Also Extensive Improvement in Details.

The Interstate Commerce Commission has issued its regular annual bulletin of block signal statistics showing the mileage of railroads thus operated on January 1, 1913. The length of road operated under the automatic block system was 22,218.8 miles, and under the manual system, 61,731 miles; total, both kinds, 83,949.8 miles. The details which make up these totals appear in Table No. 1, reproduced herewith.

In five cases considerable lengths of road are operated jointly by two companies, each company owning one of the main tracks. This makes a small fictitious increase in the aggregate mileage of the country.

The Seaboard Air Line operates its manual block system by telephones, not by telegraph, as was erroneously reported a year ago.

A comparison between the figures now published by the commission and those for the same date given in our own table,

printed December 27, page 1267, shows remarkable differences, the total length of road signaled, as shown in the table now published, being 6,000 miles greater than that in the earlier one; and yet, with the exception of a very few roads, for which we could not get accurate figures, all of the statistics in both tables are official. It will have to be assumed that a large mileage was put under the block system after December 15, when our information was gathered, and before January 15, when the reports were sent to the commission; or else that many inaccurate reports were made in one case or the other. That there has been some inaccuracy is indicated by the fact that the government statement shows for some roads a less mileage than was shown in ours.

We reprint the government statement because it contains more details than ours, and also because the government requires a good deal of collateral information, which should tend to make the whole more accurate.

The statement of the Missouri Pacific alone would account for 4,445 miles of the difference in the total mileage; but in addition to this there are large discrepancies in the statements of the Central Vermont, the Chicago, Peoria & St. Louis, the Cincinnati, Hamilton & Dayton and the St. Louis & San Francisco. Other roads on which the total now reported is considerably larger than appeared in our December report are: Atchison, Topeka & Santa Fe; Buffalo, Rochester & Pittsburgh; Chesapeake & Ohio; Chicago & Alton; Chicago, Rock Island & Pacific (St. Paul & Kansas City Short Line); Cumberland Valley; Delaware & Hudson; Louisville & Nashville; New York Central and the Wabash. The statements of the following roads show a smaller total than was shown in December: Baltimore & Ohio; Chicago & Eastern Illinois; Chicago & North Western; Chicago, Indianapolis & Louisville; Chicago, Milwaukee & St. Paul (Tacoma & Eastern 173 miles added); Copper Range; El Paso & Southwestern; Monongahela; New York, New Haven & Hartford; Pennsylvania Railroad; Queen & Crescent (Alabama Great Southern). The Minneapolis, St. Paul & Sault Ste Marie, reporting this year 1,420 miles operated under the manual block system, reported on January 1, 1912, about 1,000 miles more than that

The comparison of January 1, 1913, with January 1, 1912, shows a net increase of 7,540.1 miles of road block signaled, as follows

	Jan. 1, 1913.	Jan. 1, 1912.	Increase
Automatic miles of road	28,218.8	20,334.9	1,883.9
Manual	61,731.0	56,074.8	5,656.2
Total miles	83,949.8	76,409.7	7,540.1

The last preceding report showed a total increase in twelve months of 5,140.6 miles.

The bulletin contains a separate list of the increases on certain roads. In this list are the names of thirteen companies on whose lines there has been a decrease in the mileage of roads worked by the manual block system. Most of these items, but not all, show that automatic signals have been installed in place of the manual.

A table is given showing the length of road on which alternating current is used in signal operating circuits and in track circuits. A mileage considerably in excess of that reported one year ago is shown on four roads: Atchison, Topeka & Santa Fe; Cumberland Valley; Pennsylvania, and Southern Pacific. On the Pennsylvania lines east of Pittsburgh there is now a length of over two hundred miles of road (589 miles of track) on which alternating current is used for track circuits.

The list of roads, showing the mileage on each, where upper-quadrant, three-position automatic block signals are used, is considerably longer than last year. The mileage of road equipped with upper-quadrant signals has increased materially on the following 14 roads: Atchison, Topeka & Santa Fe; Buffalo, Rochester & Pittsburgh; Chicago & North Western; Chicago, Rock Island & Pacific; Chicago, St. Paul, Minneapolis & Omaha; Columbia & Puget Sound; Cumberland Valley; Delaware & Hudson; Erie; Boston & Albany; New York Central; Norfolk & Western; Pennsylvania; Michigan Central. The table showing this data seems to be imperfect, as two prominent roads which appeared a year ago as using upper-quadrant signals are now absent from the list.

The list of roads from which statements were received concerning new work proposed for the present year differs considerably from that which we published December 27. The following roads, with the mileage given, did not appear in our list: Atchison, Topeka & Santa Fe, 300; Central New England, 17; Central of New Jersey, 28; Missouri, Kansas & Texas, 105; Southern, 96; Wabash, 244. The Pennsylvania, including lines west of Pittsburgh, reports over 1,000 miles proposed new work; but from statements made in the announcement which was published in the *Railway Age Gazette*, it is to be assumed that a large part of this mileage consists, not of extensions of the block system, but of lines on which the automatic system is to be introduced in place of the manual.

The tables in the bulletin are accompanied by numerous foot notes containing explanatory matter. Most of these notes convey the same information that has been given in former years, and need not be repeated in this place. Light signals—signals which give their indications by lights of different colors and in which the engineman sees no moving part—are now in use on the Boston & Maine (in Hoosac tunnel); the Hudson & Manhattan; the Buffalo, Rochester & Pittsburgh (2 miles); the New York Central and the Pennsylvania.

A comparison of the totals shown in Table No. 2 with those

in the same table published one year ago, shows that the length of road equipped with exposed disk signals has decreased sixteen miles; that equipped with enclosed disks, 172 miles. Electro-pneumatic block signalling has been increased by 10 miles (70 miles of track). The increase in mileage of electric motor signals is 2,082 (3,732 miles of track). The total increase in length of *tracks* equipped with automatic block signals is 3,530 miles, of which all but 34 miles is classed "normal clear." The last column in Table No. 2 should be headed "number of block sections," not block stations.

Table No. 3, not reproduced, shows that in the operation of the manual block system, the use of the telephone has been largely increased, as follows:

	1913. Miles of road.	1912. Miles of road.	
Telegraph	38,106	37,417	Inc. 689 miles
Telephone	23,002	16,544	Inc. 6,458 miles

There is an increase of 303 miles in the length of road where electric bells are used in manual block signalling, the Great Northern reporting 293 miles thus worked. The Great Northern also reports 212 miles of line worked by the controlled manual system, with no track circuits. On the New York Central the length of road worked by the controlled manual system has decreased 115 miles.

The electric train staff is now used on 508 miles of track, to which may be added five miles of the double track line in the Hoosac tunnel where the train staff is used whenever it is necessary to run trains on either track in a direction opposite to the current of traffic.

Table No. 4, not reproduced, shows 18,069 miles of road on which the manual block system is used only for the protection of trains at the rear; that is to say, in the blocking operations on single track, an operator sending a train eastward from A to B does not go through the formality of asking B to protect the section from westbound trains. The principal items making up this 18,069 miles are: Baltimore & Ohio, 1,708 miles; B. R. & P., 312; Central Vermont, 402; C. & N. W., 187; C. B. & Q., 6,315; Missouri Pacific, 7,213; Michigan Central, 922; Wabash, 835.

The table giving statistics of the use of the telegraph and the telephone in the transmission of train orders shows a total of 155,690 miles of road on which the telegraph is used, a decrease of 13,710 miles from the total of the preceding year; and that the telephone is used on 68,097 miles of road, an increase of 9,513 miles over the total of the preceding year.

SLIDE VALVE SUCCESSFULLY USED ON SUPERHEATER LOCOMOTIVES.

In 1911 the Delaware, Lackawanna & Western received 15 large consolidation locomotives from the American Locomotive Company. These were fitted with slide valves and were designed for a working steam pressure of 170 lbs. per sq. in., and a tractive effort of 51,400 lbs., thus necessitating the use of comparatively large cylinders, 26 in. x 30 in.; in spite of the fact that these and very carefully lagged to prevent heat losses the amount of condensation was considerable. To overcome such losses and effect a greater economy in operation it was decided to apply a superheater to one of the locomotives as an experiment. As the locomotives were less than two years old and the cylinders were in first class condition it seemed advisable to retain them and to try to use the slide valves, although experiments which had been made on other roads indicated that such valves could not be successfully used with superheat.

Engine 388 was selected for the test, and when the superheater was applied was equipped with gun iron valves, packing strips and balance plates. The pistons were also fitted with gun iron packing rings and the cylinders were bushed with the same material. Graphite lubricators, furnished by the National Graphite Lubricator Company, Scranton, Pa., were applied. Graphite in the stick form is used with this device and is pulverized and delivered directly to the cylinders through the oil plugs in combination with the usual hydrostatic lubrication from the cab lubricator. The graphite oil mixture is introduced to the valve chamber over the balance plate, where it is intimately mixed with the inflowing steam and an auxiliary oil stream is applied to the bridges to direct sprays of oil against the under sides of the valve. None of the parts were redesigned. The saturated steam engines of this class have 445 tubes, while the superheated steam locomotive has 259 2 in. tubes and thirty-four 5½ in. flues. A working steam pressure of 160 lbs. is used as compared to 170 lbs. for the saturated steam locomotive. The grate area is 58 sq. ft.

The engine thus equipped was turned out of the Scranton, Pa., shops on December 13, 1912, and after being broken in was placed in service on December 16. Up to and including May 1, 1913, the following mileage has been made:

December	957	April	2,596
January	2,647	May 1	119
February	2,499		
March	2,739	Total	11,557

The locomotive has thus been in practically continuous service since the superheater was installed, and has been tried out exhaustively in slow and manifest freight service, taking its place in the pool with other engines of the same class. The degree of superheat is high, the terminal temperature ranging around 650 deg. F., as determined by the pyrometer readings. No more trouble has been experienced with the slide valve than on other engines of the same class using saturated steam.

Comparative tests of this engine made in slow freight service on the Scranton and the Morris & Essex division, as against a saturated steam engine of exactly the same design, gave the following results:

	Locomotive 388. Superheat.	Locomotive 399. Saturated Steam.
Engine miles	775	775
Ton miles	1,454,854	1,467,260
Time on road	72 hrs. 46 min.	73 hrs. 0 min.
Average speed, miles per hr.	10.63	10.6
Weight of coal used, lbs.	130,770	182,200
Coal per hour, lbs.	1,736	2,495
Coal per minute, lbs.	30	41.6
Coal per engine mile	168.3	234.7
Coal per 1,000 ton miles	89.9	124.2
Average coal per trip, lbs.	22,950	30,300

The superheated steam locomotive used 27.5 per cent. less coal per 1,000 ton miles and 28.3 per cent. less coal per engine mile. It should be noted that in addition to being equipped with the superheater it also had a brick arch, engine 399 having neither of these devices. The steam chests of the superheater engine have been removed and the valves and valve seats examined at regular intervals, but have been found at all times to be in first class condition. If the use of the graphite lubricator will make it possible to apply superheaters to old locomotives and retain the slide valves, thus cutting out the expense of providing new cylinders, the problem of converting such engines from saturated to superheated steam will be greatly simplified.

GERMAN RAILROAD CONSTRUCTION IN AFRICA.—The Germans are to extend the Usambara railroad, now at New Moschi, 196 miles inland from Tanga and at the foot of Mt. Kilimanjaro, to Mambo, German East Africa, and it will supposedly terminate finally at Lake Victoria. They are also building a railroad from Duala, on the Kamerun coast, to Bidjoka, 95 miles. This line is already open to a point on Sanga river 50 miles west of Edea. On the west coast the Germans, almost as soon as they received a portion of the French Congo as a result of the Morocco incident, considered the advisability of continuing this line to either Libenge on the Ubanghi river, at the mouth of the Lobaje, or to the Congo, at the mouth of the Sanga. It is reported that they are to build either a railroad or an automobile route betwen Bukoba, on Lake Victoria, and Kissenge, on Lake Kivu, which lies between German East Africa and Belgian Congo.—*Mining and Scientific Press.*

GOVERNMENT APPRAISAL ENGINEERS.

The announcement issued by the Interstate Commerce Commission giving the names of the engineers who have been engaged to make valuations of railway property in accordance with the law which went into effect on May 1, was noticed in the *Railway Age Gazette* of May 2, page 986. The country is to be divided into five districts, and each of these five engineers—R. A. Thompson, W. D. Pence, J. S. Worley, H. M. Jones and E. F. Wendt—will have direct charge of one district; and in addition each will be a member of a board to advise with the members of the Interstate Commerce Commission and with the advisory board of three engineers, which is yet to be appointed.

R. A. Thompson.

Robert Andrew Thompson, Mem. Am. Soc. C. E., was born July 11, 1869, at New Waverly, Tex., and was educated at the University of Texas, where he took his degree in 1892. He received the degree of master of arts in 1893 and of civil engineer in 1900. He was for a time instructor in civil engineering at the university. In 1895-7 he was engaged on construction work on the Kansas City Southern and other railways. For eleven years, 1898-1908, Mr. Thompson was chief engineer of the State Railroad Commission of Texas. In January, 1909, he was appointed chief engineer of the Wichita Falls & Northwestern, in which position he remained nearly three years. While engaged in this work, he located and constructed about three hundred miles of railway in western Texas and Oklahoma, lines which are now a part of the Missouri, Kansas & Texas. Since October, 1911, Mr. Thompson has been chief engineer of the State Railroad Commission of California, where he has had charge of extensive valuation work.

W. D. Pence.

E. F. Wendt.

John S. Worley.

Edwin Frederick Wendt, Mem. Am. Soc. C. E., was born at New Brighton, Pa., and was educated at Geneva College, Beaver Falls, Pa., where he graduated with honors in 1895. In the same year he entered the service of the Pittsburgh & Lake Erie, joining the engineering corps, and he has been with that road ever since. He served continuously in the engineering department, holding different positions, until October 1, 1898, when he was appointed assistant engineer in charge of maintenance of way and construction and contract work. While he has held this position, the road has been greatly extended and in many parts reconstructed. Nearly all important structures have been rebuilt and a number of branch lines have been constructed. Mr. Wendt has for several years been on important committees of the American Railway Engineering Association and was chairman of the committee on records and accounts. In connection with this work and working in conjunction with the late Walter Berg, he made extensive studies in valuation of property. He was elected president of the American Railway Engineering Association at its annual meeting last March.

Howard M. Jones.

William David Pence, Mem. Am. Soc. C. E., was born at Columbus, Ind., November 26, 1865, and was educated at the University of Illinois, where he took the degree of civil engineer in 1895. For six years he was assistant engineer and resident engineer on the Atchison, Topeka & Santa Fe. For eight years he was a teacher and a professor at the University of Illinois; for another eight years, 1899-1906, he was professor of civil engineering at Purdue University. Since 1906 he has been professor of railway engineering at the University of Wisconsin, and also chief engineer of the Wisconsin State Railroad Commission and the State Tax Commission, where he has had extensive experience in valuation work. Professor Pence has for years been the editor of the publication of the American Railway Engineering Association, and has been a member of numerous engineering societies.

John Stephen Worley was born at Oak Grove, Mo., in 1876, and was educated at the University of Missouri and the University of Kansas. He took his bachelor's degree in engineering at the latter university in 1903 and his master's degree in 1904. Mr. Worley has had considerable railroad experience—chief engineer on the construction of the St. Louis & North

Arkansas, chief engineer of the Kansas, Oklahoma & Southwestern and of the Fort Scott & Pittsburg—but the more important part of his career has had to do with municipal and other public service enterprises. For some time he was principal assistant engineer on municipal improvements and appraisals for the Riggs & Sherman Company, consulting engineers, Toledo, Ohio. Mr. Worley went to Kansas City in 1909, where with E. B. Black, he formed the firm of Worley & Black, consulting engineers. This firm has designed and supervised the construction of municipal improvements at many places throughout the central states, and during the past two years has appraised the property of a number of public utilities. Mr. Worley took part in an examination of the physical properties of the Central of Georgia and the Buffalo, Rochester & Pittsburgh railroads; and in 1912 was engineer in charge of an investigation of the methods of operation and accounting of the Delaware, Lackawanna & Western.

Howard Murfree Jones, Mem. Am. Soc. C. E., was born in Murfreesboro, Tenn., October 9, 1874, and was educated at Vanderbilt University, Nashville, Tenn., and at Union College, Schenectady, N. Y., graduating at Union in 1895 with the degree of bachelor of engineering. Mr. Jones has had eleven years' experience in railroad work, having entered the service of the Nashville, Chattanooga & St. Louis in October, 1895. He served in the chief engineer's office of this road at Nashville for seven years, rising to the position of assistant engineer. He left the road and for a year was with the Louisville Bridge & Iron Company as assistant bridge engineer, but he then returned to the railroad and from 1903-1907 was bridge designer and bridge engineer. He opened an office as consulting and designing engineer in Nashville in January, 1907, and during the six years since that time has designed and built a large number of bridges, including two across the Cumberland River, at Nashville, which, together, cost over a million dollars. Mr. Jones was for eight years secretary and treasurer of the Engineering Association of the South, and has been president of that association.

HEARING ON ELECTRIFICATION IN CHICAGO.

The Chicago City Council Committee on Railway Terminals held a hearing on May 12, on a proposed ordinance to require the substitution of some other power than steam locomotives for the operation of the Chicago terminals. The position of the railways toward such an ordinance was presented in a lengthy statement signed by the executive officers of the principal Chicago roads, explaining the differences in conditions in the terminals of Chicago and in those of other cities where electrification has been tried, and asking the committee to defer final action on the pending ordinance until the conclusion of the extensive investigation which has been under way for the past two years by the Chicago Association of Commerce Committee on Smoke Abatement and Electrification of Railway Terminals. The statement, which was presented for the roads by Attorney Robert Redfield, is as follows:

"Your committee have pending before you, for consideration and report, an ordinance in reference to the electrification of terminals in the city of Chicago.

"Before you act upon this proposed ordinance we think that it is due you to know the attitude of the railroad companies represented by the undersigned. We also write you because we are confident that there are considerations of importance affecting the interests of the city as a whole, concerning which we believe you would desire to be informed.

"Permit us, first, to mention briefly the attitude of our railroads toward the subject under consideration. We recognize the desirability of eliminating or reducing to a minimum the creation of smoke in the city, and particularly in the residence districts, and the congested centers of population. We have for some time been seeking a solution of the problems entering into this question.

"No further proof of our good will and sincerity in this matter is needed than reference to the fact that, at the invitation of the Association of Commerce, we joined it in the formation of a committee, upon which we had only minority representation, created for the study of the problems of smoke elimination, and the replacement of steam by other power; that the railroads have furnished all of the money to defray the expense of this investigation, for the reason that the necessary preliminary study, if conducted independently, could not be made to cover in so thorough and unbiased a way the complexities of the enormous business interchanged daily between the commercial interests through the railroads. We have turned over to this committee all the data in our possession, or desired, bearing upon this subject, consisting of plans of tracks, yards, terminals, interchange and industrial tracks, coal consumed, number and kind of locomotives in use and daily mileage thereof, as well as data upon many pertinent and technical subjects and operating conditions—the latter embracing the tonnage of freight received and forwarded, both by the carload and through freight houses, also the number of passenger trains, covering the past ten years' operations.

"It ought not to be overlooked that the Association of Commerce committee has been, for nearly two years, pursuing a thorough, systematic and uninterrupted study of this important question; that it is making marked progress in the performance of the duties entrusted to it; and that when it completes the labors of its investigations its conclusions will be entitled to that respect and confidence which the character of the committee and the thoroughness of its study of the subject will command.

"The second consideration which we desire to submit to you is that in Chicago the railroad situation is entirely different from that in any other part of the United States where electrification of terminals has been attempted. Chicago has had a phenomenal industrial growth. To keep pace with this growth the railroads have been under the necessity of laying tracks under all sorts of conditions. The demands for service have compelled junction and interchange tracks, grade crossings, elevations, inclines and depressions. The requirements of new industries located in all parts of the city have been and are so irresistible that good engineering and economic operation have been given secondary consideration. As business has increased by leaps and bounds, new tracks, cross-overs and grade crossings have become so numerous that there has grown up a net-work of steel rails in many localities so intricate and interrelated that only the oldest and most experienced employees now know all the properties of their respective lines. In other cities the railroad companies generally keep to their own properties, but in Chicago there is a peculiarly free exchange of business. The locomotives of one line are permitted to go on the rails of other lines, anywhere that business necessities demand. Coal is supplied for almost daily necessity, with dependable regularity, lumber comes in and is switched to the yards in a few hours, and distributed to the factories with the same dispatch as other and more concentrated raw materials. The orders of jobbing houses, filed one day, are on the road to the consignee the next. Daily trains of merchandise, stock, fruit and vegetables are taken to the congested centers of the city, unloaded, reshipped or sold locally, in a few hours. The commercial supremacy of Chicago has been brought about through the superiority of its transportation facilities. Unlike New York, with its hundreds of miles of docks and wharves, the merchants of Chicago depend almost entirely upon the railroads for service, and get it. Commerce and transportation are closer together in Chicago than in any other large city in the United States or in the world. It is a shorter distance from the shipping room to the carrier on an average than in any other commercial center, and the business activities radiate to greater distances by reason of such advantages. This unique and peculiar condition of freight terminals, brought about by this rapid growth and the necessity of prompt interchange between railroads, differentiates the condition here from that

obtaining in other places where electrification of freight terminals has been proposed.

"The difference is illustrated by New York, which is Chicago's principal competitor, and which has also been frequently referred to as more progressive than Chicago in the matter of electrification. Among the important points of difference between the railroad terminals of the two cities and their approaches are these:

"First: The geography of the city of New York brings the railroad tracks into the terminals through tunnels and along comparatively straight paths, with few crossings and no interchange, whereas in Chicago the tracks converge into the city from nearly all directions, and over many crossings.

"Second: At the present time practically no freight is handled by electricity in the city of New York, and in the two instances where a comparatively small number of freight cars are handled there is no interchange. In Chicago there is an interchange of 25,000 freight cars a day, and 65,000 cars of freight are daily moved into the city. The subject of freight terminal electrification in New York City is now a matter of study, and no conclusions have been reached.

"Third: In so far as electrification has been adopted in New York City, it was necessitated by tunnel conditions and the character of the passenger terminals.

"The foregoing brings us to a suggestion, that the consequence of an erroneous determination of this complex problem, by a superficial consideration, will be most serious to the commercial and industrial interests of this city, and prudence would seem to dictate the wiser course of completing the systematic investigation now well under way by the Association of Commerce. Chicago owes her supremacy, in the competitive race, to the superiority of her facilities for moving freight by rail, and to the extent that these facilities are impaired, her supremacy will be lost to her competitors.

"We therefore respectfully request that your committee defer final action upon the pending ordinance until the committee of the Chicago Association of Commerce has completed its labors and prepared its report upon the whole subject matter.

"In the meantime, the railroads are not only co-operating with that committee, but are also co-operating with the Bureau of Smoke Prevention of the City of Chicago, and have made substantial progress in the elimination of smoke. In detail, a few of the measures adopted for the reduction of smoke are as follows:

"The organization of a staff of officers, in the city of Chicago, who inspect the operation of locomotives, and instruct the enginemen as to the reduction of smoke;

"The equipment of switching and road locomotives with air jets, superheaters and mechanical stokers;

"The use of a better grade of coal;

"The use of improved front end devices, whereby the amount of cinders and dirt carried into the open air has been more than cut in two;

"The construction of new boiler plants, with furnaces built under the recommendation of the City Smoke Department.

"The result, as shown by the official records of the Bureau of Smoke Prevention of the City of Chicago, is a reduction of smoke, from a density of 23 per cent., in 1910, to 7 per cent., in 1912, an accomplishment to which the chief inspector refers as 'a most wonderful and satisfactory improvement.'

"We beg leave to assure your committee that we shall continue to give unremitting and sincere efforts to the elimination of smoke, and to the perfection of plans for the substitution of other power in place of steam."

The statement was signed by Chicago, Burlington & Quincy Railroad, by D. Miller, president; Chicago & North Western, by W. A. Gardner, president; Chicago, Milwaukee & St. Paul, by A. J. Earling, president; Pennsylvania Lines, by J. J. Turner, vice-president; Illinois Central, by W. L. Park, vice-president; New York Central Lines, by J. J. Bernet, vice-president; Atchison, Topeka & Santa Fe, by E. P. Ripley, president; Chicago, Rock Island & Pacific, by H. U. Mudge, president.

Howard Elting, president of the Chicago Association of Commerce, also presented a statement outlining the position of the Chicago Association of Commerce toward the investigation, and strongly urging the committee to postpone consideration of the question until the final report of the committee is issued. He said that by January 1, 1914, the committee will be in a position to report something tangible and definite as a solution of this important problem, and that if, on the other hand, the railroads should be forced suddenly to abandon steam and adopt electrification, it is altogether possible that a serious disorganization of Chicago's shipping facilities would result. He outlined the reasons which led the Chicago Association of Commerce to appoint the committee consisting of nine men named by the association, four by the mayor of Chicago, and four by the railroads, because of the necessity for a thorough scientific investigation which would make possible a report so conclusive that it must inspire the public confidence. He declared that the electrification of the railroad terminals in Chicago constitutes a problem that is unique in the United States, because the terminals of Chicago's 38 railroads are bound together by constant intercommunication into a complex network with which no other city in the world has anything to compare, a situation existing because Chicago has the most excessive railroad facilities in the world. The best interests of the city demand that the question be solved correctly for the public in question, and business interests in particular must ultimately bear the expense of hundreds of millions of dollars, and must either benefit or suffer by the effects of any changes in the operation of Chicago railway terminals. It is the part of wisdom, therefore, to inquire fully into the returns of this big investment and to make certain that it will be a good business proposition for the city of Chicago. He felt confident that the work of the association's committee during the past two years represents more actual progress toward the solution of the smoke problem than has been recorded in any other equal period of the city's history. The entire cost of the investigation, which up to the present time has been about $250,000, is being borne by the railroads, and they exercise no control over the course of the investigation other than their proportionate representation of four out of 17 members. The value of the investigation will be measured by the completeness of the information upon which its conclusions will be based, until its complete conclusions are impossible, and any results considered apart from all the other findings of the investigation are without practical value. He believed that the most direct road to the solution of Chicago's smoke problem is that followed by this investigation.

He was followed by Judge Jesse G. Holdom, chairman of the Chicago Association of Commerce committee, who outlined in detail the progress of the investigation thus far, and the work that remains to be done before a report can be rendered.

O. Monett, chief smoke inspector of the city, declared that he was familiar with the work of the committee, and that any action on the proposed ordinance at this time would be immature and ill-advised. He said that the railways were not taking advantage of the time required by the investigation to delay the abatement of the smoke nuisance, but are making every effort that can be made under present conditions to reduce the amount of smoke. The percentage of locomotive smoke density has been reduced from 23 per cent. in 1910 to 7 per cent. in 1912, and the railways are now employing more smoke inspectors than the city, and spending more money to reduce the smoke from their locomotives than the city is spending for all the smokestacks in the city. The committee announced that a series of further hearings will be held on the subject before any conclusion is reached.

Railroads in Belgian Congo.—The Mayumbe railroad, which goes north from Boma, Belgian Congo, is now being operated for over 70 miles, and it is stated that eventually it will serve the Minduli copper mine, in French Congo. The latter is now, however, connected by a light railroad 95 miles long, with Brazzaville, a town on the French side of Stanley Pool, where connection is made at Kinshasa.—*Mining and Scientific Press.*

ANNUAL MEETING OF THE AIR BRAKE ASSOCIATION.

Last Two Days' Proceedings—Papers on Triple Valve Operation, Air Hose Failures, and Location of Steam Heat Traps.

A report of the first two days' sessions of the Air Brake Convention was published in the *Railway Age Gazette* of May 9; following is an account of the remainder of the convention.

WILL THE TRIPLE VALVE OPERATE AS INTENDED?

A paper on this subject was presented by S. W. Dudley, of the Westinghouse Air Brake Company, who outlined in the first part the various external and internal conditions that affect the operation of the triple valve. The most important feature of the paper was a report of tests made by representatives of the Pennsylvania Lines and of the Westinghouse Air Brake Company to determine, comparatively, the effect of the more common circumstances affecting the service operation of the triple valve in modern passenger train service. A primary consideration was the relative effect of 1 in., 1¼ in. and 1½ in. brake pipe on the release, the service and the emergency functions of the quick action triple valve. Other considerations were the effect of main reservoir pressure, compressor capacity, design of triple valve, kind of service brake applications, use of full release position, single and double brake equipment per car, condition of triple valve, rate of recharge of auxiliary reservoirs permitted and brake pipe leakage. An abstract follows:

The tests were made on a 12-car train test rack of double PM-1612 equipments including one complete No. 6 ET locomotive brake equipment, located out of doors at the plant of the Westinghouse Air Brake Company, Wilmerding, Pa. The apparatus was arranged so that any desired combination of conditions with regard to compressor capacity, size of brake pipe, arrangement of equipment or manipulation could be readily obtained. Standard (not extra heavy) pipe was used in all cases. The test rack duplicated, as nearly as possible, train service conditions.

The triples first used were taken from stock and had been operated on the rack, more or less, for about two weeks, and were by no means in a uniform condition. They, therefore, represented as nearly as possible, the condition which might be expected on a train equipped for service.

With a 6-lb. train pipe reduction some of the brakes failed to apply. Six tests were made with a 1 in. and 1½ in. train pipe; 74 per cent. were applied with the 1 in. pipe and 77 per cent. with the 1½ in. pipe. In the release test 16 per cent. failed to release with the 1 in. pipe and 17 per cent. with the 1½ in. pipe. It will thus be seen that there was no marked difference between the 1 in. and 1½ in. pipe under these conditions.

After the valves were put in good condition (according to the indication of a portable testing truck) not a single brake failed to apply (except on the very light 4 and 5-lb. reductions), and only a relatively small number failed to release. This shows clearly that the condition of the triple valve is an important factor in both the application and release of the brakes; that it may be the determining one; and that any improvement in the condition of the valves will assist in preventing improper operation of the brakes. Therefore, the tests referred to up to this point in which the influence of the triple valve itself was evidently the predominating factor, will not be used in comparing in detail the effect of different sizes of pipe and other factors.

As a means of comparison the rate of rise of brake pipe pressure on the last car in the train was taken as the standard, as it is directly and primarily affected by the conditions to be compared.

When releasing brakes and increasing the pressure in the brake pipe, it was found that a 1½ inch pipe produces no improvement, and on the whole is less satisfactory than a 1¼ inch pipe in this respect. The time to increase the brake pipe pressure 5 lbs. on the last car in the train is practically the same as the 1¼ inch pipe.

The effect of 1½ inch brake pipe in service applications was found to considerably delay the time of obtaining full brake cylinder pressure corresponding to the reductions made on the train as a whole, but at the same time cause a more uniform starting of the application of all the brakes. The average time to obtain maximum pressure in making a 20 lb. reduction with the 1½ in. pipe was 24.6 seconds, which is 5 seconds, or 25 per cent. longer than for the 1¼ in. pipe and 10 seconds, or 70 per cent. longer than for the 1 in. pipe.

While the use of 1½ in. pipe slightly increases the emergency brake cylinder pressure, it seriously interferes with the obtaining of serial quick action, especially with the brake (both triple valves) on the car next behind the locomotive cut out. The brake cylinder pressure in emergency is increased 6 lbs. or 7.7 per cent. above that obtained with the 1 in. pipe and 4.5 lbs. or 5.8 per cent. above that with the 1¼ in. pipe. The 1½ in. pipe offers no appreciable advantages over the 1¼ in. pipe and does introduce some distinctly undesirable features..

The record of the brakes released with the 1¼ in. brake pipe is slightly better than with the 1 in. pipe. Its advantages in this particular are so slight as to be negligible in comparison with the much more marked differences produced by the use of other means. The time to increase the brake pipe pressure 5 lbs. on the last car is, under all conditions, less with the 1¼ in. pipe than with the 1 in. pipe. This should result in a corresponding improvement in releasing brakes. The summary of the tests chosen as representing conditions where some brakes are close to the "sticking point," shows that for the 1 in. pipe out of a total of 432 possible stuck brakes 6.5 per cent. were stuck for 10 seconds and 3.7 per cent. stuck for 60 seconds. The substitution of a 1¼ in. pipe for a 1 in. pipe, other conditions remaining the same, reduced these percentages to 1.6 per cent. and 0.9 per cent. respectively. The percentages for 1½ in. pipe were 1.2 per cent. and 1.2 per cent. respectively, showing no appreciable gain over 1¼ in. pipe. However, on the whole, the difference between the effect of 1 in. and 1¼ in. pipe on the release of the brakes was not sufficient to indicate that the larger pipe would materially assist in releasing the brakes under otherwise unfavorable conditions. That is to say, the substitution of a 1¼ in. brake pipe for a 1 in. brake pipe could not be expected to produce any marked improvement under conditions which would otherwise tend to cause stuck brakes, although its tendency is unquestionably in this direction.

The effect of a 1¼ in. brake pipe in service applications is to somewhat delay the application of the brakes on the train as a whole, but at the same time produce a more uniform starting of the application of all the brakes. With a 1¼ in. brake pipe the time to start the application of the brakes on the twelfth car is practically the same as for the 1 in. pipe. The time to obtain maximum pressure in making a 20 lb. reduction is 19.6 seconds, which is 5 seconds longer than with the 1 in. pipe.

The use of the 1¼ in. pipe slightly increases the emergency brake cylinder pressure, but tends to hinder serial quick action. This interference with quick action, however, was not appreciable except under the more severe conditions; which conditions were, however, not sufficient to affect the obtaining of quick action with the 1 in. pipe. The emergency brake cylinder pressure is increased 1.5 lbs. or 2 per cent. above that with the 1 in. pipe. The time of transmission of quick action throughout the train is not appreciably affected.

The use of a 1¼ in. pipe would tend toward improvement in releasing brakes, would be a distinct economic advantage (due to having but one, instead of two standard sizes of air brake hose and fittings to be kept in stock and handled) and would not be objectionable, either on account of a slower service application or its effect on quick action except under extreme

conditions. However, it could not be expected to entirely eliminate the troubles heretofore experienced with double equipment cars, other conditions remaining unchanged, and is of much less benefit than a number of the other factors, such as manipulation, main reservoir pressure, and so on as mentioned in this report.

As would be expected, with low main reservoir pressure and short time in full release position there is not much difference in the results with different size pipes, but with the higher (140 lbs.) main reservoir pressure the effect of large size pipe is marked. With 140 lbs. main reservoir pressure, for all reductions and times in full release position, the difference between the brake pipe pressure on car 1 and on car 12 with 1¼ in. pipe is half or less than half that with 1 in. pipe. With other conditions the same, the 1¼ in. pipe permitted the brake pipe pressure on the last car to rise to a higher point than did the 1 in. during the time the brake valve handle was in full release position.

Concerning the use of 1 in. and 1¼ in. pipe on the locomotive, it was found that there was no appreciable difference. The larger size brake pipe permits a greater amount of air loss by leakage without causing an application of the brakes.

Discussion:—P. J. Langan (D. L. & W.) stated that he had found it impossible to make 5 lb. reductions without brakes sticking. Mr. Turner explained that that was on account of the large auxiliary reservoirs used on the D. L. & W. which allow the brake to set sufficiently to cause a stuck brake, there being enough pressure in the brake cylinder to make some appreciable brake application and too much pressure in the auxiliary reservoir to permit the triple valve to go to release position when the train line was recharged. With the smaller auxiliary reservoir this difficulty would be overcome.

AIR HOSE FAILURES.

A paper on this subject was read by T. W. Dow, of the Erie. An abstract follows:

Several roads are making an accurate check of the cost of damage due to burst hose, intending to bring it before the M. C. B. Association to use as an argument for establishing a positive time limit in which to remove all hose from service. While the cost of such a practice might seem unwarranted and excessive to many, when it is compared with the cost of damage to equipment from the failure of the air hose it will be found that there will be a balance in favor of this practice. In checking several thousand 1⅜ in. air hose that had failed due to bursting, during the year of 1912, the average life was found to be less than 20 months, and a small percentage of the number had been manufactured over 24 months; and it has been suggested by a number of mechanical officials that under the existing conditions it did not appear to be unreasonable to limit the service of air hose to the latter figure, or 24 months.

In making the stretching test on 1 in. sections of various inner tubes it was found that some developed noticeably large holes which at first were very small. These were due to particles of grit which were seen in the rubber before being stretched. It is believed that such conditions account for the large number of porous hose. It is maintained by many, however, that the practice of pulling hose apart is responsible for short life and it is possible that the pulling apart has a tendency to opening up the pores in the inner tube similar to the conditions developed in the stretching test.

During the soap suds test of the air hose on a large number of trains during the warm season of 1912, it was found that about 10 per cent. were porous. A large portion of this number were porous throughout the entire length of the tube, but many were noticed leaking only at the nipple end, having been made so probably by being bruised, and it is thought that this may be aggravated by the new recommended location of the angle cock, 11 in. back of the pulling face of the knuckle.

While a large number of air hose fail due to the tube blowing off the fittings, a check during the year 1912 showed a lesser number than during the year of 1911. This may have been due to a local condition rather than to any improvement in the make-up of the inner tube, or to the method of fastening, but it is thought that serious consideration should be given to both.

Failure through chafing, being burned, torn off and damaged couplings, still continues, but all such can be eliminated by proper attention to the location of the pipes and a regard for a rule that has been many years in print, but not in force, whereby all hose should be uncoupled and not pulled apart. From examination made, it would appear that air hose manufactured within the two years just passed fail more rapidly than those manufactured four or five years ago.

Discussion.—H. F. Wood (B. & M.) presented some figures on the life of air brake hose that showed that two years would be a practical limit to keep hose in service.

T. E. Hessenbruch (P. & R.) stated that out of 1,200 pieces of defective hose taken from the scrap pile and given a pressure test of 125 lbs., 54 per cent. were porous, having been in service on an average of 18 months; 24 per cent. failed on the nipple end and 11 per cent. on the coupler end; 3 per cent. were weather beaten, being in service on an average of 48 months; 1 per cent. were cut by trap; 1 per cent. were torn, and 6 per cent. had miscellaneous failures. He also stated that considerable trouble was experienced from rust collecting in the groove of the coupling which prevented the gasket from having a good bearing.

F. B. Farmer spoke of the stiffening effect extreme cold has on poor hose which greatly interferes with successful train operation, tearing the hose gaskets and increasing train pipe leakage. Other speakers mentioned similar troubles from frozen hose, and C. W. Wheeler (N. Y. C. & H. R.) has found it necessary to wire the hose together at temperatures in the neighborhood of 20 deg. below zero.

C. N. Remfry (D., M. & N.) stated that his road made a practice of limiting the life of air hose to two years—although the average life was 2 years and 2 months—and claimed a material saving when considering the damage that is done to the equipment by hose failures. He also found that the hose gave better service when the distance between the coupler knuckle and angle cock key was 11 in.

The subject was continued to next year.

LOCATION OF STEAM HEAT TRAPS.

C. W. Martin (Penna.) presented a paper on this subject. An abstract follows:

To the air brake inspector in charge of equipment, who is called on to give an explanation of the cause of removal of wheels from passenger equipment cars which have been slid flat, the disposition of the water of condensation from the steam heat trap or drip becomes a serious problem. This condition has been considerably aggravated by the introduction of the steel car, which requires the number of square feet of heating surface to be more than doubled; this increases the amount of condensation to be discharged at the traps and usually requires more traps, due to the radiators being broken up into smaller units, because of the increased length of the vehicle.

On postal and Pullman cars the number of steam traps has been increased from one or two with the wooden car, to six or seven with steel equipment, and these are located close to the truck, where the condensation drops on the rail directly in front of the wheel, or is blown back on the truck and brake rigging to freeze and add to the rigidity of the parts, preventing that portion of the truck which should be free to move in order to maintain an equal distribution of the weight of the car on the rail, from adjusting itself to the inequalities of the track. This relieves some of the wheels of their proper proportion of the weight at the time the brake is applied, and permits them to slide.

Where the traps cannot be located away from the truck or triple valve, some arrangement should be made to conduct the condensation close enough to the track to prevent flying back under the car. A sheet iron tube clamped to a trap of the verti-

cal type conducts the water from the trap down close to the track, and where the trap is located near the center of the car, gives good satisfaction.

A guard placed around the trap on the side nearest the part to be protected, and fastened to the trap by a clamp held in place by a stove bolt or machine screw, will also be helpful. The shield may be made from heavy sheet iron stiffened by a rib of half-round iron along the edge, or by flanging it over a heavy wire. While the object of this shield is to protect the truck from water and still allow the atmosphere free access to the trap, in order that any variation in temperature may affect it promptly, it has been criticized somewhat because of the water blowing around the edges of the guard, because of it being wide and shallow.

A device made up from rubber hose, 4 in. in diameter, clamped to the trap and run as close to the track as desired has also been found satisfactory. Where it is necessary to locate the traps outside the rail, this arrangement is preferable to either of those mentioned above. This is especially true when the cars are to be run in an electrified zone, where the third rail is used, as the hose is very flexible, not easily injured by striking any obstruction, and is a non-conductor.

This matter is one which should be taken up by the car designers and builders, with a view to having these traps located at some point as far from the track as possible, and where this is not possible, to provide a suitable shield or guard to protect the brake rigging and equipment.

Discussion.—The discussion confirmed the troubles mentioned in the paper. M. Purcell (N. P.) stated that the brake rigging had in some cases been rendered inoperative by the ice from the drip.

OTHER BUSINESS.

The convention was addressed by J. F. Enright, superintendent of motive power and equipment of the Denver & Rio Grande. He spoke of the difficulties he experienced with cars received from valley roads where it was not as necessary to maintain the air brake system at such a high rate of efficiency as on mountain grades. The greatest trouble was found in lack of proper retaining valves.

The executive committee voted as the sense of the association against the formation of a supplymen's association to work in conjunction with the Air Brake Association, desiring to furnish their own entertainment at the conventions.

The following officers were elected for the ensuing year: W. J. Hatch, Canadian Pacific, president; L. H. Albers, New York Central Lines, first vice-president; J. T. Slattery, Denver, & Rio Grande, second vice-president; T. W. Dow, Erie, third vice-president; F. M. Nellis, Westinghouse Air Brake Company, secretary, and Otto Best, Nathan Manufacturing Company, treasurer.

JAPANESE LOAN FOR RAILWAY BOND REDEMPTION.—Arrangements have been practically concluded for the issue in Paris shortly of a Japanese loan of $38,500,000, of which $35,000,000 will be devoted to the redemption of railway bonds. The rate of interest will be 5 per cent.

MEASURING TRAIN SPEED IN 1832.—A locomotive steam engine, constructed by Davis and Garther, of York, Pa., commenced her operation on the Baltimore & Ohio Railroad under the most favorable auspices on Tuesday. It started from the Pratt street depot for Ellicott's Mills, with the entire train destined for that place, consisting of 14 loaded cars, carrying, together with the engine tender, a gross weight of 50 tons. The whole went off in fine style and was soon out of sight. A gentleman present says it was out of sight of the depot in about six minutes, and the rapid gliding of the immense train was one of the most imposing and most beautiful spectacles he ever witnessed.—*Extract from the National Gazette, published in the American Railroad Journal of July* 28, 1832.

DEDICATION OF NEW BUILDINGS AT UNIVERSITY OF ILLINOIS.

The new transportation building and the new Locomotive and Mining Laboratories of the Engineering Department of the University of Illinois were dedicated with appropriate exercises at Urbana, Ill., on May 8, 9 and 10. At the opening session on May 8, J. G. Pangborn, special representative of the president of the Baltimore & Ohio, presented an address outlining the history of the various inventions which led up to the use of steam for propulsion and the development of the various types of the steam locomotive.

The program for Friday began with a railway conference in the Transportation building, at which B. A. Worthington, president of the Chicago & Alton, discussed "Modern Problems of the Steam Railway," and W. B. McKinley, president of the Illinois Traction System, "The Modern Problems of the Electric Railway." Mr. Worthington dealt with the serious situation in which the railways find themselves on account of restrictive legislation speaking in part as follows:

"In enjoying the splendid results which actually have been materialized under the conditions which have prevailed, one can scarcely believe that there possibly could be anything so seriously wrong with the railroads themselves, nor with the primary conditions under which the railroads have been operated; not that governmental control is undesirable to the railroads, for in fact it is highly desirable when properly exercised, but the sixteen billion dollar institution of the railroads, erected almost entirely by private subscription, is a national asset of far too great an economic value to be meddled with indiscriminately, or to be hampered by ill-advised legislation which caters to public prejudice and thrives upon public credulity and public passiveness. The truth of the matter is the public has not yet been brought face to face with the really serious condition of affairs that actually exists, nor to a realization of the dominant fact that the public, regardless of the actual investment of not a single dollar in American railroad properties, collectively holds the controlling interest in these railroads, and accordingly enjoys the greatest dividend returns.

"While enjoying the fruits of prosperity, the public—that is, those not directly interested in the finances of railroad properties—while depreciating the values and hampering the service of the railroads, seem to place a great abiding confidence in the stability of other values. As a matter of fact, the railroads being the chief instrumentality in creating such other values, still constitute the *real value underlying such other values.* If, for example, the railroads should be withdrawn, these artificial or contingent values would quickly collapse; and in the exact proportion that these railroads *are* withdrawn, through inefficient or inadequate service, such other values shall certainly depreciate.

"When we stop to consider the precarious situation of the railroads, the very values which underlie our government bonds themselves, the endowment values upon which have been constructed public institutions without number, the foundation and the buttress of our national strength and our national greatness, serious doubt arises.

"But the question is, how much more radical legislation will be required to convince the people that the situation is fast becoming insufferable? In plain words, how much longer are the people going to stand for this revolutionary state of affairs? Are they so blinded by prejudice that they cannot, or rather will not see the error of their way until it will be too late? Passing years will prove convincingly whether 'prudence,' indeed, has been consulted in our present legislative functions. Already indications are becoming apparent to the trained eye that *something* is wrong. Railroad securities, our letters of credit abroad and incidentally the strongest national defense that any nation ever erected, are being returned to us under protest and subject to severe discounts which we ourselves are imposing. Again I ask the question, has prudence been con-

sulted, and is confidence protected as *you* want it protected?

"Are we not even now changing a form of government long enough established to produce a wealth of $100,000,000,000 in substantially forty years and place us in the foremost ranks of all the nations of the world? And are not these changes due to 'light and transient causes' in the intended and accepted sense of the expression? In plain words, are we not 'killing the goose that laid the golden egg'?

"A railroad plant is not totally unlike any other kind of a plant. It is an organic structure which is supposed to grow, and it thrives best under cultivation. But who would think, for instance, that he could raise more wheat to the acre by heaping upon productive fields all sorts of rubbish that prejudice could conceive, and in addition thereto, passing laws that the kernels shall be larger and the stalks shorter? This seems very much like an absurdity, but I ask you in all sincerity, is it not a pertinent analogy?"

"The Changing Character of the Problems of the Railroad" was discussed by T. H. Goodnow, president of the Western Railway Club, who outlined the progress that has been made in railway mechanical work, especially in the car department. He said that there is a lack of the right sort of young men entering the shops of the railways today and it is becoming more necessary to depend upon immigrants.

Albert Reichmann, president of the Western Society of Engineers, spoke on "The Technical Society as an Influence in Education."

"It is very evident," he said, "that an engineer in order to be successful cannot be a recluse. He must associate with his fellow engineers. He can best secure such association through the technical societies. The meeting of engineers under conditions where all are on a common footing fosters a spirit of kindly co-operation and helpfulness which binds them together and makes each of greater usefulness to the others.

"In the technical societies the various steps of mechanical development are depicted both from the practical and theoretical standpoints. They afford the engineer an opportunity to supplement his own knowledge by the experience of his fellow engineers. They afford him the opportunity to present to the world what he himself has accomplished and to receive criticisms and suggestions from his fellow men and resulting from the discussion of the various subjects which are presented the engineer learns to appreciate the benefits of co-operation; by means of which both the giver and receiver are greatly benefited."

H. G. Hetzler, president of the Chicago & Western Indiana, spoke on "Proper Aims in Training for Railway Service."

W. L. Park, vice-president of the Illinois Central, was unable to be present, but sent an address on "Vocational Education in Connection with Railroad Work." He said in part:

"The magnitude and ingenuity of the great progressive achievement of our railroads has been so wonderful and the results so beneficial and far reaching that we have, to a great extent, lost sight of the necessity of economizing; we must now take cognizance of the terrific waste and crude methods, and begin to apply the scientific methods.

"We must bring about a better system of activities before we have wasted our birthright of natural resources. This power of efficiency must come out of institutions of this character—with their equipment for experimentation and ability to explore the world for knowledge and to make it available to the student.

"I would not deprecate in any way all that is intended by these great schools of special training. There are too few of them, and those that do exist are frequently restricted in their accomplishment by lack of funds to do all that the faculty have in mind.

"I would, however, impress upon those who are responsible for the future prosperity of our railroads, the importance of maintaining a proper balance in the human equation—we must not forget the thousands in the ranks who are deprived of the very rudiments of learning, upon whom we must yet continue to place great responsibilities. The knowledge, concentrated in our educational institutions, should be made available in some degree at least to those deprived of the advantages until there comes a time of more equal opportunities; some system of education yet to be evolved that will give to those seeking knowledge of this vocation an opportunity while employed in a gainful occupation, to acquire it."

Robert Quayle, general superintendent of motive power of the Chicago & North Western, spoke on "How Can the Technical School Help in the Solution of Railway Problems?"

Samuel O. Dunn, editor of the *Railway Age Gazette*, gave a brief talk on "Research as a Factor in Railway Administration."

The formal dedicatory exercises were held on Friday afternoon in the University Auditorium. Dr. W. F. M. Goss, dean of the College of Engineering, presided, and addresses were made by Dr. E. J. James, president of the University; W. L. Abbott, president of the board of trustees; and Willard A. Smith, editor of the *Railway and Engineering Review*. A "Mining Conference" was held on Thursday and Friday.

LOCOMOTIVE BOILER INSPECTION.

The following notes are taken from a paper which was recently read before the Western Railway Club by Frank McManamy, assistant chief inspector of the Division of Locomotive Boiler Inspection of the Interstate Commerce Commission.

A statement which is frequently made to us when repairs are ordered on locomotives which do not meet the requirements of the law is, "I do not consider that dangerous." If we refer to Section 2 of the law, we find that Congress was evidently not satisfied with simply requiring that locomotives must be "safe to operate," and in such condition that they were not immediately dangerous, but they must also be "in proper condition," and the rules were provided to show what was meant by "proper condition." This is briefly but completely covered by Rule 7, which provides that "the mechanical officer in charge at all points where boiler work is done must know that *all* defects disclosed by an inspection are properly repaired before the locomotive is returned to service," and this is just what is desired by the most progressive railroad managers. No one can question the fact that defects which are apparently unimportant in themselves often cause serious accidents.

The most frequent objection that has been made to our method of inspection has been that defects are reported which are not violations of the law, resulting in mechanical officers being asked by the managers to explain why such defects were permitted. It seems to me that those who raise this objection must have done so without having given the matter much thought. The purpose of legislation of this character is to promote safety and not to collect penalties. The penalty must be provided, however; otherwise the law might be ignored, and, when necessary, proper action will be taken to enforce it. We have endeavored, however, with very gratifying success, in most instances, to obviate the necessity of bringing suits to collect penalties, by reporting all defective conditions found, so that they might be repaired before they became serious enough to cause injury, or to violate the law. This policy can only be successfully followed on roads where a sincere desire exists and an honest effort is being made to comply with the requirements of the law.

Section 6 of the law provides that the "first duty of the district inspector shall be to see that the carriers shall make inspections in accordance with the rules and regulations established or approved by the Interstate Commerce Commission, and that the carriers repair the defects which such inspections disclose before the boiler or boilers, or appurtenances pertaining thereto, are again put in service." This requirement makes the principal work of the government inspector of a supervisory character, and plainly shows that the intention of Congress was to place the burden of inspection and responsibility for the condition of locomotives upon the carriers.

The law provides that the district inspector "shall make such personal inspections of locomotive boilers under his care as may

be necessary to fully carry out the provisions of this act, as may be consistent with his other duties," and this is being done, but where attempts are made by any railroad to shift the burden of inspection onto the government by continuing defective locomotives in service until the defects are discovered and ordered repaired by a government inspector, it will be necessary to resort to the penalties provided in Section 9 of the law, as the law did not intend nor provide sufficient force for the government to do this work alone.

I have frequently heard the statement made that a defective locomotive could be continued in service without incurring a penalty, until ordered out of service by an inspector. In our opinion, this is not the correct view. Section 9 of the law provides a penalty for three distinct acts: First, for violating the act itself; second, for violating any rule or regulation made under its provisions; and third, for violating a lawful order of an inspector. Under these provisions railroads are just as liable for the penalty if they operate a locomotive in a defective condition which has never been seen by a district inspector, as they are for operating one which has been ordered out of service by an inspector. This for the reason that Congress recognized the fact that it would be impossible for 50 inspectors to know at all times the condition of the 65,000 locomotives in service; therefore, the responsibility for making proper inspections, proper repairs and for the general condition of equipment was placed absolutely on the carriers and a penalty provided for failure to comply, regardless of whether the locomotive had been inspected by a district inspector, or not.

Among the rules which have apparently in many instances been misunderstood are the following: Rules 9 and 10 provide a maximum period between the removal of flues and also require the interior of the boiler to have the scale removed and be thoroughly cleaned and inspected whenever a sufficient number of flues are removed to allow examination. We find that the fact that the period given for the removal of flues is a maximum, is apparently overlooked, and it is assumed that the rule is being complied with if the boiler is scaled and inspected once in three years, even though flues are removed each year or oftener. This is not a proper compliance with the rule, because where water conditions are such as to make a frequent removal of flues necessary, it is reasonable to assume that the same conditions make it important that the interior of the boiler be thoroughly cleaned and inspected in accordance with the rules.

Rule 19 is another one that quite frequently is not fully complied with. It requires that at the time of applying a hydrostatic test the boiler must be thoroughly examined while under pressure. We find the practice to be more or less common of failing to hold the pressure while this examination is made; therefore, defective conditions which could possibly have been discovered while the pressure was on may remain undetected. The practice of screwing down safety valves when applying hydrostatic test could be improved upon, although it is not specifically prohibited by the rules. We have found cases where valves were damaged in this way and they frequently leak, resulting in water running down over the boiler, making it impossible to determine whether the water is coming from the safety valves or from some defective seam or rivet, or from a crack in the boiler shell.

Rules 45 to 48, governing the washing of boilers, are in many instances not properly observed. Some roads have been following the plan of removing all washout plugs and washing boilers thoroughly only once in 30 days, which is recorded as the government washout, and although water conditions were such as to require numerous other washouts during the month, all plugs are not removed and only a partial washout is given, which is recorded as the railroad company's wash, or a short wash or some similar term. This is not in accordance with the rules. Rule 45 requires boilers "to be thoroughly washed as often as water conditions require, but not less frequently than once each month," and Rule 46 provides that when boilers are washed *all* washout, arch and water bar plugs must be removed.

This does not apply to a water change when only the washout plugs in the water-legs are removed to facilitate emptying the boiler, but where a hose is used to wash sediment out of the boiler, and, perhaps, other washout plugs are removed and the crown sheet rinsed, or the barrel of the boiler partially washed

Rule 50 is another which apparently has not been fully understood, or at least properly complied with by many carriers. It provides "that all steam valves, cocks and joints, studs, bolts and seams shall be kept in such repair that they will not emit steam in front of the enginemen so as to obscure their vision," and, we believe, covers every point where steam leaks occur. It was intended to insure a reasonably clear view of the track and signals for the enginemen, yet we find many instances where no inspection is made while the locomotive is under steam, which is the only time such leaks can be located, yet a report is certified to stating that all steam leaks have been repaired. Inasmuch as the United States statutes provide a very severe penalty for a wrongful certification on a report of this kind, this places the railroad inspector in a very unpleasant position. The law requires a sworn report of each inspection and of the repairs made as a result of the inspection, and as the inspector is responsible, under the law, for the correctness of the statements to which he certifies, the report should show conditions exactly as he finds them.

Another point, the importance of which is not fully realized, is the responsibility of the man who signs reports as officer in charge. Rule 7 provides that "the mechanical officer in charge at each point where boiler work is done will be held responsible for the inspection and repair of all locomotive boilers and their appurtenances under his jurisdiction. He must *know* that all defects disclosed by any inspection are properly repaired before the locomotive is returned to service." The officer in charge is required to sign the following certification: "I hereby certify that to the best of my knowledge and belief the above report is correct." The rule above quoted, which requires him to know that *all* defects disclosed by any inspection are repaired before the locomotive is returned to service and the certification which he signs places even greater responsibility on him than on the inspector, because, in addition to knowing that the inspection and repairs have been made, he must know that the report is correct. For this reason the officer in charge at points where inspections are made should give more of his time and attention to this work than is frequently done at present.

Proper care and adjustment of safety valves is another matter that does not always receive the attention that it should. Rule 34 provides that "every boiler shall be equipped with at least two safety valves, the capacity of which shall be sufficient to prevent, under any conditions of service, an accumulation of pressure more than 5 per cent. above the allowed steam pressure." This rule does not mean that the government shall design the safety valves, say what make they shall be, or anything of that kind. It simply fixes a minimum capacity below which you shall not go. When we have demonstrated by test that the boiler can generate steam faster than the safety valves can take care of it, we have asked and will insist that the capacity of the safety valves be increased to meet the requirements of the rule. Of the first 500 locomotives on which safety valve tests were made, 58 per cent. had valves which would not relieve the pressure in accordance with Rule 34. Immediate steps were taken, however, to remedy this condition and a material improvement has resulted, but there is need for a further improvement in this direction.

Our policy has been to freely and frankly discuss matters of this kind with railroad officers in order to bring about a better understanding of what we believe the law requires, to the end that the desired improvement may be brought about without the necessity of threshing such matters out in the courts. In this we have been wonderfully successful, due largely to the cooperation we have received from a large majority of the railroad officers of the country.

RAILWAYS OF THE UNION OF SOUTH AFRICA.*

**System of 9,050 Miles Owned and Operated by Government—
Organization, Engineering, Operating and Financial Features.**

By E. R. Lewis,
Assistant to General Manager, Duluth, South Shore & Atlantic.

The birth of the Union of South Africa on May 31, 1910, brought under one management the railway systems formerly owned and operated by the governments of the four separate colonies combined in this South African federation. These are the south coast colonies of the Cape of Good Hope and Natal, and the former Boer colonies which adjoin them on the north, known as the Transvaal and the Orange Free State; or the Orange River Colony, as it was called after the British occupation.

At the time of union, the railway systems of these states included 7,207 miles of single track in operation, while approximately 860 miles were under construction. There were authorized in 1911 an additional 527 miles of extensions, now nearly all in operation so that today the government-owned railways of the Union total some 8,500 miles, exclusive of 545 miles of leased and operated lines. This system of nearly 9,050 miles of railways serves an area more than ten times the size of the state of New York, or 500,000 square miles, with a population of about six millions of people.

The conditions under which this system is operated with conspicuous success are unique. The South African colonies had each its responsible government before the consummation of the present Union, which resulted in the amalgamation of the four governments and their different departments, including those of public works and crown lands. The Department of Public Works and Crown Lands is presided over by a minister of the Union government. That division of the department relating to railways and harbors is under one general manager who reports directly to the minister. Thus the policies of railway construction, maintenance and operation are the policies of the government of the country; the results of parliamentary debate, of political expediency and of ministerial decision. With the union of the four colonies, their dissimilar railway equipments and properties, each born of the necessities of that locality which it had formerly served, were pooled under the new ownership and combined under one management. The heavy traffic of the mining districts of the Transvaal, and of the coal fields of northern Natal had been carried in cars and by locomotives of much greater average capacity than those which transported the live stock and forage of the more pastoral Orange Free State and Colony of the Cape of Good Hope.

THE "AMERICAN" UNIT SYSTEM OF ORGANIZATION.

With this new spirit of combination came the decision to adopt for the Union Railways a form of management somewhat similar, or at least based upon, the unit system of some of our most extensive railways, which came to be known in South Africa as the American system.

That this American-African unit system, successor to four highly departmentalized colonial railway managements of many years standing, is quite dissimilar from any American railway management, is not surprising nor indicative of failure.

The retraining of four such lusty orphans, suddenly bereaved, with dispositions ever inclined to disagree in small ways with their next neighbors, now members of the same family, could not be accomplished without some more or less stifled strife and bickering. That so little of bitterness resulted, is a triumph possible only to a nation worthy of those leaders who have guided this republic of the antipodes to its present place among the world powers.

Though at present it presents evidence of being an uncomfortably long step in the right direction, this change should ultimately effect many desired economies. The new railway management was designed primarily to promote efficiency through decentralization. With this end in view, eight divisions of the Union Railways were established. On each division an officer termed a divisional superintendent was put in complete control of operation, engineering, passenger and freight traffic and other details of the running of approximately 1,000 miles of main line.

Furthermore there were appointed three assistant general managers, with jurisdiction over two or three of the eight divisions. Both the divisional superintendents and the assistant general managers are residents of their respective territories, the assistant general managers reporting directly to the general managers at Johannesburg, where are located the headquarters offices.

The assistant general manager at Capetown has jurisdiction over System A, comprising two divisions, with divisional superintendents at Capetown and Kimberley. The assistant general manager at Bloemfontein controls System B, made up of three divisions; while the assistant general manager at Johannesburg has three divisions under his management.

The intention underlying the whole organization was that wide powers of initiative and control should be vested primarily in the man on the spot. Thus, the divisional superintendent is given command of the operating, mechanical, traffic and engineer officers within the limits of his territory. The assistant general managers are intended, of course, to control their several territories in much the same manner as would be done by a general manager of a smaller railway, without interfering in those details of working over which the superintendents exercise executive powers. Thus the general manager is to a great extent relieved of executive matters, and able, therefore, to give his time largely to the larger problems of administration.

All matters pertaining to construction of new lines are under the control of the engineer-in-chief. The survey and construction staff of engineers is extensive, as is necessary in a country of such great area, and a government organization required to investigate the many propositions for new branches which are put before the houses of parliament.

The control of the engineering work on lines under operation being in the hands of the divisional superintendents, the chief engineer is in some measure free to give his attention to consultations, and to act in an advisory capacity to the general manager.

The principles of this organization sound familiar, and are indeed, nearly identical with similar railway organizations of America. The underlying principle is to combat the tendency of all large organizations toward the centralization of control, with the consequent delays owing to lack of authority of resident officers, the multiplication of accounts and the expense and general annoyance of what is commonly called "red tape."

Undoubtedly the results desired in South Africa will be obtained sooner or later if the officers in authority stand by their guns. It is not an easy matter to uproot a bureaucracy of forty years' growth in a government service, much less in four combined government services. That it is being done, however, with advantage to these railways is demonstrable. The difficulties which must be overcome can only be estimated by those familiar with governmental organizations.

Legislative expediency is responsible for the network of wandering branch railway lines which have from time to time been constructed to develop sparsely populated districts of South

*The author of this article acquired most of his information regarding the railways of the Union of South Africa while serving as assistant to their engineer-in-chief.

Africa, sometimes of seeming small future possibilities. Dividends and early returns on capital expended not being so necessary as in the case of privately-owned lines, however, the results of these governmental policies have proved wise, as evidenced by the favorable returns obtained from some of the most arid regions in a few years time.

OPERATION AND OPERATING RESULTS.

Railway operation, or "transportation," in South Africa is distinctly English in method and results. Less than 5 per cent. of the local passenger trains run as much as five minutes off schedule time. Only 23 per cent. of the freight trains run as much as five minutes late per trip. It is safe to say that few railways in America can show such annual records, and these results are obtained in South Africa under conditions unfavorable in many respects, compared with those under which American railways are operated.

The average cost of maintenance per mile per annum of the South African railways is $840, or about 24 cents per train mile. Maintenance of equipment averages 10 cents per engine mile for engines; 13 cents per passenger train mile for coaches, and 11 cents per freight train mile for freight cars. "Running" expenses average about 32 cents per train mile.

For the past ten years gross expenditure has averaged about 62 per cent. of gross earnings, the mileage has about doubled, passenger traffic has increased from 29,000,000 to over 37,000,000 passengers carried annually, and gross freight tonnage has increased from 670,000,000 to 1,110,000,000 tons revenue freight.

The adjustment of freight rates after the consummation of Union of the colonies occupied the attention of government officials for a considerable time, and much of the deliberation had to do with the advisability or otherwise of adopting the basing point system of freight rate making which obtains on the railroads of the southeastern states of the United States. This system was finally and rightly rejected as unsuitable to South African ratings. Both freight and passenger tariffs in that country are influenced largely by the isolated positions of the colonies and by the peculiar topography of the subcontinent.

ENGINEERING CONDITIONS.

The interior of the country is a vast tableland, averaging some 4,000 ft. above mean sea level. The ascent from the coast to the karoo of the hinterland is everywhere abrupt. Each of the few negotiable mountain passes presents serious obstacles to railroad location. The coast divisions of these railways include tunnels, viaducts, rock cuts, heavy grades and sharp curves. The "Cape gage" of 3 ft. 6 in., now the standard gage of the Union Railways, is largely the result of these conditions on the mountain divisions, which were first built without reference to possible extensions into comparatively easy country.

The South African rivers are raging torrents during the short seasons of rain, and dry beds of sand and stone during the remainder of the year when their flow is largely underground. The climate of the karoo is generally delightful, with winters like the crisp October days of our middle states, with once in two or three years a light snow fall. The summers bring hot weather at midday with occasional heavy showers. The nights are very cool. The direct rays of the summer sun are so intense that cross ties are buried in ballast to the railheads to prevent tie checking, and excessive expansion of rails.

These climatic conditions are due to altitude, to latitude, and to the effects of the cold Antarctic ocean current, which follows northward close to the west coast; as well as to the warm Indian ocean current which laves the southeast coast from Zululand to the Cape Peninsula. Frost is left out of reckoning in railway work. Water tanks are open topped. Water pipes may with impunity be laid on top of the ground. Heaving track is an unknown condition. A snow storm is a rarity even in the mountain districts. The sun shines during more days of the year than in almost any other country in the world. The vegetation is luxuriant and subtropical, but a large percentage of the soil is lost to agriculture, because of inability to conserve water for irrigation. Evaporation is excessive, and dams conserving locomotive water supplies are only located across deep and narrow gulches.

Built gradually inland by tortuous routes through the mountain passes from the coast ports of Capetown, Port Elizabeth, Durban, and, in Portuguese territory, Lorenco Marques, four separate lines of railway, since 1873, have been extended, branched and finally connected in the vicinity of the gold mines of Johannesburg. Most of these railway extensions were made in advance of the settlement of the districts they traverse. They have enjoyed almost from their inception the financial potency of government ownership and control. They were built on a permanent basis, even though they were development lines. The number of wooden bridges on the South African railways today may probably be counted on the fingers of one hand. Even water openings as small as 6 and 9 ft. across were originally spanned by plate girders on masonry abutments. Owing to the ravages of wood devouring ants and to the difficulty of obtaining native timber fence posts, telegraph poles and, to a certain extent, cross-ties are made of iron and steel. Old rails play an important part in maintenance repairs, being used as posts and girders in buildings, and in concrete as reinforcement.

The capital expenditure on these railways at the end of 1910 was approximately $380,000,000. The general manager of railways and harbors in his report for that year voiced the governmental policy in part as follows:

"The development of the natural resources of a large area of this vast territory, equal to nearly four times the size of the United Kingdom, is as yet only in the early stages, and, in the interests of the country generally, it is incumbent upon the administration to pursue the policy best suited to aid expansion. . . . South Africa has now become a producer of almost every product necessary for its sustenance, although not yet to such an extent as to make it self-supporting. South Africa differs from most other countries. Its natural means of production require the aid of science to promote development in the initial stages. The presence of great mineral wealth and the markets opened up thereby should, however, provide the resources required, and compensate for the greater natural advantages of other countries."

REVENUES DERIVED BY GOVERNMENT FROM RAILWAYS.

As a matter of fact, the railways have for years been important sources of revenue to the colonial governments. In 1910 the net income of the railways of the Union amounted to an equivalent of $26,500,000, or over 45.5 per cent. of the gross earnings. Nor was this an abnormal year. It must be understood that a large percentage of the freight and passenger traffic is through business. Passenger rates are three times as great as the 2 cent fares of the United States. Freight rates are comparatively even higher than passenger fares. There is no competition except as between the different coast terminals of the system itself. On the other hand, these results are obtained in spite of narrow gage tracks, climbing grades as steep as 3 per cent. around curves as sharp as 20 deg. on the mountain divisions. Locomotive water of acceptable quality and in sufficient quantity is the reverse of plentiful and water softening plants have in some cases been installed.

The equipment of these railways includes 1,450 locomotives, many of American manufacture, and a few of the Mallet compound type; 2,072 passenger coaches and 2,300 freight cars. Approximately $225,000 is annually expended on purchase and repair of tarpaulins used for covering freight loaded in gondola cars. Only 10 per cent. of the freight cars are enclosed. Even stock is transported in high sided gondola cars covered with netting of light rope. The passenger coaches compare favorably with the equipment of the best railways of Europe. South African trains de luxe are all that the name implies, even to compartment sleepers, observation cars and shower baths.

These railways have some 50,000 employees, of whom 26,500 are white, the remainder being Hindus and negroes of the vari-

ous African tribes. The section laborers are almost all negroes, while a large percentage of the foremen are half breeds or negroes. A pension system to which the employees contribute monthly is successfully maintained and self-supporting. It is in fact, a civil service, to which belong regular employees of the railway and other governmental departments, as the public works and post office departments.

The railways obtain a net annual revenue of $110,000 from the catering department, the gross earnings of which are $1,300,000. In addition to the dining car service this department includes railway restaurants, hotels and bars at many of the principal stations and terminals.

All railway news stands are likewise owned and operated to advantage by the Department of Publicity. This department carries on the usual railway advertising, controls the leasing of advertising rights on railway property and goes extensively into photography as a means of educating the world at large as to the products and scenery of South Africa, the opportunities for the immigrant and the traveler.

We note in this connection that "In conjunction with the various municipalities the publicity branch will also, as opportunity offers, thoroughly bioscope South African scenery and industries. The films will be sent to England and sold to bioscope distributing firms."

Betterment work has been steadily proceeded with year by year as on American railways. Surveys for diversions and reductions of grades were under way on a large scale in Cape Colony and the Transvaal in 1903, since which time many extensive betterments in alinement have been carried out. Bridges have been strengthened or replaced to allow of the purchase of heavier equipment, and new track with 80-lb. rail, tie plates and new ties has been laid on the western and other lines of the system. The most thorough renewals have been made within the past two years between Capetown and the Kimberley diamond mines.

COST OF CONSTRUCTION.

Measured by American standards South Africa railway construction is expensive and maintenance is cheap. These conditions are partially the result of cheap unskilled labor, of expensive skilled labor and of the expense of importing machinery; but cheap cost of maintenance is a natural result of exceptionally well-constructed, well-drained roadbed, permanent bridges and good track. The idea that developing lines must be cheap in first cost has been proved wrong through all the years of experience in railway building, but American capital seems never to have learned the lesson. The estimated cost of 526 miles of single line built by the Union in 1911 averaged $23,000 per mile. In this estimate the cost of grading looms very large. Nearly all of the actual construction of the earthworks is performed by negro labor with pick, shovel and wheelbarrow at a wage of scarcely $1.00 per day. South African railway contracts are most often let to large contracting firms, who obligate themselves to turn over the railway complete, for a certain lump sum, after the government has for a certain length of time operated over the track on approval. Such a bargain is usually made only after exhaustive examination by the bidders of soundings for bridges and excavations. The bid is based on the government engineers' approximate estimates made from the located lines and contour maps, which are most exact. All items appearing on these maps and profiles are considered as within the scope of the lump sum bid. All others are extra and are paid for by the force account method. The vexatious questions of classification of materials and overhaul are thus eliminated, while the location and construction of buildings, water tanks, station grounds and side tracks, fence crossings and cattle guards are worked out in advance of construction and included in the contract.

The rails used are of European and American manufacture; the American rail being easier to procure on short notice, while the English rail is favored as better wearing in addition to being a "home" product. The cross ties in use on these railways are of hardwood and pressed steel. The pressed steel inverted trough "sleeper" has not proved economical. It makes bad track when mixed with wooden ties. Derailments are disastrous to the section of steel ties. Once they are bent, it is very difficult to repair and regage them. Cinders and moisture cause them to rust and deteriorate rapidly.

Steel trough sleepers are most in favor in dry desert districts where the loose sand will not pack under wooden ties and where the white ants make short work of wood fiber. Here the inverted trough sleeper confines the sand under its surface where it solidifies or cakes. In such regions track surfacing is done only during rainy weather. The wooden ties in use on the Union railways are the D'jatti from Java, the Jarrah and Eucalyptus from Australia, and the yellow wood of the Knysna forest of Cape Colony. Here the government operates a creosoting factory.

Nine railway tie plantations are maintained by these government railways, where are grown trees of the different varieties of Eucalyptus, pine, cedar and cypress. Of the nine forest farms under cultivation eight are in the colony of the Cape of Good Hope and one is in the Transvaal. The total acreage in trees is 7,341, while nearly 30,000 acres in all are reserved for this purpose.

The use of concrete is very general for bridge piers and abutments, culverts and foundations of all descriptions. Corrugated, galvanized iron is very largely used for roofing, fencing and siding. Water tanks are of 4 ft. sq., cast iron plates framed and calked, imported knocked down from England. Brick and concrete are the usual building materials. Many government buildings have roofs of slate or tile.

PROVISION FOR GOOD OF EMPLOYEES.

The government railways house most of their employees and officers at nominal rentals in comfortable quarters, and further assist them by transporting free of charge all goods ordered from railway co-operative or government contractors' stores, at 10 per cent. less than retail prices at coast ports. These supplies accompany the monthly pay trains, and payment therefor is deducted from monthly wage disbursements.

Schools are built, furnished and maintained for the education of the children of the railway employees. Railway physicians are stationed at convenient points, and free dispensaries are at the disposal of the families of the railway staff, as well as the services of the railway surgeon who has a private hospital car in which he makes regular trips over his district to treat those who cannot come to him.

Railway missions have been established and missionaries have coaches where necessary to hold services at way stations where other quarters are not available.

In short, the management of these railways meets the needs of the country, and anticipates and provides for the wants and comforts of its employees and their families. The lines, so curious to the American mind in many ways, have been, and are the great civilizers of South Africa. In this land of perfect climate, of wonderful flora and more wonderful mines, of savage peoples and arid plains, of luxuriant valleys and sterile mountains, the same problems of civilization and progress are being solved as in our own country, largely by means of representative systems of rapid transit, chief among which is the steam railway.

Proposed Railroad Improvements in Belgian Congo.—The main artery of trade between Congo seaports and not only the upper Belgian Congo, but the French Congo as well, is the Lower Congo railroad from Matadi to Leopoldville, 250 miles. Recently this road has somewhat reduced its freight tariffs. The double-tracking of this line is still under consideration as a possibility, as is the reduction of its curves and grades, and the widening of its gage. The problem of its electrification has recently been studied.—*Mining and Scientific Press.*

CAR WHEELS.

At the meeting of the New England Railroad Club on Tuesday evening, May 13, two papers were presented—one on cast iron wheels by A. A. Hale, of the Griffin Wheel Company, and the other on steel wheels by M. D. Hayes, of the Midvale Steel Company.

Mr. Hale first reviewed the history of the development of the cast iron wheel and then took up its physical properties. He presented a chart showing that the coefficient of friction between the chilled iron wheel and the brake shoe, whether the latter was of the insert type or plain cast iron, was about 20 per cent. more than with the steel wheel, and stated that a great many types of brake shoes which are used on chilled iron wheels cannot be used on steel wheels because of the injury to the tread; therefore, plain shoes having a lower coefficient of friction are essential to steel wheel service; and further the comparative metal worn from brake shoes under like conditions indicates that the life of the shoes is increased from 20 to 25 per cent. where chilled iron wheels are used—a statement that is also borne out by laboratory work.

The real service performed by a wheel is the amount of work that it does. Available data shows that in freight service the performance of the chilled wheel will approximate 375,000 ton miles per wheel, for $\frac{3}{8}$ in. radial wear. Based on a life of from 10 to 12 years and an average mileage of 26 miles per day, it was estimated that the average mileage of a chilled wheel under freight equipment in the United States was from 100,000 to 110,000 miles. Under the present guarantees of 6 years for a 625-lb. wheel, 5 years for a 675-lb. and 4 years for a 725-lb., under cars of 60,000, 80,000 and 100,000 lbs. capacity, respectively, the average chilled iron wheel costs the railroad company 29 cents per year, or $2.32 per car, and the wheel records of the leading railroads of the United States show that 97 per cent. of all freight cars, including 100,000 lbs. capacity cars, are equipped with chilled iron wheels, and, on this basis, it was estimated that there are 2,219,563 chilled iron wheels in use, whose first cost was about $167,600,000.

The trouble is that excessive work is demanded from wheels in proportion to their increase in work as compared with other parts of the running gear, and yet, with nearly 700,000 wheels under 100,000 lbs. capacity cars, replacements have amounted to but 0.9 per cent., and most of these wheels weigh but 700 lbs. They are also being extensively used in passenger service, and by actual count, during a day in the Chicago terminals, out of 49,500 wheels entering there were 15,992 of cast iron.

During the past three years a number of special types of cast wheels have been marketed and they have been widely adopted for both passenger and freight service.

As for carrying capacity, special chilled wheels 33 in. in diameter and weighing 925 lbs. have been placed under engine tenders having a capacity of 9,500 gallons of water and 16 tons of coal, each wheel carrying 27,000 lbs., or a total load of 216,000 lbs. Wheels of the same diameter weighing 840 lbs. are in use under ore cars of 60 tons capacity, operating in a mountainous district, and are working satisfactorily. In fact, chilled iron is the only metal which will stand up under extremely heavy loads without flowing.

The causes for which wheels are removed depend largely on the care which is given them, so that the defects which cause sharp flanges, flat spots, brake burns, etc., can be practically eliminated if sufficient forethought is given to the subject.

Take sharp flanges, for example. One of the first essentials to the prevention of worn flanges is to have wheels of the same circumference mounted on the same axle, also the trucks should be in proper alinement. If a flat spot is formed on a chilled wheel it sounds a warning that attention is needed. In the case of the steel wheel the large flat spots are often rolled out so that the noise is eliminated, but the wheel remains out of round, and there is an increasing burden put on the track and rolling stock.

Like the flat spot, the shelled out spot is caused by skidding. The high temperature thus produced causes a violent local expansion and almost as rapid a contraction, while the balance of the wheel is cool, and this causes the metal to become disintegrated and tear apart, after which the blows which are received in subsequent service cause small pieces to drop out of the surface which has been so weakened, and it takes only a short time for the typical shell-out to appear. If the wheel were examined immediately after skidding took place, the fine network of hair lines could be easily detected.

It would seem that both wheels on an axle should be equally affected, but this need not be the case, because of the sometimes uneven distribution of the load. In brake-burned wheels the tread is broken up in fine hair lines running parallel to each other across the tread. They are developed in greatest numbers in freight service in sections where the grades are most frequent and severe.

Mr. Hayes divided his paper on the steel wheel into two parts, the steel tired and solid steel wheel. He gave a general description of the several types of steel tired wheels which are and have been made, and entered in some detail into the methods of rolling tires.

As for the rolled steel wheel there are four manufacturers now in the market, each producing essentially the same article, but by quite different methods. For example, No. 1 casts a long rectilinear ingot, rolls it into a round bloom, cuts it into short cylinders and then presses and rolls the wheel. No. 2 casts a small conical ingot and presses and rolls this direct into the wheel. No. 3 casts a long cylindrical ingot, cuts it cold, in a lathe into short cylinders and then presses and rolls it. No. 4 casts a long rectilinear ingot, rolls it into a flat slab, cuts square blanks from the slab and then presses out the wheel. The average properties of the rolled steel wheel may be taken, as thus made, as:

Chemical Properties.	
Carbon	.68 to .85
Manganese	.60 to .65
Silicon	.15 to .30
Phosphorus, not to exceed	.06
Sulphur, not to exceed	.05

Physical Properties.	
Tensile strength	125,000 lbs.
Elastic limit	72,000 lbs.
Extension	10 per cent.
Contraction	15 per cent.

Thus the solid steel wheel has the same high qualities as the steel tire.

The method of fabrication used by the Midvale Steel Company is to pour cylindrical ingots from the bottom. These ingots are about 6 ft. long and 20 in. in diameter. They are poured in groups of four from a common riser. After cooling, they are stripped and cut into short cylinders in a lathe, two tools being used entering from opposite sides. They are not cut quite off, but a central portion about 3 in. diameter is left. This is broken and its fracture serves to indicate in a way, the quality of the metal. The top cylinder only, which is about 15 per cent. of the ingot, is discarded and a wheel is made from each of the other sections. Any segregation that may have occurred on the center line of the ingot is punched out in the forming of the wheel seat in the hub.

This section of the ingot is first heated and then subjected to two pressing operations, in which an embryo of a hub and flange is formed. It is then reheated and rolled. Two driving rolls grip it on the web and roll it out, increasing the diameter of the piece until the wheel is formed, a back roll bearing against the outer edge meanwhile to form the tread and flange.

The discussion turned to a great extent on brake shoe action. On this there is comparatively little information, but it appears that the same brake shoe when applied on steel wheels shows a greater wear than when applied on chilled wheels, but as for the effect on the wheels it is almost impossible to segregate the wear of wheels due to operating conditions from the wear by the brake shoe, and yet in a laboratory steel wheel on which more than 10,000 brake applications have been made, varying

from 3,000 to 20,000 lbs. in pressure, there is no appreciable wear.

The importance of keeping brake rigging in good condition was emphasized and attention was called to the great injury that could come to wheels where the hangers were at improper angles.

One speaker in calling attention to the good work that had been done in the past by the cast iron wheel, expressed the belief, though he had no data to substantiate it, that from a metallurgical standpoint the cast iron wheel improved by use. That is to say, the jar and vibration to which it was subjected tended to permit the molecules of the metal to readjust themselves, and thus relieve the initial internal stresses to which the metal was subjected.

THE SIGNAL DEPARTMENT.*

"Jim Cheevers," the bright creation of the editor of *Locomotive Engineering*, was made foreman of a small outlying railroad shop, and found the machinery being run by an unnecessarily large slow speed engine, discarded from the big shops elsewhere, and noticed that a much used path from the yard outside to the enginehouse was through the engine-room; and that a man who had been, on entering, in somewhat of a hurry, which was rare, generally was slowed down as he emerged from the engine-room on the other side. After some study and a campaign of correspondence with the master mechanic, he obtained a small high speed engine and substituted it for the big slow speed type. In a few days Jim was pleased to note a material change in his small force by a quickening of the men's gait, particularly upon passing through the engine-room.

So it is with signals. The present day checking which enforces proper respect for certain of the operating rules is such as to brace up the entire train movement. No longer, without others knowing, can the zealous local freight crew, anxious for a record, make one more last switch on the main track in advance of an approaching superior train. No longer can the inferior train make a too close run for a meeting point. On the other hand, a train, instead of taking siding upon some arbitrary order of the despatcher to wait ten, twenty, and perhaps thirty minutes for a following train to pass, rather can, on signal track, run until, as passing out of any block, the signal seen behind standing at stop marks the entrance of the following train into block limits in the rear, and gives notice to clear the main track at the next siding, with a total delay possibly of not more than five or ten minutes. A train entering a clear block proceeds with certainty at a maximum speed even though it may know that it is following another quite closely. The increase in capacity of a road is due largely to the possible increase in number of trains which may pass a given point in a given time, particularly in those periods of "bunching" which are so apt to occur.

In Tennessee, a heavy single track operating division of 150 miles required three sets of despatchers. The signal engineer designed and installed a controlled manual signal system to give superiority to trains "over the mountain" a distance of nine miles. The number of train orders was reduced thereby 34 per cent. and one set of train despatchers withdrawn.

At a certain junction of single and double track, it is necessary for orders to be put out for all trains in one direction, requiring very close application to the key by the telegraph operator, and a second man is continuously required to handle the interlocking machine. The installation of a system providing for handling trains by signals to the next telegraph office on single track, allows the transfer of most of the orders to this latter station, relieving the first station to such an extent that, for each twenty-four hours, two of the three extra men on the switches are eliminated, with a monthly saving of $110 by an original outlay of $1,500 and a merely nominal increase in monthly expense.

A good signal repairman may make up in moulds the concrete foundation blocks and put on them a good smooth surface. He may make a pretty fair looking bend or offset in a piece of 1¼ in. round steel and put up a smooth even weld in that cross-section of metal. He may cut and thread 1 in. gas pipe and measure and punch the rivet holes for the lengths so as to accurately fit up the connecting line. He may adjust a compensator so as to properly take up the variation due to temperature change. He may either sharpen a chisel or temper it, or grind a twist drill and lay out and drill a set of holes in a steel tie plate so that the track shall remain correctly at gage. He may either file and set a saw and cut a fair miter in lumber for wire trunking, or renew a leather on the piston of an air valve and pack a stuffing box. He knows the sort of lubrication to apply to a mechanical locking bed and to a switch movement, to an air cylinder and to a gasoline engine. He can test out a simple electrical circuit and repair the fault, renew the wire trunking lumber, either over or underground, and apply the pitch, when necessary. He must intelligently handle the expensive 30 per cent. rubber compound wire and properly make and insulate a splice, or may have occasion to do linemen's work and must be able to use the spurs to climb a pole. He may either set a pole, apply a cross-arm to the pole, put on the braces, pins and glasses, tie the wire to the glass, or do odd jobs of painting. If every fifteen mile section of road does not have a man who can do either or all of the things required, it means that a man must travel from some neighboring section to do the required work.

Except the traffic be very dense and fast, a repairman can reach any part of a fifteen mile district in about an hour, by velocipede or motor car. Being on the spot quickly after an accident is of great advantage both as to prevention of unnecessary damage to apparatus and as to check on the working conditions. Modern interlocking plants with their simple checks and counterchecks, such as the facing point lock, the bolt lock, the mechanical locking and the time lock, are about as near foolproof, when rightly maintained, as it is possible to make them. I speak of this for the reason that in every new art there comes a time when there is, through ignorance, a suspicion of some unknown failing against which a man cannot protect himself.

On a lightly signaled division, the repair force may spend as much as six hours in travel for every hour of work. Where this is the case, there is an incentive to provide other duties for the signal force, so as to reduce, to as great an extent as practicable, the waste time on the road. In one case this was done by assigning to the signal men all miscellaneous blacksmith work on the division, all light repairs such as window glass setting, and odd painting. A crew of three men under this assignment would regularly start at one end of the division, and, moving forward a few miles daily, would keep up all light repairs on track tools, switches, switch stands, frogs, crossings, buildings and signals, with but very little time spent in travel.

*Extracts from a paper read before the Central Railway Club, Buffalo, N. Y., May 9, by B. H. Mann, signal engineer of the Missouri Pacific, and president of the Railway Signal Association.

Speed of Locomotives in 1832.—Extract from a report of John Randel, Esq., engineer in chief of the New Castle and Frenchtown Railroad Company, to the board of directors, dated New Castle, July 4, 1832, relative to the performance of the locomotive "Delaware." This engine is one of Stephenson's make, with Booth's patent boiler, and the performance detailed is the first effort made with her. "Yesterday and today I made a trial of this engine between this place and Frenchtown, and have the satisfaction of being able to say that it worked well. The large radii of our curves (the least being 10,000 ft.) will enable us to pass through them without abating its velocity. In going yesterday to Frenchtown we passed through the fifth curve (radius 20,000 ft.) with a velocity of 15 miles an hour. Returning to New Castle we passed through it with a velocity of upwards of 20 miles per hour."—*Extract from the National Gazette, published in the American Railroad Journal of July 14, 1832.*

Maintenance of Way Section.

THE recommendations adopted by the Safety Committee of the Chicago & North Western, which appear in another column in this issue, may impress some as enjoining conduct the desirability of which is self-evident, but it is accidents that result from failing to do what is obviously the right thing to do that are most numerous. If employees can be impressed with the inadvisability of doing things in a way which they know involves risk, or "taking a chance," a large proportion of the accidents will be eliminated. The fact that conditions giving rise to these recommendations have been found to exist on a road with the standards of maintenance of the North Western is a strong indication that these same conditions can be found on many other roads.

IN our issue of November 15, 1912, we described a method used on the Pittsburgh & Lake Erie to equate the work on various track sections as a basis for allotting labor forces for these sections. In this issue E. R. Lewis describes a similar method used on another line and gives the values assigned to the principal items of maintenance work on one large division. These studies are particularly encouraging as showing the attention which is being paid on certain roads to the economic supervision of expenditures for maintenance of way and their distribution to secure the best results. They are especially instructive in view of the general practice of distributing forces arbitrarily to the various sections, and allotting the same number of men to each gang, regardless of the local conditions on the different sections. A study of actual performances and of local conditions is essential to a proper distribution of forces. As Mr. Lewis says, "No employer of labor can accurately distribute his laborers until he knows how much work each one has to do."

WHILE the suggestion made in another column that 6 ft. is a sufficient length for a guard rail will undoubtedly appear radical to many men, this length is nevertheless in line with the trend in guard rail development. Two general conditions govern the length of a guard rail, first (and most important), the service required, and second, the economical use of material. It is for the latter reason that 15 ft. and 16 ft. 6 in. guard rails are commonly used now, one rail thus making two guard rails. With reference to the service required from a guard rail, it is not many years since it was considered necessary that it should be at least 18 or 20 ft. long to properly guide wheels past the point of a frog and to have sufficient rigidity to remain in its proper position. The recent tendency has been materially to reduce the length of the guard rail, as it has been felt that the shorter rails carry the wheels past the point of a frog as safely as the longer rails, the protection opposite the frog being exactly the same, and less material is required. With the modern spacing blocks and rail braces, the short rail can also be held in its correct position as rigidly as the longer rail with its old fastenings could be held a few years ago.

A CLAUSE in a contract recently executed between a railway and a boarding camp contractor stipulating that no meals shall be furnished free to employees of the railway calls attention to a minor but very common abuse. On many roads it is customary for the officers and engineers to stop at the nearest camp for dinner, and it is generally understood that no payments for their meals is expected. In many instances such a camp is the only accessible place to eat and the engineer can also frequently discuss details of the work with the contractor and foremen at this time. The objectionable feature is not in eating at the contractor's camp, but in failing to pay for it—which practice really degenerates into a petty form of graft. Another objectionable practice of a similar nature which is found on many roads and sometimes even specified in the contracts, is the provision for free board and lodging for the foreman. As practically the entire income of a boarding contractor is derived from the payments of the men for board, the laborers in the gang are thus in reality paying the foremen's board, although less able to pay it than the foremen. The placing of the boarding concession on this road upon a sound business basis, where every employee pays for what he gets, is simply applied common sense and common honesty, and its influence upon all concerned should be beneficial, showing, as it does, the attitude of the company towards the various forms of petty graft and irregularity.

THE importance attached to a systematic inspection of frogs and switches varies widely on different roads. On some the engineer maintenance of way or the division engineer personally inspects all main line switches with the supervisors and foremen, noting their condition, giving directions regarding their maintenance and advising regarding repairs or renewals. On others no such inspection is made, the maintenance of switches being left to the supervisors, and in some instances almost entirely to the foremen. This latter practice does not seem consistent with the attention paid to other details of maintenance. Every switch in a main track is a source of weakness and danger, even though small, and therefore precautions to insure the highest standard of maintenance of turnouts are important. The number of accidents resulting from broken or worn switch parts is far from negligible, and in not a few cases the defects giving rise to them would have been discovered by proper inspection. The increasing number of derailments due to worn switch points, especially in combination with worn wheel flanges, has been the cause of considerable concern on a number of roads recently. The action of the American Railway Engineering Association in assigning to one of its committees the study of the relation between worn flanges and worn switch points with a view to decreasing the number of derailments due to them should result beneficially. At the same time it emphasizes the importance of the entire subject of switch maintenance.

THE practice as to setting ballast stakes preparatory to ballasting old tracks varies widely on different roads, and on different divisions of the same roads. In many cases stakes are carefully set before the ballast is unloaded, and the track is then raised to the stakes. In other cases the practice is to raise the track a uniform amount depending on the quantity of ballast unloaded and the judgment of the foreman, without reference to stakes. While extensively followed, this latter practice is open to several objections. The grade line of an old track tends to depart considerably from that originally laid out owing to settlement of banks and other natural conditions. Again, if left to himself, the average track man will raise his track on all occasions, when in fact many times he should dig down to avoid disturbing the grade line. Also rather than compensating each other, successive raises of ballast nearly always tend to aggravate these discrepancies. If these conditions are allowed to continue through successive ballasting, the variations between the actual and theoretical grade lines, while short and perhaps unimportant in themselves, may be sufficient to interfere seriously with tonnage trains and may ultimately result in a reduction in tonnage. On an undulating grade below the maximum these variations may be unimportant, but if on the maximum grade they assume considerable importance. It is very common to find upon theoretical ruling grades of .5 per cent., short stretches of 1 per cent. or even higher grades, due to these causes. Another point which should be considered in setting ballast stakes is that of adapting the raise to the amount of ballast required. With a uniform raise the high points are lifted with the low, although in most

cases the fact that they remain high indicates that less ballast is actually required. If properly set ballast stakes should not only remove many of the minor irregularities in grade, but should also adapt the raise to the needs of the track, in this way conserving the ballast. An inch of ballast saved per mile will pay the cost of setting the stakes several times. Either the maintaining of a uniform grade line or the saving of ballast should be sufficiently important to justify the setting of grade stakes, for the cost of setting these stakes is almost negligible as compared with the amount expended in ballasting.

PROBABLY the most conspicuous inconsistency existing in maintenance work lies in the manner in which ties are handled after being treated with preservatives. The treatment of ties has become so general that a discussion of its merits at this time is superfluous, even though it may add from 10 to 25 cents to the cost of the tie. But precautions to protect the tie frequently end at the treating plant. After it has been left the ties are handled in the same way as previously. One still frequently sees section forces dragging them into place with picks which have been driven into the wood until they have penetrated almost, if not entirely, through the treated portion, giving the moisture direct access to the unprotected timber. Although not as prevalent as formerly, this practice is still followed on a number of roads in spite of the fact that tie tongs can be purchased at a nominal cost, or can be made at the company shops. A cause of much more serious damage is the adzing of ties after treatment. While the adzing of hewn ties is usually necessary to provide a full bearing for the rail, this can be done before treatment as well as after. Not only is the load on the tie concentrated under the rail, but moisture itself is retained here longer than on exposed portions of the tie. Under these conditions nothing can tend to decrease the life of the tie to a greater extent than to remove part of the protected coating on this heavily loaded portion. A beam designed to perform the work of a tie would be especially strengthened at the point of application of the loads, but on the contrary, the resistance of the tie is usually decreased at this point. The adzing of ties before treatment would appear to be consistent with the practice of treating itself, and it is becoming more generally adopted as it is brought to the attention of railway men. It is entirely probable that the thorough preparation of the ties before treatment to reduce the mutilation after treatment to the minimum, will become the general practice before many years.

OPPORTUNITIES FOR MAINTENANCE MEN.

THE comment is frequently heard from engineers and supervisors that there is little opportunity for advancement for officers in the maintenance of way department, the line of promotion being confined closely to those coming up through the operating department. This situation is true on many roads, but is far from universally true. A brief study of the Biographical Directory of Railway Officials just issued, shows that out of 35 presidents of prominent roads selected at random, six came up through the maintenance department, while the number of operating vice-presidents who came up through the same channel is considerably larger. Among the presidents may be mentioned L. F. Loree, of the Delaware & Hudson, who advanced through the engineering department to general manager of the Pennsylvania Lines West; Samuel Rea, of the Pennsylvania who rose through the engineering department of this road as did his predecessors, Jacob McCrea and A. J. Cassatt; H. U. Mudge of the Rock Island, who advanced from section hand to the positions of roadmaster and superintendent; S. M. Felton, of the Chicago Great Western, who started as an engineer on the Pennsylvania; H. E. Bush, of the Missouri Pacific, who advanced through the engineering department, and W. J. Harahan, of the Seaboard Air Line, who was roadmaster, engineer of maintenance of way and chief engineer. Among the operating vice-presidents may be mentioned E. J. Pearson, of the Missouri Pacific; A. T. Hardin, of the New York Central & Hudson River; W. B. Storey, Jr., of the Atchison, Topeka & Santa Fe; George T. Slade, of the Northern Pacific, and A. W. Thompson, of the Baltimore & Ohio. These lists might be lengthened by mention of many other prominent railway men, such as J. Kruttschnitt, chairman of the Southern Pacific. The recent increase in the appointments of engineering and maintenance of way officers to prominent executive positions, including W. J. Harahan, of the Seaboard Air Line; A. T. Hardin, of the New York Central; E. P. Bracken, general manager of the Burlington, as well as the promotion of others to superintendents and similar positions, should be a source of gratification to maintenance men. When the demand is for men who can handle men, and at the same time have a knowledge of the value of labor and materials, it would seem that the maintenance man should be well qualified for promotion, and the increase in the number of them who are being promoted indicates that this fact is constantly becoming better appreciated.

SYSTEMATIC TRAINING OF FOREMEN.

IT is a universal complaint that we do not have the same quality of track foremen we had a few years ago and that they are not capable of doing any work which may be assigned to them outside of their routine duties. It must be admitted that this is to a large measure true. Many track supervisors have only one or two foremen upon whom they can rely properly to lay a switch in a main line. Bridge supervisors likewise complain that they can trust but few of their foremen to operate a pile driver or to build falsework under a main track. This is largely due to two conditions. In the first place, the larger maintenance organizations naturally cause a greater tendency towards specialization, with the result that less attention is paid by the supervisors to instructing the foremen with regard to other than the duties immediately before them. Secondly, with the more permanent nature of the present roadbed and bridge construction, the frequency of emergencies requiring wide experience is less than formerly. It is natural that a man who becomes efficient in any one kind of work should be kept at this and each man should be encouraged to become a specialist in some one line. However, men should seldom be allowed to specialize in one line of work to the exclusion of other lines, for the time is very apt to come when they will be called on to handle other duties. Few things are more disheartening to a construction superintendent than to attempt to carry on track changes or other work of similar nature with foremen who have never done other than routine maintenance work. Their attempts to cut, throw and connect up track in a limited time between trains would often be amusing but for the seriousness of the matter. A versatile foreman is not only valuable in such emergencies as the recent floods, but also in many smaller local emergencies which are encountered from time to time. It is largely because of his versatility and wide knowledge of various problems that the "hobo" is an efficient laborer, and it is not unusual for a "hobo" to be more adept in handling a certain problem than the foreman himself. If the supervisor in any department will make it a point to instruct his foreman regarding the more special problems as opportunity offers and give them an opportunity to handle special work from time to time, he will soon develop a set of men whom he can rely on to handle any class of work he may suddenly desire to call upon them for and greatly widen the field of their usefulness as well as lessen his trials. The gradual narrowing of the range of activities of the foremen is not due entirely to a decrease in the ability of these men, for they themselves are victims of the larger and more specialized organizations built up by the supervisors. The need of personal attention and instruction of the foremen by the supervisor is becoming increasingly important from year to year because of the changing conditions under which they work.

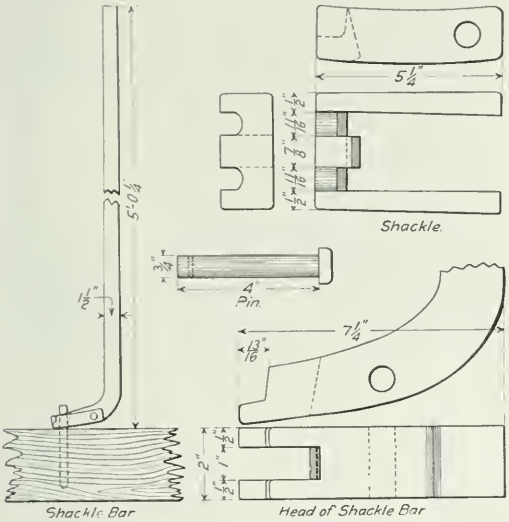
Letters to the Editor.

A SHACKLE BAR.

St. Augustine, Fla., March 10, 1913.

To the Editor of the Railway Age Gazette:

In the issue of the *Railway Age Gazette* for February 21, 1913, there was an article entitled, "A Bolt Puller," by H. C. Swartz, master of bridges and buildings of the Grand Trunk, St. Thomas, Ont. The accompanying blue print shows a similar device which has been used on the Florida East Coast for a number of years. This device is the result of many years



Shackle Bar and Details.

experience and development, and is shown herewith in its final form. While at first glance it would appear to be more complicated than the bar described by Mr. Swartz, it has stood the test of time and is so constructed that it will pull either round or square bolts or drifts of any size commonly used. We make these bars in our own shops and find them very useful and reliable.

A. H. Stead,
Assistant Engineer, Florida East Coast.

INSPECTION BY AUTOMOBILE.

Chicago, May 5, 1913.

To the Editor of the Railway Age Gazette:

With reference to the article published in your issue of December 20, on the cost of automobiles for inspection, the following data on their employment during the construction of the Southern New England Railway may be of interest. In the execution of this work, automobiles were found to be not only desirable but absolutely necessary both for the engineering force employed by the railroad and for the contractors. In this connection, it is interesting to note that the contractors in making claims for the rent of idle plant, present bills to the railway company for their automobiles the same as for steam shovels, boilers, steam drills, derricks and other equipment.

During the construction of the line between Palmer, Mass., and Providence, R. I., the officers of the Southern New England used two machines, one being a seven passenger Alco, and the other a five passenger R-C-H. The contractors used five machines, including two seven passenger Pierce-Arrows, one seven passenger Locomobile, one seven passenger Palmer-Singer, and one Buick runabout. This equipment, however, was found to be inadequate, and additional machines were frequently hired.

The cost of the R-C-H machine used by the engineering department of the railway for a service of about 5,000 miles between September 1, 1912, and March 1, 1913, amounted to $308.73, covering gasolene, oil, tires, repairs and garage charges. This is at the rate of a little less than 6.2 cents per mile. When it is considered that the machines usually carry from four to five passengers, the economy for the service is self-evident. The railway company, however, charges off $600 for depreciation on the machine originally valued at $950. This charge is undoubtedly too heavy, as $300 would probably be sufficient, but accepting figures as they are, they show the total cost of operation of 18 cents per mile.

The advantage of the machines in making trips where frequent short stops are necessary for inspection purposes is clearly indicated in the accompanying table covering a trip from Palmer to Providence in July, 1912:

		Traveling Time.
Leave Power House (1 mile from Palmer)	5:00 A. M.	
Arrive West Brimfield Trestle	5:07	:07
Leave West Brimfield Trestle	5:16	
Arrive Worcester	6:40	1:24
Leave Worcester	6:51	
Arrive Uxbridge	7:48	:57
Arrive Millville	8:00	:12
Arrive Woonsocket	8:16	:16
Leave Woonsocket	9:00	
Arrive Providence Depot	10:00	1:00
Total time traveling		3:56
Dead time		1:04
Total time		5:00

As the distance is about 80 miles, this record shows an average speed of 20.34 miles per hour. No trouble of any kind was experienced with the machine. On another trip the run straight through from Palmer to Providence was made in 3 hours and 37 minutes. On this occasion a seven passenger Packard was employed. The same distance is covered by train on the New York, New Haven & Hartford in 3 hours and 6 minutes.

H. C. Estep.

GRAND TRUNK STAFF MEETING.

The first of a series of staff meetings which are intended to be held periodically for the discussion of technical, practical and accounting features connected with railway construction, maintenance and operation on the Grand Trunk, was held in Toronto on April 19. This meeting was largely attended by the higher officers of the construction, maintenance and operating departments with their chief assistants, division officers and other assistants. The purpose of these meetings is to discuss improved methods, standard practice, economics of construction and maintenance, etc. At this first meeting revised standard specifications covering various classes of work, together with standard forms for reports and accounting in connection with such work, were discussed and adopted, and will go into effect at once. This meeting was presided over by H. R. Safford, chief engineer, although the discussions were entirely informal and position and rank were disregarded.

Among the benefits outlined by Mr. Safford in opening the meeting, were; first: those arising from the personal acquaintance of a large and widely scattered organization; second: increased co-operation between various portions of the same department and between different departments; four departments being represented at this conference. The frequency of these meetings has not been determined, but it is believed that conferences of this nature will not only insure greater standardization and economy of work, but also the formulation of better standards due to the opportunity for a free exchange of ideas.

SANTA FE ROUNDHOUSE AT RIVERBANK, CAL.

The Unit System of Concrete Construction Was Adopted in This Structure. Details of the Design, Casting and Erection.

The Atchison, Topeka & Santa Fe has recently built at Riverbank, Cal., a 90-ft., 15-stall roundhouse entirely of reinforced concrete, where the concrete was cast on the ground in wooden molds arranged in a casting yard adjoining the building site, instead of being poured in place. The reinforcing steel was locked in place in these molds, which were carefully inspected before concrete was placed. After the concrete had set, the members or "units" were lifted from the molds by a crane and set in the building much as if they had been of structural steel. The molds or forms were made with great care, and considerable attention was given to the details and finish, the result being a particularly smooth and attractive concrete surface. The wall slabs were cast flat and the exposed face finished to a fine granulated surface with a cork float.

Fig. 1—Roundhouse Site Showing Foundations and Slab Yard.

Fig. 2—Stiff Leg Derrick for Erecting Units of Roundhouse.

The forms were bedded solidly on timbers laid on the earth and lined up perfectly true and out of wind. The casting yard was about 50 ft. x 250 ft. A stiff leg derrick mounted on trucks which ran on two rails spaced about 30 ft. apart was used to handle the units in the yard. As soon as the units were sufficiently set, they were removed from the forms by this derrick and placed in storage piles to season before being placed in the building.

The parts were erected by a 10-ton stiff leg derrick, with 70-ft. trussed boom and 12-ft. bull wheel, mounted on a triangular tower about 25 ft. high; this tower being mounted on trucks the same as the yard derrick and operated on two rails. As erection progressed, these trucks were moved around on a circular line following the contour of the building. As units were required for erection, they were lifted from storage piles and placed on a truck which was pushed by hand to a point where they could be lifted by the erecting derrick and placed in the building.

Fig. 3—Interior View of Completed Roundhouse.

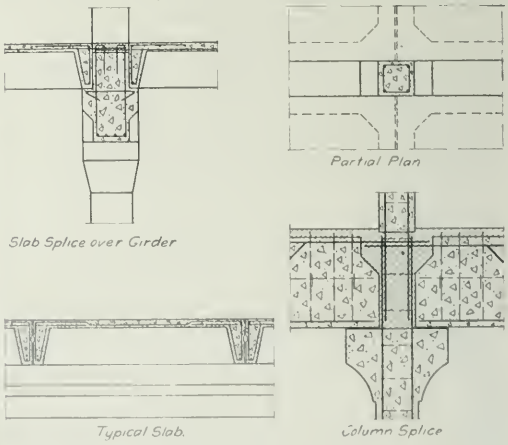


Fig. 4—Details of "Unit-Bilt" Construction of Engine House at Riverbank, Cal.

The foundations of the building, including the engine pits, were poured in the usual manner, except that the column foot-

ings were cast with a socket in which the unit columns were set, and the intermediate retaining walls were cast so as to engage in slots in the columns. The columns were placed in position, plumbed, and then the space under and around the bottoms of the columns was poured full of a 1:2 grout. After this grout had hardened, the wall slabs were placed in position, then the girders were set on the column brackets, and after that the roof slabs were set on the ledges of the girders, as will be seen.

Typical connections between columns and girders and between girders and roof slabs are shown in the accompanying cuts. The arrangement of the main reinforcement for the girders follows usual practice, some of the bars being bent up and carried over the supports. These bent up bars project from the ends of the units and lap over similar bars from the abutting girders. The length of lap is sufficient to develop the requisite stresses in these bars. When the grout is poured, these girders become as truly continuous as in ordinary monolithic construction.

The bars projecting from the tops of the columns into this grout give rigidity, and necessary knee brace action. The roof slabs rest for their full width on the girder ledge; projecting bars extend into the grout space over the girder. The stirrups in the girders also project from the unit girder into this same space, and after this space on top of the girder and between the ends of the slabs has been filled with grout, the strength of the girder is greatly increased on the compression side through the T-beam action resulting. Exhaustive tests have been made, a number of girders being tested to failure, both before and after this grouting had been done. Before grouting, the girder failed in compression, while the girders tested after grouting failed in tension after sustaining approximately double the load sustained by the girders tested without this grouting. The slab beams and a portion of the slab acted in compression with the girder.

The general layout of the building is in conformity with the Santa Fe standard low type roundhouse. The completed building is a true monolith; with the added advantage that the method of construction insures accuracy of design and a quality of workmanship and strength seldom obtained by ordinary reinforced concrete methods. The windows in the rear wall are about 15 ft. wide, and extend from a point about 3 ft. above the floor to the bottom of the eave strut. There are heavy pilasters at the sides of the windows, while the panel below the window is made of very light construction, so that an engine pushing through the wall would not in any way damage the structural part of the building, and would cause only slight inconvenience and expense in replacing the windows and panel beneath. At the end of the house, provision is made for further extension by making the end wall slabs so that they may be easily removed without damage and by providing special roof connections.

This method of putting up buildings, while new as applied to roundhouses, has been in general use for several years in various parts of the country in connection with the construction of factories, warehouses and grain elevators. The method is known as the "Unit-Bilt," and is patented by the Unit Construction Company, St. Louis, Mo.

An incident during the construction of this roundhouse furnished an excellent example of one of the advantages offered by "Unit-Bilt" methods. By mistake, the contractor received a quantity of sand containing considerable mica, which weakened the concrete. The first roof slab containing this sand broke as it was being lifted from the mold, after which all units containing that kind of sand, were tested on the ground with double the required load, and where any failure occurred, the unit was destroyed. With this method of construction it is possible not only closely to inspect each unit before placing it in building, but if desirable, each unit can be tested. Had the building been constructed by ordinary methods the defect would not have been discovered until the centering was removed, when the building would have collapsed. This roundhouse was erected by the Van-Sant Houghton Company of San Francisco, Pacific coast representatives of the Unit Construction Company.

COPPER IN RAILS.

The Chicago, Milwaukee & St. Paul is having 10,000 tons of rail rolled this year containing 0.5 per cent. copper. This follows an order of 5,000 tons of the same composition rolled last year, which went through the past winter without a single broken rail.

THE COST AND HOW TO COUNT IT.

By E. R. Lewis,
Assistant to General Manager, Duluth, South Shore & Atlantic, Duluth, Minn.

The world of transportation is vitally interested in reducing to a truly economic minimum the cost of maintaining railway properties. Chief among these properties is the permanent way. A factor of its upkeep is labor. It is possible only by strict, accurate and continuous accounting to know the cost of maintenance of any railway system. In so far as the labor costs are concerned, this accounting must depend on data furnished by foremen in direct charge of the laborers who perform maintenance work.

Objections are urged that these foremen are overburdened with accounts in addition to the manual labor they have to perform; that their hours of labor are long enough; that the foremen should be allowed to rest instead of keeping books on Sundays and out of hours; and that many of the otherwise best foremen are not versed in mathematics or accounting. That there is a regrettable tendency to multiply railway reports, there is no doubt. This tendency is the result of thoughtlessness, or ignorance, or both. There is no sufficient reason why railway accounting should be increasingly cumbersome.

The best answer to these objections lies, however, in the growing tendency to employ foremen competent to keep accounts, and in the recognition by railway managements of the value of foremen of trained brain rather than of untrained brawn. One extra laborer will more than replace the manual effort of the foreman, whose mental effort, directed to overseeing his men, to the study of improving methods of maintenance, and to the accurate keeping of accounts, will far outweigh the loss to the company of the work he might do with pick or shovel.

The time is past when unskilled direction of unskilled labor is considered desirable. Unskilled labor is of most value to a railway when directly supervised by skilled foremen who keep as constant and careful watch over their books as over their laborers. The cost to a railway of foremen educated to the keeping of accounts often means no more than periodical trips over the different divisions by a clerk or clerks well versed in the desired forms of accounting, and capable of making the matters plain to the foremen.

If it is worth while for the railways to keep accounts, it is surely worth while to base them on accurate data. It must be borne in mind that the keeping of accurate accounts is a matter of education which must begin with the officer highest up. He must learn to recognize the benefits and must provide for the expenditures necessary for such true economies as the accounting will create. This education must reach all members of the staff, down to the man lowest down; for he is the working unit, and the accounting of his labor is the foundation of the economics of railway maintenance.

The generally accepted unit of maintenance values is one mile of single main track. Considering this as 100 per cent., the value of the maintenance of other track units, as one mile of industrial track, one turnout, or one railway crossing may be comparatively stated or equated.

It is, of course, true that circumstances of climate, soil, drainage, materials of construction and maintenance, methods of procedure, management and supply of materials and tools may be of such diverse nature as to exert pronounced influences on any results obtainable for comparative use. Nevertheless, it is practicable to collect and tabulate accurate figures which will give satisfactory average results over zones of several hundred miles extent. Good judgment must govern the division of such territory, to avoid diverse conditions within any one zone. In order to obtain proper results, the accounts for each zone, when considered, should cover a period of one or more complete years, thus accounting for the labor performed during all seasons.

An accounting has recently been completed covering a period of 12 months on a division of 300 miles of single main track and nearly 500 miles of branch tracks and sidings. Several section foremen in charge of large yards, others in charge of country sections of main line and others in charge of industrial tracks, were required to keep strict hourly accounts of labor performed for the maintenance of the several units of the permanent way. The accounts were kept in especially prepared time books under the various prescribed headings. Little instruction of foremen was necessary beyond the initial letter which accompanied the time book and a verbal explanation by the roadmaster.

Preliminary questioning brought out the fact that section foremen are in general prejudiced in favor of caring for main line tracks, rather than for turnouts, sidings, yard tracks, industrial tracks or crossings. They point out the difficulties of keeping tracks clear of cars and consequent loss of time; of the trouble of transporting track materials to their destinations; of the inferior drainage; of the comparatively poor ballast and materials of which these tracks are constructed. While there is much merit in these claims, the actual results show that these difficulties are magnified in the minds of the foremen because they must be to a degree surmounted through the personal efforts of the foremen themselves. Many of them prefer harder straight away work where they are free from worry.

The equated results of 12 months' accounting over the one division referred to are as follows:

Percentages of Labor Expended on Maintenance Units in Terms of One Mile of Main Track.

1 mile of single main track, Class "B"	100	per cent.
1 mile of single branch track	65	per cent.
1 mile of passing track	46	per cent.
1 mile of yard track	32.4	per cent.
1 mile of industrial track	24.0	per cent.
1 main track turnout	3.4	per cent.
1 side track turnout	1.4	per cent.
1 railroad crossing (1 track crossing only)	3.1	per cent.
1 highway crossing (highway over 1 track)	2.0	per cent.
1 mile of fence (5,280 ft. only)	2.7	per cent.
1 mile of right-of-way (100 ft. wide)	4.2	per cent.
1 farm crossing (over 1 track only)	0.4	per cent.

Though these percentages represent actual performance in maintenance, it does not follow that the maintenance is ideal or that the percentages are of unvarying ratio, applicable to all cases and to calculations on all railways. They will in fact vary from year to year on the same territory. But continuous similar records covering longer periods of time are valuable references and guide the railway officer in manning his territory. They make possible a just distribution of maintenance forces. Without some such actual basis of calculation, scientific management is not possible. No employer of labor can accurately distribute his laborers unless he knows how much work each one has to do.

THE FOREMAN PROBLEM.*

By J. D. Archibald,
Assistant Supervisor, Northern Central, Baltimore, Md.

Young men and sons of our present day foremen are not seeking positions as future track foremen for several reasons, which I think are as follows: First: To become a foreman it is necessary to begin as a laborer. This is distasteful to most young men. Second: The children of our present day foremen have had a chance to obtain a better education than did their fathers, and they are in a position to command better positions. Third: A track foreman must be within call at all hours. Many young men like to stop work when the whistle blows and not resume work until the following day. Fourth: Many railways are not paying wages that are attractive. Other departments pay better wages, thus attracting young men. Fifth: The promotion from laborer to foreman is slow.

The first reason above will always be at the bottom of the problem. Most of our present day laborers are from southern Europe and have a poor education. Some, however, are willing to be taught, and it is the duty of each roadmaster to study such laborers. As good men are spotted, they should be placed where they have a chance to learn good track work under a good foreman who will take enough interest to instruct them. The very best way to develop good foremen is by actual work upon the tracks.

*Received in the contest on The Foreman Problem which closed March 25, 1912.

COMPARATIVE ECONOMY OF TREATED TIES.

The Relative Savings of Treated and Untreated Ties, with and without Tie Plates and with Cut and Screw Spikes.

By R. J. Parker,
General Superintendent, Atchison, Topeka & Santa Fe.

Economy in track maintenance resulting from the use of treated ties is not alone measured by greater longevity through the increased resistance of the tie to decay, for a feature that enters in no little degree is that of mechanical wear. We might say that the conditions to which we must give special heed are longevity, mechanical wear and holding power of spikes.

While the latter may be considered under the general head of "mechanical wear," it is really a condition in itself and may with profit be given individual consideration.

Wood is subject to deterioration because of the attack of enemies of both the animal and vegetable kingdoms, and decay may begin within or without. The chief cause of deterioration of ties aside from mechanical wear is due to the penetration of the wood by vegetable spores which feed upon and cause the destruction of the wood cells. Many inquiries as to the cause of cross tie failure develop that 75 per cent. fail because of decay, and 25 per cent. because of rail cutting. The active introduction of preservative processes during the past few years has proven the practicability of tie treatment and our ability to resist the attack of fungi. However, I doubt if there is a railroad in the United States that has sufficient data to determine positively what may be expected and the information furnished will, therefore, be largely personal opinions expressed by various men based on their observation. My idea as to the values of different ties and the life we may expect of them may be briefly stated as follows:

Untreated pine in our territory in general will not last to exceed four years and in a considerable portion of our territory in the South it will not last to exceed two years. On the other hand, heart pine ties in our arid districts will give us ten to 12 years' service, for we have many ties on our Pecos Valley lines that have given this service already.

The average pine tie that gives us approximately four years' life untreated will give nine years' life if treated with creosote when used without tie plates. If plates are installed when the tie is new, the ties will without question give at least 12 years' life.

Untreated red oak ties will not average over four years' life, and while we have not been treating this timber long enough to be able to give a definite estimate of its life, some examined recently, that have been in the track for six years look approximately as good as when they were put in. We believe that 12 years is a low estimate on red oak ties treated with creosote if they are sound when treated.

Untreated white oak ties are generally estimated to last eight years, but an investigation made recently led me to believe that this was too high, and that we will do well if we get from six to seven years out of such ties. I know of numerous cases where white oak ties have been taken out in the last year that have not been in over four years. We have been treating white oak ties only a year, so that we have no idea yet what life we will get from the treated white oak, but reasoning from the service we are getting from red oak, I see no reason why we cannot expect at least two and a half times the service out of the treated tie that we will get from the untreated tie.

It is only in the last five or six years that gum was considered fit for tie timber, and many mistakes have been made in the preparation of this timber for treatment with the result that there has been a large loss of ties by decay before treatment, and also many gum ties were treated that were not fit. However, the gum ties that we have had the longest show up excellently, and I believe that if this timber is treated before it has a chance to decay we will get more spike holding power and resistance to rail wear than out of any other tie unless it be the creosoted white oak.

Different authorities say that the average life of untreated cross ties in the United States is about seven years. It has been demonstrated that decay can be prevented for a period of 25 years or more, but of what advantage is it to so lengthen the life of a tie if it must be removed in considerably less time from mechanical wear? Mechanical wear by rail cutting and by the destruction of the fibres by spikes opens up the interior of the wood to the attacks of fungi causing decay. Decay, of course, breaks down the structure of the wood and weakens it to withstand mechanical wear.

Obviously the variance in cost of maintenance in the use of treated ties as against untreated ties is greater: when no tie plates are used; when cut spikes are used as compared with screw spikes; when tie plates are not used, and with light rail as compared with heavy rail with wider base.

All of these are conditions that produce mechanical wear. With the opening up of the interior of the wood through the destruction of its fibres, we hasten the process of decay, for the fungi will more quickly attack untreated wood than treated. As longevity is the governing element in the ultimate cost of tie renewals, by shortening the life of the untreated tie, we thus place a greater distance between the final aggregate cost of track maintenance with the treated tie as compared with the untreated tie in favor of the treated tie, for we should consider not alone the initial cost of the tie and its insertion, but also the indeterminate sums of money spent in restoring the track to standard conditions, to which we might properly add the interest charges which will accrue in connection with that portion of the expenditures for ties.

For one mile of track with untreated ties, assuming 3,000 ties to the mile at a cost of $0.62 for hewn white oak and $0.12 for placing in gravel ballast we have

3,000 untreated ties at $0.62	$1,860
3,000 ties inserted at $0.12	360
Total	$2,220

Using treated ties of the same kind and under identical track conditions we have

3,000 treated ties at $0.82	$2,460
3,000 ties inserted at $0.12	360
Total	$2,820
Difference in initial cost in favor of untreated tie	600

However, assuming the life of the untreated ties at seven years and treated ties at 14 years, our final reckoning would show for the mile of track at the end of 14 years

Untreated	$4,440
Treated	2,820
Difference in favor of the treated	$1,620

which amount of money with the use of treated ties would have been available for seven years. At 4 per cent. compounded, the interest would amount to $511.78. So much for the interest charges which in defense of the untreated tie might rightfully lead us to the consideration of means of getting out of the untreated tie its maximum life. In doing so there would come to us first of all the following conditions on which the economical use of ties depends: Their preservation; their proper manufacture or shaping; the introduction in the case of heavy traffic lines of adequate tie plates to transmit the load from the comparative narrow rail base to the wood; and a form of fastening which will hold the rail closely to the bearing surface upon which it is to rest. Unless these conditions are observed the wave

motion of the rail together with the intermittent depression and lifting of the ties and the sliding back and forth of the rails will speedily result in their destruction. Again when it becomes necessary at periods ranging from a few months up to seven or eight years to renew rails, we are confronted with these problems: Usually the rail is of heavier section than that it replaces; the ties were already cut by rails having narrower base or even if the rail is of the same section the ties are cut and before the new rails can be placed it is indispensable that the ties should be adzed; labor is usually unskilled and is becoming more so every year; the adzes speedily become dull. Some ties are practically uncut, others are cut by varying degrees up to perhaps one or two inches. The result is that they are mutilated; depressions are formed which gather and hold moisture, the old spike holes plugged or unplugged are covered or partially covered by the base of the rail, spikes are driven into place and the ties are left in such condition that they are peculiarly receptive to moisture and germs that cause decay; therefore, this is another strong argument in favor of the treated tie because of the germ resisting qualities.

Tie plugs play an important part in the life of a tie. Ties fail quite as much from spike cutting as from rail cutting. This is especially true where the curvature is heavy and it is necessary to reline and regage track at frequent intervals; again the roadbed of a railroad is more or less elastic. All ties do not have the same bearing, so even in the most perfect track only approximately stable conditions exist. Because of the wave motion under passing trains, there are comparatively few spikes that are in contact with the rails, and while these spikes are redriven from time to time, it eventually becomes necessary to draw them and drive them in a new place. It is false economy to redrive a spike without immediately plugging the hole it formerly occupied.

The boring of the tie previous to treatment makes it practicable to thoroughly impregnate it with a preservative against decay at the point where it is most vulnerable, namely, where the spikes are inserted and where the wearing action of the tie plates and the rails occurs.

I have dwelt on the economy in the use of ties to illustrate how maximum service may be gotten out of untreated ties, but with all precaution taken, I do not believe that the average life of the untreated tie taken the country over will exceed seven years. It is true that in arid sections untreated ties will average ten to 12 years. The Santa Fe has a record of a large number of Arizona pine ties that have been in track on a secondary line 15 to 18 years, and are still good for one or two more years. It would seem that under such conditions, especially where the traffic and wheel loads are light, full tie plating or the use of screw spikes is unwarranted. Where these conditions prevail in one section of country, the opposite is true in other sections, where the average life of untreated pine ties is as low as two and three years. While this extremely short life of the tie might be increased through practical means of preventing decay that is hastened by mechanical wear, still the wisdom of resorting to such expensive methods to lengthen the life of a tie which without treatment can at best withstand the destructive effects of the fungi only a year or two longer, is questionable.

If 25 per cent. of the tie failures is due to mechanical wear, what part of that wear and tear is overcome by the use of tie plates, screw spikes and dowels? Some authorities say that if these remedies are adopted the average life of ties would be raised from seven years to 21 years or made to last three times as long. However, getting down to a more conservative basis, the great majority of maintenance men will agree that ties unprotected from rail wear and spike destruction will suffer a deterioration of at least 25 per cent., as previously mentioned. Therefore, let us assume that tie plates and screw spikes will entirely eliminate mechanical wear, as I confidently believe they will, and lengthen the life of ties just that much through their application. Let us see, then, what this amounts to in dollars and cents, taking the average maximum life of untreated ties to be seven years and treated ties 21 years, or three times greater, which experimental tests would seem to justify.

One mile of track with untreated ties, cut spikes and no tie plates.

3,000 ties at $0.62	$1,860.00
12,000 spikes at $1.55 per cwt	99.20
3,000 ties inserted at $0.12	360.00
Total	$2,319.20

One mile of track with untreated ties, screw spikes and tie plates.

3,000 ties at $0.62	$1,860.00
12,000 screw spikes at $0.0336 each	403.20
6,000 tie plates at $0.1475 each	885.00
Boring ties for screw spikes	30.00
3,000 ties inserted at $0.15	450.00
Total	$3,628.20
Cost for 7 years	$3,628.20
Cost for 5.25 years	2,319.20
Difference in favor unprotected tie	1,309.00

On this basis in 21 years, ties with tie plates and screw spikes would have to be renewed three times, and ties with cut spikes and without tie plates, four times. Assuming that the screw spikes and tie plates will wear out three ties or have a life of 21 years, and that we can use the cut spikes the second time, the cost for one mile of track would be, in 21 years:

UNTREATED TIES, CUT SPIKES AND NO TIE PLATES.	
12,000 ties at $0.62	$7,440.00
24,000 spikes at $1.55 per cwt	198.40
12,000 ties inserted at $0.12	1,440.00
Total	$9,078.40
UNTREATED TIES, SCREW SPIKES AND TIE PLATES.	
9,000 ties at $0.62	$5,580.00
12,000 screw spikes at $0.0336 each	403.20
6,000 tie plates at $0.1475 each for screw spikes	885.00
Boring 9,000 ties for screw spikes	90.00
9,000 ties inserted at $0.15	1,350.00
Total	$8,308.20
	9,078.40
Difference	$770.20

This shows a difference of $770.20 in favor of construction with screw spikes and tie plates in the place of cut spikes without tie plates, and merely covers the mechanical wear. When due consideration is given to the saving in maintenance expense by reason of frequent redriving of spikes, in the case of cut spikes, and the cost of restoring track to standard condition subsequent to tie renewals four times in 21 years in the one case as against three times in the other, I believe the argument in favor of screw spikes and tie plates has considerably the best of it. Coupled with this is the fact that disintegration caused by decay is hastened by mechanical wear in the case of the unprotected tie, which in itself would far more than offset the difference that the initial expense in the construction would bring about.

These are approximate figures at best, but are sufficiently accurate to command respectful attention. Still further comparison can be drawn by placing the untreated tie with cut spikes and without tie plates against the treated tie with screw spikes and tie plates, thus:

UNTREATED TIES, CUT SPIKES AND NO TIE PLATES.	
12,000 ties at $0.62	$7,440.00
24,000 spikes at $1.55 per cwt	198.40
12,000 ties inserted at $0.12	1,440.00
Total	$9,078.40
TREATED TIES, SCREW SPIKES AND TIE PLATES.	
3,000 ties at $0.82	$2,460.00
12,000 screw spikes at $0.0336 each	403.20
6,000 tie plates at $0.1475 each	885.00
Boring 3,000 ties for screw spikes	30.00
Total	$3,778.20

The foregoing tabulation is based on untreated ties, unprotected from mechanical wear, as having an average life of 5.25 years, which is allowing seven years as the average life of tie less 25 per cent. for mechanical wear, as compared with treated ties fully protected from mechanical wear with screw spikes and tie plates which experience indicates last two and a half to three times longer than an untreated tie unprotected from mechanical wear. It will be noticed that there is a difference of $5,300.20 in favor of the treated tie protected from mechanical

wear, simply taking into consideration the cost of material and the work of inserting the ties. When we add to this the saving in interest charges and the indeterminate cost of rehabilitating the track after each disturbance caused by tie renewal and the difference in running maintenance expense caused by redriving spikes due to the frequent relining and regaging necessary with the cut spikes, especially where no tie plates are used, we have shown in dollars and cents the best possible argument in favor of the treated tie fully protected from mechanical wear. These figures are all based on current prices, although there is every reason to believe that instead of the price of ties remaining the same it will steadily advance to such an extent that within 15 or 20 years we will be paying at least twice as much for ties as we are today. Another strong argument in favor of inserting the chemically treated tie is that their length of life will be increased and a correspondingly smaller number of ties will have to be bought from now on.

In figuring on the use of screw spikes in the foregoing tabulation I have not taken into consideration the use of dowels. Some railroads prefer the use of dowels at the initial insertion, and the A., T. & S. F. has experimented with them, but has found that the screw spikes hold equally well and have perhaps equal lasting qualities when the tie is simply bored to receive the screw spike and thoroughly treated after boring. If it is desired to consider the dowels with the initial insertion, we might add to the figures I have shown the cost of the dowels, which averages about 1¾c. each; the cost of boring ties and inserting dowels would scarcely be any more than the cost of boring ties to receive the screw spike. Some railroads use eight spikes to the tie; others six, but the figures I have given contemplate using four. Another argument in favor of the screw spike is the fact that it is in itself a rail anchor as well as a spike.

In conclusion it might be well to say that any method of inserting ties in track that overcomes unnecessary and deep abrasion should receive highest commendation, whether it be with treated ties or untreated ties, because it is due to decay that fully 75 per cent. of ties fail. Any method of handling that will prevent an unnecessary opening into the interior of the tie and which will prevent moisture from creeping in, is worth while. Tie tongs should displace the track pick in performing the function for which they are intended.

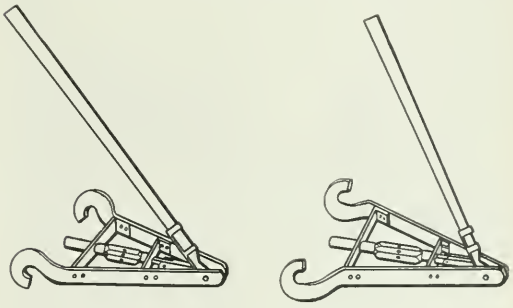
CURVING RAIL WITH A LEVER BENDER.

By L. J. Evans,
Western Pacific, Stockton, Cal.

In the issue of the *Railway Age Gazette* of November 15, 1912, there appeared an article entitled "Jim-Crow Lever Bender vs. Roller Bender for Curving Rails." In my opinion the lever eccentric bender is one of the most efficient track tools to be had today if properly handled, and if it receives the same attention it will compare favorably with a steam curving machine for curving rails. Several years ago I had charge of track laying on an extension up a mountain side to a smelter site. For almost the entire length the track was a series of curves ranging from 8 to 16 deg. As no steam curving machine was available a lever bender was used. After this had been working two days it was found that the track laying was being seriously retarded by the output of the rail curver, 40 to 45 rails per day being as many as could be turned out by moving the curver along the rail and lowering the plunger every 14 to 16 in.

It occurred to us that by allowing the lever and all working parts to remain in the same position as we had been using them and inverting the arms of the bender, we could use it with greater economy and despatch. We therefore built a platform of ties and 4 in. planks on which we fastened the curver securely. Having available a number of stationary rollers which had been used on a steam curver the previous year, we placed them up so as to allow the plunger of the curver to press against the web of the rail. As the flange of the rail was wider than the clearance in the arms of the bender, two short pieces of iron ¾ in. x 2½ in. x 7 in., with one end turned outward 1½ in., were placed between the arms of the bender and the web of the rail, thus clearing the flange and preventing the rail from tilting.

A foreman and eight men had been employed on the bender up to this time. It required 4½ hours of their time to make the change in the bender and build the platform. With the new arrangement the gang was reorganized with four men working the lever and two men on each end of the rail with tongs, leading the rail on the rollers through the curver. While 40 to 45 rails was considered a good day's work with the bender as first used, a careful count kept for 12 days following the



Lever Rail Bender in Ordinary and Inverted Position.

change showed an average of 73 rails per day. With a force of one foreman at $3.50 per day, and eight men at $1.60 per day, this cost $0.2233 per rail.

The previous year the average number of rails curved by the steam curver was 115 per day of 10 hours. With a crew composed of one engineer at $4.25 per day, one foreman at $4 per day, and 10 laborers at $2 each per day, this cost was $0.237 per rail, or $0.0137 more than with the lever eccentric curver. The above is simply a comparison of labor charges and does not include the depreciation of machine, interest on money invested, fuel, oil and other incidentals, which, if considered would give the lever bender a still more favorable comparison.

PORTABLE TELEPHONES FOR EXTRA GANGS.

When an extra gang is working on a line that is equipped with telephones for train despatching it is a great convenience and a means of saving considerable time for the gang and for trains using the road if the timekeeper is equipped with a portable telephone set which he can cut in on the line wherever the gang is working. By the use of such a set he can keep posted on all train movements either by asking the despatcher where a given train is, or simply by listening to the orders that are going over the wire. When trains are running late or extras are frequent it is common for a rail or ballast gang to hold up trains until the track can be closed or a run-off finished. On the other hand, the foreman may plan the gang's work so as to have the track ready for service at the time a regular train is due, but such a train may be late enough to cause considerable loss of time to the gang. If the foreman knows exactly when trains are coming he can plan the work of the gang so as to eliminate delay both to traffic and to the men. A telephone is also very convenient in making reports and calling aid in case of emergencies. P. J. McAndrews, roadmaster, Chicago & North Western, at Belle Plaine, Ia., has been using a set made by the Western Electric Company, shown in the accompanying cuts. The box contains the complete mechanism, and the jointed pole for making the line connection is the only

other equipment required. A line wire about 150 ft. long is supplied which allows the timekeeper to arrange the connection at the most convenient point. The instrument may be kept in a bunk car, although when possible the foreman's car is provided with a permanent telephone. The connecting pole has two hooks on the upper end, one of which is attached rigidly to the pole, and the other is carried on the end of a wire which can be pulled out for several feet from the upper end of the pole. To make a connection with the line wires the hook connected to the movable wire on the pole is dropped over one of

Telephone and Rod in Shape for Carrying.

Telephone in Use Showing Connection to Line Wires.

the line wires, the pole is pulled down enough to draw out this wire for a distance of several feet, and the hook attached to the pole is then dropped over the other line wire. In this position the hook serves both as an electric connection and a means of supporting the pole. The cost of the instrument is about $25, and the saving in the time of a gang can easily be made to amount to many times this figure in a season's work.

TIME CLOCKS FOR TRACK WALKERS.

The Pennsylvania Railroad has recently supplied the track walkers on certain districts with time clocks to insure that the required inspections of the track are being made. Previous to the installation of these time clocks a card system was generally used. While this was the most satisfactory method which had been developed up to that time, it was not entirely reliable, as it was necessary for the operators at the various stations to mark the track walker's cards and collusion between the track walker and operator sometimes resulted.

The time clock system can be so arranged that the track walker's beat may include the entire track foreman's subdivision or it may cover only a limited portion of it. Patrol boxes containing keys each having a different number or letter are located at points where it is desired to secure the records. The boxes are so equipped that they may be placed on telegraph poles, mile posts, or any other permanent structure. Each patrolman carries a time or registering clock. As he makes his rounds he unlocks the metal patrol box with his master key and takes from the box the key for that station, which is attached to the box by a substantial chain. He operates the clock with this key, registering the time and the number or letter of the station on a paper dial in the clock. He then proceeds to the next box, where he repeats the operation. In this way he makes an accurate record of his patrol.

The keys are so made that it is impossible for the patrolman to substitute false keys. It is also impossible for him to remain at any one station and record for the entire patrol without detection, as the keys for the various stations are of different designs. When the track walker has completed his work he delivers his clock to the section foreman who removes the paper dial and sends it to the supervisor for permanent record.

CONTINUOUS RENEWAL OF TIES.

The following from an English contemporary describes the method of renewal of ties to face rather than singly, and is of interest to track men in this country, because of the recent discussions of this subject.

Experience from the past has evolved a system of making the necessary renewal of the sleepers, which are an important part of the equipment, in a way best suited to the general circumstances of this country, and it may be laid down, as an almost universal rule, that sleepers are renewed in bulk with the renewal of the rails. Here and there it may be necessary to renew any single sleeper which has deteriorated more rapidly than the others, but such cases are exceptional, and generally the renewal of the sleepers is carried out with the renewal of the rails. This will occur, under normal conditions, in about 15 years, but must be largely determined by the service on the track, and local conditions.

After such a period the sleepers will not, of course, all be in a uniform condition, so that it is necessary to grade them, usually, into three classes. Those in the best condition would be used on small branch lines with a light train service or in sidings; others in less good condition might be used whole as they are, or cut up as required, for posts or supports or any other of the many purposes demanded by railway work, other than in the track bed; and the last of the three qualities is classified as firewood and only used for that purpose.

The track renewals are in this country mostly carried out on Sunday when the train service is considerably less than on week days, but as much as possible is prepared beforehand so as to have the minimum interference with the running of trains and to reduce Sunday labor.

As the space for handling the material is often very limited, the new sleepers, already prepared by having the chairs affixed to them, to be put in the track are brought out in bulk from the nearest depot, and the old material is removed in a similar manner. The old rails, sleepers, etc., are removed from the track as soon as possession of the line is obtained by the engineering department, and loaded up into the ballast train as soon as possible for despatch to the depot. Meanwhile the new equipment is put in its place so that the traffic can be resumed over the section of newly-laid track at the end of the day's work. A length of about a mile is dealt with at a time, and the interruption to the traffic is only for a period of about 12 hours at a time when it causes the least inconvenience.

Although hardwood sleepers, uncreosoted, have been used to a small extent, the usual timber employed is the Scotch pine from the forests on the Baltic Sea. The sleepers are generally creosoted under pressure before being put into service.

Proposed Line for French Congo.—The French have under consideration the building of a railroad from Libreville, on the French Congo coast, to Nouvelle Anvers, on the Congo river. The first two sections of the line, N'Jole to Makakou, a distance of 300 miles, have already been surveyed.—*Mining and Scientific Press.*

EFFICIENCY OF MAINTENANCE OF WAY LABOR.

A Discussion of the Problems of Section and Extra Gang Organization and Methods of Removing Some of the Defects.

By H. C. Landon,
General Manager, Watauga and Yadkin Valley Railroad, North Wilkesboro, N. C.

The items upon which the efficiency of maintenance of way track labor depend, are the character of the men forming the gangs, character of the foreman, the tools and appliances, daily reports and supervision. The basis of the maintenance of way track labor organization is the section gang. The floating or extra gang is an auxiliary to the section gang and performs work which cannot be done by the section gang during the busy season. It is upon the organization of these gangs that the best results depend; it is also in these gangs, particularly the extra gangs, that much valuable time is wasted during the working season.

CHARACTER OF GANGS.

Ordinarily, the section gang consists of only two or three men, or even less in winter, but it may be increased to six, eight, ten or more in the summer season. With the smaller gangs the greatest efficiency is secured, as a better class of men, frequently native laborers, is secured. If a gang of three men is maintained during the winter and the summer gang is only six men, at least 50 per cent. of the gang is composed of experienced men who know what to do under proper direction. This, however, is not the case where on our trunk lines only one or two men are employed on a section during the winter, and six or more during the summer, or two-thirds of the time. If the men are of any value whatever, they are picked up by contractors and others, leaving only old and inefficient men to be hired either in winter or summer. In the spring, therefore, the important unit of the maintenance of way organization often starts out with all new men unacquainted with the work, and we expect of them the full efficiency of the old-time section gang. By proper handling and careful instructions the men are improved gradually, but we generally find that the work is not progressing as it should, and as additional men are put on the expenses are accordingly increased. Careful training by experienced foremen, and supervisors or road-masters can in time make an ineffective gang somewhat effective, but it takes time and therefore money.

The remedies for the ineffective gang are sufficiently numerous. It is the common practice to shut off all work in winter, and to cut the section gang to the minimum in hours and men. This is a source of loss, as much efficient work can be done in the winter season, at least in the middle states. This work is necessary and should be done where track conditions are often such as to cause criticism. The gage of many of our roads, especially those with much curvature, can receive attention, missing and cut spikes can be replaced, rails can be rolled by adzing the ties, fences repaired, drainage improved, etc. Of course, there are short periods where gangs or men can be laid off to advantage, and if short no bad results will follow. If we can keep small gangs during the winter we then have a good nucleus for the larger gangs during the summer, there will be much less work to perform, much less labor will be required to perform it, and economy is effected.

Wages that will attract better men should be paid, so that the effect of the winter lay off will be counteracted. Railroad managers invariably argue that only the lowest wages should be paid to section men. While the proposition might seem radical, it is believed that for the men who are worth it, an increase in the price of section labor would decrease the cost of maintenance. Graduated pay of men is also important and necessary to get results. There is no question but that a minimum rate can be established for green men and a higher rate per hour for others with two years' experience, or who can pass certain tests designated by the proper officer, and a still higher rate per hour for natives with three years' experience. An attractive rate should be paid for firstmen, who may be promoted to foremen. I believe it would work to advantage also to have a higher salary for natives than for green foreign laborers, and that there are many other inducements to improve the class of labor, and therefore increase the efficiency.

It is in the extra or floating gangs that the greatest waste of labor and money prevails. Twenty-five per cent. efficiency would probably be large for many of these gangs. On most roads they are made up of foreign laborers furnished by labor agencies of various kinds, who of course always furnish the best they have. These gangs are composed of men who do not speak our language, and who are not familiar with our ways. Their manner of living does not provide the sturdy bodies necessary to active and productive labor. For our extra gangs there does not seem to be any other source of labor, and so probably we must use the foreign laborers.

The first thing which should be done is to cull out the old, young and weak, for the very weakest material offered is for extra gangs. The very moment we begin to cut out and clean out the weak and inefficient, we encounter another difficulty which is not always considered, but is generally a reality. The foreign labor is clannish, and the gangs we secure seem to be composed of relations. If you remove one the whole gang may go and the work stops. Occasionally a good gang is secured. The remedy to apply to improve the efficiency is to continually keep after the labor agents to supply good laborers and get rid of the poor laborers at once. Provide fairly good quarters for that class of foremen who will carefully instruct and work their men, and have efficient assistant foremen who are workers, who will see that men while working do not get in each other's way, and who will determine what is a good day's work. Establish a piece work system and pay the men for what they do. This latter plan can in many cases be established.

Cheap labor is always expensive. To illustrate the economy of good labor, although a high price may be paid, I will cite a case where a telegraph line was being built in connection with a new railroad in New York. The railroad company furnished a foreman and a gang to dig the holes and raise the poles and to help string the wires. The work was begun late in September, and was carried on into the winter. In October the cost of the finished line was $1.43 per pole, working all foreign laborers. In December, however, the cost had run up to $2.40 per pole, on account of bad digging and bad weather. The wages paid were $1.40 per day for common laborers. Native labor was plentiful at $2 per day, and it was resolved to experiment with part native labor and part foreign labor. The cost was at once reduced to about $1.85 per pole. The following month all native laborers were employed, and with worse digging, much of it being in rock, and in the middle of the winter the cost per pole was reduced to less than $1.40, and kept down to about these figures until the work was completed. If we can accomplish these results on the construction of a telegraph line, we can do the same on the maintenance of track. On some of our lines extra gangs are employed for a short time during the summer. If the gang is any good, it is only just beginning to be efficient when it is laid off and the men scatter to find work elsewhere, or return to their foreign homes. The conclusion generally is that we could have done the same work better with half of the laborers, had there been a better class of laborers engaged. I do not believe we should

encourage a higher price for the class of laborers now furnished on extra gangs, but rather should draw a better class of extra gang laborers by a higher rate if necessary.

THE FOREMAN.

The section foreman is the man who should and who can advance the efficiency in labor, and who is at fault if the labor is not efficient. On many of our railroads he is well paid, so that we should get better foremen, and therefore better results from our laborers than we do. Our foremen are not carefully trained, and they in turn are too careless in their instructions to the men, and both they and the men are indifferent to the value of labor. The foremen do not understand the value of materials, and while economy has been preached to them in many different ways, it has not appealed to them. The company pays the bills, and the cost of tools and materials has not been explained in a way to impress upon them their value. The training has only been general and desultory. The supervisor has discussed with them in a general way the tamping of ties, loose bolts, drainage, etc. Systematic arrangement of work has also been discussed in a way. These are the average foremen.

Foremen should be trained to become money savers and labor savers. The average foreman is not the only cause of our inefficiency, but he so often allows the bad conditions found on our railroads that we wonder why more serious accidents do not occur. To increase the efficiency of foremen radical methods must be pursued. On each section there should be at least one man who can successfully fill the job as section foreman, known as a firstman or assistant foreman. When the hours are cut in the winter, or the gang is laid off temporarily, this man should be kept at work. If this is not done, the firstman who has had some training, is picked up by some other road or industry, the result being that when one wants a good man he has to go to some other road to get a man who will then require some additional training before he is satisfactory. To carefully guard your interest the foreman should be interested and enthusiastic, and should believe in the future of the road as though he was the highest official. He will then watch the material and labor to see that no money is wasted, the bunching of men will be avoided and a certain specified amount of labor will be accomplished daily. He will so plan his work that he will know exactly what is going to be done the following day or the following week. There will be no mis-strokes, and every move will count for something. Six men will not be carelessly sent to remove a tie when two or three men can do it. All work will be carefully planned, and when the work is started all tools necessary to do the work properly will be at hand. The division officials will be out on the ground enough to see that the work is being properly looked after and effective work recognized.

In order also to make the foreman and assistant foreman understand the importance of their work, all foremen and assistants on the division should be called together at some convenient time for general instructions. It is believed that when the foremen are duly impressed with their responsibilities such improvement will follow. That he is not enthusiastic and is not familiar with his four or six miles of section is a familiar fact. It is rare he can tell you much about the curvature, gage or elevation, and if you check him up, you will find him more often wrong than right. If he is unobserving in these things one can be assured that he gives the saving of labor or material very little attention. It is true that he is anxious for good track, but he wants much help and money to get it. The real remedy, therefore, is the careful selection and education of the foreman and to have the foreman know what he is getting for the labor and material that he uses, and the cost of the tools and supplies that he uses.

TOOLS.

On some of our lines the efficiency is decidedly lessened by the lack of proper tools or tools not properly taken care of. It is not uncommon to see a large gang of men laying track with only one or two adzes, and these about as sharp as a garden hoe, chewing the tie surface instead of cutting it. The fact that grind stones were lying idle in the tool houses has not occurred to any one. It is not uncommon to see gangs working partly equipped with tools, which is a mistaken policy. It is better to have too many tools than not enough.

Care in the use of tools is equally important. On a short line with which I was connected, it was difficult to get sharpened tools until an appeal was made to the proper official to establish a division blacksmith shop in the supervisor's headquarters to take care of our own tools and hand cars. The efficiency of the work was then decidedly increased. While the mechanical department aimed to repair tools promptly, it was difficult to get them to and from the shop quickly and properly repaired. The hand car, which is the most important tool or appliance on the section is rarely ever given proper attention. I have seen repeated cases where men walked to and from their work, all on account of the need of a $25 hand car which the management failed to furnish, the hand cars originally having not been properly taken care of, due to carelessness on the part of the foreman and lack of proper instructions. On one road 50 per cent. of the cars were unfit to use, and the men were unfit to work after they had succeeded in getting the cars to their destination. The cars were sent to the shops for repairs, and when returned were about as serviceable as before they were sent to the shop. With the maintenance of way blacksmith shop it was demonstrated that these hand cars could be satisfactorily repaired, and instead of only 50 per cent. of the cars being available, at least 97 per cent. were in running condition, and all were available. It is believed that the efficiency was increased, at least one man to each gang, due to the easy running cars with which they were furnished.

REPORTS.

If the section foreman is aware that the amount of work he accomplishes daily is carefully and intelligently watched, he is anxious to make as much progress as possible. As the supervisor or roadmaster passes over the section from time to time he gets a fair impression of what is being done and spurs on the laggards to greater effort. There is, however, in this method no way of comparing the work of the various sections and gangs. This can only be accomplished by daily reports, showing the work done and the amount of material used. The reports should be sent to the supervisor daily, who in turn completes them and forwards them to the division engineer not later than the second day after the work is performed. The division engineer or other officer to whom these reports are sent knows exactly how much money is spent daily, the total for the month up to date, and also the progress of each section gang. The very fact that these reports spur each man who is anxious to put forth his best efforts leads him to perform the greatest amount of labor possible, and to eliminate the waste of the time of his men in useless puttering around.

SUPERVISION.

The desired supervision of the various gangs rests with the supervisor or roadmaster who will insist upon having intelligent and ambitious foremen. He will organize the gangs and secure men if possible, who will make good foremen and will take measures to train them. He will see that the work progresses systematically over the sections, beginning at one end of the section and completing the work as it progresses, and will see that the gangs are not moving uselessly about from one end of the section to the other. As a general proposition hand cars will only be used in the going and returning from work morning and night. A hand car moving over the track at any other time should be subject to investigation.

The supervisor or roadmaster will see that proper tools and materials are at all times provided, and will especially see that tools are taken care of and kept in condition to do the work properly, only sharp tools being permitted to be used. It is

necessary for the supervisor or roadmaster to be with the men as much as possible and to point out to them the necessity of avoiding unnecessary and wasted efforts, and keep them intelligently informed as to just what is expected. If the results expected are clearly outlined, the work will move with the least possible labor loss.

CREEPING OF RAILS.

By Paul M. La Bach.
Assistant Engineer, Chicago, Rock Island & Pacific, Chicago.

The term creeping is used to denote the sliding of the track or its component parts in the direction of the axis of the permanent way. There are few causes of creeping found in the track itself, such as those due to temperature changes, the creeping of sufficient magnitude to cause track disturbances being, except in very rare cases, the result of forces generated by the rolling load. A large variety of subdivisions may be made but the following will include all those ordinarily found: Creeping due to the tractive power of the locomotive; creeping due to the friction of locked wheels; creeping due to the wave motion in the track; and creeping due to the discontinuity of the track structure.

CREEPING DUE TO THE TRACTIVE POWER OF THE LOCOMOTIVE.

The force acting at the circumference of the drivers tends to move the rail in a direction contrary to that of the locomotive. If we assume that the force due to the steam pressure is constant we will have the following equation:

$$F = P \times \frac{r}{R} \frac{\sin (X + B)}{\cos B} \text{ where}$$

P = Steam pressure.
r = Radius of the crank.
R = Radius of the driver.
X = Angle of crank.
B = Angle connecting rod makes with axis of cylinder.
\+ = Angle below center.
— = Angle above center.

It will be seen that F changes continually in steam engines and has been found to vary from 20 per cent. below to 20 per cent. above the average in trials made. As this force also decreases as the speed increases, the reader is referred to the curves shown in the article by C. L. de Muralt in the *Railway Age Gazette* of January 17, 1913, referring to both steam and electric motive power. It has been found in practice that the force exerted in this manner is always exceeded, on the steam roads at least, by the forces due to the mass and velocity of the train. Where motors are placed on all axles, different results might be expected, but published accounts of them are not at hand. For those cases in which trains are hauled this action may be regarded as favorable, as it counteracts greater forces which will be spoken of later.

CREEPING DUE TO LOCKED WHEELS.

As long as the wheels continue to revolve upon their axes, without sliding, the friction on the rail is static, but when they become locked and begin to slide the friction becomes dynamic. The following coefficients are in common use for the different speeds, although 1/7 is considered a fair average by some.

DYNAMIC FRICTION BETWEEN WHEEL AND RAIL.*

Just coming to rest....0.242	34.1 m. p. h..... .065
6.8 m. p. h..... .088	40.9 m. p. h..... .057
13.6 m. p. h..... .072	47.7 m. p. h..... .040
27.3 m. p. h..... .070	54.5 m. p. h..... .038

When the brakes are applied the velocity of the train gradually decreases to the point where the brake-shoe friction equals the dynamic friction of the wheel and rail. When this point is reached the dynamic friction of the brake-shoe and wheel rises owing to the reduced speed of rotation and locks the wheel while it slips over the rails because the static friction between wheels and rail has become dynamic friction and is thus reduced from 0.24 to about 0.09. As the speed is reduced, in sliding, the dynamic friction is increased and brings the train to rest. The maximum effect of creeping will therefore be found where stops are made and will be in the direction of running.

*Henderson, Locomotive Operation, page 204.

CREEPING DUE TO WAVE MOTION.

The creeping of the rails has been thought by many to be the direct result of the wave motion in the track under rolling loads. Prof. Johnson advanced the theory that the movement was similar to that of oscillating fluids. That liquids do creep is undoubted and can be calculated but the height of the wave is

Fig. 1.

much greater in proportion to its length than in the case of the rail.

When a single wheel rolls along a track we have a depression under it and an elevation in the front and rear.

Mr. Coüard made the following record from experiments* performed in June, 1903: "When the first wheel of the engine is at 6 meters (19.68 ft.) the movement of the cross-tie, from low to

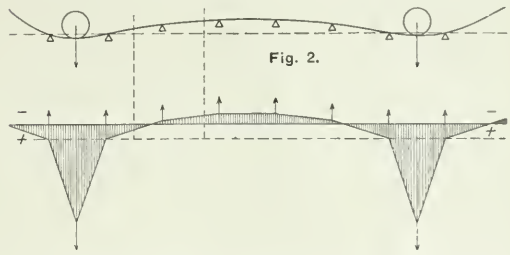


Fig. 2.

Figs. 2 and 3—Upper Part of Diagram Shows Deflection Under Two Wheels of Equal Weight and the Lower One the Corresponding Bending Moments.

high, begins. When the first wheel of the engine is at 3 meters (9.84 ft.) the displacement is maximum. When the first wheel of the engine is at 2 meters (6.56 ft.) the movement from high

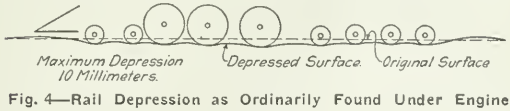

Fig. 4—Rail Depression as Ordinarily Found Under Engine and Tender.

to low, below the initial position, begins. When the wheel is on the cross-tie the depression of the tie reaches the maximum."

This motion is further illustrated by Figures 2, 3 and 4.

produce here. His conclusions will be understood by referring to Fig. 5.

G = Wheel load.
I = Moment of inertia.
E = Coefficient of elasticity.
x = Distance of load from axis Y passing through center of beam.

As the load is a rolling one it will increase from O to G and the lower side of the beam increases in length over the upper side. The total sliding may be expressed by the following formula:

$$W = (x + B)e = \frac{Ge}{2EI} (l^2 - x^2)$$

This will only occur where the least resistance is to be overcome. In the figure shown this would be at the point A as at the instant shown A has the smaller reaction and therefore the least friction. If we move the load in the opposite direction, that is from A to B, then the slipping will occur at B. When x = o we will have the maximum value.

$$W = \frac{Gel^2}{2EI} \qquad (I)$$

When the load continues to advance beyond the center of the beam towards the right support, the beam under the left support begins to move towards B, as that reaction becomes the largest. The whole beam moves in the direction of motion of the load. This movement will be measured by W. Zimmermann represents the work of friction developed by this movement for a beam supported on two points as

$$A_1 = \frac{G^2 efl^2}{6EI} \qquad (II)$$

For a beam fastened at one support to prevent creeping this would become

$$A_2 = \frac{G^2 efl^2}{6EI} \qquad (III)$$

In the above formulae

G is the rolling load.
f is the coefficient of friction of the beam on its supports.
l is the distance apart of the points of supports.
E is the modulus of elasticity.
I is the moment of inertia.
e is the distance of neutral fibre from outer fibre.

From (I) and (II)

$$A_2 = GWf$$

If we wish to know the mean force P which performs the work A we will have

$$PW = GWf$$

Whence

$$P = Gf$$

That is to say that the force which moves the rail in the direction of its length is nearly equal to the friction of the wheel on the rail. In order to get the magnitude of this force we will assume the following values:

G = 14,000 lbs.
e = 2.65 in.
l = 20 in.
E = 29,000,000
I = 41.30

From formula I

$$W = \frac{14,000 \times 2.65 \times 20 \times 20}{2 \times 29,000,000 \times 41.30} = \frac{7,000 \times 2.65}{72,500 \times 41.30} = \frac{18,550}{2,994,250}$$

$$= .0062 \text{ in.} = \frac{1}{160} \text{ in.} = \text{sliding.}$$

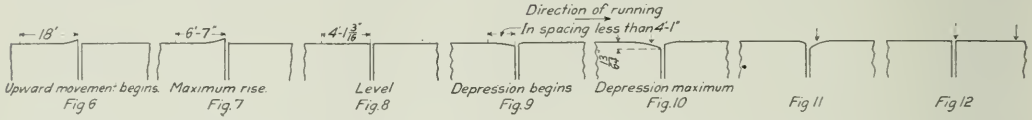
$A_2 = GWf = 14,000 \times 13.33 \times 0.15$
$= 28,000$ ft. lbs. = work of friction.
$P = Gf = 14,000 \times 0.15 = 2,100$ lbs. = reaction due to the work.

The sliding which would otherwise take place will be prevented by the rail attachments and the butting of the rails themselves. The general law expressed by the foregoing is that creeping due to wave motion increases directly as the load and the square of the tie spacing and inversely as the stiffness of the rail.

It will follow as a corollary that this kind of creeping will increase with the speed, the stress in the rails and the traffic.

CREEPING DUE TO THE DISCONTINUITY OF THE TRACK STRUCTURE.

A great many experiments have been made abroad in order to find out just what happens in the rail joint, the principal ones being those of Zimmermann, Flamanche, Coüard, Cuenot, Ast and Wasintynski. For present purposes it will not be necessary to go into the question, as they did, for while following the same principles, our joint fixtures are not the same in detail. As a graphical illustration, the following from the experiments of Mr. Ast has been selected. The joint has no filling.



These diagrams show in a general way what happens to the first wheel of an engine when running if the action of the fish plates is nil. There will always be an upward step in front of the wheel, and consequently a blow delivered which is proportional to its height. By referring to Figs. 2 and 3 it will be seen that there is a tendency to rise between the first and second wheels so that the influence of the first wheel is felt in an upward direction, until the second wheel passes the joint. This will increase the upward step. The remedy which we apply is an attempt at continuity. If a perfect fishing could be devised, without any play, and which did not wear, our troubles would cease and we would only have the difference in height of the

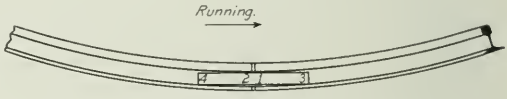


Fig. 13.

rails, due to the wear of the rolls. This may amount to 3/64 of an inch.

In case there is any play between the parts we will have the situation shown in Fig. 13. A plain fish plate is shown for clearness in drawing. When the load is equally divided the ends will be level, but with the load on the left side of the joint there will be an upward tendency on the right hand side due to the forward wheel passing far enough beyond the joint to cause a negative bending in the rail which will be enough to counterbalance the downward pressure at 3 transmitted by the fish plate itself. When the plate is badly worn we will have little pressure between the rail and the plate at either the top or bottom.

It must be borne in mind also that if the load is on the left of the joint that the downward pressure is greater than that

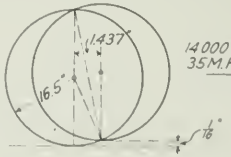

Fig. 14.

transmitted through the fish plate to the right hand side, even under the best of circumstances. When there is a notch worn at 2 so that the rail bends under its load without producing very much pressure on the plate we will have the step up at its maximum.

If we assume that there is 1/64 in. play and that two rails of the + and — inequalities (1/32 + 1/64) found in practice are all in conjunction, then the difference in elevation is 1/16 of an inch, and the wheel delivers a blow of considerable magnitude. If we use the method of Professor Moore, *Railway Age Gazette*, November 15, 1912, the horizontal component of the force will be 54,000 lbs. for the wheels of our heaviest cars, which will, however, be diminished, as the ends are rounded off with wear.

The conclusion we would come to in view of the foregoing figures is that the hammering on the ends of the rails is largely responsible for the creeping. It increases with the speed, load and flexibility of the rail. As the creeping due to wave action and to hammering of the ends is in the same direction it would be difficult to separate them without very careful measuring apparatus. One seldom realizes the force of creeping until he tries to stop it, and he then usually discovers that the first remedies applied are generally inadequate.

ABSTRACT OF ENGINEERING ARTICLES SINCE APRIL 18, 1913.

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the regular weekly issues of the *Railway Age Gazette* since April 18, 1913:

New D. L. & W. Line North of Scranton, Pa.—The Delaware, Lackawanna & Western has under construction a new three-track line between Clark's Summit, Pa., and Hallstead, 41 miles, which involves much heavy construction work and several large structures, one of which will be the largest concrete railway structure built up to this time. A comparison of the grades, curvature and other physical characteristics of the old and new lines was given in the issue of April 25, page 941.

New Delaware River Bridge of the P. & R.—The Philadelphia & Reading is now completing the construction of a double track concrete arch bridge 1,445 ft. long across the Delaware river near Yardley, Pa. The construction of this bridge and the contractor's plant layout are described and illustrated in detail by Edwin Chamberlain, assistant engineer, in the issue of April 25, page 944.

C. M. & St. P. Electrification Through the Rocky Mountains.—Further details of the electrification of the C. M. & St. P. between Harlowton, Mont., and Avery, Idaho, originally announced in the *Railway Age Gazette* of January 10, 1913, were given with a map and profile, in the issue of May 2, page 985.

Government Valuation of Railways.—The Interstate Commerce Commission has given out a statement outlining in a general way the manner in which this valuation work will be done. This announcement, together with the names of the five engineers appointed to form a commission in charge of this work, appears in the *Railway Age Gazette* of May 2, page 986. An editorial discussing the need for concerted action on the part of the railways in defining fundamental principles upon which this valuation should be made, was published in the same issue, page 978.

Weighing Methods on an Eastern Trunk Line.—The methods in use for installing, maintaining and operating track scales on a prominent eastern line were described in the *Railway Age Gazette* of May 2, page 992.

Weldon Viaduct Over the Roanoke River.—The Atlantic Coast Line has recently completed a large steel viaduct crossing the Roanoke river at Weldon, N. C. This viaduct was described and illustrated in the *Railway Age Gazette* of May 2, page 998.

New Freight Pier at Communipaw, N. J.—The Central R. R. of New Jersey completed last year a new covered freight pier for export business at Communipaw, N. J. This pier represents a modern type of construction for such structures and was described and illustrated in the issue of May 9, page 1023.

Erecting the St. Lawrence River Bridge.—In constructing a new bridge over the St. Lawrence river in the suburbs of Montreal, the Canadian Pacific erected two 408 ft. channel spans upon the adjacent approach spans and moved them into place by supporting one end upon barges and the other upon trucks moving on the approach spans. These spans were each moved into position in less than three hours total time, the net moving time being only 28.5 min. The method used to accomplish this was described and illustrated in the issue of May 9, page 1027.

Double Tracking on the Nashville, Chattanooga & St. Louis.—The N. C. & St. L. has been building second track north from Chattanooga during the past two years. This work has involved a number of interesting problems which, with their solutions, were described in the issue of May 9, page 1035.

A $50,000 Freight Platform.—The Studebaker Corporation has recently completed a loading platform for handling automobiles at Detroit. The interesting features of this platform and the methods of loading automobiles were described and illustrated in the issue of May 9, page 1038.

TIE RENEWALS AND BALLASTING.*

By Engineer.

It is important that new ties should be put in the track as early in the season as possible, for this is certain to disturb the track more or less, and ample time should be allowed to ballast and surface the track so that it may become well settled before hot weather arrives and track gangs begin to shrink in size. At points where the rail is to be relaid this should be finished before the ties are renewed, tie renewal and surfacing gangs following as fast as the rail laying is finished.

On main lines with heavy and fast traffic ties should be renewed freely, and it may even be economical to take out ties which can be used again in second or third grade tracks, in order to insure perfect safety on heavy traffic lines. On side tracks and unimportant branches ties should not be renewed until their full life is insured.

Second-hand and smaller ties can be used to advantage in the little used tracks, while only the largest in size and the best in quality should be allowed on main lines.

A very wide field for economy is presented in the selection of the different qualities of ties and kinds of timber which can be used to advantage on the different portions of a large system. Different varieties of ties are most suited for use in the arid regions of the West, in the damp climate of the South and the cold winters and hot summers of the northern part of the country. Different kinds of timber and different methods of treatment are being studied by some roads in relation to their life and service in various localities. The tie map of the C. R. I. & P. described in the *Railway Age Gazette* of June 21, 1912, is a suggestion along this line. The selection and distribution of ties can be watched closely to advantage by all from general manager to section men. The heads of the maintenance departments should see that the allotment is properly made as to amount and kind. The superintendent and roadmaster should further distribute by quality and size to the various points needed, and the section man can also further differentiate to the various parts of the track, the best ties to the joints and softer places and the poorer to the places of lesser wear. On a large road this question is worthy of the sole attention of a competent man. On a system of 8,000 miles using an average of 300 ties per mile per year on renewals, the ties costing 80 cents each in the track, a saving of ten ties per mile per year would amount to a saving of $64,000, while an average increase of life one year by proper distribution of ties that are now lasting ten years would amount to an annual saving of $174,720. By proper supervision these amounts may be multiplied several times. For the year ending June 30, 1912, one western road spent $3,201,865 on the maintenance of 2,600 miles of track, of which $850,901, or over 26½ per cent., was for ties. This was at the rate of $327 per mile and is quoted to show the large relative cost of this one item of track maintenance, and the opportunity for saving by competent supervision instead of leaving the entire question to the section foreman or supervisor, as is done in so many cases.

The usual way of handling tie renewals is with regular section gangs to which extra men have been added. Light surfacing is also done in the same manner, while heavy surfacing and heavy ballasting is frequently done by extra gangs. The surfacing after rail renewal should follow the rail and tie surfacing gangs very closely in order that the rail may not be bent or damaged in any manner by the traffic before the track has been properly surfaced. There is a standing order on one Western road that tie spacing and surfacing shall follow rail laying within a mile.

Where there is plenty of good ballast under the track the surfacing should only be enough to take out the inequalities.

*The fourth of a series of articles on timely maintenance topics. The first appeared on page 351 of the issue of February 21, the second appeared on page 498 of the issue of March 14, and the third on page 905 of the issue of April 18.

The bed of the ties should not be disturbed more than enough to make an even bearing, as any unnecessary disturbance of the bed is injurious and requires time to restore it. Where more than the necessary amount of ballast is put in it is also a waste of money, for an inch of additional ballast per mile of track amounts to 163 cubic yards of ballast, costing on an average about 60 cents per cubic yard, or approximately $100 per mile. However, where ballast is thin or where there is poor ballast under the track, additional ballast should be put in. It is the custom to surface track by making a light raise of two to four inches. This method is advisable where there is some ballast, but where an additional thickness of ballast would be of advantage in distributing the loads over the roadbed. Where there is a new roadbed or track with little or no ballast under it, it becomes a question of adding the proper amount of ballast and making the amount of raise accordingly. Wherever it is necessary to put in over three or four inches of ballast the track should generally be surfaced more than once, as the higher the raise the harder it is for track men to bring the ties to an even bearing. The tamping is likely to be more or less uneven, and the roadbed may settle more in one place than another. Where a thick bed of ballast is put under the track some roads make the raise in several successive lifts of 3 or 4 inches each and some roads make the entire raise in one lift, using large and heavy jacks. This has been done with very good results even under heavy traffic. The main necessity is to keep a long and gradual run off well tamped where the raise begins. It is not as necessary to tamp ties solidly as it is to tamp them evenly, so that when they settle they will all settle alike.

Another reason which probably has rendered it customary to make a two to four-inch lift of the track every few years, is that the weight of rolling stock and the amount of traffic has increased gradually on most of our roads, and this method has added to the amount of ballast under the ties in a similar ratio. There is much track in the country which is not yet even reasonably ballasted, and there is very little track which has a fully adequate amount of ballast under it to properly distribute the weight to the roadbed, and to properly drain the water from the track. The proper thickness depends to a great extent on the quality and kind of material in the roadbed, as well as the quality and kind of ballast. A solid, well drained roadbed will not need nearly so much ballast as a soft, wet one.

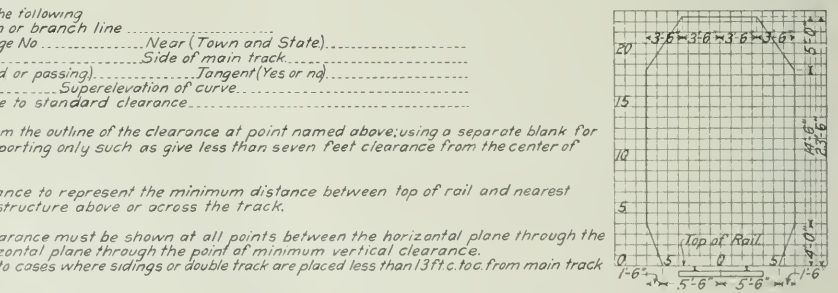
The gangs for ballasting and surfacing need not necessarily be as large as those for laying rail. From 25 to 40 men with two foremen or one foreman and one assistant is ordinarily enough. With too many men in the gang or too many men under the control of each foreman the work can not be properly watched and track will not be raised as true to grade, nor the ties tamped as evenly. In rail laying gangs, native or hobo labor is ordinarily the best, while the surfacing gangs are frequently composed of foreigners. Where gangs are working near each other or at similar work, by creating a spirit of rivalry between the gangs or between different portions of the same gang, very good results may be obtained. The best way to do surfacing and ballasting is with ordinary section gangs. Additional men should be added to them until the extra work is finished.

As soon as the harvest begins and the hot weather is at hand it is hard to keep the forces up to normal. Consequently wisdom demands that the coming month be used to clear up all of this work as far as is possible to do so, and extra men should be employed so that as far as possible the only work left to be done after the first of July will be the regular maintenance work.

A RECORD OF MAXIMUM CLEARANCES.

By Jas. G. Wishart,
Chief Draftsman, Chicago, Rock Island & Pacific, Chicago.

One of the most important records of a railroad, both from a safety and efficiency standpoint, is that of the minimum clearances on its lines. While most railroads make an effort to keep such a record, many of them are more or less unsatisfactory. While the data compiled may be accurate enough, it is in a great many cases put together in too general a form, making necessary reference to other records, and in cases where a doubt arises as to the clearance of a shipment, the reference of the matter to the division officers for a ruling, thus losing valuable time which may result in the loss of the business. The importance of having a strictly up-to-date clearance record, accurately compiled and in such shape that the route, destina-



Standard Blank for Recording Clearance of Each Obstruction.

tion and clearance of a shipment can be quickly and accurately ascertained, is realized on those roads where the acceptance or rejection of shipments of unusual or large dimensions is referred to the department keeping the clearance record, which is, of course, usually the engineering department. In addition to the fact that large and profitable shipments may be lost by railroads whose clearance records are not in such shape that a definite decision can be given in a short time, there may also be cases where shipments accepted on the basis of an improperly compiled clearance diagram, fail to clear some bridge or other structure along the line, and thus cause loss and damage to the railroad company's property, loss of life, inconvenience to the shipper and loss of future business due to the dissatisfaction of the shipper.

A clearance record consisting of a series of tables and diagrams, shown in the accompanying illustrations, will fully meet all the requirements and will enable one to decide within a few minutes on the acceptance or rejection, as far as clearance is concerned, of shipments which may mean the gain or loss of hundreds of dollars in revenue to the company.

Blank forms similar to that shown should first be made up on tracing cloth and a supply of blue line prints sent to each engineer who is to perform the field work. Instructions should also be issued to them that every obstruction that comes within 7 ft. of the center of the track, measured horizontally, and every structure projecting over the track, is to be accurately

measured and platted on one of these blanks. A separate blank is to be used for each obstruction, all dimensions needed for its location being entered as well as a complete description as called for in the table at the upper right hand corner of the blank. The heavy solid line represents the standard clearance diagram, and can be shown simply to bring out at a glance any structure which does not conform to the standard. The dimensions shown are not intended to represent a recommended standard, but are simply those now in use on some roads.

The information when completed for a division and platted on the blanks is forwarded to the office of record, usually that of the chief engineer, where the permanent record is compiled. This permanent record is made up on tracing cloth, for blue printing, on sheets 11 in. long by 17 in. wide and bound in book form. The information from six or seven of the blanks returned from the field is platted on one sheet, a distinctive style of line being used for each obstruction shown on the sheet. A full description of each obstruction is also shown on the sheet, being arranged according to mile post location, numbers in the column headed "Page," refer to the page carrying the diagrams covered by the figures in that line. At the bottom of the columns or at the end of each division, a summary is shown giving the minimum clearance over the entire division. In most cases the clearance of a shipment may be determined directly from the table. Where a doubt arises it is only necessary to turn to the page showing the obstructions on the section of line where the doubtful point is located, and from the description on that page a decision can readily be arrived at.

In compiling the permanent record it is especially important that the track alinement be entered correctly at each obstruction. This information is necessary when shipments of extraordinary length are offered, and they are routed over lines where obstructions are encountered on curves.

In order to keep this record up to date, it is necessary to have the hearty co-operation of the division forces. Blue prints of the diagrams for the respective divisions should be furnished to all operating and engineering officers. They should then be instructed to make special reports of any changes, in

Note:-Dimensions shown are measurements from center of track & top of rail to obstructions.

Typical Maximum Clearance Table.

Two examples of these sheets are shown herewith, one for a single track road and the other for a double track road. The data from these sheets is then compiled in tabular form, as shown in the accompanying table, giving the minimum horizontal clearances at heights varying by one foot, from the top of rail to as high as it is thought advisable to carry them. These clearances are shown for consecutive sections of the line, the territory covered by a section being varied according to the number and distance apart of the obstructions. The structures which affect the clearance record, to the office of record, which then revises the diagrams and tables and furnishes new prints to all concerned.

While this method of keeping a clearance record requires a great deal of time and expense in compiling, the benefits derived by being able to accept one large shipment, which otherwise might have been lost, will offset a large amount of the cost of the record. The time alone saved by the use of this form will in a short time more than pay for its compilation.

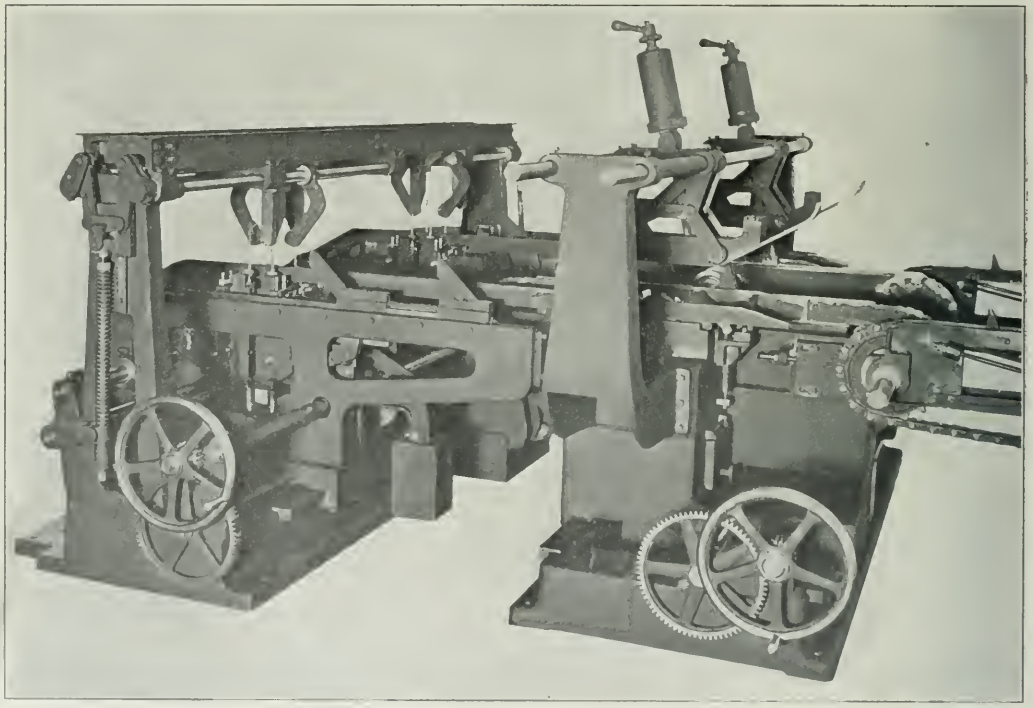
TIE ADZING AND BORING MACHINES.

The adzing and boring of ties before treatment has been practiced to quite an extent in Europe for some time, but it is only within the last two or three years that this subject has received serious attention in this country. With the greatly increased study which has been given recently to the protection of ties the inconsistency of spending from 25 to 50 per cent. of the first cost of a tie in injecting a preservative to increase its life, most of which is retained in the outer portions of the tie, and then cutting and mutilating it by adzing or driving spikes where the service demanded is most severe has become evident. This has brought about the development of machines to properly prepare the ties before they are treated.

The demand for a machine of this nature was the direct result of the application of screw spikes on a large scale, although it has now extended so far beyond this field of screw spikes that two-thirds of the ties adzed and bored before treatment last year were for use with cut spikes. When the Santa Fe first considered the extensive application of screw spikes it became evident that the boring of the ties by hand in the track was slow and expensive, and a machine was therefore devised to bore them before they were installed. The first machine for this purpose was brought out by Greenlee Brothers & Company, Rockford, Ill., late in 1910, and was installed at the Somerville treating plant of the Santa Fe in January, 1911. As it was thought at that time that it would probably be desirable to move this machine from place to place, it was mounted in a car. The second machine of this same type was built the same year for the Santa Fe while others were built for the Northern Pacific and the Panama Railroad; the latter machine not being mounted on a car. Since that time additional machines have been built until nine are now in operation and almost an equal number will be installed this year. The latest machine completed is one which has just been shipped to the Delaware, Lackawanna & Western for installation in the treating plant at Paterson, N. J., and is shown in the accompanying photograph.

While the machines built in 1911 were made as compact as possible, so as to be placed on a car, it became evident that these machines would practically all be permanently located at treating plants. In later designs, therefore, the mounting in cars has been discontinued and they have been allowed to spread out more so that all parts are accessible for inspection and maintenance. They are mounted upon a concrete base covered with a wood block to absorb the shock and thus reduce the heating of the boring tools.

In delivering the ties to the machine they are spaced by means of dogs moving on the conveyor, as shown in the photograph, so that they are fed to the adzing knives at a uniform rate. They are then carried over the knives by other dogs.



New Combined Tie Adzing and Boring Machine.

An important improvement incorporated in the Lackawanna machine is an adjustable device for adzing irregularly hewn ties uniformly so that the finished surfaces are not only parallel, but the ties are adzed to a sufficient depth to provide full bearing for the rail, which was not necessarily the case when the knives moved in a rigid frame and the depth of cutting was limited by the high points of the ties.

The ties are carried from the adzing knives directly to the boring spindles—eight in number, which work upward. Another improvement in this machine permits the boring spindles to be inclined to enable spikes to be driven at an angle, as may be desired under certain conditions. Likewise, the spindles are adjustable for gage so that this may be varied if necessary. The bits may be readily replaced if broken, with a delay of but a few seconds.

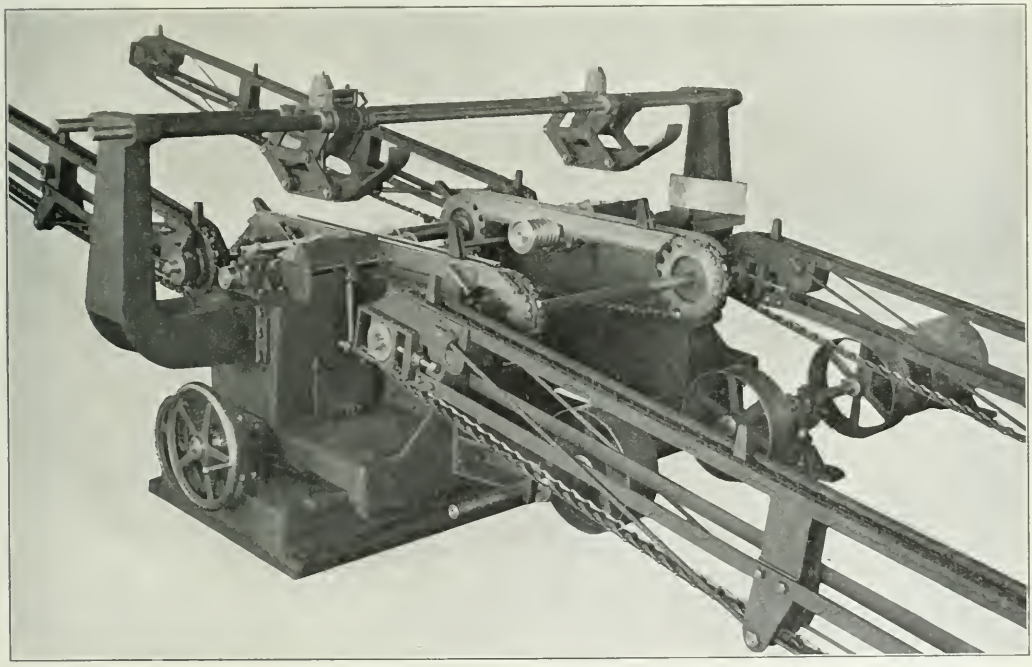
The ties pass from the boring spindles to a stamping unit,

not shown in the photograph, where any desired mark can be placed upon the ends by means of an air hammer. On the Lackawanna the weight of rail for which they are bored and whether hard or soft wood is marked, while at the Port Reading plant, owned jointly by the Philadelphia & Reading and the Central Railroad of New Jersey, the ownership and weight of rail is marked. All shavings and sawdust are collected in a pit under the machine and are withdrawn by air.

Another attachment first installed on a machine for the Philadelphia & Reading and since adopted on a new machine now being built for the Santa Fe, is the cutoff saws which are arranged to remove a small amount from the ends of the ties to detect unsound ties which show no surface defects and thus pass the inspectors. The experience gained from this first machine would indicate that these saws are a justifiable precaution. This attachment is mounted as a separate unit and is placed between the conveyor and the adzing knives.

All the various operations of the machine are synchronized so they act uniformly. The rate of operating depends directly upon the length of travel and the speed of rotation of the bits; the boring operation governing the speed of the entire machine. The Lackawanna machine is timed to pass 6.5 pine ties per min., harder woods, of course, reducing the output. The Santa Fe has passed as many as 4,200 ties through one of its machines in ten hours, although this is considerably above the average rate. A power plant generating 50 h. p. is required to operate this machine. If cutoff saws are installed, more power is required; 75 h. p. being used at Port Reading. The entire machine is under the control of one man; the only other labor required for its operation being that necessary to unload the ties from the tram onto the conveyor and to receive them onto trams after passing through the machine.

Where boring is not required, another machine has been designed by the same company, for adzing only, as shown in an accompanying photograph.



Independent Tie Adzing Machine.

THE IMPORTANCE OF DETAILS.*

By O. B. Cook,
Section Foreman, Chicago & North Western, Parkersburg, Ia.

It is a singular fact that since the "Safety First" movement has been inaugurated, the old things and the little things have been the ones that have claimed our attention. While we find the foreigners employed in track work today fairly intelligent, many section foremen choose the wrong methods to educate them and are often prejudiced and inclined to look upon them as "cattle," good only for what can be gotten out of them. We should first gain their confidence and respect, and then if we see a man do a careless or dangerous thing, it will be easy to correct it.

The proper use of tools and handling of material should be shown to them. It is not necessary to go into detail and enumerate the things that are dangerous to do, as we all know them. However, there is one thing of importance—the handling of hand cars—that deserves special emphasis. They should be kept in the best possible condition. A little shimming up of the wheels to make them run true and safely on the rail, the shimming up of a tight box or other sundry repairs will take less time than the making out of an accident report and will prevent many of these accidents. When several hand cars are used in extra gang work, it is almost impossible to keep the foreign laborers from overloading the best car, with the danger of one or more men falling off and getting killed or badly injured. I do not know of any better way to make section foremen see these things in the proper light than to have them attend the division safety committee meetings. This will broaden their views and will make them see some of the "little old" things with the dangers attached to them, that the section foreman would not think of otherwise.

*Received in the Safety contest which closed October 25, 1912.

GUARD RAIL DESIGN.

By F. W. Rizer,
Assistant Engineer, Chicago, Burlington & Quincy, Chicago.

Although many of our track appliances, as frogs, switches, crossings, switch stands, etc., have been improved from time to time to meet the requirements of heavier traffic and to obtain greater efficiency, so far as general practice is concerned, the guard rail remains as it was a number of years ago and the only improvements have been in the attachments that secure it in place.

The sole function of the turnout guard rail is to prevent wheel flanges from fouling the frog point when approaching it from the toe end. Slight variations in the gage and surface of the track cause a lateral movement of the trucks which increases as the speed of the train increases and wherever there is a break in the continuity of the rail, as at the frog point, a guard rail is necessary to insure the safe passage of the wheels over the break in the rail.

The average length of the main track turnout guard rails in service at the present time is about 15 ft., of which a certain length at each end is flared or at an angle with the main track and the middle part parallel to the main rail, the object being to guide the wheel flange into the flangeway as smoothly as possible, where the lateral movement is restrained while the wheels pass over the frog.

In designing a guard rail to fulfil the requirements it would

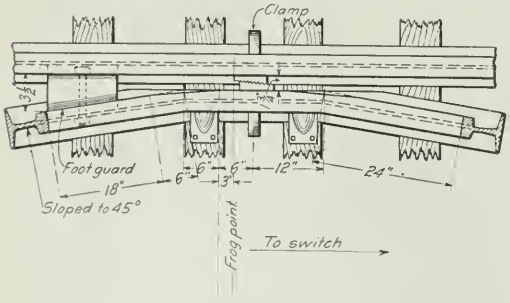


Fig. 1—A 6-ft. Guard Rail.

seem that, as the point of danger is at the frog point only, a few inches or a foot of rail parallel to the main rail, with diverging ends would accomplish the purpose as efficiently as the long guard rail and materially reduce the cost. The angle of the diverging ends should be small and may be determined from a series of practical tests or from the analogous case of the heel riser or raising rail used in frogs and crossings where there is a divergence in the vertical plane. The present practice is to plane these raising rails one-half inch in 6 or 10 in. The former gives an angle of 4 deg. 46 min., and the latter 2 deg. 52 min., and as these rails are subject to practically the same conditions as the guard rail, where the forces act in a horizontal plane the angle of the diverging ends of the guard rail may be established at about 4 deg. The end of the guard rail should be at such a distance from the gage side of the rail as will provide proper clearance for wheel flanges, considering the free movement in the journal boxes, and the wear and variations in the trucks and wheels. A distance of 3⅛ in., which is twice the width of the standard flangeway, provides ample clearance. Subtracting the flangeway (1¼ in.) from this distance and dividing the difference by the sine of 4 deg. gives a length of 25 in. for the diverging end, or the length may be established at 2 ft., making the angle 4 deg. 11 min.

A further easement in the diverging end may be effected by planing off the side of the rail head for 6 in. on each side of the bent point as shown in Fig. 1. This shows a short guard rail as described above. It will be noticed that the ends, instead of being vertical, make an angle of 45 deg. with the horizontal, to prevent dragging brake rigging or other parts from fouling on them. This is an important feature and should be included in specifications, especially as the additional cost would be but a few cents.

It has been the practice for many years to secure the guard rail in proper position by two or more cast iron blocks placed between the webs of the main and guard rails. Bolts extending through both webs and the block hold the guard rail in position and rail braces of various design are applied against the outer surface of the guard rail to resist the thrust of the wheel flanges. There are two defects in the above arrangement: first, as the inside surface of the guard rail head is worn away, the width of the flangeway increases and no means is provided by

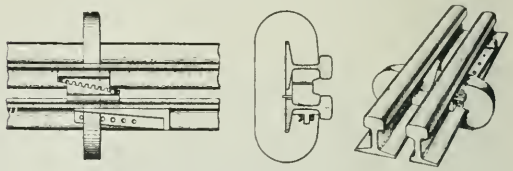

Fig. 2—An Adjustable Guard Rail Clamp.

which the wear may be compensated, except where a two-way block is used in which case one adjustment may be made; second, the lateral thrust of the moving wheel flanges tends to overturn the guard rail, and in a short time results in an increase in the width of the flangeway. Several arrangements of plates and braces have been designed to eliminate the latter defect with but partial success. There is a device known as a guard rail clamp which reduces the defects mentioned above to a minimum. This device has been used extensively in the East, where it has given good service. It comprises a heavy forged or cast steel yoke formed to fit the contour of the rails, a two-piece adjustable block by means of which the guard rail may be brought nearer the main rail to compensate for wear, or the flangeway may be increased when the gage is widened on curves, and a wedge shaped piece which holds the parts securely together. Fig. 2 shows this device in detail.

Rail braces of approved design should be applied near the bends in the guard rail as shown in Fig. 1, and by shearing the flange of the guard rail clearance is provided so that both

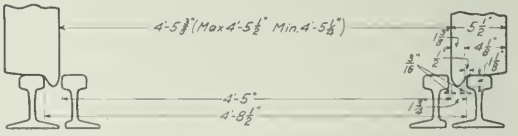

Fig. 3—Standard Guard Rail Spacing of Master Car Builders' Association.

rails may be spiked. When it is necessary to adjust the guard rail on account of wear, tie plugs should be inserted in the old spike holes and the spikes redriven.

Opinion varies as to the use of foot guards. Most of the designs now in service, both metal and wood, are satisfactory, but it is essential that the foot guard be attached to the guard rail in the shop so that when the guard rail is installed no connection with the main line rail is necessary to hold the foot guard in place. The foot guard shown in Fig. 1 is a solid hard wood block.

The details described above cover the essential features of an efficient guard rail, and although to many the short length may seem radical, there are others who think that in the long guard rail there are several feet of rail from which no service is obtained. Some trackmen may contend that a short guard rail

would not be safe if placed opposite a main line spring frog on account of the movement of the spring rail, which is held in proper position by a spring. This rail is free to move outward a maximum distance of 1¾ in. at the frog point, the movement decreasing toward the toe end of the frog where there is no movement. However, as stated above, the real point of danger is at the frog point and should the spring rail open, the short guard rail would arrest the excess lateral movement before the flanges could foul the frog point, which is all that is desired.

In connection with the installation of guard rails there are two details which must be observed: the main rails must be spiked to proper gage, 4 ft. 8½ in. for tangents, and increased when the curvature is sharper than 3 or 4 deg.; and the gage of the guard rails must in all cases be 4 ft. 5 in. This dimension never varies. If the track gage is 4 ft. 8¾ in., the width of the flangeways is one-half the difference of 4 ft. 8¾ in., and 4 ft. 5 in., or 1⅞ in. The following table shows the correct flangeway for track gages from 4 ft. 8½ in. to 4 ft. 9½ in:

Gage of track.	Width of flangeway.	Guard rail gage.
4 ft. 8½ in.	1¾ in.	4 ft. 5 in.
4 ft. 8⅝ in.	1 13/16 in.	4 ft. 5 in.
4 ft. 8¾ in.	1⅞ in.	4 ft. 5 in.
4 ft. 8⅞ in.	1 15/16 in.	4 ft. 5 in.
4 ft. 9 in.	2 in.	4 ft. 5 in.
4 ft. 9⅛ in.	2 1/16 in.	4 ft. 5 in.
4 ft. 9¼ in.	2⅛ in.	4 ft. 5 in.
4 ft. 9⅜ in.	2 3/16 in.	4 ft. 5 in.
4 ft. 9½ in.	2¼ in.	4 ft. 5 in.

This guard rail gage of 4 ft. 5 in. has been established by the Master Car Builders' Association, and as the clearance and distance between wheel flanges is based on 4 ft. 5 in., it is important that the guard rail gage be maintained at this distance. Fig. 3 is an elevation showing the M. C. B. standard car wheel and the relative position of the guard rails.

SAFETY FIRST.*

By Richard Brooke,
Assistant Division Engineer, Baltimore & Ohio, Pittsburgh, Pa.

In dealing with the "safety" problem in the maintenance of way department it must be remembered that the majority of the men in this department, the track laborers, are of a lower grade of intelligence than those of any other department of the railroad, and it is, therefore, more difficult to make each individual undertsand the importance of the movement and to get him interested. A large percentage of fatalities are caused by trains or engines striking men who are standing, walking or working on the track and in a great many cases, where there are two or more tracks, the men get out of the way of one train and step in front of another coming from the opposite direction. Quite a number of men are also killed or injured by trains striking the hand cars or the motor cars on which the men are riding.

To avoid accidents of this kind and any injuries that are liable to result from tools that are not in proper condition, material handled carelessly, etc., the men, if possible, and especially the foreman and assistant foremen, must be made to understand that the company is trying with the co-operation of each individual to do everything possible for their personal safety. This can be accomplished largely through the influence of the supervisors and foremen.

Supervisors should call meetings of their foremen and assistant foremen and try to impress on them the importance of "Safety First" and what they can do to promote it. They should understand that they are, to a certain extent, responsible for the safety of their men, and that in most cases, accidents can be avoided if the safety rules of the company are strictly enforced and by careful vigilance on their part. If dangerous conditions exist on their sections, they should be reported to the division safety committee, with suggestions as to how they can be remedied.

In case of an accident on the division the supervisor should make a thorough investigation and post bulletins at all tool houses, outlining the cause and how it could have been avoided. The fact that a supervisor and section foreman are on the safety committee will add greatly to the interest taken by the men.

*Received in the Safety contest which closed October 25, 1913.

A WELL EQUIPPED BOARDING CAMP.

In the reconstruction of the clearing yard near Chicago, plans for which were described in the *Railway Age Gazette* of March 21, about 400 "hobos" are employed in track gangs. In addition to the good rate of pay which is offered and the fact that the work is located near Chicago, one of the most important factors in securing and holding a good grade of native labor is the treatment which the men receive in the camp. This is all the more important this year because of the large amount of work under way. The Chicago & Western Indiana in conjunction with the Consolidated Boarding & Supply Company, Chicago, which has the contract for boarding the men, have given careful attention to the equipment and management of the camp.

The railway company furnished the cars necessary for the

View in Laborers' Dining Car.

camp, remodeling them from old refrigerator cars for this job. They were sealed, covered with a new roof of tar paper, and painted inside and out. Each camp provides for 200 men and foremen. There are 23 cars in a camp; 12 bunk cars, six diners, one store, one commissary, one kitchen, one foremen's diner and one foremen's bunk. The general arrangement of the camp is shown in the accompanying panorama. All the cars, with the exception of the two foremen's cars are on one track, being divided into three groups as a precaution in case of fire. The bunk cars are separated into two groups of six each, located at the ends of the string. The row of six diners is divided in the middle by the kitchen car, the company and store cars completing the center group of nine. The foremen's diner is directly opposite the kitchen car on an adjacent track, and is

reached by a gangway between the doors. The foremen's bunk car adjoins this diner.

The bunk cars are each equipped with 16 bunks, fitted with a straw tick, a pair of blankets and a pillow covered with a colored slip. The cars have side doors and six windows, two in each side and one in each end. Provision is made for the men to wash in all of the bunk cars. The foremen's bunk car is fitted with steel bunks and iron beds, having a capacity of about 10 men. One man is employed to care for all of the bunk cars.

Each dining car seats 33 men, the appearance of the interior of one of these cars being shown in one of the accompanying illustrations. The table is covered with white oil cloth. Heavy hotel chinaware is used with the single exception of the soup bowls, which are of white graniteware. The kitchen car is 33 ft. long and has two large ranges, having a total length of about 11 ft. These are equipped with all the necessary cooking utensils. The car is manned by a cook, a second cook and a pot washer. A flunky is provided for each dining car to set the tables and place the food on the table. The store car is provided with a refrigerator holding one ton of ice and a large supply of meat. The commissary car is in charge of a clerk who has supervision of the entire camp. The charges for these commissary supplies as well as for board are handled through the railway company, the commissary clerk having access to the timekeeper's books at frequent intervals for checking his payroll.

The food served the men is of good quality throughout. Meats are secured directly from a packing house and are shipped two or three times a week so as to insure a fresh supply at all times. Beef, pork, mutton, sausage and bacon are the staple meats; eggs being provided on Friday, and roast pork and dressing for Sunday dinner. All kinds of vegetables are provided in season and all kinds of canned goods are kept in stock. A baker is employed who works at nights baking all the bread, cakes, cookies and pies that are needed. Either pie, cake or pudding is provided for every dinner and supper. The foremen's dining car is supplied with practically the same food that the men receive, the principal difference being in the service. In addition to the 10 foremen who are boarded here continually, about 30 men from the railway company's office at Clearing are fed at noons in this foremen's car. In the laborer's dining cars the meat is put on the table on big platters and the vegetables in large dishes. The men help themselves as often as they like, the dishes being refilled when they are empty. The camp requires about one ton of meat and 2,500 lbs. of potatoes a week. The daily requirement of sugar is about 100 lbs., and of flour close to one barrel. The water supply for drinking and cooking purposes is secured from artesian wells alongside the camp.

This camp is under the general supervision of M. D. Crawley, general manager of the Consolidated Boarding & Supply Company, to whom we are indebted for courtesies in securing this information.

View of Boarding Camp—Bunk Cars at Each End and Dining Cars in Center.

CONSERVING LIVE STOCK.

J. C. Nelson, engineer maintenance of way of the Seaboard Air Line Railway, writes to the *Wall Street Journal:*

"During the period of harsh criticism and strict government regulation, smiles appear seldom on the average railroad man's face and laughs are still more infrequent. However, we do once in a while run up against something that will bring these results and as an illustration, I attach herewith a verbatim copy of a letter received a few days ago. I may add that we have as yet reached no decision as to this proposition. We are holding the papers hoping that a time may come some day when we can reach a decision which will be equitable and just to all concerned."

The letter follows:

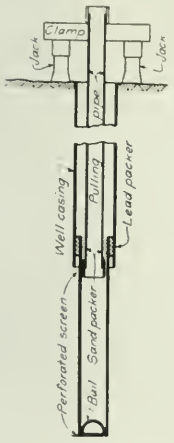
"I wish you would have the culbert cut two feet deepr so my ditch will have moare fall so it will wash out the san and it wont stop in ditch. I hase the ditch most finished so it will do the work O. K. and I will be ready for a settle and will give bond for it to stay fix for year or longer and I want to make a trade with you to make a rat trap that will catch all the rats on your division. I will do this with you, send the rats to you ded or live ten cts each and will take it in passes for my family & self and as long as thare is any rats to be caught you give me a milage pass and charge it to the rat acct, and if any of us rides any more than the rat acct pays for will get ticket or you give me a pass on your division and the hides of all the stocks that the R. R. kills and when only one or two legs are broken I will by them give ½ price or will deliver them to Richland. I could fix a light thing to load a cow on a trane in 5 minutes and if trane should cut a young mars foot off only one I would by her then to rase mules with. Thare is thousand of stock killed that the trane hit, no need of it. I hase saved severald that had thare leg broke. Last Monday I was at Charles and they had a cow that the trane had broke one of her legs and about 2 inch of the bone was sticking out. The foman sayed he was going to have her killed. I told him to take the cow at 250 cts & I would fix the leg O K and pay for the feed if cow dyed and if live he pay me for my surgical opperation. I sawed two inched of the bone off and put the other bone in and I think in a few weeks the cow will be O K and lots of time it would save the Sixion foman ½ day work going seeing after the cows that is killed & when I skin one I will drag it off the rightoway and the busards will eat it up before it begin to smell bad much and that will save the Foman of buyin stock—and if you will have the suer that covered up in san doing no good dug up and put under the R. R. to controle the water that comes down on the left of the St going up town that would stop all the rane from runing in track and having so much slop, the ditch I cut controles all the water that comes down on other side. let me no what day you will come and I will meet you."

"SANDING IN" WELL SCREENS, CASING AND PIPES.

By L. J. Putnam,
Division Engineer, Chicago & North Western, Boone, Ia.

The railways as well as many of the smaller towns and cities throughout Iowa and the neighboring states depend for their water supply on cased wells from 60 to 200 ft. deep. The water-bearing material encountered lies usually immediately over rock which is in all cases limestone. Resort to these shallow wells is had on account of the water being much better for boiler use than the deeper artesian waters encountered below or in the limestone. The well used by the Chicago and North Western, and very generally by other roads and cities is a drilled well cased with 12 in. butt jointed, steel drive casing with a tubular brass screen about 30 ft. long at the bottom. These large dimension screens cost about $350 each, and the well casing costs about $1.60 per ft.

These wells are of short life, as there is a gradual choking up, not so much from clogging of the screen as from the gradual drawing in around the screen of fine material which shuts off the flow of water to a large extent and makes it necessary to sink other wells. From one to four years is about the range in life of wells of this character. When new wells are put down the casing is necessarily sunk to the bottom of the water bearing vein. The screen is then lowered and the casing is jacked up slightly less than the length of the screen, so as to bare the screen for the whole of its perforated length. After this operation, the top of the screen, which is provided with a lead packing ring, is swaged out with a special tool to seal the top of the screen against the casing. For a larger portion of the distance sunk the material encountered is clay which develops a very high skin friction on the casing, making it very difficult to withdraw the casing to bare the screen, and frequently it is necessary to pull the casing partially from the inside near the bottom to relieve the strain on the threaded joints occasioned by outside top pulling, and thus prevent pulling the casing in two and losing the screen, the casing and the labor expended.



Method of "Sanding in" Well Casings.

The withdrawal of the casing to bare the screen as well as the removal for re-use of the casing and screen is a problem which has been very successfully solved by what is locally termed "sanding in" of an inside pulling arrangement. Where the pulling of the casing for uncovering the screen develops more of a strain than the threaded joints will safely bear a 10 in. casing is firmly coupled up and lowered into the well. The lower end of this inside casing bears an ordinary coupling, or if the coupling does not fit the outer casing closely, a special coupling is provided so that it forms a close, but not a driving fit inside the 12 in. casing. This special coupling is lowered to about one-half the depth of the well and "sanded in," which consists simply in dropping a shovelful of sand between the inner and outer casing. Jacks can now be applied to the inner casing as well as the outer, only as much strain being put on the top of the outer casing as it can safely stand. The first strain of the jacks on the inner casing produces a wedging effect in the "sand packer" between the inner and outer casing and clamps the two firmly together. When the casing has been withdrawn sufficiently, a few turns of the inner casing after dropping it a little to loosen the sand will cause the sand to sift through, freeing the inner casing for removal. If the pulling strain is too great for the combined strength of the two casings, a rod can be inserted to engage the bottom of the inner casing and other jacks used on this.

In the case of removal of screens and casings, the method of procedure is obvious. The brass screens as furnished by the factory usually have a bail at the bottom, intended for use in lowering the screen. Our practice is to take this out entirely and close the bottom with a shovelful of cement mortar after the screen is in. The dropping of cylinders, drop pipes, or rods into wells during the operation of placing pumps is not an infrequent occurrence. With concrete bottom, no harm is done; while with the factory made bottom a weight dropped on it is apt to lower the screen so as to pull it down below the casing, resulting usually in complete loss of screen and well. If the screen is not lowered by such an accident, the chances are that it will be pulled in two with the same net result—loss of screen and well. Even if the factory made bottom were free from this objection, the bail would be useless for removing the screen from an abandoned well for two reasons: first, it would be covered with fine sand during the operation of the well and second, if not so covered, a strain on it sufficient to slip the top lead packer in the casing would collapse the screen, which is too fragile for such strains. Our method is to "sand in" a coupling as above described at the top of the screen, where it is solid. No trouble is then experienced in pulling the screen without damage to it. After the screen is removed, if the casing starts unduly hard, an innner casing is sanded in near the bottom and both casings removed together.

The above method is in general use by us with the best success. The pulling is necessarily slow for part of the distance, but we have just recovered for re-use material worth $600 by an outlay of $50 for labor, an instance of what can usually be expected. Aside from the saving of material from abandoned wells, this method makes it possible to raise casings to bare screens when skin friction is so great that wells of this nature would be impossible without this expedient.

The same method might be successfully used in other than well work, as for instance anchoring guy wires or lines to holes drilled in rock where a temporary arrangement easily removed is desired. In fact the ordinary reader will recall many places where such a method can be used to great advantage. The accompanying cuts illustrates the application to the removal of a well screen.

"SAFETY" RECOMMENDATIONS.

In the report of the general safety committee of the Chicago & North Western for the years 1911 and 1912, just issued, figures are given showing that during the two years ending December 31, 1912, 10 fewer track men and two fewer bridge men were killed and 927 fewer track men and 141 fewer bridge men were injured than in the two years immediately preceding. The report also contains a large number of general recommendations made by the local safety committees and approved by the central safety committee, of which the following are of interest to maintenance of way men:

Foremen of extra gangs should be provided with a whistle to notify men to get off the track when trains are approaching.

Gearing of hand cars should have shields over them.

Instructions should be issued to stop the practice of burning ties on right of way near bridges.

The use of guy wires on top of outfit cars provided with stoves should be prohibited and standard way car jacks ordered to be used instead.

Gas pipes should be adopted for use of handles on hand cars instead of wooden handles.

Bunk cars occupied by B. & B. and track forces should be protected at night by blue lights and during the day by blue flags, placed one on each side of the car and at diagonal corners.

All gasolene hand cars should be covered so there will be no

danger of anybody getting hurt by the engine while it is in motion.

Wherever possible loading of scrap iron in stock cars should be avoided.

Flagmen of section or extra gangs should be provided with torpedoes in addition to a flag.

Division superintendents should issue instructions prohibiting section men from going under cars when it rains or for any other reason.

Before bunk cars are moved, the side steps should be removed and placed inside of the car.

FLOOD RECONSTRUCTION ON THE PITTSBURGH & LAKE ERIE.

The Pittsburgh & Lake Erie suffered an actual damage to track and structures of about $100,000 as a result of the flood of March 26. The Beaver and Mahoning rivers rose to a height five feet greater than previously known, cutting off railway communication on all lines. In spite of the amount of damage done, through business on this line was restored with an interruption of only four days. That the delay was so small was due in a large measure to the completeness of the organization immediately improvised to handle the work.

As soon as the flood arrived, all machinery including wrecking

Picking 500 Ft. of Track out of the River with a Wrecking Outfit.

outfits and pile drivers was gotten under steam. Forces were divided into day and night shifts so arranged that no person would work over 10 hours, and were maintained in this manner for 10 days until the damage was practically repaired, although both freight and passenger traffic were resumed within 36 hours after the water had left the rails. During the first 24 hours after the line was opened, even though only single track was in service at several points, 38 freight trains of coal, coke and general merchandise were handled.

One interesting method used in this emergency work is that illustrated in the accompanying photograph. Between Fallston and Beaver Falls the current in the Beaver river was so great as to wash out the embankment under both main tracks. Before the track next to the hill was entirely undermined it was shifted further into the hill onto a solid embankment. The track on the river side was completely undermined and 500 ft. of it went into the river. A wrecking train working on the track next to the bank succeeded in lifting this second track out of the river and pulling it onto a solid embankment at a cost of about $100, as compared with fully $500 to save the track in any other way. If the wrecker had not been utilized it would have been necessary to tear the track apart, and if this had been done some of the ties and rails would have been lost, while with the method adopted, no material of any kind was lost. We are indebted to E. F. Wendt, assistant engineer, for the photograph and information.

THE FOREMAN PROBLEM.*

By F. H. Carpenter,
Roadmaster, Atchison, Topeka & Santa Fe, Hutchinson, Kan.

The question of a supply of section foremen is simply a matter of dollars and cents. The wages paid are not attractive enough to hold the best foremen, or to induce young men to learn track work with the view of becoming foremen. The following methods are suggested for training young men for these positions:

First. Allow the roadmaster to pay a graduated scale of wages to a few men, placing them with the best foremen.

Second. Pay section laborers the prevailing scale of wages paid by other employers.

Third. Organize classes under competent men to work as extra gangs, with a graduated wage scale.

If the roadmaster should be permitted to hire a few bright, energetic young fellows and place them with his best foremen, at wages beginning at, say, $1.25 a day and increasing, at intervals of a few months, up to $1.75, he could rely upon these apprentices being taught to do the work as he wants it done, but a man who understands the work and is a good hand sometimes makes a poor foreman. This could be discovered by giving him a tryout even before he has worked long enough to be considered competent for a section.

The prospects are poor for making good section foremen of the Mexicans with whom we have been furnished during the last five or six years. They are incompetent and after they have worked about six or eight months they want to go home, and that is the last of them. The natives that we are able to hire for $1.25 a day, are, with very few exceptions, a shiftless and incompetent class of men, and are poor material from which to draw foremen.

I am also in favor of paying the wages for track labor paid by other employers of labor, about $1.75 a day. This would give us plenty of good material from which to select, and a class of men that would do more work than an equal number of foreigners, but I doubt very much if any western road, under present conditions, would feel justified in raising the wages of so large a class of men. It is more important, however, to have a good class of foremen than to have a good class of laborers, and a dollar invested in foremen will bring better results than one invested in laborers.

The third method is objectionable on the ground that men working in extra gangs do not learn the real business of maintaining track. Their work has more to do with construction than maintenance. They would probably be a division gang, not under the control of any one roadmaster. The place to learn the duties of a section foreman is on a section with a good foreman.

*Received in the contest on The Foreman Problem, which closed March 25, 1912.

General News.

The Boston & Maine has discontinued a number of passenger trains on the Fitchburg and the Southern divisions and has discharged some of the men in the engineering and bridge departments.

The federal grand jury at Chicago has returned an indictment against the Illinois Central charging that the road permitted the shipment of cattle out of quarantined areas in Mississippi in 1912 without properly designating the character of the shipment, in violation of the rules of the Department of Agriculture.

The Lehigh Valley now has telephones in use for train despatching throughout the whole of its lines. The company expects to follow this improvement with the installation of telephone wires for messages where necessary, and the officers are looking forward to the time when telegraph instruments will be thrown out of use entirely.

Harry T. Wilkins, formerly chief clerk in the office of Theodore N. Ely, has been appointed Special Agent of the Traffic Department of the Pennsylvania Railroad, with office in Broad Street Station, Philadelphia, to take charge of the preparation, installation and display of the Pennsylvania's exhibit at the Panama-Pacific Exposition to be held in San Francisco in 1915.

Thirteen complaints alleging violations of the law regulating the transportation of livestock were filed in the United States district court at Chicago on May 6, against the Chicago, Rock Island & Pacific; three against the Chicago & North Western; one against the Illinois Central; three against the Chicago, Milwaukee & St. Paul; one against the Pere Marquette; one against the Wabash; and three against the Chicago, Burlington & Quincy.

The committee on territories of the Lower House of Congress is preparing to report a bill providing for the construction of government railroads in Alaska, in accordance with the general plan which was laid before Congress some months since by President Taft. The committee has held a number of hearings and has taken testimony of representatives of commercial interests in Alaska, both for and against the construction of railroads by the government.

The "Katy Office Efficiency Association" is to be organized on the Missouri, Kansas & Texas at a meeting on May 22, for the purpose of studying and discussing subjects that pertain to the efficiency of office work on the system. Membership in the new organization will consist of the chief clerk, assistant chief clerk, accountants and timekeepers in the office of each division superintendent, the chief clerk, assistant chief clerk, accountant and chief timekeeper in the office of the superintendent of motive power, assistant superintendent of motive power and master car builders, traveling and division storekeeper and chief clerk to the general storekeeper and chief clerks, assistant chief clerks and heads of all departments in the general office at Dallas, Denison, Parsons and St. Louis.

The Boston & Maine announces that its new direct route from Boston to Springfield, about the same length as the parallel Boston & Albany, will be opened for business June 23. This route is made possible by the construction of the Hampden Railroad from Bondville, Mass., to Springfield, 16 miles, the work on which has just been finished. President Mellen, answering, before the Interstate Commerce Commission, at Boston, the criticisms alleging extravagance in making the large expenditures necessary to build the Hampden Railroad, said that he expected the new link would furnish enough additional traffic for the Central Massachusetts division of the road to make that division a paying property. On June 23 also, the Boston & Maine will put in use its new line from South Vernon, Vt., northward, 11 miles, to Brattleboro, on the New Hampshire side of the Connecticut river. With this length completed the Boston & Maine can run trains on its own rails from Springfield, Mass., northward to Windsor, Vt., and the New York-White Mountain trains will use Central Vermont tracks only from Windsor to White River Junction, 14 miles.

Unfilled Tonnage of the Steel Corporation.

The report of the United States Steel Corporation shows that the unfilled tonnage on April 30 was 6,978,762 tons, compared with 7,468,956 tons at the end of the previous month, a decrease of 490,194 tons. It had been estimated that the decrease would not exceed 300,000 tons. The figures show that during April orders were booked at the rate of 7,860,000 tons a year, comparing with shipments at the rate of approximately 13,500,000 tons a year. The unfilled tonnage on the books of the Steel Corporation is now smaller than it has been since October 31, 1912, when it was 7,594,381 tons. The shrinkage in April of this year was the largest reported in any month since June, 1910, when it was 1,145,000 tons.

Substitute for the Car Repairers' Blue Flag.

The railway commissioners of Canada, following an investigation of certain complaints, have recommended to the railways of the Dominion that a metal or wooden disk be used as a signal for the protection of cars which are being repaired, instead of the flag, which is "subject to the caprices of the wind." The commissioners recommend the use of a disk the shape of a semaphore arm, to be hung on the ladder at the end of a car and so fixed as to project 18 inches out beyond the side of the car. In this position it would be visible the length of an ordinary train. The horizontal arm would be fastened to a short vertical board, fitted with hooks by which it could be supported on the rounds of the ladder. At night a blue lantern could be hung from the projecting arm. The railways are requested to send to the commission their views on this suggestion.

Soo Line Co-operative Association.

As noted in last week's issue, the Minneapolis, St. Paul & Sault Ste. Marie is organizing an association to be known as the Soo Line Co-operative Club, or Association, for the purpose of providing a means for the investment of small savings by the employees, as well as to promote interest in the welfare of the company. It is proposed to incorporate the association and to issue shares of $1 each. Any employee who has been in the company's service for six months will be eligible, and may acquire one share; the $1 to be repaid to him in case he leaves the company's service. Employees are asked to sign a card addressed to the comptroller, giving authority to pay into the treasury of the association for his account the $1 for membership stock certificate, and a certain sum each month, to be deducted from his wages. The small savings of the many employees as they come to the club's treasurer, are to be invested in securities of the Soo Line or subsidiary companies. At the end of each year the earnings from the investment will be distributed so that each member should begin at the end of the first year to receive a small income from whatever amount he shall have saved during the year. Already a considerable number of employees have signed the membership cards.

Illinois Central Employees Ask to Aid Company.

Officers of the Illinois Central were greatly surprised last week to receive a communication signed by a large number of clerks, engineers, conductors and other employees, requesting that they be permitted to give one or more days' pay to aid the company in making repairs rendered necessary by the recent floods in the South. The employees also sought permission to solicit contributions from all employees on the payroll of the company by means of the following statement: "We feel as railroad employees that we should deeply deplore these unfortunate conditions, and to the end that the Illinois Central may have our assistance, co-operation and support in rebuilding and repairing its bridges, track and equipment, we, hereby appeal to you to join us in the contribution of the equivalent of one or more days' pay to that end."

In declining the offer Vice-President W. L. Park said, in part: "In all my railroad experience, in the ranks and as an officer, I never have encountered so unselfish and loyal an offer. That these men should voluntarily tender their mite to assist their company (and I use the word 'their' advisedly, for such men are really partners in the institution) is an evidence of such patriotic loyalty and self-abnegation that I am inclined to the belief that it is unparalleled in railroad history."

Death of John Saxby.

There has just died at Hayward Heath, forty miles south of London, an Englishman whose name is known to railroad men throughout the United States; John Saxby, of the firm of Saxby & Farmer. He died, at the age of 92, on Wednesday, April 23, and his portrait was printed in the *Railway Gazette* (London) of May 2. The first patent bearing Saxby's name was taken out in 1854, for a signal lamp with a movable inner case which changed the color of the light as the signal arm moved up or down. This was the joint invention of Saxby and W. V. Greenwood. Saxby's first interlocking patent—the invention which has made his name a household word among signal men all over the world—was taken out in June, 1856. His first installation was an interlocking of eight signals and six switches at Bricklayers' Arms Junction where, fifteen years before, the semaphore designed by Gregory had been first introduced. In 1860, Austin Chambers patented an improvement on Saxby's idea, but a few months later Saxby made still further improvements, and thereafter kept the lead over all his competitors. His patent for preliminary latch locking was taken out in March, 1867. The firm of Saxby & Farmer was established about 1860. Both of the partners had been connected with the London, Brighton & South Coast Railway. Mr. Saxby for many years lived in France attending to the continental business of his firm.

Prompt Settlement of Freight Claims.

J. H. Reich, superintendent of car service of the Frisco lines in Texas, has issued an order having for its object the satisfaction of patrons by speedy payment of their claims and obviating much red tape. New rules, just issued to agents, contain the following provisions:

"Agents at all stations are authorized to pay by draft claims for visible loss (not concealed) or damage to carload and less than carload freight to the limit of $25. Agents at New Orleans, Houston, Beaumont, Victoria and Brownsville, $50.

"Agents must not pay claims for damage to perishable freight, alleged loss of grain or coal from carload or less than carload shipments, damage to live stock, nor for damage to sewer pipe, drain tile and kindred articles. All such claims should be promptly forwarded to the head office.

"No claim for shortage must be adjusted under this authority until twenty (20) days after shortage is noted.

"Before paying claims, agent must satisfy himself of the invoice value and also satisfy himself that proper credit is given for the salvage or insist upon such salvage being turned over to the company." . . .

"Safety First" on the New York Central.

Marcus A. Dow, general safety agent of the New York Central Lines, is planning to hold meetings at prominent points on the company's lines at least as often as two each week. There was one at Toledo, O., on Wednesday of this week, and the next two are to follow at Watertown, N. Y., and Utica, N. Y. During the past five weeks meetings have been held at Erie, Rochester, Albany, Oswego, Syracuse, Corning, Buffalo, Detroit and Cleveland. Attendance has been voluntary, but the numbers present have ranged from 300 to about 1,000, and the officers of the road have been much pleased at the intelligent interest in the subject which has been taken by the employees in general. Some of the superintendents report interesting cases of the good results of the meetings. On the morning following one of the recent lectures, an engineman, who had been present at the meeting, was found spending an hour in teaching a new employee how to get on and off an engine or car safely. In another case a conductor, the day following a meeting, called the superintendent's attention to a man who had persisted in standing between the rails of the track and getting on the foot board of the engine as it moved toward him. The conductor had tried to correct this man's practice by giving him a friendly warning, but the dangerous practice was persisted in, so the conductor very properly reported the case to the superior officer.

"Safety First" with Variations.

"Safety First" on the Pennsylvania Railroad now includes moving picture exhibitions; and in connection with the last safety-first meeting in New York City, there was a lecture on "First Aid to the Injured" by the medical examiner of the Manhattan division of the road; and these two matters of utility were supplemented by some moving pictures illustrating humorous subjects, together with music by an orchestra led by the supervisor of signals.

This meeting, which was held on the evening of Thursday, May 8, in the auditorium of the Young Men's Christian Association in the Pennsylvania station, was attended by over 600 employees of the Manhattan division.

One of the moving picture films depicted a man being taught the proper way to handle tools; another scene showed a shopman learning how to operate safety appliances; and another was that of a mechanic working underneath a freight car and courting injury. Seeing the repairmen the foreman quickly informs him of his jeopardy and then demonstrates how to work under a car without fear of accident. Still another view illustrates how a car is thrown off the track through failure of the engineman to observe signals.

Following the moving pictures 63 lantern slides were shown, illustrating the usual subjects dealt with in lectures of this kind; and all of the slides were of a character to come "close home," being taken from scenes on the Manhattan division. Following the pictures five-minute talks were given by enginemen, conductors, foremen and others, including a signal maintainer. The medical examiner, in his lecture on "First Aid," cautioned workmen against hurrying just before closing time. Many accidents occur just before the luncheon or dinner hour.

Safety First on the Chicago Great Western.

The Chicago Great Western is pursuing a vigorous "Safety First" campaign with a view to arousing such active interest as will secure the co-operation of every man in the service. The entire system is now organized and good work is being done by all divisions and departments. An innovation that appears to be original with the Great Western is the setting aside of a day to celebrate the inauguration of the safety movement. The management has designated Saturday, May 24, as "Safety Day," and arrangements have been made to celebrate the day in a fitting manner at Oelwein, Ia. Special trains will be run over each division, arriving at Oelwein about 3:00 p. m. Athletic sports will be provided in the afternoon, and a "Safety Rally" will be held in the evening. The meeting will be attended by many general officers. It is expected that about 2,500 persons will attend.

The Great Western has also started a campaign of education among the public school children in all schools adjacent to its line, and has arranged to present banners and buttons to all classes and pupils in an attempt to inculcate in their minds the lesson it is desired to teach. The banners are arranged to hang upon the wall of the school room, and have a red cross on a white center and blue field with the words "Safety First" above the cross and "Safety Always" below the cross in white letters. The buttons have a red cross on a white background and a blue band with the words "Safety First, Safety Always" in white. These banners and buttons will be presented to the respective classes by speakers who will explain their significance. It is hoped that such an impression will be made on the minds of the school children as to cause them to recognize the danger of trespassing on railroad property as well as of unnecessary exposure to other risks.

The New Haven Investigation.

The attorney general at Washington announces that he is going to appoint a special attorney to investigate the New York, New Haven & Hartford Railroad; but first there will be careful study of the facts which have been brought out by the Interstate Commerce Commission, and by the proceedings before the grand jury, last year, when the New Haven and the Grand Trunk were accused of conspiracy.

At the hearing before the Interstate Commerce Commission at Washington last week the attorneys for the New York, New Haven & Hartford presented the following points:

The freight service between Boston and New York is the best in the world—eight to ten hours for 230 miles. The Boston & Maine, as a railroad machine, is overloaded. The reinstatement of 3,500 men in the fall of 1912 has improved service, but the road will not earn fixed charges this year. There was never

a more honest effort to treat fairly a subsidiary than has been made by President Mellen, in reference to the Boston & Maine. Except for the New Haven, the crisis on the Boston & Maine would have come earlier than it did. Improvement in rail service has decreased steamship revenues; there has been no suppression of boat traffic. In the complaint against the investment in and management of interurban railways, Brandeis is a minority of one. Connecticut and Rhode Island approve them. Public demand in Massachusetts now is that the New Haven build electric roads in connection with the Berkshire Street Railway. The New York, Westchester & Boston is built for the future.

The *Wall Street Journal*, summarizing the Boston hearings, says:

"Mr. Mellen stood upon his feet for five hours last week before Commissioner Prouty, and he fired such a broadside against the Brandeis charges that New England newspapers have not had time to digest it. It will take weeks for people to get a clear conception concerning the fallacies which Mr. Brandeis has so skillfully injected into the New England railroad situation. While the Validation Commission of the State of Massachusetts more than a year ago marked the Rhode Island trolleys down from their cost of $20,000,000 to about $6,000,000 and said their value was yet to be determined, and while Brandeis and his fellow agitators have been harping on this waste and extravagance for the upbuilding of transportation in New England, Mr. Mellen showed that the Rhode Island trolleys were earning 3 per cent. on a $24,000,000 cost; the New Haven following the same line of development it did with the Central New England, putting in more money to raise the efficiency and bring about profitable results in the end.

"Mr. Mellen believes that not only will the Rhode Island trolleys in a short time be returning 4 per cent. on their cost, but he has the figures to show that his New Haven investments, outside of the Boston & Maine, are now earning their cost to the New Haven on a 4 per cent. basis; in other words, the New Haven has the control of the Central New England, many trolley lines feeding the steam lines, and steamships co-operating therewith, all at probably no cost to the New Haven road so far as the money has been borrowed at 4 per cent. No other interest than the New Haven could have been found to raise money at 4 per cent. and put it into the development of transportation in New England."

Association of Railway Telegraph Superintendents.

The annual convention of the Association of Railway Telegraph Superintendents will be held at the Planters Hotel, St. Louis, Mo., May 20-23. On May 20, papers will be presented on Some Facts Concerning Telephone Transmission, by Elam Miller and Charles A. Robinson, both of the American Telephone & Telegraph Company, New York; Use of Telephone by Railroads for Despatching Trains, Handling Messages, etc., by J. C. Johnson, superintendent of telegraph, Pennsylvania Railroad; Inductive Disturbances as Affecting Telegraph and Telephone Circuits, by F. J. Howe, Western Union Telegraph Company.

On May 21, the papers will comprise Protection Against Lighting and High Currents for Telegraph and Telephone Equipment, by M. H. Clapp, superintendent of telegraph, Northern Pacific; Main Line Power for Selective Circuits, Including Transmission and Signaling, by Richard F. Spamer, Western Electric Company; Full Use of Wires, by H. D. Teed, superintendent of telegraph, St. Louis & San Francisco; Organization for Maintenance of Lines, by M. C. Allen, Western Union Telegraph Company.

On May 22, there will be a paper on Organization for Wire Chiefs and Telephone Inspectors, by J. B. Sheldon, superintendent of telegraph, Union Pacific.

Association of Railroad Chief Surgeons.

Plans for obtaining better sanitary conditions on railways were discussed at the annual meeting of the Association of Railroad Chief Surgeons held at the Hotel Sherman, Chicago, on May 5. A committee was appointed to co-operate with the committee of the American Medical Association assigned to the promotion of public health and railway sanitation. It was also decided to seek the co-operation of state boards of health and health officers in the various localities, with a view to obtaining supplies of pure water and ice for use on railway trains. Officers were elected as follows: President, Dr. W. H. Bohart, chief surgeon, Chicago & Eastern Illinois; vice-president, Dr. G. G. Dowdall, chief surgeon, Illinois Central; secretary, Dr. L. J. Mitchell, editor of the *Railway Surgical Journal*.

Utah Society of Engineers.

The Utah Society of Engineers at a recent annual meeting elected the following officers for the ensuing year: President, A. S. Peters, Mountain States Telephone & Telegraph Company, Salt Lake City, Utah; first vice-president, E. H. Beckstrand, University of Utah, Salt Lake City, Utah; second vice-president, H. D. Randall, General Electric Company, Salt Lake City, Utah; secretary, F. D. Ulmer, Oregon Short Line Railroad, Salt Lake City, Utah; treasurer, L. H. Krebs, No. 968 West Third South street, Salt Lake City, Utah.

Railway Development Association.

At the annual meeting of the Railway Development Association, held in Nashville, Tenn., on May 7, the following officers were elected: President, W. W. Wood, general industrial agent of the Baltimore & Ohio; vice-president, Rutledge Smith, of Nashville, Tenn.; secretary, W. H. Labaume, Roanoke, Va.; treasurer, L. L. Lawrence, of Laurel, Miss.

Cleveland Engineering Society.

At the regular meeting of the Cleveland Engineering Society on May 13, J. H. Stratton, of the Wellman Seaver Morgan Company, Cleveland, Ohio, presented an illustrated paper on the Development of Ore Unloading on the Great Lakes. An informal meeting of the society will be held on May 20, at which W. A. Faber, of the American Steel & Wire Company, Cleveland, will present a paper on Boiler Furnace Efficiency.

New York Railroad Club.

At the next regular meeting of the New York Railroad Club, to be held May 16, Frederick C. Syze will present a paper on Thoughts on Discipline.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York. Annual meeting, October 14-15, Philadelphia, Pa.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-24, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wenlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.; annual convention, October 18-24, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—F. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 15-18, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way & Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliance Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotebford, Union Station, Peoria, Ill.; 2d Thursday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxom, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, Wednesday and Thursday, June 11-12, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago, 1st Monday in month, except July and August, Chicago.

Traffic News.

The Texas railways have filed tariffs with the Interstate Commerce Commission, effective June 2, providing that they will cease paying loading charges on carload freight handled across the Galveston wharves.

Effective May 11, trains 7 and 8 on the Chicago & Alton, known as the "Midnight Special," leaving Chicago and St. Louis at 12:01 a. m., were made through non-stop trains between those points. They will not carry any mail or express and will be exclusively for Chicago-St. Louis passengers.

J. M. Belleville, president of the National Industrial Traffic League, has issued a call for a meeting of the league, to be held at the Iroquois hotel, Buffalo, on May 23 and 24, for the purpose of receiving reports of various committees and of discussing an extensive docket on various topics relating to the relation between railways and shippers.

A complaint has been filed with the Interstate Commerce Commission by Anderson, Clayton & Coat, Oklahoma City, asking a reduction in the rates on gin-compressed round bales of cotton below the rates charged for cotton when shipped in square bales. It is stated in the complaint that while four 36-ft. cars would be required to carry 50,000 lbs. of flat cotton, and two cars to carry the same weight of cotton in flat bales, a single 36 ft. car loaded with round bale cotton will carry 50,000 lbs., and yet the same freight rate is charged on 100 lbs. in a round bale as in the flat, or compressed only in square bales. A reduction of 33 1/3 per cent. is asked.

Prof. F. R. Stevens, the agricultural specialist employed by the Lehigh Valley to travel around among the farmers in the territory adjacent to that road, has added to the wealth of the farmers an amount equal to "scores of times the money paid to him." This is stated on the authority of L. W. Lighty, a farmer whose letter has been printed in an agricultural journal, and republished by the railroad company. Mr. Lighty says of Mr. Stevens: "He is conservative and always advises caution in new and untried moves. His rule is not to attempt to help a farmer until the farmer asks to be helped. At first not many asked, but now the requests come so fast and thick that he is able to reach only about a fourth of those who ask for assistance." Mr. Lighty's estimate of value is made on the authority of the farmers, who have observed the work done by the specialist during the past three years. And he adds: "Why do other large railroad systems follow this good example? Why does not our commonwealth join hands and assist in this excellent work?"

Proposed General Increase in Freight Rates.

The application of the Eastern Trunk lines for authority to make a general increase of 5 per cent. in freight rates was presented to the Interstate Commerce Commission at Washington on Wednesday of this week, the spokesmen for the railways being George F. Brownell, vice-president of the Erie; George S. Patterson, general counsel of the Pennsylvania; Clyde Brown, general solicitor of the New York Central, and Hugh Bond, general counsel of the Baltimore & Ohio, representing the fifty-two lines east of the Mississippi and north of the Ohio and Potomac.

The petition recited the efforts of the eastern lines three years ago to obtain permission to increase their freight rates. The commission at that time indicated a willingness to reconsider its conclusions in the light of future developments in the operation of the carriers. The petition declares that the carriers are prepared to show that the cost of conducting the business has been, and is being, steadily increased by increases in capital charges, increases in wages, increases in taxes, increased burdens imposed by legislative enactment, elimination of grade crossings and in various other respects, and that existing rates are insufficient to afford just and reasonable compensation and return to the carriers, and are unreasonably low in view of the value of the service afforded.

The commission promised to take up the subject at an early date, but gave no assurance that even if the case were reopened it would be able to conduct the necessary public hearings before the summer recess.

There has been much speculation as to the extent to which actual and formal expression will be made before the commission of the opposition to an advance in rates, which opposition has been voiced in the newspapers by numerous spokesmen for shippers. Some railroad officers say that they have tangible evidence that shippers are much less inclined to oppose an advance than they were in 1910.

Samuel Rea, president of the Pennsylvania Railroad, in a published statement gives reasons for an increase in freight rates as follows:

"The annual revenue from freight in the territory concerned is about $800,000,000. Five per cent. of this is $40,000,000. There are about 40,000,000 people in this portion of the country. The proposed increase, therefore, means an average of $1 per year per head of population—8 cents a month.

"Everybody knows that the railroads have been put to greatly increased expense in recent years. On the Pennsylvania lines east of Pittsburgh the added cost of new legislation from August, 1906, to December, 1912, was nearly $11,000,000. Recently many more laws have been enacted. The New Jersey grade crossing bill alone involves a cost to this company of more than $40,000,000. Extra crew laws, drinking water laws, railroad valuation laws are all adding to the cost of operation.

"Now, if the public through constituted authority, demands certain measures of safety, certain improvements, such measures of safety and comfort must be paid for by somebody. As a matter of fact, there are nearly 100,000 persons interested as investors in the stock of the different companies of the Pennsylvania Railroad system. It is likely that holders of this company's bonds number 200,000. Strike at the investors in railroad securities and you hurt depositors of savings banks, policyholders in life insurance companies, women investors and many others least able to cope with the situation.

"As Mr. Prouty said, 'The United States is trying an experiment which has never been successfully worked out yet in the history of the world. It is trying to build, develop and operate its railroads by private capital under rates and regulations fixed, not by the owners of that capital, but by the public. The question is, Can you obtain under this system the new capital necessary to develop our present railroad systems and to build our new railroad systems?'

"Are the people willing to pay the railroads sufficient freight rates to enable them to render the service which the people demand and should have? The country is growing; unless its growth is to be stultified, its railroads must grow. It is impossible to continue this building and developing of railroads of the country without more capital. To obtain that capital, the railroads must have credit—credit that will withstand the scrutiny of the banker of Lombard street, as well as appeal to the investor in Philadelphia. That credit cannot be assured and maintained unless the railroads are permitted to earn sufficient revenue to have left over at the end of the year a surplus out of which to make the necessary improvements which do not add to the earning power of the company and which yet assure the investor of the productive value, both new and prospective, of the enterprise in which he proposes to put his money."

At Pittsburgh May 5 Mr. Rea said that the Pennsylvania earned last year only 4.83 per cent. on its investment. Explaining this he says:

"Reference in this case was to the earnings of $35,776,669 in 1912 for *railroad* business alone—approximately 4.83 per cent.—upon the $741,120,877 which had been actually expended upon the transportation property of the Pennsylvania Railroad Company. The cost of bonds and stocks of other companies held by this company is not included in this $741,120,877, nor is the income derived therefrom embraced in the earnings of $35,776,669.

"This sum of $741,120,877 was in part provided out of capital stock and bonds and in part out of surplus earnings, and is made up by adding to the cost of road and equipment, as shown in the annual reports, the amounts also therein reported of appropriations from surplus for improvements. A liberal portion of the surplus earnings, instead of being paid out as dividends, has been expended on additions and betterments which have largely improved the facilities at the disposal of the public—facilities which have enabled the railroad to give better service. If the investors in the stock and bonds of the Pennsylvania Railroad had supplied directly all the money which has been invested in the transportation property of this company—after the fashion in vogue in England—and if they received the entire annual net earnings from the operations of such property, they would today be getting only 4.83 per cent. on their actual cash outlay."

Car Location.

The accompanying table, which is taken from Car Location bulletin No. 5-A of the American Railway Association, gives a summary of the location of freight car equipment by groups on April 15, together with surpluses and shortages on the same date.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association in presenting statistical bulletin No. 143, giving a summary of car surpluses and shortages by groups from January 31, 1912, to May 1, 1913, says:

The total surplus on May 1 was 53,977 cars; on April 15, 70,715 cars; and on May 9, 1912, 136,776 cars. Compared with the preceding period; there is a decrease in the total surplus of 16,738 cars, of which 4,394 is in box, 908 in flat, 9,602 in coal and 1,834 in miscellaneous cars. The decrease in box car surplus is in all groups, except 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 9 (Texas, Louisiana and New Mexico), and 11 (Canadian Lines). The decrease in flat car surplus is in all groups, except 1 (New England Lines), and 5 (as above). The decrease in coal car surplus is in all groups, except 4 (the Virginias and Carolinas), and 5 (as above). The decrease in miscellaneous car surplus is in groups 1 (as above), 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 4 (as above), 7 (Montana, Wyoming, Nebraska and the Dakotas), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona).

The total shortage on May 1 was 14,178 cars; on April 15,

13,217 cars; and on May 9, 1912, 6,678 cars. Compared with the preceding period; there is an increase in the total shortage of 961 cars, of which 81 is in flat, 1,537 in coal, and a decrease of 27 in box and 630 in miscellaneous cars. The decrease in box car shortage is in groups 2 (as above), 3 (Ohio, Indiana, Michigan and western Pennsylvania), 4, 7, 8 and 11 (as above). The increase in flat car shortage is in groups 1, 5 (as above), 6 (Iowa, Illinois, Wisconsin and Minnesota), and 8 (as above). The increase in coal car shortage is in all groups, except 6, 7, 8, 9, 10 and 11 (as above). The decrease in miscellaneous car shortage is in groups 3, 4, 5, 8 and 11 (as above).

Compared with the same date of 1912, there is a decrease in the total surplus of 82,799 cars, of which 2,276 is in box, 202 in flat, 71,269 in coal and 9,052 in miscellaneous. There is an increase in the total shortage of 7,500 cars, of which 3,860 is in box, 592 in flat, 2,500 in coal and 548 in miscellaneous cars.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

Car Surpluses and Shortages.

Date.	No. of roads.	Surpluses—Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages—Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

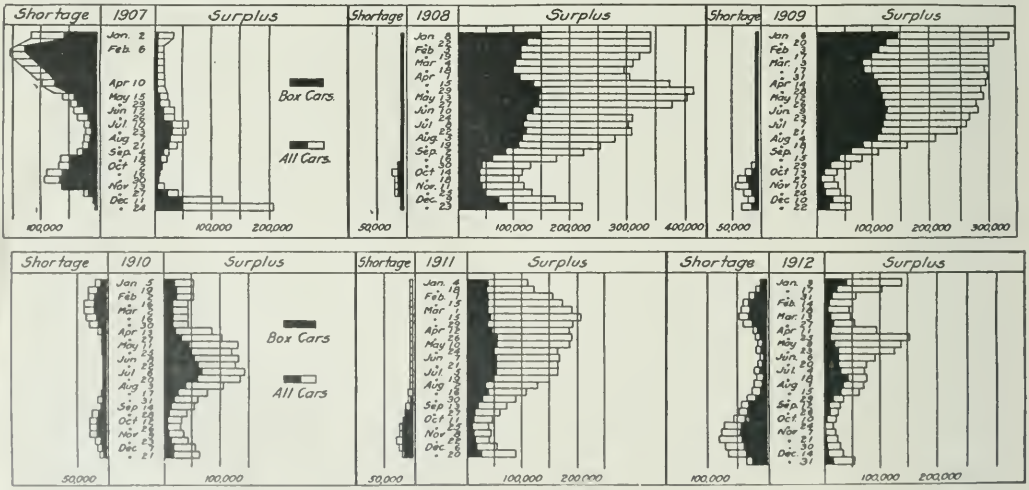
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

INTERSTATE COMMERCE COMMISSION.

The ruling of the commission in conference on April 8 that the term "families," as contained in the pass provisions, does not include nurses who may be in attendance upon and traveling with a railway employee who is entitled to free transportation, has been rescinded by the commission.

The commission has ruled that carriers shall be permitted to charge for copies of their tariffs, such charges not to exceed the cost of the paper, of the extra printing and of mailing. It is discriminatory to furnish certain shippers with copies of the tariffs and to deny such copies to other shippers. The carriers will be required to publish price lists of their tariffs and to print enough copies to meet the demand.

The commission has suspended from May 8 until September 5 the supplement to the tariff of the Southern Railway, which would cancel through joint rates on smoking and plug tobacco in less than carload lots from Winston-Salem, N. C., to points in Maryland, Delaware and Virginia reached by water from Baltimore, Md., providing that on and after May 8 combination rates apply. While this would result in no increase in rates, it is claimed by shippers that the publication of through rates greatly facilitates correct prepayment of freight charges.

The commission has suspended from May 12 until September 9 the supplement to the tariff of the Chicago & Alton, which cancels existing through joint rates applicable to the transporta-

tion of bituminous coal, in carloads, from the following mines located on the line of the Toledo, St. Louis & Western in Illinois: Coffeen, Edwardsville, Panama and Sorento, on traffic destined to points located on the Chicago, Milwaukee & St. Paul in Wisconsin, Minnesota and other states. Such cancellation would result in substantial increases by the application of combination rates.

The commission has suspended from May 11 until September 8 the items in a supplement to Agent F. A. Leland's tariff, which contain exceptions to the Western classification and affect the rating on iron and steel window sash (glazed), C. L., and iron and steel window frames when shipped with sash from interstate points to points in Texas, Louisiana and Mexico. Under the present provisions, glazed sash are rated fifth class and may be shipped at that rating in carloads mixed with window frames. The proposed provisions rate sash at fourth class and frames at fifth class ratings, C. L., and will not permit of mixing at the lower rating.

The commission has suspended from May 5 until September 2 tariff of the Chicago & North Western, and from May 10 until September 2 certain schedules contained in supplements to the tariff of the Chicago Great Western. The first mentioned tariff contains a schedule increasing from 13 cents to 16 cents per 100 lbs. the rate applicable to the transportation of cement in carloads from Mason City, Ia., to International Falls, Minn. Schedules suspended in the above-mentioned issues of the Chicago Great Western cancel existing joint rates between same points as well as the rates to intermediate points on the lines of the Northern Pacific, Minnesota & International and Big Fork & International, including Bemidji and Pequot, Minn., providing in lieu thereof for the application of combination rates, which results in advances; for example, the present rate to Bemidji is 13 cents and the proposed rate is 20 cents per 100 lbs.

Complaint Dismissed.

Scott Paper Company v. Pennsylvania Railroad. Opinion by the commission:

The commission decided that the rates on toilet paper from Philadelphia, Pa., to points in central freight association territory were not unreasonable or unjustly discriminatory as compared with rates from Albany, N. Y. (26 I. C. C., 601.)

Kellogg Food Company v. Grand Trunk Railway Company of Canada et al. Opinion by Commissioner Meyer:

The commission decided that the classification of food products known as Protose, Nutose, and Nuttolene under third class in official classification was not unjustly discriminatory. (26 I. C. C., 611.)

Rates on Excelsior and Flax Tow.

In re investigation and suspension of advances in rates by carriers for the transportation of excelsior from St. Paul, Minn., and other points to Chicago, Ill., and other points.

In re investigation and suspension of advances in rates by carriers for the transportation of flax tow, flax moss, and flax fiber, between St. Paul, Minn., Winona, Minn., and other points and Chicago, Ill., Peoria, Ill., Kansas City Mo., and other points. Opinion by the commission:

The commission decided that the proposed advances in the rates on flax tow and excelsior from St. Paul to Chicago were justified. The proposed advances in the rates on flax tow and excelsior from St. Paul to Des Moines, Omaha, Kansas City and other points were found not to have been justified. The carriers, however, are not precluded from undertaking reasonable adjustments of the rates to the latter points. (26 I. C. C., 689.)

Cement Rate Increased.

In re investigation and suspension of cement rates from Pennsylvania to New Jersey points. Opinion by Commissioner Marble:

The commission will not, for the purpose of indirectly influencing intrastate rates, prevent increase of an interstate rate on which no tonnage moves to a basis in harmony with like rates in the same region. The commission decided that the proposed advance in the joint rate on cement, Nazareth, Pa., group to Phillipsburg, N. J., was justified. The order of suspension will be vacated. (26 I. C. C., 687.)

Panhandle Not the Pennsylvania Company.

Duhlmeier Brothers v. Pennsylvania Company et al. Opinion by the commission:

A car of lumber reached Chicago via the line of the Pennsylvania Company. The complainant sent instructions for delivery of the car to agents of the Pittsburgh, Cincinnati, Chicago & St. Louis, which did not handle the shipment. Owing to delay in receipt of delivery instructions by the Pennsylvania Company demurrage charges accrued, which the complainant seeks to recover. Although the Pittsburgh, Cincinnati, Chicago & St. Louis is one of a group of roads comprising the Pennsylvania system, that line and the lines of the Pennsylvania Company are separately operated, file separate reports and tariffs, and are shown in railroad publications as distinct railway companies. The commission decided that notice to the Pittsburgh, Cincinnati, Chicago & St. Louis was not notice to the Pennsylvania Company and that demurrage charges were properly collected. The complaint was dismissed. (27 I. C. C., 4.)

Damages of $2.50 Denied.

Joseph F. Maxey v. Baltimore & Ohio Southwestern. Opinion by the commission:

A shipment of household goods was billed from Atlanta, Ga., to Newport, Ky. The defendant has no warehouse facilities of its own at Newport, but uses the Louisville & Nashville depot for making deliveries. Newport is regarded as a part of the Cincinnati terminals, so far as freight charges and deliveries are concerned. On the arrival of the shipment at Cincinnati, Ohio, the consignee was notified that the shipment would be forwarded to Newport or could be called for at Cincinnati. The consignee called for the goods at Cincinnati, and the cost of the drayage amounted to $2.50. The complainant contends that as the shipment was billed to Newport, the cost of the drayage should be refunded by the defendant. The commission decided that as the consignee was given the option of receiving the freight at either Newport or Cincinnati, and as it had not been shown that to have secured proper delivery by rail would have involved an unreasonable delay, the complaint should be dismissed. (26 I. C. C., 506.)

Protection of Potato Shipments in Winter.

In re investigation and suspension of new rules governing the allowance for stoves and lining of cars transporting potatoes from points in Minnesota and Wisconsin to points west of the Mississippi river. Opinion by Commissioner Harlan:

Hitherto when shipments of potatoes have been made in winter, shippers have lined the cars and provided stoves and attendants to protect the shipments from the cold. The carriers have exacted no charge for the transportation of the attendants, the stoves or the lining, either to the destination or for the return trip. Although this has been the practice in the region in question, the tariffs of the carriers did not provide specifically for this practice. The tariffs under suspension provide rules governing such shipments, and include changes from the previous practice. One of the new rules is that the carriers refuse to accept shipments of potatoes during the period from November 1 to April 15, unless the shipper at his own expense provides for protection against the cold. The carrier also reserves the right of accepting such shipments when in its judgment the weather conditions permit. The complainant contends that the carrier should provide protection against freezing in transit. The commission decided that as the potato traffic from the points of origin in question was large, and as carriers in other parts of the country furnished protection against freezing, and as section 1 of the Act requires carriers to provide all services of ventilation, refrigeration or icing, storage and handling of property transported, the carriers should be required by law to provide the service asked for by the shippers. The commission also decided that as, under the present rules, the shippers were responsible for damage by freezing, the carriers could not reserve the right of refusing shipments on account of weather conditions. No order was entered, but the commission urged that a conference be held between the shippers and carriers, so that mutually satisfactory regulations could be determined upon. The case will be held open for a future order in case the result of the conference is not satisfactory. (26 I. C. C., 681.)

Texas City Wharfage Charges Reduced.

In re wharfage charges of the Galveston Wharf Company, at Galveston, Tex. Opinion by Commissioner Harlan:

In the original case, 23 I. C. C., 533, the commission found that the railway companies were discriminating against Galveston and the Galveston Wharf Company in favor of Texas City and the Texas City Terminal Company by paying to the latter company excessive divisions out of the rates to that port. As the record was not broad enough to justify a definite order fixing the division for the future, the carriers were directed to confer with representatives of the two wharf companies and to submit a new schedule of divisions with the Terminal company. Conferences were held, but the parties failed to agree. The commission was, therefore, asked to fix the division. The commission decided that the Texas City Terminal Company, in compensation for its services and the use of its facilities, is entitled to a switching allowance of $3.50 per loaded car. Any allowance to that company in excess of that amount will be an unjust discrimination against the Galveston Wharf Company. Settlement between the Texas City Terminal Company and its trunk line connections may be made on the basis here stated for services rendered since August 1, 1912. The Galveston Commercial Association pointed out that the Texas City interests were offering to the American Steel & Wire Company and other large shippers warehousing services on their wharves at Texas City at less than cost, and that they are able to do this only because of the large divisions out of the rates that the Terminal company was formerly receiving and will be able to continue to do it only in the event that the commission fixes the allowance of the Texas City Terminal Company on an excessive basis. The commission was not prepared to express any view as to the legality of these arrangements, but will look into them further and take such steps as may be required. No order was deemed necessary. (26 I. C. C., 695.)

STATE COMMISSIONS.

The Board of Railway Commissioners for Canada has passed an order, requiring the Grand Trunk to renew the rails on its Barrie division, between miles 22 and 26; and directing that, until the completion of the work, trains between Trout Creek and Powassan shall not run faster than 15 miles an hour.

The Pennsylvania State Railroad Commission has dismissed the case of the teamsters of Philadelphia who asked for an order requiring the Pennsylvania and the Reading railroads, at their freight houses in Philadelphia, to truck goods to the door, so that teamsters could load packages on to their wagons with the least possible labor. The commission holds that to order the roads to change their practice in the way desired would not hasten delivery of freight.

COURT NEWS.

The Supreme Court of Texas has rendered a decision sustaining an injunction issued by the district court of Anderson county, restraining the International & Great Northern from moving its machine shops and roundhouse from Palestine, Tex., to Houston.

The Supreme Court of the United States has declared unconstitutional the reciprocal demurrage law of Oregon, which was passed in 1907. The decision of the court is based on the same grounds as those laid down in the Minnesota case—that the law in its operation interfered with interstate commerce.

In the United States district court at Boston, May 8, the New York Central & Hudson River was convicted by a jury on eight charges of working trainmen unlawfully more than sixteen hours consecutively. On twenty other charges the road was acquitted, the delays having been found excusable under the terms of the law.

The Supreme Court of the United States has handed down a decision sustaining the employers' liability law of Indiana. The decision is in the suit of Hackett against the Chicago, Indianapolis & Louisville. Hackett was a yard switchman and sustained the loss of both legs through the fault of the yard foreman.

The Colorado & Southern, the Chicago, Burlington & Quincy, and the Union Pacific have filed an appeal in the United States district court at Denver from the decision of the Colorado Railroad Commission ordering reductions in freight rates on coal from the northern Colorado fields to Denver. The appeal follows the refusal of the commission to grant a re-hearing of the case.

The Supreme Court of the United States has affirmed the decision of the Supreme Court of Appeals of Virginia in a case against the Norfolk & Western for damages on a shipment of tobacco shipped from a point on that road to Texas on a through bill of lading, the damage having occurred while the property was in the hands of the Old Dominion Steamship Company. The decision simply sustains the Interstate Commerce law, as amended, which makes the carrier issuing a bill of lading responsible for safe carriage through to destination.

The Maryland Court of Appeals holds that the Public Service Commission of the state has no authority to regulate the issuance of securities by the Baltimore & Ohio Railroad beyond passing on the question whether they are issued in proper form and in good faith. Suit had been instituted to sustain the authority of the commission to determine the aggregate amount of capital stock which might be issued and also the aggregate of bonded indebtedness; also the price at which stock or bonds should be sold and what disposition should be made of the proceeds.

The Supreme Court of the United States has refused a rehearing in the Minehill Corporation tax case, in which it was decided that a corporation engaged only in leasing its property and investing its funds was not "doing business," and therefore was not liable for the tax. The decision exempted hundreds of railroad companies from paying the tax, as well as telegraph and other corporations. Attorney General McReynolds had asked a rehearing on the ground that the decision was in conflict with previous corporation tax decisions of the court and would lead to inequality in the operation of the law. He declared the result would be that any corporation might avoid the tax simply by leasing its plant.

The United States circuit court of appeals at New Orleans has rendered a decision in the case of the United States vs. the Houston Belt & Terminal Company, which holds that the hours-of-service law, regulating the working time of telegraphers, applies to the service of certain towermen. It was charged that the company was working its towermen in 12-hour daily shifts, where the law makes a limit of nine hours; and the railway in defense claimed that the act did not apply to the tower men, because they did not handle train orders. Judge Foster, in delivering the court's opinion, held that the signals or communications transmitted by tower men were to be deemed train orders. "To say that the tower men only used the telephones for giving information not covered by the statute would be the merest sophistry," he said. "It is difficult to perceive how anything could be a more imperative order affecting train movements than for one of the tower men at Houston to notify another that he had started a train and at the same time telling him to hold all traffic in the opposite direction over the same track."

By a decision by Judge W. I. Grubb, of the United States district court for the middle district of Alabama, issued on May 5, the Louisville & Nashville loses its suit to have the Alabama State Railroad Commission declared in contempt of court for ordering a reduction in passenger rates in that state notwithstanding the action of the federal court some months ago, which held a former reduction illegal. The present suit followed the action of the commission in ordering the road to reduce all passenger rates, March 6, to 2½ cents a mile. Judge Grubb says that the railroad company's remedy, if it has one, lies in independent proceedings in the state or federal court, where it can ask for an injunction against the railroad commission. Under the law of the state, the commission has the power to make and enforce railroad rates independent of any legislative act, or any injunction against a legislative act. The rate which the court had declared illegal was 2½ cents a mile, prescribed specifically by a legislative act. The court held that so low a rate would be confiscatory and on the issuance of the decision the road increased fares to the basis of three cents a mile.

Railway Officers.

Executive, Financial and Legal Officers.

Robert E. Strahorn has resigned as vice-president of the Oregon-Washington Railroad & Navigation Company.

E. J. Dedman, general manager of the Gainesville & Northwestern, has been elected also vice-president, with office at Gainesville, Ga.

Edward Chambers, assistant freight traffic manager of the Atchison, Topeka & Santa Fe Coast Lines, has been elected vice-president, in charge of traffic, with headquarters at Chicago, succeeding George T. Nicholson, deceased. Mr. Chambers was born February 16, 1859, at Waukegan, Ill., and was educated in the public schools. His entire railway service has been with the Atchison, Topeka & Santa Fe system, with which road he began work in November, 1878, as a freight handler on the platform at Pueblo, Colo. He remained at that place until 1885, successively as check clerk, foreman of transfer platform, and cashier. He was then transferred to San Diego, Cal., as local agent, and in 1887 became local agent at Los Angeles, Cal. Seven years later he was promoted to assistant general freight agent at that point; from 1894 to 1896 he was general freight agent, with headquarters at the same place, and then until March, 1905, he was freight traffic manager of the Coast Lines, with office at San Francisco, Cal. He relinquishes the duties of the latter position June 1 to become vice-president of the Santa Fe system, in charge of traffic, as above noted.

E. Chambers.

William V. S. Thorne, director of purchases of the Union Pacific, with office at New York, has been elected vice-president of the Union Pacific, the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company, with headquarters at New York. He was born on March 22, 1865, at Millbrook, N. Y., and graduated from Sheffield Scientific School of Yale University in the class of 1885. The same year he began railway work with the St. Paul, Minneapolis & Manitoba, now a part of the Great Northern, and at various times during the following nine and a half years he was stationed in Minnesota, in South Dakota, in Wisconsin and in Montana, with the engineering department on location and construction work. He was then transferred to the operating department as clerk to the general manager, and subsequently was promoted to assistant purchasing agent, and then to superintendent of the St. Cloud, Minn., shops. His next position was assistant superintendent of the Breckenridge division, and he was later made superintendent of the Eastern Railway of Minnesota division. In 1895 he was elected vice-president and general manager of the Pennsylvania Coal Company, and vice-president of the Erie & Wyoming Valley Railroad, one of its subsidiaries, with headquarters at New York, and soon afterwards was elected president of the Delaware Valley & Kingston Railway, a company which was formed to build a railroad along the route of the old Delaware & Hudson canal from Hawley, Pa., to Kingston, N. Y. These three properties were sold to the Erie Railroad in 1900. In the summer of 1902 he was appointed assistant to E. H. Harriman, of the Southern Pacific and Union Pacific systems, and the following year was made director of purchases of both systems. In consequence of the order of the Supreme Court, separating the Union Pacific and the Southern Pacific, he resigned on January 31, 1913, as director of purchases of the Southern Pacific, remaining with the Union Pacific.

W. V. S. Thorne.

John M. Metheany has been elected secretary and auditor of the Grand Rapids & Indiana, with headquarters at Grand Rapids, Mich., succeeding R. R. Metheany, deceased.

Daniel Breck has been appointed vice-president of the Missouri, Oklahoma & Gulf, in charge of the operating department and traffic, with headquarters at Muskogee, Okla., succeeding J. W. Hoffman.

C. C. Barry, auditor of Morgan's Louisiana & Texas Railroad & Steamship Company and the Iberia & Vermillion, secretary and auditor of the Lake Charles & Northern, and auditor and assistant secretary of the Louisiana Western with headquarters at New Orleans, La., has been appointed assistant comptroller of the Southern Pacific Company with headquarters at New York, and H. S. Walker succeeds Mr. Barry with headquarters at New Orleans.

Operating Officers.

J. M. Boyd, assistant general air brake inspector of the Northern Pacific, has been appointed trainmaster of the Fargo division, with office at Dilworth, Minn.

H. W. Stanley, assistant general manager of the Seaboard Air Line, with office at Portsmouth, Va., has been appointed general manager, effective May 15.

F. M. Smith, roadmaster of the Seattle division of the Northern Pacific, has been appointed assistant trainmaster of the Seattle division on line north of Seattle, with office at Seattle, Wash.

F. C. Noessel, chief despatcher of the Kansas City, Mexico & Orient of Texas, at San Angelo, Tex., has been appointed trainmaster, with headquarters at San Angelo, and A. J. Cleary succeeds Mr. Noessel.

G. L. Hickey, assistant division superintendent of the Southern Pacific at Tucson, Ariz., has been appointed assistant superintendent of the Montana division of the Oregon Short Line, with headquarters at Pocatello, Idaho, succeeding George Baker, assigned to other duties.

A change in the organization of the New York, New Haven & Hartford and the Central New England went into effect on May 1, and C. L. Bardo, general manager, is now in charge of all matters pertaining to transportation, maintenance of equipment, power stations, high tension lines, track signals, bridges and buildings. The engineer of maintenance of way, the general superintendent, the mechanical superintendent, the electrical superintendent, the signal engineer, the superintendent of telegraph, the contract agent and the superintendent of dining cars will report to the general manager. H. Gilliam, electric superintendent of the New York, New Haven & Hartford at Stamford, Conn., will have charge of and be responsible for the maintenance, distribution and control of all electrical apparatus and high tension wires from the crossarms outside of the switchhouse to the shoes of the locomotives, which includes the high tension primaries of all transformers and switches connected to the distributing system. On all matters pertaining to operation he will report to the division superintendent. He will also act in an advisory capacity for all high tension lines heretofore maintained by the signal engineer, including direct current line between Providence and Fall River, Warreen and Bristol, Nantasket Junction and Pemberton.

George F. Dickson, whose appointment as superintendent of the Georgia & Florida, with headquarters at Douglas, Ga., has been announced in these columns, was born on December 1, 1872, at Lake Waccamaw, N. C., and was educated in the common schools. He began railway work in July, 1891, with the Plant System of railways as a telegraph operator, and in 1896 was promoted to train despatcher, becoming chief despatcher in 1901. He remained in the service of that system and its successor, the Atlantic Coast Line, until 1905, and then became trainmaster on the Atlanta, Birmingham & Atlantic. In April, 1912, he went to the Georgia & Florida, as trainmaster, which position he held at the time of his appointment on April 15, as superintendent of the same road, with headquarters at Douglas, Ga., as above noted.

G. F. Dickson.

Traffic Officers.

L. G. Paul, traveling passenger agent of the Baltimore & Ohio Southwestern, with headquarters at St. Louis, Mo., has been appointed division passenger agent at Chillicothe, Ohio, succeeding L. B. Jay.

Harry V. Wilmot has been appointed district passenger agent of the Northern Pacific at Milwaukee, Wis., in place of M. E. Harlan, who has been promoted to a position in the traffic department at St. Paul, Minn.

W. E. Phillips has been appointed traveling freight agent of the Toledo, St. Louis & Western, succeeding K. W. Curtis, resigned, and H. R. Mason has been appointed traveling freight agent, both with offices at Pittsburgh, Pa.

F. R. Clark, traveling freight agent in the office of the division freight agent of the Grand Trunk at Toronto, Ont., has been promoted to traveling freight agent in the office of the assistant foreign freight agent, with headquarters at Toronto, and F. G. Gould succeeds Mr. Clark.

H. C. Stevenson, traveling passenger and freight agent of the Baltimore & Ohio Southwestern, with headquarters at Denver, Colo., has been appointed southwestern passenger agent, with office at Dallas, Tex., succeeding W. F. Geisert, who takes Mr. Stevenson's place at Denver.

L. B. Jay, division passenger agent of the Baltimore & Ohio Southwestern at Chillicothe, Ohio, has been appointed district passenger agent of the Cincinnati, Hamilton & Dayton, with office at Indianapolis, Ind., in place of H. G. Alexander, who takes service with the Chicago, Indianapolis & Louisville.

G. W. Housley having resigned as general agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern at Hot Springs, Ark., all matters pertaining to freight traffic will be handled by R. M. McWilliams, assistant general freight agent, and that regarding passenger business by F. E. Schroeder, assistant general passenger agent, whose headquarters are at Little Rock, Ark.

H. J. Booth, formerly general coal and ore agent of the Wheeling & Lake Erie, has been appointed special agent in connection with the traffic department of that road and traffic manager of the Lorain & West Virginia, with headquarters at Cleveland, Ohio. Mr. Booth recently was granted a leave of absence. R. F. Smith, commercial agent of the former road at Cleveland, Ohio, has been appointed commercial agent; A. O. Ellis, traveling passenger agent, with headquarters at Canton, Ohio, is appointed traveling freight agent also; Charles Schoch has been appointed contracting freight agent, and E. D. Shenk has been appointed commercial agent at Cleveland.

Engineering and Rolling Stock Officers.

B. H. Allmain has been appointed roadmaster of the Seattle division of the Northern Pacific, with headquarters at Seattle, Wash., succeeding F. M. Smith, promoted.

H. F. Grewe, general foreman of the mechanical department of the Wabash-Pittsburgh Terminal and the West Side Belt, at Carnegie, Pa., has been appointed master mechanic in charge of locomotive and car departments of both companies, with headquarters at Rook (Carnegie, Pa.).

P. Alquist, chief inspector of the car department of the Pere Marquette at Detroit, Mich., has been appointed superintendent of the car department of the Missouri, Kansas & Texas, with headquarters at Sedalia, Mo., succeeding W. A. Mitchell, whose title was master car builder, and which office has been abolished.

T. R. Stewart, who has been appointed master mechanic of the Baltimore & Ohio, at Cumberland, Md., as has been announced in these columns, began railway work with the Baltimore & Ohio in September, 1886. He was consecutively boilermaker, foreman, roundhouse foreman and general foreman until February, 1904, when he was appointed master mechanic, and is now transferred in the same capacity from the Riverside shops, Baltimore, Md., to Cumberland, as above noted.

F. H. Hanson, supervisor of materials of the Lake Shore & Michigan Southern, and the Chicago, Indiana & Southern, at Cleveland, Ohio, has been appointed assistant master car builder of the Lake Shore division of the Lake Shore & Michigan Southern and the Dunkirk, Allegheny Valley & Pittsburgh, with headquarters at Collinwood shops, Ohio, and H. W. Gardner has been appointed supervisor of materials of the Lake Shore & Michigan Southern, with headquarters at Cleveland, succeeding Mr. Hanson.

P. Coniff, who has been appointed superintendent of shops of the Baltimore & Ohio, at Mount Clare, Baltimore, Md., as has been announced in these columns, began railroad work in 1888. He was a machinist on the Pittsburgh & Lake Erie, the Pittsburgh, Fort Wayne & Chicago and the St. Louis, Iron Mountain & Southern railroads until December, 1902, when he entered the service of the Baltimore & Ohio as a roundhouse foreman. He later became general shop foreman, and was promoted to master mechanic at Cumberland, Md., on May 1, 1911, which position he held at the time of his recent promotion as superintendent of shops of the same road, as above noted.

J. Kirkpatrick, who has been appointed master mechanic of the Baltimore & Ohio, at the Riverside shops, Baltimore, Md., as has been announced in these columns, served his machinist apprenticeship with the Kingston (Ontario) Locomotive Works from 1878 to 1882, and was later connected with the Canadian Pacific, the South Eastern and the Grand Trunk railways. He entered the service of the Baltimore & Ohio in March, 1903, and was promoted to master mechanic in the New Castle, Pa., shops in August, 1903, remaining in that position until 1905, when he was transferred to Cumberland in the same capacity. In February, 1907, he went to the Newark, Ohio, shops as master mechanic, and now goes to the Riverside shops of the same road.

J. Kirkpatrick.

J. F. Bowden, who becomes master mechanic of the Baltimore & Ohio at Newark, Ohio, as has been announced in these columns, served his apprenticeship in the Baltimore & Ohio shops at Keyser, W. Va., starting in March, 1885. He became roundhouse foreman at Grafton in September, 1895, and general fore-

man at Washington, D. C., November 1, 1898. He was then general foreman at Cumberland, Md., and at Benwood, W. Va., and was appointed master mechanic at Parkersburg, W. Va., in September, 1907. He was transferred in the same capacity to Garrett, Ind., on December 1, 1908, and now becomes master mechanic of the same road at Newark, Ohio, as above noted.

F. W. Rhuark, whose appointment as master mechanic of the Baltimore & Ohio, at Garrett, Ind., has been announced in these columns, began railway work as a water boy with the Baltimore & Ohio in June, 1879. He was then a machinist with the Lake Shore, the Toledo & Ohio Central and the Chicago & Alton railroads. In 1893 he became road foreman of engines of the Baltimore & Ohio, and was later in the service of the Big Four, the Erie and the St. Louis & San Francisco railroads. He was appointed machine shop foreman of the Baltimore & Ohio in January, 1906, and then was successively general foreman and motive power inspector until December 1, 1910, when he was appointed master mechanic at Lorain, Ohio, and is now transferred in the same capacity to Garrett, Ind.
