Heretofore, the Union Pacific has not been an originating carrier for California business. It now becomes a great originating carrier for that business, as it already was for business from the north Pacific coast. Its own lines extend only as far east as Omaha and Kansas City. It practically controls the Illinois Central, with a line from Omaha to Chicago, but it has heretofore handled most of its through business in connection with the Chicago & North Western, although it has also handled a large amount in connection with the Chicago, Milwaukee & St. Paul. It has some through train service to St. Louis in connection with the Wabash. As the Chicago, Milwaukee & St. Paul now has its own line to Puget Sound, and routes its own north Pacific coast business over its own line, it would seem that the relations between the Union Pacific and the North Western, which, having no line to the northwest, naturally would deliver more business to the Union Pacific for that territory, would grow closer rather than otherwise. The Rock Island has a line to St. Louis; the Southern Pacific has a traffic arrangement with the Frisco lines for handling business to and from St. Louis. It is an interesting question whether the Southern Pacific will work with the Frisco or the Rock Island in handling business to or from St. Louis. The probabilities seem to favor it working with the Rock Island to Chicago and the Frisco lines to St. Louis. Likewise, the probabilities seem to favor the Union Pacific working more closely with the Wabash in the handling of St. Louis business.

While what we have said in regard to the results of the dissolution of the Union Pacific and Southern Pacific is partly theoretical, it is plain that the way the dissolution has been carried out will make it necessary to draw a new map of the railway situation and the routes of traffic in the western half of the United States. Whether the railways as a whole, and the public as a whole, will benefit is conjectural. That some roads and some communities will benefit and that others will be hurt, seems quite likely. Experienced railway men differ so widely as to who will be helped and who hurt that we hesitate to make any conjectures on our own account. The probability seems to be that as between the railways themselves, who will ultimately be hurt and who helped will depend on which have the more skillful traffic departments and the more efficient operating departments. The railways directly concerned are most of them efficiently operated. Perhaps the competition will stimulate all of them to greater efficiency. It would seem, however, that one of the immediate effects will be to increase the cost of operation in the territory directly affected.

NEW BOOKS.

A Treatise on Cement Specifications. By Jerome Cochran. Cloth bound, 6 in. x 9 in., 191 pages, 7 illustrations. D. Van Nostrand Co., New York. Price $1.00.

While the author recognizes in his preface the impossibility of drawing specifications for cement which will be applicable to all classes of work and under all conditions, he has tried to make the presentation of the subject more complete than has ever before been attempted. The specifications proper cover 76 pages and include clauses on general conditions governing the use of cement, furnishing it to the contractor, purchasing it from manufacturers, delivering and storing it, inspecting and testing, testing requirements, methods of testing, and significance of tests. In addition to the specifications there are chapters on methods of mechanical analyses of Portland cement, bibliography of specifications for cement and bibliography of foreign cement specifications. The work is intended as a guide to students and young engineers in the preparation of specifications, and the aim has been to make this set consistent and in conformity with modern practice.

An Extension of the Dewey Decimal System of Classification Applied to the Engineering Industries. By L. P. Breckenridge and G. A. Goodenough. Bulletin No. 9 (revised edition). University of Illinois Engineering Experiment Station. Size 6 in. x 9 in., 117 pages. Price, 50 cents.

The filing and classification of engineering data has become a matter of much importance, and this bulletin was prepared for use as a guide in carrying out such work. Bulletin No. 9 was originally issued in 1906, and the demand was so great that a second edition was printed and distributed, 20,000 copies in all having been sent out. The demand for the bulletin having continued, the revised bulletin has been prepared with a number of changes and extensions presenting subdivisions of subjects in such detail as to constitute a complete classification for most industries, even though they are highly specialized. This revision has been made in accordance with the 1911 edition of "Decimal Classification," by Melvil Dewey. The experiment station is unable to make this revised bulletin subject to gratuitous distribution and a charge of 50 cents is made for copies postpaid.

Proceedings of the American Society for Testing Materials and Year Book. Cloth bound, 6 in. x 9 in., 600 pages. Published by American Society for Testing Materials, Philadelphia, Pa. Price, $5.

This volume contains the proceedings of the fifteenth annual meeting of this important organization, held in New York on March 28-29, 1912. These proceedings consist mainly in the revision of specifications adopted previously by this association. In the year book are given the charter, by-laws of the association and list of members. It also contains all the standard specifications, some 54 in number, which have been adopted by the association up to this time. These specifications include such subjects as Bessemer and open hearth steel rails, structural steel for bridges; engine, tender and car wheels, steel axles, locomotive cylinders, cast and wrought iron, cement, structural timber and yellow pine and trestle timbers. In addition seven sets of specifications adopted by other associations are published as information, including the specifications for rails and steel railway bridges of the American Railway Engineering Association and the specifications for rails of the American Steel Manufacturers, the Manufacturers' Standard Practice and the United States Steel Products Company.

Letters to the Editor.

RAILWAY OFFICERS AND RAILWAY SUPPLY MEN.

Pittsburgh, Pa., January 20, 1913.

To the Editor of the Railway Age Gazette:

An editorial which appeared in your issue of November 1, 1912, page 822, with reference to the relations between railway officers and the representatives of railway supply houses only recently came to my attention, but discloses an attitude so fundamentally in error that I feel compelled to reply, not because I am now interested in the business of selling certain equipment to the railroads, but as a matter of simple justice to both parties involved in this discussion.

This editorial, among other things, quotes the criticism of a "foreign railway officer" during a recent visit to this country, who was "very much surprised at the great amount of time which the heads of the mechanical department give to receiving railway supply men," to which you add the following astonishing comment: "When we consider the tremendous responsibility which rests upon the average motive power department superintendent and the need for greater efficiency in that department, it seems a shame that his time should be taken up in listening to the salesmen's arguments as to the merits of the various devices used on cars and locomotives, or in the shop," etc.

As a matter of fact, the criticism of the foreign railway officer mentioned is so out of line with what I know to be the judgment of the great majority of railroad officials and involves so glaring a misconception, based on the idea that the railroad supply representative has *all to get* and *nothing to give*, that I am exceedingly surprised to observe the seal of your approval placed upon the suggestions made. I am convinced not merely from my own experience of many years as a railroad man, and particularly as a motive power officer, but through perhaps unusual opportunities for observation during that period that there is no single factor which can be made of greater practical value and material assistance to railway mechanical, operating and executive officers than the co-operation and active interest of the representatives of railway supply manufacturing concerns in connection with the numberless important and far reaching problems that are incident to railroad operations. This co-operation and assistance is of greater value to the railroad companies today than it ever has been before, largely by reason of the specialization and highly scientific and technical development taking place in every art and industry. The reasons for this relationship and interdependence are both sound and substantial: First, the business of the railroads is primarily—I had almost said exclusively—transportation; that is, the handling of freight and passenger traffic, which business has now assumed stupendous proportions. Second, the business of the "supply man," so called, is to study railroad conditions as they exist, to originate product or devices to meet real needs as they develop, and to show the railroad man how and why a particular product, apparatus, or equipment meets a real need to the profit or betterment of the railroad.

While there are exceptions, of course, the fact of the matter is that the representatives of practically all reliable railway supply houses are not merely "salesmen" in the narrow sense of that term as used in your editorial, but experts, educated in their respective lines far beyond what would be possible for any busy railroad official. In other words, the supply man is able to bring to the railroad official not only a different angle of view but a wealth of data and experience along the line of the specific railroad problem in which he is particularly interested. Whether it happens that apparatus is purchased from such supply man or otherwise, the opportunity is afforded the railroad man to acquire pertinent and valuable information which, in the nature of things, he cannot originate for himself through such imperfect media as correspondence, the technical press, or individual research; yet in a brief, time-saving interview with the supply man he may secure such practical (and profitable) familiarity with any given subject as would be impossible to obtain otherwise. Such knowledge cannot fail to be of assistance to him in practical railroad methods, and increased railroad efficiency as well as broadening his own capacity to handle railroad problems. The present tendency of the times is more than ever before in the direction of placing in the field thoroughly trained experts in each particular business, and competition is very largely coming to be based upon the broad assistance and co-operation which the supply man can render along lines related to, but outside of the mere selling of a particular product or equipment.

Now a word in regard to the railroad official himself: There are, of course, exceptions here also; but my personal experience, first as a railroad man, and second as a supply man, leads me to affirm that as a rule the most wide awake, enterprising and progressive railroad officials today welcome the representatives of the supply houses because they thoroughly appreciate the supply man as an ally and a co-laborer who can assist materially in yet larger results in the field of transportation, and not at all as useless pests created to make the lives of railroad men miserable, as might be inferred from your editorial. In any event, the railroad man is always the arbiter of the situation and may regulate interviews with supply men as best suits his time and convenience, by reason of which fact alone your editorial largely loses its force.

In brief, I wish to record my sincere testimony to the fact that the vast majority of railroad officials with whom I have come in contact are always ready to consider facts and more than willing to listen to and act upon suggestions in the direction of improvement. On the other hand, my experience is that railway supply representatives are normally considerate, patient, painstaking, and capable of rendering the railroads a large and valuable service because of their being thoroughly informed and interested in their product and its application to conditions directly affected thereby.

I feel very strongly, therefore, that, whatever the conditions may be abroad, the "foreign railway officer" quoted, entirely missed the point with reference to the contact of supply men with our railway officials on this side and the fairer and generally accepted view, as I have found it, is that the wonderful railroad transportation facilities now available in this country are the result of united effort, viz., the splendid judgment, courage, foresight, and executive capacity of the railroad man, with the technical knowledge, invention, and development along a hundred different lines on the part of the supply man; and lacking which unity no such progress as has been made would have been possible.

A. L. Humphrey,
Vice-President and General Manager, Westinghouse Air Brake Company.

New Line for Chile.—The Osorno to Puerto Montt Railway, the port of the latter name being the present terminus of the Longitudinal Railway, has recently been opened to public traffic. In 1906 the President of Chile was authorized to contract for the construction of this railway for a sum not exceeding $4,380,000. In 1907 a bid was made for this construction, within a period of five years, and on September 26 of that year work was commenced on the line. An additional sum of $162,360 appropriated by the government for inspection and expropriations of land makes the total cost of the line $4,542,360. The gage of the railway is 5 ft. 6 in., and the roadbed, which is a continuation of the central system, is 78 miles long and has 10 miles of switches. There are five stations between Osorno and Puerto Montt, 18 bridges and 160 culverts. The minimum curve of this railway has a radius of 325 yds., and the maximum grade is 1½ per cent. The 12 acres of land at Puerto Montt on which the station and yards of the railway are situated were reclaimed from the sea. A driveway 1,190 yds. long is being constructed at Puerto Montt.

THE GRAND CENTRAL TERMINAL, NEW YORK.

The New Outbound Station was Placed In Service on Sunday, Feb. 2. Description of Details of This Important Structure.

The completion of the outbound station, the largest unit in the Grand Central Terminal project of the New York Central & Hudson River and the New York, New Haven & Hartford railroads in New York, announced in the news columns of the *Railway Age Gazette* last week, marks an important step in the development of large passenger stations in this country. This project embodies a number of unusual and very interesting conditions. In the first place, the investment feature has been carefully considered in the design of the entire terminal. The substitution of electricity for steam has permitted the utilization of the air rights for commercial purposes by the construction of additional facilities above the tracks, a portion of which will be leased to private parties. The revenue from these tenants will materially reduce the fixed charges on the entire terminal. This is the first development of this principle which permits the location of terminals in the heart of cities without involving the almost prohibitive outlay otherwise required. The construction work itself was made unusually difficult as the new building is located on the site of the old one and provision had to be made to accommodate the heavy traffic of both the New York Central & Hudson River and the New York, New Haven & Hartford at all times without delay. This traffic reached as many as 42 movements per hour at certain periods of the day and this had to be handled on only two tracks between Fiftieth and Fifty-sixth streets for several months. A new feature in the design of the station itself is the introduction of ramps or inclines to replace stairways in all main thoroughfares, while the separation of through and local traffic on different levels is unusual.

Looking West. Stairs Lead Up to the Side Street and to the Gallery at the Right. Four-faced Clock in Center of Room, Lighted from Within. Passage at Left of Stairs Leads to Interborough Subway, on Same Level.

Main Concourse, Grand Central Terminal, New York.

An inbound station will also be constructed immediately west of the outbound station to further divide the traffic between inbound and outbound business. The excavation is now nearly completed for this inbound station, which will be 200 ft. by 150 ft. in size, exclusive of a cab-stand 190 ft. by 45 ft. It is expected that this building will be ready for use about January 1, 1914. The general construction features of the entire project, outside of the station building proper, were

described in the *Railway Age Gazette* of November 22, 1912, page 981, and the interlocking machines May 12, 1911, page 1115. This article will be devoted to the station building.

GENERAL FEATURES.

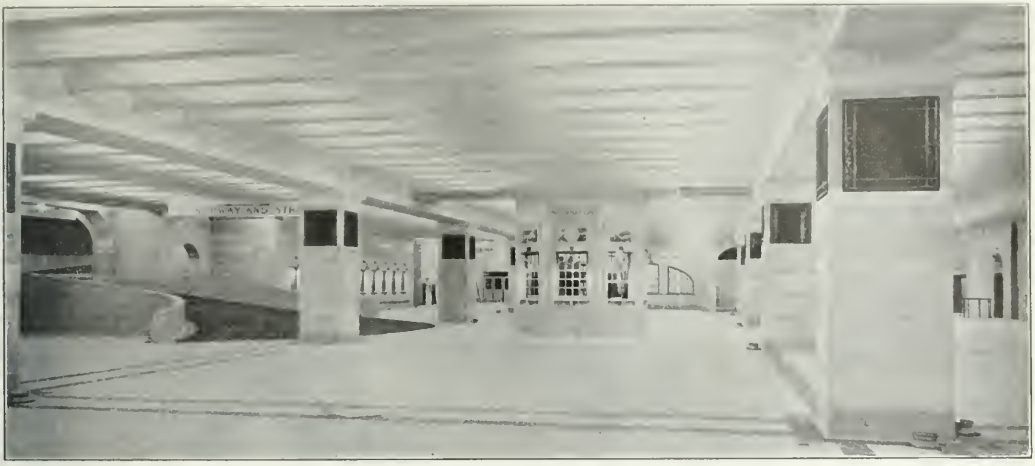
The outbound building faces on Forty-second street between Vanderbilt avenue and Depew place, and extends north to Forty-fifth street. It is 673 ft. long by 301 ft. wide and seven stories high at present, although provisions are made for 13 stories additional in the future. The base and lower portion of the structure are of Stony Creek granite with Bedford limestone above. The style of architecture adopted resembles somewhat the Doric motif and more directly the Tuscan modified to some extent by the French Renaissance. The front of the station facing on Forty-second street opposite Park avenue is set off by three high arched windows, surrounded by massive pillars and surmounted by a large statuary group. Similar, though less elaborate arches face on Depew place and Vanderbilt avenue opposite Forty-third street.

Constructed coincident with, and an essential part of the station, is a new elevated roadway or street which starts at Fortieth street and Park avenue, crosses over Forty-second street and divides, passing around both sides of the building and coming down to the grade of the present street at Forty-fifth street, opening a new avenue for vehicle traffic north and south and relieving the congestion on Lexington and Madison avenues. That portion of the roadway parallel to 42d street, in front of the station, will be 50 ft. wide and will be protected on the outside by an ornamental stone balustrade.

Looking East; Forty-second Street on the Right; Concourse on the Left.

Main Waiting Room, Grand Central Terminal, New York.

Cork insulation under the roadway will prevent disturbance to the stores which are located under this driveway on the level of Forty-second street. The westerly driveway is a public thoroughfare for traffic not necessarily destined to the entrances, at which most of the passengers will enter, lead directly to the express and suburban concourses by separate ramps, while the third entrance leads through the main waiting room to the express concourse. Other entrances are

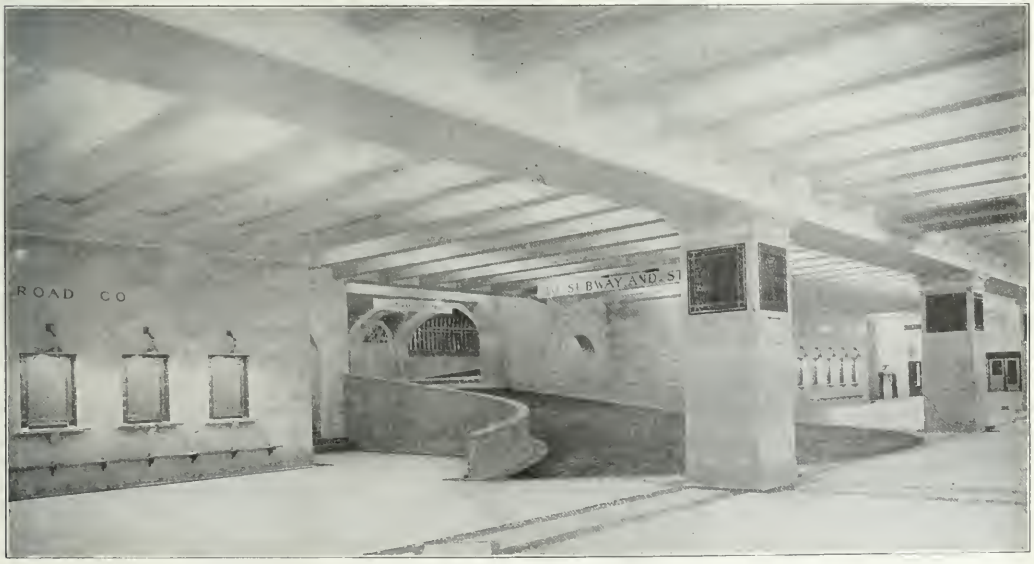


Information Bureau in Center Is Immediately Below the Bureau on Upper Level.

Lower Concourse; Looking West.

station and will also provide access to the cab-stand in the station and to the baggage and mail facilities. That portion of the roadway south of the north line of Forty-second street is still uncompleted.

The three main entrances for foot passengers are located provided at Forty-third street on Depew place and Vanderbilt avenue, the former entering the main concourse directly, and the latter by way of the gallery. Two cab entrances are provided, one on Vanderbilt avenue and Forty-third street under the overhead driveway, for the use of passengers with-



Lower Concourse; Ticket-Office Windows and Ramp to Subway and Street.

on Forty-second street, one at the southeast corner of the building at Depew place, one at the southwest corner at Vanderbilt avenue and the third at the centre of the Forty-second street side directly opposite Park avenue. The two corner out baggage, and the other immediately north of the main concourse and adjacent to the baggage room, for passengers with baggage. Passengers from either of these cab-stands will enter the station on the gallery surrounding the main

concourse and can descend to the main floor either by elevators or by a broad stairway at the west end of the concourse.

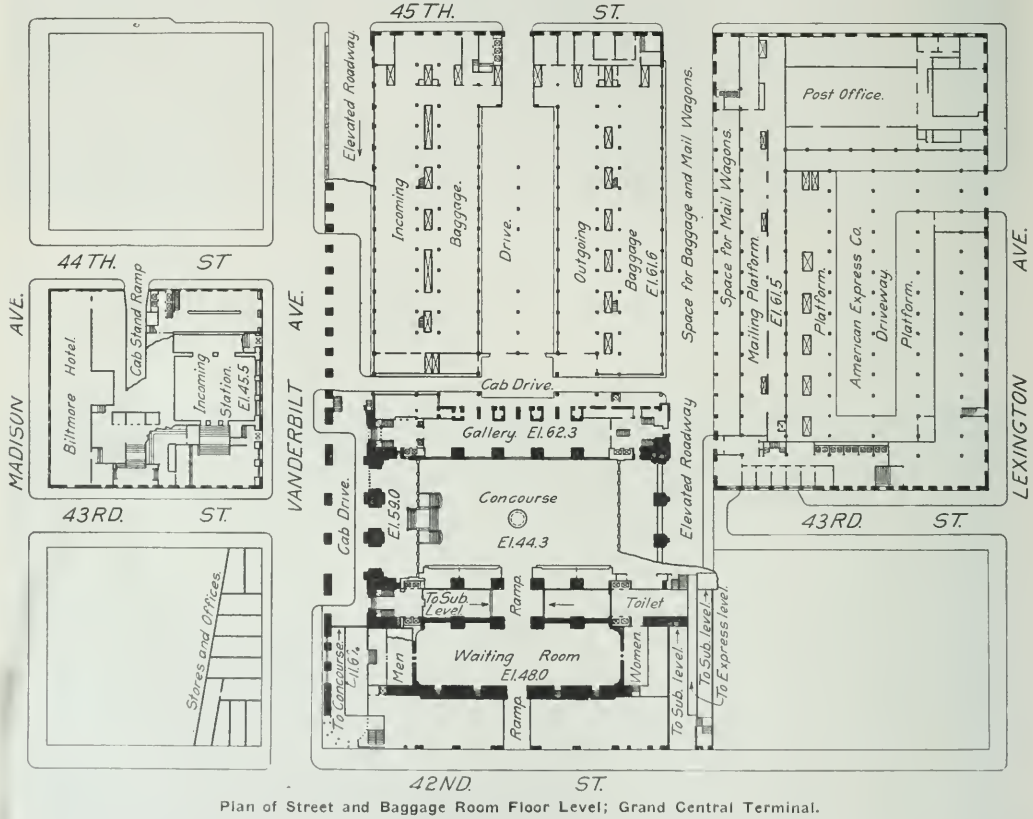
As the waiting room, concourses and platforms are all on different levels and all below the street level, an elaborate system of ramps was required. Temporary ramps in service during the early construction periods were arranged at different grades and the results carefully watched. From the experience gained here a maximum grade for the permanent ramps of 10 per cent. was established which was exceeded in only three instances where an 11 per cent. grade was required. Stairways are only used in auxiliary passageways where the amount of traffic is light.

THE MAIN FLOOR.

As about 80 per cent. of the people arriving at, or departing from the terminal use the subway, the elevation of the main concourse floor on the express level was made practically the same as that of the mezzanine or ticket office floor of the subway and the other floors have been arranged accordingly. Direct entrance has been provided from the subway to the concourse without passing through the waiting room so that with the exception of passengers entering the station through the center entrance on Forty-second street, no one need go to the waiting room unless actually waiting for a train.

The most prominent feature of the new station is the main concourse where all the facilities are provided for making the necessary arrangements for travel, including ticket offices, information bureaus, baggage and parcel rooms, telegraph offices, etc. This concourse is 287 ft. long, 120 ft. wide and 125 ft. high to the center of the arched roof, with a further extension under the gallery on the east end of 55 ft. and under the gallery and street on the west end of 105 ft. This concourse is finished in Botticino marble and buff tinted stone. The three large arched windows facing on Depew place and on Vanderbilt avenue opposite 43d street form the ends of the concourse. It is lighted at night by chandeliers in the galleries on the north side and ends and by concealed lights along the arched ceiling. No seats will be placed in this area.

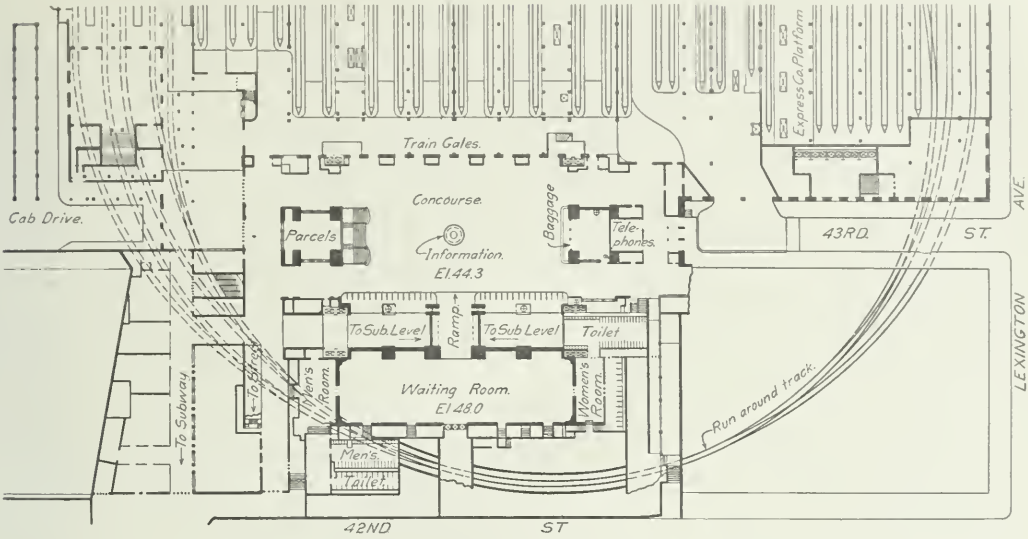
The arched ceiling of the main concourse is painted turquoise blue. It presents a view of a section of the heavens as seen during the months from October to March, or from Aquarius to Cancer. Sweeping across the ceiling from east to west are two broad bands of gold, representing the Ecliptic and the Equator. The figures and signs, in their relation to one another and to the Ecliptic and Equator are shown as nearly as possible in astronomically correct arrangement and extend on a segment of a circle across the entire ceiling. The signs of the Zodiac in progression are Aquarius, Pisces, Aries, Taurus, Gemini and Cancer. Besides the signs of the Zodiac, there are depicted certain familiar constellations, among them being Orion, Pegasus, Musca and Triangulae. The signs and constellations are drawn on the blue field in gold outline and modeled delicately with a stipple of tiny stars. The great stars which mark the signs and constellations, 63 of them, are illuminated. From Rigel, the star marking the toe of Orion, or the Hunter, to Propus, marking the tip of his club, there is



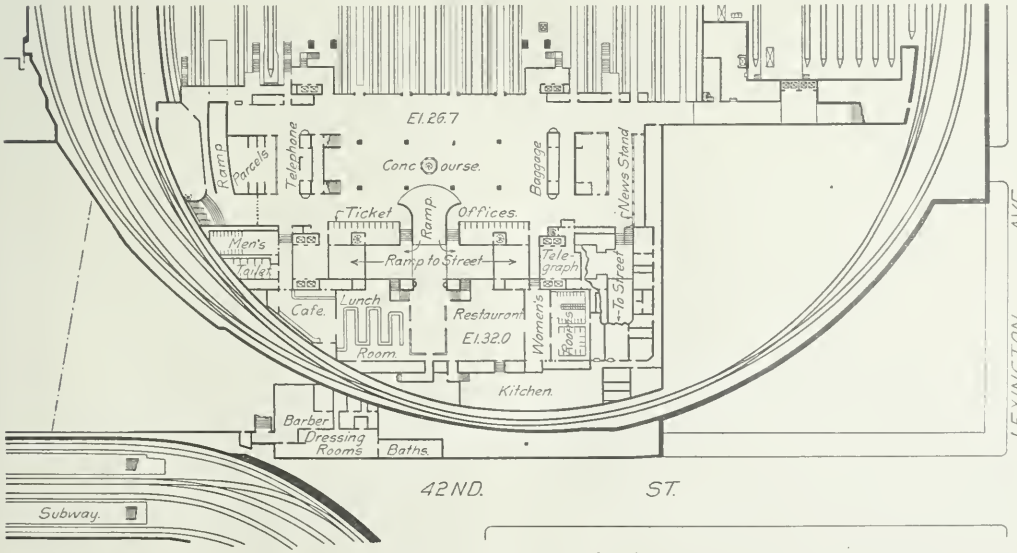
Plan of Street and Baggage Room Floor Level; Grand Central Terminal.

an expanse of 40 ft. The other constellations are on a similarly large scale. The milky way, composed as it is of myriads of tiny stars, is represented running across the ceiling from southwest to northeast.

The various facilities required by a traveler are arranged in the order of his usual preparations. Directly in the center of the concourse is located the information booth, octagonal in shape, and surmounted by a large clock with four faces so that it is visible from all portions of the concourse. Forty-eight ticket windows are arranged along the south side in two groups, those for the New York Central & Hudson River being located west of the central entrance into the waiting room and those for the New York, New Haven & Hartford east of this entrance. Under the balcony at the east end of the room is located the baggage checking room where the claim checks received at the inner cab-stand are exchanged for the regular baggage checks. Pneumatic tubes connect this office with the main baggage room. Directly back of this are situated the telephone booths, while to one side are the telegraph offices, a postoffice and an express office. Under the stairway leading from the gallery at the opposite end of the room is found the parcel room. Drinking fountains are installed in each of the four corners of the concourse. On the north side of the room, directly opposite the ticket win-



Plan of Express Floor Level.



Plan of Suburban Floor Level.

dows, are the gates and indicators leading to the trains. Beyond these gates is a narrow concourse and short ramps leading to the platforms three feet below the level of the concourse and even with that of the car floors.

The main waiting room is situated between 42d street and the main concourse, the center entrance to the station leading directly into the waiting room and through this to the main concourse. It is 3½ ft. below the level of Forty-second street and 3 ft. 9 in. above the main concourse, connecting with both by ramps. This room is 65 ft. x 205 ft. in size, is provided with artistic beamed ceilings and is finished in buff stone and marble. It is lighted by five large electroliers suspended from the centers of large panels in the ceiling. Directly connected with this are the men's and women's waiting rooms, lavatories and toilets, while a stairway leads from this floor to the restaurant directly beneath. The women's waiting room is finished in quartered oak and is provided with a telephone room, hair-dressing parlors and shoe shining shop. Convenient to the men's or smoking room are a barber shop, baths and private dressing rooms. Several private barber shops are also provided so that an incoming traveler can reserve one ahead by telegraph, thus insuring immediate attention upon arrival.

THE SUBURBAN LEVEL.

Directly below the main concourse and similar to it in general details, is the suburban concourse. It is reached by ramps from the two main corner entrances and by a broad ramp from the subway. The latter is one of the most beautiful features of the station. It is a marble corridor 40 ft. wide between the main concourse and the waiting room and, opening above into these rooms, it presents a very pleasing effect, flanked as it is by large columns. This concourse is lighted by five large electroliers suspended by heavy bronze chains.

An information booth similar to that on the main floor is placed in the center of this concourse. Ticket offices for both roads are placed directly below those on the express level and are connected by small circular stairways enabling ticket sellers to go quickly from one floor to another as the business demands. Likewise, the baggage checking room is located directly below that on the express level and the parcel room on the suburban concourse is connected with that on the upper floor by a "dumb waiter," enabling a passenger to present his check for a parcel on either floor, as desired. The train gates open out on the north side of the concourse as on the upper floor.

A restaurant and a lunch room are located on the suburban concourse directly below the main waiting room, being divided by a heavy bronze grating with glass lights. The ceiling in this room is made up of a series of Gustavino arches of cream-colored tile giving a very attractive grotto-like effect. Access to this is had directly from the suburban concourse or by a stairway from the waiting room. Adjoining the east end of this restaurant will be a women's rest room, and at the opposite end will be a bar.

BAGGAGE AND EXPRESS FACILITIES.

The baggage room is situated immediately north of the main concourse on the 45th street level (17 ft. higher than the concourse, and directly over two wide platforms on the express level which are designed expressly for solid baggage trains. It is entered either directly from 45th street or by a driveway from Depew place. Outbound baggage can be unloaded either along the platform facing on Depew place or from the enclosed interior driveway. Passengers with baggage coming to the station by carriage will receive a claim check for their baggage at the cab-stand, which check will be exchanged at the regular baggage office on either the main or suburban concourses for a regular baggage check. Ten elevators are provided in the outgoing baggage room and nine in the incoming baggage room, some of which are so spaced that baggage can be lowered directly in front of the different cars in a solid baggage train along the special baggage platforms referred to. When baggage is not destined for such a train, but rather for one of the regular passenger trains, it will be lowered by the elevators to a transverse subway running beneath the tracks of the lower level near Forty-fifth street, carried through this subway to the proper point and raised to the track level by another elevator. Incoming baggage will be lowered to a subway near Forty-third street and taken to the baggage room. In this way all conflict in the handling of baggage is eliminated and interference with passengers is reduced to a minimum. Electric motor trucks are being used exclusively in the handling of baggage.

Across Depew place from the outgoing baggage room are to be found the facilities for handling mail and express, the driveway for the mail wagons being recessed back from Depew place to avoid interference with baggage wagons unloading at the outgoing baggage room doors opposite. Six elevators lead from the mail and express rooms to platforms below provided for solid mail and express trains, while such traffic destined for passenger trains will be handled in the same way baggage is.

All illumination of the station is by direct lighting from electroliers and individual lights, with the exception of the arched ceiling over the main concourse which is lighted by concealed lights. Ten per cent. of the lights are on an entirely independent system, so that no accident to the regular power supply can shut off the light entirely.

In view of the large amount of traffic now passing through this station it is interesting to note that the average annual increase in traffic for the last 10 years based upon the number of loaded cars handled is 7.1 per cent. Some idea of the volume of this traffic may be gained from figures gathered for the eight days from Friday, August 30, 1912, to September 6, including the Labor Day holiday. In this period 4,826 trains with 31,269 cars were handled, while 944,000 people passed in and out of the station. This was the heaviest traffic ever handled at this station and the trains were moved with an average delay of only .34 min. An average daily movement of about 600 trains and 3,700 cars is regularly handled at the present time, the maximum density being from 8:30 to 9:30 in the morning, with 39 scheduled trains inbound in the winter and 34 in the summer, and 13 scheduled trains outbound in the same time. About 7,500 pieces of baggage are also handled daily.

The construction of the Grand Central Terminal facilities is all being carried out under the supervision of George W. Kittredge, chief engineer, New York Central & Hudson River, and George A. Harwood, chief engineer, electric zone improvements. Warren & Wetmore are the architects of the station and terminal buildings.

Shops in Victoria.—The Victorian government has decided to establish locomotive and car building shops at Ballarat and Bendigo at an estimated cost of $400,000 each. The Newport shops, where it was the intention of the government to centralize the manufacture of all rolling stock, have become congested, showing that there is a limit to the policy. There was a popular demand to build small shops at various stations, but the government has proposed two properly equipped shops. Practically all the plant and equipment will have to be imported. The scheme will put a certain amount of check on the ambition of local private enterprise, for the new shops, together with the Newport shops, will considerably increase the output of rolling stock in the near future. During last year the Newport shops turned out 37 locomotives, 78 passenger cars and 688 freight cars. This year the program is for the construction of 51 locomotives, including those to be assembled at the workshops from parts made by contract, 146 passenger cars, 75 vans and 928 freight cars. About 350 men are to be employed at each of the new workshops, and a rough estimate of the annual output from each is from 15 to 20 locomotives and 200 freight cars.

VENTILATION OF STEEL SLEEPING CARS.*

Excellent Results Obtained with Exhaust Ventilators and No Deck Sashes Compared to Wooden Cars with Both Devices.

By Thomas R. Crowder, M.D.

Two years ago the author presented before the American Public Health Association the results of a study of the ventilation of sleeping cars.† An attempt was made to determine the amount of fresh air which enters the running car under various conditions of operation, the places of entrance of the air, its distribution, and the general direction of its currents. Two plans of ventilating were considered in that study, which were called "natural ventilation" and "ventilation by exhaustion."

To the majority of the cars investigated there had been applied a device‡ intended to remove air through certain of the upper windows, or deck-sashes, by a suction effect dependent on train motion, all other deck-sashes remaining closed. This plan was called "ventilation by exhaustion." That the exhaust apparatus actually did what it was intended to do was easily determined by means of the anemometer. It was found that each of the exhaust ventilators would remove about 15,000 cu. ft. of air each hour at a 40 mile train speed. Six to eight of them were applied to each car.

The results of a large number of observations showed that by the application of this exhaust device the active ventilation of the body and berths of a sleeping car is considerably increased over and above what may be expected from the natural forces of the wind through the open deck-sashes, and that the flow of fresh air into the car is more regular and better distributed. The respiratory contamination of the air of the breathing zone and of the occupied berth remains almost constantly low. Carbon dioxid reaches a proportion of ten parts in 10,000 of air with relative rarity; and the computed fresh air supply averages about 2,000 cu. ft. per hour for each berth and about 40,000 cu. ft. per hour for the car. With the adoption of this exhaust system of ventilation as a standard of construction the deck-sashes cease to perform any important function. Indeed, they may become a direct hindrance to the most efficient operation of the device.

This previous study was made on the standard Pullman sleeping car of wooden construction. The exhaust ventilator considered was applied to cars which had been previously in service and had been originally ventilated by the natural or deck-sash method. Since the completion of that study the all-steel sleeping car has come into extensive use. These cars are all equipped with exhaust ventilators in the building; and for the reasons stated above the deck-sashes are omitted, or, if not entirely omitted, are reduced in number from twenty-four to four, and these four are very small. Only electricity is used for lighting; this avoids the necessity of making openings through the roof to carry away the combustion gases of burning lights. The upper portion of the car is almost entirely free from natural openings. It is therefore readily seen that whatever air enters these cars must come from crevices about windows and doors located low down. From this it would naturally follow that the lower levels of the car receive a larger air supply than with the older type of construction. It is not considered a matter of great hygienic importance whether they do or do not; no increase in the air supply is demanded on hygienic grounds; but in order to have some adequate information as to what actually does take place and to be able to make accurate comparisons, a series of thirty-six steel cars was investigated during the first two months of 1912.

The methods used in the investigation of these cars are the same as those previously employed. Samples of the air to be examined were collected in glass-stoppered bottles, sealed, and were analyzed in the Petterson-Palmquist apparatus for the determination of carbon dioxid. Air was collected from the center aisle, in order to determine the respiratory contamination of the general air of the car, and from lower and upper berths in order to determine the respiratory contamination of the air within them. From these contaminations air supplies have been computed as before.

All the observations in the cars included in the present series were made during the night, after the passengers had retired. The time ranged from 11:00 p. m. to early morning. The outside temperature varied from zero F. to 36 F.; it was generally as low as 20 F. Samples were taken as nearly simultaneously as possible in the aisle and in from three to six berths; samples from the same places were repeated at approximately fifteen minute intervals for one or two hours. This was done in order to obtain general averages, which are more important and give much more dependable information of the condition of the air than single observations or short series. From the latter erroneous conclusions are very likely to be drawn. It must be recognized that in any running car the conditions are liable to rapid and relatively great variation. Minimum actual rates of air supply, hence degrees of respiratory contamination, alternate with maximum actual rates; and these minimums and maximums may lie a considerable distance apart. They represent temporary and local, not continuous and general, conditions. General averages are much more significant.

GENERAL RESULTS.

The air tests first recorded were collected from the car body, and not from the berths. The air supply as computed is expressed to the nearest thousand in terms of cubic feet per car per hour. It is that volume which would keep the CO_2 at the average proportion found in the air of the car if the number of occupants did not change.

The following is a summary of these observations:

Cars examined	36
Average number of occupants	16.2
Number of air samples analyzed	246
Average number of samples per car	6.86
Average carbon dioxid	5.78:10,000
Highest average CO_2 in any car	8.13:10,000
Lowest average CO_2 in any car	4.72:10,000
Highest CO_2 in any sample	9.5 :10,000
Lowest CO_2 in any sample	4.5 :10,000
Number samples showing CO_2 over 10:10,000	0 (0.00 per cent.)
Number samples showing CO_2 over 8:10,000	5 (2.03 per cent.)
Number samples showing CO_2 over 7:10,000	20 (8.13 per cent.)
Number samples showing CO_2 over 6:10,000	56 (22.76 per cent.)
Number samples showing CO_2 6 or less:10,000	190 (77.24 per cent.)
Average hourly air supply per car, cu. ft.	54,600
Highest hourly air supply for any car, cu. ft.	125,000
Highest excepting Nos. 9 and 10,* cu. ft.	75,000
Average excepting Nos. 9 and 10,* cu. ft.	53,000
Lowest hourly air supply for any car, cu. ft.	32,000
Number of cars showing less than 40,000 cu. ft. per hour, 3..	(8.33 per cent.)

The average air supply to the breathing zone of the steel sleeping car, as computed from the average proportion of CO_2 and the average number of occupants in the 36 cars examined, is

*Abstract of a paper presented before the Fifteenth International Congress on Hygiene and Demography, by Dr. Crowder, who is superintendent of sanitation for the Pullman Company, Chicago. It was also printed in the *Archives of Internal Medicine*, January, 1913.

†A Study of the Ventilation of Sleeping Cars, *The Archives of Internal Medicine*, 1911, vii, 85. Abstracted in *Railway Age Gazette*, August 25, 1911.

‡The Garland ventilator, which was described in the *Railway Age Gazette*, June 22, 1910.

*During the first ten experiments the drop-sashes in the doors were let alone as found; in all later experiments they were purposely kept closed while observations were being made. Only twice, namely, in experiments 9 and 10, was the air supply markedly affected by these open drop-sashes, and in these cars the sashes were opened widely.

found to be approximately 54,600 cu. ft. per hour, as above stated; or, in those cars kept entirely closed, even to drop-sashes in the end doors, 53,000 cu. ft. per hour. This compares with 40,600 cu. ft. per hour for the older type of car, equipped with the same ventilating device, but maintaining the deck-sash construction, and with 28,300 cu. ft. per hour for cars having the ordinary deck-sash ventilation. The results in the steel car are also more uniform and more regular, as will be found by consulting the detailed results of the first group of experiments. The complete comparative averages may be grouped as follows:

Wood Cars (with Deck-Sash Construction).

Natural ventilation (deck-sash method)—
Fully closed car.....18,500 cu. ft. per hour
With open deck-sashes.....28,300 cu. ft. per hour
With open deck-sashes and open end doors.....40,700 cu. ft. per hour
Exhaust ventilation (the exhaust method)—
Fully closed car.....40,600 cu. ft. per hour
With open doors.....57,900 cu. ft. per hour

Steel Cars (Constructed Without Deck-Sashes).

Exhaust ventilation—
Fully closed car.....53,000 cu. ft. per hour
With open drop-sashes in end doors.....65,900 cu. ft. per hour

Any or all of these figures might be changed by longer series of observations. For most of the groups it is believed a sufficient number have been made to insure the relative correctness of the results obtained.

LOWER BERTH.

The observations in the lower berths cover all the cars investigated. The air supply per berth, as computed, is the number of cubic feet which must be supplied to one person each hour in order to maintain the CO_2 at the average proportion found. The berths included in this list were each occupied by one adult. The observations may be summarized as follows:

Cars in which lower berths were examined..... 36
Number of lower berths examined.....128
Average number of lower berths per car..... 3.56
Total number of air samples from lower berths.....856
Average number of lower berth samples per car..... 23.78
Average number of samples per berth..... 6.53

Average CO_2 in air of car body..... 5.78:10,000
Average CO_2 in air of lower berths..... 6.76:10,000
Highest average CO_2 in lower berths of any car..... 9.25:10,000
Lowest average CO_2 in lower berths of any car..... 5.55:10,000
Highest CO_2 in any lower berth sample..... 14 :10,000
Lowest CO_2 in any lower berth sample..... 4.5 :10,000

Number L. B. samples showing CO_2 over 12:10,000... 3 (0.35 per cent.)
Number L. B. samples showing CO_2 over 10:10,000... 18 (2.10 per cent.)
Number L. B. samples showing CO_2 over 8:10,000...137 (16.00 per cent.)
Number L. B. samples showing CO_2 over 7:10,000...238 (27.80 per cent.)
Number L. B. samples showing CO_2 over 6:10,000...476 (55.61 per cent.)
Number L. B. samples showing CO_2 6 or less:10,000...380 (44.39 per cent.)

Number L. B. with higher CO_2 than aisle at same time.658 (76.87 per cent.)
Number L. B. with lower CO_2 than aisle at same time.. 68 (7.95 per cent.)
Number L. B. with CO_2 equal to aisle at same time....130 (15.19 per cent.)

Average hourly air supply per lower berth, cu. ft.....2,170
Highest average hourly air supply to L. B. of any car, cu. ft.....3,870
Lowest average hourly air supply to L. B. of any car, cu. ft.....1,140

Number cars showing average of less than 1,500 cu. ft. per L. B. per hour, 3†.....(8.33 per cent.)

†These cars were Nos. 13, 22 and 23. The last two were on the same train and samples were taken in them at approximately the same time. The train was running directly with a strong wind. Nos. 13 and 22 are the same car, on different trips.

On the basis of 856 carbon dioxid determinations in the air of 126 lower berths in 36 steel sleeping cars equipped with exhaust ventilators, the average air supply per berth is found to be approximately 2,170 cu. ft. per hour. This compares with 2,030 cu. ft. for the lower berths of the older type of cars equipped with the same ventilating device, and with 1,390 cu. ft. in cars ventilated by the deck-sash method.

UPPER BERTH.

The results of examination of upper berths may be summarized as follows:

Cars in which upper berths were examined..... 21
Number of upper berths examined..... 30
Average number of upper berths per car..... 1.43
Total number of air samples from upper berths.....207
Average number of upper berth samples per car..... 9.86
Average number of samples per berth..... 6.9

Average CO_2 in air of car body..... 5.86:10,000
Average CO_2 in air of upper berths..... 7.00:10,000
Highest average CO_2 in upper berths of any car..... 8.70:10,000
Lowest average CO_2 in upper berths of any car..... 5.44:10,000
Highest CO_2 in any upper berth sample..... 11.5 :10,000
Lowest CO_2 in any upper berth sample..... 4.5 :10,000

Number U. B. samples showing CO_2 over 12:10,000... 0 (0.00 per cent.)
Number U. B. samples showing CO_2 over 10:10,000... 5 (2.42 per cent.)
Number U. B. samples showing CO_2 over 8:10,000... 34 (16.43 per cent.)
Number U. B. samples showing CO_2 over 7:10,000... 83 (40.10 per cent.)
Number U. B. samples showing CO_2 over 6:10,000...139 (67.15 per cent.)
Number U. B. samples showing CO_2 6 or less:10,000... 68 (32.84 per cent.)

Number U. B. with higher CO_2 than aisle at same time.182 (87.92 per cent.)
Number U. B. with lower CO_2 than aisle at same time. 13 (6.28 per cent.)
Number U. B. with CO_2 equal to aisle at same time... 12 (5.80 per cent.)

Average hourly air supply per upper herth, cu. ft.....2,000
Highest average hourly air supply for U. B. of any car, cu. ft.....4,170
Lowest average hourly air supply for U. B. of any car, cu. ft.....1,280

Number of cars showing average of less than 1,500 cu. ft per U. B. per hour, 2.....(9.52 per cent.)

On the basis of 207 carbon dioxid determinations in 30 upper berths of 21 steel sleeping cars equipped with exhaust ventilators, the average air supply per berth is found to be approximately 2,000 cu. ft. per hour. This compares with 1,880 cu. ft. for the upper berths of the older type of cars equipped with the same ventilating device, and with 1,270 cu. ft. in cars ventilated by the deck-sash method.

COMPARISON OF LOWER AND UPPER BERTHS.

We are able to compare the ventilation of the lower and upper berths in the same cars in all of the 21 cars in which upper berths were investigated. The comparison for each car is shown in Table 1. It will be seen that the ventilation of lowers and uppers is, on the average, much the same. It is relatively rare for the average air supply of the two to fall

Table 1.—Comparison of the Ventilation of Lower and Upper Berths in Steel Sleeping Cars Equipped with Exhaust Ventilators.

Experiment	CO_2 per 10,000 of Air: Aisle Aver. CO_2	Lowers: No. of Tests	Lowers: Aver. CO_2	Uppers: No. of Tests	Uppers: Aver. CO_2	Equivalent Hourly Air Supply per Berth: Lower	Upper

†Drop sash of rear door open 12 inches.
‡Drop-sashes of end doors open 24 inches.
§Train running directly with a strong wind.

far apart. If one is high the other is high; if one is low the other is low. The general averages show results which would indicate that the lower receives slightly more air than the upper, but the difference is almost trifling. In 13 cars the lower received the greater air supply; in eight cars the upper received the greater supply. This runs in part counter to the findings of the previous study, where in every car the lowers were found to receive a little more air than the uppers. In that series there were only five cars in which this comparison could be made.

The simultaneous averages of CO_2 in the air of two to four lowers and in one or two uppers in the same car can be compared 148 times. The average proportion of CO_2 in the air of the lowers was less than in the uppers 83 times (56.1 per cent.); it was greater 58 times (39.2 per cent.), and they were equal 7 times (4.7 per cent.).

The proportion of CO_2 in the air of the individual lower and upper berths in the same section, the samples being taken at approximately the same time, can be compared 185 times. The lower berth had less CO_2 than the upper 96 times (51.9 per cent).; it had more than the upper 62 times (33.5 per cent.), and they were equal 27 times (14.6 per cent.). The air sup-

ply is, of course, inversely as these proportions of CO_2; the lower had a greater air supply than the upper in 51.9 per cent., a less air supply than the upper in 33.5 per cent., and they were momentarily equal in 14.6 per cent. of the cases.

The upper berth has no window opening into it The edge of the berth is about on a level with the top of the window. There is a space of about one-half inch between the edge of the berth and the wall—a total open space of about 36 sq. in. Through this wide crevice the upper berth receives much of its air supply, which must then pass inward and upward across the berth and its occupant toward the ventilator exits.

GENERAL COMPARISONS.

We may here bring together the comparative results for the car body and the lower and upper berths in the three classes of cars. The general averages of CO_2 and the computed air supplies are shown in Fig. 1, in which the CO_2 and the equivalent hourly air supplies per person are grouped for the three

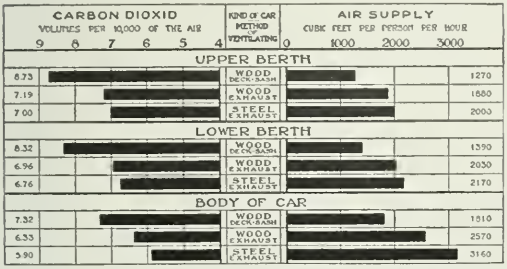

Fig. 1—Comparative CO_2 and Air Supply of the Berths and Aisle in Steel Cars with Exhaust Ventilation, and in Wood Cars with Exhaust and Natural Ventilation.

classes of cars, showing their relations as established by a study of the air of the aisle, the lower berth, and the upper berth, respectively.*

The determinations of CO_2 and computations of air supply refer to the running car. When a train stops, the active ventilation is much reduced and the CO_2 rises. It may finally reach a maximum of 20 volumes in 10,000, though it usually stops around 15. This rise in the CO_2 is generally detected within a very short time—one or two minutes. On starting again the air supply is increased and the CO_2 falls rapidly. In working out the series of observations presented in this and the previous study, no attention was paid to stops lasting up to four or five minutes; samples taken after those of longer duration have been dropped out of consideration. Had attention been confined strictly to the running car the results would be changed slightly; the CO_2 would be a little lower and the equivalent air supply proportionately higher.

As a general rule it is found that the CO_2 in the air of the berths and in the air of the aisle follow each other consistently in successive determinations, that of the berths averaging a little higher, as would be expected from the fact that the inflowing air from end passageways is not likely to enter them, but to be mixed in the aisles with the contaminated air that flows out from them.

From what has preceded it is seen that the air supply to the breathing zone of the steel car, constructed without deck-sashes, is materially increased over that of cars similarly equipped as to exhaust ventilating devices, but built with deck-sashes in the ordinary way. This increased ventilation is much more noticeable in the air of the aisles than in that of the berths; it results in a somewhat greater difference between the average CO_2 of the aisle and berths than was found in the previous series, which is interpreted to mean that more air flows from the end doors and passageway windows into the body of the car by reason of there being no crevices at the top to supply the exhaust demand of the ventilators. It is probable that the power of exhaustion developed by these ventilators is very slight as measured by differences of the internal and external barometric pressure. They no doubt act mainly by furnishing a ready exit and continuous outflow of that air forced in by the wind, preventing its damming back near the places of entrance. In this way a constant upward movement of the incoming air is assured, and this leads to a constant and equalized renewal of the air in the lower levels.

HYGIENIC CONSIDERATIONS.

On the basis of well controlled experiments, the following statements seem to be entirely warranted:

1. All trustworthy evidence goes to show that the normal expired air contains no volatile poison and that it is not capable of harming the human organism when rebreathed under the ordinary conditions of ventilation.

2. The increase of carbon dioxid and the decrease of oxygen have nothing to do with the ventilation problem under normal conditions, or with the subjective or objective effects of close air. Carbon dioxid is a necessary constituent of the air of the lungs; it is not to be considered as a poison or the index of a poison. Its proportion in the air of a room is a convenient and fairly accurate index of the quantitative air supply.

3. Air performs for the body a physical function (heat-abstraction) which is quite as important as its chemical function (oxygen-supplying).

4. The ordinary defects of ventilation lie with the physical function of the air and not with the chemical.

5. Temperature, humidity and air movement are the physical qualities of the air which are of importance in this relation.

6. The success of ventilation depends on whether or not these physical qualities of the air are so regulated as to maintain its physical function of heat abstraction without embarrassment to the reflex mechanism for the regulation of body temperature. "The good effects of efficient ventilation and of out-door air depend on the coolness, the relative humidity and the motion of the air and the ceaseless variation of these qualities." (Hill.)

These six statements, then, are the main items of the code which should govern attempts to ventilate. It will be noted that quantity of air as a measure of ventilation efficiency is to a large degree lost sight of, while the physical qualities of the air as they affect its ability to absorb body heat come strongly forward. The hygienic value of ventilation for the purpose of supplying chemically pure air is much less than has been generally supposed. It should now be looked on as a process to be carried out in the interest of the heat economy of the body.

DOUBLE TRACKING IN NEW SOUTH WALES.—A statement made by the minister for railways of New South Wales regarding the expenditure on double tracking work indicates that from July 1 to October 31, 1911, the expenditures totaled $865,000. Over the same period last year the amount was $1,160,000. Although the rate of expenditure had thus greatly increased, he did not anticipate any difficulty in meeting the requirements of the near future. It was explained that money was being spent on double tracking at a greater rate than at any previous period.

NEW LINE FOR QUEENSLAND.—Work on the Queensland government railway extension to connect the Chillagoe Company's line with the Mount Mulligan coalfield will be commenced shortly. In order to defray the cost of the undertaking, the Chillagoe Company has agreed to guarantee the issue of £125,000 ($625,000) 4 per cent. ten-year treasury bonds. The Queensland government will build and run the line. It is anticipated that the scheme will effect a saving in the government's fuel bill of from 30 to 40 per cent.

*Strictly considered there is no proper comparison of the aisles as set forth in this chart, because the number of passengers varied for the different classes of cars, and as this number varies the CO_2 and the volume of air *per person* will also vary in like ratio, with any given air supply to the car. The variation in the average number of passengers for the different classes was, however, so small as to make this direct comparison allowable.

DECISION ON HOURS-OF-SERVICE LAW.

The Circuit Court of Appeals for the Eighth Circuit, Judges Hook, Smith and Van Valkenburgh, in the case of the government against the Kansas City Southern, has reversed the District court for the eastern district of Oklahoma, and holds that, in the case at bar, involving excessive hours of service of men on a freight train, in May, 1910, the railroad company did not show sufficient reason for disregarding the 16-hour limit; and has remanded the case for a new trial. The decision, prepared by Judge Van Valkenburgh, was filed January 24.

The road admitted that the men on the train in question were on duty over 16 hours, but in defense pleaded that the delays were due to the poor quality of the coal, though it had been bought from an approved source and had been inspected; to unexpected long delays in meeting opposing trains, to delays in switching and for cleaning the fire in the engine, all of these being unforeseen; also to the breaking of one of the rods used in shaking the grate of one of the engines, and to leaky flues.

The train started out on its trip forty-five minutes late; was delayed at Spiro thirty minutes to clean the fire and then thirty minutes more to wait for an opposing train; at Gans there was another delay of about one hour to meet another train; then there was a delay of one hour, ten minutes, due to the poor steaming of the engine, and fifty minutes for another meeting. When 14 miles short of the end of the run the conductor found that he had only 57 minutes left in which to complete the trip within 16 hours, and he set out about half his cars; but even with the size of the train thus reduced he still lost time and was nearly two hours in running this 14 miles. The lower court held that the railroad had made a good defense and decided against the government.

The circuit court of appeals finds that the defendant in its original answer did not properly set forth all of its reasons; but as the lower court seems to have been lenient in this matter the case is treated as though the answer had been full and complete.

Quoting numerous decisions, the court holds that this is a penal statute and therefore must be strictly construed; but also that it is highly remedial and, therefore, must be liberally construed in order that its purposes may be effected. Attention is called to the fact that in the hours of service law the words "knowingly and wilfully" do not appear; also, the clause relating to acceptable excuses for non-compliance with the law, does not contain the phrase "by the exercise of due diligence and foresight." But the purpose of the law was to prevent trainmen from working unreasonably long hours, and the carrier must be held to a high degree of diligence and foresight; as high as may be consistent with the object aimed at and the practical operation of the railroad. Numerous excuses for delay which are not acceptable under the law are set forth.

The court considers three of the excuses given in this case as worthy of consideration; the steaming qualities of the coal, the leaky flues of the engine and the defective shaker rod. Coal from the same source had not given trouble on other occasions; the engineman did not notice any defect in it; the entire testimony concerning it is meager and indefinite and the court accepts the presumption that the coal was good. The failure to make steam was much more probably due to the leaky flues.

As to the flues, the testimony is also indefinite and unsatisfactory. Testimony as to when the leaking began and as to the inspection of the engine is vague. Proof of diligence on the part of the company is far from conclusive. The reports made by the enginemen showing that the shaker rod needed repairs are not very satisfactory and there is some confusion on this point also; and the court is in doubt whether the rod was in good condition when the trip started; whether its derangement was not one of the ordinary incidents of operation which should have been anticipated. Moreover, the evidence is not clear as to whether this defect was what caused the delay at Spiro, and it is held that this defense of the company is not conclusively established. The train despatcher knew that the train was badly delayed, and at a number of places; and knew the reasons; and the decision of the court below that the despatcher exercised reasonable discretion is not accepted.

The court below was mistaken in directing a verdict for the defendants; it should have submitted the case to the jury under appropriate instructions; and, therefore, a new trial is ordered.

A LARGE CAR FERRY.

The Southern Pacific has long held the record for operating the largest ferry boat in the world, the *Solano,* but this road is now building at its shipyard in Oakland a larger steamer to be known as the *Contra Costa.* The *Solano* has been operating across the Carquinez Straits between Port Costa, Cal., and Benicia in practically continuous service for the past 32 years, transferring both passenger and freight trains. The *Contra Costa* is required to handle the increased amount of traffic.

The hull of the new boat will be of steel, the length over guards being 433 ft. and the width over guards 116 ft. Four tracks laid at 12 ft. centers will accommodate two locomotives with 36 freight cars or 24 passenger cars. The boat will be propelled by two radial paddle wheels on either side of the vessel. Two independent engines below the main deck, one on each paddle wheel shaft, will develop 2,500 h. p. each. The boiler arrangement includes eight dryback Scotch boilers. A restaurant, bar and waiting room will be located on the main deck for the convenience of passengers while crossing the river. The exact dimensions are as follows:

Length over guards	433 ft. 4 in.
Length over transoms	420 ft.
Width over guards	116 ft.
Beam moulded	66 ft.
Depth amidships	19 ft. 9 in.
Depth at sides	19 ft. 3 in.
Camber or reverse shear	1 ft.
Draft, light	5 ft.
Draft, loaded	6 ft.
Tonnage	3,800 tons

The addition of the second boat has necessitated the enlargement of landing facilities and an extra slip will be built at each side. At Port Costa the new slip will be located 1,400 ft. southeast of the present one. The length of the slip from the mouth to the nose of apron will be 450 ft. and the width at the mouth 200 ft., tapering to about 60 ft. at the apron. The wharf at the bay side, which is a continuation of the land side wharf at the old slip, is 35 ft. wide out to the fender. The fender or spring piles, which are on the bay side, are driven in two rows connected with each other by six ribbon courses each composed of four pieces of 3 ft. by 14 in. pine with joints broken to form practically continuous timbers.

The slip side of the wharf is protected by three rows of spring piles connected by 10 ribbon courses, the face of this piling being lined with about 4 in. by 8 in. sheathing. Starting with the apron the first 175 ft. of this sheathing is solid up to and around the terminal dolphins, which are composed of 70 piles, exclusive of the spring piles. The fender line on the land side extends 760 ft. beyond the mouth of the slip, 665 ft. of which is of two pile construction without sheathing and backed by two pile braced bents 6 ft. apart. All the sheath piles back of the apron hinges are creosoted, while the others are untreated. Where the wharf meets the shore a concrete retaining wall varying from 3 to 5 ft. in height protects the bank from crumbling and the deck of the wharf from contact with the earth.

At Benicia, the slip is located opposite the present one, being separated from it by a wharf 541 ft. long of the same general construction as that at Port Costa. The construction here is more difficult because of the necessity of removing a small island of rock lying in the path of the slip. The Benicia slip is 520 ft. long, with the wharf line 5 ft. above extreme high water.

The aprons and operating mechanism are the same for both slips. The length of the apron proper is 100 ft. from hinges to nose and the width is 49 ft. Four tracks spaced 12 ft. between centers are provided on each apron. The free end of the apron is supported on a pontoon 45 ft. long and 11.5 ft. deep. The buoyancy is so regulated that with the counterweights in the towers it exceeds the weight of the apron by 10,440 lbs., enabling the platform to be raised to any height desired. To lower the apparatus, the counterweight is raised by two hydraulic cylinders 19 in. in diameter and 10 ft. long, working under a pressure of 125 lbs. per sq. in. Power is supplied by pumps and tanks on the boats.

SUPERHEATER SWITCH ENGINES WITH GAINES COMBUSTION CHAMBER.

The Illinois Central has recently received 10 switch engines of the 0-6-0 type from the American Locomotive Company; 30 more are under construction. They embody a combination of important features, which would seem to mark a distinct step forward in switch engine design. The main feature is the use of a Schmidt superheater, having 19 units, in conjunction with a Gaines combustion chamber. These are the first switch engines of which we have record that are so equipped, and the results will be watched with interest. Walschaert valve gear and the Ragonnet power reverse gear are also used. The following are the principal dimensions and data:

Type	0-6-0
Service	Switching
Fuel	Bituminous coal
Tractive effort	32,400 lbs.
Weight in working order	166,000 lbs.
Weight on drivers	166,000 lbs.
Wheel base, driving	11 ft. 8 in.
Cylinders.	
Kind	Simple
Diameter	21 in.
Stroke	26 in.
Wheels.	
Driving, diameter over tire	51 in.
Driving journals, diameter	9 in.
Boiler.	
Style	Extended wagon top
Working pressure	170 lbs.
Outside diameter of first ring	63 in.
Firebox, width and length	78 in. x 109⅝ in.
Tubes, number and diameter	151—2 in.
Tubes, length	13 ft. 4 in.
Heating surface, tubes	1,046.8 sq. ft.
Heating surface, flues	362.2 sq. ft.
Heating surface, firebox	150.5 sq. ft.
Heating surface, total	1,559.5 sq. ft.
Superheating surface	266.6 sq. ft.
Grate area	38.8 sq. ft.
Tender.	
Water capacity	5,500 gals.
Coal capacity	6½ tons

Ten of these engines are now in service, working with saturated steam engines which have 31,200 lbs. tractive effort, and while no tests have been run to determine the actual saving in water and fuel consumption, there is a very noticeable decrease. Very few sparks are thrown from the stacks and the front ends are found to be remarkably clean, most of the cinders collecting in the space between the brick arch and the back tubesheet. Several of the engines have been in service night and day for some time and it has been found necessary to clean the flues only once in two weeks.

The lack of cylinder condensation resulting from the use of the superheater eliminates almost entirely the throwing of water from the stack, a feature which will be much appreciated at passenger terminals. This also assists in making the engines respond quickly to the opening of the throttle, and on account of this feature one yardmaster claims he can handle from 20 to 25 per cent. more cars a day with these engines than with switchers of the same power using saturated steam. The yardmen are also enthusiastic over the saving in time resulting from the use of the power reverse gear. From an operating standpoint this time saving stands out most prominently, but the effect of the superheater in giving a quick responding or "smart" engine is almost as greatly appreciated. The engines are fitted with exhaust tips 4⅞ in. in diameter and having a ⅞ in. bridge at the top, the latter having been found necessary under the short cut-off conditions obtaining when moving any considerable distance. A special superheater oil is used for lubricating the valves and cylinders.

Illinois Central Switcher Which Has Several Important New Features.

Railways in Cyprus.—Cyprus possesses one railway on a gage of 2 ft. 6 in. from Famagusta, a point on the east coast, to Nicosia and Morphou. It is 61 miles long and was opened for traffic to the former place in August, 1905, and to the latter in March, 1907. The total cost of the line, including rolling stock, has been $637,335. The steepest gradient is 1½ per cent., but the line is generally level. The traffic is small and disappointing, and the expectation that Famagusta new harbor works, which have cost $570,000, would make that town the seaport of the island in place of Larnaca has not been realized. The gross receipts of the railway in 1912 were $57,035 and the operating expenses $58,315, this showing a deficit of $1,280.

Railways in Mauritius.—Mauritius is well supplied with railways, which consist of six separate branches, with a total mileage of 120 miles. They are all of the 4 ft. 8½ in. gage, and there is in addition one short branch of 10 miles, which is on a gage of 2 ft. 6 in. The North and Midland lines, which together equal 67 miles, were opened for traffic in 1864 and 1865. The grades on the Midland line are very severe, as may be judged from the fact that, in a distance of 16 miles from Port Louis to Curepipe, the line rises 1,800 ft. The track for the four principal lines is composed of 74-lb. rails. These rails are gradually being replaced by 80-lb. rails. The other branches are laid with rails of varying weight, the Black River branch being laid with 40-lb. rails.

REPORT OF CAR SERVICE COMMISSION.

Outline of the Results Obtained Thus Far and the Larger Problem of Interchanging "Legal-Tender" Equipment.

The commission on car service appointed recently by the American Railway Association to investigate complaints of diversion of cars, has submitted a report to the executive committee. The commission consists of Fairfax Harrison, president of the Chicago, Indianapolis & Louisville; R. H. Aishton, vice-president of the Chicago & North Western, and T. E. Clarke, assistant to the president of the Delaware, Lackawanna & Western, with Arthur Hale, general agent of the American Railway Association, as secretary.

The commission has held meetings at Chicago on November 18, November 20, December 21 and January 28.

The first case before the commission was that of the Baltimore & Ohio versus Wheeling & Lake Erie, which was given a preliminary hearing on November 20. It involved the alleged misuse of open cars. The evidence showed that the Wheeling & Lake Erie had used cars of the Baltimore & Ohio in its own trade because of shortage of its own cars, which were widely scattered, especially on roads west of Chicago and St. Louis. It developed that the balance in favor of the Wheeling & Lake Erie on these lines was over 1,200, while Wheeling & Lake Erie owed the Baltimore & Ohio some 500 cars. The commission, believing the best way to handle this case would be to correct the difficulty, took the matter up with all the western roads concerned and also with the roads connecting these western roads with the Wheeling & Lake Erie. Personal visits were made by members of the commission in most cases, and the response was so general that 800 cars were returned, regardless of home route, to the Wheeling & Lake Erie. This action was followed by a temporary improvement by the Wheeling & Lake Erie in its balance with the Baltimore & Ohio.

The commission next received the case of the St. Louis, Rocky Mountain and Pacific versus Colorado & Southern, which, like the prior case, covered open cars only. In this case also the commission secured such an improvement in the situation that the complaint has not since been heard from.

Immediately afterward the commission was requested by the Interstate Commerce Commission to take up the cases of certain coal roads in Illinois and Indiana, whose open cars were retained by roads north and west of Chicago. It became evident that the methods in the first two cases could not be successfully applied to such a large and serious situation, and the commission decided that the desired results could only be obtained by securing the co-operation of the railroads on a much larger scale. The commission therefore drafted the following declaration, which was promptly signed by practically all the roads centering in Chicago.

> It is hereby declared to be the policy of the undersigned that all open cars shall be returned in regular course to their owners without diversion or unnecessary delay for return loads, and to that end instructions will be given and enforced that open cars be loaded promptly only in the direction of home or sent empty to the home road under car service rules; and that such cars be given preference in movement over dead freight.

This declaration was generally put into effect with the result of relieving the situation at the coal mines in Indiana and Illinois.

The commission then received the following cases, all of which concerned open cars:

3 to 5—Chesapeake & Ohio vs. three railroads.
6 to 24—Hocking Valley vs. nineteen railroads.
25 to 26—Norfolk & Western vs. Wheeling & Lake Erie and Wabash railroads.
27—Midland Valley vs. Sunset Central Lines.

These cases were heard on December 21, and the evidence showed that the coal car situation was practically the same in the rest of the country as it had proved to be in the vicinity of Chicago. The declaration signed in Chicago was explained, and the complaining roads agreed that if such a declaration were signed and enforced generally, further action on these complaints would be unnecessary. The commission therefore requested all the railroads of the country to sign this declaration, and it has been generally signed, although is in some sections modified to suit local conditions. The action taken, based upon this declaration, appears generally to have settled the open car situation for the moment, as all the cases before the commission have now been withdrawn, or allowed to lie dormant, excepting those of the Baltimore & Ohio, and Chesapeake & Ohio, against the Wheeling & Lake Erie, and the Midland Valley against the Sunset Central Lines. In these cases investigations were made by the commission which developed such exceptional conditions that it appeared necessary to exercise the power conferred upon the commission by Per Diem Rule 19, paragraph 5, and action has been taken as follows:

PENALTIES FOR VIOLATION OF RULES.

In the case of the Baltimore & Ohio against the Wheeling & Lake Erie, the commission found that there was a violation of car service rules by the Wheeling & Lake Erie in respect to Baltimore & Ohio cars during the period from September 1, 1912, to January 28, 1913, and imposed a fine of $9,884 to be paid by the Wheeling & Lake Erie to the Baltimore & Ohio, the expense incident to the investigation, $64.82, to be paid by the Wheeling & Lake Erie to the American Railway Association.

In the case of the Chesapeake & Ohio against the Wheeling & Lake Erie, the commission found that there was a violation of car service rules by the Wheeling & Lake Erie in respect to Chesapeake & Ohio cars during the period from September 1, 1912, to January 28, 1913, and imposed a fine of $3,534 to be paid by the Wheeling & Lake Erie to the Chesapeake & Ohio, the expense of $32.41 to be paid by the Wheeling & Lake Erie.

In the case of the Midland Valley against the Sunset-Central Lines the commission found that there was a violation of car service rules by the Sunset-Central Lines in respect to Midland Valley cars during the period from September 1, 1912, to January 28, 1913, and imposed a fine of $7,912 to be paid by the Sunset-Central Lines to the Midland Valley, the expense of $50 to be paid by the Sunset-Central Lines.

The commission has received no complaints involving open cars for over a month, but latterly it has received informal, though reliable, advice that the movement of our large crops has resulted in draining western roads of their box cars in favor of the eastern roads. Beside the information derived from railroads, the commission has received through the Interstate Commerce Commission complaints from the Minneapolis Chamber of Commerce, and the Western Grain Dealers' Association, of Des Moines, Ia. The commission is investigating this box car matter, but it is of opinion that the action taken in respect to open cars will not avail to remedy the box car situation—though it may palliate it temporarily.

The commission is advised that over 85 per cent. of the box car mileage in the United States is made under load, while open cars seldom average more than 55 per cent. loaded. It is evident that the prompt return of open cars to their owners cannot materially decrease their loaded mileage, so that the enforcement of Per Diem Rule 19 on open cars, as contemplated by the open car declaration, is practicable and advisable. The commission fears, however, that the sudden enforcement of drastic measures tending to return box cars to their owners without regard to the traffic which offered would result in a decrease in the loaded mileage of box cars. While such a course might fill the present shortages somewhat, it would infallibly result in new and greater shortages at all points in the country.

The commission recognizes that a greater incentive should be given to the distributing railroads properly to equip themselves with box cars and to improve their demurrage and storage rules, especially at the seaboard, but it believes that these results can be obtained by some better method than a blind enforcement of Rule 19.

Having had the benefit of this experience and concentrated study of car service under existing conditions, the commission has formulated for its own guidance some general principles which it takes this opportunity to present for the consideration of the executive committee in the hope that further study of the problem may lead to a solution on an enduring basis of what is after all one of the most acute difficulties in the operation and financial management of the American railways today.

PRINCIPLES FOR STUDY OF CAR SERVICE PROBLEM.

1. In actual practice all equipment falls into two classes:

A. Special Equipment, e. g., open cars, which necessarily involve an empty return movement.

The fair use of special equipment can be, and now is, effectively regulated by Rule 19.

B. "Legal Tender" Equipment, e. g., box cars, which may be and are loaded at any time at any point in any direction, when there is traffic.

The fair use of box cars cannot be effectively regulated by Car Service Rule 19, because

2. The practice of the home route in the case of box cars is an economic waste, from which it has developed in practice that

3. There is in effect today a pool of "legal tender" equipment but without regulation and in its results unjust

(a) during times of car shortage to those originating lines which have provided the equivalent of, or more than, their quota of cars, and to the public served by those lines, and

(b) during times of car surplus, to distributing lines.

4. To be just to the railroads themselves and to the public generally, this pool should be regulated to the end that there shall be secured to every road the use, when it needs them, of its quota of "legal tender" equipment, whether its own or the equivalent in foreign cars, or, in the alternative, compensation in money for the difference. Such regulation can be made effective only by abandonment of the right to physical return to the owner of its own cars, and the substitution of the right to possession and use by each line of "legal tender" cars in kind equivalent to the cars by it owned and contributed to the pool.

5. The objections to recognizing a box car pool in the past have rested largely on the desire of roads, which have supplied their quota of "legal tender" equipment and have maintained them on high standards, to be assured of the use of cars measuring up to their standards. The answer is that in practice existing car service rules have not secured this result so far as box cars are concerned.

6. In any event the inequalities in standards, strength, equipment, capacity and maintenance, of the box cars in general use today are less than they have been, but the regulation of the existing pool should lead to the general adoption of a standard box car.

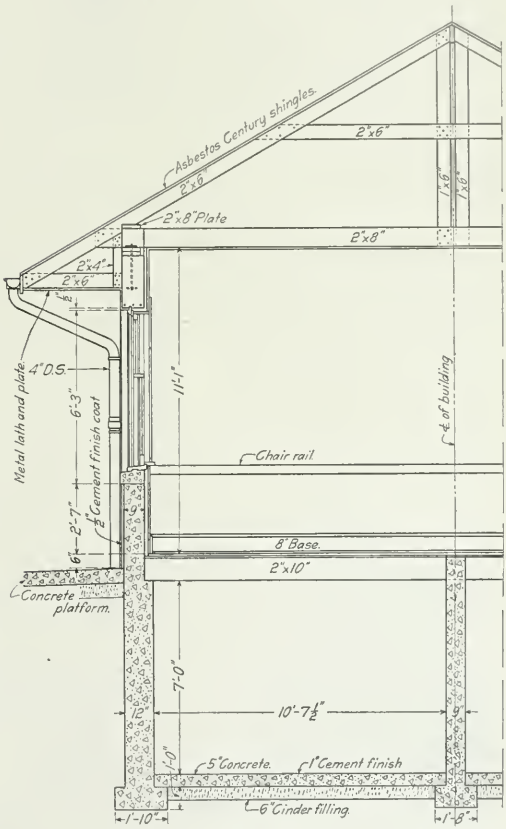
It is estimated that any car builder could build a box car on uniform standard specifications at a saving of at least $65 per car, under any market conditions. On the basis of box cars built in the United States in the calendar year 1912, viz.: 107,887, this would mean a saving of $7,012,655 in capital investment in the railroads and contributes not the least argument in favor of regulating the existing box car pool.

QUEENSLAND'S FIRST BUFFET CAR.—The Central-West Railway, Queensland, has just put in service a buffet car—the pioneer convenience of the kind in Queensland. This car, which was built at the company's shops, has been put on between Emerald and Longreach, which is rather a "dry" portion of the line.

DULUTH, MISSABE AND NORTHERN STATION AT HIBBING, MINNESOTA.

Hibbing, Minn., is one of the principal mining towns on the Missabe Range. It is the northern terminus of the main line of the Duluth, Missabe & Northern, and in addition to a heavy through passenger traffic to and from Duluth, this point supplies considerable local business to other towns on the range. In order to provide adequate station facilities for handling this passenger traffic, the company built a new passenger station last year in connection with the opening of its new line into Hibbing, which was made necessary by the development in open pit mining operations.

The new building is a one story structure with basement, its

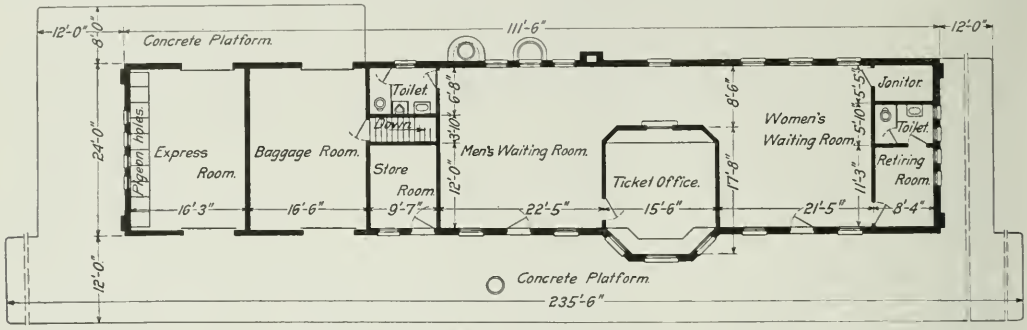


Cross Section Showing Construction of Hibbing Station.

over-all dimensions being 111 ft. 6 in. x 24 ft. The waiting rooms extend the full width of the building; the portions assigned to men and women being separated by the ticket office, which is about two-thirds of the width of the waiting rooms. A single ticket window opens on the space that is common to both waiting rooms. A janitor's room, ladies' retiring room and toilet room occupy a strip 8 ft. 4 in. wide across the end of the ladies' waiting room and a storeroom, stairway to basement and men's toilet room occupy a similar position at the end of the men's waiting room. A baggage room and express room complete the floor plan.

The foundations and walls are of reinforced concrete, the exterior treatment suggesting the prevailing type of station archi-

tecture found in the southwest. The foundations are carried down far enough to form a 7 ft. basement, which is floored with 5 in. of concrete on 6 in. of cinders. The exterior foundation walls are 12 in. thick, and the interior walls 9 in. thick. Above the floor level the exterior walls are 9 in. thick, finished on the outside with a ½ in. coating of pebble dash cement, and on the inside with plaster in the public rooms and plank wainscoting in the express and baggage rooms. The door and window sills are



Floor Plan of Hibbing Station; Duluth, Missabe & Northern.

of concrete, cast separate and set after the walls were cast. The floors are of maple, except in the men's toilet and the express and baggage rooms in which concrete is used. The roof is framed of timbers and covered with asbestos Century shingles. A concrete platform 235 ft. 6 in. x 12 ft. wide is provided in front of the station, and extensions to this platform are carried around both ends of the building.

The building and platforms are lighted by incandescent electric lights and the building is heated by a furnace located in the basement. Coal for this furnace is supplied to a basement storage room through a coal hole in the concrete platform.

The building was erected under the supervision of H. L. Dresser, chief engineer, and under the personal direction of George K. Nuss, inspector.

Duluth, Missabe & Northern Station at Hibbing, Minn.

New Lines for Bolivia.—It is expected that the line from La Paz to Viacha, an extension of the line from Arica, Chile, to La Paz, will soon be open to traffic. When completed this will be the second line from La Paz to Viacha, an important center.

REPORT OF BLOCK SIGNAL AND TRAIN CONTROL BOARD.*

Statistics.—Since the organization of the board in July, 1907, 1,146 devices and systems intended to promote the safety of railroad operation have been brought to the board's attention, and in 1,047 cases complete plans have been furnished. All of these 1,047 cases have been disposed of, opinions regarding the practicability and merit of the devices or systems having been transmitted to the proprietor in each case.

The Block System.[1]—The desirability of using the block system as the only reasonably safe method of regulating the movements of railway trains, which had already been set forth by the Commission in several of its annual reports, was confirmed. The Commission, as well as this board, in recommending compulsory legislation, has taken the conservative attitude that the Government should not prescribe detail methods, but should

*The Block Signal & Train Control Board of the Interstate Commerce Commission went out of existence June 30, 1912. Its final report, dated June 29, has just been published by the commission. This report consists mainly of a review of the five years' work of the board, which work has been made known to the readers of the Railway Age Gazette in its notices of the four annual reports of the board. In the present article we give extracts from those chapters of the final report which are of present interest. An appendix to the report, filling 15 pages, contains a description of the automatic train stop of the Railway Automatic Safety Appliance Company, of Wilmington, Del., which was tried on the Pere Marquette and the Pennsylvania. In this apparatus the "stop" is a horizontal arm fixed on a post about 4 ft. high, and it applies the brakes on a train by striking a projection carried on the buffer beam of the locomotive.

[1]A general review of the block system and its use in the United States was issued by the Commission in February, 1907, before the establishment of this board.

require the gradual installation of the block system on all railroads carrying passengers. The soundness of the principle that the block system is the one and only adequate method now known of spacing trains not only has the constantly renewed indorsement of the majority of prominent railroads, as evidenced by their action in extending its use, but there is a special and significant indorsement in its use on an increasing number of lines which are used only by freight trains. . . . The propriety of using the block system on these lines of light traffic, and the economical results of such use, have been set forth, especially in Appendix B of the fourth annual report. A report was made on the use of the simple manual block system on the Northern Pacific under regulations—the "A B C system"—increasing its safety without the addition of costly electrical apparatus, and simplifying and cheapening the operation by abolishing the time-table and its complicated rules. This was published in Appendix A of the second annual report. . . . Subsequently a change was made in the A B C system which improved it. This was in the provision for moving trains in case of failure of the telegraph wire. Instead of an emergency time-table, the simple train staff, with no electric locking from station to station, was provided.

Automatic Train Stops.—The automatic train stop, the investigation of which was one of the two chief purposes aimed at in the establishment of this board, continues to be a live subject, and serious attention is being given it by competent engineers. . . . Inductive systems—that is, those in which electrical apparatus on the roadway acts upon electrical apparatus on the train by means of electrostatic or electromagnetic induction, and without any physical contact—continue to offer promise of success. A mechanical-trip type of train stop now being tried has a rigid roadside member so securely fastened to the track as to be as little susceptible to breakage or removal as a rail of the track itself. This rigid member acts upon the engine member of every train at every point of indication and causes an air-brake valve to be opened. This is the normal operation at the entrance of a train to each block section if the fixed visual signal is at "stop" or if the block section is obstructed. If, however, the fixed signal is at "proceed," or the route clear, the movable roadside member comes into operation to engage a member on the engine in such a manner as to prevent the escape of air from the brake pipe due to the previous opening of the valve by the fixed roadside member, or it in some other way forestalls or nullifies its action. Not only does such an arrangement place the mechanical trip within the class of "closed-circuit" devices, but it assures that each apparatus will be operated every time a train passes a signal or a point of indication, thus affording a complete check of its operative condition.

Track.—In the use of steel rails prior to 1900 there were comparatively few rail fractures. During the past 10 years the breakage of rails has increased rapidly until now it is of very frequent occurrence. On some roads the number of broken rails found in a single day during the past winter was a matter of grave concern to the officers. It is probably owing to the use of the automatic block system and its track circuit, which in most cases detects broken rails, that more accidents of a serious nature have not resulted from these breakages.

It is of the greatest importance to discover the cause of these rail breakages. The Bureau of Standards in its investigations conducted for the Safety Appliance Division of the Interstate Commerce Commission has performed an excellent service, and this work, if continued, will no doubt contribute very materially to the solution of the problem. Of the number of things pointed out in the report of the Bureau of Standards two are conspicuous: (1) That by the present method of inspection faulty rails are passed for shipment from the mills, and (2) that rails are overloaded.

From the fact that since 1900 an effort has been made by the mills to shorten the time of making rails so as to increase the mill output, and that by so hastening the metallurgical process the soundness of the metal has been decreased, one obvious method of improving the quality of rails would appear to be to take all the time needed to insure sound rails. . . . If the railroads of the country will unitedly insist that the rails furnished them shall conform to the best specifications they are able to compile, a considerable improvement in the quality of the steel will result. It is also doubtless true that more attention should be directed toward determining just what stresses are being developed by the enormous wheel loads now being carried and whether rails can be made to carry them, or whether the practicable limit of loading has been reached.

The board has devoted considerable time to the investigation of various designs of ties intended as substitutes for wood ties. The most that can be said for the many designs that have been submitted is that in general they indicate only in moderate degree an appreciation of the real problem to be solved. On the Bessemer & Lake Erie the I-beam form of steel tie has been given a thorough trial. From the standpoint of strength, durability, and adaptability to the use of proper track fastenings this form of steel tie can be said to be adequate. It furnishes a good support for vertical loads, and proper resistance for forces in compression, tension, and bending. With stone ballast it holds the track in adjustment more satisfactorily than with light ballast. Projecting flanges have been used to secure greater resistance against displacement, and no reason is apparent why such flanges should not prove adequate.

Concrete ties are found in only a few experimental installations. The use of concrete ties reinforced with steel must remain a question for the future, as no examples of this type are in use. Considering the great advance in the use of reinforced concrete during the past few years, it may be hoped that eventually a reinforced concrete tie will be evolved meeting practical requirements. . . . A common defect found in many designs of ties is the complication of the rail fastenings. Where bolts are used both the head and the nut should be accessible and the bolts should be capable of renewal without disturbing the ballast to any extent. Most inventors make no provision for shimming. To provide adequately for shimming or for widening the gage appears to have been a difficult problem for inventors, as it involves the use of adjustable fastenings, with consequent chance for lost motion and change of adjustment. Another factor having to do with both form and material is the question of insulation of the rails on the one side of the track from those on the other, where electric track circuits are used for signaling. The electric track circuit is coming more and more into use, and no design of tie can be deemed suitable for general use which does not adequately provide for insulation of the rails from the ties.

Headlights.—The board has had submitted to it a number of plans and descriptions of locomotive headlights and devices for enabling such lights to be moved so that the beam of light may be thrown upon a curved track ahead. The board believes that it is not practicable properly to control the direction of a headlight beam through the swiveling of the trucks or by any relation of the train or engine to the track upon which it is running, but that simple mechanical means may readily be designed to swing the headlight so that the engineman may, within limits, have complete control over the direction of the beam.

It is found in practice that very few oil headlights give a sufficiently brilliant light to illuminate the track far enough ahead of the engine to enable an obstruction to be discovered and the train brought to a stop before reaching it. There seems to be no sound reason, however, why by the use of properly designed reflectors and lenses the oil headlight cannot be made to give a much better light than it generally affords. The so-called high-power headlights use electric current or acetylene gas. The electric apparatus is somewhat more complicated than that required for the gas headlight. It is not believed that the danger of explosion from the use of the acetylene headlight is sufficient to militate against its use. The amount of light from either is

believed to be ample. If a headlight is to be used as more than a marker it should be a high-power light having both the direction and intensity of the beam controllable by the engineman. The control of the direction of the beam enables the engineman to illuminate curved track ahead and throw light along the slopes of cuts where landslides are likely to occur. The control of the intensity of the beam by the engineman directly from the cab is regarded as a necessity, as when meeting or passing other trains and for preventing improper reading of fixed or classification signals. Perhaps the most common and the most weighty objection to the use of high-power headlights is that an engineman running in one direction is dazzled by the light of an engine coming toward him. To meet this objection it is deemed important that every high-power headlight should be so arranged that the engineman can occult it at will.

Car Couplers.—The board has examined a number of couplers, but none that possessed such exceptional merit from the standpoint of safety as to warrant a recommendation that it be used to the exclusion of many of the couplers already in actual railway service. It is believed that the Master Car Builders' Association has the coupler problem fairly well in hand, and that couplers are now being furnished which meet the demands of safety as fully as can be expected owing to the restrictions of manufacture and in view of the exceptionally hard service to which such appliances are subjected.

Automatic Connectors.—The use of a practical device for automatically connecting the air brake, steam heat, and signal pipe lines through a train is desirable, not alone from the standpoint of safety, but also because of economy and the saving of time in train operation. Automatic connectors have been in experimental use for several years. They are of two general types, namely, side-port and butt-face. The side-port connector is one in which the contact faces are in a vertical plane parallel to the track. The butt-face connector is one in which the contact faces are in a vertical plane at right angles to the track. It is imperative that upon general adoption all connectors must be of the same general type so far as the contour of their coupling heads and range of their gathering and registering devices are concerned. In other words, the side-port and butt-face types of connectors cannot be used together, nor can the pin and funnel and wing types of gathering devices be used together. It is apparent, therefore, that until some one type has been decided upon by adequate authority and definitely adopted as standard, little progress in equipment for actual service can be hoped for. Another important question is the stopping of leaks and making light repairs. From an operating standpoint it is clearly impracticable to have an engine at hand for the purpose of separating cars whenever it becomes necessary to remove defective gaskets and insert new ones. Some means must be provided for doing such work while the connector heads are coupled together. . . . The gathering and registering device must be capable of considerable distortion without destroying the ability of the connectors to register and lock in position when their faces are brought together. Not only for convenience and for obvious mechanical reasons, but also to make it possible to couple hand hose with the automatic connectors during the transition period, connectors should be located directly below the car coupler and in a vertical plane containing the center line of the coupler. To meet the requirements of the Master Car Builders' Association the center line of the connector head must not extend downward farther than 17½ inches below the horizontal center line of the drawbar. The central axis of the connector head must also be the center line of the air-brake port. A practicable connector, therefore, must be located within very restricted limits, and in addition must be so designed that it will meet all extraordinary conditions of train operation, not only in road service but in switching yards and terminals as well. . .

Inspections.—In previous reports references have been made to inspections carried on by the board covering signaling practices, methods of operation, and conditions of roadway. These inspections have been continued. They have been made for the double purpose of (*a*) carrying on the investigation relating to block signal systems and other devices intended to promote safety in railway travel, and (*b*) to set forth in a summary for the benefit of the officers of railroads any bad practices or unsafe conditions observed. Brief summaries of these inspections were published in the third and the fourth annual reports. Some statements regarding inspections in an appendix to the fourth, which were couched in brief and general terms, conveyed wrong impressions concerning the conditions on certain roads. Those railroad officers who have considered that their roads were unduly criticized in this statement of inspections and who have made known to the board their definite objections have been furnished with detail information showing the grounds for the board's statements.

General Conditions Affecting Safety.—In discussing this subject it may be assumed at the outset that railroad officers and employees are as anxious to do everything in their power to promote safety as the public is to have safeguards provided, and that railroad officers and employees are not immune to the horrors of a terrible wreck. If all think alike and have the same desire, why are not better safeguards provided? The general answer, for most railroads, is the expense involved. Money is not available with which to provide and install the apparatus; it is needed elsewhere. The railroad officer responsible for results does his utmost to meet the demands made on him. His first responsibility, as he sees it, is to provide earnings. He knows that if he fails in this some one will be found to replace him. It is but natural, therefore, that the railroad officer has in the struggle for existence given chief attention to the conditions directly affecting the financial end of the business, and less attention to the conditions affecting safety. Safety he very much desires, but earnings he must have. Then, too, there is the element of chance in the one which is totally lacking in the other. This chance must be taken, not in the spirit of gamble, but simply as a necessity. Human life has a value, the same as freight, and if it has been lost in transit it is paid for and becomes one of the operating expenses. The problem for the railroads is one of great difficulties, if not impossibilities. There is the immensely greater volume of business to be handled; the palatial passenger service, with greatly increased speeds and consequent demands on equipment and roadbed; and the general advance in wages; with resultant higher cost of construction, maintenance, and operation. All these things have added to the expense on the one hand, with no corresponding increase of earnings on the other. Every added demand upon existing facilities and methods introduces sources of danger. As the demand does not diminish, it seems necessary that methods and facilities must improve if the standard of safety is to be maintained.

As regards methods, it may be said that on the large majority of American railroads excellence of administration is nullified by faulty organization, magnification of individual function to the detriment of team work, and by an almost entire absence of a definite system of broad training of subordinates for higher duties. These, and the shifting of responsibility from one officer or department to another, prevent the attainment of that high order of discipline and morale which must be had if carelessness is to be overcome and skill and painstaking loyalty are to govern the acts of the men on whom the public must depend for safety. As has been observed in former reports, this condition is largely due to causes which have their roots in the conditions of society in America.

While the deficiencies noted above may explain, they can hardly excuse failure to take greater advantage of the facilities for promoting safety which already exist or are ready for final development by the railroads. The railways have been slow in installing the block system, long since demonstrated to be the prime requisite for safety against collision. The railroads have failed to investigate as fully as they should the availability of devices to supplement the block system as now used, and which

if adopted would add directly to the safety secured by existing means. This question of neglect of definite measures affects the public also. The failure of the government to require the installation of the block system is a definite feature of recent congressional history, there being more and stronger reasons to require this improvement than exist for the use of some other safety devices now required by law. Intelligent co-operation by the States and the Federal Government in establishing more uniform requirements for the operation of railroads would result in marked advancement and help to do away with the uncertainty felt by railroads as to their future. . . .

NEW YORK COMMISSION REDUCES SUBURBAN FARES.

The New York State Public Service Commission, Second District, Frank W. Stevens, chairman, acting on complaints from mayors and citizens, has ordered sweeping reductions in the fares charged to suburban passengers between Westchester county points and New York city by the New York Central and the New York, New Haven & Hartford railroads, and the order provides for the reëstablishment of the rates which were in effect on June 30, 1910. The reductions to and from the principal points are as follows:

NEW YORK CENTRAL.

HUDSON DIVISION:

	Present rate.	Reduced rate.
60-trip monthly.		
Yonkers	$6.75	$5.90
Irvington	7.95	7.30
Tarrytown	8.25	7.60
Croton	9.60	8.65
Peekskill	11.05	10.30
50-trip family tickets.		
Yonkers	$12.00	$11.50
Irvington	17.60	16.40
Tarrytown	20.00	17.55
Croton	27.20	24.75
Peekskill	32.80	29.90

HARLEM DIVISION:

	Present rate.	Reduced rate.
60-trip monthly		
Williams Bridge	$5.60	$5.15
Mount Vernon	6.50	5.60
White Plains	8.10	7.35
50-trip family tickets.		
Williams Bridge	$6.25	$6.25
Mount Vernon	11.20	9.80
White Plains	18.40	16.40
Round-trip.		
Williams Bridge	$0.25	$0.25
Mount Vernon	.60	.45
White Plains	.95	.90

NEW YORK, NEW HAVEN & HARTFORD.

	Present rate.	Reduced rate.
One-way fares.		
Mount Vernon	$0.35	$0.30
New Rochelle	.40	.35
Port Chester	.60	.55
60-trip monthly.		
Mount Vernon	$6.75	$5.60
60-trip monthly.		
New Rochelle	7.65	6.35
Port Chester	9.90	8.25
50-trip family tickets.		
Mount Vernon	$12.50	$10.00
New Rochelle	14.50	12.00
Port Chester	21.75	19.25

The new rates are ordered to be put into effect on March 1, and to continue for a period of at least three years.

In discussing the case, the Commission states that the rule it has uniformly followed in cases of increase of rates charged by a corporation subject to its jurisdiction is as follows:

A rate (1) fixed and established as the voluntary act of the corporation itself; (2) which has been charged and collected by the corporation during a period of time sufficiently long to show that it is not a mere experiment, and has been the rate which the corporation charged and collected as a regular and settled rate; (3) which has been accepted by the public in its dealings with the corporation as just and reasonable; (4) under which business affected by the rate has prospered and increased, must, as against the corporation, be treated as presumptively just and reasonable.

It is unreasonable to increase such a rate without a new state of facts which make the old rate not remunerative. Such facts, if they exist, are peculiarly within the knowledge of the corporation. A change having been made by it from a presumptively reasonable rate, the burden lies upon it to overcome the presumption that the increased rate is unreasonable.

The commission thinks that the roads have not succeeded in overcoming the presumption that these increases were unjust and unreasonable; and, continuing, says:

1. We hold that as matter of public policy, the rates into New York city from the commuting district should be placed at the lowest possible point, both in the interest of the public and of the railroads. The prosperity of the railroads is bound up with the growth and prosperity of the city of New York. It is of the utmost importance that homes for literally armies of people may be found in the county of Westchester. Every consideration of public welfare demands that that county be given over to the residences of those who earn their livelihood in the city of New York. Without them, the city's work cannot be done, and the city itself affords no proper place of residence for hundreds of thousands except on terms of unwarranted congestion or excessive expense. Public health, public convenience, and public interest in every way require that cheap and rapid transportation be afforded into New York city from points as far out in the country as is practicable, and any policy which makes against this must be disapproved.

From the point of view of the railroads, their prosperity is bound up in the growth and development of New York city, very largely dependent upon cheap transportation. The railroad corporations should be prepared to afford this transportation at the lowest possible rates, if they are to consult properly their own financial interests in developing and encouraging the enormous business which the city as a whole gives to them, both freight and passenger.

For these reasons the question is not just how many tenths of a cent the rate can be raised or lowered for each mile of travel, but at what point it should be placed in order to enlarge the commuting business, increase the suburban population, and thereby increase the general prosperity. Of course, this point must be fixed with proper reference to fair and reasonable returns to the corporation.

2. An attentive study of the evidence submitted satisfies us that the increased rates have operated unfavorably to the communities affected; that they have discouraged travel; that they have not permitted the growth and development of the communities within the commutation zone; and that they have added materially and unjustifiably to the burden of those who are required to travel back and forth daily in order to carry on their business in the city.

3. The Commission is also satisfied from the evidence that the revenues derived from the increased rates have not increased above those received formerly in anything like the proportion of increase of rate. The ostensible reason of the companies for increasing these rates was the increased expense of operation. This expectation has in a large measure, according to the evidence, been disappointed. The operating costs have not been decreased, but the gross earnings from the commutation rates have not afforded the relief to the companies which they expected from the increase in rates. This is another proof that the effect of the increase has been to diminish travel and not to better the net financial result to the companies. We are convinced that the fares complained of tend to restrict rather than to promote travel and to such an extent as to defeat materially the purpose for which commuters' fares are primarily established.

4. The New Haven company has based its defense upon tollage and terminal charges paid by it for the use of the Grand Central Terminal. It allocates such charges wholly against the passenger traffic in and out of that terminal, with certain fixed amounts per regular passenger and other fixed amounts for each commutation passenger. By making this allocation it claims to have shown that it is carrying the commutation traffic at a loss, and hence that there is no possibility of saying that the rate charged by it is unreasonable.

We are of the opinion that this allocation to the particular traffic handled cannot be sustained. Such allocation is against universal practice, and has never before been made. . . . The New York Central has to bear the same terminal expenses, but does not appeal to the principle which is urged by the New Haven.

We regard these tollage and terminal charges as being in the nature of rent, and the fixing of the same by the number of passengers passing through the station is only a method of measuring the amount of rent paid. In principle, the case is precisely as though the New Haven paid a fixed sum determined arbitrarily instead of a variable sum determined by the number of passengers using the facilities. These rent charges must be con-

sidered as a part of the general expenses of the road and apportioned upon its entire business, precisely as the charges of maintaining all of its other stations are apportioned. We are unable to see any reason why the general rule should be departed from in this case.

The foregoing conclusions are the result of much study and consideration. They dispose of the cases and require that the rates be restored to those prevailing before the increases complained of.

These cases have not been free from embarrassing questions. The Commission is not disposed to overlook or minimize the contention of the respondents that the increase in costs of operation should be reflected in rates. It should not be forgotten that the increased costs claimed by the respondents arise largely from the alleged increased cost of moving trains by electric energy. The Commission feels that, assuming some such increased cost to have been shown, there should be taken into consideration in connection therewith that the change from steam to electricity as a motive power has made possible the utilization of the site of the Grand Central Terminal for other purposes and to an extent that may well pay an adequate return upon the cost of the station itself. It is a serious question, to be determined only by future developments, whether the use of electric energy is not the only possible method of economical operation in a city liwe New York, and whether it will not, all things considered, justify the continuance of the former rates rather than an increase in rates.

There is another matter of large importance in the case of the New Haven. It has at very great expense built and put in operation the New York, Westchester & Boston as far as New Rochelle. It contemplates a completion of that line to Port Chester. When that road is completed to Port Chester, if it makes such connections and arrangements in New York city as to enable it to furnish a service as convenient and adequate as that which the New Haven now furnishes into the Grand Central Terminal, a question will at once arise whether the New Haven may not justly seek by all reasonable means to divert traffic from its main line to the New York, W. & B., and thereby reduce its terminal expenses and increase its returns upon its subsidiary investment. . . .

NATIONAL TRAIN INDICATORS.

The illustrations show the types of train indicators in use at the two great passenger stations in Manhattan, New York City—the Pennsylvania station, which was opened in 1910, and the Grand Central Terminal, just put in service last week. In both of them the information given to the passenger is put in simple and effective form, and two important features of an indicator, simplicity of operation, and architectural design in harmony with the building, have been successfully carried out. The indicators in the Pennsylvania station are operated by hand, as is the flat part of the Grand Central indicators; but the upper triangular indicators at the Grand Central contain electric motors by which the rolls, carrying the aprons or ribbons bearing the names of the trains, are operated, under the control of the gateman, who opens and closes the circuits by means of levers fixed in the wall at the side of the gate.

The Pennsylvania indicator is of cast iron. The post is set in line with the high iron fence surrounding the concourse, and serves as one of the posts of the fence. At each gateway leading to a platform there are two indicators, one on each side. The posts are about 16 ft. high. The sign cards are 17 x 32 in., made of aluminum. These cards are large enough to display not only the name of a train, but its principal destinations. A card bearing 29 words is easily readable a fair distance away. The cards of an indicator are carried on a light frame, inside of the larger frame, as shown in Fig. 2, and this inner frame is lowered by means of a small crank inserted in the hole shown near the base of the post. The movable parts are operated by five shafts, ½ in. in diameter, by means of miter gears and universal joints. The track number at the top is illuminated from within, but the rest of the lettering is made visible by the ordinary lighting of the room or building. The numerals used for showing the time of the train are borne on thin steel ribbons, enameled on both sides. A single crank serves to move both the name card and the time ribbon.

In the Grand Central Terminal two general types of indicators are used; one, Fig. 3, showing indications on two faces at right angles, and visible from all parts of the room, the

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Train Indicators at New York City Stations.

other, Fig. 4, presenting only one flat surface. The faces of the indicators shown in Fig. 3 are 20 in. x 40 in. The opening is about 10 in x 30 in. In the round disk in the ornamental top the figures show the number of the track. These indicators are made of metal, heavily coppered.

The flat indicators, showing names of stations for trains on track No. 30 (Fig. 3) are set at the sides of the gateway, and are not shown in the engraving. In this picture the reader sees a sample of all the gateways to trains on the upper level. In the lower concourse, the triangular indicators are set on top of the flat indicators. The flat indicators on the lower level are somewhat less ornate in design than that here shown. In all of these the striking feature is the simplicity of the design and the simplicity and effectiveness of the lettering—plain white letters on a solid, dull black ground.

These letters are painted on black curtains, all of the curtains likely to be wanted at a particular indicator being rolled on sticks, like curtain rollers, and kept in the drawers in the lower part of the indicator. To display the bulletin of a train the roller bearing it is put in position at the bottom of the space allotted to the curtain, and its upper end is drawn to the top of the space by means of endless chains, one at each side, which, when moved by the attendant, unroll the curtain its full length, displaying the names. The operation takes only 10 or 15 seconds. The section of the indicator containing the drawers is about 3 ft. 6 in. high and the mechanism for turning the chains is in a space, about 10 in. high, immediately above this. These indicators are 11 ft. high and from 32 in. to 40 in. wide. The curtain is made of black, waterproof, rubber-faced drill and it is about 5 ft. long. The curtains are the same size and color as the space which they cover and as, when stretched, they lie flat, the appearance of the indicator when empty is precisely the same as when in use, except for the absence of all the lettering, but the track number.

All these indicators are made by the National Indicator Company, Long Island City, N. Y. In the Pennsylvania station there are 44, of the type shown, and at the Grand Central there are 28 of the angle type and 34 of the flat. Indicators like Fig. 4 have been made also for the Erie and the Baltimore & Ohio.

FUEL ECONOMY ON THE BUFFALO, ROCHESTER & PITTSBURGH.

By H. C. Woodbridge,
General Manager's Special Representative.

During the past five or six years we have made good use of the stereotyped methods for effecting economy in fuel. Bulletins, lectures, tests, demonstrations and better supervision have resulted in a creditable increase in the ton miles per ton of coal consumed, but we were still confronted by the fact that a large percentage of the coal supply was being burned or thrown out the stack without producing any returns on the money invested. Engines standing at terminals or on sidings ready for service or while drifting, were almost without exception "howling" their approval of the fuel furnished and the one thing that our firemen could do to prevent this immediate waste, and at the same time keep the engines ready for service, was to open the firebox door, and this procedure which was advocated, though not enforced, was frequently the prime cause for leaking flues and fireboxes, which in turn resulted in engine failures, shop expense and much waste of fuel. Opening the fire door also permitted the presence in the firebox of an excess amount of cold air which contributed to incomplete combustion and consequent waste of valuable gases.

We therefore decided that the much instructed firemen and engine preparers must be furnished with suitable means for overcoming this, and to this end we designed the smokebox damper with attachments, which is shown in the drawings. The economies effected by the use of this appliance in 13 engines during the past six months have been so marked that orders have been issued requiring that all Buffalo, Rochester & Pittsburgh locomotives be similarly equipped at the earliest possible date.

While the damper was originally intended to be used only when the engine was standing or drifting, during the first experiment it was discovered that such a means for controlling the draft on the fire could be used to great advantage while the engine was working, particularly when maximum effort was being exerted at slow speed. Under such circumstances the drain on the boiler capacity is not great because of the slow speed, but without the damper it was necessary that a very heavy fire be carried in order that the intense and heavy, though infrequent exhausts, would not create draft enough to tear holes in the fire or otherwise destroy it. With the damper closed, or nearly closed, our firemen maintain only a light fire during the most severe service, with a consequent reduction in fuel consumption and physical effort. Partially or entirely closing the damper restricts equally the draft through all flues.

At terminals the dampers are left closed while the fires are being cleaned, the usual leakages about the deflector plates or damper fittings being sufficient to keep the gases from backing out the firebox door when the blower is applied, preventing, however, a great inrush of cold air and consequent sudden chilling of flues and firebox.

Experiments demonstrate that the proper use of this attachment will effect a saving of 3,000 lbs. of coal per trip in freight service or per day in pusher service. The reduction in fuel consumed in an engine with a closed damper, as compared with an engine with an open damper, while standing on sidings or at terminals, is very marked, but we have not made tests of sufficient duration to determine what the actual saving is.

The following description of the operation and use of the draft regulating damper is taken from an instruction pamphlet for the engine crews and engine terminal employees, which was issued by the superintendent of motive power, F. J. Harrison.

The damper is located in the front part of the smokebox, and has an operating rod extending from the lever arm on the dam-

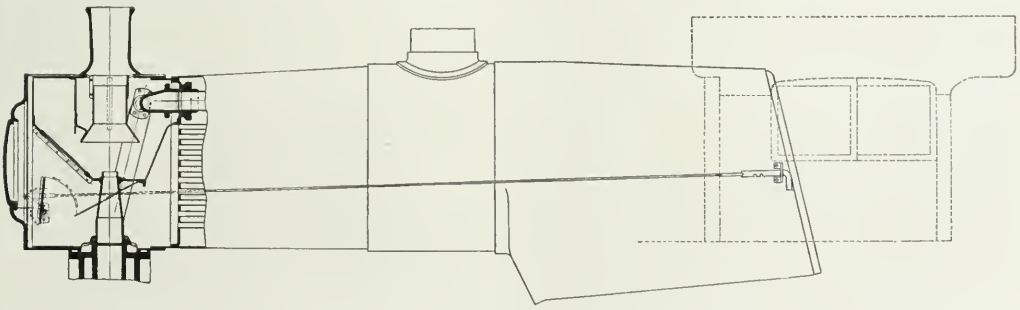


Fig. 1—Draft Regulating Damper in a Wide Open Position.

per shaft back into the cab at the fireman's side of the boiler. It is shown wide open in Fig. 1 (the handle pushed ahead into the third notch) in which position there is practically no interference with the draft, and the fire will burn as freely as though the engine was not equipped with a damper. It should be allowed to remain in this position only when it is necessary to increase the steam pressure rapidly, or when, because of adverse conditions, it is necessary to subject the fire to a maximum draft.

The damper is shown closed in Fig. 2 (the handle is pulled back into the first notch) in which position there is nearly complete obstruction to the passage of gases or air through the flues or smokebox. It should be placed in this position whenever the fire is being cleaned or has been removed from the grates in order that cold air will be prevented from passing through the flues. While the fire is being cleaned the blower must be used lightly. The damper should also be closed whenever an engine under fire is standing or drifting. At such times the draft on the fire is so mild that the coal in the firebox cokes, combustion taking place much more slowly than when the draft is not obstructed, and at the same time the heat of the slow fire is largely retained in the boiler. Under such conditions cold air cannot enter the firebox through a hole in the fire in sufficient quantities or rapidly enough to cause injury to the firebox or flues.

It must also be closed whenever it is advisable to decrease the steam pressure or to deaden the fire preparatory to drifting

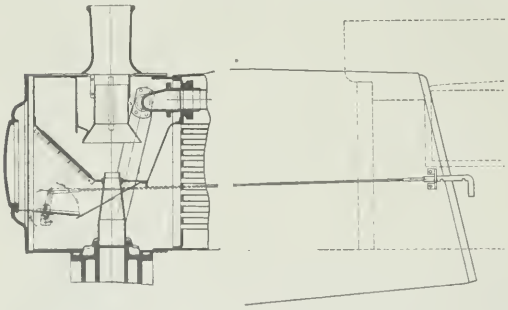

Fig. 2—Draft Regulating Damper in a Closed Position.

or stopping, or to prevent popping while the engine is working; and also when there is danger of the fire being partially destroyed by excessive draft, as when an engine slips or during many switching movements, when the draft on the fire would otherwise be excessive.

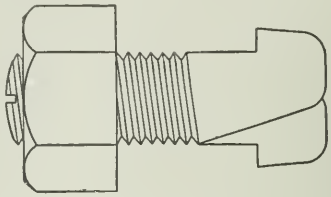
The damper is shown in an intermediate position in Fig. 3. Placing it in this position will so restrict the draft that under normal working conditions the most economical methods of firing can be employed with consequent economy in labor and fuel.

The draft regulating features of a locomotive, such as the stack, stack extension or petticoat pipe, nozzle tip, etc., must of necessity be constructed and located so that the engine will not fail because of a lack of steam, even when supplied with coal of inferior quality or when handled by a more or less inexperienced engine crew, under the most trying conditions of service. It is evident that such an arrangement will provide for an unnecessarily severe draft under favorable or normal working conditions, and therefore a means for restricting the draft while the engine is working makes possible a lighter and more scientific firing.

Argentine Railways.—The Buenos Aires-Pacific Railway, between July, 1911, and October 15, 1912, opened to traffic 332 miles of new line and established 27 new stations.

A NEW TYPE OF BOLT.

There are many occasions when construction would be simplified and time saved if the inner side of a tube or box member, to which it is necessary to connect some other piece, was so placed that a bolt could be passed through from the inside. A type of bolt intended to overcome this difficulty has been invented by Peter M. Kling, an employee of the Brooklyn



The Kling Bolt.

Rapid Transit Company, and is being placed on the market by the U. S. Metal & Manufacturing Company, New York. It is split into two pieces, each half having a head so shaped that it will pass through any hole that will take the body of the bolt. When the two halves are entered they are brought into alinement, the nut is put on; the two heads shown in the illustration hold the material in the same way as the head of an ordinary bolt. The splitting does not reduce the tensile strength as the area of the metal at the head is greater than that at the root of the thread.

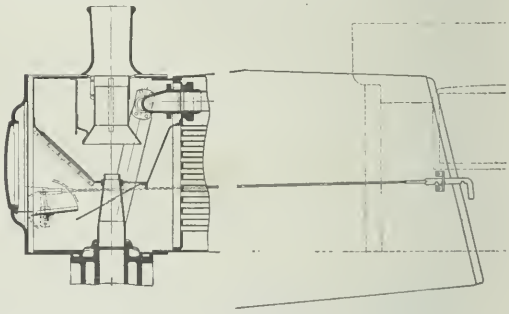


Fig. 3—Draft Regulating Damper Partly Open.

Railways in Ceylon.—Ceylon has an extensive system of railways, with a total length of 577 miles, of which about 509 miles are of the 5 ft. 6 in. gage, the remainder being on a gage of 2 ft. 6 in. The track is laid with 80 and 88-lb. rails on the former gage, and 46¼-lb. rails on the latter. Extensions are now under construction, the most important of which is that of the northern line to Mannar, which, when completed, will form a short and convenient route to India.

Wage Advances in Victoria.—The Victorian government has authorized increases in the wages of railway employees which will involve an additional expenditure of about $225,000 annually. The announcement has not been received with satisfaction by the employees interested. What seems to be aggravating the situation is the fact that at present the general rate of wages in Victoria is rather less than that of New South Wales, South Australia and Western Australia. Had not the revenue shown a decline of $250,000 for the first three months of 1912 as compared with the year previous, the government would probably have agreed to the higher wage.

General News.

The Louisville & Nashville, following conferences with representatives of the brotherhoods, has increased the pay of enginemen and conductors.

The senate of the Colorado legislature has passed a bill requiring the railways in the state more than twelve miles in length to equip all of their locomotives with headlights of 1,200 candle power.

It is announced that the Portland Railway, Light & Power Company will begin work at once on the electrification of 23 miles of the line of its subsidiary company, the Mount Hood Railway & Power Company, from Montavilla to Bull Runn, Oregon.

The United States Civil Service Commission announces examinations March 5 and 6 at cities throughout the United States and also at Culebra, Canal Zone, for the position of accounting and statistical clerk for the Interstate Commerce Commission; salaries, at the beginning, probably $1,200.

Senator Gronna, of North Dakota, has introduced in Congress a bill requiring interstate carriers to transport live stock at the rate of twenty miles an hour, or faster. There is a provision that the carrier must not unload animals without the consent of the shipper, unless it is absolutely necessary to do so. The bill also prescribes that penalties be paid to shippers by the carriers for delays.

The New York, New Haven & Hartford intends to take care of its old and faithful employees who become incapacitated in its service. E. O. Brown, for many years commercial agent at the Grand Central station, New York City, who retired on February 1, has been given a pension for the remainder of his life. President Mellen says that he intends to see that all employees of long service and equal fidelity with Mr. Brown shall be similarly pensioned.

According to the New York *Journal of Commerce*, the New York, New Haven & Hartford was recently offered by financial interests control of the Bangor & Aroostook. The offer was refused on the ground, it is understood, that beyond projects to which it is fully committed and the development of the Rutland, the New Haven's policy hereafter will be contraction rather than expansion and the improvement of the properties that it already owns and controls.

S. Hirai, vice-president of the Imperial Government Railways of Japan, has written to R. C. Richards, chairman of the Central Safety Committee of the Chicago & North Western, asking for literature and information on the subject of the organization of safety committees with a view to the introduction of a "safety first" campaign on the Japanese railways. Mr. Richards has furnished him with a large amount of information on the subject.

The Senate committee on interstate commerce has held hearings in Washington this week on the subject of physical valuation of railroads, and a number of representatives of railroad companies presented protests against the proposed law. The bill introduced in the house by Mr. Adamson, of Georgia, authorizing the Interstate Commerce Commission to make a valuation, was passed by the House, but in the Senate important modifications have been made in it; hence the giving of further hearings.

Among the latest devices adopted by railways for the purpose of constantly reminding their employees of the "safety first" idea, the safety committee of the Canadian Pacific is distributing colored cards containing a series of "Safety First Resolutions for Railway Men for 1913," including many suggestions of ways in which accidents may be averted by the exercise of care. The committee has also distributed a large number of "safety first" mottoes to be pasted in hats, on which are printed: "The chance taker is a widow maker and an orphan maker," or "The chance taker helps to support the artificial limb maker."

Between two hundred and three hundred shopmen of the Lehigh Valley at Packerton, Pa., have gone out on strike. The road, however, had its car repairs in such good shape that it decided to lay off one hundred of its car repair men. Three hundred of their companions in the Brotherhood of Railway Carmen of America then demanded that the hundred men who had been laid off should be reinstated and put to work. The request was refused on the ground that there was no work for them to do, and the men walked out. Three hundred other employees in the shops remained at work.

President Mellen, of the New York, New Haven & Hartford, about a month ago, announced that, pending the construction of No. 20 crossovers on that road, as called for by the Public Utilities Commission of Connecticut, new time-tables would be adopted soon, in order to provide for the slower schedules necessary on account of the stops which have to be made at short crossovers, as required by the state commission. He now announces that Mr. Whaley, the new vice-president in charge of operation, thinks that perhaps the public can be better accommodated by leaving the principal schedules as they are; and, therefore, the issuance of the new time-tables will be postponed. Mr. Whaley asks for time in which to further consider the problem. Mr. Mellen thanks the public for courteously heeding his former notice and says that he hopes Mr. Whaley's plan will cause the public less inconvenience than would follow the installation of a new general time table.

The House Committee on interstate and foreign commerce held a hearing in the capitol at Washington last week on the general subject of safety of railway employees and passengers; but the only subjects taken up appear to have been automatic stops, high power headlights and steel cars; and only brief testimony was taken on these. The committee will have no further hearings during the present session, and there does not seem to be any likelihood of action on any of the subjects considered. No one appeared either for or against the bill, which has been before Congress for several years, to make compulsory the use of the block system. Jacob A. Cantor appeared as an advocate of the La Croix automatic train stop, and B. F. Wooding appeared in favor of his device of a similar nature. A representative of the Commercial Acetylene Company spoke on the bill which has been introduced in Congress to require high power headlights on locomotives, arguing that, by reason of the great differences of opinion as to what are the desirable characteristics of a high power light, the whole subject had better be left in the hands of the Interstate Commerce Commission. Representative Charles A. Talcott spoke in favor of the bill to make compulsory the use of steel passenger cars.

Governor Recommends Sale of Texas State Railroad.

In a message to the legislature Governor Colquitt of Texas recommends that the state dispose of the Texas State Railroad, for the reason that it has been a financial burden since its construction. The state, it is said, has been having an unpleasant experience in government railroad ownership. Several years ago it built a railroad between Palestine and Rusk and also built a short line to give one of its plantations in South Texas a transportation outlet. The latter road has been sold at a heavy loss from its original cost. The other line is known as the State Railroad. Governor Colquitt says: "The State Railroad is still a Jonah and a heavy expense to the penitentiary management. It has been operated during the last two years at a loss of over $50,000. There are $100,000 of bonds on it held by the public school fund; they bear 5 per cent. interest. According to the railroad commission, the road cost $577,899.63, and showed a depreciation of $68,828.12 at the time of its valuation. It still runs from Rusk to Palestine."

Amenities on the New Haven.

I have agreed to meet our men's representatives once a month, to devote a day to them if need be, to receive their suggestions, the result of their observations, and to profit by them, I hope, to our mutual advantage. I can ill spare the time, but know of no better use for it.

I believe there must be better co-operation on the part of the officials and labor organizations, or the result will be worse for both. I am earnestly desirous of promoting that closer co-operation by all means in my power.

Personal conferences with employees or their representatives are most beneficial. Personal acquaintance is most important. Through personal contact many erroneous impressions are dis-

sipated. Less differences arise where there are opportunities for discussion of matters of mutual interest.

The president of a large business enterprise should not be unknown to those who are working to make that enterprise a success. The employees should see the personal side of the man at the top, not hedged about by what their imaginations have surrounded him, but as a human being like themselves—with all their frailties, prejudices, and limitation. They can grow to like him and he them; and both can do better work in consequence.—*President Mellen.*

Y. M. C. A. for Safety.

At a recent conference in Chicago between the heads of a number of railway safety committees and representatives of railroad Young Men's Christian Associations, a plan was agreed upon for the co-operation of the railroad associations with the railway companies in the promotion of the "safety first" movement. The railway men will prepare lectures on safety, to be given at association centers, and in the delivery of these lectures the men in charge will have the advantages of the facilities of the associations, such as stereopticons, motion picture apparatus, etc.

Firemen's Wages.

The leaders of the firemen's brotherhood reported on February 10, that 33,916 men had voted on the question of empowering the officers to order a strike on the 54 eastern roads, and only 1,198 of these were against the proposition. After a conference with the railway officers it was said that no concessions were made on either side; and on Wednesday, the 12th, at the request of the firemen Judge Knapp, of the Commerce Court, and H. W. Hangar, acting commissioner of labor, arrived in New York and went into the conference with the firemen and afterwards with the officers of the railways, to see if conciliation could be effected. The conferences were still going on at the time of going to press.

The railways' committee, Elisha Lee, chairman, on Monday issued a statement saying:

If the firemen announce that as a result of their strike vote their committee will call out the men, the railroads will of course take steps immediately to prepare for the operation of trains under strike conditions. The companies feel, however, that such a catastrophe should, in the public interest, be prevented at all hazards.

Some indication of the attitude of the firemen toward arbitration established by public authority as a means of settling all labor disputes is given by President Carter. At one of the very first meetings with the committee of managers, he said: "When the railroads try to put over a compulsory arbitration law, we are going to beat you. We will give you that tip right here today. You can't get it through."

The firemen have offered to arbitrate the questions at issue under the Erdman Act. The committee make it clear that the real purpose of the strike vote and threat is to force the railways, if possible, to agree to arbitration in such form. The Erdman Act was never devised to settle such a vast problem as that presented in settling the relations of 52 railroads with their employees. That is a problem, the railways maintain, which must be settled by a commission of sufficient size and character to represent the public interest and be free from political influence of every kind.

The railroads contended in the engineers' case, and they contend now, that the appointing power, if this power is to be taken over by the federal government, should be in the hands of officials holding a "life tenure," and it was for this reason that the Chief Justice of the United States was added to the appointing board. The defects of the Erdman Act were noted by the arbitrators themselves in the engineers' case and are commented on at length in their report. There have been a number of unsatisfactory and unjust awards, and the law has been severely criticised, not only by the railroads, but by the employees and their representatives.

The railroad controversy with the firemen date back to last July. The firemen first asked for an increase of $20,800,000, or about 77 per cent. They later modified their request so as to ask for an increase of about $15,134,000, or 56 per cent. Then they made other changes in their demands, which, as submitted to the men on the strike ballot, call for an increase in the firemen's payroll on fifty-four eastern railroads of $9,600,000, or about 35 per cent. Such an increase is neither warranted by conditions, nor within the roads' ability to pay, having regard to all of their obligations.

Proposed Government Railroads in Alaska.

President Taft has sent Congress a message recommending the construction by the government of two independent railroads in Alaska involving 733 miles of line at a cost of about $35,000,000. This recommendation is in accordance with the report of the special commission which was sent to Alaska several months ago. The President says that the roads ought to be operated by private interests under lease. He proposes that the equipment now being used on the Panama canal shall be transported to Alaska for the building of these railroads.

The commission recommends a line from Cordova by way of Chitina to Fairbanks and one from Seward around Cook inlet to Iditarod. The first would run to the Bering coal fields and the second to the Matanuska field. The plans of the commission contemplate the use of existing railways.

The President in his message says:

"The commission finds that railway connections with open ports on the Pacific are not only justified but imperative if the fertile regions of inland Alaska and its mineral resources are to be utilized. The commission describes all of the railway routes. From Chitina to Fairbanks, 313 miles, the estimated cost of a road is $13,971,000. The commission proposes that if this railway is built by other interests than those controlling the Copper River & Northwestern, and if an equitable traffic arrangement cannot be made with that company, connection should be made with Valdez by the Thompson Pass route, 101 miles, estimated to cost $6,101,479."

The President says that if commercial development of the two fields named should disclose that the quality of the coal is the same in both, the Bering river field would have the advantage of greater proximity to open tidewater. A branch line from the Copper River Railway to the Bering river field, a distance of 38 miles, at an estimated cost of $2,054,000, is recommended to afford an outlet for the coal on Prince William Sound and into the Copper river valley and the region where there is at present the largest market for Alaska coal.

Union Pacific-Southern Pacific Dissolution.

The following is the official announcement of the dissolution plan to separate the Union Pacific and Southern Pacific:

"The boards of directors of the Union Pacific Railroad Company and Southern Pacific Company approved plans which have been under consideration by special committees for several weeks and which have been worked out with the attorney general, subject to the approval of the courts, as follows:

"The purchase by the Union Pacific of the entire capital stock of the Central Pacific consisting of $67,275,500 par value of common and $17,400,000 par value preferred for the sum of $104,189,941—the cost at which it stands upon the books of the Southern Pacific Company. Of this amount, $84,675,500 was to have been paid in stock of the Southern Pacific Company held by Union Pacific, at par, but legal difficulties having been found in the way the plan has been changed so that payment is to be made as follows, viz.: $120,650,000 par value—being the entire amount of stock of Southern Pacific Company held by Union Pacific—is to be offered to the stockholders, common and preferred, of the Union Pacific and stockholders of the Southern Pacific Company other than the Union Pacific and Oregon Short Line, for subscription at 98⅝ per cent. and accrued dividend. This offer is to be underwritten and subscribers are to receive the dividend payable April 1, 1913 (details to be given later). The proceeds of $84,675,500 of this stock less the underwriting commission and expenses is to be paid over to Southern Pacific Company, together with $5,449,000 of the Southern Pacific Company's 4 per cent. gold bonds and $14,065,441 in cash.

"The attorney general of the United States has assented to the essential features of this plan, but it is of course subject to the approval of the district court in which the government litigation is pending, and also dependent upon the approval by the California Railroad Commission of agreements for certain trackage and running rights in that state. The plan and agreements will be presented to the court and commission with the least possible delay."

The *Wall Street Journal* on the morning after the announcement of the dissolution plan printed the following:

Syndicate headed by Kuhn, Loeb & Co., which will underwrite the offering of the $126,650,000 Southern Pacific stock to Union and Southern Pacific stockholders will receive a commission of 2 per cent.

Southern Pacific stockholders will be entitled to one share of Southern Pacific stock for every three shares now held, and Union Pacific stockholders to one share of Southern Pacific stock for every four shares of Union Pacific now held, preferred stock sharing equally with the common.

At the time when it was proposed to exchange $84,000,000 of the Southern Pacific stock as part payment for Central Pacific, the bankers informed the attorney-general that as the remainder of the Union Pacific's Southern Pacific stock amounted to $46,650,000, they could see no reason why he should not have free rein in deciding who should participate in the syndicate, as the necessary money could be raised without much trouble. When it was discovered, however, that the Kentucky laws prohibited Southern Pacific from accepting its own stock and that it would, therefore, be necessary to market the entire $126,650,000, the bankers satisfied the attorney-general that they would have to have utter freedom in forming the syndicate to prevent a serious disturbance of the market, assurance being given that the syndicate would so handle the stock as to carry out the Supreme Court's decree insisting on wide distribution thereof.

Decided emphasis is laid upon the fact that the plan, as it goes before the court, is not the railroad's plan, and, therefore, subject to decided alteration, but is the plan which has been formulated in a way to satisfy the government and that, therefore, it is not anticipated that the court will be disposed to make any important changes.

When asked whether there was likely to be any great change in the Southern Pacific board at the annual meeting in April, a prominent director said: "I do not believe so. It is to my mind a most creditable comment on the integrity and ability of the American business man that Julius Kruttschnitt, now chairman of the Southern Pacific board, Henry W. DeForrest and their confreres who were formerly associated with the Southern Pacific and the Union Pacific, have, since the dissolution, taken up the fight for the Southern Pacific in earnest and contended every inch of the ground that has been gone over, and have faithfully and competently championed the cause of the Southern Pacific stockholders. The same is true of the Union Pacific officials, who have waged the battle as though they had never been connected with the Southern Pacific. The separation of the two properties is complete; the control of the Southern Pacific will be in the market for any aspiring line, such as the Rock Island, to purchase. I know we have the government's approval for the statement that the dissolution of these two properties has been real."

It is understood that the agreement under which the Central Pacific stock is deposited as security for $28,800,000 Southern Pacific bonds is such that although the ownership of the stock might change, the bonds would not need to be retired as long as the stock certificates were left in possession of the trustee.

The Grand Trunk in Massachusetts and Rhode Island.

Counsel for officers of the Grand Trunk, indicted in New York City on charges of violation of the anti-trust law, has asked the court to order testimony taken in London to show the character of the acts of the directors of the Grand Trunk in connection with the alleged unlawful doings in Massachusetts and Rhode Island. An interurban company, proposing to build an electric road from Boston to Providence, has asked for a charter allowing it to use the proposed route of the Grand Trunk's unfinished line, the Southern New England; and the Grand Trunk people say that they have told the electric company that its application would be favorably considered. Among the promoters of the electric line are Kidder, Peabody & Company, Stone & Webster and James F. Shaw. The Grand Trunk says, further, in a published statement:

"1. That the suspension of work on the Palmer-Providence line was ordered from London in November as a result of a resolution adopted by the directors, because of the impossibility of obtaining money in London.

"2. That the cause of the inability of the Grand Trunk to get money was due to the financial stringency and state of semi-panic resulting from the Balkan war.

"3. That there was no cause for the suspension of the Palmer Providence project except the conditions resulting from the Balkan War, and the inability of the Grand Trunk to get money.

"4. That at the same time as the suspension of work on the Palmer-Providence extension, orders were received from London to suspend work throughout the Grand Trunk system. . . .

"6. That the board of directors did not intend to abandon work on the Palmer-Providence extension, but expected that it would be resumed as soon as the financial conditions made it possible.

"7. That the provisional New Hampshire Corporation, the formation of which was alleged to have been contemplated by the Grand Trunk Railway Company to construct a line from White River Junction to Boston, was never considered by the Grand Trunk directors, and that if any act was done by the late President Hayes, looking to the organization of such a corporation, it was done without authority from the board of directors and not ratified by them."

"The Providence extension is a Central Vermont matter. It has nothing to do with the proposed extension of the Central Vermont to Boston, nor has it any connection with the proposed traffic or trackage agreement with the New Haven, which, if carried out, would obviate the necessity for duplicating the Boston & Maine. Reference to the abandonment of the Providence line, or to an agreement between the New Haven and the Grand Trunk, are both misleading, because there was no abandonment and there never has been an agreement—only a proposed agreement."

American Society of Engineering Contractors.

At the annual meeting of the American Society of Engineering Contractors, held in New York on January 14, it was decided to establish an information bureau through which members of the society in good standing can receive answers to specific questions. The questions submitted will be referred to members of the society who specialize in the various fields, and the answers will be mailed to the members and also published in the journal of the society. A committee was also appointed to consider the advisability of this society endeavoring to protect its members against unjust contracts and specifications.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York, Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances' Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Association.—D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—H. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. J. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The lower house of the Oregon legislature has passed a bill, recommended by the state railroad commission, which gives the commission power to suspend an increased rate, pending an investigation.

Emory R. Johnson, professor of transportation at the University of Pennsylvania, and special commissioner on Panama traffic and tolls, appointed by President Taft, gave an address before the City Club of Chicago, on February 5, on the subject of Panama canal tolls. He advocated a repeal of the clause in the act fixing the Panama canal rates which provides for the exemption of tolls for coastwise shipping. Professor Johnson's views were commented on in the *Railway Age Gazette* of November 22, 1912, page 1005, and December 6, 1912, page 1073.

Rates on cotton from New Orleans to Liverpool, which have been very high for several months, have now dropped to a point where considerable shipments are being made, 41 cents per 100 lbs. having been quoted last week. Rates have been as high as 68 cents a part of the time. At this rate, at 50 cents, which prevailed for a time, a good deal of cotton from Arkansas and other states north of Louisiana was driven away and was exported through Boston, Newport News and Brunswick. At one time cotton was sent from Arkansas to Liverpool through Boston at 5 cents per 100 lbs. cheaper than through New Orleans.

The committee on interstate and foreign commerce of the lower House of Congress held hearings last week on the bill, proposed by the Stanley investigating committee, to amend section 3 of the interstate commerce act, second paragraph, by adding to the last line a provision to the effect that carriers shall not be required to give the use of terminal facilities to a rival carrier *except for switching purposes.* The effect of the four italicised words would be to leave the Interstate Commerce Commission free to require a railroad to do switching for competing roads and to regulate the rates for such service. Attorneys for the Pennsylvania, the Louisville & Nashville and the Chicago, Milwaukee & St. Paul appeared in opposition to the bill. Mr. Sewall, representing the C. M. & St. P., showed how hay and vegetables, on certain tracks in Chicago, were more valuable than on certain other tracks; and how it would be unjust for a road to be compelled by law to farm out its advantages to any other road that might apply.

A Thirty Years' Custom to Be Abandoned.

The Pennsylvania and the Baltimore & Ohio have given notice that after the end of this month they will cease to deliver freight by wagon to store doors in Washington, D. C. This free delivery of freight has been in vogue at Washington since about 1883. The Pennsylvania has issued a circular explaining its action, which is in part as follows:

The making of free store-door deliveries of certain classes of shipments originated in 1883 out of the desire to relieve serious congestion in the Washington freight terminal. This unusual practice was confined to certain classes of shipments originating in the territory adjacent to the Atlantic Seaboard and north of Wilmington. At that time most manufactured articles came from the North Atlantic States. . . . Washington now enjoys a privilege which is accorded to hardly any other city of the United States. As the plan never extended to shipments from the west and south, the withdrawal will not affect traffic from those territories. The plan of free delivery was originally adopted as a temporary expedient, and was never intended to be permanent, and no increase in freight rates was made; since that time there has been an actual reduction of freight rates to Washington from the territory affected. For example, the rates on traffic to which free delivery was extended, from New York to Washington, in cents per 100 lbs., have been as follows:

	1st Class.	2d Class.	3d Class.	4th Class.
1883	55	45	30	25
1913	37	31	26	20

The plan of free delivery was expensive for the company, which made an arrangement with a local express agency to make deliveries on its behalf. Owing to increased cost of operation, the express company has increased its charges to the railroad company for the service rendered.

The original boundaries of free delivery were coterminous with the old city of Washington. The Interstate Commerce

Commission has in two recent decisions, however, extended the area of free delivery on the ground that the limitation of territory was an unjust discrimination against consignees outside.

The original temporary and anomalous condition, which had continued for no logical reasons, should, as a matter of propriety to all parties concerned, now be discontinued. The railroad has been making great improvements in the freight facilities in the city of Washington, and since 1902 has expended about $4,500,000 in improving freight facilities in the city of Washington. Interest at 5 per cent. on the investment of $4,500,000 amounts to $225,000 per annum.

As no increase of rates was made when free delivery was instituted; as there has been a reduction in the rates concerned since the practice has been in vogue; and as the expensive improvements referred to have added extensively to the facilities, there should not now be any further reduction in freight rates.

It is the purpose further to add to freight facilities in Washington, probably including another new freight station.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 137, giving a summary of car surpluses and shortages by groups from October 25, 1911, to February 1, 1913, says: The total surplus on February 1 1913, was 62,045 cars; on January 15, 1913, 53,230 cars, on January 31, 1912, 55,592 cars. Compared with the preceding period; there is an increase in the total suplus of 8,815 cars, of which 3,221 is in box, 625 in flat, 4,746 in coal and 223 in miscellaneous cars. The increase in box car surplus is general, except in groups 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 6 (Iowa, Illinois, Wisconsin and Minnesota), 7 (Montana, Wyoming, Nebraska and the Dakotas), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 11 (Canadian Lines). The increase in flat car surplus appears in groups 1 (New England Lines), 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 5, 8 (as above), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The increase in coal car surplus is shown in groups 2, 3 (as above), 4 (the Virginias and Carolinas), 5, 6, 7 and 10 (as above). The increase in miscellaneous car surplus is general, except in groups 4, 5, 8 and 10 (as above).

The total shortage on February 1, 1913, was 24,785 cars; on January 15, 1913, 24,791 cars; on January 31, 1912, 23,011 cars. Compared with the preceding period; there is a decrease in the total shortage of 6 cars, an increase of 1,211 coal cars and a decrease of 876 box, 225 flat and 116 miscellaneous cars. The decrease in box car shortage is shown in groups 1, 2, 3, 5 (as above), 9 (Texas, Louisiana and New Mexico), 10 and 11 (as above). The decrease in flat car shortage pre-

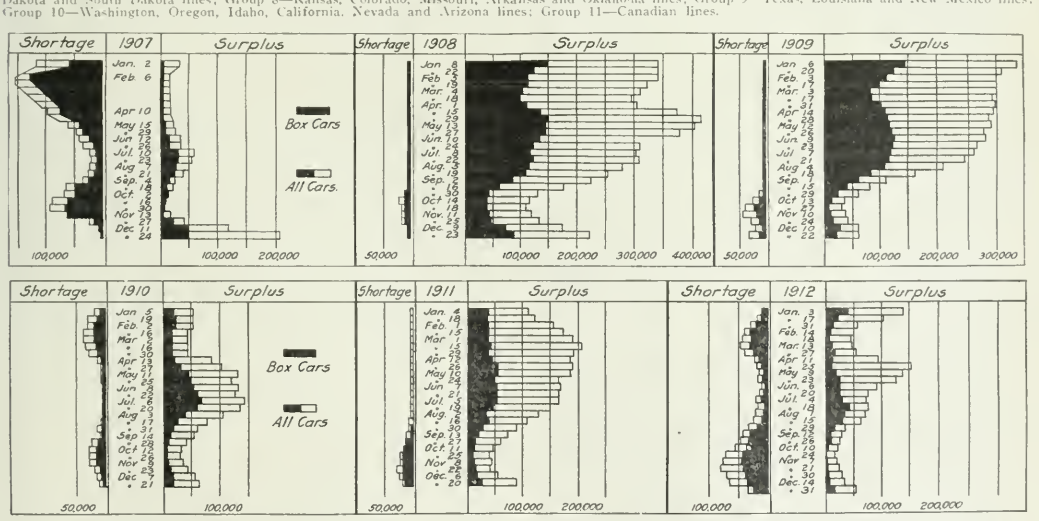
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

vails in groups 1, 3, 5 and 8 (as above). The decrease in miscellaneous car shortage is in groups 1, 3, 6, 7 and 11 (as above). The increase in coal car shortage is general except in groups 3, 5, 6 and 9 (as above).

Compared with the same date of 1912; there is an increase in the total surplus of 6,453 cars, made up as follows, an increase of 10,219 box, and 2,855 coal, and a decrease of 2,969 flat and 3,652 miscellaneous cars. There is an increase in the total shortage of 1,774 cars, of which there is an increase of 1,651 box, 1,330 flat, and a decrease of 818 coal and 389 miscellaneous cars.

Car Location.

The accompanying table, which is taken from Car Location, bulletin No. 2, of the American Railway Association, gives a summary of the location of freight car equipment by groups on December 31, together with surpluses and shortages on the same date.

Car Location on December 31.

Car Balance and Performance.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 138, covering car balances and performances for October, 1912, says:

The miles per car per day, for October was 26.0, an increase of 1.6 over September, 1912, and the highest figure of which we have record. This figure for October, 1911, was 25.0.

Ton miles per car per day was 433 in October, 1912, compared with 396 in September, 1912; this is also the highest figure in our record, this is an increase of 13.35 per cent. over the figure for October, 1911, which was 382.

The proportion of home cars on line was 50 per cent., compared with 53 per cent. in September. This figure for October, 1911, was 58 per cent.

There is an increase of 0.1 per cent. in the percentage of loaded car mileage compared with September, 1912. The per cent. of loaded car mileage in October, 1911, was 72.6 per cent.

The average earnings per car per day were $3.03 compared with $2.73 in September. There is an increase of 11.40 per cent. over the earnings for October, 1911, which were $2.72.

The table on the opposite page gives car balance and performance in the month covered by the report, and the diagram on the same page shows car earnings and car mileage and different car performance figures monthly from July, 1907.

Annual Dinner Traffic Club of Pittsburgh.

The annual dinner of the Traffic Club of Pittsburgh was held on January 30, at the Hotel Schenley, Pittsburgh. As in previous years, the dinner was attended by a large number of railway officials of high rank from nearly all parts of the country. The attendance was over 600, of whom about 200 came in three special trains composed entirely of private cars from New York, Chicago and St. Louis. President J. T. Johnson of the club presided, and George A. Post, president of the Railway Business Association, acted as toastmaster. Mr. Post, in his address, reviewed the development of new standards of business ethics which has taken place in the business world generally, and which he said has largely been responsible for the increase in the regulation of the railways, and declared that railway regulation has now reached such a point that railway men may well be the freest from any special solicitude as to what changes may be wrought by the change of party domination at Washington, for the reason that they are now "as thoroughly in the power of the people as the ingenuity of mortal mind could devise." The fact that a democratic president will succeed a republican will not mean that there will be any change in the atmosphere surrounding the executive department concerning railroads. He said:

"To my mind, this situation in some respects, has its compensations. The people, regardless of party affiliations, having recorded their will, and having overborne all opposition in subjecting the railroads to rigorous inspection of even minute details of operation, have no longer any misgivings about their power to compel the railroads to do whatever they want them to do. Therefore, the incoming administration cannot be imbued with the sentiment that in the railroad field there is an Augean stable to be cleansed. The railroad question is now narrowed down to that of revenue sufficient for efficient service and the conservation of railway credit. This is susceptible of study in the light of facts and figures. In approaching its consideration the issue is not befogged by any suspicion of guilt as to the honesty of the figures, for the government controls the figures.

"It is my conviction that from now on there will be less and less of open hostility to railroads, and a closer analysis of their needs and of their efficiency. Upon those points there will be, of course, divergent views, attended by acrimonious discussion as to the personal or territorial interests of the disputants' clash. But the underlying conditions are now healthful, because they are constantly under supervisory observation.

"There is well grounded solicitude on the part of the railways at the present time, but it is not a solicitude born of any fear of castigation for evils that may be uncovered. It is a solicitude that there may not be due heed taken to their financial necessities. That is naturally a matter for grave concern, and it is a matter which sooner or later must have the painstaking attention of the American people. They will awaken some day to a full realization of how deeply it is their concern. Their awakening will be mightily helped by such warnings as one that was a short time ago sounded by Charles A. Prouty, long an honored member of the Interstate Commerce Commission, and recently its chairman. He said: 'The United States is trying an experiment which never has been successfully worked out yet in the history of the world. It is trying to build, develop and operate its railroads by private capital under rates and regulations fixed, not by the owners of that capital, but by the public. We can make rates reasonable, we can remove discriminations, we can put in schedules for the running of trains; all that is easy. The question is here: Can we obtain under this system the new money which is necessary to develop our own railroad systems and to build new railroad systems?'

"So, it is apparent that the question now is *not* what the people

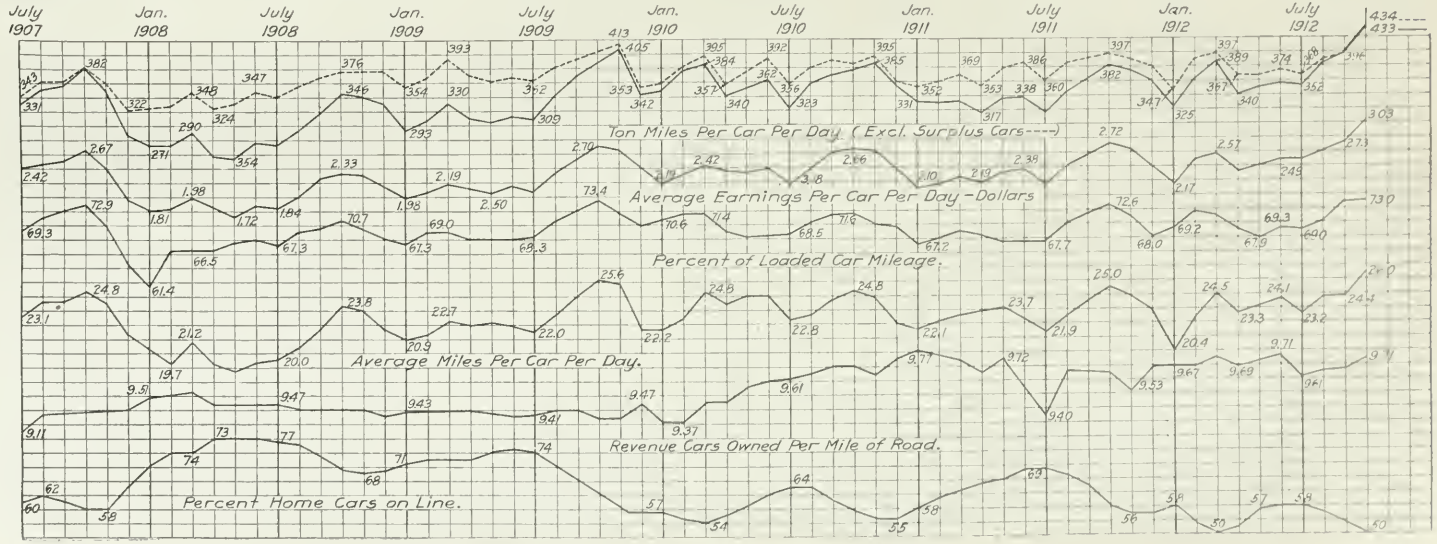
*Denotes deficiency.



Freight Car Mileage, Earnings and Performance, 1907 to 1912.

shall do to the railroads. They have done it. The burning question is: What shall the railroads be permitted to do *for the people?*

"Pending the consideration of this all-important question, the railways may accelerate public action by a consistent, persistent course of so ministering to the people's desires and necessities, with the facilities they have, as to win their appreciative regard."

The other speakers were Emory R. Johnson, professor of transportation and commerce at the University of Pennsylvania and special commissioner on Panama traffic and tolls, and Arthur Brisbane, chief editorial writer of the Hearst newspapers. Professor Johnson reviewed the controversy regarding the policy of exempting the coastwise carriers from payment of canal tolls, making use of much of the data regarding the traffic to be handled through the canal which was included in his report to the president, and which has been abstracted in previous issues of the *Railway Age Gazette*. Professor Johnson declared that as between arbitration of the question of the exemption of the owners of the coastwise shipping from the payment of Panama Canal tolls and the repeal of the toll amendment clause of the canal act, the latter course seems the simpler and wiser one to pursue. "If we arbitrate and lose," he said, "we must return all the tolls that have been collected, and henceforth either charge no tolls, or collect the same tolls on all vessels using the canal. If we arbitrate and win we will but have established our right to pursue a policy which is at least of doubtful wisdom. Whatever the Hay-Pauncefote treaty may ultimately be held to mean, the policy of exempting the owners of the coastwise ships from canal tolls should be decided upon its merits. The American people will insist that our treaty obligations, whatever they may be, shall be fulfilled."

Professor Johnson submitted figures showing that approximately $19,250,000 will be required annually to make the canal commercially self-sustaining, and that unless tolls are assessed against the coastwise shipping the revenue from the operation of the canal will fall far short of this amount. The government can be justified in relieving the coastwise shippers from the payment of tolls, and thus in reducing the canal revenue by $18,000,000 or $20,000,000 during the first decade only upon the condition that the general public, rather than the owners of the coastwise vessels, will profit from this loss of revenue to the government, and because the rates of the coastwise steamship companies will be regulated by conference in accordance with what the traffic will bear rather than with reference to the cost of service, the rates paid by shippers will be the same whether tolls be paid or not.

The effect which canal tolls upon coastwise shipping will have upon rail and water rates, and the adjustment of the charges of coastwise carriers and the railroads engaged in handling traffic between the two seaboards of the United States was summarized by the speaker as follows:

"The rates on traffic handled by regular steamship lines between the two seaboards will be but slightly affected by canal tolls. Only such producers and traders as use vessels which they own or charter for the shipment of full cargoes will profit by the exemption of the coastwise shipping from tolls. Probably 99 out of every 100 shippers will pay the same rates whether there be tolls or not. Most of the intercoastal traffic will consist of general commodities and package freight handled by the established steamship lines. Bulk cargoes of lumber, coal, ore and heavy steel products will comprise a relatively small share of the total traffic. The rates charged by the several steamship lines will be the same. The charges will be regulated by agreements among the competing companies and will be fixed primarily with reference to what the traffic will bear and only secondarily, if at all, with reference to the cost of the service to the carriers. The several steamship lines will maintain relatively stable schedules of charges which will ordinarily be adjusted with reference to the even more stable schedule of commodity and class rates maintained by the transcontinental railroads and their eastern rail connections. If the regular steamship lines are required to pay Panama tolls, their payments to the government will be a part of their operating expenses which will thus be increased by the amount of the tolls. If the steamship companies are exempted from the payment of tolls they will thereby receive a subsidy equal to the amount of the tolls not collected by the government.

"In advocating the policy of adhering to business principles in the management of the Panama Canal, it is not recommended that the rate of tolls should be high. Indeed, the schedule of charges fixed by the President establishes relatively low rates—rates that will not unduly restrict the use of the canal. The owners of the vessels that serve the coastwise trade will derive greater benefit from the canal than will the owners of any other vessels. Rates double those established by the President might be imposed without preventing the canal from being used by the coastwise carriers. In view of these facts, it seems just that those who derive immediate benefit from the use of the canal should pay reasonable tolls."

INTERSTATE COMMERCE COMMISSION.

The commission has further suspended from January 25 until July 26, certain schedules in a supplement to the tariff of the Central of New Jersey, which advance class rates from points in Pennsylvania to St. Paul, Minn., and other destinations.

The commission has further suspended from February 1 until August 1 certain schedules in Leland's tariff, which advance rates for the transportation of sash, doors and blinds from stations in Louisiana to stations in Texas and between other points.

The commission has suspended from January 29 until May 29, an item in a supplement to W. P. Emerson's tariff, which advances rates for the transportation of edible nuts from New Orleans and Port Chalmette, La., to St. Louis, Mo., and other points.

The commission has further suspended from January 29 until July 29 certain schedules in a supplement to W. H. Hosmer's tariff, which advance rates for the transportation of cartridge shells from Chicago, St. Louis, Mo., and other points to Kansas City, Mo., and other destinations.

The commission has further suspended from February 8 until August 8, certain schedules in supplements to the tariff of the Chicago, Milwaukee & St. Paul, which advance rates for the transportation of grain between points in Iowa, South Dakota and Minnesota and points in Illinois and Wisconsin.

The commission has further suspended from January 28 until July 28, and May 28, the schedules in certain tariffs, which eliminate reconsignment and storage privileges at Minnesota Transfer, Minn., on lumber and shingles shipped from points in Oregon and Washington to eastern destinations.

The commission has suspended from January 6 until March 31 a tariff of the Southern Railway in Mississippi, which advances by amounts averaging about 2 cents per 100 lbs. rates for the transportation of gum and cottonwood lumber, staves and heading from points in Mississippi to Mobile, Ala., and other points.

The commission has further suspended from February 1 until August 1 a supplement to F. A. Leland's tariff and a supplement to W. A. Poteet's tariff, which advance rates for the transportation of certain commodities between certain stations located in Texas common point territory and St. Louis, Mo., and other points.

The commission has further suspended from February 8 until August 8, certain schedules in supplements to the tariffs of the Chicago, Milwaukee & St. Paul and the Chicago, Rock Island & Pacific, which advance rates for the transportation of starch from Cedar Rapids, Ia., and other points to Missouri river points on traffic destined beyond.

The commission has suspended from January 30 until April 30 certain items in certain tariffs, which cancel existing joint through rates and routes for the transportation of lumber and shingles from Edmonds, Everett, Anacortes, Olympia and Dupont, Wash., to eastern points in connection with certain lines, leaving the combination of local rates to apply in case shipments are made over those lines.

The commission has suspended from February 2 until June 2 certain schedules in supplements to the tariff of the Chicago, St. Paul, Minneapolis & Omaha, which advance from 9½ cents to 10 cents per 100 lbs. rates for the transportation of brick from St. Paul, Minneapolis and Minnesota Transfer, Minn., to Union Center, Baraboo, Madison and Beloit, Wis., and Belvidere, De Kalb, Dixon and Fulton Junction, Ill.

The commission has suspended from February 1 until June 1 a note in a supplement to Hosmer's tariff, which cancels joint

rates on salt from Milwaukee, Wis., to points on the Wabash west of the Mississippi river. As to most points this would result in an advance of 3½ cents per 100 lbs. For example, the present rate from Milwaukee to Omaha via the Chicago & North Western and the Wabash is 14 cents per 100 lbs., the proposed rate being the combination on Chicago of 17½ cents per 100 lbs.

The commission has suspended until May 31 certain tariffs, which establish new storage charges for the transportation of dangerous articles other than explosives, including such commodities as petroleum and petroleum products. Under the suspended tariffs the commodities mentioned, if not removed from railroad premises within 24 hours after date of arrival, would be subject to a storage charge of 10 cents per 100 lbs. for the second 24 hours after arrival and to a storage charge of 20 cents per 100 lbs. for each 24-hour period thereafter until removed from railroad premises.

Complaint Dismissed.

Standard Vitrified Brick Company et al. v. Chicago, Burlington & Quincy et al. Opinion by Commissioner Clements:

The commission found that the rate of 12½ cents per 100 lbs. on brick from the Kansas gas belt to various Chicago, Burlington & Quincy stations in Missouri and Iowa for an average haul of 400 miles was not unreasonable. (25 I. C. C., 669.)

Highland Park Manufacturing Company v. Southern Railway. Opinion by the commission:

The commission found that lawful rates according to published tariffs had been charged on shipments of cottonseed from Charlotte and Pineville, N. C., to Rock Hill, S. C. The rates were attacked as unreasonable but the evidence was not conclusive. (26 I. C. C., 67.)

Miller Manufacturing Company v. Wabash Railroad, et al. Opinion by the commission:

The complainant shipped a portable cooling room from St. Louis, Mo., to Keewatin, Minn., and contends that the defendant did not charge the proper rate according to its tariff. The testimony was confined to the matter of classification and the commission found that the charges were properly assessed according to the tariff. (26 I. C. C., 71.)

Casey-Hedges Manufacturing Company et al. v. Central of Georgia. Opinion by the commission:

The complainant contends that the failure of the defendant to absorb a portion of the switching charges of the connecting lines at Chattanooga, Tenn., on through shipments of coke from Durham, Ga., when $1 per car switching charges was absorbed by it on shipments of coal, resulted in a discrimination against coke in favor of coal. The commission found that the competition between these two commodities was negligible and that the present rate on coke between the two points in question, including the switching charge, was reasonable. (26 I. C. C., 63.)

Reparation Awarded.

John W. Keogh v. Minneapolis, St. Paul & Sault Ste. Marie. Opinion by the commission:

The commission found that the rates charged by defendants for transportation of excelsior bolts in carloads from certain Wisconsin points to St. Paul, Minn., were unreasonable and prescribed lower rates for the future. (26 I. C. C., 73.)

Ludowici-Celadon Company v. Pennsylvania Company, et al. Opinion by the commission:

The commission found that the charges collected by defendants for transportation of three carloads of unglazed tile slabs or brick tile, from New Lexington, Ohio, to Springfield, Mo., were in excess of the published rate. (26 I. C. C., 82.)

Rates on Fence Posts Not Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of fence posts from stations in Arkansas to Kansas City, Mo., and other points. Opinion by Commissioner Clements:

The proposed advances are from 12 to 15 cents to Kansas City and from 18½ to 21 cents to Omaha and Lincoln. The defendants did not contend that the present rates on fence posts are unreasonably low, but that as that commodity took lumber rates in other sections of the country, they were justified in making the proposed increases which would put the rate on fence posts on the basis applicable on lumber between the same points. The commission found that the evidence in support of the proposed increases was not conclusive, and dismissed the complaint. (26 I. C. C., 42.)

Rates on Excelsior and Excelsior Wrappers Increased.

In re investigation and suspension of advances in proportional rates by carriers for the transportation of excelsior and excelsior wrappers from certain stations on the Bangor & Aroostook to Brownville Junction, Maine, and other points. Opinion by Commissioner Prouty.

The proposed advances are one and two cents per 100 lbs. on the portions of the through transportation service performed by the initial carrier. The commission found that they are not excessive and that the resulting through rates are not unreasonable. The order of suspension was vacated. (26 I. C. C., 44.)

Rates from West to Stations on Line of Rhode Island Company.

In re investigation and suspension of advances in class and commodity rates by carriers from western points to stations in Rhode Island, located on the line of the Rhode Island Company. Opinion by Commissioner Prouty:

The present rates from the West to points on the line of the Rhode Island Company are on the same basis as the rates from similar points to Boston. By the suspended tariff the defendants propose to establish certain arbitraries to the points in question over Boston, as was formerly the practice. The commission found that the Boston rate applies at nearly all points in Massachusetts, Connecticut and Rhode Island, that communication is extremely easy and that competition between the points in the vicinity is very active. The commission decided that in future the rates to the points in question should not exceed the Boston rate. (26 I. C. C., 51.)

Rates from the Walsenburg Coal Field.

In re investigation and suspension of advances in rates by carriers for the transportation of coal from the Walsenburg district of Colorado to stations in Kansas, Oklahoma, and Texas. Opinion by Commissioner Harlan:

The defendants undertook to advance the coal rates from the Walsenburg field to points in Kansas, Oklahoma, and Texas by 35 cents a ton, without making any change in the rates to the same destinations from the Canon City field. The commission decided that the suspended tariffs should be canceled, but that the defendants should be allowed to establish a coal rate from the Walsenburg field that is 10 cents higher than that from the Canon City field to the same destinations. The contention of carriers that discrimination cannot be predicated of a carrier by a shipper not on its line is not sustained, as an undue discrimination against a given point may be effected as well by a joint rate as by a one-line rate. (26 I. C. C., 85.)

Relief from Fourth Section.

B. L. Gillis & Son et al. v. Philadelphia, Baltimore & Washington et al. Opinion by the commission:

The complainant contends that the rate of 10 cents per 100 lbs. on sugar in carloads from Philadelphia, Pa., to Salisbury, Md., is unreasonable because the rate from Philadelphia to Norfolk, Va., a point to which Salisbury is intermediate, is only 8½ cents per 100 lbs. The commission found that the rate to Norfolk, Va., was affected by water competition and that the present rate to Salisbury is reasonable compared with rates to similar points. Relief from the fourth section was granted in the case of the rate from Philadelphia to Norfolk. (26 I. C. C., 61.)

Rates on Clay Products Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of brick from Brickland, N. Mex., to stations in Arizona. Opinion by Commissioner Harlan:

The advances in rates on clay products, including brick, common and pressed, also hollow building tiles or blocks, minimum 40,000 lbs., from Brickland, N. Mex., to points on the line of the Southern Pacific, in Arizona, were proposed to readjust the present rate arrangement which results in discrimination in favor of Brickland compared with other points. The proposed scale is

based approximately on 2 cents per ton per mile for the first 50 miles, and for longer hauls on a basis of 1 cent per ton per mile for the additional mileage. The commission decided that the present arrangement does result in discrimination in favor of Brickland and that the proposed rate was not unreasonable. The order of suspension was vacated. (26 I. C. C., 8.)

Rates on Cement, Paving and Roofing Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of cement, paving or roofing and other commodities in carloads from Chicago and Milwaukee, Wis., and other points to destinations in South and North Dakota, Montana and other states. Opinion by Commissioner Clements:

The proposed advances in the rates in question are uniformly two cents per 100 lbs. The principal contention of the complainant was that under the proposed arrangement the combination rates between certain points would aggregate less than the proposed joint rates between those points. The defendant agreed to realine all such rates and it was shown that if this were done the complainant would make no further protest against the defendant's tariff as a whole. The order of suspension was vacated with the understanding that the carriers will make the necessary corrections. (26 I. C. C., 11.)

Cotton Storage Regulations.

Dumee, Son & Company v. Pennsylvania Railroad. Dumee, Son & Company v. Philadelphia & Reading. Opinion by Commissioner Clements:

In this case the complainant contends that the defendants discriminated against Philadelphia, Pa., by reducing the period of free storage time at the piers from 30 to 10 days when export cotton originated at Philadelphia without changing the period of 30 days allowed at the piers on all export cotton not originating in Philadelphia. The commission found that in a large number of cases the defendants had to pay large per diem charges on account of the delays at the piers. It was also shown that 30 days were still allowed on cotton originating outside of Philadelphia on account of the uncertainty of timely connections with steamers after long rail hauls and also on account of the competition with other ports. The commission decided that as the sailing dates were readily ascertainable at Philadelphia, the ten-day period was quite sufficient.

Cotton is also shipped to the complainant at local stations in Philadelphia. The damaged portion is there removed and the remainder is rebilled locally to the export pier billed for export. The complainant contends that as all of the original consignment to Philadelphia, except the damaged portion, is eventually exported, the storage rules applicable to export cotton should govern the shipment to and from the local station in Philadelphia and, therefore, 30 days should be allowed instead of four days applicable to strictly local traffic. The defendants contend that the shipments in question were strictly local in character and that if they were not they would have been shipped directly to the pier instead of to the local stations. The commission found that there were no transit privileges permitting the sorting en route of export cotton at Philadelphia and that the present practice of the complainant resulted in two separate local shipments and that therefore they were subject to the storage regulation applicable to local traffic. (26 I. C. C., 33.)

Indiana Points Discriminated Against.

Indianapolis Freight Bureau v Cleveland, Cincinnati, Chicago & St. Louis et al. Opinion by Commissioner Harlan:

The complainants contend that the millers and grain dealers at Indianapolis and other Indiana points are discriminated against in favor of the millers and grain dealers at Champaign, Ill., Cincinnati, Ohio, and other points on account of a note in the tariffs of the lines south of the Ohio river which provides that the proportional or shrinkage rates will not be applied on shipments of grain and grain products on which milling-in-transit privileges have been accorded at points north of the Ohio river and east of the Illinois-Indiana state line. This note puts the grain dealers and millers at Indiana points under a rate disadvantage of two cents per 100 lbs. on shipments to Atlanta, Ga., as compared with the dealers and millers at Champaign, Cincinnati and other points, although the through movement in each case is over the same route. The grain dealers of Louisville, Ky., objected to any modification of the present tariffs on the ground that transit at Indianapolis has not been properly policed, but the commission found that even if this were the case it would not justify a rate discrimination against Indianapolis. Grain moves to the southeast either through the upper or lower Ohio river crossings. The grain dealers of Louisville also urged that the upper Ohio river crossings have no other market for grains than the southeast, while Indianapolis has the eastern as well as the Virginia and Carolina territory and should not, therefore, be given the southeast also. The commission found that such a rate policy would be fair neither to the millers and dealers of Indianapolis nor to the consumer in southeastern territory. The commission went on to say that the carrier may not, as a public servant, serve one community at the expense of another or build a rate wall around one point to advance the interests of a competing point. The defendants attempted to justify the note in their tariffs on the ground that it was compelled by competition with other Ohio river crossings. The commission decided, however, that it was more probable that the enjoyment of transit privileges under the same rate by millers and dealers at Indianapolis would not be felt so much by the millers at the lower Ohio river crossings as by their competitors at the upper crossings on the same routes. The commission decided further that whether the consequences of the new competition would be felt at the lower crossings or at the upper crossings, Indianapolis and other Indiana points are now discriminated against and that in future they should be given the full use, at the same aggregate through charge, of the transit privileges which are accorded to all other points on the same routes. (26 I. C. C., 53.)

Rates on Horses and Mules Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of horses and mules in carloads to Chicago, St. Louis, Mo., and other points and stations in South Dakota, Nebraska, Kansas, Oklahoma, Colorado and Wyoming. Opinion by Commissioner Harlan:

The proposed increases in the tariff under suspension range from 50 cents to $16.50 per standard car. The defendants declared that while they required more revenue for this service, the real purpose of the advances was to eliminate a "low rate basin" by raising the rates from this territory to a more equitable basis compared with the rates from adjacent territory. The testimony showed that the traffic in horses and mules had been decreasing rapidly and that at present it was less than one-tenth of the traffic in cattle from the territory in question. The defendants contended that the per car earnings should be considerably larger for the transportation of horses and mules than for the transportation of cattle, partly on account of the greater value of a carload of horses and partly on account of the damage claims on that traffic which is about six times as great as on cattle traffic. The diminishing supply of horses has resulted in an increase in their value, and also there has been a material increase in their quality and grade since the present rates were established. The commission found that the rates on horses from this district were too low compared with the rates on cattle, and also that the order suspending the proposed advances should be vacated. This order must not be understood to be final in case the reasonableness of any rate involved should be attacked at some future time. (26 I. C. C., 47.)

STATE COMMISSIONS.

The New York State Public Service Commission, First district, has ordered the United States Express Company to cease charging 25 cents, or any sum, for carrying baggage checks, this charge being in addition to the charge imposed for transporting [in the opposite direction] baggage covered by such checks.

The Illinois Railroad & Warehouse Commission held a hearing at Chicago on February 5, on the adoption of a uniform bill of lading. Representatives of the principal organizations of shippers having headquarters in Chicago protested against the adoption of the proposed bill until the Interstate Commerce Commission has given its final approval. Representatives of the railways present advocated its adoption. The question was finally taken under advisement by the commission.

Railway Officers.

Executive, Financial and Legal Officers.

E. F. Bisbee, formerly vice-president of the Oklahoma National Stock Yards, has been elected vice-president of the St. Louis National Stock Yards, with headquarters at National Stock Yards, Ill., in place of George R. Collett, resigned.

John Skelton Williams, until recently president of the Georgia & Florida, has been elected chairman of the board of directors of that road. Bruce W. Duer has been elected vice-president in charge of operation, with headquarters at Augusta, Ga., and C. T. Earnest has been elected secretary and treasurer.

G. C. Jones, general manager of the Central Vermont at St. Albans, Vt., has been elected vice-president in charge of construction, transportation and maintenance departments; M. M. Reynolds has been elected vice-president, in charge of financial and accounting departments, and J. E. Dalrymple, is vice-president in charge of traffic department. M. M. Reynolds and J. E. Dalrymple also hold similar positions on the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que.

The following appointments and resignations went into effect February 6, on the Union Pacific: C. B. Seger, deputy comptroller, was appointed vice-president and comptroller, succeeding William Mahl, resigned; Thomas Price was appointed assistant secretary, succeeding Joseph Hellen, resigned, both with headquarters at New York, and the following resignations were accepted, but no successors appointed: J. Kruttschnitt, director of maintenance and operation; L. J. Spence, director of traffic; Maxwell Evarts, general counsel; W. A. Worthington, assistant director of maintenance and operation; F. W. Mahl, assistant to director of maintenance and operation; W. S. Basinger, assistant to director of traffic; F. H. Plaisted, assistant to director of traffic.

Operating Officers.

L. W. Tucker has been appointed general manager of the Brinson Railway.

S. M. Woodward has been appointed superintendent of the Manufacturers' Railway, with headquarters at St. Louis, Mo., succeeding John J. Baulch, deceased.

S. S. Russell, superintendent of car service of the Central Vermont, at St. Albans, Vt., has been appointed general superintendent of transportation with office at St. Albans, and his former position has been abolished.

J. A. Shepherd, general manager of the Western Maryland, has been appointed superintendent of the Kansas City Terminals of the Missouri Pacific, with headquarters at Kansas City, Mo., succeeding J. A. Somerville, assigned to other duties.

John F. Keefe has been appointed superintendent of the Northern division of the Central Vermont, with office at St. Albans, Vt., succeeding C. E. Soule, resigned, and J. R. Fitzgerald has been appointed trainmaster of the Third and Fourth districts, with office at St. Albans.

B. R. Pollock, general manager of the New York, New Haven & Hartford, at New Haven, Conn., has resigned that position and has been appointed general manager, transportation department of the Boston & Maine (controlled by the New Haven), with office in the North station, Boston, Mass. A portrait of Mr. Pollock and a sketch of his railway career were published in the *Railway Age Gazette* of December 13, 1912, page 1159.

Miles Bronson, whose appointment as manager of the Grand Central Terminal, with headquarters at New York, was recently announced in these columns, has been appointed also general superintendent of the electric division of the New York Central & Hudson River succeeding A. R. Whaley, resigned, and Garret H. Wilson, assistant superintendent of the Grand Central Terminal, at New York, has been appointed superintendent of the Grand Central Terminal, also of the electric division of the New York Central & Hudson River.

G. L. Whipple, whose appointment as manager of transportation of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been announced in these columns, was

born January 30, 1872, at Keithsburg, Ill. He received a common school education and began railway work in 1887 with the Chicago, Milwaukee & St. Paul as a telegraph operator, which position he held for seven years. He was then a train despatcher for eight years, chief train despatcher four years, trainmaster four years and assistant superintendent of transportation for two years, until February 1, when he was made superintendent of transportation.

G. A. Stokes, whose appointment as superintendent of the Toronto terminals of the Grand Trunk has been announced in these columns, entered the service of that company on November 15, 1897, as a telegraph operator at Listowel, Ont., remaining in that position until October, 1898. He was then until March of the following year relieving agent, and from March, 1899, to April, 1907, was agent consecutively at Harrison, Ont., at Wingham, at Wiarton, and at Brantford. In April, 1907, he was appointed train despatcher at Stratford, Ont., remaining in this position until November 1, 1910, when he was made yardmaster at Don, Toronto, and in September, 1912, was appointed general yardmaster at the Toronto terminals. He was promoted on October 25, of the same year, to acting superintendent of the Toronto terminals, which position he held at the time of his recent appointment as superintendent of the Toronto terminals of the same road, as above noted.

G. A. Stokes.

William Scott Wilson, who has been appointed superintendent of transportation of the Ontario lines of the Grand Trunk, with headquarters at Toronto, Ont., as has been announced in these columns, was born at Caledonia, Ont., and was educated in the public and high schools of his native town. He began railway work in May, 1888, as operator and ticket clerk on the Grand Trunk and served in the same capacity at various places in western Ontario, until 1894, when he was made despatcher at London, Ont. From 1897 to 1901 he was with the Great Northern, in the states of Minnesota and Washington, also with the Pacific Coast Railway, and the Pacific Coast Steamship Company. He was appointed despatcher on the Grand Trunk at Island Pond, Vt., in June, 1901, leaving that position in July, 1902, to go to the Rutland Railroad as despatcher at Rutland, Vt., and from December 1, 1902, to May, 1907, he was despatcher on the Grand Trunk at London, Ont. In May, 1907, he was made chief despatcher of the same road at Stratford, Ont., remaining in that position until July 1, 1910. He was then promoted to trainmaster at Stratford, which position he held at the time of his recent appointment as superintendent of transportation of the Ontario lines of the same road, as above noted.

W. S. Wilson.

The Canadian Pacific has created a department of investigation, in charge of Rufus C. Chamberlain, until recently chief of police at Vancouver, B. C., whose title will be chief of the department of investigation, with office at Montreal, Que. Hereafter all enquiries or investigations excepting those involving the relations between officials and employees, and those which must necessarily be conducted through the audit department, will be under the control and supervision of the chief of the department of investigation, who will report to the president. He will have such assistants on the different sections of the system as may be necessary to enable him to perform his work efficiently.

W. A. Cooper, general superintendent of sleeping, dining and parlor cars and news service of the Canadian Pacific, has been appointed manager, with office at Montreal, Que., and the following subordinate officers of this department have been appointed: A. Rutledge, general superintendent eastern lines, Montreal; H. F. Mathews, general superintendent western lines, Winnipeg, Man.; H. G. Ganson, assistant general superintendent western lines, Vancouver, B. C.; F. A. Tingley, superintendent British Columbia division, Vancouver; W. H. Pratt, assistant superintendent British Columbia division, Vancouver; J. M. Willard, assistant superintendent Manitoba division, Winnipeg, Man.; D. S. Fraser, assistant superintendent Manitoba division, Winnipeg; A. Bayard Smith, assistant superintendent, Toronto, Ont.; W. H. Power, second assistant superintendent, Glen yards, Montreal, Que., and J. H. McNeill, second assistant superintendent Alberta division, Calgary, Alta.

Traffic Officers.

R. R. Beegle has been appointed assistant milk freight agent of the Erie Railroad, with office at Buffalo, N. Y.

Harry E. Webster has been appointed traveling coal freight agent of the Baltimore & Ohio, with headquarters at Uniontown, Pa., succeeding H. C. Tucker, promoted.

James R. Wood, passenger traffic manager of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., will be retired under the pension rules of the company on March 1.

Engineering and Rolling Stock Officers.

D. McCooe has been appointed superintendent of track of the Grand Trunk, at the Toronto, Ont., terminals.

A. G. Holt is the assistant chief engineer of the Chicago, Milwaukee & St. Paul, with office at Chicago, and not H. E. Holt as stated in our issue of last week.

William D. Faucette, whose appointment as chief engineer of the Seaboard Air Line, with headquarters at Portsmouth, Va., has been announced in these columns, was born in June, 1881, at Halifax, North Carolina, and was educated at North Carolina State College of Agriculture and Mechanic Arts, at Raleigh, N. C., where he received the degree of B. E. and C. E. He began railway work with the Seaboard Air Line in 1901 as inspecting engineer at Savannah, Ga., and was engaged in terminal, river and harbor work, also on yards, etc., and the following year was made assistant engineer at the Savannah office. Two years later he was placed in charge of that office, and in 1906 was transferred as assistant engineer to the chief engineer's office at Portsmouth, Va. In 1910 he was made chief clerk to the president of the same road at New York, remaining in that position. President N. S. Meldrum was succeeded by W. J. Harahan, in September, 1912, at which time Mr. Faucette was transferred in the same capacity to Norfolk, Va. He remained in that position until January 1, 1913, when he was made chief engineer of the same road, with headquarters at Portsmouth, as above noted.

W. D. Faucette.

H. W. Ridgway, master mechanic of the Colorado & Southern at Denver, Colo., has been appointed superintendent of motive power and car department, with office at Denver, succeeding H. C. Van Buskirk, resigned.

Howell H. Althouse, chief engineer of the Erie Railroad, having resigned to take service elsewhere, the duties of that office will, until further notice devolve upon Robert C. Falconer, superintendent of construction, with headquarters at New York.

Joseph Chidley, division master mechanic of the Lake Shore & Michigan Southern at Collinwood, Ohio, has been appointed assistant superintendent of motive power of the Lake Shore & Michigan Southern, the Dunkirk, Allegheny Valley & Pittsburgh, the Chicago, Indiana & Southern, and the Indiana Harbor Belt, with office at Cleveland, succeeding S. K. Dickerson, transferred. O. M. Foster, division master mechanic of the Lake Shore & Michigan Southern, at Elkhart, Ind., has been appointed master mechanic, Lake Shore division, with office at Collinwood, succeeding Joseph Chidley, promoted. M. D. Franey, assistant division master mechanic, at Collinwood, succeeds Mr. Foster, and B. F. Kuhn, superintendent of shops at Collinwood, succeeds Mr. Franey.

Purchasing Officers.

George H. Jenkins has been appointed assistant to general purchasing agent of the Grand Trunk, with office at Montreal, Que.

Joseph Campbell Snyder has been appointed assistant purchasing agent of the New York Central & Hudson River, with headquarters at Grand Central Terminal, New York. He was born on March 24, 1876, at Richmond, Va., and was educated in the public schools at Washington, D. C. He began railway work on May 18, 1893, with the Richmond & Danville, now a part of the Southern Railway. In June, 1901, he entered the service of the New York Central & Hudson River as a stenographer in the purchasing department, and now becomes assistant purchasing agent of the same road in charge of the purchase of steel products, rubber goods, paints, oils, and such other articles as may be assigned to him from time to time by the purchasing agent.

OBITUARY.

H. A. Price, assistant general passenger agent of the Intercolonial Railway at Montreal, Que., died on February 2.

W. J. O'Meara, for many years eastern passenger agent of the Chicago, Burlington & Quincy at New York, died on February 7, at Bellerose, Long Island, at the age of 46. He had been in the service of the Chicago, Burlington & Quincy for 27 years.

Joseph W. Gilluly, treasurer of the Denver & Rio Grande, died suddenly at his home in Denver, Colo., on February 6, aged 62 years. Mr. Gilluly has been with the Denver & Rio Grande since August, 1872, when he began as a clerk in the auditor's office. From August, 1878, to June, 1879, he was chief clerk in the treasurer's office and was then auditor until November, 1880, when he was appointed cashier, which position he held until July, 1886, at which time he was elected treasurer. He also was treasurer of the Rio Grande Southern.

Thomas Walton Roby, comptroller of the Seaboard Air Line since July 1, 1900, died on February 7, at Norfolk, Va. He was born on December 20, 1851, at Quincy, Gadsden county, Fla., and was educated at Quincy Academy. He began railway work in June, 1878, as bookkeeper on the Florida Central, and since that time has been in the continuous service of that and other companies now included in the Seaboard Air Line. In April, 1880, he was made secretary and treasurer of the Florida Central and was later treasurer of the Florida Central & Western, then cashier and auditor of the same road. For about one month in 1884 he was auditor of the Florida Transit & Peninsula. From March, 1884, to October of the following year he was auditor of consolidated lines known as the Florida Railway & Navigation Company, and then to April, 1889, was auditor for receivers of the same road, later becoming auditor of the same property which was reorganized as the Florida Central & Peninsula. He was appointed comptroller of the Seaboard Air Line on July 1, 1900.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Chicago, Terre Haute & Southeastern is figuring on 5 locomotives.

The Louisiana & Arkansas has ordered 4 ten-wheel locomotives from the Baldwin Locomotive Works.

The Birmingham & Southeastern has ordered 1 ten-wheel locomotive from the Baldwin Locomotive Works.

The Wabash, Chester & Western has ordered 1 eight-wheel locomotive from the Baldwin Locomotive Works.

The Maryland Steel Company has ordered 1 six-wheel switching locomotive from the Baldwin Locomotive Works.

The Pennsylvania Railroad has ordered 30 Pacific type locomotives and 15 switching locomotives, from the Baldwin Locomotive Works.

The Lake Shore & Michigan Southern, mentioned in the *Railway Age Gazette* of December 20 as figuring on a number of locomotives, is now definitely in the market for 23 switching locomotives.

The St. Louis Southwestern, mentioned in the *Railway Age Gazette* of January 17 as being in the market for 20 locomotives, has ordered 10 consolidation locomotives and 10 ten-wheel locomotives from the Baldwin Locomotive Works.

CAR BUILDING.

The Havana Central is in the market for 740 freight cars.

The Baltimore & Ohio is in the market for 1,000 50-ton coke cars.

The Mineral Range is in the market for 100 all-steel rock cars.

The Missouri, Kansas & Texas is in the market for 1,000 drop-bottom stock cars.

The Chicago, Rock Island & Pacific has ordered 1,000 box cars from the the Western Steel Car & Foundry Company.

The Harriman Lines have ordered 3,100 box cars and 2,200 stock cars from the Pullman Company, 500 flat cars from the Bettendorf Axle Company, 2,000 gondola cars from the Pressed Steel Car Company, and 800 automobile cars, 10 caboose cars and some box cars from the Standard Steel Car Company.

The Pennsylvania System has ordered 10,000 freight cars as follows: 4,500 from the Cambria Steel Company; 2,500 from the Pressed Steel Car Company; 1,500 from the Standard Steel Car Company; 1,000 from the American Car & Foundry Company, and 500 from the Ralston Steel Car Company. These cars will all be of 100,000 lbs. capacity. Of the total, the Lines East will get 5,000 cars and the Lines West, 5,000 cars. The order comprises 8,000 all-steel hopper cars, 1,000 wood and steel gondola cars, 500 refrigerator cars and 500 wood and steel box cars.

IRON AND STEEL.

The Great Northern has ordered 15,000 tons of rails from the Illinois Steel Company.

The Waterloo, Cedar Falls & Northern has ordered 7,000 tons of rails from the Illinois Steel Company.

General Conditions in Steel.—Satisfaction with the present conditions in the steel industry is felt generally in spite of the recent falling off in orders. The volume of unfilled orders on the books guarantees steady operation for the first half of the year, and even if orders fall considerably below shipments within this period, steady operation for the mills in the last half of the year is assured. The prices are satisfactory, and should production continue at its present rate, earnings will be on a rising scale, for there is a large amount of steel to be delivered which was booked at prices considerably below current quotations.

Supply Trade News.

The H. W. Johns-Manville Company, New York, has opened a branch office in the Dooly block, Salt Lake City, Utah.

C. H. Burt, formerly in the signal department of the New York Central & Hudson River, has been appointed sales engineer of the Signal Accessories Company, 30 Church street, New York.

The American Steel Foundries, New York, have declared a quarterly dividend of one-half of 1 per cent. The last previous quarterly dividend was 1¼ per cent., and was paid May 15, 1911.

F. H. Allison has been made general purchasing agent in charge of all office and factory supplies for the American Vanadium Company and the Flannery Bolt Company, both of Pittsburgh, Pa.

The Ceresit Waterproofing Company, Chicago, has created a superintendence department which will be in charge of John J. Lyons. It will be the function of this department to superintend any structure where engineers or architects desire to have a check on its practice of the waterproofing work. When superintendence is desired, the company is prepared to give a bond of guarantee.

C. J. Olmstead, who has been assistant western manager of the Westinghouse Air Brake Company in the western district, has been appointed western manager with headquarters at Chicago, effective February 1. Mr. Olmstead was born in Concord, Mich., and in 1890 entered the employ of the Pullman Company at Chicago, as chief clerk in the manufacturing and sales department. He remained with this company in various capacities for several years, leaving in April, 1905, as assistant to the general manager, to become associated with the Westinghouse Air Brake Company as commercial representative in the western district. This position he held until he was promoted to the office of assistant western manager, with headquarters at Chicago, on June 1, 1912, which position he has held until his new promotion as western manager.

C. J. Olmstead.

The General Electric Company, Schenectady, N. Y., has received among recent orders the following: Two 50-ft. gas-electric motor cars for the Great Northern; nine 100-h. p., four-motor, car equipments with Sprague-General Electric portable unit control for the Salt Lake & Ogden; one 15,000-k. w., Curtis turbo-alternator for the Rhode Island Company; sub-station equipment consisting of two 300-k. w., 600-v. rotary converters, six 100-k. w., 2300-370 v., transformers and switchboard apparatus, also 11 55-h. p. four-motor car equipments for the Toledo & Chicago Interurban.

The annual report of the Chicago Pneumatic Tool Company for the year ending December 31, 1912, shows profits of $1,002,260. After deductions for depreciation, improvements, interest and sinking fund payments, the amount available for dividends was $601,195.60. Four per cent. dividends amounting to $257,951.32 were paid, leaving a balance of $343,244.28 carried to surplus. The total surplus account carried forward at the close of the year was $2,007,181. President W. O. Duntley, in his report, states that the substantial increase in net earnings for the year 1912, compared with the year 1911, is due to the favorable development of business generally during the last nine months. The plants are being operated to their capacity, necessary improvements have been effected at all the plants, and they have been maintained in the usual first-class condition.

The twentieth annual dinner of the Chicago Railway Equipment Company was held at the Union League Club in Chicago, on the evening of February 4. This being the "China" anniversary of the organization of the company, all of the decorations were of a Chinese character. The dinner was attended by officers, directors and stockholders of the company and some outside guests. President E. B. Leigh and other officers of the company read papers reviewing its history, and showing how its present prosperity has been attained. Secretary-Treasurer Walker and General Superintendent Harrison having been with the company ever since its organization, were presented with gold watches by President Leigh on behalf of the company. Mr. Leigh himself was then the recipient of a silver loving cup presented by the stockholders. H. S. Burkhardt, formerly president of the company, acted as toastmaster, and short talks were made by several persons.

Another important addition has been made to the Westinghouse family of associated companies by the incorporation of the Locomotive Stoker Company, which corporation will take over the patents, goodwill and all other rights and interests, pertaining to mechanical stokers for locomotives, heretofore owned by the Westinghouse Air Brake Company. This includes the Street locomotive stoker, which has been so successfully developed under the auspices of the Westinghouse Air Brake Company, by Clement F. Street, who now becomes vice-president and one of the directors of the Locomotive Stoker Company. The directors of the company are: H. H. Westinghouse, John F. Miller, A. L. Humphrey, W. S. Bartholomew and Clement F. Street. The officers of the company are as follows: W. S. Bartholomew, president; A. L. Humphrey, vice-president; Clement F. Street, vice-president; F. L. Wassell, secretary; P. W. Lander, treasurer, and J. H. Eicher, auditor. The headquarters of the company will be at Schenectady, N. Y., where the Street stokers will be manufactured as heretofore. Additional manufacturing facilities have been provided to care for the rapidly increasing demand. The New York office of the company is at 30 Church street, and the Chicago office, 827 Railway Exchange building. W. S. Bartholomew, recently elected president of the Locomotive Stoker Company, has been in the railway supply business for over twenty-five years, having been for many years western representative of the Adams & Westlake Company, and later eastern manager of that company, with headquarters at Philadelphia. He went with the Westinghouse Air Brake Company, as New England manager, in 1903, and became western manager in 1905, which position he has held to date. He is succeeded as western manager by C. J. Olmstead, who has up to this time been assistant western manager, as mentioned elsewhere in these columns. A. L. Humphrey, who, in

W. S. Bartholomew.

A. L. Humphrey.

addition to his many other duties, becomes one of the vice-presidents of the Locomotive Stoker Company, is well known in railway and railway supply circles, having for ten years prior to 1888 been apprentice, foreman and master mechanic on the Chicago, Burlington & Quincy, Union Pacific, Southern Pacific and Atchison, Topeka & Santa Fe railways. From 1888 to 1903 he was superintendent of motive power of the Colorado Midland, Colorado Southern and Chicago & Alton railroads; 1903 to 1905, western manager of the Westinghouse Air Brake Company, Chicago; 1905 to 1909, general manager of the Westinghouse Air Brake Company, Pittsburgh, and from 1909 to date vice-president and general manager of the Westinghouse Air Brake Company, which position he still holds. Clement F. Street, vice-president of the Locomotive Stoker Company was born near Salem, Ohio, and at the age of 18, after attending college for one year, entered the works of the Buckeye Engine Company as a machinist's apprentice. After three years he entered the drawing room of the same company. The next two years were spent in drawing and erecting steam engines and boilers on the road. For two years after this he was chief draftsman for the Johnstown Company, Johnstown, Pa., and for the following four years, chief draftsman in the motive power department of the Chicago & St. Paul Railway with office at Milwaukee, Wis. In 1892 he resigned this position to go to the *Railway and Engineering Review*, Chicago, as mechanical editor with which publication he remained for seven years, both as mechanical editor and manager One year of this time, however, was spent in a trip around the world in the interest of the Field Columbia Museum. He left the *Railway and Engineering Review* to go to the Dayton Malleable Iron Company and spent nine years in designing and selling railway supplies for this company, for the Wellman, Seaver, Morgan Company, Cleveland, Ohio, and for the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. In 1907 he conceived his general idea of the locomotive stoker and arranged with the Westinghouse Air Brake Company to supply the necessary funds for developing it. Since that time he has devoted his entire time and energy to the perfection of the device, and during the past year has conducted a regular business of making and selling these stokers under the firm name of Clement F. Street, Inc., Schenectady, N. Y.

Clement F. Street.

The McKeen Motor Car Company, Omaha, Neb., has received orders as follows: Two 55-ft. motor cars and one 200-h. p. switching locomotive for the Minneapolis & Northern; one 70-ft. 200-h. p. motor car and one 200-h. p. switching locomotive for the Lake Erie & Youngstown; five 70-ft. motor cars for the Sunset-Central lines, for use on the Morgan's Louisiana & Texas Railroad & Steamship Company, the Galveston, Harrisburg & San Antonio, and the Houston & Texas Central.

H. M. Perry has accepted a position with Edwin S. Woods & Co., Chicago, manufacturers of "anti-friction" side and center bearings and will devote his energies to both the mechanical and sales departments. Mr. Perry has had a wide experience in car building, having been connected with the Flint & Pere Marquette, the Atchison, Topeka & Santa Fe and the Algoma Central & Hudson Bay in the capacity of master car builder. Mr. Perry was connected with the Pullman Company about 1885 as general superintendent, and shortly thereafter with the United States Rolling Stock Company in the same capacity; and at a later date with the Madison Car Company as manager. Later he devoted about three years to expert investigation on brake beams in service.

Railway Construction.

ABERDEEN & ROCK FISH.—An extension has been opened for business from Oak Mills Junction, N. C., east via Skibo to Fayetteville, 13 miles.

ALTOONA NORTHERN (Electric).—An officer writes that the company will build the line from Altoona, Pa., to Patton, 20 miles. S. Morris, Altoona, may be addressed. (January 31, p. 230.)

ATCHISON, TOPEKA & SANTA FE.—See San Pedro, Los Angeles & Salt Lake.

CENTRAL IDAHO RAILROAD.—See Oregon Short Line.

CHARLESTON INTERURBAN.—This company will build an extension, it is said, east to Montgomery, W. Va., about 25 miles. The route is via Dana, Malden, Dickson and Cedargrove. W. E. Chilton, Charleston, W. Va., is president.

GULF, TEXAS & WESTERN.—According to press reports this company has amended its charter to build an extension of the line under construction from Jacksboro southeast to Salesville, 23 miles, from the latter place south to Mineral Wells, an additional 8 miles. Surveys for this extension were started some time ago. (September 20, p. 559.)

IDAHO NORTHERN RAILWAY.—See Oregon Short Line.

KENTUCKY, TENNESSEE & ALABAMA.—This company is to be organized at Chattanooga, Tenn., it is said, to build from Williamsburg, Ky., southwest to Chattanooga, Tenn., about 150 miles, with branch lines to Harriman and to Wartburg.

MOBILE & OHIO.—A new branch called the Dawes branch has been opened for business from Mann, Ala., to Dawes, 8 miles.

MORGANTOWN & DUNKIRK VALLEY (Electric).—See Morgantown & Wheeling.

MORGANTOWN & WHEELING (Electric).—An officer is quoted as saying that this company, proposes to build about 65 miles from Cassville, W. Va., northwest via Brave, Pa., to Wheeling, W. Va. The Morgantown & Dunkirk Valley, which is building from Morgantown, W. Va., northwest via Randall, Cassville and Pentress to Blacksville, 22½ miles, is to form part of the line. L. S. Brock, president, and Hennon & Hartley, chief engineers.

NATIONAL RAILWAYS OF MEXICO.—A new line on the Guadalajara division has been opened for business from Penjamo, Mex., south to Jauja and Zacapu, 48 miles, with a spur from Jauja to Cantabria, 3 miles.

NEW YORK ROADS.—The New York Public Service Commission, First district, has awarded contracts for the construction of the Astoria branch to Cooper & Evans at $860,744, and for the Corona branch to the E. E. Smith Contracting Company at $2,063,588, of the proposed rapid transit system in Queens borough. These branches are to run from the Queens end of the Queensboro bridge, one north to Astoria and the other eastwardly to Corona and Flushing. The contracts awarded cover the greater part of these two routes. Bids for the section covering the junction and embracing the joint station near the Queens end of the Queensboro bridge have not yet been asked for. Both lines will be elevated railroads, and under the proposed dual system are to be operated jointly by the Interborough Rapid Transit Company and the New York Municipal Railway Corporation (Brooklyn Rapid Transit). (January 31, p. 231.)

NORTHERN PACIFIC.—According to press reports bids are being asked for grading a 12-mile extension of the Sunnyside branch from Gibbon, Wash., northwest to Granview.

The Sidney branch of the Yellowstone division has been opened for business from Glendive, Mont., north to Sidney, 55.2 miles.

OIL BELT (Electric).—An officer writes that the plans call for a line from Charleston, Ill., south via Casey, Bellair, Oblong, Hardinville, Bridgeport, Linn and Patton to Mt. Carmel, about 100 miles. Contracts have been let to the Lamar Construction Company. Track has been laid on 14 miles and this section is now in operation. There will be two steel bridges on the first section between Oblong and Bridgeport, including one 80-ft. span,

and another of 160 ft. The company expects to develop a traffic in oil, coal, stone, hay, corn, livestock, fruit, poultry and farming produce. W. E. Finley, president, Bridgeport. (November 15, p. 973.)

Oregon Short Line.—On the Idaho division a new branch called the Central Idaho Railroad has been opened for business from Shoshone, Idaho, west to Hill City, 73.1 miles. The line between Murphy, Nampa, and Montour, 73 miles, formerly operated as the Idaho Northern Railway, is now operated by the Oregon Short Line, as a part of its Idaho division.

Prince Edward Island.—A new branch has been opened for business called the Elmira & Souris branch, from Elmira, Prince Edward Island, eastward to Souris, 14.7 miles.

San Antonio, Fredericksburg & Northern.—An officer of this company, which was incorporated in Texas with $30,000 capital, and headquarters at Fredericksburg and San Antonio, writes that the company plans to carry out work on a line which was started in 1890, and was later abandoned. Since that time several unsuccessful attempts have been made to revise the proposition. R. A. Love and Foster Crane have arranged to finance the project. The final location of the line, which includes some of the old grade, has been made, and construction work is now under way. The plans call for a line from a point on the Kerrville branch of the San Antonio & Aransas Pass, about four miles northwest of Waring, Kendall county, Tex., north to Fredericksburg, in Gillespie county, about 25 miles. Construction work on several miles will be heavy. One mile at the summit will call for the removal of over 100,000 cu. yds. of rock. The maximum grade at the summit will be 2 per cent. compensated, and the maximum curvature will be 5 deg. The line will be laid with 60-lb. rail. Cotton, grain and stock will be the principal commodities handled by the line. R. A. Love, president; F. Crane, vice-president; A. L. Cunningham, chief engineer. (January 17, p. 132.)

San Pedro, Los Angeles & Salt Lake.—An officer writes that the company is locating the line from Riverside, Cal., north to Keenbrook, 25 miles, to have a maximum grade of 1 per cent., from Keenbrook to Cajon Summit, 12½ miles, to have a grade of 2 2/10 per cent., and from Cajon Summit to Otis, 56 miles, to have a grade of 1 per cent. No estimate has been made of the cost of constructing this new line, and it has not yet been decided to build the line. At present the company operates its trains between Colton and Daggett via the Cajon Pass over the Santa Fe tracks. The grades on this line in Cajon Pass west of the Summit are 2 2/10 per cent. and 3 per cent. A second track for eastbound traffic is being built by the Santa Fe between Cajon and Summit stations, which will provide a maximum 2 2/10 per cent. grade for that road on the west side of the Pass. (January 10, p. 88.)

Waycross & Western.—This company will increase its capital stock from $250,000 to $710,000, it is said, and will issue bonds to pay for the line under construction for some time from Waycross, Ga., southwest via Sirmans and Milltown to Ray's Mills, 51 miles. Twenty-one miles have been completed. The Empire Construction Company has the contract to build the line. (November 29, p. 1064.)

Winnemucca Northern.—An officer writes that the prospects of building this line from Winnemucca, Nev., northeast to Boise, Idaho, are good. Grading contracts will probably be let as soon as the location surveys are completed. The line may eventually be extended northeast into Montana. There will be about 40 miles of heavy work and 20 miles of rock work. The maximum grade will be 2 per cent. on four miles, and on the rest of the line 1 per cent. There will be a steel bridge 604 ft. long and another 550 ft. long, with about five miles of trestles. The company expects to develop a traffic in ore from the mines, also in cattle, sheep and grain. Thomas Nelson is president; H. H. Sheldon, chief engineer, and E. R. Place, general manager, Winnemucca.

RAILWAY STRUCTURES.

Beaumont, Tex.—The St. Louis & San Francisco has awarded a contract to J. W. Thompson & Co., St. Louis, for the construction of new freight and passenger terminals, including a passenger station, inbound and outbound freight sheds, and the necessary yards, team tracks, etc.

Railway Financial News.

Chesapeake & Ohio.—The Elkhorn Fuel Company has been incorporated under the laws of West Virginia to acquire about 300,000 acres of coal properties in Kentucky. These coal properties are said to comprise nearly all of the Elkhorn seam of coal not now owned by the Consolidation Coal Company. The C. & O. has agreed to build a line from its Big Stony division through the middle of this 300,000 acres.

Chicago, Memphis & Gulf.—This road, which runs from Dyersburg, Tenn., to Hickman, Ky., 52 miles, has been bought by the Illinois Central, which company has assumed the $735,000 5 per cent. bonds due January 1, 1940.

Chicago, Terre Haute & Southeastern.—One per cent. has been declared on the $6,500,000 income mortgage bonds as the amount to which coupons No. 7 and 8, together, are entitled. The interest on these bonds during the period covered by coupons No. 1 to 8, inclusive, is non-cumulative and heretofore three payments of 1 per cent. each have been made, one in 1911 and two in 1912.

Cleveland Short Line.—The Ohio Public Service Commission has granted its permission to this company to issue $1,000,000 common stock. The company now has $3,750,000 outstanding common stock, all of which is owned by the Lake Shore & Michigan Southern, which company has subscribed for the additional $1,000,000 stock. The L. S. & M. S. also owns $3,525,000 preferred stock and $7,000,000 4½ per cent. bonds.

Fitchburg Railroad.—This company, which is leased by the Boston & Maine, has sold to Blodgett & Company, Boston, Mass., and N. W. Harris & Co., New York, $400,000 20-year 4½ per cent. bonds at 100.42.

Galveston, Houston & Henderson.—The Texas commission has placed a valuation of $2,919,249 on this property. The company had filed a petition for a revaluation to show that the valuation was equal to the $3,000,000 outstanding securities. This is the first of the Texas lines to get a revaluation to provide for paying off and refinancing maturing bonds.

Grand Trunk.—The directors have declared a dividend of 2½ per cent. on the third preference stock. These dividends are payable from the earnings of 1912. Dividends of 1½ per cent. and ½ of 1 per cent., respectively, were declared from the earnings of 1911 and 1910.

Little Miami.—L. von Hoffman & Company, New York, have purchased from the Pennsylvania Company a block of $1,026,000 Little Miami 4 per cent. bonds, dated November 1, 1912-1962, issued to refund the 5 per cent. bonds which matured last November.

Norfolk Southern.—Harris, Forbes & Co. have bought from Kuhn, Loeb & Co., both of New York, $6,000,000 first and refunding 5 per cent. 50-year bonds which the railroad company sold to Kuhn, Loeb & Co. for the purpose of retiring notes which were issued to buy three small roads in North Carolina, and to connect these roads and build terminals in Raleigh and Chattanooga.

Southern Pacific.—See an item in regard to the Harriman Lines' dissolution plan in General News.

Union Pacific.—See an item in regard to the Harriman Lines' dissolution plan in General News.

Virginian Railway.—Stockholders have voted to approve the suggestion of the directors to reduce the stock from $34,850,000 to $31,271,500. (January 24, page 192.)

Wabash-Pittsburgh Terminal.—Daniel B. Ely & Co., New York, say that the reorganization plan of the Wabash-Pittsburgh Terminal and the Wheeling & Lake Erie will very shortly be made public.

Arica-La Paz Railway.—It is estimated that the railway from Arica, Chile, to La Paz, Bolivia, will have an annual freight traffic of 40,000 tons, consisting principally of ores from the Corocoro and Tacora mines. Passenger trains will take 16 hours in making the trip from Arica to La Paz.

* Illustrated.

THE necessity for giving more attention to the sanitary condition of railway coaches is forcibly presented in an article by J. T. Ainslie Walker on another page. If the medical authorities can agree on a suitable preparation, which it is practicable to apply for disinfecting the cars, the railways will undoubtedly be more than willing to make efficient use of it. Three roads have recently made provision for more aggressive measures along sanitary lines by the appointment of medical officers to take charge of such work. The next logical step, after the passenger car situation has been attended to, will be a consideration of box and refrigerator cars which are used for the transportation of food products. Such cars, which are not sealed when empty, are often entered by trespassers whose condition is anything but sanitary, and frequently are misused by the more ignorant classes of employees. They are also sometimes contaminated by perishable goods in an advanced state of decay. No provision is made for guarding against infection from these causes, or for properly cleansing the cars before they are again loaded with foodstuffs. How this may be accomplished effectively will be an important problem for the new school of medical or sanitary officers to solve in a practical manner.

MANY railroad officers who have risen to the position of superintendent or higher have stowed away a collection of worthless stock certificates. This collection represents "investment" in wild-cat schemes of one kind or another. The same thing is true of thousands of Americans who have worked their way up to business positions corresponding in salary with that of superintendent on a railroad. But this loss of savings seems especially unnecessary in the case of railroad men. A banker advising a client about investments will make a sharp distinction between investments that are proper for a business man and that are proper for a widow or other person entirely dependent on income from investments. Investments for the latter will yield not much over 4½ per cent.; for the former 5½ to 7 per cent. Most railroad men are business men in the sense that they are not dependent on their income from investments. If a railroad man invests in securities of a semi-speculative character of his own company or of a competitor, he is in a far better position to watch his investment closely than is the ordinary non-railroad man who is working for a salary, and who invests in railroad securities. The advantages of having railroad officers invest in railroad securities is tritely apparent. But how many superintendents have gone or written to the financial vice-president of their company and asked for advice as to investments? The mere thought seems radical and against accepted practice. Yet the treasurer or financial vice-president of a large road is in an exceptionally good position to recommend investments. Of course all sorts of objections at once present themselves, the most obvious being that if the investment turns out badly the investor will be inclined to hold his adviser responsible. But many of the same difficulties suggest themselves in the management of a pension fund, and in practice they do not prove to be formidable. The treasurer of one of the largest railroad companies in the country makes investments for the pension fund of his company every few months, and while, of course, he cannot make what would be called a business man's investments, he can and does use his position and knowledge to make the most profitable investments possible. Would it not be feasible to let it be known among officers of the rank of superintendent or above that if they cared to write to the treasurer or to the financial vice-president and ask definite questions in regard to an investment in any of the securities of their company they will receive an answer telling them what are the advantages and disadvantages of the particular investment?

COMPARISONS of statistics regarding accidents occurring under widely differing conditions may not be highly instructive, but they may not be without significance. Accidents on railways, excepting those to trespassers, are largely due to shortcom-

ings of the managements or employees. Those occurring in city streets are due directly to the carelessness or recklessness of those suffering or causing them, and indirectly to inefficient government. Some interesting comparisons can be made between the fatalities caused by accidents in the streets of New York City in the calendar year 1912, and those occurring on the entire railway system of the United States in the year ending June 30, 1912. The number of passengers killed in all train accidents was 139; the number of people killed by automobiles in New York City was 221. The number of railway passengers killed from all causes was 318; the number of persons killed by automobiles and street cars in New York City was 355. The number of passengers and railway employees on duty killed was 3,238; the number of persons killed by automobiles, trolleys and wagons in New York City was 532, or 16 per cent. as large. The total number of passengers and employees killed, including employees not on duty, was 5,151. In other words, although the railways hauled one billion passengers a total of about 35 billion miles, they killed fewer passengers in train accidents than were killed by automobiles in New York City, and fewer altogether than were killed by automobiles and trolley cars in New York City; and although they had working for them 1,700,000 men, there were 10.5 per cent. as many people killed in the streets of New York City alone as there were killed of both passengers and employees in the entire country. It may not be amiss to add in this connection that while the railways killed an average of 29 people a day, 15 of those killed each day were trespassers whose deaths were due to the failure of the governments of this country to make and enforce proper laws. It may not be amiss to add further that while the railways were killing an average of 29 persons a day, only 14 of whose deaths can possibly be attributed to their fault or that of their employees, there were being committed in the entire country over 9,000 homicides, or an average of 25 a day, all of which, like the deaths of the trespassers, were due to inefficient government. When the number of people killed in the streets of a single city exceeds the total number of passengers killed on 245,000 miles of railway; when the number of trespassers killed on railways exceeds the total number of all other persons killed on railways; when the number of homicides in the country is 80 per cent. greater than the number of fatalities that can, on any construction of the facts, be attributed to the fault of railways and their employees, it would seem that the governments of this country might well devote a little more time to regulating their own shortcomings and a little less time to regulating the shortcomings of the railways. But that would not help to "keep the bunk in bunkum."

THE LESSONS OF THE FIREMEN'S CONTROVERSY.

THE firemen have won over the managers of the Eastern railways in the controversy about the way their differences shall be arbitrated. The railways made the firemen three propositions. First, they offered them advances in wages relatively the same as those awarded to the enginemen by the board of eminent citizens that arbitrated the enginemen's case. Second, they offered to submit the controversy to arbitration by a board similar to that which arbitrated the enginemen's case. Third, they offered to submit the matter to arbitration by a board composed of two representatives of labor, two representatives of the railways and two disinterested persons. All these propositions the firemen rejected. They offered the railways the alternative of arbitration under the Erdman Act or a strike.

That the firemen have won is not because their side of the case was more skilfully handled than that of the railways. It was not. Never, we believe, has the railway side of any labor controversy been handled better than was done in this case by Elisha Lee and his associates. The firemen won because they had the greater brute force and the greater disposition to use it regardless of consequences.

The result contains three lessons which it behooves the people of the United States to learn.

First, the physical power of the railway brotherhoods exceeds that of the railway managers. Of course the railways could lock the employees out, just as the employees could strike; but the railways have much more to lose by suspension of operations.

Second, the brotherhoods occupy a better strategic position than the railway managements do. This is because the managers have had many collisions with public opinion in which they have been worsted; and it has taught them that in all their acts they must respect the rights of the public. One of these rights is to have transportation maintained without interruption. The employees fully appreciate the position the managers are in. They have not had similar collisions with public opinion in which they have been worsted. Therefore they have not been taught to respect the rights of the public, and some of their organizations do not respect them. In this instance and in many others, they have shown that when regard for the rights of the public becomes incompatible with resort to a strike to secure what they demand, they will trample on the rights of the public and declare the strike. They recognize the responsibility of the managers to the public. They do not accept any responsibility on their own part to the public. Naturally this gives them a great advantage over the managers.

The third lesson which the public needs to learn flows naturally from the first two. It is that the public should adopt some means for protecting its rights against those who have both the power and the disposition to trample on them. The existing law, as the developments in this and many other cases have indicated, is insufficient to protect the rights of the public. There was nothing in the Erdman Act to prevent the firemen from striking, and they doubtless would have struck, and brought down on the public all the direful consequences, if the managers had not yielded. Furthermore, there is nothing in the Erdman Act to insure that mediation and arbitration under it will result in fair adjustments of wages and conditions of employment. It is just as essential, in the long run, that railway labor controversies shall be settled on a right basis as that they shall be settled at all. If wages and conditions of employment are made unreasonable, the cost of rendering the service of transportation will be made unreasonable and the rates that the public will have to pay for it will be made unreasonable.

The managers showed great forbearance and great public spirit by yielding, to prevent a strike—a public spirit strikingly contrasting with the selfish and reckless contempt for public rights and the public welfare displayed by Mr. Carter and his associates. Perhaps it might have been better for the public, in the long run, had the strike come; for then the demonstration of the need for additional legislation regarding the labor situation on railways would have been complete.

ON THE EFFICIENCY OF AMERICAN RAILWAYS.

WE publish on another page a letter in which Professor Cunningham of Harvard University criticizes some of the statistics used by James J. Hill in his recent address before the Railway Business Association. Mr. Hill sought to show that the efficiency of the railways of the United States is higher and their rates lower than those of the railways of Europe. Although one of the world's greatest experts in devising and using statistical units adapted to indicate and promote efficiency of operation, Mr. Hill seems, in this instance, to have fallen into some inaccuracies. But we do not believe, and we do not think Mr. Cunningham believes, that any such errors made by Mr. Hill were sufficient to affect the soundness of his conclusions.

Mr. Cunningham criticizes Mr. Hill's use of the number of tons hauled one mile per dollar of net revenue as an index of efficiency. He points out that net revenue is made up from both passenger and freight receipts. Because of differences in the ratios of passenger to freight traffic handled, in the wages paid, etc., it is very hard to make satisfactory comparisons indicating the efficiencies of the railways of different countries. The greatest economy is secured by handling traffic in the largest

units. It is easier, however, to increase the size of the units in which freight is handled than in which passengers are handled. The railways of the United States handle their freight with the largest and most powerful locomotives, the largest cars and in the largest trainloads, of any railways in the world. Among the railways of Europe the Prussian-Hessian are their closest rivals in this respect. The densities of freight traffic on the Prussian-Hessian roads and ours are about the same, but the average freight trainload in this country in 1909 was 363 tons, and in Prussia-Hesse only 233 tons. Unlike conditions may explain part of this difference, but they will not explain anywhere near all of it. On the other hand, the Prussian-Hessian lines handle over 50 per cent. more passengers per train than our railways. But, as Professor Cunningham shows, their density of passenger traffic is 400 per cent. greater than that of our railways, and 85 per cent. of it is second and third class, while practically all of ours is first class. They apparently do handle their passenger traffic more economically; and in view of the facts they certainly ought to.

Mr. Cunningham criticizes Mr. Hill's use of average rates per ton per mile to indicate the relative costs of transportation to the public. It is true that many allowances and qualifications must be made in using ton mile rates as evidence of actual rates. Mr. Cunningham mentions the most important of these. After all the necessary allowances and qualifications have been made, however, the reasonable and candid student must conclude that the freight rates of the United States and of Canada, where American methods are used, are the lowest in the world. We have never heard of any such student reaching any other conclusion.

It is also true, as Mr. Cunningham says, that in considering the cost of transportation to the public, passenger as well as freight rates must be included. The average passenger rate in the United States is relatively high. But average passenger rates as well as average freight rates must be used with many allowances and qualifications. In their case also the densities of traffic, the lengths of haul and the conditions of service must be considered. Furthermore, it must be considered that in this country the railway will carry a maximum of 150 lbs. of baggage free for each passenger, while in Europe the carriage of baggage must be paid for. Persons who have kept account of all of the expenses of railway travel under like conditions in Europe and the United States find that it is no more expensive in the United States than in Europe. Charles Frederick Carter contributed to the *Review of Reviews* for May, 1912, an interesting article on "Cost of Travel at Home and Abroad." He gave exhaustive illustrations all leading to the same conclusion. One was the case of an American traveler who kept an account of his expenditures on eleven journeys in Europe aggregating 2,154 miles. He never rode in a "train de luxe"; but he paid out in fares $76.55; and for the transportation of baggage weighing 168 lbs., $19.42; a total of $95.97, and an average of 4.46 cents a mile. On returning home he made a schedule of eleven journeys in the United States with an aggregate mileage of 2,211 miles. For these trips the total cost of one-way tickets and parlor car tickets was $60.15. The addition of a possible excess baggage charge of $2.75 increased the total to $62.90, making an average of 2.86 cents a mile, or $33.07 less than the cost of the European trips.

Considering both freight and passenger rates, the charges of the Prussian-Hessian railways are the lowest, on the average, in Europe. One way to reach an approximately correct conclusion as to the relative costs of passenger, express and freight transportation in Prussia and the United States is to apply the average passenger and freight rates of Prussia to the traffic of the railways of the United States. The earnings per mile of the railways of the United States in 1910, from freight and passenger business were $10,769.48. The addition of the revenue of both the railways and express companies from express, increases this to $11,377. Our density of freight traffic was 1,071,086 ton miles, and our density of passenger traffic 138,169 ton miles. While the earnings of both the express companies and the railways from express have been included in these earnings per mile, it is not possible to include the express density in the traffic figures, because it is not known. The average rate per ton per mile in Prussia, where express is included in freight, was 1.37 cents; the average passenger rate, 89 cents. If these rates had been applied to our freight and passenger traffic in 1910, the earnings per mile of our railways from freight and passengers alone, including nothing for express, would have been $15,903.57 per mile. This is over 40 per cent. more than actually was earned from freight, passengers and express, including the earnings of the express companies. In other words, with a freight traffic density approximately the same as that of our railways, with a passenger density over 400 per cent. greater, the average rates of the Prussian-Hessian lines were so much higher that their application to the passenger and freight traffic of our railways would produce 40 per cent. larger earnings than are actually received by our railways and the express companies from passengers, freight and express. And while allowances are being made for differences in the hauls and character of the traffic, allowance should also be made for the fact that while the average daily compensation of the employees of the Prussian-Hessian railways in 1910 was only 80.7 cents, the average daily compensation of the employees of American railways was $2.29, or 184 per cent. greater.*

Similar and even stronger comparisons, all pointing to the relative efficiency of our railways and the lowness of their rates, might be made between them and the railways of other European countries. If such comparisons do not settle whether the railways of the United States are more efficiently and beneficially managed, from the standpoint of the public, than are those of Europe, we are unable to imagine what evidence would. However, as we said at the start, Professor Cunningham does not question Mr. Hill's general conclusions; we are quite sure he agrees with them. And we have said what we have to supplement what Mr. Hill said, and not to controvert what Mr. Cunningham says.

ON TELLING ALL THE FACTS.

WE publish on another page a letter signed "New York," commenting on the editorial in our issue of January 31, entitled "Some More Reasons Why Railways are Unpopular." "New York" is the chief passenger officer of a large railway system. He concedes that the service given to railway passengers is not 100 per cent. perfect. He believes, however, that it comes nearer being so than that given to the public by commercial hotels, government institutions, etc.

We hasten to subscribe to "New York's" views. We did not imply that railway service in this country is not as good as that rendered by other concerns or institutions with whose service it can be appropriately compared. There is not a complaint that can be made about the service on sleeping cars and dining cars that cannot be made with equal force about the service given in even the best hotels in the United States. The most uncivil railway ticket clerk is a perfect gentleman compared with the average hotel desk clerk. Furthermore, telling the truth is somewhat characteristic of railway employees, while veracity among hotel clerks is apparently a rare commodity. Was there really ever a case at a large hotel in the United States when a traveler was promised that he would be transferred to a room with bath in case he would first take a room without a bath that he ever got the room with a bath? There are very few hotel proprietors in the United States who could not learn a good deal about how to serve their patrons by visiting the hotels run by the railway companies in Canada, the Fred Harvey hotels on the railways in the Southwest, and some other railway hotels that might be mentioned.

Another place patronized by the public where the service given is as bad as the worst service on railways is the theater. In the large class of lordly and insolent whippersnappers those who sell

*Bulletin No. 34, Bureau of Railway Economics, page 40.

tickets at theater box offices easily rank first. The patron who is charged $2 for seeing the kind of shows given at most "first class" play houses is entitled to courteous treatment. If he should get that, it would, in many cases, be all he got for his money. But he seldom receives the courteous treatment, and he often has to go out and buy tickets from a scalper at a large advance in price. It is easy to imagine what the public would say and do if the employees of railways treated their patrons as the employees of theaters treat theirs, and, if, in addition, the railways let a large share of their transportation and sleeping car tickets fall into the hands of scalpers who made the public pay extra for them.

As to the service given to the public by employees of national, state and municipal governments, to which our correspondent alludes, it is probably the worst of all. The mail carrier on your route is usually very obliging and civil. He is a cheering and outstanding exception to the rule; and even mail carriers are not always polite. As to the general run of government employees, if the citizen desires to know how obliging and courteous they are, let him go to the city hall to pay his taxes, or to the federal building to get information. He will soon learn that government exists, not as the great Declaration says, for the benefit of the governed, but for the benefit of their employees. Some people think railway service in this country would be improved under government ownership. After thirty years of public operation of the old State railway system in France and four years of public operation of the Western Railway in that country, M. Guyot, formerly Minister of Public Works of France, writes: "It has set up a class of workmen and employees who consider that the line is run for their benefit and not for the convenience of shippers or travelers."

But—the *Railway Age Gazette* is a publication devoted to railway transportation. It considers it to be its function to do what little it can in a modest way to improve railway service. Suppose railway transportation is 75 per cent., or 80 per cent., or 90 per cent. efficient. We deem it our function to comment on the 10 or 15 or 25 per cent. of inefficiency as well as on the 75 or 80 or 90 per cent. of efficiency; and such comment does not imply that the efficiency of railway service is less than that of other forms of service rendered to the public. It is unfortunate that when a journal or a man devoted to the interests of a particular line of business tries to tell 100 per cent. of the truth about it, those whose attitude toward that business is critical or unfriendly are more likely to believe the comments made which harmonize with their own views than those which run counter to them. Fortunately, on the other hand, most people are disposed to be fair, and 100 per cent. candor inspires confidence and belief in fair people. Therefore, it is to the selfish interest of railways that all those who wish them well shall try to tell, not merely the facts, but all of the facts about them. Furthermore, that is the only square thing to do.

Recognizing and conceding our great limitations, both in point of ability and virtue, we venture to set down that this is the policy that this paper is trying to follow. God forbid that we should offer up the prayer of the Pharisee; but we can't help adding that while we are trying to tell what is bad as well as what is good in the railway business, there are many other publications that would show more consistency, if not more of a still greater virtue, if they would try to tell what is good as well as what is bad in the railway business.

NEW BOOKS.

Diary of a Roundhouse Foreman. By T. S. Reilly. Bound in cloth. 158 pages. 5 in. x 7 in. Published by the Norman W. Henley Company, 132 Nassau street, New York. Price, $1.00.

The book is published in the form of a diary and gives in colloquial form the experiences and trials of the engine house foreman. The hero of the story is a young college graduate who is serving his apprenticeship and has endeavored to push his way to the top. Many suggestions are given for the diplomatic handling of men.

Letters to the Editor.

TRAIN-ORDER SIGNALS NORMALLY AT STOP.

New Orleans, La., January 28, 1913.

To the Editor of the Railway Age Gazette:

The "slogan" of today in railroad circles is "Safety First"; and in some states, this one for example, the railroad commission is demanding that roads not equipped with block signals shall increase the number of telegraph offices, especially night offices, in order that trains may be better spaced. Whether this is or is not done, there is one thing that should be done at once; keep the signals normally at stop. To keep them at "proceed," as is done at present invites disaster. I can recall a number of serious collisions that would have been prevented had the semaphores displayed stop instead of proceed, caused by operators taking train orders for trains which had passed their station. It is the rule that despatchers shall not place a restricting order at a station for a train where there is any doubt as to the train having passed, or by the average running time could have passed the station; but the rule is often ignored. The normal position of the semaphore was changed from stop to proceed, not with the view of increasing the safety of trains; but with the idea of eliminating the stops caused by operators when there were no orders for trains and no reason for spacing; or to allow agents more time to attend to station work outside of the office. On the road with which I serve, on one district alone, within the past month, four trains have passed stations without the knowledge of the operators, the operators reporting the trains as "not yet by." Subscriber.

SOME REASONS WHY RAILWAYS DO NOT GIVE 100 PER CENT. SERVICE.

——, February 10, 1913.

To the Editor of the Railway Age Gazette:

Referring to the editorial in your issue of January 31, entitled "Some More Reasons Why Railways Are Unpopular," I am not an apologist for incivility or inefficiency; the facts are indisputable. It is not practicable anywhere in life to receive 100 per cent. of the time 100 per cent. of efficiency from 100 per cent of employees, nor can you get the maximum efficiency 100 per cent. of the time even from the 100 per cent. man, and in whatever degree the capacity of the human machine falls below the 100 per cent. maximum standard, he gives less than 100 per cent. of efficiency some or all the time.

Let me illustrate by concrete examples I can vouch for personally, and a large portion prove by a witness:

Thursday, January 30, 1913. United States city of 425,000. Breakfast at one of the three best hotels: waiter service attention inferior; coffee inferior; food and cooking good. Lunch at same hotel: waiter service attention very inferior; food and cooking good; coffee inferior. Dinner at another of the three hotels: waiter A1; food and cooking excellent; coffee a grade above lunch and breakfast.

November 13, 1912.—United States city of 2,500,000. At a high class hotel that really tries to give excellent service. Breakfast, all good except leathery toast served, although prior instructions to waiter specified precise wishes, i. e., that toast be freshly made and hot. Bath tub plug unserviceable; could not retain water in tub.

November 14, 1912.—Same hotel. Hat girl gossiping with captain at dining room door; paid no attention whatever until called. Breakfast, all good except toast, which was the other extreme—hard as a board, could not be eaten readily.

Now, Mr. Editor, while the foregoing items are not too serious to me, I have heard a railway meal service damned altogether for less. I am not necessarily a crank; but I am cranky enough to be able to observe inefficiency wherever it comes within my observation. In the course of nearly forty years' railway service,

and, I believe, considerably more than one million miles traveling—at least ten of those years living all the time in hotels, sleeping and dining cars—I feel fairly qualified to give the opinion that man for man and place for place the railway and its employees compare favorably with the average commercial house and its employees, and excellently well with governmental service and employees, federal, state or municipal.

It matters much how the railway employee is addressed and what is the physical and mental condition of the inquirer. Not every man is gifted with inexhaustible patience to answer with unruffled serenity *all* the questions asked; and the way some are put, the hectoring bully, the nervous woman, the utterly inane, almost insane, slush that is dignified by being called "a question" or "an inquiry!" I was through the mill as a ticket clerk, and writhed and suffered and still kept civil, and today careful inquiry shows that after four decades the same exacting public exacts still more than when I was a lad, and our boys have just the same kind of heterogeneous collection to deal with.

Pardon me for taking so much space, but there are two sides to every phase of these matters, and there is as much fault on the part of the public as of the railways. New York.

THE LESSON OF IRVINGTON.

Chicago, January 29, 1913.

To the Editor of the Railway Age Gazette:

I have been reading your editorial of last week, page 133, telling, under 18 heads, the causes of the collision on the Cincinnati, Hamilton & Dayton. You say that railroad officers will need no assistance in making use of this lesson; but it seems to me that it is somewhat of a mixed problem, or at least that there is room for quite a lot of discussion as to what action should be taken on some of the points in your list. Looking at one's own road and the conditions actually on hand to be dealt with, the question whether a certain duty is up to the employee, or to the supervising officer, or to the directors of the company, sometimes admits of more than one answer.

The causes of this collision, as outlined by you, are: (1) The block system was not arranged to protect against opposing movements; (2) because of bad judgment or overloaded trains, engines became stalled on hills; (3) the engineman covered the headlight prematurely; (4) the engineman started to close the switch, but did not carry out his purpose; (5) the switch was not lighted; (6) Gross made a positive statement when he had as a basis only a supposition; (7) the passenger engineman did not slacken speed; he should have done so because of the absence of the light; (8) the lamp had failed; (9) the engineman was specifically responsible, according to rule 104 A; (10) the conductor and each of two brakemen attended the switch at different times, but no one of the three cared enough about the light to relight the lamp; (11) the company allows disregard of the rule prescribed to insure the safety of trains when lights do not burn; (12) the failure of lights is frequent; (13) trains have to double hills frequently; (14) the engineman was not sufficiently experienced; (15) the brakeman was not sufficiently experienced; (16) the fireman was not sufficiently experienced; (17) the speed as limited by a city ordinance was exceeded by the passenger train; (18) the electric headlight of the passenger engine was out of order and a poorer light or no light had been put in its place.

Where lies the responsibility? Item 17 surely should be referred to the president of the road. Where a city imposes a speed limit of 30 miles an hour three or four miles out in the country, the absurdity of the situation ought to be apparent, even to an alderman; and it is the duty of a railroad company to do everything practicable to get such an ordinance changed. If a change cannot be had, the road must obey the rule; or, if it deliberately decides to defy the law, it is due the trainmen to explain to them the company's attitude. Breaking a law habitually, the officers set a very bad example, particularly if the reasons for their decision are obscure or are kept secret.

The 18th item is troublesome, also. The slowness of shop foremen (often due in large measure to difficulties with help for which the foreman is not responsible) and an unwise policy as to carrying a sufficient supply of repair parts, in many cases seem to combine to neutralize the value of the large sums of money that have been spent for high-power headlights. If legislatures with their crude measures are going to prescribe headlights, there would seem to be necessary still another law to provide for state inspection or periodical inquiry to see that the lights actually are used with regularity and effectiveness.

Item 8, keeping switch lights burning, is another difficult point. The percentage of switch lights failing is exceedingly small, and yet the few failures that do occur make much trouble. Perhaps, if the Indiana rule requiring trains to stop and revive dead lights could be generally enforced the imperfect lights would make still more trouble, and then somebody would be disturbed sufficiently to produce an actual reform. Keeping lamps cleaned, filled and provided with good wicks, properly adjusted, is not a difficult task; but it *is* a difficult task to get trackmen who will be 100 per cent. efficient in this work. The proper remedy, it seems to me, is not to make trains stop for dead lights, but to have all switches protected by distant signals, so that safety will be insured simply by reducing speed. Reducing speed would not impose very serious delay, while yet the inconvenience would be sufficient, if all cases were promptly reported, to force somebody to take action.

Items 3 and 9 are plainly up to the engineman. Items 5 and 6 are equally clear; there is no excuse for this plain shiftlessness. Item 10 is equally conclusive against the conductor and the two brakemen, both of whom, I understand, had had occasion to turn the switch; but consideration of the cases of these three men only brings out in strong light the need of much more detailed, minute and rigid supervision of all of the work of men who, like these, are out of sight of their boss all the time. In the case of men—quite as intelligent as freight conductors—in offices and shops the need of admonition, instruction, reproof or exhortation is evident every day; and yet we go on blindly trusting freight train men to do their work entirely in accordance with their own individual judgment. That they will do many things wrong is a foregone conclusion.

In all the other items of this indictment it is the officers, not the employees, who have got to do the house cleaning. Indeed, every ambitious superintendent or trainmaster will feel a personal relation to every item of the whole 18; for, whatever the shortcomings of his men, he means to cure all shortcomings if he can discover how to do it. But as to items 1, 2, 7, 11, 12, 13, 14, 15 and 16, who will raise any question? Every now and then some accident shows a general laxity throughout the service. This seems to be one of that kind. Our problem is not an "accident problem"; that is a misleading term. It is the problem of good management, and mainly one of good management of men. Is it not time that we got away from this attitude of the governmental authorities, always looking at symptoms, and turn our attention to more constructive ideas? Good management is always a duty, even if no accident ever happened, and if good management be constantly striven for the accident record, after a time, will be reduced, so that no official will need to lie awake nights worrying about his responsibility for it.

It seems to me that the most significant items in this list are the last three—14, 15, 16; three inexperienced men. Would not the correction of these features surely have prevented the accident? Without doubt. Who will boldly adopt a rule that *no train of any class,* no light engine even, shall ever be run over the road except with thoroughly tried men in charge? Thorough trying out will involve much apprenticeship and a decided increase in expenses; but shall we ever secure safety without adequate attention to this feature? Why should not every division superintendent at once present to his general manager an estimate of the cost of so enlarging his working force of enginemen, firemen and conductors as to provide for all emergencies. An Assistant To.

A CRITICISM OF JAMES J. HILL'S STATISTICS.

Cambridge, Mass., January 15, 1913.

To the Editor of the Railway Age Gazette:

In his remarkable address before the Railway Business Association recently (*Railway Age Gazette*, December 20, 1912), James J. Hill has made a masterly presentation of the railway situation, and has set forth strong and convincing arguments to show that the one paramount need of the railways is greater terminal facilities. Mr. Hill's opinions are held in highest regard both in and out of railway circles and his statements command the greatest respect, since hardly anyone is better acquainted than he with the details of operation and the large matters of administrative policy of American railways. It is, therefore, with some hesitation that the writer ventures to call attention to the doubtful use which Mr. Hill has made of statistics of foreign railways to illustrate his address, particularly those applying to Germany. Similar mistakes and omissions are occasionally noted in the statements of other railway officials of high standing, and it may be of interest to call attention to some features which deserve attention in the interpretation of statistics of European roads.

The figure most commonly misinterpreted or misapplied is that giving the average revenue per ton mile. This unit for the United States in 1910 was 0.753 cents; in Prussia-Hesse in the same year it was 1.37 cents; and on the North Eastern Railway of England, the only line in England computing ton-mile statistics, it was 2.30 cents in 1909. It is frequently concluded that the British shipper pays freight rates which are 206 per cent. higher than the rates in this country; and the shipper in Prussia is charged 82 per cent. more. Such a conclusion, however, is faulty. In the first place, neither England nor Prussia have express companies. Their freight traffic includes the smaller packages which in this country go by express, and in England, particularly, the freight service between all important points moves with a speed and regularity that resembles passenger service. To make a fair comparison between the ton-mile rates of the United States and these foreign countries it is necessary to add to our ton mileage and revenue the tonnage moved by the express companies and the revenue therefrom. Ton-mile statistics are not computed by the express companies, but a recent study made by the Interstate Commerce Commission established the fact that for three selected months the average revenue *per ton* was $30.80, the average distance carried not being given. But whatever may be the express ton-mile rate, it would undoubtedly tend to increase the average freight ton-mile rate considerably.

In the second place, the English freight rates (on which the North Eastern ton-mile revenue is based) include a charge for the collection and delivery of freight at originating point and at destination. In this country the railways do not collect and deliver like the express companies, and if this expense were added to our average ton-mile rate the effect would be startling. Every condition favors the United States in the usual basis of comparison, since we have a higher percentage of low grade freight taking low commodity rates (much of which moves by water in Europe) and our haul is five times as long as on the North Eastern of England, and twice as long as in Prussia. Consequently, our terminal charges per ton-mile are less.

A comparison between countries on a passenger-mile revenue basis is fairer than the ton-mile unit, but even in this case one fact is often overlooked. In this country a generous proportion of our travelers ride in parlor cars. The extra charge for this privilege goes to the Pullman company and is not included in the passenger-mile rate. In England and Germany the first-class carriages are equivalent to our parlor cars and their passenger revenue units include the excess charges to travelers who use the first class cars. A very few parlor cars are now being introduced in England, but they are unknown in Germany. To make a proper comparison of the passenger-mile revenue in the three countries it would be necessary to make some allowance for the 0.5 cent per mile additional paid in the United States by passengers who use parlor cars. The average revenue per passenger mile in 1910 was 1.938 cents in the United States and 0.89 cents in Prussia-Hesse. The figure for Great Britain is not available. It is evident from the very low passenger rates in Prussia that the passenger traffic is carried at or below cost, and the administration necessarily must recoup itself from the freight service, in which the rates are relatively higher. The tabulation which follows shows the normal rates and the division of the passenger traffic in Prussia-Hesse in 1910:

Class.	Normal Rates per Passenger Mile. Slow Trains.	Fast Trains.	Per Cent. passenger miles in each class.
First class	2.68c.	2.79c.	0.89
Second class	1.72	1.84	11.00
Third class	1.15	1.22	39.51
Fourth class	0.766	....	44.59
Military	....	....	4.01

As already stated, the Prussian first class corresponds to our parlor car; their second class is as good or better than our modern coaches; their third class is not quite as comfortable as our very old coaches, and we have nothing that compares with their fourth class, in which the great majority of passengers are obliged to stand. First class compartments are designed to seat four passengers; second class, six passengers, and third class, eight passengers.

The figures which Mr. Hill uses for traffic density do not agree with those of other authorities. His estimate for Great Britain (it must be an estimate since ton mileage is not computed except on the North Eastern) is 529,622 ton miles per mile of line. A recent bulletin of the Bureau of Railway Economics gives the North Eastern density as 814,713. Mr. Hill's figure for Germany is 827,400, but the official statistics of the *Reichs-Eisenbahn-Amt*, 1910, give 933,569 metric tons, which is equivalent to 1,029,000 tons of 2,000 lbs. The latter figure is but slightly less than the ton-mile density of the United States, which in 1910 was 1,071,086.

The density of passenger mileage is of equal interest since it must be taken into account with the freight density and the two balanced if we are to form an intelligent opinion of the relative performance. The following tabulation shows that Prussia exceeds the United States in both freight and passenger density, but if the comparison is narrowed to Group 2 (comprising roughly the States of New York, New Jersey, Pennsylvania and Delaware) a territory more nearly like Prussia, the showing is more favorable to the highly developed Eastern section of this country. In Group 2 the passenger density is less than one-half that of Prussia, but the ton mileage is 143 per cent. greater. The figures are for 1910.

	Ton miles per mile of line.	Passenger miles per mile of line.
United States	1,071,086	138,169
Prussia-Hesse	1,150,490	693,921
Group 2, U. S. A.	2,797,011	314,187

As a proof that the railways of the United States have been capably managed, and their resources and powers used to the highest business advantage, Mr. Hill calls attention to the fact that in the United States we move 272 tons one mile for every dollar of net revenue, while Germany moves only 172, France 88, and Great Britain but 58. This unit of comparison is misleading, since net revenue is made up of receipts from both passenger and freight transportation, and the ratio of one to the other, and the units of revenue, differ widely in the several countries named. In the United States 23 per cent. of operating revenue comes from passengers; in Prussia-Hesse, 29 per cent.; in France, 33 per cent.; and in Great Britain, 38 per cent. It would be as fair to express the relation between passenger miles and net revenue, and point to the showing as evidence that our resources and powers are *not* used to advantage. In the United States, for each dollar of net revenue a passenger is moved 32 miles; in Germany, the distance is 97 miles, or three times as far. Neither comparison, however, is of any practical value.

William J. Cunningham,
Assistant Professor of Transportation, Harvard University.

THE NEEDS OF THE RAILWAYS.*

What Can and What Cannot Be Done by the Railways Themselves to Offset the Increasing Expenses of Operation.

By Samuel O. Dunn,
Editor of the *Railway Age Gazette.*

When I speak of the needs of the railways I do not mean what they need to serve themselves. I do not even mean what they need merely for their own profit, the good of their employees and the benefit of those who travel and ship. I mean what they need to promote the interests, not only of those having investments in railways, but also of the much larger number having investments in other enterprises; not only what they need for the good of those who work for them, but also what they need for the good of all who work at all; not only what they need for the benefit of the relatively few who travel much, but also what they need for the benefit of the many who travel little or none; not only what they need for the benefit of the relatively few who ship, but also what they need for the benefit of the many who produce and consume what is shipped.

The prime requisite of good transportation is safety. Our railways are less safe than they ought to be. Their accident record is often exaggerated and misrepresented. But without exaggeration or misrepresentation it is bad enough.

The accidents on American railways are usually discussed as if they were a distinct disease. They are less a disease, perhaps, than a symptom. We are rather notorious for accidents in all our industrial pursuits. We have a bad name for automobile and other casualties in our city streets. We have more homicides and fewer punishments for them than other leading nations. The diagnosis all these symptoms suggest is that, for temperamental or other reasons, we as a people tend to act in disregard of our own safety and the rights and safety of others. They suggest that we have not been apt, either in our industrial organizations or our governments, in devising means for controlling those of a reckless and unruly spirit.

The problem of dealing with trespassing is the problem of dealing with more than half of all the fatalities on our railways; and as long as it is handled as it is now by the governments there will be no reduction in the deaths of trespassers, which now number over 5,000 a year.

Probably three-fourths of all accidents, except those to trespassers, are due to railway employees incurring risks in ignorant or intentional disregard of the operating rules, and to the failure of the managements to give the instruction and training and administer the discipline necessary to stop these things. It seems possible, however, that some form of government regulation may be required to reduce these man-failure accidents. In England railway operating rules when filed with and approved by the Board of Trade acquire the force of law. The same thing is true in our own state of Indiana as to rules filed with the state railroad commission.

The classes of accidents already referred to, constituting together a very large majority, are not remediable by physical improvements in the railways, but only better laws, better railway rules and better enforcement of and obedience to them. There are, however, many accidents that can be reduced only by physical improvements which will cost very large amounts.

ARE FACILITIES INADEQUATE?

Next to safety the most important requisite of good transportation is adequacy. There is much complaint that at certain times the freight service of our railways is inadequate. In 1906, 1907, and again in 1912 we have been seriously troubled with what are called "car shortages." The situation last fall was not as bad as it was in the years 1906 and 1907, but it would have been worse if the fall and winter had not been remarkably mild.

The statistics show that these so-called car shortages are usually comparatively brief. They commonly begin around October 1, reach their maximum late in that month or early in November, and disappear before January. The largest net shortage was in February, 1907, and amounted to 137,847 cars. The next largest was that of October, 1907, reaching 82,811 cars; and the third largest that of November, 1912, amounting to 51,259 cars. On the other hand, the net surpluses since 1907 have usually exceeded 100,000 cars, have often exceeded 300,000, and have been as much as 400,000. Furthermore, the shortages are not of annual occurrence, while large surpluses are.

These figures show that the trouble has been merely that our railway facilities have been unable to carry the peak of the load. Now, which involves the greater economic loss to the country—to have transportation facilities that are inadequate to handle the maximum traffic, or to have facilities which are in excess of the requirements most of the time? It is generally accepted in business that it is best to have your plant large enough to handle the regular maximum business satisfactorily. Doubtless, the same principle applies here.

The congestion of traffic in 1906 and 1907 came at the end and climax of a period of industrial and commercial expansion, during which traffic had increased greatly and railway construction and the purchase of equipment went forward rapidly. The congestion of traffic last fall came at the end of a period of comparative business depression, during which there was relatively little construction of new lines and purchasing of new equipment, and at the beginning of what promises to be another period of great industrial and commercial development. Much of the equipment is now in a condition of relative depreciation which will make it necessary soon to replace it. This combination of conditions suggests that unless rapid increases in the facilities of the railways are made we may in a very few years be confronted with a congestion of traffic even worse than that which lasted from the fall of 1906 until June, 1907.

MOST ECONOMICAL MEANS OF INCREASING CAPACITY.

The most economical way to increase the capacity of a railway is, when practicable, to increase the capacity of its cars and the power of its engines. Cars of large capacity and engines of great power together make it possible to handle a given traffic with a minimum of trains; and the fewer trains you run the more traffic you can handle with a given mileage of main tracks.

American railways have acted on these principles more effectively in the handling of freight than any others. They increased the average capacity of freight cars from 28 tons in 1902, to 36 tons in 1910, or 21.4 per cent. in eight years. The Prussian-Hessian state system, which is the leader of Europe in economy of operation, increased the capacity of its cars from 14.1 tons in 1900 to 15.5 in 1909, or less than 10 per cent. The average capacity of its cars is less than one-half as much as ours, and it increased in nine years less than one-half as much in proportion as did ours in eight years. We have no figures regarding the average seating capacity of passenger cars in this country. On the Pennsylvania Railroad it increased from 57 in 1900 to 63 in 1909, or 10.5 per cent. The increase in the same years on the Prussian-Hessian Railways was from 46 to 49, or 6.5 per cent. The average tractive power of the locomotives on the railways of the United States increased from 20,485 pounds in 1902 to 27,282 in 1910, or 33 per cent., and far exceeds the power of the locomotives of any other railways.

The result of this combination of increases in car capacity and

*From an address delivered before the Graduate School of Business Administration of Harvard University, Cambridge, Mass., December 4, 1912.

locomotive power in the United States was large increases in the tonnage and the passengers hauled per train. The average number of tons per train in 1900 was 271, and in 1910, 380, an increase of 40 per cent.; and the increase in passengers per train was from 41 to 56, or 36 per cent. The Prussian-Hessian railways increased their train load from 163 tons in 1900 to 233 tons in 1909, or almost 40 per cent. The percentage of increase in their train load in nine years was as great as that in ours in ten; but our train load was substantially larger at the beginning of the period than theirs was at the end, and was 63 per cent. greater in 1910 than theirs was in 1909. They increased their number of passengers per train from 80 in 1900 to 84 in 1909, or 6.3 per cent.

The additions to the average train load have been made possible, of course, not merely by the increases in the capacity of cars and the tractive power of engines, but also by many reductions in grade and curvature, and much strengthening of track.

The operating and financial results gained by the means outlined have been notable. The mile of line is the unit of railway operation. The number of tons of freight hauled one mile per mile of road grew 45.3 per cent. between 1900 and 1910. This more dense freight traffic was handled with an increase in the number of freight cars per mile of road of 25 per cent., and an increase in freight train mileage per mile from 2,557 to 2,683, or but 3 per cent. Between 1900 and 1910 the increase in the density of passenger traffic was 60.5 per cent. This largely increased traffic was handled with an increase in the number of passenger cars per 100 miles of road of but 8.3 per cent., and an increase in the number of passenger trains run one mile per mile of line of from 1,887 to 2,279, or 21.7 per cent. It was possible, owing to the increases in train loads, to handle the large increases in freight and passenger traffic with an addition of but 2.9 per cent. to main traicks per mile of road, and an addition of only 8.7 per cent. to the mileage of all tracks per mile of road. There were large increases in the prices of materials and the wages of labor, and these tended to increase operating expenses. The increase in operating expenses per mile was from $4,933 in 1900 to $7,658 in 1910, or 55 per cent. The increase in the cost of road and equipment per mile was from $56,567 to $63,631, or 12.4 per cent. In other words, on each mile of road there was handled an increase of 45.3 per cent. in freight traffic, and of 60.5 per cent. in passenger traffic, with an increase in expenses per mile of 55 per cent., and an increase in investment per mile of 12.4 per cent. The increase in the freight density of the Prussian-Hessian roads between 1900 and 1909 was from 889,441 ton miles to 1,069,743 ton miles, or 20.3 per cent.; the increase in their operating expenses per mile was from $10,373 to $14,527, or 40 per cent.; and the increase in their cost of construction per mile from $98,050 to $110,727, or 12.9 per cent. On comparing the figures for the nine-year period 1900-1909 in both the United States and Prussia-Hesse, we find that the freight density of our roads increased 29.7 per cent. and that of theirs 20.3 per cent.; that the operating expenses of our roads increased 37.2 per cent and those of theirs 40 per cent.; and that the cost of road and equipment of our roads per mile increased 9.7 per cent. and that of theirs 12.9. It is probable that meantime the increase in the density of our passenger traffic was about as great in proportion as in theirs, although their passenger density in 1900 is not available.

CAN CAPACITY CONTINUE TO BE SO ECONOMICALLY INCREASED?

What has been said shows the way the capacity of our railways has been intensively increased in the past and the results gained. It also shows that their intensive capacity must be further greatly and rapidly augmented. Can this further increase in capacity be attained by the same methods, and with the same economy as past increases?

It would seem that the extent to which the capacity of some kinds of cars can be increased in future is somewhat limited. Furthermore, commercial conditions prevent increasing the average load per freight car in proportion to the average capacity per car. Attempts to increase minimum carload weights always call forth protests and opposition. How great are the practical obstacles to increasing freight car loading is illustrated by the fact that, while between 1902 and 1910 the average capacity per car increased 21.4 per cent., the average loading increased only from 17 to 19 tons, or less than 12 per cent. There is no question, however, that, without any increase in the present capacity of cars it would be commercially practicable to greatly increase their average loading; and this would be, in effect, to increase the freight carrying capacity of the roads in the most economical way possible.

There are practical limits to the increases that can be made in the capacity of passenger as well as of freight cars, and more especially in their loading. Travelers in this country demand a large amount of car space and usually get it. On one of the large western trunk lines the average number of passengers per car in 1902 was 11, and in 1912 only 13, although meantime the density of its traffic and the size of its cars had largely increased.

There are obstacles to the utilization of the increased capacity of engines as well as cars. The longer freight trains are made the more trouble there is from buckling and draw-bars pulling out. The longer trains require longer passing tracks; and there is greater difficulty in handling them at yards and terminals. Railway train employees are hostile to the handling of extremely long trains with ordinary-sized crews, and in many states are getting legislation passed to increase the size of crews. This, of course, tends to nullify one of the main advantages of running long trains, viz., the saving in labor cost. In Arizona the people by referendum ballot at the last election adopted a law to prohibit the operation of freight trains exceeding 70 cars. There are also commercial difficulties. To secure large average freight train loads it is necessary to have much low grade traffic so situated that it can be conveniently assembled in large quantities at certain points, and then moved slowly in large solid trains for substantial distances; and these conditions do not obtain on all roads.

The practical difficulties to increasing passenger train loads are still greater. The public demands more and more frequent service; it insists on trains being run on fast schedules; and both these things hinder increases in passenger train loads.

The practical obstacles to increasing train loads in proportion to the power of locomotives are illustrated by the fact that while the average tractive power of the locomotives of our railways increased 33 per cent. between 1902 and 1910, the average number of tons per train increased only 28 per cent. and the number of passengers per train only 24 per cent. The difficulty of increasing passenger train loads beyond a certain point is especially great The railways of Interstate Commerce Commission Group II have a passenger traffic density 129 per cent. greater than the average in the United States, yet they carry only 12.5 per cent. more passengers per train than the average. The railways of Prussia-Hesse in 1909 had a passenger traffic density over 430 per cent. greater than that of our railways, or 675,023 passenger miles per mile as compared with our 127,299; and 60 per cent. of their passengers were third class, while practically all of ours are first class; yet they carried only 85 passengers per train as compared with our 54, or only about 52 per cent. more. Because of the fact that increased passenger traffic cannot be dealt with with anything approaching a proportionately increased train load the economics that can be introduced in handling it are incomparably less than that that can be made in the handling of freight.

The differences between the train loads on different roads are very large, and indicate that many railways, by reducing their grades, strengthening their tracks and buying more powerful locomotives, can materially increase them. All that it is meant to indicate here is that progress in this direction in future may be less rapid in proportion than it has been in the past.

EXTENSIVE ADDITIONS AND IMPROVEMENTS NEEDED.

If my reasoning is correct, it will be necessary in future to make larger proportionate increases in the amount of equipment and the number of trains run to handle the increased freight

business. Our passenger traffic has in recent years been increasing faster in proportion than our freight traffic. This, doubtless, will continue to be true. The number of passengers carried per car and per train has not been, and, doubtless will not be, susceptible of as great increase in proportion as the tons hauled per car and per train. Therefore, the increase in the amount of passenger equipment that will have to be provided and in the number of passenger trains that will have to be run will be even greater in proportion than the necessary increases in freight equipment and freight trains.

With the amount of equipment now handled and the number of trains now run, tracks and terminals are overtaxed. Therefore, we must have more tracks per mile of line; and if the amount of equipment and the number of trains run must in future increase faster in proportion to the traffic than they have in the past, then it follows that there must in future be larger increases in our miles of track per mile of line in proportion to the increase in traffic than there have been in the past, and that these increases must be made both in main tracks and in yard tracks and sidings.

There is one class of improvements in passenger service which the public especially demands, and which should be mentioned here because of their great cost. These are improvements in passenger stations and terminals. These improvements are made, not only to increase the convenience and comfort of beginning and finishing railway trips, but also to gratify the civic pride and aesthetic tastes of the people of the different communities. Some of my economist friends question whether there is a public demand for such large expenditures as are made on passenger terminals and whether they are economically justifiable. They may not be economically justifiable; but it is certain that there is a public demand for them.

There is needed extensive, as well as intensive, development. There are large parts of our country in which mileage should be increased. During the half-decade ending with June 30, 1906, the total mileage increased 5,300 miles per year, while during the half-decade ending with June 30, 1911, it increased only 4,231 miles per year. While there is this need for new construction in certain sections, the need for intensive development now exceeds that for extensive development.

The provision of the facilities needed will require a very large investment. Various estimates have been made. They range from $1,100,000,000 a year to $1,700,000,000 a year. There may have been larger. The increase in the cost of road and equipment in 1902-1907 was 21 per cent.; and at the end of the period facilities were inadequate. It is probable that in future it will be necessary to buy more equipment and build more tracks and terminals in proportion to provide for any given future increase in business than it has been heretofore. And besides, the demands for unproductive improvements to increase the comfort and the safety of transportation and the expenditures needed to satisfy them are much greater than in the past. Apparently it is conservative to say that the percentage of increase in cost of road and equipment during the next five years should be at least 40 per cent. There are no figures for cost of road and equipment later than 1910. Probably for 1912 it would be about $15,500,000,000. An increase of 40 per cent. in that in five years would be $6,200,000,000. That is a very large sum. But even if no new mileage were built, and there were an increase of 40 per cent. in the probable present cost per mile of road and equipment, it would be raised to only $90,000, or $21,000 less than that of the railways of Prussia-Hesse in 1909, $51,000 less than of the capitalization per mile of the railways of France in 1908, and $184,000 less than the capitalization per mile of the railways of the United Kingdom in 1909.

MAKING UNPRODUCTIVE IMPROVEMENTS FROM EARNING.

Railway officers contend that the unproductive improvements should be largely made from current earnings. This view has the endorsement of high authority. The board of eminent and public spirited citizens that recently arbitrated the wage controversy between the eastern railways and their locomotive enginemen said:

"Some of these expenditures (from earnings) are for the elevation of tracks through cities, the elimination of grade crossings, the introduction of safety appliances, the electrification of roads entering the larger cities, and the construction of elaborate, often monumental, terminals. While the elevation of tracks, the elimination of grade crossings, the introduction of safety devices, etc., do somewhat increase the net earning power of the road, in that traffic is more easily and rapidly handled, it cannot be said that this increase is anything like proportionate to the additional investment; yet the public demands these additions and betterments for their safety, comfort and convenience. The policy of withholding a considerable amount out of the income for additions and betterments is not criticized. Indeed, it is believed to be wise."

The earnings used for these purposes may either be surplus funds left over after substantial dividends have been paid; or they may be funds so used when no dividends, or only small ones, are paid. In the past earnings often have been used for both productive and unproductive permanent improvements; and as the arbitration board said in the report just quoted, "in many cases the 'water' put on the market has been made substance altogether by the above process, by the increasing value of real estate, especially in cities, and other factors; in other cases this has been accomplished in part. In still other cases much of the common stock does not yet represent substance." When stockholders have voluntarily gone without dividends, or accepted small ones, it has been with the expectation of getting a substantial return later from the invested earnings. They would not have released the bird they had in hand if they had not expected to get the two they thought they saw in the bush. The same thing will be true in future. And as the arbitration board said in its discussion of this subject, "If the dividends are decreased below a reasonable amount, for the sake of additions and improvements, the stockholders are justified in regarding the amount put in as their property, and therefore a basis for future dividends." If net earnings are inadequate to yield both interest and reasonable dividends and a surplus from which to make unproductive improvements, and the improvements are made from earnings which might properly be paid out in dividends and are subsequently capitalized, the effect in unduly inflating and loading down the railway's capitalization is just the same as if the unproductive improvements had been made from new capital in the first place. The conclusion is that a railway whose capitalization is reasonable ought, at least under normal conditions of prosperity, to earn and pay interest on its bonds and substantial dividends on its stock, and have besides a sufficient surplus for such improvements as should be made from earnings.

The arbitration board said in its report:

"If, on the other hand, the dividends now paid are reasonable and the additions and betterments are taken out of the income such expenditures should not be the basis upon which new securities are issued."

It certainly does seem, both in view of our past experience and as a matter of principle, that nothing should be capitalized except what represents actual risk taken or actual sacrifice made in establishing and developing the business. There is risk taken when people invest in the stock of a new railway even if they pay only $50, or even $25, a share for it; and there is sacrifice when they refrain from taking any dividends at all on an investment of only $25 or $50 a share, or only 3 or 4 per cent. on an investment of $100 a share; and we must continue to pay people in one way or another to take these risks and make these sacrifices just as long as risk and sacrifice are necessary to the development of industry; and they will be necessary as long as there is any industry left to develop. On the other hand, it is a sound principle that when a railway has paid substantial dividends and invested surplus in the property that surplus should not be capitalized, but left there to benefit the public by enabling the road to give better service and to benefit the security holders by protecting them in

bad years as well as in good in the enjoyment of their usual interest and dividends.

HOW IS NEW CAPITAL TO BE RAISED?

Practically all of the needed productive improvements and extensions should and must be made from new capital derived from the sale of bonds and stocks. The rate of interest in general has risen in recent years, and the bond market of the railways has been affected by this. Then, our railways have heretofore been financed to so great an extent with the proceeds from the sale of bonds that their funded debts are excessive in proportion to their outstanding stocks. Their net capitalization in 1910, according to the statistics of the Interstate Commerce Commission, was $14,338,575,940, or $62,657 a mile; and of this $8,811,584,162, or $38,505 per mile, or over 60 per cent. was funded debt, and $5,526,991,778, or $24,152 per mile or nearly 40 per cent. was stock. Considering them as a whole their outstanding debt is excessive in proportion to their outstanding stock. What the present stockholders need for their own good and the public's is not more creditors but more partners. For some years to come improvements and extensions ought to be, and in many cases must be, financed chiefly with capital raised by the sale of stock.

If, however, a higher rate of interest must be paid on bonds and a larger proportion of railway financing is to be done in future than heretofore by the sale of stocks it will be necessary for the roads to earn more net in proportion than heretofore to pay a return on the total investment in their properties; for in order to market stock it will be necessary to pay a dividend on it substantially exceeding the rate of interest of bonds, the reason being, of course, the larger risk involved in investment in stock.

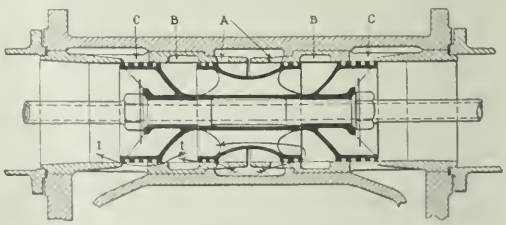
Now, are the net earnings of the railways large enough, or are they likely to become large enough, to make the improvements that should be made from earnings, and to pay a proper return on the present capital and the needed additional investment of capital? In 1900 the net operating income was 5.4 per cent. on the net capitalization and 4.65 per cent. on the reported cost of road and equipment; in 1905 it was 6.3 per cent. on the net capitalization and 5.26 per cent. on the cost of road and equipment; and in 1910 it was 5.7 per cent. on the net capitalization and 5.73 per cent. on the cost of road and equipment. The highest of these percentages of return seems small compared with the rates of return in other lines of industry. The average percentage of net earnings on the capital of national banks was 11.4 in 1900, 13.7 in 1905, and 16 in 1910; and the net earnings on the investment in manufactures in the same years was, 1900, 17 per cent.; 1905, 13 per cent.; 1910, 12 per cent. If one is disposed to reject these figures it would seem sufficient to say that if investment in railways had heretofore been as profitable as in other lines, the increase of investment in railways would have been sufficient to have caused their capacity to have increased as fast in proportion as the productive capacity of other industries.

There is no question that there is going to be a very large increase in traffic and gross earnings. Just how large the increase in gross will be will depend on the rates the roads are allowed to charge. Assuming any given amount of gross earnings, net operating income will depend on how efficiently the railways are operated, how much their taxes are, and what unit prices and wages they have to pay for materials and labor. With so many factors that are uncertain, evidently no one can accurately predict the future of net operating income. The extent to which expenses, and, therefore, net income depend on the efficiency of management has been brought into much prominence in recent years. It has been charged that generally speaking, the management of our railways is much less efficient than it ought to be and can be made. In the earlier parts of this paper, it has been shown that the managements have very perseveringly and effectively endeavored year after year to keep down expenses and fixed charges by increasing the capacity of equipment and the average loading of cars and trains. It is generally recognized by railway managers and students of railway operation—indeed, it is incontrovertible—that it is by these methods that the greatest economies can be effected. In view of these facts and many others that could be cited it is a little hard for one who is constantly in close contact with railway matters to believe that the railway managements have not been doing about all that has been reasonably practicable to promote economy and efficiency. During the ten years from 1900 to 1910 the average wages and prices paid increased 25 or 30 per cent., and average rates received increased very little; and yet the increase in business and economy in management enabled the roads to increase their net earnings.

The vital question regarding future operating expenses is as to whether the prices of materials and equipment and the wages of labor are going to advance, and if so, how much. If traffic should grow much and wages and prices should rise in the next decade, and there should be no increases in freight and passenger rates, it seems highly probable that the increase in operating expenses would be excessive in proportion to the increase in gross earnings; that in consequence the increase in net earnings would be inadequate; and that therefore the intensive and extensive development of the railways would be insufficient. But the conditions are now pretty generally appreciated, especially by the more important railway regulating authorities; there is a growing public disposition to question what may seem unreasonable demands regarding conditions of work and wages on the part of railway employees; there is also a growing tendency in most parts of the country to deal with railway rates in a conservative manner; and, therefore, on the whole prospects seem good that the increases in railway net earnings that are needed will occur and that the roads will be able to, and will, very greatly improve and enlarge their facilities.

HOCHWALD PISTON VALVE.

An interesting arrangement of piston valve has recently been introduced on a number of German locomotives. The peculiar features of the valve are twofold: it has the equivalent of a double port opening, similar to the Allen D valve, and it automatically decreases the piston clearance as the valve closes and increases it again for the period of compression. It is known as the Hochwald valve and is shown in longitudinal section in the engraving. It consists of an ordinary inside admission piston valve, with the ends pretty well separated and between them an auxiliary valve whose longitudinal section is similar to that of an ordinary D valve. This auxiliary valve is located in the steam space of the main valve. The main steam ports



The Hochwald Piston Valve.

are indicated at *A*, and the auxiliary valve has a bearing equal only to the lap of the valve. It is shown in its central position, with the two steam ports *A* open into its interior. The rings of the main valve at the ends cover the ports *C C*, which lead to the cylinder, and have a lap considerably less than that of the auxiliary D valve.

Suppose the valve to be moved to the left from its central position. The first event is to uncover the steam port *C* at the right, allowing the exhaust to escape. Next the lap of the valve at the left-hand end uncovers the steam port *C* at that end, and puts the whole interior of the valve in communication with the cylinder, thus increasing the end clearance of the piston

by that amount. This persists during the period of compression. When the valve has moved to the left by the amount of the lap of the auxiliary valve, the steam from the left-hand port *A* passes up and over the rings through the left-hand cavity *B* and into the left-hand cylinder port. At the same time the edge of the right-hand port *A* is opened into the interior of the valve and steam passes by this route to the left-hand cylinder port *C*. The lesser lap of the main valve causes the port *C* to be wide open while double the width of opening for the flow of steam is afforded by the two openings of the auxiliary valve.

When the valve closes, the steam is first cut off by the auxiliary valve, and expansion occurs in the ordinary way during the period elapsing up to the point when the main valve closes the cylinder ports *C*. Then the space in the interior of the valve is cut off from the cylinder and the clearance of the piston is correspondingly decreased, with a consequent rise in the expansion line of the indicator diagram corresponding to this decrease of clearance. The result is that the valve presents the advantage of an ample clearance space during compression and a small one during expansion.

TRAIN ACCIDENTS IN JANUARY.[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of January, 1913:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
7.	Southern; G. & F.	Hazlehurst.	xc.	P. & F.	1	0
†8.	Vandalia	Terre Haute.	rc.	P. & P.	4	17
19.	Illinois C.	Brookhaven.	bc.	P. & F.	2	5
24.	Phila. & R.	Yardley.	xc.	P. & F.	0	11
28.	Wabash	Defiance.	rc.	F. & F.	1	0

Derailments.

Date.	Road.	Place.	Cause of Derailm't.	Kind of Train.	Kil'd.	Inj'd.
1.	Ches. & O.	Huntington.	d. bridge.	F.	8	1
3.	New Orl., M. & Chi.	Leaf, Miss.	d. bridge.	P.	2	14
†7.	Cleve., C. C. & St. L.	Stockwell.	b. tire.	P.*	1	60

17.	Penn.	Lock Haven.	slide.	P.	0	1
24.	Illinois C.	Melvin.	unx.	P.	0	5
31.	St. Louis & S. F.	Ardmore.	.....	P.	0	8

The trains in collision at Hazlehurst, Ga., on the 7th were northbound passenger No. 5 of the Southern Railway and a freight of the Georgia & Florida. The passenger train struck the freight train on the crossing of the two roads, overturning two cars. The engineman of the passenger was caught between the engine and tender and was killed. There are no signals at the crossing. The freight had stopped before crossing, but the passenger had not.

In the rear collision at Terre Haute, Ind., on the afternoon of the eighth, passenger train No. 20, second section, eastbound, ran into the rear of local passenger train No. 8, standing in the station. Two cars of the standing train were badly damaged. Two passengers and two employees were killed and 11 passengers, 5 employees and one other person were injured. The collision was due to excessive speed of No. 20 approaching the station, and to disregard of the rights of the standing train.

The trains in collision near Brookhaven, Miss., on the night of the 19th, were a southbound express passenger and a northbound freight. Both engines and several cars were badly damaged. One engineman and one brakeman were killed, and five passengers were injured. The collision was due to a misplaced switch, the lamp of which was not burning.

In the collision near Yardley, Pa., on the evening of the 24th a westbound express passenger train ran into a locomotive without train and both engines and the baggage car were wrecked. Three trainmen and 8 passengers were injured. The light engine was wrongfully using a crossover on the time of the passenger train.

The trains in collision near Defiance, Ohio, on the 28th, were westbound freights. The leading train had been stopped just beyond a curve and the following one ran into it at full speed. One brakeman jumped off and was killed. The collision is charged to the flagman of the standing train, who had gone back only 850 ft., though a severe snowstorm prevailed.

The train derailed on the Chesapeake & Ohio near Huntington, W. Va., on the 1st, was a westbound freight. The engineman and seven bridge repairmen were killed and one employee was injured. The train was moving at only about six miles an hour over a bridge supported on temporary trestle work, one side of which appears to have been undermined by a flood which had raised the Guyandot river about 8 ft. This accident was reported in the *Railway Age Gazette* of January 10.

The train derailed on the afternoon of the 3rd near Leaf, Miss., was southbound passenger No. 3 and the tender and first three cars in the train broke through a bridge and fell to the swamp below. The train porter and the news agent were killed and 11 passengers and 3 employees were injured. The cause of the derailment was the failure of the piles supporting the bridge.

The train derailed near Stockwell, Ind., on the afternoon of the seventh, was westbound passenger No. 15, and two cars were wrecked. The train was running at about 60 miles an hour and the derailment was due to a broken tire on one of the wheels of the baggage car. One passenger was killed and 60 passengers and four employees were injured, two of the injured being possibly fatal.

The train derailed at Charlton, Mass., on the evening of the 16th was westbound passenger No. 39. The rear car was thrown off the track at a facing point switch, the evidence indicating that the switch was turned by a freight fireman just as the rear truck of the rear car was passing. The train was running at about 35 miles an hour and the car was thrown violently against the pusher engine of a westbound freight which stood on the side track, crushing in one side. The porter of the car was fatally injured. Nine passengers were injured, four of them seriously. The track and cars were examined after the accident and no defect found.

It was mechanically impossible for the switch to be opened without first throwing the unlocking lever situated 40 ft. east of the switch. The fireman claims to have thrown this unlocking lever, which controls the switch, as train No. 39 was passing, but denies throwing the switch. Assuming the speed of the train to have been 35 miles an hour at the time of the accident, it would have been impossible for the fireman to unlock the lever and walk to the switchstand of the switch before the rear of the train had reached that point. While the fireman insists that he did not throw the switch, yet it is impossible to reach any other conclusion. The fireman has been in the service since 1906, is a qualified engineer and had a good record up to this time.

The train derailed near Lock Haven, Pa., on the 17, was a southbound express, and the cause of the derailment was a large rock which had fallen down from the side of a mountain. The whole train, except the rear car, was derailed, and an express car was overturned, seriously injuring the messenger. The baggage car and two passenger cars fell down a bank.

The train derailed near Melvin, Ill., on the 24th, was the "Daylight Special" southbound. The train was running at about 35 miles an hour; the tender and first four cars were overturned. Five passengers were injured. The cause of the derailment was not discovered.

The train derailed on the St. Louis & San Francisco near Ard-

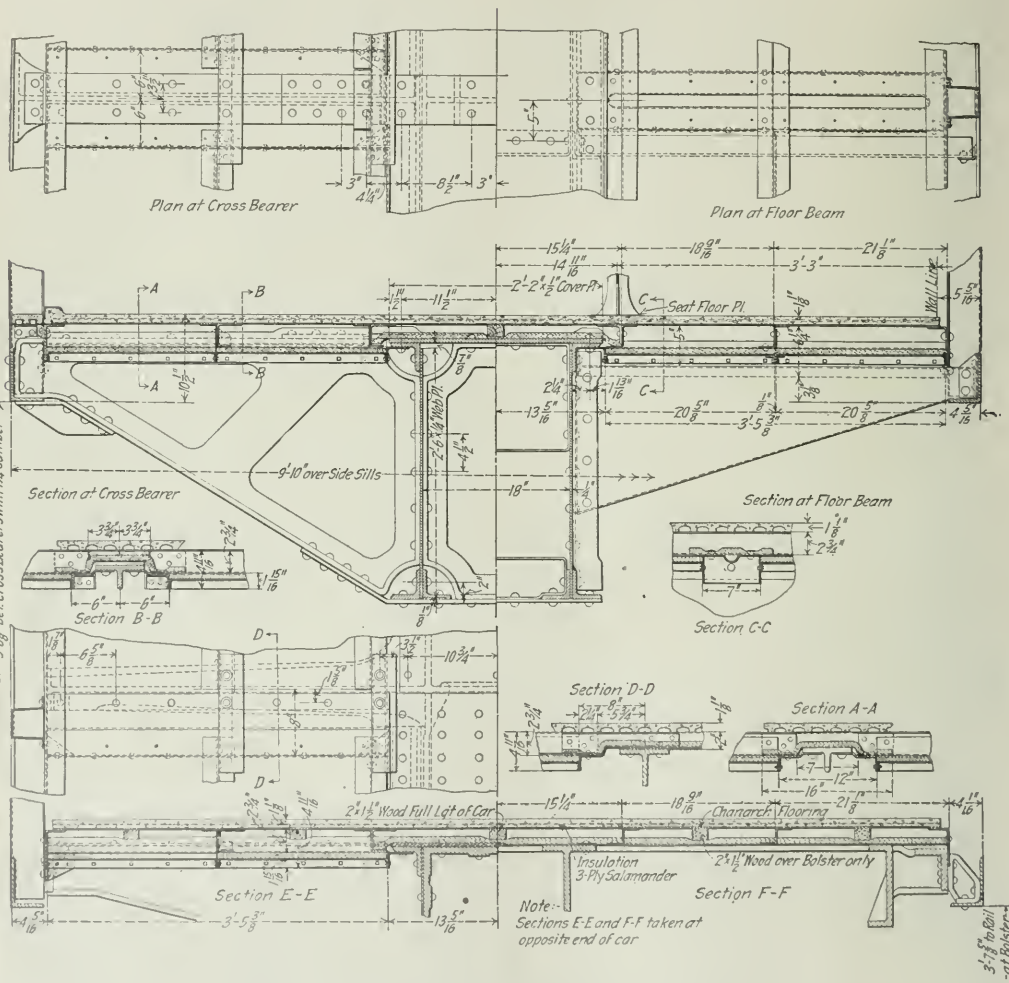
[1]Abbreviations and marks used in Accident List: rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

more, Okla., on the 31st of January, was passenger No. 580. The tender was the first vehicle to leave the track. All of the cars were derailed and the smoking car was overturned. Eight passengers were injured.

Electric Car Accidents.—Of the accidents to electric cars in the United States reported as occurring in the month of January, two were attended with fatal results; a slight collision on the third avenue elevated line of the Interborough in New York City, on the 25th, in which one passenger was killed, and a collision between a passenger train and a freight train on the International Interurban Railway near Lockport, N. Y., on the same day, in which the motorman was killed and 10 or 15 passengers were injured. The freight train was at a standstill on the main line about a half mile south of the station. The forward passenger car and one car of the freight were completely wrecked. On the Toledo & Western Interurban line at Toledo, Ohio, an express car, filled with merchandise, ran off the track in the street and was overturned on the sidewalk, where it took fire, from a stove inside, and was partly destroyed.

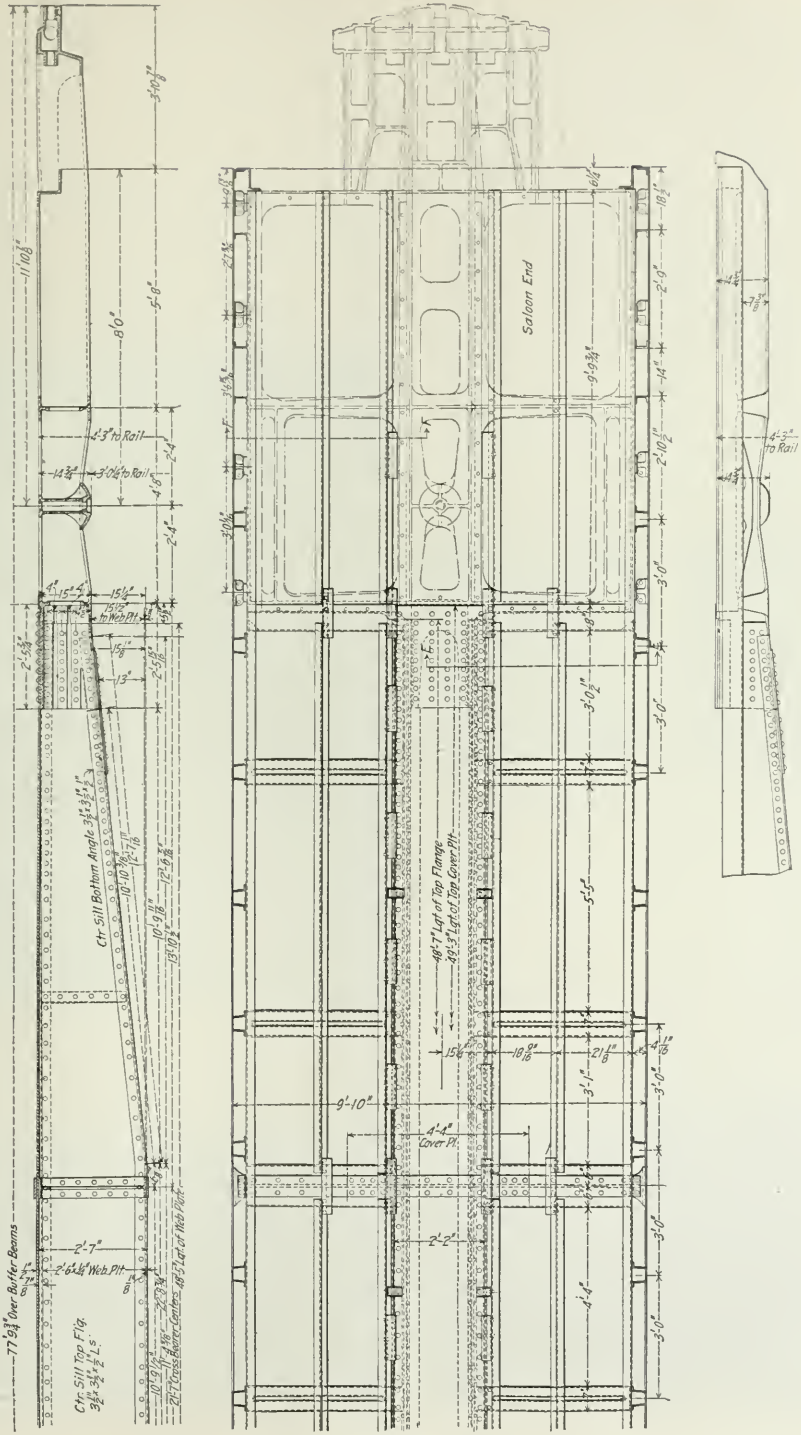
STEEL COACHES FOR THE NEW YORK CENTRAL.

The New York Central Lines have recently put in service a number of coaches which represent the most recent development in the design of all-steel passenger equipment. These cars are 70 ft. long over the end sills, 77 ft. 9¾ in. over the buffers, and are mounted on six-wheel trucks set at 54 ft. centers. They will seat 84 passengers and are particularly noteworthy for the strength of the end construction and the thoroughness of the insulation.



Details of Underframe; New York Central Lines Steel Coach.

In the underframe, Commonwealth combined cast steel double body bolsters and platforms are used, connected by fish-belly type center sills, and side sills consisting of steel angles. The center sills, which are spaced 18 in. apart, are built up of ¼ in. web plates with two 3½ in. x 3½ in. x ½ in. angles at the bottom, and one 3½ in. x 3½ in. x ½ in. angle at the top. For a distance of 22 ft. 8¾ in. at the center they have a depth of 31 in. A top cover plate 26 in. x ½ in., extends their full length.



Arrangement of Underframe Members; New York Central Lines Steel Coach.

Two cast steel cross bearers are used, with top and bottom cover plates, 6 in. x ½ in., and there are seven pressed steel floor supports of channel section on each side of the car. The outside floor stringers consist of an angle pressed from ¼ in. plate, while the intermediate stringers are of Z shape, pressed from ⅛ in. plate. The stringers extend the length of the car.

The posts are pressed from ⅛ in. steel, are of channel section with flanges, to which a 1/16 in. cover plate is riveted; a 5 in. 6⅔ lb. channel, extending the entire length of the car, forms the plate. The belt rail is placed outside the posts and extends the length of the car, while back of it between the posts are placed 4 in. x 4 in. x 3/16 in. pressed steel angles. The side sheathing is riveted between the belt rail and these angles.

A 6-in. Z-bar is used for the body corner post and is set in a pocket in the underframe casting at the bottom, while at the top it is secured to both the side and end plates. Back of this post is a large cast steel knee extending along the side of the car for 23½ in. and reaching as high as the belt rail. This is intended as an anti-telescoping device and was furnished by the Commonwealth Steel Company. The door posts are 6 in., 12¼ lb., I-beams and are also set in pockets in the underframe casting. They are fastened at the top to the end plate, which is a 5 in. channel placed with the web in a horizontal position. This plate is secured to the side plates and the deck sills by a gusset bracing. The intermediate end posts are 4 in. Z-bars secured at the top and bottom in the same manner as the side posts.

The vestibule diaphragm posts are 6 in. I-beams, also resting in pockets. They are supported at the top by a 5 in. channel extending back to the end frame and secured to the gusset which reinforces the end plate. There is also a similar channel secured to the opposite side of the post, which extends upward and outward to a connection at the junction of the deck end plate and side plate. The former is a 5 in. straight channel with the flanges cut away at the end and the web turned inward for riveting to the deck side plate. A diagonal brace extends from the top of the door post at this point and large gusset plates are used to make the joint rigid. In addition there is a diagonal brace from the top of the vestibule diaphragm post to the side plate near its junction with the corner post. The vestibule corner post is ⅛ in. thick, pressed to the proper contour and secured to the buffer beam extensions at the bottom, and to the side plate and vestibule end plate at the top. The latter is a 3½ in. x 3½ in. x ¼ in. angle, and is riveted to the vestibule diaphragm posts above their connection to the diagonal braces.

Special attention has been given to the insulation of the car. Next to the inside finish at all points is a ½ in. sheet of Resisto or H. W. Johns-Manville Company "Nycinsul" insulation, and on the inner face of the outer sheets a ¼ in. sheet of Resisto is applied. The latter is brought inward around the posts and other members and is joined to either the inner insulation or the wooden fastening strip which secures the inside finish. This insulation is secured to the plates by fasteners spot welded in place. There is no continuous metallic connection between the inside and outside of the car at any point, and all open spaces between the framing are carefully filled with wood blocks or other suitable material.

The carlines, both upper and lower deck, are of channel shape and are pressed from ⅛ in. plate. The interior finish is of steel, finished to imitate mahogany, except below the window sills and on the headlining, where agasote is used. The window sills and sash are of Cuban mahogany. The Gould axle system of electric lighting is employed.

The total weight of the car is 142,000 lbs., giving a weight per square foot of interior floor area of 22.9 lbs., and per seated passenger of 1,690 lbs. Both the Barney & Smith Car Company and the American Car & Foundry Company have built cars from this design, which is the result of co-operation between the engineers of the railroad company and the builders.

SCIENTIFIC CLEANSING OF RAILWAY COACHES.

By J. T. Ainslie Walker.

This article has been prepared in response to a suggestion made by Mr. Sherman Allen in connection with the treasury department movement to bring about better sanitary conditions on railroad cars and vessels. There are various phases presented by this problem, but the remarks are confined to one upon which I can speak with some little authority—one which, up to the present, has received little serious attention; that is that particular phase which deals with the transmission of disease through the agency of the bacilliferous dust to be found on the floors of railway cars.

The number of passengers carried in the United States exceeds 1,000,000,000 a year; and in round figures this traffic is accommodated in 50,000 cars, or 20,000 persons per car per year. There is no material available for framing any estimate of the proportion of passengers in an infectious condition. In the case of certain diseases there can be no question as to their being infectious before they can be recognized: and of so huge a total being in fact more than 10 times the entire population of the country—it is clear that there must be a large number of cases carried in a condition of unrecognized infection. If the cars were disinfected, for example, after each journey, each passenger's risk in railway travel would be confined to his chance of sitting by the side of an infected person during the journey. As it is, in the absence of systematic routine disinfection, the risk must be enormously enhanced.

We have in fact the same sort of thing as in the process for

New York Central Lines Steel Coach.

detecting scarce bacteria in water; if a very large quantity is passed through a single filter, the deposit will contain and infect a culture tube with the organism which is being sought, where any manageable quantity of water would probably fail to do so. The deposit in the case of each railway car is the residual infection of such of its 50,000 inmates per year as may have been infected; and there must be an enormous increase of risk to individual passengers from this inevitable accumulation of infective matter over the risk which would be run if the cars were disinfected regularly.

In the course of a discussion on a paper entitled "Infection in Transportation," read by Dr. H. M. Bracken, secretary of the Minnesota State Board of Health, at the first annual meeting of the National Association for the Study and Prevention of Tuberculosis, Dr. Victor C. Vaughan of Ann Arbor, said he held it proved that railroad cars scatter infection.

Applying Disinfectant to Hudson & Manhattan Car.

Writing on "Dust and Disease," in the *American Journal of Public Health* of September, 1912, Prof. Winslow and Dr. Kligler, in referring to certain experiments conducted by Dr. Prausnitz, state that of 21 animals inoculated with dust from railway carriages, 5—or nearly 25 per cent.—developed tuberculosis, and that Dr. Kinyoun, of Washington, on several occasions found pneumococci (the organism of pneumonia) in similar dust.

A medical writer in the Philadelphia *Public Ledger* of January 13, 1913, says: "Railroad cars bear an unenviable reputation as centers for the spread of infection, and there can be little doubt of the urgent need for the adoption of more efficient methods of cleansing and disinfection—particularly the latter."

It would not be a difficult matter to adduce further evidence as to the infective potentialities to be found lurking on the floors of railroad cars, but the above should be sufficient to convince even the most sceptical.

EXISTING REGULATIONS.

Replies to an inquiry addressed to each state as to the methods of disinfection employed in railroad cars engaged in interstate transportation, show that 11 call for the use of formaldehyde, 23 have no regulations at all, and five require the application of certain unspecified preparations. There is, however, no uniformity of procedure. In some cases, the regulations call for treatment of the cars at the end of each journey; in others, they receive attention at intervals of one to two months.

The preponderance of formaldehyde fumigation over all other forms of disinfection, as revealed in these figures, is greatly to be regretted from the fact that this method is wholly unreliable. As I have had occasion to point out recently, contrary to the generally accepted notion as to the use of formaldehyde for fumigating rooms, this disinfectant does not act in the form of a vapor or gas; in practice, it is dissolved in the minute droplets which result from the condensation of steam, in the absence of which formaldehyde has no bactericidal action whatever. Water will take up in solution 40 per cent. of formaldehyde gas, in which form it is known officially in the United States Pharmacopœia as "formaldehyde solution," the Rideal-Walker co-efficient of which is 0.3; i. e., it has about one-third the efficiency of pure carbolic acid. If we take one part of carbolic acid in 20 parts of water as our standard of efficiency, to prepare a solution of formaldehyde capable of doing the same work, one part must be mixed with six parts of water.

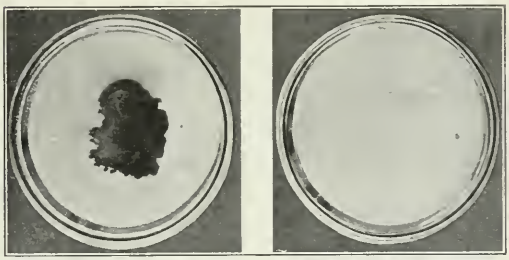


Fig. 1—Control Plate Showing Vigorous Culture.

Fig. 2—Treated Plate With Organisms Destroyed.

We now see the difficulty of obtaining uniformly trustworthy results when working with formaldehyde. If too much steam is admitted into the chamber the ultimate dilution produced may be too weak; and if too little steam is admitted, part of the formaldehyde will be unavailable, i. e., it will remain in the gaseous form, which as already explained, has no bactericidal action.

Klein, the eminent European bacteriologist, in a report to the London County Council in 1902, said: "In cases where wood flooring, unpainted or unvarnished articles of furniture or similar absorbing materials and cloth fabrics are to be subjected to disinfection on account of their being possibly polluted with tubercular sputum, disinfection with formalin (40 per cent. formaldehyde) will not suffice."

In view of the fact that the destruction of the tubercle bacillus is one of the principal objects to be aimed at in the disinfection of railroad cars, the futility of using a preparation which on the highest authority has been demonstrated to be inefficient for this purpose must be manifest. Dr. Vaughan on the occasion referred to above said the method of disinfection by formaldehyde was "simple nonsense," and the medical writer in the *Public Ledger* characterizes formaldehyde fumigation as "a tedious, dangerous and unreliable method of performing this work."

The only satisfactory alternative to fumigation is the appli-

cation of a modern liquid bactericide of guaranteed efficiency. As regards the relative merits of the two processes, the *British Medical Journal* of November 3, 1894, referring to the disinfection of rooms by fumigation, stated: "On the ground even of economy there is no comparison between this obsolete process and a disinfectant spray; and while cases of renewed house infection are familiar to almost every medical officer in this country, we have Dr. Dujardin-Beaumetz's authority for saying that where the disinfectant spray has been introduced they are practically unknown in France."

The efficiency of the liquid spray method of disinfecting cars was demonstrated recently by practical experiments carried out before prominent officials of the New York Central & Hudson River, the Interborough Rapid Transit Company, the Erie and the Hudson & Manhattan. It was shown that the time occupied in treating the floor of a car by this method was only about 30 seconds, and that from a bacteriological point of view, the result was satisfactory, as will be seen by referring to the accompanying illustrations which represent the actual bacteriological plates employed in the experiments conducted before the officials of the Hudson & Manhattan Railroad Company.

The procedure adopted was to inoculate two sterile agar plates with a strong culture of B. prodigiosus (a bacillus much used by bacteriologists in experimental work by reason of its distinctive coloring), one of which was reserved as a control (i. e., it received no treatment), and the other placed on the floor, of which it became an integral part during the process of spraying—the glass cover of the plate, of course, being removed during this operation. Both plates were then incubated for 24 hours. The efficiency of the process is clearly shown in the accompanying illustrations, Fig. 1, the control plate, displaying a vigorous culture, while on Fig. 2, the plate treated, the organisms have been completely destroyed.

SELECTION OF BACTERICIDE.

As stated above, the most suitable preparation for use in railroad cars is one of the modern high-testing varieties. It should perhaps be explained here for the benefit of those who may not be familiar with the subject, that, briefly, the germicidal efficiency of a disinfectant is stated in terms of pure carbolic acid, which is taken as the standard. For instance, if we say a disinfectant has a co-efficient of 5, we mean that this preparation is five times stronger than pure carbolic acid and should be diluted for use accordingly. The standard dilution of pure carbolic, as adopted by hospitals, etc., is 1 in 25; therefore, using a disinfectant having a co-efficient of say, 5, the equivalent dilution would be 1 in 125. Working with a disinfectant having a co-efficient of 20—and preparations of this strength are available—it will be seen that the dilution equivalent to 1 in 25 pure carbolic acid is 1 in 500. The use of such a preparation will not only ensure efficient disinfection, but will entail a surprisingly low expenditure. Taking $1.50 per gallon as a fair average price in bulk for such a disinfectant, a simple calculation will show the cost of the working dilution of 1 in 500 to be well under one-third of a cent per gallon. Practical experience has shown that one gallon of such a dilution is sufficient for the disinfection of 600 square feet, from which it follows that 10,000 square feet can be disinfected at a cost of approximately 5 cents. A further advantage accruing from the adoption of the higher co-efficient is the complete absence of the objectionable odor which renders impossible the use of low dilutions, such as 1 in 125.

Railway companies are among the most enlightened of the public services, and although up to now the means which they have used for disinfection are utterly inefficient and capricious, the reason for this inefficiency is largely to be found in the fact that little but caprice has been available for their guidance.

Direct Railway from Rome to Naples.—The work on the direct railway now under construction between Rome and Naples, Italy, is being pushed forward rapidly.

MONTHLY CIRCULAR TO STATION AGENTS.

The Canadian Pacific, whose station agents are scattered over an immense territory, issues for their benefit a regular monthly bulletin, containing changes in connections and other things which, though perhaps not so important as new time tables, embrace nevertheless many details which enable the agent to better serve the public. Beginning with the present year this bulletin is enlarged and takes the shape of a handsome illustrated circular of eight pages; and its contents are made sufficiently attractive to induce the live agent to read it, even when the matter may seem not to affect his station. In line with the improvement in station service, now engaging the attention of superintendents in all parts of the country, this circular is to be warmly commended. A first step in broadening an agent who is too narrow is to get him interested in railroad matters outside his own field, and a circular like this is an appropriate means. The January circular contains 32 numbered paragraphs. A local agent could not do better than prepare himself to pass an examination on his knowledge of these 32 subjects. Some roads, to compile so much news in a single month, and make it interesting, would have to go outside their own territory; but that is not an objection to the idea. We note the information given in some of the Canadian Pacific items:

Paragraph 1 gives information of a change in train service on a branch, including a notice of a stage connection. Other paragraphs give information about through tickets, about conventions, about optional routing on certain tickets, and other subjects commonly found in circulars to agents.

Paragraph 3 tells of 66 miles of new double track just finished on certain divisions. No. 4 tells about new steamships being built for the company, with something about proposed excursions by these vessels. There is a picture of the "Empress of Russia." Paragraph 7 tells of the new city ticket office of the company in Montreal and there is a full-page illustration of the building, which belongs to the Dominion Express Company.

A paragraph of about 200 words describes the company's new yards at Transcona, six miles east of Winnipeg, which will occupy 550 acres of land and will have a capacity for 12,000 freight cars. A similar paragraph describes the new St. Lawrence river bridge at Montreal and the new station at Vancouver, which will cost $1,250,000. Other enterprises of the company mentioned are the enlargement of the hotel at Quebec; telephone train despatching, now extending throughout nearly the whole of the main line across the continent; new cars and engines ordered in the month of December, and new extensions of the service of the Dominion Express Company. At Fort William the company is building a bascule bridge to give access to its plant on Island No. 2; this will cost a million dollars.

A whole page is devoted to notes concerning the development of western Canada. At Calgary the Canadian Pacific telegraph office, in 1905, employed five persons; now the number employed is 150. At Medicine Hat a New York capitalist is building 100 dwelling houses. Carloads of machinery are arriving at this place every day, and the number of banks in the city is now eight. At Saskatoon a new concrete bridge over the South Saskatchewan river will be 1,462 ft. long, 61 ft. wide and cost $330,000. The Canadian Pacific hotel at Winnipeg will be extended at a cost of $1,500,000. Dropping from these grand enterprises to the every-day details of humdrum work, paragraph 32 calls the attention of agents to the instructions in regard to handling correspondence.

New German Railway.—A railway line of considerable strategic importance is to be built from Hanover to Cuxhaven, the German seaport at the mouth of the estuary of the Elbe river. The line, which will be about 120 miles long, will pass through Rottenburg, Bremervörde and Bederkesa. As the railway does not run along the coast, but midway between the Elbe and Weser rivers, trains will not be exposed to the fire of warships.

IMPRESSIONS OF HUNGARIAN RAILWAY PRACTICE.

Shop Emergency Hospital, Drinking Fountains, an Efficient Apprentice System, and the Labor Situation Are Noteworthy.

By Henry W. Jacobs.

At Budapest I had the pleasure of visiting one of the large shops of the Hungarian Railway in company with the general superintendent of motive power, Johann Papp. At this place, although the shops are not nearly as large as at Crewe, England, I found that, as a whole, the layout was more complete in detail than in the shops either in Europe or in the United States that it has been my pleasure to visit. Mr. Papp told me that the embodiments and refinements in shop and roundhouse layout which are applied in practice in Budapest were gathered by him, as a result of many journeys, from the best practice of each of the civilized railroad countries, including the United States and Canada.

EMERGENCY HOSPITAL.

For instance, on my first entering the office building assigned to the superintendent of shops, I was struck with the room, conveniently located at the entrance, for the reception of anyone who might be injured in the shops. This emergency hospital chamber was equipped with an operating table and the most modern surgical apparatus, so that major emergency operations could be conducted without a moment's delay.

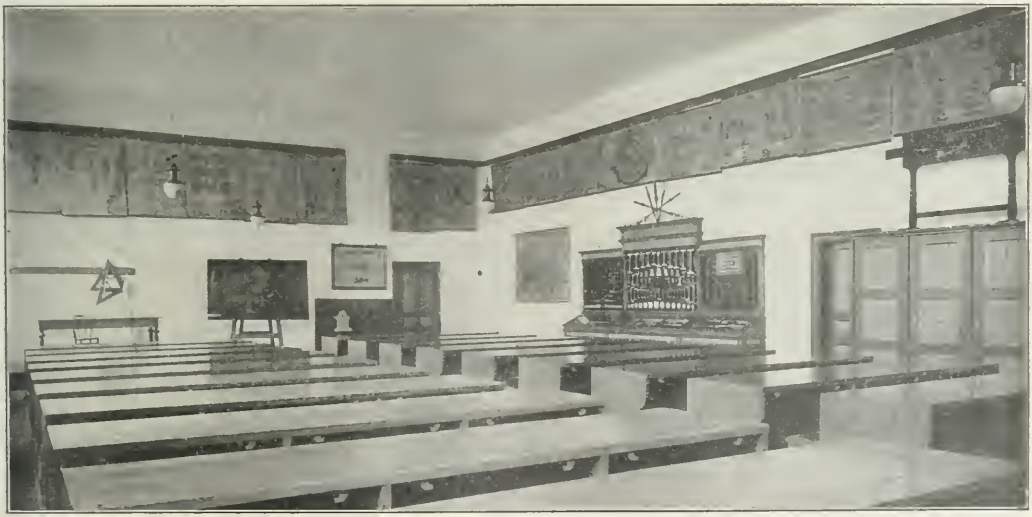
Not only are the shop employees so provided for, but men in the train service and passengers are similarly prepared for in case of any accident to trains, a full hospital train with road cars being held in readiness for departure to the scene of any accident upon telegraphic notice. The special equipment of these trains, allowing for the difference in purpose, is similar to that of our emergency cars for mining disasters. The cars constituting these trains are not old converted coaches, ill adapted to the purpose in view, but are complete with every regard for the comfort and succor of the injured.

DRINKING FOUNTAINS.

Another indication of the attitude of the administration toward the welfare of the men was in the machine shop. I observed a construction somewhat like a soda water fountain with a neatly dressed girl in attendance. This naturally surprised me very much, and I inquired as to what it meant. It developed that in order to offset the desire for alcoholic drinks, the superintendent of shops, Mr. Hermann, had decided to establish these soda fountains in the shops, where various kinds of soft drinks could be obtained by the workmen practically at cost, the men being free to come and go for such refreshing beverages just as they would in our shops for ice water. Any small profit that might remain over from the sale of the drinks was applied to a charity. Undoubtedly this institution is a most excellent step in the interest of the sobriety and health of the employees, and the superintendent of shops, or chief of shops, as he is called, is to be congratulated for this practical, humanitarian step.

APPRENTICE SYSTEM.

The next point that impressed me was the apprenticeship school or shop. Here in a separate building from the main plant the apprentice spends the first two years of his service under the direct supervision of instructors. Tools are made, such as chisels, flatters, taps, and many small parts of locomotives, in addition to many models of either special machine or locomotive types. During my visit they had under construction, to be used as a permanent exhibit, a complete model of one of the beautiful railroad bridges that have just been completed, spanning the Danube. This work was done by the apprentices under the careful supervision of practical mechanics. What particularly impressed me was the explanation given by Mr. Papp as to the method and purpose underlying the instruction period of the apprentices. Instead of the boys and young men passing from one department of a shop to another in a rather indiscriminate manner, picking up knowledge of work, perhaps sometimes indifferently from a foreman or the mechanics, or sometimes shop instructors, they were set apart during the first two impressionable years of their apprenticeship to be thoroughly



Apprentice Class Room of the Hungarian State Railways at Budapest.

grounded by those who were known to be most competent to instruct in skilled practical work, as to the right and best ways of doing each class of work so that bad or faulty habits of work would not be learned—to be unlearned later. For the succeeding two years the boys work in the regular shops where they receive additional care and instruction and gradually become amalgamated with the regular working organization. After the preliminary two years the boys are much better fitted to go into the main shops with the older mechanics and continue their apprenticeship.

During apprenticeship the boys have to attend school for two hours of each day, and for these study, lecture and drawing periods they are paid as they would be for productive work, the railway administration knowing that the cost of this instruction is a most valuable asset in the working ability of its future mechanics. The schedule of study hours during the four years' apprenticeship is as follows:

	Hours per week for each of the four school years.			
	1st year.	2nd year.	3rd year.	4th year.
Reading and general instruction	1	1	1	..
Review instruction in reading and writing	1	..	..	..
Composition	1	1	1	..
Arithmetic and geometry	2	2	1	..
Review instruction in mathematics	1	..	..	..
Time keeping and cost accounting	..	..	1	..
Physics and chemistry	2	1	..	..
Elements of mechanical design	..	..	1	1
Instruction in theory of machine power operation	..	1	1	1
Instruction in hygiene	..	..	..	1
Mechanical drawing	4	4	4	4

In selecting apprentices the first chance is given to those sons of railway employees who have capacity for this class of work. Candidates for membership must have passed through the middle grades of the common school, and be over fourteen years of age. Every year a theoretical and practical examination is held. In addition to giving oral and written answers to examination questions, the boys are permitted four hours in which to accomplish a certain piece of work according to a blueprint. The way in which this work is done, as well as the mental aptitude shown by the pupil, determines his proficiency. The examinations are conducted in the presence of parents and others of the public that are interested. Prizes are awarded for those that are especially advanced.

Before completing his fourth year of apprenticeship, the apprentice must produce a masterpiece of work, usually a model of some machine, locomotive or structure used in the railroad service. During the apprenticeship course the boys are paid regular wages, which are increased from term to term, ten per cent. of their earnings being held out in a savings fund until the end of the apprenticeship.

Upon the completion of their apprenticeship there is no binding agreement upon the young men to continue in railroad service, although places are provided for those that desire them. The Government Railroad Administration considers it its duty to the industries of the nation to offer this sacrifice upon the altar of education and advancement of the commercial development of the people.

I regretted that in this visit there were not present such missionaries as George M. Basford, who for many years has been an advance prophet of railroad apprenticeship instruction in the states, and also those men who have followed up his inspiration by practical application on some of our largest railway systems, such as Mr Thomas, Mr. Cross, Mr. Henshaw, and others, whose ideal has been to make thinking, skilled mechanics of the younger generation, rather than specialized automatons. In Budapest was wrought into complete execution the kind of instruction that these American pioneers are so earnestly developing on the roads that they serve, and too much credit cannot be accorded to the earnestness of their work and the support that is being given by their officers.

WHAT BECOMES OF THE APPRENTICE?

What becomes of these apprentices after they have completed their general grounding as all-round mechanics? It is only after this general training that the special development of the particular abilities that the young man may have shown is undertaken. In no American shop have I seen specialized pursuits and occupations carried to the extent and thoroughness that exists in the shops at Budapest. In each class of work, such as erecting, rod, bench, piston rod and crank pin work, machine work, etc., each of the gangs was composed of carefully trained men who were especially fitted for the particular class of work to be performed by it. It was explained that certain qualities in mechanics, as in poets, are inherent and cannot be acquired by training. How often do we see men operating fast moving machinery requiring quick action and co-ordination of the eyes, the brain, and the hands, who may have quick action between the eyes and the brain, but do not have co-ordination of the hands, so essential to most efficient operation. These men would be much better adapted to their occupation if they were working on the erecting floor or at the bench. Again how often do we find men of a nervous and energetic temperament fretting away their time standing at machines when they should be working in the erecting shop where vent could be given to their energetic natures. And again we find men running lathes where great accuracy of touch is required, such as in making close fits, who are by temperament and physical make-up ponderous and clumsy, and who would be happier working in a steam pipe gang lifting and fitting up heavy steam pipes. The contrast and misfit of occupation is as glaring as the performance of a draft horse would be on a race track.

The two years of training in a separate building gives those who are studying the character and capabilities of the apprentices an opportunity to later select and assign them to that class of work which is especially fitted to their qualities and characteristics. A man does that thing best which he loves to do—because he can do it well rather than because he is directed to do the work without consideration for or sympathy with his particular aptitudes.

TRADES ORGANIZATIONS.

Of special interest is, of course, the organization and attitude of the body of the working men in the shops, etc. The policy of the Hungarian State Railways is that of the open shop. Trade unions in the form that we know them in the United States are non-existent on the government railroads. In Hungary many recruits from all classes of trades (outside the railways) are drawn to a political party known as the social democratic party, whose members are principally socialistic. This political party has a vigorous representative in the parliament, and its program is one of spirited protest against the constituted form of government. For this reason it is deemed against the interests of, and loyalty to, the state to permit those who serve the state to be affiliated with a political organization in conflict with the administration of the state enterprises. No man in the state railroad employ may be a member of the social democratic organization, upon pain of dismissal.

ADJUSTMENT OF GRIEVANCES.

On the other hand, excellent arrangements are made for the presentation or discussion of grievances or desired changes in the working conditions of the men. The men have regularly elected representatives from among their own members, for each division of the railway, and for the railway as a whole. These representatives sit in session with officials selected by the railway for the mutual discussion and adjustment of matters affecting the welfare of the men. In practice this permanently constituted arbitration board seems to work out very satisfactorily, for both in working conditions and in rates of pay the railroad men, and particularly the shop men, are better off than those in similar kinds of work in private employ elsewhere in the country.

The railway administration has no difficulty in attracting to its service the most competent men in each of the trades, it being considered an honor to be in the government employ. When a man has served a probation period of three years, he then becomes a sworn worker for the state, and cannot be

summarily dismissed. If there were just cause for dismissal or other corrective measure, this cause is determined as a result of evidence presented before a regularly constituted court, or committee of inquiry, and upon its recommendation a responsible officer will take action. In this way the men are guarded against injustice due to action that is hasty, ill considered, tyrannical or born of personal feeling or prejudice on the part of some minor official or foreman. In the manifest love that the men have for their work it is seen that this security in their positions, so long as they do their duty, does not make them slothful or negligent.

In spite of the fact that there is always a superabundance of competent men in the various trades anxious to get into the railway service, the railway administration deems it to be to the interest of its employees and their families, that opportunities should be afforded their sons to specially fit themselves for railroad positions, if they are capable of so doing.

Because of this general method of training, the men not only turn out careful work of high quality, but the occupations being specialized favor large production of similar units or pieces at a minimum price per piece. A further factor in bringing the standard unit cost to a remarkably low figure is the system of paying the men upon an output basis instead of an hourly wage. These two policies, careful training and intensive wage system, coupled with careful engine house inspection by the enginemen themselves, make for the best and cheapest locomotive operation; and when replacements or repairs are necessary, these operations are performed at the minimum cost. For these reasons, the costs of locomotive maintenance are found to be extraordinarily low on the Hungarian lines, upon any unit basis selected for comparison, as compared with American or with other European lines.

RECORDS OF AUTOMATIC BLOCK SIGNALS.

Automatic block signals are now an important element in the safety of travel on most of our principal railways, and they are so conspicuous a feature that even the unthinking public takes cognizance of them. The advertising department makes use of them, and to good effect. One transcontinental line, in advertising a recent excursion, emphasized the statement that "every inch" of the line to be traversed was protected by automatics.

And, though the perfection to which automatic signaling has been brought on American railroads makes a highly creditable chapter in recent railroad history, this creditable record gets very little notice in print. We have an almost unbroken record of negative evidence, for reports of collisions due to faults in automatic signals are exceedingly rare; but this negative evidence is about all. The reader, therefore, will be interested in the following records of the performance of automatics on eight prominent roads for one year. We are not permitted to name the roads, but the facts have value regardless of names. Moreover, we have to show the reverse, not the obverse of the picture. The magnitude of the signals' virtues is shown by setting forth the exceedingly small proportions of their faults.

As is well known to railway men, the signal records of different railways are kept according to methods which in details are quite varied, so that exact comparisons cannot be made except by means of elaborate studies not now practicable. Nevertheless, these ratios are in some degree instructive. And the figures are suggestive by way of showing the paucity of information available and the need of standards.

AUTOMATIC BLOCK SIGNAL PERFORMANCE ON 8 RAILROADS.

Road.	Ratio of Failures to Operations; 1 in	Ratio of Dangerous Failures to Operations; 1 in
E[1]	.....	.....
G[2]	58,736	2,246,663
H	125,222	3,072,983
L	26,783	1,127,566
N	35,308	.....
O	27,027	1,290,535
R	21,878	2,428,180
W	.....	600,464
Y	.....	1,606,231

[1] See below.
[2] One month.

All causes of false clear automatic signals reported on road E for 12 months were as follows:

a, Water leaked into case; froze slot arm in clear position.
b, Someone broke into hanjo head (inclosed disk signal) and bent counterbalance rod so it fouled head, holding signal clear.
c, Reported clear with train in block; maintainer found nothing wrong.
d, Grounded slot coil.
e, Distant arm reported clear with train in block. No cause found.
f, Home disk bent and fouled side of head.
g, Distant arm partly clear with home arm at stop; sleet and snow on blade.
h, Home arm going to stop position caught on lamp; pole changer did not operate and home and distant in rear cleared together.
i, Reported. No cause found.
j, Water in relay contact held local circuit closed.
k, Lightning.
l, Carbon point of relay fused by lightning.
m, Corroded and grounded joint in battery wire.
n, Open joint in wire under planking at drawbridge.
o, Grounded control circuit.
p, Temporary home and distant line wires crossed; insulation mischievously or maliciously cut.
q, Broken mechanism.
r, Tie plates under insulated joint bridged the insulation; current came from rear battery and closed relay.
s, Broken stop link.
t, Foreign current.
u, Polarized armature stuck.
v, Western Union guy wire touched line.
w, Someone broke open relay box and bent relay fingers; relay remained closed.

In this list it will be seen that carelessness or inefficiency of the men in charge was responsible for items *m, r, u, v,* and probably *o;* cold weather for *a* and probably for *j* (freezing of condensed moisture); snow for item *g;* lightning for *k, l,* and probably *d;* malice or mischief, *b p,* and *w;* and defects of apparatus *f, h, n, q,* and *s.*

Road H is one with a dense passenger traffic within a small territory. Road N reports that the record is "admittedly poor," new signals having been installed before there had been time to instruct maintainers properly in their duties.

The causes of all false clear automatic signals reported on Road O for 12 months were as follows:

a, Defective signal magnet.
b, Ice in signal cylinder.
c, Ice on contacts of switch circuit controller—failed to shunt track.
d, Pin in connecting rod leading from switch to switch box either worked out or was removed by person unknown; failed to shunt track.
e, Switch circuit controller disconnected; failed to shunt track.
f, Broken wire leading from rail to switch box; failed to shunt.
g, Springs weak in combined circuit breaker and plunger lock; failed to shunt.
h, Improper wire connections to signal.
i, Linemen changing wires got control wire crossed with another wire.
j, Pivot screw on polarized armature of relay becoming loose and binding armature it could not move.
k, Bracket in relay tightened causing same conditions as last preceding.
l, Magnet burned out by lightning and relay armature fused closed.
m, Relay badly damaged by lightning, not allowing armature to drop away.
n, Caution (light). Relay sticking clear.
o, Contact points in relay stuck to contact post.
p, Rods supporting relay contact binding failed to open when de-energized.
q, Fixed red marker light displayed white by reason of lens falling out. Broken set screw.
r, Lamp hung on bracket improperly. Showed white light.
s, Broken insulation on pole changer. (Two cases.)
t, Operating rod on pole changer broken.
u, Broken rail or broken bond wires and foreign current. (Five cases.)
v, Disk signal. Moisture between armature and magnet on buffer holding disk clear.
w, Disk signal. Bearings slightly worn.
x, Unknown. (Two.)

30 Total.

In this list, four items, *c, d, e, f,* have to do with connections at outlying switches. These appear to have occurred in sections where the signal control (wire line) circuit was not run to the switch and where, consequently, a track connection, arranged on the "open circuit" principle, was depended upon to set the signal in the stop position when the switch was opened. Ten

of the failures here listed, *b*, *g*, *h*, *i*, *j*, *k*, *n*, *o*, *p*, and *r*, are chargeable to negligence; but it is to be observed that in at least four of the cases, *b*, *g*, *j*, and *k*, the trouble was of a character which could have been prevented only by the highest degree of vigilance; in other words, we have here a reminder that the requirements of the signal maintainer's duties are severe.

On Road Y the causes of all false clear automatic signals reported for one year were as follows:

December—1, from relay sweating and freezing.

January—1, due to control wire cut and short circuited. (Maliciousness.)

February—1, carefully investigated but no cause discovered.

March—1, due to relay sweating.

April—1, due to piece of baling wire thrown over line wires; 1, due to control wire touching lightning arrester wire, thereby grounding circuit. (Fault of maintainer.)

June—3, due to lightning damaging relays; 1, due to piece of barbed wire thrown across line wires; 3, due to ants getting into arc lamp lightning arresters and thereby grounding circuits; 1, due to circuit controller sweating; 1, due to bent vertical rod rubbing against inside of post; 1, cause unknown.

July—1, due to relay contacts fused by lightning.

August—3, due to lightning damaging relays.

October—1, due to slot arm of signal mechanism being improperly adjusted (fault of maintainer); 2, failures the cause of which is uncertain but supposedly due to excessive mechanical friction in toggles of slot arm (the toggle angles are to be changed).

November—1, carefully investigated but no cause found.

Road Y adds the following comments: "We investigate all false clear failures very carefully and take such action as is necessary to prevent their recurrence whenever it is possible to do so. We have succeeded in getting an oil that will not freeze at our lowest temperatures and have no further trouble from dash-pots freezing, which used to cause some failures. Last year we increased the toggle angle on certain signal motor mechanisms from 5/16 in. to ⅜ in. on three divisions and since this change we have had no unexplainable false clear failures on these three divisions. We therefore believe that practically all of our false clear failures, which used to be reported as 'cause unknown,' are really due to friction in the slot arm and can be prevented by this change. By substituting bone bushing for Lavite bushings in our relays we have reduced the number of false clear failures due to relays being damaged by lightning, but have not been able to entirely overcome them. We have so far been unable to find any lightning arrester that will protect our relays and other signal apparatus and all lightning arresters that we have tried so far have shown a liability to ground our circuits from time to time. Failures are occasionally caused by relays sweating and then either freezing or rusting, but we have found no cause for this and no remedy up to date. Although there are two failures in the above list caused by pieces of wire being thrown over our line wires (which are bare) we really have very few false clear failures from this cause and do not feel justified in using insulated line wires, which would cause other trouble. To prevent failures from up-and-down rod rubbing, we are taking the guides out of all our signals as we have decided that they do more harm than good."

As we have said, the really significant thing about these records is what they tell by indirection. The writer who will put on paper an equally illuminating story of the maintenance which has produced the 999,999 safe movements (to one that is unsafe), has not yet arisen. As further illuminating the problem which confronts the signal engineer in his efforts to achieve perfection there is given below the record, for three months, on a prominent road, of the discipline administered in cases where employees were chargeable with misconduct or negligence. In each of these cases all of the employees of the department were made acquainted with the facts as here given, with the names omitted.

DISCIPLINE: SIGNAL DEPARTMENT.

November 3.—Slot at interlocking plant slipping. Investigation revealed that batteryman was careless; battery dirty. Batteryman suspended two days.

November 8.—Signal failed on account of exhausted battery element. Maintainer and batteryman inspected battery less than one week previous. Maintainer and batteryman suspended one day each.

November 17.—Batteryman discharged for being off duty without permission.

November 19.—Batteryman discharged for drinking and neglect of duty.

December 1.—Slot control springs in electric lock changed by maintainer to remain permanently closed. Maintainer suspended ten days.

December 2.—Signal lamps found in dirty condition and otherwise neglected. Lampman suspended two days.

December 16.—Batteryman transferred to construction gang on account of inability to be neat. His previous good record earned this consideration.

December 31.—Signal failed and delayed several trains on account of maintainer being absent without permission. Maintainer discharged.

January 6.—Careless maintenance and inspection of lamps. Lampman discharged.

January 15.—Improper inspections of signal batteries and lamps. Maintainer and batteryman discharged.

January 31.—Mechanical repairman intoxicated. Discharged.

WHAT MANY STATION AGENTS MISS.

By a Station Agent.

With the increasing tendency of the state and interstate commissions to regulate and lower rates, and the insistent demands of the employees for higher wages, there is left but one source of increased profit for the American railroads, and that is to get more business.

The agent at important competing points is naturally expected to be on the lookout, and to get all of the business that can possibly be secured; this is all well and good, but the agent at the smaller point may do something; he has not been properly impressed with the necessity of working up business. It has usually been understood that as there was no competition all business was sure to be given to him.

The successful farmer is the one who makes two blades of grass grow where only one grew before; and the successful agent is one who gets two tons of freight where only one was secured before, whether his station has competition or not.

Many agents are working day in and day out over gold mines of possible revenue; but being blind they see not, and being deaf they hear not. The community around may be capable of producing an unlimited amount of some commodity, which would furnish a neat revenue if a market was secured for it, and at the same time make the people more prosperous. It may be grain, timber, potatoes, tobacco, live stock, or any of the numerous things that go to furnish the revenue of a railroad. The thing necessary is to get the local people interested, get them to work together. Get them willing and eager to handle the producing end of the matter, and then as a rule the finding of a market is easy. Enthusiasm is most contagious, and once let a live agent go into the matter in earnest, and he will be surprised at the support given him and at the results obtained.

For instance, the town of A issued bonds and built a dam across the river to secure waterpower for generating electricity, to be sold at cost to residents, and for use of incoming industries. The town authorities, men who were elected, not on account of their fitness for the position, nor on account of their business ability, but because they were good fellows, have been vainly trying to get some company to come in and use this power free, but thus far a thousand horse power or more remains idle. It is a source of possible revenue for the railroad company, and it seems to me that the agent there should interest himself in trying to assist the townspeople; but he takes the stand that it is the duty of the traffic department to look after such matters. The traffic man in charge of that district, who is a good man and is doing his best, has so much territory to cover that he cannot give this matter the attention it deserves. It is a source of possible revenue, and the company is losing that revenue.

This agent has leisure time and the company is paying him for all of his time; why cannot he use this time, that belongs to his employers, in assisting the town officers in getting some industry to come in?

Station B is situated in an agricultural district. The people by popular subscription built a factory to can vegetables raised

by the farmers. The farmers fairly swamped it with tomatoes, corn, pumpkins, and everything that it could handle, but through ignorance of selling methods, and inefficient management it was a losing venture. After the second year it shut down. A few feeble efforts were made to sell the property, but what was everybody's business was nobody's business, and the machinery lay and rusted several years, and was eventually sold for junk. Here was another possible source of revenue. The owners of that property would have practically given the plant to someone that would guarantee to operate it, and it would seem that the agent, with the assistance of his traffic or industrial department, could have found some canning company that would take it.

Agent Jones was in charge of station C for eight or ten years. He handled the position as others before him had handled it, taking in what money came his way. If business was good it was all well and good; if it wasn't, why, he was not paid for worrying! Agent Brown took his place. Brown made it a point to get acquainted with his patrons; he learned what crops they raised most successfully. Through the agricultural college maintained by his state he secured much information about the crops they were producing. He worked up sufficient interest among the farmers to get them to invite representatives from the agricultural college to address them. He circulated a paper among them in which they pledged themselves to plant a certain acreage in potatoes the following season, provided a warehouse was built, and secured pledges for about 600 acres.

Armed with this he went after the larger and more important wholesale potato companies, with the result that two warehouses were at once put up. In former seasons the farmers had a market for their crops only as buyers happened in; now they have a steady market and can sell any day. In former years the total of the land planted in potatoes would not exceed 100 acres; this last season over 500 acres were dug. When one figures that about four acres will produce a carload of potatoes, which will average $50 freight charges, it will be seen that not only the farmers made money, but that the railroad came in for its share.

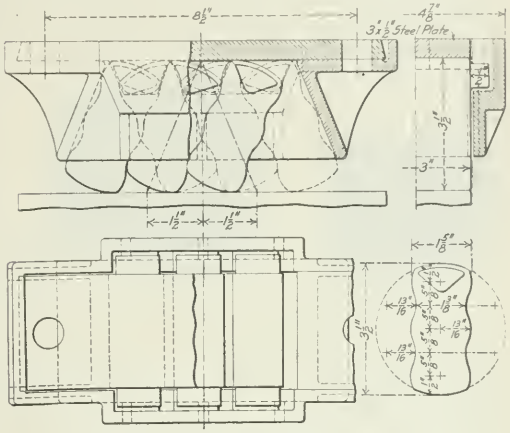
In a matter of this kind the agent at the noncompeting point has an advantage, in that he gets all of the business he helps develop. If it is a competing point his competitor is sure to share in the results of his labors. The agent at the country station has an advantage over the agent in the city, in that the city agent must work up such matters to hold his position, while the man at the small town is overlooked; and when he does start something, it is noticed.

There are two ways of getting a good position; one, by being appointed to one; another, by developing the one you have into a good one. To my notion there is much more satisfaction holding one of the latter than the former.

Railway Development in Bolivia.—The ambitious program of railway construction in Bolivia which was put forward as long ago as 1904 has only been fulfilled in part. The cost of construction per mile is exceptionally heavy in that country even for South America. Nevertheless there are open to traffic today in Bolivia some 700 miles of native line, exclusive of the track of the same systems which is located in neighboring territory. Recently a preliminary survey was made of the entire line of the Chimore railway, the work having been divided into sections, the first of which is from Salta to Santa Rosa; the second from Santa Rosa to Santo Domingo; the third from Santo Domingo to Puerta Patino; and the fourth from Puerta Patino to Secuano. The fifth will reach the headquarters at Trinidad. Plans for a branch railway from Macha-cama-ca to Uncia have been completed and passed by the government. It has also accepted the proposal of a French syndicate for the construction of a line between Quiaca and Tarija. This line will supply an important link in the railway system of the republic, and will place Bolivia in direct communication with Argentina.

ANTI-FRICTION SIDE BEARING.

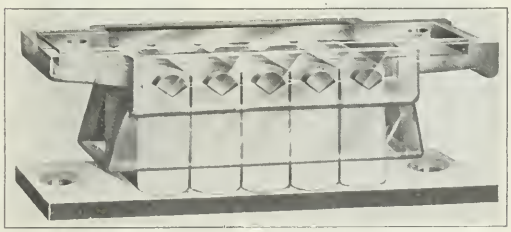
An interesting development in side bearings for car and tender trucks has been made by Edwin S. Woods & Company, Chicago. These bearings are intended to carry heavy loads with a short travel. The illustrations show two applications; the one with the flat sides is used for tender trucks, and the one with the corrugated sides for freight car trucks. The rollers work between oil-tempered steel spring bars, and are made of malleable iron or cast steel. The design is based on the fact that the capacity of rollers varies directly as their diameter and length. That is to say, a roller one inch in diameter and 2 in. in length, or 2 in. in diameter and one



Three-Roller Side Bearing for Freight Cars.

inch in length, will have twice the capacity of a roller one inch in diameter and one inch in length. In the case of the tender roller bearing, there are five rollers 4 in. in diameter and 3 in. long, which is the equivalent of one large roller 10 in. in diameter and 6 in. long. These rollers have a side clearance of ⅛ in., and the friction is restricted to the rolling on the two bearing plates.

The drawing shows a three roller bearing for freight cars. These rollers are corrugated, which allows them to be in contact in all positions and still have a greater length of travel than



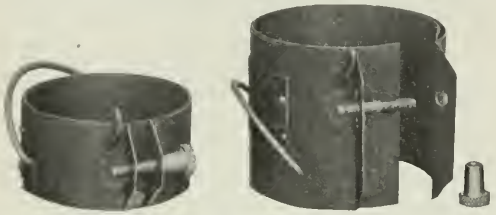
Anti-Friction Side Bearing for Tenders.

in the case of the flat-sided roller. In the normal position the corrugations will be in contact at their apices. As the rollers move to one side or the other the apex of one corrugation will slide into the hollow of the other until there is a positive bearing, as shown in the illustration. Of course, it is necessary that these corrugations be carefully made to the correct radius, which is one-half the width of the roller. In the present instance the travel is 1½ in. each side of the center line, making a total of 3 in., which is probably more than will

be required in this class of service, although by slight changes in the design of the roller this movement can be increased. The claims of the makers of this device are that it is of simple construction, contains no small parts, requires little attention, and has a large carrying capacity.

GRAPHO-METAL PACKING.

A difficult problem in the maintenance of locomotives is that of keeping the rod and valve packing in a good, non-leakable condition with the least amount of wear. To provide for this a new packing was recently placed on the market by the American Piston Company, Indianapolis, Ind. It is known as the Grapho-Metal packing and, as its name implies, is a combination of a special soft babbitt metal and graphite. It is made up of half rings, as shown in the illustrations, and is



Nut Lock and Piston Rod Shields for Westinghouse Cross Compound Pump.

especially adapted to air pumps, valve stems, throttle rods, cab valves, injectors, etc. It is easily compressed by screwing the gland nut down hard after it has been applied, which forces it against the rod, adapting it to the position or shape of the rod, and in this way allowing for any imperfections in alinement. The end surfaces of the upper and lower rings contain a lower percentage of graphite, thus forming a support for the packing in cases where the stuffing box clearance is too great; also sealing the packing into the stuffing box, and in this way restricting the loss to service wear only. This is found to be slight, owing to the lubricating qualities of the graphite which is always in contact with the rods.

Air Pump Packing. Throttle Rod Packing.

The air pump packing is divided into rings and is applied in the ordinary manner, care being taken to see that the gland nuts are firmly screwed into place. The special advantage of the packing in this service is that no swabs or oil cups are required, as the graphite will give the necessary lubrication. After the pump has been in operation a short time the packing will become polished, which will reduce the friction and wear. Reports from roads using this packing state that it has been in service during the last 18 or 20 months and is still in good condition. The pumps may be taken out of service and repaired without necessarily destroying the packing, as the lye or acid baths usually given the pumps at such times have no effect on it.

The throttle packing is made up of a number of rings, depending upon the depth of the stuffing box, and is applied in the same manner as on the pump, being screwed hard up into place so that there will be a positive bearing on the rod. The packing for cab fittings is made in one piece. This packing has also been used successfully on injector steam rams and water valve stems, and is being developed for use on steam pistons for superheater as well as for saturated engines. It has also been successfully used on a needle valve of a Diesel crude oil engine during the past year, resisting a pressure of 1,200 lbs. per square inch.

A combination piston rod shield and nut lock has been devised by the same company for use on air pumps, which together with the air pump packing described, comprise the air pump packing set. The illustrations show the shields for a Westinghouse cross compound pump. The large shield is shown open ready to be placed around the rod. It is closed and held in position by the bolt and nut shown. The inner sleeve is then raised by pressing down on the adjusting lever until it bears firmly on the upper and lower gland nut. The cam on the head of the bolt is then thrown over, firmly clamping the shield to the gland nuts. The necessary adjustments for making the locking lever effective are made with the knurled nut on the clamping bolt.

UNION PACIFIC ACCIDENT CHART.

The Union Pacific has posted in its various agency offices a large "accident chart" showing the remarkable improvement in its accident record in the last nine years, as the result of its campaign for safety in operation. The chart looks like a condensed profile of a road across the Rocky mountains, except that it shows only one slope, the peak being almost at the beginning of the record in 1903. The chart is ruled vertically for months and years from July, 1903, to June, 1912, and horizontally for train accidents per 1,000,000 locomotive miles, and the resultant curve shows the fluctuations in the accident record by seasons, with an almost constant reduction from year to year. Beginning at a point showing 19 train accidents per 1,000,000 locomotive miles in July, 1903, the highest point reached is for December of that year, when the line shows 27 accidents per 1,000,000 locomotive miles. In the fiscal year 1904-1905, the highest point shown is 25 accidents; in 1905-1906, 22; 1906-1907, 17; 1907-1908, 16; 1908-1909, a fraction over 16; 1909-1910, 13½; 1910-1911, 8; 1911-1912, 6. The highest and lowest points on the chart are for December, 1903, with 27 accidents, and February, 1912, with a fraction under 3. Below the chart is printed the following:

"The black irregular line shows the reduction in accidents as a result of the heavy investments made by this company in automatic electric block signals, good equipment, first-class roadway and double track, aided by good men and good discipline.

"This chart does not include injuries or deaths, but illustrates the causes that contribute to same, although of accidents classified below, the large majority do not cause deaths or injuries.

"Collisions.

"Derailments from defects of road and equipment, negligence in operating and unforeseen obstructions.

"Other train accidents.

"The Union Pacific holds courts of inquiry to determine the cause and responsibility in each case, and gives to the public information promptly of all its accidents when accompanied by fatalities or injuries."

Maintenance of Way Section.

THE March Maintenance of Way Edition, if published the third Friday of the month, as is our usual custom, would be issued on March 21. The American Railway Engineering Association will meet in Chicago on March 18-20, and a *Daily Railway Age Gazette* will be issued on the morning of March 21. It has, therefore, been decided to publish the Maintenance of Way Edition one week earlier than usual, or on March 14.

THE recent renewal of active hostilities in Mexico will be watched with concern by those southwestern roads which depend on Mexico as the main source of their track laborers. This latest outbreak, combined with the war in southeastern Europe, will undoubtedly intensify the labor shortage during the coming season.

IF marks are made upon the rails at the ends of sections of track which are now heaving badly, they will be of considerable assistance next summer when the season's track work is under way. By improving the drainage at a few of these worst places each year, the standards of maintenance on the entire section can be greatly raised in a few years at a comparatively moderate expense.

AT this season of the year the handling of locomotive cinders is frequently a vexatious problem. It is necessary that they be removed from the pits promptly, and when wet down before loading they are very likely to freeze in the cars so that in some cases it is necessary to use light charges of dynamite to break the frost before unloading. At most terminals the disposal of these cinders during the winter is far from satisfactory.

THE mildness of the winter thus far is in marked contrast to the conditions existing a year ago, except in the north Pacific coast states, where the winter has been more than usually severe and the snow fall above normal. However, even in the central states, although comparatively free from snow, the temperature has been low enough during recent weeks to cause considerable difficulty in keeping all facilities in use. For this reason, the next contest, that on "Winter Methods," is timely. In this contest, descriptions of methods new or not generally used for overcoming any of the many difficulties encountered in the prosecution of construction or repair work, or in the routine maintenance work of keeping the tracks, water stations and other facilities in service, will be eligible. Prizes of $25 and $15 will be paid for the first and second best papers received, while all others accepted and published will be paid for at our space rates. All contributions should be sent to the Civil Engineering Editor, *Railway Age Gazette,* Transportation building, Chicago, and must be received before February 25.

ONE of the best evidences of the increasing appreciation of the value of the annual exhibit of the National Railway Appliances Association, which will be held in Chicago from March 15 to 21, inclusive, is the comment heard after the close of each exhibit that more supervisors and foremen attended than in any previous year. The attendance of these men reflects the more general support given this exhibit by the railway officers, many of whom not only arrange for their men to get away, but advise their supervisors and more progressive foremen to attend. One roadmaster, located over 450 miles from Chicago, had his foremen select two of their number to attend the exhibit last year. These men were at the Coliseum an hour before the doors opened and spent the entire day studying the various devices. Upon their return they wrote a report which was discussed at the next meeting of the foremen. Several roads in the vicinity of Chicago sent all their foremen from certain divisions last year, while others at a distance arranged for their roadmasters to attend. The value of the opportunity to see not only the more recent developments in maintenance of way material, but also standard appliances used on other roads, is evident. The roadmasters and foremen are among the most careful students of the various devices, and many exhibitors vouch for the practical criticisms made by them.

WITH the shortage of labor which is certain to develop during the coming season, and which will be more serious than that of 1912 if present indications of the amount of work to be undertaken are accurate, it is highly essential that those in charge of maintenance of way work make every effort to start as early in the spring as possible. Those roads which started early last year not only got practically all the men they required, but were enabled to select their forces to a large extent and secure them at a rate considerably lower than that paid later in the season. When wages advanced about the middle of the summer they were able in some instances to let many of their men go without serious detriment to their work, while other roads which started late in the season were unable to secure the number of men required, and in a number of instances were forced to postpone needed improvements entirely. Furthermore, work done in the spring is better done, for the weather conditions are more favorable and the men are more willing to work after a winter spent in inactivity. To take full advantage of these conditions, plans must be made now and material secured and distributed in advance of the work. Ties can be stacked along the right of way ready for insertion; rail can be distributed and switch and other material can be assembled so as to guard against needless delays. Enough tools for the work in view can be gathered together, bunk cars can be cleaned and fitted up for the men and many other preparations made which will lessen the amount of work necessary when the season actually opens. Not only is it economical to start early, but from the outlook it will be positively necessary to do so this year if the work outlined is to be completed.

THE seasoning of ties and other timber before treatment has been the cause of much discussion for years. Equal attention has not been given to the benefits resulting from seasoning ties after treatment. Owing to the very rapid increase in the use of treated ties, the demand for them has been such that they have been given little opportunity to season after leaving the retorts, but have been immediately shipped out to be put in track, especially late in the fall. Because of the increased expense and difficulty of operating a plant in the winter, many plants whose capacity is such that they can treat the required amount of timber during the summer season close down during cold weather soon after they have completed treating that season's requirements. As a result ties are required the following spring almost as soon as the plant begins operation and are put into the track as fast as they can be taken from the cylinders. The detrimental effects of this practice have been observed with ties treated with zinc chloride more than with those treated with creosote. The rapid corrosion of track fastenings, especially spikes in zinc chloride treated ties, has been noted in some instances and has been generally attributed to lack of seasoning of the ties. The rapid drop in potential of track circuits for signals and crossing bells which has been observed where such ties have been used has also been attributed to the same cause. The detrimental effects of a too quick insertion of creosoted ties are, however, of a different nature and are reflected in the tie itself. Not only are ties which have thoroughly dried out after treatment much less disagreeable to handle, but they are more solid throughout, as would be expected to be the case

after the oils which tend to soften the fibres have evaporated. This also tends to give greater strength to the timber itself, which is desirable. On one road where a quantity of ties had been allowed to stand for about a year before being put in the track, the section foremen reported that it was more than usually difficult to drive spikes into them. This same effect is brought out in the tests conducted on the Atchison, Topeka & Santa Fe on "Long Leaf Pine Bridge Timbers," an abstract of the results of which was published recently in these columns. While these tests were carried out on long bridge timbers, and they were subjected to stresses different from those to which ties are subjected in the track, the same qualities of increased strength and toughness are desirable in both. While an increase in the time allowed for seasoning ties increases the amount of money tied up in them, at least two roads have concluded that the advantages gained by this seasoning after treatment are of sufficient importance to justify the expense and are taking the steps necessary to secure these advantages by operating their treating plants throughout the winter.

PERIODICAL BRIDGE INSPECTION.

IN a paper on "Railroad Bridge Design in Europe and America Compared," presented to the Western Society of Engineers on February 10, the author draws a number of comparisons which in general are favorable to American methods. But in discussing the testing and inspecting of bridges he takes occasion to approve the European practice. He points out that the matter of tests is given no mention in American bridge specifications while it is a prominent feature of the regulations governing design on European roads. He speaks favorably of the use of test trains, whose composition and placing are minutely given in the French railway regulations, and of the periodical inspection which is denied and required by the Prussian regulations, contrasting the practice in both these respects with that in the United States, where, he says, "such matters have been left entirely with the maintenance of way department."

While it is no doubt true that "there is not enough periodical inspection of bridges in America," the author's implication that all such inspection is handled by track men who are not competent to judge of the condition of bridges cannot be substantiated. The inspection by trackwalkers, of all bridges covered in the track inspection, is the only form of inspection that comes under the track department, and it is intended only to guard against damage to the structure from drift, high water, slides or train accidents, which would make immediate operation unsafe. In addition to such inspection there is probably not a road of importance in the country which does not have some method of bridge inspection by experienced bridge men. While they may properly be classed in the maintenance of way department on some roads, they are apparently not so classed by the author of the paper.

The fact that American specifications do not cover the testing and inspecting of bridges as is customary in Europe is no reflection on American practice. In this country a railway draws up specifications governing the design, construction and erection of bridges, work which is handled wholly or in part by contract. Since periodical inspection of bridges in service is made by company employees and not by contractors, the roads' regulations for inspection naturally take the form of instructions to the men responsible for the work. In Europe the bridge specifications are usually prepared and enforced by the governments. Design, construction and maintenance are all handled by the road or its contractor in accordance with the specifications of the government, and for this reason all these points are covered in one set of specifications.

Although test trains for periodically determining the strength of bridges have not been used to any great extent in this country, at least one prominent road, the Pennsylvania Railroad, does use this system. Serious doubts as to its efficacy have been raised recently by bridge men because the test made on a bridge near Glen Loch, Pa., on November 26, failed to detect a condition which caused a wreck the next day.

The paper considers only steel structures, which explains the statement that "bridges that are properly designed and not overloaded practically never wear out," and the inference, in the discussion of rivet strength, that the provision for frequent inspection is tantamount to a confession that the structure is not properly designed. But, granting the truth of the first statement as to steel bridges, the second does not necessarily follow even for such structures. Inspections are made as much to avoid failures as to detect them. Under certain conditions such as a movement of the substructure or the closing of an expansion joint, the action of a properly designed bridge may be so changed as to be equivalent to a change in the loading. Even if new bridges designed according to present standards need no inspection, there are very few roads on which all structures fall within this class. Since the erection of the older bridges on most lines, train loads have increased, foundations have weakened and steel connections have deteriorated so that there are now structures in various degrees of serviceability. In addition to these, most roads have built timber structures which admittedly require careful inspection to insure their safe condition. So no road can afford to overlook regular and frequent bridge inspection.

The American Railway Engineering Association has realized this and includes in its Manual a set of instructions for bridge inspection which provides for inspection of three kinds: First, by regular track forces daily or as often as they inspect the track; second, by bridge foremen at regular intervals of from one to six months, and third, annual or semi-annual inspections by men experienced in bridge design and maintenance, and primarily responsible for the maintenance of bridges on the entire road. The association regards these three inspections as the least a road should do to make its bridges safe. A number of roads are doing even more than this, and all are gradually coming up to that standard as a minimum.

On account of the widely differing forms of organization on American roads the systems of inspection vary considerably. The inspection by track men is more uniform than the other two forms, for trackwalking by some member of a section gang is practically universal, and it is obvious that such an inspection made primarily to insure the safety of the track should also include the bridges.

There is probably greater variation in the method of making the second type of inspection than in the case of either of the other two, and many roads have not yet adopted any system which can be classed under this head. There is need, however, for some form of inspection between the frequent casual examination by an unskilled laborer and the infrequent critical inspection by a technical officer. On some roads each division has one or more bridge inspectors, who spend their time examining the structures on their territory and reporting monthly to the division officer in charge of bridge maintenance. Such men are usually picked from bridge gangs so that this inspection is not very different from that on roads which require the division bridge foreman or master carpenters to regularly examine all structures under their supervision.

On roads having a bridge engineer the technical inspection is usually made by him in person, although in some cases this is done in theory only, and inspectors from the bridge engineer's office handle most of the detailed work. In some cases the bridge engineer takes an engine and business car and makes one trip over the entire system, inspecting personally in detail all bridges of a certain span or class. In other cases the bridges are covered in a general inspection of track which is participated in by the division officials, the bridges receiving the attention of the bridge engineer, the division superintendent, the division engineer or master carpenter, and perhaps also the local bridge foreman.

Letters to the Editor.

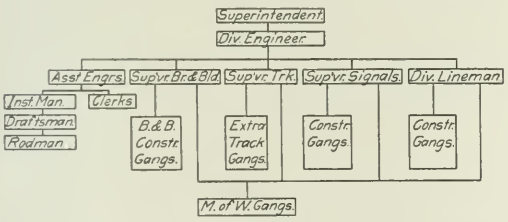
A SUGGESTED ORGANIZATION FOR COMBINED FORCES.

Chicago, December 20, 1912.

To the Editor of the Railway Age Gazette:

There is a feeling among many operating officers that the maintenance organization should be rearranged to eliminate certain losses and effect a higher state of efficiency. Numerous ideas on the subject have been advanced, which have at least provided a foundation for further development and several practical tests are now being made, the results of which should furnish interesting data for future progress. It is a usual occurrence, under present conditions, to see men of the various departments, such as linemen, bridge men, signal men, carpenters, water service men and others, leave their division headquarters on the morning train and return on the evening train, and in the majority of cases the aggregate time spent in actual labor represents a small proportion of a day's work.

The logical solution of the problem is to establish maintenance gangs at various points on the division to maintain all structures, the mileage covered by each gang being determined by the number of coal and water stations, yards, bridges, interlocking plants, automatic signals, etc., located thereon. The section gang of today is not qualified to perform this service, although the duties of the gang might be extended to include much repair work. The section foreman has attained a certain proficiency in track



Proposed Organization for Maintenance of Way Department.

work, by many years' experience, but there are few who are mechanics or who have any perception of mechanical devices, and as most of them are middle aged men, there is slight probability that they will acquire a practical knowledge of other work. There are many men on the division who might be developed into good foremen for maintenance gangs, but there is one man who is already well qualified for the position; this man is the signal construction foreman, who is a good electrician, carpenter and blacksmith, is a good man on concrete work, is familiar with the gasolene engine and its operation, understands the use of tools, is accustomed to work from plans and blue prints and to conform to the company's standards and in fact must be an all around mechanic who will tackle anything and accomplish it in a workmanlike manner.

The organization of the gang would depend upon the particular requirements of the section in question, but in general there should be an assistant foreman, a few fair mechanics and as many laborers as are necessary from time to time. The gang should have a motor car and a standard complement of tools. With such an organization and equipment a foreman could maintain everything on a territory several times the mileage of that now covered by the section gang. He would lay out his work each day and assign the various jobs to the best advantage. Several jobs might be in progress at the same time—the foreman with some laborers repairing an interlocking plant, telegraph or telephone apparatus; the assistant foreman with a few laborers putting in new ties, a new rail or repairing a bridge, while each of the mechanics with a few laborers might be unloading company material, cleaning up the right of way and station grounds or other work. The daily patroling of the track could be assigned to capable men of the old section gang, who, while they were not doing this could help on other work.

A first class foreman could be obtained for $90 or $100 per month, but on sections that did not require an all around man the salary could, of course, be less, based on the requirements; the assistant foreman should receive from $50 to $65 per month, the mechanics from 20 to 25 cents an hour and the laborers about 15 cents an hour. In addition to providing an efficient and economical organization this arrangement would also provide an excellent training school for maintenance employees and there would be an incentive for bright young fellows to engage in the work, as there would be far greater opportunity for steady advancement than under present conditions where young men of the right kind do not seek positions on the section because the pay is low, the work mostly routine and the chance of advancement small.

The establishment of a maintenance of way gang as outlined above would necessitate a rearrangement of the division organization and the following organization is suggested. The division superintendent of today is a busy executive officer and as he has an assistant superintendent and a train master to direct transportation matters, and a master mechanic to direct motive power and equipment matters, so he should have an officer to direct maintenance of way matters, as is now the practice on some roads. As maintenance of way comprises engineering work the division engineer is the logical head to direct these matters, to whom should report the supervisor of bridges and buildings, the supervisor of track, the supervisor of signals and the division lineman, where one is required, also the assistant engineers, draftsmen, clerks, etc. The maintenance foreman should report to the division engineer through the supervisors of track, signals, etc., and receive instructions from the several supervisors. The various kinds of addition and betterment work require numerous construction and extra gangs; these gangs should be under the direction of the proper supervisor. The chart shown herewith is a graphic representation of such an organization. On a small road or on branch lines where there are few special structures or apparatus it would be an economical arrangement to send a maintenance gang over the line from station to station, as required, to make necessary repairs, the repairs to be made being determined by the division engineer from an inspection trip over the line at certain specified periods. This gang should have good bunk cars, material cars, a tool car and also a cook car when good board is not available at reasonable prices.

F. W. Rizer,
Assistant Engineer, Chicago, Burlington & Quincy.

OUR PRESENT TRACK CONSTRUCTION.

Omaha, Neb., February 10, 1913.

To the Editor of the Railway Age Gazette:

In the *Railway Age Gazette* of December 20, 1912, there appeared an article entitled "Advantages of Renewing Ties to Face," by R. P. Trabue, roadmaster of the Nashville, Chattanooga & St. Louis. I attempted this about 30 years ago and am still fully convinced of the many advantages of this system, but gave it up because railroads in that day, and to an extent yet, have periods of "economizing" when unsatisfactory operating methods prevail, including the deferring of maintenance expenditures—arbitrary cutting down of requisitions for rails, ballast, ties for renewal, etc. While track which has been maintained under the ordinary method will stand two or three years of this "economizing," if in fairly good condition, it is a very serious matter if there are sections of from 2,000 to 3,000 ft. in a place that should be renewed to face.

Mr. Trabue states, in this article, that "The last advantage is what I consider the most important to be obtained by the method

of renewal of ties in continuous stretches, a more uniform degree of rail bearing. Experience with both methods of renewals has shown that the greatest safeguard against broken rails lies in the highest possible degree of uniformity of resistance of the ties. Statistics show that the number of derailments caused by the broken rails is greater than that due to any other defect of railway roadbed. (See *Railway Age Gazette* of January 12, 1912.) These same statistics show an average of one broken rail for every 714.4 rails in track, of Bessemer steel. On 139 miles of main line track on this division laid with 80 lb. rail, open hearth and Bessemer, two rails broke in 24 months, or an average per year of one broken rail for 44,480 rails in track."

The advantages of renewing ties to face are much greater in stone ballast than in gravel, chats, or dirt, both as to the cost of renewal and the uniformity of rail bearing obtained, but barring defective rails and equipment, rails break because of uneven bearings, and not because the rail cannot carry the moving load from tie to tie or with every other tie removed.

It is safe, however, to conclude that no considerable percentage of the differences shown between the broken rail record of the country at large and that of the Nashville, Chattanooga & St. Louis, is attributable to the system of tie renewal. The Nashville, Chattanooga & St. Louis has a very old and well seasoned roadbed, well drained and ballasted, and not a very heavy tonnage, in a climate where the thermometer rarely falls to zero and where the temperature is below the freezing point but a very small portion of the time. Many rails have been broken when the temperature was extremely low, and the roadbed frozen solid. Under these conditions, in some cases, 20 or 30 rails have been broken in a few hours by a single pair of flat wheels. I believe it will be conceded that no sound rail of 80 or 90 lb. section will break, except under very defective equipment, if it has even bearings at intervals of two feet which are not more compressible than timber and crushed stone and are not loaded beyond their elastic limits. By renewing ties to face approximate uniformity of bearing, so far as the action of the tie is concerned, is obtained and maintained for several years, and at all times is more nearly uniform than in the usual method. So far as the ballast is concerned a nearer approach to uniformity is possible and maintainable than when ties are put in here and there every year; but we are skating on thin ice if these differences account for five per cent. of the broken rails.

In 1881 a lot of 56 lb. rails was rolled, some of which are still doing service. If one of these old rails is taken from the track, laid on the ties and turned over and over it will be seen to have a succession of kinks in every direction from one end to the other. These rails have rarely broken and they have carried loads on dirt track which have broken 80 lb. rails on ballasted track. The axle loads have more than doubled since these rails were rolled and while then our high speed trains were made up of light passenger equipment, they now have axle loads as great or greater than our freight. Add to this the fact that we have raised the center of gravity of our engines in the meantime probably two feet, until they are undesirably high and as high as designers dare make them, causing a rolling which greatly increases the vertical load on one rail or the other; the increase in dynamic effect of the unbalanced part; the fact that the present high stiff rail cannot adjust itself to the uneven bearing upon the ties as the light limber rail could; that it is difficult, if not impossible, to make the present heavy rail compare with the old 56 lb. rail in quality, and that the whole load rests on the same width of sub-grade as before; and we will find, I believe, that the service calls not for 80, nor 90, nor 100 lb., but for 120 lb. rails to insure the same degree of safety, so far as broken rails are concerned, as we had with the 56 lb. rail.

Rails rest directly on ties that are continually decaying and failing in their support. The change that takes place in the course of the life of a tie is enough to make proper support of the rail by the tie impossible, regardless of the condition of ballast and sub grade. The tie rests on ballast of various kinds which is continually working and grinding and crushing, and even when of such a nature that it is not affected by frost or water, it is continually failing in its support, and more rapidly in some spots than in others. In turn, the ballast rests on earth material subject to great variation in its ability to support ballast owing to the different degrees of moisture and frost action which may also lift places of varying sizes and abruptness, so we see we are dependent on three undependable factors for bearings for our rails.

Considering the rail as a continuous girder, loaded in a specific way, and leaving out of consideration the accidental excessive loading due to flat wheels and other equipment defects, we do not know the length of span nor the initial stresses necessary to make the girder take its bearings. In fact, we do not know what our rails are subjected to with any degree of certainty. The heavy axle loads have undoubtedly come to stay and to increase still further, while our track design is becoming more and more unsuitable. The old oak pole tie, once in the majority, is falling further and further into the minority. By heavier rail, tie plates, screw spikes, timber treatment, more ballast, better drainage, and by the never ending tamp, tamp, tamp, of the section men the losing fight is prolonged only to finally force the adoption of a track design that will transmit the load on the rail to a level below the action of the elements making it relatively permanent, and positive in action.

There are no signs of an evolution from the present position to a scientific solution of the problem, and every radical change in the plan of railroad track supports thus far suggested involves greatly increased first cost, and doubtful results. The necessity for extensive and very expensive experiments at this time is apparent, but it is hardly likely that the required funds for any real improvement along these lines will be available so long as the roads are in the hands of inexperienced, ignorant, and hostile committees, commissions and politicians. In fact, it seems more probable that if the present trend of affairs continue for another five years it will be impossible to meet the requirements for transportation even as efficiently and safely as at present.

E. Holbrook,
Special Engineer, Union Pacific.

ABSTRACT OF ENGINEERING ARTICLES SINCE JANUARY 24, 1913.

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the regular weekly issues of the *Railway Age Gazette* since January 24, 1912:

Lift Bridges Over the Buffalo River.—The construction of three movable bridges replacing fixed spans over the Buffalo river at Buffalo, N. Y., involved some interesting work, particularly in the substructures. The piers for one of these bridges consisted of pairs of cylinders which were built inside of steel sheet piling cofferdams. This work was described in an article by Emile Low, consulting engineer, Buffalo, N. Y., in the issue of January 31, page 197.

A Continuous Rail.—A composite rail having a removable head which is cramped over a base section, the two sections having staggered joints, was described in the issue of January 31, page 207.

American Wood Preservers' Association.—The election of officers and business at the closing session of the Wood Preservers' convention which were too late to include in the last maintenance section, were mentioned in the issue of January 31, page 217.

Base Failures in Rails.—A letter by Paul M. La Bach, assistant engineer, C. R. I. & P., commenting on the causes of base failures in rails, was published in the issue of February 7, page 237.

An Analysis of Steel Ingot Manufacture.—A discussion of the six ingot defects to which forging steel is ordinarily liable and the means for correcting them, written by Bradley Stoughton, consulting engineer, New York, was published in the issue of February 7, page 245.

The Grand Central Terminal, New York.—The new Grand Central Terminal, New York, opened for service Sunday, February 2, which is one of the most unusual passenger stations in the world, was illustrated and described in the issue of February 14, page 279.

A Large Car Ferry.—A new ferry boat, the "Contra Costa," which will be the largest ferry boat in the world, being built by the Southern Pacific for operation between Port Costa, Cal., and Benicia, was described in the issue of February 14, page 288.

D., M. & N. Station at Hibbing, Minn.—The construction of a combined concrete and timber station for a small city was described in the issue of February 14, page 291.

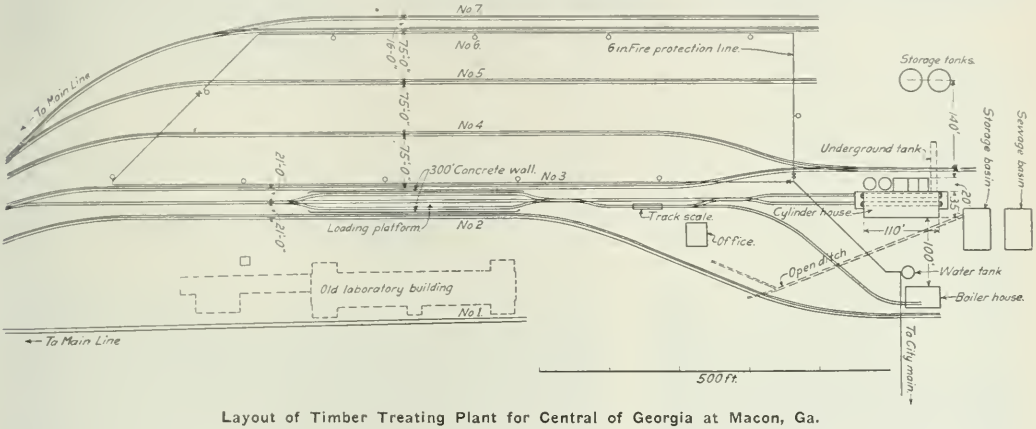
TREATING PLANT FOR CENTRAL OF GEORGIA.

The Recently Completed Facilities at Macon, Ga., for Preserving Ties and Timber by Three Alternative Processes.

During the early part of December, 1912, the Central of Georgia started to operate its new wood preserving plant at Macon, Ga. Before the construction of this plant the officers of the road made extensive investigations throughout the country as to the best manner in which to preserve their ties and, since from 50 to 60 per cent. of the ties they were using were oak and cypress, and the rest inferior long leaf yellow pine, they decided to treat the pine ties with the empty cell creosote process, the oak ties with zinc chloride, and all piling, bridge and trestle timbers with the full cell creosote process.

They decided to locate the plant at Macon, Ga., which is near the center of the system and makes a very good receiving and distributing center. It is just outside the city on the main line to Atlanta, where the company owned about 80 acres of available property, high and dry, with good drainage. The creosote storage tanks were located at Savannah, so that the tank steamers from Europe, which bring in the principal supply for this plant, could discharge directly into the storage tanks. A total storage capacity of 1,000,000 gal. is provided in two tanks.

The present yard consists of seven tracks, leading from the main ladder, all arranged for both the 36 in. gage and the standard gage equipment. The main ladder is laid with 70-lb. rails and the storage tracks with 56 lb. The plant is located at the opposite end of the yard from the main line connection, with the loading platform between the ladder and the cylinder building.



Layout of Timber Treating Plant for Central of Georgia at Macon, Ga.

The boiler house and storage tanks are located 100 ft. and 140 ft., respectively, from the cylinder house in opposite directions in order to reduce the fire risk. A 6-in. fire line is also provided around the storage yard, which is connected to a 1,000 gal. fire pump and a 50-ft. tank having a capacity of 50,000 gal. All buildings are of steel construction.

The loading platform is located about half way between the cylinder house and the ladder tracks. It is 300 ft. long, with

three-rail tracks on each side which are 42 ft. center to center. This platform is 4 ft. high with walls of reinforced concrete retaining an earth fill. On this fill are laid three 36-in. gage tracks. Between the cylinder house and the loading platform there is located a track scale in order to check the treatment from time to time as may be necessary. This is a narrow gage scale of 50 tons capacity of the Fairbanks type, with registering beam for recording exact weights.

The creosote is transported to the plant from the storage tanks at Savannah in 10,000-gal. tank cars, which are set in on track No. 3, over a cylindrical underground tank. When the creosote has been heated to the proper temperature, the bot-

Rear View of Boiler House, Cylinder House and Storage Tanks at Macon Plant.

tom connection of the tank car is opened and the creosote drops by gravity into the underground tank in a few minutes. Two general service pumps located in a pit at one end of this tank pump the creosote to the two storage tanks, and from them to the working tanks as it is needed. This arrangement has proved to be economical for handling hot creosote with the least trouble. The storage tanks have a capacity of 150,000 gal. each, and the working tanks 44,000 gal. each.

Fused zinc chloride in drums is delivered in box cars which are also set on track No. 3. The drums are stored in the zinc chloride room, where they are emptied directly into a concrete mixing sump near the underground tank from which the chemical is syphoned into No. 1 overhead tank as needed in the treatment.

The cylinders are 7 ft. in diameter by 116 ft. long, made of ¾ in. flanged steel plate and designed for a working pressure of 200 lb. per sq. in. The cylinders are set up on concrete foundations so arranged that a man can walk under them. The cylinders have a combination pressed steel and cast steel door on each end, which are strong, light and easy to handle. Just above the two working cylinders is located an air and creosote reservoir or Rueping cylinder and on the inside of the building, adjacent to the cylinders, are two 7,000 gal. measuring tanks, which are direct connected to the pressure pumps, cylinders and outside measuring tanks. The two working tanks just outside of the building, are set up on reinforced concrete piers, and these tanks are so arranged that the Rueping cylinder, as well as the measuring tanks in the building, can be filled by gravity.

The piping is so arranged that the zinc chloride treatment can be carried on in either cylinder while the Rueping or full cell process is being carried on in the other. For maintaining the pressure on the cylinders there are two pot valve pressure pumps designed for a working pressure of 300 lb. per sq. in. A Deane vertical uniplex vacuum pump is used to create a vacuum in the cylinder, and an Imperial type air compressor having a capacity of 650 cu. ft. of free air per minute furnishes compressed air to operate the Rueping process and blow back the creosote to the working tanks. One end of the cylinder house is partitioned off to form a shop and generator room which contains a 10 k. w. generator and switchboard furnishing light to the plant and yard.

The boiler house contains two 150 h. p. Scotch marine internal furnace boilers, having a working pressure of 130 lb. per sq. in. In this boiler house there is also located the fire pump mentioned above, a boiler feed pump, and a Hoppes feed water heater. The steam line from the boiler house to the cylinder house and the return exhaust line are carried in overhead steam pipes, making a very neat arrangement.

A Porter locomotive weighing 47,000 lb. is used for handling the narrow gage tram and bolster cars as well as the standard gage cars in the yard. The locomotive is of 36 in. gage with special cast steel bumpers on each end.

C. K. Lawrence, chief engineer, and J. B. Maddock, engineer of bridges and buildings of the Central of Georgia, had supervision over the building of this plant, and Grant B. Shipley, Pittsburgh, Pa., was the consulting engineer. The plant is operated under the direction of Mr. Lawrence, J. H. Stewart being the superintendent in charge.

NEW LINE FOR GERMAN EAST AFRICA.—The German East African Central Railway will, it is announced, be opened for traffic this summer, two years before the arranged time. The line will run from the coast at Dares-Salaam, and cross the colony in a westerly direction to Tabora, one of the most important trading centers in the East African lake district. The length of the railway will be nearly 550 miles. The German government has determined to push on with the building of the remaining portion of the line as far as Ujiji, on Lake Tanganyika.

AN ACREAGE TABLE.

By James G. Wishart,
Chief Draftsman, Chicago, Rock Island & Pacific, Chicago.

The table of acreages shown herewith is for use primarily in figuring railroad right-of-way. This property is usually of uniform width, the majority of it being 100 ft. wide. Where this is the case, the acreage for strips in lengths of even hundreds may be found directly in the first double column of the table. The acreage for lengths less than 100 ft. can be taken directly from the second and third double columns. By adding together quantities taken from two of these columns, the acreage for any strip 100 ft. wide up to 6,100 ft. long can be determined directly. The acreage of right-of-way in other widths than 100 ft. can be determined by taking the acreage for a 100 ft. width and multiplying it by the proper width expressed decimally. The acreage of irregular tracts can be found by first reducing them to parallelograms. This table will be found especially valuable as a time saver in valuation work, tax reports, etc., where the right-of-way acreage is required to be shown in quarter sections.

AREAS OF 100 FT. STRIPS OF LAND FOR LENGTHS GIVEN IN ACRES.

Length.	Area in Acres.	Length.	Area in Acres.	Length.	Area in Acres.

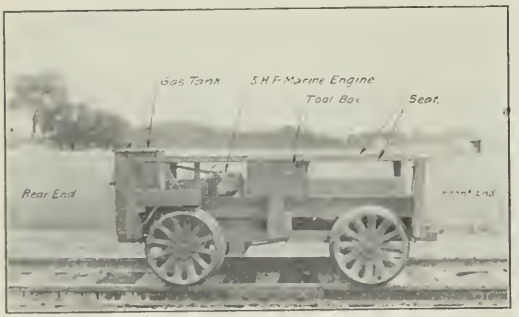
PREVENTING TRACK BOLTS FROM RUSTING.—To prevent the nuts rusting on track bolts, the track walkers on the Pittsburgh & Lake Erie are supplied with a brush and a can of inferior grade lubricating oil. About once a year they oil the nuts with the brush as they make their regular track inspections. It is found that this practice very largely eliminates the necessity of cutting the nuts with a chisel when disconnecting the rail, and the proportion of bolts fit for further use after removal is much above the average.

A "HOME-MADE" MOTOR CAR.*

By W. K. Walker,
Division Engineer, Missouri Pacific, Wichita, Kan.

As carpenter gangs are the highest paid laborers in regular maintenance work, it is necessary to get all work in their line done in the least time possible. On a line in a prairie country, with maintenance work consisting mainly of light repairs, such as renewing a few caps, stringers, sway braces, etc., one will readily realize that a bridge gang consisting of a foreman and eight bridge carpenters spends considerable time in going from one bridge to another. The repairs required for each structure are determined by a supervisor, a bill of material is made out and the material for each structure is unloaded from a local freight train ahead of the work. The carpenter gang follows and makes the needed repairs.

About 18 months ago I designed a home-made motor car to transfer the men from job to job quickly. The wheels, axles and boxes of an ordinary push car were used, to which was fastened a frame, 5 ft. wide x 6 ft. 6 in. long. On each side of the frame was placed a running board for the men to sit on when going to or coming from work. Located in the center and near the rear end of the car is a 5 h. p. marine engine which drives the car



A Home Made Motor Car.

by a chain drive and sprocket wheel connected to the front axle. The car has two speeds. The slow speed, from five to eight miles an hour, is used when making the heavier pulls and the high speed, from 20 to 25 miles an hour, is ordinarily used in going to and from work. The engine is water cooled and has dry battery ignition. The car is so arranged that a push car can be coupled behind it. No trouble is experienced in carrying nine men on the car and pulling the push car loaded with tools, etc., while the car is frequently used in transferring stringers, caps, etc., from place to place. Cost of the car was as follows:

Engine complete	$65.00
Labor and material constructing car	40.00
Other small parts	15.00
Total	$120.00

With a car of such small cost doing the work it does, one familiar with bridge work in a prairie country can very readily realize the saving from the investment. The cost of operation for oil and supplies is approximately two cents per mile traveled. From a close record of work accomplished by the car, I find that since it has been in operation an average daily saving of $? has been made.

Snow Sheds on Transandine Railway.—The Chilean government has decided to spend $1,459,950 on the snow sheds, for better protection of the Transandine Railway from Los Andes to the tunnel through the mountains to the Argentine side. This line has been badly blocked during the winter months ever since the road was opened in April, 1910.

*Re[illegible] the contest for Bridge Kinks, which closed June 25, 1912

COST OF RAILROAD CONSTRUCTION.

The following figures of cost of railroad construction west of the Rocky mountains have been compiled from the known cost of over one thousand miles of new railroad recently built on different lines, and while they are not an exact guide for estimates, or for work where conditions are special, they show an excellent average for modern railroad construction, with heavy rails, steel bridges over all important streams, high class ballast, timber lined tunnels and 3,500-ft. sidings 8 miles apart.

Engineering—Including general preliminary reconnoissances and locations with ample revisions, average per mile	$2,530
In heavy mountainous country	5,215
In moderately mountainous country	2,980
In fairly level country	1,190
Grading—With unit prices for solid rock 80 to 90 cents; loose rock, 38 to 42 cents; earth, 16 to 20 cents, per cubic yard; clearing, $45 to $50 per acre; grubbing included in grading. Average per mile of main line	22,100
In heavy mountainous country wet, lined	120,500
In rolling country	7,860
In fairly level country	6,840
Tunnels—Average per lineal foot	94
In serpentine, fairly wet, lined	96
In hard limestone, dry, no lining	78
In rotten granite, shale, volcanic rock, wet, lined	92
In earth and broken limestone, wet, lined. Lining—Maximum, $24; minimum, $8.65.	151
Bridges, trestles and culverts—Average per mile	3,160
In heavy mountainous country	8,800
In fairly level country, no large streams, no high trestles, no steel spans	570
In rolling country, no large streams	1,260
Ties—Spaced 2,880 per mile of track; average	2,270
Rails—85-lb.	5,100
Frogs and switches	160
Track fastenings and other materials	850
Ballast—9 in. below the tie. Maximum, $660; minimum, $573.	610
Track laying and surfacing	1,160
Telegraph and telephone lines—Per mile	165
Station buildings and fixtures—Exclusive of all large stations	220
Engine house and turntables—Per mile of line	450
Machinery and tools for engine house	175
Water stations	575
Fuel stations	160
Legal expenses	400
Stationery and printing	47
Insurance and taxes	300

The foregoing table omits a number of items of cost which would be of no value if reduced to a per mile basis, and others which are special to each railroad. Readers who are interested in new railroad projects will do well to note that these figures of actual cost largely exceed the irresponsible and optimistic estimates which are generally given by promoters.

FACILITIES FOR CURVING RAIL.

By M. Ganley,
Roadmaster, Atchison, Topeka & Santa Fe, Argentine, Kan.

As more attention is being given each year to the proper curving of rail before placing it in the track, the importance of well arranged facilities for doing this work is increasing. The following arrangement has been found to work very satisfactory. A roadmaster can usually find some isolated track in a terminal opposite which he can build a platform about 70 ft. long and 10 or 12 ft. wide. This platform should be built level with the floor of a flat car and can be made of old car sills or other convenient material. A roller rail bender is bolted down about in the middle of the platform and a small stationary engine with a hoisting drum is placed at one end. An iron hook is fastened to the rope line leading to the drum.

When rail is to be curved, a carload of rail is set alongside the platform at the end opposite the engine and the rail is unloaded. One rail is then placed in the bender and the bender adjusted for the required curvature. The rails are then pulled through the bender one at a time by the hoisting engine and drum.

A gang of 18 men and a foreman have curved 180 rails in a day in this way. If the rail was being curved out on the road, the work would not be done as uniformly and the progress would be very much slower. Before undertaking to curve rails, the exact length and degree of curve for which the rail is intended should be furnished the foreman by the engineering department. The foreman can then curve and load it

SERVICE TESTS OF TIES IN EXPERIMENTAL TRACK.

Results Indicate That Treatments Have In General Increased the Durability of These Ties Over Similar Untreated Material.

The Forest Service in co-operation with various railways now has in service eight test tracks in various parts of the country in which the life of various kinds of ties and fastenings is being very carefully watched. With the exception of those ties in the track of the Chicago, Milwaukee & St. Paul which were treated in the experimental cylinders in the Forest Products Laboratory all the treated ties were prepared in commercial plants. The results of these tests are published in a bulletin of the Forest Service by Howard F. Weiss, director of the Forest Products Laboratory.

GULF, COLORADO & SANTA FE TRACK.

The oldest experimental track is that of the Santa Fe between Pelican and Cleveland, Tex., in which 5,477 ties were placed in February, 1902. The results of this test have been reported annually in these columns, the last report appearing in the issue of July 26, 1912. This test was designed to obtain information, first, as to the durability of ties made from untreated beach, hemlock, black, red, Spanish, turkey, white and willow oak, loblolly, longleaf and shortleaf pine, and tamarack; and second, as to the efficiency of the Allardyce, Burnett, Hasselmann and Wellhouse processes, and of preservative treatments with Beaumont oil, with spirittine, and with zinc chloride in combination with Beaumont oil and with English creosote. From this test the conclusions are drawn, first that zinc chloride is an effective preservative for ties subjected to the severe conditions under which these were laid; second, that a fairly heavy impregnation of zinc chloride is advantageous; third, that a light injection of creosote apparently adds to the effectiveness of zinc chloride treatments; fourth, that treatment with preservatives will not yield good results unless the ties are sound in the first place and the treating is properly done; fifth, that the great variation in durability of the different species in nearly all of the treatments indicates that some of the species were not properly treated, and sixth, that species which, when untreated, decay most rapidly appear to give the greatest relative increase in service when treated.

NORTHERN PACIFIC TRACK AT PLAINS, MONT.

There were 2,650 hewed ties placed in the main line of the Northern Pacific in 1907 in gravel ballast with good drainage conditions. This line is single track with a very heavy traffic. The objects of the tests were to ascertain the durability of green and air-seasoned untreated Douglas fir and western larch ties; the durability of burnettized Douglas fir and tamarack ties, and the efficiency of the flanged, flat, and wooden tie plates when used with cut or screw spikes. The ties were treated with a 6 per cent. solution, receiving an injection of 0.786 lbs. of dry zinc chloride per cu. ft. After being in the track four years an inspection showed that none of the ties indicated any marked difference in relative durability; Douglas fir ties were not checking as badly as the western larch ties; ties treated with zinc chloride were more rail-worn than untreated ties of the same species; untreated larch ties were more rail-worn than untreated Douglas fir ties, but were not as badly worn as the treated ties of either species; the flat metal plates were causing the ties less damage than any of the other plates used; flanged tie-plates caused more checking and brooming than flat ones. Wooden plates did not prove serviceable, as they worked out from under the rail and split badly; they did not prevent wear, of the ties; and, because of lack of support under the head, the screw spikes tended to become bent by the lateral thrust of the rail.

NORTHERN PACIFIC TRACK AT MAYWOOD, WASH.

About 2,280 sawed ties were placed in the main line of the Northern Pacific near Maywood, Wash., in the fall and winter of 1906-7. One 2 deg. and one 5 deg. curve are included in this test. The track is well drained, with gravel ballast. The objects of the test were to determine the durability of green and air-seasoned untreated Douglas fir and western hemlock ties; the durability of creosoted Douglas fir ties; the efficiency of flat tie-plates in preventing wear; and the relative efficiency of screw and cut spikes as rail fastenings. Four hundred and fifty air-seasoned Douglas fir ties were treated by the full-cell process. An inspection in June, 1911, showed that the green, untreated hemlock ties were beginning to deteriorate quite rapidly; the Douglas fir ties seemed to be better than the hemlock regarding checking, rail wear, brooming and decay; and, the creosoted Douglas fir ties were decidedly more rail cut than the untreated ties.

CHICAGO & NORTH WESTERN TRACK NEAR JANESVILLE, WIS.

About 3,040 hewed ties were placed in the main line of the Chicago & North Western, in December, 1907, to determine the natural durability of eastern hemlock and tamarack ties; the comparative efficiency of the Burnett, Wellhouse and open-tank creosote processes; the comparative efficiency of flat and flanged metal tie-plates and creosoted wooden plates; and of cut and screw spikes used with treated ties. The ties were treated with a 4 per cent. solution of zinc chloride, receiving an average injection of 12 lbs. per cu. ft. Those treated in open-tank with coal tar creosote absorbed about 15 lbs. per tie. On an inspection made in May, 1911, it was found that approximately 15 per cent. of the untreated hemlock and 13 per cent. of the untreated tamarack ties were so badly decayed that they were unserviceable, and that in addition, about 8 per cent. of the hemlock and 30 per cent. of the tamarack were affected with decay to a lesser extent; only two of the treated ties showed any evidence of decay; about 44 per cent. of the hemlock and 60 per cent of the tamarack ties which were untreated and unprotected by plates were rail cut to a depth varying from one-fourth to one-half inch, and practically all showed rail wear to some extent; there was no apparent difference in the condition of the ties equipped with flat plates and cut spikes, and those equipped with flat plates and screw spikes; many of the flanged plates were still only partially embedded in the ties and gravel was found under a good many of them; the damage to the ties with wooden plates appeared to be less than to those otherwise protected, but some of the plates were missing and many were split and damaged; lack of support under the outer portion of the head of the screw spikes had, in some cases, resulted in the spikes bending outward from the rail.

INDIANAPOLIS, COLUMBUS & SOUTHERN TRACTION COMPANY, NEAR TAYLORSVILLE, IND.

About 945 hewed ties were laid in the Indianapolis, Columbus & Southern Traction Company's tracks, in September, 1909. The roadbed was well drained; with gravel ballast. The object of the test was to secure the comparative efficiency of red and black oak ties treated with coal-tar creosote by the full-cell process, zinc creosote, and "asphaltic crude oil," using low pressures. Those ties treated with creosote were boiled in the oil at a temperature not exceeding 225 deg. F. from one to four hours, after which a pressure not exceeding 45 lbs. per sq. in. was applied until the desired absorption was obtained. Those treated with creosote and zinc chloride were first heated to 212 deg. F., after which they were impregnated with a 4½ per cent. solution of zinc chloride under a pressure of not more than 45 lbs. per sq. in. In the treatments with "asphaltic crude oil" the injection was very light. On account of the viscous nature of the oil it was not possible to apply pressure exceeding 20 lbs. per sq. in. with the apparatus used. After being in the track

two years an inspection showed no badly decayed ties, although approximately 2 per cent. of those treated with about 14 lbs. of creosote per cu. ft., and approximately 12 per cent. of those treated with creosote and zinc chloride were slightly affected by decay; and a number of the ties of each treatment were more or less split on the ends. In practically all such cases, however, the exposed portions of the ties appeared thoroughly sound and well treated, and it is probable that the greater part of the splitting existed at the time of treatment. Only two of the ties showed any rail wear, and this was so slight as to be negligible.

OTHER TEST TRACKS.

Early in 1910, 920 sawed ties were placed in a track of the Birmingham Southern at Ensley, Ala., in slag ballast and poor drainage. The test was designed to secure information regarding the natural durability of longleaf pine and white oak ties and also the comparative efficiency of "cresol-calcium" and coal-tar creosote in protecting shortleaf pine, loblolly pine and red-oak ties from decay when treated by the low pressure process. These ties have been in too short a time to enable any conclusions to be drawn.

In July, 1910, 100 ties were placed in the main track of the Wenatchee Valley & Northern near Delmont, Wash. The ties were hewed on two faces with the bark on the other two and have not been in sufficiently long to furnish any results.

In August, 1911, 1,711 hewed and sawed ties were placed in the main line of the Chicago, Milwaukee & St. Paul near Hartford, Wis., on a well drained roadbed with gravel ballast. On about half of these ties are placed flat steel plates with a boss under the spike heads for screw spikes. The rest are unplated and the rail is fastened with cut spikes. The object of the test was to determine the natural durability of red oak and hard maple ties; the efficiency of the Burnett, Card, zinc-creosote, full-cell creosote, Rueping, and crude-oil treatments in protecting red oak and maple, and the kyanizing process in protecting spruce ties from decay; and the efficiency of flat-bottom plates when laid with screw and cut spikes in protecting ties from mechanical wear. Because of the short length of time this track has been in, it has not been possible to secure any results up to the present time.

In general, the results from these various test tracks indicate that with one exception, the treatments have increased the durability of the ties over those of similar untreated material. It is not economical to tie-plate ties with low decay resistance, such as loblolly, hemlock, beech and tamarack, if laid untreated, as they will decay, before they fail from mechanical wear. The increased resistance to decay secured from preservatives, makes it desirable to protect treated ties from deterioration by mechanical agencies. The experience gained thus far is not conclusive as to the best form of plates to use. Wooden plates, when simply laid under the rail, have not proved satisfactory, while flanged metal plates have a decided tendency to split the tie. The metal plates with flat or slightly corrugated bottom have thus far given the best results.

ROCK ISLAND LINES' ANNUAL TRACK INSPECTION.

The results of the annual track inspection of the Chicago, Rock Island & Pacific, which was made in December, 1912, has recently been made public. Prizes of $100 were awarded to the roadmasters whose track showed the greatest improvement on one division, or a group of divisions, while a prize of $50 was awarded the foreman making the greatest improvement on each roadmaster's subdivision. On this basis prizes of $100 each were awarded to roadmasters G. W. Kohn, Peoria, Ill.; T. H. O'Brien, Atlantic, Ia.; A. Burke, St. Joseph, Mo.; C. H. Gruver, Albert Lea, Minn; J Dulin, Oskaloosa, Ia.; J. Singleton, Des Moines, Ia.; V. B. Simpson, Eldon, Mo.; J. G. Hutchison, Clay Center, Kan.; C. B. Lane, Dalhart, Tex.; J. J. Breheny, Fairbury, Neb.; M. Dunnean, Goodland, Kan.; J. A. Trainer, Booneville, Ark.; R. T. Gollehon, El Dorado, Ark.; D. Bogue, Haileyville, Okla.; G. Woods, El Reno, Okla., and W. H. Gruhlkey, Amarillo, Tex. Forty-nine prizes of $50 were also awarded to section foremen.

THE TREATMENT OF DOUGLAS FIR WITH CREOSOTE OIL.*

By G. A. Coleman,
Coleman Creosoting Co., Seattle, Wash.

It is well known that Douglas fir is more difficult to treat than most eastern and southern pines. It is not surprising, therefore, that early operators, failing or having only indifferent success with the methods used for softer woods, should cast about for a more efficient treatment. As a result of these efforts but little new has been brought out. Two systems, nevertheless, have survived—the steam and vacuum process, refined and adapted to new conditions, and a new timber; and the boiling process. Good work can be done by the latter when conditions are ideal, but the great variety in the grain and density, and condition of seasoning of timber, especially piling, when treated in commercial quantities, renders the work very irregular, so much so, that in common practice from 5 to 8 per cent. of the treated material has to be returned for re-treatment. By the steaming process fairly uniform work can be obtained, as the effect of steaming is to render the timbers equal as to moisture, so that during the vacuum, the real drying period, the seasoning goes forward uniformly.

Unless first water seasoned, sun baked or air seasoned, timber cannot be successfully treated by the boiling process, as no part of the treatment has any effect on that hardened condition characteristic of Douglas fir. Results show that piling taken directly from the boom to the retorts will frequently have a penetration of 1½ in. on the under or wet side after treatment by the boiling process, while the upper or dry side will have almost no penetration. The effect of steaming is somewhat similar to that of water seasoning. Early operators undoubtedly failed with the steaming process, because of plants poorly equipped for maintaining adequate temperatures under the vacuum, and attempted to make up the deficiency by excessive steaming, sometimes as long as 24 hours, which is far beyond the point of safety. There is a critical point somewhat beyond the time of being heated through, beyond which steaming should not be carried, and which must necessarily vary with the dimensions of the timber. Yet, that wood may be subjected to a high temperature for a short period without serious injury is often demonstrated in the burning of mill constructed buildings. Large wooden columns in a fire of several hours will sometimes be half consumed, and yet under the charred surface the wood will retain practically all of its original strength. Wooden columns of sufficient size are preferred to unprotected iron by insurance companies on account of this remarkable quality.

There is quite a difference of opinion between operators upon the Pacific coast regarding the relative merits of these two processes. The plant with which the writer is connected uses either, as specified by the purchaser, but has been able to obtain the best results by the steam and vacuum process. This is evidenced by the fact that out of 14,000 piles treated during the past seven months by this plant, but 1,100 have been treated by the boiling process. Timber can be severely injured by either process if care is not taken, but the best tests we have so far made of wood treated by the boiling process show a depreciation of 23 per cent.; while one test showed 33 per cent. This depreciation is excessive and is no doubt accounted for by the long boiling period of 30 to 48 hours in oil heated to a temperature of 225 deg. Fahr.

It is announced that the Forestry Department will soon pub-

*Abstract of a paper read before the ninth annual convention of the American Wood Preservers' Association, held in Chicago, January 21-23, 1913.

lish a report upon 9 in. x 16 in. timber treated by this process which will give us further information on this important point. Recent preliminary tests by the same laboratory on creosoted piling steamed six and seven hours, which is common practice, showed the excellent result of less than 10 per cent. depreciation, while an over-steamed test which showed a depreciation of 38 per cent. immediately after treatment, while yet soft, on further seasoning, recovered to 90 per cent. of its original strength.

It is not necessary, however, to extend the steaming beyond the point at which the timber becomes thoroughly heated through and uniform in moisture content. After the steaming, a vacuum, the most refined drying process known to the industrial arts, is begun and maintained at temperatures well below the boiling point until the wood is dry enough to receive the oil. The low average temperature at which this system of treatment is carried on undoubtedly accounts for the comparatively slight depreciation. That the fuel consumption per cubic foot of treated material is fully 25 per cent. less gives added evidence of the less heat units applied. In conclusion, therefore, in the opinion of the writer, two points recommend the steaming process, uniformity of penetration and a minimum depreciation.

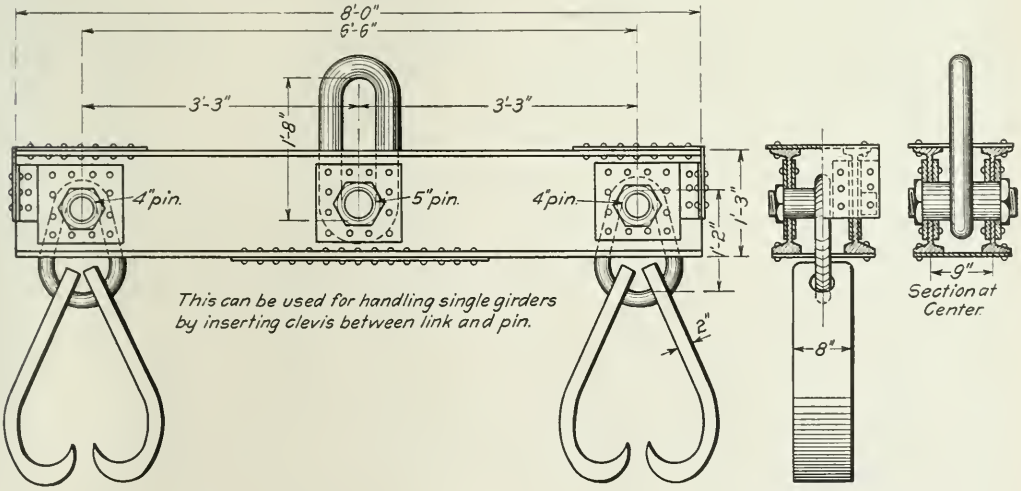
ERECTING HOOKS FOR HANDLING DECK PLATE GIRDER SPANS.

By N. W. McCallum,
Supervisor of Structures, New York Central & Hudson River, New York City.

The amount of time allowed for erecting plate girder spans in place of old structures on lines carrying a heavy traffic is frequently very limited and any device which will cut down the amount of time required for such work is of much assistance. The erecting hooks shown on the drawing were devised by one of the bridge foremen of the Mohawk division of the New York Central & Hudson River, and the details were perfected in the office of the bridge supervisor a number of years ago. They were planned especially for use in erecting a bridge across the Mohawk river at Schenectady, which consisted of ten four-track deck plate girder spans about 70 ft. long, making 40 spans to be installed. The old spans to be removed were approximately the same length, center to center of girders, so that the same hooks were also used in lifting them out. Since that time these hooks have been used in placing all other deck plate girders on this division. They have also been used for handling single girders by knocking out the end pins and putting in a clevis on the link carrying the hooks.

The device consists essentially of a built up steel section with a supporting link at the center and with two clamps on each end to pick up the girders. These clamps are spaced 6 ft. 6 in. between centers, the standard width center to center of girders for deck plate girder bridges on this road, for spans of approximately the length referred to.

Most of the deck girders are shipped already assembled. The steel is put in place with a wrecking crane, the top link of the balance beam hooks being passed over the hook on the load block of the crane. Each pair of hooks of the balance beam engages the top flanges of each girder of the assembled span. If the spans are too long to handle with one wrecking crane, two are used, one at each end, with a set of balanced beam hooks for each. These hooks save from seven to ten minutes time on each lift over the old method of handling such spans with chains, the saving depending, of course, on the size of the span and the weight of the chains.



Erecting Hooks for Handling Deck Plate Girder Spans.

A SHORT METHOD FOR LOCATING FROG POINTS.

The following tables have been prepared by J. L. Taylor, assistant division engineer, Grand Rapids & Indiana, for the quick and accurate location of frogs. These tables are based upon methods outlined in "Modern Location of Standard Turnouts," by C. M. Kurtz of the Southern Pacific. The values of "g" are based upon the dimensions of the standard frogs used by a number of the roads, the overall dimensions of which are 8 ft. for rigid frogs Nos. 4 to 6, inclusive, and 15 ft. for spring frogs Nos. 7 to 10 inclusive. It will be noted that the distance "g" is given as 8 ft. 6 in. for the No. 7 frog. If a No. 7 rigid frog is to be employed where "g" equals 5 ft., the values of "n" and "d" shown can be used, unless one is crowded for room, when corrected values of "n" and "d" can be readily obtained so that the curve can start at the actual heel of the shorter frog. On the other hand, if larger values of "g" are required, as in cases where some tangent is desired behind the

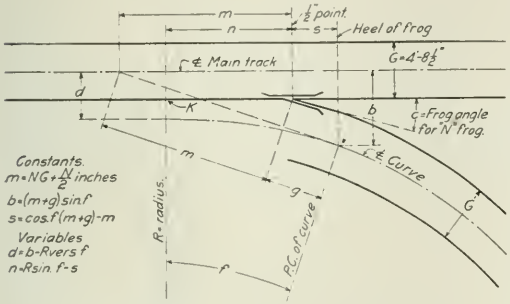
main track frog, corrected values of "n" and "d" are easily obtained as follows:

Corrected "d" = "d" (from table) + additional length × sin f.

Corrected "n" = "n" (from table) — additional length × cos f.

If corrected "n" is a minus quantity, the frog point is located on the side of "k" opposite that shown in the illustration. In maintenance work where the main or ladder track is a tangent, the accompanying tables are complete in themselves for either office or field work. In staking out new tracks, the parallel tangent distant "d" from the center of the main tangent can be used for the base line and intersections for diverging tracks can be made directly on this parallel tangent. Even when it is



A Short Method of Locating Frog Points.

desired to locate a turnout in a track already built to connect with a diverging fixed tangent, the intersection between the two tangents can be made directly at a point distant "d" from the center of the main tangent, reducing the field work necessary to ascertain the tangent distance for the assumed curve for the given intersection angle, as all other necessary distances are readily secured from the tables.

REMOVING SNOW SLIDES BY BLASTING.

At this season of the year when snow becomes a serious obstacle in the operation of trains, especially in the mountains, the following information relative to the use of dynamite, which was used for clearing the tracks in one instance, is of timely interest.

As a result of a slide across the line of one of the western railways the snow was banked about 40 ft. over the rails for a distance of about 600 ft. Because of similar slides at other points along the line, the forces clearing the track were unable to reach this particular slide for a period of 24 hours. At the time the slide occurred the weather was mild and the snow very soft, but it turned cold and the snow froze hard. When the rotary plow reached this point it was able to make little progress. It was suggested that the snow be moved by dynamite and although there were some fears of damage to the track, authority was given to try this method. Three 1¼ in. steel bars each 18 ft. long were welded together and forced through the snow to a distance of about 35 ft., or almost down to the track. Four or five cartridges of 40 per cent. dynamite were placed in this hole and fired by electricity as a springing charge. This hole was then loaded with 62 kegs of blasting powder and exploded, as a result of which the snow was removed to within about a foot of the track. Two or three similar shots cleared the remainder of the slide in about three hours' time so that the rotary could complete the work and open the line. Careful examination showed that the track had not been damaged. As a result of this experiment, the road has since used several carloads of blasting powder for this service with a large saving in time and money.

THE SECTION FOREMAN PROBLEM.*

By B. A. West,

Roadmaster, Atchison, Topeka & Santa Fe Ry., Pueblo, Colo.

I have been employed as track laborer, section and extra gang foreman and roadmaster, holding the latter position for the past 13 years, so I think I realize fairly well the problem of the future supply of track foremen. I have now as laborers Mexicans, Italians, Greeks and a very few Americans. My practice in training foremen is about as follows:

While around section, yard and extra gangs I carefully note the action and methods of the men in doing their work, the handling of their tools and the interest they take. Whenever a man impresses me as capable I carefully question the foreman regarding the length of time he has worked, his habits, his education, his family, his willingness and his ambition. If I am satisfied with the answers to these questions I place him on some important section, or in a yard where he can be employed steadily and where he can learn track work most rapidly and best. Whenever the regular foreman is called away this man is left in charge of the gang, or if material is needed this man is sent for it, and if he proves capable in these small duties I place him in a gang where a sub-foreman is needed. I have it understood by all foremen as well as laborers that the instructions of sub-foremen are to be obeyed just the same as those of the foremen. By selecting Americans from among our laborers I find that they have acquired to a certain extent the language of the foreigners and understand their method of working and their temper. They can direct such laborers to much better advantage than foremen who might be transferred from another part of the road and who had never had experience with these particular foreigners.

It is evident to me that the railways must depend almost entirely upon the foreigners for laborers in the track department, and for this reason the future supply of track foremen will have to be drawn largely from that class. In selecting men for foremen I make no distinction between the native white and the foreigner, and if a foreign laborer shows efficiency and intelligence and is more suitable than any available American, I place him as foreman. I always place a foreigner in charge of a gang of his own nationality. I always caution a foreign foreman to keep himself neat and make the men in his gang do the same, to keep their cars and bunk houses cleaned up, and to refrain from carrying dangerous weapons or quarreling with each other. I impress upon him the necessity for overcoming the local prejudice against foreign labor, and I find that such foreign foremen in many instances get better results out of their men than an American hobo foreman who has never handled foreigners. The only drawback to making good foremen out of foreigners is their inability to read and write, making it hard for them to keep their labor distribution and reports correctly. When they learn the language I find foreign foremen just as competent as American foremen, in fact, some of them are better bookkeepers than the Americans.

Foremen should be kept posted at all times by quarterly meetings with the heads of the maintenance department; if not quarterly, these meetings should be held at least semi-annually. The men should be educated to transfer material and keep a correct record of the transfer, to make light repairs to depots or stock chutes, to set fixed signals, to patch holes in depot platforms, to replace window panes in depots, section or bunk houses, to note material required for repairs in stock yards or on chutes, to unload material for water-treating plants, and similar small jobs by which they could easily save the company more than the amount of their wages. The men also might properly be trained to take care of bonded track and to maintain automatic signals and crossing bells. I have seen a $3-a-day man sent out to fix a window pane who had to spend the en-

* Received in the contest on The Section Foreman Problem, which closed March 25, 1912.

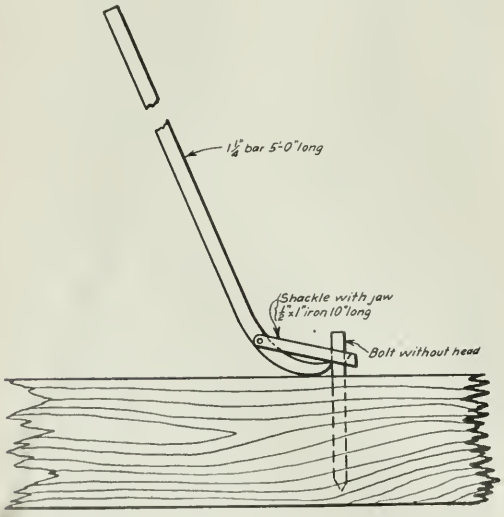
tire day on a job which could have been done in twenty minutes. I have seen five or six men at $2.75 a day sent out to unload a part of a car of treated water supplies and spend an entire day at it when a foreman and his gang could have done the same work in an hour's time. My suggestion is to educate foremen to do this work, and pay them a few dollars per month to induce them to make the effort necessary to learn to handle this work. Roadmasters and supervisors should be educated as well as the foremen. It might not be practicable to place all of the departments under one supervising head, but I suggest that there are at least several departments connected with maintenance of way that could be so combined with a resulting increase in efficiency.

A BOLT PULLER.*

By H. C. Swartz,

Master of Bridges and Buildings, Grand Trunk, St. Thomas, Ont.

The shackle bar is of use for withdrawing bolts without heads, as shown in the illustration. By pressing down on the bar the toe of the bar and the shackle grip two sides of the bolt and the harder the bar is pressed down the tighter is the



Shackle Bar for Withdrawing Bolts from Timber.

grip. By raising the bar slightly the shackle is loosened and a new grip can be secured. Where the bolt is too far down in the timber to secure a grip, a little adzing will usually enable the device to secure a hold on the bolt.

TIMBER FOR CREOSOTED BLOCK PAVING.†

By Harry G. Davis,

Manager Paving Department, Chicago Creosoting Co., Chicago, Ill.

There are several commercial woods in the Central West available for paving purposes, any of which are sufficiently strong for the purpose, and selection can be made from these as determined by the more technical features of wood preservation, such as the adaptability of the wood to treatment, and its power to withstand decay after treatment. These woods are Southern yellow pine, tamarack, hemlock and maple. The writer has had no opportunity to study Norway pine. One street paved in Chicago with black gum is not considered a sufficiently conclusive experiment to warrant one in forming a definite opinion as to that wood.

The writer knows from actual experience that each of these woods is adapted to treatment. Observations made at our plant during the past year show that maple is most easily treated, followed closely by tamarack and hemlock, all three greatly outclassing yellow pine in this respect. There is no doubt that hard maple is the strongest of the four, followed next by yellow pine, and then by tamarack and hemlock. But each is sufficiently strong for paving purposes.

*Submitted in the contest on Tools, which closed August 25, 1912.

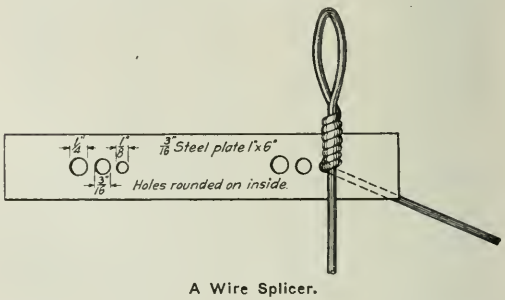
†Abstract of a paper read before the ninth annual convention of the American Wood Preservers' Association, held in Chicago, January 21-23, 1913.

A WIRE SPLICER.*

By H. C. Swartz,

Master of bridges and buildings, Grand Trunk, St. Thomas, Ont.

The wire splicer shown on accompanying drawing is used to splice wires without taking out the temper as is apt to be the case when the wire is wound without pinchers. This splicer is of special use in connection with semaphores where the wire has to be



A Wire Splicer.

covered and passes through pipes filled with oil, it being necessary to connect up the hardened wire in the pipes with the regular semaphore wire at either end. It is also useful in making "tell tales" for overhead bridges and for making coil springs.

PROPER USE OF TOOLS TO AVOID INJURY.†

By E. K. Coggins,

Chief Clerk to Roadmaster, Southern Railway, Knoxville, Tenn.

Many of the so-called unavoidable accidents that result in personal injury to maintenance of way employees would never happen if the foreman or man directly in charge of the work would perform his duty in taking the proper precaution to look after the safety of the men working under him. It very often happens that a section laborer or bridge man gets a badly smashed hand or loses one or more fingers, and the report of the accident simply shows that the party was injured while handling or setting a lever or ratchet jack. The fact is not brought out in the investigation that he was a new man who had not been instructed and that the injury could have been avoided if the foreman had taken a moment to explain the proper and safe way to handle the jack, had shown him that if the trigger or trip was sprung the jack would fall and had told him how easily he could be hurt if not careful.

Railroad companies spend a great deal of money to provide the proper tools and equipment for safe handling of heavy material, and a great many personal injuries could be prevented

*Received in the contest on Tools, which closed August 25, 1912.

†Received in the Safety contest, which closed October 25, 1912.

by the proper use of the same. Men are crippled every day by the careless handling of rail or heavy bridge timbers by hand, when the injuries could easily have been prevented and time and money saved in the work by using rail tongs, timber hooks, dollies, etc., which, if not on the ground, have probably been left on the cars or at the tool houses.

PREPARING FOR THE SEASON'S WORK.

By Engineer.

It is almost a truism that there is great economy in having work done at the proper time. When it is delayed the amount to be done increases rapidly, so that it takes more work to accomplish the same results. This is as true in railroad work as in any other line of industry, and in this article we would call attention to the great importance of having maintenance of way work done in the proper season. If it is neglected or postponed, its cost is increased, delays to operation are occasioned by inferior track and other delays result from the necessity for doing the work when the volume of traffic has greatly increased.

The coming month is the season of preparation for active spring work in the maintenance department which should start as soon as the frost is out of the ground. In the southern part of the country, where work can go on the entire year, this preparation is not so important, but in the northern and central states where it is still too cold for active work on the track, preparation should be made by deciding on what is to be done and making arrangements to carry it forward as soon as the weather will permit.

The larger items of new construction, improvements and repairs should have been fully decided on before this, so that in a general way the amount to be done during the coming season is known. It remains to decide on the details and determine what smaller repairs shall be made. The amount of ballast to be used on each division and branch should have been allotted; the number of ties each section is to have, and the amount of rail relaying to be done should have been fully investigated and settled by the higher officers; and maintenance forces should be making preparations for going ahead with all work, so that it will be completed in its right order.

The proper officer should make requisition for all material required, stating when and where it will be needed, so that the supervisor or roadmaster, the master carpenter and men in charge will know when to expect it and the supply department will have advance information and will not be behind in having the material on hand. The ordering of material may be emphasized as the first and most important work for this season of the year. If plans are not finished they should be completed at once and all officers who will have to do with handling the work should be fully advised as to what is to be done, and consulted as to the best method of doing it. All officers in charge of forces, supervisors, roadmasters, master carpenters, signal and telegraph superintendents, should have all tools examined to see that they are in shape for the season's work. Those needing it should be sharpened and repaired, useless tools should be discarded and needed additional tools ordered for all regular or extra gangs they expect to put to work. All gangs should be organized, on paper at least, so that when the time comes it will only be a question of giving the orders to get the work under way. It should not be necessary to make unforeseen shifts of foremen from one place to another, or of men, because it was not known they would be wanted. Work trains should be anticipated and trainmasters should arrange for them.

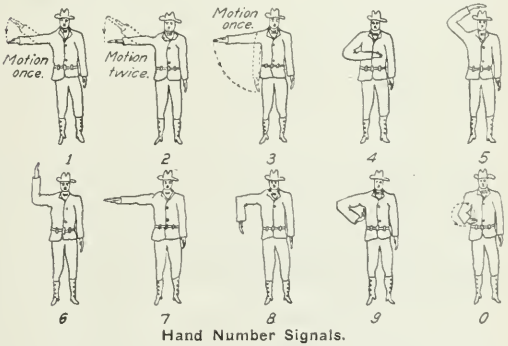
The supervisor should go over his track in detail with the section foremen to spot all weak places; to note what ties should be replaced and what rails should be taken out (except where a general renewal is to be made); to see that farm and highway crossings need to be put in good shape, especially when any have been moved on account of flangers; to see that fences and gates are ready for the heavier use they will get in the spring and that the section foremen are alive to the necessity of closely watching places that are shimmed so as to get the shims out and keep the track surfaced up promptly as the frost goes out. Just as the frost goes out, the track should be very closely watched, as in a few hours what was apparently a very well surfaced and safe piece of track may become a very rough and unsafe piece. Thick shims should be replaced by thinner and constant attention is needed to keep the track smooth. Experience has taught foremen the localities where this is likely to happen, for there are other localities where shims are unknown and this trouble is not serious.

Drainage should be looked after, so that when the spring thaws and rains come no damage will be done, and so that the track will not be soft and troublesome. Ditches, culverts and bridges should be cleaned and put in shape. The master carpenter should go over all his bridges and see what is needed at each of them, whether the piles are all sound and whether any of the timbers need renewing. Buildings should all be examined and repairs decided on, screens repaired or ordered, painting decided on, platforms gone over and needed repairs listed, sidewalks, streets, driveways and all plankings and pavements examined with a view to keeping them in good condition.

With these ordinary repairs decided on and material ordered arrangements should be made for getting men as early in the season as work can be begun. In the more southerly states, rail laying, putting in ties and ballasting may begin during March, but in the northerly states that is likely to be too early. Preparation should be made, however, to have the men ready to start the heavy work as early in the season as the weather will allow. "The early road catches the hobo." The best men are out early and the cheapest work is that done in the very early spring.

HAND NUMBER SIGNALS FOR ENGINEERS.

The need of communicating between two or more members of surveying parties in the field is frequently felt, and is often rendered difficult by the lack of an understanding regarding proper signals. A simple system of signs or symbols indicating numbers has been extensively used on location and maintenance parties on the Burlington lines west of the Missouri river. These symbols, which are indicated on the accompanying sketch,



Hand Number Signals.

are quickly learned, easily given and easily read, so that communication is rendered easy between a transitman and head chainman, or between other members of a party. These signals are shown on a blue print 3¾ in. x 7 in., suitable for mounting in a loose leaf book with other similar blue prints showing track and switch layouts, or the print can be pasted in the back of a field book. We are indebted to F. T. Darrow, engineer of maintenance of way, Burlington lines west of the Missouri river, for this information.

CAUSES OF INJURY IN THE MAINTENANCE OF WAY DEPARTMENT.*

By E. H. Barnhart,
Assistant Division Engineer, Baltimore & Ohio, New Castle, Pa.

On the division with which I am connected there are 380 miles of main track maintained by 55 foremen under four supervisors. During the past year the minimum number of men employed in any one month was 465, and the maximum number 1,110. There were 42 personal injuries and one death to maintenance of way employees working on or about the track on the division during the year. Comparing the personal injuries with the average number employed during the year, one out of every 8,659 men was killed while one out of every 206 was injured.

It is interesting to note, in this connection, the comparison of injuries to those working under American foremen and those working under foreign foremen. Of the 55 foremen mentioned above, 11 men, or 20 per cent., are foreign born. Of the 42 personal injuries, 14 occurred to men working under foreign foremen. Thus, while only 20 per cent. of the foremen are foreigners, 33 1/3 per cent. of the total number of injuries occurred under their supervision.

An analysis of the manner in which these personal injuries occurred is pertinent here, and, from this analysis, conclusions may be drawn and remedies applied. For purposes of analysis, these causes will be classified under general heads, viz.:

Tools slipping, including misplacing jacks, bars, etc.	7
Flying spawls from tools, account using defective tools	4
Handling heavy material, men not working together	15
Careless use of hand cars—running too fast, men falling off, etc.	6
Weather conditions, slipping on ice, etc.	3
Foot caught in interlocking	1
Trackwalker riding local freight to where gang was working	1
Falling through car door while unloading material	1
Jumping from train on piece of coal	1
Miscellaneous	3

From the above analysis it is seen that the first five causes are responsible for about 80 per cent. of the personal injuries occurring during the year.

In my opinion there are five principal causes contributing to between 80 and 90 per cent. of the accidents to maintenance of way employees.

First.—Trackmen working on track do not pay proper attention to the work or are not careful to observe the movement of trains. It may seem strange that I should place this first, in view of the above analysis. Local conditions, however, are responsible for there being no accidents due to this cause. Of the main track mileage maintained, only about 26 per cent. is curved track, thus affording a good view to approaching trains. Another reason is due to the fact that, during October of last year, the Baltimore & Ohio published a book of rules in eleven different languages for the government of employees working on or about the tracks. These were distributed among foremen who were required to receipt for them. Rule 4 of this book reads as follows: "On the approach of a train, employees who are working on or about the track must move to a place of safety, standing clear of all running tracks. They must not walk or stand on the track except when necessary for the proper performance of their duties." We have been endeavoring to impress upon the foremen the importance of this rule, and, while all are not strictly observing it, the results shown above are very encouraging. This rule should be strictly enforced wherever possible on double track railroads.

Second.—Improper handling of heavy materials, such as rails, ties, etc. Thirty-five per cent. of our personal injuries during the past year occurred from this cause. Good results could be obtained if the foremen would designate some one of the laborers to act as spokesman when handling heavy material and require all of the men to lift or let go at his word. It would be well, also, to caution each man when it is necessary to handle any material. Constant care and watchfulness on the part of the foreman is needed, especially with the very large number of foreigners employed.

Third.—Improper handling of tools was responsible for 16 per cent. of the personal injuries. Here, again, the foreman should exercise constant care and watchfulness in the placing of jacks and in the use of mauls, claw bars, etc. Foremen cannot caution their men too frequently about exercising extreme care in the handling of tools. Supervisors should also be constantly on the lookout, in their frequent trips over the road, for the improper use of tools which are liable to cause injury to laborers.

Fourth—Careless use of hand cars caused 15 per cent. of the personal injuries. Our men all have instructions not to use hand cars in a fog; not to go around dangerous curves without proper protection and to keep themselves posted about the movement of trains whenever near a telegraph office. But, with all the instructions issued, foremen, and more especially foreign foremen, are very careless in the operation of hand cars. The one employee was killed as the result of the foreign foreman not informing himself about the movement of trains and an overdue first class train struck the hand car, throwing the man under the car.

Fifth.—The use of chisels with worn heads; handles with wind shakes, etc., was responsible for 12 per cent. of the accidents. A more rigid inspection of the tools in use by the supervisor or roadmaster would, I believe, remedy this condition. Our foremen have instructions to send a chisel to the repair shop for dressing as soon as it begins to wear. The injuries from this cause occurred in the earlier part of the safety campaign and I believe our foremen are beginning to realize that it does not pay to use defective tools.

It will require personal attention on the part of the supervisor or roadmaster, more especially with the foreign foremen who cannot understand written or typewritten instructions, to get the desired results. If we can reduce the number of injuries from one out of every 206 to one out of every 720, it will amply repay the extra effort put forth. It not only helps the head of the department, but the foremen are in shape to do better work and the company gets more efficient service.

*Received in the Safety contest which closed October 25, 1912.

A HAND DERRICK FOR LIFTING HEAVY TIMBERS.

By W. V. Parker.
Chicago, Rock Island & Pacific, Amarillo, Texas.

The hand derrick shown in the accompanying illustration has been successfully used by a bridge gang on one division of the Rock Island for the past year, and has been found to be very convenient for handling stringers, caps, floor beams and other

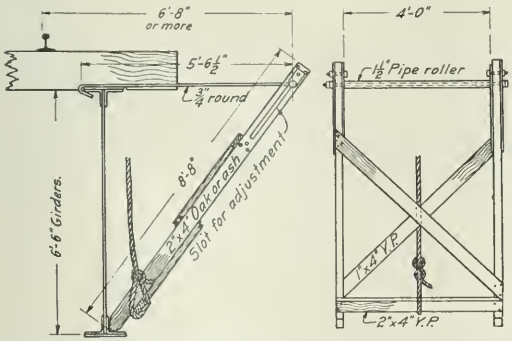
Small Hand Derrick for Lifting Heavy Timbers.

heavy members. The crab weighs 425 lbs. By using one snatch block, two men can easily raise timbers weighing 1,750 lbs. Four men are the entire force required to operate the crab while handling heavy timbers; replacing eight or ten men otherwise required. To prevent the crab from tipping, a rail clamp may be used which fastens over the ball of the rail on the side opposite the load. These clamps have not been used with this crab, however, and are not recommended, as their use prevents the moving of the crab. Rather, when necessary to counterbalance the load, old ties, guard rails, or other timbers are placed on the opposite side of the car, as shown in the photograph. The cost of this device, including labor and material is from $10 to $15.

A DEVICE FOR RENEWING TIES ON VIADUCTS.

By H. H. Harman,
Engineer of Bridges, Bessemer & Lake Erie, Greenville, Pa.

The device shown in the drawing has been found of much assistance when renewing ties on high viaducts, of which there are a number on our line. While the dimensions given are for the standard height of girders used on the Bessemer road, they can, of course, be changed to suit any other depth of girder. The device consists essentially of two oak timbers joined together by cross braces and by a pipe roller at the upper end which will revolve freely. Two hooks are provided, one end of which fastens over the bolt on which the roller revolves; the other end is bent to hook over the upper flange of the girder, as shown. When using this device, the lower end of the



A Frame to Assist in Renewing Ties on Viaducts.

frame is lowered into position on the outer lower flange angle of the girder by means of a rope, as shown, and the hooks are inserted over the top of the girder. When removing a tie it is forced out until the end reaches the roller, from which point it can then be very readily moved out to clear the outer rail and can either be dropped into the ravine below or be moved back on the track. A new tie is inserted in its place in the same way.

The use of this device enables ties to be put in much faster and with less danger of accident to the men than is ordinarily the case. The ties can be moved readily and the men are not required to lift out beyond the girders with the risk of falling to the ground. The device can be easily picked up and moved from place to place by two men.

New Transandine Railway.—Engineers have now completed the plans for the new Transandine Railway the Chilean government intends to construct through the Maipo river valley, placing Santiago in direct communication with Buenos Ayres, Argentina, the journey taking only 30 hours.

THE FOREMAN PROBLEM.*

By John C. Pierson.

The men who hold the position of section foremen do not do so because they are satisfied, but usually because they are too old to start anything else. They usually have the idea that they are driven for all the work that is in them to be put aside when they can no longer stand the pace. In the first place, then, the railways should do something to overcome this feeling among the men. It is almost impossible for a man to support himself and family on the wages of the trackman. Foreigners may be able to do this, but as very few of them have the education required for a foreman, Americans must be secured to offer a supply for the foremen of the future. There is very little to induce a man to serve an apprenticeship as a laborer at $1.50 a day, with no prospects of rising higher than a section foreman at a salary of $65 to $75 per month, when he could become a brakeman earning $75 to $100 a month from the start. The brakeman's work is not as hard as that of the trackman, and a track foreman has fully as much responsibility as any conductor. The section foreman's salary should be raised high enough to attract young men to enter this branch of work.

The opinion is too prevalent that it takes no skill to be a good trackman. It requires at least four years for a man who is interested in his work to become efficient in building and maintaining track, and very few men in the average section gang have interest enough to enable them to learn it in this time. Railway companies are generally opposed to labor organizations, but these organizations set the wages that railway companies pay. Track labor is not organized, in accordance with the wishes of the company, yet in the face of the men's compliance with the company's wishes they are made to take any wages that the company sees fit. Since the welfare of the trackmen lies entirely in the hands of the company some effort should be made to make them more contented. One way of stimulating interest is by frequent meeting of the men and officers to establish close relationships. The payment of higher wages is opposed to economy, but the time is coming when the saving of money cannot enter into the question of securing foremen. The two things to consider, then, in securing efficient track foremen are (1) to endeavor to show the men that the company is interested in their welfare, and (2) to pay laborers more money, or at least place the foremen on wages which will induce young men to enter the force with that position in view.

A LOCAL SAFETY COMMITTEE.†

By F. E. Crabbs,
Roadmaster, Chicago & North Western, Chicago, Ill.

In the Chicago terminal I have organized a section foremen's safety committee composed of four yard foremen. These foremen meet at my office once every month where all reports from the division and central safety committees are read. Any accidents reported by these committees are gone over and the best ways of avoiding such occurrences on our own division are considered. After all of these matters have been discussed the committee starts on an inspection of the terminal. When the inspection is finished a report is made to me as chairman of the committee, and it is surprising what these men find that I fail to see in my daily walk over the terminal. They find the foreman of each section and talk matters over with him in a friendly way, explaining how easy it would be for a man to stumble over a rail, old tie or pile of rubbish; that the push car has been left too close to the track or a foot block is missing here and there. It is interesting to note how quickly the foreman will get busy and have the repairs made before the roadmaster comes on

*Received in the contest on The Section Foreman Problem, which closed March 25, 1912.

†Received in the contest on Safety, which closed October 25, 1912.

the ground, as he realizes that he has overlooked an unsafe condition. The committee has found places where the clearance was dangerously close, such conditions being remedied at once by moving the tracks.

We actually find that our laborers are becoming educated to the "Safety First" movement and are more careful that they do not get injured in their work. They are more watchful for their fellow employees and are doing their work better as they become more familiar with the safety plan. We have one man who inspects every switch in each yard every morning, makes any necessary repairs and renews any defective foot blocking as a matter of safety. We also have one man in each yard who goes over the entire yard twice a day picking up drawbars and car doors, or any scrap he may find. When rails, frogs, switches or ties are removed from the track they must be piled a safe distance from the track and material is removed from between tracks entirely as a safety precaution.

Every roadmaster should get into the habit of talking with his foremen and laborers along these lines, saying, for example: "As a matter of safety you should fix that joint, look after the line of that track at a certain place, see that the blocking in a certain switch is replaced, or that some obstruction is removed before and not after someone is injured."

Last, but not least, the officers higher up should be the advisers to all. The danger is growing greater and greater and the good will and advice of the officials tendered the employee in the way of safe operation will do much to reduce accidents.

SNOW ENGINEERING.

By J. W. Foote,
Division Engineer, Erie, Salamanca, N. Y.

During the winter months snow is the greatest enemy to the successful operation of railways in the colder latitudes, and as such it is fought year after year. Yet, in spite of the large annual expenditure for the removal of snow and ice, no consideration seems to be given to the snow problem when new lines are constructed. Proper provision is made to prevent washouts and land slides. The drainage problem is taken care of by the construction of bridges and culverts, banks are sloped, riprap is installed, and every means is provided to prevent delays to operation. Air currents are as real and material as water currents, and in each particular location a study of them will result in determining the direction of the prevailing winter wind.

On every division the snow drifting points are known and dreaded, and it is an annual task for the maintenance officers to endeavor to maintain uninterrupted traffic from November to March. Even when the road is kept open, the cost of the removal of snow and ice and the loss due to low tonnage and slow time is enormous. With such known hazards to successful operation should it not be the policy of our railways to eliminate snow dangers during construction, instead of meeting them annually and battling with them more or less successfully?

Berm ditches are made along the upper slopes of cuts and drainage ditches at the bottom to properly carry off the water of the open season. The construction forces should also excavate ditches and throw up embankments to act as permanent snow bunkers where it is known that the track will be swept with winter winds that will surely pile the snow in huge drifts to stop or seriously delay traffic and reduce tonnage. All timber should be conserved along the property with a view of using the natural resources for the deflection of the winds and the prevention of drifts, and in some cases trees and hedges should be planted where the sweep of the wind is unobstructed. It would repay railways about to be constructed through a country subject to snow, to have a winter study made in addition to the usual location, with a view to avoiding serious snow conditions.

We are all familiar with the problem presented when a cut drifts full of snow. Preventive remedies could have been applied during construction by removing the side hill bank entirely or by conserving the timber adjoining the cut, yet in few cases are these means used. The expense of making such provisions after construction is the chief deterrent, and our railways are content to use such means as they have at hand to keep trains moving. The rotary snow plow has eliminated many of the serious delays of the past and modern methods are now in use at terminal points, yet we see the old methods of the broom and salt used by a great army of men as of old.

Reduction of unit costs at last has become recognized by a rather extravagant railway world as necessary and essential for economical operation, but nevertheless the huge army of snow fighters are engaged in the annual battle with the elements. The snow army should be reduced. In many terminals the force has been cut in two by the steam heating of switches and by the use of hydro-carbon. Hydro-carbon is particularly effective at interlocking plants, in moderate snows. Moderate snows at terminals where switching movements are frequent are as serious as severe storms are on the line. Interlocking plants are kept open by ordinary means with the greatest difficulty in a drifting storm, but a small force of men using hydro-carbon to burn out the snow can keep a plant in operation when a large force armed with brooms would be almost powerless.

Steam heating of switches is a powerful and efficient automatic snow remover, and can be used with effect in terminals where an ample steam plant is available. By its use the points are kept clear of snow and in perfect working order. The expense of installing and the removal and storage each spring is offset by the saving effected during the winter months.

Both methods are used successfully and their application should be general in busy terminals. The impracticability of their use at outlying points, however, demands that a more serious study of the prevailing winds be made and the application of the remedy to permanently deflect, as far as possible, the drift bearing winter winds. Years of battling with snow should be a strong argument for the recognition during location of the importance of making proper provision in the construction of a new railway for means to eliminate as far as possible the snow hazards now encountered.

THE FOREMAN PROBLEM.*

By V. P. Drugan,
Assistant Supervisor, Baltimore & Ohio, Philadelphia, Pa.

The railways will have to make their own foremen from the material at hand, and the factors that enter into this are efficient methods in track work; organization and rewards. In standardizing methods of work, it will be found that one foreman on every supervisor's territory is able to do work of some certain kind in a better and quicker manner than the foreman of the adjoining section, while this last mentioned foreman is superior to the first foreman in some other branch of track work. Obviously, if there were a medium of exchange by which the foremen could acquire the best methods of each other, gradually eliminating the poor methods, both the foremen and the companies would be benefited. It is suggested that a supervisor's assistant could make studies and comparisons of these methods so that eventually there would be a standard method for performing each item of track work. On every section there are generally several men whose ability and industry surpass that of the others. The best one of these should be given an increase of from 20 to 25 per cent. above the others, with the title and duties of leading laborer or assistant foreman. After he has received sufficient training in this position, and as the opportunity arises through increase in force, he should be transferred

*Received in the contest on the Section Foreman Problem, which closed March 25, 1912.

to an extra gang made up of the pick of the men on the subdivision. This gang would form an admirable nucleus for expansion during the busy seasons, and this increase would offer ample opportunity to study the ability of the men in handling others, as the foreman would have to depend upon them to a large extent in handling the large force of green men. At the time of force reduction, the former green men should be culled over, and the good ones distributed to various sections.

The matter of rewards can be handled by the railways by a more liberal policy toward the men in the way of passes. A man who has qualified for the extra gang should be given a card pass good over his sub-division, and when he becomes a foreman a pass for himself and family would go a long way towards insuring a satisfied, contented man.

The operation of this method would increase the rating of that portion of the extra gang under observation for foremen and would add to the cost of supervision. An economic study, however, will show that the results of the studies of the assistant supervisors will eventually make for a saving of labor and an increase in efficiency more than sufficient to justify this increased cost.

ANNUAL CONVENTION OF THE AMERICAN RAILWAY ENGINEERING ASSOCIATION.

The "stated meeting" of the Railway Signal Association will be held at the Congress hotel, Chicago, March 17, while the fourteenth annual convention of the American Railway Engineering Association will be held at the same place on March 18-21, inclusive. The various committees of the Railway Signal Association will present progress reports at the meeting on the first day, while on the three following days, 19 regular and two special committees will present reports to the latter association. A new feature of the convention of the Engineering Association will be a reception by the president and officers in the Gold room of the hotel to the members and guests. The annual banquet will be held on Wednesday evening. Another new feature this year is the extending of the convention to cover four days. The regular sessions will conclude on Thursday afternoon as formerly, and Friday will be devoted to the inspection of the exhibits of the Railway Appliances Association.

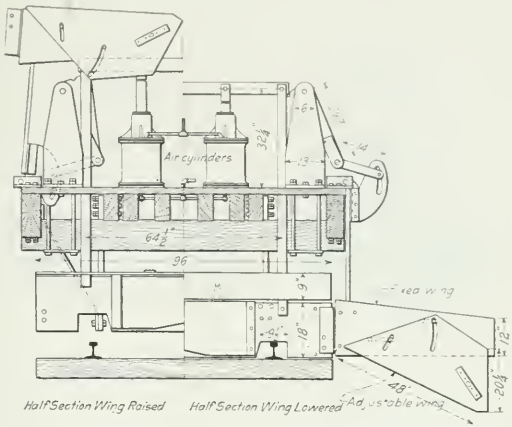
The annual exhibit of road, track and signal appliances in connection with this convention will be held at the Coliseum and the Armory during the entire week beginning Saturday, March 15. From the large number of reservations for space made to date, it is expected that this exhibit will exceed that of any previous year, both in number of exhibitors represented and in space occupied.

THE CAFFERTY-MARKLE BALLAST SPREADER.

A new spreader for distributing ballast was used at various points on the eastern lines of the Atchison, Topeka & Santa Fe last summer with satisfactory results. It is designed to follow an ordinary ballast plow to remove the larger portion of the material remaining between the rails, to throw the ballast off the ends of the ties outside of the rail and to shape the shoulder. The spreader is built on a flat car, carrying an ordinary ballast plow.

The middle portion extends down between the rails almost to the top of the ties with two independent wings over the ends of the ties. It is operated by air from two vertical cylinders placed on the platform of the car, which are directly connected to the train line. When in use the central portion is held in place by vertical rods extending through the cross beam of the car body to heavy timbers supporting the floor. When out of service it is raised vertically clear of the rails by the air cylinders. The side wings are operated separately from the center board and are adjustable vertically and horizontally. When not in use they are revolved about bell cranks on the platform and fold back over the air cylinders. When working on double track, the inner wing can be replaced with a longer one to level off the material between the tracks.

This spreader has been used in both stone and gravel ballast,



Half Sections of the Cafferty-Markle Spreader.

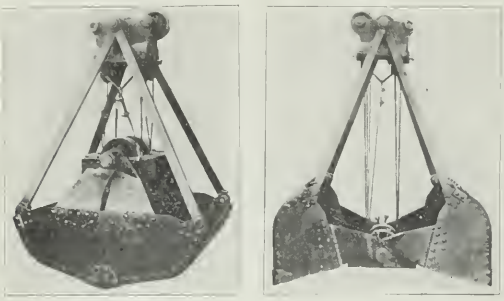
and it is said that it removes more than 80 per cent. of the material from between the rails and off the ends of the ties. The actual saving in the handling of ballast is estimated at from 15 to 25 per cent., depending on local conditions. The records which have been kept for comparative purposes so far, indicate that

The Spreader Working In Stone Ballast.

this saving per mile of single track ballasted may reach as high as $65. This spreader has been developed and patented by J. F. Markle, Chanute, Kan., and T. S. Cafferty, Union, N. Y.

A NEW STYLE BUCKET.

A new style bucket has recently been brought out for use in extra heavy digging, such as iron ore, slag, rock, clay, etc. This bucket has been constructed with a view to low maintenance cost. The shells consist of plates fastened together with angles. The sheaves are placed at right angles with the top and bottom castings, thereby forming a housing which prevents the rope from



Closed. Open.

New Browning Bucket.

running off. The cable is reeved so that the load is on the center sheave in preference to the outer ones. The large main bearings are of steel with bronze bushings. This bucket is made in the ordinary sizes and is manufactured by the Browning Engineering Co., Cleveland, O.

NOTES ON ANALYSIS AND TESTING OF COAL TAR CREOSOTE.*

By L. B. Shipley,
Barrett Manufacturing Co.

This paper deals with three subjects which are under investigation in the research laboratories of the Barrett Manufacturing Company: Distillation tests of oils, comparative volatility of oils and extraction of oils from treated wood. The distillation tests compare the three methods which embrace the various types of distillation: American Railway Engineering Association retort methods, described in Bulletin 65 of the association; National Electric Light Association, report of committee on Preservative Treatment of Poles and Crossarms, 1911; and Forest Service of the Department of Agriculture, described by Dean & Bateman, circular 112, "Analysis and Grading of Creosotes." The retort method and that of the N. E. L. A. give approximately the same results, while the Forest Service method gives considerably more distillate at 200 deg., 210 deg. and 235 deg. than do the others, a result which might be expected.

S. R. Church, in the Proceedings of 1912, page 117, described a series of tests to determine the relation that exists between the evaporation of an oil and its distillation range. These tests have shown that the relative evaporative loss from an open dish and from treated wood is comparable. The next logical step, and one which we are now arranging to carry out, is to make use of an experimental cylinder for a similar series of tests, and thus closely approximate conditions which are met in practice.

Through the courtesy of the United States Wood Preserving Company, Norfolk, Va., one-foot sections of a pile were treated in an experimental cylinder during April, 1912, and in November, 1912, six months after treatment, during which time the sections were exposed to laboratory conditions in gunny sacks; they were quartered, and alternate quarters reduced to fine sawdust by means of a circular rip-saw. The oil was extracted with benzol in an extraction apparatus and the benzol then removed by distillation up to 210 deg. C., with the thermometer bulb in the liquid. Six different oils were used in these tests, two coal tar creosotes, two oil tar distillates, one of 50 per cent. coal tar creosote and 50 per cent. oil tar distillate, and one paving oil. The writer would draw from the results of these tests the following conclusions: The specific gravities are increased by evaporation in all cases except the paving oil. The tar acids do not appear to have evaporated any faster than the other portions of the oil. The extraction of an oil apparently gives a fair index of its original character.

* Abstract of a paper read before the ninth annual convention of the American Wood Preservers' Association, held at Chicago, January 21-23, 1913.

SINKING GOLD IN WATERWAYS.

Tens of millions of dollars have been wasted in appropriations made by Congress for the development of impracticable river and harbor projects; here a little and there a little for the political benefit of grafting Congressmen. On the two hundred miles of the Mississippi river between the Missouri and the mouth of the Ohio we have spent $15,000,000. Yet the traffic on this part of the river, including that of St. Louis, has steadily decreased, and in 1911 it fell to 191,965 tons. The United States has spent more in improving this stretch of the Mississippi river—200 miles—than the Central Government of Germany has spent for improving the Rhine from Strasburg to the frontier of Holland, about 355 miles, on which the annual traffic reaches the enormous aggregate of 40,000,000 tons. In Germany, France and Belgium the waterways are improved for the benefit of the people and the development of commerce. In the opinion of Senator Burton "we should not consider our rivers merely as weapons with which to hold the railroads in subjection." In the general River and Harbor Bill of 1910, which called for $52,000,000, 296 out of the 391 Congressional Districts in the United States received appropriations for this purpose. The Big Sandy river and its tributaries have cost the taxpayers $1,700,000, and "the annual traffic on these streams, exclusive of timber, amounts to 2,000 tons." "In interest alone on its investment, it costs the United States $20 for every ton of freight carried on these streams. Added to this is the annual cost of maintenance of $20,000, or $10 for every ton of traffic." The improvement of the Big Sandy was undertaken to furnish cheap transportation of coal. Last year not a single ton of coal was carried on the Big Sandy system. The Hennepin Canal, Trinity River in Texas, and the Muskingum River in Ohio, are similar examples. The Missouri River between Kansas City and the Mississippi has cost the taxpayers $11,500,000. In 1910 the traffic over this stretch of navigable water aggregated about as much as two ordinary freight cars would hold.

France has expended $450,000,000 on its waterways; the River Seine carries annually about 10,000,000 tons of freight between Paris and the ports of Rouen and Havre. The United States has expended $600,000,000 in river and harbor improvements, the most of which has been thrown away. In France the government requires the railroads to charge twenty per cent. higher freight rates than the waterways, and in Belgium and Germany competition between the railroads and the waterways is regulated and controlled through government ownership of the railroads. So long as the railroads in this country are suffered to put up or put down their rates accordingly as the waterways are effective or not it is not possible that, however the waterways may be improved, they will be able to serve the alleged purposes for which they have been improved. The Interstate Commerce Commission should have the power to fix both maximum and minimum rates on all interstate water and rail transportation; the waterways should be granted terminal facilities, should issue through bills of lading, and the railroads should be required to co-operate with the waterways so that the boat lines may assume their natural position as supplemental means of transportation to our rail lines.—*New York Times.*

General News.

The Wabash Pittsburgh Terminal & West Side Belt Railroad has established a "Safety Committee," which will act in conjunction with the safety committee of the Wheeling & Lake Erie.

The man who, single handed, robbed ticket offices in daylight in New York, Buffalo, Cleveland, Pittsburgh and Philadelphia, was caught at Boston and has been sentenced to from six to ten years in the Massachusetts state's prison.

The Southern Pacific lines in Louisiana have organized a police force in charge of J. S. Webster, who has been appointed general special agent. Heretofore this service has been handled for the company by a private detective bureau under contract.

The Atchison, Topeka & Santa Fe was fined $200, and the Baltimore & Ohio $1,100 in the federal district court at Chicago on February 12, for violation of the federal hours of service law, and the Chicago & North Western was fined $200 for violation of the safety appliance law.

The Kansas Senate has adopted a resolution instructing the state public utilities commission to investigate the $100,000,000 bond issue of 1901 of the Union Pacific, and to take such action as in its judgment "may be deemed proper for the protection of the interests of the people of the state."

The general manager of the Pennsylvania Railroad has issued a circular calling attention to the necessity of special care on the part of track foremen in watching laborers who while at work on the track wear ear mufflers. With mufflers on the ears a man may not quickly hear an approaching train.

Port Nelson has been selected as the place for the northern terminus of the Hudson Bay Railway. This announcement was made by the Canadian Government at Winnipeg last week. Churchill, the rival location, has a better harbor, but Port Nelson is held to be ideal for a town site railroad terminus.

The Chicago & Alton has refused the demand of unions representing its employees at the Bloomington shops, that the working time in the shops be placed on a basis of eight hours a day, and five days a week instead of six days a week, in order that the full force may have an opportunity to obtain employment.

About 250 employees of the Lehigh Valley at Buffalo, N. Y., struck last Wednesday in response to a strike order, which, it is said, has been sent to all members of the International Association of Car Workers on the Lehigh Valley, about 2,000 men. The strikers demand shorter hours and a 20 per cent. increase in pay.

The governor of Massachusetts, in furtherance of his proposal to have a New England "railroad conference," has appointed for that purpose on behalf of Massachusetts Hon. M. P. Knowlton, of Springfield, former chief justice of the Supreme Court, and Rear Admiral F. T. Bowles, of Boston, late chief constructor of the navy.

The new "Overland Limited" express of the Chicago & North Western, announced last year, will be put in service April 1. The train will run between Chicago and San Francisco in 64 hours, and the extra fare will be $10. On the same date the new train of the Chicago, Milwaukee & St. Paul will be put on, running through in 72 hours.

The telegraphers of the Southern Railway have secured an increase in pay, said to be about 8 per cent. This announcement was made following a series of conferences said to have been facilitated by Judge Knapp, of the Commerce Court, and the acting commission of labor, G. W. W. Hangar, acting as a board of mediation under the Erdman law. The number of employees affected is said to be about 2,000.

On Thursday of last week the Delaware, Lackawanna & Western moved from Slateford Junction to Port Morris, a coal train said to be more than a mile long. The distance between these places, over the new cut-off line, is about 30 miles. The train consisted of 132 cars of coal, with three engines at the head and two at the rear. It is said that the train made "average freight speed," but the reporter very candidly adds that "the immense pull of the engines at the front of the train caused several couplings to break."

At Bridgeport, Conn., on Tuesday last, L. J. Carmalt, engineer of Maintenance of Way of the New York, New Haven & Hartford, was arrested on a charge of manslaughter, in connection with the derailment at Westport, October 3. He was released on $5,000 bail. The state's attorney proposes to have Mr. Carmalt tried with Messrs. Horn, Pollock and Woodward, who were indicted about two months ago on the same charge.

The Bangor & Aroostook announced on Monday of this week that freight would be accepted for all points on the line. Since the strike of enginemen freight had been accepted only in carload lots. President Todd, in a published statement, named various attempts to delay or wreck trains, and announced that until the authorities put a stop to outrages the early morning and late afternoon passenger trains would not be restored; neither would freight trains be run at night. The strikers denied knowledge of anything connected with the outrages and said that none of the men who had left the road were allowed to go on the property of the company except as paying passengers.

The feeling, always prevalent in legislative bodies, that a state commission can do anything that it sets out to do, has received a recent illustration in the action of the lower house of the New York legislature, at Albany, which has adopted a resolution calling on the public service commission for an inventory and appraisal of the property of the New York Telephone Company. Chairman Stevens, replying to the resolution, says that to do the work with his present force would take 28 years. If the work must be done sooner, a little appropriation of $270,000 will be needed. The Telephone company has 364 exchanges in 49 different counties of the state, together with hundreds of pay stations in towns and villages where there are no exchanges.

The Interstate Commerce Commission has published the annual report of the District Electric Railway Commission, a body which, under the direction of the Interstate Commerce Commission, regulates in certain features the operations of street railways in the District of Columbia. The chairman of this district commission is John H. Marble, secretary of the Interstate Commerce Commission. The district commission has held 37 executive sessions and eight public sessions during the year, and has received 106 complaints. These complaints deal with the usual variety of subjects well known to everybody interested in street railway regulation. The orders of the district body have to be confirmed by the national body. These orders have to do with such things as changing the time interval between street cars from 13¼ minutes to 12½ minutes. Forty-three orders were issued during the year.

Judge Mayer, in the United States District Court at New York City, February 15, authorized the appointment of a commission to go to London to take testimony concerning the action of the directors of the Grand Trunk in relation to the stoppage of work on the company's extension from Palmer to Providence, R. I. In the superior court at Concord, N. H., February 15, the Grand Trunk Railway Company filed a bill to test the legality of the Southern New England Railway Company, which was organized to build a line from White River Junction, Vt., southeastward toward Boston. The bill says that the signature of the Grand Trunk by the late Charles M. Hays, its president, is not binding on the G. T. company, but was Hays' unauthorized act. He did not have the power to bind the company to the purchase of shares of the capital stock of the proposed New Hampshire company. It is further alleged that the route set forth in the articles of agreement does not describe a route within the meaning or contemplation of the statutes.

The plans of the railways for the location of the proposed Union station in Chicago have encountered the opposition of the Chicago plan commission. A conference was held on Monday last between J. J. Turner, vice-president of the Pennsylvania Lines West, Darius Miller, president of the Chicago, Burlington & Quincy, A. J. Earling, president of the Chicago, Milwaukee & St. Paul, and B. A. Worthington, president of the Chicago & Alton, and members of the commission. The railways have selected a site for the proposed station between Adams, Jackson, Clinton and Canal streets, as described in the *Railway Age Gazette* of August 23, 1912, page 354, while the plan commission's scheme provides for the location of all new railway passenger stations south of Twelfth street. The commission's plan has been investigated by the roads for several

years, and has been rejected as impracticable. While they have practically completed plans for building on the site between Adams and Jackson streets, the plan commission declined to approve the plan of the railways, but decided to appoint a committee of five to consider the question further, and to endeavor to reconcile the two plans.

From the Chicago Inter-Ocean, December 31, 1862.

George M. Pullman, of the firm of Pullman & Moore, house raisers, is experimenting with what he calls a "palace sleeping car." The wise ones predict it will be a failure.

Fatal Accidents in New York City.

Not all of the dangerous places in the world are to be found on the railroads, although, at times, one reading American newspapers might get the impression that such was the fact. No less than 2,712 violent deaths occurred in New York City during the calender year 1912, as reported by the board of Coroners; and railroad men will be interested in some of the details of this statement, showing the causes of the deaths. Railroads seem to be much more careful of people's lives than are the people themselves. Four hundred seventy-four of these deaths were suicides; and of the other causes in the list, some of the most prominent are the following:

Accidental falls and falling articles	726	Overlying	32
Accidental burns	267	Chokcd hy food	15
Submersion	229	In subways (none in train accidents)	14
Accidentally overcome by gas	183	Explosions	14
Homicides by shooting	114	Machinery accidents	11
Automobiles	146	Kicked by horse	10
Horse drawn vehicles	108	Electric shocks	5
Surface street cars, electric	62	Accidental cutting	4
Surface street cars, horse drawn	10	On N. Y. C. & H. R. R. R.	3
Elevators	53	Accidental shooting	3
Accidental poison	52		

The number of persons killed in automobile accidents, 146, is 55 more than in the preceding year. Of the accidental falls, 97 were falls from windows, and of the 97 victims 36 were under 14 years of age. Of the 5,697 deaths reported to the coroner's office during the year, 149 were of persons never identified, and of these unidentified 64 were children.

Unfilled Tonnage of the Steel Corporation.

The report of the United States Steel Corporation shows that on January 31, 1913, the unfilled tonnage was 7,827,368 tons, compared with 7,932,164 tons on December 31, 1912, a decrease of 104,796 tons. The unfilled tonnage on November 30, 1912, was 7,852,883 tons; October 31, 1912, 7,594,381 tons; September 30, 1912, 6,551,507 tons; and January 31, 1912, 5,379,721 tons. The decrease shown last month was the first since March, 1912. The showing did not come as a surprise, for shipments during January were heavy, and it was generally known that the volume of orders was decreasing. This was partly due to the congested condition at the mills, making it impossible for them to accept new orders for early delivery.

Congestion on a Section of the Panama Railroad.

While the building of the Panama Canal has often been characterized as largely a railway traffic problem and railway men in this country have grown used to the reports from the Isthmus of exceedingly busy stretches of track, the changes in the operation of the main line of the Panama Railroad to be made on account of the removal of the construction tracks from the site of the Miraflores spillway will set a record for dense traffic on the Isthmus. The dirt trains from the south end of the Culebra cut have been crossing the site of the spillway to reach the dumps at Miraflores; but the excavation for the spillway has now so far progressed that it will be necessary to remove these tracks by the first of March. After considering the possibility of raising the tracks on bridges over the spillway this plan was abandoned and it was decided to send the dirt trains over the main line of the Panama Railroad through the tunnel at Miraflores. This tunnel is single track and in the 10 hours between 7 a. m. at 5 p. m. will be used by 6 regular passenger and 10 regular freight trains of the Panama Railroad, and during this time 80 dirt trains pass out of the south end of the cut and return into it. Approximately 175 trains will use the 1,050 ft. section of single track in 10 hours, which is at a rate of one every 3 minutes 26 seconds. A train 940 ft. long traveling at 10 miles an hour will require about 2 minutes and 20 seconds to traverse and clear the single track section, and successive trains will not be able to follow each other faster than one a minute. An interlocking plant will be built to work the switches at both ends of the tunnel.

"Safety First" on the Canadian Pacific.

The Canadian Pacific has ordered the establishment of safety committees throughout the company's lines. A sheet filled with mottoes of the "safety first" propaganda has already been prepared, in which points that have already been emphasized in the work of numerous safety committees are brought out in a new light by being written in the first person; for example:

I will not stand in front of a moving car, or engine, to board same.

I will always respect the blue flag, because the lives of my fellow-employees depend upon it.

I will not stand between the cab and the apron when coaling an engine.

I will not push a drawbar with my foot, or hands, when cars are moving, or when they are close together.

I will turn down boards with nails sticking out of same.

I will not adjust a coupler, turn an angle cock, or uncouple hose when cars are in motion.

I will not hold on to the side of a car when passing platforms, buildings, or obstructions close to the track.

I will not use 2 in. nails in building a scaffold where 4 in. nails would be safer.

I will not shove cars into a freight shed, or on team tracks, without first making sure that all men and teams are clear.

I will do all I can to stop the loss of life and lessen the injuries to my fellow-employees.

I will not kick cars into sidings, where boarding cars, or cars being loaded, or unloaded, are standing.

I will remember that it is better to let a train wait than to cause an accident.

I WILL NOT TAKE CHANCES.

I believe that Safety First is simply a habit and I will cultivate the habit.

The prevention of accidents is a duty I owe myself, my family, and my fellow-employees.

I believe that some accidents are not inevitable and I know the great majority of them can be prevented by care.

I will take out immediately sufficient accident and life insurance to protect myself and those dependent upon me.

Railway Etiquette.*

Middle Jersey is one broad grin because of the new rule of etiquette issued by the Pennsylvania Railroad for the guidance of trainmen on the division having its headquarters at Camden. It will be recalled that Caniden was long the home of Walt Whitman, and that one of his intimates in those days was a plain young railway worker. . . . The fiat has gone forth that no employee shall address a passenger as "friend," "stranger," "comrade," "brother," "sister," "neighbor," or by "any other term of this character," such, one is permitted to conjecture, as "pard," or "countess." The conversation of the railway employee with the patron of the road shall be yea, yea and nay, nay, or the equivalent; which, according to the official prescription, is to be "Sir," "Madam," or "Beg pardon."

No doubt these regulations will be obeyed with promptness and precision on through express trains; but there are a good many way trains running out of Camden; and Central Jersey, like Cape Cod, is as easy in manners as an old shoe. The first time Brakeman Bill Thompson says "Beg pardon" to his neighbor, Mrs. Sinnexson she will laugh in his face, and the book of etiquette will never again come between the pair. When the grizzled conductor whom everybody between Camden and Bridgeton has known for a lifetime, sits down a moment to rally some young woman from a way station about her new beau, like as not he will forget the book of etiquette, and call her "Sister Jennie"; and in all probability he will so far transgress the proprieties as to salute the benevolent, spectacled old gentleman from Vineland, with the easy and familiar "Hello, Doc!" Should the New England lines suddenly catch the Pennsylvania's notion of railway etiquette, journeys hereabouts would lose a good deal of their fine native flavor. It would be a pity were those amiable Cape conductors forbidden to pass a friendly word with the strange passenger whose receptive air seems to invite confidence and the jocular word.

*From numerous newspaper expressions on this absorbingly interesting topic we select that of the *Boston Transcript*.—Editor.

W. J. Lampton, of New York, sends to the *Tribune* a half dozen verses, of which we copy four:

No more we'll hear the pleasant cheer
At all the wayside stops
Of brakemen or conductors kind:
"Well, neighbor, how's the crops?"

No more the word we oft have heard
Of "Partner, how d'y' do?"
And never shall we hear again:
"Say, friend, you're looking blue."

No more today, the good old way;
The ruling now forbids,
And kindly trainmen may not ask:
"Well, sister, how's the kids?"

"Beg pardon," "Sir," or "Madam," now
The fetters of the free,
Makes travel on the P. R. R.
A cold formality.

Freight Traffic Across the Isthmuses.

The Bureau of Foreign and Domestic Commerce, Washington, has published a statement to the effect that the value of the freight carried across the isthmuses of Panama and Tehuantepec, eastbound and westbound, in the year 1912, amounted to $125,000,000. This is an estimate, based on statistics for five months ending with November, during which time the merchandise carried from the Atlantic to the Pacific over the Tehuantepec Railroad was 24½ millions; from the Pacific to the Atlantic 14⅓ millions; from the Atlantic to the Pacific over the Panama Railroad, five millions, and from the Pacific to the Atlantic over the Panama line, 3¾ millions.

For a few of the principal commodities the quantities for the five months are given, as follows:

EASTBOUND.

	Panama.	Tehuantepec.
Barley, bushels	174,914	62,088
Fish, canned, tons	3,156	5,634
Fruit, tons	3.303	2,614
Sugar, tons	.....	100,963
Wines, tons	1,424	1,863
Wool, tons	834	3,385

WESTBOUND.

	Panama.	Tehuantepec.
Iron and steel, tons	12,327	14,732
Printing paper, tons	302	587
Starch, tons	292	727
Tobacco, tons	16	604

Firemen's Wages.

The eastern railroads and the committee of their firemen have agreed to arbitrate the firemen's demands under the Erdman act. This decision followed the sending of a letter by the railroads' committee, on Tuesday last, to the government conciliators, which letter is printed below. Following the announcement that an agreement had been reached, Judge Knapp said that the firemen's committee had voted to join the other classes of employees and the officers of the railroads in asking Congress to modify the Erdman act. The railroads have selected W. W. Atterbury, vice-president of the Pennsylvania Railroad, as their member on the board of three arbitrators, and the firemen's committee has named Albert Phillips, third vice-president of the firemen's brotherhood. Mr. Phillips was born in California and began his railway service as a fireman on the Sacramento division of the Southern Pacific fifteen years ago. He was made an engineman in 1903. For the last three years he has devoted his time entirely to his position as an officer of the brotherhood.

In the course of the negotiations last week, Mr. Carter, chief of the firemen, was quoted as charging that the railroads desired to force the men to strike, for the purpose of teaching the American people that freight rates must be increased; or to secure a compulsory arbitration law; or, thirdly, to scare President-elect Woodrow Wilson by celebrating his inauguration with the biggest strike that the country has ever had. Compulsory arbitration, said Mr. Lee, would provide for a commisison which could raise wages 10 cents and then raise freight rates 20 cents, after the fashion of the acts of the coal strike commission.

Mr. Carter said the increase in pay asked for by the firemen would be only 15 per cent.; it would not be so large as had been claimed by the railroad argument. He said that they were only asking the same rates that were granted to the firemen of the western railroads in 1910. His reasons for objecting to an arbitration arranged voluntarily and not under the Erdman law were set forth as follows:

1. Awards are based on false evidence prepared by the railroads and considered by the arbitration board after hearings have been closed.

2. Testimony and documentary evidence are introduced and considered without witnesses being placed under oath, and with no legal means of penalizing witnesses for false testimony.

3. Awards are not based on testimony and evidence submitted, but on information secured by individual members of the board.

4. No opportunity is given to controvert false testimony considered by the board after hearings are closed.

Mr. Carter's charge of falsity in the records evidently is based on the statement made in the dissenting opinion of Mr. Morrissey in the engineers' arbitration.

Mr. Lee, chairman of the committee of railroad managers, replying to published statements of Mr. Carter, said that the firemen were making excessive demands because they hoped to show that they could get more out of the employers than could the engineers' brotherhood. There is keen rivalry between the two brotherhoods for membership of the engineers. The demand for two firemen on heavy engines will soon expand into a demand for two on all engines. As to false testimony, there was not a particle of testimony introduced by the railroads in the engineers' arbitration that would not have been introduced had sworn testimony been taken. The managers prefer to swear to their testimony, but past experience has shown that such procedure does not deter representatives of the Union from resorting to all kinds of sharp practice.

Letter of Railroads' Committee to Government Conciliators.

At the urgent request of you as representatives of the government, and under the strongest protest we are able to voice, the managers' committee agree to arbitrate the firemen's controversy under the Erdman act. The managers also desire to give notice at this time that they shall earnestly request that the hearings in this arbitration be open to the public.

As the managers have stood out to the limit against arbitration under the Erdman act, and as the government—or the public—is responsible for whatever the consequences may be, the managers reiterate their principal objections to the Erdman act; these were pointed out by the board of arbitration in the engineers' case:

"The responsibility which ultimately would rest upon a third member of an Erdman arbitration board was too great to impose on any one man.

"The operation of the act is to settle a dispute rather than to adjudicate a controversy.

"The arbitrators are three in number. Each side is represented by one arbitrator. It rests therefore upon the third arbitrator to bring the other two arbitrators as nearly as possible together, and if he cannot do so, he must decide between them. This is accomplished by splitting differences, and the case may be adjusted without adequate investigation of the facts involved, and the award may not rest upon a basis of equity.

"But the most fundamental defect of the Erdman act is that the interests of the public are not guarded by it."

The managers feel that the public will not tolerate a strike, and realizing their three-fold responsibility to the public, their men, and their shareholders, they only agreed to arbitration under the Erdman act when it seemed the only way to avert the calamity of a strike.

The firemen's brotherhood has no responsibility except to its members.

The question the public should seriously consider is whether, in compelling the railroads to arbitrate under a defective and inadequate law, and in thus securing temporary convenience and accommodation, they are not sacrificing their permanent welfare.

The managers' committee wishes to warn the public at this time of another and similar demand for increased wages made by the conductors and trainmen. We desire to put the public on notice as to the crisis that will confront them when these demands are considered by the railroads.

We also desire to call attention to the serious public danger of these recurring demands, backed up by repeated demands that the railroads arbitrate "under the law."

The whole situation is now in the hands of the government

and the people. They have taken it out of the hands of the managers at a time when the latter hoped to make a stand for the public good.

Proposed Physical Valuation of Railways.

The Senate committee on interstate commerce at its hearings in Washington last week on the bill, H. R. 22593, providing for a valuation by the Interstate Commerce Commission, listened to Professor John R. Commons, of the University of Wisconsin; E. W. Bemis, of Chicago; President F. A. Delano, of the Wabash; Chairman Frank Trumbull, of the Chesapeake & Ohio and the Missouri, Kansas & Texas; and L. F. Loree, president of the Delaware & Hudson. Mr. Trumbull explained in detail a number of changes in the phraseology of the bill which the railroads desire to have made. Mr. Loree pointed out the wide disparity in prevailing methods of making valuations of railroad property, as set forth in a report presented to the National Association of Railway Commissioners at Washington last November. Actual instances are shown where engineers of equal competency differ 100 per cent. in their estimates of the value of certain properties. In view of the difficulty of the task and of the fact that the Interstate Commerce Commission is already overworked, Mr. Loree proposed that the bill now pending be amended to include the following: "To enable the commission to make such investigation and report it is authorized and directed to constitute and employ a Railway Valuation Board to consist of nine members, three of whom shall be selected by the Interstate Commerce Commission, three shall be nominated to the commission by the American Railway Association, and one each to be nominated to the commission by the Chief Engineer of the United States Army, by the Chief of the Bureau of Steam Engineering of the United States Navy, and by the president of the American Society of Civil Engineers." The Senate committee on February 17 voted to report the bill favorably.

Proposed Legislation.

Both houses of the Oklahoma legislature have passed a full crew bill. It requires all freight trains to be manned with a fireman, engineer and three brakemen.

Assemblyman Jones has introduced in the legislature of New York a bill to provide for reciprocal demurrage, and to compel railroads to carry freight and deliver it on time.

A bill has been introduced in the Iowa legislature requiring that all railway locomotives be equipped with headlights of not less than 1,500 c. p., measured without the aid of a reflector.

A bill has been introduced in the legislature of Indiana to require the engines of a double-header train always to be kept together; this to prevent the second engineman from being blinded by the smoke of the leading engine.

A bill providing for an extra brakeman on all passenger trains of six coaches or more, and on all freight trains of 25 cars or more, has been defeated in the lower house of the Texas legislature.

A bill has been introduced in the Texas legislature which designates the state railroad commission as a board of arbitration, with power to settle disputes between the railways and their employees regarding wages or conditions of service.

The Farmers' Union of Texas sent to all the members of the legislature a protest against the passage of any full-crew bill. They asked that no additional burden be placed on the producers of the state. The memorial said: "We are opposed to the bill now pending that will compel the railroads to employ additional men on their trains, thereby increasing the cost of operation about $1,000,000 a year. We believe that this increased expense is unnecessary and unjustified, and we know that every increased expense of operating the railroads is borne by the farmers and producers."

A bill to require all cabooses to be 24 ft. long has been introduced in the New York legislature. The bill goes into minute particulars, specifying the number and length of the berths to be provided for the men to sleep in. After July, 1920, it will be unlawful to use a caboose not complying with the statute.

A bill has been introduced in the Illinois legislature providing for the formation of a state board of control, composed of the railroad and warehouse commissioners, the governor, the attorney general, the secretary of state, the state auditor, and the state treasurer, to have mandatory jurisdiction over security issues of all railways operating in the state.

In the Senate of the Indiana legislature, three railroad bills have been voted down; one to require the interurban roads to have a fixed signal at small stations by which passengers could stop a car; one to prevent the overloading of street cars and one requiring locomotives to be so designed that the fireman and the engineman may at all times easily see each other. This last proposition is not dead, however, and it is expected that another bill will be introduced.

The legislature of Indiana has before it a bill to require the railroads of the state to pay their employees twice a month. P. S. Ahrens, treasurer of the Lake Shore & Michigan Southern, opposing the passage of the bill, told the Senate committee that he believed a majority of the employees did not care for it. He had been informed that in New York State most of the employees are more than willing to go back to monthly payments. Many employees do not draw their wages for the first two weeks of the month but let the money rest in the paymaster's office until the end of the month. A bill for a similar purpose has been introduced in Kansas.

Senator Crawford, of South Dakota, has introduced in Congress a bill providing that federal courts shall enjoin the enforcement of state laws only under severe restrictions. It provides that no interlocutory order or decree of a federal court to enjoin the enforcement of a state law or any order by an administrative body, pursuant to state law, shall be granted except under conditions specifically stated. No injunction could be granted by any United States court until the application has been presented to a Justice of the Supreme Court or to a Circuit or District Judge, and then only after having been considered by three Judges sitting together, one of whom must be a Justice of the Supreme Court, a majority determining the question presented. No injunction can issue except upon ten days' notice; but if it is shown that irreparable loss may ensue, a temporary restraining injunction may be issued for no longer than ten days, and may be dissolved upon a proper showing by the other side. Senator Crawford aims to thwart the railroads in their litigation to prevent the enforcement of two-cent fare laws in certain states.

Sixty-six bills affecting railways have been introduced in the Colorado legislature, including a full crew bill, a headlight bill, a bill requiring the installation of automatic block signals, and a bill repealing the anti-scalping law and making railway tickets subject to assignment and sale by the holder. At a meeting last week of committees representing the Denver Chamber of Commerce, the State Retail Dealers' Association, the Denver Real Estate Exchange, the Colorado Manufacturers' Association, and the Colorado Publicity League, called to consider bills before the legislature, officers of the railways presented arguments against many of the bills, and stated that if they were passed the people could expect little progress from the railways. A telegram from E. E. MacLeod, chairman of the Western Passenger Association, stated that if the railway ticket bill were passed it would naturally mean an advance in passenger fares to Colorado, and that at a recent meeting of western lines to consider summer tourist fares to Colorado for the season of 1913, action on the subject was postponed and the proposed rates to Colorado were held up pending advice of the final outcome. Telegrams were also received from Newman Erb, president of the Denver & Salt Lake, and Darius Miller, president of the Chicago, Burlington & Quincy, expressing the hope that the legislature would see fit not to enact laws disturbing or curtailing development.

Railway Business Association.

The members of the executive committee and the advisory committee of the Railway Business Association are as follows: Executive committee, E. L. Adreon, St. Louis, Mo.; J. C. Bradley, Buffalo, N. Y.; J. S. Coffin, New York; Walter H. Cottingham, Cleveland, Ohio; O. H. Cutler, New York; William C. Dodd, Newark, N. J.; Henry Elliot, East St. Louis; Irving T. Hartz, Chicago; F. T. Heffelfinger, Minneapolis, Minn.; W. B. Leach, Boston, Mass.; E. B. Leigh, Chicago; W. H. Marshall, New York; William McConway, Pittsburgh, Pa.; W. H. Miner, Chicago; A. H. Mulliken, Chicago; Rudolph Ortmann, Chicago; W. W. Salmon, Rochester, N. Y.; J. H. Schwacke, Philadelphia;

James S Stevenson, Detroit, Mich H. H Westinghouse, New York, and W W Willits, Chicago, advisory committee, J. S. Coffin, O H Cutler, Irving T Hartz, L. B. Leigh, W H. Marshall, A H Mudiken, H H Westinghouse, W W Willits and the president and vice-president

New York Railroad Club.

The next regular meeting of the New York Railroad Club will be held February 21, and will be devoted to further promotion of the Safety First campaign A paper will be presented by J W Coon, of Baltimore, assistant to the general manager of the Baltimore & Ohio and chairman of the general safety committee of that road. It will be supplemented by lantern slide illustrations by C. W. Egan, general claim agent of the Baltimore & Ohio This will be followed by a discussion.

American Society of Civil Engineers.

At the meeting of the American Society of Civil Engineers, held February 19, two papers were presented for discussion as follows A Suggested Improvement in Bailing Water-Bound Macadam Roads, by J. L. Sheem. Assoc. M Am. Soc. C. E.; and Long-Time Tests of Portland Cement, by I. Hiroi, M. Am. Soc. C. E. These papers were printed in the *Proceedings* for December, 1912

American Institute of Consulting Engineers.

A meeting of the institute for the purpose of further discussing "Professional Relations," will be held at the Engineers' Club, New York, Tuesday, March 11, 1913, at 8 p. m. There will be an informal dinner at 6:30 p. m. at the same place.

Railway Club of Pittsburgh.

At the regular monthly meeting of the Railway Club of Pittsburgh, to be held at the Monongahela House, Pittsburgh, Pa., February 28, Gilbert E. Ryder, of the Locomotive Superheater Company, New York, will read a paper on The Operation and Maintenance of Superheater Locomotives.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and place of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—N. B. A. Nesbitt, Dixon Crucible Co., Jersey City, N. J. Meeting with Am. Ry. Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que., 2d Tuesday in month, except June, July and Aug. Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clemert H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 84 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, O-1 State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 794, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren F. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS. Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION. A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCES' ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 10-1 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Supts.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The government has filed suit in the Commerce Court against the Erie Railroad charging violation of law in granting passes to representatives of trans-Atlantic steamship companies. The steamship lines are not subject to the act to regulate commerce and they have no arrangement with the railroads for carrying freight on through bills of lading.

The five principal express companies, reporting to the Interstate Commerce Commission, in accordance with the order of the commission, have presented estimates of the probable diminution in their receipts if the reduced rates proposed by the commission were to be adopted. The estimates are based on the actual traffic carried on a single day in October last. The companies say that the losses would amount to from 22 per cent. to 31 per cent. of their gross receipts. The loss for 12 months would be several times greater than the net returns from operation for the last fiscal year. The greatest loss is said to be that on shipments weighing less than 40 lbs., and especially on those weighing less than 20 lbs. each. The companies say that a reduction on interstate traffic would force some reductions on intrastate traffic, and that if the commission's proposed scheme of reduction were applied to all of the intrastate traffic the loss would be about two-thirds that of the estimated loss on interstate traffic

The New York, Westchester & Boston, the electric road opened from New York to New Rochelle and White Plains last May, and whose officers have intelligently cultivated the friendship of the public, has issued a notice calling the attention of passengers to the fact that they may send complaints and criticisms direct to the president of the road. The notice, posted in the stations and cars, reads: "For the safety and convenience of the public it is necessary that rules be enforced. The enforcement of these rules may temporarily inconvenience a few. For the convenience of our patrons who desire to make complaints or suggestions relative to the service, station agents and conductors are provided with blanks which may be obtained on application and which when filled out and signed may be forwarded to the president." An officer of the road, speaking of the new notice, observes, with truth, that it will steady the employee in the performance of his duties. When a question arises with a passenger, both the passenger and the employee will more readily see that a prolonged argument will be unsatisfactory on both sides.

To Make New York a Way-Station?

"In our own particular branch of business the most important thing for us is to secure rebilling from New York to points beyond, on the through rate from the originating point of shipment on the same terms that are allowed the western terminals. The Pennsylvania and Lehigh Valley railroads have in a modified form made New York a rebilling point. Grain can now be rebilled from the Pennsylvania and Lehigh tracks, but not from the elevator. In practice this privilege, while incomplete, is valuable, for it somewhat enlarges our power of distribution. In principle it is admirable, for it admits our contention that New York is entitled to rebilling and those roads have the thanks of the trade. What we require is rebilling from the elevators as well as from the tracks. That would enable us to carry a stock always available for New England delivery."—*E. T. Cushing, before New York Oats Trade.*

INTERSTATE COMMERCE COMMISSION.

The commission has further suspended from February 5 until August 5 certain schedules contained in Leland's tariff, which advance rates for the transportation of fence posts from stations in Arkansas to Kansas City, Mo., and other points.

The commission has suspended from February 12, until August 12, the schedules in W. H. Hosmer's tariff which contain new rules governing allowances made by carriers for stoves and lining of cars used in the transportation of potatoes.

The commission has suspended from February 12, until June 12, the schedules in certain tariffs, which advance rates for the transportation of excelsior from St. Paul, Minn., and other points to Chicago, Kansas City, Mo., and other points.

The commission has suspended until June 14, 1913, certain tariffs which contain advances in rates on grain from certain points in South Dakota and adjoining territory to Chicago and Milwaukee, Wis., ranging from ½ to 3½ cents per 100 lbs.

The commission has suspended from February 13, until August 13, a supplement to the tariff of the Galveston, Harrisburg & San Antonio, which provides for the withdrawal of rules and regulations governing the reconsignment of lumber at El Paso, Tex.

The commission has suspended from February 18 until August 18, certain schedules in the tariff of the El Paso & Southwestern, which advance rates for the transportation of coal from Dawson, N. Mex., to certain stations located on the Wichita Falls & Northwestern.

The Interstate Commerce Commission has suspended from February 19 to August 19, a certain freight tariff filed by the Pere Marquette; supplement No. 12 to tariff No. 2594. In this tariff the road proposed to advance "break bulk" rates on grain from Milwaukee and other points to Atlantic seaboard points.

The commission has issued a notice, dated January 7, tentatively endorsing the changes made in the car demurrage rules by the American Railway Association at its last meeting, in November. The commission recommends that these rules be incorporated in all interstate tariffs, but reserves the right to inquire into the legality or reasonableness of any rule which may be complained of.

The commission has suspended until June 10, items in certain tariffs which advance rates for the transportation of brooms 10 cents per 100 lbs. in carloads from Chicago and Peoria, Ill., St. Paul, Minn., etc., Missouri River points and points in Mississippi River territory to Denver, Col., and other points taking same rates. The present rate from Chicago to Denver is $1.10 per 100 lbs., and the proposed rate is $1.20 per 100 lbs.

The commission has suspended until March 31, the schedules in supplements to the tariff of the Texas & Pacific, which advance rates 2 cents per 100 lbs. for the transportation of lumber from Alexandria, La., to New Orleans, La., when for beyond, and also advance by a like amount rates on certain kinds of lumber from Louisiana points to Cairo, Ill., St. Louis, Mo., and other points. Similar advances in tariffs of other carriers are under suspension by previous orders in the same docket.

The commission, by order No. 5518, announces that it is going to make a general inquiry into the practices of all railroads in the issuance of freight bills. Complaint has been made that unjust and unreasonable regulations are in force. The commission will inquire particularly as to whether such bills show the route, name of initial carrier, junction points, full statement of charges accruing enroute, for reconsignment, switching, storage, etc., and as to whether the bill presented to the consignee always shows the name of the consignor and the date of arrival of goods.

Complaint Dismissed.

Wichita Wholesale Furniture Company v. St. Louis, Iron Mountain & Southern et al. Opinion by the commission:

The complainant contends that the rate of 50 cents per 100 lbs. for the transportation of furniture in carloads from Fort Smith, Ark., to Wichita, Kan., is unreasonable. The commission found that the evidence was not conclusive. (26 I. C. C., 107.)

Texhoma Mill & Elevator Company v. Chicago, Rock Island & Pacific et al. Opinion by the commission.

Complainant contends that the rate of 2½ cents per 100 lbs. for the transportation of grain in carloads from Texhoma, Okla., to Texhoma, Tex., is unreasonable on the ground that the service performed is merely a switching service. The commission found that the complainant's shipments were made as through interstate movements to points beyond Texhoma, Tex., and that as the through rate was not complained of, the rate between the two points in question could not be found unreasonable. (26 I. C. C., 94.)

REVENUES AND EXPENSES OF RAILWAYS.

MONTH OF DECEMBER, 1912.

*Merged with American Express on July 1, 1912.

Reparation Awarded.

George A. Hornel & Company v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner McChord:

The commission found that the rate of 20 cents per 100 lbs. for the transportation of fresh meat and packing house products from Austin, Minn., to Chicago was unreasonable to the extent that it exceeded 18.5 cents per 100 lbs. for the transportation of fresh meat between the two points in question, and 16.5 per 100 lbs. for the transportation of packing house products. (26 I. C. C., 112.)

J. J. Newman Lumber Company v. Mississippi Central Railroad et al. Opinion by the commission:

The complainant alleges misrouting by defendant and consequent exaction of excessive charges for the transportation of 12 cars of yellow pine lumber from McCallum and Sumrall, Miss., to St. Albans, Vt., thence reconsigned to Worcester and Fitchburg, Mass., and Willimantic, Conn. The commission found that the New Orleans & Northeastern negligently routed these shipments via a route other than the cheapest available route and so deprived the complainant of the privilege of reconsignment at the joint through rate of 37 cents per 100 lbs. to Worcester, Fitchburg and Willimantic. (26 I. C. C., 97.)

C. M. Papillo v. Atlanta & West Point et al. Opinion by the commission:

The complainant contends that the rate of 93 cents per 100 lbs. for the transportation of household goods in carloads from West Point, Ga., to Waco, Tex., is unreasonable. Reparation is sought. The rate in question is not a through rate but is based on the lowest combination. The complainant called attention to the rate of 77 cents per 100 lbs. on household goods from points east of Chicago and north of the Ohio river to California and Nevada points, and also showed that the rates from West Point to Waco were lower on vehicles, furniture, cooperage, vegetables, etc., than applied on household goods. The commission found that the present rate is unreasonable to the extent that it exceeds 77 cents per 100 lbs. (26 I. C. C., 65.)

Rates on Canteloupes and Potatoes Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of canteloupes, potatoes and other fruits and vegetables from Ruston, La., and other points to Chicago and other points. Opinion by Commissioner McChord:

The defendants showed that the present rate arrangement had been reached in haphazard manner and that it needed readjustment. The commission decided that the proposed increases are reasonable. The order of suspension was vacated. (26 I. C. C., 101.)

Sugar Rate Reduced.

W. J. Echols & Company et al. v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

The complainant contends that the carload rates on sugar via sea-and-rail route from points in Atlantic seaboard territory to Fort Smith, Ark., are unreasonable. These rates vary from 45 to 50 cents per 100 lbs. The commission found that these rates were unreasonable and prescribed lower rates for the future. The new rates are in each case six cents lower than the rates now in effect. (26 I. C. C., 110.)

Pulp Wood Rates Reduced.

Rhinelander Paper Company v. Minneapolis, St. Paul & Sault Ste. Marie. Opinion by the commission:

The complainant contends that the rate of 6 cents per 100 lbs. for the transportation of pulp wood in carloads from Trenary, Delta Junction and Manistique, Mich., to Rhinelander, Wis., and the rate of 7½ cents per 100 lbs. for the transportation of pulp wood in carloads from Whitedale, Bovee and Christiansen Spur, Mich., to Rhinelander are unreasonable. The complainant contends that as Ladysmith, a point 87 miles west of Rhinelander, enjoys a differential of one cent under Rhinelander on movements from Minnesota, Rhinelander should be accorded an equal differential under Ladysmith on movements from Michigan. The defendants concede that Rhinelander is entitled to a differential of one cent under Ladysmith on traffic from Michigan points and have recently published tariffs naming the same rate of 6 cents per 100 lbs. from the first three stations, but reducing the rate of 7½ cents per 100 lbs. from the latter three stations to 6½ cents per 100 lbs. and making the rate to Ladysmith from all these stations a differential of one cent higher than to Rhinelander. The commission found that the rates now in effect are not unreasonable. Reparation was awarded on shipments which moved from the latter three stations under the rate of 7½ cents per 100 lbs. (26 I. C. C., 104.)

Common Brick Rates Not Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of building brick and other articles in carloads from Orchard Park and Jewettville, N. Y., to Canadian points. Opinion by Commissioner McChord:

The advances complained of in the tariff average about 35 cents per ton and in some cases are as high as 65 cents per ton. The defendants contended that the commission in the *Stowe Fuller case*, 12 I. C. C., 213, ruled that all classes of brick should take the same rate. The commission declared, however, that that case did not relate to common brick and that common brick should enjoy a lower rate than paving and fire brick. The commission decided that the defendants did not show that the proposed increases were reasonable and ordered them to withdraw the suspended tariffs. (26 I. C. C., 129.)

Mixed Carload Rate.

West Point Manufacturing Company v. Chattahooche Valley et al. Opinion by the commission:

The complainant contends that the provision of the defendant's tariff governing the shipment of cotton duck and denims from southeastern territory to Pacific coast terminals is unreasonable, in that it prohibits the shipment of mixed carloads of cotton duck and denims with cotton sheeting, drills and bagging. The commission found that all these goods were shipped in the same kind of packages and that duck and drills weighed about the same to the carload and took the same rates. The commission decided that the rule in question was unreasonable insofar as it deals with mixed carloads of duck and drills, and ordered that in future the rate on mixed carloads of cotton duck and cotton drills should be the carload rate. Reparation was awarded. (26 I. C. C., 79.)

STATE COMMISSIONS.

Myer Hurley, a member of the Public Utilities Commission of Kansas, is general chairman of the Brotherhood of Locomotive Engineers for the Atchison, Topeka & Santa Fe, a position which he has held for fourteen years. The *Santa Fe Magazine* for February contains a portrait of Hurley. He was appointed commissioner January 23, last. For six years Mr. Hurley was chairman of the board of trustees of the grand lodge of his brotherhood. He began railway service in 1879 as a fireman on the Louisville & Nashville, and has been on the Santa Fe 25 years.

COURT NEWS.

In the federal court at Trenton, N. J., February 14, the government filed a suit against the Delaware, Lackawanna & Western Railroad and the Delaware, Lackawanna & Western Coal Company, charging violation of the anti-trust law in the agreement between the two defendants for marketing coal. The government charges that the railroad by its great facilities, resources and power is able to buy so much of the coal produced by independent operators that it can control the price of more than 90 per cent. of the entire production along its lines, so that at non-competing points it can arbitrarily fix the price of all anthracite coal. The business of the railroad is declared to have been immensely profitable, the majority of the stock of the company being held, in large blocks, by less than twenty-five individuals. A still smaller number of men dominates its affairs by their unity of purpose and effort.

The suit will be of interest to all anthracite roads. Besides the Lackawanna, the Lehigh Valley has organized and distributed the stock of a coal sales company in the same way. The Delaware & Hudson sells its coal to the Hudson Coal Company, but the stock of the latter is owned by the D. & H. The Reading is believed to be liable to attack by the government under both the Sherman law and the commodities clause of the Interstate Commerce law.

Railway Officers.

Executive, Financial and Legal Officers.

James Imbrie, vice-president of the Brinson Railway, with office at New York, has been elected chairman of the board and John H. Hunter has been elected vice-president. The general offices will be transferred from Springfield, Ga., to Savannah.

Operating Officers.

G. B. Perdue has been appointed trainmaster of districts 27 and 28 of the Grand Trunk, with headquarters at Durand, Mich.

A. Syverson has been appointed superintendent of the Ann Arbor, with office at Owosso, Mich., to succeed W. D. Holliday, resigned; effective February 14.

A. B. Warner has been appointed superintendent of the Chicago, Rock Island & Gulf, with headquarters at Ft. Worth, Tex., succeeding C. L. Ruppert.

John W. Walters has been appointed trainmaster and roadmaster of the St. Louis, Brownsville & Mexico, with office at Kingsville, Tex., succeeding E. S. Heyser, resigned.

J. H. Reich, car accountant of the New Orleans, Texas & Mexico, has been appointed superintendent of that road, and the St. Louis, Brownsville & Mexico, with headquarters at Houston, Tex.

C. J. Wilson has been appointed superintendent of the Duluth, Winnipeg & Pacific, with headquarters at Virginia, Minn., to succeed C. W. Houston, resigned to engage in private business.

E. S. Heyser, trainmaster and roadmaster of the St. Louis, Brownsville & Mexico, has been appointed general superintendent of the San Benito & Rio Grande Valley, with headquarters at San Benito, Tex.

S. P. Coughlin has been appointed assistant superintendent of the Houston East & West Texas and the Houston & Shreveport, with headquarters at Houston, Tex., succeeding H. J. Micksch, transferred.

G. C. Randall has been appointed superintendent of transportation of the Colorado & Southern, in charge of freight and passenger train movements, car distribution and assignment of locomotives, with headquarters at Denver, Colo.

C. L. Ruppert, superintendent of the Chicago, Rock Island & Gulf at Ft. Worth, Tex., has been appointed superintendent of the Oklahoma division of the Chicago, Rock Island & Pacific, with office at El Reno, Okla., in place of J. McGie, deceased.

F. M. Conner, assistant trainmaster of the Cincinnati, Hamilton & Dayton, at Hume, Ill., has been appointed trainmaster, with headquarters at Indianapolis, Ind., succeeding E. W. Hoffman, promoted, and C. W. Havens succeeds Mr. Conner.

J. A. Sormerville, superintendent of terminals of the Missouri Pacific at Kansas City, Mo., has been appointed superintendent of transportation of that road and the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, Mo. He succeeds E. F. Kearney, who recently was made general superintendent of transportation of the Missouri Pacific system.

J. P. Burrus, superintendent of the Fort Worth division of the International & Great Northern, at Mart, Tex., has been appointed superintendent of the Gulf division, including Taylor sub-division, with headquarters at Palestine, succeeding T. C Radey, resigned; and S. E. Burkhead, inspector of transportation and stations of the Texas & Pacific, has been appointed superintendent of the Fort Worth division of the International & Great Northern, with headquarters at Mart, succeeding Mr. Burrus.

C. E. Hix, car accountant of the Seaboard Air Line at Portsmouth, Va., has been appointed to the new position of superintendent of transportation. The assistant general manager will in future have jurisdiction over the maintenance of way, operating and telegraph departments, and the following officers will report to and receive instructions from him: Engineer maintenance of way, superintendent of transportation, superintendent of telegraph, car accountant, fuel inspector and division superintendents on all except maintenance of way matters, upon which they will report to the engineer maintenance of way.

Frederick H. Hammill, division superintendent of the Chicago & North Western at Boone, Iowa, has been appointed assistant general superintendent, with office at Boone, with jurisdiction over the East Iowa, West Iowa, Iowa & Minnesota, Northern Iowa and Sioux City divisions. F. J. Byington, assistant division superintendent at Baraboo, Wis., has been appointed superintendent of the West Iowa division, with headquarters at Boone, Ia., in place of Mr. Hammill. J. W. Layden, trainmaster at Baraboo, succeeds Mr. Byington as assistant superintendent of that place. J. H. Hull succeeds Mr. Layden as trainmaster. J. S. Rice has been appointed trainmaster of the East Iowa division at Belle Plaine, Iowa, in place of A. Syverson, resigned.

John A. Shepherd, whose appointment as superintendent of terminals of the Missouri Pacific at Kansas City, Mo., has been announced in these columns, was born April 21, 1874, at Homer, Ill. He was educated in the common schools and began railway work in September, 1893, as a telegraph operator for the Wabash, remaining with that road for ten years as train despatcher and chief despatcher. He was then until October, 1905, assistant superintendent for the Terminal Railroad Association of St. Louis, in charge of freight movement. On the latter date Mr. Shepherd became superintendent of the Western Maryland, with headquarters at Hagerstown, Md., and in May, 1911, he was promoted to general manager, with office at Baltimore, Md., which position he held until February 1 this year, when he was appointed superintendent of terminals of the Missouri Pacific, as noted above.

W. A. Cooper, whose appointment as manager of sleeping, dining and parlor car and news service of the Canadian Pacific, with office at Montreal, Que., has been announced in these columns, was born on March 22, 1871, at Montreal. He began railway work in February, 1886, as secretary to assistant general manager of the Grand Trunk, and in June, 1891, was appointed chief clerk in the office of the general superintendent of the Eastern division of the Canadian Pacific. Three years later he was made inspector of sleeping, dining and parlor cars and news service of the Canadian Pacific, and in July, 1897, was made assistant superintendent of the same department. In December, 1905, he was promoted to superintendent, and in August, 1908, became general superintendent, which position he held at the time of his recent appointment as manager of the same department, as above noted.

Stanley Saunders Russell, whose appointment as general superintendent of transportation of the Central Vermont, with headquarters at St. Albans, Vt., has been announced in these columns, was born on October 18, 1874, at Rednersville, Ont., and was educated in the public schools and at Belleville College. He began railway work in November, 1891, in the office of the assistant superintendent of the Grand Trunk at Belleville, and the following year was transferred to Toronto. In August, 1896, he was appointed secretary to the superintendent at Toronto, and in March, 1898, he became chief clerk to the joint superintendent of the Grand Trunk and the Wabash at St. Thomas. From June to December, 1902, he was private secretary to the vice-president and general manager of the Central Vermont at St. Albans, and from January, 1903, to December of the following year was chief clerk to the superintendent of transportation, and then became chief clerk to the general manager. In October, 1911, he was made

S. S. Russell.

superintendent of car service, which position he held at the time of his recent appointment as general superintendent of transportation of the same road, as above noted.

Clinton Lloyd Bardo, assistant to general manager of the Lehigh Valley, at South Bethlehem, Pa., has been appointed general manager of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., succeeding B. R. Pollock, resigned. Mr. Bardo was born at Montgomery, Pa., in 1867, and began railway work in 1885 as an operator on the Pennsylvania Railroad. The next year he worked as operator on the Philadelphia & Reading and then went to the Tidewater Oil Co. as operator and supply agent in the construction department at Mauch Chunk, Pa. In 1887 he went to the Lehigh Valley as operator, and was later made train despatcher. In 1892 he was appointed assistant trainmaster of the Wyoming division and after a few months was made trainmaster of that division. He was transferred to the New York division in 1901, and in 1904 went to the New York, New Haven & Hartford as freight trainmaster of the New York division. He was appointed assistant superintendent of this division in 1905, and on June 1, 1907, was appointed superintendent of the Grand Central Station and Electric division of the New York Central & Hudson River, leaving that road on March 15, 1911, to become assistant to general manager of the Lehigh Valley, with headquarters at South Bethlehem, Pa., which position he held at the time of his recent appointment as general manager of the New York, New Haven & Hartford, as above noted. Mr. Bardo has been appointed also general manager of the Central New England.

S. E. Burkhead, who has been appointed superintendent of the Fort Worth division of the International & Great Northern, with headquarters at Mart, Tex., was born on July 24, 1873, at Sparta, Tenn., and was educated at Southwestern University, Georgetown, Tex. He began railway work with the International & Great Northern on May 15, 1889, as machinist apprentice, and remained in the service of that company until December, 1909, holding the positions of locomotive fireman, locomotive engineman, inspector of transportation for the entire line, assistant superintendent, Gulf division, and chairman of the rule committee introducing the rules of the American Railway Association. From December, 1909, to September, 1911, he was with the Denver & Rio Grande, first as assistant superintendent of the First division Colorado lines, and then as superintendent of the Salt Lake division, Utah lines. In December, 1911, he went to the Texas & Pacific as trainmaster, Eastern division, and was later chairman of the rule committee, introducing the rules of the American Railway Association, and then superintendent of terminals at Fort Worth, Tex., until his appointment as inspector of transportation and stations of the same road, which position he held at the time of his recent appointment as superintendent of the Forth Worth division of the International & Great Northern, as above noted.

S. E. Burkhead.

F. M. Melin, division superintendent of the Chicago, Milwaukee & St. Paul at Milwaukee, Wis., has been transferred to Aberdeen, S. D., as superintendent of the Hastings & Dakota division, succeeding J. T. Gillick, promoted. J. M. Oxley, division superintendent at Chicago, has been appointed division superintendent, with headquarters at Ottumwa, Iowa, in place of J. A. MacDonald, who has been appointed superintendent of the Northern and LaCrosse divisions, with headquarters at Milwaukee, succeeding Mr. Melin. E. W. Morrison, assistant division superintendent at Milwaukee, succeeds Mr. Oxley as superintendent of the Chicago division. N. P. Thurber has been appointed assistant superintendent of the Prairie du Chien and Mineral Point divisions, with office at Milwaukee. W. B. Foster, superintendent at Tacoma, Wash., has been appointed general superintendent of the Puget Sound lines, with headquarters at Seattle, Wash. P. C. Hart, who formerly was general superintendent of the Chicago, Milwaukee & Puget Sound, and who recently was promoted to general manager of the Chicago, Milwaukee & St. Paul lines east of the Missouri river, with headquarters at Chicago, has been in the service of the St. Paul road since 1876. He began railway work as section man, and has since filled the positions of telegraph operator, station agent, brakeman, conductor, chief clerk in the superintendent's office, trainmaster, superintendent of terminals, division superintendent, superintendent of construction, and general superintendent, until his recent promotion as general manager on February 1. J. T. Gillick, whose appointment as assistant to the general manager, with office at Chicago, has already been announced, was born in June, 1870, at Glencoe, Minn. He began railway work in 1884 with the Chicago, Milwaukee & St. Paul, and has been successively telegraph operator, train despatcher, trainmaster and division superintendent.

P. C. Hart.

Traffic Officers.

John Gray has been appointed a freight agent of the Grand Trunk, with office at Toronto, Ont.

J. B. DeCamara has been appointed commercial agent of the International & Great Northern, with office at Laredo, Tex.

F. Duval Armstrong has been appointed general agent of the Frisco Lines at New Orleans, La., succeeding I. T. Preston, deceased.

C. H. Pearson has been appointed assistant general freight agent of the Alabama Great Southern, with headquarters at Birmingham, Ala.

J. T. Baird has been appointed commercial agent of the Central of Georgia, with office at Oklahoma City, Okla., succeeding Tinsley Smith, transferred.

J. O. Goodsell, traveling passenger agent of the Union Pacific, with headquarters at Detroit, Mich., has been appointed city passenger agent at Chicago.

Gordon Edwards has been appointed traveling freight agent of the Delaware & Hudson Company, with office at Pittsburgh, Pa., succeeding F. C. Snyder, deceased.

W. F. Freeman has been appointed soliciting freight agent of the Georgia Southern & Florida, with office at Atlanta, Ga., succeeding W. B. Butler, resigned.

E. L. Kemp, assistant superintendent of the Illinois Central at Louisville, Ky., has been appointed local freight agent at Chicago, succeeding L. F. Barron, resigned.

L. K. Bemis has been appointed traveling freight and passenger agent of the Illinois Central, with headquarters at Salt Lake City, Utah, succeeding R. E. Watson, resigned.

J. A. Sullivan, local freight agent of the Wabash at Detroit, Mich., has been appointed division freight agent, with office at Detroit, succeeding E. H. B. Cull, deceased. Effective February 15.

Joseph L. Sheppard has been appointed assistant general freight agent of the Illinois Central and the Yazoo & Missis-

sippi Valley, with headquarters at Memphis, Tenn., to succeed Fred H. Law, transferred.

F. W. Robinson, assistant to director of traffic on the Harriman Lines, with office at Chicago, has been appointed assistant traffic manager of the Oregon-Washington Railroad & Navigation Company, with headquarters at Portland, Oregon.

Fred H. Law, assistant general freight agent of the Illinois Central and Yazoo & Mississippi Valley, at Memphis, Tenn., has been appointed assistant general freight agent, with headquarters at St. Louis, Mo., succeeding J. S. Weitzell, who has been granted leave of absence on account of ill health.

E. S. Johnson, commercial agent of the Macon, Dublin & Savannah, at Miami, Fla., has been appointed commercial agent, with office at Jacksonville, succeeding M. H. Dorsett, resigned to accept service with another company. W. F. Mundee has been appointed contracting freight agent, at Jacksonville. The office of commercial agent at Miami has been abolished, but the commercial agent at Jacksonville will have an office in Miami during the perishable season.

Edward Emery, traveling passenger agent of the Baltimore & Ohio at Denver, Colo., has been appointed traveling agent of the passenger department, with headquarters at Baltimore, Md., and he will now be an inspector of passenger service. He will inspect and report on passenger and ticket offices, station buildings and train service, as well as the prompt and careful handling of baggage. He will inculcate ideas as to neatness, and as to alertness to the interests of travelers and in presenting the advantages of the Baltimore & Ohio. Mr. Emery entered Baltimore & Ohio service in the baggage department at Pittsburgh in October, 1903, and was later advanced to ticket clerk and city ticket agent there.

In addition to the representatives local to the Union Pacific, Oregon Short Line and Oregon-Washington Railroad & Navigation Company, comprising the Union Pacific System, the following will solely represent Union Pacific System Lines: Willard Massey, New England freight and passenger agent, Boston, Mass.; E. A. Shewe, general agent, Butte, Mont.; W. H. Connor, general agent at Cincinnati, Ohio, and Cleveland; J. W. Turtle, traveling passenger agent, Des Moines, Ia.; J. C. Ferguson, general agent at Detroit, Mich.; H. O. Wilson, general agent at Los Angeles, Cal.; L. L. Davis, commercial agent, Milwaukee, Wis.; H. F. Carter, district passenger agent, and D. M. Collins, district freight agent, both with headquarters at Minneapolis, Minn.; J. B. DeFriest, general eastern agent at New York City; H. V. Blasdel, agent of the passenger department, and A. V. Stevenson, agent of the freight department, both with headquarters at Oakland, Cal.; J. C. Percival, agent at Olympia, Wash.; S. C. Milbourne, general agent at Philadelphia, Pa.; J. E. Corfield, general agent at Pittsburgh, Pa.; L. M. Tudor, commerical agent, Pueblo, Colo.; B. F. Owlsey, agent at Port Townsend, Wash.; A. J. Dutcher, general agent at St. Louis, Mo.; James Warrack, district freight and passenger agent, Sacramento, Cal.; S. F. Booth, general agent at San Francisco, Cal.; F. W. Angier, agent of the passenger department, and L. M. Cheshire, agent of the freight department, both with headquarters at San Jose, Cal.; J. B. Courtright, traveling freight and passenger agent, Vancouver, B. C.; W. C. Knowles, traveling passenger agent, with headquarters at Cincinnati, in place of W. T. Holly, resigned, to go with another company.

Engineering and Rolling Stock Officers.

J. V. Murphy has been appointed roadmaster of the Houston & Texas Central at Ennis, Tex., in place of L. Acker, resigned.

C. R Diemar has been appointed assistant engineer of the Baltimore & Ohio Southwestern, with office at Cincinnati, Ohio.

H. H. Gibson has been appointed chief engineer of the New Orleans Southern & Grand Isle, with headquarters at Algiers, La.

F. E. Watson has been appointed division engineer of the Chicago, Rock Island & Pacific at Trenton, Mo., succeeding R Johnson.

Watson Townsend has resigned as assistant engineer of the Union Pacific, with headquarters at Omaha, Neb., to accept the position of city engineer of Omaha.

R. C. Hyde has been appointed master mechanic of the Louisiana division of the Chicago, Rock Island & Pacific, with headquarters at El Dorado, Ark., succeeding H. J. Osborne, resigned.

J. G. Sheldrick, resident engineer of the Minneapolis, St. Paul & Sault Ste. Marie at Superior, Wis., has been appointed division engineer of the Superior-Duluth division, with headquarters at Superior.

H. H. Eggleston, assistant supervisor of bridges and buildings of the Baltimore & Ohio Chicago Terminal at Chicago, has been appointed supervisor of bridges and buildings of the Chicago Great Western at Des Moines, Iowa.

A. H. Hogeland, chief engineer of the Great Northern, has been appointed consulting engineer, with headquarters at St. Paul, Minn. R. Budd, assistant to the president, succeeds Mr. Hogeland as chief engineer, with office at St. Paul.

T. A. Summerskill has been appointed superintendent of motive power of the Central Vermont, with office at St. Albans, Vt.; and J. E. Fitzsimons, acting superintendent of motive power, at St. Albans, has been appointed master mechanic, with office at St. Albans.

H. E. Smith has been appointed general signal foreman of the terminals of the Louisville & Nashville and the Nashville, Chattanooga & St. Louis, at Nashville, Tenn., succeeding J. H. Clark, signal inspector, resigned, and the office of signal inspector is abolished.

H. R. Carpenter, assistant engineer of the Missouri Pacific at St. Louis, Mo., has been appointed engineering maintenance of way, with headquarters at St. Louis, Mo. F. K. Bennett, assistant engineer at St. Louis, has been transferred to Kansas City, Mo., in a similar capacity.

The office of chief enginer of the Kansas City, Mexico & Orient, formerly held by W. W. Colpitts, has been abolished. H. B. Holmes has been appointed resident engineer, with headquarters at Kansas City, Mo., and will have jurisdiction over matters pertaining to the engineering department.

B. R. Kulp has been appointed acting division engineer of the Chicago & North Western at Antigo, Wis., succeeding W. J. Jackson, who has been transferred to Madison, Wis., as division engineer in place of S. S. Long, who succeeds W. T. Main as division engineer at Chicago. Mr. Main will engage in private business.

P. D. Galarneau, superintendent of the St. Louis, Mo., shops of the Armour Car Lines, has been transferred to Meridian, Miss., in charge of the shops, also of the New Orleans and Mobile repair forces, succeeding A. B. Chadwick, resigned. C. H. Taylor, superintendent of the South Omaha, Neb., shops, succeeds Mr. Galarneau, and J. C. Rowe succeeds Mr. Taylor.

W. E. Anderson, master mechanic of the Colorado & Southern at Trinidad, Colo., has been transferred to Denver, Colo., as master mechanic of that road and the Atchison, Topeka & Santa Fe, succeeding H. W. Ridgway, who has been appointed superintendent of motive power, with office at Denver, Col., in place of H. C. Van Buskirk, who has resigned on account of ill health. J. M. Davis succeeds Mr. Anderson as master mechanic at Trinidad.

F. P. Sisson, resident engineer of the Grand Trunk at Detroit, Mich., has been appointed assistant engineer, and H. G. Batten has been appointed supervisor of bridges and buildings, both with headquarters at Detroit. O. H. Sessions has been appointed assistant engineer and G. Sanders has been appointed supervisor of bridges and buildings, both with headquarters at Battle Creek. The position of roadmaster having been abolished, the following now have the title of supervisor of track: H. Plowman, at Milwaukee Junction, Mich.; J. Mullen, Durand; J. Lockert, Grand Rapids; C. Hawkins, Pontiac; J. Nolan, Valparaiso, Ind.; J. Cotter, Battle Creek, Mich., and F. Tranzow, at Durand.

F. T. Chase, who recently was appointed master mechanic of the Missouri, Kansas & Texas Railway of Texas, with headquarters at Smithville, Tex., was born at Atlanta, Ga., August 25, 1862. He was educated in the common schools, and after serving an apprenticeship as millwright and machinist, began railway work in October, 1881, as a locomotive fireman on the Texas & Pacific. From April, 1882, to September, 1887, he was

engaged in other business, on the latter date re-entering service as a machinist for the Missouri, Kansas & Texas of Texas. He was a locomotive engineer on that road for ten years from August, 1889, and a locomotive fireman from May, 1899, to August, 1900. He was then promoted to foreman of machinery at Smithville, Tex., which position he held until his appointment as master mechanic, as noted above.

William Garstang, superintendent of motive power and master car builder of the Cleveland, Cincinnati, Chicago & St. Louis, the Peoria & Eastern and the Cincinnati Northern, having requested to be relieved of a portion of his duties, has been appointed general master car builder, and S. K. Dickerson, formerly assistant superintendent of motive power of the Lake Shore & Michigan Southern, has been appointed superintendent of motive power, both with headquarters at Indianapolis, Ind. Mr. Garstang was born February 28, 1851, in England, and was educated in the public schools. He began railway work in 1863 as a machinist apprentice with the Cleveland & Erie, now the Lake Shore & Michigan Southern, at Cleveland, Ohio, where he remained six years. He was then for 11 years machinist and general foreman for the Atlantic & Great Western and the New York, Pennsylvania & Ohio; three years general foreman of the Cleveland & Pittsburgh division of the Pennsylvania Company; five years master mechanic of the Cleveland, Columbus, Cincinnati & Indianapolis, now the Cleveland, Cincinnati, Chicago & St. Louis. From 1888 to April, 1893, Mr. Garstang was superintendent of motive power of the Chesapeake & Ohio, and on the latter date became superintendent of motive power of the Cleveland, Cincinnati, Chicago & St. Louis.

W. Garstang.

Purchasing Officers.

Joseph J. Bennett has been appointed assistant purchasing agent of the Illinois Central, with headquarters at Chicago.

T. J. Lowe has been appointed fuel agent of the Canadian Northern and the Duluth, Winnipeg & Pacific, with headquarters at Winnipeg, Man.

Special Officers.

G. S. Ward has been appointed chief special agent of the Seaboard Air Line, effective March 1.

W. B. Wells, commercial agent of the Frisco Lines at Dallas, Tex., has been appointed industrial agent, with headquarters at St. Louis, Mo. E. F. Hundley succeeds Mr. Wells.

George K. Andrews has been appointed commissioner of agriculture, with supervision over the lines of the Missouri Pacific, with headquarters at St. Louis, Mo. L. A. Markham, commissioner of agriculture for the entire system, with headquarters at Little Rock, Ark., will hereafter have jurisdiction over the St. Louis, Iron Mountain & Southern only, and will retain his headquarters at Little Rock.

OBITUARY.

Robert Law, formerly for many years connected with the Burlington system, and afterwards vice-president and general manager of the Colorado & Northwestern, died on February 7, at Los Angeles, Cal., aged 61 years.

George Copland, vice-president, secretary-treasurer and auditor of the Lexington & Eastern, with headquarters at Lexington, Ky., died at that place on February 11. He was born on November 13, 1837, in Aberdeenshire, Scotland, and had been in the service of the Lexington & Eastern since 1894.

William Randall, auditor of freight and ticket accounts of the Chicago, Burlington & Quincy, with headquarters at Omaha, Neb., died in that city on February 7, at the age of 71 years. Mr. Randall had been in the service of the Burlington system since 1872, and had been auditor of freight and ticket accounts since 1875.

William Riley McKeen, who was president of the Terre Haute & Indianapolis, now the Vandalia, from 1867 to January 15, 1896, died at Terre Haute, Ind., on February 18. Mr. McKeen was born on October 12, 1829, in Vigo County, Ind. He was the father of Benjamin McKeen, general manager of the Pennsylvania Lines west of Pittsburgh, and of W. R. McKeen, Jr., consulting engineer of motor cars on the Union Pacific.

Albert S. Cheever, who was superintendent of the Fitchburg division of the Boston & Maine from November, 1902, for ten years, died on February 17, at his home in Somerville, Mass. He was born on September 17, 1857, at Chelsea, Mass., and began railway work as a clerk in the general superintendent's office of the Fitchburg Railroad, now a part of the Boston & Maine. After holding various subordinate positions in the chief engineer's office, he became assistant engineer, with headquarters at Fitchburg, and in May, 1887, was made division engineer in charge of the Western division of the same road. From November, 1890, to September, 1897, and from December, 1898, to July, 1900, he was chief engineer of the Fitchburg, and then until November, 1902, was assistant chief engineer of the Boston & Maine. He was appointed superintendent of the Fitchburg division of the same road in November, 1902, remaining in that position until November 17, 1912, when he was assigned to special work in the operating department.

NEW LINES FOR ARGENTINA.—The Buenos Ayres Great Southern Railway, already the longest system in Argentina, has outlined a comprehensive construction program for the year 1913. The principal undertaking is the new connection with Chile. This line has now been opened to traffic as far as Sennilosa, about 20 miles west of Neuquen, and about 180 miles from the Chilean border. The company will at once proceed with the remaining section. This will enter the Cordilléras, and an immense amount of rock blasting will have to be undertaken. Twenty tons of dynamite have already been sent to the spot where the blasting is to begin, while the staff of laborers has been materially increased, the contractors recognizing that they have before them one of the most difficult, as well as the most costly portions of the work. The company will also commence the construction of the branch line from Alvarez Jonte to Lezama. Other branch lines to be taken in hand within the course of the next few months will include one from San Vicente to Villanuéva and another from Darwin to Conésa.

RAILWAY DEVELOPMENT IN ROUMANIA.—The project to grant a large credit to the railway authorities continues to be discussed and it is thought that the government will advocate such action soon after parliament reassembles, although only a part of what is wanted may be granted. The director general of railways has now made a report in which he urges the opening of the following credits: For the development of the system (new lines and new facilities), $25,600,000; for construction of a central station in Bucharest, $5,000,000; for improvement (double tracking, etc.) of existing lines, $1,400,000; making a total of $32,000,000. If these credits should be granted the expenses already incurred in the construction of various new lines would be liquidated at first, and other new lines would then be built. It is thought probable that one of the first lines to be built would be a double-track road from Bucharest to Craiova via Rosiori and Caracal, of which the estimated cost is $13,125,000. Other lines which would probably be among the first are those which would connect Bucharest with Jassy via Urziceni, Faurei, and Tecuci, and Jassy with Burdujeni via Harlau and Botoshani. The eventual construction is also contemplated of a number of strategic lines in Moldavia, the narrow spur of Roumania running to the north between Austria-Hungary and Russia, as well as the development of the urban system in and around Bucharest.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Norfolk & Western is in the market for 60 locomotives.

The Baltimore & Ohio is considering the purchase of a large number of locomotives.

The Ocean Shore has ordered 2 mogul locomotives from the Baldwin Locomotive Works.

The Chicago & Western Indiana is in the market for five additional switching locomotives.

The Virginia & Rainy Lake has ordered 2 consolidation locomotives from the Baldwin Locomotive Works.

The Atlantic Coast Line has ordered 4 six-wheel switching locomotives from the Baldwin Locomotive Works.

The Chicago, Burlington & Quincy has ordered 25 switching locomotives from the Baldwin Locomotive Works.

The Federal Furnace Company has ordered 1 six-wheel switching locomotive from the Baldwin Locomotive Works.

Guinle & Company, New York, have ordered 1 four-wheel switching locomotive from the American Locomotive Company.

The Pennsylvania Lines West have ordered 70 additional consolidation locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 26 in. x 28 in. cylinders, 62 in. driving wheels and in working order will weigh 254,000 lbs.

CAR BUILDING.

The Norfolk & Western is negotiating for an additional 2,000 freight cars.

The Utah Railway, Salt Lake City, Utah, is said to be figuring on 500 coal cars.

The Toledo, St. Louis & Western is considering the purchase of 1,000 box cars.

The Atlantic Coast Line has ordered 1,000 box cars and 300 flat cars from the Barney & Smith Car Company.

The Berwind-White Coal Mining Company, New York, has ordered 100 gondola cars from the Cambria Steel Company.

The Harriman Lines, instead of having ordered 2,000 gondola cars from the Pressed Steel Car Company and 800 automobile cars, 10 cabooses and some box cars from the Standard Steel Car Company, as mentioned in the *Railway Age Gazette* of February 14, have ordered cars from those two companies as follows: 2,280 drop bottom gondola cars, 200 hopper bottom gondola cars and 203 tank cars from the Pressed Steel Car Company; 1,000 box cars, 800 automobile cars and 110 caboose cars from the Standard Steel Car Company. This company has also ordered 2,290 box cars from the American Car & Foundry.

IRON AND STEEL.

General Conditions in Steel.—The volume of orders in the steel industry has shown a further falling off during the past week. This is partly due to the threatened strike of the firemen and partly to the fact that the change of administration is now near at hand. Production continues at the same high rate and prices are still firm. It is expected that the unfilled tonnage at the end of the current month will show a considerable decrease from the previous month as it is unlikely that the volume of orders placed will show a material increase in the near future.

Argentine Railway Development.—The Argentine government's program for construction of new lines includes a proposal to survey a route for a railway joining up the northeast section of the North Argentine Railway with a point on the line between Rio Cuarto and Villa Dolores.

Supply Trade News.

Richard S. Buck has resigned his position with Sanderson & Porter, New York, to become chief engineer of the Dominion Bridge Company.

The H. W. Johns-Manville Company, New York, has moved its Newark, N. J., office to 329 Halsey street, where 4,000 sq. ft. of floor space is available.

A. B. Chadwick has resigned his position in the shops of the Armour Car Lines at Meridian, Miss., to go to the Grip Nut Company, Chicago, as superintendent of its plant at Whitney, Ind.

At a recent meeting of the directors of the Weir Frog Company, Cincinnati, Ohio, B. W. Rowe, the former president, was elected chairman of the board of directors, and O. DeG. Vanderbilt, Jr., was elected president in his place.

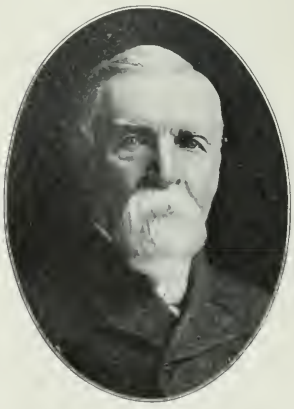
Erle C. Cowgill has resigned as secretary of The M-C-B Company, McCormick building, Chicago, to become general manager of a plantation company in Mississippi. His interest in The M-C-B Company was taken over by other members of the firm.

The Griffin Wheel Company, Chicago, has been reincorporated under the laws of Massachusetts, and has increased its capital stock from $10,000,000 to $21,000,000, of which approximately $15,000,000 has been issued. The company has been an Illinois corporation.

The Armour Car Lines are enlarging their car shops at Meridian, Miss. Additional trackage, machinery and buildings are being added to allow a force of 300 men to be at work rebuilding cars. These improvements are in charge of P. D. Galarneau, superintendent.

The O. M. Edwards Company, Syracuse, N. Y., has been incorporated with $1,000,000 common stock and $250,000 seven per cent. preferred stock to make among other things freight car equipments, including padlocks, valves, etc. The officers are as follows: President, O. M. Edwards; first vice-president, W. A. Le Brun; second vice-president and assistant manager, E. W. Edwards; and secretary-treasurer, J. J. Edwards.

John Fritz, pioneer ironmaster and one of the first to introduce the Bessemer process in this country, died at his home in Bethlehem, Pa., on February 13 at the age of 91. Mr. Fritz was born in Chester county, Pa., on August 21, 1822. He received his early education in a country school and became an apprentice in a blacksmith shop in 1838. In 1844 he went to a mill for rolling bar iron at Coatesville, Pa., still serving as an apprentice. After three months he was made a mechanic, and three months later he was given charge of the industry as ironmaster. In 1852 he was associated with a brother and two brothers-in-law in the establishment of a small foundry and machine shop at Catasauqua, and two years later he assisted in the construction of the Cambria Iron Works at Johnstown. In the same year he was made superintendent of that company. In 1860 he was called upon to design the plant of the Bethlehem Iron Company. He accepted, and when the plant was completed he was made superintendent and engineer. It was there that he helped perfect the Bessemer process, which was introduced in 1864. He was one of the very first to recognize its significance, and a large



John Fritz.

measure of its success is due to him. In 1880 Mr. Fritz built for the Bethlehem company a plant for the manufacture of armor plate, which was the first plant of its kind in this country. He introduced processes from England and France for the manufacture of this product. He resigned his position as president of the Bethlehem Steel Company in 1893 and retired from active business. Mr. Fritz was a vice-president of the American Society of Mechanical Engineers from 1882 to 1884, and was president in 1895. He had also been president of the American Institute of Mining Engineers, and was an honorary member of the American Society of Civil Engineers. In 1893 he was awarded the Bessemer medal by the Iron and Steel Institute of England, and in the same year was elected an honorary member of that institute, one of the greatest honors an engineer can receive. His eightieth birthday was celebrated by a dinner given in his honor at the Waldorf-Astoria, New York, on which occasion the John Fritz gold medal for achievement in educational sciences in this country was founded. This medal is awarded annually by a committee of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers and the American Institute of Electrical Engineers. The first medal was conferred upon John Fritz himself. Mr. Fritz understood thoroughly every branch of the iron and steel industry, and his great value lay in his genius for organization, his ability to improve upon methods and his capacity for handling men.

Weber H. Arkenburgh has resigned his position as general signal inspector of the Chicago, Rock Island & Pacific, and is now in the publicity department of the Union Switch & Signal Company, Swissvale, Pa., with office at that place. Mr. Arkenburgh was born at Orange, N. J., in 1880, and after graduating from Williams College in the class of 1902 with the degree of A. B., entered railway service as a laborer in the signal department of the Delaware, Lackawanna & Western. Since that time he has been in the service of the Gulf, Colorado & Santa Fe, the Union Pacific, the Hall Signal Company, Garwood, N. J., the Long Island Railroad, and the Chicago, Rock Island & Pacific. In 1908 he did some special work on the Signal Dictionary for the *Railway Age Gazette*. Mr. Arkenburgh organized the Chicago Signal Club in 1910, was president part of that year, and vice-president the next year, and secretary and treasurer during 1912.

W. H. Arkenburgh.

TRADE PUBLICATIONS.

FROGS.—The P. & M. Co., Chicago, has issued a leaflet of tables of turn-out dimensions, together with instructions for their use by a short method for accurately locating frog points.

NATIONAL UNION OF RAILWAY MEN.—A cable despatch from London, February 14, says that under the title of the National Union of Railway Men the three principal unions of railway employees in Great Britain have been amalgamated. The new organization absorbs the Amalgamated Society of Railway Servants, the United Pointsmen and Signal Men's Union, and the General Railway Workers' Union. These societies have about 200,000 members. The despatch says that the executive officers of the new union will be invested with authority to begin and terminate strikes according to their own judgment, without taking a ballot of the members.

Railway Construction.

CENTRAL RAILWAY OF CANADA.—An officer writes that work will be continued in the spring on the line from Montreal, Que., west via Hawkesbury, Ont., Carleton Place, Fenelon Falls and Orillia to Midland, 342 miles. C. J. Wills & Son, Montreal, are the contractors. About 30 miles is ready for tracklaying. No grade will exceed 6/10 of 1 per cent. and no curve will exceed 8 deg. There will be 12 or more large bridges on the line, also freight and passenger terminals at Montreal and elevators and wharves at Midland. Arrangements are being made with the government to permit the Intercolonial to use the company's tracks through Ontario to the Lakes. Senator Owens is president, and F. Stuart Williamson, chief engineer, Montreal. (November 29, p. 1062.)

CHICAGO, BURLINGTON & QUINCY.—The contract for the line from Orin Junction to Powder River, Wyo., 108 miles, the closing link in the new route between Denver and Billings, has been let to Twohy Brothers, of Portland, Oregon.

FARMINGTON & OAKLAND INTERURBAN (Electric).—This company has asked for incorporation in Maine, with a capital of $300,000, to build from Farmington east via New Sharon, Mercer and Smithfield, thence south to Oakland, about 40 miles.

GREAT NORTHERN.—This company has made surveys for building an extension from Plentywood, Mont., west via Scobey.

HEMINGFORD & WESTERN.—Under this name a company is being organized in Nebraska to build from Hemingford, Neb., west to a point in eastern Wyoming. D. W. Butler, Hemingford, is to be president and general manager.

HOOPPOLE, YORKTOWN & TAMPICO.—Incorporated in Illinois with $100,000 capital and office at Hooppole. The plans call for building from Hooppole, in Henry county, Ill., northeast via Bureau county, to Tampico in Whiteside county, about 15 miles. The incorporators and directors include C. W. Groves, J. Ringel, G. R. Mathis and J. Tonkinson, of Hooppole; J. H. Cooley and J. W. Mathis, of Tampico, and R. H. Mathis, of Prophetstown.

MISSISSIPPI NORTHWESTERN.—An officer writes that the company expects to let contracts in about 90 days. The plans call for building from Biloxi, Miss., via Carthage and Yazoo City to Gaines Landing, Ark. The maximum grades will be 1 per cent. and the maximum curvature 6 deg. W. G. Seaver, president; J. M. Searles, chief engineer. (September 27, p. 599.)

NACOGDOCHES & SOUTHEASTERN.—This company, operating a 20-mile line from Nacogdoches, Tex., to Dunham, is planning to build a three-mile extension to a connection with the Angelina & Neches River. P. A. McCarthy & Sons, consulting engineers, Lufkin, have made surveys and estimates.

NIAGARA FALLS, WELLAND & LAKE ERIE (Electric).—According to press reports surveys will be started soon for a line to connect Fort Erie, Ont., with Fort Colborne and other towns in Ontario. The headquarters of the company will be at Welland.

NORTHERN PACIFIC.—A contract has been given to the Cook Construction Company for grading work on an extension from Stanton, N. Dak., west on 68 miles.

OKLAHOMA, NEW MEXICO & PACIFIC.—According to press reports surveys are now being made from Ardmore, Okla., west to Waurika, and grading work has been started. J. L. Hamon, Ardmore, is interested. (October 18, p. 775.)

OKLAHOMA PACIFIC.—An officer writes that arrangements are being made to secure capital and the prospects of building are favorable at this time, but the date of letting contracts for construction, etc., has not yet been decided upon. The projected route is from Denver, Colo., southeast through the Panhandle of Oklahoma and Texas and Oklahoma to Oklahoma City, thence through the northeast corner of Texas and the southwest corner of Arkansas to Texarkana, Ark., and across Louisiana to New Orleans, over 1,000 miles. The principal bridges to be constructed include one across the Red river near Texarkana, and one over the South Canadian river near Oklahoma City. The company expects to develop a traffic in lumber, livestock, grain, cotton, ore and coal. V. A. Clark is president, Arnett, Okla.

Pacific Coast.—Incorporation has been asked for in the Dominion of Canada, to build from Hardy Bay to Suquash on Vancouver Island, B. C., about 12 miles. Also to operate steamship lines from Hardy Bay. Bernard & McKeown, Montreal, Que., are solicitors for the applicants.

Palmetto Railway (Electric).—Under this name a company is being organized in South Carolina, it is said, with a capital of $500,000. The plans call for building from Columbia, S. C., northwest via Prosperity, Newberry, Clinton and Laurens to Greenville, about 100 miles. A. J. Christopher, W. L. Gray and E. S. Hudgins, Laurens, S. C., are interested.

Quanah, Acme & Pacific.—An officer writes regarding the extension west of Roaring Springs, Tex., that nothing has been done toward extending the line beyond that place. Work was started last September on the extension from Paducah west to Roaring Springs, 40 miles, and at the present time over 1,000,000 cu. yds. of material has been moved and about 5,000 cu. yds. of concrete work completed. It is expected that the line to Roaring Springs will be opened about May 15. The Texas Building Company has contracts for grading, bridge and concrete work. The maximum grade will be 1 per cent. compensated for curvature and the maximum curves will be 4 deg. (February 7, page 271.)

Raleigh, Western & Atlantic.—Application has been made in North Carolina for a charter, it is said, to build from Bunn, N. C., southwest to Raleigh, thence northwest to Durham, about 50 miles. J. H. Pou, Raleigh, may be addressed.

Rio Grande Valley Traction.—According to press reports a contract has been given to Dudley & Orr, El Paso, Tex., to build from Washington Park, El Paso, to Ysleta, 10 miles. (January 17, p. 132.)

Toronto Eastern.—Construction is now under way, it is said, from Bowmanville, Ont., west to Pickering, 19 miles, and surveys are being made for an extension from Pickering west for 12 miles. E. W. Oliver is chief engineer, Toronto, Ont.

Tullahoma, Lynchburg & Fayetteville (Electric).—An officer writes that contracts are to be let about April 1 to build from Tullahoma, Tenn., on the Nashville, Chattanooga & St. Louis west via Cumberland Springs, Lynchburg and Mulberry to Fayetteville. The power will be generated at Manchester where the company will have a waterpower plant, using the waters of the Little and Big Duck rivers. There will be 14 small bridges on the line and a 218 ft. trestle. W. D. Cummings is engineer in charge, Manchester.

York & Oxford (Electric).—Incorporation has been asked for in Maine to operate a line from Sanford, Me., to a connection with the Boston & Maine and the Atlantic Shore Line, thence north through the towns of Alfred, Waterboro, Limerick, Cornish, Baldwin and Hiram to a connection with the Maine Central and the Bridgton & Saco River railroads, about 40 miles. The capital of the company is not to exceed $500,000.

RAILWAY STRUCTURES.

La Grange, Ga.—An officer of the Atlanta, Birmingham & Atlantic writes that bids are wanted for putting up a brick veneer passenger station one story high, 30 ft. x 116 ft., between Depot and Main streets in La Grange. The cost of the improvement will be about $12,000.

Lewistown, Mont.—The Great Northern is making plans for a station to be built at Lewistown.

Macon, Ga.—An officer of the Central of Georgia writes that the company has submitted a proposition to the authorities of the city of Macon to put up a passenger station to be 250 ft. long; also a freight station at the foot of Cherry street, in Macon. Definite plans to carry out these improvements have not yet been made.

Sudbury Junction, Ont.—The Canadian Northern has been authorized to build bridges in Ontario as follows: Across Jackfish river, mile 314 from Sudbury Junction; across Goose river (first crossing), district of Sudbury, mile 171 from Sudbury Junction; and across Kabinakagami river, district of Algoma, mile 286 from Sudbury Junction.

Railway Financial News.

Baltimore & Ohio Chicago Terminal.—This company has given the Minneapolis, St. Paul & Sault Ste. Marie a contract providing for the Soo, which now gets into Chicago over the Illinois Central tracks, to use the Grand Central Station of the Baltimore & Ohio Chicago Terminal.

Baltimore & Ohio.—The Public Service Commission of Maryland has applied to the circuit court of Baltimore for an injunction against the issue by the Baltimore & Ohio of $63,250,000 4 per cent. 20-year convertible bonds. The company has refused to ask permission of the Maryland Public Service Commission fearing that it may lose some of the benefits of an act of the Maryland legislature allowing exemptions by which the Baltimore & Ohio saves something in taxes.

Choctaw, Newcastle & Western.—B. R. Stevens, representing, it is said, the stockholders and creditors of this road, has filed an application in the superior court of Oklahoma for the appointment of a receiver, alleging indebtedness amounting to $9,000. This road runs from Alderson to Cambria, Okla., three miles.

Denver, Northwestern & Pacific.—The United States district court at Denver, Colo., has authorized the receivers to issue $750,000 6 per cent. receivers' certificates. The proceeds of the sale of these certificates are to be used to pay for new equipment.

Interborough Rapid Transit.—Stockholders are to vote on March 5 on the question of authorizing a mortgage to secure an issue of $300,000,000 5 per cent. 53-year bonds to provide for expenditures under the Rapid Transit contracts which are being finally passed upon by the New York Public Service Commission, First district.

Minneapolis, St. Paul & Sault Ste. Marie.—See Baltimore & Ohio Chicago Terminal.

Missouri, Kansas & Texas.—The bill which had been passed by the Texas legislature permitting the merger of the Texas Central with the M. K. & T. has been vetoed by Governor Colquitt on the ground that it is unconstitutional.

Pennsylvania Railroad.—President Rea has made the following statement

"The question of Pennsylvania Railroad financing for 1913 has not received the consideration of the board of directors and probably will not for some weeks to come.

"It is the policy of the Pennsylvania management to make public declaration of any purposes it may have in the direction of new financing at the earliest practicable moment after such policy is decided on. In all cases where an issue of new stock is to be made, such issue is always announced immediately after the meeting of the board of directors, which takes action on such propositions. It is not the policy of the management to comment on irresponsible rumors concerning its intentions. The public may rely, therefore, on the fact that any statements concerning the Pennsylvania Railroad's financing which are not announced by the company are wholly speculative and suppositious."

Pittsburgh, Cincinnati, Chicago & St. Louis.—The Ohio Public Service Commission has authorized the issue of $4,000,000 consolidated mortgage bonds for new construction and equipment, and $3,000,000 consolidated mortgage bonds, to retire Steubenville & Indiana 5 per cent. bonds maturing January 1, 1914.

Seaboard Air Line.—This company has sold $6,000,000 3-year 5 per cent. notes secured by $10,000,000 refunding bonds. The proceeds of the note sale are to be used for additions and betterments and to reimburse the treasury for capital expenditures. (December 6, 1912, p. 1076.)

Southern Pacific.—The syndicate agreement made by Kuhn, Loeb & Co. with about 500 other participants, which provides for underwriting the stock of the Southern Pacific which is to be offered to Union and Southern Pacific stockholders, contains no provision by which participants agree to hold stock off from the market longer than April 5.

Texas Central.—See Missouri, Kansas & Texas.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,250 copies were printed; that of those 8,250 copies, 6,796 were mailed to regular paid subscribers and 148 were provided for counter and news companies' sales; that the total copies printed this year to date were 78,009 copies—an average of 8,668 copies a week.

Volume 54. February 28, 1913. Number 9.

CONTENTS

*Illustrated.

THE practice of reserving without payment sleeping car accommodations that are not used is attaining such an extent as to suggest the advisability of curtailing or abolishing the privilege of reservation, in the interest of the public as well as of the railways. This is particularly true in the larger cities. A business man in Chicago expects to have to go to New York on some day next week. He telephones for a lower berth or a compartment, knowing that if he does not go the reservation will cost him nothing, even if he fails to notify the road to cancel it. Meanwhile, some one who wants to pay for accommodations is told that no space is available, and goes to another road, or another car is put on. If the first man does not go the road hauls empty space which might have been filled, possibly an extra car. If the second man unwillingly takes an upper berth and finds vacant lowers on the train he is inclined to criticize. It has become a common thing for frequent travelers to reserve accommodations that they have only an uncertain expectation of using, frequently on two or three roads for successive days, causing one, two or three roads to haul empty space or extra cars, and inconveniencing other people. While the practice of allowing sleeping car accommodations to be reserved in advance without payment was undoubtedly a real convenience to many travelers before it was abused, it is questionable if its continuance under present conditons can be justified. The added convenience of a few is gained at the cost of inconvenience to a larger number. If the man who benefits by the practice does not believe this let him reverse the situation, and apply for accommodations for an unexpected trip at a time when he will be obliged to wait for some one to cancel a reservation, or to go by another road. Two or three years ago the roads in the Western Passenger Association discussed a proposal to discontinue free reservations, but no action was taken. One leading western line now refuses to reserve accommodations until they are paid for, and it is probable that the subject will be brought up again. The conditions could be improved without hardship to any one by requiring payment for all reservations when made, with a provision for a refund if notice of cancellation were given within a reasonable time.

WHEN a strike by the firemen of the eastern railways was imminent, Victor Berger, the Socialist member of the House of Representatives from Milwaukee, Wis., introduced a bill for government acquisition of railways. The measure evidently was predicated on the theory that under government ownership railway strikes would be less likely. This is a theory often advanced by advocates of government ownership. It is a theory that the historical facts do not sustain. A bad strike took place on the state railways of Victoria in 1903. The prime minister notified the enginemen's and firemen's unions that they must withdraw from affiliation with the central labor organization, the Trades Hall. He feared such affiliation would embroil the railway employees in labor quarrels with which they had no concern. The answer to him was that unless his notice was withdrawn within 15 hours all the enginemen and firemen would strike; and this they did. The public sided with the government and the strike collapsed. This was followed by legislation, still in effect, which prohibits any employee of the Victorian government from taking any part whatever in politics except to vote for members of Parliament. An illustration of the fact that under government ownership railway employees may dictate to the management, instead of the management to the employees, was afforded by an incident that occurred in Italy soon after government operation of railways was resumed in that country in 1905. Discipline at Rome was bad. The Minister of Public Works decided to transfer there the district manager at Milan and give him authority over the whole States System. This officer had the reputation of a severe disciplinarian. When the railway employees heard of the change they sent a deputation to the Minister of Public Works to notify him that they would all strike if the appointment were persisted in, and the Minister of Public Works yielded The public's recollection of the great railway strike in France in 1910 must still be fresh. The two state railways, as well as the five large private railways, were involved. The resulting demoralization is graphically described in the report of the board which arbitrated the controversy between the eastern railways in this country and their locomotive engineers. The government took summary and effective action, which in similar circumstances could not be duplicated in the

United States. The ministers on the very day the strike was declared ordered the employees to join their colors for three weeks' military training. The "military training" assigned was that of returning to their work on the railways. Disobedience would be punished by military law. The strike was broken. The next day trains were running into Paris. The advocates of government ownership who say, or imply, that under it strikes would not occur presume too much on public ignorance.

IT appears certain that the present Congress will pass a bill for a valuation of railways (as amended by the Senate). The status of the proposed bill at the time we go to press is indicated by the report printed in another column. As the two houses seem to be in accord, further serious amendment is not to be expected. There is being manifested a desire by the more radical members of Congress to get through a measure giving instructions regarding the way the valuation shall be made that would tend to hold the amount of the appraisal down to the practical minimum. The decisions of the federal courts have not covered the entire subject of valuation. There are, however, certain points to be considered which the Supreme Court specifically mentioned in its opinion in the Nebraska rate case. These include the original cost of construction and of permanent improvements, the probable cost of reproduction and the market value of stocks and bonds. In subsequent decisions in public utility cases—for example, in the Consolidated Gas case—the court has said with equal definiteness that the value to be considered is the present value, and that if the value of a public utility has increased since it was built that is the concern's good fortune and it has a right to benefit by it. There are some people, including some members of Congress, who would like to have the proposed valuation based on the original cost of construction. In other words, they deny the right of a public utility to profit by the "unearned increment" in its real estate. Others would exclude from consideration the investment that has been made from earnings. Others would base the appraisal entirely on the physical machine, and make no allowance for "going value." All these proposals are at variance with the decisions of the Supreme Court. Nothing but harm can result from making a valuation that does not give full weight to all of the factors mentioned by the court. If any of these factors are left out the valuation will be made lower than the decisions warrant. The public will be given the impression that the value of the railway properties is less than it actually is. If the Interstate Commerce Commission should then try to regulate rates and earnings on the basis of the valuation the courts would reverse it. That large part of the public that wishes to see railway rates made as low as possible would be disappointed, and unfair sentiment against the courts as well as against the railways would be increased. Much of the present hostility to the courts has been developed by the action of Congress and the state legislatures in passing laws of the most doubtful constitutionality, thereby "putting it up to the courts." The property of public utilities is just as private in its ownership as any other property. The constitutional provisions safeguarding property apply to it just as much as to other property. These constitutional safeguards can be removed by amending the Constitution. Until they are removed it is just as much the duty of the law-makers to observe them as it is of the courts. The stockholders of railways have nothing to fear from a valuation based on the same factors that would be included in the valuation of any other kind of property. They have no reason to fear the immediate effect of attempts to confiscate their property, because the courts usually defeat them. But all owners of property have reason to fear attempts by law-making bodies to pass legislation which the courts in obedience to constitutional mandates must nullify, and in the process of nullifying which they incur an odium and a public hostility that bodes ill for American institutions in general

C. E. RUSSELL VS. THE INTERSTATE COMMISSION ON RAILWAY CAPITALIZATION.

CHARLES EDWARD RUSSELL, returns to the attack on the railways in an article in *Pearson's* for March. He continues to discuss railway accidents, and in this article strives to show that the decrepit condition into which, as he alleges, the railways of the United States have fallen is due to the increasing burden of their capitalization. He gives a table purporting to show the capitalization from 1902 to 1911 and concludes with the statement, "meantime, I may say that my figures are taken from the Interstate Commerce Commission reports." The figures he gives are from the Commission's reports, but they are for the gross capitalization, which includes duplications due to inter-corporate ownership of stocks and bonds, and which the Interstate Commerce Commission has expressly and repeatedly repudiated as representing the actual capitalization of the railways. That his misrepresentations are typical of those put in circulation by critics of railway capitalization in this country is our excuse for noticing them.

Mr. Russell gives $67,936 as the average capitalization per mile in 1906. In its statistical report for 1907, page 17, the Interstate Commerce Commission quoted as follows from its own report on the "Intercorporate relationships of railways in the United States as of June 30, 1906":

> If, however, the problem be to state the amount of securities which are an actual or a contingent claim upon the revenues of the railways of the country considered as a whole, it is evident that the phrase "in the hands of the public" must exclude from outstanding capital all railway holdings. This has been done by the present investigation and results in a reduction of the amount which general discussions have heretofore accepted as measuring the claim of railway securities on railway revenues from $67,936 per mile of line to $58,050 per mile of line.

Mr. Russell gives $70,628 as the average capitalization for the year 1907. The Commission in its Statistics of Railways for 1907, page 76, said:

> The net amount outstanding in the hands of the public on June 30, 1907, if assigned on a mileage basis shows a capitalization of $58,298 per mile of line. *This figure represents correctly the average capitalization per mile of the railways in the United States, meaning by that phrase the amount of active capital to be supported by freight and passenger rates.*

Mr. Russell gives $72,482 as the average capitalization in 1908. The Commission in its Statistics for that year, page 68, said:

> It appears that out of the aggregate amount of $16,767,544,827 of railway securities which are reported by the carriers only $12,833,591,510 are outstanding in the hands of the public on June 30, 1908. *This is equivalent to an outstanding capitalization of $57,201 per mile of line.*

Mr. Russell gives $74,475 as the capitalization per mile in 1909. The Commission in its Statistics for 1909, after referring to the gross capitalization, said on page 56:

> Excluding from this amount the capital reported as assigned to properties other than railway, the remainder, $13,711,867,733, is equivalent to an average of $59,259 per mile of line. It is this figure which measures the amount of railway securities in the hands of individuals and corporations other than railway corporations.

Mr. Russell gives as the average capitalization in 1910, $77,189 The Commission in its Statistics for 1910, page 52, said:

> These statistical reports have for a series of years contained the statements of the average amount of *actually outstanding capital securities per mile of road*, and in continuation of that custom such an average as of June 30, 1910, is here stated. The figure found as of that date is $62,657.

In other words, the figures that Mr. Russell gives as being "taken from the Interstate Commission reports" exceed by $9,888 to $15,281 per mile the figures which the Commission specifically gives as its own figures for average capitalization. Mr. Russell admits that the way he calculates "is not exactly the way the expert railway jugglers figure capitalization." This neatly classifies the Interstate Commerce Commission. He adds that when the experts "have howled sufficiently on this point" he will explain it. It will require some explaining.

Mr. Russell is greatly grieved because, as he says, the railways maintain press bureaus "to influence public opinion," and he asks, "What part of the transportation business is the influenc-

ing of public opinion?" His own articles are one of the best explanations of why railway press bureaus are necessary. When socialistic penny-a-liners hire themselves to muck-raking magazines to misstate the official statistics of the Interstate Commerce Commission regarding railways it becomes needful for the railway managements, in justice to their stockholders and to the public, to employ people to tell the truth about the railway business; and the public will have considerable difficulty in seeing wherein it is any worse for the railways to employ men to refute misrepresentations than it is for muck-raking magazines to employ men to write them.

RAILROAD LANGUAGE.

SHOW Your Tickets! That is a very simple injunction, known to everybody that ever traveled in America, and plain as day. When such a sign is displayed at the entrance to a train platform no one has to ask when, where, or to whom it applies. But in a large new station recently opened, "in a city of over 100,000 inhabitants" (to use the phraseology of certain legislative acts) the architect, or artist, or manager, or painter has adopted the following legend: "All Passengers Will Be Required to Show Transportation at the Gates." By thus using 57 letters instead of 15 the painter lengthens his job 280 per cent.; but it is hard to see any other advantage in the lengthening. That word "transportation," however, will show the rising generation how serenely we can ignore Mr. Roosevelt and others who would make a hobby of simplification. It might be a good idea to add to this sign a suffix informing boys and girls that, after passing through the gates, they will board "equipment" drawn by "power," instead of cars drawn by engines.

Railroad language is not always stilted or redundant. Often it fails of its purpose by reason of its brevity. A general passenger agent recently wrote the following letter (names fictitious):

Chicago, N. Y., February 31.

G. H. Cutter:—

Dear Sir—In reply to yours of the 20th in regard to through car from Wobbledon to London. We discontinued these through cars some time ago because with so many branch lines and a car from each (and not enough business from any one line to fill a car) we were hauling unnecessary equipment on our already heavy main line trains. In addition to this was the loss of time for switching cars from branch-line trains to a main-line train, thus delaying a great number of people. Take a train from Edinburgh to London and put on a car from each branch as the train proceeds, and I am sure you will appreciate the necessity for our present rule. We feel that the arrangement in effect takes the best care of the great majority, and I trust that you will agree with us in this.

Yours truly,

John Smith,
General Passenger Agent.

It is a safe wager that Mr. Cutter was not satisfied with this response to his request, or demand. We do not assume that the railway ought to satisfy him; but it would be possible to come very much nearer to the ideal refusal: the refusal of the genius who, as we are often told, can make people swallow his refusals as cheerfully as they accept favorable responses from ordinary people. Traffic officers would do well in many cases to consult the legal department in small matters like this, as well as in things deemed more weighty. The passenger man's suavity and habitual desire to please, combined with the accuracy, philosophy and enthusiasm of the jury lawyer, would produce great results. Mere repetition, with variations, such as a lawyer uses to convince 12 men, could often be profitably used on one man; especially where that man is likely to publish your letter. Statistics of the actual number of passengers carried in each through car, for a series of months, might have softened Mr. Cutter (or might have shown that the experiment of through cars had better be renewed). Taking care of "the great majority" is a delicate point to handle. Probably Mr. Cutter does not belong to the majority; what does he care for that argument? However, we are not thinking of writing the general passenger agent's letter for him; the point is that if a request like Mr. Cutter's is to be refused, it is worth while to answer, very fully, every expressed and unexpressed question that may arise in the applicant's mind, even if the letter has to be amplified or rewritten repeatedly, and by different men.

Brevity is a fault in many of our train rules. One of the best codes of secondary rules (we mean those rules which are supplementary to the standard code and usually numbered from 600 upward) was that in force on the Cincinnati, New Orleans & Texas Pacific ten or 15 years ago, and it was three or four times as long as those of other roads. But, though apparently redundant, it was simple and clear. With proper numbering, paragraphing and headings a subject may be treated as clearly and effectively with 50 rules as with ten. Our fault is that we treat brevity as an absolute necessity, whereas its value is relative.

In the government report on the collision at Irvington, Ind., November 13, a paragraph of the rules of the road referring to signals was quoted as follows:

The definition of a "fixed signal" covers such signals as slow boards, stop boards, yard limits, switch, train order, block, interlocking, semaphore, disk, ball, or other means for indicating stop, caution, or proceed.

Fixed signals out of order had not been carefully reported, and this neglect had become general and was acquiesced in by the officers; and apparently this imperfect way of stating that a switch target and a switch light are to be treated as fixed signals had its influence in causing this laxity. In contrast with this brevity, look at the detail with which the Union Pacific explains to employees the care of gasoline motor cars used by track foremen, a matter which, probably, is of far less importance, or at least one much less directly connected with the safety of trains. The following is a fac-simile, with the type reduced one quarter in size, of some of these U. P. rules:

Examination Questions

1 . What inspection should be made before attempting to start out with a motor car?

2 . . What precautions must be observed in handling gasoline?

3 . . . Before leaving a car for any length of time what are the several things that should be attended to?

6 . . Explain briefly what a carbureter is for and how it works.

7 . Why are gasoline engines provided with a timer?

11 . When a car has been prepared ready to start and several attempts to start it have failed to produce any results, what are the first two or three things you would look for to determine what is wrong?

Taking the Union Pacific style as a model these signal rules would be set forth somewhat as in the next fourteen lines:

The following are the different kinds of fixed signals in use—

Slow Boards
Stop Boards
Yard Limit Boards
Switch Targets
Train Order Signals
Block Signals, Manual
Block Signals, Automatic
Interlocking Signals
Interlocking Signals, Dwarf
Semaphore Signals
Disk Signals
Ball Signals.

Will not every train-rule examiner endorse this suggestion? On most roads the examiner on train rules is allowed a fair chance only in a part of his work. He ought to have more aid from the printing press. As the development of these simple propositions may be independently taken up by any officer, there would seem to be no good reason for not having the best help

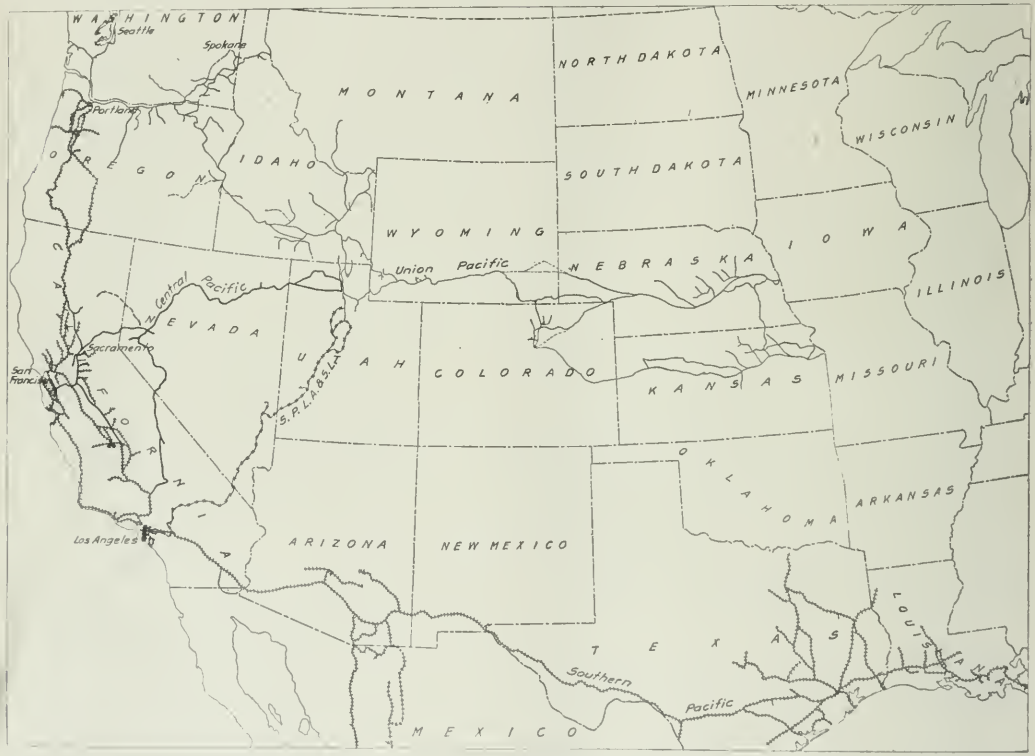
of the printer—the really skilful printer—on every road, and in every superintendent's office.

The language of other train rules, of train orders, of "blue envelopes," of reports of investigations, and other things will be taken up at another time.

SOUTHERN PACIFIC.

RANKING in importance, as an asset, with territory traversed by a railroad are the loyalty and esprit de corps of its organization, and in its separation from the Union Pacific, the Southern Pacific retains not only the form of the Harriman Lines organization, but also the personnel; it loses the Central Pacific, but it retains a territory that is increasingly important as a local territory, and with it the men and the operating and traffic organization that have contributed so much to make the mileage of 2,105 miles. Excluding this Central Pacific, which forms a main line connecting San Francisco with the western terminus of the Union Pacific at Ogden, the Southern Pacific runs the entire length of the longest and one of the richest states in the Union. It has almost a monopoly of business in many parts of California; it forms a southern base line for all of the southwest, which is developing so rapidly, and runs across some of the richest parts of Texas and through a rapidly developing part of Louisiana, having tributary to its lines, to name but a few of the most important, Portland, San Francisco, Los Angeles, El Paso, Houston and New Orleans.

The Southern Pacific's liberality in its expenditures for maintenance and additions and betterments is proverbial. In the Harriman Lines dissolution the Southern Pacific has lost a very valuable piece of railroad property, a property, however,



The Central Pacific, which is to be sold to the Union Pacific but which formed part of S. P. last year, is shown by a heavy continuous line and the Union Pacific and its controlled San Pedro, Los Angeles & Salt Lake are shown by distinct symbols.

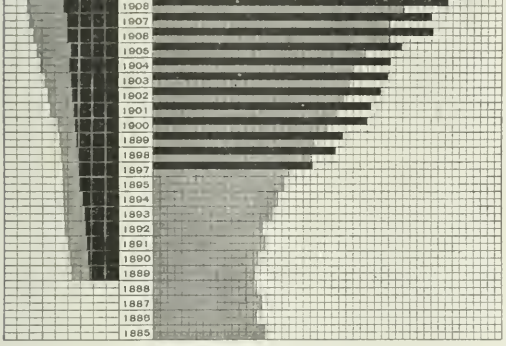
The Southern Pacific.

Harriman Pacifics a standard by which to measure all roads operating under western conditions. Of course, there are great stretches of territory along the main line from El Paso west to California that have not begun to develop at all locally, and this six or seven hundred miles of line has to be supported almost entirely from transcontinental business or by the rest of the system, but the Southern Pacific has tributary to its lines thousands of miles of as rich local territory as is to be found anywhere. The Southern Pacific and proprietary companies, including the Central Pacific, operates about 9,970 miles of first main track. Of this mileage the Central Pacific, which has heretofore been controlled by the ownership of all of the stock and operated under lease by the Southern Pacific, and which is now to be taken over by the Union Pacific, has a which was not necessarily an integral part of its system; and has gained on the other hand what may or may not prove to be far more serious—a competitor, where it formerly had a subsidiary.

The showing made in the fiscal year ended June 30, 1912, was in its gross results, of course, forecast months ago, and the annual report coming so long after the close of the fiscal year, as it does now, is liable to be misleading unless one forcibly gets back into the conditions of the 12 months ended June 30, 1912. Conditions, and especially conditions affecting railroad gross earnings, have changed so materially in the last eight months that a report which would have been considered as simply typical of those conditions if published in July, coming now when we have had six months of large gross earnings,

heavy crop movements, mild operating weather and almost unvaried reports of greatly improved industrial conditions, seems out of the average and bad.

Conditions in the 12 months covered by this report were unfavorable enough to try the best railroad organization in the country. Skilled labor in the Southern Pacific's territory has always been scarce and wages high, and under such circumstances it is hard to get an adequate conception of the difficulties imposed on a railroad company's organization by a strike of 5,189 employees, most of whom were skilled laborers be-



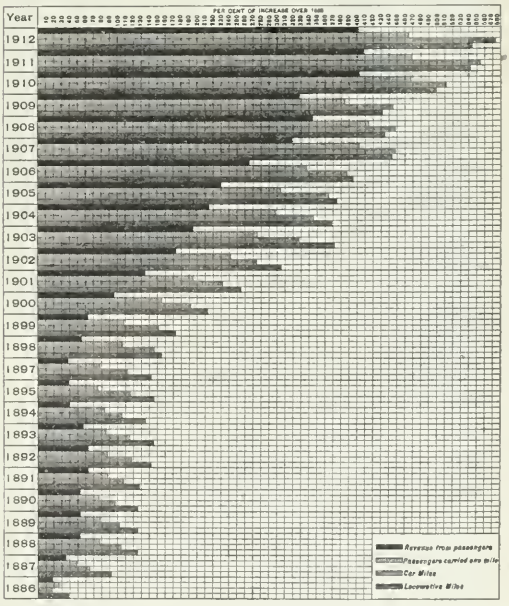
Ton Miles per Train and Car Mile.

longing to the machinists', boilermakers', blacksmiths', car repairers' and sheet metal workers' unions. A strike such as this affects not only expenses but gross revenue to a serious degree as well. Notwithstanding the strike, however, the Southern Pacific earned from operation $131,500,000, which is less by only .83 of 1 per cent. than total operating revenues in 1911. After the payment of operating expenses and taxes there was $39,400,000 net operating income, which is less by $3,350,000 than in 1911. After the payment of fixed charges there was a surplus of $21,700,000, out of which $16,360,000 was paid in dividends, leaving $5,240,000 surplus, comparing with a surplus in 1911 of $9,730,000.

The Southern Pacific carried more passengers and more freight in 1912 than in 1911, but received a lower ton mile and passenger mile rate, and, of course, paid out more in expenses per passenger and per ton of freight. As far as revenue alone is concerned, if the Southern Pacific had been without its Central Pacific in 1912 and had nothing whatsoever to compensate it for this loss, there would still have been a surplus, after the payment of dividends, of $513,436. The Central Pacific pays 6 per cent. dividends on its common stock to the Southern Pacific, which common stock dividends amounted to $4,036,530 in 1912, and 4 per cent. on the preferred, which amounted to $692,000 in 1912. The lease provides that anything over and above 6 per cent. earned on the common stock shall be divided equally between the Central Pacific stockholders and the lessee. In 1912, however, there was no surplus, so that the $4,728,530 received in dividends was the only direct income which the Southern Pacific got from its Central Pacific. If the government's theory that control of the Southern Pacific by the Union Pacific suppressed competition was right, there is then at least a fair chance that the strategic loss of the Central Pacific may be more than made up for by the greater freedom with which the Southern Pacific may solicit and obtain business in opposition to the Union Pacific.

Of course, the Southern Pacific is to be paid in cash for its Central Pacific stock, but the immediate return on the investment of this cash is hardly likely to amount to between $4,000,000 and $5,000,000 a year. The point is this, that with this cash the Southern Pacific will be in a position to make improvements and additions which it would otherwise have to make only through increasing its own interest charges. In the meantime, the growth of business should so add to the Southern Pacific revenue without correspondingly increasing gross that the loss from investment in Central Pacific can be made up. The explanation of the lower ton mile rate received in 1911 than in 1912 is to be found in a comparison of the tonnage of various commodities carried in the two years. The total tonnage carried in 1912 amounted to 26,950,000 tons, an increase of 3.08 per cent. over 1911. Of the 1912 total tonnage, 27.04 per cent. was furnished by products of mines, while of the 1911 tonnage but 26.20 per cent. was furnished by products of mines. On the other hand, products of animals, which in general yield a high average ton mile rate, except under certain conditions such as have obtained between Kansas City and Chicago, furnished but 3.72 per cent. of the total tonnage in 1912, as against 4.27 per cent. in 1911; however, merchandise, which on the Southern Pacific pretty certainly yields a high average ton mile rate, furnished 8.28 per cent. of the total tonnage, as against 8.22 per cent. in 1911; and products of manufactures furnished 16.99 per cent. of the total in 1912 and 16.94 per cent. in 1911. The average ton mile rate was 1.168 cents in 1912 and 1.186 cents in 1911.

The decrease in passenger revenue was due to a shorter



Showing by years the per cent. of increase over the calendar year 1885 in the gross revenues from the transportation of passengers, the number of passengers carried one mile, and the number of miles run by cars and locomotives in passenger-train service, of the Southern Pacific lines from January 1, 1885, to June 30, 1912.

Locomotive miles include revenue passenger-train miles, one-fourth of mixed train miles, and helping passenger-train miles but do not include miles run by motor cars.

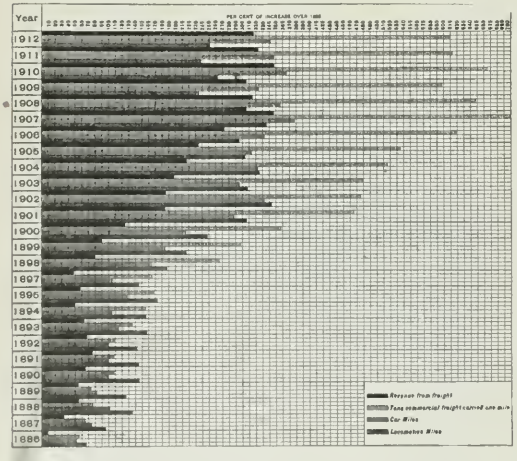
Growth in Passenger Service and Traffic.

average haul per passenger and also to a slight decrease in the revenue per passenger per mile. There were 22,186,000 passengers carried in 1912 and 22,060,000 passengers in 1911. The average

haul, however, was 74.25 miles in 1912 and 75.08 miles in 1911.

Operating statistics reflect the difficulties of operating conditions. The average revenue train load of revenue freight amounted to 382 tons in 1912 and to a little over 384 tons in 1911, which is a decrease of less than 1 per cent.; but total train load, including company freight, decreased from 474 tons in 1911 to 456 tons in 1912—3.84 per cent. With an increase of 1.30 per cent. in revenue freight and a decrease of over 16 per cent. in the ton mileage of company freight, resulting in a decrease in total tons of freight carried of 1.98 per cent., there was an increase of 2.09 per cent. in revenue freight train mileage and of 3.54 per cent. in freight revenue locomotive miles. The mileage of loaded freight cars remained almost the same in 1912 as in 1911, and the mileage of empty cars decreased by 5.35 per cent.

Of course, with a strike of machinists, repairs of locomotives per locomotive cost more in 1912 than in 1911, amounting to $3,893 (including both repairs and replacements) in 1912 and to $3,516 in 1911. On the other hand, other expenses for maintenance were cut down rather heavily. Maintenance of way and structures cost $1,411 per mile of main track in 1912 and $1,571 in 1911; repairs and replacements of passenger cars cost $871 in 1912 and $1,050 in 1911 per car; and repairs and replacements of freight train cars cost $98 in 1912 and $113 in 1911. This was a decrease of over 10 per cent. in maintenance of way, over 17 per cent. in amount spent for repairs of passenger train cars and of over 13 per cent. in amount spent for



Showing by years the per cent. of increase over the calendar year 1885 in the gross revenues from the transportation of commercial freight, the number of tons of commercial freight carried one mile, and the number of miles run by cars and locomotives in freight-train service, of the Southern Pacific lines from January 1, 1885, to June 30, 1912.

Locomotive miles include revenue freight-train miles, three-fourths of mixed-train miles, and helping freight-train miles.

Growth in Freight Service and Traffic.

repairs of freight train cars. The following table shows the per cent. of total operating revenues consumed by operating expenses:

	1912. Per cent.	1911. Per cent.
Maintenance of way and structures and maintenance of equipment	25.56	25.59
Traffic, transportation and general expenses	37.26	35.54

The Southern Pacific, under the plan which has been approved by the attorney general, will receive about $97,000,000 in cash for its Central Pacific stock. This, of course, is in addition to something over $14,000,000 in its own bonds with which the Union Pacific is to make up the balance of the purchase price of Central Pacific stock.

On June 30, 1912, the Southern Pacific had $10,420,000 cash and total current assets, including Union Pacific "bond purchase notes," of $54,420,000. Current liabilities amounted to $36,800,000, which included $12,000,000 due to the Union Pacific. Presumably this $12,000,000 will be subtracted from the cash to be paid by the Union Pacific to the Southern Pacific, so that the S. P. will receive about $85,000,000 cash. This will both put the company in a very strong position for working capital and permit it to spend large sums for additions and betterments and make advances to subsidiary companies for construction for some time to come without doing any new financing.

The following table shows the principal figures for operation in 1912 as compared with 1911:

	1912.	1911.
Average mileage operated	9,970	9,895
Freight revenue	$72,648,092	$73,677,293
Passenger revenue	40,269,238	40,814,400
Total operating revenue	120,433,056	121,911,028
Maint. of way and structures	14,464,205	15,889,130
Maint. of equipment	16,318,141	15,312,206
Traffic expenses	3,201,367	2,947,064
Transportation expenses	38,270,811	36,524,585
General expenses	3,397,583	3,848,676
Total operating expenses	75,652,106	74,521,660
Taxes	5,621,239	4,850,348
Operating income	39,412,888	42,764,978
Gross income	48,265,408	49,500,167
Net income	21,698,845	26,117,207
Dividends	16,361,187	16,361,426
Surplus	5,241,966	9,727,566

NEW BOOKS.

Economics of Railroad Construction, Second Edition. By Walter Loring Webb, C.E. Bound in cloth, illustrated, 332 pages, 5 in. x 8 in. Published by John Wiley & Sons, 43 E. 19 street, New York. Price $2.50.

The scope of this book which was first brought out six years ago is well explained by its title. It includes seventeen chapters covering such matters as organization, capitalization, valuation, and volume of traffic in the first part, operating expenses, motive power, car construction, track economics, train resistance in part two, and physical elements of a railway in part three. The book is written from the standpoint of the constructing or operating engineer and deals briefly with principles and their practical application. The present edition has been thoroughly revised and the chapters on operating expenses, distance, curvature and grade have practically been rewritten.

A Handbook of English for Engineers. By Wilbur Owen Sypherd. Leather binding, 4½ in. x 6½ in., 310 pages. Published by Scott, Foresman & Co., Chicago. Price $1.50.

The author of a "Handbook of English for Engineers" has entered a new field of text-book writing. There is an abundant supply of books containing grammatical and rhetorical rules and outlining courses of study in English composition, but it is believed that this is the first attempt to prepare such a book from the standpoint of the engineer, including in it only the forms of writing of particular use to the engineer and drawing all illustrations from engineering literature. In chapter one the author discusses the planning and presentation of technical papers, and includes brief sections on paragraphs, sentences and words, illustrating good usage and common faults. Chapter two is called "Mechanical Details Common to the Various Forms of Technical Writing," and covers by rules and illustrations the subjects of abbreviation, hyphenation, punctuation, numbers and capitals. The third chapter is devoted to the writing of business letters, showing proper forms and placing especial emphasis on applications for engineering positions. In chapter four the subject of reports is treated in a similar way, and chapter five takes up articles for technical journals with numerous illustrations drawn from standard technical papers. Three appendices are included, giving rules for the preparation of manuscript and the correction of proof, examples of faulty paragraphs and sentences, lists of words frequently misused and misspelled and a bibliography of the subject. The book has been designed by the author to meet the needs particularly of advanced engineering students and young engineering graduates.

Letters to the Editor.

THE BUREAU OF RAILWAY ECONOMICS.

——, February 12, 1913.

To the Editor of the Railway Age Gazette:

I was very much interested in the editorial in your issue of February 7, page 235, relative to the Bureau of Railway Economics.

It happens to be my work to handle the railroad news for a large metropolitan daily. The work of the Bureau of Railway Economics came to my attention immediately after the bureau was formed. I began at once to use its reports as fast as they came out and to prepare statistical matter for them. J. M. Connell, general passenger agent of the Santa Fe, with office at Topeka, Kan., wrote me soon after the establishment of the bureau asking that I look over the bulletins and press notices sent out by the bureau, and I replied that I had already been branded as a corporation hireling for using the bureau's matter, but that I considered it invaluable if the public was to have the truth about the railways.

Then came real trouble. The managing editor shut off my publicity for the railways by saying that any mention of the Bureau of Railway Economics must be eliminated because the American Publishers' Association had decided that the matter sent out by it was in the nature of advertising and that the bureau was unwilling to pay for its publication. To pay space rates for such matter would bankrupt even the railways themselves, and the good intentions of the railways, it would seem to me, have been mistaken by the publishers of the larger dailies for an effort to get a chance to air their grievances. It seems to me as though the railways are being hit with both ends of the stick, and I for one deplore the attitude of the press in refusing to give the Bureau of Railway Economics credit for the work that it has undertaken, and which is purely educational.

Railroad Editor.

THE PRESS ON ARBITRATION OF RAILWAY WAGES.

Springfield, Mass., February 22, 1913.

To the Editor of the Railway Age Gazette:

As you have said in your editorial of this week, discussing the demands of the firemen for higher wages, the railroads have during the past few years learned some serious lessons concerning the attitude of the public. One important lesson which they have just learned, in this present crisis, is that the public press will not support them, however strong may be their position. Every editorial on the firemen's controversy—not pronounced in its prejudice toward "labor"—has either been exceedingly cautious in its support of the railways or plainly lukewarm; and with some of the dailies which are supposed to be strong and independent this lukewarmness has become positive silence. So far as my observation goes not more than one prominent paper has spoken out vigorously.

No argument could be more forcible than that which the railroads have presented in support of their objection to the Erdman law. That a difficult question, involving the weightiest financial elements, and a multitude of intricate details unfamiliar to all non-railroaders, and the decision of which is sure to bring down on the head of the decider severe criticism, ought not to be settled by one man, is too obvious to need argument. Not an editor in the country could miss the point. Yet every editorial on the subject has borne the ear marks of the hackwriter—or the coward. Each writer saw what ought to be said but carefully avoided saying it; or else said it so faintly that the effect was as bad as though he had kept silent.

Railway employees have got wage increases for the past ten years by the splitting of differences; and they do not intend to give up that soft thing. The real trouble in the present situation is that, in the engineman's case in 1912, Reason decided that on most of the big roads an increase in pay was not deserved. If Reason is going to thus side with the bloated bondholder, the firemen want nothing to do with it!

The press bases its views on reason, but the writers seem unable to forget that their main affections must be showered on "labor," morning, noon and night. *The Republican*, of this city, usually fair and independent, did not find its voice to condemn the Erdman law until after the firemen had won their contention. Condemning the railroads for their misbehavior toward the public has become such a habit that to do them justice comes very hard. These same editors, who accept the firemen's contention that arbitration is the thing and the number of arbitrators a mere detail, have no trouble in discerning the foolishness of Congress in other matters; and yet the Erdman act is only a typical example of the half baked measures that the House of Representatives is hatching up at every session.

The sole arbitrator of the firemen's case will have a perplexing task, at best; but it is to be hoped that for once we may have the question of wages in train service thrashed out on the basis of actual conditions and pure reason, with the "weight" of cowardly and incompetent railway officers on the one hand, and of unprincipled labor advocates on the other, entirely eliminated.

G. E. A.

NEEDED—A DEFLECTABLE HEADLIGHT.

New York, February 13, 1913.

To the Editor of the Railway Age Gazette:

That rigid headlights on locomotives are unsatisfactory on curves has long been known. They throw the light where it is not needed and leave the track ahead in darkness. This defect was emphasized a short time ago in causing the loss of a man's life. On his way home at night he dodged a train, and stepped into a frog which, according to the report, was located on a sharp curve; he was unable to withdraw his foot in time to escape a second train.

No doubt if the man had observed the rules of the company concerning trespassing he would not have been there, but the fact nevertheless remains that an easily controlled, deflectable headlight that would throw light straight ahead when in its normal position and to either side, at the will of the engineer, is highly desirable. It is believed that automobiles will soon be fitted with lights of this kind and that its use may be extended to the locomotive. To design and build such a contrivance would surely be simple.

W. F. Schaphorst.

ECONOMY OF LOCOMOTIVES.

Boston, Mass., February 15, 1913.

To the Editor of the Railway Age Gazette:

The account given of German locomotive performance by Mr. Jacobs in a recent issue of the *Railway Age Gazette* (January 3, 1913, page 26) almost makes one feel that Mr. Brandeis may not have been so far off when he said that the railroads of this country could save $300,000,000 a year by intelligent effort. I refer to the coal consumptions per mile, which he gave, for different kinds of service. The trouble with this kind of statistics is that they are too general and are not based on any unit of work. The question is whether the German locomotives are worked as hard as ours and whether they are more carefully fired and operated.

If one studies the results of the tests of locomotives at the St. Louis Exhibition and on the testing plant of the Pennsylvania Railroad at Altoona, it is evident that the results are so good that they can scarcely be better in Germany. The steam used per indicated horse power per hour by the Atlantic type locomotive tested recently at Altoona is wonderfully small, and the evaporations per pound of coal of this and the locomotives tested at St. Louis were high, and unsurpassed. These two factors together make the economy, and the question is can

German locomotives do any better. I do not think they can. The cause of their economy must then be due to gentle handling on the part of the engineer, care in firing, and working more nearly at the economical point of cut-off. It is possible to work a locomotive so hard when starting and climbing grades that the exhaust will eject enormous quantities of coal from the stack; and all of our road beds are black with coal. In this country, as I understand it, it is considered more economical, in total cost of haulage, to operate a locomotive as above indicated rather than to operate the locomotive itself economically. It would be very interesting if Mr. Jacobs could get his German figures into such shape that they could be compared with American figures on a unit of work basis. F. W. Dean.

TENDER DERAILMENTS.

Stamps, Ark., February 3, 1913.

To the Editor of the Railway Age Gazette:

In the *Railway Age Gazette* of January 31, page 209, "G. E." states: "Since the tender frame and truck bolsters are held in the same relative positions, notwithstanding the location of the side bearings, it is difficult to see how the spacing of them can have any effect on tender derailments. The thousands of six-wheel trucks and of recent four-wheel trucks for steel cars, having side bearings far outside the journals, carrying loads with high centers of gravity, have reputations for safety which cannot be assailed."

The conclusion that the reputation for safety of trucks under passenger equipment with widely spaced side bearings, "cannot be assailed" is not convincing. If it is conceded that such trucks are the least likely to derail of any known, it does not necessarily follow that their safety is because of widely spaced side bearings, but rather in spite of it. Years of accumulated experience condemn widely spaced side bearings when in combination with a short truck wheelbase and insufficient truck spring capacity. The writer believes the disinclination of the passenger truck to derail is primarily due to its long wheel base, which is effective in resisting a tendency of the truck to rotate in a horizontal plane, as more fully explained hereafter. Moreover, the center of gravity of a passenger car is lower ordinarily than that of either a tender or a loaded box car.

Referring to the remarks of Prof. Moore on the Westport wreck. His analysis of the vertical forces in a plane at right angles to the track is very interesting. A similar investigation of the forces in a horizontal plane parallel to the track, at the instant the vertical forces were as indicated in Fig. 6, will shed further light upon the subject. The energy of the train may be expressed as:

$$E = 66.827\ V^2,$$

in which E is the energy in foot-pounds per ton and V the speed in miles per hour. Solving for E, with V at 48 miles an hour, we have for the energy per ton, 153,969 ft.-lbs. If the train resistance is, say, 6 lbs. per ton, and no other resistances are to be overcome by the energy of the train, it will run a distance of 25,344 ft. before coming to a stop. Dividing 153,969 ft.-lbs. by 25,344 ft., we have 6 lbs. as the constant force whose point of application is at the center plate, and which is the required force to overcome the resistance of the train. If the vertical reactions of all the wheels in the train on the left side are equal to those on the right side, with the exception of the one truck under consideration—the reactions of this truck being as above referred to (Fig. 6)—the forces are as shown below, for a train of 400 tons:

The 2,400-lb. force will tend to produce rotation of the truck in a horizontal plane parallel with the track, and about a point near the force of 49,650 lbs. In other words, the truck is certain to be slewed, and consequently derailed. For the force of 2,400 lbs. to produce no rotation in a horizontal plane, the vertical reactions (weights on the wheels) must be equal. When the weight of the car is carried on the center plate, this occurs, and it is the normal condition; but when the car body is rocking, the weight is alternately carried on the center plate and one side bearing, and on the center plate and the other side bearing. The farther the side bearings are spaced from the center plate, the greater the vertical reaction on that side for any given load and oscillation. With the weight carried on the center plate only, the reactions are equal, and the momentum of the car, acting through the center pin, is distributed in equal halves to each side; but when the car rocks, unequal vertical reactions occur; i. e., more weight is momentarily carried on one side than on the other. The greater the difference in the reactions, the greater is the tendency for the truck to slew.

This has often been demonstrated in the actual handling of cars which have been derailed by reason of the load being placed on one side of the car. The principle can also be demonstrated experimentally, and in the writer's opinion it is the cause of the great majority of our derailments. F. W. Green,

General Manager, Louisiana & Arkansas.

UNREASONABLE FACILITIES.

London, England, January 27, 1913.

To the Editor of the Railway Age Gazette:

I see that the Colorado Supreme Court has compelled the Colorado & Southern to continue to operate an unprofitable line, holding that the law imposes on the carrier "the duty of furnishing facilities to the public on its entire system, not a part," and that, having once undertaken to serve the public, a railway cannot abandon an unprofitable portion of its business without surrendering its charter.

What the precise wording of the statute under which the Colorado court proceeded, I have no means of knowing. But, on the assumption that the Colorado statute, like the act to regulate commerce, is founded upon our English act of 1854, and requires railway companies to afford to the public "*reasonable* facilities," the decision of the English courts is even more relevant than the action of the Mexican government (commented on in the *Railway Age Gazette*, p. 89) and may interest your readers.

Our railway commission in 1891 in the Winsford case took the same line as the Colorado court, and held that under the act of 1854, "if a railway company carry passengers at all, it must afford such facilities for them as are reasonable over the whole extent of their system. . . . The effect of the act is to deprive railway companies which have commenced a particular traffic of the power, which they previously had, of continuing or discontinuing it at their own discretion. . . . The fact that a branch does not yield a profit over working expenses does not afford a reason why it should not be worked." Three years later in the Darlaston case the same point came up. A company had discontinued passenger service and closed a station, because the bulk of the traffic had been diverted by a tramway, and they were losing money. The commissioners again ordered the station to be reopened and passenger traffic resumed; though they stated in their judgment "It is but too plain that the line must be worked at a loss, and we regret to impose this burden upon the defendants." The case was taken to the Court of Appeals, and the judgment of the commissioners reversed. Reasonable facilities, said that court, must be "reasonable as regards the company as well as the public": "to require a railway company to give facilities to the public which involve a heavy loss on themselves . . . seems to me to disregard the plain language of the act, and to assume a jurisdiction to compel a railway company to give unreasonable facilities which is contrary to the terms of the act.

And this is how the law in England stands today.

W. M. Acworth.

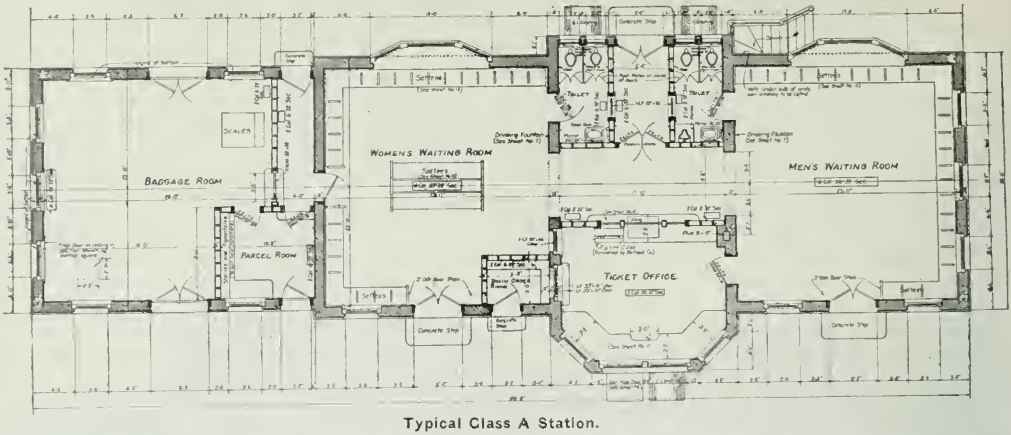
ATTRACTIVE STATIONS FOR SMALL TOWNS.

New Passenger Facilities Provided at Five Points on the Buffalo, Rochester & Pittsburgh—Two General Standards.

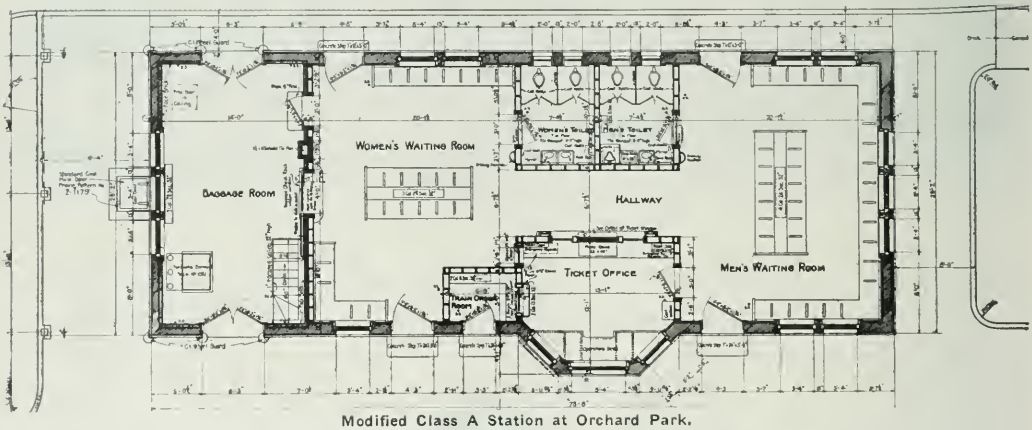
The Buffalo, Rochester & Pittsburgh has built a number of stations in small towns and villages along its line for which two standard designs applicable to most locations have been worked out. The five stations recently built at Ridgway, Pa., and at Scottsville, Mumford, Springville and Orchard Park, N. Y., are typical of this form of construction. The class A station is 99 ft. 8 in. long, the main portion of the building being 28 ft. wide, and the baggage room end 26 ft. wide. There are separate waiting rooms for men and women, each of these being 23 ft. 11 in. x 25 ft. 10 in. in size. Settees are provided around the walls and drinking fountains are furnished in both rooms. The waiting rooms are connected by a broad corridor, one side of which leads to the main entrance in the rear of the building and the other faces the ticket windows. A train order room opening off the ticket office and a parcel room, which is included in the baggage room, are also provided. The class B station is 28 ft. x 67 ft. 8 in. over all, having a single waiting room and a freight room as shown in the accompanying floor plan. The Orchard Park station is a modification of the class A plan, being shortened to 73 ft. 8 in. by reducing the waiting rooms to 20 ft. 1½ in., and the baggage room to 14 ft. A broad porte cochere has been provided at this station and a long shelter covers the platform. The other details of the building are similar to the standard class A station.

Track Side of Class A Station at Ridgway, Pa.

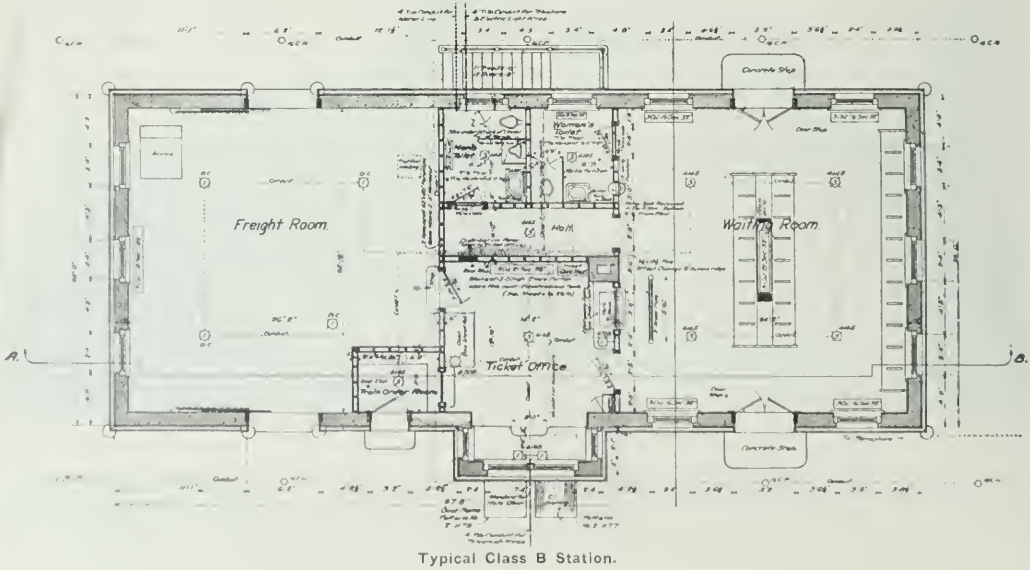
Rear of Class A Station at Springville, N. Y.



Typical Class A Station.



Modified Class A Station at Orchard Park.



Typical Class B Station.

The buildings are of brick faced with red repressed brick, with the exception of the Orchard Park station, which is of red impervious brick with window sills and lintels of Litholite. Litholite has been used in the Scottsville, Mumford and Springville buildings for belting and window sills, and in the first two for keystones. In the Ridgway station corner quoins of Litholite are added to the trimming. The roofs are covered with red tile, the imperial Spanish style being used in three cases and the French style in the other two. The interior trim is of selected first grade red oak, all rooms except the baggage

Modified Class A Station at Orchard Park, N. Y.

or freight room and the toilet rooms being wainscoted with the same wood as the trim. The baggage and freight rooms are finished in yellow pine, the portion above the wainscoting being ceiled on studded partitions. In the Orchard Park station the studded partition in the baggage room is veneered with brick. In all of the rooms except the baggage and freight rooms the walls above the wainscoting are lathed, plastered and painted, the ceilings being calcimined. The floors, except in the baggage, freight and toilet rooms are of two thicknesses. First a ⅞ in. floor of hemlock is laid diagonally on the joists, then a layer of

Class B Station at Scottsville, N. Y.

waterproof building paper is laid, on which the floor surface of ⅞ in. x 2½ in. first quality comb grained Georgia pine is laid at right angles to the joists. The baggage and freight room floors are of 2 in. yellow pine flooring. The bases throughout the building with the exception of baggage, freight and toilet rooms are of sanitary composition cove 10 in. high, finished with plinth blocks at the door openings. The toilet room floors are small pattern hexagonal tile, the wainscoting in these rooms being of glazed tile 6 ft. high, with the tile cove base and round edge capping. All metal toilet room fittings are of nickel-plated brass. With the exception of the Ridgway station, the buildings are heated with hot water, steam being used in the former case. Gas and electricity are both provided for lighting in all except the Scottsville station, where electricity alone is used. At two points the water, gas and electricity were obtained from local companies, and in the other three cases the water for station use and for fire protection had to be secured from dug wells, the water being pumped into an elevated tank by a windmill in each case. Particular care has been taken in the adaptation of these buildings to their surroundings and unusually attractive parks, flower beds, broad walks and shrubbery have been provided in some cases.

The plans and specifications for these buildings were made in the office of E. F. Robinson, chief engineer. The concrete foundations, concrete curbs, sidewalks, brick platform, grading, track work, and where necessary the water supply and sewers were placed by company forces. The buildings above the foundation line were built by contract.

THE JACOBS-SHUPERT BOILER TESTS.

On page 76 of Dr. Goss' report* on the comparative tests of the Jacobs-Shupert and the radial stay boilers, the following summary is presented as to the tests of evaporative efficiency and capacity: "The results show that the Jacobs-Shupert boiler and the radial stay boiler, under all of the various conditions of the tests, operate at practically the same efficiency. There are indications that under very high rates of power, the Jacobs-Shupert boiler has some slight advantage."

The general statement as to equality of steaming capacity is what was to be expected. But in reviewing the report a criti-

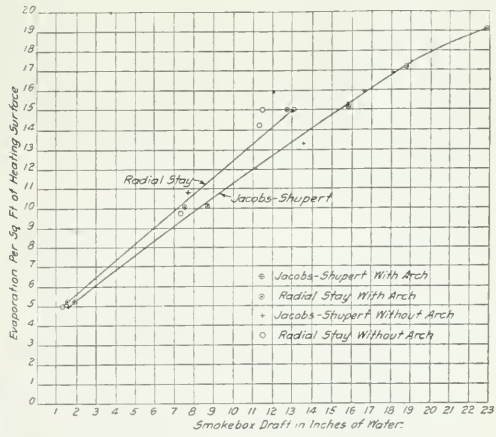


Fig. 1.

cism of the statement as to quality has been made on the basis that, while the actual amount of steam produced might be approximately the same, yet it is done with widely different blast conditions, and that, if a diagram be drawn, with ordinates equal to the evaporation per square foot of heating surface per hour and abscissae equal to the smokebox draft in inches of water, it will be seen that, taking the averages for all of the tests, the radial stay boiler required much less draft to produce the same rate of evaporation per square foot of heating surface than the Jacobs-Shupert.

Such a diagram is shown in Fig. 1, As examples it will here be seen that with 7.4 in. of draft the radial stay boiler produced the same rate of evaporation as did the Jacobs-Shupert

*An abstract of this report appeared in the *Railway Age Gazette* of February 7, 1913, page 251.

at 8.7 in. Or the radial stay at 13.1 in. was on a par with the Jacobs-Shupert at 15.8 in.

If this were to hold it might mean that, while boiler efficiencies were the same, there would be a great reduction in engine efficiency as a direct result because of the increase of back pressure required to maintain the heavy draft.

Taking the results purely on the basis of draft and constructing diagrams using the draft in inches for abscissae, and evaporation per pound of coal fired for ordinates, we obtain a diagram that confirms Dr. Goss' conclusion that was quoted. Such a diagram is shown in Fig. 2. From this we see that the rate of firing with the Jacobs-Shupert boiler was less than with the radial stay on the basis of draft. Hence it is but natural that,

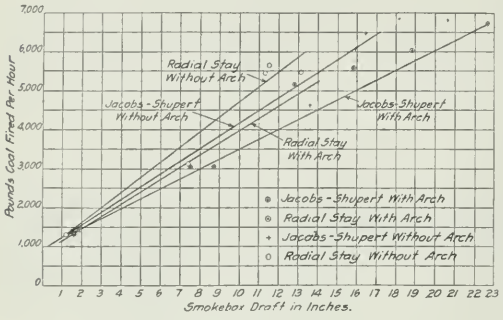

Fig. 2.

given more coal, the radial stay boiler should show a higher rate of evaporation with the same draft, as tested, than does the Jacobs-Shupert.

There is another point, minor and insignificant to be sure, that was ignored in the construction of diagram, Fig. 1; and that was the fact that, in all computations involving heating surface, it was the *developed* surface that was used (see Dr. Goss' report, page 42). As the Jacobs-Shupert boiler contained about 0.8 per cent. more total heating surface than the radial stay boiler, this tends to lower its line in the diagram of evaporation per square foot of heating surface.

But if we assume that the rate of evaporation is proportional

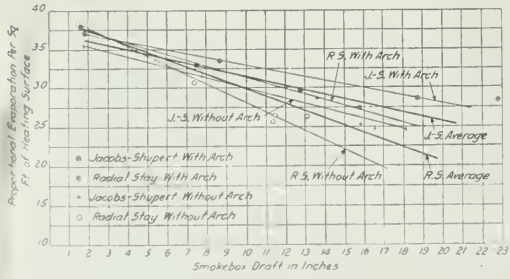

Fig. 3.

to the amount of coal burned, and that the efficiency of the two boilers under the varying conditions of draft remains as given in the report, we may construct a diagram like that shown in Fig. 3. In this the rate of evaporation per square foot of projected heating surface has been divided by the amount of coal burned per hour, and the quotients used as ordinates, with the draft in inches for the abscissae as before. This shows that the radial stay boiler was the more economical at low rates of draft, up to about 5.8 in., and that, thereafter, the Jacobs-Shupert boiler was the more economical; that is, gave a higher rate of evaporation, which is in exact accord with Dr. Goss' assertion reached by an entirely different route. This is given merely to call attention to the criticism that has been pretty extensively made, and to show that the diagram of Fig. 1 can only be considered when all of the modifying conditions are taken into account; in short, that, when taken by itself, it may give an entirely erroneous idea of the work of the two boilers.

CHROME-VANADIUM TENDER WHEELS.

For a number of years the Vandalia Railroad has been keeping comparative service records of chrome-vanadium and carbon steel wheels used under passenger tenders, which carry 7,500 gal. of water and 12 tons of coal, making an average load of each wheel on the rail of 17,875 lbs. when the tender is loaded. The average results show that about two and a half times as much mileage was obtained from the chrome-vanadium wheels per unit of wear and turning as from the carbon steel wheels. A summary of these records for 3½ years' service, up to June, 1912, is shown in the table.

Summary of Comparative Service Tests of Chrome-Vanadium and Carbon Steel Tender Wheels.

	Chrome-vanadium tender wheels.	Carbon steel tender wheels.	Per cent. in favor of chrome-vanadium wheels.
Coal capacity, tender, tons	12	12	...
Water capacity, tender, gals	7,500	7,500	...
Weight of tender in working order, lbs.	143,000	143,000	...
Average load per wheel on rail, lbs	17,875	17,875	...
Class of service	Passenger	Passenger	...
Average mileage per 1/16 in. diam wear.	12,857	12,857	39
Average mileage per 1/16 in. diam. wear and turning	6,137	2,427	152
Maximum mileage per 1/16 in. diam. wear and turning	6,894	3,344	105
Minimum mileage per 1/16 in. diam. wear and turning	5,536	1,294	327

From the results thus far obtained the Vandalia has drawn the following conclusions as to the relative advantages of the chrome-vanadium wheels. The material is more uniform and a greater mileage is obtained per unit of wear; this results directly in less flange wear and a smaller amount of material wasted in turning the wheels in the lathe, with a consequent greater mileage per unit of wear plus turning. There is an entire absence of shelled or burned spots in the treads, as compared with the carbon steel wheels.

The results cover 10 mated pairs of carbon and 16 mated pairs of chrome-vanadium solid steel wheels. Contour charts were made of each wheel before and after each turning. The large amount of material removed in turning the carbon steel wheels was due in some instances to the wheels shelling or being burned. Up to the present time the chrome-vanadium wheels under observation have made over 300,000 miles, and it is expected that they will probably reach 400,000 miles. No trouble has been experienced in machining the chrome-vanadium wheels in a truck wheel lathe at a cutting speed of 15 ft. per minute.

Research work since the Vandalia wheels were placed in service has resulted in a new method of heat treatment. The wheel is heated to a certain temperature and is then spinned for a pre-determined length of time in a trough of water, with the tread immersed to a little below the limit of wear line of the wheel. It is then taken out and allowed to cool in the air, after which it is reheated for annealing. In this way the plate and hub are not affected by the immersion of the ring in the water, but undergo an annealing operation while the rim is being hardened. This results in a somewhat higher and more uniform hardness across the rim than is to be found in the wheels now in service on the Vandalia.

New Line for Brazil.—The government of the State of Minas, Brazil, has signed a contract with Col. José Caetano Pimentel for the construction and operation for 50 years of a railway to run from the Doce river, near the Bueno Brandao colony, to Urucu station on the Bahia-Minas Railway.

LATEST ASPECTS OF THE "SAFETY FIRST" MOVEMENT.

Valuable Experiences and Lessons In Machine-Shop Safety, and Instructive Conclusions Concerning Discipline of Employees.

Two recent papers on "safety first" were by two of the best-informed and best qualified men now at work in that department of the railroad service, and we give below liberal extracts from their papers. The first was read at the New York Railroad Club, February 21, and the other at the Western Railway Club, Chicago, February 18.

J. W. COON'S PAPER.

J. W. Coon, assistant to the general manager of the Baltimore & Ohio, in speaking on "Safety on the Railroads," said:

Everyone who has studied the question of preserving human life on railroads will agree that there are ample rules and instructions in effect and that they are clearly drawn. It is impossible to correct present evils simply by securing greater alertness on the part of the officers or by originating additional rules. The great majority of railroad men are careful and competent. The mistakes are made by the few, but we must work with all, for we do not know the few who will cause the trouble.

Before a physician will give the patient medicine he must know where the trouble is. So in safety work. Before you can apply a remedy, you must know your weakest division, your poorest shop, yard, etc. General letters stating that personal injuries are increasing and something must be done will do about as much good as to attempt to persuade a healthy country boy on some hot Saturday afternoon that it is more pleasant to study his geography lesson than to visit the old swimming hole. You must be able to say to a given shop, "you are making the poorest showing on the system"; "your yard is making the poorest showing"; "your division is the last on the list," etc. To be able to do this, we keep a record of injuries to employees by shops, yards, divisions, etc.

Their standing was first figured on a basis of the number of employees. We found, however, that this was not exactly fair. To illustrate—a shop normally has one thousand men; business drops off and the allotment is cut. The master mechanic very naturally and properly endeavors to keep his organization together, and therefore reduces the number of hours worked per day, or works but five days a week. The danger of injury, in this case, would only be half as great, yet the number of employees would remain practically the same, and the shop would be making a good showing. We therefore figure the standing of each division, yard, shop, etc., by dividing the total wages earned by the number of injuries. Then if business falls off the wages will do so in a corresponding measure. In this way we can tell at a glance the point making the poorest showing.

The suggestions made by the local committeemen should be given every consideration. The division making the best showing will always be the one on which the superintendent and other local officers take personal interest in the work and follow out as many of the suggestions as possible. The superintendent is influenced by the interest displayed by his superior, so that it is essential that from the president down personal interest be taken by all the officers.

We have covered over 1,500 machines in the shops. We have put walkways on many bridges, especially where located near switches. Moved buildings and poles back to give clearances. Raised the hand railing on caboose cars as men have been jerked over the low ones, etc. All at the suggestion of the men. The men will take about the same interest they see the company taking. More essential even than to locate the sore is to ascertain what caused it. If your fatal injuries are due to train accidents you must give the problem special attention. Ascertain whether it is due to track, equipment or men.

We found, in carefully analyzing the fatal injuries to employees during the past year, that over 90 per cent. were due to causes that no expenditure of money in providing additional safeguards, etc., could possibly have prevented. They were due to failure of the human element. I do not say they resulted from carelessness; some were due to thoughtlessness, some to lack of familiarity with the movements and some to carelessness, even though possibly this was caused by over zealousness on the part of the employee in trying to do the work in too much haste.

Only 19 per cent. of all employees fatally injured in the past year were killed in train accidents, and this includes all the minor accidents, such as cars sidewiped in the yards, striking cars too hard, etc., and not entirely due to collisions or derailments, as many think; in other words, over 80 per cent. were fatally injured in other than train accidents.

It is sometimes said that men have to run by signals, on rainy or foggy nights, without being sure of their position; that otherwise they would be taken off the preferred run, or at least, criticized. I have been in the operating department of this road for twenty-five years, and have never yet known of an engineer being censured where he could not make time because of fog or extremely stormy weather. Often a message is sent an engineer asking the cause of the delay. Some might consider this as a criticism. It is not. It is necessary to make report of every delay, and it is to enable a local officer to do this that the message is sent. President Willard has said to every officer and employee that safety is to be the first consideration, comfort of passengers next and speed or punctuality last. We had had no accident to bring out this talk. He was merely outlining his policy to be followed by all. A copy of this talk was sent to each employee in the service.

We post on bulletin boards over the entire 6,000 miles of road, within two or three days of its occurrence, the cause of any fatal injury, and caution our men to avoid a similar accident. The monthly employees' magazine is read by our 60,000 employees. We carry on observation tests—sometimes improperly called "surprise tests." This work is the greatest aid in safety. Each division is required to make not less than a given number of tests. For example, a clearance card is made to show the wrong engine number or incorrect date to see if the crew are alert and detect these errors. A train order is improperly repeated to see if the despatcher or operator is vigilant. A signal light is removed or a signal improperly displayed to see if the rules requiring train to stop under those circumstances are observed. These are not "surprise" tests; they are limited to conditions met with every day and no "catch" features are permitted. These tests should be diversified—should be made with every employee in train service and a careful record should be kept. If an engineer fails he should be given another test of a different nature and this followed up to see if he profited by the lesson. If habitually careless he should not remain in train service. The value of these tests cannot be over-estimated. In fact I would advocate the appointment of one or more men, thoroughly familiar with railroad operation, whose business it would be to see that these tests were properly made, proper record kept and failures followed up. Let the inspector get on a freight train and ask the brakeman under what orders he is running to see if he goes over the train orders and is fully informed. Let him examine the lanterns to see if torpedoes are attached, that they are clean and ready for instant use. Let him talk to the men as to what constitutes proper flagging, etc.

For five years on the Baltimore & Ohio we have not killed a single passenger in a train accident, and during that time we have carried 85,000,000. We want the employees to be equally

careful in their shop, yard or track work, where passengers are not involved. . . .

GEORGE BRADSHAW'S PAPER.

George Bradshaw, general safety agent of the New York Central Lines, in speaking before the Western Railway Club said:

Railroad men have always known that unsafe conditions and practices should be corrected, but the problem has been to find an effective way of correcting them and keeping them corrected. The public have been trying to find a way of doing this apparently simple thing for the last thirty years by the enactment of laws. Yet, every year the personal injury record among employees has been growing worse. The doctor has been giving us the wrong medicine.

Safety committees composed of officers and employees—whose duties are to discover and correct unsafe conditions and practices—now exist on almost 200,000 miles of railroad in the United States. The man who first conceived the idea is R. C. Richards of the Chicago & North Western. The most difficult thing in the world to find is a new thought. Mr. Richards belongs to that small class of great men who have originated ideas: and in future years railroad men the country over will honor him for the service he has rendered.

The New York Central took up safety work as a distinct branch of the service about two and a half years ago. It now has 60 division and shop committees comprising about 900 members, over a territory of about 12,000 miles. We began this work in the shops, where attention was chiefly directed to the guarding of machines. To do this is by no means an easy task. It requires general knowledge of machine operation, and familiarity with personal injury records covering varied and extensive conditions. The proper time and place to guard a machine is when the machine is being built and the man who should guard it is the man who made it. Our factory laws permit manufacturers to construct and distribute machines without giving any consideration whatever to safeguards, and then after machines have been distributed all over the country and perhaps put into use without safeguards, state inspectors are employed to ferret the machines out and have them guarded at the expense of the users. Wood is proper for covers, walk-ways and railings, but generally speaking should not be applied to machines or used to enclose parts of machines. Pipe railing may be used in front of switchboards, about pits, and around flywheels and pulleys in engine rooms where only those in charge have occasion to go. It should not be used for guarding flywheels and pulleys in shops. Woven wire is preferable for flywheels, pulleys and large gears because it allows free circulation of light and air, and permits a view at all times of movable parts of machine. It is also more easily and cheaply applied than heavy sheet metal. Wire not less than ⅛ in. diameter, with mesh not greater than 1 in., should be used. Smoke stack netting or expanded metal serves the purpose.

Safeguards for machines must not interfere with the operation of machine or inconvenience the operator; they should, as far as possible, be automatic so that their efficiency does not depend upon their being properly adjusted. They should be strong and firmly attached. Ordinarily a space of not less than 6 in. should be left between guard and floor to permit sweeping. They should be attached to the machine, floor, or other support so that they cannot be set aside. Doors or slides should close automatically where necessary.

It is seldom advisable to purchase patent safeguards, because a large percentage of such safeguards are not practicable. In almost every shop there is considerable scrap material which may be used to good advantage in the construction of guards and the very fact that guards are being made and applied in the shop is in itself an object lesson in safety.

We have prepared and put into effect standard specifications for safety devices. These specifications, illustrated by photographs and drawings, are printed in portfolio form and distributed to all officers having anything to do with machinery. These specifications have been developed as a result of experience in the construction of safeguards for many machines in various shops during the last three years. Many guards applied when this work was first begun, we have found as the result of further study to be not fully protective, unnecessarily expensive, or otherwise objectionable. We have, therefore, taken those guards which experience has shown to be the most effective, practicable and economical, and made them standard for all shops.

Mr. Bradshaw showed his audience a large number of pictures illustrating his statements. In one picture, for example, a guard covered only the upper part of some gears, leaving the lower portion exposed. An employee was caught and injured; and the exposed portion of the gears has since been enclosed. Other pictures showed a number of safeguards constructed according to the new standard specifications. In many of these woven wire was the principal material. In a woven wire guard for gears at the end of a lathe, the guard is attached to the machine by hinges in such a manner that it swings shut of its own accord. A careless employee cannot leave the guard out of its proper position.

The conditions corrected by safety committees do not as a rule involve a great deal of expense.

Unsafe conditions are not responsible for the greater number of preventable injuries. The record for two years shows that from 60 to 70 per cent. of the accidents which could have been avoided were due to unsafe practices on the part of employees. We do not make proper and sufficient investigation of the moral and mental qualification of the men we employ in the more responsible branches of the service. Under the system now prevailing on most roads, almost any man of prescribed age who can pass a physical examination can get a responsible position. In nine cases out of ten, we take the references given by the applicant, write them formal letters of inquiry and the butcher and the barber, the teamster and the trader do the rest. The duty of employing new men is generally delegated by officers to assistants, and by them further delegated down the line till it often happens that a clerk is the only one, other than the examining physician, who sees or knows anything about the applicant before he reports for duty.

Instead of this method, there should be on every road, a central employment bureau with branches at important points which should have sole authority in the employment of men. This bureau should encourage—if necessary should advertise for—applicants and should make a careful and thorough investigation of the antecedents and of the personal record of every applicant. We could and we should have in charge of our trains the finest body of men in the world. The work is attractive, even fascinating, the pay is good and the chances for advancement encouraging. The most popular toy in the world for boys is an engine and string of cars, and when these boys grow up, they all want to go railroading. We don't need them all, but we could, if we went about it in the right way, select the best of them. When a capable country boy comes timidly into a railroad office today and applies for a job, if we don't happen to need men at the time, the employing officer, or more likely his clerk says, "Can't do anything for you now." The boy goes away and gets a job clerking at ten dollars a week. A few months later there is a rush of business and we need men, but we have no waiting list—we don't even take names and addresses of applicants, and consequently we have to take anything we can get on short notice, and that often means the boomer and the loafer. Even this method wouldn't be so objectionable, if we gave every new man a careful and thorough training before allowing him to go to work, but we don't do that; that is, we don't carry it far enough.

It should be borne in mind that the attitude of the yardmaster and the roundhouse foreman toward the Safety Movement, being observed and understood by individual employees, is often more potent than that of the general manager, whose views are known by employees only in a general and indefinite way. If the yardmaster is permitted to remain indifferent to the necessity for

compliance with instructions, their enforcement will be difficult and to a great extent impossible.

Mr. Bradshaw showed copies of numerous pamphlets which have been issued by him as circulars among the employees. He finds that employees are glad to receive this literature and that they read it attentively. He has almost completed a "Safety Exhibit Car" which will contain models of approved safety devices, safety literature, photographs and other things of interest. This car, in charge of a competent man, will be exhibited at all important points where employees will be given an opportunity to see what is being done for the prevention of injuries. Every employee on the system will be required to visit the car.

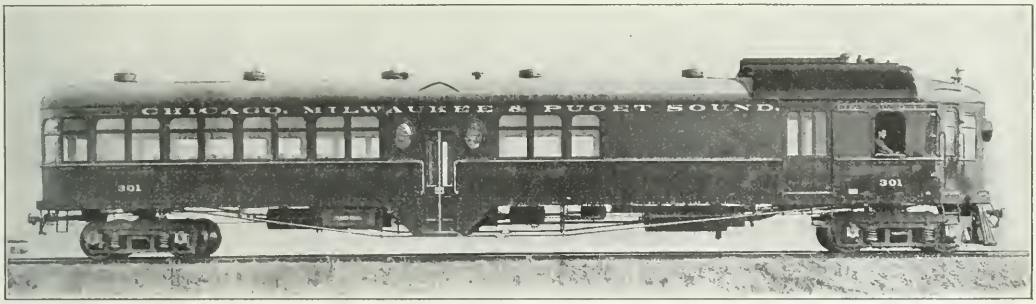
MOTOR CARS ON CHICAGO, MILWAUKEE & PUGET SOUND.

The Chicago, Milwaukee & Puget Sound has recently placed in service on branch lines in the state of Washington, two General Electric Company gas-electric motor cars. One of these is operating between Everett and Monroe, a distance of 14 miles, and makes five single trips a day, totaling 70 miles; while the other runs from Seattle, via Cedar Falls to Enumclaw, a distance of 62 miles, and makes one round trip each day, covering 124 miles.

The cars are of the combination passenger, smoking and baggage compartment type, with turtle back roof. They are 70 ft. 5 in. long, 10 ft. 5 in. wide, weigh approximately 50 tons, and have a total seating capacity for 77 people. The cab, containing the power plant apparatus, measures 11 ft. 11 in. long; next is the baggage room, 15 ft. long; then the smoking section, 10 ft. 11 in. long; and the passenger compartment, 27 ft. 5 in. long. A center vestibule with side entrance runs crosswise between the passenger and smoking compartments. The smoking section provides for 20, and the passenger compartment for 57 people. All-steel construction is used throughout, except in the case of the interior finish, which is of mahogany.

The generating unit is located above the floor line of the cab, where it is under the immediate observation of the engineer. It consists of an eight-cylinder, four-cycle gas engine of the "V" type, direct connected to a 600 volt, commutating pole, electric generator, designed to meet the special conditions the service demands. The engine can rotate at normal speed, irrespective of the speed of the car, which is started by compressed air taken from the main reservoirs of the air brake system, which are built with surplus capacity for this purpose. The main air compressor is driven from the crank shaft of the main engine, and is fitted with an automatic governor to maintain a constant pressure. An auxiliary equipment is also provided, consisting of a two-cylinder, four-cycle gas engine, direct connected to a single cylinder air compressor and lighting generator. The function of this set, which is started by hand, is to supply an initial charge of air for starting the main engine and in addition to deliver power for lighting the car.

The control is similar to that of any standard electric trolley car. Mounted on the axles of the forward truck are two GE-205, 600 volt, commutating pole railway motors of 100 horse power each, which by means of a special controller, are placed progressively in series and parallel connection. Two extra points are provided on the controller for final speed acceleration in parallel, whereby the motor fields are shunted and weakened. The resulting higher armature speeds permit the use of smaller pinions, and full utilization of the power input is secured throughout the entire speed range, from start to full speed. Energy is transmitted directly without the intervention of mechanical change speed gearing. The voltage is governed by varying the strength of the generator field by the movement of a single handle on the controller, and the resultant speed changes of the motors produce a smooth and rapid acceleration. Separate handles are provided for throttling the engine and for reversing the car. The latter is accomplished by changing the motor connections in the usual manner without stopping the engine, which always rotates in the same direction. This allows the car to be brought to a halt quickly, independent of the brakes in an emergency. The radiators are placed on the roof and circulation for cooling the engine is maintained by the thermo-siphon system.



Gas-Electric Motor Car for Branch Line Service.

The trucks are of the swing bolster type. The brake equipment includes hand brakes in addition to the combined straight and automatic air brakes. A high power Mazda incandescent headlight and reflector are provided and a hot water heater, coal fired, is installed for heating the car. A 150-gallon gasolene tank for the power supply is suspended under the car. While the engine is running the gasolene is pumped automatically, and when starting, by a hand pump.

These cars made the trip across the continent under their own power. Car 300 left Chicago on the Chicago, Milwaukee & Puget Sound tracks and covered the distance to Tacoma, Wash., 2201.2 miles, in ten days, daylight running. Necessarily, the special schedules of the motor cars while on the trip were subject to the exigencies of regular traffic requirements and numerous delays were encountered. The car in question averaged 220 miles a day, and on one day covered 315 miles. A run from Malden to Othello, Wash., 103 miles, was made in 2 hours 10 minutes, and in one case 20 miles of 2.2 per cent. grade were negotiated in 56 minutes with one stop.

Railroad Construction in the Philippines.—During the fiscal year ended June 30, 1912, 65 miles of new line were opened to traffic in the Philippine Islands, 33 miles were graded and track was laid on 43 miles.

THE PRODUCTION OF SOUND RAIL INGOTS.

The American Institute of Mining Engineers Devoted an Entire Day to This Subject—Abstracts of Two Papers.

The sessions on February 19 of the meeting of the American Institute of Mining Engineers, held in New York, were devoted to the discussion of sound ingots for rail steel and a number of railway men participated in the discussion. Among the papers presented were two entitled "Comparative Notes on Steel Rail Rolling," by Robert W. Hunt, and "Piping and Segregation of Ingots of Steel and Ductility Tests for Open-Hearth Steel Rails," by P. H. Dudley, which are given below.

The discussion was presented under the following topics: First, Is the present method of getting rid of pipes by cropping a safe and reliable device for making sound steel? Second, Is it desirable to increase the amount of metal arbitrarily cropped off the top of an ingot, and, if so, what would be a fair excess price to pay for cropping off 20 per cent.? Third, Is it commercially practicable to make ingots without pipes or blow holes, and what additional expense of manufacture would be justified to accomplish this result? Fourth, What process for making pipeless ingots seems to promise the most commercial success, and why? The opinion was expressed by several that little piping was present in good mill practice, and it was felt that the proportion to be cropped from the top of the ingot should not be arbitrarily fixed, as that would work to the detriment of the better mills and would penalize them. The point was brought out that head failures in rails can be traced to the interior of the ingot, and that this class of failures is about 50 per cent. of the total. These failures are invariably due to segregation and are almost entirely confined to rails from the upper third of the ingot. While pipes are caused mainly by the use of silicon, titanium and aluminum, segregation is greatly reduced by them. There was considerable discussion over the use of aluminum and titanium, several men objecting strongly to aluminum.

COMPARATIVE NOTES ON STEEL RAIL ROLLING.

By Robert W. Hunt.

I have frequently stated that while the chemical composition of steel was important, even greater importance was connected with the mechanical and heat treatment of the metal. During the past year I encountered such a positive example of that fact that I deem it worth putting upon record.

A prominent railway system divided an order for open-hearth steel rails between two steel works, both of which are under the control of the same corporation, giving to one about 18,000 tons, and to the other 7,500 tons of the same section and to be made under the same specifications. The rolling results obtained in the two mills varied so widely that a study of the figures is intensely interesting and serves to illustrate the advantages obtained by careful ingot casting, and quite as pertinently the possible benefits of careful subsequent heating and rolling with moderate reductions in the rolling process. The smaller order was rolled complete in four instalments during the same months that the larger order was being made in eight separate instalments; but, to permit of exact comparisons, the totals of the four instalments (completing the order with the mill which I will call A) are given with the totals of the first four instalments of the larger order, made by the mill designated as B. These rolling results are.

	Mill A.	Mill B.
Number of rollings	4	4
Total number of rails rolled	18,278	27,832
Percentage of rails cut to short length because of flaws near ends, etc.	0.7	7.6
Percentage of rails made second quality for flaws, etc.	0.9	6.3
Percentage of rails scrapped for flaws, etc	0.6	4.5
Percentage of rails scrapped for failure at drop test	None	3.4

It should be stated that the above figures cover all the reasons for putting the rails in the classes stated. Thus a part of the percentage of rails cut to short lengths may have been because of bad drilling or bad sawing. Such classification, however, in this case is entirely proper, as neither mill suffered from unusual or abnormal difficulties in any way, and the figures indicate ordinary performance uninfluenced by unusual errors of either workmanship or mechanical troubles in rolling.

Emphasis should be laid on the fact that both mills were working to exactly the same specifications, and producing a section which has been in use for several years and in large tonnage. It is an 85 lb. section having 36.7 per cent. of the metal in the head, 22.2 per cent. in the web, and 41 per cent. in the base, being, therefore, well proportioned for the avoiding of torn flanges or other rolling difficulties, sometimes encountered with sections having thin flanges.

The chemical composition and drop-test specified with the average results obtained, were

	Specified.	Average Obtained. Mill A.	Mill B.
Carbon, per cent	.55 —.70	.60	.61
Phosphorus, per cent., not over	.045	.023	.023
Manganese, per cent.,	.65 —.95	.83	.74
Silicon, per cent	.075—.18	.13	.14
Sulphur, per cent., not over	.055	.029	.039

	Specified— Min.	Max.	Obtained— Mill A— Min.	Max.	Mill B— Min.	Max.
Deflection on 4 ft. supports with 2,000 lb. tup falling 20 ft	1.75 in.	3.25 in.	2.3 in.	3.2 in.	2.2 in.	3.8 in.
Average deflection			2.7 in.		2.8 in.	

	Mill A.	Mill B.
Number test pieces breaking on first blow	0	9
Number test pieces showing pipe or segregation when nicked and broken	3	9
Number heats rejected because of two pieces failing at drop test	0	2
Number heats rejected for exceeding deflection limits at drop test	0	4
Number heats rolled	119	173

Both mills took advantage of the full range permitted in the chemical limits, and the success reached in obtaining consistent carbon results is shown by the table below.

Permitted Carbon: Per cent.	.55	.56	.57	.58	.59	.60	.61	.62	.63	.64	.65	.66	.67	.68	.69	.70	Total Heats
Number of Heats:																	
Mill A.	..	1	2	4	5	17	17	14	13	14	11	8	9	4	..	..	119
Mill B.	20	8	9	14	12	16	14	14	14	15	7	7	10	6	6	1	173

It will be noted that Mill A's results were more consistent than B's.

The chemical compositions obtained at the two mills agree so closely that some other reason must be sought to explain the divergent physical results obtained in the product, and, therefore, data on the actual performance of the mill operations is important. The principal items are:

	Mill A.	Mill B.
Number of furnaces making the steel	6	27
Average size heats cast	196,000 lbs.	183,500 lbs.
Maximum weight heats cast	214,000 lbs.	220,000 lbs.
Minimum weight heats cast	128,000 lbs.	155,000 lbs.
Average time metal held in ladle before casting	4 min.	3½ min.
Maximum time metal held in ladle before casting	11 min.	52 min.
Minimum time metal held in ladle before casting	1 min.	2 min.
Average number of ingots per heat	20	23
Maximum number of ingots per heat	22	28
Minimum number of ingots per heat	13	20
Average time between casting and stripping	43 min.	1 hr. 7 min.
Maximum time between casting and stripping	2 hr. 15 min.	5 hr. 55 min.
Minimum time between casting and stripping	24 min.	15 min.
Average time between stripping and charging in soaking pits	16 min.	46 min.
Maximum time between stripping and charging in soaking pits	1 hr. 6 min.	11 hrs.
Minimum time between stripping and charging in soaking pits	3 min.	10 min.
Average time between charging in soaking pits and blooming	2 hr. 20 min.	2 hr. 47 min.

	Mill A.	Mill B.
Maximum time between charging in soaking pits and blooming	4 hr. 30 min. *b*	6 hr. 5 min. *a*
Minimum time between charging in soaking pits and blooming	1 hr. 30 min.	1 hr. 0 min.
Number of cold heats charges	8	None
Per cent. top discard	10 to 13	10 to 12
Time in reheating furnaces	20—50 mm.	None *c*
Average weight ingots	9,740 lbs.	7,970 lbs.
Size of ingots	22 in. x 26 in.	20 in. x 24 in.
Number passes in blooming mill	21 to 25	9
Size of bloom produced	7 x 9	8 x 8
Number passes in rail mill	11	9
Total passes	32 to 36	18

a One heat in pits 24 hrs.
b One heat in pits 25 hrs.
c Mill B rolls direct, does not reheat.

It will be especially noticed that both mills were casting large heats, approximating 85 tons. These were made by almost identical methods, using the usual scrap and pig iron process, the iron being taken from mixers as required, and varying in proportion to the scrap used. As far as possible at both mills, this mixer metal was used for recarbonizing in the furnace, but many heats had coke or coal added to the ladle on tapping, in addition to the usual ferro-manganese and ferro-silicon. While the heats at mill A were slightly larger than at B, the difference is not of importance, but it is pertinent to note that there are but 6 furnaces represented at mill A as against 27 furnishing rail steel at B; and consequently, there were probably but two steel melters working at A as against at least six at B. The personal equation may, therefore, have played an important part in making the steel.

Equally noticeable is the fact that while the average for the time intervals of the various operations at the two mills is not much different, still the range between the maximum and minimum for B is consistently greater than for A. There can be but little doubt but that a delay between casting and stripping ingots and between stripping and charging in the soaking pits is likely to be seriously reflected in the soundness of the ingots, and of at least equal importance, is the necessity for teeming the steel at uniform temperature. A variation of 50 minutes in the time heats were held in the ladle prior to casting must have caused variable teeming temperatures, and produced many blowholes in some of the ingots. Admitting the presence of blowholes near the surface of the sides of the ingots, and remembering the oxidizing action in the soaking pits, it is not surprising that heavy reductions in the blooming mill had an extremely detrimental effect on the product. This is reflected, no doubt, in the large number of rails containing flaws found at mill B.

Appreciating, therefore, the probable difference in the ingots produced at the two mills and the actual difference in the blooming practice, the principal other variable existing was in the reheating of the blooms at mill A. There the ingots were cut into four blooms, which were then given a wash heat in reheating furnaces, after which they were rolled into two rails in a rail train of 11 passes. At mill B the rail train consisted of 9 passes with no reheating of the blooms.

It is interesting to note the reported history of the heats rejected at mill B. Two heats were rejected at the drop test because two of the three test pieces broke on the first blow of the tup. The steel of the first heat was reported as being somewhat low in temperature when tapped. While pouring, the nozzle froze up, and while the ingots were in the soaking pits an average of four hours and 20 minutes, they bloomed cold and rough. The second heat was quite the opposite, the tapping temperature being high, and while casting the stopper head was finally lost, but the heating and the blooming were normal.

Analysis of rejected heats gave:

C	P	Mn	Sil.	S	Remarks
.70	.015	.74	.11	.034	Two pieces broke
.57	.020	.65	.08	.035	Two pieces broke
.55	.014	.65	.08	.036	Deflection over limit
.55	.017	.65	.09	.037	Deflection over limit
.60	.026	.71	.11	.041	Deflection over limit
.57	.026	.75	.08	.051	Deflection over limit

Four heats were lost at the drop test, because they exceeded the deflection limits. On the first, all conditions were reported normal, save that the ingots were held in the pits for an average time of 24 hours. The second heat tapped cold, the pouring nozzle froze, and the ingot tops were spongy. The third tapped hot, but otherwise, and like the fourth, had normal conditions.

PIPING AND SEGREGATION OF INGOTS AND DUCTILITY TESTS.

By P. H. Dudley,
Consulting Engineer, New York Central Lines.

The piping and segregation of ingots of steel is a comprehensive subject, and must be studied with reference to the different grades of soft, medium, and hard steel, rather than in a general manner, as though applicable to all grades. Ingots of rail-steel containing from 0.50 to 0.75 per cent. of carbon are of an entirely different character from those of softer steel when they are sufficiently deoxidized to form comparatively pure steel, as a well-defined shrinkage-cavity forms. This important fact should be remembered in discussing rail-steel, for the greater the degree of deoxidation, the larger will be the difference between the inclosed volume of hot fluid metal in the mold and the cooler resulting set metal, and the still proportionately lesser volume, should the ingot be allowed to become cold before equalizing the heat and rolling.

The exterior blowholes in the outside walls of the ingots can be prevented from forming by sufficient deoxidizers, as silicon, ferro-titanium, or their combination, and aluminum. The latter has been extensively used, but all of its oxidation-products do not always escape from the metal, and it should not be used when the steel is to be subjected to the present heavy wheel loads. The silicon-content for rail-steel now ranges from 0.10 to 0.20 per cent., to make it sound and prevent small blowholes from forming in the setting metal.

When sufficient deoxidizers are used to purify efficiently the steel, then, as must be expected, a small cavity starts to form in the top under the cap of the ingot in the setting steel, and its development should be retarded by stripping the ingot and promptly charging into the reheating furnace.

The sides of the contours of the shrinkage cavities in well-deoxidized steel are parabolic in form, and of proportionately greater volume and depth in the long type of ingots than in those which are short and stubby, but of larger volume and base.

When the mills began to make 33 ft. rails and teemed them in the same ingot molds which had been used for 30 ft. rails, and then rolled them in four 33 ft. 100 lb. rails, a great many ingots were not stripped, weighed and charged into the reheating furnaces with sufficient promptness to prevent a number of piped rails, as the requisite mill practice to check them was not then comprehended under the changed manufacturing conditions.

The segregation was also large, and in 1908 I confined the rolling of Bessemer and open-hearth rails for the New York Central Lines in the United States mills to three 33 ft. rail-length ingots for those of about 19 in. square upon the base. It was also stated in the specifications for the New York Central Lines that short, stubby ingots of from 2.5 to 3 times the length of the width of the base were required for rails. Ingots of about 8,200 lbs. weight, teemed in molds 20 x 24 in., have been extensively made for six lengths of 33 ft. 100 lb. rails, and, in good mill practice, with practically complete elimination of piped rails. The blooms, however, are cut, and only rolled in three rail lengths at a time. Ingots 25 x 30 in., of about 12,000 lbs. weight, have been used for eight 33 ft. basic open-hearth 100 lb. rails where the ordinary rail mill equipment had not been installed. The ingots were bloomed and then shipped to a rail mill to be reheated and rolled, and but a few piped rails were found during manufacture. The rails in the track fulfill the requirements of safety and severe service.

Only 25 piped rails are known to have been found in service in the track in 65, 70, 75, 80, 95 and 100 lb. sections out of about 1,100,000 30 ft. rails, of which the length of the ingot

was not over but under three times the width of the base.

THE DROP AND EXHAUSTED-DUCTILITY TESTS.

The exhausted-ductility tests for the purification of the steel were introduced into the specifications for the New York Central Lines in 1910 to secure rails of sufficient toughness to withstand the low temperatures in the Mohawk valley of from 20 deg. to 30 deg. below zero, though 40 deg. is often reported by the trackmen. The ductility which is possible for a given composition, size of ingots, section, and other steps of manufacture, has been practically ascertained, and it is to see by the exhausted-ductility tests whether or not it is secured.

It requires but a moment to stamp the crop of the rail with the 6 in. spacing bar of seven points before placing the butt on the supports of the drop-testing machine. The elongation of each of the six marked inches on the test-butts after the drop, is measured by a flexible rule, and the increase in hundredths of inches per inch, indicates the per cent. of elongation. It takes but a moment to test the butt, and the exhausted-ductility is obtained in three or more blows, though it is measured after each blow, and recorded.

The term ductility in the specifications for the New York Central Lines, is used in the sense of tenacity and toughness of the steel, the exhausted ductility being its measure. This also becomes a soundness test for seams, segregation, slag inclusions and other foreign matter in the web or head of the rails, and is better than the special nick test in other specifications.

The elongation and exhausted ductility tests of stel rails are made concurrently with the manufacture at the plant under the drop-testing machine on four or 5 ft. lengths of the top crop of the rail bars, the results being tabulated as shown by the appended blanks for ductility and elongation tests, a copy being furnished to the manufacturers.

The butts are tested within three hours after the ingots of a melt are teemed and rolled, and the facts as to the full ductility of the steel as made and rolled are available for the manufacture of subsequent melts. The utilization of such knowledge of each melt has enabled the manufacturers to make rails of greater uniformity, homogeneity, safety, and economy of the output than was believed possible before such tests were installed. The practical non-breakage of such rails in the track for the winter of 1911-12, shows that a high quality was secured in their manufacture.

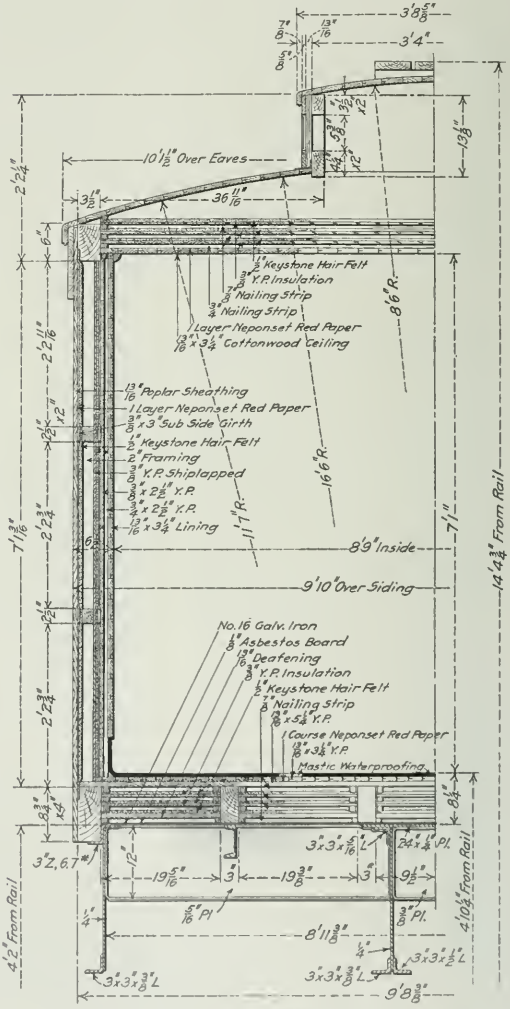
When the ductility tests were first proposed, the most experienced steel men did not think it was possible to secure such uniform results per melt of steel. It was considered by some of the presidents of the steel mills that when dealing with the larger melts of from 60 to 80 tons in a ladle, the temperature might be just right for teeming the first ingot, but too low for the middle ingot to give the full ductility of the chemical composition and to reduce its percentage for the last ingot teemed of the melt. However, the heavy body of slag over the top of the molten steel in the ladle did not allow sufficient heat to escape to modify the ductility in well-made steel from the first to the last ingot poured.

The examination of the results from more than 200,000 tons of steel now shows that it is possible to secure nearly uniform results from each melt. It is found that there is some difference in the ductility which may be obtained, according to the section which is being rolled. The well-designed sections of not too great width of base compared to the height, finish with nearly the full ductility of the metal.

The manufacturers have examined the tabulated results of their product and some have adopted the system of testing and keeping the same records for all rails made for their own information, whether required by their customer or not, as is required by the New York Central Lines. The American Railway Engineering Association has followed the New York Central Lines and adopted nearly their ductility and elongation tests in their specifications.

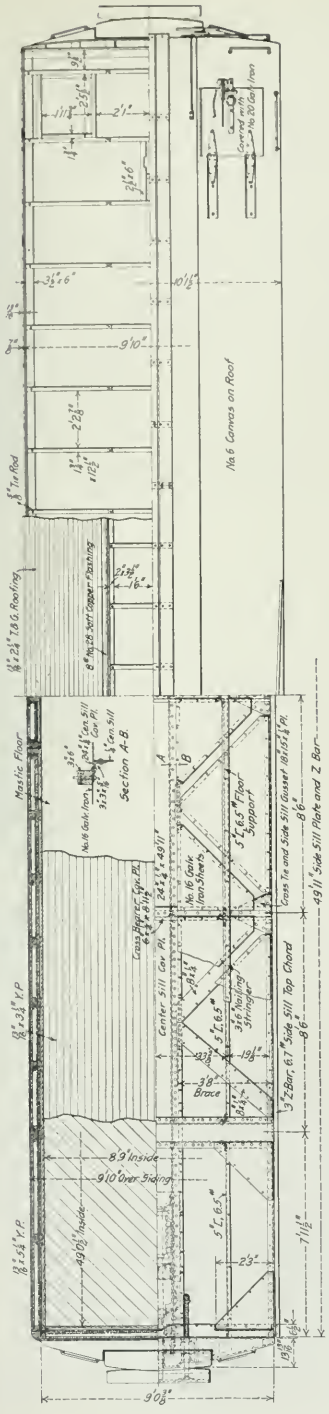
REFRIGERATOR CARS FOR EXPRESS SERVICE.

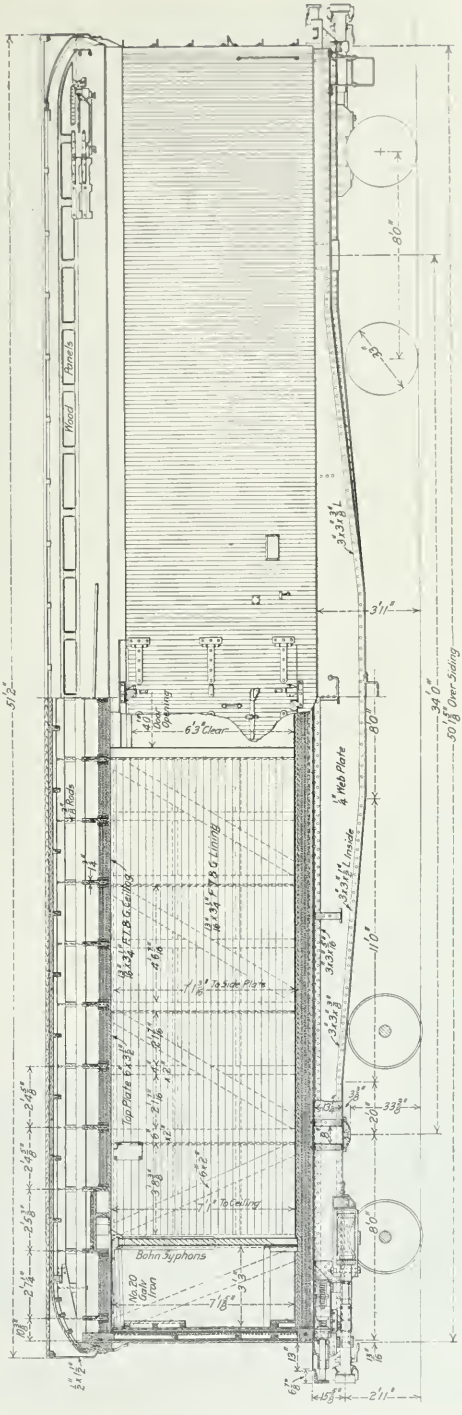
Wells, Fargo & Company have received from the American Car & Foundry Company the first of an order of 75 steel underframe refrigerator cars for express service. These cars, which are equipped for operation in passenger trains, are 50 ft. in length over end sills, weigh, complete, 86,000 lbs., and have a capacity for 60,000 lbs. of lading and 14,000 lbs. of ice. They are mounted on four wheel trucks, which have 5½ in. by 10 in. journals and are spaced 34 ft. between centers.



Half Section Through Express Refrigerator Car.

The underframe has two center and two side sills of the fishbelly type, 24 in. deep at the center for a distance of 8 ft. The center sills are 13¼ in. deep at the body bolster, are spaced 14 in. apart and are built up of web plates ¼ in. thick with outside angles at the top, and outside and inside angles at the bottom. A top cover plate, 24 in. by ¼ in., runs their entire length. The side sills have ¼ in. web plates, the





General Arrangement of Wells Fargo & Company Express Refrigerator Car.

bottom member being an angle and the top a 3 in. Z-bar, the outside flange of which forms a support for the wooden superstructure.

The end sills are of cast steel, with a flange cast on the upper side to prevent shifting of the car body on the underframe. The body bolsters are built up of ⅜ in. pressed steel members, spaced 8 in. back to back, with top and bottom cover plates 14 in. x ⅝ in., extending between the side sills. Between the bolsters are three built up crossties, consisting of 5/16 in. pressed steel members with top and bottom cover plates. Between the side and center sills a 5 in. channel extends the full length of the car. The underframe is braced by diagonal plates, 8 in. wide, extending from the side to the center sills, and ¼ in. gusset plates connecting the side sills to the body bolsters and end sills.

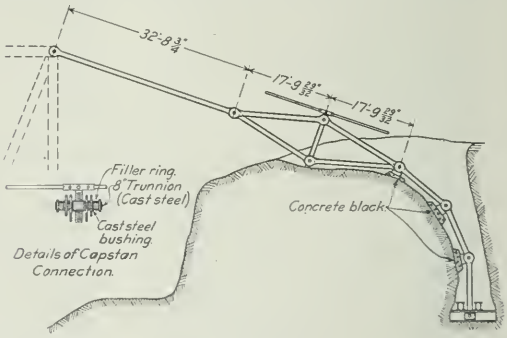
Particular attention has been given to the insulation. On top of, and riveted to the underframe members, is a layer of No. 16 galvanized iron, over which a course of ⅛ in. asbestos paper is applied. There is an air space between this and the 13/16 in. deafening floor, on top of which is a layer of ½ in. Keystone hair felt held in position by ⅞ in. wood furring. To the latter is nailed a single course of ⅜ in. yellow pine, which supports the second course of ½ in. Keystone hair felt, the latter also being held in position by ⅞ in. nailing strips. These in turn support another course of ⅜ in. yellow pine, on top of which is laid the third course of ½ in. Keystone hair felt. This insulation is all located below the main floor, between 3 in. by 6 in. yellow pine nailing sills. Resting on the four nailing sills and the two 4 in. by 8¾ in. side sill fillers, is a course of 13/16 in. by 5¼ in. yellow pine forming the sub-floor. A layer of Neponset red paper is applied between this and the main floor, which is of 13/16 in. by 3¼ in. yellow pine. Over the main floor, except at the ice bunkers, is placed waterproofing and Mastic flooring, made by the H. W. Johns-Manville Co., and this also extends up the sides of the car for 6 in. This permits the floor of the car to be cleaned by flushing with water. The insulation of the sides, ends and roof is similar to that of the floor, three courses of ½ in. Keystone hair felt and a layer of Neponset red paper being used; and it will be noticed that three air spaces are provided.

The Bohn system of refrigeration is used, and also the Bohn all-steel collapsible bulkheads. The hatch covers are placed in the lower deck of the roof, and each bunker has a capacity for 7,000 lb. of ice. The ice grates are made of white oak bars and when not in use can be folded back in a 3-in. recess in the end of the car, thus leaving the ends flush.

The roof is of the monitor or clere-story type, conforming to passenger equipment construction, and a dummy vestibule mechanism is used with Fowler semi-elliptic springs at the end plates. The buffing device is of the Miner friction type and is so applied that the mechanism can be lowered for repairs when necessary. The following special equipment is used: Draft gear, Miner; couplers, McConway & Torley; coupler centering device, American Car & Foundry Company; air brakes, Westinghouse, high speed, schedule, L. N.; hand brakes, Lindstrom; slack adjuster, American Brake Company; truck frames, Commonwealth Steel Company; journal boxes and lids, Symington; wheels, Carnegie Steel Company, 33 in. rolled steel; brake beams, Diamond special; springs, Standard Steel Works; door insulation, La Flare. The cars are constructed throughout to meet M. C. B. standards and the U. S. safety appliance requirements.

THE CROOKED RIVER ARCH BRIDGE.

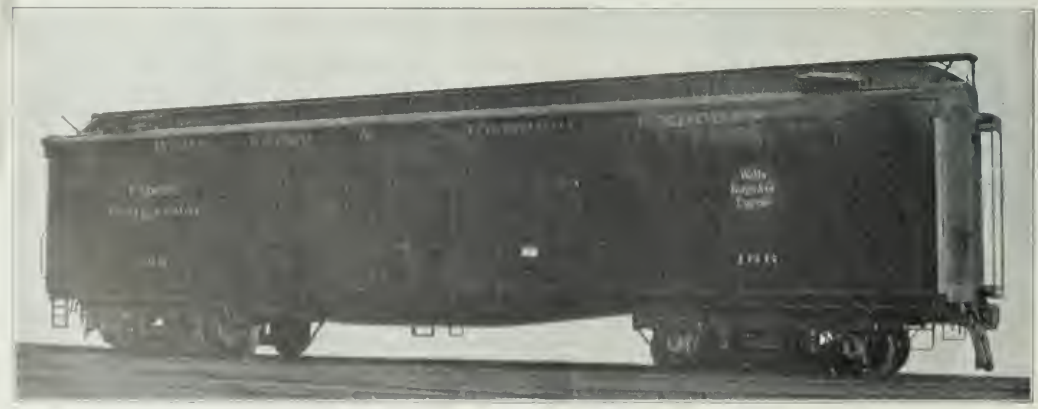
In connection with the bridge work on the Oregon Trunk, described in the *Railway Age Gazette* of March 22 and 29, 1912, the arch bridge which was constructed to carry this line across Crooked river canyon has features which make it unusually interesting. Its location is unique, in that it spans the gorge at a height of 320 ft. above water at a point where the canyon



The Erection Device for Lowering the Cantilever Arms.

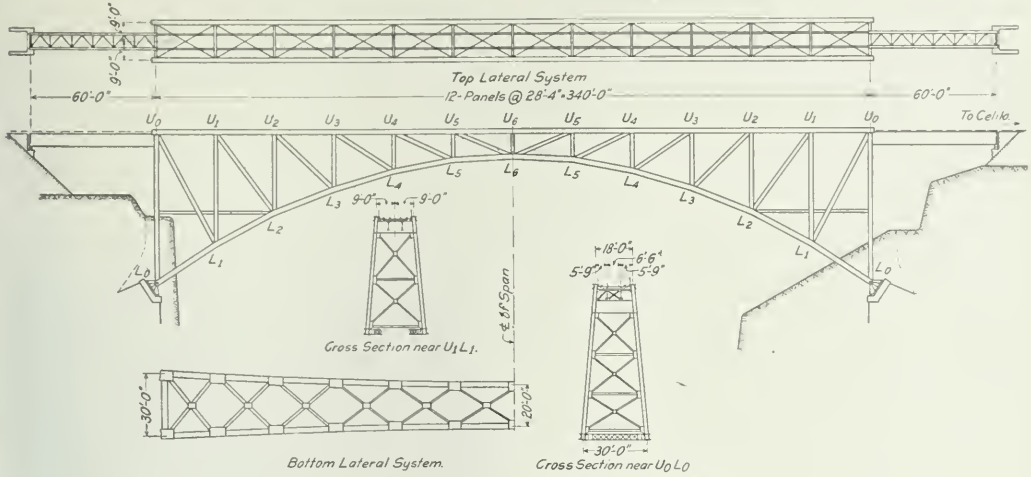
walls are only 350 ft. apart. So far as is known, the only other bridge in this country that carries traffic at a higher elevation above water is the Pecos river viaduct, and the difference is only a matter of inches.

Those who read the description referred to will recall that



Wells Fargo Refrigerator Car for Express Service.

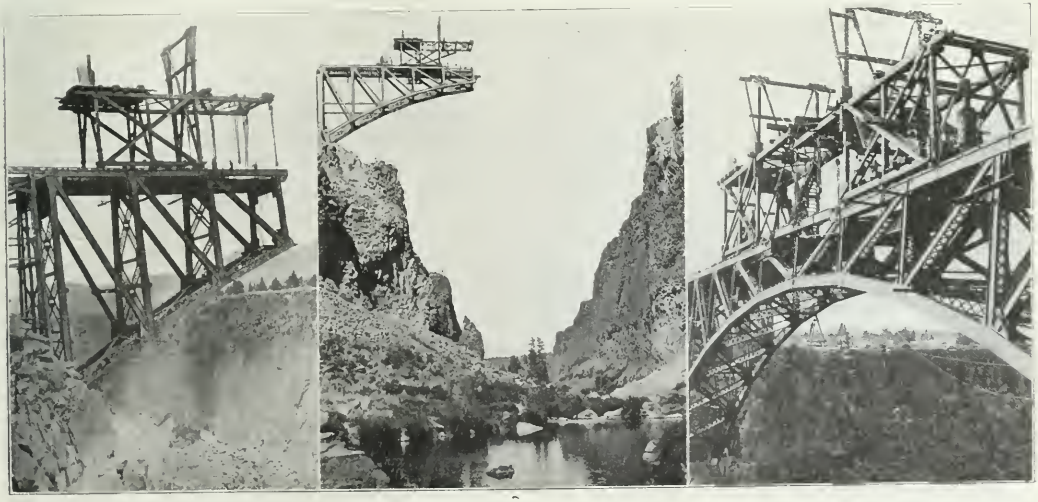
the line leaves the Spokane, Portland & Seattle, or North Bank road, at Fallbridge, on the Columbia river, crosses that stream on the Celilo bridge and penetrates southward into the central portion of Oregon by ascending the canyon of the Des Chutes river onto the central plateau. Twenty-six miles from the present terminus of the road at Bend, Ore., and 130 miles south of the Columbia, the line crosses the Crooked river canyon.



Elevations and Plans of Crooked River Arch Bridge.

The span designed for this crossing is a two-hinged spandrel braced arch—a type well adapted to the conditions. The extreme height of towers which would have been required and the danger to them from masses of rock falling from the steep walls, made a single span crossing preferable to a viaduct. The necessity for erection without falsework and the possibility of securing foundations capable of taking unlimited thrust, led to the selection of an arch span. The type chosen could be erected as a cantilever with practically no changes in the members from the section required for service stresses. In this particular design the sections of the first two panels of top chord were the only ones governed by erection stresses.

The erection of former American arches of the two-hinged type has been complicated by the necessity of securing a division of dead load stresses between top and bottom chords at the center of the span. The uncertainty as to the result of such an attempt to place both chords in compression is avoided in the Crooked river arch, where the structure is designed as a three-hinged arch for dead load stresses by inserting a hinge or pin at the crown. After the trusses have taken their dead load stress, the upper chord section is riveted in place at the crown at a temperature of 60 deg., which converts the arch into the stiffer two-hinged type for live load and temperature stresses. This same idea has been recently used in a 523.5 ft. arch erected by German engineers across the Sanaga river in Africa with very satisfactory results.



Traveller Erecting the Third Panel. Erecting the Fifth Panel on the North End. Placing the Last Top-Chord Member.

The standard loading for all bridges on the Oregon Trunk

is two 188.5 ton engines followed by 5,000 lb. per ft. for the trusses, and one 214 ton engine followed by the same uniform load for the floor system. All bridges are for single track.

The Crooked river span is 340 ft. long and is divided into 12 panels. The trusses are 72 ft. deep at the ends and 12 ft. at the center, the bottom chord following a parabolic curve. The top chords are 18 ft. center to center, and as the trusses are battered 1 in 12 for greater stability, the Lo points are 30 ft. apart. A massive, three-web, cast steel shoe at this point carries a horizontal pin 13 in. in diameter. The pin holes in the bottom chords connecting at this point are bored on the skew necessitated by the batter of the trusses.

Field work on the bridge was begun while the construction work was proceeding along the road, in order that the foundations would be ready for the steel as soon as rails were laid to the bridge site. This largely increased the cost of the foundation work, as all material supplies had to be hauled in by wagon from Shaniko, 65 miles away. A cableway was set up on the bridge axis to elevate rock and water for the concrete from the bottom of the canyon. After blasting out the weathered rock on the face of the canyon walls down to good quality basalt, the pedestals were built. These were constructed of 1:2:4 concrete, with crushed stone and screenings for aggregate. A machine mixer was used so that the piers might be of uniform quality and monolithic construction.

The erection device, shown in one of the accompanying drawings, consisted of a chain of four eyebars from the Uo point of the arch to the ground and from there running in a curve to the grillage beams set in the bottom of shafts excavated 30 ft. into the solid rock. These shafts were filled with concrete after setting the grillages and bars. To provide for the control of the position of the semi-spans, in closing the arch, an adjustment toggle was placed in the eyebar chain. This consisted of a large parallelogram of eyebars, with a 6½ in. screw working in the short diagonal in such a way as to increase or shorten the length of the figure. There was enough movement in this toggle to provide for raising the arms 15 in. at the crown, or lowering them 8 in. from normal position, in making the connection. The screw was turned by a capstan head, in which were inserted long bars against which the men pushed. Before erection had proceeded

Adjusting Cantilever Arms Before Closure.

far enough to put much load on the anchorages, the toggles were adjusted to give an elevation of 9 in. to the outer end of the arm.

After placing this device and filling the shafts with concrete, the erection contractor built a trestle out to the arch pedestals and assembled his traveler. This was of timber, 76 ft. long over all and with an overhanging boom of 32 ft. Two 8 in. x 16 in. sticks comprised each side of the boom, and were guyed back over a transverse bent by 1¾ in. steel rods. The engine deck was built on the rear end of the boom timbers and was high enough to enable the derrick car to pass underneath. This rig traveled on two rails, laid on short cross ties on the top chords. The complete traveler weighed about 45 tons. Its rigging consisted of six sets of 1¾ in. manila falls and one set of wire falls.

After lowering the 10½ ton shoes to place, the bottom chord was set and the pin driven, after which the end post was placed and the pin driven to connect to the anchorage chain. The diagonal UoL1 was then placed, thus making the panel self-supporting. The remaining members of the panel in the truss and floor system were placed and the traveler run forward to repeat the operation. Riveting was started on all principal truss connections except bottom chord splices in each panel as soon as completed. This was done because of high erection stresses and to reduce the number of drift pins and temporary bolts required for erection.

After five panels of the north arm had been placed, work was started on the south side of the canyon. Materials for the

The Completed Arch.

traveler, falsework and anchorage were carried over the gorge on the cableway, and as soon as the traveler had been constructed, the transfer of bridge material was begun. In doing this the members were lowered into the canyon from the north end and then by hooking on a tackle from the south traveler they were drifted across the stream. The tackles from the north traveler were then removed and the material hoisted and erected. In this way all steel for the south arm was transferred safely and with but little delay to erection.

When the five panels of each arm were finished, the bottom chords and diagonals of the two center panels were put in place, and the two semi-spans lowered to bearing on the center pin by means of the erection device. The structure was then a three-hinged arch. To bring it to its final condition of two-hinges, the center section of the top chord, which was two panels in length and unpunched at both ends, was set in place. The first time the temperature of the steel reached 60 deg., the ends of the chord were center-punched through the holes in the splice plates attached to the adjoining chords, and drilled. One end was then riveted up and the other left until the temperature of the steel had again reached 60 deg., when it was quickly riveted up.

The bridge was designed in the office of Ralph Modjeski, chief engineer of bridges of the Oregon Trunk, Ralph Budd being chief engineer. It was fabricated by the American Bridge Company and erected by the Missouri Valley Bridge and Iron Company. W. R. Weidman was resident engineer, with Ralph Harris and Clement E. Chase, assistants in charge of substructure and superstructure respectively. We are indebted to Mr. Chase for the information contained herein.

Brazilian Surveys Approved.—The president of the state of Sao Paulo, Brazil, has signed a decree approving the definite surveys of the first section of five miles of the line from Jaboticabal to Rio Pardo.

SPEED RESTRICTIONS ON THE CHICAGO & NORTH WESTERN.

The Chicago & North Western recently made practical tests of its speed restrictions of the movements of trains over crossovers, turnouts, junction turnouts, and on certain signal indications at interlocking plants, and as a result has established additional safeguards and rules to govern the speeds of trains. These are as follows:

(1) When a signal to proceed is displayed by a dwarf, or low-speed signal located at the bottom of a home signal, or across the track from it, a train may proceed at a speed not to exceed 15 miles per hour.

(2) The speed of a train moving over a crossover; turnout from a main track to a siding, or to a diverging route at a junction, must not exceed 15 miles per hour, with certain exceptions, the points at which exceptions are permitted being indicated on the current time table by special rules, which give in each case the speed in miles per hour that may be attained at any particular point or turnout at which the above rules do not apply.

In formulating the rules for the speed restrictions at definite points, or for turnouts of varying degrees, the question arose as to whether the restrictions were sufficient to insure absolute safety and smooth operation for the train or whether they were greater than necessary. That is to say, did the restrictions call for lower speed than was essential for the safe and smooth operation of trains over the certain turnouts or stretches of track? In order to satisfy themselves on this point, the general officers of the road conducted a series of speed tests over the crossovers and turnouts in question. A train composed of a high-speed locomotive and several cars was employed for this purpose. A speed indicator was installed in the locomotive for the guidance of the engineman and another one in the observation car on the rear of the train for the convenience of the observers, who were general officers and officers of the division on which the tests were being made. Telephone communication was also established between the locomotive and the observation car, a complete telephone outfit being located in the observation car.

Speed tests were made over leads and crossovers, over turnouts from No. 7 to No. 20, and at varying speeds over each number of turnout, these varying from five miles per hour over No. 7 turnouts to over 50 miles per hour over No. 20 turnouts.

The train was run through each turnout several times at different speeds, and always once or twice at a higher rate of speed than was considered at all, or was later decided upon for that number of turnout.

Careful records were made of the different speeds over each turnout and the behavior of the train noted in each case. It was found throughout the test that it is very difficult to judge the speed of a train while riding on it. Everyone in the large party on the train was inclined to judge its speed when moving at 20 miles or less per hour as less than was actually the case, and when the train was running at 35 miles or more per hour it seemed to be running at a higher rate of speed than that.

The speeds of trains under these restrictions are checked frequently to find out how closely enginemen are able to judge them, and, as an additional precaution, a more general use of speed recorders which will accurately indicate to enginemen the speed at which they are running will be adopted.

THE PHILIPPINE RAILWAY COMPANY.—On June 30, 1912, this company had in operation 59 miles of line in the island of Cebu, Philippine Islands, and 74 miles of line in the island of Panay, a total of 133 miles of line. The lines of this company in the island of Cebu cost $3,317,000, or about $65,283 per mile. The lines in Panay cost $5,065,000 or $68,444 per mile.

THE RAILWAY VALUATION LAW.

It is now expected that Congress will pass a railway valuation law at the present session. The Senate on February 24, passed House Bill 22593 after extensive amendment, and it is believed that the House will readily accept the changes that have been made. The bill as it leaves the Senate provides for valuation not only of physical property, but also of franchises and other intangible values; and provision is made also for investigating the history of past financial operations.

In the bill as reported by the Senate committee and passed by the Senate, the principal section (to be Section 19a of the Interstate Commerce law) is as follows:

"That the commission shall, as hereinafter provided, investigate, ascertain, and report the value of all the property owned or used by every common carrier subject to the provisions of this act. To enable the commission to make such investigation and report, it is authorized to employ such experts and other assistants as may be necessary. The commission may appoint examiners who shall have power to administer oaths, examine witnesses and take testimony. The commission shall make an inventory which shall list the property of every common carrier subject to the provisions of this act in detail, and show the value thereof as hereinafter provided, and shall classify the physical property, as nearly as practicable, in conformity with the classification of expenditures for road and equipment, as prescribed by the Interstate Commerce Commission.

"First. In such investigation said commission shall ascertain and report in detail as to each piece of property owned or used by said common carrier for its purposes as a common carrier, the original cost to date, the cost of reproduction new, the cost of reproduction less depreciation, and an analysis of the methods by which these several costs are obtained, and the reason for their differences, if any. The commission shall in like manner ascertain and report separately other values, and elements of value, if any, of the property of such common carrier, and an analysis of the methods of valuation employed, and of the reasons for any differences between any such value, and each of the foregoing cost values.

"Second. Such investigation and report shall state in detail and separately from improvements the original cost of all lands, rights of way, and terminals owned or used for the purposes of a common carrier, and ascertained as of the time of dedication to public use, and the present value of the same, and separately the original and present cost of condemnation and damages or of purchase in excess of such original cost or present value.

"Third. Such investigation and report shall show separately the property held for purposes other than those of a common carrier, and the original cost and present value of the same, together with an analysis of the methods of valuation employed.

"Fourth. In ascertaining the original cost to date of the property of such common carrier the commission, in addition to such other elements as it may deem necessary, shall investigate and report upon the history and organization of the present and of any previous corporation operating such property; upon any increases or decreases of stocks, bonds or other securities, in any reorganization; upon moneys received by any such corporation by reason of any issues of stocks, bonds, or other securities; upon the syndicating, banking and other financial arrangements under which such issues were made and the expense thereof; and upon the net and gross earnings of such corporations; and shall also ascertain and report in such detail as may be determined by the commission upon the expenditure of all moneys and the purposes for which the same were expended.

"Fifth. The commission shall ascertain and report the amount and value of any aid, gift, grant of right of way, or donation, made to any such common carrier, or to any previous corporation operating such property, by the Government of the United States or by any State, county or municipal government, or by individuals, associations or corporations; and it shall also ascertain and report the grants of land to any such common carrier, or any

previous corporation operating such property, by the Government of the United States, or by any State, county, or municipal government, and the amount of money derived from the sale of any portion of such grants and the value of the unsold portion thereof at the time acquired and at the present time, also, the amount and value of any concession and allowance made by such common carrier to the Government of the United States, or to any State, county or municipal government in consideration of such aid, gift, grant or donation."

The rest of the bill, given in following paragraphs, is here reprinted as reported by the Senate sub-committee. Numerous changes in detail were subsequently made, but the only one that seems to be important is an addition providing that in appeals to the courts new testimony may be accepted by the court; and the court shall then stay proceedings and give the commission a chance to revise its valuation:

"Except as herein otherwise provided, the commission shall have power to prescribe the method of procedure to be followed in the conduct of the investigation, the form in which the results of the valuation shall be submitted, and the classification of the elements that constitute the ascertained value, and such investigation shall show the value of the property of every common carrier as a whole and the value of its property in each of the several States and Territories and the District of Columbia, classified and in detail as herein required.

"Such investigation shall be commenced within sixty days after the approval of this act and shall be prosecuted with diligence and thoroughness, and the result thereof reported to Congress at the beginning of each regular session thereafter until completed.

"Every common carrier subject to the provisions of this act shall furnish to the commission or its agents from time to time and as the commission may require maps, profiles, contracts, reports of engineers, and any other documents, records, and papers, or copies of any or all of the same, in aid of such investigation and determination of the value of the property of said common carrier, and shall grant to all agents of the commission free access to its right of way, its property, and its accounts, records, and memoranda whenever and wherever requested by any such duly authorized agent, and every common carrier is hereby directed and required to co-operate with and aid the commission in the work of the valuation of its property in such further particulars and to such extent as the commission may require and direct, and all rules and regulations made by the commission for the purpose of administering the provisions of this section and section twenty of this act shall have the full force and effect of law.

"Upon the completion of the valuation herein provided for the commission shall thereafter in like manner keep itself informed of all extensions and improvements or other changes in the condition and value of the property of all common carriers, and shall ascertain the value thereof, and shall from time to time, as may be required for the proper regulation of such common carriers under the provisions of this act, revise and correct its valuation of property, showing such revision and correction classified and as a whole and in each of the several States and Territories and the District of Columbia, which tentative valuations shall be reported to Congress at the beginning of each regular session.

"To enable the commission to make such changes and corrections in its valuations of each class of property, every common carrier subject to the provisions of this act shall report currently to the commission, and as the commission may require, all improvements and changes in its property, and file with the commission copies of all contracts for such improvements and changes at the time the same are executed.

"Whenever the commission shall have completed the tentative valuation of the property of any common carrier, and the tentative valuations of its property in each of the several states and territories and the District of Columbia, and before such valuation shall be considered in any proceeding involved in the act to regulate commerce, the commission, in addition to notices to petitioners and carriers required in such proceeding, shall give notice by registered letter to the said carrier, the Attorney General of the United States, the governor of any State in which the property so valued is located, and also by publication in three daily papers published in three of the principal cities through which the railroad of such common carrier runs; such notice shall state the valuation placed upon the several classes of property of said carrier, and shall allow thirty days in which to file a protest of the same with the commission. If no protest is filed within thirty days, said valuation shall become permanent.

"If notice of protest is filed the commission shall fix a time for hearing the same, and shall proceed as promptly as may be to hear and consider any matter relative and material thereto which may be presented in support of any such protest so filed as aforesaid. If after hearing any protest of such tentative valuation under the provisions of this act the commission shall be of the opinion that its valuation should not be made permanent, it shall make such changes as may be necessary, and shall issue an order making such corrected tentative valuation permanent. All permanent valuations by the commission and the classification thereof shall be published and shall be prima facie evidence relative to the value of the property in all proceedings under this act.

"The provisions of this section shall apply to receivers of carriers and operating trustees. In case of failure or refusal on the part of any carrier, receiver, or trustee to comply with all the requirements of this section and in the manner prescribed by the commission such carrier, receiver, or trustee shall forfeit to the United States the sum of five hundred dollars for each such offense and for each and every day of the continuance of such offense, such forfeiture to be recoverable in the same manner as other forfeitures provided for in this act.

"That the district courts of the United States shall have jurisdiction, upon the application of the Attorney General of the United States at the request of the commission, alleging a failure to comply with or a violation of any of the provisions of this section by any common carrier, to issue a writ or writs of mandamus commanding such common carrier to comply with the provisions of this section."

Amend the title so as to read: "An act to amend an act entitled 'An act to regulate commerce,' approved February fourth, eighteen hundred and eighty-seven, and all acts amendatory thereof by providing for valuation of the several classes of property of carriers subject thereto and securing information concerning their stocks and bonds and boards of directors."

New Line from Shanghai to Peking.—China has opened her shortest cut from Shanghai, on the sea, to Peking. Early in December through traffic was opened from Pukow, on the Yangtze river (opposite Nanking) to Tientsin, and a journey is now possible from Shanghai to Peking in 40 hours as against 5 days by the previous shortest route. The only other line from the Yangtze to Peking is that from Hankow, about 755 miles long. The newly opened line from Pukow to Tientsin is 626 miles, and to that has to be added the 73 miles from Tientsin to Peking and the 193 miles from Shanghai to Nanking, making the total rail distance from Shanghai to Peking some 892 miles, which is broken only by the Yangtze river at Nanking. The first through trains to run over the line from Pukow to Tientsin left Tientsin and Pukow, respectively, on December 4, and two trains per week are now running from both places, leaving Pukow for Tientsin on Mondays and Fridays at 9 a. m., and arriving at Tientsin on the following days at 11:07 a. m.; and leaving Tientsin for Pukow on Wednesdays and Saturdays at 1 p. m., and arriving at Pukow on the following afternoons at 3:15 p. m. The trains are provided with dining cars and comfortable sleeping cars, and passengers may make the journey in comparative luxury.

General News.

Miss Jane Fairman, who has been in the employ of the Illinois Central in the accounting department for 43 years, will be retired on a pension on March 31.

The Post Office Department reports that the number of parcels carried in the mails in the month of January was about 40 millions; and over one-tenth of these parcels were mailed in Chicago.

The freight house of the Illinois Central and the Yazoo & Mississippi Valley, at Jackson, Miss., was destroyed by fire on February 14. The loss, including the value of freight in storage, is estimated at $75,000.

The strike of the members of the International Brotherhood of Railway Car Men employed on the Missouri, Kansas & Texas, which was declared in September, 1911, was officially called off by officers of the union on February 18.

Counsel for President Chamberlin, of the Grand Trunk, has withdrawn the request that a commission be sent by the federal court to London to take evidence concerning the acts of the Grand Trunk directors in relation to the Southern New England Railway.

The legislature of Indiana has passed a law making it illegal for any person to drink intoxicating liquors on a passenger train or car, steam or electric, except in case of actual sickness of the person using the stimulant, and excepting also drinks taken in cars regularly licensed to sell intoxicating liquors. The penalty for violation of this law is from $5 to $25.

"Stop, look and listen"! at grade crossings is a legend that has long been familiar; but how many people comply with the injunction? Reckless drivers of carriages and automobiles seem to be more numerous than ever. The secretary of the National Highways Protective Society has caused a bill to be introduced in the New York legislature requiring that every vehicle stop within 100 ft. of a grade crossing, and making the violation of the rule a misdemeanor.

West Virginia has an "anti-trust" railroad law, signed by the governor this week, to go into effect July 1 next. The title of the act is: "To preserve competition among common carriers and to prevent monopoly of the business of common carriers, and protect interstate commerce from restraint and monopoly." The act prohibits any director, officer, agent, representative or attorney of any railroad company from acting as president, vice-president, director or general executive officer of any competing line. It also prohibits any railroad from consolidating its stock or franchise with that of any competing road.

The telephone since its introduction on American railroads, has, no doubt, prevented a considerable number of derailments; but it must now look to its laurels; there is a competitor in the field. C. Lagervall, section foreman on the Chicago Great Western, at Renova, Minn., recently discovered in a passing freight train a dragging brake beam, and, though he was quick to give a signal, he was unable to attract the attention of the trainmen. But his gasoline motor car was at hand, and, quickly mounting the car he followed the train to the next stop and there notified the conductor of the dangerous car.

The Postal Telegraph Company has had filed in the United States District Court at Chicago a suit to enjoin the International Brotherhood of Electrical Workers and its members from interfering with its wires. A grand jury investigation shows extensive depredations following the discharge of union employees in December. A mass of testimony revealed the cutting of wires and cable, destruction of wires by means of acid and other forms of violence. Restraint of interstate commerce is alleged. It is requested that the defendants be enjoined from obstructing interstate and government messages over the Postal, from cutting, burning or otherwise injuring its telegraph lines and from interfering by threats, intimidation, persuasion or force with employees or prospective employees of the company. The telegraph company has been powerless to prevent frequently recurring acts of violence, committed usually at night on its thirty-five miles of cables along the elevated railroad lines in Chicago or in underground conduits. These cables are particularly open to attack and difficult to guard.

The safety committee of the New York division of the Pennsylvania Railroad is to hold a meeting at Trenton, N. J., next Sunday evening and a theatre has been engaged, so as to provide ample room; and the general public is invited. There will be an illustrated lecture on railway accidents, their causes and remedies, by Messrs. J. O. Young and H. J. Fackenstall, enginemen, members of the committee. The road will run special trains from Jersey City and from Philadelphia. At Pittsburgh, Pa., March 10, there is to be a "safety first" rally which is expected to be the largest ever. This will be under the management of employees of the Buffalo, Rochester & Pittsburgh; the Baltimore & Ohio; the Bessemer & Lake Erie; the Wheeling & Lake Erie; the Pennsylvania, both east and west; the Philadelphia & Reading; the Western Maryland and the Wabash-Pittsburgh Terminal. The chairman will be R. L. O'Donnel, general superintendent of the Pennsylvania, at Pittsburgh.

A committee composed of Ralph C. Richards, chairman of the central safety committee of the Chicago & North Western, L. F. Shedd, general safety supervisor of the Chicago, Rock Island & Pacific, and W. N. Northcott, metropolitan secretary of the Railroad Young Men's Christian Association, has been appointed to carry out the plan of co-operation between the Y. M. C. A. and the railroads in promoting the "safety first" movement which was mentioned in a recent issue. Lectures are to be prepared by the heads of the safety departments of the various roads. These will be illustrated with photographs which can be shown by lantern slides, and will be delivered at various Y. M. C. A. headquarters; and also at noon and evening meetings wherever large numbers of employees can be reached. The Y. M. C. A. will give the use of its stereopticons, its buildings and all of its equipment for this purpose. It has devised an apparatus called a "shadow box," by the aid of which lantern slide pictures can be shown on a screen in daylight. The subjects of the lectures have been assigned as follows: "Car Shop Risks," by A. W. Smallen, chairman of the safety bureau, Chicago, Milwaukee & St. Paul; "Machine Shop Risks," by George Bradshaw, general safety agent, New York Central Lines; "Transportation Risks," by R. C. Richards, Chicago & North Western; "Yard Men's Risks," by L. F. Shedd, Chicago, Rock Island & Pacific; "Trespassers," by W. B. Spaulding, general claim agent, St. Louis & San Francisco; "Maintenance and Construction Risks," by J. D. M. Hamilton, claims attorney, Atchison, Topeka & Santa Fe.

Pure Drinking Water on Trains.

The Treasury Department has issued an order to the effect that the drinking water on all trains, cars and boats used in interstate commerce must be certified by state or municipal authorities as being incapable of conveying disease. Ice which is put into drinking water must be taken from a safe source, duly certified, and must be washed with water that is safe; and must be handled so as to prevent contamination. Water containers must be cleaned by scalding at least once a week.

A Railroad Clearing House to Be Established in Chicago.

The joint committee appointed by the executive committee of the Society of Railway Financial Officers and the Committee on Corporate, Fiscal and General Accounts of the Association of American Railway Accounting Officers, which met at Pinehurst, N. C., have, after full discussion, unanimously approved the general principle of clearing house settlement of adjusted balances between all railroads. In the discussion, it was found that 13 of the roads centering at Chicago are already organizing a clearing house. It was, therefore, decided to postpone further action by the joint committee until after the clearing house of the 13 Chicago roads had been actually tried out.

A Simple Issue.

Colonel Melvin O. Adams, president of the Boston, Revere Beach & Lynn, a road 15 miles long, speaking before the state legislative committee at Boston, now considering a proposed law to abolish the smoke nuisance, said:

"The narrow gage line, which has developed Winthrop so that it has grown faster than any town in the country except two boom towns out West, will have to send its equipment

to the scrap heap if electrification is ordered. It will drive us into bankruptcy. Yet we carry 20,000,000 people a year to as delightful a breathing spot as there is in the world and carry them from congested Boston for a five-cent fare."

Western Pacific Opposes Union Pacific-Southern Pacific Dissolution Plan.

R. S. Lovett, chairman of the executive committee of the Union Pacific, Attorney General Wickersham, and Maxwell Evarts, general counsel of the Southern Pacific, appeared before four judges of the United States Circuit Court at St. Louis on February 24, and outlined the plan of dissolution of the Union Pacific and Southern Pacific, which has been announced. F. W. M. Cutcheon, general counsel of the Western Pacific, presented a vigorous opposition to that feature of the plan which provides for joint use of the Benicia cut-off between Oakland and Sacramento, arguing that the plan proposed would perpetuate a monopoly. He also opposed some features of the stock distribution plan. Mr. Evarts stated that the Southern Pacific was willing to perpetuate whatever rights the Western Pacific now has over the Benicia cut-off.

The "Merchants' Limited."

The Merchants' Limited express trains of the New York, New Haven & Hartford, leaving New York for Boston and Boston for New York, at 5 p. m., are now made up of new steel cars just out of the shops of the Borman Company. The New Haven road evidently has a new press agent. Describing this as "the most gorgeous train in America," he says:

"These new trains are practically indestructible. Made of steel they could go through a stone wall without being scratched. Reinforced underneath with two immense steel girders running the length of the car and attached at the end to a solid cast steel U frame forming the vestibule, no impact however great could telescope them. A rear end collision might tilt them up on end a bit but that would be all. So far as resisting powers go they are built like battleships."

Each train has four parlor cars and an observation smoking car. The interior finish is Mexican mahogany, except the smokers, in which it is cocoa wood. Each of the parlor cars has 36 chairs, the usual drawing-room having been omitted; and with doors open a passenger standing in the aisle may see from one end of the train to the other, except when the dining car interferes. At night the cars have indirect lighting, each having ten 100-watt lamps distributed along the center. These lamps, with ornamented brass shields beneath them, throw their light up against a white ceiling. The axle lighting system has storage batteries sufficient to supply lighting current for 10 hours. The cars are heated by steam. In the observation smoking car there is a buffet for making coffee.

The Boston & Albany.

A committee of the Massachusetts legislature, having under consideration a proposed law requiring the electrification of railroads in and near Boston, listened last week to a statement of J. H. Hustis, vice-president of the Boston & Albany, telling of the financial difficulties likely to be imposed on that road if electrification should be required. If electric propulsion were adopted it would have to be extended to South Framingham, 21 miles from Boston, and the cost would be over $6,000,000. Allowing for a normal increase in passenger traffic and considering all possible economies resulting from electric operation, Mr. Hustis estimated that there would be a net loss in operation of nearly $500,000 a year. To electrify completely, for freight as well as passenger, would make the cost materially greater than $6,000,000. To the suggestion that passenger fares might be increased, Mr. Hustis said that the increase over present rates would have to be 40 per cent. In view of the active competition of electric street car lines this would be out of the question. To the suggestion that the B. & A. should electrify because the New Haven intended to do so and because the B. & A. is controlled by the New Haven, Mr. Hustis said that each road must be considered by itself. The New Haven does not control the B. & A. It is sending westbound freight over the Boston & Albany, because this is more economical than to send by way of the Western termini of the New Haven; but the traffic agreement between the two roads is intended to make the Boston & Albany an independent operating unit. From nearly two years' experience the wisdom of this arrangement has been fully demonstrated. In this time the Boston & Albany has increased ton mileage 66 per cent., while increasing freight train miles only 21 per cent. Passenger and freight rates have not been increased on the Boston & Albany for 10 years, while yet labor and material have increased in cost tremendously.

Mr. Hustis, continuing, said:

"If the Boston & Albany service, both passenger and freight, today is not generally satisfactory to the public that it serves, then the fact is not known to its management. If the road is to continue to serve the public satisfactorily it must receive from the public that measure of confidence to which its service entitles it. Its management must be allowed reasonable latitude in which to provide for its development. It ought not to be fettered with legislation that will clog its natural growth and in turn react on the community that it is striving to serve. The road is satisfactorily handling a very largely increased traffic at rates which are substantially the same as twelve years ago, and with reasonable expedition, regularity and economy. It has suffered in its operating showing, as have all the railroads, in the enormous increases in expenses, yet its unit costs of operation compare favorably with those of other roads of similar character. The lessee company has, moreover, not allowed the yearly deficit since 1906 to stand in the way of appropriating more money for improvements.

"It has now reached a point where the volume of business, at the rates which have been in effect for more than a decade, just about enables it to meet its operating expenses, leaving practically no surplus. Any contraction in its volume of business, any reductions in rates, or any additional burdens (such as that proposed by compulsory electrification) would prevent the road from earning its guaranteed rental and there would again be an annual deficit, which on the date of the last report to the railroad commission aggregated $5,000,000."

Harriman Safety Medals.

The American Museum of Safety, New York, has appointed the following committee to award annually the medals, given by Mrs. E. H. Harriman, to the railroads which shall have done most to promote the "safety first" idea: Chairman, Arthur T. Hadley, president of Yale University; Samuel O. Dunn, editor of the *Railway Age Gazette;* Franklin K. Lane, chairman of the Interstate Commerce Commission; W. F. Allen, secretary of the American Railway Association, and the Commissioner of Labor. Three medals will be awarded each year as follows: A gold medal to the railroad company itself, a silver medal to the member of the operating department of that road who has done most to bring this condition about, and a bronze medal to the employee of the winning road who has been most conspicuous in the promotion of safety. It is planned to give with each medal an engraved certificate, which may be hung on the wall as the medals will be too valuable for public display. These certificates will bear the name of the giver, those of the members of the committee and that of the recipient. Forms are now being drawn up to be sent out to the roads. These will be submitted to the committee for its approval. The first medals will be awarded in January, 1914.

International Congress of Refrigeration.

The opening meeting of the third International Congress of Refrigeration will be held in Washington, D. C., September 15, 1913, and the business and scientific meetings will be held in Chicago beginning September 15. The preliminary announcements of the congress says that more than 40 countries will be represented by official government delegates, as well as by delegates from industrial associations, technical societies and institutions of learning, also by experts and practical men interested in the application of refrigeration to the various industries. Many different applications of refrigeration will be practically demonstrated by operating and stationary exhibits; so also will the materials by which refrigeration is produced, economized and transmitted, be shown and illustrated. Carloads of refrigerated fruit, vegetables, meat, etc., will also be exhibited just as they are transported under refrigeration. It is proposed

to serve at the banquet only such foods and beverages as are customarily held in cold storage in America. The object of this congress is to provide an opportunity for drawing into concerted action the scientific and practical men of the world who are engaged in developing the science and art of refrigeration, thus affording the aid of properly organized efforts to the many industries that do or can derive benefits from refrigeration. J. F. Dickerson, editor of *Ice and Refrigeration*, Chicago, is secretary.

Southeastern Accounting Conference.

The annual meeting of the Southeastern Accounting Conference was held at Norfolk, Va., on February 6 and 7. Officers for the ensuing year were elected as follows: Chairman, W. L. Bird, auditor Norfolk Southern; secretary, M. B. Nichols, auditor of traffic Central of Georgia. The chairmen of the standing committees for the ensuing year are as follows: General Accounts and Subjects, M. F. Molloy, comptroller Cincinnati, New Orleans & Texas Pacific; Passenger Accounts, T. H. Wright, auditor passenger receipts Seaboard Air Line; Freight Accounts, William McGowan, auditor merchandise receipts Baltimore & Ohio; Disbursement Accounts, J. H. McEwen, auditor of disbursements Nashville, Chattanooga & St. Louis; Efficiency, W. D. Beymer, comptroller Central of Georgia. The next meeting will be held in Louisville, Ky., on October 9 and 10, 1913.

Chicago Transportation Association.

The sixth annual dinner of the Chicago Transportation Association was held at the Auditorium hotel on February 20. W. A. Garrett, vice-president of the Chicago Great Western, acted as toastmaster, and the speakers were J. N. Tittemore, Rev. W. T. Dorward and Harry F. Atwood.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec, Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neary, Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que., 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago, 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCES' ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The general deficiency bill, carrying $24,235,740 to supply deficiencies in appropriations has been reported, providing for the Commerce Court until Congress decides whether the tribunal shall be abolished.

The Chicago, Rock Island & Pacific is running a "diversified farming special" train over its lines in northwestern Missouri and northeastern Kansas, in co-operation with the Agricultural College of Missouri, and the St. Joseph Agricultural Congress.

A sixth demonstration farm has been established by the Missouri Pacific, at Arcadia, Mo., on the grounds of the Arcadia College adjoining the right of way of the railway. Eighteen acres will be placed under cultivation at once. A specialty will be made of fruits, especially apples.

W. L. English, who has recently been connected with the agricultural extension work of Clemson Agricultural College, South Carolina, has been appointed supervisor of agriculture of the St. Louis & San Francisco, and will have supervision over a large number of demonstration farms to be established in several states traversed by the Frisco lines.

The largest single shipment of automobiles ever sent out of Michigan was recently started from the Buick plant in Detroit, consigned to the Buick company's representatives in San Francisco, via the Pere Marquette, Chicago, Rock Island & Pacific, and Union Pacific. The train consisted of 75 cars drawn by two locomotives. The shipment consisted of 375 automobiles of factory cash value of $431,925.

The Bangor & Aroostook has notified the Interstate Commerce Commission of the cancellation of all joint freight tariffs with the Maine Central, the Boston & Maine, and the New York, New Haven & Hartford, because of the alleged arbitrary and discriminatory manner of these roads towards the Bangor & Aroostook. The B. & A. intends to bring suit against these roads for $75,000 or more, alleged to be overdue on traffic balances.

The Traffic Club of Cleveland was organized on February 15, by 78 traffic officers of railways, water lines, electric lines and industrial concerns. D. F. Hurd, of the Traffic Bureau of the Cleveland Chamber of Commerce, was elected president; W. A. Newman, general freight agent of the Lake Shore & Michigan Southern, vice-president; J. A. Coakley, division freight agent of the American Steel & Wire Co., second vice-president; W. V. Bishop, traffic manager of the Upson Nut Co., secretary, and C. M. Andrus, traffic manager of the Otis Steel Co., treasurer.

The express companies operating in Canada report to the Canadian government net earnings for the calendar year 1912 as follows:

Canadian Express Co. (owned and operated by the Grand Trunk)	$283,281
Dominion Express Co. (owned and operated by the Canadian Pacific)	645,288
Canadian Northern Express Co.	192,436

The gross receipts of the three companies for the year were $10,564,418. The business done by all the express companies, including the American companies operating to some extent in Canada, in financial paper during the year, such as money orders, travelers' checks, C. O. D. checks, telegraphic transfers and letters of credit, amounted to $56,905,122, as compared with $52,165,852 in 1911.

On March 3, the Denver & Rio Grande, in connection with the Colorado Agricultural College, will start a special agricultural demonstration train over its line on a nine day tour of the principal farming and stock raising sections of the Upper Arkansas, Eagle, Roaring Fork, Grand, Uncompahgre, North Fork and San Luis valleys in Colorado. This special educational train will consist of coaches for lecture purposes and baggage cars containing exhibits on agronomy, including alfalfa improvement, seed selection, seed improvement, bee culture, animal husbandry, including dairying and poultry raising, home economics, rural school betterment and other subjects of vital interest to the farming and stock-raising communities. This is the fifth year that the Denver & Rio Grande in co-operation with the agricultural colleges of Colorado and Utah has operated special demonstration trains through its agricultural districts.

Traffic Club of Chicago.

The nominating committee of the Traffic Club of Chicago has named the following as the regular ticket to be voted on at the annual election on March 25: President, Guy S. McCabe, general western agent, Pennsylvania Lines; secretary, W. H. Wharton, commercial agent, Nashville, Chattanooga & St. Louis; treasurer, Charles B. Hopper, general freight agent, Goodrich Transportation Company; first vice-president, W. M. Hopkins, manager transportation department, Chicago Board of Trade; second vice-president, Frank W. Smith, member Uniform Classification Committee; third vice-president, L. Richards, traffic manager, Quaker Oats Company. Directors for two years: F. B. Montgomery, traffic manager, International Harvester Company; V. D. Fort, assistant freight traffic manager, Illinois Central; C. E. Finch, general agent, American Express Company; H. K. McEvoy, assistant general passenger agent, Chicago & Alton.

Packing Boxes; A New Association.

Much interest has been aroused by a complaint filed with the Interstate Commerce Commission by the R. W. Pridham Company, of Los Angeles, Cal., against the Southern Pacific and 37 other railways, demanding the same rates eastbound on goods in fibre boxes as are given on shipments in wooden boxes. The case was heard at Los Angeles on January 28, and an adjournment was taken for the introduction of further testimony in Chicago at a later date. It is understood that this case will open up an investigation by the commission of the entire subject of the use of substitutes for wooden boxes. At a meeting held in Chicago last week the Association of Users of Fibre Board Containers was organized "to co-operate with the transportation companies and manufacturers of fibre cases in establishing and maintaining the high standard of shipment containers, and to at all times procure from the transportation companies fair and equitable recognition, regulation, and facilities for shipments in said containers."

At the annual meeting of the National Poultry, Butter and Egg Association, held in Chicago recently, the subject of packing cases was one of the principal topics of discussion, and the transportation committee was authorized to confer with the carriers and co-operate in devising ways and means for the elimination of economic waste, loss and damage in the handling of poultry, butter and eggs. The transportation committee then conferred with the General Managers' Association, of Chicago, which appointed a standing committee of three to co-operate with the transportation committee of the National Poultry, Butter and Egg Association.

The National Association of Box Manufacturers, at its annual convention in Chicago, February 18 to 21, also devoted much of the time of the meeting to the discussion of the packing box situation. J. E. Williams, chairman of the Uniform Classification Committee, addressed the association briefly on the possibilities of standardizing wooden boxes from the classification standpoint, and offered to assist the standardization committee of the association in any manner compatible with the duties of his office.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association in presenting statistical bulletin No. 137-A giving a summary of car surpluses and shortages by groups from November 8, 1911, to February 15, 1913, says: The total surplus on February 15, 1913, was 52,700 cars; on February 1, 1913, 62,045 cars, and on February 14, 1912, 50,886 cars. Compared with the preceding period; there is a decrease in the total surplus of 9,345 cars, of which 6,191 is in box, 4,654 in coal, and an increase of 98 flat and 1,402 miscellaneous cars. The decrease in box car shortage is general, except in groups 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), and 7 (Montana, Wyoming, Nebraska and the Dakotas). The decrease in coal car surplus is in all groups, except 7 (as above), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 9 (Texas, Louisiana and New Mexico). The increase in flat car surplus is in groups 5 (as above), 6

(Iowa, Illinois, Wisconsin and Minnesota), 7, 8, 9 (as above), 10 (Washington, Oregon, Idaho, California, Nevada and Arizona), and 11 (Canadian Lines). The increase in miscellaneous car surplus is in groups 3 (Ohio, Indiana, Michigan and western Pennsylvania), 4 (the Virginias and Carolinas), 5, 6, 7, 8, 9 and 10 (as above).

The total shortage on February 15, 1913, was 30,517 cars; on February 1, 1913, 24,785 cars, and on February 14, 1912, 36,928 cars. Compared with the preceding period; there is an increase in the total shortage of 5,732 cars, of which 2,491 is in box, 2,476 in coal, 883 in miscellaneous, and a decrease of 118 flat. The increase in box car shortage is in groups 1 (New England Lines), 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 3, 5, 6 and 10 (as above). The increase in coal car shortage is in groups 2, 3, 5, 8 and 9 (as above). The increase in miscellaneous car shortage is in groups 1, 2, 3, 6 and 11 (as above). The decrease in flat car shortage is in groups 1, 4, 6 and 10 (as above).

Compared with the same date of 1912; there is an increase in the total surplus of 1,814 cars, of which 5,383 is in box, 779 in coal, and a decrease of 2,542 flat and 1,806 miscellaneous cars. There is a decrease in the total shortage of 6,411 cars, of which 4,910 is in box, 1,408 in coal, 1,036 in miscellaneous, and an increase of 943 flat cars.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total by weekly surpluses and shortages from 1907 to 1913.

CAR SURPLUSES AND SHORTAGES.

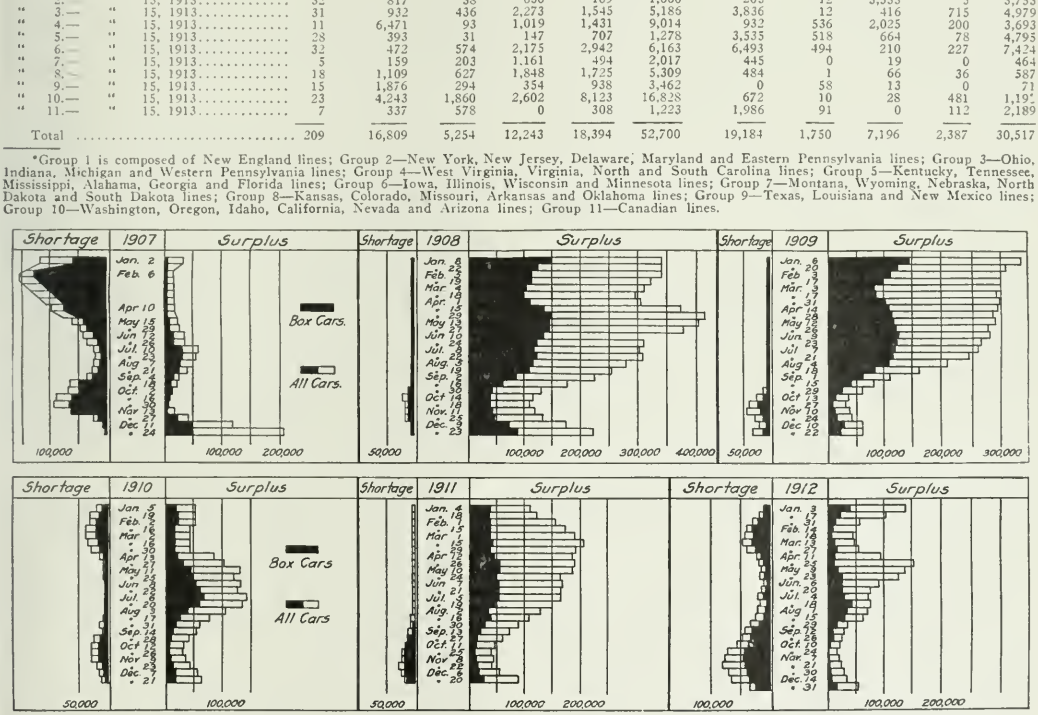
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alahama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

INTERSTATE COMMERCE COMMISSION.

Fire Brick Rates Reduced.

Ashland Fire Brick Company et al. v. Southern et al. Opinion by Chairman Lane:

The commission found that the previous order in this case, 22 I. C. C. 115, should be set aside and rates on fire brick from points in the Ashland-Olive Hill district to Birmingham, Ala., and the other destinations involved should all be made one-half cent per 100 lbs. less than they were at the time of the previous order. (26 I. C. C., 195.)

Coal Rate Reduced.

Board of Trade of Winston-Salem, N. C., v. Norfolk & Western.

Town of Martinsville, Va., v. Norfolk & Western et al. Opinion by Commissioner Clements:

The commission found that the rate of $2.10 per ton for the transportation of coal from the Pocahontas fields in Virginia and West Virginia to Winston-Salem, N. C., was not unreasonable. The rate of $2 per ton from the same points of origin

to Martinsville, Va., was found to be unreasonable to the extent it exceeds $1.80. (26 I. C. C., 146.)

Transit Case.

In re investigation into the substitution of tonnage at transit points. Opinion by Commissioner McChord:

This is the third supplemental and final report of the commission in this case. In the early part of last year the commission learned that the tariffs in many instances named transit privileges in such a manner as to conceal their real application. The commission issued an order, effective August 15, 1912, mentioned in the *Railway Age Gazette* of July 12, page 75, directed against the defendants publishing transit privileges on grain and grain products, requiring them to place certain restrictions around the privileges as published which were deemed necessary to meet the evils found accompanying the operation of the tariffs then in force. That order served to reveal the real nature of the privileges and rates as published, and it was found that the tariffs did not in reality contain the privileges they were supposed to contain. The result was that the tariffs were then enforced for the first time in a manner in which they should have been in force at all times. Shippers and millers, particularly in the Northwest and Southwest, at once complained that their business was seriously hurt. The commission immediately took up the case again and its conclusions were covered in the supplemental opinion of November 12, 1912, mentioned in the *Railway Age Gazette* of November 22, page 1007. In this opinion the commission showed that an intolerable situation had arisen due to the failure of the carriers to so publish their tariffs as to keep pace with the transit privileges and to openly publish every rate, practice or privilege that the carriers permit on their line. The commission then decided to hold further and more complete hearings on this subject. Consequently two conferences were held, at the first of which the shippers stated their side of the case, and at the second of which the carriers stated theirs. The gist of the propositions submitted at these conferences was a request for the authorization of substitution. The only limitation thereto was that one article or commodity should not be substituted for an entirely different article or commodity. In other words, it was desired to regard all wheat as wheat, all corn as corn, all hardwood as hardwood, etc. Both conferences requested that rule 76 of the Tariff Circular be abolished, and as it is true that all that the commission has said upon this subject of transit since that rule was adopted, has been based upon that rule, if it is superseded practically all the commission's subsequent requirements on the subject of transit will go with it, insofar as they constitute binding rules of action. As the previous administration of the commission upon the subject of transit was under circumstances quite different from those of today, and as much of what the commission originally set out to accomplish has now been accomplished, the commission feels that it is justified in adopting a different course of action. The substitute proposed by the carriers' conference contains substantially the same general thought as that of the shippers and is as follows:

"When rules and regulations have been established in tariff form clearly defining the purpose or purposes for and the terms under which transit privileges are granted, and providing also for the effective policing of the operations under the arrangement, a shipment may be stopped in transit and the same shipment or a proper equivalent (less invisible loss in weight), as set forth in said rules and regulations, may be forwarded at the through rate provided for by tariff from the original point of shipment to final destination plus the charge for transit privilege, if any. (This rule shall not be construed to authorize the publication of tariffs providing for the substitution of one commodity for a commodity of a different kind. That is to say, oats or the products of oats for corn, corn or the products of corn for wheat, wheat or the products of wheat for barley, or shingles for lumber.)"

The commission was assured, both on behalf of the carriers and shippers, that the carriers can lawfully publish tariffs specially permitting substitution in so many words, and that in the absence of a showing that they are unreasonable or unjustly discriminatory, they would be entirely proper and no harm would be done. The proposed amendments to rule 76 are drawn with this idea in mind. The commission decided that rule 76 should be canceled, but that it should not publish as a ruling of the commission the requirements which were proposed. It further decided that the policy of making orders, drawing rules or expressing views as to what would or would not under certain conditions be considered a violation of law as to transit privileges, should not further be indulged in by the commission, but that it should be left to the carriers to establish their own rates, regulations and practices subject to the appropriate action on the part of the commission or the court in the event that these rates, regulations or practices are found to be in violation of the law. This report closes the so-called "transit" case, and the order heretofore entered in this proceeding will be revoked and conference rulings 181 and 203 and rule 76 of the Tariff Circular will be withdrawn (26 I. C. C., 204).

STATE COMMISSIONS.

The Texas railroad commission has issued an order requiring the absorption of all switching charges on less than carload shipments on which the earnings amount to $7.50 or more per car.

Charles Bradden, of Ryde, Pa., has asked the railroad commission of that state to authorize a railroad company to permit him to cross its tracks, but the commission refuses to do so, saying that the constant endeavor should be to keep people from crossing tracks.

The railroad commission of Pennsylvania has called the Erie Railroad to account for requiring duplex tickets to be mailed to New York city for redemption. The commission holds that the Erie, like other roads, should provide for redeeming these tickets at local offices.

The railroad commission of Louisiana has fined the Kansas City Southern $100 for not keeping passenger cars on the line between DeQuincy and Lake Charles, warm enough to make the passengers comfortable. The special offense was on Friday night, December 6, last.

Harvey C. Forney, of Dauphin, Pa., has asked the state railroad commission to take action to cure the chronic lateness of a train running to that town, but the commissioners tell him that the train in question is an interstate train and the commission cannot interfere with it, without running contrary to the authority of the Interstate Commerce Commission.

The Texas railroad commission, which recently made a revaluation of the property of the Galveston, Houston & Henderson, placing it at $2,985,576, has allowed an additional amount of $41,423 for the road's proportion of loss in the destruction of the Galveston Bay bridge, which makes the total valuation large enough to cover the outstanding stocks and bonds amounting to $3,000,000. The valuation will permit the company to refund its indebtedness.

The traveling men of Louisiana have won their campaign for linen covers on seats in passenger cars, or at least they have half won it. After conferences which, it appears, resulted in an agreement with the railroads, the state railroad commission has revised its order, which was appealed from by the railroads, and now requires linen or other washable covers to be used on the backs of all seats to the extent of not less than one half of the backs, beginning at the top. These must be kept in service, and in a clean and sanitary condition, from May 15 to October 15.

The railroad commission of Louisiana, having investigated the condition of the road bed and tracks of the Opelousas, Gulf & Northeastern decides that the road is not in safe condition for the proper operation of trains. "Trains may be run over this road at a very low rate of speed, with utmost caution, without greatly endangering the lives of passengers"; but the commission orders and commands the road, within nine months, to put the tracks in safe condition for the operation of freight and passenger trains (speeds not stated). The road extends from Melville to Crowley, 57 miles.

The railroad commission of Alabama has ordered the Louisville & Nashville to reduce passenger fares between all points in Alabama on March 6 to the basis of 2½ cents a mile. Following the order of the Federal Court last summer annulling the former tariff prescribed by the commission (2 cents a mile) the Louisville & Nashville and the other principal roads of this state restored their fares to the basis of 3 cents a mile, at the

same time increasing freight rates as permitted by the decision of the court. The state commission at once began a new investigation of fares and now, following numerous hearings, has issued the present order.

The railroad commission of Oregon has ordered the railroads of the state to provide in all passenger cars bubbling drinking fountains, or free individual drinking cups for passengers, the fountain being preferred. Complying with the order of the federal government and a similar order issued by the Oregon State Board of Health, the railroads have done away with the common drinking cup, but have supplied nothing in its place; and the railroad commission finds that this omission to provide suitable and clean facilities whereby passengers may obtain drinking water from the tanks in the cars is unjust, unreasonable and inadequate. The order must be complied with in sixty days.

The Board of Railway Commissioners of Canada has decided in favor of the Canadian railways in the pulp wood rate case. The proposed rates which were filed by the most important Canadian railways increased the rates on pulp wood to New York points one cent per 100 lbs. The leading paper manufacturers in New York opposed the increase, and in this were supported by leading Canadian pulp wood dealers. The United States paper manufacturers contended that the new rates would increase the cost of the wood to them by from 35 to 45 cents a cord and increase the cost of their finished product 50 cents a ton; the Canadian wood dealers contended that they would be the losers. The new rates will not become effective until August 15.

The New York State Public Service Commission, second district last week received from the New York Central and the New York, New Haven & Hartford, petitions for rehearing of the cases in which the commission ordered reductions in fares to and from New York City; but on Tuesday, February 25, denied both. The petitioners asked that the operation of the order be suspended. They declared that the order would confiscate property without due process of law and they disputed the finding of the commission that, as a matter of public policy, the season-ticket rates to New York City should be fixed at the lowest possible point. The New Haven road also complained because the rates prescribed would not be consonant with interstate rates over the same routes. The New York Central complained that the new rates were ordered before it had had suitable opportunity to be heard in remonstrance; that the case having been begun about two years ago, the conditions had changed since the last testimony was submitted; but the commission says that during a period of eight months the road has neglected to produce its evidence. The decision of the commission in this case was reported in the *Railway Age Gazette*, February 14, page 295.

The California Railroad Commission has rendered a decision in regard to the present dissolution plan of the Union Pacific and Southern Pacific which may be summarized as follows: The Southern Pacific is ordered to give all competing railroads an opportunity to use the Benicia Short Line from Sacramento to San Francisco if it grants this privilege to the Central Pacific. The Southern Pacific is ordered to give to all competitors certain rights to terminal facilities on San Francisco bay and industrial tracks at junction points. The Central Pacific and Southern Pacific are ordered to file joint rates not to exceed rates now in force within the state. Julius Kruttschnitt, chairman of the board of the Southern Pacific, in commenting on the California commission's decision, said in part: "If the decision of the commission is upheld by the circuit court of St. Louis, the Union Pacific-Southern Pacific dissolution plan must go by the board and negotiations will have to be begun from the beginning. In a word, an entirely new plan will have to be devised. The commission's decision includes many conditions that the Union Pacific has all along been unable to accede to and which the Southern Pacific in its turn has found impossible to accept." [See an item in general news in regard to developments before the circuit court at St. Louis.]

Cost of Railroad Commissions.

The railroad commissioners of Tennessee, calling attention to the small salaries paid to men holding that office in that state—$2,000 to each commissioner, with only $4,500 for secretary, stenographer and traveling expenses—give the following list of other states in which the appropriation for railroad commission expenses is larger than in Tennessee:

Wisconsin	$99,819	California	$ 7[illegible]
Oklahoma	73,000	Minnesota	35[illegible]
Nebraska	66,511	Oregon	31,7[illegible]
Massachusetts	64,912	Virginia	29,100
Arkansas	64,000	Georgia	28,700
Pennsylvania	47,000	North Carolina	24,340
Ohio	38,300	Alabama	19,100
Illinois	37,200	Kentucky	17,300
Texas	37,280	Tennessee (total last year)	11,400

In the state of New York, which does not appear in this list, there are two commissions of five members each, and each one of the ten commissioners receives a salary of $15,000 a year.

Louisiana Flagging Rule: Order for Examination of Men.

The Railroad Commission of Louisiana, after notice and a general investigation has issued an order, No. 1517, relative to the proper protection of trains by flagmen. The commission concludes that on many of the railroads the flagging rule is inadequate and unsafe. The rule now prescribed is said to be in effect on the Southern Pacific in Louisiana, and "its efficiency has been proven beyond question." This rule with a few modifications is as follows:

"*Ordered*, That when a train stops or is delayed, under circumstances in which it may be overtaken by another train, the flagman must go back immediately with stop signals a sufficient distance to insure full protection. When recalled he may return to his train, first placing two torpedoes on the rail, when the conditions require it. The front of a train must be protected in the same way when necessary by front brakeman. If the front brakeman is not available the fireman must act in his place.

"(a) Between sunrise and sunset the flagman shall immediately after he leaves his train light a red fusee and carry it with him back one-quarter of a mile to the point where he places the first torpedo and must leave a burning fusee at the same point as the first torpedo.

"A sufficient distance to insure full protection requires that flagman shall go back to a point one-fourth mile from the rear of his train, where he must place one torpedo on the rail. He must then continue to go back at least one-half mile from the rear of his train and place two torpedoes on the rail, not more than two rail lengths apart; he may then return to within one-fourth mile from the rear of his train, and remain there until recalled. If a passenger train is due he must remain until it arrives. When he comes in he will remove the torpedo nearest to train, but the two torpedoes must be left on the rail as a caution signal to a following train.

"The recall of flagman is the most critical period, and when there is not a clear view of at least one-half mile, train must be moved forward a sufficient distance to insure safety before flagman is recalled. During foggy or stormy weather or in the vicinity of obscure curves or descending grades, or when other conditions require it, the flagman will increase the distance. When a train is flagged by a flagman the engineman must obtain a thorough explanation of the cause, stopping if necessary.

"(b) Should the speed of a train be reduced and its rear thereby endangered, making it necessary to check a following train before a flagman can get off, a lighted red fusee must be thrown on the track at intervals to insure the safety of the leading train.

"(c) When a flagman is sent out with specific instructions affecting the rights of trains, such instructions must be in writing.

"(d) When a flagman is sent to a station on a train, he will ride on the engine and engineman must stop and let him off at the first switch."

The commission orders the roads to print, distribute and enforce the rule, and to instruct all men in charge of trains; to have flagmen examined every six months on this and other rules. The examining officer must give the man a certificate and keep a record of all examinations. Every flagman must have served an apprenticeship as a flagman 30 days, and must have made at least two trips as learner over the line on which he is to serve.

COURT NEWS.

The Supreme Court of the United States this week sustained the Barker act of Arkansas, which requires railroads to furnish freight cars on request of shippers. The court ordered that the suit of the Iron Mountain road in the federal courts of that

state be dismissed. The court declined to annul the law as being a regulation of interstate commerce.

The Supreme Court of Wisconsin has rendered a decision sustaining the constitutionality of a law passed by the Wisconsin legislature in 1911, requiring railways to keep upper berths in the sleeping cars closed when they are not sold and the lower berths are occupied. The decision reversed a decision of the Dane county Circuit Court in a test case.

The Circuit Court at Baltimore, Md., holds that the Baltimore & Ohio cannot legally make a proposed issue of bonds—$62,500,000—without first securing the approval of the state public service commission; but says that the commission has not the authority to substitute its judgment for that of the directors of the railroad; it only has power to see that bonds are not issued for a fictitious or dishonest purpose.

The Supreme Court of the United States in a decision handed down this week by Justice Hughes, holds that grain in transit, stopped at Chicago for inspection, grading, etc., is, when removed from the railroad carrier to a private grain elevator, subject to the local state tax on grain placed in elevators. The decision applies only to the case in point and not to the general law that grain in transit, not at rest, is not subject to local tax.

Judge Martin, in the United States District Court at New York, February 19, dismissed indictments against George W. Sheldon and Henry W. Ackhoff, customs brokers, charged with having received rebates from the Lehigh Valley Railroad. It was shown that defendants had for nearly 30 years been salaried employees of the road and that the alleged rebates were really commissions given for extra services rendered. The prosecution had claimed that the money paid by the road had gone to shippers.

The federal court for Alaska has set aside certain indictments against an alleged "transportation trust" on the ground that the charges of discrimination presented by the government prosecutor must first be laid before the Interstate Commerce Commission. The attorney-general at Washington questions the soundness of the district court's view, and has applied to the Supreme Court of the United States to have the decision overruled. The attorney-general says that the Interstate Commerce Commission has exclusive primary jurisdiction in controversies between carriers and shippers, but not in controversies between the government and carriers or shippers.

The Supreme Court of the United States this week decided that irrespective of the provisions of the Interstate Commerce law, a person accepting gratuitous transportation from a railroad still is under the protection of state law prescribing the liability of carriers for injury or death by negligence. The decision was in the case of the heirs of Charles A. Schuyler, assistant chief clerk of the railway mail service, stationed at Ogden, Utah, killed in a train accident while riding free on his "commission" as a mail employee, in a mail car. The Southern Pacific claimed that he was a trespasser because its employees had no right to admit him to the car and, therefore it was not liable for his death. The court held Schuyler's heirs entitled to recover under state law.

The Commerce Court has rejected the motion of the Interstate Commerce Commission to dismiss the petition of the lumber tap lines in the Southwest. The court held that it has authority to review the decision of the commission and that it will proceed with the case. This case has been through unusual changes. An order was entered forbidding the trunk lines to make joint rates and through routes with the tap lines, it being held that the tap lines were owned by industrial companies and were merely plant facilities. The division of the rate was held to be a rebate. The tap lines appealed to the court, but were denied relief because the court decided that it did not have jurisdiction over a negative order of the commission. Representatives of the tap lines went to Congress and attempted to have the powers of the court altered so that it could review the law in any decision of the Interstate Commerce Commission. Congress took no action, but the commission in the meantime altered the form of the decision, whereupon the case was again taken to court. On the filing of this case the commission and the government both made a motion that the petition should be dismissed for want of jurisdiction. The court now holds it has jurisdiction and announces itself ready to proceed with the case.

Lemon Rate of $1 Sustained.

The Commerce Court has dismissed the appeal of the Atchison, Topeka & Santa Fe and other transcontinental lines, against the order of the Interstate Commerce Commission establishing a blanket rate of $1 per 100 lbs., on lemons from the Pacific coast to eastern destinations. The decision is in consonance with a former opinion of the Commerce Court, in which a similar order of the commission was annulled. The earlier decision of the commission had been based not on a finding that the rate of $1.15 was unreasonable in and of itself, but on the view of the commission that the shippers needed the reduction in order to meet Sicilian competition.

The Commerce Court, following a decision of the Supreme Court in a lumber case, held that the commission had no power to take into consideration the matter of Sicilian competition, but that it was its duty in the first place to determine whether the $1.15 rate was intrinsically unreasonable. When the commission reconsidered the case it found that, entirely apart from the matter of competition the $1.15 rate was unreasonably high, and it thereupon proceeded to reduce the rate.

The Commerce Court now holds that inasmuch as there was substantial testimony that $1 is a reasonable rate, and as there was no evidence to sustain the charge of arbitrary conduct on the part of the commission, and that as it was clear that the $1 rate was far in excess of the out-of-pocket expense of carrying the lemons, the railroads could not complain on the ground of confiscation, even if the rate did not yield its full proportion of the entire operating expenses of the roads.

Mileage Coupons in Georgia.

The county court at Atlanta, Ga., has issued an injunction against the enforcement of the recent order of the Georgia State Railroad Commission requiring the railroads to accept mileage coupons for passage on trains, from passengers getting on at certain stations within that state. The court approves the rule of the railroads requiring all such coupons to be presented at the ticket office, to be changed for trip tickets. The court thinks that the conditions printed on the mileage books are reasonable, and that there is no good ground for making the rule in Georgia different from that in other states, these coupons being valid in other states as well.

The traveling salesmen made a persistent demand for the suspension of the rule requiring coupons to be exchanged. In their response to the traveling men the railroads issued a statement which said, in part:

"An interchangeable mileage book may be used for obtaining transportation over any line party to the arrangement. The coupons from these books are equivalent to cash, and to safeguard their transmission to the treasurer of each railroad company, the requirement is made for the exchange of the coupons at ticket windows for transportation, thus causing the mileage coupons to be placed in the hands of bonded ticket agents who must account to the auditing department of each line for their value.

"The object of this requirement is to have one man, the ticket agent, handle the money and sell tickets, either for cash or coupons from an interchangeable mileage book, and thus make a record of what the company has sold; another man, the conductor, to collect the tickets, and thus make a record of their use, and thereby have an additional check against the agent, who must account for the purchase price either in cash or coupons. . . . Where the conductor lifts the coupons on the train he does not have the same facilities for safeguarding coupons, and should they become lost, the railroad honoring the mileage book would have no means of securing proper compensation.

"Attention is invited to the check system in department stores; the cash registers in small stores; the cashiers at hotels, restaurants, etc., and hundreds of other devices for the purpose of proper accounting.

"The exchange regulation has been the subject of judicial review before railroad commissioners and state courts, and the reasonableness of the requirements has been sustained."

Manila Railroad, Philippine Islands.—On June 30, 1912, the Manila Railroad Company had 450 miles of line in operation and 10 miles of line built, but not in operation. This company has been authorized to build 350 miles of new lines.

Railway Officers.

Executive, Financial and Legal Officers.

H. W. MacKenzie, assistant to comptroller of the Seaboard Air Line at Portsmouth, Va., has been elected comptroller, succeeding T. W. Roby, deceased.

The offices of Rollin H. Wilbur vice-president and general manager, and E. M. Kuntz, auditor, of the Lehigh & New England, have been transferred from Philadelphia, Pa., to South Bethlehem.

J. C. Nelms, Jr., auditor of the Kinston, Carolina Railroad & Lumber Co., at Norfolk, Va., has been appointed auditor also of the Carolina Railroad, formerly the Kinston & Snow Hill, with headquarters at Norfolk.

A. D. Lightner, general agent of the executive department of the Frisco Lines at New Orleans, La., has been elected vice-president of the New Orleans, Texas & Mexico, with headquarters at New Orleans.

M. C. Byers, chief engineer of operation of the St. Louis & San Francisco, has been appointed assistant to the president of the Great Northern, with headquarters at St. Paul, Minn., effective March 1. F. G. Jonah, chief engineer of construction, will assume the duties of chief engineer of operation, also.

Edson J. Chamberlin, president of the Grand Trunk and the Grand Trunk Pacific with headquarters at Montreal, Que., who was recently elected president also of the Central Vermont has been elected president also of the Southern New England Railroad Corporation, the Southern New England Railway Company and the Central Vermont Transportation Company succeeding E. H. Fitzhugh, resigned.

Julius Kruttschnitt, chairman of the executive committee and director of maintenance and operation of the Southern Pacific, with headquarters at New York, has been elected also president, director and ex-officio member of the executive committee of the Pacific Mail Steamship Company, succeeding R. S. Lovett. Hugh Neill, secretary of the Southern Pacific, with office at New York, has been elected secretary also of the Pacific Mail Steamship Company, succeeding Alex. Millar, resigned.

Operating Officers.

E. F. Boyle has been appointed an assistant superintendent of the Galveston, Harrisburg & San Antonio, El Paso division, with office at El Paso, Tex.

William Ward has been appointed assistant division superintendent of the Chicago, St. Paul, Minneapolis & Omaha, with office at Spooner, Wis.

D. Gilmour has been appointed superintendent of the Montreal, Que., terminals of the Grand Trunk, succeeding R. W. Scott, relieved on account of ill health.

J. M. Shea, general superintendent of the Seaboard Air Line, with headquarters at Portsmouth, Va., has resigned and his former position has been abolished.

J. T. Connor has been appointed assistant superintendent of the Galveston, Harrisburg & San Antonio, with office at San Antonio, Tex., succeeding J. E. McLean, resigned.

J. M. Teachworth has been appointed assistant superintendent of the Houston & Texas Central, Houston East & West Texas, and Houston & Shreveport, with headquarters at Houston, Tex., to succeed R. A. Crofton, resigned.

The officers of E. H. Shipman, superintendent, and J. R. Brown, car accountant, of the Lehigh & New England at Bethlehem, Pa., and W. E. Baily, trainmaster at Pen Argyle, have been transferred to South Bethlehem.

J. W. Walters has been appointed assistant superintendent of the St. Louis, Brownsville & Mexico, instead of trainmaster as previously stated, with headquarters at Kingsville, Tex. The office of trainmaster, formerly held by E. S. Heyser, is abolished.

William Hayes, superintendent and general freight and passenger agent of the Kinston, Carolina Railroad & Lumber Company, at Kinston, N. C., has been appointed general superintend-

ent also of the Carolina Railroad, formerly the Kinston & Snow Hill, with office at Kinston.

A. B. Warner, engineer of maintenance of way of the Third district of the Chicago, Rock Island & Pacific, with headquarters at El Reno, Okla., has been appointed superintendent of the Southern division of the Chicago, Rock Island & Gulf, with office at Ft. Worth, Tex., succeeding C. L. Ruppert, promoted.

Traffic Officers.

Wendall H. Stallings has been appointed soliciting agent of the Louisville & Nashville with office at Birmingham, Ala., succeeding J. V. McCullough, resigned.

The office of T. J. Fretz, general freight and passenger agent of the Lehigh & New England, has been transferred from Bethlehem, Pa., to South Bethlehem.

J. F. Dalton has been appointed general freight and passenger agent of the Carolina Railroad, formerly the Kinston & Snow Hill, with headquarters at Norfolk, Va.

Thomas J. Kay has been appointed traveling passenger agent of the Union Pacific system, with headquarters at Detroit, Mich., in place of J. O. Goodsell, transferred.

George R. Bierman, assistant city passenger and ticket agent of the Union Pacific at Omaha, Neb., has been appointed traveling passenger agent, with headquarters at Chicago.

C. E. Benjamin, general tourist agent of the Canadian Pacific, with office at Montreal, Que., has been appointed general passenger agent of the Pacific Steamship service, with office at Montreal.

H. B. Bryning, traveling immigration agent of the Northern Pacific, with office at Kansas City, Mo., has been appointed district passenger agent of the Chicago Great Western at Kansas City, to succeed L. F. McFarland, resigned.

W. H. Kirkwood has been appointed tariff inspector of the Louisiana lines of the Southern Pacific, with headquarters at New Orleans, La., in place of L. C. Bouchard, who has been appointed traveling freight and passenger agent, with headquarters at New Iberia, La., succeeding W. H. Stakelum, transferred to Lake Charles, La., as division freight and passenger agent.

George W. Boyd, who has been appointed passenger traffic manager of the Pennsylvania Railroad, with headquarters at Philadelphia, was born at Indianapolis, Ind., August 1, 1848. He began railway work in 1863 in the freight department at Indianapolis of the Cleveland, Columbus, Cincinnati & Indianapolis, now the Cleveland, Cincinnati, Chicago & St. Louis, and for several years he served as clerk of the freight department. In June, 1872, he was appointed cashier of the passenger department of the Pennsylvania Railroad, remaining in that position until January, 1874, when he was promoted to chief clerk. From January, 1882, to June, 1903, he was assistant general passenger agent of the same road and then was promoted to general passenger agent, which position he held at the time of his appointment as passenger traffic manager. Mr. Boyd has been an uncompromising foe of the ticket scalper and has often advocated anti scalping laws before committees of Congress and the legislatures of many states. He has consistently maintained the principle that railway travel, under the personally-conducted system, is the legitimate business of the railroad companies, and does not belong to independent promoters.

G. W. Boyd.

W. S. Basinger, assistant to director of traffic of the Southern Pacific with headquarters at New York, and formerly holding the same position on both the Union Pacific and the Southern Pacific, has been appointed general passenger agent of the Union Pacific, with headquarters at Omaha, Neb., effective March 1. He was born in 1872 at Savannah, Ga., and graduated from the University of Georgia in 1890. The following year he became clerk in the auditing department at Kansas City, Mo., of the Kansas City, Fort Scott & Memphis, now a part of the St. Louis & San Francisco, and from 1891 to 1897, was a clerk in the freight department of the Union Pacific, at Kansas City. He then went to the Leavenworth, Kansas & Western, now a part of the Union Pacific, as general freight and passenger agent, and from 1903 to 1905, was superintendent, treasurer and secretary of that road with headquarters at Leavenworth, Kan. He was then trainmaster on the Union Pacific for two years, and was made assistant general passenger agent at Omaha, Neb., of the same road in 1907. From 1911 to 1912, he was assistant to director of traffic of the Union Pacific and the Southern Pacific at Chicago, and then at New York. On February 6 he resigned from the Union Pacific as assistant to director of traffic and now he goes back to the Union Pacific as general passenger agent as above noted.

James Roberts Wood, passenger traffic manager of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., whose retirement on March 1, under the pension rules of the company has been announced in these columns, was born at Auburn, N. Y., on February 9, 1843. He began railway work in 1869, as secretary to the superintendent at Creston, Iowa, of the Burlington & Missouri River, now a part of the Chicago, Burlington & Quincy. From this position he was advanced to trainmaster, which he held until 1871, when he was appointed general western passenger agent of the same road, with office at Chicago. In 1873 he became general ticket agent of the same road in Nebraska, and then for a short time was western land and passenger agent. His next position was general agent of the Michigan Central and the Chicago & West Michigan, at Grand Rapids, Mich. In 1876 he was appointed assistant superintendent of the Michigan Central, at Jackson, Mich., and in 1878 he returned to Chicago as assistant general passenger agent of the same road. A few months later he went to the Chicago, Burlington & Quincy, as general passenger agent of that system. He remained in this position until April, 1881, when he was appointed general passenger agent of the Pennsylvania Railroad, and on June 1, 1903, was promoted to passenger traffic manager, from which position he retires on March 1. In April, 1890, Mr. Wood was selected as chairman pro tempore of the Passenger Committee of the Trunk Line Association, and held the position until the election of a permanent chairman, in August of the same year, having declined the permanent chairmanship. He has also served a term as president of the American Association of General Passenger and Ticket Agents. It was upon Mr. Wood's initiative that the first "limited" train, in the sense of exclusive accommodations and high speed, was inaugurated in this country. He has aided and encouraged every reform which had for its object the elevation and expansion of the passenger business.

J. R. Wood.

George W. Boyd, general passenger agent of the Pennsylvania Railroad, with office at Philadelphia, Pa., has been appointed passenger traffic manager, to succeed J. R. Wood, who retires from active service on February 28, under the pension rules of the company. Coincident with the appointment of a new passenger

traffic manager the passenger department has been reorganized. D. N. Bell and J. P. Anderson, formerly assistant general passenger agents, have been appointed general passenger agents. Heretofore, Mr. Boyd has been the only general passenger agent on the Lines East. Under the new organization, one general passenger agent will devote his time to developing travel local to the Pennsylvania Railroad and the other to building up the through passenger business. Division passenger agencies have been created at New York, at Philadelphia, at Harrisburg, at Pittsburgh, at Williamsport, at Buffalo and at Baltimore. To each one of the division passenger agents will be assigned a particular territory, and it will be his duty to give his personal attention to securing the comfort and convenience of the people in his territory. This plan, which requires the division passenger agent to make a study, more careful than ever made before, of the comfort and convenience of travel, will, it is thought, bring the management of the company into the closest possible touch with the traveling public. C. Studds, R. J. DeLong and R. M. Pile have been appointed assistant general passenger agents; O. T. Boyd, New York; F. B. Barnitz, Philadelphia; A. E. Buchanan, Harrisburg; E. Yungman, Pittsburgh; David Todd, Williamsport; B. P. Fraser, Buffalo, and William Pedrick, Jr., Baltimore, have been appointed division passenger agents, and the following have been appointed district passenger solicitors: R. L. Stall, W. P. Harriman and W. V. Kibbe, New York; F. E. Binns, Brooklyn, N. Y.; C. E. McCullough, Newark, N. J.; D. M. Sheaffer, Philadelphia, Pa.; A. C. Weile, Reading; C. A. B. Cooper, Erie; S. B. Newton, Altoona; T. L. Lipsett, Washington, D. C.; N. S. Longaker, Wilmington, Del., and C. R. Rosenberg, Atlantic City, N. J.

Engineering and Rolling Stock Officers.

R. M. Garnett has been appointed roadmaster of the St. Louis, Brownsville & Mexico, with headquarters at Kingsville, Tex.

The office of C. W. Brown, engineer maintenance of way of the Lehigh & New England, has been transferred from Bethlehem, Pa., to South Bethlehem.

W. H. Evans has been appointed district master mechanic, Second district, of the Canadian Pacific, British Columbia division, with headquarters at Vancouver, B. C.

D. S. Terry has been appointed a construction engineer of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Cincinnati, Ohio, succeeding F. W. Smith, resigned.

Hans Helland, superintendent of maintenance of way of the San Antonio & Aransas Pass at Yoakum, Tex., has been appointed construction engineer, with headquarters at San Antonio, Tex.

George McCormick has been appointed assistant general manager (mechanical) of the Galveston, Harrisburg & San Antonio, the Houston & Texas Central, the Houston East & West Texas, the Houston & Shreveport, and the Texas & New Orleans, and superintendent of motive power and machinery of the Morgan's Louisiana & Texas Railroad & Steamship Company and the Louisiana & Western Railroad, with headquarters at Houston, Tex., in place of J. W. Small, resigned.

H. W. Ridgway, who recently was appointed superintendent of the motive power and car department of the Colorado & Southern, with headquarters at Denver, Colo., was born July 17, 1866, at Delaware Water Gap, Pa. He was educated in the common schools and began railway work in November, 1881, as machinist apprentice with the Denver & Rio Grande. From May to December, 1887, he was successively journeyman and foreman of the Mexico Central at Mexico City, and then for four years was with the Denver & Rio Grande as a journeyman and gang foreman. He returned to the Mexico Central in 1893, and until 1901, was foreman and master mechanic. In February of the latter year he went to the El Paso & Northeastern as superintendent of machinery, and from April, 1903, to February 1, 1904, he was superintendent of the contract shop. He then became superintendent of shops of the Mexican Central at Aguascalientes, Mex., where he remained until December 1, 1905. On January 1, 1906, he was appointed master mechanic of the Colorado & Southern and the Atchison, Topeka & Santa Fe at Denver, Colo., from which position he has been promoted to that of superintendent of motive power and car department, as above noted.

Purchasing Officers.

James E. Kilborn has been appointed purchasing agent and storekeeper of the Rutland Railroad, and purchasing agent of the Rutland Transit Company, with office at Rutland, Vt., succeeding A. E. Douglas, resigned.

OBITUARY.

William Singer, Jr., formerly an attorney for the Southern Pacific, died at San Francisco, Cal., on February 12, aged 63 years.

Robert Bicknell Seymour, formerly chief engineer of the Chicago, Indiana & Southern, died at his home in Oak Park, Chicago, on February 23, at the age of 53 years.

Urias J. Fry, who had been superintendent of telegraph of the Chicago, Milwaukee & St. Paul system since 1888, died at his home in Milwaukee, Wis., on February 22, aged 65 years.

Henry A. Williams, assistant to general superintendent of the Southern Railway, died recently at his home in Columbia, S. C., at the age of 52. Mr. Williams began his railroad career as a brakeman.

John J. Cairns, passenger agent of the Chicago, Milwaukee & St. Paul, at Chicago, died in that city on February 18, as result of injuries received when he was struck by a train on the Northwestern Elevated Railroad the evening before. Mr. Cairns was 60 years old.

William N. D. Winne, comptroller of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, died on February 24 in Florida. He was born October 11, 1850, at Schenectady, N. Y., and was educated in the public schools of his native town and at Madison, Wis., and in private schools at Milwaukee. He began railway work in 1863 as junior clerk in the auditor's office of the Milwaukee & Prairie du Chien and continued with that road until its absorption by the Chicago, Milwaukee & St. Paul. From September, 1882, to September, 1890, he was assistant general auditor of the Chicago, Milwaukee & St. Paul. He became general auditor in 1890, and was appointed comptroller in July, 1910.

Patrick Tyrrell, ticket auditor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, died on February 22 from a stroke of apoplexy. He was born on April 6, 1838, in Ireland and began railway work in 1855. From then until October, 1865, he held various positions as clerk on the Milwaukee & Mississippi, afterwards the Milwaukee & Prairie du Chien, now a part of the Chicago, Milwaukee & St. Paul. In October, 1866, he was appointed general bookkeeper of the Chicago, Milwaukee & St. Paul, remaining in that position until July, 1869, when he became auditor of the Western Union Railroad, also now a part of the St. Paul. From July, 1879, to September, 1882, he was general clerk in the auditing department of the Chicago, Milwaukee & St. Paul, and since September, 1882, had been ticket auditor.

Charles E. Gossett, general master mechanic of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., died at Rochester, Minn., on February 19, aged 44 years. Mr. Gossett was born on January 25, 1869, in Kentucky, and was educated at the Missouri State University. He had been in railway service since 1886, when he began as machinist helper with the Wabash, St. Louis & Pacific. From 1889 to 1901, he was a locomotive fireman on the Hannibal & St. Joseph, locomotive engineer on the same road, the Wabash and the Chicago, Rock Island & Pacific. He was then until March, 1905, road foreman of equipment of the latter road, when he was made master mechanic. In August, 1908, he went to the Iowa Central as master mechanic; two years later he was appointed master mechanic of the Minneapolis & St. Louis, and on January 1, 1912, he was promoted to general master mechanic of that road.

Railroad Mileage in the Philippines.—The construction has been authorized of 1,097 miles of new line in the Philippine Islands. The total mileage in operation is now 641 miles.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Cincinnati, New Orleans & Texas Pacific has ordered 10 mikado locomotives from the Baldwin Locomotive Works and 7 Pacific type locomotives from the American Locomotive Company.

P. Welch has ordered 1 oil burning consolidation locomotive from the American Locomotive Company. The dimensions of the cylinders will be 19 in. x 28 in.; the diameter of the driving wheels will be 57 in., and the total weight in working order will be 170,000 lbs.

The Detroit Terminal Railroad has ordered 5 six-wheel switching locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 21 in. x 28 in. cylinders, 57 in. driving wheels, and in working order will weigh 170,000 lbs.

The Missouri Pacific has ordered 7 Mountain type locomotives and 5 Pacific type locomotives from the American Locomotive Company. The dimensions of the cylinders of the Mountain type locomotives will be 27 in. x 28 in.; the diameter of the driving wheels will be 63 in., and the total weight in working order will be 294,000 lbs. The Pacific type locomotives will have 26 in. x 26 in. cylinders, 73 in. driving wheels, and in working order will weigh 258,000 lbs.

CAR BUILDING.

The Chicago & Western Indiana is in the market for 300 ballast cars.

The Chicago, Rock Island & Pacific has ordered 50 caboose cars from the Whipple Car Company.

The Rutland has ordered 3 smoking cars, 2 coaches, 2 baggage cars and 1 mail and baggage car from the Osgood Bradley Car Company.

The Pennsylvania Railroad has ordered 1,000 refrigerator cars and 500 steel and wood gondola cars from the American Car & Foundry Company, and 805 steel and wood gondola cars from the Standard Steel Car Company.

The Cincinnati, New Orleans & Texas Pacific has ordered 100 gondola cars and 50 hopper cars from the Cambria Steel Company, 100 box cars from the American Car & Foundry Company and 5 dining cars from the Barney & Smith Car Company.

The Harriman Lines have recently placed a large order for freight cars, as mentioned in the *Railway Age Gazette* of January 31, February 14 and February 21. The correct division of this order is as follows: 2,280 drop bottom gondola cars, 200 hopper bottom gondola cars and 203 tank cars from the Pressed Steel Car Company; 1,000 box cars, 800 automobile cars and 110 caboose cars from the Standard Steel Car Company; 2,250 box cars from the American Car & Foundry Company; 2,050 single deck stock cars and 3,100 box cars from the Pullman Company; and 800 work cars and 500 flat cars from the Bettendorf Axle Company.

IRON AND STEEL.

The Central of New Jersey is in the market for about 800 tons of structural steel.

General Conditions of Steel.—The output of steel continues to be at the same high rate as in January, and if the total output for the current month falls below that of January, it will only be due to the fact that February is the shorter month. Orders for new business in some branches of the industry have recently shown increases since the first of January. The heavy orders for freight cars have also called for a considerable tonnage of steel. Rail buying during February has been smaller than usual, but this was to be expected after the unusually heavy contracts for 1913 delivery placed in the second half of 1912.

Supply Trade News.

F. R. Wadleigh has opened offices in the Bank of Commerce building, Norfolk, Va., as consulting engineer in all matters in connection with the preparation and purchase and use of coal.

William Thornburgh has been appointed general manager sales of the Standard Asphalt & Rubber Company, Chicago, with jurisdiction over the waterproofing, engineering, mastic floor and paving departments.

Michael Ehret, president of the Ehret Magnesia Manufacturing Company, Philadelphia, Pa., and chairman of the board of directors of the Barrett Manufacturing Company, New York, died at his home in Philadelphia on February 17, at the age of 75.

Leigh Best, vice-president of the American Locomotive Company, New York, in charge of finance, has been given full charge of the automobile department of this company in addition to his present duties. It is the purpose of the company to segregate the automobile department from the locomotive department so far as is practicable. Mr. Best was born at Chatham, N. Y., on November 4, 1867. He received a high school education and in 1892 entered the legal department of the New York Central Lines, with office in New York. Later he was made assistant to the president, while S. R. Callaway was president. In June, 1901, Mr. Callaway resigned his position to become president of the American Locomotive Company and brought Mr. Best with him as secretary of that company. Mr. Best retained that position until June, 1904, when he was made third vice-president in charge of financial, accounting, legal and corporate matters, which position he still holds. In future Mr. Best will divide his time between his present office at 30 Church street and his new office at 1886 Broadway.

As announced in last week's issue, at a recent meeting of the directors of the Weir Frog Company, Cincinnati, Ohio, O. DeG. Vanderbilt, Jr., was elected president, succeeding B. W. Rowe, who was elected chairman of the board of directors. Mr. Vanderbilt is a son-in-law of the late Col. L. C. Weir, who was once president of the Adams Express Company, and was later president of the Weir Frog Company, until his death in 1899. Mr. Vanderbilt's interest in the past have been in the East, and his headquarters at New York City, but he has spent the past four or five months in Cincinnati, taking active charge of extensive improvements and additions to the plant at Cincinnati, which will increase the capacity from 25 to 35 per cent. The company has increased its floor space for manufacturing about 16,000 sq. ft., and the space for the storage of raw material has been nearly doubled.

O. DeG. Vanderbilt, Jr.

TRADE PUBLICATIONS.

Mikado Locomotives.—Bulletin number 1012, issued by the American Locomotive Company, 30 Church street, New York, deals with the Mikado locomotives of the Chesapeake & Ohio. In comparison with locomotives of the consolidation type these show a saving in coal per ton mile of 14 per cent. and 9 per cent. saving in water per ton mile, while increasing the train loads 50 per cent. Drawings showing the side elevation and clearance diagram of the locomotives are given and also a dynamometer car record made with a train of 7,590 tons.

Railway Construction.

BOSTON & MAINE.—Favorable action has been taken by the Vermont legislature on two bills of the Boston & Maine granting that company permission to construct two connecting links parallel with the tracks of the Central Vermont, a Grand Trunk subsidiary, to complete its line down the Connecticut river valley to Massachusetts. One bill passed by the house in concurrence with the senate provides for an extension of the Sullivan County Railroad from Windsor to White River Junction. The other bill, passed by the senate, provides for an extension of the Vermont Valley Railroad from Brattleboro to the Massachusetts line at South Vernon. These connecting links will probably not be built as long as the present agreement between the Grand Trunk and the Boston & Maine for the joint use of the existing lines remains in effect.

CANADIAN PACIFIC.—An officer writes that appropriations have been made for new lines and improvements on the western lines as follows: In Manitoba, a branch line from Snowflake westerly, 9 miles, and from Gimli to Tiverton, 26 miles; in Saskatchewan, branch from Weyburn, westerly, 145 miles, and a new yard at Assiniboia. In Alberta, additional tracks at Dunmore, at Calgary, at Strathcona, at Edmonton and at Wetaskiwin; also branch lines from Coronation to Sedgewick, 25 miles, and from Lacombe east to Kerrobert, Sask., 86 miles; Stirling easterly 25 miles, Suffield, southwesterly, 25 miles, and from Bassano to Empress, 118 miles. In British Columbia, standardization of the Kaslo & Slocan from Whitewater to Kaslo, 17 miles, and on the Kootenay Central, construction from Skookumchuck to mile 60, and from mile 42 to mile 60 south of Golden. New double tracks will be constructed as follows: Kemnay, Man., to Virden, 40 miles; Whitewood, Sask., to Broadview, 15 miles; Broadview, Sask., to Grenfell, 16 miles; Indian Head, Sask., to Regina, 44 miles; Chaplin, Sask., to Swift Current, 57 miles; Swift Current to a junction with the Swift Current northwesterly branch, 6 miles; Gleichen, Alta., to Shepard, 40 miles, and double tracking will be completed on the line between Vancouver, B. C., and Ruby Creek, 81 miles. Part of this latter work has been completed and is now in operation.

Bids are wanted by J. G. Sullivan, chief engineer Western lines of the Canadian Pacific, Winnipeg, Man., up to noon April 15, for the clearing, grubbing and grading of a division of the main line in the Selkirk mountains, from Six Mile Creek to Glacier, 17 miles. This work includes a double track tunnel about 28,000 ft. long. Plans and specifications are on file at the offices of J. G. Sullivan and of F. F. Busteed, engineer grade revision, Kamloops, B. C.

The Canadian Pacific has appropriated $16,000,000 for construction work to be carried out on its eastern divisions this year. Of this amount, about $10,000,000 will be used to complete work commenced last summer, including the new Lake Shore line, and extensions from St. Johns, Que., to Farmham Junction and branches in the east end of Montreal. The greater part of the new work will consist of double tracking the new eastern lines, involving the expenditure of nearly $6,000,000. The main line from Islington to Guelph Junction, on the London (Ont.) division, will be double tracked for 50 miles. It is also proposed to double-track some of the main line between Ramford, Ont., and Port Arthur, and eventually to double-track the entire line, 563 miles, in order to facilitate the handling of grain.

CHESAPEAKE & OHIO.—An officer writes that contracts have been let and work is now under way on a 7.9-mile extension up Island Creek, W. Va. This is all of the construction that is proposed at this time, in that section.

DETROIT, BAY CITY & WESTERN.—According to press reports a contract has been given to the Bay County Construction Company, Bay City, Mich., to build the ten miles branch north from Akron, Mich., to Sebewaing (November 15, 1912, p. 973).

GRAND TRUNK PACIFIC.—The programme of construction for 1913, it is understood, includes the completion of the British Columbia section of the main line. The gap between the eastern and western sections in British Columbia is now 426 miles, and work on this section is under way throughout its entire length. Track has been laid to the Shuswap river, 1,123 miles west of Winnipeg, Man., and 154 miles east of Fort George. A steel structure spanning this river will be placed in position as soon as footings upon which work has commenced have been completed. East of Prince Rupert track has been laid to mile 705 from the Pacific coast. Between that point and Aldermere several steel bridges will be erected, and some grading must be done. From Aldermere, easterly, the grade continues to the Endaka river, 341 miles from Prince Rupert; there is then a gap of 126 miles to Fort George, upon which clearing work is being done. The company will enter the towns of Brandon, Moose Jaw, Weyburn, Battleford and Calgary this year, and will push forward with all possible speed important extensions already undertaken. This includes finishing the Weyburn branch and Regina boundary line, securing terminals in Moose Jaw for the Regina-Moose Jaw branch, which is finished to a point just north of Moose Jaw, ballasting the Battleford branch, and the construction into Calgary of the line from Tofield. On the line from Regina to the international boundary, grading is finished as far as Frobisher, 136 miles from Regina, and track has been laid to Hill Hall, 106 miles, and 90 per cent. of the grading is completed on the remaining section between Frobisher and the United States. The grade on the Tofield-Calgary branch has been finished to Calgary. Track is laid as far as mile 176, and ballasting will soon be commenced along this line until Bow river is reached, and on the completion of a steel bridge at that point, track laying will be continued to Elbow river, at which point another steel bridge will be put in place. Concrete piers are ready for both bridges. Terminals are now being prepared and it is expected that the line will be opened for the operation of passenger trains into Calgary by next August.

GULF, TEXAS & WESTERN.—An officer writes that there is no truth in the report that an extension is to be built from Salesville, Texas, south to Mineral Wells, about eight miles. The company has just completed an extension from Jacksboro south to Salesville, and has trackage rights for passenger trains over the Weatherford, Mineral Wells & Northwestern to Mineral Wells, and for freight trains to Weatherford. (February 14, page 313.)

KERRY TIMBER COMPANY'S LINES.—According to press reports the Kerry Timber Company will build a logging line in Oregon from Wood's Landing on the Columbia river, south to the Nehalem valley, 30 miles.

MIDDLE TENNESSEE.—According to press reports this company has surveys made for an extension from Mt. Pleasant, Tenn., southeast via Pulaski to Huntsville, Ala., about 70 miles.

MONTOUR RAILROAD.—This company, which operates a line from Montour Junction, Pa., southwest to North Star 12.5 miles, has given a contract to John Marsch, Chicago, to build a 30-mile extension from North Star, through a coal section in Washington and Allegheny counties to a point south of Homestead. (January 31, page 231.)

NORTHERN CALIFORNIA RAILROAD & NAVIGATION COMPANY.—Incorporated in California with a capital of $1,100,000, to build railroads. The incorporators include G. W. Bartle, S. Swinson, O. G. Bartle, J. D. Rhodes, R. H. Hayworth and M. C. Messick.

OCILLA SOUTHERN.—This company will build an extension, it is said, from the southern terminus at Nashville, Ga., east about 50 miles to Waycross.

ST. LOUIS-KANSAS CITY (Electric).—President Nevin of this company, which was organized some time ago to build a double-track line from St. Louis, Mo., west to Kansas City, about 250 miles, is quoted as saying that work had been started and would be pushed to completion. The contract for building the line has been given to the National Contracting Company, Norfolk, Va.

SULLIVAN COUNTY.—See Boston & Maine.

TEMPLE, NORTHWESTERN & GULF.—According to press reports this is the new name of the Temple-Northwestern, which was organized some time ago to build from Temple, Tex., northwest via Gatesville, Hamilton and Comanche. Work on the line was suspended about two years ago, and it is understood will be resumed by May 1. A contract has been entered into by the new owners to begin construction within five months, and to complete the line to Gatesville, about 35 miles,

within two years. Grading has been finished between Gatesville and Temple, and about four miles of track has been laid from Temple. Residents of Houston are back of the project.

Temple-Northwestern.—See Temple, Northwestern & Gulf.

Tennessee Roads.—According to press reports residents of Baileyton, Tenn., are back of a project to build a line from Baileyton, south to Greenville, about 15 miles. L. P. Campbell may be addressed.

Trans-Appalachian.—Incorporated in West Virginia, it is said, to build from Parkersburg, W. Va., southeast along the little Kanawha and Elk rivers to or near Marlinton in Pocahontas county, thence to a point in Virginia. The company proposes to develop timber lands in Pocahontas county, W. Va., and in Bath county, Va. The line may eventually be extended to a connection with the Chesapeake & Ohio at Covington, Va. H. M. Lockridge, Huntersville, W. Va., and R. S. Turk, Staunton, Va., may be addressed.

Vermont Valley.—See Boston & Maine.

RAILWAY STRUCTURES.

Clinton, Ia.—The Chicago & North Western has prepared plans for new repair shops to cost approximately $500,000, on which work is to be started this spring.

Concord, N. C.—Construction work has been begun on the new passenger station for the Southern at Concord. It will be of brick construction with stone trimmings and tile roof and will be steam heated. It will be 128 ft. x 32 ft. 6 in. and will include ample waiting rooms and modern conveniences for passengers, as well as office, baggage and express rooms. The old passenger station has been moved and converted into a freight office. The improvements at Concord also include the construction of concrete platform, macadam driveway and necessary track changes. Contract for the construction of the new passenger station has been given to J. A. Jones, of Charlotte, N. C., and contract for the installation of heating system has been awarded to the Hess & Rogers Engineering Company, Washington, D. C. (December 27, p. 1285.)

Des Moines, Ia.—The Chicago, Rock Island & Pacific is planning to build new repair shops, a roundhouse and additional yards on the east side of the city.

Fort William, Ont.—An officer of the Canadian Pacific writes that appropriations for new improvements include the following: In Ontario, a 6-stall addition to the roundhouse, increase in the elevator capacity, and extensions to freight car repair shed at Fort William; at Kenora 6-stall addition to the roundhouse. In Manitoba, 5-stall addition to the roundhouse at Minnedosa. In Saskatchewan, 4-stall addition to the roundhouse at Arcola; in Alberta, an overhead bridge at Strathcona; 6-stall addition to the roundhouse at Alyth; a 2-stall addition to the roundhouse and 50 ft. addition to the freight shed at Lacombe.

Jackson, Mich.—The Michigan Central is planning extensive additions to its shops, including an addition 250 ft. long to the main shop building, a new 30-stall roundhouse and a new blacksmith shop.

Jackson, Miss.—The Illinois Central is to rebuild at once its freight house which was destroyed by fire recently.

Lexington, Va.—The Baltimore & Ohio has given a contract to J. J. Walsh & Sons, contractors, of Baltimore, Md., for the construction of a modern passenger station at Lexington. The present passenger station will be completely overhauled and remodeled and the freight house platform will be extended.

Los Angeles, Cal.—The Southern Pacific has begun the work of clearing the site for a large new passenger station to replace the present Arcade station.

Staunton, Va.—An officer of the Chesapeake & Ohio writes regarding the reports, that a freight station is to be built at Staunton, that while the question has been under consideration, nothing definite has yet been decided in regard to the construction of the station.

Railway Financial News.

Carolina Railroad.—This company has taken over the Kinston & Snow Hill.

Delaware, Lackawanna & Western.—Harold S. Vanderbilt has been elected a director, succeeding S. S. Palmer, deceased.

Denver & Salt Lake.—This company, which is the successor of the Denver, Northwestern & Pacific, has sold $488,000 5 per cent. equipment trust certificates. The securities cover the purchase of 300 steel gondola cars, 100 box cars, two Mallet locomotives and 50 other pieces of equipment.

The Denver & Salt Lake will have about $7,500,000 first mortgage 5 per cent. bonds and $2,000,000 adjustment income bonds outstanding. When arrangements have been finally completed for taking over the road of the Denver, Northwestern & Pacific, the $10,000,000 stock of the new company will be held in a voting trust for five years.

Denver, Northwestern & Pacific.—See Denver & Salt Lake.

Galveston, Henderson & Houston.—E. T. Jeffries has been elected a director, succeeding George J. Gould, resigned.

Speyer & Co. have bought $2,000,000 first mortgage 5 per cent. bonds of 1913-1933 or 1938. This will provide for refunding an equal amount of first mortgage bonds maturing April 1, 1913.

Kansas City, Mexico & Orient.—D. J. Haff is quoted as saying that the chairman of the reorganization committee of the Kansas City, Mexico & Orient, who is now in London, will be in Kansas City next month, and that subscriptions are now being taken for funds to refinance the road, which is in the hands of a receiver, and as saying that it will require between $10,000,000 and $15,000,000 to refinance and complete the road.

Kinston & Snow Hill.—See Carolina Railroad.

New York, New Haven & Hartford.—De Ver H. Warner has been elected a director, succeeding his father, I. De Ver Warner, deceased.

Peoria Railway Terminal.—On March 1, the Chicago, Rock Island & Pacific, and the Chicago & Alton will take over the joint management of the Peoria Railway Terminal Company, which they have jointly owned for some time. President W. T. Irwin will retire, but will be retained in legal capacity. The roads will operate the terminal in alternate years, and the president will also be alternated, so that the first year the property will be operated by the Rock Island, and President B. A. Worthington, of the Chicago & Alton, will serve as president.

Pittsburgh & Lake Erie.—The directors have declared an extra dividend of 5 per cent., payable March 31. This compares with extra dividends of 12 per cent. paid in March, 1912, 25 per cent. in 1911 and 40 per cent. in 1910. The regular dividends are 10 per cent. annually. In three previous years the extra dividend has been accompanied by stock offered to the stockholders for subscription. The company has made no stock offer so far this year.

Southern Pacific.—See the refusal of the California Railroad Commisison to permit certain terms of the Union Pacific-Southern Pacific dissolution plan from being carried out under state commissions.

Union Pacific.—See the refusal of the California Railroad Commission to permit certain terms of the Union Pacific-Southern Pacific dissolution plan from being carried out under state commissions.

Brazilian-Paraguayan Railway Connection.—According to statements made by its promoters, the proposed Paraguay Northeastern Railway, for which a concession was granted in 1911, is to run from Asuncion, Paraguay, northeasterly to the Paraguayan-Brazilian frontier, where it will cross the Parana river. From that point it is proposed to connect with the Transcontinental Brazilian line, which, crossing the states of Parana and Sao Paulo, connects with the main Brazilian system at Itapetininga.

ANNUAL REPORT.

SOUTHERN PACIFIC COMPANY TWENTY-EIGHTH ANNUAL REPORT.

INCOME FOR THE YEAR.

The gross receipts and disbursements of the Southern Pacific Company in respect of its leased lines and of the Proprietary Companies in respect of lines not leased, and the other receipts and disbursements of the Southern Pacific Company and of such Proprietary Companies after excluding all offsetting transactions between them, were as follows:

	This Year.	Last Year.	+ Increase. — Decrease.
Average miles of railway operated proprietary and non proprietary:			
Lines East of El Paso	3,434.97	3,402.88	+32.09
Lines West of El Paso	6,535.43	6,492.19	+43.24
Total	9,970.40	9,895.07	+75.33
OPERATING INCOME.			
Revenue from transportation —rail lines	$120,433,055.64	$121,911,028.10	—$1,477,972.46
Revenue from outside operations	11,092,114.95	10,709,511.41	+382,603.54
Total	$131,525.170.59	$132,620,539.51	—$1,095,368.92
Operating expense—rail lines	$75,652,106.32	$74,521,659.84	+$1,130.446.48
Expenses outside operations	10,838,936.91	10,483,554.02	+355,382.89
Taxes (rail lines and properties dealt with as outside operations)	5,621,238.96	4,850,347.57	+770,891.39
Total	$92,112,282.19	$89,855,561.43	+$2,256,720.76
Net operating income over expenses and taxes	$39,412,888.40	$42,764,978.08	—$3,352.089.68
OTHER INCOME.			
Interest on bonds owned of Proprietary Companies (Table No. 4)	$2,040,929.85	$1,051,971.39	+$988,958.46
Interest on bonds owned of companies other than Proprietary Companies (Table No. 5)	2,670.883.49	2,935,575.94	—264,692.45
Dividends on stocks owned of companies other than Proprietary Companies (Table No. 6)	1,066.908.44	781,796.08	+285,112.36
Income from lands and securities not pledged for redemption of bonds	740.146.64	956,529.05	—216,382.41
Income from sinking funds pledged for the redemption of bonds	219,314.11	93,532.54	+125,781.57
Rentals for lease of road, for joint tracks, yards, and other facilities	.....	106,412.43	—106,412.43
Balance of interest received on loans and of interest accruing to June 30, on open accounts other than with Proprietary Companies	1,995,762.27	728,454,03	+1,267,308.24
Miscellaneous income	118,574.56	80,917.41	+37,657.15
Total	$8,852,519.36	$6,735,188.87	+$2,117,330.49
Total net operating and other income	$48,265,407.76	$49,500,166.95	—$1,234,759.19
FIXED AND OTHER CHARGES.			
Interest on outstanding funded debt of Southern Pacific Co. and Proprietary Companies (Table No. 7)	$23,559,447.38	$20,897,152.53	+$2,662,294.85
Sinking fund contributions and income from sinking fund investments	501,494.11	374,712.54	+126,781.57
Hire of equipment—balance	642,158.52	250,481.77	+391,676.75
Rentals for lease of road, for joint tracks, yards, and other facilities	142,307.03	.....	+142,307.03
Land department expenses	187,849.02	225,689.21	—37,840.19
Taxes on granted and other lands	347,528.70	319,517.29	+28,011.41
Miscellaneous expenses	60,585.98	34,121.52	+26,464.46
Taxes and other expenses of Southern Pacific Company	245,899.01	291,703.42	—45,804.41
Additions and betterments payable from income of Southern Pacific Company	25,232.60	123,033.79	—97,801.19
Reserve for depreciation of rolling stock owned by Southern Pacific Company and leased to other companies	854,060.67	866,547.65	—12,486.98
Total	$26,566,563.02	$23,382,959.72	+$3,183,603.30
Surplus over fixed and other charges	$21,698,844.74	$26,117,207.23	—$4,418,362.49

ASSETS AND LIABILITIES.

The combined assets and liabilities, excluding therefrom the stocks of the Proprietary Companies deposited against the issue of stocks and bonds of the Southern Pacific Company, also the offsetting open accounts between the Companies, on June 30, 1912, summarized, were as follows:

Capital Assets.		
Cost of road and franchises		$775,446,276.62
New Mexico & Arizona Railroad Co. and Sonora Railway Co. securities	6,718,000.00	
Stocks and bonds owned by Southern Pacific Company (Tables Nos. 13, 14, and 15)	$379,704,317.62	
Deduct: Stocks and bonds deposited against issue of Southern Pacific Company stock and bonds	232,932,667.41	
	146,771,650.21	
Stocks owned by Proprietary Companies (Table No. 20)	330,316.77	
Bay Shore Line terminals and other real estate	37,998,537.00	
Timber treating plants, saw mills, and other property	349,879,89	
Steamships and other floating equipment (Table No. 25)	13,757,104.89	
Rolling stock (Table No. 26)	20,217,267.00	
Advances for construction and acquisition of new lines	18,243,976.28	
Advances for Oakland-Berkeley electric lines	9,001,020.46	
Advances to Southern Pacific Railroad Co. of Mexico	39,026,799.19	
Advances to electric lines in California and Oregon	9,773,318.12	
Advances to Kern Trading & Oil Co.	8,523,255.92	
Advances to Pacific Fruit Express Co.	1,214,923.37	
Lands and other investments	2,859,564.49	
Advances to Southern Pacific Land Co.	3,560,000.00	
Sinking funds	11,313,997.72	
Trust funds	343,981.17

Note. There is included in the above equipment belonging to Companies whose properties are operated under leases, viz.: 1 locomotive, 1 passenger and 2 freight cars added, the property of Hanford and Summit Lake Ry. Co.; 3 freight cars added, the property of Porterville Northeastern Ry. Co.; and 10 work cars added, and 1 locomotive, 9 passenger, and 23 freight cars vacated, the property of Sonora Ry. Co.

†Includes following narrow gauge equipment transferred between Proprietary Companies: 13 locomotives, 13 passenger cars, 195 freight cars, and 18 work cars. *Sold by Southern Pacific Company to Proprietary Companies.

The original cost and salvage value of equipment retired during the year, and the amount charged to operating expenses in respect thereof, were as follows:

	Total.	Locomotives.	Passenger-Train Cars.	Freight-Train Cars.	Work Equipment.
Original cost (estimated if not known)	$1,616,048.24	$247,923.38	$401,772.01	$862,418.76	$103,934.09
Proceeds from sale or salvage value	821,964.48	73,643.70	231,594.28	463,615.38	53,111.12
Charged to operating expenses	$794,083.76	$174,279.68	$170,177.73	$398,803.38	$50,822.97

The locomotives added during the year averaged 142.91 tons total weight of engine, without tender, and 122.45 tons upon drivers.

STANDARD GAUGE.	THIS YEAR.	LAST YEAR.	+ INCREASE. — DECREASE.	PER CENT.
Freight train cars	48,183	49,525	— 1,342	2.71
Total capacity (tons)	1,940,058	1,917,650	+ 22,408	1.17
Average capacity (tons)	40.89	40.41	— .25	.62
Work equipment	5,388	5,301	+ 87	1.64

The equipment owned by the respective companies is shown in Tables Nos. 25 and 26. The changes during the year, the capacity, and the service of all equipment, are shown in Tables Nos. 34, 35 and 36.

TRANSPORTATION OPERATIONS.

The results of the year's transportation operations compared with those of the preceding year are as follows:

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Average miles of railway operated	9,970.40	9,895.07	75.33	.76
OPERATING INCOME.				
Freight	$72,648,091.65	$73,677,292.78	—$1,029,201.13	1.40
Passenger	40,269,238.03	40,814,399.52	—545,161.49	1.34
Mail	2,472,768.90	2,474,263.34	—1,494.44	.06
Express	2,517,086 23	2,691,685.53	—174,599.30	6.49
Other transportation revenues	1,223,329.20	1,146,768.81	76,560.39	6.68
Revenues from operations other than transportation	1,302,541.63	1,106,618.12	195,923.51	17.70
Total, rail lines	$120,433,055.64	$121,911,028.10	—$1,477,972.46	1.21
Revenues from outside operations	11,092,114.95	10,709,511.41	382,603.54	3.57
Total gross operating income	$131,525,170.59	$132,620,539.51	—$1,095,368.92	.83
OPERATING EXPENSES.				
Maintenance of way and structures	$14,464,204.81	$15,889,129.83	—$1,424,925.02	8.97
Maintenance of equipment	16,318,140.51	15,312,205.79	1,005,934.72	6.57
Traffic expenses	3,201,366.63	2,947,063.58	254,303.05	8.63
Transportaion expenses	38,270,811.05	36,524,585.10	1,746,225.95	4.78
General expenses	3,397,583.32	3,848,675.54	—451,092.22	11.72
Total, rail lines	$75,652,106.32	$74,521,659.84	$1,130,446.48	1.52
Expenses outside operations	10,838,936.91	10,483,554.02	355,382.89	3.39
Total operating expenses	$86,491,043.23	$85,005,213.86	$1,485,829.37	1.75
Net operating income	$45,034,127.36	$47,615,325.65	—$2,581,198.29	5.42
FREIGHT TRAFFIC.				
(Commereial Freight Only —Way-bill Tonnage.)				
Tons of freight carried	26,950,150	26,145,241	804,909	3.08
Tons of freight carried one mile	6,145,555,486	6,066,777,657	78,777,829	1.30
Ton miles per mile of road (a)	615,843	612,443	3,400	.56
Revenue per mile of road (a)	$7,123.32	$7,190.39	—$67.07	.93
Revenue per *revenue train* mile (a) (b)	$4.42	$4.51	—$0.09	2.00
Average revenue per ton per mile	1.168 cents	1.186 cents	—.018 cents	1.52
Average distance carried	228.03 miles	232.04 miles	—4.01 miles	1.73
PASSENGER TRAFFIC.				
Revenue passengers carried	40,329,011	39,989,058	339,953	.85
Revenue passengers carried one mile	1,787,640,025	1,808,133,603	—20,493,578	1.13
Revenue from passenger trains per mile of road (a)	$4,468.67	$4,570.09	—$101.42	2.22
Revenue from passenger trains per *revenue train* mile (a) (c)	$1.65	$1.78	—$0.13	7.30
Average revenue per passenger per mile	2.208 cents	2.215 cents	—.007 cents	.32
Average distance carried	44.32 miles	45.22 miles	—.90 miles	1.99

(a) Based on traffic over rail lines only, length of ferries used between rail stations excluded in distance over which traffic was moved. (b) Revenue freight train and all mixed train miles. (c) Revenue passenger train and all mixed train miles, including miles run by motor cars.

Compared with the previous year, the per cent. of operating revenues to the gross revenues was as follows:

RAIL LINES.	This Year.	Last Year.
For "Maintenance" (*Maintenance of Way and Structures and Maintenance of Equipment*)	25.56	25.59
For "Operation" (*Traffic Expenses, Transportation Expenses, and General Expenses*)	37.26	35.54
Total rail lines	62.82	61.13
Total rail lines and outside operations	65.76	64.10

The operating income and operating expenses for the year for all lines, distributed in accordance with the accounting regulations of the Interstate Commerce Commission, are shown in Table No. 29, and for each Company in Table No. 30. Details of passenger and freight traffic are shown in Tables Nos. 32 and 33.

The expenses of the rail lines for "Maintenance" decreased $418,990.30, or 1.34 per cent.; but expenses for "Operation" increased $1,549,436.78, or 3.58 per cent., a net increase of $1,130,446.48, or 1.52 per cent. The increase in expenses for "Operation" resulted from 1,539,233, or 5.61 per cent., more miles run by locomotives and motor cars in passenger service and of 680,459, or 3.54 per cent., more miles run by locomotives in freight service; from the additional expenses imposed by the requirements of the "Hours of Service" and "Full Train Crew" laws, and from higher wage schedules.

There were in service 34 gasoline and 65 electric motor cars. The mileage of these cars, 2,095,210 miles, or 8.28 per cent. of the total revenue passenger train mileage, is included in the mileage statistics.

In the following statements the details of operating expenses have been combined under titles of accounts to present the year's expenses in concise form.

At the timber-treating plants of the Companies, 2,375,830 cross ties and 17,695 switch ties were burnettized, and 667,765 cubic feet of piling and other timber were creosoted.

MAINTENANCE OF WAY AND STRUCTURES.

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Average miles of railway operated and maintained —first and additional main tracks	10,252.85	10,113.64	139.21	1.38
Ballast	$129,909.71	$224,782.13	—$94,872.42	42.21
Ties	1,908,202.60	2,004,200.00	—95,997.40	4.79
Rails	398,814.82	757,163.48	—358,348.66	47.33
Frogs, switches, and other track material	1,224,138.25	1,509,563.48	—285,425.23	18.91
Total material for roadway and track	$3,661,065.38	$4,495,709.09	—$834,643.71	18.57
Repairs of roadway and track	6,045,252.50	6,499,314.98	—454,062.48	4.99
Bridges, trestles and culverts	935,996.64	1,178,396.55	—242,399.91	20.57
Buildings, grounds, and appurtenances	2,284,330.29	2,210,535.30	73,794.99	3.34
Snow and sand fences and snow sheds	160,706.41	147,113.53	13,592.88	9.24
Electric power, telegraph, and telephone lines	142,398.65	113,589.79	28,808.86	25.36
Superintendence	948,597.10	873,995.05	74,602.05	8.54
Stationery and printing	37,300.40	39,230.62	—1,930.22	4.92
Other expenses	79,046.01	69,124.83	9,921.18	14.35
Property abandoned	169,511.43	262,120.09	—92,608.66	35.33
Total	$14,464,204.81	$15,889,129.83	—$1,424,925.02	8.97
Cost per mile all main tracks	$1,410.75	$1,571.06	—$160.31	10.20

The expenses include $146,556.85, for extraordinary repairs to road-bed during high water in Louisiana and other protection work.

The following rails, ties, tie plates, and continuous rail joints were used in making renewals and the entire cost thereof charged to operating expenses, with the exception of $286,155.61 for increased weight of rail and improved frogs and switches charged to additions and betterments in accordance with the Classification of Expenditures for Additions and Betterments promulgated by the Interstate Commerce Commission:

	This Year.	Last Year.	Increase or Decrease.
Mileage of new steel rails (track miles)	256.82	483.11	—226.29
Per cent. of renewal of all rail in track, including sidings	1.84	3.56	—1.72
Number of burnettized ties	2,161,885	2,211,334	—49,449
Number of other ties	1,446,551	1,378,821	67,730
Total number of ties	3,608,436	3,590,155	18,281
Equal to miles of continuous track	1,271.92	1,258.44	13.48
Per cent. of renewal of all ties in track, including sidings	9.14	9.27	—.13
Number of tie plates	4,069,475	5,365,865	—1,296,390
Equal to miles of continuous track	717.46	940.43	—222.97
Number of continuous rail joints	277,723	372,598	—94,875
Equal to miles of continuous track	433.94	582.19	—148.25

The weight of rails per yard in main line and branches at the close of the year was as follows:

Miles of first and additional main tracks operated and maintained.	Total.	164-lb.	141-lb.	116-lb.	96-lb.	90-lb.	80-lb.	76-lb. and 75-lb.	70-lb.	65-lb.	61.5 lb. and 60-lb.	56-lb. and 54-lb.	52-lb. and less than 52-lb.
Main line	5,727.11	.....	1.15	.....	20.36	1,382.80	2,498.71	1,686.73	.....	.....	109.68	.98	26.70
Branches	4,669.97	.31	9.53	5.53	.02	263.52	209.70	926.98	9.44	264.43	1,431.07	404.07	1,145.37
Total	10,397.08	.31	10.68	5.53	20.38	1,646.32	2,708.41	2,613.71	9.44	264.43	1,540.75	405.05	1,172.07
Per cent. of total miles of track	100.00	.....	.10	.05	.20	15.84	26.05	25.14	.09	2.54	14.82	3.90	11.27
Per cent. last year	100.00	.....	.03	.....	.20	12.55	26.87	26.18	.09	2.61	15.92	4.08	11.47

Maintenance of Equipment.

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Locomotives	$7,320,342.48	$6,352,424.32	$967,918.16	15.24
Passenger train cars	1,801,686.66	1,840,836.49	—39,149.83	2.13
Freight train cars	4,719,238.48	5,307,918.95	—588,680.47	11.09
Work equipment	260,253.95	375,290.21	—115,036.26	30.65
Floating equipment	274,071.96	307,408.23	—33,336.27	10.84
Shop machinery and tools	355,089.96	361,183.79	—6,093.83	1.69
Superintendence	680,247.27	640,961.50	39,285.77	6.13
Other expenses	907,209.75	126,182.30	781,027.45	618.97
Total	$16,318,140.51	$15,312,205.79	$1,005,934.72	6.57

As in the past, the companies have charged to operating expenses the original cost (estimated if not known) or purchase price, less salvage, of all rolling stock condemned, destroyed, sold, or vacated from any cause during the year. The sums thus charged are reported under "Renewals" in Table No. 29, and amounted for the year to $794,083.76.

The average cost of repairs and renewals per locomotive (excluding motor cars) and per car per annum, and the average number of serviceable locomotives and cars owned during the year were:

	Average Cost per Annum. (*Including original cost, less salvage of equipment vacated.*) This Year.	Last Year.	Average Serviceable Number. This Year.	Last Year.
Locomotives, for repairs	$3,800.00	$3,361.12		
for renewals	93.10	155.17		
Total	$3,893.10	$3,516.29	1,872	1,803
Passenger train cars, for repairs	$794.56	$1,005.73		
for renewals	76.01	44.30		
Total	$870.57	$1,050.03	2,239	2,019
Freight train cors, for repairs	$90.16	$101.80		
for renewals	8.32	11.55		
Total	$98.48	$113.35	47,921	46,829

The rolling stock owned by the respective Companies is shown in Table No. 26, and the capacity, the service, and the average cost of maintenance, are shown in Tables Nos. 34, 35 and 36.

Traffic Expenses.

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Outside agencies	$1,090,985.55	$1,027,790.73	$63,194.82	6.15
Advertising	911,497.12	1,027,180.27	—115,683.15	11.26
Superintendence	932,737.04	638,244.61	294,492.43	46.14
Stationery and printing	228,690.27	217,047.51	11,642.76	5.36
Other expenses	37,456.65	36,800.46	656.19	1.78
	$3,201,366.63	$2,947,063.58	$254,303.05	8.63

The increase in "Superintendence" resulted principally from the transfer to this account of the salaries and expenses of the Freight Claim Department, which were last year dealt with as an item in "General Expenses."

Station and terminal service	9,211,434.86	8,838,858.98	372,575.88	4.22
Ferry and river service	660,105.20	660,885.07	—779.87	.12
Injuries, loss, damage and other casualties	2,228,867.27	1,946,513.04	282,354.23	14.51
Superintendence	1,566,454.90	1,572,868.21	—6,413.31	.41
Stationery and printing	305,294.38	328,563.15	—23,268.77	7.08
Other expenses	119,937.82	105,534.20	14,403.62	13.65
	$38,270,811.05	$36,524,585.10	$1,746,225.95	4.78

The work done by the transportation department of the rail lines compared with that of last year is as follows:

	Increase.	Decrease.	Per Cent.
Total operating revenues	.....	$1,477,972.46	1.21
Transportation expenses	$1,746,225.95	.....	4.78
Tons of commercial freight carried one mile	78,777,829	.....	1.30
Tons of commercial and company freight carried one mile	.....	147,690,603	1.98
Mileage of cars in freight service, including caboose	.....	7,857,340	1.48
Locomotive mileage with freight and mixed trains, including helping	680,459	.....	3.54
Revenue passengers carried one mile	.....	20,493,578	1.13
Mileage of cars in passenger service (including motor cars and trailers)	4,027,604	.....	2.52
Mileage of motor cars (excluding trailers)	1,409,122	.....	205.39
Locomotive mileage with passenger and mixed trains, including helping	130,111	.....	.49
Total locomotive mileage in service for which the attendant expenses are charged to "Transportation Expenses"	648,969	.....	1.24

*Ton miles per revenue freight train and all mixed train miles.

The cost of fuel per locomotive mile run in revenue service and in non-revenue service for which the expenses are charged to "Transportation Expenses" was 17.33 cents against 17.93 cents last year.

General Expenses.

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Salaries and expenses of general officers	$320,634.44	$287,889.88	$32,744.56	11.37
Salaries and expenses of clerks and attendants	1,497,055.49	1,838,686.48	—341,330.99	18.58
Law expenses	437,668.27	506,785.83	—69,117.56	13.64
General office expenses	249,756.76	215,899.22	33,857.54	15.68
Stationery and printing	135,321.90	165,839.92	—30,518.02	18.40
Insurance	340,213.16	340,941.02	—727.86	.21
Pensions	219,374.19	182,482.41	36,891.78	20.22
Other expenses	197,559.11	310,150.78	—112,591.67	36.30
Total	$3,397,583.32	$3,848,675.54	—$451,092.22	11.72

The decrease in "Salaries and expenses of clerks and attendants" resulted principally from the transfer of the salaries and expenses of the Freight Claim Department, which were this year dealt with as an item in "Traffic expenses."

The average number of tons of freight per train, of loaded cars per train (excluding caboose), and of tons per loaded car for the year were:

Commercial and Company Freight. (Way-bill Tonnage.)	*Tons per Train. Tons.	+Increase. —Decrease. Tons.	Per Cent.	Loaded Cars per Train. Cars.	+Increase. —Decrease. Cars.	Per Cent.	Per Cent. of Loaded Car Mileage to Total Car Mileage.	Tons per Loaded Car. Tons.	+Increase. —Decrease. Tons.	Per Cent.
Lines East of El Paso	354.84	—32.52	8.39	18.58	—.80	4.13	73.02+4.20	19.10	—.89	4.45

Average all lines	455.73	—18.20	3.84	22.72	—.46	1.98	72.10+1.11	20.06	—.39	1.91

Transportation Expenses.

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Locomotives, fuel for	$9,176,120.72	$9,423,602.40	—$247,481.68	2.63
Locomotive service, other than fuel	8,229,137.42	7,520,221.55	708,915.87	9.43
Train service	6,773,458.48	6,127,538.50	645,919.98	10.54

GENERAL.

Under the requirements of the concessions granted for the construction of the railway of the Southern Pacific Railroad Company of Mexico, referred to in former reports, there were completed during the year 31.12 miles between Mazatlan and Tepic, which places the present end of track about 0.50 miles south of the station in the City of Tepic. Including the 39.50 miles of railway—Naco to Cananea, Sonora—purchased in 1902 from the Cananea Consolidated Copper Company, the completed mileage, June 30, 1912, is 982.42 miles.

The miles of railway projected under the concessions, the line completed, under construction, and remaining to be constructed are as follows:

	Projected. Miles.	Constructed to June 30, 1912. Miles.	Remaining to be Built. Under Construction. Miles.	To be Built. Miles.
Main Line — Empalme to Guadalajara	815.20	713.55	2.18	99.47
Branch Lines (Including Naco-Cananea Line)	691.56	268.87	—	422.69
Total	1,506.76	982.42	2.18	522.16

Under the concession as revised November 5, 1910, the time for the completion of the main line from Empalme to Guadalajara was extended to November 6, 1915, and for the branch lines to November 11, 1920.

The advances by the Southern Pacific Company for account of the construction of these lines amounted, on June 30, 1912, to $39,026,799.19. Interest charges accruing on these advances during the year have not been taken into either the assets or income of the Company.

The revolutionary depredation claims, amounting to 288,118.74 pesos, are still pending before the Mexican Government. Settlement has been retarded by the fact that the Mexican Government, since February, 1912, has been engaged in attempting to suppress an insurrection which first manifested itself in the States of Sinaloa and Chihuahua. On the main line from Empalme to Tepic, twenty-three wooden trestles, having a total length of 2,985 lineal feet, and on the Corral-Tonichi Branch, four wooden trestles, having a total length of 240 lineal feet, were destroyed by the insurrectos between February 14 and June 30, 1912. Claims for compensation for the destruction of this property will be presented to the Mexican Government.

In addition to the completed lines of railway reported under "Properties and Mileage" and the railway of the Southern Pacific Railroad Company of Mexico, above referred to, construction either was completed or is progressing, on the lines of the following companies or of companies organized in the interest of the Southern Pacific Company:

	Length of Projected Line. Miles.	Track Completed. Miles.	Grading Completed. Miles.	Grading Progressing. Miles.
Central Pacific Railway:				
Fernley, Nev., to Walker Mill Junction, Cal.	135.00	—	5.59	129.41
Oreana, Nev., to Rose Creek, Nev. (second track)	47.81	17.60	30.21	
Colusa & Hamilton Railroad:				
Hamilton, Cal., to Harrington Cal.	61.15	—	45.70	15.45
Pacific Railway & Navigation Company:				
Hillsboro, Ore., to Tillamook, Ore.	91.16	91.16		
Willamette Pacific Railroad:				
Eugene, Ore., to Marshfield, Ore.	130.00	—	8.40	121.60

A considerable part of the Company's records in its New York office in the building of the Equitable Life Assurance Society at No. 120 Broadway, were lost or impaired in the fire on January 9, 1912, which destroyed said building. Such of these records as were copies of statements received from the New Orleans, Houston, Tucson and San Francisco offices were readily replaced, and the remaining records were supplied from the full and complete details of the company's operations and transactions published annually in its reports, and the stated and special reports made to the Interstate Commerce Commission from time to time in respect of its affairs.

In the summer of 1911 the Machinists, Boilermakers, Blacksmiths, Car Repairers, and Sheet Metal Workers on the Southern Pacific and Union Pacific systems formed a Federation and presented demands involving an increase in wages aggregating thirty-six per cent. and working rules and conditions which would have seriously abridged the Company's ability to perform its duties to the public as well as to its stockholders. The employes were so informed, but at the same time were assured that the Company was willing to continue working agreements as theretofore with individual crafts, recognizing but without discriminating in favor of or against the different unions. A general strike was declared on September 30, 1911, and 5,189 employes of the Southern Pacific System and 3,042 of the Union Pacific System responded. Their places were soon filled, but, of course, many unskilled workmen were among those first employed and several months elapsed before all of these were replaced and the new force was brought up to the proper state of efficiency. Heavy expenses were incurred in hiring guards to protect the employes of the Company from violence and prevent damage to the Company's property, and much annoyance and inconvenience in the conduct of the Company's business ensued; but the expense, loss and inconvenience were very much less than anticipated when the strike occurred.

There has been a gratifying increase in the earnings beginning with the current fiscal year. The large crops throughout the country have given an impetus to business, and the prospects for a good business year are most encouraging. The operating income for the first six months of the current fiscal year compares with that of the previous year as follows:

	1912.	1911.	Increase.
Gross revenue	$75,648,104.61	$69,069,365.41	$6,578,739.20
Operating expenses	$46,041,570.26	$43,200,884.30	$2,840,685.96
Taxes	2,916,870.21	2,633,665.40	283,204.81
Total expenses and taxes	$48,958,440.47	$45,834,549.70	$3,123,890.77
Revenue over operating expenses and taxes	$26,689,664.14	$23,234,815.71	$3,454,848.43

Under the pension system put into effect on January 1, 1903, there are carried on the pension rolls of the rail and water lines 575 employes. The payments to them for the year amounted to $229,666.79.

The accompanying report of the Vice-President and Controller shows fully and in detail the financial and other transactions of the Companies.

By order of the Board of Directors,

ROBERT S. LOVETT,
Chairman of the Executive Committee.

SOUTHERN PACIFIC COMPANY AND PROPRIETARY COMPANIES.

No. 2.—Combined Income Account for the Year Ended June 30, 1912.
(Revenues and Expenses of "Proprietary" and Non-Proprietary" Lines and Miscellaneous Income of the Southern Pacific Company and Proprietary Companies, combining details shown in Tables Nos. 10 and 16.)

Operating expenses (and taxes) of proprietary lines, interest on funded debt and all other expenses of Proprietary Companies as shown in detail in Table No. 16		$109,744,453.15
Operating expenses, taxes, and all other expenses incurred in connection with the operation of the following non-proprietary lines:		
New Mexico & Arizona R. R.	$116,819.24	
Sonora Railway	905,709.16	
		1,022,528.40
Disbursements of Southern Pacific Company (Table No. 10):		
Expenses of operating steamship lines		6,988,547.56
Interest on funded debt (Table No. 7)		5,418,562.99
Interest due to Proprietary Companies on advances and open accounts	$2,825,926.18	
Less interest due from Proprietary Companies	1,106,579.40	
		1,719,346.78
Rental to Central Pacific Ry. Co.		10,000.00
Rental to Nevada & California Ry. Co.		3,333.33
Rental to Oregon & California R. R. Co.		5,000.00
Rental to Southern Pacific R. R. Co.		10,000.00
Taxes		193,382.36
General and miscellaneous expenses		52,516.65
Annual payment for redemption of San Francisco Terminal bonds		5,000.00
Reserve for depreciation of rolling stock owned and leased to other companies		854,060.67
Cost of surveys written off		30,242.67
Cost of examinations for water power written off		65,449.09
Balance to profit and loss (Table No. 3)		21,603,152.98
Total		$147,725,576.63
Revenues of proprietary lines and miscellaneous income of Proprietary Companies as shown in detail in Table No. 16		$127,996,250.42
Revenues of the following non-proprietary lines:		
New Mexico & Arizona R. R.	$60,176.94	
Sonora Railway	743,957.80	
		804,134.74
Revenues of Southern Pacific Company (Table No. 10):		
Gross revenues from operation of steamship lines		7,382,431.96
Interest on bonds owned of Proprietary Companies (Table No. 4)		1,847,879.84
Interest on bonds owned of companies other than Proprietary Companies (Table No. 5)		2,670,043.49
Dividends on stocks owned (Table No. 6)		1,063,983.94
Rentals from lease of road		1,669,537.17
Hire of equipment		2,248,822.50
Rentals from lease of joint tracks, yards, and terminal facilities		12,511.96
Miscellaneous rentals		35,005.93
Proceeds from sale and lease of lands		43,357.09
Balance of interest on loans and on open accounts other than with Proprietary Companies		1,937,001.32
Miscellaneous income		14,616.27
Total		$147,725,576.63

SOUTHERN PACIFIC COMPANY AND PROPRIETARY COMPANIES.

No. 3.—Combined Profit and Loss—Year Ended June 30, 1912.
(Combining details as shown in Tables Nos. 11 and 17.)

Dividends on stocks of Proprietary Companies, viz.:		
Central Pacific Ry. Co. preferred	$692,000.00	
Central Pacific Ry. Co. common	4,036,530.00	
Houston, East & West Texas Ry. Co.	211,200.00	
Houston & Shreveport R. R. Co.	120,000.00

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	8.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,250 copies were printed; that of those 8,250 copies, 6,800 were mailed to regular paid subscribers and 154 were provided for counter and news companies' sales; that the total copies printed this year to date were 88,259 copies—an average of 8,826 copies a week.

Volume 54. March 7, 1913. Number 10.

CONTENTS

*Illustrated.

THE policy of the Hungarian State Railways in establishing standards of performance for its motive power and rolling stock, as outlined by H. W. Jacobs in an article in this issue, is to be heartily commended. While the conditions in this country cannot be compared with those in Hungary, the necessity of keeping more intelligent records of the performance and repair of our cars and locomotives is just as important and probably more so than it is in that country. No organization or business can expect to succeed without well defined aims, and records which make it possible to see just how closely these aims are being attained. The repair and performance of equipment in charge of the mechanical department is so complicated and extensive that such records should be even more important than in an ordinary business. A superintendent of motive power said recently that with an additional expenditure of $6,000 for clerical assistance, which would be necessary to establish certain records, he would guarantee to save $200,000 a year for his company. Records are being compiled on some roads which are comparatively useless, because those in authority do not understand how to make proper use of them, or because the information is not complete, or is inaccurately compiled. Conditions should be carefully analyzed so that it will be possible to know just what any piece of equipment should cost to maintain and keep it in repair for a certain unit of performance. The records should then be arranged to show almost at a glance just what cars or locomotives are exceeding the standard allowances which have been set, so that those in charge may confine their energies to investigating the exceptional cases. In other words those at the head of the organization should have available for ready use complete and up-to-date data which will give them a clear idea of conditions throughout the system, so that they may direct their energies to bringing up the efficiency of such of the various branches of the department as may fall below the standards set.

WE publish elsewhere extracts from an address made by John B. Olmsted just before his recent retirement as a member of the New York Public Service Commission, Second district. Mr. Olmsted's frank statement of the change that his experience as a member of a regulating commission made in his attitude toward public utility corporations, and especially railways, will perhaps, surprise many persons. It will interest, but not surprise those who, whether as students or public officials, have themselves begun the investigation of public utility questions with the anti-corporation bias that Mr. Olmsted admits he had, and who have, like him, honestly tried, during a considerable period, to ascertain the exact facts about public utility businesses and to draw just conclusions from them. There are few cases of persons who have had this experience, whether as university professors, publicists, law-makers or public utility commissioners, who have not come to think and feel much as Mr. Olmsted does. It is a fact often commented on that it is the new members of commissions who, being new, know little about the businesses they regulate that are the most radical, and the older members who know the most about them who are the most conservative. The difference between an inexperienced and an experienced public utility commissioner is a good deal like the difference between an efficiency engineer and an experienced railway officer. The new commissioner, like the efficiency engineer, can point out many conditions and results that are unsatisfactory. But usually their discoveries afford little new information to the managers of the utilities. The managers know already the conditions and results that are unsatisfactory. What they want is somebody to tell them how to improve them. Only the experienced know how hard it is to devise and apply remedies, and why this is so. As Mr. Olmsted indicates, a commission armed with power thoroughly to investigate the manufacturing, or mercantile, or banking, or farming business could uncover as many things to find fault with as public utility commissions can find in any public utility business. But, as Mr. Olmsted says, such a commission would be met, as public utility commissions are now met, "with the objection that its suggestions require too much of an outlay to carry them out, and would be asked how it proposed to provide the funds for the improvements recommended." We commend his next sentence to regulating bodies and the public as the summation of all wisdom in public regulation of business: "Let us be reasonable as well as critical."

THERE are two points suggested by the passage of the bill providing for a valuation of railroads that deserve consideration separately from the question of what will be shown by such a valuation. The New York, New Haven & Hartford had an independent appraisal of its property made by John F. Stevens and a statement of the valuations of these properties

was made as of June 30, 1908, this statement being compiled by Price, Waterhouse & Company. This was an attempt to get at an entirely independent and fair valuation of a railroad property. The work was left entirely in the hands of Mr. Stevens as independent engineer in charge, and the statistical and legal basis of the valuation was left to Price, Waterhouse & Company. The cost of the valuation of the steam road property alone was $139,456. The New Haven operates only about 4,674 miles of all tracks, including sidings, out of the total of 362,709 miles of all tracks of all railroads whose operations are under the jurisdiction of the Interstate Commerce Commission. It is safe to say that if a valuation is to be made by thoroughly competent engineers and statisticians it will be a very expensive undertaking. One thing is certain: If the valuation is to be made at all it should be made by the best men available, and the Interstate Commerce Commission now has the weighty responsibility of selecting these men. No better plan could be devised than that suggested by L. F. Loree in his statement before the Senate Committee before the passage of the bill. He proposed that the commission be directed to constitute and employ a railroad valuation board to consist of nine members, three to be selected by the commission, three to be nominated to the commission by the American Railway Association, and one each to be nominated to the commission by the chief engineer of the Army, by the chief of the Bureau of Steam Engineering of the Navy, and by president of the American Society of Civil Engineers. This suggestion was ignored by the committee, but the commission has plenary powers in the premises. It is now squarely up to the commission to select examiners—economists, accountants and engineers—who shall be competent to conduct such a complicated and nice investigation as is contemplated by Congress. If the New York, New Haven & Hartford, for its own purposes, found that it was advisable to engage an engineer of Mr. Stevens' reputation and experience, and a firm of accountants of the standing of Price, Waterhouse & Company, surely it is expedient for the Interstate Commerce Commissioners to call on the best authorities which they can avail themselves of, to help them in their selection of a board of examiners.

THE "Safety-First" meeting to be held at Pittsburgh next Monday is to be managed, as announced by the Pennsylvania Railroad, "by the employees, for the employees." In other words the officers, so far as practicable, will keep their hands off. Of course, it cannot be that they intend to keep their minds off. All hands, high or low, will, no doubt, give energetic support. Everything that can reasonably be done to keep superintendents, trainmasters, road foremen, enginemen, conductors, yardmasters and shop foremen well acquainted with each other is profitable for the service, and co-operation in the management of these lectures is one good means of accomplishing such a purpose. The action of the Pennsylvania, therefore, is to be commended. We cannot believe that any weight should be accorded to the ill-natured charge that railroad officers have had some sinister motive in urging employees to safeguard their own lives and limbs, and we have seen no such charge in any reputable publication; but frank co-operation is highly desirable regardless of any criticism. We do not say that these different classes should be brought into sympathy, for 95 per cent. of them are in sympathy already; but there is need of acquaintance to make that sympathy fruitful for efficient railroading. The engineman or shop foreman who has the temperamental and other gifts qualifying him to see through the superintendent's eyes, and who can talk to his fellows convincingly, has an important function in the railroad world. This has been demonstrated on the New York division of the Pennsylvania already. At the meeting held at Trenton, N. J., this week (announced in our last issue, page 369) the lecturers gave not only the usual assortment of stereopticon views, but also displayed on the screen enlargements, from the rule-book, of a large number of "don'ts" enabling their hearers to refresh their memories more effectually in a half hour than they could otherwise do in a period three times as long—more effectually, in fact, than would be done by any amount of simple reading from the book; for the oral emphasis and the presence of other learners constitute a valuable mental stimulus. This use of the printed word on the screen—now so familiar in the moving picture shows—suggests the desirability of allowing men in the audience to ask questions; of converting the lecture into a conversazione—if we may be allowed such a "literary" expression. The "Safety-First" propaganda is essentially a teaching process, and the best teaching always implies talking by the pupils as well as by the teacher. A dozen questions often do more good than ten times as much talk from the lecturer. It would be easy, of course, to spoil a meeting by allowing too many questions from the ignorant and from persons who are offensively talkative; but the present suggestion is intended for those who are willing to do hard and thorough preparatory work, with a view to making their safety lectures of the utmost benefit. Why should not every railroad secure for this purpose the aid and counsel of the most accomplished lecturers and teachers? It will be necessary to make safety lectures attractive in order to avoid the deadening effect of sameness and tiresome repetition. The railroad officer who has sat on rule-revising committees for days at a time, can endure the tedium of considering and reconsidering the same idea a dozen different times or in a dozen different ways; but if he wishes to get brakemen and shopmen to look at things in this way—which will be necessary if they are going to learn to be always careful—he will have to apply first-quality skill to the process.

RAILWAY HOTELS AND EATING HOUSES.

ON account of limitations of space the description of the Grand Trunk hotel at Ottawa, published in this issue, does not contain sufficient detail to convey to the reader an adequate idea of the completeness of its appointments and the beauty of its architectural lines and interior furnishings. This structure is worthy of the attention of railway executive officers, not so much because it is the finest hotel in Canada's capital city, as because it represents the policy of the Grand Trunk in common with other Canadian roads to build and operate such first class hotels. These railway hotels are familiar to everyone who has traveled in Canada, and are almost uniformly recognized as the best in their respective cities.

The Canadian Pacific was the first to enter this field, and its Chateau Frontenac in Quebec, Place Viger in Montreal and Royal Alexandra in Winnipeg are all well established houses. The Canadian Pacific also has fine hotels in Vancouver and Victoria and is building a new one in Calgary which will be ready for occupancy late next summer. A series of resort hotels in the Canadian rockies is also operated by this company, being located at Banff, Laggan, Fields and Glacier. The Canadian Northern operates the Prince Arthur at Port Arthur and the Prince Edward at Brandon. The Grank Trunk, in addition to the Chateau Laurier at Ottawa, is building the Fort Garry at Winnipeg, the MacDonald at Edmonton and others at western cities along the new extension to the Pacific coast.

There are two general advantages to be gained by operating a system of hotels which includes also good lunch rooms at stations. Such facilities may be used to increase passenger traffic; and in most cases they can be made to earn a net revenue. Travelers naturally choose the road which has the best facilities of this kind, other things being equal. In the keen competition for passenger traffic, the road that can offer the most convenient and efficient service of the various kinds required by travelers, has a real advantage over competing lines. Hotels built by a railway company are naturally located conveniently in relation to that company's stations—a circumstance which quite often influences the choice of route of a traveler leaving the city. While the reports of the Canadian roads do not show the net revenue from hotels and dining rooms, the ability to buy supplies in large quantities for a large number of such places, and the excellent patronage at good rates which is practically assured,

should make their operation profitable. It is known that on some foreign lines, as, for example, the South African railways, this service is made to earn a very appreciable revenue.

The service furnished in lunch rooms and hotels run in connection with railway stations on roads in this country usually contrasts unfavorably with that in Canada. The general practice in the United States is to sell hotel and eating house concessions to outside persons or concerns at each point and allow them to furnish such service as they see fit. Travelers in the United States often have unpleasant experiences in commercial establishments located in station buildings or adjacent to stations, which are known as "railway hotels" and officially recognized by the railway company, and a large part of the traveling public has come to think of eating in railway lunch rooms as a thing to be done only when unavoidable. The dining rooms in large terminal stations in this country often are good; but many even of these are very poor. There are railway hotels and dining rooms, especially on some of the roads in the Southwest, conspicuous among them being the Santa Fe's, that afford excellent examples of the good service that such places can offer. Typical among the good hotels on the Santa Fe are those at Barstow, Calif.; Hutchinson, Kan., and Albuquerque, N. M., and one of the very good resort hotels used by it as an advertising feature is one at Grand Canyon, Ariz.

The public has no right to demand that railways furnish anything but transportation. But travelers will often criticise the companies for not seeing that the incidental comforts of travel are easily available and praise them for providing these comforts, and there is an obvious advantage in getting all the praise and escaping all the censure possible.

THE FEDERAL VALUATION LAW.

AFTER several years' discussion of the subject a law providing for a valuation of all railways by the Interstate Commerce Commission has been passed by Congress. The enactment of such legislation a few years ago would have caused much concern among railway managers. It now gives rise to little or no apprehension on their part. The legislation has a dual purpose. One is to ascertain whether, as is often charged, the railways are over-capitalized. The other is to furnish a basis for the regulation of rates. The word "valuation" is currently used in two different senses. (1) A thing is usually deemed worth what it will sell for, and what it will sell for depends on the profits it will earn. (2) The sense in which the word valuation is used in the discussion of railway and other public utility matters is the ascertainment of what a property ought to be worth as a basis for determining what it ought to be allowed to earn.

Many persons, including most railway managers, do not agree that railway rates should be based on a valuation. One of their objections is that the plan is impracticable. Different railways compete for business, and the valuation placed on two competing railways may be substantially the same, while the amount of business handled by them is widely different. The rates between competitive points on the two must be the same, but on the same rates the two roads will necessarily earn very different profits. The answer made to this is that the entire situation should be considered, and rates so adjusted as to do justice to all the competing carriers. It is hard to see how by regulating rates thus on the basis of valuation equity could be done between all competing lines. A second objection made to the use of valuation as a basis for regulating rates is that rates should be based chiefly on the value of the service rendered to the shipper and the traveler, and not on its cost to the carrier, and that if the rates themselves are reasonable the profit made by charging them must be reasonable. Economists and regulating authorities, including the Interstate Commerce Commission, recognize the fact that the value of the service principle must govern to a large extent in fixing the relations between rates on different commodities and on the same commodity when moving between different points. The purpose for which they have advocated valuation is to ascertain, not whether each individual rate is reasonable, but whether the rates as a whole are so. Regardless of whether valuation is or is not a fair measure of the reasonableness of the entire schedules of rates, it is evident that it is going to be used in the future as the main measure.

The popular impression is that the railways of the United States as a whole are largely over-capitalized, that they are paying a return on their watered stock and that they are charging excessive rates to do so. The railway managers deny that the roads as a whole are over-capitalized. The average net return on the total capitalization has never equaled six per cent. It follows, if the managers' contention is correct, that on the theory of those who have advocated valuation the rates charged are not excessive. Valuation having been adopted by law as one, if not the main, basis for the determination of the reasonableness of rates, it becomes important that any valuation made shall be fair. To be fair a valuation must include all of the factors that should be considered in determining what railway properties ought to be held to be worth.

It is gratifying that the bill passed by Congress seems to provide fully for a valuation that shall include all important factors. The law instructs the commission to ascertain the original cost to date, the cost of reproduction new, and the cost of reproduction less depreciation, and to present in its report an analysis of the methods by which these several costs are obtained and the reason for the differences between them, if any. The commission is also to ascertain and report separately all other elements of value, if any. This would include allowances for franchises, and going value, if the commission decided any such allowances should be included. One of the most important questions pertaining to valuation is how the land used for right of way and terminals should be appraised. Some contend that the appraisal should be based on the original cost, others that it should be based on what it would cost to acquire the land now. The valuation law requires both the original cost and the probable present cost to be found. It also contains a provision which will permit a carrier, in case of an appeal from the commission to the courts, to attack the valuation made by the commission and to present evidence to the court to show that the commission has erred in not giving weight to elements of value which the carrier believes should be included. Should the court uphold the contention of the carrier it will refer the matter back to the commission with instructions to revise its valuation so as to include the omitted elements. In brief, the provisions are broad enough to require the commission to give weight to all elements of value, and if the commission fails to do so to permit the roads to get orders from the courts requiring it to do so.

The large estimates that repeatedly have been made regarding the amount of water in the capitalization of the railways will lead many to expect the total valuation to fall far short of the total capitalization. It seems very much more probable that a valuation made in accordance with the provisions of the new law will exceed the net capitalization. There doubtless will be many instances where the valuations of individual roads will be less than their capitalizations. Probably, however, there will be many more important cases where the valuations will exceed the capitalizations; and there is much more ground for expecting that the total valuations will exceed the total capitalization than for expecting the opposite. Valuations of railways have been made in several states, and they have exceeded the capitalizations in more cases than the capitalizations have exceeded them. Furthermore, no valuations have been made in the states where the largest values are concentrated in big terminals. There are large terminals at the Twin Cities and Duluth in Minnesota, and on Puget Sound in Washington, and in both of these states the valuations exceeded the capitalizations.

Several state commissions are now engaged in making valuations. The federal law provides that the investigation to be

made by the Interstate Commerce Commission "shall show the value of the property of every common carrier as a whole and the value of its property in each of the several states and territories and the District of Columbia." In view of this provision it seems reasonable to expect that the state valuations now under way will be discontinued, or at least that no more will be undertaken. The cost to both the public and the carriers of making a single thorough appraisal will be large, and it would seem that no good can come from the expenditure that would be involved in duplicating the work.

THE PENNSYLVANIA AND THE NEW YORK CENTRAL.

BOTH the Pennsylvania and the New York Central & Hudson River earned in 1912 the largest revenue in their history. Both felt many of the same economic forces which are at work in shaping contemporary railroad development. While the effect of the same forces on these two eastern trunk lines is often widely different, and their ways of meeting new conditions can more often be contrasted than compared, it is, nevertheless, possible to get two independent points of view on the results of the working out of both the same federal and economic laws* by a study of the annual reports of both.

The Pennsylvania Railroad operates directly 4,025 miles of line. The Pennsylvania Railroad Company is the parent company for all of the Pennsylvania system. Through stock ownership directly or indirectly it controls or has affiliated with it all the lines which go to make up this Pennsylvania system, which comprises a mileage of 11,557, and which in 1912 had total revenues amounting to $374,096,000. The present comments and figures, however, apply to only the operations of the Pennsylvania Railroad, which had total operating revenues in 1912 of $174,608,000, which was $17,120,000, or 10.87 per cent., greater than the revenues in 1911, there being practically no change in mileage.

The New York Central & Hudson River operates 3,791 miles of road. The New York Central & Hudson River Railroad Company is the parent company for all the New York Central Lines, which include approximately 13,000 miles. The figures given in these comments, however, apply only to the lines *operated*, the revenue from which in 1912 amounted to $109,900,000, which was an increase of 5.7 per cent. over 1911, with practically no change in mileage. The Pennsylvania Railroad had operating revenues in 1912 of approximately $43,000 per mile of road operated, comparing with operating revenues on the New York Central of $29,000 per mile of road operated. The Pennsylvania gets an average ton mile rate on its freight of 5.83 mills, and a passenger mile rate of 1.962 cents. The New York Central gets a ton mile rate of 6.26 mills, and a passenger mile rate of 1.766 cents. The average ton mile rate on both the Pennsylvania and the New York Central was slightly less in 1912 than in 1911, due to changes in the character of traffic carried. There were no important changes in freight rates on either road. Of the total tonnage carried, 61 per cent. on the Pennsylvania is furnished by products of mines, and 47 per cent. on the New York Central.

The density of revenue freight tonnage per mile of all track, including sidings, is 2,245,000 on the Pennsylvania and 1,127,000 on the New York Central. The density of passenger mileage per mile of all tracks is 188,000 on the Pennsylvania and 203,000 on the New York Central. These figures, taken in connection with a careful study of the accompanying map, give a general, but fairly vivid impression, of the difference between these two great eastern trunk line properties. The tangle of lines in the coal region north of Altoona gives an impression of competition for coal business which is accurate only if corrected by the additional fact that while the New York Central carries about 12,500,000 tons of bituminous coal a year, the Eastern Pennsylvania division alone of the Pennsylvania carries 31,990,000 tons, and the entire Pennsylvania 46,420,000.

The relative importance from the point of view of total revenues of a general improvement in industrial conditions to a railroad like the Pennsylvania, depending so largely on its coal and on products originating in the Pittsburgh district, and of an extraordinarily large crop and prosperous general business conditions to a road like the New York Central, which handles a comparatively large tonnage of grain and serves commercial cities rather than manufacturing cities, is well shown by the respective increases of nearly 11 per cent. in the Pennsylvania revenue and of between 5 and 6 per cent. in the New York Central revenue.

With its increase of nearly 11 per cent. in revenue, the Pennsylvania was able to save net $42,154,000 available for dividends, which is greater by $4,020,000, or — per cent., than the net in 1911. The New York Central had $13,880,000 net available for dividends, which is less by $1,420,000 than was available at the end of 1911. This widely different result in net is not by any means all due to disproportionately increased expenses on the New York Central, as will be explained more fully later.

The Pennsylvania operated in 1912 on a 72.53 per cent. basis and the New York Central on a 73.99 per cent. basis. The Pennsylvania's operating ratio was greater by 0.63 per cent. in 1912 than in 1911 and the New York Central's by 1.17. Of its total operating revenues the Pennsylvania spent 33 per cent. for maintenance in 1912, or 2 per cent. more than in 1911, and the New York Central spent 32 per cent. in 1912, or 1.6 per cent. more than in 1911. Transportation expenses consumed 36 per cent. of total operating revenues on the P. R. R., or 1 per cent. *less* than in 1911, and 37.2 per cent. on the N. Y. C., or 0.2 per cent. *less* than in 1911. The policy in regard to expenses, which is dependent to a certain extent on the disposition of the management, was the same on both the P. R. R. and the N. Y. C., and the trend of expenses over which the management has control only to a certain extent was the same on both roads; but both in the case of maintenance and cost of transportation the P. R. R. results are rather more striking than those on the N. Y. C.

Total operating expenses amounted to $126,638,000 in 1912 on the P. R. R., an increase of $13,410,000, or 11.84 per cent.; while total operating expenses on the N. Y. C. & H. R. amounted to $81,311,000, which is $5,611,000 more than in 1911.

After the payment of operating expenses and taxes the Pennsylvania had $39,693,000 net, an increase over the previous year of $3,755,000; while the New York Central had $23,010,000, a decrease of $118,000.

Despite the increases in traffic, which necessitated greater absolute expenditures for transportation proper, both roads were able to show lower ratios for these expenses to gross revenue. This is a very important fact. In 1907, when the railroads of the country were carrying the largest tonnage up to that period in their history, transportation expenses generally mounted up relatively more rapidly than gross revenue. Of course, weather conditions in the present winter up to the end of December were favorable; but it must be remembered that the calendar year includes January and February of last winter, months in which weather conditions were unusually severe over the whole country.

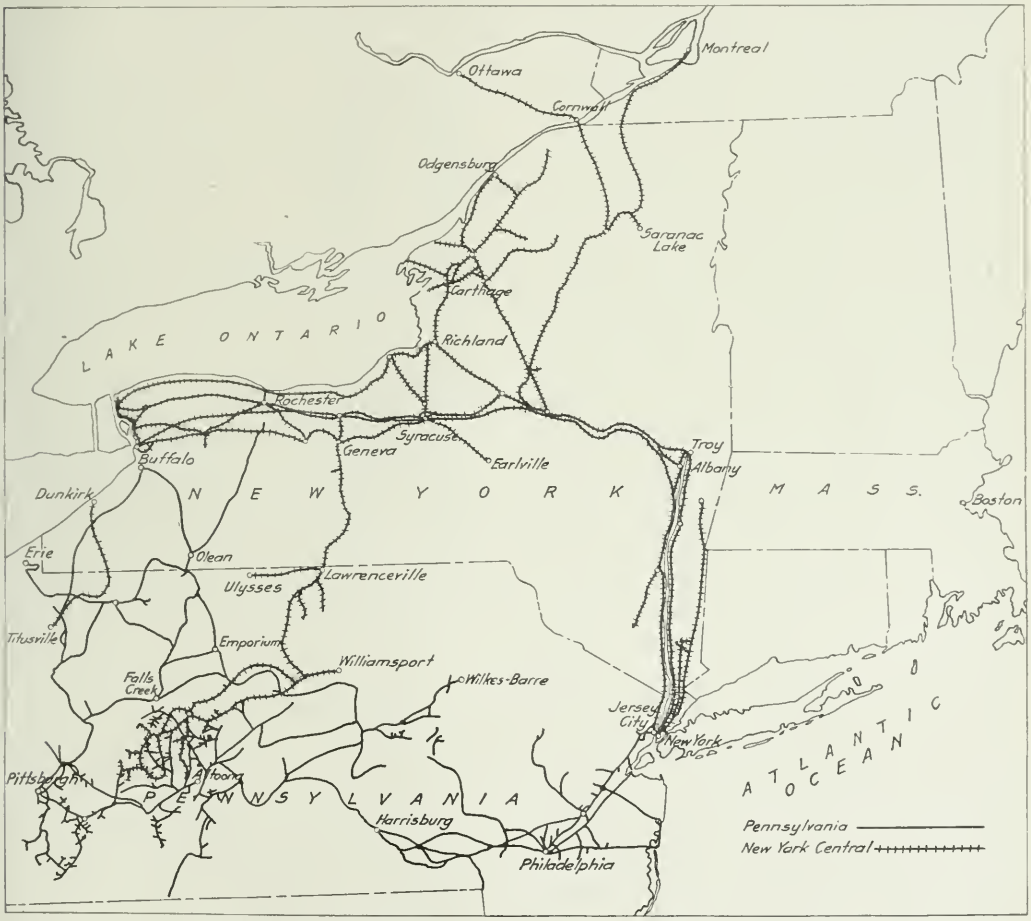
On both roads the increase in earnings was made the occasion for notably heavier expenditures for both maintenance of way and maintenance of equipment. The New York Central spent

---

*The New York Central & Hudson River and the Pennsylvania Railroad are not, of course, comparable. They are, however, instructive to use in contrast one with the other. It should be borne in mind that no attempt is being made here to criticise one road by contrasting it with the other, or in fact to draw comparisons at all in that sense. There are many figures that are used in these comments that differ widely between the Pennsylvania and the New York Central, which difference might be fully and instructively explained by an exhaustive description of conditions on each road. The same, however, could be said of two different grand divisions of the Pennsylvania Railroad itself. The fact is that the different [illegible] going to make up the Pennsylvania Railroad are often as unlike each [illegible] conditions as are certain divisions on the Pennsylvania Railroad [illegible] the New York Central, and the same is true as between different divisions of the New York Central and certain divisions on the New York Central [illegible] Pennsylvania.

$20,440,000 for maintenance of equipment, an increase of $2,302,000 over 1911, and the Pennsylvania spent $36,088,000 in 1912, an increase of $5,508,000 over 1911. One is led to surmise that the New York Central *spent* more for repairs in 1912 than in 1911, partly because it felt that it could afford to be more liberal and partly because the increased traffic necessitated heavier expenditures, while on the other hand the Pennsylvania not only *spent* more for repairs because the increased traffic called for heavier expenditures, but a very appreciable part of the heavier appropriations for maintenance of equipment was due to heavier *charges* for depreciation.* Even in 1911 the P. R. R. was making very liberal expenditures for repairs.

In making a comparison as between different roads, of standards of upkeep, the tendency is generally to take average figures which contain so many variables that an accurate comparison is impossible. Conditions are so unlike on the P. R. R. and the New York Central that a comparison of the total cost of maintenance of way and structures per road mile or per track mile is not of much value. On the other hand, when we take expenditures per mile of first, second, third, etc., track, exclusive of side tracks, for specific accounts, such as rails and ties, we get a rather interesting idea of what the two roads are doing. The Pennsylvania Railroad in 1912 spent on an average $153 per track mile for rail renewals. This, of course, includes only the cost of delivery of the rails at the point of placing them in track, but not unloading them or placing them in track. The New York Central spent on the same account $199 per track mile. The Pennsylvania spent $459 per track mile for tie renewals, against the New York Central's $295. The Pennsylvania spent $1,178 for roadway and track, which includes largely track labor, placing track material in track, policing, etc. The New York Central spent $809 on this account.



The New York Central & Hudson River and the Pennsylvania Railroad.

The difference between the expenditures on the two roads for roadway and track is rather large, but is not so striking as the difference in expenditures for ties. An expenditure of $459 per mile of track is a very heavy expenditure.

Naturally, with the much larger proportion of low grade traffic on the Pennsylvania we would expect to find a heavier average train load. It might be mentioned, however, in this connection, that the New York Central has no such grades to-

*The basis of this assumption is shown in the following table:

	New York Central.		Pennsylvania.	
	1912.	1911.	1912.	1911.
Repairs of locomotives.....	$6,776,432	$5,358,231	$12,124,823	$11,106,546
Renewals and depreciation of locomotives	1,799,015	1,405,870	2,547,474	1,114,267
Repairs of freight train cars	5,815,718	5,738,802	11,681,824	9,860,515
Renewals and depreciation of freight train cars.....	2,003,336	1,919,654	2,950,678	2,075,838

contend with as has the Pennsylvania on its Western Pennsylvania division, since, however, the great bulk of the coal traffic moves east over the Eastern Pennsylvania division, with a ruling grade of .2 of 1 per cent., on the Pennsylvania, the average trainload figures would still be very much in its favor.

The revenue trainload on the Pennsylvania in 1912 was 685 tons, which is an increase over the average trainload in 1911 of 14.53 tons. The revenue trainload on the New York Central was 465 tons in 1912, an increase of about 35½ tons, or over 8 per cent. It is fair to point out that the greater part of the increase in train loading on the New York Central was due to an increase in the loaded car mileage, with an almost corresponding decrease in the empty car mileage. Car loading also was slightly better in 1912 than in 1911. There was an increase of 19,574,000 miles in loaded car movement and a decrease of 11,942,000 miles in empty car movement. Distinct gains in operation are indicated by a decrease of 686,000 miles in freight locomotive mileage, in the face of an increase in total ton mileage carried of 662,412,000 ton miles.

The Pennsylvania's increase in train loading is due to an increase in tons per loaded car, which averaged 27.45 in 1912, an increase of 0.86 tons. The average number of loaded cars in train was 24.97, a decrease of 0.26 from 1911, and the average number of empty cars was 13.39, a decrease of 0.48. The number of car miles per mile of all tracks, including sidings, gives a rough idea of the density of movement from an operating standpoint. In 1912 the Pennsylvania had a freight car density, if it may be so called, of 129,000; the New York Central, 95,000. On the other hand, the Pennsylvania had a passenger car density of 16,100, and the New York Central a passenger car density of 17,800. From any way of looking at it, the New York Central's passenger business bulks large as a factor of expenses and as an important difficulty in the problems of the operating department.

The New York Central is in the midst of a very extensive scheme of additions and betterments, part of which it has already at least temporarily financed, and therefore is at present bearing the interest burden. The Pennsylvania is on the threshhold of extensive betterments and presumably of extensive new financing as well. In 1912 the New York Central & Hudson River spent a total of $17,084,000 on additions and betterments, exclusive of what is being spent on the Grand Central Terminal. The more important details of this construction work is mentioned in our construction news columns. The net increase in the funded debt for the year was $46,158,000. The principal part of this financing was done through the issue of notes and equipment trust certificates. There were $20,000,000 3-year 4½ per cent. notes sold, and the N. Y. C. & H. R. share of the New York Central equipment certificates issued amounted to $7,157,000. The Grand Central Terminal is being built by the N. Y. C. and H. R. and New Haven jointly. The New York State Realty & Terminal Company is interested in part in the financing of the Grand Central Terminal, and to this company the New York Central has advanced up to the end of 1912 $23,370,000, the advances made during the year amounting to about $1,560,000. In addition to these advances to the Realty company, the New York Central carries as a permanent investment $29,961,000 on account of the Grand Central Terminal improvements. This is an increase of $7,120,000. It is impossible and quite misleading to try to make a comparison of the costs of the Grand Central Terminal and the Pennsylvania station in New York City, because included in the Pennsylvania's costs are the costs of building the very expensive tunnels under both the North river and the East river and the Sunnyside yards on Long Island. The Pennsylvania thus gets besides the advantages of its terminal in New York a connection between its New York division and the Long Island Railroad, paying for the combined advantages a very heavy interest charge. The New York Central completed in 1912 the major part of its Grand Central Terminal, but the entire development will not be completed for some years. If, however, the plans of the company are carried out successfully, and at present there seems every chance that they will be carried out even more successfully than the originators of the idea ever even imagined, the New York Central will get its entrance into New York almost interest free. The terminal itself was described in the *Railway Age Gazette* of February 14, and the plan for building offices over the track spaces and obtaining in rent sufficient income to pay interest charges on the terminal itself as well as its approaches was described in the *Railway Age Gazette* of March 15, 1912, p. 462.

The Pennsylvania, since the completion of its New York terminal, has had two or three years of intensive development during which time, however, no great new projects were undertaken. President Rea's remarks in regard to improvements on the property of affiliated companies include the statement that "the surplus property fronting on Seventh avenue between Thirty-second and Thirty-third streets, New York, owned by the Pennsylvania Tunnel & Terminal Railroad Company, a subsidiary of this company [the Pennsylvania], has been conveyed to the Pennsylvania Terminal Real Estate Company looking to its future development." This suggests the possibility of some such development as is being carried out by the New York Central. It will, however, probably be years before real estate in the neighborhood of the Pennsylvania terminal becomes valuable enough to hold out the same promise of success for paying interest charges through income from rentals as is the case at the Grand Central.

The great undertaking which the Pennsylvania is about to engage in is, as President Rea put it, in brief " . . . to provide increased terminal facilities and approaches [at Philadelphia] for approximately 20 years for lines which equal eight double track railroads." The Pennsylvania spent in 1912 a total of $16,322,000 for additions and betterments, of which $14,707,000 was on the main line system between New York and Pittsburgh. Of this $14,707,000, $5,494,000 was charged to income and $9,213,000 to capital account, but this does not include any of this new work at Philadelphia.

President Brown, in his letter of transmittal with the New York Central report, makes a rather striking statement of the increases in cost of material. After pointing out that notwithstanding the fact that the New York Central handled the largest volume of traffic, both passenger and freight, in its history, and that the year was singularly favorable for handling traffic at a moderate cost, and that there were no extraordinary circumstances which called for unusual expenditures, and leaving the fact that the New York Central's net available for dividends was less by over 10 per cent. last year than in 1911 to speak for itself, he gives certain figures in regard to costs of equipment. He says:

"In October and November, 1911, contract was made by the New York Central Lines for 1912 delivery of 14,500 standard steel underframe 40-ton capacity box cars at an average cost of $790 each. The best price obtainable for these cars for delivery in 1913 is $1,075, an increase of $285 per car, or 36 per cent., which would have made an increase in the cost of these cars of $4,132,500.

"Two thousand five hundred standard 50-ton steel self-clearing hopper cars were contracted for at the same time at $810 each. The price of the same cars contracted for in December, 1912, for delivery in 1913, was $1,113 each, an increase of $303 per car, or 37 per cent.

"Eight Pacific type freight locomotives contracted for in December, 1911, cost $22,456 each; the price of locomotives, identical in every way, in December, 1912, for delivery in 1913, was $26,030, an increase of $3,574 per engine. Twenty Pacific type passenger engines for 1912 delivery cost $24,780 each, the price for 1913 delivery is $26,315 per engine, an increase of $1,535 each.

"The aggregate increase in the cost of this equipment, if purchased in December, 1912, compared with the actual prices paid in the latter part of 1911, would amount to $5,206,000 or 33 per cent."

Both Mr. Brown and Mr. Rea mention the finding of the committee which arbitrated the demand of enginemen for increased rates of pay, and both agree that arbitration under the Erdman act is not satisfactory, although it is an enormous improvement

over leaving disputes to be settled by means of a strike.

Both the New York Central and the Pennsylvania reports contain rather interesting sidelights on what is regarded as the probable future needs of railroads in the East. President Brown points out that the New York Central, notwithstanding the favorable business conditions, earned a surplus after the payment of 5 per cent. dividends of only about 1¼ per cent. on its stock, and suggests that this is by no means enough to meet future needs. The Pennsylvania paid out of its $42,154,000 net income only $27,199,000 in dividends. All of the rest it put back into the property, definitely appropriating for this purpose all but $1,661,000, which it credited to profit and loss.

The following tables show the principal figures for operation for the Pennsylvania and the New York Central in 1912 and 1911:

Pennsylvania Railroad.

	1912.	1911.
Average mileage operated	4,205	4,018
Freight revenue	$127,578,202	$113,414,431
Passenger revenue	35,405,555	33,525,583
Total operating revenues	174,607,598	157,487,413
Maint. of way and structures	21,102,640	18,353,290
Maint. of equipment	36,088,367	30,579,967
Traffic expenses	2,312,400	2,143,147
Transportation expenses	62,895,553	58,046,751
General expenses	4,238,984	4,105,239
Total operating expenses	126,637,945	113,228,393
Taxes	7,128,535	6,826,070
Operating income	39,693,133	35,907,748
Gross corporate income	58,982,867	51,617,111
Net income	42,153,964	37,318,351
Dividends	27,198,918	25,950,857
Reserve for additions and betterments	6,000,000	4,000,000
Appropriated for sinking funds, extraordinary expenditures and principal of equipment trust obligations, etc.	6,293,942	5,662,497
Surplus	1,661,104	1,704,997

New York Central & Hudson River.

	1912.	1911.
Average mileage operated	3,791	3,790
Freight revenue	$65,101,510	$61,133,310
Passenger revenue	33,134,509	31,759,238
Total operating revenues	109,900,016	103,954,863
Maint. of way and structures	14,705,289	13,723,709
Maint. of equipment	20,440,446	18,138,771
Traffic expenses	2,316,427	2,180,206
Transportation expenses	41,052,202	38,935,031
General expenses	2,796,789	2,722,485
Total operating expenses	81,311,153	75,700,203
Taxes	5,902,521	5,447,759
Operating income	23,010,367	23,128,377
Gross corporate income	40,890,960	39,364,557
Net income	13,879,837	15,304,449
Dividends	11,136,465	11,136,465
Surplus	2,743,372	4,167,984*

*In 1911 $2,500,000 was appropriated from this surplus to cover replacement value of abandoned property, including buildings at the Grand Central Terminal.

NEW BOOKS.

Poor's Manual of Railroads, 1913. Poor's Railroad Manual Co., 535 Pearl street, New York. Price, $10.

There is little new to be said about this excellent annual compilation of railroad statistics. It is the standard compilation of such statistics and its chief defect in the past has been that it has taken so long to get the figures together that they have been nearly a year old when published. The present manual contains figures for the fiscal year ended June 30, 1912. This brings the figures up very much nearer to date—in fact, the Southern Pacific annual report for the fiscal year ended June 30, 1912, appeared only a week or two ago. Government figures covering the same period will not appear for a number of months. Even with the elaborate statistics that the government now compiles, Poor's railroad manual continues to be almost the only handy source which is available for bankers, investors, railroad men and the general public to turn to for the figures for earnings, expenses, capitalization, etc., of all railroads. It includes, of course, railroads doing an intrastate business as well as those doing an interstate business. In addition to the figures which are given in the form comparable to previous years and which make a complete set of Poor's railroad manuals so very highly valued, there is no other source, government or otherwise, which contains the same complete history of railroads as is contained in Poor's manual. It is needless to say that a statistical library, if it is to include any book at all on railroad statistics, will include Poor's.

Letters to the Editor.

WHEN "ACCIDENTS" ARE NOT ACCIDENTAL; PLAIN WORDS FROM A SUPERINTENDENT.

St. Louis, Mo., February 16, 1913.

To the Editor of the Railway Age Gazette:

In its report on the collision at Corning July 4, last, the Public Service Commission of the State of New York recommended, among other things, that the discipline be improved, and that greater care be exercised in selecting local transportation officers; and deprecated the shielding of undesirable men by the various organizations, which recommendations are most timely.

As cogently set forth in your editorial of July 26 last, "The Lesson of Three Collisions," the responsibility for laxity in discipline rests largely with the managers. The appointing to, and retaining in the positions of trainmaster, master mechanic, and superintendent, of weak and inexperienced men, and men of loose morals, is one of the underlying causes of poor discipline. Unfit officers will not only keep around them unfit men, but will actually cause a decrease in the efficiency of good men. The adage, "birds of a feather flock together," is more significant than some managements seem to think.

If a manager must find a place, or pension, for a friend or relative, by all means put him somewhere outside the operating department, or pension him absolutely. I know whereof I speak in this matter, having been in the ranks on a large system for a number of years. This road has changed managements frequently; and certain of the changes brought with the new managers numerous followers, a number of whom were made trainmasters, master mechanics and superintendents. So far as could be seen, these appointments were made simply on account of old acquaintance or to cancel obligations; certainly not on account of fitness. Among others whom I now recall were three men placed in the important position of superintendent who were depraved sensualists, with all that that term implies; a number of others who were inveterate gamblers and drinkers. One of these moral lepers held the position of superintendent on a heavy division until the citizens of the town where he made his headquarters actually petitioned the management for his removal; and this was not very long ago. What a farce to talk about discipline under such conditions!

Managers who sincerely desire the best of discipline can and do find men of high character and experience for the official positions. That accomplished, a long step has been taken toward the solution of the problem. Such men, properly supported, will gradually improve the discipline in the ranks, even under present conditions.

The indiscriminate overruling by the management of the superintendents in appealed cases of discipline, no matter how small and trivial the cases may be; and the reinstating of men discharged for cause, constitute one of the worst deadening influences. This, more than any other one thing, tends to weaken discipline. This practice has obtained on some roads to such an extent that the brotherhood committees appeal all except the most flagrant cases; and, in consequence, the local officers have been reduced to figure-heads in the eyes of the officers of the organizations; and also, necessarily, in the eyes of the employees. This has gone so far, that a discharge, as a rule, means, at the most, a suspension, and the manager very often justifies himself in his actions in thus overruling the superintendent by tacitly criticizing the officer for what was proper action in the premises. This, in turn, has the effect of making the superintendent over-cautious. The men are the first to perceive this, and those inclined to be careless go the limit in taking advantage of the situation.

Only the managers can correct this. By employing competent officers, and supporting them, they can quickly clear the air. As one effective means to that end, they should adopt a

system of discipline similar to the "Brown system," which is essentially a checking account; a certain number of net demerit marks meaning dismissal. With this system a careless man automatically will check himself out eventually; and when he is out, he should stay out. No exceptions should be made to this rule unless it can be shown that an error was made in the premises; and, withal, no officer short of the highest operating officer should have authority to reinstate, for any reason, a discharged man. I have heard it suggested that a commission should be appointed to act upon appealed cases; it occurs to me that it might be feasible for such a commission to act, under certain conditions, for more than one road. In railway work the most rigid discipline is necessary, and it should be uniform; and it should be made known that a man's general habits will be carefully observed, even though it be necessary to resort to surveillance to the extent of espionage.

Up to the present time about the only moral obligation required of employees by most roads is that they shall not drink on duty, or frequent places where intoxicants are sold. In many instances this rule is not rigidly enforced, for the reason that the local officer is not clean himself. A more dangerous man, by far, than the occasional drinker (and the drinker is a dangerous man) is the sensualist, who is on the street all day when he should be taking his rest, or, improving his time, or taking wholesome recreation. This man, whose home life is, usually, unpleasant, by his very mode of living weakens himself mentally so that he cannot concentrate his mind on a given thought. He gets along in a sort of automatic way, but, sooner or later, gets into trouble. We are all familiar with these characters. All students of even the elementary principles of psychology and character-analysis can put their finger on men of this kind on short acquaintance. The same observation applies to gamblers. The two vices usually go together. These men, the drinkers, gamblers and sensualists, are the careless men. It is they who are responsible for upward of ninety per cent. of the serious accidents; and the sad part of it is that, under present conditions, the local officer often has to wait for the accident to occur before he can get rid of the dangerous man. Even then, on account of the practice of managers reinstating men on leniency pleas, and over the protest of local officers, he is, in many instances, rid of the man for only a few months.

If the real truth were revealed, if the fundamental causes of serious wrecks were made public, it would be so appalling as to cause not only the managements, but the legislatures, labor organizations, and the public to recognize the great necessity of placing on engines and trains sober and temperate men—using those terms in their most comprehensive sense.

I have been in the ranks for upward of twenty-five years; I know intimately engineers, conductors and train despatchers who have been in continuous service on heavy single-track road for from fifteen to forty years, and who are essentially safe men; and they will continue to be such, for their mental and physical habits are correct. What these men have accomplished, over in spite frequently of lack of encouragement, others can accomplish, if they can have the proper environment. After all, there is no accident about these accidents; we have simply the effects of well-known causes. We have been too eager to find excuses; which is like giving a sick patient a palliative to deaden his pain, rather than a medicine that will remove the cause of the malady.

Start in by placing a premium on character and merit; place the right kind of men in the local positions. Such men can be found in the ranks on all roads. There is no great secret in the matter, as the old switchman, or conductor or train despatcher would have us believe when they say that men for such positions "are born and not made." The essential quality is just good common sense.

Reducing the proposition a little further, an ounce of rational precept, reasonably enforced, is worth a ton of insincere type written instructions. I have never been a general manager, and am not qualified to pass on many of the requirements for that position; but this much I feel convinced of; that, regardless of his brains, or his station, the manager should serve in the ranks a number of years in order to get the necessary seasoning. As has been said:

"All that you positively know is contained in your experience; all that you shall ever know, must pass through the gateway of experience, and thus become part of yourself."

SUPERINTENDENT.

THE CAPTAIN OF A FREIGHT-TRAIN CREW.

ROCHESTER, N. Y., February 24, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read the article entitled "The Lesson of Irvington," published in the *Railway Age Gazette*, February 21, and the editorial on the same subject, January 24. The latter closes with the following: "As we have said above, this is an illustrative case of a striking character. Railroad officers will need no assistance in drawing the moral." The former, among other things, says: "Every now and then some accident shows a general laxity throughout the service."

Who is responsible for this state of affairs, the officers or the employees? What has become of the commanding officer, with the title of conductor? Why was the custom of putting such an officer in command adopted in the first place? What were his duties up to a few years ago, and why is he not still the commanding officer in fact? What would be the fate of a captain were he to permit his regiment to meet the enemy while he remained in his tent? Are conductors of today responsible for having lost their identity, or is it due to a lack of organization, for which the officers are more responsible than the employees? What would be the result if the general of an army were to issue orders direct to the privates in the field, as is the custom on many railroads today? The result would be that the captain (conductor) would permit the privates under him to perform their duties without supervision.

On roads where the officers deal directly with the members of train and engine crews, instead of through the commanding officer—the conductor—trains are being handled today as they were in the beginning when the command of a train was undefined and doubtful. Experience developed that a commanding officer must be placed in charge, with the title of conductor, to see that the train was moved over the road safely, and that each man on the train under him performed his duties in accordance with the rules. The regiments of an army are under the eye of their superiors at all times, while the regiments on a railroad are scattered over hundreds of miles out of sight of their superior officers. For this reason, if for no other, the organization of a railroad should be more perfect than the organization of an army.

The commanding officer in charge, whether he be captain or conductor, should be in the lead when meeting the enemy, not in the rear. In other words, it is the duty of the conductor to see that main track switches are closed. This is especially true when the privates in the front rank, as in the case at Irvington, are inexperienced.

When that train pulled up to back on the siding, the conductor should have remained at the switch, permitting the two brakemen to remain with the train, which was equipped with air brakes. If necessary to protect by flag, the fireman should have been sent. If on too close time against the passenger train, it would have been better to stop on the main track until the passenger train could be stopped. I am a railroad pessimist, and believe in applying a preventive just before, instead of a remedy just after.

J. S. M.

FRANKFORT-BRUSSELS LINE PROPOSED.—A new railway is proposed which would shorten the route between Frankfort on the Main, Germany, and Brussels, Belgium. At present the distance between Frankfort and Brussels through Cologne and Aix la Chapelle along the left bank of the Rhine is 213 miles.

IMPRESSIONS OF HUNGARIAN RAILWAY PRACTICE.

Second Article—Considers the Building and Repairing of Cars and Locomotives and the Organization for So Doing.

By Henry W. Jacobs

The motive power and rolling stock of the Hungarian State Lines is cared for in two large central manufacturing and repair shops located at Budapest and at fifteen independent division shops. Manufacturing of standard locomotive and car parts and tools is carried on on a large scale at Budapest.

NEW EQUIPMENT.

New locomotives are built by a separate locomotive works, a private concern that the government took over and that has a rather interesting history. The Hungarians were for so many centuries a buffer people between the invading Moslem hordes and Christian Europe that through the tribulations of relentless conflict they have developed the strongest kind of self-reliant patriotism. In more modern times with the development of peaceful pursuits this same spirit of martial self-reliance has shown itself in workaday life. Instead of depending on the alien for manufactured products, such as railroad and agricultural machinery, the people established works of their own, and one of these large manufacturing works devoted itself to the building of locomotives, orders being placed by the State Railway Lines as well as by the private railroad companies in Hungary and also to the construction of agricultural machinery. When, in the course of time, this concern got into financial difficulties the government, rather than see this business get into the hands of foreigners, took over the works, so that today practically all the locomotives and agricultural machinery used in Hungary are manufactured by this government works, keeping the industry at home and furnishing work for Hungarian subjects.

These locomotive building works are entirely independent of the Railway Administration, the latter concerning itself merely with the repair of its equipment. Cars are built by another large independent works, appertaining to Ganz & Co.

Patient's Room in Private Invalid Car on Hungarian State Railways; Available for a Moderate Rental.

EQUIPMENT REPAIRS.

At the central repair and manufacturing shops of the State Railway at Budapest, which come directly under the jurisdiction of the director of motive power and rolling stock, only the heaviest class of repairs are made. The division shops come under the division operating officers, and at some of the larger

of these also such heavy work as firebox replacement is done, although practically no manufacturing of new parts is done at any of these outlying shops.

In those fifteen division shops are the following aggregate facilities for the repair of equipment:

Locomotive pits	537
Boiler shop pits	69
Passenger car pits	1,413
Passenger painting shop pits	207

These facilities take care of the following equipment:

Locomotives	3,430
Passenger cars	7,448
Baggage cars, etc.	2,500
Freight cars	82,086

The force which handles this work is as follows:

Engineer inspectors	120
Foremen	234
Assistants	255
Workmen	10,183

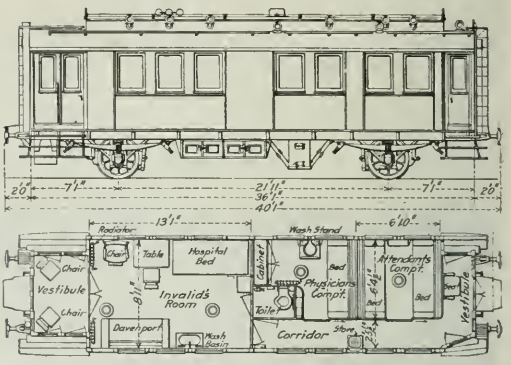
ENGINEER INSPECTORS.

A word of explanation is required as to the status of the engineer inspectors. These are men of the best technical

Surgical Supply Cabinet in Physician's Compartment on Invalid Car.

training who have served four years in practical shop work. They report to the highest officers of the division to which they are assigned, being, therefore, independent of the local shop administration. The function of these men is to exercise the closest supervision and control over the quality and costs of doing the work and to be instrumental in correcting methods where either the cost or the quality of the work is not up to standard.

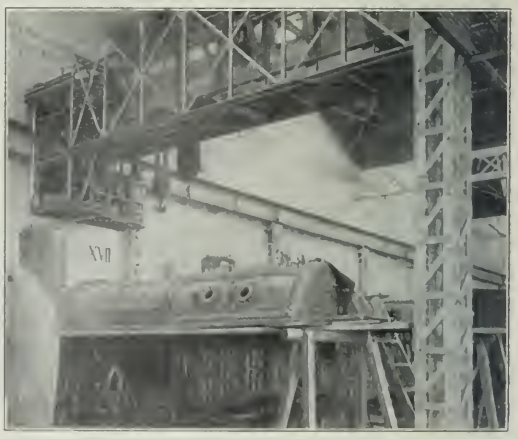
For instance, when a locomotive enters a shop the engineer inspector prescribes precisely what work should be done, there being already in effect standard schedules for the cost, the routing and the doing of each item of work. Departures are not made from the prescription of this engineer inspector without his authority. This supervision at the initial stage of the locomotive repair extends not only to the cost of doing the work, but is also concerned with the costs of the materials, the engineer preparing a detailed bill of material, whether the parts are to be repaired or new, to accompany his schedule of the work to be done. In this way the material costs are held down to the lowest figure which necessity demands. After getting the repairs on the locomotive well under way the engineer inspector follows up the work actually done in the shop, inspects its condition, sees that one gang does not hold another one back, sees



Arrangement of Private Invalid Car Used on the Hungarian State Railways.

that work is done within the standard cost, but is not slighted, and sees that the engine is returned to service as per the schedule before it was taken out of service.

A similar system upon a smaller scale obtains in roundhouse management, and due to the care that is exercised, both in general and in running repairs, engine failures are almost unknown. I must say that I find this condition of absolute reliability in the operation of the locomotives surprising in the



Boiler Shop with Traveling Crane; Hungarian State Railways at Budapest.

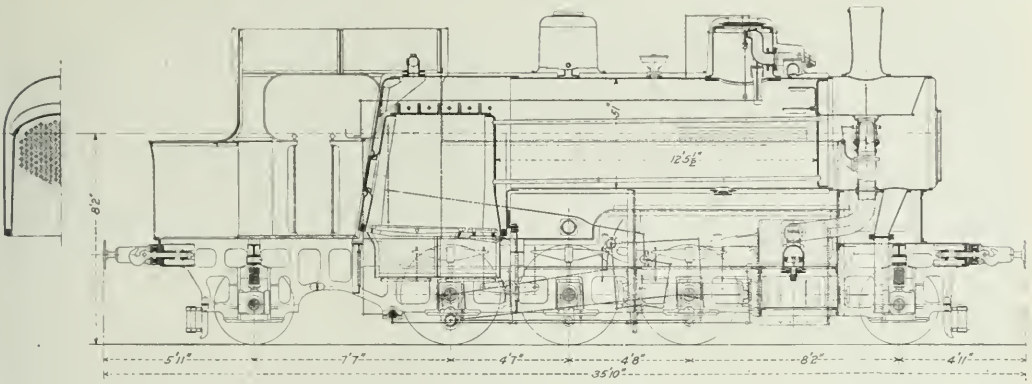
extreme. There is, however, a source of satisfaction in knowing that it is possible, with proper organization of working forces, to obtain such perfection in locomotive running and upkeep. Some of these one hundred and twenty engineer inspectors are, of course, allotted to supervision of car work, on the average of about one hundred workmen coming under the purview of one engineer.

WORKING CONDITIONS.

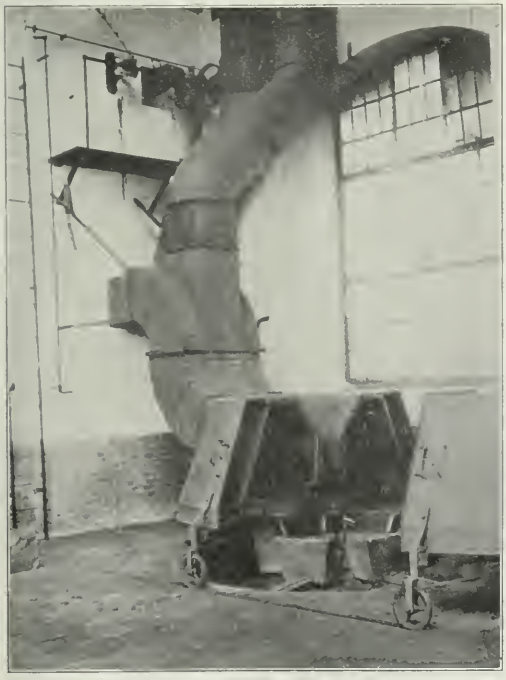
The average ten hour days worked per month by the shop forces is 24.5. The average earnings per day are about $1.40 for all classes of labor. This figure must not be compared with American shopmen's wages, for the reason that living and comparative wage conditions in Europe are so different from those obtaining in the United States. Also, it must be emphasized that the conditions are better for the men in the way of providing dwelling quarters at very low rents, and in the way of the provident and welfare institutions which care for the needs of the men and their families, both in active service and in old age. It is worth something to a man to be secure in reasonable earnings in the present and for his declining years when he gives up active service.

PERFORMANCE SCHEDULES.

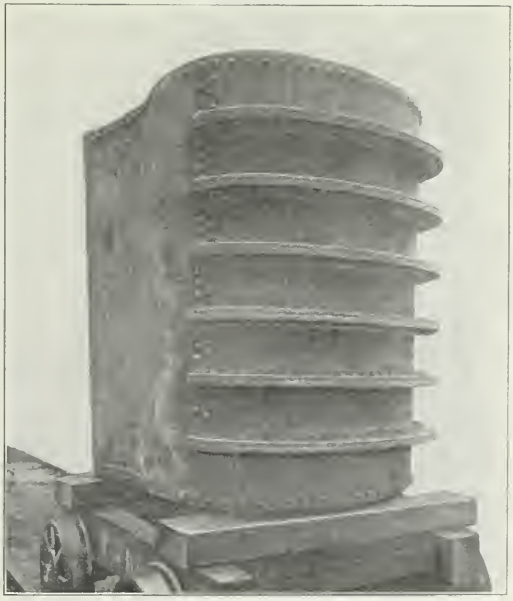
We spoke of the schedules of doing work in the shop. In conjunction with these shop schedules are similar standard schedules of the performance of the equipment in service. A locomotive or a car is not due to receive general repairs until it



Application of Polonco Sectional Crown Firebox on a Hungarian State Railways Locomotive.



Locomotive Tire Heater in Roundhouse of Hungarian State Railways.



Polonco Sectional Crown Firebox.*

*Three hundred of these, made of copper, are in use on the Hungarian State Railways. No crown stays or bolts are required. The first was built 30 years ago by the late Herr Polonco, an Austrian engineer. They are used in a bad water district where the staybolt, crown boiler requires washing out after 400 miles' service, while those of the Polonco type are washed out after 7,500 miles' service. The sections of the crown being unsupported by any connection to the wrapper are shaped like rectangular channels, instead of with a pressure resisting curve, and must be made of a heavy material. Notwithstanding this and the fact that the ordinary staybolt side sheets are joined to these sections by a seam near the crown, the maintenance cost is said to be so low as to outweigh these disadvantages.

Residential Apartment Community for Shop Employees of the Hungarian State Railways.

has performed this service. Below are listed these standards of performance:

	Between shoppings.
Passenger locomotives	56,000 miles
Freight locomotives	37,000 miles
Old locomotives of the second class	28,000 miles
Old locomotives of the third class	19,000 miles

It should be explained that locomotives are classified according to age, and that the same treatment as to policy of repairs is not accorded to the older locomotives as is accorded to the newer ones. This division into grades according to age could very well be adopted as an American practice.

CAR REPAIRS.

Car repairs are made, not after so many miles of service, but at periodic intervals, as follows:

Passenger cars in fast service, without painting...every	4 mos.
Passenger cars on through lines, without painting.every	8 mos.
Passenger cars on branch lines, without painting..every	12 mos.
Passenger cars repainted........................every	5 yrs.
Passenger cars wholly scraped, repainted and varnished, within and without ....every	10 yrs.
Freight cars, general repair, without painting....every	3 yrs.
Freight cars, general repair, with painting.......every	6 yrs.

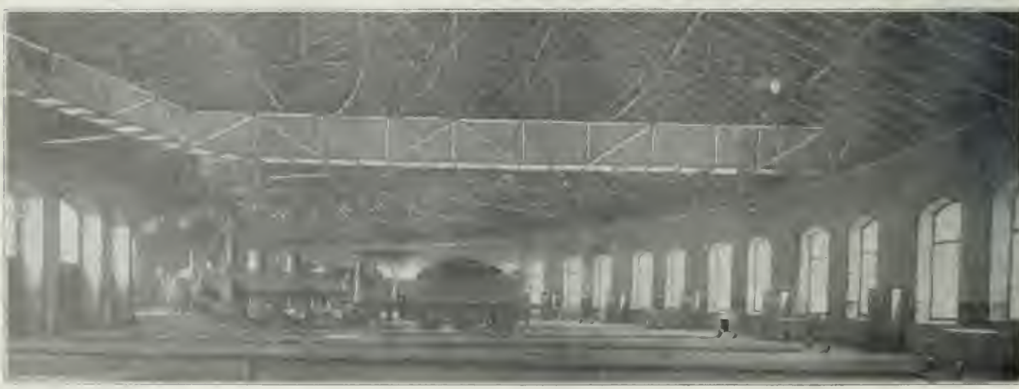
C[illegible] [illegible]led fr[illegible] [illegible] the ground [illegible]nd is re-shoveled into small tram [illegible], [illegible] are [illegible] elevator to the [illegible]aling platform, from which th[illegible] a[illegible] dumped int[illegible] the l[illegible]comotive tenders.

Typical Modern European Concrete-Steel Coaling Station.

REPAIR COST SCHEDULES.

In conjunction with these standards of performance of the equipment are standards of repair cost upon a mileage basis, an allowance or allotment being appropriated for repairs. This allowance is divided between the car yards, shops and roundhouses maintaining the equipment in a running condition, and the main general repair shops. This plan of allowance, or allotment, is so thoroughly worked out that, generally speaking the predetermined cost and performance are actually attained in practice. In those cases, however, where the performance is materially below the standard set, or where the costs are very markedly above or below the standard, an investigation is made as to the causes. It is not considered a favorable sign when costs are greatly below the pre-determined standard, as it is felt this work may have been done superficially, and the rigid inspection system is continually on guard against any such



[illegible] f[illegible] toward the center, and the smoke jacks carry the smoke and gases through the ducts to two high stacks outside, as shown on the drawing.

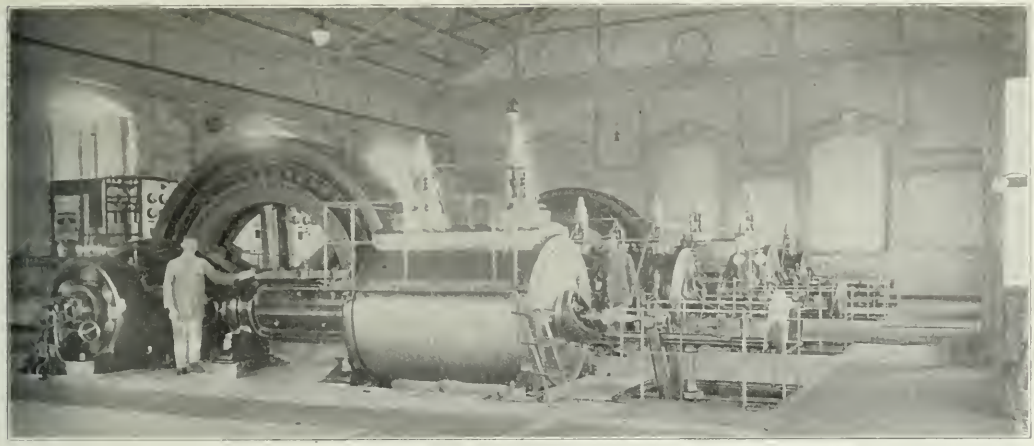
Interior of Engine House on Hungarian State Railways.

tendency. On the other hand, there is the reverse of a disregard for excessive labor costs. So closely do the standards and the actual costs compare that the amount of money spent upon the different classes of equipment, divided by the mileage performance of these classes, is a financial measure as to the existing condition of the equipment. The following table shows the actual repair costs of equipment of the Hungarian State Lines per one hundred miles of line of railway:

Locomotives	$3.44
Passenger cars	.33
Baggage cars	.12
Freight cars	.12

It must be explained that the figures above quoted as to car performance are not on the car mile, but upon the axle mile, most of the cars being four wheeled (or two axle), with a few equipped with two four-wheeled bogie trucks, as in American practice. Most of the passenger cars are also four wheeled, with a large proportion of six wheeled or three-axle cars, one of the axles being under the middle of the car. The modern through passenger equipment is to a large extent composed of four axle cars, the trucks being somewhat after the American arrangement.

These figures are quoted merely as a matter of information, the wage conditions, conditions of service and characteristics of design being so different in Hungary as not to furnish intelligible bases of comparison with American practice.



Dynamos Driven by Gas Engines; Hungarian State Railway Shops at Budapest.

Spanish Railway Construction.—The Minister of Fomento, Madrid, Spain, invites plans for constructing a 62-mile railway from Medina del Campo, in the province of Valladolid, to Benavente, province of Zamora. Plans must be received within four months. He also invites plans, to be received within six months, for constructing a 99-mile railroad from Segovia, province of Segovia, to Burgos, province of Burgos, by way of Aranda de Duero.—*Consular Report.*

THE RAILWAY VALUATION LAW.

The law empowering the Interstate Commerce Commission to make a detailed inventory of all the property of all railways subject to the Interstate Commerce law which was passed by Congress last week was signed by President Taft on March 4, and an appropriation of $500,000 is made for the purposes of valuation in the next fiscal year. The text of this law was printed in our last issue, page 397, subject to a few corrections. These corrections, which are in the matter beginning near the top of page 398, first column, are embodied in the following reprint of that part of the law:

"Except as herein otherwise provided, the commission shall have power to prescribe the method of procedure to be followed in the conduct of the investigation, the form in which the results of the valuation shall be submitted, and the classification of the elements that constitute the ascertained value, and such investigation shall show the value of the property of every common carrier as a whole and separately the value of its property in each of the several States and Territories and the District of Columbia classified and in detail as herein required.

"Such investigation shall be commenced within sixty days after the approval of this Act and shall be prosecuted with diligence and thoroughness, and the result thereof reported to Congress at the beginning of each regular session thereafter until completed.

"Every common carrier subject to the provisions of this Act shall furnish to the commission or its agents from time to time and as the commission may require maps, profiles, contracts, reports of engineers, and any other documents, records, and papers, or copies of any or all of the same, in aid of such investigation and determination of the value of the property of said common carrier, and shall grant to all agents of the commission free access to its right of way, its property, and its accounts, records, and memoranda whenever and wherever requested by any such duly authorized agent, and every common carrier is hereby directed and required to co-operate with and aid the commission in the work of the valuation of its property in such further particulars and to such extent as the commission may require and direct, and all rules and regulations made by the commission for the purpose of administering the provisions of this section and section twenty of this Act shall have the full force and effect of law, unless otherwise ordered by the commission, with the reasons therefor, the records and data of the commission shall be open to the inspection and examination of the public.

"Upon the completion of the valuation herein provided for the commission shall thereafter in like manner keep itself informed of all extensions and improvements or other changes in the condition and value of the property of all common carriers, and shall ascertain the value thereof, and shall from time to time revise and correct its valuations, showing such revision and correction classified and as a whole and separately in each of the several States and Territories and the District of Columbia, which valuations, both original and corrected, shall be tentative valuations and shall be reported to Congress at the beginning of each regular session.

"To enable the commission to make such changes and corrections in its valuations of each class of property, every common carrier subject to the provisions of this Act shall make such reports and furnish such information as the commission may require.

"Whenever the commission shall have completed the tentative valuation of the property of any common carrier as herein directed, and before such valuation shall become final, the commission shall give notice by registered letter to the said carrier, the attorney general of the United States, the governor of any State in which the property so valued is located, and to such additional parties as the commission may prescribe, stating the valuation placed upon the several classes of property of said carrier, and shall allow thirty days in which to file a protest of the same with the commission. If no protest is filed within thirty days, said valuation shall become final as of the date thereof.

"If notice of protest is filed the commission shall fix a time for hearing the same, and shall proceed as promptly as may be to hear and consider any matter relative and material thereto which may be presented in support of such protest so filed as aforesaid. If after hearing any protest of such tentative valuation under the provisions of this Act the commission shall be of the opinion that its valuation should not become final it shall make such changes as may be necessary, and shall issue an order making such corrected tentative valuation final as of the date thereof. All final valuations by the commission and the classification thereof shall be published and shall be prima facie evidence of the value of the property in all proceedings under the act to regulate commerce as of the date of the fixing thereof, and in all judicial proceedings for the enforcement of the act approved February 4, 1887, commonly known as 'the act to regulate commerce,' and the various acts amendatory thereof, and in all judicial proceedings brought to enjoin, set aside, annul, or suspend, in whole or in part, any order of the Interstate Commerce Commission.

"If upon the trial of any action involving a final value fixed by the commission evidence shall be introduced regarding such value which is found by the court to be different from that offered upon the hearing before the commission, or additional thereto, the court, before proceeding to render judgment, shall transmit a copy of such evidence to the commission, and shall stay further proceedings in said action for such time as the court shall determine from the date of such transmission. Upon the receipt of such evidence the commission shall consider the same and may fix a final value different from the one fixed in the first instance, and may alter, modify, amend, or rescind any order which it has made involving said final value, and shall report its action thereon to said court within the time fixed by the court. If the commission shall alter, modify, or amend its order, such altered, modified, or amended order shall take the place of the original order complained of and judgment shall be rendered thereon, as though made by the commission in the first instance. If the original order shall not be rescinded or changed by the commission, judgment shall be rendered upon such original order.

"The provisions of this section shall apply to receivers of carriers and operating trustees. In case of failure or refusal on the part of any carrier, receiver, or trustee to comply with all the requirements of this section and in the manner prescribed by the commission such carrier, receiver, or trustee shall forfeit to the United States the sum of five hundred dollars for each such offense and for each and every day of the continuance of such offense, such forfeitures to be recoverable in the same manner as other forfeitures provided for in section 16 of the Act to Regulate Commerce."

Remaining paragraphs unchanged.

Brazilian Concession Altered.—The president of the state of Sao Paulo, Brazil, has signed a decree granting the petition of the Empreza de Colonizacao Sul Paulista, concessionaires for building the Sao Paulo-Prainha Railway, asking for an extension of three months to complete the definite surveys for the modification of the first, second and third sections of this railway, and also an extension of three months from the date of approval of the surveys of the first section for the initiation of construction work; and also for an extension to three years of the time allowed for the completion of the railway.

Funded Debt of Manila Railroad, Philippine Islands.—On July 1, 1911, $2,986,000 bonds of the Manila Railroad were authorized. On October 18, 1911, $940,000 certificates were authorized, and on January 22, 1912, $1,000,000 certificates were authorized, making the total funded debt of this company $4,936,000. These bonds are secured by a mortgage on about 142 miles of line and represent a cost per mile of about $34,760.

GRAND TRUNK TERMINAL AT OTTAWA, ONT.

The New Union Passenger Station and Chateau Laurier, Which are Among the Finest Structures of Their Kind in Canada.

The terminal of the Grand Trunk in the city of Ottawa, which is used by all Grand Trunk trains and by through trains of the Canadian Pacific, is closely adjacent to the group of Parliament buildings which occupy a high point of ground in the center of the city overlooking the Ottawa river and the Rideau canal. In the design of the new station building and the hotel, which have recently been opened for service, particular care was taken to harmonize both the buildings and their approaches with these surroundings. Sparks street, the principal business street of the city, and Wellington street, upon which the Parliament buildings front, intersect about over the north bank of the Rideau canal. The station building and the Chateau Laurier, the new hotel, are located north of and adjacent to the canal, just across from the Parliament buildings, the station being east of the street and the hotel facing it west of the street. The triangular area between Wellington and Sparks streets over the canal has been laid out in a plaza to be known as the Plaza Laurier. This plaza and the adjacent streets are carried on a new concrete arch structure, under which passes the canal, two through railway tracks from the station and a park walk extending from the Parliament grounds. The railway tracks after passing under this bridge, are carried through an enclosed street railway terminal, the roof of which forms the broad terrace of the hotel. This covered electric railway terminal is reached by broad stairways from the street above. The back of the hotel overlooks the historic Major's Hill park which commands a view of the locks, river and Parliament grounds.

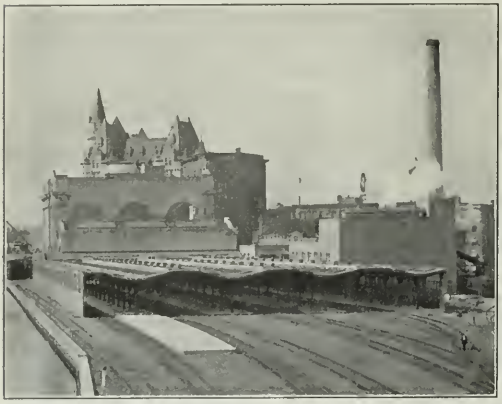
Grand Trunk Terminal in Ottawa.

The station is 281 ft. 6 in. x 140 ft. 8 in. exclusive of the train shed covering the platforms, the main portion in front being six stories high with a basement. The ground floor and the street level floor are used for station purposes and the upper four floors for the offices of the Dominion Railroad Commission. Back of this portion of the building is the vaulted main waiting room extending the full width of the building and having its end walls carried up to the same height as the six-story section. Adjoining the waiting room on the rear is a three-story section containing station facilities, and back of this is a full width concourse which is as high as the three-story section and which opens directly to the train shed in the rear. As Sparks street is elevated in front of the station to carry it over the canal, the main entrance from this street opens into the second floor of the building. The carriage entrance and the approach for baggage, mail and express is at the northeast corner of the building opposite the concourse, where the street level is practically at the same elevation as the tracks and the lower floor of the main building.

THE STATION.

The station is of fireproof construction, the foundation and walls being of concrete, granite and sandstone. The principal architectural feature of the six-story section is a colonnade of columns in the west and south elevations. The entablature and cornice supported by these columns are massive and simple, an impression which is carried out by the entire exterior. The main entrance is between two large piers and is covered by a marquise, above which is set a large clock. The three double doors open into a large entrance hall with marble tile floor, beamed ceiling and paneled walls, finished in imitation Travertine stone. On the right just inside the entrance is a branch of the Bank of Toronto and the division freight agent's office. Back of these offices is the suite of royal waiting rooms intended

for the exclusive use of royalty and the governors-general of the Dominion. This suite includes a lobby, a large waiting room and retiring rooms for ladies and gentlemen. The waiting room is elegantly finished in fumed oak and contains a large marble mantel and overmantel with an open fire-place, a massive table and numerous upholstered chairs. Clocks, telephones and complete toilet facilities are provided. These rooms have windows overlooking the canal and also have windows with massive metal grills opening into the main waiting room. On the left of the entrance hall is a large room in which commercial travelers can exhibit their samples, a feature which is thought to be entirely new in station design. The elevator hall and stairway leading to the office floors above



Rear View of Station and Train Shed.

are reached directly from the entrance hall on the left from the entrance. Two electric elevators serve this part of the building. On the upper floors in addition to the offices of the Board of Railway Commissioners, a well appointed court room is provided for public hearings.

From the entrance hall a flight of marble stairs the full

Entrance Corridor and Subway to Hotel from the Ticket Lobby.

width of the hall descends to a broad landing, from which a marble stairway at each side leads down to the main waiting room level. Between these two lower stairways is a marble balcony overlooking the waiting room, from which the voice of the train announcer is distinctly carried to all parts of the room. Between the piers supporting this balcony is the entrance to the corridor and subway which leads from the waiting room level under the plaza to the lower floor of the new hotel, affording a very convenient means of reaching the hotel from the station.

The waiting room is 56 ft. 8 in. x 130 ft. 9 in., with a vaulted

One End of the Main Waiting Room.

ceiling 75 ft. high, which gives the room an appearance of much greater size. The floor is of marble and the walls are of imitation Travertine stone with four Corinthian columns of natural imported Travertine stone along each wall supporting the arched ceiling, which is of plaster, richly coffered. The room is well lighted, having three large arched windows in each side and one in each end. The artificial lighting is furnished by

Part Interior of Train Shed and Concourse.

four 13-light electric clusters on bronze columns, 18 10-light wall clusters, and 12 8-light tungsten clusters under art domes mounted on the back of each double bench. The bronze columns are set on large pedestals of light green marble containing ventilating ducts. The benches are mahogany, with marble risers, the contour of the seat being carefully designed to make the benches comfortable. The mounting of the bench lights and the shades provided make reading in these seats very enjoyable. At one end of the waiting room is the news stand, and at the other the telephone and telegraph booths, all of which are finished in quartered oak.

Adjoining the main waiting room on the ground floor and

located under the royal waiting room in the six-story portion of the building is the ladies' waiting room 46 ft. 8 in. x 58 ft., with a rest room and well appointed toilets. The waiting room and rest room have terrazzo floors with marble base and border, plaster walls and ceiling, and are furnished with mahogany seats and easy chairs. The waiting room can be entered from the subway to the hotel, as well as from the main waiting room. Adjoining the main waiting room on the other side of the corridor are the smoking room, men's toilet, barber shop and check room. The finish in the smoking room and barber shop is the same as in the ladies' waiting room. Ample ventilating ducts are provided to keep the air circulating in the smoking room. The toilet rooms are finished with tile floors, marble wainscoting and plaster walls and ceiling. The barber shop has four chairs and is equipped with the most modern appliances, including a small sterilizing plant for towel service. The subway between the station and the hotel is 10 ft. wide and 9 ft. high. It has tile walls and floor, and is lighted by electric clusters from the ceiling.

On the east side of the main waiting room directly opposite and in line with the main entrance is a lobby leading to the concourse. On the north side of this lobby are four large ticket windows and two more are provided just around the corner opening in the main waiting room. The ticket office is large and provides ample room for all ticket cases and vaults, and the equipment for rapid handling of this business, as well as quarters for conductors and trainmen who use a door entering from the concourse. On the opposite side of the ticket lobby is the lunch room, having a seating capacity of 33 at the counter and 30 at the tables. The room is finished with a tile floor and plastered walls, the woodwork in common with that in all the other public rooms being of oak. The ticket office and lunch room occupy the first floor of the three-story section of the building mentioned above. Over the ticket office is located the office of the station master, and on the third floor are the divisional offices, all of which are served by an electric elevator entered from the main waiting room. Over the lunch room is the kitchen, which is modern in all its appointments, having 27 electric lighted refrigerators, an electrically driven ice crusher, dish washer, mincer and coffee grinder, ample gas ranges with numerous ovens, a complete ventilating and vacuum cleaning system, and a garbage refrigerator in which all refuse is frozen to eliminate odors and bacteria.

The concourse, which is entered through four double doors from the lobby, extends the full width of the building and is the same height as the three-story section adjoining it. It is amply lighted by large arched windows at each end and a large skylight in the roof. The walls are of imitation Travertine stone and the ceiling is coffered in the same style as that of the main waiting room. Five double doors at the north end of the concourse provide a convenient exit to the street, and a generous space has been allowed outside the entrance for a cab stand, with a large marquise over the entrance, allowing passengers to enter cabs without being exposed to the weather. A large clock is prominently displayed over the gates leading from the concourse to the train shed and platforms which, in common with the clocks in all public rooms and the big clock over the main entrance, is controlled electrically by a master clock.

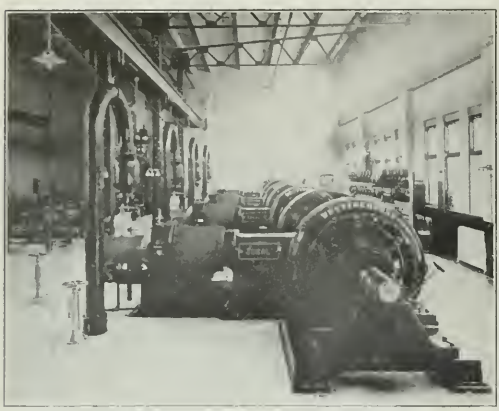
Bush Train Shed; Grand Trunk Terminal.

The train shed covers seven tracks, six of which are stub end. The south side of the shed is offset from the main building to allow the south track to pass through the train shed and along the south side of the building under the plaza, as described above. The shed and the four platforms are 533 ft. 6 in. long. The shed is of the Bush type, supported by fluted cast iron columns on concrete pedestals, spaced 27 ft. center to center in each row. The tracks are 13 ft. center to center in each bay, and the platforms are 19 ft. wide, making the transverse distance between rows of columns 42 ft. 9 in. The lighting is by one tungsten light at each panel point of the shed structure. The shed is closed on the south side along the canal by a concrete wall with large elliptical windows, and on the

north side it connects to the baggage and express annex and the power house. One of the accompanying photographs shows the shed construction clearly. The baggage room is nearest the concourse and can be approached from the street side by trucks. Division offices are located on the second floor over the baggage and express rooms.

POWER PLANT.

The power house is very complete and modern, being well housed above ground in a light roomy building which is quite in contrast to the sub-basement so frequently used for power generation purposes. The boiler room at the east end of the building contains four 300 h. p. vertical water tube boilers, fit-



General View of Engine Room in Station Power Plant.

ted with Green chain grate stokers having a unit grate area of 50 sq. ft. There are two 5 in. x 5 in. vertical steam engines, either of which can operate the stokers. Coal is delivered in hopper cars on a track just north of the boiler room, being dumped into a sheet steel hopper from which it is conveyed to the double roll crusher by a short beaded flight conveyor. The conveyor and crusher are operated by 25 h. p., 220 volt motors. From the crusher an elevator takes the coal to a scraper conveyor, which distributes it to the bunkers. A spiral ash conveyor delivers ashes to the same elevator that handles the coal, a by-pass valve in the elevator head permitting the handling of both coal and ashes in the same elevator. The elevator delivers ashes to a bunker having a capacity of four carloads. The power plant chimney is of the Weber concrete type 150 ft. high.

In the engine room are four tandem compound high speed engines, with 14 in. and 24 in. x 16 in. cylinders, direct connected to 175 kw. 250-125 volt d. c. generators. Two of these units can carry the day load and three of them can easily handle the peak load in the evening. The three-wire distribution system is used, furnishing 250 volts for power and 125 volts for lighting. This distribution system covers all parts of the station building and the hotel. The oil separators and traps discharge into a sump below the engine room floor, which is provided with a centrifugal pump to care for the accumulation of water. Two Worthington boiler feed pumps, either of which is capable of handling the maximum requirements, take the feed water from a Cochrane open heater at a temperature of 212 to 220 deg. and supply the boilers through 4 in. extra heavy lap seam mains. A fire pump takes water from the city main at 45 to 50 lbs. and maintains 130 lbs. pressure in fire hose throughout the Chateau and the station building. Two duplex pumps supply water to the station and the Chateau at 50 lbs. pressure. An air compressor with a capacity of 250 cu. ft. free air per minute furnishes the air for pneumatic tools in the power house and for air brake testing and car cleaning in the train shed.

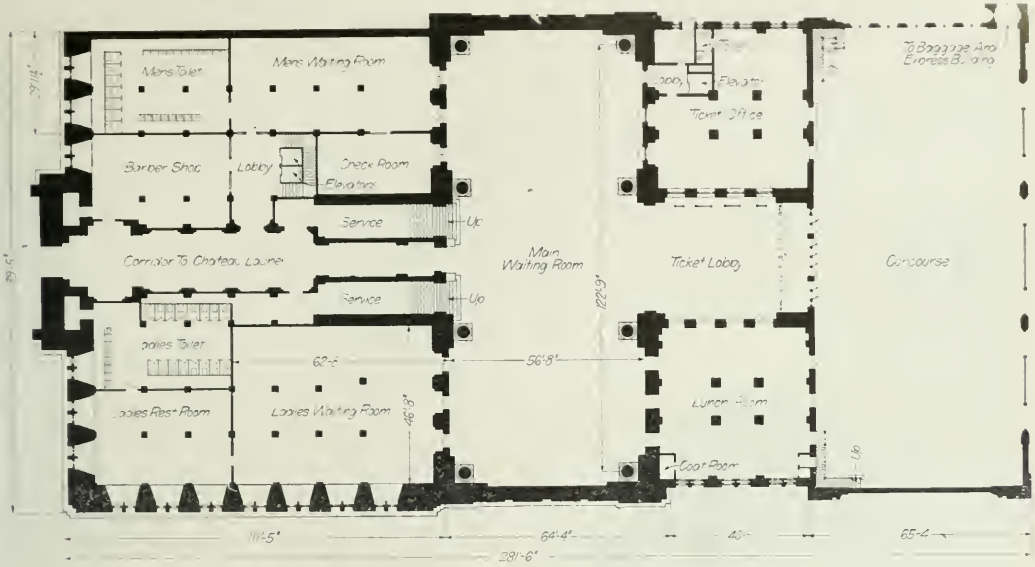
An ice-making plant, with a capacity of 5 tons a day is provided in which is made all ice used in the hotel and station and for icing drinking tanks on cars. Two duplex brine pumps circulate brine which is used in cooling refrigerators in the hotel and station. The supply and return pipes for this water are 4 in. in diameter, protected by a 3 in. cork covering. All the water used is taken from the Ottawa river, filtered through gravel beds and sterilized by a heat process installed by the J. F. Forbes Company, Philadelphia. There are three sterilizing units, each with a capacity of 1,000 gallons per hour, which is one of the largest installations of this kind in the country. The process consists of heating the water to about 180 deg. by the application of steam, all pathogenic organisms being killed at this temperature. Each unit consists of a cylindrical brass standpipe about 30 ft. high containing over 200 small tubes standing vertically, supported by a tube sheet at the lower end. A supply of raw water is maintained in these tubes at an elevation a little below the top of the tubes by feeding into a riser tube connected with the standpipe below the tube sheet. Steam pipes are inserted about 30 in. into the upper ends of the small tubes to supply the heat necessary to the process. The expansion of the water in the tubes when it reaches 180 deg. is just sufficient to cause it to overflow the tubes. This over-

Chateau Laurier, the Grand Trunk Hotel in Ottawa with the Station in the Background.

flow runs down the outside of the tubes, which are filled with cold water rising, and by convection through the walls of the tubes the hot water descending gives up a part of its heat to the water inside, thus decreasing the amount of heat that must be applied to raise the raw water to the proper temperature, and also decreasing the amount that the treated water must be cooled before being used. The treated water collects above the tube sheet at the bottom of the standpipe and stands in a riser tube connected to the standpipe above the tube sheet, from which it is pumped to tanks on the roofs of the hotel and station. This sterilized water is used for all purposes in both the hotel and the station.

A tunnel 6 ft. x 7 ft. in cross section carries all pipes and wiring from the power house to the station and hotel. In the

basement of the new station are located the heating and ventilating fans, air-washing plant, water heaters for the toilet rooms and barber shop, storage tanks for drinking water and a vacuum cleaning plant with connections all over the building and power enough to allow four cleaners to be operated at once.

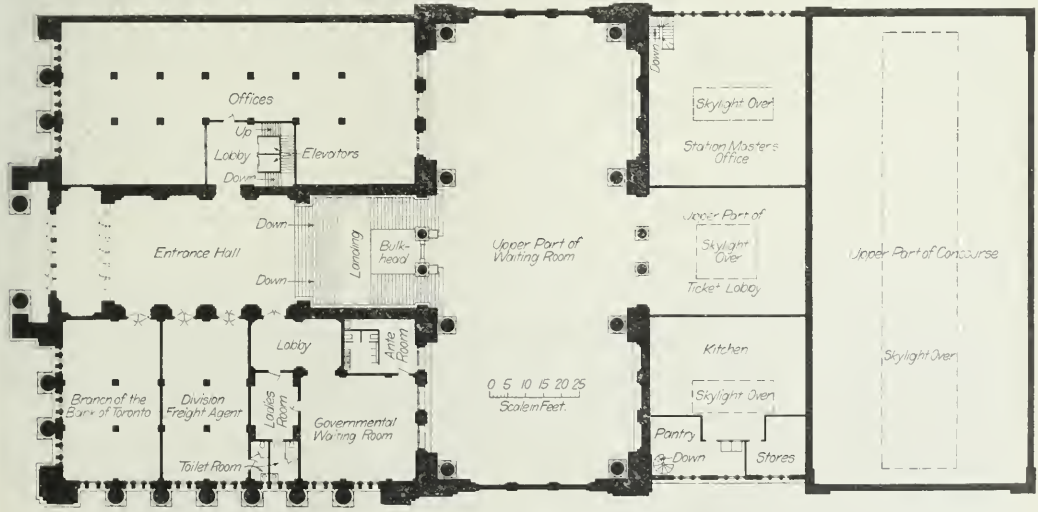


Floor Plan of the Track Level.

THE CHATEAU LAURIER.

The Chateau Laurier is an eight-story L-shaped building facing the street and the canal, the main entrance being opposite the station and the longer dimension of the building being perpendicular to the street. The Chateau type of French architecture is used, the materials of construction being the same as in the station building. The hotel building is fireproof throughout, the corridors being divided into sections by fire doors to separate them in an emergency. No wood is used in the construction of the building except the door frames and baseboards. The main corridors lead directly to fire escapes.

There is a basement and sub-basement below the street level floor, the sub-basement containing the power equipment and storage rooms and the basement containing the grill, bar, kitchen, barber shop, manicuring parlors and toilet rooms. This basement connects directly with the subway from the station building. On the street floor the main entrance opens through a loggia into a large rotunda which is decorated in Francis the First style, with richly paneled and modeled ceiling. The walls are of caen stone, and the floors are laid in Napoleon grey and



Floor Plan of the Street Level.

Belgian black marble. The room contains a finely carved caen stone fire-place, and as a central figure a bust of Sir Wilfred Laurier, ex-premier of the Dominion, for whom the hotel is named. On one side of this rotunda is the lounge, or gentlemen's writing room, which is finished in simple Flemish style, with wainscoting of oak and richly modeled plaster frieze and cornices. A marble staircase leads from the center of this room down to the grill and bar room. Back of the rotunda is a palm room which is also used as a tea room. This room has a barrel vaulted ceiling and caen stone walls and floor of Gruby tiles, the scheme of decoration being Renaissance in character. Especially designed tables, chairs and settees in verde antique were chosen for this room in which tea is served every afternoon between the hours of four and six. Adjoining the rotunda opposite the lounge is the main office of the hotel with telephone exchange, telegraph office, elevators and main staircase. From the office a long corridor leads back along the side of the building to the main dining room, which occupies the corner of the main floor overlooking the park and the Rideau canal. This room is 83 ft. long, 50 ft. wide and 29 ft. high. It is decorated in the style of the Elizabethan period with oak wainscoting. This room also has a large fire-place above which is a mural painting of local historic interest. The corridor leading back to the dining room opens out on a broad terrace overlooking the locks on the canal. During the summer months awnings are provided on this terrace and it is furnished with tables and chairs, making it a very picturesque and enjoyable lounging spot. A view of the canal and the Ottawa river is best obtained from this veranda. On the mezzanine floor are located the ball room, banquet room, private dining rooms, ladies' writing rooms, ladies' parlor, balcony overlooking the rotunda, musicians' gallery overlooking the main dining room and cafe, manager's office, accountant and auditor's office and public stenographer's office. The decoration of the ladies' writing room is in the style of the Louis XVI period with paneled ceiling and French grey enameled woodwork. The banquet room has a seating capacity of 250, and is connected with the foyer, a large room facing the Plaza Laurier, which is used for assembling guests before banquets and during the intermission of dances. The ball room is 70 ft. long x 40 ft. wide and 20 ft. high. It is divided into bays with fluted columns which support massive beams spanning the room. There are wall decorations of large painted panels portraying classical subjects which harmonize with the brown and gold tone of the room. The ball room, banquet room and foyer are all decorated in the Louis XVI style, with furniture of Italian walnut.

The second, third, fourth, fifth and sixth floors have 53 bedrooms each, the furnishings of which are of the most modern type and include every known convenience in hotel management. On the second floor there is provided a royal suite which is elegantly furnished for the exclusive use of royal guests. On each floor particularly well located rooms are furnished in an attractive manner for parlor bedroom suites.

The construction of this complete terminal was begun under the direction of Howard G. Kelly, vice-president, formerly chief engineer, and completed by H. R. Safford, chief engineer, to whom we are indebted for the foregoing information. The architects were Ross and Macfarlane of Montreal.

Arica La Paz Railway, Bolivia.—It is said that important petroleum deposits have been found, and proved of great value, at a place called Calacoto, which is one of the stations situated on the newly-built Arica-La Paz Railway. The same line has already considerably benefited by the act of the government in helping to establish a new town in the department of La Paz, called Caracaro, and contributing the sum of $25,000 towards the acquisition of the necessary land. This is in a great wine-producing district, and in a few years' time its cultivated fields should serve to yield a rich and increasing traffic to the railway company.

WHAT REGULATION TAUGHT ONE REGULATOR.*

By John B. Olmsted,

Former Member, New York Public Service Commission, Second District.

I came into office with decided leanings towards the anti-corporation view of public utility questions. Some of my good friends among the corporation lawyers in Buffalo were kind enough to say that I was too much of an anarchist to be of much use as a commissioner. Want of knowledge as to the precise point involved I have found in many cases to be the principal cause of the prejudices I then entertained. Experience has taught me that there is another side to these questions, and one not lightly to be dismissed.

For instance, I held the view, as I imagine many another person holds the view, that the New York Central Railroad is grossly over-capitalized, and is paying dividends on a large amount of what is popularly known as water. When it came to my knowledge as a part of the evidence of a long investigation in the Buffalo, Rochester & Eastern case that the estimated cost of that company's 300 miles of railroad from Troy to Buffalo, planned without adequate allowances for terminal yards and facilities at either end, and touching but one or two large centers of population, was approximately one hundred millions of dollars, I came to the view that the New York Central, with its four tracks running through the heart of so many great cities of the State, with all the attendant advantages to freight and passenger business, and with approximately 500 miles more trackage, including the vast and valuable terminal facilities of New York City, might possibly on a valuation measure up to a capitalization of five times that of the B., R. & E.

MANAGERS CONCILIATORY.

I have changed my mind also as to the attitude of most corporation managers towards the public. I had expected to find it recalcitrant and objurgatory, which is a Latinized and "more tenderer" way of saying that it was made up of kicks and damns. I have found it almost uniformly, when expressed in the presence of the Commission, conciliating and willing to abide by the results of a fair hearing. The difficulty with me has been not so much in getting the corporations to do what I thought was right as to determine in my own mind what under all the circumstances of certain cases was right.

I am fully aware that this is not the popular view of public service corporations, nor do I wish to be understood as having discovered wings on the shoulders of the managers thereof. I say that a better knowledge of the conditions under which their business is carried on brings one to a more just appreciation of some of the difficulties under which they labor. I know well that there are many—very many—particulars in which the service which they are rendering may be improved, as I know well that there are very many particulars in which the business of every man in this room might be improved if an inquiry into it were started by a commission armed with power. Such a commission would be at once met with the objection that its suggestions required too much of an outlay to carry them out, and would be asked how it proposed to provide the funds for the improvements recommended. Let us be reasonable as well as critical. Let us realize that the management of one thousand men on a street car line is no less difficult than the management of an equal number in a factory, and that there are times when you have to do the best you can with the material with which you have to work.

"STRAIGHT" STREET MORE POPULAR.

I believe that in the past ten years a great change has come over the minds of men who are in the management of public utilities. There are still some left who cling to the old "public-be-damned" idea, but they are fast being supplanted, and the

*Extracts from an address made at Amsterdam, N. Y., just before Mr. Olmsted's retirement as a public service commissioner.

up-to-date railway or electric light official stands ready to listen to any reasonable complaint that may be brought to his attention, and, what is more to the point, to turn a deaf ear to proposals which call for abhorrent and forbidden methods in their accomplishment. I am not innocent enough to believe that all the dark, devious and easy ways of "getting there" have been wholly abandoned; but I do hold the view that the street called "Straight" is a much more popular thoroughfare than it used to be, and that the directors and agents of the corporations over which we have control are walking it with much cleaner consciences and with great gain to their self-respect

RISKS OF INVESTMENT.

I have intimated that one great difficulty with certain corporations is the lack of means to carry out the improvements to service which their operating men admit would be advisable and desirable. On this point some figures from our last annual report may be illuminating. Out of 78 steam railroads reporting to the commission in this State, only 27 paid any dividends for the current year. Out of 364 electric railroads, light, heat and power, and gas corporations, 237 paid no dividends. In 1909 it was 237 out of 310, so that conditions are improving some; but the figures are significant. They are contradictory to the general impression that dividends are the foundation upon which all public service corporations are erected, and they have a sobering effect upon an official who starts in with the idea of building Rome—or even Schenectady—in a day.

The consideration of them has not swayed the mind of the Commission where conditions have become intolerable or even irritating; but they have at times prevented the attainment of ends which otherwise might have been ordered.

I know that these views are not wholly popular, and I know that in certain quarters the idea prevails that a public service commissioner should be pictured with a knot of thongs to lash the sides of all the hated corporations, irrespective of their merits or deserts. In my view that savors too much of "Donnybrook Fair." I like the expression of President Taft, who quietly reminded his hearers on one occasion, as I recollect it, that the phrase "all the people" means just what it says, and that "all the people" included also the corporations, which are made up of people just as much as a municipality is.

EVEN-HANDED JUSTICE.

The Public Service Commission is organized to hand out justice as near as it can determine it, both to shippers and to carriers, to consumers and to producers, and if it has attained some success in its work of the last five years, it has done so by a strict adherence to that view, and not by spectacular brandishings of the "big stick." It has accomplished more good by getting both parties before it, pointing out the strength or weakness of opposing views, and then appealing to that sense of fair play which is inherent in every man, than it ever has by a display of the tremendous powers which the law undoubtedly confers upon it.

AN AMERICAN FREIGHT CAR FOR USE IN GERMANY.

The Pressed Steel Car Company has shipped an all-steel general service gondola car to Heidelberg, Germany, which is believed to be the first case on record of a steel freight car of standard American design and construction being exported for use on the railroads of Germany.

Last autumn Frederick Schott, president of one of the largest German cement manufacturing companies, came to this country on a tour and while here made a careful study of freight cars in use in this country, with a view of ascertaining what advantages, in certain phases of transportation, the American types might possess over those in general use in Europe. For his particular purpose a car that could handle crushed stone, coal or other material that required dumping, as well as cement in bags or barrels, best loaded on a flat car, possessed many advantages.

Interior of General Service Gondola Car.

Mr. Schott therefore decided on a general service type of car and placed an order with the Pressed Steel Car Company for one of the standard cars of this kind manufactured by them.

The car, as will be seen from the illustration, is equipped with 16 drop doors, which are operated by a creeping shaft device, so that when closed they rest on a steel shaft and make a flat and rigid floor. The car weighs about 41,500 lbs., is 41 ft. 6 in. in length and is of 100,000 lbs. capacity. Air brakes, couplers, truck frames, bolsters and all other specialties are of American standard practice.

American General Service Gondola Car Built for Use in Germany.

THE EFFECT OF BLOCK SIGNALS AND AUTOMATIC STOPS ON ACCIDENTS.*

By A. G. Shaver,
Signal Engineer, Rock Island Lines.

It is to be regretted that the statistics of the Interstate Commerce Commission do not show exactly what accidents block signals would probably have prevented. Of the causes for train accidents, rear and butting collisions and broken rails may be considered as almost wholly preventable by block signals. Since there is some doubt as to just what is included under miscellaneous collisions, irregular track, derailments due to miscellaneous defects in roadway and derailments due to miscellaneous causes, the accidents so classed will also be considered as not having happened if the trains had been operated under block signals, although it is probable only a small percentage could have been so prevented. Of all these: rear collisions killed 117 and injured 2,019; butting collisions killed 157 and injured 3,136; miscellaneous collisions killed 100 and injured 2,656; broken rail derailments killed 52 and injured 1,065; irregular track killed 15 and injured 743; miscellaneous derailments due to defects in roadway killed 14 and injured 317; and derailments due to miscellaneous causes killed 129 and injured 1,663. The total of these is 584 killed and 11,599 injured, or 5.5 per cent. and 6.8 per cent., respectively, of the total killed and injured from all causes.

In the Interstate Commerce Commission report of block signals in service, as of January 1, 1912, 169 railroads report 176,847.7 miles of passenger lines (railways where more than one train is in operation at a time), of which 20,027.9 miles of two or more tracks and 56,381.8 miles of single track railway are equipped with block signals. Of the 43.2 per cent. of total passenger lines equipped with block signals, 11.49 per cent. are equipped with the automatic and 31.71 per cent. with the non-automatic system. This involves an approximate installation cost for the block signals in service of $48,300,000, and for those yet to be installed to completely equip all passenger lines, assuming the installation of automatics and non-automatics to continue in the same ratio, of $54,800,000, or a total of $103,100,000. There is also involved not less than an annual upkeep and operating expense for those block signals now in service of $10,000,000 and for those yet to be placed in service of $12,000,000, or a total of $22,000,000.

The block signal system as a means of preventing certain classes of train accidents is now generally recognized, and many railways are installing it along with other improvements as fast as their finances will permit. Several bills requiring the block system to be used are now pending in Congress. The best and fairest of these is the Esch bill. With a few changes and some modifications the railways could very well accept it. It is doubtful if there is any particular objection on the part of the railways to reasonable block signal legislation. Indeed, some railway managers have expressed themselves as in favor of it, for it would help them in obtaining the necessary money for installation and would compel those roads which have as yet done nothing to get busy.

During the last several years, there has been considerable agitation which would require the railways to install and use a system whereby the control and stopping of a train will be taken out of the hands of the engineman in case he fails to act when the necessity for controlling or stopping his train exists. This has continued, too, despite the fact that many of the accidents occurring would probably never have happened if an adequate block system had been in use.

An ideal train control system is one that will give the same results in service as a careful engineman. Thus far no such system seems to have been developed for general use, though hundreds of inventors have been at work on the problem and thousands of schemes have been patented. Most inventors seem to work with the idea of stopping trains, rather than of keeping them going safely, which is what the public really demands. Enough has been learned as to the probability and practicability of such devices to lead some signal engineers to conclude that the total cost for installation, maintenance and operation would be at least equal to that for block signals.

There is no difference between the automatic train control and the block system as to the results to be accomplished. Automatic train control is merely an agent to do what the engineman should do. The "surprise checking" on those roads where the block system is in use develops the fact that enginemen and trainmen are at least 90 per cent. efficient in observing and obeying the signal indications and the rules and instructions for the protection of trains. Hence, we can conclude that the automatic train control system would tend to prevent not more than 10 per cent. of the train accidents which are given above as preventable by the block system; i. e., it would save 58 persons or 55/100 of 1 per cent. of the total killed and 1,159 or 68/100 of 1 per cent. of the total injured for all causes.

No man is any better than any other in the eyes of his Creator. Because of this equality, is it not more humane and more reasonable that our energies and our resources should first be expended to eliminate those causes of railroad accidents that kill and injure the greatest number of persons? If this is so, then the trespasser should receive first attention. By a system of education, compulsion and punishment he must be made to keep at a safe distance from railway trains. This cannot be done by the expenditure of money alone. There must also be co-operation between the individual, the state and the railway.

* An address on "Railroad Accidents" delivered at Purdue University.

WEIGHING HEARING AT CHICAGO.

The final hearing, as far as the west is concerned, in the weighing investigation by the Interstate Commerce Commission, which has been in progress during the past year, was held at Chicago on February 26 and 27, before Commissioner Prouty; John T. Marchand representing the commission as attorney. The hearing was devoted almost entirely to the subject of weighing coal, and in addition various witnesses were given an opportunity to present their views as to some of the principal questions that have arisen in previous hearings.

M. N. Billings, assistant traffic manager of the Illinois Steel Company, testified as to methods of weighing shipments of iron and steel. He was followed by W. M. Hopkins, manager of the transportation department of the Chicago Board of Trade, who complained of the inaccuracy of grain weights obtained on the wagon scales of the railways in Chicago, on account of the lack of supervision, and asked to have this weighing done under the supervision of the Board of Trade. He also called to the stand Albert L. Somers, a grain commission merchant, who testified that grain cannot be sold from team tracks, except at a premium of from one-half to two cents above the market price, because of the risks to be expected in checking weights from wagon scales.

Mr. Cruikshank, representing the Streeter-Amet Weighing & Recording Scale Co., briefly described the automatic recording device manufactured by his company, which he said had been in use about 20 years.

W. F. Sheridan, inspector of transportation of the Louisville & Nashville, testified that on his line coal is weighed at or very near the mine, either on scales owned by the operators, or on the railroad track scales, using the tare weight as stenciled on the cars, and that the weights so obtained are used both for the assessment of freight charges and for making out the invoice. Where mine scales are used they are inspected in the same way that the railroad's own scales are inspected. There are no re-weighings, except for obvious discrepancies. He believed that weighing should be done at the point of origin, and that the roads should not be responsible for shrinkage in transit, due to evaporation of moisture. It is important to use point

of origin weights, not only for the purpose of assessing freight charges properly, but in order that trains may be made up according to the rated capacity of the engine. Grain is weighed in the same manner as coal, and no change is made after check weighing, except in the case of a discrepancy of 1,000 lbs. or over.

Charles Ware, general manager of the Union Pacific, was called to testify as to practices in the weighing of coal in Wyoming. He stated that most of the mines are equipped with their own track scales, and that coal weighed on these scales is not re-weighed by the railway. He also favored weighing at as near as possible to the point of origin, in order to secure the proper tonnage for locomotives. T. E. Brentnall, general scale inspector of the Union Pacific, supplemented Mr. Ware's testimony with technical details regarding the inspection of scales. He stated that on the Union Pacific all scales are examined once a month to see that the parts work freely, and that once in three months they are tested by a test car. Weights are taken while the cars are uncoupled and standing.

W. E. Wells, chief scale inspector of the Chicago, Burlington & Quincy, testified as to methods in the weighing of coal in Illinois, Iowa and Missouri. He said that most of the mines have track scales of their own, and that their weights are checked occasionally by the railway, which also inspects the scales once a month. John G. Crawford, fuel engineer of the Burlington, testified regarding the percentages of moisture in coal of various kinds and from various districts, and described a series of tests to show changes in weight of loaded cars due to evaporation or to rain while the coal was in transit.

F. C. Maegly, assistant general freight agent of the Atchison, Topeka & Santa Fe, agreed with the preceding witnesses as to the necessity for taking weights at the point of origin. He said that in the southwest some railways have provided for making an allowance for the loss of weight in washed coal due to evaporation. Some companies provide for weighing the coal eight or ten hours after it is loaded to allow time for water to run off. In the southwest coal weights obtained on mine scales are accepted by the carriers where the mines have weight agreements with the Western Railway Weighing Association & Inspection Bureau, which must have full control of the inspection of the scales. If a mine has no scale the coal is weighed at the nearest track scale of the railway, otherwise the railroads depend on the bureau to approve or condemn the scales and methods at the various mines. Coal is almost uniformly sold on the basis of the primary weight and the trade has been adjusted to it. It would entirely disarrange many features of the industry if this method were changed.

A. S. Dodge, superintendent of the Western Railway Weighing Association & Inspection Bureau, submitted a statement in addition to those he had submitted at previous hearings summarizing data for 10,501 cars weighed at 67 different points in the ordinary course of business, but which had been weighed for the purpose of the test, first uncoupled at only one end, and again uncoupled at both ends. The difference in weight was 13,960 lbs. less when cars were uncoupled at both ends, but in 8,996 cars there was no variation. The ordinary difference on the others was from 100 to 200 lbs. per car, although there was one case in which the difference was 1,980 lbs., which was being investigated. He thought the test showed conclusively the reliability of weighing cars coupled at one end. Commissioner Prouty insisted, however, that the test showed that, while there might be no variation in case the operation was properly performed, the fact that a car is coupled at one end introduces a chance for a mistake which may be small, or which may amount to a considerable difference, as in the case of the maximum difference found in the test. Mr. Dodge stated that 80 per cent. more time is required to weigh cars uncoupled at both ends.

W. J. Towne, general superintendent of the Chicago & North Western, testified regarding the scales and weighing practices of the North Western, saying that cars are usually weighed standing and uncoupled at one end, although [illegible] were weighed in motion. An effort was made to obtain the light weight of all cars once a year, but he thought it had never been completely successful. Scales at the mine are owned by the railway and invoices are made from the scale weights.

Oscar F. Bell, traffic manager of the Crane Company, and chairman of the weighing committee of the National Industrial Traffic League, discussed a large number of the causes for inaccurate weights. He agreed that weighing at or near the point of origin was necessary, but thought there should be some better method than exists at present of deciding which of two varying weights should be taken as the correct one. The stenciled tare weight of a car, he said, is almost always wrong, and in case of a difference between stenciled tare and track weights the scale weight should govern. He also believed that preference should be given to weights obtained on small scales, such as platform scales, over weights taken of an entire car and its load on a track scale. He thought notice ought to be given the shipper promptly in case of any change in the weight found by the carrier.

L. D. Davis, supervisor of scales and weighing of the Baltimore & Ohio, and A. B. Starr, general superintendent of freight transportation of the Pennsylvania lines, were prepared with a large amount of data to be used as arguments against destination weighing, but this line of testimony was made unnecessary by a statement from the commissioner that there had been no demand for destination weighing, and that the commission recognized the necessity for weighing at point of origin. Mr. Davis testified that discrepancies in the tare weight of cars are almost unavoidable, and that they frequently arise from rubbish left in the car. He disagreed with Mr. Bell that small scales would give more accurate weights than track scales, for the reason that the opportunity for error is multiplied when packages are weighed separately.

Eugene McAuliffe, general coal agent of the Frisco lines, gave a large amount of technical testimony in regard to the weighing of coal and the percentages of moisture found in different coals. He believed that, on account of the larger number of opportunities for error with small scales, weights taken on large scales would give better results, even though the smaller scale might be a more accurate machine.

At the Thursday morning session Mr. Maegly and Arthur Hale, general agent of the American Railway Association, announced that for several months a sub-committee of the committee on relations between railroads has been at work on a plan of uniform rules and specifications for weighing, which, it is hoped, may be in shape for adoption at the May meeting of the American Railway Association. The work has been subdivided so that the matter of technical construction and operation of scales will be reported upon by a committee consisting of A. F. Epright, of the Pennsylvania, and Mr. Davis, of the Baltimore & Ohio, while complete rules governing the entire matter of weighing, including the tariff rules, will be formulated by a committee consisting of Mr. Maegly and the managers of the various weighing and inspection bureaus. The committee had made a partial report to the November meeting of the American Railway Association, and new and improved rules for the light weighing of cars had been adopted, effective January 1. The technical committee expects to suggest complete specifications for standard scales, and for the best methods of installing, testing and using scales. The committee on rules may not be able to complete its work before the November meeting. The weighing committee of the National Industrial Traffic League has been asked to co-operate with the railway committees.

Mr. Hale submitted a list of points which he thought should be covered in the briefs and arguments to be filed with the commission, and made a statement in which he urged the commission not to adopt rules which would be so rigid as to deprive some roads of the incentive to strive for a higher standard. He thought that one of the dangers of government regulation was

the inclination to enforce average or compromise standards, and he thought that proper stimulation and encouragement of higher standards would bring better results. Commissioner Prouty made a statement in which he said that one of the principal questions to be considered was as to the extent to which federal control of weighing practices should be substituted for individual control. The important thing is to see that weights are made as nearly accurate as possible, and to provide methods by which controversies may be settled before the consignee has taken possession of the property. He thought the weighing should be done as early as possible after the shipment is turned over to the carrier. Many of the questions involved were such that the commission had no jurisdiction to make a formal order, for instance, it had no authority as to the matter of weighing in motion, but might make some strong recommendations on that point.

Further hearings will be held on March 10, at Philadelphia, and on March 17, at New York, for the purpose of receiving additional testimony regarding the weighing of anthracite coal. Those desiring to prepare briefs or submit arguments are to notify the commission prior to April 15, and Commissioner Prouty stated that final arguments will probably be heard about the first week in May.

FLASH LIGHTS FOR AUTOMATIC SIGNALS.

The Chicago Great Western has installed a Commercial Acetylene flashlight in one of its automatic block signals. This signal is No. 11-3, and is located about 200 yards east of the station at Maywood, Ill. It is a single-arm, upper-quadrant, three-position signal governing westbound movements. The

Acetylene Tank and Regulator for Flash-Light Signal.

light is of the standard type as manufactured by the Commercial Acetylene Railway Light & Signal Company, 80 Broadway, New York for railway signaling purposes. It flashes once each second, or 60 times a minute, and is lighted one-tenth of each second and dark nine-tenths. The flashing is continuous through all three indications of the signal. The light will burn 24 hours a day for nine months without attention. To disconnect the empty tank and connect up a full one takes 15 minutes. No relighting is necessary, as there is enough gas in the pipes to keep the flame going. The feed pipe from the tank is carried up to the lamp outside the signal post.

INCREASE IN MAIL PAY.

The post office appropriation bill as passed by Congress this week allows the postmaster general to increase, not exceeding 5 per cent., the contract compensation to be paid the railways for carrying the mails from July 1 next to the end of the present contract period, except on routes where the mail has been weighed since the beginning of the present year. This change in the law is made because of the increase in the weight of mail carried on account of the introduction of the parcel post, January 1, last; but it is only a small part of what the railroads have asked for. Ralph Peters, vice chairman of the committee on railway mail pay, has presented strong arguments to both congressional committees for a reasonable readjustment of the rates of pay, accompanying his statement with data concerning the increased weight of mails thrown upon the railroads since the establishment of the parcel post, which increase in many cases has amounted to 25 per cent. or more. With a 25 per cent. increase in weight and a 5 per cent. increase in compensation the railroads will be getting for the new business one-fifth the compensation that they should.

The annual appropriation for compensation of the railroads for the mails is about fifty millions and this, to anti-railroad congressmen, seems a huge sum; but Mr. Peters calls attention to the fact that the rural mail carriers receive 45 millions of dollars; the railway mail clerks 35 millions, and the letter carriers 37½ millions. The mail-pay committee will continue its campaign with the congressmen to secure a modification of the law so as to require the postmaster general to reweigh the mails at least once every year.

NEW YORK CITY SUBWAYS.

The New York State Public Service Commission, first district, on March 4 approved the operating contracts, which have been the subject of tedious delays and litigation since they were first proposed, many months ago, under which the Interborough Rapid Transit Company and the Brooklyn Rapid Transit Company are to operate new subways to be built in Manhattan, the Bronx and Brooklyn. The contracts, as now agreed upon, do not include the construction or operation of the proposed additional main tracks on the elevated lines on Third avenue and other avenues, this feature of the new system having been delayed by objections interposed at the last minute by owners of the Manhattan Elevated. Officers of the Interborough Rapid Transit Company, lessee of the Manhattan Company's lines, had agreed to all of the proposals of the city and state authorities, but they were surprised on the day on which the contracts were to be signed by the refusal of George J. Gould and other prominent owners of the elevated lines to agree to the proposed changes. Hearings will be given by the Public Service Commission March 15 on a proposal to authorize the Interborough Company to put up the proposed new elevated lines.

Argentine Railway Concessions.—The Argentine Director General of Railways is drafting a bill dealing with the conditions to be fulfilled by applicants for railway concessions. The object is to put a stop to acquiring concessions which will never be carried out and are obtained for speculative purposes, either by endeavoring to sell to an existing railway company whose zone has been invaded or for land speculation.

General News.

The annual meeting of the Burlington Association of Operating Officers was held at the general offices in Chicago on March 3, 4 and 5.

Suit was filed by the government on March 1, in the United States district court, at Chicago, charging the Chicago & Eastern Illinois with 104 separate violations of the hours of service law.

Officers of the Grand Trunk say that the increase in wages paid for organized labor for 1912 over 1911 amounts to $750,000, and that the increases for other classes of employees will amount to very nearly an equal amount; bringing the total wage increases for the year up to nearly $1,500,000.

The Cincinnati, New Orleans & Texas Pacific, which is now using the telephone for train despatching on 137 miles of its line, is to adopt the same plan on 117 miles additional. With this extension there will be left only 87 miles on which the telegraph is still in use for despatching.

Representative Curley of Massachusetts has introduced in Congress a bill looking to the amendment of the Constitution so as to give Congress the right to regulate hours of labor throughout the United States. Cotton and woolen manufacturers and other employers in Massachusetts suffer because of the lax labor laws in other states.

On recommendation of the Texas railroad commission it is said that the attorney general of Texas will institute proceedings for suits against the Timpson & Northwestern and the Jefferson & Northwestern railways to recover penalties aggregating $427,000 and $179,000, respectively, for alleged violations of the law requiring monthly reports to the commission.

On Tuesday, February 25, a French aviator, Marcel G. Brindejonc des Moulinais, flying in a monoplane, traversed the distance from Paris to London, 287 miles, at the rate of about 90 miles an hour. There was a dense fog when he crossed the channel. The aviator started at 9:15 a. m., landed at Calais at 10:50, resumed his flight at noon, and descended in London at 1:30.

Following a series of conferences between officers of the Illinois Central and of the Order of Railway Telegraphers a new contract has been made by which more than 1,000 of the company's operators will receive an increase in pay. The schedule is so arranged that the increases will apply in accordance with the responsibilities at different stations.

In the Federal Court at Buffalo, N. Y., March 4, fines aggregating $30,000 were imposed on the New York Central for discrimination in the assessment of demurrage charges on freight cars at East Buffalo. At the same time the Lake Shore & Michigan Southern paid fines aggregating $20,000, and the New York, Chicago & St. Louis $5,000, for violation of the 28-hour law regulating transportation of animals.

The Colorado House has passed a bill reducing passenger fares in the state. The rates in the plains district are to be two cents a mile where the annual gross passenger earnings exceed $1,000 per mile, and three cents a mile where the earnings are less than that amount. In the mountainous district the rate is to be three cents a mile where the earnings exceed $1,200 a mile, three and a half cents where they are less than $1,200 a mile, and 5 cents a mile for hauls of 10 miles or less.

The safety department of the Chicago, Burlington & Quincy, of which E. M. Switzer is the superintendent, has had a car fitted up especially for use in the "safety first" campaign. It is arranged similar to a small theater, having seats for 70 persons, and a platform with a large screen on which moving picture views will be shown during lectures to be given by Mr. Switzer. Lectures will be given from this car at prominent points on all parts of the Burlington system, the purpose being to have the car go to the men, instead of requiring the men to go to a hall to attend the lectures.

A "safety first" rally was held at Williamsport, Pa., on Monday evening last, participated in by officers and employees of the Pennsylvania, the Philadelphia & Reading, the New York Central and the Susquehanna & New York railroads. H. M. Carson, general superintendent of the Pennsylvania Railroad, presided. The principal address, which was accompanied by stereopticon views, was given by George Bradshaw, general safety agent of the New York Central. Mr. Bradshaw's lecture was preceded by a half dozen five-minute addresses by employees of the different roads, an engineman, a train master, an agent, a freight brakeman, a machinist and a passenger conductor.

To comply with the order of the Public Utilities Commission of Connecticut, and the recommendation of the Interstate Commerce Commission, the New York, New Haven & Hartford is rebuilding 78 crossovers between Boston and Woodlawn (New York) 220 miles; and at the same time will reconstruct 12 switch leads which are not in crossovers. In connection with this work 36 interlocking plants will have to be rebuilt, or extensively altered; and the estimated cost of the whole of the changes is $750,000. Forty-three of the crossovers are number 15, these having been installed in former years with the expectation of providing for all necessary movements of all classes of trains.

The Illinois Central was fined $2,000 in the federal court at Chicago on February 28, for violation of the safety appliance law, hours of service law, the law providing for the filing of reports with the Interstate Commerce Commission, and the law regulating the transportation of cattle. The Lake Erie & Western, the Lake Shore & Michigan Southern, and the Indiana Harbor Belt railways were fined in the United States court at Indianapolis on February 24, for violation of the hours of service law and the safety appliance law. Suit was filed in the United States district court at Chicago last week against the Chicago & Alton for 12 alleged violations of the hours of service law.

The Chicago plan commission has appointed a committee, consisting of Charles H. Wacker, W. D. Kerfoot, Clyde M. Carr, Michael Zimmer and James Simpson, to confer with officers of the Pennsylvania Lines; Chicago, Burlington & Quincy; Chicago, Milwaukee & St. Paul, and Chicago & Alton, with reference to the possible adaptation of their plan for the erection of the proposed union station to the "plan of Chicago," formulated by the commission. The committee will collect data and information to be presented to the railways in the effort to prove that a union terminal at Twelfth street is preferable to the site proposed by the railways between Jackson, Adams, Canal and Clinton streets.

President Percy R. Todd, of the Bangor & Aroostook, says that the action of his company in bringing suit against the Maine Central for damages is based on the refusal of the M. C. to continue an allowance to the B. & A. which was agreed upon in 1906 when the point of interchange for freight between the two roads was changed from Oldtown, Me., to Northern Maine Junction. In view of the disadvantage to the B. & A. resulting from this change the Maine Central was to pay it certain sums monthly, based on the amount of freight interchanged. These payments were made until May 1, 1911, when the M. C. refused to continue the allowance, thus depriving the B. & A. of upward of $75,000 a year.

"Safety first" reaches its highest development the farther ahead a dangerous condition can be seen; and according to "The Frisco-man," this was exemplified recently in a striking manner on a road in a southern state—not the Frisco road—when a locomotive engineman, running a fast train, on a very dark and rainy night, and approaching a street crossing, noticed sparks of light fluttering in the air. Recognizing this phenomenon as one commonly seen when a trolley slips off its wire, the engineman, surmising that possibly a street car was in trouble, shut off steam and slackened his speed. On reaching the crossing he found across his track a car, loaded with passengers, while the conductor was vainly trying to place the trolley in its position against the wire. The motorman was standing at his place on the car waiting for the connection to be made. No one had taken the precaution to watch for the express train.

Firemen's Wages.

William L. Chambers of Washington, D. C., formerly chief justice of the International Court at Samoa and member of the Spanish Treaty Claims Commission, has been chosen by Messrs. Knapp and Hangar to be the third member of the arbitration board which is to consider the Eastern firemen's demand for increased pay. Mr. Chambers was a member of the board

which, in May, 1910, arbitrated the wages of the firemen of 49 roads west of Chicago. The arbitrators, Messrs. Atterbury, Phillips and Chambers, will hold their first public session at Washington, D. C., March 10.

Pullman Cars on the New Haven.

That the Pullman Company now furnishes and operates the parlor and sleeping cars on the New York, New Haven & Hartford is a fact which, we trust, is by this time known to the readers of the *Railway Age Gazette*. We hope, therefore, that our devil-proof-reader will be forgiven for stating last week that the new parlor cars recently put on the Merchants' Limited were made by "Borman."

Proposed Legislation.

The lower house of the Indiana legislature has passed a bill limiting the length of freight trains to 85 cars.

A bill has been introduced in the Iowa senate requiring railways to pay claims within 90 days, subject to a penalty of $100.

A bill has been introduced in the senate of the Michigan legislature requiring railways to furnish cars to shippers within 72 hours, and refrigerator cars for perishable shipments within 18 hours.

A bill has been introduced in the Nebraska legislature which would require all railways in the state to employ train auditors to look after collections of tickets, leaving the conductor to run the train.

A bill has been introduced in the Michigan legislature requiring railways to furnish freight cars to shippers within 72 hours after the request is made, except in the case of refrigerator cars for perishable shipments, which shall be furnished within 18 hours.

A bill has been introduced in the Indiana legislature by Mr. McCabe to regulate demurrage on freight cars. Mr. McCabe would allow 72 hours' free time on a carload weighing from 30 to 40 tons; and 96 hours on shipments weighing more than 40 tons.

The railroad committee of the Kansas senate has amended the proposed full-crew law which it has had under consideration for several days, so as to require an additional brakeman only on trains of 50 or more cars, instead of 25 or more cars, as originally drafted.

The railway committees of the Michigan legislature have held hearings on a bill to authorize an additional charge when cash fares are paid on the trains. Conductors testified that without a penalty against the payment of cash fares too much of their time is taken up in making collections.

At a recent meeting of the Commerce Club of Pueblo, Colo., resolutions were passed expressing disapproval of bills pending in the legislature to compel railways to equip their locomotives with headlights of 1,200 c. p.; to compel railways to have a third man on all locomotives; and to prohibit running locomotives backward.

The Indiana legislature has before it a bill to amend the full crew law of the state so as to forbid the employment on trains of any person except men regularly employed as enginemen, firemen, conductors and brakemen. F. A. Feick claimed that the railroads were flagrantly violating the present law by classing colored porters as brakemen.

A bill has been reported in the Missouri senate providing that when rates fixed by statute are made inoperative on account of litigation, railways or public utilities are required to give rebate tickets providing for a refund in the event the statutory rate is upheld. The corporations are required to file an itemized statement of the overcharges with the state twice a year, so that the state may bring suit against the corporations for a return of the excess collections, to be distributed among the holders of the rebate tickets. Another bill provides that, as an inducement to railways and other public utilities to pay claims without litigation, judgments in courts of original jurisdiction will be reduced one-half in case the corporation chooses to pay without appeal.

Suits have been filed in the federal court at Danville, Ill., charging the Mobile & Ohio with transporting sheep from the quarantine district of Jordan, Ky.; the Chicago & Alton with three violations of the federal hours of service law; the Illinois Central with one violation of the law regulating the transportation of live stock; the Merchants' Bridge Company of St. Louis with 29 violations of the hours of service law; the Terminal Railroad Association of St. Louis with 68 violations of the hours of service law, and the Chicago, Burlington & Quincy with three violations of the hours of service law. Four railways were fined in the United States district court at Chicago on February 21, for violations of the law regulating the transportation of live stock. The Chicago, Milwaukee & St. Paul was fined $1,200, the Michigan Central $200, the Minneapolis, St. Paul & Sault Ste. Marie $400, and the Cleveland, Cincinnati, Chicago & St. Louis $200.

The Nebraska railway commission has issued a statement saying that the passage of the Keckley bill to reduce freight rates in the state 20 per cent., now pending in the legislature, would seriously hamper it in securing reasonable rates, because it has already, after an exhaustive investigation, issued a general order setting forth a tentative distance schedule of reduced class rates which it has held up awaiting the decision of the Supreme Court in the Minnesota rate case. If this decision when rendered shall leave it within the power of the several states to regulate their intrastate rates the commission will proceed with its investigation, following such principles as may be laid down in that decision, and will make such reductions as it is reasonably satisfied it can sustain in the courts. Representatives of the railways presented arguments against the bill at a hearing before the house committee on railroads on February 19, and showed that Mr. Keckley's comparisons of earnings in the states of Nebraska and of Iowa were based on a division of earnings and expenses published in a report of the Iowa railway commission which has since been repudiated by the commission as unreliable; and that in his comparison with Iowa and Nebraska local rates, he had used the exceptional joint rates which are 80 per cent. of the standard local rates.

President Wilson's Cabinet.

In the cabinet of the new president, as announced from Washington, this week, William G. McAdoo, of New York City, president of the Hudson & Manhattan Railroad, is Secretary of the Treasury, and Franklin K. Lane, hitherto chairman of the Interstate Commerce Commission, is Secretary of the Interior.

Beats the New York Subway.

"The Panama Canal Railroad can boast of the biggest labor train in the world," says a recent traveler. "The train is run for the accommodation of the workmen living between Panama City and Pedro Miguel, and those working at the locks at Culebra cut. There are 22 cars in the train and the average number of passengers is estimated to exceed 2,000. Three are for 'gold employees,' a term used to designate those paid in United States currency; five cars are for 'silver employees,' or those paid in Panama currency, and the remaining cars are for negroes.

"Each of the cars for gold employees will carry fifty to seventy passengers without crowding, while those for silver or European employees are packed tightly; and those for negroes are filled like sardine tins. In fact, according to the conductor of the train, the average number of negroes in a car was 165."—*New Orleans Picayune.*

The Grand Trunk Line to Providence.

President E. J. Chamberlin of the Grand Trunk appeared before the legislature of Rhode Island last week and told Governor Pothier and the legislators that if the state would guarantee the bonds of the Southern New England to the amount of $5,000,000 the company would resume work on the line in the spring. By a law passed in Canada while the late president Hays was in Europe the Grand Trunk can secure new capital for improvements only in case these are to be made in Canada. Mr. Chamberlin said that the Central Vermont would guarantee the bonds of the Southern New England and that all that was asked of Rhode

Island was to put the guarantee of the state after that of the C. V. It is expected that the legislature will submit the question to a vote of the citizens. Mr. Chamberlin is reported as saying that officers of the Grand Trunk had estimated that the Southern New England line from Palmer to Providence would be self-supporting. Vice-President M. M. Reynolds of the Grand Trunk, asked about the original plans for the financing of the Southern New England, said that these were known only to Mr. Hays; whatever plans he had in his mind perished with him when the *Titanic* sank.

On Monday of this week during the absence of Governor Pothier in Washington, a committee of 19 state officers and prominent citizens which had been appointed by the governor and asked to consider the proposed plan, voted that under no circumstances should the state of Rhode Island guarantee the bonds of the Southern New England Railway.

The Bureau of Explosives.

Colonel B. W. Dunn, chief inspector of the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles, has issued a circular calling attention to the advantages of associate membership in the bureau. The constitution of the bureau is now so amended that manufacturers and others interested can become associate members at a cost of $25 a year. Shippers and makers of chemicals and other dangerous articles not classed as explosives, are now joining the bureau. This organization is now more than seven years old, and, with the co-operation of the federal government, is a most useful and important instrumentality for safe railway operation and railway travel. Railway officers desiring to interest shippers in the bureau can secure circulars and blank applications for membership by sending to Colonel Dunn, 30 Vesey street, New York City.

A Signal Instructor on the North Western.

The Chicago & North Western, on March 1, created the position of signal instructor. The duties of the incumbent of this position are to instruct and educate enginemen, trainmen and other employees on signals and signal indications and the observance of them. Lectures will be given periodically at all the division points and at other places where automatic signals are in service or at which there are a number of interlocking plants.

A passenger car has been remodeled and fitted up for the use of the instructor, and its equipment includes a stereopticon; and also a "radiopticon," an instrument for projecting photographs and drawings without the necessity of having slides made for them. Pictures are to be taken of every indication and aspect which can be given or shown by the various types of signals at present in use on the road, and also by any signals the appearance or placing of which is out of the ordinary on account of local conditions or surroundings. The observance of switch signals and indicators, and train operation at interlocking plants will be carefully explained and illustrated in the lectures. The rules governing all signaling facilities will also be the subjects of frequent talks. C. G. Stecher, who has been supervisor on the terminal at Chicago, has been appointed signal instructor. (See Railway Officers department.)

Proposed New Bridge at New London.

Engineers of the New York, New Haven & Hartford are completing plans for a new steel bridge over the Thames river at New London, Conn. This bridge is to take the place of the present one, which was opened in October, 1889, and which cost over $1,000,000. The details of the new structure are not yet fully determined. The plans call for a four-track bridge, consisting of two double-track parallel spans. The height of the bridge above the bottom of the channel will be 140 ft. There are to be five fixed spans, four of which will be of 195 ft. each and one of 245 ft., and also one draw span having a clear channel of 150 ft.

The cost of building the new bridge, including certain sections of the approaches, is estimated at about $4,000,000. The present structure has been offered to the state of Connecticut as a feature of its highway program and a bill has been introduced in the legislature providing for the acceptance of this offer. The railroad company reserves the right to run trolley cars over the bridge. Announcement of the complete plans will probably be made soon, but the beginning of work on the bridge depends on what is to be done with the old structure.

Railway Signal Association.

At the regular meeting of this association in Chicago, March 17, seven committee reports will be brought up for discussion. Committee No. 3, Power Interlocking, will present specifications for annunciator bells; for push buttons; floor pushes; for fuses; for steel pipe conduit; and for wrought iron pipe conduit. Committee No. 5 will present a code of rules for the operation and maintenance of interlocking plants. Committee No. 6 will present standard drawings for anchor post; location for detector bar and clip bolt; stuffing box for 1 in. pipe; stuffing box for wire; connections for double switches; and details for lock rod and operating connections. Committee No. 8 will present additions to specifications and requisites for alternating current automatic block signal systems on steam railways. Committee No. 9 will present revised specifications for galvanized steel wire for mechanical connections. Committee No. 10 will submit information concerning Edison storage batteries and specifications for lead type stationary storage batteries; also a drawing of a motor panel. The special committee, W. L. Manual, chairman, will present a progress report on blanks and rules for recording signal performance.

Program of the American Railway Engineering Association.

The following is the program for the convention of the American Railway Engineering Association, which will be held at the Congress hotel, Chicago, on March 18-21, inclusive:

Morning Sessions—9:00 a. m. to 12:30 p. m.
Afternoon Sessions—2:00 p. m. to 5:30 p. m.

TUESDAY, MARCH 18.

President's Address.
Reports of Secretary and Treasurer.
Reports of Standing and Special Committees.
XII. Rules and Organization.
X. Signals and Interlocking.
XV. Iron and Steel Structures.
V. Track.
IV. Rail.
Reception at 8:00 p. m.

WEDNESDAY, MARCH 19.

XVI. Economics of Railway Location.
VII. Wooden Bridges and Trestles.
(Special) Uniform General Contract Forms.
XVII. Wood Preservation.
III. Ties.
IX. Signs, Fences and Crossings.
VIII. Masonry.
Annual Dinner at 7:00 p. m.

THURSDAY, MARCH 20.

XIX. Conservation of Natural Resources.
II. Ballast.
VI. Buildings.
VIII. Water Service.
XIV. Yards and Terminals.
(Special) Grading of Lumber.
I. Roadway.
XVIII. Electricity.
XI. Records and Accounts.
New Business.
Election and Installation of Officers.
Adjournment.

FRIDAY, MARCH 21.

Visit to National Railway Appliances Exhibition in the Coliseum and Armory.

The Board of Direction will give a reception on Tuesday evening to the members and guests. A musical program will be presented, and Past President William McNab will give an illustrated talk on the Panama Canal.

The annual dinner will be held in the Gold room of the Congress hotel on Wednesday evening. B. A. Worthington, president of the Chicago & Alton, will give an address entitled Look-

ing Into the Future; George A. Post of New York, president of the Railway Business Association, will speak; Rev. R. W. Dickie of Montreal, Can., will speak on Internationalism and P. G. Rennick, of Peoria, Ill., on the Twentieth Century Pattern.

American Society of Mechanical Engineers.

The railway committee of the American Society of Mechanical Engineers has arranged for the discussion of the subject of Steel Passenger Car Design in its various phases at a meeting to be held April 8. The following have accepted an invitation to discuss various phases of the subject: Problem of Steel Car Design, W. F. Kiesel, Jr. (Penna. R. R.); Suspension of Steel Cars, E. W. Summers, president, Summers Steel Car Company; Trucks for Steel Passenger Cars, J. A. Pilcher (N. & W.); Provision for Electric Lighting in Steel Cars, H. A. Currie (N. Y. C. & H. R.); Provision for Electrical Equipment on Steel Motor Cars, F. W. Butt (N. Y. C. & H. R.); Special Ends for Steel Passenger Cars, H. M. Estabrook, president, Barney & Smith Car Company; Draft Gears for Steel Passenger Cars, S. P. Bush, Buckeye Steel Castings Company; Cast Steel Double Body Bolster and End Frames for Steel Cars, C. T. Westlake, Commonwealth Steel Company.

Other subjects which will be discussed are as follows: Introduction to General Discussion of Steel Passenger Cars; Superstructure of Steel Cars; Roof Structure for Steel Cars; Interior Steel Finish for Steel Passenger Cars; Corrosion and Protection of Steel Passenger Cars; Air Brakes for Heavy Steel Passenger Cars; and Special Pressed Steel Shapes for Steel Cars.

The chairman of the Railway Committee is E. B. Katte, chief engineer, Electric Traction, New York Central & Hudson River, New York.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

W. E. Price has been appointed agent of the land and industrial department of the Southern Railway at Harrisburg, Pa.

During the month of January 121 cars of emigrants from 14 states were moved over the St. Louis, Brownsville & Mexico.

Dr. William T. McElveen, pastor of the First Congregational Church of Evanston, addressed the Traffic Club of Chicago at a luncheon, February 27.

The railways in the Western Passenger Association have decided to discontinue all party fares in the territory between Chicago and the Missouri river from and after March 15. They have also decided to abolish special rates for the transportation of railroad laborers, except over the lines on which they are to be employed.

On the opening of a new station at Union Hill, Jamaica, N. Y., the Long Island Railroad Company will adopt a new tariff of passenger rates in which there will be some increases in fares as well as some reductions. The changes are mostly for short distances, on single trip and round trip tickets; usually one, two or three cents.

The secretary of agriculture has released from quarantine 19,490 square miles in the southern states, in which hitherto shipments of cattle have been restricted or forbidden because of the prevalence of cattle ticks. Since the work of eradicating the ticks was begun in 1906 more than 187,000 square miles have been cleared. A map showing the quarantined territory and the areas that have been released can be had upon application to the secretary at Washington.

The New York Central and the New York, New Haven & Hartford have secured from the Appellate division of the Supreme Court of New York a writ of certiorari which will suspend the order of the Public Service Commission reducing fares on these roads in the suburban district adjacent to New York City. According to the order of the court the roads will continue charging the fares now in effect, but will give to each purchaser a certificate to the effect that, in case the order of the commission reducing the rates shall finally be sustained by the Court, the difference between the high and the low rate will be refunded.

Inefficiency of Our Paternal Government.

According to a recent press despatch from Brownsville, Tex., an express car shortage has been causing great anxiety in that region. In Brownsville, alone, there were 50 carloads of lettuce awaiting shipment. The express companies could not furnish refrigerator cars for ten days. One firm telegraphed the Interstate Commerce Commission and also the State Railroad Commission asking aid.

Summary of Revenues and Expenses of Steam Roads in December.

The Bureau of Railway Economics' summary of revenues and expenses and comments for December, 1912, are as follows: The railways whose returns are included in this bulletin operate 221,077 miles of line, or about 90 per cent. of the steam railway mileage of the United States. Total operating revenues for the month of December, 1912, amounted to $257,685,590. Compared with December, 1911, the total operating revenues of these railways show an increase of $29,154,221. These total operating revenues per mile of line amounted to $1,166 in December, 1912, and $1,050 in December, 1911, an increase of $115, or 11.0 per cent. Freight revenue per mile increased 13.2 per cent., and passenger revenue per mile 5.6 per cent.

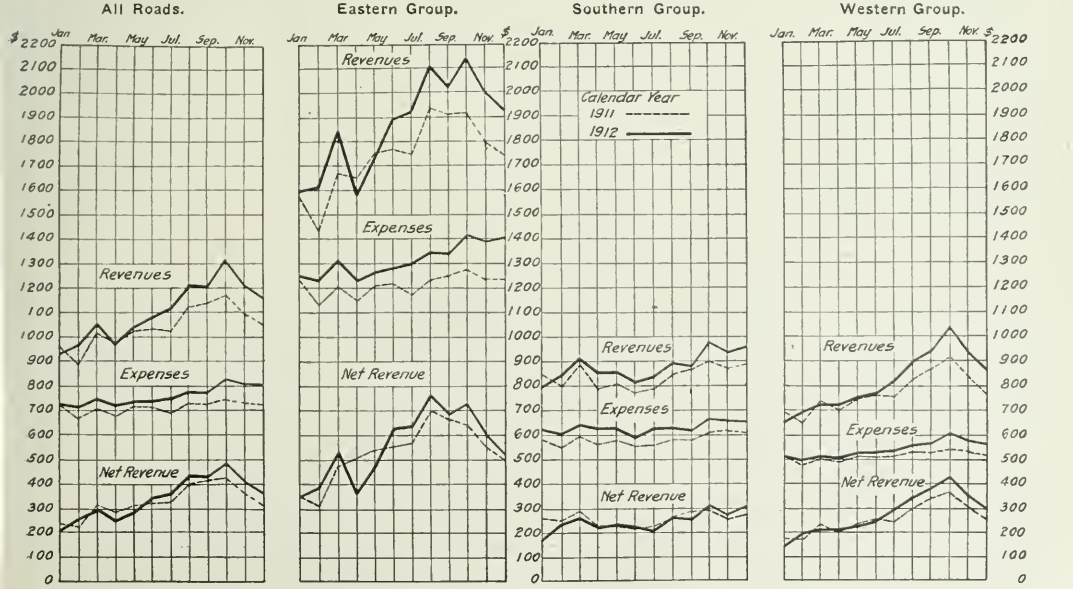
Operating expenses amounted in December to $177,690,984. This was $20,467,731 more than for December, 1911. These operating expenses per mile of line amounted to $804 in December, 1912, and $723 in December, 1911, an increase of $81 per mile or 11.2 per cent. All the five primary operating expense accounts showed increases per mile over 1911.

Net operating revenue amounted in December to $79,994,606. This was $8,686,490 more than for December, 1911. Net operating revenue per mile of line amounted to $362 in December, 1912, and $328 in December, 1911, an increase of $34 per mile, or 10.4 per cent.

Taxes for the month of December amounted to $10,501,960, or $48 per mile, an increase of 3.0 per cent. over December, 1911.

Operating income amounted in December to $315 per mile of line, and in December, 1911, to $282. This was an increase of $33, or 11.8 per cent. Operating income for each mile of line for each day in December averaged $10, and for December, 1911, $9. This is the amount available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The operating ratio for December was 69.0 per cent., which is



Monthly Revenues and Expenses Per Mile of Line in 1911 and 1912.

comparable with 66.4 per cent. in November, 1912, and 68.8 per cent. in December, 1911.

The eastern group of railways shows an increase in total operating revenues per mile of line as compared with December, 1911, of 10.7 per cent., the southern group an increase of 8.0 per cent., and the western group an increase of 12.9 per cent. Operating expenses per mile increased 13.6 per cent. on the eastern railways, 7.7 per cent. on the southern railways, and 10.4 per cent. on the western railways. For the eastern group of railways net operating revenue per mile increased 3.5 per cent., for the southern group it increased 8.6 per cent., and for the western group it increased 17.9 per cent. The increase in taxes per mile was 3.3 per cent. in the eastern group, 5.5 per cent. in the southern group, and 2.2 per cent. in the western group. Operating income per mile increased 3.6 per cent. in the eastern group, 8.9 per cent. in the southern group, and 21.1 per cent. in the western group.

Comparison of the returns for the six months of the fiscal year with those of the corresponding months of the previous fiscal year reveals an increase in total operating revenues per mile of 9.6 per cent., an increase in operating expenses per mile of 9.0 per cent., and an increase in net operating revenue per mile of 10.8 per cent. This net operating revenue per mile of the eastern group of railways increased 8.5 per cent., as compared with the corresponding period of the previous year, that of the southern group increased 1.5 per cent., and that of the western group increased 16.1 per cent.

Compilation of December returns makes possible a summary of the earnings and expenses of the railways having total operating revenues of $1,000,000 and over for the calendar year 1912. These lines include 90 per cent. of the steam railway mileage of the United States.

Total operating revenues for 1912 amounted to $2,923,936,957. This is equivalent to an increase over the previous year of $787, or 6.3 per cent. per mile of line. Freight revenue per mile increased 8.1 per cent., and passenger revenue per mile 1.0 per cent. Operating expenses increased $585 per mile, or 6.8 per cent., and net operating revenue per mile increased $201, or 5.1 per cent. There was an increase in taxes per mile of 7.7 per cent. Operating income per mile of line increased $163, or 4.7 per cent.

The results by groups are as follows: Net operating revenue per mile increased 4.9 per cent. on the eastern group of railways, and 8.4 per cent. on the western group, but decreased 3.1 per cent. on the southern group. All three groups show increases in total operating revenues per mile and in operating expenses per mile, but it is in the southern group alone that these increased operating expenses overbalance the increase in revenues. Taxes per mile increased 8.0 per cent on eastern railways, 2.8 per cent. on the southern railways, and 9.3 per cent. on the western railways. Operating income per mile increased 4.3 per cent. on the eastern group of railways; increased 8.4 per cent. on the western group; it decreased 4.0 per cent. on the southern group.

The diagram shows the variations in total operating revenues, operating expenses and net operating revenue per mile for separate months of the calendar years 1911 and 1912. The following table shows the per cent. of operating revenues consumed by each class of expenses:

Per Cent. of Total Operating Revenues.

	December		Fiscal year ending		Calendar year ending	
	1912.	1911.	1912.	1911.	1912.	1911.
Maint. of way and structures	11.8	11.1	12.7	12.9	12.8	12.7
Maint. of equipment	16.2	15.9	15.8	15.5	16.0	15.7

*Denotes deficiency.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until June 28 the operation of certain tariffs which provide for the discontinuance of free store-door delivery and pick-up service now maintained by the Baltimore & Ohio and the Pennsylvania Railroad in Washington, D. C. This service is extended to shippers and consignees on less than carload shipments originating at or destined to points north of Wilmington, Del., including New York and Boston.

President Wilson on Wednesday last nominated John H. Marble, Secretary of the Interstate Commission, to be a member of the commission in place of Mr. Lane, who becomes Secretary of the Interior. He also nominated for another term Edgar E. Clark, member of the commission, whose name was sent to the Senate three months ago by President Taft. His nomination has now been confirmed by that body. John H. Marble, for the past 12 months secretary of the Interstate Commerce Commission, was an attorney for that body for several years before he was appointed to the secretaryship. He came to the commission from California, in 1906, as a confidential clerk. He was born at Ashland, Neb., in 1869, and was educated at the University of Nebraska. He was in the newspaper business in South Dakota, Wyoming and in California (San Francisco) and was admitted to the bar in California in 1902.

J. H. Marble.

Coal Rates from Iowa to the Dakotas.

In re investigation and suspension of advances in rates by carriers for the transportation of coal in carloads from mines in Iowa to stations in South Dakota, North Dakota and Montana. Opinion by the commission:

The commission found that the defendants had not justified the advances in the rates in question and ordered them to withdraw the suspended tariffs. (26 I. C. C., 144.)

Cottonseed Rates Not Advanced.

In re advances in rates on cottonseed from points in Oklahoma to Little Rock, Ark. Opinion by Commissioner Prouty:

The commission found that the tariffs canceling present joint rates and through rates on cottonseed from points in Oklahoma to Little Rock, Ark., must be withdrawn. (26 I. C. C., 211.)

Rates on Yellow-Pine Lumber Reduced.

Davis Brothers' Lumber Company, Limited, v. Chicago, Rock Island & Pacific et al. Opinion by Commissioner Meyer:

The commission found that the rates on yellow-pine lumber in carloads from Ansley, Bernice, Dubach, and Wyatt, La., to Louisville, Ky., of 25 cents, and to Cincinnati, Ohio, of 27 cents are unreasonable to the extent that they exceed 21 cents to Louisville and 23 cents to Cincinnati, and that for the future the defendants should establish joint rates from and to said points which are not in excess of the rates last named. (26 I. C. C., 257.)

Rates on Nuts Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of edible nuts from New Orleans and Port Chalmette, La., to St. Louis, Mo., and other points. Opinion by Commissioner McChord:

The proposed increased rates on edible nuts from New Orleans and Port Chalmette, La., to St. Louis, Mo., and other points were found not to be unreasonable. The [illegible] was vacated. (26 I. C. C., 213.)

Minimum Weights on Corn.

In re investigation and suspension of advance in minimum weight on ear corn, snapped corn, and corn in the shuck in carloads by carriers operating in Southwestern Lines territory.

The proposed advance in the minimum weight on ear corn, snapped corn, and corn in the shuck in carloads throughout southwestern lines territory, to 40,000 lbs. was not found to be justified. A flat minimum weight of 40,000 lbs was found to be reasonable, however, when standard 36-ft. cars or larger are furnished. An order was entered requiring the carriers to cancel the suspended schedules and to maintain the present minimum-weight rule on cars smaller than the standard 36-ft. cars and to establish a 40,000-lb. minimum weight applicable to larger cars. (26 I. C. C., 197.)

Rates on Fuel Wood Not Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of fuel wood, sawdust, and shavings from stations in Wisconsin and Michigan to Evanston, Ill., and other points. Opinion by Commissioner McChord:

The proposed advanced rates on fuel wood, sawdust, and shavings from stations in Wisconsin and Michigan to Evanston, Ill., and other points were found to be unreasonable. The defendants were ordered to withdraw the suspended tariffs. (26 I. C. C., 254.)

Rates on Fresh Meats Not Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of fresh meats and packing-house products from Oklahoma City, Okla., and other points to points in the state of New Mexico. Opinion by the commission:

The proposed advances in rates on fresh meats and packing-house products from Oklahoma City, Okla., Fort Worth, Tex., and Wichita, Kan., to all points on the line of the Atchison, Topeka & Santa Fe in New Mexico, excepting coast line points west of Albuquerque, N. Mex., were not shown to be reasonable. The commission ordered the defendant to withdraw the suspended tariff. (26 I. C. C., 154.)

Rates on Sash, Doors and Blinds Not Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of sash, doors and blinds from stations in Louisiana to stations in Texas and between other points. Opinion by Commissioner McChord:

The present rate on sash, doors and blinds between the points in question is the same as the lumber rate. The defendants contend that these products should take a higher rate than the lumber rate, which they said was low and highly competitive in the territory involved. As the reasonableness of the lumber rate was not shown, the commission had to consider the reasonableness of the rate in question without relation to the lumber rate. After looking into the matter of per ton mile revenue, the commission decided that the proposed rate had not been shown to be reasonable and ordered the defendants to withdraw the suspended tariff. (26 I. C. C., 116.)

Fertilizer Rate Reduced.

Meridian Fertilizer Company v. Vicksburg, Shreveport & Pacific et al. Opinion by Commissioner McChord:

Rate of 12 cents per 100 lbs. for the transportation of fertilizer in carloads from Shreveport, La., to Junction City and El Dorado, Ark., was found to be unreasonable to the extent that it exceeds 11 cents, which rate is prescribed for the future. (26 I. C. C., 224.)

Complaint Dismissed.

Mansfield Hardwood Lumber Company v. Tremont & Gulf et al. Opinion by Commissioner Prouty:

The complainant contends that the rate of 31 cents per 100 lbs. for the transportation of cross ties in carloads from Eros, La., to Laredo, Tex., via Winnfield, La., was unreasonable and seeks reparation. The commission found that the joint rate on cross ties from Eros to Laredo via Tremont, Tex., was 25 cents

per 100 lbs. The commission decided that under the circumstances it should not establish a joint rate between the two points in question via Winnfield, a longer and more unnatural route, and also that the rate charged was not unreasonable. (26 I. C. C., 138.)

Ozark Cooperage & Lumber Company v. St. Louis & San Francisco et al. Opinion by the commission:

In this case the complainant contends that the rates for the transportation of cooperage stock from Black Rock, Trumann and Grassy Lake, Ark., to Brownsville, Tex., are unreasonable. The rate from Trumann and Grassy Lake was 42 cents per 100 lbs., and the rate from Black Rock was 47 cents per 100 lbs. The commission decided that these rates were not found to have been unjust or unreasonable. Since the complaint was filed the rates from all the points of origin in question to Brownsville have been reduced to 29 cents per 100 lbs., which is lower than the rate to Arkansas by the complainant. (26 I. C. C., 132.)

Union Tanning Company et al. v. Southern Railway et al. Opinion by Commissioner Clements:

The present adjustment of rates on leather from tanning points in western North Carolina on the lines of the Southern Railway was not found to be unjustly discriminatory or unreasonable. Where the other facts and conditions are substantially uniform or similar, distance may become the dominating factor in the relative adjustment of rates, but by reason of the existence of controlling facts and conditions it may be a minor factor. The weight to be given a comparison of distances varies in different cases and the reasonableness of rates should be determined by considering all of the facts standing together in each case. (26 I. C. C., 159.)

Coal Rates Not Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of soft coal in carloads from Illinois mines to Clinton, Iowa, and other points on the Chicago, Burlington & Quincy. Opinion by Chairman Lane:

The commission found that the proposed advances in the rates on soft coal in carloads from certain mines in Illinois to Clinton and Lyons, Iowa, were not shown to be reasonable, and ordered the defendants to withdraw the suspended tariffs. (26 I. C. C., 179.)

Lumber Rates Not Advanced.

In re investigation and suspension of advances in rates for the transportation of cypress lumber, laths and shingles from points located on the New Orleans, Texas & Mexico to Albany, N. Y., and other points. Opinion by Chairman Lane:

The proposed advances in rail-water-rail rates on cypress lumber from points on the New Orleans, Texas & Mexico, between Baton Rouge and New Orleans, to interior points in the north Atlantic states were not justified. An order will be issued requiring the carriers to cancel the item proposing these advances. (26 I. C. C., 186.)

Rates on Coal Not Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of coal in carloads from Hillsboro and other points in Illinois to Davenport, Iowa, and other destinations in Illinois and Iowa. Opinion by Chairman Lane:

The commission found that the proposed increases in the rates in question had been filed with the idea of securing for the mines on the lines of one of the defendants a differential in the rate which would give to such mines an advantage over other mines which had hitherto been given the same rate basis. The commission ordered the defendants to withdraw the suspended tariffs. (26 I. C. C., 140.)

Soft Coal Rates Not Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of soft coal and soft coal briquettes from southern Illinois mines to stations located on the Gould Southwestern in Arkansas. Opinion by Commissioner McChord:

The existing rates in question range from $2.25 per ton to $2.45 per ton, and the proposed advances range from 10 cents to 50 cents per ton. The defendants contend that these rates were established in anticipation of shipments of domestic coal, but that the only shipments that had been made were to the Gould Southwestern for their engine purposes. The commission found that the proposed advances were not shown to have been unreasonable and dismissed the complaint. (26 I. C. C., 135.)

Sugar Rates Reduced.

W. H. Edgar & Son v. Louisville & Nashville et al. Opinion by Commissioner Harlan:

In this case the complainants contend that the rates for the transportation of beet sugar in carloads from Cincinnati, Ohio, to Knoxville and Chattanooga, Tenn., are unreasonable. No testimony was offered upon which the commission might base any conclusion as to the reasonableness of these rates except by measuring them in their relation to rates in effect elsewhere on the same or related commodities. The commission found that, as compared with the hauls from Baltimore and New Orleans, the through charges exacted of the complainants on shipments to Knoxville and Chattanooga were discriminatory and should be corrected. The part of the through charges which accrues to the defendants' lines south of the Ohio river is the seat of the trouble, and those carriers will be required at once to readjust the rate situation. (26 I. C. C., 181.)

Powerless to Compel Switching Service.

Morris Iron Company et al. v. Baltimore & Ohio et al. Opinion by Chairman Prouty:

In this case the complainant asks the commission to compel the Baltimore & Ohio and the Northern Central to establish switching arrangements with the Frederick Railroad at Frederick, Md. A connection would have to be built between the tracks of the Baltimore & Ohio and those of the Frederick Railroad. The Northern Central now has a connection with the Frederick Railroad, but declines to interchange any cars with that road. The defendants contend that the Frederick Railroad is a part of the Western Maryland and that if they established the switching arrangements in question they would be opening up their terminals to a competitor. The commission found that the terminals of the Frederick Railroad at Frederick were larger than those of either the Baltimore & Ohio or the Northern Central. Under the present arrangement the rates from Frederick to points in the Southeast via the Frederick Railroad are greatly in excess of those via the lines of the defendants. As the Frederick Railroad was not a lateral branch line, the commission could not order a connection between it and the Baltimore & Ohio. The third section of the act to regulate commerce provides that no railroad may be required to give the use of its track or terminal facilities to carriers engaged in like business. Even though the Frederick Railroad would lose by the exchange of terminal facilities with the defendants, the commission was without authority to grant the request of the complainant. The commission found that more industries at Frederick were located on the lines of the Frederick Railroad than on the lines of either of the two defendants and also that if the switching arrangements sought by the complainant were established none of the roads would sustain a serious loss, but the shippers would benefit materially. The commission recommended that a switching connection be made between the Baltimore & Ohio and that the three roads in question enter into reciprocal switching arrangements upon the basis of charges, which, whether stated by the car or by the 100 pounds, should not exceed $5 per car. As the commission did not have the authority to require this, the complaint was dismissed. (26 I. C. C., 240.)

Responsibility for Furnishing Cars.

In re investigation and suspension of advances in rates by carriers for the transportation of coal from points on the Stony Fork branch of the Louisville & Nashville to various destinations. Opinion by Commissioner Meyer:

The tariffs under suspension propose to cancel the joint rates on coal from points on the Stony Fork branch of the Louisville & Nashville to southeastern territory. The purpose of this proposed change is to relieve the Louisville & Nashville of the

responsibility of the initial carrier and of furnishing cars. The shipments from points on the Stony Fork branch to southeastern territory move to Middlesboro, Ky., over the line of the Louisville & Nashville and thence to destination via the Southern Railway. The Louisville & Nashville contends that the service it performs in this traffic is merely a switching service and it is, therefore, not required to furnish cars for coal destined to move from Middlesboro via the Southern Railway. The Southern Railway contends that it is not the initial line and, therefore, it is under no obligation to furnish cars for loading at mines on the Stony Fork branch. During the latter part of the summer of 1911 both defendants refused to furnish cars, but the Commerce Court placed upon both the obligation to furnish cars for this traffic. The commission finds that, as the service performed by the Louisville & Nashville has already been treated as a line haul in tariffs published by it, it cannot now treat it as a mere switching movement. The carrier, upon whose line shippers are located, must assume the responsibility of furnishing transportation facilities. The Louisville & Nashville is not justified in attempting to avoid the responsibility which rests upon it as the initial carrier in regard to this traffic. Were the proposed tariffs to become effective, the mines of the Stony Fork branch would be discriminated against in favor of their competitors situated on the Cumberland Valley division of the Louisville & Nashville. The Louisville & Nashville will not be compelled to furnish exclusively its own equipment for the traffic moving from the Stony Fork branch to the Southeast under the present tariffs, for the Commerce Court has placed this responsibility upon both. Should the defendants be unable to agree among themselves upon the manner of car distribution, the commission will give that question further consideration. The commission ordered the defendants to withdraw the suspended tariffs. (26 I. C. C., 168.)

Preparation of Cars.

Southwestern Missouri Millers' Club v. St. Louis & San Francisco et al. Opinion by Commissioner Meyer:

During 1908 and 1909 the defendants' tariffs contained the following rule: "When cars furnished by this company for grain or other loading require repairing in order to insure against leakage in transit, and material necessary for repairing is furnished by the shipper, this company will pay the actual cost of same, but not to exceed 80 cents per car." This rule was canceled in 1911 and the complainants seek to have it restored. The Missouri Pacific now has in effect a similar rule restricted to business originating within the switching district in St. Louis. Though cars are now inspected by employees of the carrier before being placed for flour or grain loading, the millers find it necessary to further prepare those cars. The carriers do not deny that shippers frequently have to repair leaks and remove nails which should have been attended to by carriers. Complainants, however, do not confine their prayer for compensation to the cost incurred for repairing leaks and removing nails, but include the cost of lining the sides of the car with paper and padding, the floor with burlap, or a cushion of chaff, hay or straw, irrespective of the condition of the car as to leaks or nails. They even state that they have to line new cars that have never been used before. The reason for this padding is to protect the sacks from being soiled in transportation. The complainants sought reparation but the commission found that the rule in question was not intended to cover the expenditures in preparing cars for flour loading which the complainants seek to have included. The word "leakage" contained in the tariff refers to leakage of grain or other commodities from the car, but not to the leakage from a package to the floor of the car. The commission found that the complainant could recover for any material furnished or work done to the car itself in order to prevent leakage, but they could not recover for inserting the lining in the car. The commission is warranted in taking cognizance of the adequacy or inadequacy of the facilities of transportation of the defendant carriers. It is the duty of carriers to furnish cars suitable for transportation, but a shipper should so pack his commodity as to insure against damage by leakage from the package due to the ordinary incidents of transportation. The commission found that the protection of the sacks from becoming soiled was in the nature of private packing rather than public equipment. Where special preparation is required to fix a car for the shipment of a particular commodity the cost of special preparation ordinarily devolves upon the shipper. The commission found that the provisions for the payment of allowances to the shippers should not be approved, as they would be subject to abuses in the shape of rebates and discriminations because the repairs could not be properly policed. Especially in view of the complainant's contention that every car must be lined for the shipment of flour in sacks, it would be a sounder principle to let the rate take care of such expenditures. The commission decided that the practice of the Missouri Pacific of still granting allowances to millers situated within the switching district of St. Louis was discriminatory and ordered that carrier to discontinue this discrimination. Decision with regard to reparation was withheld until the complainants shall have filed amended specifications setting forth in detail the damages which they intend to recover under this holding. The complainant's prayer for an order requiring carriers to prepare cars for loading grain and flour in a manner indicated by the complainant was denied. (26 I. C. C., 246.)

Consumers Must Be Considered.

In re investigation and suspension of advances in rates by carriers for the transportation of soft coal in carloads from mines in Colorado to stations in Oklahoma and Texas located on the Wichita Falls & Northwestern, the Wichita Falls & Northwestern of Texas and the Wichita Falls & Southern. Opinion by Commissioner Meyer:

The tariffs which have been suspended would abolish all joint rates on coal from mines in Colorado and New Mexico to points in Oklahoma and Texas on the lines of the Wichita Falls & Northwestern system, and would make effective certain combination rates which would result in increases ranging from 60 cents to $1.20 per ton. The Wichita Falls & Northwestern system, though operated separately, is owned by the Missouri, Kansas & Texas. The defendants did not contend that the present rates were unreasonably low, but considered that the mines in Oklahoma and Arkansas produce sufficient coal for the requirements of the points on their line and felt that that was sufficient justification for the cancellation of rates from other territory. The defendants admitted that if the Wichita Falls & Northwestern was still independent it was entirely likely that no effort would have been made to cancel the present rates. The coal from New Mexico and Colorado mines is more popular at the points in question than is the coal from Texas and Oklahoma mines. Transportation charges are higher on the western coal, but the cost of production is lower, so it is able to compete with the Oklahoma and Texas coal. The commission found that the defendants, in their desire to serve the Oklahoma coal industry, should not brush aside the rights of the western producers to compete with Oklahoma producers and other consumers to receive the benefit of this competition. The commission decided further that the defendants could not operate their lines solely with a view to increasing their revenue and for the industries reached by them without regard to the interests of their patrons, except where such interests further their purpose. The commission declared that the present rates are reasonable and that the proposed advances would result in undue discrimination and ordered the defendants to withdraw the suspended tariffs. (26 I. C. C., 216.)

STATE COMMISSIONS.

The Texas railroad commission has called a hearing for March 11 on a schedule of proposed changes in the rules and regulations for the handling of baggage.

The Public Utilities Commission of New Jersey has ordered the Delaware, Lackawanna & Western to continue to honor season passes issued by it to 260 officers of the state. The road recently directed its conductors not to recognize these passes, and a member of the State Water Supply Commission appealed to the Public Utilities Commission.

The Indiana State Railroad Commission has sued the Cincinnati, Hamilton & Dayton in the Circuit Court of Indianapolis

for disobedience of the order of the commission requiring automatic block signals to be installed on the company's line eastward from Glenwood to the Ohio State line. The commission's bill says that since January 1, 1913, the company has been running trains unlawfully between these points.

The Texas Railroad Commission has amended its stopping in transit rules so that Rules 7 and 12 will read substantially as follows: "When shipments of grain, etc., are placed in a mill or other place of storage at stopping point, not reached by the tracks of the line bringing the same into that point, the cost of switching from and returning to such initial line, shall be borne by the carrier."

The Texas railway commission has issued an order providing for a periodical investigation of the operation of passenger trains for the purpose of detecting violations of the law against running trains more than 30 minutes late. The commission will issue calls at least every six months requiring the roads to submit statements of the operation of their passenger trains for a 30-day period. Where the 30-minute law has been violated the cases will at once be reported to the attorney general for prosecution, unless legal excuse can be made. It is stated that heretofore the enforcement of this law has been of a haphazard character.

The decision of the California Railroad Commission in the application of the Union Pacific, Southern Pacific and Central Pacific for approval of the plan for changes in ownership of these properties was briefly noticed in our last issue, page 405. From the full text of the decision it appears that the commission asserts the right to name the terms on which the Central Pacific shall be sold by the Southern to the Union, and the terms of all leases and joint trackage rights. Says the commission: "There is reason for grave fear that if the agreement is carried out, this state will, instead of securing two strong competing lines, secure one dominant line and one much impaired line." Continuing, the decision says: "The price at which the properties covered by the agreement between the applicants hereto shall be sold or the valuation on which its rentals shall be based, as the case may be, shall be only such price and valuation as shall first have been formally approved by the Railroad Commission." All terminals used jointly by the Central and the Southern in California must be opened to any other road desiring the use of them, provided equitable compensation is tendered. The commission will decide what is equitable. Within sixty days from the effective date of said agreement the parties must file with the commission joint rates and fares for the transportation of freight and passengers between all points in the state of California.

COURT NEWS.

A temporary injunction has been issued by the federal court at Carson City, Nev., restraining the state authorities from putting into effect the three-cent passenger fare ordered by the state railroad commission.

Arguments relating to the form of the decree to be entered in compliance with the decision of the Supreme Court in the "anti-trust" case against the Terminal Railroad Association of St. Louis, were presented before Judges Sanborn, Hook and Smith, at St. Louis, on February 25. Attorney General Wickersham and E. C. Crow, representing the government, objected to the continuation of an arbitrary element in the rates on traffic originating within the one-hundred-mile zone.

In the United States District Court at St. Louis, March 4, the government filed a suit against the St. Louis Coal Traffic Bureau to enjoin the bureau and the roads connected with it from regulating and agreeing on the rates on coal from Illinois mines to St. Louis. The court also is asked to dissolve the bureau as a combination in restraint of trade. It is said that the immediate occasion of this suit is a tariff, which was to go into effect April 1, increasing the rates on coal 5 cents a ton. All of the 24 roads interested in the Terminal Railroad Association and the Merchants' Bridge Terminal Company are made defendants.

Railway Officers.

Executive, Financial and Legal Officers.

A. H. Smith, vice-president of the New York Central & Hudson River, has been elected senior vice-president of the New York Central Lines.

Samuel C. Stickney, who has been doing special work under the direction of the vice-president in charge of operation on the Erie, has been appointed assistant to the president, with office at New York.

R. Kemp Slaughter has been appointed auditor of the Atlanta, Birmingham & Atlantic, succeeding J. L. Hamar, resigned, and F. K. Mays has been elected treasurer, succeeding H. M. Milam, resigned, both with offices at Atlanta, Ga.

W. T. Irwin, formerly president of the Peoria Railway Terminal Company, has been appointed general counsel, with headquarters at Peoria, Ill., succeeding William Jack. B. A. Worthington succeeds Mr. Irwin as president. George H. Crosby has been appointed secretary and treasurer, with office at Chicago, to succeed T. A. Greer, secretary, and T. F. Scanlon, treasurer. W. H. Burns has been appointed auditor, with headquarters at Chicago, in place of R. H. Hardin.

Operating Officers.

W. P. Moran has been appointed trainmaster of the Chicago, Milwaukee & St. Paul, with office at Savanna, Ill., in place of N. P. Thurber, promoted.

L. H. Cecil has been appointed assistant superintendent of the Louisiana lines of the Southern Pacific Company, with headquarters at Lafayette, La.

Caleb Corser has been appointed superintendent of the Copper River & Northwestern, with office at Cordova, Alaska, to succeed George Geiger, resigned.

John H. Harris has been appointed general manager of the Peoria Railway Terminal Company, with headquarters at Peoria, Ill., in place of J. H. Franke.

The office of A. J Donegan, assistant superintendent of the Algoma Central & Hudson Bay, has been transferred from Michipicoten Harbor, Ont., to Hawk Junction.

James E. Farrell has been appointed assistant to the general manager of the United Fruit Company and the Northern Railway (Costa Rica), with office at San José, Costa Rica.

The position of C. G. Smith, trainmaster of the Erie, at Cleveland, Ohio, has been abolished, and the authority of P. Minehan, trainmaster at Youngstown, has been extended over the entire division.

E. N. Brown, formerly assistant general superintendent of the Southern Pacific of Mexico, at Empalme, Mex., has been appointed division superintendent of the Chicago & Eastern Illinois, with office at Danville, Ill., succeeding John C. Muir, resigned.

E. A. Patterson, assistant superintendent of telegraph of the Chicago, Milwaukee & St. Paul, has been appointed superintendent of telegraph, with office at Milwaukee, Wis., to succeed U. J. Fry, deceased. A. C. Adams succeeds Mr. Patterson, with headquarters at Chicago.

F. Cone, assistant division superintendent of the Chicago, Burlington & Quincy at St. Louis, Mo., has been appointed assistant superintendent of the LaCrosse division, with headquarters at LaCrosse, Wis. A. J. Carter has been appointed trainmaster at Aurora, Ill., in place of G. A. Law, promoted.

George Ross, assistant superintendent of the Oregon Short Line at Salt Lake City, Utah, has been appointed an assistant superintendent of the Oregon-Washington Railroad & Navigation Company, with headquarters at La Grande, Ore., succeeding J. W. Anderson, resigned to accept service with another company.

Guy L. Anderson, clerk and assistant to R. B. Miller, traffic manager of the Oregon-Washington Railroad & Navigation Company, has been appointed general manager of the Sumpter Valley, with headquarters at Baker City, Ore. He was born

at Portland 28 years ago and began railway work at the age of 18 as a messenger boy.

Fred J. Byington, who recently was appointed superintendent of the West Iowa division of the Chicago & North Western, with headquarters at Boone, Ia., was born September 3, 1876, at Rochelle, Ill. He received a common school education, and began railway work June 1, 1894, with the Chicago & North Western as a telegraph operator on the Galesburg division. With the exception of one year with the Union Pacific as train despatcher, his entire service has been with the North Western as a telegrapher, train despatcher, chief train despatcher and assistant superintendent on various divisions until his recent promotion as division superintendent, as above noted.

George Edwin Simpson, who recently became general supervisor of transportation of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was born on May 25, 1847, at Concord, N. H. He began railway work October 1, 1864, as a telegraph operator with the Chicago, Burlington & Quincy. He was later agent and operator at Buda, Ill., and then to 1882 was train despatcher and chief train despatcher at Galesburg and Aurora, Ill., and Ottumwa, Ia. In the latter year he left the Burlington to take the position of superintendent of telegraph of the Chicago, Milwaukee & St. Paul, and in 1888 he was made superintendent of transportation of that road, which position he held until his recent promotion to general supervisor of transportation, as above noted.

George C. Randall, who, on February 1, became superintendent of transportation of the Colorado & Southern, with headquarters at Denver, Col., as already announced in these columns, was born March 31, 1883, at Northfield, Vt. He was graduated from Norwich University in 1904. Prior to attending college he was a telegraph operator for the Boston, Concord & Montreal, now a part of the Boston & Maine, and on July 10, 1904, immediately after completing his college course, he went to the Colorado & Southern as a clerk in the superintendent's office at Cheyenne, Wyo. From October, 1904, to September, 1906, he was chief train despatcher at Cheyenne, and was then made chief clerk in the car service office at Denver, which position he held until his recent appointment as superintendent of transportation, as above noted.

J. A. Somerville, whose appointment as superintendent of transportation of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, Mo., has been announced, was born in 1867 at Carthage, Ill. He began railway work in 1887 with the Chicago, Burlington & Quincy as a messenger at Keokuk, Ia. He remained with the Burlington until about four years ago, and filled the various positions of local agent at Keokuk, chief clerk in the general freight office at St. Louis, contracting freight agent at St. Joseph, Mo., general agent of all departments at Hannibal, Mo., local agent at St. Louis, and general agent at Keokuk, and superintendent of terminals at St. Louis. He resigned the latter position to go with the Missouri Pacific as superintendent of terminals at Kansas City, Mo., which position he held until his recent apointment as general superintendent of transportation, as noted above.

Fred M. Melin, who recently was appointed superintendent of the Hastings & Dakota division of the Chicago, Milwaukee & St. Paul, with office at Aberdeen, S. D., was born September 6, 1868, at Port Washington, Wis. He was educated in the common schools and began railway work in September, 1884, as night operator for the Milwaukee & Northern at Plymouth, Wis. From March, 1887, to January, 1891, he was train despatcher of that road, and then to June, 1893, chief train despatcher of the Calumet Terminal Railway at East Chicago, Ind. On the latter date he went to the Iowa Central as train despatcher and ten years later became train despatcher on the Hastings & Dakota division of the Chicago, Milwaukee & St. Paul at Minneapolis, Minn. Six months afterwards he was made chief despatcher, and from June, 1903, to March, 1908, he was trainmaster on that division, when he was transferred to the Puget Sound in a similar capacity. He was promoted to superintendent of the Musselshell division in August of that year, and in July, 1909, he was made superintendent of the Rocky Mountain division. In October of the following year he was transferred to the superintendency of the LaCrosse and Northern divisions at Milwaukee, Wis., where he remained until his recent appointment as superintendent of the Hastings & Dakota division, as above noted.

C. G. Stecher, who has been appointed to the newly created position of signal instructor for the Chicago & North Western, as noted elsewhere in this issue, was born in Germany in 1873 and came to this country in 1899. He began railway work as a lampman and batteryman on the Chicago & North Western at South Milwaukee, Wis. In September, 1902, he was promoted to the position of maintainer at Racine, Wis., and the following April to that of repairman in Chicago. He later served as lamp and signal inspector and then as electrician and foreman on the Old Chicago Terminal. In September, 1907, he was promoted to supervisor of signals in Iowa, with headquarters at Boone. He was transferred to Chicago in September, 1910, and served as chief inspector on the final signal construction work in connection with the new passenger terminal. On the completion of this work, June 1, 1911, he was appointed supervisor of signals of the Chicago terminal, and held this position until his recent appointment as signal instructor.

C. G. Stecher.

Herbert S. Balliet, engineer of maintenance of way of the Grand Central Terminal and signal engineer of the Electric division of the New York Central & Hudson River, with headquarters at New York, has been appointed assistant manager of the Grand Central Terminal. He continues to perform the duties of signal engineer of the Electric division, and engineer of maintenance of way of the terminal. Mr. Balliet was born in Neffsville, Pa., in 1868, and was for several years a telegraph operator, working both for the Western Union Company and for the United Press Association. He was at one time station agent and operator on the Philadelphia & Reading. He began on the Lehigh Valley as operator, but he soon went into the signal department and was engaged in that department eleven years—from 1894 to 1905. He was appointed assistant signal engineer in 1901. He left the Lehigh Valley to go to the New York Central in April, 1905. For two years, 1905-1906, he was secretary of the Railway Signal Association. He has been one of the most prominent members of that association from its earliest years, and in 1910 he was its president. In his position at the Grand Central during the past five years he has had charge of the construction of the extensive new tracks and signaling connected with the establishment of the new two-level station.

H. S. Balliet.

Traffic Officers.

Robert John has been appointed soliciting freight agent of the Gulf, Colorado & Santa Fe at Houston, Tex.

E. W. Eichenberger has been appointed traveling freight agent of the Lehigh Valley, with office at Pittsburgh, Pa.

C. A. Land has been appointed general agent of the Atlanta, Birmingham & Atlantic, with office at Talladega, Ala., succeeding W. W. Breedlove.

F. E. Clarke has been appointed traveling passenger agent of the Chicago & Alton, with office at St. Louis, Mo., in place of J. M. Mauden, resigned.

Lucian T. Rice has been appointed commercial agent of the Louisville, Henderson & St. Louis, with office at Louisville, Ky., succeeding E. G. Jones, resigned.

R. C. Perkins has been appointed soliciting freight agent of the Missouri & North Arkansas, with office at New Orleans, La., succeeding C. E. Trust, resigned.

George B. Haynes, assistant general passenger agent of the Chicago, Milwaukee & St. Paul, has been appointed general passenger agent, with headquarters at Chicago, effective March 1.

J. S. Bloodworth, city passenger and ticket agent of the Southern at Savannah, Ga., has been promoted to traveling passenger agent, with office at Macon, Ga., succeeding C. A. Carson, Jr., deceased and George G. Walker succeeds Mr. Bloodworth.

John H. Bunch has been appointed general freight and passenger agent of the Copper River & Northwestern, and the Alaska Steamship Company, with office at Seattle, Wash., to succeed C. J. Jones, traffic manager, resigned to accept service elsewhere.

George A. Bergen, assistant general freight agent, in charge of coal and coke traffic of the Erie and subsidiary companies, with office at New York, has been appointed coal traffic manager, with office at New York, and his former position has been abolished.

J. J. Rose has been appointed Canadian passenger agent of the Union Pacific System at Toronto, Ont., in place of George W. Vaux, transferred. W. H. Benham has been appointed general agent at Cleveland, Ohio. S. A. Myers has been appointed district passenger agent, and J. J. Kientz, city passenger agent, both with headquarters at Pittsburgh, Pa. C. C. Phillips and Herbert J. Farber have been appointed traveling freight agent, both with headquarters at Pittsburgh.

R. C. Wallis, district passenger agent of the Louisville & Nashville, at Nashville, Tenn., has been appointed division passenger agent, with headquarters at St. Louis, Mo., succeeding J. E. Davenport, resigned; Geo. E. Herring, traveling passenger agent at Cleveland, Ohio, succeeds Mr. Wallis; J. I. Zempke succeeds Mr. Herring; J. H. Settle is now district passenger agent, with headquarters at Birmingham, Ala., and E. G. Jones has been appointed city passenger agent at Louisville, Ky., succeeding Mr. Settle.

W. A. Cox, general freight agent of the Western Maryland at Pittsburgh, Pa., has resigned, and his former position has been abolished. Dudley G. Gray, formerly general freight agent of the Baltimore & Ohio, at Pittsburgh, has been appointed general western freight agent of the Western Maryland, with office at Pittsburgh, and he will have charge of all matters heretofore handled by the general freight agent. The titles of J. S. Talbot, general western agent at Chicago, and of Orno M. Brown, general eastern agent at New York, have been changed to general agent.

Fred H. Law, whose appointment as assistant general freight agent of the Illinois Central, with headquarters at St. Louis, Mo., has already been announced, was born November 10, 1876, at Sheridan, Ill. He received a high school education and began railway work with the Illinois Central in August, 1897. He filled various positions in the office of the assistant general freight agent at St. Louis until June 1, 1907, when he was advanced to commercial agent at that point. In October, 1909, he was transferred to Pittsburgh, Pa., in a similar capacity, where he remained until February, 1911, when he was made assistant general freight agent of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn. He held the latter position at the time of his recent promotion as assistant general freight agent, as above noted.

W. G. Carmichael has been appointed traveling passenger agent of the Union Pacific system, with headquarters at Pittsburgh, Pa. C. J. Collins has been appointed traveling passenger agent at Cincinnati, O., in place of Earl Z. Giblon, resigned, to take service with another road. John J. Klenke has been appointed traveling freight agent, with office at Cincinnati, succeeding Lyon Liston, resigned, to go with another company. F. B. Swope has been appointed traveling freight agent, with office at Cincinnati, in place of S. C. Sigler, resigned, to accept service with another road.

Richard Joseph DeLong, whose appointment as assistant general passenger agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has been announced in these columns, was born on July 10, 1854, in Lehigh county, Pa., and after leaving the public schools, attended the Pennsylvania State Normal School, at Millersville, Pa., from which institution he was graduated in the class of 1875. He entered the service of the Pennsylvania Railroad, on December 1, 1883, and was stenographer and special clerk in the passenger department until October 1, 1892, when he was promoted to chief clerk of the advertising department. Four years later he was placed in charge of the company's "personally conducted" tourist bureau. On January 1, 1900, he was promoted to chief clerk to the assistant general passenger agent, and in July, 1903, he was made division ticket agent of the West Jersey & Seashore. He was transferred to the New Jersey division, in a similar capacity, on June 1, 1910, and now becomes assistant general passenger agent as above noted.

David Nelson Bell, whose appointment as general passenger agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has been announced in these columns, was born in Philadelphia, on November 18, 1868. After graduating from the public schools of his native town, he entered the general office of the passenger department of the Pennsylvania Railroad on July 5, 1885. He was appointed assistant advertising agent in April, 1891, and in November, 1896, was made tourist agent of the same road. On June 1, 1903, he was appointed special assistant to the general passenger agent, and was promoted in August, 1906, to division ticket agent of the United Railroads of New Jersey division. He remained in this position until June 1, 1910, when he was appointed assistant general passenger agent, in charge of through traffic of the same road, with headquarters at Philadelphia, which position he held at the time of his recent appointment as general passenger agent, with headquarters at Philadelphia, as above noted.

D. N. Bell.

Joseph Laurens Sheppard, who recently was appointed assistant general freight agent of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., was born June 11, 1881, near Greenville, S. C. He was educated in the public schools of Memphis, and began railway work July 1, 1896, as a messenger in the office of the assistant general freight agent of the Chesapeake, Ohio & Southwestern at Memphis, Tenn. When that road was absorbed by the Illinois Central in July, 1896, he became messenger in the local freight office of the latter road at Memphis. He filled various minor positions in the local freight office of the Illinois Central and the Yazoo & Mississippi Valley until July 1, 1903, and in September of that year was made export bill of lading clerk in office of the commercial agent at Memphis. One year later he was advanced to chief clerk in that office, and in July, 1906, he was transferred to the general freight agent's office at Memphis as rate quotation clerk, and filled various clerical positions in that office, including that of chief clerk, from which he was promoted to assistant general freight agent, as above noted.

Colm Studds, who has been appointed assistant general passenger agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., as has been announced in these columns, was born in Fairfax county, Virginia, on November 23, 1861. After attending private and public schools, he entered the service of the Baltimore & Potomac, now a part of the Philadelphia, Baltimore & Washington, at Washington, D. C., in the telegraph department. For several years he served in various offices as telegraph operator, and, in 1882, entered the passenger department of the Southeastern district, as a stenographer. He was then promoted to chief clerk and city passenger agent, at Washington, and in June, 1889, was transferred to the tourist department, at Philadelphia. In August, 1892, he was appointed passenger agent of the Atlantic City district, and ten years later was transferred in the same capacity, to the Southeastern district, at Washington. On January 1, 1903, he went to New York, in charge of the Eastern district, and was then appointed passenger agent in charge of the New York district, which position he held at the time of his recent appointment as assistant general passenger agent as above noted. His entire service has been with the Pennsylvania Railroad System.

James Paul Anderson, who has been appointed general passenger agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., as has been announced in these columns, was born at Beaver, Pa., on August 29, 1862, and received his education in the public schools at Beaver and at Allegheny. He entered the service of the Allegheny Valley on July 15, 1880, as a clerk in the passenger department. After serving as chief clerk and traveling passenger agent, he was appointed general passenger agent of the same road in June, 1889, and when the Pennsylvania Railroad absorbed the Allegheny Valley in August, 1900, he was appointed division ticket agent of the Buffalo & Allegheny Valley division, now the northern division of the Pennsylvania Railroad. On April 1, 1910, he was made district passenger agent of the Pittsburgh district, and in August, 1912, was promoted to assistant general passenger agent of the Pennsylvania Railroad Lines east of Pittsburgh and Erie, with headquarters at Philadelphia, which position he held at the time of his recent appointment as general passenger agent of the same road, as above noted.

J. P. Anderson.

Engineering and Rolling Stock Officers.

V. K. Hendricks, principal assistant engineer of the St. Louis & San Francisco, has been appointed assistant chief engineer, with headquarters at Springfield, Mo.

The jurisdiction of C. R. Diemar, assistant engineer of the Baltimore & Ohio Southwestern at Cincinnati, O., extends also over the Cincinnati, Hamilton & Dayton.

J. E. Gardner has been appointed electrical engineer of the Chicago, Burlington & Quincy, with headquarters at Chicago, to succeed H. A. Gardiner, resigned; effective March 1.

W. W. Hubley has been appointed assistant supervisor of division No. 9, Middle division of the Pennsylvania Railroad, with office at Altoona, Pa., succeeding H. A. Gass, promoted.

M. B. McPartland has been appointed general foreman, locomotive department, of the Rock Island Lines, with office at Cedar Rapids, Iowa, succeeding L. C. Neyer, assigned to other duties.

F. L. Wells, signal supervisor on the Western Iowa division of the Chicago & North Western, has been transferred to the Chicago Terminal as signal supervisor to succeed C. G. Stadler, appointed signal instructor, and K. E. Kellenberger, signal inspector in the office of J. A. Peabody, signal engineer, has been appointed signal supervisor on the Western Iowa division of that road to succeed him.

R. F. Morkhill has been appointed signalling engineer of the Grand Trunk, with offices at Montreal, Que., succeeding C. A. Dunham, resigned, to resume his old duties as signal engineer of the Great Northern, with headquarters at St. Paul, Minn. Mr. Morkhill was born at Sherbrooke, Que., and about six years ago was in charge of the signalling on the Central South African Railways. He was then in the sales department at New York of the Union Switch & Signal Company, and was later one of the assistant engineers for that company engaged in the construction of the New York terminal of the Pennsylvania Railroad. Later he went to the Railway Signal Company of Canada.

Joseph Chidley, whose appointment as assistant superintendent of motive power of the Lake Shore & Michigan Southern, the Chicago & Indiana Southern and the Indiana Harbor Belt, with headquarters at Cleveland, Ohio, has been announced in these columns, entered the service of the Lake Shore & Michigan Southern on March 28, 1890, as a machinist at the Elkhart, Ind., shop, and was transferred in February, 1892, as machinist to Chicago. He was promoted to foreman machinist at Englewood, Ill., in February, 1900, and later was acting foreman at the same place until December, 1900, and was then night foreman at Elkhart, Ind., until January, 1901. The following May he was promoted to foreman at Air Line Junction, Ohio, and was made assistant master mechanic at Elkhart in November, 1904, remaining in that position until July, 1906, when he was made master mechanic at Collinwood, Ohio, and now becomes assistant superintendent of motive power of the same road, as above noted.

Nicholas Luke Smitham, whose appointment as assistant superintendent of motive power of the Missouri, Kansas & Texas Railway of Texas, with headquarters at Denison, Tex., has already been announced in these columns, was born in December, 1862, at Cornwall, England. He was educated in the public schools of Hazleton, Pa., and began railway work in 1877 as boilermaker apprentice with the Lehigh Valley. In the latter part of 1881 he went with the Colorado Iron Works at Denver, Colo., as boilermaker, remaining there a year, and then until the latter part of 1883 was with the Denver & South Park Railway as boilermaker. From that time until December, 1884, he was employed by the Denver & Rio Grande in a similar capacity, leaving to go to the Houston & Texas Central at Houston, Tex. In March, 1885, he was transferred to Walnut Springs, Tex., as general foreman in charge of boiler work. He was made general foreman of the Texas Midland at Terrell, Tex., in 1893, and two years later was promoted to master mechanic, resigning in January, 1901, to become master mechanic of the Texas Central at Walnut Springs, Tex. He then returned to the Texas Midland as master mechanic, and nine months later again entered the service of the Texas Central as master mechanic, which position he held until his recent appointment as assistant superintendent of motive power, as above noted.

David McCooe, who has been appointed superintendent of track of the Toronto, Ont., terminals of the Grand Trunk, as has been announced in these columns, was born on February 24, 1859, at Portadown, Ireland. He began railway work on March 1, 1872, on the Vandalia, and during the next seven years was consecutively water boy, section and extra gang foreman on that road. From August, 1879, to November, 1888, he was extra gang foreman and roadmaster on the Wabash, and then to November, 1890, was roadmaster on the Kansas City & Southern, now a part of the St. Louis & San Francisco. He was then freight and passenger conductor on the Fort Worth and Rio Grande until March, 1892, and then during the next five years was freight and work train conductor on the Wabash. On April 1, 1898, he went to the Grand Trunk as roadmaster. In May of the following year he was promoted to general roadmaster, and in September, 1910, was appointed superintendent of grade separation, which position he held at the time of his recent appointment as superintendent of track on the same road, as above noted.

George McCormick, whose appointment as assistant general manager of the Sunset-Central Lines of the Southern Pacific, with headquarters at Houston, Tex., has already been announced, was born July 15, 1872, at Columbus, Colorado county, Tex. He was graduated from the Agricultural and Mechanical College at Bryan, Tex., with the degree of Mechanical Engineer, in 1891. He began railway work in 1891 as apprentice in the shops of the Galveston, Harrisburg & San Antonio at Houston, Tex. In a short time he was transferred to San Antonio, Tex., as draftsman, returning to Houston in 1895 as chief draftsman. He was appointed mechanical engineer in 1900, where he remained until December 20, 1911, when he went to El Paso, Tex., as assistant superintendent of the El Paso division. He held the latter position until his appointment on February 17 as assistant general manager (mechanical) of all the Sunset-Central Lines, as above noted.

G. McCormick.

Purchasing Officers.

A. F. McCool, chief clerk to the purchasing agent of the St. Louis & San Francisco at St. Louis, Mo., has been appointed assistant purchasing agent of the south Texas and Louisiana lines, with headquarters at Houston, Tex., succeeding J. L. White, resigned.

Special Officers.

Allan Pollak has been appointed superintendent of dining cars, hotels and restaurants of the Pacific system of the Southern Pacific, with headquarters at San Francisco, Cal., to succeed D. Urquhart, resigned.

OBITUARY.

Otto Brendler, trainmaster of the Chicago, Milwaukee & St. Paul at Green Bay, Wis., died on February 28, aged 51 years.

Charles Greenleaf Wood, who, from 1900 to 1902, was treasurer of the Vera Cruz & Pacific, now a part of the National Railways of Mexico, died on March 2, at his home in New York, at the age of 61.

James Clark Young, signal engineer of the Union Pacific, died at St. Joseph's Hospital, Omaha, Neb., at noon on February 27, 1913, following an operation performed for the removal of a tumor. Mr. Young was born in Washington, D. C., March 15, 1876, and was educated at the Montana College of Agriculture and Mechanic Arts at Bozeman, Mont., taking a course in applied science. He began railway work in January, 1897, as apprentice in the signal department of the Southern Pacific at Los Angeles, Cal. On August 1, 1900, he was appointed signal foreman, and on December, 1901, signal supervisor on the Los Angeles division of the Southern Pacific. He was transferred to San Francisco and made assistant signal engineer on October 15, 1904. On April 5, 1906, he was appointed signal engineer on the Union Pacific lines east of Green River, Wyo., with headquarters at Omaha, Neb. His jurisdiction as signal engineer was extended to include the lines from Green River to Ogden, Utah, on November 15, 1907. He remained in this position until the time of his death. He was a member of Committee I, on Signal Practice, of the Railway Signal Association, and Committee N on Signals and Interlocking, of the American Railway Engineering Association. He was buried at Los Angeles, and is survived by his mother and a sister, Mrs. Walter Harvey of Seattle, Wash.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Grand Trunk is considering the purchase of 100 locomotives.

The Pennsylvania Railroad is in the market for 144 locomotives.

The Sao Paulo & Rio Grande, Brazil, is in the market for 10 switching locomotives.

The Grand Rapids & Indiana is in the market for 4 six-wheel switching locomotives.

The Erie has ordered 10 Pacific type locomotives from the American Locomotive Company.

The Chesapeake & Ohio has ordered 9 locomotives from the Baldwin Locomotive Works.

The Chicago & Western Indiana is in the market for 5 six-wheel switching locomotives.

The New York Central & Hudson River is having 50 Pacific type locomotives converted into mikado locomotives.

The Kansas City Southern has ordered 4 six-wheel switching locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 20 in. x 28 in. cylinders, 50 in. driving wheels, and in working order will weigh 156,000 lbs.

J. D. McArthur Company, Ltd., has ordered two mogul locomotives from the American Locomotive Company. The dimensions of the cylinders will be 19 in. x 26 in., the diameter of the driving wheels will be 50 in., and the total weight in working order will be 130,000 lbs.

The Canadian Copper Company has ordered one mogul locomotive from the American Locomotive Company. The dimensions of the cylinders will be 20 in. x 26 in., the diameter of the driving wheel will be 50 in., and the total weight in working order will be 155,000 lbs.

The Hang Yang Iron & Steel Works has ordered 2 four-wheel switching locomotives from the American Locomotive Company. The dimensions of the cylinders will be 14 in. x 22 in., the diameter of driving wheels will be 44 in., and the total weight in working order will be 50,000 lbs.

The Baltimore & Ohio has ordered 60 mikado locomotives and 30 Pacific type locomotives from the Baldwin Locomotive Works, and 10 Mallet locomotives from the American Locomotive Company. The Mallet locomotives will be equipped with superheaters, will have 26 in. and 41 in. x 32 in. cylinders, 57 in. driving wheels, and in working order will weigh 470,000 lbs.

CAR BUILDING.

The Seaboard Air Line is in the market for 1,500 freight cars.

The Pennsylvania Railroad is in the market for 307 passenger cars.

The Pennsylvania Lines West are in the market for 87 passenger cars.

The Erie has ordered 1,500 freight cars from the Western Steel Car & Foundry Company.

The Lehigh Valley is building 50 flat cars in the company's shops. On completion of this order an additional 50 flat cars will be built.

IRON AND STEEL.

The Minneapolis, St. Paul & Sault Ste. Marie has ordered 190 tons of bridge steel from the American Bridge Company, and 896 tons of girder span plates from the Wisconsin Bridge & Iron Company and the Chicago Bridge Company.

Supply Trade News.

The Jennison-Wright Company announces that Frank W. Cherrington has become affiliated with it as chief engineer, with headquarters at Toledo, Ohio.

R. C. Fraser, representative of the Buffalo Brake Beam Company, has been made vice-president of the company, with headquarters at 30 Pine street, New York.

The personal property of the Allis-Chalmers Company was sold at auction on February 27, at Milwaukee, for $4,000,000, to James N. Wallace, John H. McClements and Francis S. Bangs, of New York, representing the reorganization committee. The real estate was sold on February 3, for $2,250,000.

The Equipment Improvement Company, 30 Church street, New York, has been organized to handle Markel devices for locomotives and the Perfection door stop. The directors of the company are as follows: Alexander Turner, Bronze Metal Company, New York; R. H. Weatherly, Pilliod Company, New York; Le Grand Parish, American Arch Company, New York; F. H. Clark, Watson-Stillman Company, Ampere, N. J.; T. H. Hopkirk, American Steel Foundries, New York; T. Rumney, formerly assistant to the second vice-president of the Chicago, Rock Island & Pacific; and P. H. Ferguson, Pittsburgh Steel Products Company, Pittsburgh, Pa. The officers are as follows: President, F. H. Clark; vice-president, W. E. Weatherly; and secretary-treasurer, R. H. Weatherly. In the near future the company will handle other devices in addition to those mentioned above.

TRADE PUBLICATIONS.

Pneumatic Tools.—The Chicago Pneumatic Tool Company has issued bulletin No. 126, devoted to its compression riveters, and bulletin No. 129, devoted to hose couplings and hose clamp tools.

Steel Bunks.—The Hagger & Marcurson Company, Chicago, has published an illustrated folder describing its Tiger steel bunks, which were especially designed for use in logging camps in the railroad construction work.

Unions.—The Jefferson Union Company, Lexington, Mass., has published another of its series of folders reviewing the lives of great men in history and relating the advantages of Jefferson unions. The historical character chosen for this latest folder is Oliver Cromwell.

Oxygen and Hydrogen.—The International Oxygen Company, New York, has published pamphlet No. 9 on its system of generating oxygen and hydrogen for all industrial purposes. This bulletin is illustrated and furnishes clear and concise descriptions of its oxygen and hydrogen generators and describes their operation.

Threading Machinery.—The Landis Machine Company, Inc., Waynesboro, Pa., has published catalog No. 21, of its bolt threading, pipe and nipple threading, bolt pointing and nut tapping machinery, screw cutting die heads and special threading machines. This catalog is well illustrated and gives full information on the various machines. It contains 80 pages and includes a convenient index.

North Coast Railway, New South Wales.—Work on the South Grafton-Glenreagh section of the North Coast Railway is reported to be progressing satisfactorily, and clearing has been completed on the entire length. The heaviest cuts were east of the Bluff, about 18 miles from South Grafton, where sandstone was encountered. The swamp at the rear of the town was crossed partly by a viaduct about a quarter of a mile long, and partly by earthworks, the latter being now almost finished. At the Grafton end the laying of ties has commenced. Work on the principal bridge on the section, that across Sherwood creek, is now under way, while the bridge over Alipou creek has been completed, together with the approaches to Wilson's Hill, where it is proposed to span the river with a drawbridge.

Railway Construction.

Canadian Pacific.—An officer writes that contracts have been let for double-tracking work on western lines as follows: From Kemnay, Man., to Virden, 40 miles, to J. D. McArthur, Winnipeg, Man.; Whitewood, Sask., to Grenfell, Sask., 31 miles, and from Regina to Indian Head, 44 miles, to Foley Brothers, Welch & Stewart, Winnipeg; Chaplin, Sask., to Swift Current, 57 miles, to Janse Brothers, Boomer & Hughes, Calgary, Alta., and from Hammond, B. C., to Ruby Creek, 57 miles, to Grant Smith & Co., & Macdonnell, Vancouver, B. C. (February 28, p. 411.)

Carolina & Yadkin River.—An officer writes that in addition to the line in operation from Thomasville, N. C., south to Denton, 21 miles, an extension was recently put in operation from Denton southwest to High Rock, about 9 miles. A contract has been given to C. W. Lane & Co., Atlanta, Ga., to build an extension from the northern terminus at Thomasville northeast to High Point, about 8 miles.

Chicago & North Western.—An officer writes that the Iowa Southern to be constructed by the Chicago & North Western will be a small coal road to some new coal mines that the company is opening in the vicinity of Buxton, Iowa, where the railway company is operating mines for railroad purposes only. This is not a commercial road.

Grand Trunk Pacific.—An officer writes that a contract has been given to Foley Bros., Welch & Stewart to build the remaining section of 425 miles connecting the eastern and western lines, from a point at mile 195 east of Prince Rupert, B. C., to mile 1,124 west of Winnipeg, Man. The work will be heavy. Maximum grades will be 4/10 per cent., and maximum curvature 6 deg. The work includes terminals of Fort George, B. C., a 775 ft. tunnel at mile 1,153 and a 2,000 ft. tunnel at mile 1,181. A number of bridges are to be put up between mile 1,094 and mile 1,486. See Fort George, B. C., under Railway Structures. (February 28, p. 411.)

Gulf, Florida & Alabama.—An officer writes that the company is preparing to contract for the grading of a 20-mile extension to the line running north from Local, Ala., into Monroe county. The grading is through level country. There is considerable grubbing and clearing to do. The company would like to hear from contractors who will bid on this work.

Iowa Southern.—See Chicago & North Western.

Kansas-Oklahoma Traction.—Incorporated in Oklahoma with $100,000 capital and headquarters at Nowata. The plans call for building from Coffeyville, Kan., south via Nowata, Okla., and Collinsville to Tulsa, about 70 miles. It is understood that the line will cost between $30,000 and $40,000 a mile to build. Incorporators include D. H. Siggins, Warren, Pa.; W. E. Ziegler, Coffeyville; J. E. Campbell and E. B. Lawson, of Nowata.

New York Central & Hudson River.—The report of this company for the year ended December 31, 1912, shows that four-tracking work has been carried on during the year on the Hudson division through Poughkeepsie, N. Y., between Hyde Park and Barrytown, from Storm King to Chelsea, between Tivoli and Germantown and at Stockport, and four-tracking from Spuyten Duyvil to Peekskill, and the electrification of the line from Spuyten Duyvil to Croton. Work was also carried out on the construction of a connecting line between the New York Central main line and the West Shore at Harbor, east of Utica, and has been continued on the changing of grade crossings in the city of Buffalo, which has been under way for a number of years. The preparation for electrical operation of all passenger trains to Harmon on the Hudson river is about finished, and it is expected that the entire Electric division will be put in full operation in March, 1913.

Oklahoma Northern.—Incorporated in Oklahoma with $50,000 capital and headquarters at Oklahoma City. The plans call for building from Vinita, Okla., northwest to Coffeyville, Kan., about 42 miles. The estimated cost of building the line is $35,000 a mile. A. King, G. D. Meikeljohn and H. L. Steen, Omaha, Neb., and J. W. Tolliver, Centralia, Okla., are interested.

Oklahoma Roads (Electric).—C. H. Kellogg and associates have asked for a franchise at Henryetta, Okla. The plans call for building a line to connect with lines to Oklahoma City. The first section to be built will be from the Creek and Victoria mines to the mines at Dewar and at Coalton. It is planned to eventually extend the line west via Okemah to a connection with the Shawnee-Oklahoma City line at Shawnee.

Pennsylvania Railroad.—The report of this company for the year ended December 31, 1912, shows that the company has in contemplation many important and extensive improvements, including improvements at Broad street station, Philadelphia, Pa., and its approaches and facilities; improvements on the Allegheny division; elimination of grade crossings and elevation of tracks on the New York division, from Colonia, N. J., eastward, through Rahway, to Bay Way, Elizabeth, and a slight change of line in Elizabeth, where the line has already been elevated, also the abolition of additional grade crossings in Philadelphia, Lancaster, Lilly, Johnstown, Freeport, Wilkinsburg, Pittsburgh and other points on its lines when the local authorities co-operate in making the eliminations. For the eastern section of the six-track system on the New York division between Colonia, N. J., and Waverly, west of Newark, additional right of way has been acquired. This work comprehends station improvements, the elimination of 15 grade crossings by the elevation of the four existing main tracks, and the construction of two additional elevated tracks between those points. Construction work is now proceeding between Colonia and Elizabeth, and should be completed in 1914. On the Bald Eagle Valley branch the grades are being revised and the line is being double tracked between Mount Eagle and the Howard Rolling Mills and passing sidings are being extended. In West Brownsville yard, Pa., the change of grade and extension of track facilities, to connect with the new double track Monongahela river bridge, are almost completed. On the Sunbury division the double tracking was further extended by constructing second tracks at Boyd and South Danville, and between Port and Honey Pot yard, Pa. Work on the New York Connecting Railroad, owned jointly by the Pennsylvania Railroad and the New York, New Haven & Hartford, is proceeding. Additional contracts have been let for foundations and masonry of Bronx viaduct; also of piers for Bronx Kills bridge, Randall's Island viaduct, Little Hell Gate bridge, and Ward's Island viaduct; for the bases and foundations of the East River bridge on Ward's Island and Long Island City; and for the Long Island viaduct; for foundation and masonry between Lawrence and Stemler streets; and for grading and masonry between its connection with the Pennsylvania Tunnel & Terminal and the Long Island Railroads at Woodside avenue and Fourteenth avenue. To provide for increasing traffic between Pittsburgh and Buffalo via the Allegheny division and the Western New York & Pennsylvania, the construction of three tunnels and the reduction of grades and other improvements on the Allegheny division between Pittsburgh and Oil City, and the reduction of grades and improvements of the railroad and yard facilities between Oil City and Buffalo, via Brocton and the Chautauqua branch, has been authorized. On the Cambria & Clearfield, the Cherry Tree & Dixonville, and the Pennsylvania, Monongahela & Southern, various short branches were built to reach coal mining operations. Work of enlarging the Mount Vernon yards, Baltimore, on the Northern Central, was completed. The freight facilities at York, Pa., Highlandtown, Md., and at Marysville yard, are also being enlarged and improved to accommodate the increased traffic. These improvements will probably be completed in 1913. The Wilkes-Barre Connecting Railroad was incorporated during the year jointly by the Pennsylvania Railroad and the Delaware & Hudson Company to provide a 7-mile line from Buttonwood yard on the Pennsylvania Railroad, west of Wilkes-Barre, to Hudson on the Delaware & Hudson Company, to facilitate the interchange of traffic between the two roads.

Texas Roads.—According to press reports plans are being made to build from Knox City, Tex., east and southeast to Crystal Falls, 65 miles, and eventually east an additional 100 miles to Fort Worth. The line will traverse the northern part of Stephens county, where there are undeveloped coal fields. It is said that the towns of Knox City, Munday, Goree, Bomarton, Throckmorton and Woodson will furnish a right of way and land for stations. The estimated cost of the line is $1,050,000. G. W. Thomason, Haskell, may be addressed.

Toronto Eastern.—An officer writes that a contract has been given to Ewen Mackenzie, Toronto, Ont., to build through Pickering, Whitby, Oshawa and Bowmanville. Track has been laid on one mile. The grading work involves handling about 14,000 cu. yds. of earth a mile, and about 30 per cent. is finished. Maximum grade will be 2.7 per cent., and maximum curvature 10 deg. W. H. Moore, president, and B. W. Oliver, chief engineer, Toronto. (February 21, p. 374.)

RAILWAY STRUCTURES.

Chambersburg, Pa.—The Cumberland Valley has given a contract for a new passenger station at Chambersburg, to M. R. Rhoades, of Chambersburg, at $50,000 above the foundations. The cost of the foundations is about $16,000. The new building must be completed by October 1, 1913, and will face East Market street.

Eureka Springs, Ark.—An officer of the Missouri & North Arkansas writes that the company will build a new station at a cost of $15,000, at Eureka Springs, and re-arrange the yard at that place at a cost of $5,000.

Fort George, B. C.—The Grand Trunk Pacific will put up bridges between mile 1,094 and mile 1,486 as follows: At McLellan creek crossing 249 ft. long; Little Shuswap crossing 129 ft.; Rau Shuswap crossing 1,032 ft.; Cottonwood creek crossing 129 ft.; Fifty Mile river crossing 129 ft.; Goat river crossing 308 ft.; Dome creek crossing 129 ft.; Second Fraser river crossing 689 ft.; Third Fraser river crossing 968 ft.; Willow river 459 ft.; Fourth Fraser river crossing 1,227 ft.; Upper Nechaco river crossing 642 ft.; Bulkley river crossing mile 1,481, 154 ft., and crossing the same river at mile 1,486, 364 ft.

Harrison, Ark.—The Missouri & North Arkansas will construct general shops and terminals at Harrison, at a cost of $125,000.

Heber Springs, Ark.—The Missouri & North Arkansas will construct yard terminals and a roundhouse at Heber Springs, at a cost of $25,000.

Helena, Ark.—The Missouri & North Arkansas will put up a new station and construct a yard at Helena, at a cost of $50,000.

Leslie, Ark.—The Missouri & North Arkansas will put up a new station at Leslie at a cost of $7,500, and will also fill in a number of bridges at various places on the line at a cost of $30,000.

McAdam Junction, New Brunswick.—Bids are wanted by William Downie, general superintendent of the Canadian Pacific at St. John, New Brunswick, until noon, March 10, for the erection of a concrete machine shop, at McAdam Junction.

Moline, Ill.—The Chicago, Rock Island & Pacific has announced plans for the erection of a new two-story passenger station.

Mt. Clemens, Mich.—The Grand Trunk has announced that it will erect a new passenger station during the year to cost approximately $25,000.

New London, Conn.—See an item in General News regarding a new four-track steel bridge, to be built over the Thames river at New London, for the New York, New Haven & Hartford.

New York.—The report of the New York Central & Hudson River for the year ended December 31, 1912, shows that the entire work of reconstruction of the Grand Central Terminal at New York has progressed without interruption of train service. The concourse and waiting room on the express level of the main station building were opened for use on February 2, 1913. The suburban concourse was opened for partial use on October 27, 1912. Changes in the plans have delayed completion of the cross streets, and an extension of time was obtained. The whole of this work is expected to be finished during 1913. The more important work carried on during the year included improvements at Utica consisting of a new brick and stone passenger station, elimination of grade crossing at Genesee street, a new engine terminal, and increase of terminal yard tracks. Improvements at Rochester included a new stone passenger station, extension and

reconstruction of several bridges, the closing of Joiner street, placing additional tracks, the building of a new power house and the erection of several auxiliary buildings. In connection with the four-tracking of the Hudson division new passenger stations were put up at Staatsburgh and at Rhinecliff. The work in connection with the four-tracking from Spuyten Duyvil to Peekskill and the electrification from Spuyten Duyvil to Croton includes changes of bridges, stations and signals, and the development of a new terminal of the Electric division at Harmon, also improvements at Yonkers consisting of the elevation of tracks and the construction of additional main tracks, a new passenger station, a new freight station, and a new freight yard layout, and a new passenger station at Glenwood.

Ogden, Utah.—The Oregon Short Line is said to be planning the erection of a large addition to its shops.

Philadelphia, Pa.—The report of the Pennsylvania Railroad for the year ended December 31, 1912, shows that the improvement of the passenger facilities in Philadelphia, Pa., is still receiving consideration, and will necessitate an increase in the tracks and platforms, and the enlargement and improvement of the station facilities at Broad street station and approaches as far as West Philadelphia station and yard; the widening of the bridge, and approaches, over the Schuylkill river and the adjoining entrances to Fairmount Park at Girard avenue, by the construction of two additional tracks; enlargement of North Philadelphia passenger station and approaches by the addition of four new tracks with high level island platforms, and other improvements, including the relocation of the junction of the Chestnut Hill branch with the New York division at that point, which is now under contract. An ordinance was obtained from the city of Philadelphia to erect a new eight-track concrete steel bridge across North Broad street near North Philadelphia station. Extensive repairs and additions are being made to the West Philadelphia stock yards, and the piers at Greenwich, Philadelphia, are being improved, and the dock extended. The company bought property during the year for passenger terminal and station improvements at Broad street station, and other points in Philadelphia, and for the enlargement and improvement of freight stations and yard facilities, at Hamburg Junction and Greenwich in Philadelphia, Elizabethtown, Altoona, Cresson, Uniontown, Tarentum, Peterson and New Kensington. The company also has in contemplation the construction of a new double-track steel bridge over the Allegheny river at Kiskiminetas Junction to take the place of the present single-track bridge. Work on the Cortlandt street ferry house and dock, New York, which are being rebuilt, will be completed in 1913. On the Newark Rapid Transit Line, the Summit avenue passenger station, Jersey City, has been finished. The Fourth street station in Harrison, N. J., on this line, will be completed early in 1913. On the Pittsburgh division four grade crossings are being abolished in Braddock, Pa., by the construction of three under-grade bridges and one overhead bridge; work is in progress on the elimination of grade crossings in Pittsburgh at Homewood avenue, and the work of eliminating all grade crossings in the borough of Wilkinsburg has commenced. At Montgomery, Pa., the 16-span double track steel bridge over the West branch of the Susquehanna river, replacing the single track bridge, will be completed this year. A fireproof grain elevator of enlarged capacity is being erected by the Girard Point Storage Company at Girard Point, Philadelphia, to replace the present elevator. On the Philadelphia, Baltimore & Washington, the work of reconstructing the bridges over the Gunpowder and Bush rivers will be finished during 1913. The reconstruction of the bridges over Stemmers run, Back river and Gwynn's Falls will also be undertaken in the present year.

San Benito, Tex.—The St. Louis, Brownsville & Mexico and the San Benito & Rio Grande Valley have prepared plans for a new passenger station.

Slaton, Tex.—The Gulf, Colorado & Santa Fe is planning to enlarge the capacity of its roundhouse and to erect a new passenger station.

Toronto, Ont.—Bids are wanted by B. Ripley, engineer of grade separation of the Canadian Pacific, Toronto, Ont., up to noon, March 20, for the construction of the sub-structures of subways at Davenport road, at Spadina road, at Holland avenue, and at Bathurst street, North Toronto.

Railway Financial News.

Baltimore & Ohio.—The Public Service Commission has conditionally approved the new $63,250,000 4½ per cent. convertible bond issue in order to allow stockholders to take advantage of their right to subscribe therefor on or before March 3. The order is not to become effective until the Maryland Court of Appeals has passed on the legal question involved.

Boston & Albany.—This company has asked the Massachusetts railroad commission for permission to issue $2,015,000 25-year 4½ per cent. bonds for improvements.

Galveston, Houston & Henderson.—C. E. Schaff, president of the Missouri, Kansas & Texas, has been elected a director, succeeding Roger Campbell, resigned.

Speyer & Company, of New York, recently bought $2,000,000 new first mortgage 5 per cent. bonds which they are offering to exchange for a like amount of bonds falling due April 1, 1913; holders of old bonds receiving $10 cash in addition to a new bond for each $1,000 bond presented by March 24.

Chicago & Alton.—The 3-year $2,500,000 notes which mature March 15 are to be paid from cash to be obtained from the sale of a block of new general mortgage bonds.

Missouri, Kansas & Texas.—The Texas senate has passed by a vote of 22 to 6 (over Governor Colquitt's veto) a bill to permit the consolidation of the Wichita Falls & Northwestern, the Wichita Falls & Southern, the Texas Central and the Beaumont & Great Northern with the Missouri, Kansas & Texas of Texas. The house had already passed the bill over the Governor's veto.

New York Central & Hudson River.—The New York Public Service Commission, Second district, has granted the application of this company for permission to merge all of the subsidiaries of which the New York Central & Hudson River owns all of the stock. The commission has received an application for permission to consolidate a large number of other subsidiaries in which the New York Central owns directly or indirectly a large majority of the stock. Neither of these applications includes the New York & Harlem.

New York, New Haven & Hartford.—The directors have authorized President Mellen to make a lease of the Northampton division, north of Westfield, to the Boston & Albany. In all there are 66 miles of road which it is proposed to lease, reaching Holyoke, Easthampton, Northampton, Turners Falls and Shelburne Falls.

New York, Ontario & Western.—Ladenburg, Thalmann & Company, New York, have bought from the company $1,980,000 general mortgage 4 per cent. bonds.

Salt Lake & Mercur.—The circuit court has appointed Lucius Laudie receiver. The road runs from Salt Lake City to Mercur, Utah, 62 miles.

Rail Connections Between Valencia and Madrid, Spain.—The much talked of direct line from Valencia, Spain, to Madrid has not been included in the new law authorizing "complimentary" railways in Spain. The law only makes reference to the proposed line filling up the gap between the termini of existing lines at Cuenca and Utiel, and the Valencia people are not satisfied with this route, which is circuitous. On the other hand only 89 miles of line have to be built to connect these two termini, while of the proposed direct line via Motilla nothing is completed but the section from Valencia to Utiel. Valencia is the only large coast town which is not placed on one of the many direct lines which radiate from Madrid to the coast, although it is nearer than any other. As the crow flies the distance between the two cities is only some 186 miles, but the present route, via Encino, is 304 miles long, and the tri-weekly express takes 10½ hours to do the journey. By the Cuenca-Utiel route the distance would be reduced to 250 miles and considerably less again, via Motilla. Unfortunately, the latter route is through difficult country, and there is little hope of any local traffic of value, at least for a number of years to come, while the through passenger traffic is hardly sufficient to justify the present service of one daily mail train each way and an express every alternate week-day.

ANNUAL REPORTS.

THE PENNSYLVANIA RAILROAD—SIXTY-SIXTH ANNUAL REPORT.

GENERAL OFFICE, BROAD STREET STATION, PHILADELPHIA,
February 28th, 1913.

The Board of Directors submit herewith to the Stockholders of The Pennsylvania Railroad Company a synopsis of their Annual Report for the year 1912:—

Rail operations—Revenues		$174,607,598.22
Rail operations—Expenses		126,637,944.59
Net revenue—Rail operations		$47,969,653.63
Auxiliary operations—deficit		1,147,985.23
Net Railway operating revenue		$46,821,668.40
Railway tax accruals		7,128,535.02
Railway operating income		$39,693,133.38
Other income:		
Income from securities	$14,527,491.56	
Hire of equipment, etc	4,762,241.75	19,289,733.31
Gross income		$58,982,866.69
Deductions from gross income		16,828,902.66
Net income		$42,153,964.03

The number of tons of freight moved on the five general divisions east of Pittsburgh and Erie in 1912 was 143,480,431, an increase of 18,305,363, or 14.62 per cent.; the number of passengers was 72,452,887, an increase of 5,007,173, or 7.42 per cent.

The Railroad Companies east of Pittsburgh and Erie in which your Company is interested show satisfactory results. Detailed statements of their operations will be found in their respective annual reports, as well as in the full report of your Company.

The number of tons of freight moved on the lines west of Pittsburgh was 165,449,782, an increase of 26,672,392. The number of passengers carried was 34,326,381, a decrease of 335,069.

The operating revenue of all lines east and west of Pittsburgh for the year 1912 was $374,096,179.92; operating expenses, $291,867,378.81, and operating income, $82,228,801.11, an increase in operating revenue, compared with 1911, of $37,612,367.16, and an increase in operating income of $7,609,773.63. There were 473,174,093 tons of freight moved on the entire system, being an increase of 59,955,772 tons, and 178,811,733 passengers carried, an increase of 9,816,577.

There were expended during the past year for construction, equipment, and real estate on the Lines West of Pittsburgh $16,436,649.13.

The expenditures were principally for new ore docks at Cleveland, the elevation of tracks in that city, and also in Chicago and Fort Wayne, the construction of additional main tracks on the Pittsburgh, Fort Wayne and Chicago Railway, the Cleveland and Pittsburgh Railroad and the Pittsburgh, Cincinnati, Chicago and St. Louis Railway, land for new freight station at Indianapolis, increase in yard and station facilities at various points, and for additions to and improvement of the equipment.

GENERAL REMARKS.

The Income Statement is in the form prescribed by the Interstate Commerce Commission, effective July 1st, 1912, which requires the statement of certain parts of the Income Statement in greater detail; as well as showing the receipts and disbursements of certain accounts. The company is further required to include the Income derived by Sinking and other Reserve Funds as part of its Income; but as it is not permitted to charge as a payment interest on any part of its bonds which may be held in any of the Sinking or Trust Funds, such interest on bonds so held cannot be included in said Income. While these accounting changes result, therefore, in apparently swelling the Net Income of the Company to the extent of $786,230.60 yet it is offset by corresponding necessary appropriations to these funds out of net income, which appropriations were formerly included in fixed charges.

This Statement shows that the total Rail Operating Revenues were $174,607,598.22, the largest in the history of the Company, an increase of $17,120,185.52, or 10.87% as compared with 1911.

The increased express traffic resulted in a greater gross return to the Company. The future effect of the parcel post on express revenue cannot as yet be determined, nor is it known what effect the change in express rates, ordered by the Interstate Commerce Commission, will have upon the revenue received from the Express Company operating over your lines.

In the transportation of United States Mails the revenues show a decrease although the volume of the traffic increased. The rates are fixed by Congress, and there is a Congressional investigation of the subject at the present time. It is hoped that, after due consideration is given to the value of this service and to the special facilities it requires, remunerative rates will be paid.

Rail Operating Expenses are also the largest in the history of the Company, showing an increase of $13,409,551.56, or 11.84%, caused principally by the increased traffic, which necessitated not only greater outlays for transportation expenses, but also for repairs and renewals of roadbed, bridges, and buildings, signals and interlocking and for other items which add to the safety and comfort of the patrons and employes of the road; as well as for repairs and renewals of equipment, and increased charges for Depreciation.

The expenses were further increased by the severe weather in January and February, 1912, and they also reflect increases caused by higher wages; the operation of the Extra Train Crew Law; increased cost of fuel and other materials, and improved standards of track and other construction to meet the requirements of heavier rolling stock.

In the wage questions that arose during the past year with the Enginemen and Firemen on the railroads in the Eastern District of the United States, represented by their respective Brotherhoods, a general strike was averted in the case of the Engineers by the appointment of a special Board of Arbitration, consisting of seven members, one selected by the railroad companies, one by the Brotherhood of Locomotive Engineers, and the other five appointed by the Chief Justice of the Supreme Court of the United States, the Presiding Judge of the Commerce Court and the United States Commissioner of Labor, collectively.

This Arbitration Board was constituted after attempts had failed to settle the difficulty through mediation under the Erdman Act, and because the parties in the controversy, while agreeing to the principle of arbitration, would not accept arbitration under the provisions of that Act.

In the difficulties of the present year with the Firemen, represented by the Brotherhood of Locomotive Firemen, a strike was averted by the railroad companies agreeing to submit to arbitration under the provisions of the Erdman Act, which they did not believe to be satisfactory, but accepted rather than impose on the Country, the railroads and the employes the lamentable consequences of a general strike, involving over fifty railroads, having over 25% of the mileage and nearly 40% of the total Operating Revenues and Operating Expenses of all the railroads in the United States.

Considering the magnitude of the interests in this Country and those Countries with which it has commercial relations that would be affected by the interruption of railroad traffic, and the serious results that would ensue therefrom; the stoppage of food supplies, fuel and other traffic, the inconvenience, losses and suffering to the general public whose interest is paramount, and to the workers in other industries dependent on a reliable transportation service and in no way responsible for railway disputes, and the failure of strikes to produce any permanent advantages to either the employes and their families or to the transportation companies, careful consideration should be given to the recommendations for the amendment of the Erdman Act, which have been made from so many sources interested in the well-being of the Country.

The experience arising from these larger wage controversies places a serious responsibility upon those whose duty it is to enact proper legislation governing the relations between employer and employe, to consider whether the Erdman Act should not be amended to increase the number of arbitrators and thereby constitute a Board of sufficient size to properly represent the public as well as the parties to the controversy, and to direct the necessary far-reaching investigations and fully share the responsibility of an impartial determination of the equitable and economic questions arising from such disputes. It will also be found necessary to provide a longer time than thirty days specified in the Act for the consideration of the subject and the rendering of a decision.

It may not be possible to prevent strikes or lockouts by requiring compulsory arbitration, but it is wise to consider whether an obligation should not be placed upon the employer and employe to advise the authorities of the questions at issue before any lockouts or strikes can become effective, so that by due publication and inquiry the Government and the public may be fully informed of the extent of the controversy and its causes.

The net revenue of rail operations shows an increase of $3,710,633.96.

Taxes continue to increase, the charges for the present year exceeding those of the previous year by $332,649.28.

The tonnage for the year increased 14.52% and tonnage mileage increased 13.35%, while the freight train mileage increased only 10.95% due to an increased train load of 2.17%.

The passengers carried increased 7.42% with increased passenger mileage of 6.71%, while in the face of this, the passenger train mileage increased only 1.88% due to the average number of passengers per train increasing 4.84%.

In the deductions for lease of other roads the larger payments are due to the increased revenue earned on Roads operated on the basis of Net revenue.

The decrease in the interest deductions for funded debt, compared with

1911, was due to the maturity and payment on May 1st, 1912, of the River Front Railroad Company First Mortgage Bonds; and on November 1st, 1912, of the Pennsylvania Railroad Company 3½% Convertible Bonds of 1907, and also to the payments of principal due on Equipment Trust Obligations.

The Company has in contemplation many important and extensive necessary improvements, a large portion of which should not be charged to Capital Account, and for which the Reserve for Additions and Betterments will be utilized, such as the improvements of Broad Street Station, Philadelphia, and its approaches and facilities; improvements on the Allegheny Division hereinafter referred to; the elimination of grade crossings and elevation of tracks on the New York Division, from Colonia eastward, through the City of Rahway, to Bay Way, Elizabeth, and a slight change of line in the City of Elizabeth, where the line has already been elevated. It also contemplates the abolition of additional grade crossings in Philadelphia, Lancaster, Lilly, Johnstown, Freeport, Wilkinsburg, Pittsburgh, and other points on its lines when the local authorities co-operate in making the eliminations. The Company also has in contemplation the construction of a new double-track steel bridge over the Allegheny River at Kiskiminetas Junction on an improved line to take the place of the present single-track bridge.

The Capital Stock was increased over the previous year by $100.00, of which $50.00 was issued in exchange for Fractional Convertible Bond Receipts, and $50 for Dividend Scrip dated May 31, 1893.

The Funded Debt and Equipment Trust obligations were reduced as follows:

Redemption through Sinking Funds:

Consolidated Mortgage 3½% Bonds due July 1, 1945	$66,930.00
Equipment Trust Loan due 1914	121,000.00
Collateral Trust Loan Bonds 4½% due June 1, 1913	51,000.00
Philadelphia, Wilmington and Baltimore Railroad 4% Stock Trust Certificates due July 1, 1921	114,000.00

Payment at Maturity of:

Ten Year Gold Convertible 3½% Bonds	10,222,500.00
River Front Railroad Company's 1st Mortgage 4½% Bonds	212,000.00
Equipment Trust obligations	6,441,100.07

It will shortly be necessary for the Company to provide capital for the $10,222,500 of Ten Year Gold Convertible 3½% Bonds which matured November 1st, 1912, and for $9,735,000.00, of Collateral Trust Loan 4½% Bonds due June 1st, 1913, together with maturing equipment trust obligations, and also for new construction work, the extension and improvement of terminals, track and facilities, and the purchase of equipment. The matter is now receiving careful consideration, but no decision has yet been reached as to the form or extent of the proposed financing.

The issues of Equipment Trust Securities during the year consisted of $7,000,000.00 of Pennsylvania General Freight Equipment Trust Certificates of 1912, of which the Pennsylvania Railroad Company's proportion was $1,572,100.00. There were this year furnished for the Pennsylvania Railroad Company 875 steel underframe and steel body-frame refrigerator cars; for the Pennsylvania Company, 1,000 steel underframe and steel body-frame automobile box cars; for the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company 3,000 all steel coke gondola cars; and for the New York, Philadelphia and Norfolk Railroad Company 800 steel underframe ventilated box cars and 50 steel underframe gondola cars, an aggregate of 5,725 cars.

During the year the final payments were made under 19 series of equipment trusts, the last originated in 1903, which amounted to $19,000,000. These series covered 3,325 steel underframe box cars, 3,000 steel hopper gondola cars, 6,000 steel underframe long gondola cars, in service on the Pennsylvania Railroad; 500 refrigerator cars, 1,500 steel hopper gondola cars, 600 steel underframe long gondola cars, 500 steel flat cars, sub-leased to the Pennsylvania Company; 210 steel underframe box cars, 300 steel hopper gondola cars, 400 steel underframe long gondola cars, sub-leased to the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company; 200 steel hopper gondola cars, sub-leased to the Cleveland, Akron and Cincinnati Railway Company; and 85 refrigerator cars sub-leased to the Grand Rapids and Indiana Railway Company, representing in all 16,620 cars.

The cars therefore have become the property of the respective companies which paid the cost thereof.

The expenditures for acquisition of property during the year were mainly to cover additional right of way for new lines, elimination of grade crossings, and for passenger terminal and station improvements at Broad Street Station, and other points in Philadelphia, and for the enlargement and improvement of freight stations and facilities at Hamburg Junction and Greenwich in Philadelphia, Elizabethtown, Altoona, Cresson, Uniontown, Tarentum, Peterson and New Kensington.

The block signal system on the main line between New York and Pittsburgh was further improved by the installation of automatic signals on the Philadelphia Division between Dillerville Block Station and Branch Intersection, and on the Pittsburgh Division between Summerhill and Latrobe, and the work will be continued next year on the Middle and Philadelphia Divisions.

The Cortlandt Street Ferry House and Dock, New York City, which are being rebuilt, have so far progressed that the two ferry slips are now in operation, and the remainder of the work will be completed in 1913.

On the Newark Rapid Transit Line, described in the Annual Report for 1910, the Summit Avenue passenger station, Jersey City, was partially completed and opened on May 30th, 1912, and has since been finished, and is accommodating a large amount of traffic. The Fourth Street Station in Harrison, N. J., on this line, will be completed early in 1913.

For the eastern section of the six-track system on the New York Division between Colonia, N. J., and Waverly, west of Newark, N. J., additional right of way has been acquired. This work comprehends station improvements, the elimination of fifteen grade crossings by the elevation of the four existing main tracks, and also the construction of two additional elevated tracks between those points. Construction work is now proceeding between Colonia and Elizabeth, and should be completed in 1914.

The State of New Jersey, in which your Company and other lines have extensive mileage, is now considering the enactment of new legislation for the elimination of grade crossings. It has long been the policy of the Company to encourage the removal of grade crossings, and it has spent large sums of money for that purpose, but still greater results in this direction would have been attained had the States and municipalities been authorized, or willing, to co-operate in the outlay. The railroads in many instances have been the pioneers in the development of the towns, cities and territories served by them, and their existence has materially added to the population and prosperity of these communities. But with so many crossings still to be eliminated, the greatly increased payments for taxes and other items, and outlays for improvements in their railroads and equipment, which still confront them and are essential to public safety and convenience, it seems unfair and unwise to propose that the railroad companies should be burdened with either the entire cost, or an undue proportion of the cost, of eliminating grade crossings, many of which have been opened subsequently to the construction of the railroads, and against their strong protest. For these reasons and on account of the great increase of motor, street railway, vehicular and pedestrian travel, it is hoped that the legislation now pending will be so framed in the public interest, as to enable either the State, the municipalities or the railroads to take the initiative in the abolition of existing crossings, and to co-operate in carrying on the work by providing a fair and equitable division of the expenditure, as do the laws of New York, Massachusetts, Vermont, Ohio and other States.

The improvement of the passenger facilities in Philadelphia is still receiving consideration by the various departments in the service, and also by the Consulting Electrical Engineers of the Company. As outlined in the last annual report, it will necessitate (1) an increase in the tracks and platforms, and the enlargement and improvement of the station facilities at Broad Street Station and its approaches as far as West Philadelphia Station and Yard; (2) the widening of the bridge, and its approaches, over the Schuylkill River and the adjoining entrances to Fairmount Park at Girard Avenue, by the construction of two additional tracks and a revision of the signals and interlocking, which is now proceeding, and (3) the enlargement of North Philadelphia passenger station and its approaches by the addition of four new tracks with high level island platforms, and other improvements including the relocation of the junction of the Chestnut Hill Branch with the New York division at that point, which is now under contract.

In brief the Philadelphia Terminal problem is to provide increased terminal facilities and approaches for approximately 20 years, for lines which equal eight double-track railroads.

An Ordinance was obtained from the City of Philadelphia to erect a new eight-track concrete steel bridge across North Broad Street near North Philadelphia Station.

Pending the results of the investigation of terminal improvements for Broad Street Station, Philadelphia, satisfactory progress is being made in the acquisition of the necessary real estate.

Extensive repairs and additions are being made to the West Philadelphia stock yards of the Company, and the piers at Greenwich, Philadelphia, are being improved, and the dock extended, to facilitate the loading of coal at that point.

On the Bald Eagle Valley Branch the grades are being revised and the line is being double-tracked between Mount Eagle and the Howard Rolling Mills and passing sidings are being extended, to provide for the increased tonnage passing between the Main Line and the Erie Division via Tyrone and Lock Haven.

On the Pittsburgh Division four grade crossings are being abolished in Braddock, Pa., by the construction of three under-grade bridges and one over-head bridge; work is in progress on the elimination of grade crossings in the City of Pittsburgh at Homewood Avenue, and the work of eliminating all grade crossings in the Borough of Wilkinsburg has commenced.

In West Brownsville Yard, Pa., the change of grade and extension of track facilities, necessary to connect with the new double track Monongahela River bridge, at that point are almost completed.

On the Sunbury Division the double tracking was further extended during the year by constructing second tracks at Boyd and South Danville, and between Port and Honey Pot Yard, Pa.

At Montgomery, Pa., the sixteen span double track steel bridge over the West Branch of the Susquehanna River, replacing the single track bridge at that point, will be completed this year.

The aggregate expenditures for Construction and Equipment during the year upon the owned and leased lines of this Company was $16,322,247.38 for which the Company has been reimbursed by leased lines to the extent of $727,502.41. The sum of $888,107.06 was expended on the Western New York and Pennsylvania Railway, Cambria and Clearfield Railway, and other Branch Roads, and charged against Income as Expenditures on Branch Roads for Construction. The expenditures on the line owned and on the Harrisburg, Portsmouth, Mt. Joy and Lancaster Railroad and the United New Jersey Railroad and Canal Company, operated under long-term leases, comprising the main line system between New York and Pittsburgh, amounted to $14,706,637.91, which has been disposed of as follows:

Charged to Income as Extraordinary Expenditures	$1,841,127.72	
Charged to Reserve for additions and Betterments appropriated out of Income of previous year	3,652,567.37	
		$5,493,695.09
Charged to Capital Account:		
Road	$3,602,489.93	
Equipment	5,610,452.89	
		9,212,942.82
		$14,706,637.91

Under the Balance Sheet prescribed by the Interstate Commerce Commission, the Road and Equipment Account includes not only these capital charges, but also similar expenditures made out of Income since June 30th, 1907. Therefore, the expenditures charged against Income and against the Reserve for Additions and Betterments, created in previous year have been so included.

The Additions and Betterments expenditures on the Harrisburg, Portsmouth, Mt. Joy and Lancaster Railroad and the lines of the United New Jersey Railroad and Canal Company, both operated by this Company under leases for 999 years have also been included under the Road and Equipment Account as "Leased Lines—Road."

Expenditures during 1912	$1,979,160.61
Expenditures June 30th, 1907, to December 31st, 1911	9,940,950.10
	$11,920,110.71

An offsetting liability appears on the credit side of the Balance Sheet, entitled "Additions to Property since June 30th, 1907, through Income," in which is carried not only the $5,493,695.09, but also the payments through Income on account of Car Trust Certificates amounting to $2,901,727.99 for 1912, and $637,644.08 for previous years, aggregating $9,033,067.16.

On account of principal and interest of Water Supply Trust Certificates $524,251.81 were expended during the year and charged against Income.

The construction of the New York Connecting Railroad, owned jointly by this Company and the New York, New Haven and Hartford Railroad Company, as described in the report of last year, is proceeding. Additional contracts have been awarded for foundations and masonry of Bronx Viaduct; foundations and masonry of Piers for Bronx Kills Bridge, Randalls Island Viaduct, Little Hell Gate Bridge, and Wards Island Viaduct; for the bases and foundations of the East River Bridge on Wards Island and Long Island City; and for the Long Island Viaduct; for foundation and masonry between Lawrence and Stemler Streets; and for grading and masonry between its connection with the Pennsylvania Tunnel and Terminal and the Long Island Railroads at Woodside Avenue and Fourteenth Avenue.

The increasing traffic between Pittsburgh and Buffalo via the Allegheny Division and the Western New York and Pennsylvania Railway requires the construction of three tunnels and the reduction of grades and other improvements on the Allegheny Division between Pittsburgh and Oil City,

and the reduction of grades and improvements of the railroad and yard facilities on the said railway between Oil City and Buffalo, via Brocton and the Chautauqua Branch, to more fully utilize it as the principal route for passenger and freight traffic between these cities, and the work has been authorized. As the result of these improvements, the heavy grades will be restricted to relatively short distances between the said cities, and this route, which was objectionable because of heavy grades, will be over 58 miles shorter than the present route via Oil City, the Salamanca Branch, and Olean, and will have not only this advantage in distance, which will produce satisfactory operating economies, but its use will postpone for several years the double tracking and other expenditures on the present route.

To meet the Construction and Equipment expenditures on the Western New York and Pennsylvania Railway during the year, advances aggregating $525,212.36 were made by this Company, and charged against the net income of the Lessee Company. This Company will also be required to provide funds for the improvements heretofore mentioned on that railway during the year 1913.

On the Cambria and Clearfield Railway, the Cherry Tree and Dixonville Railroad, and the Pennsylvania, Monongahela and Southern Railroad, various short branches were built to reach coal mining operations.

This Company advanced $184,591.36 to the Cambria and Clearfield Railway Company to meet its construction expenditures, which was charged against the net income of the Lessee Company.

It has been deemed advisable to absorb the Cambria and Clearfield Railway Company, which for many years has been owned and operated by this Company in connection with its main line, the construction of that road and its several constituents having been promoted by this Company for the development of the bituminous coal traffic in the Clearfield region. The necessity for maintaining that Company as a separate corporation no longer exists, and the agreement providing for its acquisition will, in accordance with notice given to the stockholders, be submitted for approval at the annual meeting.

The sum of $94,408.94 was advanced to the Pennsylvania, Monongahela and Southern Railroad Company to meet its construction expenditures for 1912, for which it reimbursed this Company by the issuance of its stock and bonds in equal portions.

A fireproof elevator with enlarged capacity and modern facilities is being erected by the Girard Point Storage Company at Girard Point, Philadelphia, to take the place of the present elevator.

On the Philadelphia, Baltimore and Washington Railroad, the work of reconstructing the bridges over the Gunpowder and Bush Rivers is proceeding, and will be finished during 1913. The reconstruction of the bridges over Stemmers Run, Back River and Gwynn's Falls will also be undertaken in the present year.

The installation of automatic block signals on the Maryland Division has been completed between Washington and Baltimore, between Principio and Iron Hill, and between Ruthby and Wilmington, and the work will be continued next year.

On the Northern Central Railway the work of enlarging the Mount Vernon Yards, Baltimore, was entirely completed. The freight facilities at York, Pa., Highlandtown, Md., and at Marysville Yard, are also being enlarged and improved to accommodate the increased traffic. These improvements will probably be completed in 1913.

The execution and delivery of the proposed lease by this Company of the railroad, property and franchises of the Northern Central Railway Company, is still delayed by litigation. Under its provisions, which have been fully explained in the Annual Report for 1910, the lease and rental payments became effective January 1st, 1911, and an accounting between the lessor and lessee from that date will be necessary if and when the lease has been duly executed and delivered in conformity with its terms and conditions.

The Wilkes-Barre Connecting Railroad Company was incorporated during the year jointly by this Company and the Delaware and Hudson Company to provide a line, seven miles in length, from Buttonwood Yard on the Pennsylvania Railroad, west of the City of Wilkes-Barre, to Hudson on the line of the Delaware and Hudson Company, to facilitate the interchange of traffic between the two roads, and avoid its movement through the business centre of that city, and via the tracks of other railroads.

The surplus property fronting on Seventh Avenue between Thirty-second and Thirty-third Streets, New York City, owned by the Pennsylvania Tunnel and Terminal Railroad Company, a subsidiary of this Company, has been conveyed to the Pennsylvania Terminal Real Estate Company looking to its future development.

During the year the Company made advances to the Long Island Railroad Company aggregating $2,625,000, for the improvement of its railroad and facilities, and the construction of new lines and equipment, and will receive therefor securities of that Company.

Minor advances were also made to the Pennsylvania Tunnel and Terminal Railroad Company in 1912, for which its certificate of indebtedness to this Company has been issued.

The pensions paid during the year amounted to $646,375.34.

The stockholders will be asked to authorize an increase in the annual sum set apart for pension purposes from $700,000 to $750,000 per annum and to give authority to the Board of Directors to hereafter increase the pension appropriation to such extent as may, from time to time, be necessary to meet the requirements for which the Pension Department was created; such increase to be reported to the stockholders.

The additional appropriation is necessitated by the increasing number of pensioned employees, especially between the ages of 65 and 69 years; and the advances in wages from time to time, which increase the average pension allowances.

The securities held by the Company, December 31st, 1912, at a valuation of $331,909,154.32, produced a direct income during the year of $14,527,491.56. During the year the Company increased its holdings of Norfolk and Western Railway Company Common stock, by $4,788,100.00 through the conversion of a like amount of Norfolk and Western Railway Company Convertible bonds, to which it had subscribed at par, during the year, and also acquired $3,000,000 of Pennsylvania Terminal Real Estate Company stock.

Effective May 8th, 1912, the name of the Buffalo and Allegheny Valley Division was changed to Northern Division.

By order of the Board,

SAMUEL REA,
President.

STOCKHOLDERS MAY OBTAIN COPIES OF THE ANNUAL REPORT COMPLETE, BY APPLYING TO OR ADDRESSING
LEWIS NEILSON, SECRETARY,
BROAD STREET STATION, PHILADELPHIA, PA.

FORTY-FOURTH ANNUAL REPORT OF THE NEW YORK CENTRAL AND HUDSON RIVER RAILROAD COMPANY.

To the Stockholders of

The New York Central and Hudson River Railroad Company:

The Board of Directors herewith submits its report for the year ended December 31, 1912, with statements showing the results for the year and the financial condition of the company.

The mileage embraced in the operation of the road is as follows:

	Miles
Main line and branches owned	805.49
Proprietary lines	3.06
Lines leased*	2,626.13
Lines operated under contract	81.70
Trackage rights	274.27
Total road operated	3,790.65

*The Dunkirk Allegheny Valley and Pittsburgh Railroad, 90.51 miles, is also leased by this company, but its mileage and operations are not included in this report. Separate accounts are kept and independent returns prepared in its behalf.

Of the total road operated, 290.71 miles are operated in freight service only and 14.96 miles are operated in passenger service only.

The decrease of mileage of leased lines is due to abandonment of part of the Pardee branch of the Beech Creek Railroad and a change of alinement of the main line of the same railroad. The difference in the reported mileage of road operated under trackage rights is caused by a careful revision of previously reported figures by the engineering authorities of the various railroads interested. A statement showing the total miles of road and track operated will be found on another page.

The standard form of income account promulgated by the Interstate Commerce Commission was adopted by this company on July 1, 1912. No revision of figures for the previous year nor for the first six months of the year covered by this report has been made and, therefore, some of the comparisons between the years 1911 and 191[illegible] are somewhat distorted. The accounts principally affected by this change of form are "taxes accrued," part of the taxes which were previously charged to this account being now shown in "miscellaneous tax accruals" in the "deductions from gross corporate income" and "miscellaneous income" from which have been transferred to "miscellaneous rents" the amounts receivable as rental of property not used in the operation of the road.

The capital stock authorized is [illegible] $250,000,000.00
of which there is issued and outstanding [illegible] 222,729,300.00

having a balance authorized but not issued of [illegible] $27,270,700.00

The mortgage, bonded and secured debt outstanding on December 31, 1911, was [illegible] $299,870,608.18

[illegible] has been added as follows:

[illegible] mortgage bonds bearing interest at the rate of three and one-half per cent per annum $5,000,000.00

[illegible] notes of this company bearing interest at the rate of four per cent per annum 9,156,000.00

[illegible] collateral note of New York [illegible] bearing interest at the rate of four and one-half per cent per annum 20,000,000.00

This company's pro rata liability in connection with the equipment trust certificates of 1912, bearing interest at the rate of four and one-half per cent per annum 7,156,741.50

Equipment trust certificates on account of the Boston & Albany Railroad, bearing interest at the rate of four and one-half per cent per annum (see page 10) 5,220,000.00

Mortgage on real estate in the city of New York, bearing interest at the rate of three and one-half per cent per annum 1,000,000.00

Mortgage on real estate in the city of Utica, bearing interest at the rate of six per cent per annum 2,500.00 47,535,241.50

$347,405,849.68

and has been decreased as follows:

Payments of installments falling due during the year on this company's pro rata liability in connection with the certificates issued under equipment trust agreements, as follows:

Trust of 1907, installment due November, 1912	$793,660.12	
Trust of 1910, installment due January 1912	433,964.42	
Payment of mortgage on real estate in the city of New York	150,000.00	1,377,624.54

Outstanding, as shown on the balance sheet of December 31, 1912 ..... $346,028,225.14

In accordance with the consent of the Public Service Commission of the Second District of the State of New York, there have been acquired out of the proceeds of the issue of securities specially authorized for the purpose, 100,786 shares of common stock and 22,181 shares of preferred stock of the New York and Harlem Railroad Company of a par value of $6,148,350, at a cost of $21,493,053.16; 80,081 shares of stock of the Rome Watertown and Ogdensburg Railroad Company, of a par value of $8,008,100, at a cost of $10,250,368; and 9,322 shares of the stock of the Utica and Black River Railroad Company of a par value of $932,200, at a cost of $1,677,960.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME.

Operating income.	1912.	1911.	Increase or Decrease.
	3,790.65	3,790.23	0.42 *miles*
Rail operations	*miles operated*	*miles operated*	
Revenues	$109,900,015.57	$103,954,862.81	$5,945,152.76
Expenses	81,311,153.31	75,700,202.78	5,610,950.53
Net revenue from rail operations	$28,588,862.26	$28,254,660.03	$334,202.23

Percentage of expenses to revenues	(73.99%)	(72.82%)	(1.17%)

†Revised for purposes of comparison.

For the year covered by this report the revenue from transportation was $108,454,633.07, an increase of $5,903,734.81, revenue from [illegible] other) than transportation was $1,445,382.50, an increase of $41,[illegible] revenue from auxiliary operations (connected with, but in addition to transportation by rail) was $5,579,083.89, an increase of $376,511.27.

The total gross revenue from all operations was $115,479,099.40, an increase of $6,321,664.03.

Freight revenue was $65,101,599.99, an increase of $3,968,200.07. The revenue freight carried amounted to $1,901,182 tons, an increase of 3,650,647 tons over last year.

Products of agriculture show an increase of 441,275 tons, chief of which are grain 208,196 tons, flour and other mill products 139,868 tons and cotton 42,703 tons. Products of animals show an added tonnage of 59,677; live stock, dressed meats and other packing house products show a decrease of 49,028 tons; wool, hides and leather an increase of 48,150 tons; milk increased 26,537 tons while dairy products fell off 4,876 tons. Products of mines show an increase of 1,815,306 tons, of which bituminous coal yielded 830,830 tons, anthracite coal 62,856 tons, coke 151,120 tons, ores 403,119 tons, and stone, sand and other articles 367,381 tons. Products of forests increased 287,711 tons. Manufactured articles increased 1,264,861 tons; cement, brick and lime showing 355,583 tons over last year's movement; metal productions increased 375,920 tons; bar and sheet metal show an increase of 154,342 tons; iron and steel rails declined to the extent of 34,367 tons. Commodities not classifiable decreased 218,183 tons.

There have been practically no changes in freight rates during the year, but owing to the large increase in medium and low class commodities transported the average revenue per ton fell from $1.27 in 1911 to $1.25 in the year 1912 and the rate per ton per mile declined from 6.33 mills to 6.26 mills.

The revenue from passengers amounted to $33,134,508.72, an increase of $1,375,270.74. There was an increase of 992,801 in the number of local passengers and of 1,158,715 in the number of commutation passengers, but the number of interline passengers decreased 100,885. The average amount received from each passenger showed a slight increase but owing to the increased volume of commutation business, the average rate per passenger per mile showed a very small decrease.

The special service train revenue shows an apparent decrease of $133,298.25 due mainly to a revised method of accounting, a large part of the revenue which was formerly credited to this account now being credited to ordinary passenger revenue. The actual decrease is explained by the military movements to and from Pine Camp during the previous year, there being no corresponding source of revenue in 1912.

The total revenue of all passenger-train transportation was $41,566,413.41, an increase of $1,927,884.98 over the year 1911. Of this amount the revenue from express traffic was $4,736,754.97, an increase of $533,977.55 due to an enlarged volume of business.

The expenses of rail operations amounted to $81,311,153.31, an increase of $5,610,950.53. The ratio of rail operating expenses to the total revenues for the year was 73.99%, an increase of 1.17% over the ratio for the year 1911. Of the total increase of $5,610,950.53 the larger part was occasioned by increased expenditures in the upkeep of the road and equipment, the total increases being as follows: For maintenance of way, structures and equipment $3,283,255.34, for expenses of securing and transporting traffic and of general administration $2,327,695.19.

The operating expenses, by groups, were:

Maintenance of way and structures	$14,705,288.99	an increase of $981,579.79
Maintenance of equipment	20,440,446.48	an increase of 2,301,675.55
Traffic expenses	2,316,426.51	an increase of 136,220.02
Transportation expenses	41,052,202.08	an increase of 2,117,171.14
General expenses	2,796,789.25	an increase of 74,304.03
Auxiliary operations	5,255,057.55	an increase of 373,960.76

In the maintenance of way and structures the repairs of roadway and track cost $201,918.42 more than in 1911 and the maintenance and repairs of buildings, fixtures and grounds increased $393,867.78. Removal of snow, sand and ice necessitated an increased expenditure of $198,535.88. Improvements to signal apparatus increased $133,206.97.

In the maintenance of equipment the repairs of locomotives and cars increased $1,716,257.86, while the charges for renewals and depreciation of equipment increased $461,370.80.

Transportation expenses show large increases in the cost of labor, partly accounted for by the increase in the rates of pay of the engineers as explained in a subsequent part of this report. Other increases were consequent on the enlarged volume of business transacted.

Efficiency of operation is clearly indicated by the statistics of mileage of locomotives, trains and cars. Freight locomotive mileage decreased 686,021 miles, freight train mileage decreased 378,799 miles, while loaded freight car mileage increased 19,574,385 miles. Empty car mileage decreased 11,942,275 miles, due to heavy west-bound traffic, and caboose mileage decreased 72,653 miles. Passenger locomotive mileage increased 147,158 miles, passenger train mileage increased 212,520 miles and passenger car mileage increased 3,351,872 miles.

The average load per freight train mile increased 35.49 tons (over 8%) and the load per car mile increased seven-tenths of a ton. The consumption of fuel per mile run by freight locomotives increased three-quarters of a pound, and by passenger locomotives decreased over a pound and a half. The average cost of coal increased six cents a ton and the average cost of fuel per locomotive mile increased 63/100ths of a cent.

In the operation of the Pension Department 135 employees were retired and placed upon the pension rolls. Of these retirements, 70 were authorized because of the attainment of seventy years of age and 65 because of total and permanent physical disability. Sixty-two pensioners died during 1912 and at the close of the year 700 retired employees were carried upon the pension rol's. The average monthly pension allowance to these men was $24.19 and the total amount paid in pension allowances during the year was $201,536.31.

Auxiliary operations show an increase in the net revenue of $2,550.51. All the accounts under this head produced increases except harbor terminal transfers with a decrease of $117,531.09 and dining and special car service which decreased $37,622.79.

The amount of taxes accrued during the year was $5,918,482.90, equal to 5.13% of the gross operating revenues of the year. The increase was $470,723.77, or 8.64%, due to a general raising of the tax rates assessed on real estate. The Federal Government tax on income of corporations amounted to $128,245.84, a very small decrease from that paid in 1911. As in previous years, a large portion of this amount was paid under protest. Of the suits that were instituted to recover the amounts paid on accounts of lessor companies under the claim that they are not liable to this tax, those in behalf of the West Shore Railroad Company and the Mohawk and Malone Railway Company, selected as test cases, were tried in the city of New York and the judgment of the court was in favor of the two companies. The Federal Government has taken the whole question involved to the Supreme Court where arguments have been heard and final judgment is expected early in 1913.

In deductions from gross corporate income, rentals of leased lines have

increased $18,360.12. The rental of the Boston and Albany Railroad was larger by $22,500.00, the amount of interest on Improvement bonds issued in 1912. The rental of the Dunkirk Allegheny Valley and Pittsburgh Railway decreased $6,041.68 due to the refunding of its bonded debt at a lower rate of interest during the year 1911.

In other income an increase of $1,142,300.67 is reported in the income derived from capital stock held by this company, due to the acquisition during the year of shares of the New York and Harlem Railroad Company, Rome Watertown and Ogdensburg Railroad Company and the Utica and Black River Railroad Company, as stated in a previous paragraph.

Interest on the funded obligations of this company increased $1,606,227.31, made up of interest on securities issued during the year as follows: Gold mortgage bonds, $175,000.00; Gold debentures of 1912, $324,583.47; Three year gold notes of 1912, $553,125.00; Equipment trust of 1912, $288,558.83 and an increase of $264,960.01 in the interest on three year gold notes of 1911, the difference between nine months' interest charged in 1911 and a whole year's interest charged in 1912.

Separately operated properties resulted in a loss of $346,612.72, being the amount of this company's proportion of the annual guarantee to the Merchants Despatch Transportation Company, $369,080.04, less the profit from the operation of the Dunkirk Allegheny Valley and Pittsburgh Railroad $22,467.32, the net result being an increase of $135,919.70 in the deductions from gross corporate income. No dividend was paid on the capital stock of the St. Lawrence and Adirondack Railway Company for this year, reducing the amount of this company's income from investments $64,600.00 and reducing deductions from gross corporate income by the same amount.

The rate of dividend for the year was five per cent, being the same as for the previous year.

The surplus for the year, after paying dividends, amounted to $2,743,372.35, a decrease as compared with the year 1911 of $1,424,611.69.

Several very extensive and important projects for the improvement of facilities have been carried on during the year, chief of which are the following:—

Improvements at Utica, consisting of a new brick and stone passenger station, elimination of grade crossing at Genesee Street, a new engine terminal, increase of terminal yard tracks and the installation of new signal apparatus, for which has been expended during the year the sum of $1,353,057.24.

Improvements at Rochester, comprising a new stone passenger station, extension and reconstruction of several bridges, the closing of Joiner Street, placing additional tracks, the building of a new power house for heating the passenger station and other buildings and the erection of several auxiliary buildings, involving during the year an expenditure of $690,991.40.

Four-tracking the Hudson division through Poughkeepsie, between Hyde Park and Barrytown, from Storm King to Chelsea, between Tivoli and Germantown and at Stockport. Included in this plan are new passenger stations at Staatsburgh and Rhinecliff. The charges on account of this improvement reached the total of $2,594,608.15 during the year.

Four-tracking from Spuyten Duyvil to Peekskill and the electrification of line from Spuyten Duyvil to Croton, including the consequent changes in bridges, stations and signals, cost during the year $2,156,276.27. In this is included the development of a new terminal of the Electric division at Harmon and an important and comprehensive plan of improvements at Yonkers, consisting of the elevation of tracks and the construction of additional main tracks, a new passenger station, a new freight station, a new freight yard layout and a new passenger station at Glenwood.

The construction of a connection between this company's main line and the West Shore Railroad at Harbor, east of Utica, has cost during the year $325,012.31, of which amount $31,346.03 has been charged to the West Shore Railroad Company as advances for new construction.

The changing of grade crossings in the city of Buffalo, which has been in progress for many years, has been continued at a cost of $208,177.04 for the work done during the year.

The total expenditures for additions and betterments to the property of this company during the year were:

Expenditures on road account	$10,196,570.08	
Additional trust equipment	7,672,796.85	$17,869,366.93
Credit value of equipment retired	$4,843,288.80	
Amount to equal equipment trust installments	1,748,240.66	
	$6,591,529.46	
Expenditures on equipment account	5,806,061.87	785,467.59
making a net addition to this company's property account of		$17,083,899.34

Expenditures on account of construction work on leased lines amounted to $12,229,631.31, making a grand total of extraordinary expenditures during the year of $29,313,530.65, details of which are shown on subsequent pages.

Under date of October 1, 1912, The New York Central and Hudson River Railroad Company became party to an agreement establishing the Boston and Albany Equipment Trust of 1912, under which, and subsequent leases, certain equipment will be acquired for use upon the Boston and Albany Railroad. The agreement provides that the total amount of trust certificates to be issued thereunder shall not exceed $7,500,000, or 90% of the cost of the equipment to be furnished. The certificates bear interest at the rate of 4½% per annum, and are to be paid in fifteen annual installments, the first being payable October 1, 1913. Of the certificates authorized $5,220,000 have been issued, covering not to exceed 90% of the cost of 21 locomotives, 31 passenger cars, 5,200 freight cars and 100 ballast cars. The New York Central and Hudson River Railroad Company and the New York New Haven and Hartford Railroad Company have entered into an agreement by which the New Haven Company assumes one-half of the payments under this equipment trust and becomes entitled to a one-half interest in the equipment, which, however, during the life of the trust, continues assigned to Boston and Albany Railroad use.

On November 20, 1912, the Board of Directors authorized The New York Central and Hudson River Railroad Company, together with The Lake Shore and Michigan Southern Railway Company, The Michigan Central Railroad Company, The Cleveland Cincinnati Chicago and St. Louis Railway Company, The Pittsburgh and Lake Erie Railroad Company and The Toledo and Ohio Central Railway Company to enter into an equipment trust agreement, to be dated January 1, 1913, for the purpose of establishing the New York Central Lines Equipment Trust of 1913. This agreement will provide for an issue of $34,000,000 of equipment trust certificates, bearing interest at the rate of 4½% per annum, being not to exceed 90% of the total cost of the equipment to be furnished under the terms of the said agreement. The certificates are to be paid in fifteen annual installments, the first being payable January 1, 1914. Out of the $34,000,000 of certificates authorized there will be issued, early in 1913, $12,540,000. The cost of the equipment to be assigned to this company in connection with the issue of these latter certificates will be approximately $5,079,000, and the pro rata amount of the certificates, representing not to exceed 90% of the cost, will be approximately $4,436,000. Full particulars as to the character of the equipment to be acquired will be set fortb in the report to the stockholders for the year 1913.

On another page will be found details with respect to the New York Central Lines Equipment Trust of 1912, showing the locomotives and cars acquired thereunder and the certificates outstanding.

The operation of the Boston and Albany Railroad under the agreement between this company and the New Haven and Hartford Railroad Company, which became effective on July 1, 1911, and was outlined in last year's report, has resulted in a surplus of $71,601.60 during the year covered by this report, one-half of which amount is shown in deductions from income under the title "Transfer of income to other companies."

A special committee, appointed by the Board of Directors of the Merchants Despatch Transportation Company, recommended the sale by that company to The New York Central and Hudson River Railroad Company and The Lake Shore and Michigan Southern Railway Company of all its refrigerator equipment, consisting of 5,388 cars and also 1,000 cars covered by the Merchants Despatch Equipment Trust of 1911, in proportion to the holdings of the two companies of the capital stock of the Merchants Despatch Transportation Company. On November 13, 1912, the Board of Directors authorized the cancellation of the agreement for the use of refrigerator cars dated November 1, 1907, between the Merchants Despatch Transportation Company, The New York Central and Hudson River Railroad Company, The Lake Shore and Michigan Southern Railway Company, The Michigan Central Railroad Company, The Cleveland Cincinnati Chicago and St. Louis Railway Company, The Pittsburgh and Lake Erie Railroad Company, the Peoria and Eastern Railway Company, the Rutland Railroad Company, the Lake Erie and Western Railroad Company and the Chicago Indiana and Southern Railroad Company, and on the same date authorized the purchase by this company of 2,868 refrigerator cars at cost, less depreciation; and 532 refrigerator cars covered by the Merchants Despatch Equipment Trust of 1911, this company to pay the Merchants Despatch Transportation Company 532/1000ths of the amount already paid by it on account of the 1,000 cars, less depreciation, and to assume 532/1000ths of all future payments to be made under the agreement and lease known as the Merchants Despatch Equipment Trust of 1911, the cars to be transferred to this company on January 1, 1913.

Early in January the General Chairmen's Association of the Brotherhood of Locomotive Engineers, representing the engineers on fifty-two railroads in the Eastern Section of the United States, formulated demands for a general increase in wages and for certain modifications in the rules governing their employment; and these demands were submitted to the various roads on January 22nd.

On March 14th, 15th and 25th conferences were held between the representatives of the Brotherhood of Locomotive Engineers and a Conference Committee of Managers authorized to conduct the negotiations for all of the roads concerned; the Committee of Managers declined to grant the requests either in whole or in part.

A vote of the employees was taken, resulting almost unanimously in favor of a strike, whereupon the Honorable Martin A. Knapp, Presiding Judge of the United States Commerce Court, and the Honorable Charles P. Neill, United States Commissioner of Labor, tendered mediation under the Erdman Act.

Both parties declined arbitration under that Act, and it was finally agreed, on April 30th, to submit the matters in dispute to a Board of Arbitration to consist of seven members—one to be named by the railroads, one by the engineers, and these two to agree upon five others; or, failing to so agree within fifteen days, the Chief Justice of the Supreme Court of the United States, the Presiding Judge of the Commerce Court and the United States Commissioner of Labor should name the other five members.

The railroads selected Mr. Daniel Willard, President of the Baltimore & Ohio Railroad Company, and the engineers selected Mr. P. H. Morrissey, former Grand Master of the Brotherhood of Railroad Trainmen; these two representatives having failed to agree, the other five arbitrators were appointed by the Chief Justice of the Supreme Court of the United States, the Presiding Judge of the Commerce Court and the Commissioner of Labor, as follows:

Hon. Oscar S. Straus, New York,
Dr. Charles R. Van Hise, Madison, Wisconsin,
Mr. Frederick N. Judson, St Louis, Missouri,
Dr. Albert Shaw, New York,
Mr. Otto M. Eidlitz, New York.

The Board so constituted held its first meeting in New York city, Friday, July 12th, 1912, electing the Honorable Oscar S. Straus chairman. Hearings were held at the Oriental Hotel, Manhattan Beach, from July 15th to 27th; Grand Chief Engineer Warren S. Stone represented the Brotherhood of Locomotive Engineers and handled the case with marked ability. The evidence of a large number of witnesses on both sides was taken and a most exhaustive investigation of the question in all its details was made. The Board finally published its award on November 25th.

The Commission appointed by the Chief Justice of the Supreme Court, the Presiding Judge of the Commerce Court and the Commissioner of Labor was composed of men of high character and wide experience. Months of patient, painstaking investigation and labor were given to the consideration of the subject, and the conclusions reached, as well as recommendations submitted, are worthy of the most careful consideration.

The statement that "there is a growing realization that labor difficulties upon railroads should not be settled by war," is too self-evident to require discussion. A complete suspension of service, as was threatened by the engineers on the railroads involved in this controversy, would, in less than one week, impose suffering, almost beyond comprehension, on a vast number of people.

The principle of arbitration in some form has been accepted by both sides, and it is safe to say that neither the railroads nor any organization of employees would precipitate a strike in the face of an offer to arbitrate the question at issue.

The Arbitration Commission, recognizing this, has suggested permanent commissions, both National and State, to consider and decide all controversies of this character.

The Commission recognized the fact that under existing methods, the findings of commissions selected to consider each case, with no data save that submitted at the time, are almost always in the nature of a compromise to secure a settlement of that particular controversy, rather than a thorough, painstaking investigation to ascertain the real merits of the case.

In speaking of the Erdman Act, the Commission states, as follows:

"That the Erdman Act marks a great advance in the settlement of railroad labor disputes is shown by the increased frequency with which the Act has been invoked. Within a year after the passage of the Act a fruitless attempt was made to utilize its provisions, but nearly eight years elapsed before another case occurred. In contrast with this, during the past five years the Act has been invoked in forty-six cases, of which only eleven were arbitrations. Thus the method of mediation has been much more frequently used.

"Since the law was passed there has been no case of a great railroad strike, and, although the merits of the Erdman Act are great, indeed, certain defects in it have become apparent.

"In the cases of mediation there is no attempt on the part of the mediators to make a judicial decision wholly upon the basis of equity and justice. The primary purpose is to bring the parties together and avert a strike. This is accomplished by getting the parties sufficiently near together that suggestions may be made to which both agree. While whenever mediation is successful a strike is averted, the adjustments cannot always be regarded as based solely upon the merits of the case. Where the case is one of arbitration under the Erdman Act, the results in the above respects are usually very similar to those of mediation. The arbitrators are three in number. Each side is represented by one arbitrator. It rests, therefore, upon the third arbitrator to bring the other two arbitrators as nearly as possible together, and if he cannot do so, he must decide between them. This is accomplished by splitting differences, and the case may be adjusted without adequate investigation of the facts involved, in consequence of which the award may not rest upon a basis of equity.

"This method of splitting differences is very unsatisfactory, but it is an inevitable result of mediation or arbitration under the Erdman Act. Feeling in advance that a mediation or arbitration will result in giving only a part of what they ask, the men make maximum demands regarding compensation, rules of service, etc., while the expectation that these demands will not be fully awarded. Upon the other hand, the railroad officers, appreciating the tendency of mediators and arbitrators to split differences, make only minimum concessions, or none at all.

"By the above statements it is not meant to assert that the awards that have been made under the Erdman Act have not been reasonably fair, but that in regard to this matter the Board do not have, nor is it possible for them to obtain, adequate knowledge upon which to formulate a judgment. Cases before the Interstate Commerce Commission, no more complicated than those which have come before the mediators or arbitrators under the Erdman Act, have required a year or more before a decision was made; while the Erdman arbitrators are compelled to make a finding in thirty days, and this, notwithstanding the fact that the Interstate Commerce Commissioners have a large expert staff, including a number of examiners who act for them in taking evidence."

The recommendation of the Commission summarized is as follows:

"Instead of having a board for each case, whose members have other duties and wholly inadequate time in which to perform the work, there would be a continuous board, the members of which give their entire time to the adjustment of wages. This board would have a corps of experts and statisticians; it would be allowed sufficient time to investigate a case fully. Thus an award would be made upon the basis of merit instead of the basis of securing a settlement. If desirable, that feature of the Erdman Act and Canadian Industrial Disputes Act might be added, which provides for one representative from each party to the controversy. If this were done, and the board consisted of five or more members, it would have a permanent majority and a shifting minority. It can be urged in favor of this feature that each representative would intimately know the facts regarding his side of the case and the point of view of those represented. A board thus constituted would have a permanent controlling center interested in securing equity, which might be assisted in its work by representatives of each of the parties to the controversy.

"Above all, the wage commissions proposed would represent the public. They would work in co-operation with the Interstate Commerce Commission and thus secure to railway employees just wages; and this without regard to whether the employees are fully organized. Under the existing situation, well organized railway labor, illustrated by engineers, firemen, conductors, trainmen, etc., receive consideration from railroads not accorded to the classes of labor that are not so well organized.

"It does not follow from the above that advances in pay to organized labor have been too frequent or too large, but merely that the question of an advance for a given class of labor engaged in work upon the public utilities should not depend upon organization, but upon justice. Especially for the public utilities is it important that labor should have a just wage, and if the existing wages are not adequate they should be increased. If a just increase in wages places the public utilities in a position that does not enable them to secure a fair return upon capital invested and maintain a proper reserve, they should be allowed to increase their rates until they are in that position. In short, the public utilities should not impose an undue burden upon the public by paying higher wages than are reasonable, nor should the public receive services from the railroads at a rate so low that labor does not receive fair compensation and capital its fair return. How important this statement is will be understood when it is appreciated that, of the gross earnings of the railroads of the United States as a whole, over 42 per cent goes to labor (excluding officials) and on the fifty-two railroads involved in this controversy, over 45 per cent.

"If the arguments above presented are sound, there seems to be no way to obtain justice for the three parties concerned—the railway companies, the railway employees and the public—except through a permanent board which shall have continually before them the problem of the adjustment of wages."

In concluding a singularly exhaustive and able report, the Board states:

"It is well understood by the Board that the problem for which the above plan is a suggested solution is a complex and difficult one. The suggestion, however, grows out of a profound conviction that the food and clothing of our people, the industries and general welfare of the nation, cannot be permitted to depend upon the policies and the dictates of any particular group of men, whether employers or employees, nor upon the determination of a group of employers and employees combined. The public utilities of the nation are of such fundamental importance to the whole people that their operation must not be interrupted, and means must be worked out which will guarantee this result."

Compulsory arbitration of course means that the railroads must submit the question of compensation and conditions of service of all employees to a commission having no interest in, or responsibility for, the financial result of the operations of the properties.

For the employee it involves the surrender to some extent of his liberty of action in deciding whether the wage he receives and the conditions under which he works are satisfactory or not.

The proposition is not an attractive one for either the employer or the employee, but it is doubtful if in the long run it will not be better for both than the conditions which may arise without some such arrangement for settling controversies.

Whether by a permanent commission, or by mediation or arbitration provided in each case as it arises, there can be little doubt that future controversies between the railroads and their employees regarding compensation, conditions of service, etc., will be settled by some form of arbitration.

It is to be feared that the result of this will be a gradual increase in compensation of railroad employees. What this increase has been during the past seven years is shown by the following figures:

In the year 1905 the gross earnings of the New York Central road were $86,095,692. Of this amount, $36,570,212, or 42.47%, was paid in wages.

In 1912 gross earnings were $115,479,099, of which amount $54,115,761, or 46.86%, was paid in wages.

Making due allowance for the additional force in service, this company paid its employees in 1912, $9,500,000 more than if the rates of pay of 1905 had been in effect. This increased payment on account of the higher level of wages was equivalent to 4.27% on the outstanding stock of the company.

For the year ended December 31, 1912, the New York Central handled the largest volume of traffic, both passenger and freight, in its history. The year was singularly favorable for handling the traffic at a moderate cost, with no casualties of a serious or unusually expensive character.

In October and November, 1911, contract was made by the New York Central Lines for 1912 delivery of 14,500 standard steel underframe 40-ton capacity box cars at an average cost of $790 each. The best price obtainable for these cars for delivery in 1913 is $1,075, an increase of $285 per car, or 36 per cent, which would have made an increase in the cost of these cars of $4,132,500.

Two thousand five hundred standard 50-ton steel self-clearing hopper cars were contracted for at the same time at $810 each. The price of the same cars contracted for in December, 1912, for delivery in 1913, was $1,113 each, an increase of $303 per car, or 37 per cent.

Eighty Pacific type freight locomotives contracted for in December, 1911, cost $22,456 each; the price of locomotives, identical in every way, in December, 1912, for delivery in 1913, was $26,030, an increase of $3,574 per engine. Twenty Pacific type passenger engines for 1912 delivery cost $24,790 each, the price for 1913 delivery is $26,315 per engine, an increase of $1,535 each.

The aggregate increase in the cost of this equipment, if purchased in December, 1912, compared with the actual prices paid in the latter part of 1911, would amount to $5,206,000, or 33 per cent.

During the period covered by this report, every detail of operation has been watched constantly and intelligently, and no expense incurred not absolutely necessary to maintain the property in that high state of efficiency necessary to render safe and satisfactory service to the public.

Notwithstanding the favorable conditions under which the business was conducted and the large gross earnings, the road earned five per cent on its stock, with a surplus of only $2,743,372.35—or about 1¼ per cent on stock—a slender margin from which to provide against less favorable years and to put something back into the property from earnings, which should, if possible, be done every year.

The Engineers' Arbitration Commission stated:

"If a just increase in wages places the public utilities in a position that does not enable them to secure a fair return upon capital invested and maintain a proper reserve, they should be allowed to increase their rates until they are in that position."

In the light of conditions present and immediately prospective, it does not seem that an application to the Interstate Commerce Commission for permission to make some increase in freight rates can be long deferred.

The preparation for electrical operation of all passenger trains to Harmon on the Hudson River is practically completed and it is expected that the entire Electric Division will be put in full operation in March, 1913.

The concourse and waiting room on the express level of the new Grand Central Terminal main station building were opened for use on February 2, 1913, while this report was in process of compilation, thus placing in service the major portion of the facilities for the handling of passenger traffic in and out of New York city, work on which was begun in 1903. The suburban concourse was opened for partial use on October 27, 1912.

Changes in the scope of the plan have delayed the completion of the cross streets and an extension of time was obtained; the whole of this work will be finished during 1913. The Adams Express building on Lexington Avenue was completed and occupied early in the year. Vanderbilt Avenue has been reconstructed, and is now open for traffic. Work on the arrival station and the new hotel is progressing satisfactorily. The demolition of the hospital building, Lexington Avenue between 42nd and 43rd Streets, and the old Grand Central Palace is now in process.

The entire work of reconstruction of the Terminal has progressed without interruption of train service, and the prompt handling of the heavy traffic without a single serious accident to a passenger from the construction, excavation and blasting necessarily incident to the carrying on of an improvement of this magnitude, is most gratifying. The press and public have been unanimous in their approval of the result as embodied in the appointments and arrangement of the station facilities, from a practical as well as an artistic standpoint.

I desire to express the appreciation of the management of the unremitting efforts and loyal co-operation of the officers and employees of the Construction and Operating Departments whose efficiency and devotion to duty have accomplished these very gratifying results. Also to the public, whose patience in overlooking many discomforts and inconveniences incident to the reconstruction period has immeasurably aided in the safe and rapid conduct of the work.

Appreciative acknowledgment is made to the Public Service Commission of the State of New York, the Massachusetts Board of Railroad Commissioners and the Interstate Commerce Commission for helpful co-operation in improving the service and in maintaining friendly and cordial relations between the road and the public.

Especial obligation is felt for the timely and efficient efforts of the Interstate Commerce Commission in expediting the movement and preventing the abuse of cars. The freedom with which an unprecedented volume of traffic has been moved and the absence of any serious car shortage or congestion is due in no small measure to this wise and helpful co-operation.

An amendment to the by laws of the company abolished the Executive Committee as a standing committee and constituted a Finance Committee of which the following directors were made the members: William K. Vanderbilt, J. Pierpont Morgan, William Rockefeller, George F. Baker and Lewis Cass Ledyard.

The following changes in Executive officers were made during the year:

March 7th, William K. Vanderbilt, Jr., Assistant to the President, was made a Vice President of the Company and of all the New York Central Lines; April 3rd, Alfred H. Smith, Vice President and General Manager of The New York Central and Hudson River Railroad Company, was made a Vice President of all the New York Central Lines, relinquishing his duties as General Manager; April 15th, Abraham T. Hardin was made Assistant Vice President of The New York Central and Hudson River Railroad Company.

The following appointments, all being promotions, were made during the year:

February 23d, George W. Porter, Paymaster, to be Assistant Treasurer to succeed Milton S. Barger, who was appointed Treasurer of the New York Central Lines West, succeeding Charles F. Cox, deceased. April 15th, Patrick E. Crowley, General Manager; Howard L. Ingersoll, Assistant General Manager; William J. Fripp, Assistant General Manager. October 1st, Stephen R. Payne, Assistant to the General Manager.

Grateful acknowledgment is made of the faithful, efficient performance of duty of employees in every department of the service during the year.

WILLIAM C. BROWN,
President.

CONDENSED GENERAL BALANCE SHEET, DECEMBER 31, 1912.

ASSETS.

PROPERTY OWNED AS INVESTMENT:			
Physical property owned:			
Road and equipment to June 30, 1907:			
Road	$155,206,678.71

VOLUME 54. MARCH 14, 1913. NUMBER 11.

CONTENTS

*Illustrated.

THE appointments to the Inter-state Commerce Commission made by President Wilson immediately after his inauguration give general satisfaction to railways and shippers. Commissioner E. E. Clark's reappointment was desired by most of those who were familiar with his work on the commission and who wished to see it maintained as a fair and efficient body. Many persons would like to see one or more experienced railway officers appointed to the commission. Aside from this there is little or no criticism and much commendation of the promotion of Secretary Marble to the membership made vacant by the retirement of Franklin K. Lane to become secretary of the interior. Mr. Marble has served the commission capably as an attorney and as its secretary. As one of its attorneys he conducted some important investigations into transportation conditions and practices. He is able, very industrious, and always has been considered fair. An active member of a state commission notorious for its baiting of railways was pressed for appointment to succeed Mr. Lane. Those directly affected by the commission's work, as well as the general public, may well give thanks, not only for Mr. Marble's appointment, but for the failure of the state commissioner in question to get appointed. The retirement of Mr. Lane as chairman and a member of the commission has taken from it one of its ablest members. If he had always been as fair as he was able, Mr. Lane would have taken rank among the greatest public utility commissioners that the country has ever had. Unfortunately for his work on the commission, his temperament is decidedly more administrative than judicial. This gave him a tendency to wish to manage the railways rather than simply to regulate them. As a cabinet officer he will be in a position better suited to his temperament and to the exercise of his unquestionably great talents.

A JOINT resolution was introduced in the Wisconsin senate the other day, and referred to the committee on corporations, which reads as follows: "Resolved by the senate, the assembly concurring, that whereas railroad travel is a most beneficent means of education, and broadening to the people of this state, and whereas the visiting of all parts of the state by its people is highly conductive to the welfare of the people of the state, and the development of its resources and business, therefore be it resolved, That the Railroad Commission of Wisconsin is hereby directed to investigate and report to the next session of the legislature to meet in 1915, the effect of an increase of freight rates and decrease of passenger rates to one cent per mile, and how much increase of freight rates would be required to make up for the reduction of passenger rates to one cent per mile, and its conclusions upon such reduction of passenger rates to one cent per mile of travel." In view of the beneficent and broadening effects which the Wisconsin senator attributes to railway travel, one might wonder perhaps that he did not instead present an amendment to the anti-pass law to permit everybody to ride free. However, we are considering in this instance an unusual type of state senator. He wishes to be fair to the railways without ceasing from his lifelong endeavor to be a friend of the people. Perhaps, too, he does not believe in pauperizing his constituents, and feels that the advantages of travel will be more highly appreciated if they are asked to contribute a small part of its cost just to show good faith. Shippers and consignees, while also developing the resources of the state, are engaged in the business of making profits out of the process of moving commodities from one place to another where their price will be higher. The passenger who is being beneficently educated and broadened may not be making money out of it. Therefore, instead of making the railways pay for his education and broadening, and perhaps lopping off some of their freight rates for good measure, the senator would impose the burden on those who are deriving the greatest benefits from transportation.

WE fear that our friend, the senator, will not be appreciated in his day and generation. It is true that the passengers have more votes, and that on government owned railways it is quite common for passenger fares to be low and freight rates high, but in Wisconsin and other parts of our great democracy the shippers are better organized. As for the Wisconsin commission's conclusions upon such reduction of passenger fares, they are readily available, if the commission has not changed its mind, in its decision rendered in 1907, reducing passenger fares in the state to 2½ cents per mile. The commission said at that time, "We are not concerned about what our right might be to reduce the passenger rates to a point where passengers were being carried at a loss and to recoup such loss by a species of piracy practiced upon the shippers of the state. . . . We believe not one good economic reason can be urged in favor of making the shipper bear a portion of the carrying cost of the passenger. Low freight rates are vastly more important to the people of the state than low passenger fares. . . . The freight rate is in reality an indirect tax. . . . actually paid by the consumer. . . . If it is excessive it may be more important that it be reduced to a proper level than that the consumer should have the privilege of riding at two cents a mile. He must use coal. He may not want to ride even at two cents." The senator apparently appreciates that *reductions* in freight rates do not always reach the consumer so directly as indicated by the theory which the commission elucidates. Therefore, he believes that the people will be more benefited by a reduction in passenger rates. He fails to recognize, however, that *advances* in freight rates nearly always do reach the consumer. Enough reasons have perhaps been indicated to keep the railways from becoming unduly elated by any hope of the advance in freight rates held forth by the resolution or from being unduly worried over the prospect of the proposed reduction in passenger fares.

MEDILL McCORMICK, who is one of the principal owners of a large Chicago newspaper, and also a leader of the progressives in the Illinois legislature, has introduced a full crew bill, after the defeat of a similar bill at the last session. The *Manufacturers' News*, the organ of the Illinois Manufacturers' Association, is moved thereby to comment as follows: "We are at a loss to understand why Mr. McCormick appears as the father of this measure. Last spring the newspapers of Chicago went to the mat with the labor unions because the pressmen's union was working a superfluous man or two on the press crew in some shops and wanted to in others. We cannot understand why it is not just as fair for the newspapers to pay for a man they do not need in the operating of a press as it is for the railroads to pay for a man they do not need in operating a train. We should think that if Mr. McCormick pursues the policy he is now following some one would get up in the legislature on behalf of the pressmen's union, and introduce a bill regulating the number of men necessary to operate a newspaper press." Special regulation of railways is only justified on the ground that they are public service corporations and that regulation is needed to cause them to render service in such a way and at such rates as will promote the interests of the public. Legislation to confer an advantage on the employees at the cost of the roads, which is not primarily intended and does not operate to confer an advantage on the general public, is no more justifiable than similar legislation regulating the relations between manufacturers and their employees, farmers and their employees, grocers and their employees, or newspapers and their employees. Consistency and principle demand that those who advocate such legislation as to some business concerns shall advocate it as to all, and that those who are not willing to have it applied to themselves shall not seek its application to others. Aside from the aptness of the parallel which the *Manufacturers' News* has drawn between the employment of superfluous labor on a printing press and on a freight train it is significant to note that as a spokesman of shippers it apparently appreciates the connection between unnecessary additions to operating expenses and the level of freight rates.

THE Webb bill to enable states to prohibit the shipment of intoxicating liquors into prohibition territory, which was recently re-passed by Congress after President Taft had vetoed it as unconstitutional, presents some interesting complications for the railways. It makes illegal the transportation of liquor in interstate commerce when it is destined to any place where its sale is unlawful. It would be a simple matter to keep track of the "dry" states, but prohibition legislation has not followed state lines. There are prohibition counties, cities, townships, villages and other kinds of prohibition districts. There are also places where it may be legal to sell liquor at a drug store—on presentation of the proper physician's certificate, of course—while it would be illegal to transport the commodity to a grocer in the same place. Must the overworked station agent add to the list of tariffs, classifications and their supplements with which he is supposed to be familiar, a compendium of prohibition legislation and a "wet and dry" map? The law becomes effective at once; and, pending the arrival of these data, the local agent seems likely to be in as bad a predicament as Flannery in "Pigs is Pigs," who was unable to deliver a consignment of guinea-pigs because of a dispute as to their classification. Not that the commodity under consideration is liable to the same tendency toward multiplication that troubled Flannery, but booze is booze, and it has often been said on good authority that railway tariffs and classifications are enough to drive wiser men than station agents to drink. Many railways have already abolished the sale of liquor in their dining cars, partly out of respect for prohibition sentiment, and partly because of the difficulty of complying with prohibition laws on the fly. The Illinois roads stopped the sale on their trains entirely last year after a law had been passed which left a few loopholes open. It is understood that they even had something to do with bringing about the passage of the law as a means of securing better order on some of the trains largely patronized by deadhead politicians traveling between Chicago and Springfield. If they have difficulty in complying with the new law it may be no greater than they and the express companies, by allowing their agents to deliver C. O. D. packages to John Doe or a "representative" of the local minister of the gospel, have in the past caused the local authorities who were charged with enforcement of the prohibition laws.

OXY-ACETYLENE welding and cutting has become fairly well established in the railway shops of this country, and Mr. Jacobs' observations of the extent to which it has been developed in Europe are particularly interesting at this time. Bad mistakes were made in introducing it here. One of the most serious of these was that the responsibility of its introduction was in some cases placed in the hands of salesmen who were not at all familiar with railroad work and the needs of the railway shops, or even with the apparatus itself. Too many claims were made for it, and usually the apparatus was left in unskilled hands before these claims were realized. Another feature that has not been fully appreciated has been the necessity for systematically instructing the men in the use of apparatus. As noted in Mr. Jacobs' article the German government has provided courses of study in the art of handling oxy-acetylene welding in the various trade schools, and special schools have been opened for giving instruction in this art; something should be done along these lines in this country. Mr. Jacobs was instrumental in installing several years ago in the Topeka shops of the Atchison, Topeka & Santa Fe, a stationary plant for generating the gases used in connection with oxy-acetylene welding and cutting, these gases being carried to various parts of the shop in the same way as compressed air is conveyed. As the possibilities of the process become better realized in the railroad

shops of this country, this practice will undoubtedly be extended, for it is said to have given extremely satisfactory results at the Topeka shops. The work done there was fully described by Mr. Jacobs in the June 17, 1910, issue of the *Railway Age Gazette*, page 1535. Another serious mistake has been made in the past in that the limitations of the welding process were not fully understood. For instance, attempts have been made to weld cracks in fireboxes, although those in charge should have realized that the metal in the vicinity of the crack had been weakened by the stresses to which it had been subjected and that welding the crack would only cause the fatigued metal to crack again elsewhere in the same vicinity. Oxy-acetylene, or in fact any type of welding, is useless for this purpose and should only be used where a new piece is to be inserted, replacing all of the bad material. Even then it is a most difficult job and should only be attempted by expert welders.

A REFRESHING INNOVATION.

DIFFICULTY is often experienced by railroad passengers in learning the causes of delays to trains on which they are traveling. To remove this source of irritation, conductors should see, when traffic is interrupted, that trainmen pass immediately through their trains and freely announce the conditions, advising passengers without reservation the reason for the delay, and, if necessary, the best means of proceeding on their journey. When a train is disabled at or near a station, trainmen should notify the passengers as to the cause and probable extent of the delay in order that they may continue on their journey, or return, on any available train. If passengers desire to communicate with their friends from the station they should be accorded promptly the use of the telephone or telegraph. Station agents should post on their bulletin boards, or in other conspicuous places in their stations, a notice giving the location of any obstruction to traffic, the probable length of the delay, and any other information in their possession, as to the cause and extent of the difficulty. Passengers should have every opportunity to allay unnecessary anxiety on the part of friends or families, due to train delays or accidents. They have a right to prompt information as to the cause and the details of any delays either to the train on which they are traveling or that for which they may be waiting.

The foregoing is the substance of an order which, in mandatory form—"must" instead of "should"—has been issued to passenger conductors by the Pennsylvania Railroad. We do not put the words in quotation marks, because the thoughts are exactly like our own. If we have not put them in print with enough frequency and effectiveness, we have to that extent fallen short of the duty of a good preacher of perfect service. No superintendent or manager can be ignorant of the way in which, in innumerable instances, a passenger who is unexpectedly delayed is obliged to hurriedly revolve in his mind and compare, one with another, a half dozen different schemes for recovering as much as possible of the time that, by some slight accident, he has been compelled to lose. In very bad accidents, trainmen and station men have to some extent properly attended to passengers' interests heretofore, but the present order is significant because of its application to all circumstances. A delay of ten minutes often wastes an hour of some passenger's time; perhaps that of many passengers. The conductor or a wide-awake brakeman will often be able to save a passenger enough time in studying his routes to make the difference between catching a connection and losing it.

It is to be admitted that, if employees carry out successfully this idea of saving for passengers all the time that it is possible to save, they will be doing better than their superiors have done in the past. Theoretically, the despatchers advise agents and conductors of bad delays and, through the agents and conductors, the information reaches the passengers; but cases in which this process is intolerably slow are familiar to all experienced travelers. With the very general distribution of telephones now to be found on every railroad, there is no reason why this item of the passenger service should not be much improved, unless it be the neglect of the superintendent to order and insist on celerity. The present circular has nothing to do directly with despatchers, but the despatcher has an important connection with the matter, if the purpose of the manager is to be carried out properly.

Of course, if Pennsylvania trainmen are to tell passengers all they know they may sometimes tell things that had better be left unsaid until the superintendent can be consulted, or may lose the company a few cents by sending away a passenger who could be kept on the Pennsylvania's cars; but this bugaboo may well be ignored—if only to find out by actual test how big or little it really is. A trainman is not going to be really efficient in the promotion of passengers' comfort and convenience except as he has practice in the art, and it is high time that opportunity for practice in this branch be given. Precept has been well worked already. All of us acquire proficiency by learning the lessons of our mistakes. Trainmen, very generally, in the matter of assisting passengers in cases of delay have avoided mistakes—and have missed many good lessons—by shirking the duty entirely.

LIGNITE AS A LOCOMOTIVE FUEL.

ABOUT two years ago the Bureau of Mines in its bulletin No. 14, on briquetting tests of lignite, stated that there were about 150,000 square miles of workable lignite beds in this country; that the principal deposits were in the western half of North Dakota, in the northwestern part of South Dakota, and in the eastern half of Montana; and that in North Dakota alone there was a workable deposit of 31,000 square miles. If we take the weight of lignite as 50 lbs. per cubic foot, the weight given in a report of the Bureau of Mines, and consider the workable lignite beds as only 1 ft. deep (some of the beds are much deeper than this), we find that there are 104,544,000,000 tons of lignite available. This supply is mainly in territory where the cost of bituminous coal is exceptionally high, and the railroads in that section are thus especially interested in making use of it as locomotive fuel.

Realizing the vast opportunities for its use in locomotive service, the International Railway Fuel Association has appointed a committee, of which S. B. Flagg, engineer of the Bureau of Mines at Pittsburgh, is chairman, to report on this subject at its annual convention to be held in Chicago next May, and it is expected that some very interesting material and data will be presented. Not only has the Bureau of Mines made several investigations of lignite at its St. Louis plant, but the railroads themselves have given it a considerable amount of attention. The American Locomotive Company has produced a spark arrester especially designed for engines burning lignite, which has been applied to 21 locomotives on the Chicago & North Western. The Chicago, Burlington & Quincy has developed an arrangement whereby lignite may be burned without the danger of large sparks being thrown from the stack and setting fires along the right of way. The Oregon-Washington Railroad & Navigation Company is using a number of Mikado engines built by the Baldwin Locomotive Works, especially designed for burning this fuel. With the cost of a good grade of coal in the western sections of Nebraska, Wyoming and Colorado ranging between $5 and $6 a ton, it would seem that marked economies could be made with lignite from the mines in North Dakota, which would cost about $1.75 a ton.

It is true that lignite has its disadvantages. In its raw state it must be used a very short time after it is mined, for if allowed to weather too long it will slake and crumble into small particles. As a means of overcoming this difficulty, the lignite briquet has been developed, which will stand weather for a considerably longer time. The cost of briquetting is found to be a trifle over the cost of the raw lignite, but the heating value will be increased about 50 per cent., and the moisture, which in the raw lignite is in the neighborhood of 40 per cent., will be reduced to about 20 per cent. Assuming that the heat value of the available

bituminous coals which come from Iowa is about 11,000 B. t. u., and that of the lignite briquet a trifle over 9,000 B. t. u. It will be seen that even with the added cost of briquetting the total cost of the fuel will be reduced. Tests of briquetted coals, not lignite, have shown that a very even fire may be maintained in locomotive fireboxes, that the boiler capacity will be increased; and that when the boiler is forced the efficiency of the briquets increases. The heat value of the lignite as taken from the mines varies between 6,000 and 8,000 B. t. u., and where coaling stations can be located near the mines the raw lignite may be used successfully; but when it must be stored more than four months exposed to the weather, or a much longer time under cover, the lignite should be briquetted.

The report on the mineral resources of the United States, by the United States Geological Survey for 1911, shows that only 8,451,365 tons of lignite were mined during that year. The lignite industry is thus decidedly in its infancy, and the possibilities of its use as a fuel for locomotives have but begun to be developed. With such a man as Mr. Flagg, who is thoroughly conversant with the coal resources of this country, as chairman of the committee for the Fuel Association, and with the backing of the railway fuel men on the committee, much can be accomplished to secure the consideration due it—although the mere fact that it is to be considered by the association, based on past records, insures a complete report and a thorough discussion.

SUGGESTIONS FOR LEGISLATION FOR ARBITRATION OF LABOR DISPUTES.

ONE of the most important problems that the welfare of the American public demands shall be solved in the near future is that of settling without lockouts and strikes and in an equitable way contentions between railways and their employees. The deficiencies of the Erdman act are generally recognized. It does not prohibit lockouts or strikes before mediation and arbitration, and it does not make sure enough that the settlements of controversies will be such as to protect the rights and interests of all. Various suggestions for the amendment of this law are being made. The *Railway Age Gazette* offers tentatively for consideration certain provisions which a federal railway mediation and arbitration law might contain.

The term "railroad" should be defined so as to cover interurban electric roads whose tariffs are filed with the Interstate Commerce Commission or which engage in interstate commerce. The provisions of the act should at least be sufficiently broad to take in all employees operating steam roads or electric roads owned or controlled by them.

There seems no good reason why the same provisions should not apply to interurban electric roads engaged in interstate commerce as to steam roads. With the progress of electrification of steam roads the differences between other characteristics of the two classes of railways, as well as between their motive powers, will tend to disappear.

It shall be unlawful for any employer to declare or cause a lockout, or for any employee to go on strike on account of any dispute prior to or during a reference of such dispute to the Mediation Commission or to a Board of Arbitration; provided, that nothing in this act shall prohibit the suspension or discontinuance of the working of any persons for any cause not constituting a lockout or strike.

Employers and employees shall give at least thirty days' notice of an intended change affecting conditions of employment with respect to wages or hours, and in every case where a dispute has been referred to the mediation commission or to a board of arbitration, until the dispute has been finally dealt with by such commission or board, neither of the parties affected shall alter the conditions of employment with respect to wages or hours, or in a case if the dispute do not be concerned in doing, directly or indirectly anything in the nature of a lockout or strike, or a suspension or discontinuance of employment or work, but the relationship of employer and employee shall continue uninterrupted by the dispute, or anything arising out of the dispute, but if, in the opinion of the commission or board either party uses this or any other provision of this act for the purpose of unjustly maintaining a given condition of affairs through delay, such party shall be guilty of an offense, and liable to the same penalties as are imposed for a violation of the next preceding section.

Any employer declaring or causing a lockout contrary to the provisions of this act shall be liable to a fine of not less than $100, nor more than $1000 for each day or part of a day that such lockout exists.

Any employee who goes on strike contrary to the provisions of this act shall be liable to a fine of not less than $10 nor more than $50, for each day or part of a day that such employee is on strike.

Any person who incites, encourages or aids in any manner any employer to declare or continue a lockout, or any employee to go or continue on strike contrary to the provisions of this act, shall be guilty of an offense and liable to a fine of not less than $50 nor more than $1,000.

The board of arbitration that handled the controversy between the eastern railways and their enginemen recommended that some limitation should be put on the legal right of railway employees to quit work as well as on the legal right of railway managements to interfere with transportation service by lockouts. Strong objection has been made to any such legislation by some spokesmen of labor. They contend this would be an infringement on the liberty of working men. It would not, of course, be any more of an infringement on the liberty of railway employees than on that of railway managements. It is not proposed to prohibit any individual employee from quitting work or being discharged for ordinary causes. It is not even proposed to prohibit a disruption of the relations between the employers and the employees after mediation and arbitration. It is only proposed to prohibit a strike or lockout and the resulting interference with transportation service prior to and during the pendency of mediation and arbitration. The public's right to insist that transportation service shall not be stopped, or practically stopped, before employers and employees have presented their claims and the evidence in support of them to some impartial body representing the public, and until this body has reported on the merits of the controversy, seems clear. The only sound foundation of any legal right of any person or class of persons is that the existence of that legal right tends to promote the greatest good of the greatest number. If a legal right cannot be exercised except in opposition to the greatest good of the greatest number it is one that should be curtailed or abolished. Surely, neither a lockout nor a strike that interferes with transportation, nor the existence of the right to precipitate such a lockout or a strike before every reasonable means for preventing it has been exhausted, can be held to be in the interest of the greatest good of the greatest number.

A permanent commission of three members on mediation, conciliation and investigation shall be constituted, composed of the chairman of the Interstate Commerce Commission, another member of the Interstate Commerce Commission to be named by the chairman, and the United States Commissioner of Labor.

In the event of difference one member shall be added and shall be named by the railway employer and one shall be added to be named by the railway employees—parties to the difference.

Whenever a difference exists between any railway employer and railway employees and it appears to the Interstate Commerce Commission that the parties thereto are unable to satisfactorily adjust the same, and that by reason of such difference remaining unadjusted a railway lockout or strike has been or is likely to be caused, or the regular and safe transportation of mails, passengers, and freight has been or may be interrupted, or the safety of any person employed on a railway train or car has been or is likely to be endangered, the Interstate Commerce Commission may either on the application of any party to the difference or on the application of any municipality directly affected by the difference, or of its own motion, cause inquiry to be made into the same and the cause thereof, by the mediation commission.

The chairman of the Interstate Commerce Commission shall, in writing, notify each party to name a member of the mediation commission, stating in such notice a time, not later than five days after the receipt of such notice, within which this is to be done.

If either party within such time, or any extension thereof granted by the Interstate Commerce Commission, does not appoint a member of the mediation commission, the three members of the permanent commission may appoint any members in the place of those in default.

It shall be the duty of the mediation commission to endeavor by conciliation and mediation to bring about an amicable settlement of the difference to the satisfaction of both parties and to report its proceedings to the Interstate Commerce Commission.

In case the mediation commission is unable to effect an amicable settlement by conciliation and mediation the Interstate Commerce Commission may refer the difference to arbitration. In such case a board of arbitrators shall be established by the Interstate Commerce Commission, and shall consist of the permanent members, two other members selected by these three members, and one member to be selected by the railway employer and one by the railway employees. In case either party within ten days after the receipt of notice fails to name its member of the arbitration board, the five members of the board shall themselves select a member or members in the place of the party or parties in default, and the board of

seven so constituted shall act as a board of arbitrators. In case of arbitration pursuant to the above provisions, the findings and recommendations of the majority of the arbitrators shall be those of the board.

The proper composition of an arbitration board has been the subject of much discussion and many differences of opinion. F. A. Delano, it will be recalled, has advocated in these columns the creation of a permanent, even-numbered arbitration court. The board of arbitration in the enginemen's dispute recommended the creation of permanent wage commissions. It has been objected to proposals such as these that if such a court should render a few decisions in favor of either the railways, on the one hand, or their employees, on the other, it would become suspected of bias and its usefulness would be diminished. On the other hand, it has been contended in favor of a permanent commission always composed of the same members that it would have the advantage of becoming an expert body. Another suggestion that has been urged is that wage controversies should be settled by the same body that settles rate controversies, namely, the Interstate Commerce Commission, because it is desirable that the same body should look at both sides of the railway ledger.

It would seem that an arbitration board composed as suggested in the provision above outlined would meet many objections and have many advantages. As three of its members—the chairman of the Interstate Commerce Commission, another member of the commission, and the labor commissioner of the United States—would be practically permanent, they would acquire expert knowledge. As two of them would be members of the Interstate Commerce Commission they would help to enable the commission to look at both sides of the railway ledger. As each board of arbitration would include two representatives of the public who had not served on previous boards, there would be less danger of the board falling under suspicion of being biased in favor of one side or the other. These five members representing the public would constitute a clear majority. The addition of one member representing the railways, and one representing the employees would help the board to get, better than it otherwise could, the points of view of both parties.

Immediately after the appointment of the board of arbitration the chairman shall promptly convene it, and the board shall in such manner as it thinks advisable make thorough and expeditious inquiry into all the facts and circumstances connected with the difference and the causes thereof, and shall consider what is reasonable and proper to be done by both of either parties with the view of putting an end to the difference and to prevent its recurrence, and shall with all reasonable diligence make a written report to the Interstate Commerce Commission setting forth the various proceedings and steps taken by the board, and its findings, including the cause of the difference and the board's recommendations with a view to its removal and prevention of its recurrence.

The Interstate Commerce Commission shall cause a report to be filed in its office and a copy thereof to be sent to each party to the difference and to any municipal corporation, or to the representative of any newspaper who may apply therefor.

Any other person shall be entitled to a copy on payment of the actual cost thereof.

The desirability of having all regulation of railways concentrated as far as may be reasonably practicable in the hands of the Interstate Commerce Commission, of having a permanent record of all the evidence taken, the findings made and the opinions rendered, and of having the attention of the Interstate Commerce Commission directed to the labor situation as well as to the railway rate situation, argue for the above provisions.

For the purpose of inquiry the board shall have all the power of summoning before it witnesses, and of requiring them to give evidence on oath, and, in general, shall have the same powers in respect to enforcing attendance of witnesses and production of testimony as are vested in any civil court.

Provision shall be made for payment of members of the commission and for expenses of witnesses.

No counsel or solicitor should be entitled to appear before the board except with the consent of all parties to the difference, but the parties to the difference may appear in person or by agents.

Courts should not have any jurisdiction to recognize or enforce or to receive in evidence any report of the board of arbitration or of the mediation commission.

The reasons for most of the foregoing provisions seem obvious. That providing that the courts shall have no jurisdiction to enforce awards is, of course, intended to make clear that while mediation and arbitration, if necessary to a settlement, are to be compulsory, there is to be no compulsion to give effect to the award. The enforcement of obedience to reasonable awards may safely be left, for the present, at least, to public opinion. The foregoing proposed provisions are offered tentatively for consideration and discussion.

NEW BOOKS.

Railroad Construction. By Charles Lee Crandall, professor of railroad engineering, Cornell University, and Fred Asa Barnes, assistant professor of railroad engineering, Cornell University. Size 6 in. x 9 in., 321 pages, 81 illustrations, cloth bound. Published by McGraw-Hill Book Co., New York. Price $3.

The authors have expanded into book form a series of notes which have been used for instructional purposes at Cornell University. It has not been felt until recent years that construction methods were sufficiently standardized to warrant the publication of such a book, and frequent revisions were made in the notes. The work of the American Railway Engineering Association and the very general exchange of ideas among railway engineers in recent years, has done much to make the practice on the various roads practically the same. The field covered by the book is a large one, and it is obviously impossible to treat each branch as exhaustively as is done in special books devoted to each of the various subjects. For class room instruction, which is perhaps the field in which the work will find direct application, and for young engineers who are not fortunate enough to be employed by a company which issues elaborate sets of standards, the book should furnish a valuable summary of methods of handling railway construction. It is divided into 10 chapters. The first is a general introduction covering estimates, classification, shrinkage, the mass diagram and overhaul. The chapter on earthwork considers briefly the various methods in current use for moving earthwork, with some typical cost data for each. Rock excavation, tunneling, masonry foundations, culvert and bridge masonry, trestles and bridges and track material and roadbed are each covered in a similar way in separate chapters. The last chapter is devoted to estimates and records with some miscellaneous matter. The book contains numerous references to current literature and the proceedings of engineering societies, and there is a bibliography covering the matter treated in each chapter.

Hand Book of Railroad Expenses. By J. Shirley Eaton. McGraw-Hill Book Co., New York. Flexible leather binding. 555 pages, 7½ in. x 5 in. Price, $3.

Mr. Eaton's book on Railroad Operations—How to Know Them was for a good many years a standard book on railroad operating expenses as given in the annual reports made by the companies to their stockholders. Since the Interstate Commerce Commission has put into effect its uniform classification for operating expenses and for other accounts of railroads, a good many changes have been made by some roads in their system of accounts, and Mr. Eaton's earlier book became to a certain extent obsolete. In the present book is included Mr. Eaton's exposition of the various items under operating expenses and also the text of the Interstate Commerce Commission's classification of operating expenses, income account, balance sheet, etc. Under operating expenses the full text of the commission's classification and instructions is given, and there are incorporated in this text revisions which the commission has issued as supplements to its original orders. One hundred and fifty-two pages of the book are devoted to an index which is very complete. Mr. Eaton says that all existing indexes of expenses have been freely drawn on and acknowledges especially his indebtedness to the index in use on the New York Central & Hudson River.

The greatest importance of this book lies in this index. There has been a very distinct need, ever since the Interstate Commerce Commission promulgated its classification of expenses, for a field book of operating expenses. This book of Mr. Eaton's appears to supply this want admirably.

Letters to the Editor.

AIR HOSE AND AUTOMATIC CONNECTORS.

St. Louis, Mo., March 3, 1913.

To the Editor of the Railway Age Gazette:

A number of articles have appeared recently in the *Railway Age Gazette* pertaining to economy in railway operation. Among them is an exhaustive article on "Air Hose." The maintenance of this particular equipment is shown to be enormous, but no definite solution has been offered as to its reduction, there being a difference of opinion as to whether or not under the present system of air couplings it would justify the railroads to invest in a better grade of rubber, owing to the severe abuse the hose is subjected to.

Eight months is the average life of an air hose, and it is very improbable that a more expensive hose would be economy in the long run, until the cause of an acknowledged fifty per cent. of hose failure has been eliminated; i. e., pulling couplings apart instead of uncoupling. The only permanent cure of the hose problem is automatic train pipe connectors. A practical automatic connector would reduce the physical abuse of the hose to a minimum and render the pulling stress on a hose impossible.

The hose question, however, passes into insignificance when compared with the real economy of automatic train pipe connectors. "Motion means money" is the slogan of one of our leading railroad men, and the automatic train pipe connector illustrates the statement strongly. There are approximately three million cars in the United States. Assume that one-half of this number are in service and that the air and steam hose are coupled and uncoupled once daily. Allowing the lowest possible average, it takes three-quarters of a minute to couple or uncouple the present hose connection. This shows that one million one hundred and twenty-five thousand minutes are consumed daily in operating the present hose connectors, which equals over two years. Figure this for one year and the result is over seven hundred years. The safety feature of such a device must also be taken into account and this will save a few more thousand dollars annually. While the efficiency engineer is at work, it would be well for him to give some thought to automatic connections for air and steam hose.

A. H. Burchard.

JAMES J. HILL'S STATISTICS.

Baltimore, Md., February 28, 1913.

To the Editor of the Railway Age Gazette:

One notes in your issue of February 21 a criticism by William J. Cunningham, assistant professor of transportation, Harvard University, of some of James J. Hill's transportation statistics. Mr. Cunningham undertakes to show that Mr. Hill's comparison of the rate per ton per mile of the United States with those of Prussia-Hesse and of the North-Eastern Railway of England is misleading because the Prussian and English rates include receipts from the service done in this country by the express companies; also because the English freight rate includes a collect and delivery service which the railroads in this country leave the shipper to do for himself. We do not think Mr. Cunningham has made much of an impression on the substantial correctness of Mr. Hill's statements for the following reasons:

(1) Mr. Cunningham is evidently not aware that some of the important railroads in this country are collecting and delivering freight for shippers out of their already meager freight rates.

(2) He overlooks the fact that both England and Germany have, and have had, for many years a parcels post very extensively used by the public. It is therefore very misleading of Mr. Cunningham to suggest that the European rates per ton per mile cover the whole service that in this country is done by the express companies. A large part of the high paying light weighing stuff goes into the post office and the railroads only get a part of the revenue on this. If they did all that the express companies have done here their average freight rate per mile would be higher.

Beyond this there are numerous and varied charges in Europe for use of station and other facilities, which are practically non-existent in the United States, and it is exceedingly doubtful whether these are included in the European freight rate per ton per mile. I refer to such charges as hire of sheets (tarpaulins), counting fees, weighing fees, advice-note fees, cost of waybill forms and stamps for same, all of which are additional to the freight rates and probably are reported under miscellaneous collections, thereby escaping inclusion in freight revenue.

It is the more misleading in that Mr. Cunningham permits himself to state that if the express business, both tonnage and revenue, were added to the freight business of the railroad companies the effect on the average ton mile rate "would be startling." Approximations of the ton mileage and the actual gross revenues of the express companies are now readily accessible, and it is therefore possible to state that inclusion of the express companies' business with the railroad companies' business would increase the rate per ton per mile on the whole business to about 8 mills, or 7 per cent. more than the rate per ton per mile secured on the freight business of the railroads in the United States for the year 1910. It will be observed there is still a very long way to travel in order to reach the 1.37 cents of Prussia-Hesse or the 2.30 cents of England. The slight increase on inclusion of the express business hardly seems to warrant the use of so strong an adjective as "startling" to describe the effect of the express business on the general average rate per ton per mile.

(3) But whatever additional service the European freight rates may cover, such additions are much more than fully cancelled when consideration is given to incomes in the two countries expressed in a common currency to obtain numerical relation. All incomes are from 50 to more than 100 per cent. lower in Europe than here with prices to correspond. A mere comparison therefore of incomes or freight rates stated in United States currency and where the European figures have been converted at the par of international exchange leaves out of the reckoning a very important factor in the equities of the case, that being what figure 1.37 cents cuts in the German income or price, and what 8 mills in the United States income or price. Of course to arrive at a conclusion on this point it is necessary to take account of the usufruct the United States railroad gets out of the ton of freight, for this has a direct bearing on the rate per ton per mile. Allowing therefore twice the haul to United States railroads, as per Mr. Cunningham, which approximates the actual figures, we still find that the United States railroad burdens income and prices less than the German railway. The United States haul being 140 miles, we have 140 multiplied by 8 mills, or $1.12, as the transportation charge in the United States; similarly the German haul being 70 miles, we have 70 multiplied by 1.37 cents, or 96 cents as the transportation charge in Germany; but 1.12 is only 1.12 per cent. of 100 (United States price or income), while 0.96 is 1.92 per cent. of 50 (German price or income), and as 1.12 is only 60 per cent. of 1.92, it seems plain the United States railroad is 60 per cent. kinder to the United States income or price than is the German railway to the German income or price—this, too, after tacking on express rates to railroad rates in the United States.

Mr. Cunningham's undertaking to show that when Mr. Hill calls attention to the fact that in the United States we move 272 tons one mile for every dollar of net revenue, while Germany only moves 172 tons, France 88 tons, and Great Britain but 58 tons, is advancing a comparison of no value and seems to be rather a splitting of hairs, especially in the case of the comparison between the United States and Prussia-Hesse. The difference between the United States 23 per cent. of operating revenue coming from passengers and the Prussia-Hesse 29 per cent. of operating revenue from the same source is too slight to materially lessen the gap between the 272 tons one mile of the United States and the 172 tons one mile of Germany. We do not think Mr. Cunningham's pronunciamento on this point has lessened the *comparative* value of Mr. Hill's figures.

Statistician, Baltimore & Ohio.

OXY-ACETYLENE WELDING AND CUTTING.

Recent Observations of the Development of This Art in European Commercial and Railway Repair Establishments.

By Henry W. Jacobs.

One development which was apparent in European railway practice, and which is undergoing the most thorough revolution in Germany was the application of the oxy-acetylene blow pipe to metal working of all kinds. Not only is the process being repeatedly applied wherever it is found to benefit the work, either in economy or quality, in various railroad shop operations, but it is also causing a revolution in many of the industrial metal working trades.

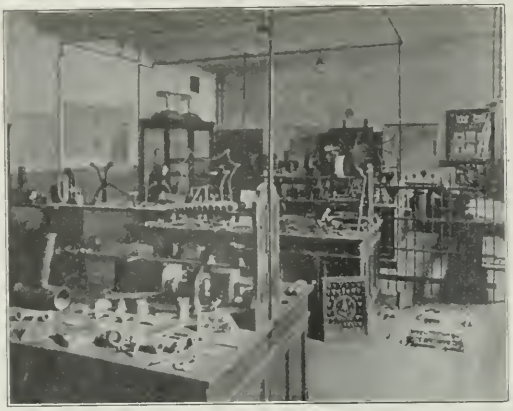
During the past ten years the whole practice of metal cutting throughout the world, and particularly in America, has been greatly improved by the introduction of the high speed tungsten alloy tool steels, there being scarcely a railroad shop in the United States that has not increased its production and cheapened its costs in such matters as turning tires, knuckle pins, boring cylinders, etc. Great as are the changes in shop practice due to high speed steels, the revolution that will be worked in the treatment of all kinds of metals by the oxy-acetylene flame in the forming, building up, repairing of worn or fatigued material, cutting apart and joining together, and, in fact, all kinds of metal forming and working, is bound to far overshadow it.

For instance, in the piping of buildings for all purposes, and whether the pipes are of iron, steel, or some non-corrosive material, metal working is undergoing a complete metamorphosis from the ground up. Piping heretofore used has walls relatively thick compared with its inside diameter, necessitated by the method of joining the ends of the lengths of pipe together, which consists in cutting a thread on the end of the pipe so that it may be screwed into a coupling, elbow, or tee; the depths of these threads determines the thickness of the pipe wall. With pipes or tubes that may be joined together by being oxy-acetylene welded this thickness is not necessary, and a tube of thinner material may be used. These thin walled pipes are easily rolled and butt welded from the strip. I was told that this method of making these thinner pipes was more economical than the present method of making wrought iron or steel piping used for water, gas or steam purposes. Flat bands of steel or iron are run through rolling machines to the desired diameter, and are then put through an automatic machine and oxy-acetylene butt welded.

The New Royal School of Machine Construction at Cologne, Germany.

In place of having unions, elbows and couplings, as is the present practice in piping a building, these are eliminated and the joints are welded as the piping is being put in place. It will be readily seen that with this method there is no chance of leaks due to threaded connections, and as the walls of the piping are thinner, a great saving is accomplished in the first cost of the pipe. When pipe is applied in a building, all of the joints and connections are as easily made in place as a wiped lead joint, and are much neater and stronger in proportion to the metal dealt with. I was informed by those in charge of this kind of work that joints made in this way were done more quickly and cheaply than with the threaded connections.

To indicate the scale on which this oxy-acetylene piping is being applied in buildings, the High Court of Justice building, located at Cologne, has 8 kilometers, or over 5 miles of welded piping and joints in it; and plumbers and pipe workers from all over Germany, and in fact from the other countries of Europe, are becoming expert in the new method as rapidly as they can. Pipes for railway usage may thus be applied in roundhouses, shops and water service installations, eliminating the losses due to compressed air, steam and water leaks—there being no me-



A Collection of Oxy-Acetylene Welded Articles in the Royal School of Machine Construction at Cologne.

chanical joints. The application of oxy-acetylene welding to piping is given as a striking example of the use of the new process, although it is only one of thousands that might be cited.

With the far-sightedness and the thoroughness with which the Germans prepare for any change in their methods, they easily recognized the importance of proper and careful training in the practice of doing this welding work. The Royal Prussian government has co-operated, and, to an extent, endowed and sup-

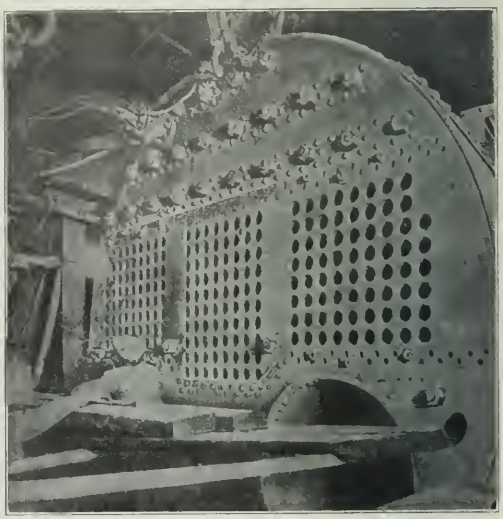
ported the foundation, first of a special advanced course in one of the largest technical industrial schools, where investigation and instruction as to the best and most skillful manner of applying oxy-acetylene welding and cutting to the different trades has been completely worked out. This school is known as the Koniglche Vereinigte Maschinenbauschulen at Cologne. The first course in the new art was given in May, 1909, and since that time 29 successive courses of instruction in the different trades have been given. In the winter of 1911-12, for instance, 464 men from various trades and walks of life took this course at this particular technical school—this in addition to those receiving instruction at the 21 other Royal Prussian technical or trade schools, and also in addition to the instruction given in similar schools in the other German kingdoms.

The subdivision of these 464 students was as follows:

Factory owners	78
Factory managers and engineers	125
Foremen	116
Mechanics	113
Students	27
Others	5

Another classification according to the kind of trade is as follows:

Boiler inspectors	17
Boiler workers, etc	118
Coppersmiths	18
Blacksmiths	12
Machinists	50
Ship-builders	12
Pipe workers	11
Electricians	9



Replacing Flue Sheet of Marine Boiler by Oxy-Acetylene Welding on the Steamship "Sanai." At the Right the Welding Is Completed, While at the Left It Is In Progress. Flue Sheet Is One Inch Thick.

Bicycle and automobile mechanics	11
Safe makers	6
Locksmiths	44
Employees of foundries and rolling mills	8
Gas works employees	6
Gun makers	1
Aluminum workers	12
Carbide manufacturers	1
Teachers in technical schools	27
Master foremen in technical schools	21
Merchants and others	47
Plumbers	33

There is just now being founded at Nuremberg a special school devoted exclusively to practical and theoretical instruction in this new art, the first building appropriation being about $40,000. In this school, as in all of the others throughout Germany and the rest of Europe, the instruction is being carried out along the best standard lines, each school being advised uniformly of the latest and best developments in the practice of oxy-acetylene welding, and through yearly meetings and reports from all of the schools and industries, the best developments are taken advantage of by everybody, and a very rapid general introduction of the art is being made.

One of the illustrations shows a typical example of the saving that can be made by oxy-acetylene welding of large broken

gray iron castings which are too large to carry in stock for replacement. The sketches show a low pressure cylinder for a blower engine in a rolling mill. This cylinder broke as indicated. To cast and machine a new cylinder would have meant a delay of a month and would have thrown 400 men out of work for that time. The welding of cracks in a large complicated casting like this represents a very difficult feat, because of the tendency of cast iron to develop new cracks in the neighborhood of the weld. This is due to the strain set up in the metal when the casting cools after welding. To overcome this the cylinder was covered with asbestos on the outside and kept at a dull red heat by a wood fire inside of the cylinder, while being welded by the oxy-acetylene flame. The operators wore wooden shoes and heavy felt gloves and worked behind asbestos shields to protect themselves from the heat. After the weld was completed the cylinder was covered with insulation and allowed to cool very slowly. After two days the insulation was removed and the welds were found to be perfect. The cylinder was then given a hydrostatic and a severe endurance test, both of which were stood without a sign of a flaw.

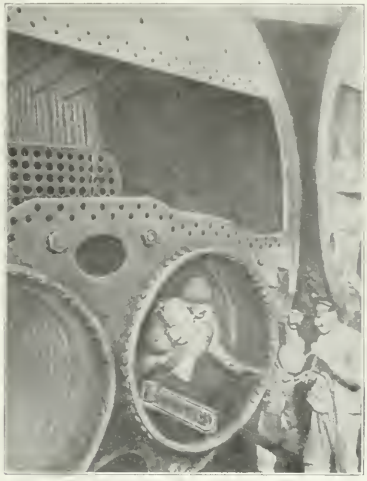
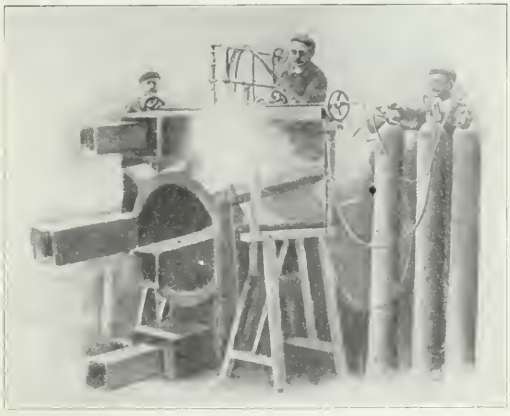
Main Base Casting of a Shear (Cast Iron) After Being Repaired with the Oxy-Acetylene Blow Pipe.



A Marine Boiler After Cutting Out Damaged Flue Sheet with Oxy-Acetylene Blow Pipe.

Cutting Done by Oxy-Acetylene Blow Pipe.

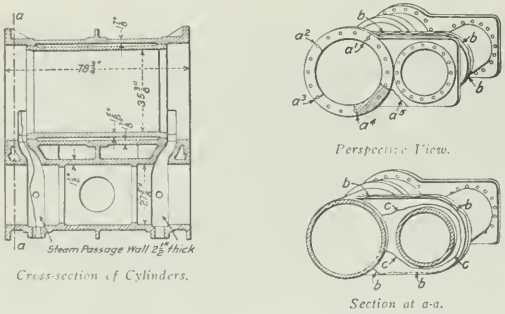
In railroad work applications are made to the welding of safe ends to flues; in the filling up of pitted spots on flues after they have been rattled; in the cutting out of all kinds of holes in steel sheets, such as fire-door holes before flanging; cutting out between frame jaws in plate frames; various classes of boiler repairs; equipping wrecking outfits with apparatus for cutting; welding together of cylinder and valve chest covers, dome covers, metal tool boxes, metal shovel handles, etc., and repairing blow-holes in all kinds of castings as is now done in the United States; and, in fact, an innumerable variety of work where it is required to cut two pieces of steel, iron or other metal apart, join them together, or add metal to worn or broken



Cutting Off the Riser from a Large Gun Carriage.

parts, or parts needing bosses or shoulders instead of having to use an originally thicker piece of metal.

Although I had letters of introduction from the best sources, and was freely admitted into the works where these processes were generally employed, I found that where manufacturing concerns had specialists on certain articles and had been able



The Cracks in This Low Pressure Cylinder of a Rolling Mill Engine Were Repaired by the Oxy-Acetylene Process.

to reduce the cost of production very much through the art of oxy-acetylene welding, strangers were not admitted to the plants, and the art was guarded as a sort of trade secret, showing the value attached by manufacturers to some of the most important developments of the process so that they might retain some advantage over competitors.

Cutting a Hole Through a Boiler Plate with an Oxy-Acetylene Torch.

In conclusion I would strongly urge the railroad mechanical department officers and mechanical engineers who will attend the meeting of the American Society of Mechanical Engineers, to be held in Europe this coming summer, to take advantage of the opportunity to visit the industries where the art of oxy-acetylene welding is being practiced.

Railway Extension in Trinidad.—Work on the extension from San Fernando to Siparia was somewhat delayed until the middle of January by the continual heavy rains, and only one of the three locomotives used for carrying materials has lately been in use. Ballasting the track especially has been delayed, and there are two 120 ft. span bridges yet to be completed on the line.

THROUGH ROUTES ESTABLISHED.

*St. Louis, Springfield & Peoria et al. v. Peoria & Pekin Union. Opinion by Commissioner Meyer:**

The complainants are interurban electric railways under the common management of the Illinois Traction system. They have both passenger and freight terminal facilities in Peoria, Ill., and also a physical connection with the lines of the defendant. At present, however, there is no interchange of traffic between the complainants and the defendant, and the complainants request the commission to require the defendant to permit the complainants to construct a new physical connection as the present connection would not be adequate; and further to require the defendant to establish through routes and joint through rates and to exchange interstate traffic. The complainants' equipment and facilities will permit interchange with a standard gage steam road. The defendant conducts a general terminal transfer business in Peoria for the steam railroads which enter that city, and for the use of its property it charges $22,500 a year to roads which have no terminal facilities in Peoria. Two roads have freight terminals in Peoria, but no passenger terminals, and they pay the defendant for the use of its passenger terminal $2,000 a year. The lines of the Atchison, Topeka & Santa Fe connect with the defendant's lines at Pekin, and by paying a switching charge of $3 per car the former is enabled to have its traffic delivered at Peoria and to receive traffic therefrom. What the complainants request is nothing more nor less than an arrangement similar to that which exists between the defendant and the Santa Fe.

The commission found that the construction of a connection at the point mentioned in the complainants' brief is reasonably practicable; that it could be put in with safety, and that sufficient business would be offered to justify its construction and maintenance. The defendant contended that the commission was without authority to grant the relief sought by the complainants, because the compelling of switch connections did not apply to all roads but only to lateral branch line roads; and that the complainants' lines are not lateral branch lines, and are therefore not entitled to the use of the defendant's facilities, except upon such terms as the defendant sees fit to offer them; also that the defendant has the right to absolutely refuse the use of its terminals and facilities to complainants, but that it is willing to permit the use of the same upon the same terms as the roads which enter Peoria, but which have no terminal facilities there, are using them. The commission found that as the complainants' lines were independent lines and not lateral branch lines, the request for the switch connection should be denied. The question to be decided was whether this was a case in which to order the establishment of through routes between the complainants and the defendant over the existing connection. If the connection is not sufficient to render the service which the law requires, both carriers are under obligation to render the facilities adequate. The defendant asserts that the complainants seek the use of its terminals as embraced in the contract for which other roads paid $22,500 a year, for a compensation less than that sum. The commission did not agree with this assertion, as the complainants have their own facilities in Peoria, as previously mentioned. Owing to the present lack of interchange, interstate traffic shipped via the complainants and the defendant involves long drayage hauls and excessive loading and unloading. The commission disagreed with the argument of the defendant that when the defendant was required to transport traffic between the complainants' terminal and points on its line it was giving the complainants the use of its track and terminal facilities within the meaning of the third section of the act to regulate commerce. The commission found that shipments moving interstate generally pass through one or more terminals, and that the contention made by the defendant,

*Though this decision of the Interstate Commerce Commission is abstracted, the original language is preserved insofar as is possible.

if admitted, would completely nullify the power of the commission to establish through routes. The commission found further that the defendant now discriminates against the complainants in favor of the three roads which at present use only a portion of the defendant's facilities, and that this practice showed that the defendant recognized the difference between an interchange, such as the complainants want, and the use of its terminal facilities as defined by it. The commission decided that the defendant has not the privilege to accord one carrier an interchange of traffic and to deny such an interchange to a competitor of that carrier, or to accord one carrier the use of part of its terminal facilities and to deny such use to another.

The defendant asserted that it has the right to "absolutely refuse" the use of its terminal facilities to the complainants. The commission found that though the terminal facilities of the defendant were private property, they were devoted to public use and were therefore subject to regulation. If the defendant had the right to refuse the use of its terminals and facilities to the complainants it could also refuse such rights to all other steam roads entering Peoria and literally seal Peoria through the instrumentality of its rails and hold that community as a closed domain. If a carrier receives fair compensation for service, how could it be claimed and argued that its property was being confiscated as a result of compulsory performance of such service? The commission found further that a common carrier is bound to accept a car for transportation whenever such car is offered at places where it can reasonably receive it. To determine whether or not it will transport the car the carrier cannot lawfully inquire into the ownership and origin of the contents, nor into the route over which it has been moved in order to reach its rails; it can only ask that it be given reasonable compensation for the service performed. The defendant in effect endeavors to compel the complainants to pay for services and facilities which they do not desire and of which they cannot make use. The commission decided that a common carrier cannot arbitrarily require the purchase of its services when they are not wanted. The commission decided that the complainants are entitled to through routes and through rates with the defendant, that they are entitled to through routes on interstate traffic passing through Peoria to points on their lines and from interstate points to industries on the lines of the defendant in Peoria, and from such industries to interstate points reached by the complainants. If an agreement in regard to the rates is not made within 60 days, further proceedings will be had with a view to the issuance of a proper order.

Commissioner Prouty concurring, said in part: The defendant is properly a belt railroad; it was constructed for the express purpose of giving main-line railroads access to the various industries in and about Peoria; it has no main line, and it is entirely immaterial to it by what connecting railroad the main-line haul is performed. The commission may properly establish through rates to and from industries upon a terminal railroad of this character. The commission may order the through service, leaving the parties to provide the necessary connections. At any rate it is clear to me that the defendant should be required to handle the business of the complainants upon fair terms, and this commission should at least attempt to compel this. If we mistake in the making of our order the defendant has ample protection in the courts, while, if we err by denying the petition of the complainants it is not clear that this error can be corrected. (26 I. C. C., 226.)

Railroad Extension in Spain.—Under a recent concession the Alcoy & Gandia Railroad secured the right to construct and operate without government subvention a 12½ mile extension from Gandia northward along the coast to the town of Cullera. Work is under way, and when completed it will give Gandia a second route to Valencia, put the coast points in closer touch with the important fruit district of Alcira, and in general will establish more efficient communication between Valencia and the numerous agricultural communities to the southeast.

ARBITRATION OF THE FIREMEN'S WAGE CONTROVERSY.

The arbitration, under the Erdman act, of the controversy between the locomotive firemen and the eastern railroads was begun at the Waldorf-Astoria Hotel, New York, last Monday. W. W. Atterbury, the member of the arbitration board appointed by the railroads, and Albert Philips, appointed by the firemen having failed to agree on a third member, William L. Chambers, formerly chief justice of the International Court in Samoa and a member of the Spanish Claims Commisison, was chosen, under the law, by the presiding judge of the Commerce Court and the acting commissioner of labor, acting jointly. There appeared for the firemen W. S. Carter, president, and Timothy Shea, assistant president of the Brotherhood of Locomotive Firemen and Enginemen. For the railroads there appeared Elisha Lee, assistant to the general manager, Pennsylvania Railroad, who is chairman of the conference committee of managers. Mr. Lee will be assisted, as occasion may arise, by his colleagues on the committee. Under the terms of the Erdman act the arbitration must be closed within 30 days from the date of the appointment of the third arbitrator, which was March 3, so that unless both sides agree to an extension of time, the decision will be announced by April 2.

Judge Chambers was selected as chairman by the other two members of the arbitration board. In his opening remarks he said, in part: "I am, of course, entirely ignorant of every question and every fact connected with this arbitration. My first consultation with anybody about the case occurred within the last hour with my colleagues. I do not own a share of railroad stock, nor a bond of a railroad, and I have paid my fare on railroads all my life. I have many close and intimate friends among the officers of railroads and I have perhaps as many in the brotherhood. If I were not a lawyer I expect I should be a railroad employee. We expect these proceedings to go along, not only peaceably, but with that feeling which I know from experience really exists between the railroad managements and the brotherhood. I have presided in a number of arbitrations, not only under the Erdman act, but in several other instances, and with very rare exceptions I have found that both the representatives of the railroads and of the brotherhoods have been controlled by high principles and a sincere desire to reach conclusions to the general interest of the railroads and the brotherhoods and equally in the interest of the public. In a sense I feel that, as the presiding arbitrator, I represent the public.

"The proceedings will be along the line of court proceedings, but not with the strict application of court rules. We are going to admit evidence which, in a court of justice, might be ruled out because it was hearsay or irrelevant. Our desire is to learn everything possible about the facts in the case. I believe my colleagues are as impartial in this investigation as I am myself. . . ."

In opening the case for the firemen, Mr. Carter emphasized the point that the firemen's requests had been twice amended; had they known what the final method of settlement would be they would probably have presented larger claims. Samuel T. Steinberger, a clerk in the general office of the Brotherhood at Peoria, was the first witness. He said that he had prepared a statement showing regulations and rates of pay existing on lines participating in this arbitration as compared with those of western lines and with the rates now asked for. It was evident that Mr. Carter's purpose was to emphasize the higher rates and more favorable conditions on western roads as compared with those in the East. Mr. Steinberger gave averages of the pay received by the firemen on different classes of engines according to weight on drivers for both the west and east, against which Mr. Carter set the demands now made, showing that they were based on the western rates, but were a little lower. The rates for the eastern roads gave no information regarding the practice with heavy freight locomotives seldom used on passenger trains, but the present demands include rates for such engines, in such work;

and no rates were given for the present demands for freight service in the case of locomotives weighing 200,000 lbs. or more on drivers, as in this case two firemen are asked for. In the cross-examination, Mr. Lee brought out objections to the methods used in obtaining the average rates shown in the tables. Asked by Mr. Lee if he considered it fair to compare the eastern and western rates in this way, Mr. Steinberger admitted that it was not exactly correct, but it was as near as he could get to it. Mr. Lee then informed the board that the railroads objected to the method used in obtaining the rate and promised to submit a correct statement.

The next witness was J. W. Lott, of Elkhart, Ind., employed on the Lake Shore & Michigan Southern as fireman and extra engineman. On that road a fireman is called two hours before the leaving time of his train in freight service and three hours before in passenger service. It is part of the fireman's duties to put the tools on the engine and fill the lubricator. The witness claimed that this work should be done by someone else, and characterized the filling of lubricators as dangerous. On the division on which he worked, which is 95 miles long, 75 per cent. of the trips on freight trains occupy, he said, from 12 to 16 hours. The witness also admitted that given the same tonnage, a locomotive with a superheater burned less coal than a similar locomotive using saturated steam, but he claimed that the superheater locomotives actually burn just as much coal as the others, as they haul heavier loads. He also claimed that those equipped with superheaters are no better at starting a heavy train than those using saturated steam.

E. L. McGinnis, a fireman on the Pittsburgh division of the Pennsylvania Railroad, said that on that division, in the last few years, there had been an increase of 200 tons in the rating of certain locomotives without any changes being made in them.

Mr. Cory, a fireman on the Cleveland, Cincinnati, Chicago & St. Louis at Indianapolis, Ind., said that he had been told by the road foreman of engines, in taking up the matter of a fireman being called out of his turn, that the firemen broke the rules daily regarding the cleaning of locomotives and that therefore the company could not be held to account for breaking other rules.

James A. Bell, New Castle, Pa., a fireman on the Pennsylvania Lines west of Pittsburgh, gave testimony regarding the difficulty of a fireman's shoveling coal ahead on freight engines. Cross-examined by Mr. Lee, he admitted that there had been four recent increases in wages, but claimed his wages would not go any further now than previously.

David May, of the Baltimore division of the Baltimore & Ohio, gave similar testimony to that of Mr. Lott regarding superheaters. He said that on his division automatic stokers had been a failure; but he believed the locomotives so equipped were now working satisfactorily on another division. He caused considerable amusement when he declared that a thermometer which he carried on the locomotive during the summer had burst from the heat when passing through a tunnel.

W. F. Heckenberger, a fireman on the Philadelphia division of the Pennsylvania, said that in cases of accident both enginemen and firemen were disciplined, but admitted that the enginemen were held principally to account.

J. E. Weaver, of the Lake Shore & Michigan Southern at Elkhart, Indiana, said that firemen are frequently disciplined for making black smoke in Chicago. He claimed that the poor quality of the fuel was to blame. He said that it was often necessary for the fireman to assist the engineman in reversing the large engines. This completed the testimony for the first two days.

C. A. Kauffman, of the Philadelphia division of the Baltimore & Ohio, was the first witness called on Wednesday morning. He stated that at his terminal there was no difficulty in getting supplies placed on locomotives previous to a trip, but he understood there was trouble at some terminals of the road. He stated that there had been a great reduction in the number of engine crews since the introduction of the Mikado type locomotives. F. A. Murphy, of the Cumberland division of the Baltimore & Ohio, followed. He said that a number of locomotives on that division are equipped with the Street locomotive stoker, but that they are not popular with the firemen and that the oldest men choose the hand-fired engines when they are available. He claimed that the stokers require constant attention and that therefore the firemen get no chance to rest while in sidings; that the fireman has to fire by hand about 50 per cent. of the coal burned, and that the coal that goes to the stoker must be dry and passed through a screen which will take nothing larger than 2½ in. square, requiring much labor in breaking coal. The dust resulting from this, he said, is excessive. On this division screened coal for the stokers is supplied at one terminal only. T. E. Ditto, also of the Baltimore & Ohio, said that several firemen on his division had been paid $1 per day extra to go to the Cumberland division to fire because of the difficulty of keeping men on the large locomotives there. His experience with the automatic stokers was confined to six trips. He also claimed that he could see no saving of coal under any conditions with a superheater. J. A. Davis and C. B. Hubler, of the Buffalo division, Delaware, Lackawanna & Western, both testified to the use of two firemen on certain large locomotives in road service, but these locomotives have since been placed in pusher service.

Warren L. Adair, a fireman on the St. Louis division of the Cleveland, Cincinnati, Chicago & St Louis, testified regarding the use of the superheater. He stated that a superheater is satisfactory when new and in good condition, but that the large flues soon become blocked with cinders around the superheater units and leaks develop at the joints. On cross-examination by Mr. Lee he admitted that a saturated steam locomotive is as bad as one using superheated steam when in a run-down condition. In questioning Mr. Adair, Mr. Carter explained that he had to depend on firemen for the technical testimony regarding such devices as the superheater as he was unable to obtain a mechanical expert anywhere who was willing to testify on the men's side. Mr. Lee offered to lend him an expert for testimony but Mr. Carter refused the offer.

N. W. Ayers, of the Lake Shore & Michigan Southern, at Erie, Pa., said that three Street stokers in use on that road about a year and a half had been removed because unsatisfactory. He claimed the parts of the stoker were in the way and bothered a fireman in the performance of his duties. Firemen Lieban, of Harrisburg, Pa., and Lienhardt, of Tyrone, Pa., both Pennsylvania men, followed in the lines of several previous witnesses. E. G. Boling, of Terre Haute, Ind., a fireman on the Vandalia, stated that he had had no personal experience handling an automatic stoker, but had ridden a locomotive equipped with one for some time and watched its action. He did not state the type used, but claimed that conditions must be ideal in order to get satisfactory results. He said the stoker would only work satisfactorily with good coal, and compared its use with the instruction of a student fireman, saying that it was necessary to watch it closely and help out frequently by hand firing. Mr. Carter at this time added to his statement regarding his inability to obtain expert testimony, and compared the superheater and such devices with the compound locomotive, which, he said, after having cost "millions and billions of dollars" had been abandoned as unsatisfactory. He said that the superheater was supposed to make a saving in the fireman's work but that no such result was obtained, and classed it and the compound locomotive together as fads. When Mr. Atterbury said that information concerning tests at the Altoona testing plant of the Pennsylvania were available to Mr. Carter the latter replied that such results showed testing plant conditions only and were of no use for what he wanted. He then attempted to bring out, in questioning Mr. Boling, that bad water is worse to contend with on superheated than on saturated steam locomotives, owing to the scale forming in the superheater tubes and reducing their conductivity. J. M. Dunlevey, of the Pennsylvania division, New York Central & Hudson River, stated that the heat on the Mallet compound locomotives which he fires is so intense that his overalls and trousers are frequently burned through. Mr. Carter suggested that the company make "an appropriation for pants" for the firemen on these locomotives.

EDGAR E. CLARK.

The reappointment of E. E. Clark to the Interstate Commerce Commission for another term of six years was noticed in our issue of March 7, page 451. On the eighth, Mr. Clark was chosen chairman of the commission for the current year, taking the place of Mr. Lane, who leaves the commission to enter the President's cabinet as Secretary of the Interior.

Mr. Clark has been a member of the commission for six years, and during that time has made a reputation for integrity, impartiality, and assiduous devotion to the duties of his position. These are essential qualifications for the head of this important body, and it is, therefore, to be expected that he will fill his new post with credit to himself, and to the interest of the public.

Mr. Clark was born in Lima, N. Y., February 18, 1856, and was educated at Wesleyan Seminary in his native town. He moved west in 1871, and began his railroad career as a brakeman. He was soon promoted and rose through the usual channels to the position of passenger conductor, which he held in 1889, when he was selected grand senior conductor of the Order of Railway Conductors, at the convention in Denver, Colo., in May of that year. The following year, 1890, he was chosen grand chief conductor; and he remained the head of the order up to the time that he was appointed by President Roosevelt a member of the Interstate Commerce Commission in 1906. As leader of the brotherhood Mr. Clark enjoyed an enviable reputation for fairness, public spirit and progressive views. During his incumbency the membership of the conductors' brotherhood increased from 12,000 to 38,000. While in this position Mr. Clark was appointed by the President a member of the Anthracite Coal Strike Commission of 1902, a body whose strong, yet conservative conclusions elicited the general approval of the country.

Edgar E. Clark.

For several years past Mr. Clark has had direct charge of that part of the commission's work which has to do with the compilation of the passenger and freight tariffs filed by the railroads and the administration of the regulations under which this very troublesome work is managed by the railroads. As the reader will recall from the last annual report, recently issued, the number of tariffs filed in 1912, which was 108,766, represents a reduction of more than 50 per cent. in the number issued, as compared with 1908; a reduction, accomplished only by the most persistent attention to innumerable details and in the face of constant objection and criticism, which has proved as beneficial to the railways, in the simplification of work and the reduction of expense, as it has to the people who use the tariffs in added convenience.

Mr. Clark is the first and only member of the commission who is familiar with the actual physical operation of a railroad. The first chairman, Judge Thomas M. Cooley, had been a receiver, but was essentially a lawyer and an economist; Commissioner Yeomans had been superintendent of a small road for a short time; and Commissioner Clements had been president of a small railway for one year; but the man who knocks around on freight trains for five or ten years, as did Mr. Clark, and who also has the qualifications of mind and character to rise to a position of leadership, gets a schooling and an experience which can be secured in no other way. He becomes familiar with the feelings and needs of the employees, and also with the views, motives and responsibilities of operating officers. At the same time he learns the feeling of the public—the railroads' patrons. As, during the past six years, Chairman Clark has become sufficiently acquainted with public sentiment in those phases wherein the railways do not satisfy it, to offset any undue sympathy with railroad employees which he may have had, we may now expect him to be the most impartial of judges. Evidence that he has the judicial temperatment we already have, as has been noted.

BALTIMORE & OHIO IMPROVEMENTS.

Extensive improvements are to be carried out by the Baltimore & Ohio on the Somerset & Cambria division between Johnstown, Pa., and Rockwood, at a cost of about $1,500,000. The work will be started as soon as the consent of the city authorities of Johnstown can be obtained. The new passenger and freight houses and yards in Johnstown will more than double the present facilities at that place. There will be new passenger and freight facilities at Somerset, a number of long passing sidings, and five steel bridges; a new passenger station at Rockwood, and a new track, low-grade, between that place and Garrett. The passenger station at Johnstown will be of stone, 28 ft. x 100 ft. The freight house will be brick, 28 ft. x 300 ft., with concrete foundations. It will have covered platforms 14 ft. wide x 200 ft. long. The building will have a refrigerator room and two team tracks. A new roundhouse and other terminal buildings will be put up in Johnstown, which with yard improvements will cost $500,000. The yards will have a capacity of 240 cars. An engine house with a turntable 80 ft. long will be built, and there will also be a 70-ft. ash pit.

The new freight yard at Somerset is to have a capacity of 500 cars, and the roundhouse and other buildings at that place will cost about $400,000. Steel bridges will replace lighter structures at Holsople, at Skew, at Paint Creek at Hog Back Tunnel, and at Stony Creek. Work on the low-grade line between Rockwood and Garrett, to be 8 miles long and cost $500,000, has been started.

Regarding the recent report that the Baltimore & Ohio would spend $27,000,000 for new tracks and other improvements, an officer writes that the report was based on a tentative statement made by President Willard before the Public Service Commission of Maryland, referring to improvements that it may be necessary to carry out on the Baltimore & Ohio during this and future years.

THE KIANGSU-CHEKIANG RAILWAYS.

Progress That Has Been Made Towards a Modern System of Railroads, Remarkably Low Costs of Labor for Operation.

By Lewis R. Freeman.

The railway question which China is facing today is not whether the thousands of miles of line, which are soon to be constructed, shall be built by foreigners or by themselves—that question seems already to have been settled—but rather whether they shall be built with borrowed or with Chinese money. The question will doubtless take a long time to decide, but eventually the Chinese will probably borrow the money for their great enterprises, retaining as complete control of the expenditures as possible, while the smaller lines will be financed and built by local capitalists.

Country Station, Showing Platforms of Concrete and Macadam.

The Shanghai-Nanking Railway is undoubtedly the best built road in the Chinese Empire, a product of foreign financing and engineering, and now being largely operated under foreign direction. In the Peking-Kalgan, the Chinese government, taking advantage of men trained under European supervision, and using the profits of one of its own foreign built lines, overcame serious engineering difficulties and constructed a 132-mile line more economically than a similar work has ever before been done. In the present account of the Kiangsu-Chekiang Railway I shall tell something of a line—two connecting lines really—that was financed by the Chinese gentry of the interested provinces, built by Chinese engineers, and is now being operated without the aid, even in an advisory capacity, of a single foreigner. The most notable fact regarding these lines is that their cost of construction and operation have proved lower than those of any other important road in China.

The Kiangsu-Chekiang Railways, passing through a section of country almost identical in character with that traversed by the Shanghai-Nanking Railway, were built at a cost of approximately $20,000 a mile (the Chinese claim even considerably less than that figure) against $55,000 a mile for the British-built Shanghai line. Foreigners claim that the Kiangsu lines are poorly constructed in every respect, that the ballast is neither of good quality nor properly laid, that the ties are culls which could not be sold elsewhere, that the rolling stock is mostly a heterogenous collection of antiques from all parts of the world, and that such of it as is up-to-date is rapidly being ruined by incompetent and careless handling. The Chinese, denying all these charges, maintain that even if they were true the margin of advantage—$35,000 a mile—which their lines have over the Shanghai-Nanking Railway will allow them something to draw upon for renewals. The fact that the through line from Shanghai to Hangchow has operated for over a year now without any serious defects cropping out, and at a most handsome profit, cannot be lost sight of in passing on the merits of the question.

Foreigners in Shanghai shook their heads doubtfully when it was announced by the Chinese that the itinerary of the Pacific Coast Commercial Commission included a trip to Hangchow and back by a special on the Kiangsu-Checkiang Railways. They warned the Chinese that a railway accident, however trivial, at the outset of the visit might upset the plans for the whole tour and do irreparable harm. They finally induced our hosts to "minimize the chances" by arranging that the down trip should be made in house-boats via the Whangpoo and the Grand canal. Even after our arrival strenuous endeavors were made to arrange that the journey in both directions between Shanghai and Hangchow should be made in house-boats, but the plan of returning by train was adhered to by the Chinese.

Girder Bridge on Concrete Abutments.

Our introduction to the Chekiang section of the railway came a few days sooner than was expected, however, and under circumstances which gave us a much fairer opportunity of judging the line than would have been possible by the night trip in the special alone. Contrary tides and the inability of the launches to keep up to schedule with their heavy trains of house-boats brought us to Kashing, the half-way point between Shanghai and Hangchow, so far behind time that it was found necessary, in order to meet our luncheon engagement at Hangchow, to abandon the boats and take the morning train on its way through from Shanghai.

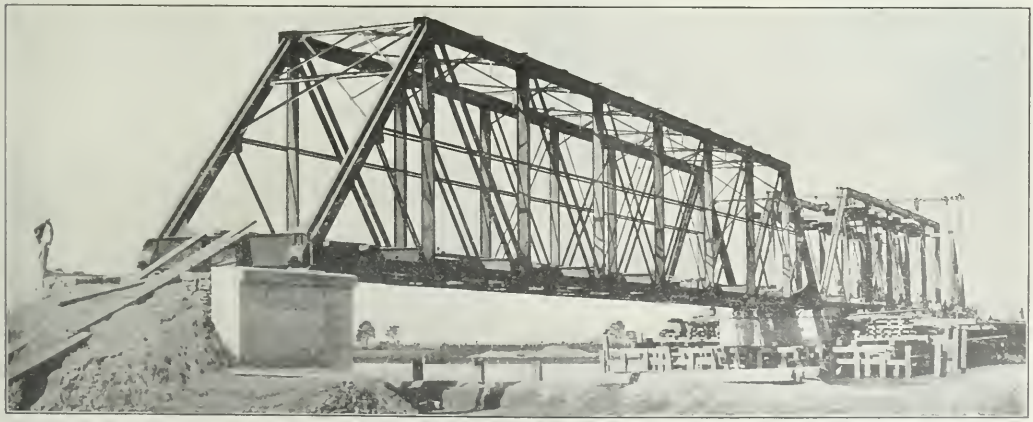
Shanghai Terminal; Kiangsu-Chekiang Railway.

The commodious and substantial brick station has large and comfortable, first, second and third class waiting rooms, and is finished throughout, plainly but attractively, in teak. There are gates for regulating the movement of passengers, and a viaduct for crossing to and from the main platform in leaving and taking the down trains which came in on the farther siding. The platform is strongly built of well tamped macadam in brick retaining walls, and extends for some distance beyond either end of the station.

The track is heavily but rather loosely ballasted. The ties are Japanese hardwood, and all of those which we saw, not only at Kashing, but at a number of other stations as well, appeared of fair quality and in good condition. They are 6 in. x 8 in. x 8 ft. long, and spaced 2 ft. 4 in. between centers. They cost sixty cents gold apiece, delivered, and are expected to have a life of from six to eight years.

The limestone and sandstone ballast did not appear—and is not, in fact—of the quality of the granite that was used in the Shanghai-Nanking roadbed. It was brought from a quarry situated at the end of a spur near Hangchow, and was furnished at the very reasonable cost of 25 cents per cubic yard. It was laid 10 ft. wide and 6 in. deep.

Seventy-five pound rails were used. They were 33 ft. long, of standard section, and were laid with even joints. They bore the marks of the Hanyang Iron Works, the greatest manufacturing concern of China. I may say, in this connection, that it is only a matter of a few years before China will make all of her own rails, as well as all the other more simple iron and steel products.

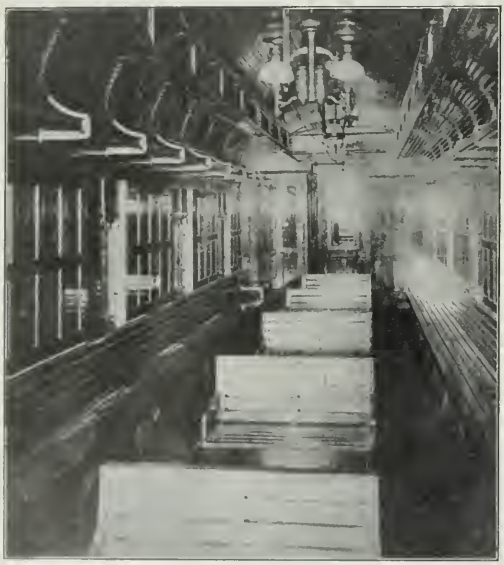


Bridge Over Taoling River.

The nine or ten-car Shanghai-Nanking train came into Kashing behind its American Locomotive Company locomotive, and three or four of us found ourselves in a bright, well-finished American-made car, where we rode in comfort for two hours and a half before discovering that we were in the second-class section of the train. This car, in fact, with its easy cane seats, Pintsch lights, large luggage racks and commodious and well-appointed lavatories, was more comfortable than many of the so-called first-

class cars in which I have ridden in western America. The seats were arranged facing each other in twos, and when tea or refreshments were ordered a folding table was swung up between them from the wall where it had been hanging. This we found a common arrangement on many of the Chinese roads, where the traveling public is much given to lunching and tea drinking through all hours of the day and night.

Many of the cars of the Kiangsu part of the line have a stork-like appearance caused by the fitting of American built bodies and trucks upon the large Chinese standard wheels. The cars and trucks were ordered from America, as were also the engines. The latter from the American Locomotive Company, were ordered to meet the requirements of the Chinese Railway Board's rule that the height from the top of the rail to the center of the draw-bar or coupling should be 3 ft. 7 in. The cars were ordered to be built according to American practice, which stipulate a height of 2 ft. 9 in. To the American car and the American truck has been fitted the standard Chinese wheel, 3 ft. 6 in. in diameter, or 9 in. more than the American standard. To give clearance to this



Interior of Third-Class Coach; Kiangsu-Chekiang Railway.

wheel the car bodies have been blocked up at the kingbolt and on the sides about 9 in. The result is neither graceful nor conducive to stability.

Our journey down to Hangchow, and our later return from there in the really luxurious special which the directors of the two roads put at our disposal, gave us little opportunity for investigating any of the multifarious defects which our foreign friends in Shanghai harped on so continuously. On the score of comfort, even on the train which we boarded without warning at the wayside station, there was nothing to be desired. In fact, the only disagreeable feature noted was the very considerable jar and rattle while the train was in motion, which made sustained conversation almost impossible. This trouble is doubtless due partly to the patched up cars, as well as to the roadbed.

Neither on the trip from Kashing to Hangchow, nor from Hangchow back to Shanghai, nor in three or four short side trips about Hangchow, was there an accident of any kind, nor the least hitch in the by no means simple arrangements for handling so large a party. Quite naturally, considering what we had been led to believe would happend to us if we traveled over these lines, the Commercial commission was agreeably surprised in the Kiangsu-Chekiang Railways. For my own part, the favorable opinion formed at that time has not materially been altered by a couple of recent trips which I have made over the roads at my leisure.

An interesting fact in connection with the Chekiang Railway, which operates the 78 miles of line from Fengching to Hangchow, and is building the important extension from the latter point to Ningpo, is the large number of stockholders it has. Only Chinese were permitted to subscribe for stock, and the capital of $10,000,000 is divided between 53,000 different individuals. Forty-thousand of these are coolies, tradesmen and small farmers, and

Third-Class Waiting Room, Built of Brick, Concrete and Tile.

it is said that subscriptions for as low an amount as $5 were accepted.

The economy with which this line is run may be judged from the fact that the president and vice-president receive no salaries, and that the chief engineer, a graduate of the University of California and a perfectly competent man, gets $2,750 a year. Locomotive enginemen receive from $28 to $37 per month; station masters, $8.50 to $16; track foremen, $4.50, and coolie section hands, 15 cents a day. If graft were cut down at all it would readily be seen not only that this road could have been built inside of the figure which the Chinese claim—$20,000 per mile—but that its operating expenses must also be about as low as those of any road in the world. On the recently completed Sunning Railway in Kwantung province, near Canton, the salaries average even lower than these, the president and general manager receiving $38 a month; locomotive enginemen, $20; firemen, $8, and section hands 13 cents a day.

The Chekiang Railway, from Fengching to Hangchow, is 78

Gates at Grade Crossing.

miles long on the main line, with about half that length of sidings. There are a total of 144 steel girder bridges, supported on concrete abutments, and 157 culverts. All of the girders were purchased from the American Bridge Company of New York. The longest bridge on the road is a 60-ft. span. The average span of all bridges is 45 ft.

I find this comment on the method of bridging many of the waterways where there was difficulty in finding good foundation, or where regular practice would have been inconvenient: "The country traversed by the Chekiang and Kiangsu Railways is a network of canals and creeks, the natural highways of commerce and trade in this low-lying section. The closing or narrowing of those

streams by cofferdam to the detriment of the great junk and river traffic was prohibited by the authorities, so in many instances the railway engineer put into practice the old scheme of building one abutment at the water's edge, the other on dry land to one side, and, after completion, diverting the shallow canal from its old channel to its new one between the abutments. There is nothing remarkable about this practice, though a London paper has used it as an argument to criticize the professional ability and capacity of the engineers. . . . The mere fact that such a practice could be resorted to is an indication of the harmlessness and sluggishness of the water, and as nearly all are tidal canals it rather reflects on the good judgment of the engineer than otherwise, as the best method of keeping the narrow channels open to junk traffic during the construction of the road."

The Chekiang Railway has 15 stations, and the Kiangsu line 10. All of the station buildings on both lines are of brick, of which the one I described at Kashing is a fair type.

The Kiangsu line has 48 bridges, exclusive of culverts, some being stone arches and some steel girders. The longest is over the Zia Tang. It is 440 ft. long, in two spans, and has proved the most expensive undertaking in the construction of the road. Three other bridges, 400, 300 and 100 ft. long, respectively, were constructed cheaply and quickly.

Nearly all the rolling stock on the Kiangsu line is American, and except for the appearance of the American car bodies on Chinese wheels, it is a very creditable assortment. The Chekiang road has been aptly described as a menagerie of rolling stock, no less than a dozen different types being in service on the 78 miles of line. Several factories of the United States, Germany and England are represented, with the result that some of the yards have the appearance of an international exhibition of railway equipment. The company stoutly maintains that it knows exactly what it is doing, and that the motley array was bought with the idea of experimenting with everything the market afforded and with the idea of determining for itself which was best. This is possibly true, but it gives one the impression of being rather a wild piece of extravagance for a road which in other respects has made such a strong showing on the score of economy.

To the charge that the Chinese are sacrificing quality for economy in the construction of those roads which they are building independently of foreign direction, George Bronson Rea, in a last year's number of his *Far Eastern Review,* makes the following convincing reply:

"In the building of such roads as the Peking-Kalgan, the Kiangsu, the Chekiang and the Sunning, under purely native supervision and control, China has demonstrated to the world that she is fully competent to develop her transportation facilities at figures defying foreign competition. At a cost of $20,000 to $30,000 per mile there is very little scope for dishonesty. The roads may not be up to accepted foreign standards, but there are many new roads throughout the world of which the same may be said; and if China is satisfied and willing to construct a cheap road at first, and improve it as receipts increase, she will only be following a precedent set by successful pioneer railway builders in all countries."

RAIL PRODUCTION IN 1912.

Statistical Bulletin No. 2, of the Bureau of Statistics of the American Iron and Steel Institute, Philadelphia, Pa., shows that the production of all kinds of rails in the United States in 1912 amounted to 3,327,915 tons, against 2,822,790 tons in 1911, an increase of 505,125 tons, or over 17.8 per cent. Included in the total for 1912 are 174,004 tons of girder and high T steel rails for electric and street railways, as compared with an output of 205,469 tons of similar rails in 1911.

Of the total production of rails in 1912 3,165,939 tons were rolled from Bessemer, open-hearth, and electric steel blooms or billets; 42,586 tons were rolled from new seconds, defective new rails, and steel crop ends; and 119,390 tons were rerolled from old steel rails or were renewed steel rails. No iron rails are reported for 1912.

The production of Bessemer rails in 1912 amounted to 1,099,926 tons, against 1,053,420 tons in 1911, an increase of 46,506 tons. Of the total in 1912 1,070,480 tons were rolled from ingots and 29,446 tons were rolled from new seconds, defective new rails, crop ends, etc. The maximum production of Bessemer rails was reached in 1906, when 3,791,459 tons were produced.

The production of open-hearth rails in 1912 amounted to 2,105,144 tons, against 1,676,923 tons in 1911, an increase of 428,221 tons, or over 25.5 per cent. Of the total in 1912 2,092,004 tons were rolled from ingots and 13,140 tons were rolled from new seconds, defective new rails, crop ends, etc. Almost all were rolled from basic steel. The maximum production was reached in 1912. It will be noticed that the production of open-hearth rails in 1912 was almost twice that of Bessemer rails in the same year.

In 1912 the production of rails rolled from steel made in electric furnaces amounted to 3,455 tons, as compared with 462 tons in 1911. In 1909 and 1910 small quantities of rails were also rolled from electric steel, but these rails were included with the Bessemer and open-hearth rails reported for these years.

In 1912 the production of steel rails rolled from new seconds, defective new rails, crop ends, old steel rails, etc., including renewed rails, amounted to 161,976 tons, of which 42,586 tons were rolled from new seconds, etc., and 119,390 tons were renewed rails or were rerolled from old steel rails. Of the 42,586 tons rolled from new seconds, etc., 29,446 tons were rolled from Bessemer steel and 13,140 tons were rolled from open-hearth steel, and are therefore included in the totals given for Bessemer and open-hearth rails for that year. But, as the 119,390 tons of rails rolled from old steel rails in 1912, and the renewed rails as well, could not be classified by the manufacturers they are not included in the Bessemer or open-hearth rail output for that year, but are grouped under the general heading of electric and rerolled steel rails. Prior to 1911 all rails of this class are included with Bessemer or open-hearth steel rails.

No iron rails were rolled in 1912. In 1911 the production was 234 tons, all rolled in Illinois, and all weighing less than 45 pounds to the yard, against 230 tons in 1910.

The table on the following page gives the production of all kinds of rails in 1912, classified according to their weight per yard, and totals according to weight since 1902.

Stone and Concrete Bridge Over Canal.

Kind of rails—Gross tons.	Under 45 lbs.	45 lbs. and less than 85.	85 lbs. and over.	Total. Gross tons.
Open-hearth steel rails	75,203	488,695	1,541,246	2,105,144
Bessemer steel rails	103,826	591,744	404,356	1,099,926
Electric and other steel rails	69,643	38,153	15,049	122,845
Iron rails	None	None	None	None
Total for 1912	248,672	1,118,592	1,960,651	3,327,915
Years—Gross tons.				
Total for 1911	218,758	1,067,696	1,536,336	2,822,790
Total for 1910	260,709	1,275,339	2,099,983	3,636,031
Total for 1909	255,726	1,024,856	1,743,263	3,023,845
Total for 1908	183,869	687,632	1,049,514	1,921,015
Total for 1907	295,838	1,569,985	1,767,831	3,633,654
Total for 1906	284,612	1,749,650	1,943,625	3,977,887
Total for 1905	228,252	1,601,624	1,546,053	3,375,929
Total for 1904	291,883	1,320,677	672,151	2,284,711
Total for 1903	221,262	1,603,088	1,168,127	2,992,477

The production in 1912 of rails weighing under 45 pounds to the yard shows an increase of 29,914 tons as compared with 1911; rails weighing 45 pounds and less than 85 pounds show an increase of 50,896 tons; and rails weighing 85 pounds and over show an increase of 424,315 tons. In 1912 over 41 per cent. of the rails weighing less than 45 pounds to the yard, nearly 53 per cent. of the rails weighing 45 pounds and less than 85 pounds, and over 20 per cent. of the rails weighing over 85 pounds were rolled from Bessemer steel, while in the same year over 30 per cent. of the rails weighing less than 45 pounds per yard, over 43 per cent. of the rails weighing 45 pounds and less than 85 pounds, and over 78 per cent. of the rails weighing 85 pounds and over were rolled from open-hearth steel.

In the following table the production of all kinds of rails from 1903 to 1912 is given by processes. Of the total production of rails in 1912 about 33.05 per cent. were rolled from Bessemer steel, about 63.25 per cent. were rolled from acid and basic open-hearth steel and about 3.70 per cent. were rolled from electric steel and from old steel rails. As previously stated no iron rails were rolled in 1912.

Years—Gross tons.	Bessemer.	Open-hearth.	*Iron and all other.	Total.
1912	1,099,926	2,105,144	†122,845	3,327,915
1911	1,053,420	1,676,923	†92,447	2,822,790
1910	1,884,442	1,751,359	230	3,636,031
1909	1,767,171	1,256,674	...	3,023,845
1908	1,349,153	571,791	71	1,921,015
1907	3,380,025	252,704	925	3,633,654
1906	3,791,459	186,413	15	3,977,887
1905	3,192,347	183,264	318	3,375,929
1904	2,137,957	145,883	871	2,284,711
1903	2,946,756	45,054	667	2,992,477

*Iron rails only from 1903 to 1910 inclusive.

†Include 234 tons of iron rails in 1911 but none in 1912; also 462 tons in 1911 and 3,455 tons in 1912 of rails rolled from electric steel; also 91,751 tons in 1911 and 119,390 tons in 1912 of renewed rails or rails rerolled from old steel rails which the manufacturers could not classify as Bessemer or open hearth steel rails.

Included in the 3,327,915 tons of steel rails rolled in 1912 are 149,267 tons of alloy rails, against 153,989 tons in 1911. The following table gives the production of titanium, manganese, and other alloy steel rails by processes from 1909 to 1912.

Alloy rails—Gross tons.	Bessemer	Open hearth and electric.	Total.
[illegible] steel rails	103,941	37,832	141,773
[illegible] nickel, and nickel	4,933	2,561	7,494
	108,874	40,393	149,267
[illegible] 1911	[illegible] 150	[illegible] 539	153,989
[illegible] 1910	[illegible] 65	7,389	257,354
[illegible] 1909	[illegible] 699	13,696	49,395

In the following table the production of titanium, manganese and other alloy steel rails is given by kinds since 1909.

Alloy rails—Gross tons.	1909.	1910.	1911	1912
Titanium steel rails	35,943	56,759	152,990	141,773
Manganese, nickel, etc.	13,450	565	999	7,494
	49,395	57,324	153,989	149,267

In addition to the rails rolled in 1912 we imported 3,780 tons of iron and steel rails. During the same year we exported 446,473 tons of steel rails. In 1911 our exports of rails, all steel [illegible] to 420,874 tons and our imports to 3,414 tons.

NEW VIEWS CONCERNING RAILWAY COMMISSIONS.

For the last twenty years the public has intrusted its interests to state railway commissioners whose only claim to their positions is their ability to cozen the voters into electing them; their principal asset, political ability; their experience, legal "hair-splitting," combined with an egotism begotten of elevation from a sphere where the question was where tomorrow's bread and butter was coming from, to an office where the earning power of hundreds of millions of dollars was affected by their actions. From a position of little or no importance to one where they assumed to dictate to leaders in the world of transportation and of finance. . . The *St. Louis Republic* announces the failures of efforts to regulate railways by commissioners, and states that there exists a demand for a change. The "Public Utilities" bill now before the Missouri legislature says:

"The people of Missouri have had exactly the same experience with elected railroad commissioners that every other state that has tried them has had. It is because this method of railroad regulation has been a practical failure the country over that the states are turning to expert commissions, chosen by executive appointment. The present plan of railway control has so worked in Missouri that there is general demand for an appointive commission to take up railway regulation."—*Railway Record.*

THE GEE LOCOMOTIVE STOKER.

The stoker shown in the illustrations has been developed and patented by N. E. Gee of the mechanical engineer's office of the Pennsylvania at Altoona, Pa. It is of the over-feed type, using steam jets for distributing the coal over the grate.

Four main parts are embodied in this stoker—the source of power, the coal crusher, the coal conveyor and the coal dis-

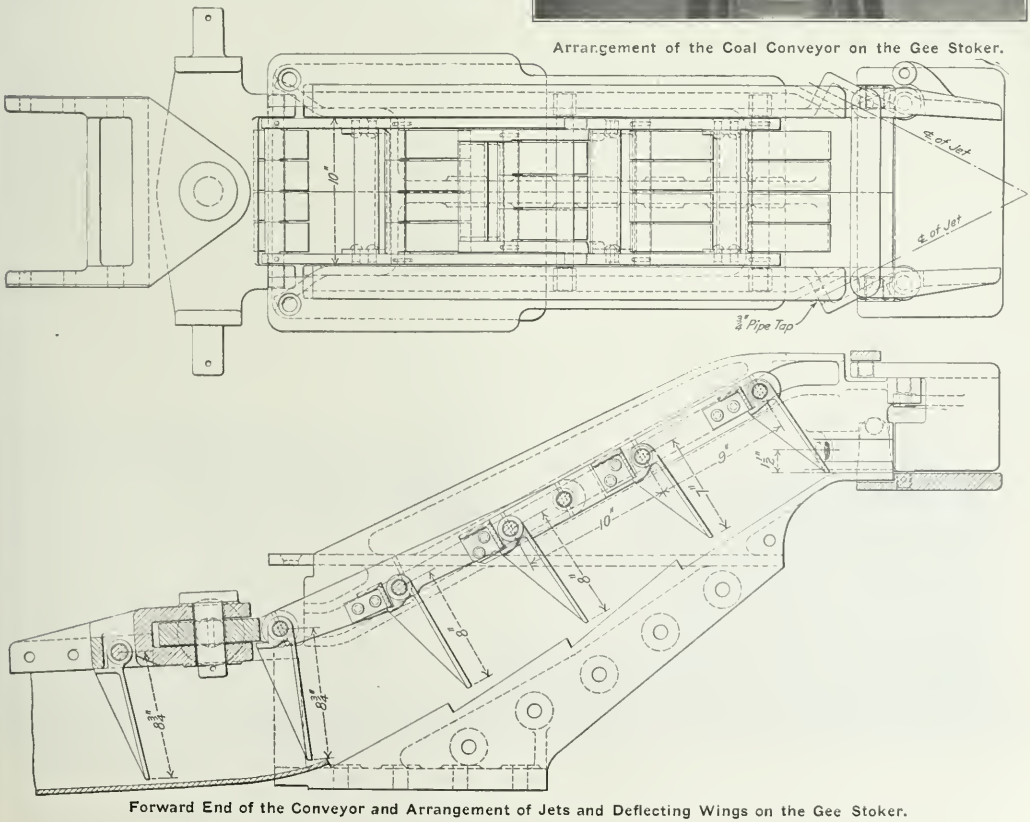
View of the Stoker Showing the Fireman's Control Lever.

tributer. The first three are of the same general style as those used on the Crawford stoker. The source of power is a cylinder 18 in. in diameter x 11½ in. stroke, secured to the locomotive frame below the cab, which transmits reciprocating motion through a jack shaft to the coal crusher and the conveyor. The crusher is located beneath the rear end of the coal pocket in the tender and the conveyor is in a trough below the tender floor and transfers the coal from the crusher to the distributer. It is horizontal to the end of the tender and is then inclined upward, terminating at an opening in the back head of the boiler just below the fire door. This opening is the lower part of an enlarged fire door opening of the ordinary construction. The conveyor is of the reciprocating type with swinging fingers and the trough of the inclined section is of cast steel, the bottom having notches or steps which prevent the coal sliding backward.

The coal distributer is simple in its arrangement and consists of a flat cast iron plate or apron extending inside the firebox, two vertical, cast iron wings, one on either side, which are hinged at the rear, and two stationary steam jets which discharge from a point just back of the wings, diagonally across the apron. The angle of discharge is such that the centers of the two jets meet at a point a few inches in front of the center of the plate. The two wings are connected by a cross bar, giving them simultaneous movement, and are operated by a connection to the fireman's control lever.

The steam jets are intermittent in their action, and are open only at the extreme forward end of the stroke of the conveyor. This is accomplished by means of a nozzle control valve which embodies two separate and independent piston valves, one regulating the amount of the steam discharge through either of the two jets, and the other the intermittent action of the blast. The latter is operated through a yoke connected to the conveyor driv-

Arrangement of the Coal Conveyor on the Gee Stoker.



Forward End of the Conveyor and Arrangement of Jets and Deflecting Wings on the Gee Stoker.

ing arm and consists of a differential piston held in a closed position by the steam pressure, except as it is opened by the yoke. The other valve is connected to the fireman's control lever and reduces or entirely closes the passage to one or the other of the nozzles as desired. When the control lever is in the center, the deflecting wings stand parallel to the sides of the conveyor and steam is admitted to both of the jets. In this position the coal is distributed evenly across the grate except in the back corners. When the control lever is pulled to its extreme backward position the deflecting wings are swung to the left and the left jet is shut off while the one on the right is wide open. In this position the coal is discharged to the left back corner of the firebox. When the control lever is thrown forward it supplies the right back corner. Intermediate positions between these extremes will place the coal at any desired location on the grate.

The stoker occupies but little room in the engine cab and in no way interferes with hand firing. The apron and the distributing wings are so arranged that they may be easily removed from the outside of the firebox and can be replaced with spare parts if necessary. These are the only parts of the apparatus that are exposed to the action of the fire. It is claimed that it is possible to fire any kind of coal with this device at any rate up to 18,000 lbs. an hour and that it readily operates with 40 lbs. steam pressure. The stoker has successfully fired a large locomotive for over fifty trips.

LARGE CAPACITY WRECKING CRANE.

Two wrecking cranes of greater capacity than any heretofore made have recently been built for the Norfolk & Western by the Industrial Works, Bay City, Mich. They were designed to meet the needs of the modern heavy equipment which has developed so rapidly during the past few years. It is only a short time since the 100-ton cranes were standard, and these were soon followed by the 120-ton cranes, which were then adequate for almost any class of work. These new cranes have a capacity of 150 tons at 17 ft. radius and almost any obstruction to traffic may be easily handled by them. They are also valuable in other work where heavy loads are to be handled, such as in modern construction work, bridge replacements, etc.

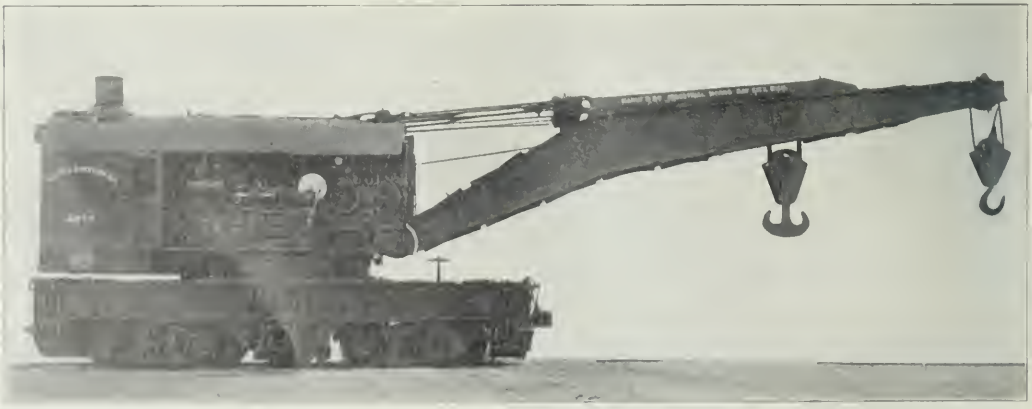
Each crane is provided with a system of telescope outriggers so that a load that would be too great a strain on the track may be distributed over a large area of the road bed. Where extreme loads are to be handled, or where the ground close to the track is not firm enough to give sufficient foundation, a special outrigger is used. This is 10 ft. long and is located in the center of the car body. It may be extended over to one side or the other about 7 ft. beyond the side of the car.

The framework of the car is 27 ft. long by 10 ft. wide, and is constructed entirely of steel and cast iron, with heavy end and longitudinal sills, all strongly reinforced and tied together. Two four wheel trucks with steel wheels are provided, with hubs of special weight to suit the large axles used. Complete air brakes, with engineer's valves, etc., are connected to each truck, and in addition a hand brake is connected to one truck. The draft rigging, attached to both ends of the car, is of extra heavy weight and the automatic couplers are of the standard type. The weight of the crane, in working condition, is about 143 tons, which weight is distributed over a wheel base of approximately 20 ft. All of the M. C. B. requirements are included in its construction. The load of the crane is distributed to the heavy cast steel bed plate through a system of rollers which operate on a path turned on the bed plate. The rollers are made of cast steel, and are arranged with equalizers to provide an equal bearing on the base plate. In addition to the equalizers a simple form of adjustment is provided for each roller.

A noteworthy feature in the operation of the crane is the air control for some of the movements. The main hoist, auxiliary hoist, boom hoist and slewing are all operated by means of air clutches controlled by valves, which gives an easy and quick means of control. The main and auxiliary hoist brakes are of the screw types and are operated by a hand wheel. They will hold the maximum loads in any position, or will lower them at a slow rate of speed. The operator's platform is so placed that the handles of the operating levers are readily accessible, and so that the operator may have a clear view of the work.

The boiler is of the vertical type, being designed for 150-lbs. pressure, supplying steam to two engines located on each side of the crane. All of the principal bearings are accessible for inspection. The crane will hoist its maximum load at the rate of 10 to 15 ft. per minute, and the boom may be raised or lowered while handling this maximum load. The operations of hoisting with either the main or auxiliary block, raising or lowering the boom and slewing may be performed independently and simultaneously with loads up to the capacity of the engines.

Electrification on the North Eastern Railway, England.—The North Eastern Railway has decided to electrify its mineral line between Shildon and Newport, near Middlesborough. This distance is 18 miles, and the total length of the track, including sidings, will be about 50 miles. A great amount of mineral traffic passes from Shildon to Newport, the average weight of the trains being more than 900 tons. It is said that ten electric freight locomotives are to be built by the company at Darlington; each of them will be capable of starting and hauling at a speed of 25 miles an hour a train weighing 1,400 tons.



150-Ton Wrecking Crane for the Norfolk & Western.

Maintenance of Way Section.

ONE point emphasized in several of the contest papers published in this issue is the advisability of preparing for the winter during the entire preceding season. In other words, the time to begin to prepare for next winter is when the frost leaves the ground this spring rather than to wait until next October or November when labor forces will have been reduced and many odds and ends will remain to be cleaned up.

THE standard practice regarding the construction of station platforms varies widely. The actual practice regarding the maintenance of these platforms varies even more widely. With his intimate knowledge of their relative importance from the standpoint of safety, the average supervisor of structures is inclined to slight the platforms in favor of the bridges or larger buildings. However, aside from the question of personal injuries and claims, defects in the station platform are much more evident to the average person and will give rise to much more complaint than those on a bridge or more complicated structure, which most people know nothing about. On the other hand, well kept buildings and platforms will compensate for many other faults in the eyes of the traveling public, and will be reflected in more general good will towards the company.

NINE papers were received in the contest on "Winter Maintenance Methods." These papers were submitted to E. S. Koller, assistant general manager, Chicago, Burlington & Quincy, H. G. Clark, assistant to the vice-president, Chicago, Rock Island & Pacific, and H. H. Decker, engineer of maintenance, Chicago & North Western. The paper by A. M. Clough, supervisor, New York Central & Hudson River, Batavia, N. Y., was awarded first prize, and that by S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore, Md., second prize. Other papers were submitted by F. M. Patterson, assistant engineer, Chicago, Burlington & Quincy, Chicago; F. W. Fuller, roadmaster, Northern Pacific, Dilworth, Minn.; L. C. Lawton, division engineer, Atchison, Topeka & Santa Fe, Newton, Kan.; J. H. Markley, master bridges and buildings, Toledo, Peoria & Western, Peoria, Ill.; A. S. Markley, master carpenter, Chicago & Eastern Illinois, Danville, Ill.; F. A. Kell, roadmaster, Missouri Pacific, St. Louis, Mo., and Joseph J. Morgan, New York Central & Hudson River, Kingston, N. Y., all of which are published in this issue.

NEARLY two years ago we conducted a contest entitled, "How the Roadmaster Can Promote Efficiency." Since then we have received several requests for a similar contest covering the bridge, building and water service departments. We have, therefore, selected as the subject of the next contest, "Efficient Methods in the Bridge, Building and Water Service Departments." On many roads these three departments are combined. Contributions describing the organization, distribution and management of the different regular and extra gangs, special methods or kinks in the construction or repair of any structures, and in fact, all ideas tending to promote efficiency in these departments, will be acceptable. In addition to the ordinary bridge structures, this contest will include the maintenance of water tanks, pumping plants, coal chutes and other yard buildings; station buildings and platforms, and any other structures ordinarily coming under the supervision of this department. The judges will give special consideration to statements and data regarding the actual results secured by the improvement described, so that all information of this nature should be included. We will pay $25 and $15 for the best and second best papers received, and will pay for all other contributions accepted and published at our space rates. All contributions should be sent to the Civil Engineering Editor, *Railway Age Gazette*, Transportation Bldg., Chicago, and must be received before April 25.

THE adaptability of steam for melting snow and ice around switches, track pans, turntables, etc., is brought out in a number of articles on various phases of winter maintenance in this issue. The clearing of tracks by melting the snow and ice is more satisfactory than by sweeping or picking them out, although direct radiation from steam pipes is only one of the methods in use for melting them. The local conditions must, of course, be the deciding factor in the choice of methods. The use of steam for this purpose is naturally particularly applicable at points where boilers are already in use in regular service, as at track pans, turntables or yard switches, located near pumping plants or terminal powerhouses. This method may also be used to advantage when old portable boilers are available. In many cases the boilers used for hoists or concrete mixing plants during the summer, are idle all winter and could as well be used for this purpose. The installation of steam pipes for keeping switches clean is not necessarily difficult or expensive for the installation can be of a temporary character, with the pipes taken out and stored during the summer. As it is usually customary to skeleton the track at switches during the winter to secure free drainage, the only cost chargeable to the installation of the steam pipes is the labor necessary to lay and connect them. As the pipe is laid with coils or bends between the ties, there is no difficulty with expansion and contraction, and condensation can easily be handled by inserting a drip cock at the low point in the line. Installations of steam pipes at track pans and turntables may well be of more permanent character, carefully located to secure the best results and provided with steam traps to care for the condensation. In addition to the uses mentioned above, steam can frequently be used to good advantage in ordinary maintenance work in keeping concrete aggregate ready for use and maintaining sufficient heat in new concrete until it can set. The suggestion in one of the articles in this issue that coal cars and cinder cars be equipped with steam pipes for facilitating the unloading of materials from these cars in cold weather, is also worthy of consideration.

THE amount of attention now being paid to screw spikes and other details of more permanent track construction emphasizes the temporary nature of our present standard construction. The distinction between temporary and permanent railway structures is, however, only relative. We commonly call a timber bridge with a life of eight or ten years a temporary structure as compared with one of steel or concrete. On the other hand, our so-called permanent track construction has a life even shorter than that of a timber bridge, for the average life of rail and untreated ties which are still largely in the majority may be safely assumed to be seven years. As the ballast will need replenishing at least this often, it may be said that the entire track structure must be replaced every seven or eight years.

The report of the Interstate Commerce Commission for the year ended June 30, 1911, gives the cost of maintenance of way and structures as $1,550 per mile of line, or $1,040 per mile of track, including all tracks. The amounts expended for main tracks exclusive of side tracks would probably therefore be about $1,350 to $1,400 per mile. While not all of this was expended on the track, this report indicates that at least three-fourths of it, or $1,000 per mile, was. This is an annual charge for maintenance in excess of 10 per cent. of the original cost of the average track structure above the sub-grade. Such construction, requiring such a high expenditure for maintenance, cannot be accurately termed permanent. Analysis of the expenditure for

maintenance of way and structures for the year ended June 30, 1910, which is the last year for which the complete statistics of the Interstate Commerce Commission are available, shows that 20.093 per cent. of the total operating expenses fell in this subdivision. With the exception of labor, the largest single item is that for ties, which is 3.099 per cent. of the total operating expense, or over one-sixth of the entire expenditure for maintenance of way and structures. This amount is three times that spent for rails and considerably greater than that spent for ballast, rail and all other track material combined.

It is evident, therefore, that one of the greatest fields for a study of possible economies lies in the tie, because of its great influence upon the total result. Screw spike construction is one result of this study; the steel tie is another. As with almost any new form of construction designed to decrease the annual charges, the first cost of installation is increased. This was so with the treated tie and is so with the screw spike. This, in itself is sometimes, although perhaps less frequently than formerly, the stumbling block in the way of the adoption of new types of construction. While our present track construction is the result of more than a half century of development, we are far behind European practice in our adoption of permanent construction notwithstanding the fact that the service demanded there is less severe than in this country. It would seem that the expenditures for the maintenance of our track are out of proportion to the maintenance of other structures and that, with the constantly increasing service demanded of the track, a more permanent construction is fast becoming necessary.

COMPANY VERSUS CONTRACT CONSTRUCTION WORK.

At this time, when the construction and betterment work to be done this year has been largely decided on and plans are being prepared for its prosecution, it is well to consider the relative advantages of doing this work by contract or by company forces. This subject has been the theme of controversy for years, and there is much to be said on both sides. While the decision as to each piece of work should depend largely on local conditions, including the nature of what is to be done and the experience and character of the organization of the particular road, most of it is handled in accordance with some well defined policy of the individual railway.

The subject at once divides itself into two quite different problems—the construction of new lines, and the betterment of existing lines. The practice on most roads in new construction varies only in respect of the extent to which the work is done by contract. Some roads contract all parts of new construction from the clearing of the right of way to track laying and ballasting, and take over the line when it is ready to operate. But this is not the general practice. While the grading is usually contracted, most roads lay their own track and ballast it. Most roads also erect their own steel bridges, while many also do all their own concrete work, as the Chicago, Milwaukee & St Paul is doing on a portion of its new line between Great Falls, Mont., and Lewistown, where about 400 men are now employed. The advantages of contract work are greatest on new extensions, in the building of which a large amount of equipment is required. The contractor is frequently justified in securing more elaborate equipment and developing a more complete organization than an individual railway, because he can count on being able to use them on different railways year after year.

With maintenance and betterment work, however, the conditions are different, and with the rapidly increasing ratio which the expenditures for this work bear to the total expenditures for improvements and construction, the tendency of the roads to do more and more of these classes of work with their own forces is becoming increasingly important. A number of large roads maintain strong organizations to do practically everything of this nature, others are securing new equipment and doing an increasing amount each year, and practically all have sufficient facilities to load ballast and do many small pieces of work which it is not practicable to contract for. The Burlington has long followed the policy of doing its own betterment work and now operates about 15 steam shovels and two large suction dredges on the lines east of the Missouri river alone, while additional steam shovels and another dredge are now being built. While perhaps few other roads have gone so far in this direction, several operate 8 or 10 steam shovels each in ballast pits and on the smaller improvement work. The Atchison, Topeka & Santa Fe requires 20 steam shovels with the necessary auxiliary equipment for this miscellaneous work alone, without attempting to do any of the heavier work. One large road has just placed an order for five steam shovels for this spring's delivery.

Two conditions not present in the construction of new lines greatly favor the handling of betterment work by company forces. One of these is the very frequent necessity of interfering to a certain extent with the operation of trains and of maintaining structures in safe condition for their passage. The other is the practical continuity of betterments from year to year. The first is the most important consideration. When improvements are being made alongside existing tracks a certain amount of interference with the main tracks and with the operation of trains may be necessary. To insure the protection of trains it then becomes requisite for the railway to have someone in charge who is thoroughly familiar with train movements and whom the company can hold directly responsible. If the work is done by contract this requires the placing of a company representative on the ground whose authority must be supreme whenever train movements are concerned, frequently leading to more or less friction with the contractor. Where more or less delay because of traffic is to be expected, the contractors are likely to base their bids on the maximum delay which may be expected, while company forces can take the delays as they come, light traffic tending to reduce the cost of the work.

With bridge work under the main tracks absolute safety of the structures at all times is essential, and several roads that are willing to contract grading along the main tracks do all of their own bridge work. The Chicago, Milwaukee & St. Paul has at the present time 2,300 men employed on work of this nature on the lines east of the Missouri river, while the Burlington has 21 concrete gangs on one division alone. Both of these roads do all bridge work along existing lines, and much on extensions, with company forces. A number of other large railways do likewise, while others, such as the Illinois Central and Lake Shore, do a large and increasing proportion of this work in the same way.

The practical continuity of betterment work from year to year, has enabled the railways to build up organizations for it. In past years the first cost of construction equipment has often prevented the adoption of a policy of handling betterments with company forces, but this obstacle is rapidly being overcome as the advantages of this practice are more generally realized, and several roads are this spring buying more of the kind of equipment mentioned than ever before. The demands upon the railways for additional facilities require a large amount of work to be done each year, and because of this pressure improvements are not subject to the variations that the building of extensions is. With construction equipment directly under its control, a railway company can adapt its program for the year more closely to the traffic conditions than would be possible with a number of individual contracts.

Besides enabling a railway to arrange a more flexible program for its season's work, the possession of this equipment is an advantage in emergencies, such as slides and washouts, the value of which it is impossible to estimate, but which nevertheless exists. Much of it is also available for other service when not required for construction. A number of roads use their construction cars for carrying coal and other revenue traffic when out of construction service, while the steam shovels are frequently used to load storage coal, etc.

Letters to the Editor.

HAND SIGNALS FOR ENGINEERS.

Wilkesbarre, Pa., February 22, 1913.

To the Editor of the Railway Age Gazette:

I have noted the hand number signals for engineers, printed on page 351 of the *Railway Age Gazette* of February 21 and while these signals are very good, it would seem to me that there might be opportunity for several of them to be mistaken or confused when read from some distance. I give herewith a code of signals used for the same purpose by some of the engineering corps in the construction department of the Pennsylvania on

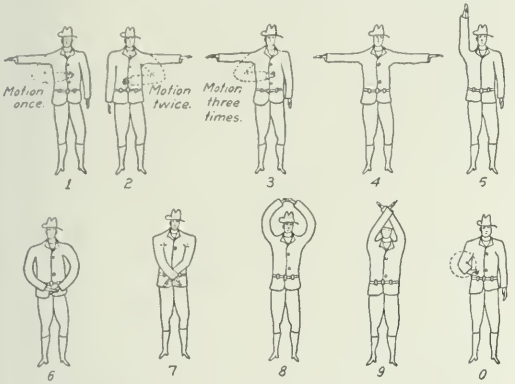


Fig. 1—Hand Number Signals Used on the Pennsylvania.

the lines east of Pittsburgh and Erie, which I think give less liability for error.

W. W. Portser,
Assistant Supervisor, Pennsylvania R. R.

[Another system of signals which has been used on some of the western roads with good results and with little confusion is to a certain extent a combination of the two systems. As shown

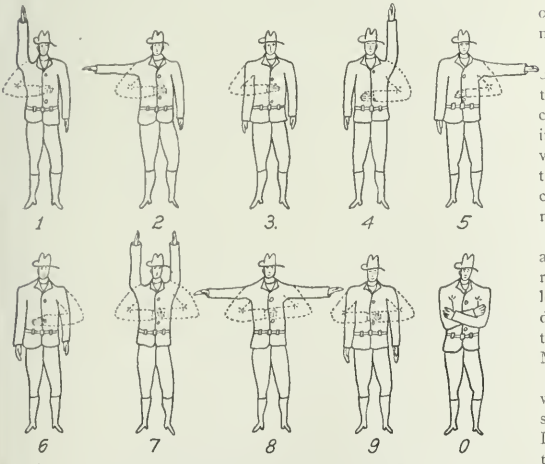

Fig. 2—Hand Signals Used on One of the Western Roads.

in Fig. 2, the right arm in the vertical, horizontal and lowered positions, indicates the first three numerals; the left arm in the same positions the next three, and both arms the following three, while the arms crossed indicate the zero.—Editor.]

STAKING TRACK CONNECTIONS ON ACTUAL CENTER LINES.

Chicago, February 25, 1913.

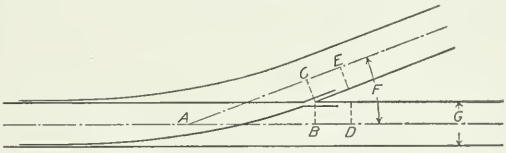
To the Editor of the Railway Age Gazette:

In the issue of January 24, 1913, there appeared an article by W. H. Wilms, entitled "Notes on Staking Out Track Connections," which was very interesting.

Early track experience convinced me that none of the then published field books, or books on track, contained either practical or correct formulas for the location of track connections. As a result I worked out independent solutions for track problems, in which the same offset method was employed which was advocated by Mr. Wilms.

There is no doubt about the correctness of the results obtained by this method, or the method outlined by J. L. Taylor, in your issue of February 21, under the title of, "A Short Method for Locating Frog Points." However, my work and the opinion of other experienced track men seem to justify the statement that the simplest and most expeditious method of solving track problems, either for office or field work, is generally to use the actual center lines and the heel of the frog, rather than an offset line and a curve produced, as in the articles mentioned above.

About 13 or 14 years ago, the importance of the basic principle shown in the following sketch was impressed upon me as being the key to the simplest practical and, at the same time, theoretically correct track work.



Method of Staking Out a Frog.

NG=AB=AC and NG+K=AD=AE in which N=frog number; G=gage of track; and K=distance from the point of the heel of the frog.

Starting with the above, demonstrations may be built up, for graphic or numerical solution, for the single problem of Mr. Taylor and for all of those given by Mr. Wilms, that are quite as simple, that require the solution of the same or a less number of triangles and that have the further advantage of requiring no superfluous offsets or curves produced.

The track man has the selection of the frog and, in a majority of the cases, the degree of the curve that shall be tangent to the heel of the frog. As Mr. Wilms states, the most practical curve to use is generally one of the same degree as the curve in the switch lead. A table giving the location of the frog for various angles between the principle and diverging track, so that the frog shall be tangent to a curve of the same degree as the curve in the switch lead, will be of practical value to the track man.

If the frog location, taken from such a table, did not fall at a joint, and space permitted moving the frog to avoid cutting rail, the frog may be placed at once at the joint near the table location that will give a curve back of the frog of slightly less degree. The proposition then is a curve problem with a fixed tangent distance and central angle, and is outside the pale of Mr. Taylor's tables.

There can be no doubt that many expensive mistakes in track work are due to improperly set stakes or to insufficient understanding between the engineer and track foreman, or to both. In switch work, I have always preferred to set two stakes on the center line, one a foot ahead of the point of the switch rail, and one a foot ahead of the actual frog point. Or, in very exact work, three stakes, one a foot ahead of the point of the switch rail, and one each at the toe and heel of the frog. In such positions, the stakes stand between ties.

S. S. Roberts,
Division Engineer of Construction, Illinois Central.

WINTER MAINTENANCE METHODS CONTEST.

Nine Papers Discussing Means of Meeting Problems Incident to This Season and of Preparing for Them in Advance.

FIRST PRIZE—HANDLING MAINTENANCE WORK IN WINTER.

By A. M. Clough,
Supervisor of Track, New York Central & Hudson River, Batavia, N. Y.

"Prevention is better than cure!" Many things can be guarded against in good weather to simplify and make easier the handling of tracks, switches and traffic when extreme cold weather prevails.

In the open country, where permanent snow fence cannot be maintained, properly constructed portable snow fences should be placed at the proper distance from the tops of cuts that are known to give trouble. These fences, of course, are placed on the land adjacent to the right of way, for which privilege a small rental has to be paid. Where the width of the Right of Way will permit, stationary snow fence should be built. In some cases planting trees along the top of cuts has been found efficient. Trees, however, suffer from fires in summer and have been known to be broken down and smothered with snow and ice in winter.

Rails of the proper section should be laid on their side in the flange way of all farm and highway crossings to keep the planks from being thrown out by the flanges of wheels. A little salt spread in those flange ways each day will keep them in excellent condition until the crossing can be shoveled off. The ballast should be removed from between the ties to a depth of four or five inches at all frogs, guard rails and switches, and in every case a system of drainage with a catch-basin having a grate covering at each switch in yards and a perfect system of surface drainge from all frogs and guard rails leading to them should be installed. In the open country this should also be done, the surface drainage leading to the side ditches. Salt should be used very sparingly at switches or frogs where the ground heaves as it tends to prevent heaving and when track heaves on both sides of a switch or frog at which salt has been used, high shimming is necessary, which is a very undesirable feature of winter track work. Where high shimming is necessary all shims ¾ in. and up to 1¼ in. thick should be at least 12 in. long and have holes bored for the spikes. Over this height they should be 18 in. long and 8 in. wide and in addition to the holes for the spikes, they should be secured to the ties by ten-penny nails and 8-in. track spikes should be used. Every foot of track that is known to heave at all should be carefully marked in winter and as soon as the weather will permit it should be thoroughly drained and no shimming will be necessary the following winter. The best way to keep main line tracks open in winter is to never let them get closed and this can only be accomplished by having the very best organization and equipment ready at all times, and as men are more plentiful in winter than in summer a substantial force of men should be kept working all the time, ditching, handling cinders, ties, coal, etc., to be ready for emergencies. A thorough canvass should be made of a division and a list of all men available made up and kept at division headquarters. Arrangements should be made with restaurants or commissary stores for a quick and efficient way to feed large gangs of extra men. Suitable cars for handling them should always be in readiness. Plenty of snow shovels, picks and brooms should be kept on hand ready for use and in giving them out each man should be given a check number and made to understand that he must take care of his shovel and return it before receiving his pay.

Snow fighting equipment should be of the very best and kept at suitable places and in first-class working condition at all times. When a storm is imminent, engines and crews should be ordered immediately, and the flangers started over the most troublesome territory first. As the storm develops in severity or the snow gets deeper snow plows should be ordered out with one or two engines as the necessity arises, then as a last resort the rotaries may have to be called into service, particularly if the wind becomes high and cuts commence to fill up.

Section foremen, trainmasters and engineers should keep the roadmaster and despatchers advised of local conditions. The roadmaster should stay at his headquarters and not ride around on snow plows, etc., and should be in constant touch with the despatchers; direct the movement of his men and equipment; and augment or reduce his snow-fighting forces as the circumstances require.

By keeping the snow-fighting equipment constantly running and having enough of it, by having fresh crews and engines always ready to take the place of men tired out and engines frozen up, it is seldom that tracks will get blocked. If, however, a train gets stuck in the snow, instant measures should be taken to release it. A train with a good force of men and with a snow plow ahead should be immediately despatched to release the stalled train. The plow should be run as close up to it as possible and the men unloaded, the plow taken back and placed on the nearest siding, the engine returning to the train in the snow and the men having shoveled up to and alongside and under the cars. The cars should be uncoupled in groups small enough to be handled and pulled back. The tracks can then be cleaned and the proceeding repeated until the whole train is released. It is never wise to handle too many cars at once as draw heads will be pulled out or wheels derailed, that will greatly delay the work.

On two, three or four track lines after continued heavy snow storms, when the flangers and plows have been run frequently and the space between the tracks gets filled up, a special snow wing made to be put on a roadbed spreader should be used to remove all snow from the tracks, level with the top of the rail. In using this machine careful flagging is necessary and the assistance of the despatcher is very essential, as two tracks are always occupied while at work, but the saving in manual labor and the efficiency of the work accomplished are well worth all the extra efforts put into it.

Track water pans are perhaps the most expensive and troublesome adjunct to a trunk line of railroad in winter and make necessary heroic efforts to keep the track open and smooth in severe weather. At least one-half of the water in the pan is spilled over onto the track every time an engine scoops up the other half, and no other means has yet been devised to remove the ice from between the rails and alongside the pans but the pick and shovel when preparing the track for shimming. After removing the heaviest part of the ice, a steam hose connected to the pipes which convey the steam to warm the water in the pans, helps wonderfully to clean off the ties and make shimming the track easy. A roadbed spreader used to remove the loose ice from the adjacent tracks or from the shoulder outside the tracks can do the work of 100 men in 30 min.

Melting snow and ice from switches, which is gradually gaining favor, can only be utilized fully by having perfect drainage as before described. While yet in its experimental stage this method is found to work best in daytime, the glare of the strong light having the effect of blinding men working around it at night and has been the cause of accidents.

In yards a snow train with a large force of men should be kept constantly employed when snowfalls are frequent or continuous. After a heavy storm, all snow should be drawn away to make room for more.

SECOND PRIZE—HANDLING MAINTENANCE OF WAY WORK IN WINTER WEATHER.

By S. C. Tanner,
Master Carpenter, Baltimore & Ohio, Baltimore, Md.

The maintenance of water stations in winter is very important, as we cannot operate a railroad without them, and if they are

frozen up they are of no use. It is only where water tanks are much exposed and in severe weather that the water in the tanks will freeze. Some years ago, however, we had a case at Oakland, which is located in the mountains, where the tank became frozen to such an extent that we had a shortage of water. With a few hours work of two men we turned the exhaust pipe from the pump down into the tank of ice and water, and in a very short time the ice was all melted and we had no further trouble. We also ran a coil of pipe into the penstock pits and used the exhaust steam to keep them thawed out. This can be done at a small expense at any place where the pump house is not too far from the tank. This plan always proves efficient and is about the only way to prevent track water pans from freezing. On account of the length of such pans live steam is required.

Our new water tanks are made frost proof, and where tank spouts are used, the outlet spouts are placed at an angle of about 45 deg. leading from the tank valve so that water will not remain in the outlet spout long enough to freeze. Our new pen-stocks are of the anti-freezing type placed in frost-proof pits. Where snow and ice accumulates on tracks adjacent to penstocks and tanks, the best method of taking care of it is by running steam lines from the pump house if not too far away. In case the pits are over 500 ft. from the pump house, salt freely sprinkled on the ice will remove it.

Success has been had in keeping snow and ice from yard switches where steam is available by placing steam pipes between switch ties below the ballast, the steam being turned on as needed, but the most convenient and effective method is the use of the snow melting device now on the market. Salt sprinkled on switches is also very effective.

To keep the line open for traffic it is best to prevent snow from drifting onto the tracks if possible. This is easily accomplished by setting up portable snow fences where snow is liable to drift. These are made of 1 in. by 6 in. chestnut, 16 ft. panels, 6 boards high and set up like a sawbuck, joining the panels together at the ends and making the fence as long as required. These fences should be placed 50 ft. from the track on the side the snow drifts form, and as many strings of fences 50 ft. apart as the local conditions may require. When tracks become covered, snow plows and flangers are about the only means we have of keeping the tracks open and these should be run over the tracks as often as the conditions require.

Concrete for bridges or other construction should not be placed in freezing weather, but when it is necessary to do so the aggregate and water should be warmed and after the concrete is in place, small camp fires built around it will prevent freezing until it sets, or if this cannot be done the concrete should be covered with building paper and that covered with warm sand or cinders.

Other bridge work can be handled in winter as well as summer, but to protect men from slipping when the structure is covered with ice, we sprinkle cinders or sand where the men are to walk to make it safe for them. Much trouble is also experienced with some of our safety crossing gates freezing up in the winter months. Proper drainage is about the only help for gates which are not of the anti-freezing type. Gates which are directly pipe connected, with the pipe placed in a larger one and run through stuffing boxes or the pneumatic type do not freeze.

Track scales are also troublesome in freezing weather, and where steam plants are available we place pipe coils in the pits and use steam to keep them thawed out. Where steam plants are not located near enough for this use, the scales are quickly thawed out with steam from yard engines used through a steam hose and applied directly to the ice.

One of the most important parts of winter work is the maintaining of water lines and water barrels for fire protection. We locate all water lines as much as possible where the frost will not reach them. This is best done by placing them in the ground below the frost line. Where risers come up into buildings, when conditions will permit, a frost-proof valve is placed at the intersection of the main line and riser, which is operated with a long stem key reaching below the frost line, the valve being properly drained. Where this cannot be done, the pipes must be well covered with frost-proof covering, and when the weather is severe and there is danger of freezing, a ⅜-in. tap made in the extreme end of the fire line and left open will cause a light movement of the water and prevent freezing.

In water barrels used for fire protection on bridges and buildings we use ½ bushel of rock salt well dissolved in each barrel of water. We also place in each barrel a box 10 in. by 10 in. x 6 in. made of cheap rough lumber, with a stick 2 in. x 2 in. for a handle placed in one corner of the box long enough to reach the top of the barrel when the box is at the bottom. The stick will prevent the barrel from bursting if the water should freeze, and at the same time provides a dipper to be used in case of fire. These dippers are of no value for any other purpose and are therefore never disturbed or removed from the fire barrels by outside parties, whereas, if fire buckets were used they would not remain in place over night. The rough box with the long handle costs less than half as much as a regular fire bucket.

THE UTILITY OF THE WINTER FORCE.

By F. W. Patterson,
Assistant Engineer, Chicago, Burlington & Quincy, Chicago, Ill.

Perhaps the best advice as to handling any but the absolutely necessary maintenance or construction work in winter is that of Punch to the young couple about to be married—"Don't." All work done during the summer season should be performed keeping in mind that period of the year when forces are reduced and weather conditions are such that the efficiency of the men is lowered.

Aside from the removal of snow and ice, perhaps the greatest amount of work to be done during freezing weather is shimming, necessitated either by low joints or by heaving. The underlying cause of both of these conditions is poor drainage and should be removed during the summer months by the use of tile. Perhaps there is no expenditure that will yield so large a return on the investment as the intelligent use of tile drainage, and while it is extensively used there are still many places where it could be employed profitably, especially on branches of light traffic, where the winter forces resemble a Central American army on a peace footing—all officers and no privates. Shimming in itself is expensive work besides containing elements of danger, increasing the liability to spreading track and broken rails.

An important item of "winter work" during the summer is the care of portable snow fences. As soon as the necessity for their use is over they should be piled carefully at some convenient place on the right of way and protected from fire by keeping all grass and rubbish cleaned away from them.

As winter approaches the ballast should be dug away from under all switch points and spring frogs nearly to the bottom of the ties so that snow and ice may be easily removed before they interfere with the moving parts of the turnout. Yard and sidetracks should be thoroughly "cleaned up" not only as a matter of safety, but also to facilitate the removal of snow.

The question of the size of the gangs for the winter is one requiring close study and is one that is particularly vexatious in that large portion of the country between the Allegheny and the Rocky mountains, and the Ohio river and the latitude of Chicago. Over this area the winters are sometimes mild enough to allow and even demand surfacing and lining almost all of the time while others are so severe that it is impossible to do such work from the first of November until March, and the winter force must confine its activities in track work to shimming and spike lining.

With such diverse conditions to be looked for it is clearly difficult to provide a fixed limit for the size of the gangs and the roadmaster and section foreman should be allowed some discretion in increasing their forces to meet emergencies, care being taken that this latitude be safeguarded against abuse. There are, perhaps, few easier ways to waste money than by maintaining section forces when weather conditions render efficient work impos-

sible, but on the other hand there is no season in the year when the proverbial "stitch in time" will save more needlework in the future.

Increasing forces for the beginning of spring work affords as good an opportunity for saving or wasting money as does the size of the winter force. While it is most desirable to begin work at an early date, there is such a thing as getting too early a start and paying out money for work that is not done, or if done, is of no real benefit. Branches of light traffic, having either "mud track" or only a light application of ballast offer chances for real economy by taking care that forces are not increased until good work can be done. This was impressed on the writer's mind most vividly some years ago on a branch line where the usual winter section force comprised the foreman only, and where it had been customary to increase to the spring rating on March 15. In the year in question the early part of March was very wet and it would have been impossible to do efficient work, even if the gangs had been put on. Accordingly, each foreman was seen and told that while authority had been given the roadmaster to put on additional men on March 15, none would be put on until weather conditions would permit satisfactory work to be done, except in emergency cases when the foreman would be allowed to hire men temporarily, making prompt report to the roadmaster in each case. A few demurred, but after a little argument all agreed that it was a wise policy. The wet weather continued and it was almost the first of April before orders were given to put on the men. Just as the order had gone out the roadmaster of an intersecting branch line of another road was met who had a tale of woe to unfold concerning such fine weather with no men for the sections. As it was known that this road had increased its forces on the fifteenth the roadmaster was asked what had become of his men. "Oh," he replied, "we've exhausted our appropriation for this month and have to lay them off until the first of next month, and you ought to see the shape our mud track is in with the messing around they've done on it the past ten days."

The practice of doing as much winter work as possible in the summer, and of postponing spring work until spring will save money, frosted fingers and bad temper, all matters in which economy is highly commendable.

CONCRETING IN COLD WEATHER.

By A. S. Markley,

Master Carpenter, Chicago & Eastern Illinois, Danville, Ill.

In carrying on concrete work in cold weather where the work is exposed to the elements, numerous precautions must be taken. The placing of heavy tarpaulins or tents over the forms, securing them to the ground or to the floor to exclude cold air, is one means of protection. Inside the tarpaulins, which should be large enough to allow some circulation outside the forms, steam pipes from ¾ to 1½ in. in diameter should be placed with sufficient radiation to heat the interior. An ordinary vertical boiler of sufficient capacity to supply steam for heating both the enclosure and the water used in the concrete is necessary.

Water is best held in barrels in which live steam is run to maintain the proper temperature. Steam can also be utilized for heating the stone, sand, or gravel by piling these materials over pipes properly trapped at the outlet through which live steam passes. Another way of heating the materials is to secure a cylinder 12 in. to 18 in. in diameter made of No. 8 iron 12 ft. to 20 ft. long and open at both ends, in which a wood fire is kindled. Material piled over this will be heated and the frost excluded. With this arrangement, however, a night man is necessary to maintain the fires and to have material ready for the workmen on their arrival in the morning.

Where the concrete is submerged in water, forms should be properly built and allowed to fill with water. The concrete can then be deposited under water through an 8-in. tube made of galvanized iron with a hopper at the top sufficiently large to receive the mixture from wheelbarrows. The lower end should be kept sealed on the bottom and as fast as the pipe is filled with concrete it should be raised sufficiently to allow the material to escape at the bottom. A very uniform concrete can be made in this way, as where there is no fluctuation of the temperature the concrete sets uniformly. In addition, as it is submerged, all voids are filled in without the necessity of tamping or spading.

WINTER MAINTENANCE OF WATER STATIONS.

By J. H. Markley,

Master Bridges and Buildings, Toledo, Peoria & Western, Peoria, Ill.

Last winter was a very severe one on the water service branch of the maintenance of way department in this locality, and I am proud to say that not one locomotive pulled up to a tank on this road, but what secured water without delay, except in one case and this was at an isolated tank very seldom used, and which is fed by a spring. When the winter set in, as it did, very severe, I notified all pumpers to be on the alert, and when conditions were such that they could not properly handle them to let me know and I would send relief. Every man realized the situation and exercised an added interest in his charge, and every one of them mastered the work in hand successfully. Their highest aim was that no failure should take place and this interest brought them success.

Experience has taught us some priceless lessons on the care of water tanks during severely cold weather. The practice used to be to wait until it became very cold and then start out with a car load of sawdust and rough lumber to box up the goosenecks and the discharge pipes of the tanks, and fill the boxes with sawdust. This did some good, but it was not a perfect success.

We use no sawdust now and where we have no return pipes from the tanks which must stand full of water, we use no protection whatever. The discharge pipe runs up through the center of the tank to a point above the water line, when the tank is full, and is drained as soon as the pump is shut down. We drain these pipes whether they are boxed in or not.

When tanks are connected to stand pipes or any return pipes that must stand full of water, we box up around the four center posts, by first setting up 2 in. by 4 in. studding, faced with the out side of the post. On the out side of these timbers is laid a very heavy tar paper, then drop-siding. The paper keeps the wind from coming in contact with the pipe. On the inside of the studding is a lining of No. 2 flooring. This forms the first and important dead-air space. After the return pipes are installed they are boxed in also. This makes three dead-air spaces, and so far has proved a success. The door to this inclosure is made similar to those on refrigerator cars, including its fastening.

At two points on our line where we got our water supply from ponds or creeks, we have trouble during extreme and continuous cold weather with ice forming on the bottom and around the inside of the staves. At one of these points where we have a gasoline pump we installed a small 24 in. by 60 in. steam boiler in the pump house and laid a ½-in. pipe from the boiler into the tank to thaw the ice with steam. In the spring the pipe is taken down and stored in the pump house. At another point where we have a steam pump, we laid a ¾-in. pipe alongside the discharge pipe, extending about 2 ft. above the ground under the tank. When necessary a pipe can be connected to it and used with the same result as explained in the former case.

Another very important feature in connection with tanks during cold weather is the outlet valve. We are using the stopper valve, which I think is the very best. It sets up 12 in. from the bottom of the tank and the seats are made of the best grade of harness leather. These valves have always proved reliable in the extreme cold weather.

SOME METHODS OF HANDLING SNOW AND ICE.

By F. W. Fuller,

Roadmaster, Northern Pacific, Dilworth, Minn.

We plan for and usually get six months of winter up here, and the snow when not falling is being blown around. We begin to prepare for this in September by seeing that all grass on the right of way is burned and all weeds mowed. The next thing is to place the portable snow fence so as to protect all small cuts,

and see that all large cuts are protected in like manner or by a six foot permanent fence, built from 100 to 300 ft. from the track. All switches and sidings are protected in like manner.

Keeping switches in service is no small matter in so cold a climate, as we find the use of salt in zero weather does more harm than good. It starts the snow to melting, which then freezes hard. Cleaning switches by digging the dirt all out down to the bottom of the tie in the fall gives some room for loose snow. Then we leave at each switch a broom, an old No. 2 shovel and a chisel made from an old file, which is sharpened at one end and fitted to an old ferrule from scuffle hoe or fork, so that it will slip onto the broom handle. This can be used to clean ice from the switch point, and will save many calls on the section forces at night as the train crew can clean a switch so as to get through safely.

In cleaning around stations we find the use of a team and a snow scraper such as is used to haul the snow off the ice by ice cutting gangs, a very convenient and cheap tool, taking the place of fully a dozen men with snow shovels. We also use the Jordan spreader in cleaning up the passing tracks and yards, using it on snow in the same manner it is used on ballast. Of course, we keep the necessary wedge, Russel and rotary plows in good shape and in use when necessary. All engines are equipped with air flangers, forward of the pony trucks, operated by the engineer as needed.

WINTER TRACK WORK.

By L. C. Lawton,

Division Engineer, Atchison, Topeka & Santa Fe, Newton, Kan.

We have found that much of the track work usually done in winter can be done to much better advantage in the fall, both as to cost and standard of track. This is especially true on the many western branch lines with little or no ballast, but will apply to main lines as well. Last winter we had a record amount of snow, with heavy winds which filled cuts time and again. Our cuts were 20 or 22 ft. wide, but snow was so packed in the space between slope and track that melting snow could not be drained, and as a result during several thaws, the track was flooded. To avoid this, the cuts were re-tied early last summer so that the roadbed would be as compact as possible by winter. In several places holes caused by sinking of ballast, which held water under the track, were sub-drained. A thorough campaign was then made over the division and a spirited contest aroused between roadmasters as to who would have the best drained cuts. Cuts were widened to full section, either with team or train, and ditches made as low as possible, always making the inside slope of the ditch start from the ends of ties. The grade of the ditch was also increased as much as possible.

Another protection to those cuts which gave the most trouble last year was an increase in snow fences, built in a more scientific method. Those built within 50 ft. of the track were made tight and close to the ground, and placed to best advantage on waste banks to get the largest possible drift of snow behind them. In a few places two lines of fence were built where cuts were deepest. This has reduced our snow bucking to a minimum, and the snow left in the cuts has drained freely with no injury to the tracks so far this year. This is partly brought about by section men cutting a trench through drifts a foot or so outside the ends of ties. Unless we have an unusually wet spring, we are quitting the winter at least two months ahead of our usual schedule in track work. The great saving, however, comes in having safe track for operation of our trains. We have added to the efficiency of our trains and rolling stock by doing away with slow orders and added not a little to the safety of all employees.

WINTER CONDITIONS AND THEIR REMEDIES.

By Jos. J. Morgan,

New York Central & Hudson River, Kingston, N. Y.

Probably no more serious conditions are encountered as the result of blizzards, than those existing in large yards at terminals, etc. In order to clear certain main tracks of snow it is often necessary to block other less important tracks in the yard, which in turn have to be cleared. Why not take care of this snow in the first place? After the main tracks have been cleared with snow plow, a gang of men can follow up the plow, loading the snow on cars and dumping it at some safe point. The advantages of this method are numerous. Warm days frequently occur during the winter when the snow which is piled between tracks (an unsafe practice in itself), melts, the water running around the switches and freezing during the night, resulting in much annoyance, delay and the expense for its removal.

It is a well-known fact that rail breakages are numerous during the winter season, especially after sudden cold periods. Everything is being done to minimize these breakages; but, it seems at present that rails will break under these conditions notwithstanding the closest study. Therefore additional attention should be expended in looking out for such breaks by placing extra trackwalkers on each section, so as to admit of more frequent and careful examination of all rails in main tracks, thus insuring "safety," the watchword of the present day.

The changing of seasons seems to be occasionally overlooked by the foremen, in that they allow their stock of winter necessities to remain very low, if not entirely exhausted, until the time arrives when such items are actually needed for use. In order to insure the prompt handling of the difficulties which subsequently arise as a result of cold weather, it would be well for supervisors to issue a "reminder" to their foremen some time prior to December 21, calling their attention to the necessity of having an adequate supply of snow shovels, snow brooms, track shims, etc., on hand, so as to be prepared for such conditions.

The winter season can be handled just as expeditiously and profitably as any other season if there exists: First—An absolute preparedness to cope with the conditions incident thereto. Second—An unflinching carefulness on the part of all concerned. Third—A considerable amount of special attention given to rails and fastenings in main tracks, which are liable to be affected by winter conditions.

WINTER TRACK WORK.

By F. A. Kell,

Roadmaster, Missouri Pacific, St. Louis, Mo.

To make the handling of maintenance work economical during the winter, the track must be so handled during the summer months that at the beginning of the winter it will be in as near a perfect condition as possible. All ties actually needing renewing during the year should be renewed before winter. All tracks should be surfaced and lined and the ballast properly dressed. All ditches should be cleaned out to the standard width and uniform depth so that the water will quickly drain from the roadbed.

The old leaves, grass and other rubbish should be cleaned from the ends of all culverts, sluice drains or sewer pipes so they will not become clogged up and cause an undue amount of rain or snow water to stand in pools and soften the roadbed. After a heavy fall of snow, or especially when snow commences to thaw, where practicable, a ditch one or two shovels widths wide should be cut through the snow in the ditches so that the water from the snow melting will run off and not stand in the ditch or the roadbed. A few dollars spent in this way at the proper time may keep a soft spot from forming in the roadbed which would cost a great deal more to remove, to say nothing of slow orders that might be required to properly protect trains over this soft spot, and possible wrecks. Good drainage is the chief factor in economical maintenance of track. A good, live, energetic foreman will not neglect the drainage of his track at any time of the year, especially in winter weather.

After the track has been put in first-class condition by well organized gangs during the summer, the forces should be reduced as much as practicable, taking into consideration importance of track, amount and kind of traffic, and climate. All track and frog bolts should be inspected once a month throughout the year and the loose bolts tightened. This is far more important work than some seem to think and requires the special attention of the

section foreman to see that this is properly done and especially in the winter when it is freezing and thawing and joint ties have a tendency to churn if the ballast is not properly taken care of. A foreman that takes the proper interest in his work can tell at a glance if the bolt is loose or not, and if not loose it should not be touched, for if he tries to make it tighter he will probably strain or break the bolt, causing unnecessary labor and waste of material.

If track bolts are allowed to become loose and remain so, it will not be long until the angle bar and both ends of the rail where angle bars and rails come in contact with each other will begin to wear, and in order to make a good joint new angle bars and all new bolts will be required. This means a heavy expense, also damage to roadbed and additional cost for raising low joints and surfacing track, when a small per cent. of the total amount spent at the right time for keeping all bolts tight would save angle bars, rail, ballast, and labor. In yards and terminals, the tightening track and frog bolts should not, under any circumstances, be neglected.

During the winter as in all other seasons, yard and terminal tracks should be kept clean of all dirt and trash. In busy terminals, especially in the freight yards and lead tracks, there is a great amount of dirt and rubbish which falls from cars during switching. This is more economically cleaned up by regular yard cleaners who are assigned a certain territory with suitable shovel and wheelbarrow. If possible, in large yards there should be short spur tracks built at several points in the yards if there is no other track that could be used for this purpose on which to keep dump coal cars so that yard cleaners can wheel cleanings to these cars and load them. By doing this, unsightly piles of dirt in the yard are avoided and tracks are always kept clean without the extra expense for work train in loading this dirt.

The accumulation of dirt in large terminals stops up drains and water ways and when sand and dirt get under the rails they cause the rails to cut down in the ties faster than when kept clean.

During the winter months when there is not too much frost in the ties, on all track that is getting out of gage or rails turning, the ties should be properly adzed and old spike holes plugged and track put to good gage. This will save a great amount of labor when renewing ties the following year if ties do not have to be renewed out of face which would not seem practical except under certain conditions.

At the commencement of winter all switches should be gone over and the dirt properly cleaned from around switch rods and under switch points between the ties. Good judgment should be used in this, as I have noticed some men clean the dirt out very near the bottom of ties, leaving a large deep hole for water to stand in, or some switchman to step in; also requiring unnecessary labor to remove this dirt and haul it away.

The handling of maintenance work during the winter months makes necessary a reorganization of forces which must be handled with diplomacy if the proper results are acquired. As the forces are reduced, foremen are too apt to get the impression that they have not enough men to do much work and do not make any effort to show an improvement, but simply put in the time some way until the next spring when they will get more help. Any improvement made, no matter how small, will show in the next year's work and if there is no improvement there is a tendency to go backward.

GENERAL COMMITTEE MEETING, ROADMASTERS' ASSOCIATION.

At a general committee meeting of the Roadmasters' and Maintenance of Way Association, held in Chicago on February 13 roadmasters from 22 different railways were in attendance. The meeting was called for the purpose of discussing economical maintenance methods outlined in the work of the various committees of the association for the coming year. The large attendance at this meeting indicates the widespread interest of the members in the work of the association this year.

HEATING THE EMBANKMENT ALONG TRACK PANS.

One of the most serious maintenance problems encountered on roads using track pans at water stations is the removal of ice which collects in large quantities between the tracks because of the large quantities of water thrown from the pans by engines taking water when running at high speeds. To eliminate this trouble by preventing the formation of the ice, a steam heating

Ice on Departing End of Track Pans.

system between the tracks has been installed at Dola, O., and Davis, Ind., on the western division of the northwest system of the Pennsylvania lines. At these points two lines of 3 in. pipe are laid about 3 ft. 10 in. apart and about 21 in. below the top of the ballast between the tracks in which the track pans are constructed. One inch oak boards are placed under and on top of the pipes, which are then covered with ordinary stone ballast. These lines are crossed at intervals of about 300 ft. in concrete pits where condensation traps and swing joint expansion con-

End of Track Pans, Showing Steam Pipes.

nections are provided. The pipes are also anchored at intervals of about 300 ft. midway between the expansion pits. The lines of pipe are carried about 35 ft. beyond the ends of the track pans to dead ends with valves for the exhaust of air.

The two lines of pipe are supplied with exhaust steam at about 25 lbs pressure from a 6 in. line leading from the power house to a point midway between the ends of the track pans. An arrangement is provided enabling live steam to be supplied at a greater pressure if necessary.

It has been found that these pipes effect an important saving in the labor otherwise required to remove the ice from around the track pans. It has also been found that this arrangement can be improved by extending the heating pipes about 150 ft. beyond the ends of the pans. As now installed, this system does not entirely eliminate the collection of ice along the outside of the rails, but it is expected that this situation will be improved by laying a system of hot water pipes along the outside of the rails within the limits of the track pans, crossing it under the rails at the ends and then extending it alongside the rails about 150 ft. at the leaving ends of the track pans, this arrangement being only temporary and to be removed during the summer. At both of these stations there are sidings beside the track pans and it is proposed to construct similar heating arrangements between the main tracks and sidings.

We are indebted to Guy Scott, division engineer of the Western division, for this information.

SNOW REMOVAL BY STEAM RADIATION.

By J. W. Foote,
Division Engineer, Erie, Salamanca, N. Y.

Of the various kinds of snow and ice removal by heat, that by steam radiation is probably the most efficient. At a terminal where steam is avilable this system is particularly effective and economical and it is included in the standard practice of the Erie where it is giving good results. The simplicity of the arrangement commends itself. It consists of two 1 in. pipes, joined together by a return bend, placed between the switch ties, in a series consisting of four to six return coils for each switch. Each switch installation is connected with a main lead pipe which varies in diameter from one inch, for four to eight switches, to two inches, for nine to fifteen switches, not more than fifteen installations being connected in series. Each switch installation is equipped with a ¾ in. steam trap at its lowest point so that the condensed steam drains off automatically. The ballast is first removed at the locations of the installation to a depth of three or four inches below the base of rail and the ends of the steam pipes are supported above the roadbed upon wooden blocks. The steam pipes are not perforated but perform their function by direct radiation. The lead pipe is covered and is above the ground.

Once the plant is installed it is a simple matter to remove the pipes at the close of the winter and store them for the following year, when they may be set up very quickly at a nominal expenditure. Where this arrangement is in place, no attention need be paid to the points, provided the steam pressure is ample. The snow is melted as it falls and the points are kept perfectly dry and free from snow and ice. This scheme, of course, is applicable where team is already available and at points where it would pay on account of a large number of switches to install a power plant. However, as a general thing the outlying switches on most railways are so few in number on main line sections that the usual winter force can adequately take care of them by hand, and in fact can find no other work to do in time of snow.

This same principle is applied by many railways to keep the pit rails and the centers of turntables free from snow troubles. A single steam pipe line equipped with a trap will keep the pit rail perfectly clear of snow at all times, and a series of pipes laid in circles around the center does similar service there. At a busy terminal the advantage of a free turning table is too apparent to require any explanation of its help to keep traffic moving.

Another cause of the high cost of winter operation is the unloading of cars of frozen material, such as coal, cinders and sand. Railways engaged in the unloading of coal in large quantities maintain systems of coal steaming. In some cases perforated steam pipes with pointed ends are driven into the coal and the escaping steam drives out the frost. This results in a great loss of the energy of the steam and at the same time is expensive. In other cases large steaming houses are provided. These houses are lined with sheets of galvanized or lohmanized iron and provide room for steaming eight or more cars at a time. This system depends on air heated to a high temperature by coils of steam pipe thawing out the coal and in time of severe weather several hours are required to secure the desired result at a high cost and loss of time in unloading and in switching in congested territory. It would seem feasible to equip cars engaged in this service with steam coils and secure the radiation of the steam pipes directly upon the frozen material. These cars could be placed upon a steam line and thawed dry in a short time, eliminating the present heavy maintenance cost of buildings and the loss of time. Of course, this would mean a large first cost, but if it were made a part of the standard equipment it should fully repay the first cost. In any event, cars assigned to cinder service could be so equipped.

WATER REQUIRED BY A LARGE RAILWAY SYSTEM.

A paper was presented before the annual meeting of the Illinois Water Supply Association at Champaign, Ill., on March 11, by C. R. Knowles, general foreman of water works, Illinois Central, from which the following abstract is taken:

The consumption of water by railway systems has greatly increased, and it has been necessary to raise the standard of the supply both in quantity and quality to meet traffic conditions. In former years it was the practice to erect a tank and establish a water station at any point where water of any kind was most convenient, with little regard to the quality or future requirements. This has necessitated many changes to meet the new conditions and added requirements, such as relocating water stations with due regard to curvature, grades and the many previously unknown expedients of operation.

To accomplish these results it is often necessary to pipe water a considerable distance, or if an ample supply is not otherwise available, to sink wells or construct a reservoir impounding a storage supply. In the event that the available supply is not satisfactory in quality, it is often necessary to erect treating plants to convert it into a suitable water for locomotive purposes. All these changing conditions and increasing requirements have made it necessary to maintain a water works department organization whose duties are similar to those of a city water works department.

The amount of water required for all purposes by one railroad 6,500 miles long is approximately 16,500,000,000 gal. annually. In the state of Illinois on 2,000 miles of road, 4,236,838,000 gal. of water was used for locomotives alone, of which 1,751,790,000 gal. is purchased from municipal and privately owned water works plants and 138,645,000 gal. is treated by purifying plants owned by the railroad. It is necessary to maintain 123 water stations to distribute this water to locomotives. In addition to the above, the washing and filling of locomotive boilers at terminals requires approximately 950,000,000 gal. per annum, which is provided by the same pumping plants with additional facilities for maintaining the desired pressure for washing the boilers and the necessary pipe line for the distribution of this water under pressure.

Stationary power plants also require approximately 300,000,000 gal. per annum, including water used for condensing engines, of which 125,000,000 gal. is city water. It is estimated that 250,000,000 gal. additional is required for miscellaneous purposes at shops, roundhouses, offices and stations. This makes a grand total of 5,736,838,000 gal. of water used for all purposes by this one road in Illinois alone.

New Line for Ecuador.—Plans and specifications will be received up to March 20 at the Dirección de Obras Públicas, Quito, for construction of a railway between Puerto Bolivar and a navigable point on the river Zamora, with the object of opening up the districts of Zaruma and Loja.

EARLY TRACK WORK.*

By Engineer.

The coming season is likely to be one in which it will be hard to obtain men for manual labor. The wars in Mexico and Europe are likely to cause a scarcity of immigration of laborers from Mexico, Italy, Austria, Greece and all Southern Europe, from which localities the greatest number of our laboring men have been coming in recent years. It is reported that an Austrian government edict forbids any male citizen between the ages of 18 and 40 to leave any Mediterranean port during 1913 or until the edict is removed. In Italy, the newspapers are attacking laws on the rights of aliens passed by a number of states to try and discourage emigration to this country. Emigration from both Italy and Austria was unusually low for the month of February, when it is normally very high. A larger number of these nationalities than usual returned to their native lands last year, so that the indications are that men will be few and scarce. Consequently, railroads which employ and get their laboring forces on the ground at the earliest date possible will have a very great advantage over the other roads in getting their work completed.

Under usual weather conditions the coming month of April is the proper month to begin track work throughout the northern states, and it can not be too strongly emphasized that forces should be organized and started to work at the very earliest opportunity. This not only gets the work under way in the proper season, but gives the roads first on the ground the advantage of getting the best men and the gangs that are best suited for the different kinds of work. The gangs for rail laying and heavier work should as far as possible be men of larger size and greater physical strength; men from northern Europe, negroes or hobos.

All of the nationalities of Southern Europe furnish gangs which are good track men and also gangs which are poor track men. Their quality depends to a large extent upon the interpreter and foreman; also there is the usual difference arising because men of the same "calibre" and same class in life seem to congregate.

The local laborer is by far the best of all, and the earlier in the season the work is started the more likelihood there is of being able to obtain local men to fill out the ordinary section and bridge gangs, and when these men are once employed they are much more likely to stay with the company throughout the season. The railroads are not likely to obtain them at all if they wait until later in the season.

The railroads have apparently planned on much new work for the coming season and on account of the scarcity of labor, wages are likely to be high, and this without increasing the supply very materially. Indeed, some of the roads have already begun to raise wages in order to offer a little more than their competitors.

It is a wise policy to arrange for more comfortable and sanitary camps than is customary in order to retain the forces which are hired. All men are human and even the poorest laborer prefers a clean place to sleep and clean, wholesome food to eat. Bunk cars and all boarding cars should be properly made and prepared for the season's work. Screens should be prepared so that at the proper time they can be used, and cars should be furnished in perfect sanitary condition in such numbers that the laborer will not be crowded.

As soon as the frost begins to go out of the ground the section men should as rapidly as possible take out all the shims and surface up the low spots so as to get the track in good surface and well drained. Extra gangs should be started laying rail, putting in ties and ballasting. This naturally pre-supposes that rail has been shipped and that the ties are on the ground or on the way, and that the ballast pits are open and ready for the steam shovel. If the rail is not on the ground it is time to get after it and hurry it all possible. It is also time to have the ties distributed, and efforts should be made to get them delivered as soon as possible.

The section men should clean up around the depots, open all ditches, clean up the right of way, look after the road crossings, cattle guards and fences, straighten up signs that have sagged as the frost has gone out of the ground, and get everything in neat shape and ready for spring track work so that they can give the latter their undivided attention until completed.

Where construction work is to be done, it is time to get the teams started, steam shovels under way, which will require a release of equipment which may have been in coal or other service and which can now comfortably be released from that service and repaired, equipped and put into the construction work. Where dredge work is to be done preparations should be made so that as soon as the ice is gone from the water where the dredge is to operate it can be put into operation.

Concrete gangs should be equipped and located on the ground and material for them should be looked after so that work can go ahead which may not have been economical in the winter on account of its location or on account of the severity of the weather. However, this class of work can often be carried on to advantage throughout the year. Bridge repairs should be pushed and all pile bridges and culverts should be fixed in good repair with as little delay as possible, and the pile drivers should begin operations so that they may finish their allotted work.

Material which has been ordered should have begun to come before this, and if not it should be looked up and hurried. Any additional material needed should be ordered without delay. Tools should have been properly repaired, but if this has not yet been done they should be put in shape at once for the season's work. There is a great loss of labor if tools and materials are not on hand when they are ready to be used. This loss is very apparent to the men in charge of the labor and they should give the supply department all assistance possible in getting material on the ground by ordering promptly so that there will be no delay on account of insufficient notice.

On the other hand there is a loss of capital invested if the supply of material on hand is too large and much material will deteriorate if held too long before being used. Consequently, the most perfect arrangement for handling material is to have it delivered just as it is to be used, and the nearer this stage is reached the cheaper work can be done. As this can not be perfectly accomplished and the promptness of delivery depends to a large extent upon the assistance given the supply department by the operating and construction departments, it behooves the superintendent, the roadmaster, the supervisor, the master carpenter, the engineers and all foremen, to find out what material they need, see that it is ordered and find out if it is coming on time, and if not, get after it.

As April is the time for beginning farm work, so it is also the time for beginning railroad work throughout a large portion of the country. A good start in the month of April by the track men, the bridge men, the section men, the signal men and, in fact, all maintenance and construction men will get the season's work well under way, and will insure getting it through on time.

About two years ago one of our large systems decided to begin work early in the season, and in 1911 had over 8,000 maintenance men at work in April, which number was increased to 10,000 in May. The results were good and in 1912 they put over 10,000 at work in April and increased this to over 12,000 in May. The results were excellent, for by the first of June a very large part of the rail laying, tie renewals and ballasting were completed, allowing work in the hot summer months to be slacked up and the work to be kept well in hand throughout the season at much reduced expense. This year will probably see as good or better advancement of the work on this system. April is the month for beginning, and a good beginning is half the battle. One day's work in April or May is worth two in July or August.

* This is the first of a series of articles on this subject. The first appeared in the issue of February 21.

DEVELOPMENT IN THE USE OF SCREW SPIKES.

This Type of More Permanent Track Construction Now Used on 730 Miles of Track. Nearly 200 Miles Installed Last Year.

No problem connected with the maintenance of track, with the possible exception of that of securing sound rails, is receiving so much attention from railway men at the present time as that of the future tie supply. The number of ties required annually is so large and constitutes such a drain upon the timber resources of the country that it is evident that something must be done in the near future to alter conditions. Either the demand for tie timber must be reduced or a substitute for timber must be found. Much attention is being given to both solutions and definite progress has been made in each. Many designs of steel, concrete and composite ties have been made, and in some instances with good indications of success. However, greater attention has been given to the development of methods for securing a greater life from wood ties, in this way reducing the demand for timber, for it is evident that if the average life of the tie can be increased, the number required for renewal will be correspondingly reduced.

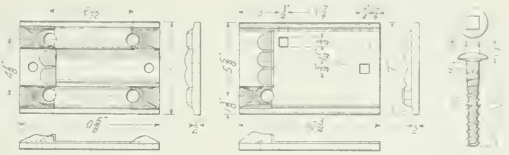
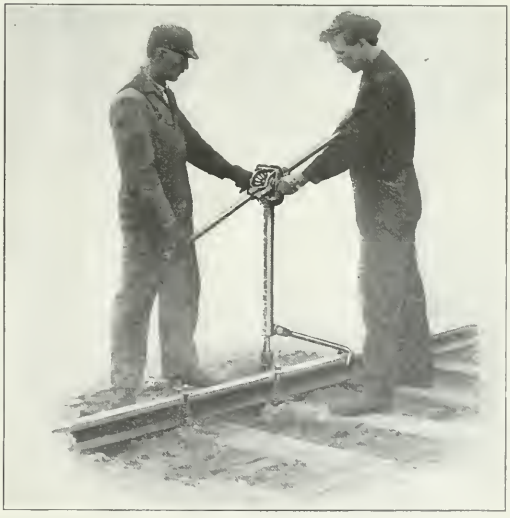
DESTRUCTIVE AGENTS.

A tie is subject to destructive action by decay and by mechanical wear. The former is retarded by treating the timber. Although a comparatively new industry, timber preservation is being extended very rapidly, until it is probable that within a few years most of the ties in track will be treated by some process. Over 75 per cent. of the ties now in track on the Santa Fe are treated, this road being a pioneer in this work and probably having a larger proportion of treated ties than any other large system in the country. However, other roads, such as the Union Pacific, Southern Pacific, Illinois Central, Burlington, Lackawanna and Rock Island also have large numbers of treated ties in service.

The total number of ties purchased in 1910, the latest year for which records are available, as reported by the United States Department of Commerce and Labor, was 148,231,000, of which 30,544,000, or 21 per cent., were treated. This represents an increase of nearly 7,000,000 in the number of treated ties bought over 1908, the previous high year. At least seven or eight new treating plants are under construction, and as many more have been completed within the past year, so that this increase bids fair to be sustained. This large proportion of treated ties is already exerting an important effect on the tie consumption as is shown by the requirements for maintenance purposes on the Santa Fe for this year, which are decreased by 600,000 ties as compared with previous years. This is attributed to the increased life of treated ties, which have now been in the track sufficiently long for the effect to be evident.



Intermediate Joint, D. L. & W. Standard 101-lb. Screw Spike Tie Plate and Screw Spike.



Ratchet Wrench for Driving Spikes.

As the life of the ties has increased with treatment, the proportion removed from the track because of mechanical wear has increased. This mechanical wear very largely arises from two causes; rail cutting and spike killing. To strengthen the tie

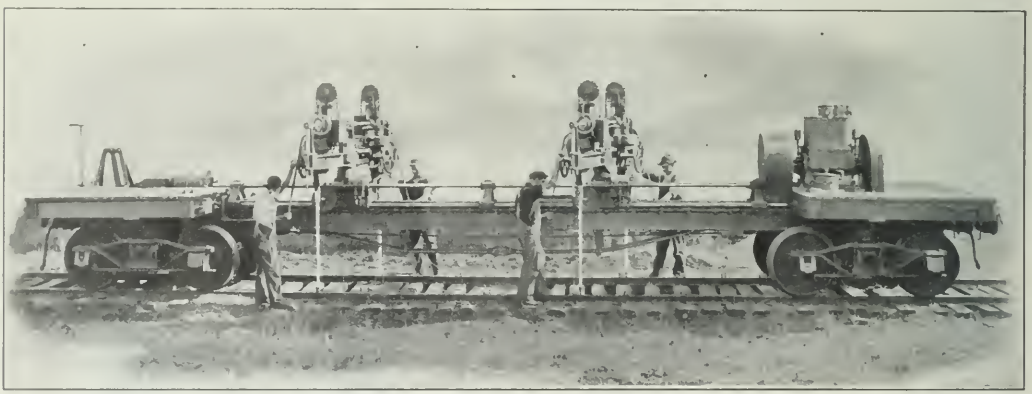
against the former action, tie plates are being used in largely increased numbers, while the size of the plates themselves has been increased to distribute the loads over the ties without cutting into them. This has been largely successful, but it has not been possible to make the plate as closely an integral part of the tie as is desired and the movement of the plate on the tie is frequently the cause of damage to it.

Spike-killing is a source of injury to the tie which becomes more serious as the life of the tie is increased. Tie plugs are generally used to reduce the injury as much as possible, but they are a partial remedy rather than a preventative. At best, spikes must be re-driven when rail is relaid, which occurs on an average of every seven or eight years on main lines. Re-gaging of the track, spacing of ties in connection with ballasting, etc., also greatly increase this spike killing. In this way the mechanical life of the tie is in many cases the governing condition and a number of roads are only injecting sufficient preservative into the timber to give it a protection against decay equal to the mechanical life. As this mechanical life is increased, heavier treatments can be given.

The screw spike is considered by many men to offer the most practical means for increasing the mechanical life of ties. It is effective in greatly decreasing the movement and consequent wear between the rail, tie and tie plate, and at the same time it largely eliminates the spike killing of the tie. The driving of a common spike is very destructive to the wood fiber, cutting and distorting it greatly. Also, after being driven, the spike does not possess a sufficient grip upon the wood to prevent loosening under the movement of the rail. After it has been driven down a few times the timber loses its grip and it becomes necessary to draw the spike and redrive it in another hole. On the other hand, when a screw spike is driven into a previously bored hole the destruction of the wood fiber is practically limited to that occasioned by the thrust of the screw threads. The grip upon the wood and the resistance to pulling are greatly increased by the greater surface exposed to contact. Tests conducted by the Bureau of Forestry at Purdue University several years ago showed that the ratio of the resistance of screw spikes to common spikes varied from 1.87 in white oak to 4.63 in longleaf pine. More thorough and exhaustive tests which are now being conducted by one of the prominent railways, tend to bear out these same conclusions.

When once properly driven, the screw spike does not loosen readily and retains its grip upon the rail for a long time. Cut spikes retard rail creeping only for a short time after being driven, while screw spikes remain tight and in this way greatly reduce the wear of the tie, tie plate and rail upon each other, retard creeping and eliminate noisy track. Equally important with the resistance to vertical pulling is the resistance of the screw spikes to lateral thrust. With its intimate contact with the wood fiber as well as its greater and more irregular cross section, the screw spike offers greater resistance here also. With the rapidly increasing proportion of soft wood ties, this additional resistance to wear is becoming more essential for from their nature these softer woods are more susceptible to treatment and if they can be protected from mechanical injury, a comparatively long life can be secured.

When discussing any type of more rigid track construction, a strong difference of opinion always arises among engineers as to the point to which this rigidity and unity of motion of the rail and ties should be carried. With the common cut spike construction, the rail, tie plate and tie are all free to move more or less upon each other. With the screw spike driven down tight against the rail, nearly all this play is eliminated and the three act as a unit, greatly arresting the motion of the individual parts and thereby reducing the wear upon them. Some men do not consider it advisable to arrest this movement too closely, believing it introduces undue strains in the track structure, and even suggest that where screw spikes are used they be left with the head perhaps a quarter of an inch above the base of the rail so that a slight vertical movement of the rail will be possible without lifting the tie from its bed. In contrast with this, other engineers claim that one advantage of the screw spike is the self tamping effect which gradually brings the tie to an even, permanent bearing.



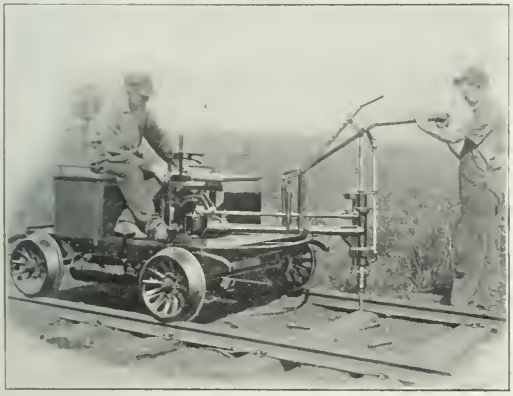
Large Greenlee Spike Driving Car.

DEVELOPMENT OF THE SCREW SPIKE.

The screw spike has only come into use in this country to any extent within the past few years, but recent installations have been of sufficient magnitude to justify its serious consideration. Over 730 miles of screw spike track is now in service on 14 railways in this country, which, however, is less than in Europe where this type of construction has been used for over 50 years. The French railways were among the first to experiment with the screw spike, its use on that system beginning about 1860. They rapidly adopted it as standard, and a number of French roads have used it exclusively for the last 30 years. While the German, Austrian and Belgian railways did not favor it for some time, they have also come to use the screw spike to a large degree, and since April 1, 1899, the Prussian railways have used them exclusively for maintenance as well as new construction. The British railways, however, with the exception of the London & North Western, use iron and steel spikes without points with trenails, driving them into previously bored holes. On the London & North Western, screw spikes are used.

The Atchison, Topeka & Santa Fe was a pioneer in the use of screw spikes in the United States, having about 120

miles of screw spike track in service at the beginning of 1912. The first screw spikes on this road were inserted in 1905, 3,000 being placed in track at Rothville, Mo., nearly all of which have since been removed because of the decay of the ties. In 1908 about a half mile of screw spike track was laid in the main line a short distance east of Topeka, Kan., and in the same year 7,000 screw spikes were placed at Wyaconda, Mo. The first large installation was made late in 1910, when 55 miles of screw spike track was laid in the main line between Hutchinson and Kinsley in southwestern Kansas. The eastern 21 miles of this installation were equipped solidly with screw spikes, the ties being renewed out of face at the same time, while on the remaining 34 miles, screw spikes were placed in



Small Greenlee Spike Driving Car with Single Spindle.

all new ties, which were about 60 per cent. of the total. This single track line carries nearly all the heavy transcontinental freight traffic and most of the through passenger business. The following year, about 60 miles of new second track was laid in Arizona with screw spikes beside the old track which was equipped with common cut spikes, affording an opportunity for a good comparison of results under similar traffic and climatic conditions. Owing to the desire to observe the results secured from this large mileage already in, no further installation was made during the past year.

While starting somewhat later than the Santa Fe, the Delaware, Lackawanna & Western has gone into the use of screw spikes to a greater extent than any other road and has made them standard for all main line construction. During the past two years, this road has used screw spikes exclusively for all new construction and for maintenance purposes on main lines, inserting them in all new ties placed in main tracks. The Hopatcong cut-off, which was completed a year ago, was laid entirely with screw spikes, this cut-off being 28 miles long and built for two tracks with 13.5 miles of screw spikes in side tracks. At the end of 1912 over 4,000,000 screw spikes were in main track on this road, equivalent to over 330 miles of continuous track. All slip, movable point and simple switches within the limits of screw spike track are put in with the same type of construction.

The Chicago, Rock Island & Pacific is another large user of screw spikes, with about 110 miles of screw spike track now in service. Screw spikes are used with 100 lb. rail in all creosoted and soft wood ties having two or more years available service. As this weight of rail is standard for the important lines on this road, the amount of screw spike track will increase rapidly, about 50 miles being put in during the past year. About a quarter of a mile of this track has been in use on a high speed 4 deg. curve reversing on a 6 deg. curve about five years, the rest being installed during the last two years.

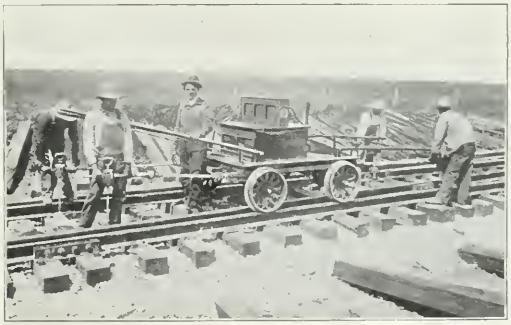
The New York, New Haven & Hartford also has a large mileage of screw spike track, over 84 miles being installed between New York and Boston. The first installation on this road consisted of one mile of track near Greenwich, Conn., which was placed in service since 1907. At the present rate of installation, it is expected that all four tracks between New York and New Haven will be entirely equipped with screw spikes within two years.

The Harriman lines have recently gone into the use of screw spikes to some extent. Six miles of screw spikes were driven in main track and 1.17 miles in side track on the Union Pacific in July, 1910. Late in 1912, 50 miles additional were installed, 25 miles on the Union Pacific and 25 miles on the Southern Pacific.

Among the other more prominent installations are those of the Pennsylvania Railroad, which has about 25 miles of screw spike track, mainly on the New York Terminal division, which has now been in service about two years; the Chicago & North Western with one mile near Janesville, Wis., placed in December, 1907; the Pennsylvania lines with 1.5 miles which has now been in service about two and one-half years in experimental track; the Erie with one mile which has been in service two years; the Baltimore & Ohio with one mile which has been in service three years; the Chicago & Eastern Illinois with one-third mile which has been in service five years; and the Northern Pacific with 5,276 screw spikes in main track near Plains, Mont., and 1,500 near Maywood, Wash., the spikes in both places being in experimental track under supervision of the United States Forest Service. In addition, screw spikes are used on bridges on the Baltimore & Ohio when ties are renewed singly or out of face, while the Nashville, Chattanooga & St. Louis has about half a mile of screw spikes in track entirely on bridges.

Believing that it is not advisable to hold the rail in close contact with the tie plate, the Pittsburgh & Lake Erie has adopted a form of track construction whereby the tie plate is made an integral part of the tie by the use of screw spikes and the rail is held in place by cut spikes driven through slots in the plate.

When using screw spikes it is essential that the tie be bored before treatment so that it will be fully treated where the



The Au-tra-kar in Use on the Santa Fe.

danger of exposure to moisture is the greatest. This boring at the treating plant is a development of the past two years, the first screw spikes being inserted in ties bored in place in the track. The first 18 miles of the 55 mile installation of the Santa Fe was placed in this way and all ties on the Lackawanna were bored in place for screw spikes until the completion of the new treating plant at Paterson, N. J., a year ago. This boring previous to treatment is also extending rapidly to ties used with cut spikes, and it is also becoming the general practice for the ties to be adzed before treatment in

order that the mutilation at the time of placing in the track may be reduced to a minimum.

In Europe it is customary on many roads to insert hardwood dowels or plugs into the tie to receive the spike. This dowel gives a resistance to the spike equal to that of a hardwood tie and distributes the stresses transmitted to it by a spike so that they come within the limits of the crushing resistance of the softer wood. Some four or five years ago this same idea was seriously agitated in this country, and about 50,000 dowels were inserted experimentally in new ties on the Santa Fe. However, later practice has shown that it is not necessary to insert these dowels, at least during the early life of the tie, as when the wood decays about the spike the tie can then be bored and the dowel inserted at any time.

The Harriman lines have adopted a helical spring or liner for the 50 miles of track installed the past season, as shown in the accompanying drawing, this liner being inserted in the tie by means of a special mandrel at the treating plant. While this Thollier liner has been used for many years in Europe, this is the first installation of any magnitude in this country, the purpose of the liner being to provide increased resistance against crushing of the wood fibers.

THE SCREW SPIKE TIE PLATE.

While, as a general proposition the tie plate is now widely recognized as advisable with soft wood ties, it is essential with screw spikes for it is not economical to protect the tie against spike killing without at the same time providing against rail cutting. For this reason special attention has been given to the design of the screw spike tie plate and especially to the boss supporting the head of the spike.

At first these spikes were used with the ordinary flat tie plates and this practice is still followed by the New Haven, whose experience has not shown the necessity of a supporting lug. However, the general experience has been that the thrust

Early Type of Snow Car on the Rock Island Near Chicago.

of the rail soon bends the spikes outward, making it difficult to withdraw them. In a preliminary report just issued by the Forest Service on the results evident so far in four sections of test track, the conclusion is reached that "it is desirable to have some form of boss on the plates to reinforce the heads of the spikes against lateral thrust." The design of this raised portion varies to quite an extent. The first plates were made with the support for the entire head except that portion bearing on the rail. However, this was open to the objection that any irregularity either in the plate, in the spike or in its driving would prevent the head of the spike from taking full bearing on the rail. Therefore the later plates are now generally made to support the spike at the rear of the head only. A further development has recently been brought out consisting of a ball and socket washer, with an adjustable support to fit the head of the spike. While because of their irregular section the first plates had to be cast, later designs with a simple contact as those of the Harriman lines, can be rolled.

The Lackawanna has recently changed the design of the tie plate slightly by withdrawing the inner edge of the spike hole a short distance from the shoulder line to prevent the base of the rail from cutting into the neck of the spike in case of a derailment and making it difficult to withdraw the spike. The

Latest Type of Snow Spike Driving Car.

Lackawanna practice also differs in that a special plate slotted for one screw spike and two cut spikes is used at the joints.

SCREW SPIKE DRIVING APPARATUS.

The best method of driving screw spikes depends on a variety of conditions, including the density of traffic and the number of spikes to be driven. Where only a small number are placed, a hand wrench is generally used. Also, on very busy lines, such as the Lackawanna, hand wrenches are required, as it is impracticable to place any car on the track. The hand wrench is open to the objection that the spikes may not be driven uniformly. While one may be driven so as to injure the wood fiber or turn off the head, another may not be turned down far enough. Where screw spikes have worked loose, it has generally been attributed to this defect of hand driving. Hand driving is also slower and more expensive, although within the past year a ratchet wrench, shown in one of the accompanying photographs, has come upon the market.

The earliest type of power driving cars was brought out by Greenlee Brothers of Rockford, Ill., for use in laying the 55 miles of test track on the Santa Fe west of Hutchinson, Kan., in 1910. This car was similar in general design to that shown in an accompanying photograph, with the exception that it was provided with six driving spindles. This car is a double truck steel car driven by a 27 h. p. steam engine mounted on the platform and is provided with radial arm spike driving heads, permitting each spindle to reach four ties at one setting of the car. This car bored the ties for four spikes per tie and drove the spikes on a mile of track per day when laying the stretch referred to. As it was necessary for a locomotive to attend this car while working on the main line, a smaller self-propelling car with two spindles has since been built by the same company for this same road. This car is driven by a gasolene engine and is capable of running to sidings under its own power to clear trains.

Either of the above cars must run onto a side track to allow trains to pass, which causes considerable delay. For this reason there has arisen a demand for a lighter car, especially for maintenance work, which can be lifted off the track to let a train pass, and at least three different types of cars have been developed for this purpose. The Greenlee Company has built a small gasolene motor car similar to the ordinary section motor car with one spindle mounted on a pivot in the center of the car and free to

swing to either side. This spindle is provided with a combined boring and spike driving head which can be used for either purpose. It is geared to operate at the same speed as the spindles on the larger cars and can drive the spikes for 1,500 to 2,000 ft. of track per day where no boring is necessary. If the ties must be bored in place, this distance will be reduced about 40 per cent. Among the roads on which this car has been used are the Santa Fe and Southern Pacific.

The Au-Tra-Kar, made by Burton W. Mudge & Co., Chicago, is another small self-propelling car which can readily be lifted from the track. This car is provided with two boring spindles on the front end and two driving spindles on the rear end. These spindles are free to swing laterally and telescope so that three ties can be reached without moving the car. Each spindle is equipped with a friction clutch which is adjusted to slip when the spike has been driven to the desired degree of resistance, thus insuring the driving of the spikes uniformly. The driving extensions are hung on cranes which support the tools, relieving the operator of this weight. This car has been used extensively on the Santa Fe.

A small car of a somewhat different design is the Snow car, made by the T. W. Snow Construction Company, Chicago. This car differs from other types in that electric power is generated for boring the ties and driving the spikes, permitting the car to be placed on the embankment to one side, clear of the main line. Power is carried from the car to the boring and driving spindles by cables, sufficient cable being provided to enable 2,000 ft. of track to be covered from one position of the car. In this way interference with trains is reduced to a minimum, for the car is at all times clear of traffic and requires no protection. The men can work until a train is almost upon them and with a quick throw of the cable, can step to one side to allow the train to pass. The first car of this type was brought out about two years ago. A car which has just been shipped for use on the Rock Island lines in Iowa, embodies several improvements. It follows closely the lines of automobile construction in the details of its design and is provided with practically all the accessories ordinarily placed on the automobile, except the steering gear. A 40 h. p. direct connected gasolene engine is installed for propelling the car, which also drives a 7½ k. w. generator when putting in spikes. The car is supported on cast steel flanged wheels, mounted on rigid journals and is capable of developing a speed of 50 miles per hour if desired. As the engine must drive the generator while the car is standing still, four times the ordinary area of front end radiation surface was required. The generator provides power sufficient to drive three boring tools and two spike driving tools, this ratio having been found to keep all tools working continuously and give a uniform rate of progress. Fuses are provided with each individual tool, which will blow out if the tools encounter increased resistance, in this way protecting the generator. The car weighs 3,400 lbs. and can carry 12 men, although only five are required to operate it. It is capable of boring the ties and driving 550 spikes per hour.

COMPARATIVE COSTS OF SCREW SPIKE CONSTRUCTION.

The cost of installing screw spike track is considerably more than for the ordinary construction. All the various details including the cost of the tie plates and spikes, as well as the boring and driving, add to the expense. Previous to the installation of boring machines at the treating plants, the ties were bored in the track. The early installations on the Santa Fe were placed in this manner, the 55 mile stretch in western Kansas being bored by the machine referred to above, which also drove the spikes, this boring costing about 1.25 ct. per hole. On the Delaware, Lackawanna & Western this hand work was done with a small portable tool working to template. Field boring is still necessary on this road at switch leads and other special track work. All boring of ties on the New Haven is done by hand with the common tools, although machine boring is being considered.

On the Rock Island the cost of placing two tie plates, boring four holes and driving the spikes has averaged 13.74 ct. when done by hand. This cost was reduced to 4.89 ct. per tie when using a machine with two drills and one spindle driving tool for scattered work and to 2.9 ct. per tie when using two drills and two driving tools for continuous work. The cost of preparing the ties for screw spikes, including drilling eight holes per tie, averaged about four cents per tie on construction work on the Pennsylvania Railroad while the cost of driving the screw spikes with an air drill machine averaged about 0.9 ct. per spike. The cost of driving the spikes on the New Haven averages about 0.7 ct. each; and on the Baltimore & Ohio, 1.1 ct. On the Pennsylvania lines the cost of preparing the tie, exclusive of the treatment, averaged from 5.3 ct. to 15 ct., while the cost of placing it in the track, exclusive of lining and surfacing, cost from 10.6 ct. to 19.5 ct.

While screw spikes have not been in use in sufficient quantities long enough to enable final results to be secured, some conclusions can be drawn from the small installations which have been in service for five years or more and from the more extensive stretches which have been in service for two years. The results so far secured indicate that maintenance charges will be materially reduced, especially in the items of lining and surfacing track and in tightening fastenings. Whether these savings will be reduced sufficiently to offset the increased first cost cannot be determined at the present time, although there is little doubt but that they will, on heavy traffic lines at least. It has usually been necessary to tighten the spikes about three months after driving and again after an interval of about six months, after which they require little further attention. A careful examination of the Santa Fe track in Kansas last summer failed to show any loose spikes and it was impossible to slip a steel tape between the head of the spike and the rail, although these spikes had not been tightened for a year.

The track men very frequently object to screw spikes at first because of the greater difficulty of withdrawing the spikes when making routine repairs or at times of an accident. This objection is most serious in the case of derailments or other accidents where the heads of the spikes are deformed so that a wrench cannot be placed upon them. In such cases it may be necessary to cut the spike off altogether or to square the heads with a chisel before the wrench can be used, as was necessary for a long distance on one road recently. The former method is objectionable as it prevents driving another spike in the same place. However, this very fact that the screw spike is more difficult to remove is of itself an important advantage in decreasing the damage done to the track by derailments. Opportunity has been afforded on the Lackawanna to observe the effect of derailments on this track in a number of instances, including one runaway, and it is found that the track withstands such punishment with far less injury than does cut spike track and can be gotten back into service much more readily. It has usually been possible to get in to a wreck over the existing track with few, if any, repairs, while accidents on other track frequently so tear it up that portions of it have to be rebuilt.

While more limited, the experience of the Santa Fe in this regard tends to corroborate that of the Lackawanna. In a derailment on screw spike track west of Hutchinson, Kan., in November, 1911, a freight train of 60 cars was running at a speed of about 30 miles per hour when a drawbar fell between the rails, causing two cars to derail on a fill and go down the embankment. The head trucks of the third car were derailed and ran on the ties for a distance of 10 car lengths before stopping. A large number of the heads of the screw spikes were badly dented on top, three of the spikes were badly bent and one tie plate was broken. Notwithstanding the severe lateral blows that the track sustained, it was not forced out of gage, although the track was driven out of line in two places but not sufficiently to prevent the passage of trains. With the exception of lining these places and the replacing of two or three broken ties, no other repairs were required. It is obviously impossible for a track to offer a greater resistance to derailments or other

hard usage and not at the same time offer some greater difficulties for reconstruction. The roads which have gone into this type of construction feel that the advantage gained in this regard far outweighs the disadvantage.

The principal objections to the screw spike may be summarized as: the increased first cost and the increased difficulty and cost of making repairs or renewals. On the other hand, the advantages claimed are: the securing of increased life from the ties; decreased cost of maintenance, and greater strength and stability of the track.

ABSTRACT OF ENGINEERING ARTICLES SINCE FEBRUARY 21.

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the regular weekly issues of the *Railway Age Gazette* since February 21, 1913:

Attractive Stations for Small Towns.—The Buffalo, Rochester & Pittsburgh has given careful consideration to the design of attractive stations for small towns along its lines. Two standard plans have been adopted, which are used wherever local conditions permit. An illustrated description of five of these stations was published in the issue of February 28, page 383.

The Production of Sound Rail Ingots.—A paper on "Comparative Notes on Steel Rail Rolling" by Robert W. Hunt, and one on "Piping and Segregation of Ingots and Ductility Tests" by Dr. P. H. Dudley, both of which were read before the meeting of the American Institute of Mining Engineers on February 19, were abstracted in the issue of February 28, page 390.

The Crooked River Arch Bridge.—The Oregon Trunk has built a steel arch bridge over the Crooked river canyon which has a number of unusual features. The extreme depth of the canyon made its erection difficult and its design is such that it acts as a two-hinged arch for live load and three-hinged arch for dead load. This bridge was described and illustrated in the issue of February 28, page 394.

Grand Trunk Terminal at Ottawa, Ont.—An attractive station and hotel building have been recently completed by the Grand Trunk near the center of the city of Ottawa. An illustrated description of these buildings is published in the issue of March 7, page 435.

An editorial commenting on the policy of Canadian roads in operating hotels and eating houses as compared with the practice in this country, was published in the same issue, page 420.

SOUTHERN PACIFIC ANNUAL TRACK INSPECTION.

The Southern Pacific has just issued a booklet containing the results of the annual inspection of track and structures for 1912, and the names of the winners of the various prizes. For the purposes of this inspection, the Southern Pacific system is divided into three grand districts known as the northern, southern and central districts. The assistant chief engineer in charge of the maintenance department acts as inspector over all lines. The general superintendent, district engineer and the division superintendents and division engineers also assist in this inspection on the grand district on which they are located, no division superintendent or division engineer, however, taking part in the inspection on his own division. In addition to the track, the stations, pump houses, fuel oil plants and power plants are also inspected and rated. This inspection was started on September 23, and was concluded on December 12, 1912, requiring 34 days, and covering 6,630 miles of line.

As a result of this inspection, the Salt Lake division, T. F. Rowlands, division superintendent, was awarded the highest rating of 94.1; the Oakland district of the western division, L. Bulger, roadmaster, was pronounced the best roadmaster's district, with a rating of 95.5, and Section 19 of this same district, P. A. Devine, foreman, received the highest section rating on the Pacific system with a score of 99.1. A gold medal was awarded the roadmaster with the best district and the section foreman with the best section, while silver medals were awarded to 15 section foremen having the best sections on the various roadmasters' districts. Silver medals were also awarded to 32 agents having perfect stations, to 27 pumpers having perfect pump houses, to eight pumpers having perfect fuel oil plants and to nine engineers with perfect power plants.

FOREMEN'S MEETINGS TO DISCUSS ACCIDENTS.*

By Earl Barton,
Section Foreman, Chicago & North Western, Huron, S. D.

I have been a member of the Dakota division safety committee for the past 18 months, and I believe if every section foreman had the same opportunity to attend these meetings there would be a surprising decrease in the number of small accidents. While it is impossible for all section foremen to be members of a division safety committee, there should be some way to bring them face to face with the accidents which are occurring every day in the maintenance of way department. I think roadmasters could accomplish good results by calling a meeting of their section foremen every six months, probably just before spring work commences and just before the track freezes up in the fall. The roadmasters should act as chairmen of the meetings, and have a record of the accidents which had occurred on the division during the preceding six months. Each accident should be thoroughly discussed and the foremen should have the privilege of expressing their opinions as to the best way to prevent these accidents. After the accidents had been thoroughly discussed each foreman should be called upon to bring up for discussion any dangerous conditions which he thinks might cause an accident. The remainder of the day should be spent in talking over the safest and most efficient way of handling the season's work with foreign laborers. By conducting the meeting in this way the new foreman would derive much benefit from the experience of the older foremen.

I find when loading and unloading ties with a mixed gang of experienced and inexperienced men that when two men are required to handle one tie by working an experienced man with an inexperienced one we have less men injured. Also, in terminal yards where there is a large amount of rail to be handled, it is much safer to build skids on a level with a flat car for storing emergency and scrap rail. By using two short rails for sliding the rails on and off the cars, there is no chance for a man to be injured and there is no heavy lifting. A skid should be built for each weight of rail handled and one for scrap.

I have one man whose duty it is to take care of the switch lights and foot blocking in switches, frogs and guard rails. This man goes over the switches the first thing in the morning and repairs any defective blocks he finds. The foreman should accompany him as often as possible on this inspection tour. A good man should be chosen for this work who can be trusted. I have had very little trouble with my blocking and lights since adopting this system, and they are in a safe condition at all times.

The track at the ends of bridges should have a wide shoulder. The runway to handcar houses should be filled in level with the top of the plank so there will be no chance for switchmen and trainmen falling over them. Foremen should be very careful in regard to using bad order tools. A great many employees are injured from the use of defective tools. It is much easier to have such a tool fixed than to explain why you were using it. Roadmasters should make frequent inspections of the tools used by their foremen. Never trust a piece of work of a dangerous nature to someone else when it is possible for you to attend to it yourself.

New Line for Spain.—A company has been formed for the construction and operation of a strategic railway from Malaga to Algeciras and Cadiz, Spain. The cost of construction of this line is estimated at about $8,640,000.

*Received in the Safety contest, which closed October 25, 1912.

THIRD AND FOURTH TRACK CONSTRUCTION.

Geological and Traffic Conditions Created Unusual Problems on New York Central Between Albany and New York.

The New York Central & Hudson River has been carrying on the construction of third and fourth tracks between Albany and New York for the past three or four years. Because of the location of this line on the east bank of the Hudson river where the high bluffs approach very close to the water's edge,

Building New Tracks on Trestles North of Staatsburg.

this work has necessarily been very difficult and expensive, especially since the alinement is being improved at many points by the elimination of curves and at other places by reductions in the degree of curvature. The existing two tracks have been

Deck of Trestle in Staatsburg Cut.

very badly congested for some time as a very heavy passenger business, nearly all of which consists of important fast trains, is handled in addition to a heavy freight movement. There are 43 scheduled passenger trains and an average of 30 freight trains daily. The natural conditions combined with this heavy traffic make progress on this work slow and render necessary the taking of many precautions to prevent interference to traffic.

As the conditions met in all the work on this road between New York and Albany are largely similar, a description of the problems encountered on the 11 miles between Staatsburg and Barrytown, which is now being completed, will be in a general way typical.

The geological conditions in this vicinity are very interesting and are to a large extent responsible for the difficulties encountered. The rock on both sides of the Hudson river is of a very uncertain character and rather than being regular, there exists a very uniform lack of regularity. Lying nearly in the region of the Appalachian upfolding, this rock has been distorted and twisted greatly until it is now very badly broken and is inclined at all angles and in all directions. As a result the rock is rotten in the extreme and is full of pockets of clay and quicksand which are encountered most unexpectedly. In

Rock Face in Front of Soft Material.

some places the rock slopes sharply towards the river with a bed of silt or clay clinging to it on which the roadbed must rest. Again it may incline away from the river and contain pockets of quicksand forming sink holes over which the track must be laid. In some instances the rock is nearly vertical and a slight movement will dislodge large masses which may descend on the tracks.

No records are available regarding the difficulties encountered in building the original road, and later the second track, but they were probably small compared with those recently encountered, as the early roadbed was narrow and the undisturbed

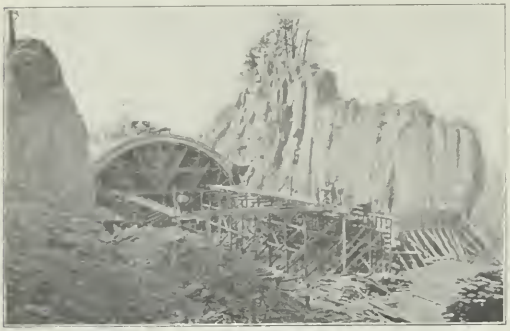
Completed Slope Showing No Indication of Rock Face in Original Cut.

portions of the foundation material were sufficiently stable to support the loads and maintain equilibrium.

Many of the sink holes are short, with rock cuts at either end; this condition of itself introducing serious complications

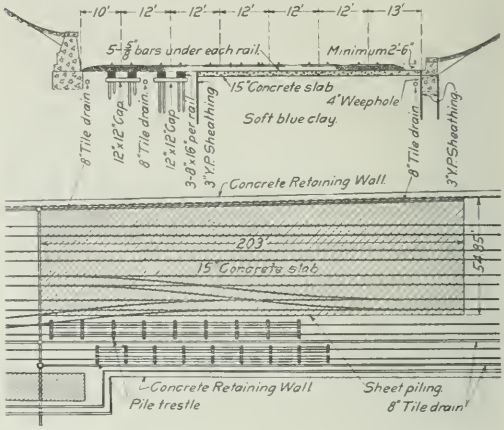
in maintaining smooth riding track under high speed trains. In one instance a ledge of rock projects under one rail while the other rail is supported on a bed of mud, necessitating in itself, very careful maintenance.

In the vicinity of Staatsburg a number of these sink holes were encountered. At one point there existed a peat pocket 300 ft. long and 10 ft. deep resting on rock. Sheet piling was driven adjacent to the main track, the bed excavated under the new tracks and the hole backfilled with rock on which the new tracks were laid. At another point where similar material was encountered, but to a greater depth, sheet piling was driven between the new and old tracks to prevent the flow of material from under these tracks. Piles were driven and capped under the new tracks and a solid floor of 12 in. x 12 in. stringers laid lengthwise with the tracks, on which the ties and track structure were placed. As the ground water level is practically at the surface, it is expected that this construction will be protected from decay for some time to come. The tracks have been placed on the land side of the old fills than when on the river side.



North Portal of the Astor Tunnel Showing Centering and Concrete Mixing Equipment.

Near Rhinecliff, where a cut was to be widened for additional tracks on the land side, the face of the cut gave every indication of solid rock, and plans were made to excavate accordingly. When construction began it was found that this rock was but a surface shell a few feet thick and that back of it there was a pocket of very unstable material. When this was discovered, plans for the handling of work had to be changed immediately and additional right of way secured to provide for the increased slopes. One of the accompanying photographs shows this condition when the steam shovel was uncovering the softer material behind the rock.



Plan and Elevation of Concrete Slabs Required in Poughkeepsie Cuts.

Owing to the close proximity of the old line, extreme care

Beginning Excavation for the New Astor Tunnel.

accompanying photographs show details of the work at this point.

It is to be expected under these circumstances, much settlement is encountered on fills and large mud waves frequently appear. These conditions interfered greatly with the estimates of material and made impossible the balancing of quantities with any degree of accuracy. One interesting fact noted is that the settlement has uniformly been greater where the new was necessary at all times when blasting rock. This was especially necessary because of the character of the material. Many times the effect of comparatively light shots was felt on the back of a ledge of rock at a distance from the point where work was being done; in some instances this effect being noticed at 20 ft. through apparently solid rock resulting in dislodging large pieces. In other instances large quantities have been removed by comparatively light charges because of the opening

of numerous seams that were not known to exist. The rock crumbled readily when blasted so that nearly all of it could be removed by the steam shovel. This uncertain character of the rock made necessary constant inspection day and night to insure protection against detached pieces of rock being jarred loose and falling on the main tracks.

At several places the present line tunnels through points of rock extending into the river. In connection with the construction of additional tracks, these tunnels are in several instances being replaced with open cuts. At such places great care must be taken to prevent the rock from falling on the tracks, especially as much of the rock in the tunnel roofs is badly eaten by locomotive gases.

At the John Jacob Astor estate, two miles north of Rhinecliff, previous agreement required the maintenance of a tunnel. As the alinement was changed somewhat at this point, the new tunnel was built independent of the old line. By agreement with the Astor estate, the contractor was permitted to excavate an open cut, construct the tunnel in the open and then cover it, restoring the original surface. The accompanying photographs show this feature clearly. The tunnel consists of a flat concrete arch with a span of 58 ft. 1 in. and a maximum rise of 35 ft. above the top of rail.

The presence of large estates bordering the tracks with riparian rights extending to the river required, in many instances, special precautions to maintain slopes and to prevent injury to trees, etc. In several instances where bridges were raised and new embankments built, walled pits were left in the slopes about the trees.

Where the new tracks were built on the river side, less difficulty was encountered, although it was only possible to build on this side at certain places because of the great depth of the water. While the river is not wide enough for the wind to create waves of any magnitude, a number of fast steamers run on the river and create waves of considerable size which do damage to unprotected banks. For this reason, all new embankments were protected with riprap. A dry wall was first built at the toe of the slope of heavy stone brought from building excavations at New York and placed with derricks. Some of the filling material required inside of this wall was also brought up from New York on scows; the contractors securing it from building excavations there.

The track crosses a number of tidal bights where provision must be made for the passage of considerable quantities of water every 12 hours. Openings were made at these places, either by culverts or short bridges. Cast iron pipe and concrete boxes were used for the smaller openings while the bridges were built of I beams embedded in concrete and resting on concrete abutments.

A very interesting problem was encountered in Poughkeepsie where similar work is under way. While some difficulty had been experienced in holding the tracks to surface in several places, no unusual difficulties were anticipated. However, when the widening of the cuts was undertaken, trouble was suddenly encountered in holding the new tracks up. In two different instances these tracks were left in good condition in the evening and showed no signs of weakness under heavy traffic during the early portion of the night; however, towards morning they suddenly dropped, creating such a condition that traffic could only move over them with great care. In order to insure continuous operation, it became necessary to drive piling under these tracks the length of these pockets and build standard trestle construction. A wall of sheet piling was then driven between these and the adjacent tracks to prevent any movement of material and the material under the remaining tracks was then excavated. Following this a concrete slab was laid under the remaining tracks the entire length of the sink holes, resting directly on the mud, and designed to confine this material as well as to distribute the load. The results so far, indicate that this has been successful. This construction was required in three instances at Poughkeepsie. The length of concrete mats required ranged from 90 ft. to 910 ft., and they extended under four and five tracks.

This construction work was all handled under the direction of G. W. Kittredge, chief engineer; J. W. Pfau, engineer of construction, and R. E. Dougherty, district engineer, with George D. Evans, assistant district engineer, directly in charge.

ORGANIZATION OF FLOATING GANG TO TRAIN FOREMEN.*

By W. H. Cleveland,
Roadmaster, Atchison, Topeka & Santa Fe, Wellington, Kan.

A school for section men is often advocated in its various phases. One of the popular ideas is monthly meetings, held at some point on each division. This is good as far as it goes, but it merely provides for an exchange of ideas and explanations and social friendship. The only way that proficiency can be gained is by actual experience; by being brought in actual contact with the work, in all its varying conditions; by working under the supervision of some one who is master of the art. There must also be some object in view, something in sight to work for. There must be, first, present means of support, second, assurance of future promotion.

To provide a supply of competent foremen for the future, I would recommend the systematic organization of floating gangs. On each superintendent's division organize one small floating gang as large as the working conditions of the division will permit. Let this gang consist of from six to ten laborers. Let the men employed in this gang be selected from the ranks of American labor, of the proper age and of the highest intelligence that it is possible to obtain. Pay them wages as much above those of the foreign labor as the division conditions will warrant, taking into consideration, the wages paid locally to labor in other industries, and let them understand that they are in line for promotion as their experience and proficiency warrant. Place the most experienced foreman you have over this gang; a man who is master of the profession in all its features; a man whose qualifications place him in line for promotion to the position of roadmaster. Pay him the extra gang foreman's salary and let him understand that his business is to do a high standard of work, supervise all work, and act as instructor of the men under him, to fit them for positions as foremen. Place this gang in good comfortable bunk cars with a boarding car for the men, so that they will always be at home with the outfit. Let the foreman board the men. Equip them with the necessary tools for doing all kinds of work, including emergency work—wrecks, washouts, etc. Furnish them with standard blue prints and rules and literature. Then use this gang on any part of the division where it is needed. If there are switches to be laid or improvements of any kind to be made on any section, move this gang there and let it do the work in connection with the regular section gang, schooling the men in the art of switch laying and track laying to standard. In this manner the regular section gangs will get the schooling and instruction which will greatly benefit them. Make it the duty of the instructing foreman thoroughly to instruct each foreman and gang on whose territory he is working and make some part of every Sunday an information day for this gang and the foremen and men near where he happens to be stationed. Once a month let the roadmaster be present and make it a general instruction meeting, taking up the matters of timebooks and reports, book of rules, time cards, blue prints and estimates, and the subject of emergencies. In this way the entire division will soon become thoroughly informed on all subjects and will be experienced in all standard and emergency work. Then when you want a relief or permanent foreman you can promote a high class man from this gang and immediately fill his place in the gang with a new man. If you want a relief or permanent

*Received in the contest on The Foreman Problem, which closed March 25, 1912.

roadmaster on quick notice promote the foreman of this gang and you will have a man that is qualified and acquainted with all parts of the division and its working conditions, and one of the best laborers in the gang can be promoted to relieve the foreman in his absence.

When there is no track laying or important work to be done, let this gang help out with the ordinary work on the division If there is a small piece of ballasting to be done; if there are the renewals; if there is fence to be repaired, or new fence to build, use them for such work; and if there is no special work to do, then float them from one section to another, helping out the worst sections.

If at any time forces are short and a section foreman has a mile or two of rough track that he cannot reach in good time, then float this gang over to him and let them help him out a week or so and then pass them to the next section needing help. This will save the necessity of increasing forces and will permit division operation with much less force. In case of accidents, wrecks, washouts, and such emergencies, this gang in cars can be gotten on the ground quickly and their experience should make them very valuable. Any division can find continual work for such a gang, unless it is in severe winter weather, and the arrangement will insure a supply of foremen of a high class without gathering the foremen monthly to some fixed point on the division, which depletes a large portion of the division of foremen for one day and does not instruct the section laborer from whose ranks the foremen must be taken.

KILLING WEEDS WITH CHEMICALS.

The weeding of track, especially in dirt ballast, is a source of heavy annual expense to the railways. As the weeds offer serious impediment to trains if allowed to grow undisturbed, it is necessary that they be removed. The most common method of removal is by hand weeding with hoes or similar tools. On some of the western roads, weed burners are also used. Another method which has gained wide attention during the past

C. M. & St. P. Track, near Dunnville, Wis., Treated July 26, 1911. Photo Taken May 16, 1912.

two years is that of the destruction of weeds by the use of a chemical.

During the past two seasons the Atlas "A" weed killer has been used to such an extent that a definite comparison of results can now be secured. This material is a concentrated chemical solution weighing about 13.5 lbs. per gal. It is dark gray in color, with an odor similar to that of lye. Before applying, this liquid is diluted with water in the ratio of about 15 to 20 gal. of water to one of the chemical, the water serving simply as a means of distribution of the chemical. In general, about 10 gal. of the chemical is required for each one foot width of track one mile long, although this varies somewhat with the density of the weed growth, the nature of the ballast and soil, and the season in which it is applied. After the first year's application this amount can be reduced until the fourth or fifth year, when it is stated that the ground will be practically sterile and will support very little vegetation.

Where it has been tried it has generally been used in sufficient quantities to warrant the equipping of a tank car with a sprinkling device whereby the diluted liquid is distributed over the

Photographs of B. & O. Track on Shawneetown Branch Before and Eight Weeks After Treatment. Heavy Growth of Warren Weed Originally.

track. However, a small tank can be installed on a push car if desired and the material sprayed from that. Where a large car is used a spraying device consisting of a perforated pipe about 2½ in. by 8 ft. long is attached to the discharge pipe so that it is held about 8 in. above the rails. This pipe is drilled from end to end with three or four rows of 3/16 in. holes. Elbows are placed in each end of the pipe with the closed end turned up, the elbows being drilled with a number of holes located so as to throw the chemical out the required distance beyond the ends of the ties. The amount of flow can be regulated by a valve in the discharge pipe, which can be operated from the platform of the car. The chemical and the water are mixed by pumping air through the train air line into the bottom of the tank to agitate the solution. This same air line can be used to maintain a pressure in the tank while spraying is being done.

The applications should be made in a dry spell when the plants are thirsty and will quickly absorb the moisture. For this reason it is not advisable to apply the solution after a heavy rain when the plants are saturated. While the material may be applied at any time during the growing season, best results can be secured by using it early in the season before the vegetation has reached the stage where it will remain standing after being killed, for not only is it more sensitive and more easily killed early in the year, but no unsightly stalks are left standing. The chemical is poisonous and care is required to see that it is not used along the right of way where stock is grazing, for when the vegetation is moist it tends to attract cattle and kills them. However, a recent improvement has been made whereby it is said that this chemical has been made distasteful to stock so that they leave it alone. This has recently been tried on the Cuban railways where, due to the lack of dining car facilities, venders sell eatables at the various stations and much refuse is thrown from the windows of the trains, attracting pigs, goats and other animals. The use of this improved chemical has not only resulted in killing the vegetation but also in repelling the live stock.

While the cost of this material varies somewhat with the amount of the chemical used, it averages about $35 to $45 per mile of track for the first application and a lesser amount for succeeding years. As the cost of weeding ordinary dirt ballast track ranges from $30 to $50, the economy is evident, while the section forces are enabled to devote their time to more productive work.

While this product has been used extensively in South America, Australia and other foreign countries, it has only been used here for the past two years. One of the first roads in this country to use it to any extent was the Chicago, Milwaukee & St. Paul, which treated 16 miles of track in northern Wisconsin in July, 1911, with an average of 62.5 gal. per mile at a cost, including the expense of the train crew, of $26.23 per mile. This

Removing Chemical from Supply Car to Spraying Car on Fort Dodge, Des Moines & Southern.

track was sprayed by means of a sprinkling apparatus attached to an old tank car. The track was not ballasted and was covered with sod. About 24 hours after the application was made the vegetation had wilted, and this year there was no trouble with weeds or grass.

The Baltimore & Ohio treated 36 miles of earth ballasted roadbed between Flora, Ill., and Shawneetown during the past summer. The vegetation on this line varied from a light growth of

Treated and Untreated Track on C. M. & St. P. at Downsville, Wis. Treated July 26, 1911. Photo Taken May 16, 1912.

grass to a heavy massed growth of foxtail and crab grass interspersed at various places with berry vine, milkweed and a very heavy growth of Warren weed. Due to continued wet weather in the spring the application of the weed killer was not made until the middle of July, at which time a width of 12 ft. was treated with 100 gal. of the chemical per mile. Within three days after the application was made most of the weeds began to die and the effect was very noticeable. The difference after an interval of eight weeks is shown in one of the accompanying photographs. The Warren weed was entirely killed while the foxtail and crab grass were very largely, although not entirely, destroyed—the application not being heavy enough to permeate entirely the thick mass of roots. This application was made at a total cost of $37.65 per mile, exclusive of $29.32 for equipping the car with a sprinkling device.

Forty miles of track of the Fort Dodge, Des Moines & Southern was treated in the same manner, this track being ballasted with gravel in which a considerable amount of soil which would support vegetation was mixed. Due to various delays, this track was not treated until quite late in the season after the weeds had made a strong start. However, with the exception of a few spots where wiry grass was present, the weeds were thoroughly killed.

The Pennsylvania Railroad applied this material at different points on the Delaware and Manhattan divisions during the last season. The mixture was prepared in the ratio of one gal. of the chemical to from 15 to 40 gal. of water, depending on the density of the weed growth. It was applied both with hand sprinkling cans and from cars carrying tanks connected to small pumps operated by air from a locomotive. The time required for applying it varied from about 30 min. for a train equipped with tanks to go over two miles of single track to 250 hours for sprinkling three tracks for a length of 1,850 ft. by hand. Among other roads which have also used this material for killing weeds is the Public Service Railway of New Jersey, which treated 65 miles of track during the past year.

PREVENTION OF ACCIDENTS TO MAINTENANCE OF WAY EMPLOYEES.*

By W. E. Davin,
Supervisor, Pittsburgh & Lake Erie, McKees Rocks, Pa.

According to my observation a large number of accidents to employees in the maintenance of way department is due to dangerous practices and to the carelessness of the employees themselves. On many roads safety committees have been appointed and representatives from all of the various departments act on these committees and report in accordance with the policies outlined. In the work of the safety committees it would seem that nearly all of the efforts are directed toward the prevention of accidents to trainmen and shopmen, and comparatively little is being done by these committees toward the prevention of accidents to employees in the maintenance of way department. This lack of interest may be due to the failure of the supervisors, roadmasters and foremen who are actually in charge of the men and work in the field, and who have every opportunity to observe the conditions and practices that are causing accidents to employees in this department, to give this matter serious consideration.

Every supervisor, roadmaster and foreman, whether a member of a safety committee or not, should consider it his duty to give attention to all matters pertaining to the safety of the men employed under him. In addition to this all conditions that may seem dangerous or that might cause injury to trainmen or others should not be overlooked but should be reported to the proper officers. The primary work, however, of those in charge of maintenance should be to remedy defective and dangerous practices and conditions in the department which they represent. In this respect I have done a great deal of work on my division, taking up each case separately and applying a remedy wherever possible to prevent a recurrence and to eliminate the dangerous features and practices.

When employees in this department are injured report is made to the proper officers. The supervisor makes a thorough investigation and determines as far as possible the cause, and if it is found that the accident could have been avoided by some other

*Received in the Safety contest, which closed October 25, 1912.

method or practice or by the use of other or better tools, a circular letter is sent to all foremen calling attention to this particular accident, how it occurred, the extent of the injury, and explaining in detail how it might have been avoided together with instructions to the foremen to explain the details to each man in his gang. Where foreigners are employed who cannot understand English, one of the foreigners in the gang explains to them the instructions in their own language.

Many dangerous methods are in use by trackmen in performing track construction and repair work and in handling tools. Many of these methods may have been used for years and have caused numbers of accidents. In order to bring these matters before the men in a practical manner special instructions are issued from time to time explaining the dangerous features and methods of handling work and tools and how to avoid injury from them.

Lack of system and bad practice are responsible for many injuries. When handling rails a good man at each end of the rail with a rail fork and the rest of the gang giving attention to these men is a safe method. The men at the ends of the rail should be competent. Rail forks are used when loading and unloading rail. Tongs are always used when handling and carrying rails. With the majority of foreigners it is common practice to do considerable talking. When performing hazardous work we aim to stop this as much as possible.

Rail cutters or chisels are kept in good repair. Battered head cutters are not used. It is just as important to keep the striking face of a cutter in repair for safety as it is to keep the cutting edge in repair for cutting. The use of spike mauls for striking chisels is not permitted. Striking hammers or sledges with wide striking faces are used. When cutting rails the practice of lifting the rail as high as the men can reach and allowing it to drop across a tie or rail is not permitted. The use of a rail bender is perfectly satisfactory.

Holding a spike maul on the head of a spike and striking it with another maul is a dangerous practice and is not permitted, a rail punch being used instead. Many injuries are due to the head flying off when pulling spikes and from pieces of steel flying from the bar and spike maul. If the spike is first tapped with the spike maul it will not be necessary to drive the bar under the spike head with a maul.

Track jacks are dangerous to operate and the most competent man in the gang is always assigned to this work. The use of tie tongs for handling ties not only prevents injury to the men but is a great saving to the ties compared with the old practice of handling them with picks. When trackmen are working at interlocked switches, in addition to a proper arrangement with the towerman, a block is placed in the points to prevent men from being caught in case the lever is accidentally thrown by the towerman. The use of a megaphone is of much assistance in handling men in busy yards and terminals and at points where the view of approaching trains is obstructed. Cutting or breaking track bolts out of joints has caused many accidents. If bolts must be cut out one should see that all other men in the gang are out of the reach of any parts that may fly from the bolt or cutter.

Jumping on and off moving cars and trains, crawling under cars, climbing over cars in yards, passing between cars standing close together, taking shelter from rain under cars, sitting under cars to eat lunch, getting on and off hand and push cars in motion, running hand and push cars or motor cars over interlocking switches without a clear understanding with the towerman, applying brakes on hand and motor cars without warning to the men on the car, allowing the men to leave track tools on or near track, standing, walking or working on tracks while trains are passing on adjacent tracks, riding on or standing close to a plow when unloading ballast or other material, standing near cables when ploughing off cars, sitting on brake wheels of cars at any time, thawing, handling or transporting dynamite or other high explosives, running hand cars and motor cars at a high rate of speed and too close together and standing close to track when trains are passing are some of the many acts of carelessness on part of employees which result in accidents and injury and to which we have given special attention.

Foreigners are the victims of many acts of carelessness and poor judgment on the part of the gang foreman who does not stop to think of the results that follow. They are easily confused and foremen should use more than ordinary care to keep them out of the way of trains.

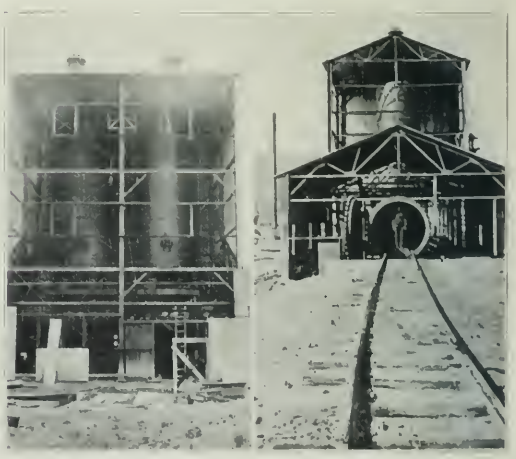
When working on double tracks and four tracks at busy terminals trackmen can do much to prevent injury to employees in the transportation department by keeping the work cleaned up every day wherever it is possible to do so. When work is in progress that cannot be put in safe condition daily, a notice should be placed on the bulletin boards for protection of trainmen.

The unloading and piling of material at a safe distance from tracks is a very important matter that trackmen must strictly comply with. The use of improved machinery and tools for handling materials in connection with maintenance of way work has proven a large factor in decreasing the number of accidents and also in decreasing the cost of labor.

CREOSOTING PLANT NEAR CONNELLSVILLE, PA.

The creosoting plant of the Pittsburgh Wood Preserving Company, Pittsburgh, Pa., has just completed its first year in operation, which has proved thoroughly successful. This plant is located on the tracks of the Pittsburgh & Lake Erie and near those of the Baltimore & Ohio, the Western Maryland and the Pennsylvania at Broadford Junction, Pa., near Connellsville. The site includes 50 acres of property near the Youghiogheny river, on the hill side of the tracks, where good drainage is secured.

Beech, birch, maple, red oak, white oak and chestnut ties, red



Overhead Creosote Weighing Tanks. End View of Cylinder House Under Construction.

oak piling and yellow pine structural timbers have all been treated and the plant caters to the commercial business throughout the Pittsburgh district. Last summer extensive tests were made of actual treatment with the empty cell process, and it was found that a thorough penetration of all sap wood could be secured in the above named species by a careful treatment of the seasoned wood. All ties at this plant are

seasoned in the yard from six months to over one year before treatment.

The main buildings are located at the extreme end of the property and away from the main ladder track. The loading platform is between the ladder track and the cylinder house, and is 4 ft. high with tracks on each side spaced 44 ft. center to center. On top of this loading platform there are three 36 in. gage tracks. Between the cylinder house and the loading platform is located a standard 50 ft. track scale arranged for weighing all charges in and out of the treating cylinders. The main ladder track is constructed of 80 lb. rails throughout, and all storage tracks are three rail, 36 in. and standard gage, for handling the narrow gage trams and locomotive. An electric hoist is used to handle treated ties in the yard.

The treating plant consists of two 7 ft. cylinders, each arranged for a capacity of about 500,000 ties per year. The cylinders are set on concrete piers so that a man can walk under and around them. There are two special high pressure measuring, or working, tanks which are mounted on scales above the cylinders. Each tank will hold about 75 tons of creosote and, with the special arrangement, it is possible to weigh this heavy load within the graduations of 20 lbs. on the scale beam or, if further refinement and accuracy is wanted, the scales on the loading platform can be used as a check. Thus all creosote used is weighed in and out of the cylinders, and it is possible to secure very accurate results. The cylinder house is equipped with special rotary vacuum pump, air compressor, pressure pump, general service pump and circulation pump for the Card process. At one end of the building a room is partitioned off for the generator.

The boiler house is located about 125 ft. from the main building, and is arranged for two 150 h. p. boilers. The 40,000 lb. Porter yard locomotive is also housed here. The steam line from the boiler house to the main building and the exhaust line are carried overhead on steel supports.

An adzing plant is provided where all ties are faced to suit the tie plate and bored for screw spikes, before treatment. On the feed end of the adzing machine there is an automatic dumping arrangement which drops the ties from the trams onto the table which feeds the adzing machine. The tram cars drop down by gravity through a spring switch to the opposite end of the machine, ready for reloading. This adzing machine is driven by a 70 h. p. engine located in the same building. Adjacent to this adzing machine there is located a block cutting machine for the manufacture of blocks for shop floors and bridges.

For storing the creosote at this plant there are three very large storage tanks, sufficient for a year's supply of creosote. The creosote arrives in tank cars, and is dropped by gravity into the underground unloading tank, from which it is pumped to either of the three storage tanks.

Most of the railroad work at this plant is treated under the supervision of Dr. Herman von Schrenk, and the plant is managed by Grant B. Shipley of the Pittsburgh Wood Preserving Company.

Adzing Plant, Boiler House, Cylinder House and Storage Yard at Connellsville Creosoting Plant.

PROTECTION OF RAILWAY EMBANKMENT AGAINST STORMS.

The main line of the Louisville & Nashville between New Orleans and Mobile is located along the northerly shore of the Gulf of Mexico for many miles, and is subject to occasional damage from the storms which move inland from the Gulf. These storms are not unusual in the spring and fall, but seldom do much damage, lasting for only a short time. However, occasionally there comes a storm of greater violence which may continue for several days, doing much damage to the track and to property of all kinds. Such a storm occurred about two years ago, damaging the track for many miles and putting it entirely out of commission for a number of days. To avoid the repetition of such trouble this portion of the track had been rebuilt and anchored so that it is now believed that it will safely withstand further storms. This reconstruction work is now practically completed.

Panorama of Connellsville Plant with Cylinder House in Foreground.

The elevation of the subgrade of the new embankment has been established 6.5 ft. above the level of mean tide and it was made 22 ft. wide at the top and 48 ft. wide at the bottom. The center of the embankment is composed mainly of sand, which will facilitate drainage and the shoulders have been built of a tough, cohesive material, proof against wave and current action, secured from 12 to 15 ft. below the sand stratum. The shoulders of the embankment have been built to the height of the ties to shield the track from the direct wash of the incoming water and

the growth of sea marsh cane will be encouraged on the slopes as a further protection against wash.

In order to increase the weight of the track rails of 90 lb. section are now replacing the 70 and 80 lb. rails formerly used. The track is anchored to the roadbed by Crouse-Hinds Co. harpoon anchors, which are driven in pairs, one on each side of the track, these double anchors being placed at intervals of 66 ft. along the track for the entire distance between Lakeshore, Miss., and Micheaud, La. These anchors were driven down until the tops were 24 in. below the base of the rail and were then drawn up 20 in. by means of track jacks to open the flukes or barbs. Each anchor has a holding power of 9,000 lbs.

The track is attached to the anchors by rail clamps loosely connected to the ring at the head of the anchor shaft by wraps of galvanized wire to admit of the rail "running." This anchor connection may be readily detached to admit of track adjustment. In addition to this, the bridges have in some cases been raised to a greater elevation and the construction of the superstructure altered in some cases to diminish the water pressure.

At another point on the line between Pascagoula, Miss., and Gautier, where the road is exposed to the full force of the storms from the Gulf for a distance of about two miles, the work of raising the rails to a point above the highest recorded storm tide, or 11 ft. above mean tide, is in progress. This embankment is being protected by strong sheet piling wherever channels created by bayous in the sea marsh extend at right angles up to the embankment.

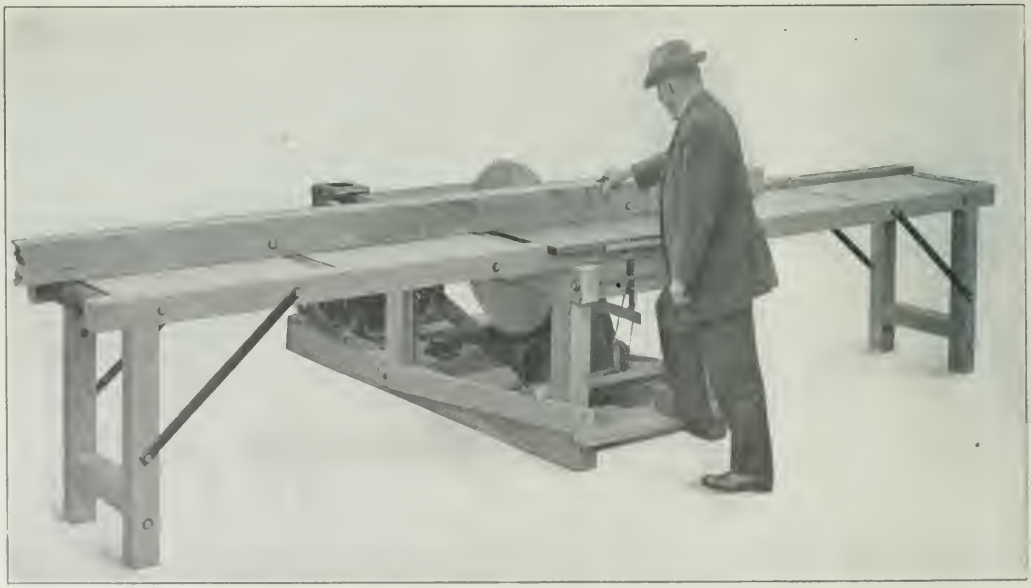
A HEAVY COMBINED RIP AND CUT-OFF SAW.

A new machine for ripping and cutting up heavy timbers for bridge and dock work, heavy framing, concrete form construction and similar work, has recently been put upon the market by the American Saw Mill Machinery Co., of Hackettstown, N. J. This machine is driven either by a gasoline engine or by an electric motor mounted upon the frame immediately behind and belt connected directly to the saw, or it is built without power with a countershaft mounted on the frame to attach to other available power.

The frame is of selected timber, accurately framed and strongly bolted together. The central section, or main frame, which is used for ripping, is entirely self-contained and is constructed of 3½ in. x 5½ in. timber with a hardwood top 36 in. x 58 in., which is hinged at the top to permit its raising to allow free access to the mandrel and other working parts. A substantial steel ripping guide is provided, which is adjustable to any position on the table by a clamp screw. The extension tables at the sides are made of 3½ in. x 3½ in. timbers, 23 in. wide and 6 ft. long and are fitted with three 3½ in. steel rolls. These tables are secured to the center section by steel plates which rest on steel dowels, so arranged that when the table top is raised these extensions can be readily detached and the legs folded up for convenience in moving. The mandrel of 1 11/16 in. steel with a 4 in. x 6 in. pulley and is designed for saws with a 1¼ in. hole. It is carried in babbitted bearings on a substantial iron swinging frame which is drawn forward by means of a foot treadle. A device is provided for locking this swinging frame in any desired position when used as a rip saw. A belt tightener is also provided for maintaining a constant tension on the belt.

This machine is equipped with one 30 in. rip saw and one 30 in. cut-off saw with a maximum projection of 11 in. through the table top. The table stands 34 in. above the floor. The entire machine requires a floor space of 8 ft. x 15 ft., and weighs 1,100 lbs. without power.

Railway Improvements in the Netherlands.—A new railway line is soon to be constructed from Hoogeveen, in the province of Drenthe, to Ommen, in the province of Overysel. The distance is only 15 miles, but the new line will traverse a territory without railway facilities at present. This section is a great peat district. The railroad yards at Hoogeveen will be enlarged to meet the wants of the new line. Another important improvement in that region, soon to begin, is the double-tracking of the line between Hoogeveen and Groningen via Meppel, about 55 miles, coupled with enlargement of railway yards at several towns along the line.



New Rip and Cut-Off Saw.

General News.

The Sonora Railway—the Southern Pacific's line in the western part of Mexico—is reported to be in the hands of the rebels for a distance of 240 miles.

The *Railway Record* has added up the amounts of fines which it has found reported as imposed on railroads during a single week, and finds the aggregate sum $739,275.

The Chesapeake & Ohio has made an increase of 10 per cent., dating from February 1, in the pay of all clerical employees whose salaries have been less than $150 a month.

The Central Safety Committee of the Chicago & North Western has awarded the company's "Safety" banner for the best record of safety for the year 1912 to the East Iowa division.

The Grand Rapids & Northwestern has placed an order with the Great Lakes Engineering Works for three steel car ferries to be operated from Ludington, Mich., to Milwaukee and Manitowoc, Wis.

The Atchison, Topeka & Santa Fe is planning to build a very complete reproduction of the Grand Canyon of Arizona to be exhibited at the Panama-Pacific Exposition in San Francisco. The reproduction of the canyon will occupy five acres.

An electric car propelled by the storage batteries of the Federal Storage Battery Car Company is now in service on the Newton Lower Falls branch of the Boston & Albany. This branch extends from Riverside, Mass., to Newton Lower Falls, one mile.

A grain elevator in the freight yards of the Michigan Central at East One Hundred and Twenty-first street and South Park avenue, Chicago, was destroyed by fire on March 9. The fire spread to a large number of freight cars loaded with grain, and caused a loss estimated at $125,000.

Charles A. Lutz, chief examiner of carriers' accounts for the Interstate Commerce Commission, has resigned that position to become controller of the United States Express Company. George G. Thompson, chief clerk in the post office department, who has had an important part in the establishment of the parcel post, is also to take a position with the United States Express Company, that of general purchasing agent.

A suit has been filed in the United States district court at Chicago against the Chicago & Eastern Illinois to recover $3,900 in penalties for failure to report instances where employees were worked more than 16 hours a day Fines aggregating $3,275 were imposed on the Chicago & Alton, the Chicago Junction, the Chicago, Milwaukee & St. Paul, the Grand Trunk, and the Wabash railways on March 4, in the United States court at Chicago for violations of the hours of service law, the safety appliance law, and the law regulating the shipment of cattle.

The Grand Trunk in Southern New England.

As reported last week, page 446, the special committee of legislators and citizens, appointed by the governor of Rhode Island to consider the question of guaranteeing the bonds of the Southern New England, made an unfavorable report. It is now said that the governor will accept the opinion of the committee. At Montreal this week, Mr. Chamberlin, president of the Grand Trunk, said that work on the Southern New England from Palmer to Providence could be started immediately, provided the state of Rhode Island should guarantee the bonds; but he added that if the state refused to give the guarantee there would be no immediate prospects of a resumption of the work.

Wireless Telegraph to Moving Trains.

The Delaware, Lackawanna & Western is to erect two wireless telegraph stations, one at Scranton, Pa., and one at Binghamton, N. Y., 65 miles north of Scranton, with a view to transmitting messages to passenger trains while they are moving on the road between the two places. Mr. Cullen, passenger traffic manager of the road says that if the experiments prove successful, receiving apparatus will be installed on all of the through passenger trains, and that he hopes to extend the wireless telegraph to Buffalo and to Hoboken—that is, throughout the length of the main line of the road, 410 miles.

New Car Shops at Ashtabula.

The Lake Shore & Michigan Southern has bought land at Ashtabula, Ohio, in the western part of the city, on which to build a shop for the repair of its steel cars. On account of the large number of steel freight cars now in use, and as ore and coal moves chiefly through Ashtabula, for which traffic the steel cars are largely used, the shop is to be located at that point. The plant, including the cost of the land which has just been purchased, will cost in the neighborhood of $1,000,000.

A Correction.

In the article on page 289 of the issue of February 14, entitled Superheater Switch Engines with Gaines Combustion Chamber, it was erroneously stated that a 7/8 in. bridge is used in the exhaust tip. This should be 3/8 in.

New Trains to the Pacific Coast.

The new Overland Limited train on the Chicago & North Western and the Union Pacific, to be placed in service on April 1, on a 64-hour schedule from Chicago to San Francisco, will leave Chicago daily at 7 p. m., arriving at San Francisco at 9:30 the third morning. Eastbound the train will leave San Francisco at 2 p. m., arriving at Chicago at 9 a. m. the third day. An extra fare of $10 will be charged. On the same day the Chicago, Milwaukee & St. Paul and the Union Pacific will put into service a 72-hour train between Chicago and San Francisco and Los Angeles without extra fare, to be known as "The Pacific Limited." It will leave Chicago at 10:45 a. m., arriving at 9:40 a. m. on the third day at both Los Angeles and San Francisco, running via the San Pedro, Los Angeles & Salt Lake to Los Angeles, and via the Central Pacific to San Francisco.

Unfilled Tonnage of the Steel Corporation.

The report of the United States Steel Corporation shows that on February 28, the unfilled tonnage was 7,656,714 tons, a decrease of 170,654 tons from the previous month. This decrease was about as expected, as the orders have been on the decline since October. In that month orders averaged about 80,000 tons a day; in November, 55,000 tons a day; in December, 46,000 tons a day; in January, 38,000 tons a day; and in February about 35,000 tons a day. The unfilled tonnage on January 31, 1913, was 7,827,368 tons; on December 31, 1912, 7,932,164 tons; on November 30, 1912, 7,852,883 tons; and on February 29, 1912, 5,454,200 tons. The present unfilled tonnage has been exceeded six times during the history of the corporation. The largest unfilled tonnage was on December 31, 1906, when it was 8,489,718 tons.

The Very Latest Thing in Signs.

The Chicago & North Western has just installed a novel electric advertising sign over the river front in Chicago, facing the Rush street bridge. The sign measures 50 ft. square, and shows a large passenger locomotive and part of a train. In front of the locomotive is a semaphore signal which automatically changes from the stop position to the clear position. When the change has been made the driving wheels of the locomotive are seen to revolve and a small ribbon of smoke is emitted from the stack. When the signal goes back to the stop position the wheels slow down and stop. Surmounting the sign is a large trade mark of the company in colors, and underneath the train are a few lines of advertising of its service. The sign stands on the roof of one of the company's freight houses, and is so located that it is seen by thousands of people. The sign contains 3,800 tungsten lamps, 29,500 lbs. of steel and 30,000 ft. of wire. Its total weight is 18¾ tons.

Railway Legislation.

An anti-pass bill has been defeated in the senate of the Utah legislature after it had been amended so as to allow most of the public officeholders of the state to ride free.

Both houses of the legislature of Connecticut have passed a bill amending the charters of common carriers so as to require

them to furnish free transportation to members of the legislature when that body is in session.

Both houses of the Texas legislature have passed a bill authorizing the St. Louis Southwestern of Texas to purchase and operate the Stephenville North & South Texas. An amendment to require the company to purchase the state railroad, running from Rusk to Palestine, was defeated.

A bill has been introduced in the Ohio legislature requiring all railways in the state to equip their trains entirely with steel passenger cars, and to install automatic block signals throughout their lines after January 1, 1914. Wooden passenger cars operated in the meantime are to be attached behind the steel cars if there are any in the train.

Both houses of the Oklahoma legislature have passed a bill to make 2¼ cents a mile the legal rate for passenger fares in the state until provided otherwise by the legislature or the corporation commission. The latter provision was inserted to enable the corporation commission to re-establish the 2-cent fare if the Supreme Court sustains the legality of that rate in cases now before it.

Both houses of the Indiana legislature have passed the bill drafted by Chairman Wood, of the railroad commission, providing for the elimination of grade crossings. The bill requires the newly established public service commission to keep on file a list of all highway crossings of railways, each to be designated by number, and provides for hearings before the commission, after which it may order a separation of the grades, at least three-fourths of the expense to be borne by the railway company, and not exceeding one-fourth by the county.

A Texas legislator thinks that some railway officers are not earning their salaries and has introduced a bill requiring the railroad commission to make such orders "as may be necessary to secure economy in the expense of operating the railways in Texas," and authorizing the commission to limit the salaries which railway corporations may pay, and such other orders "as may be necessary to prevent the dissipation of the earnings of railway corporations by unnecessary or extravagant expenditures to those performing no service, or unnecessary service."

Proposed Improvements at Springfield, Mass.

The State Railroad Commissioners of Massachusetts, acting as a special commission, under a law passed in 1910, has made a report on proposed new railroad lines in and near Springfield, Mass., to meet the demands of the city for the abolition of grade crossings and the enlargement of passenger and freight facilities in the city. Changes, according to various plans, have been under consideration for several years, but there is much difference of opinion between the several railroad companies, and between the railroads and the city, and it does not appear when the present plan is to be carried out; but the commission makes its report in accordance with the mandate of the legislature. The plan has been filed with the Hampden county superior court, at Springfield. In its main features it is similar to one presented by William Barclay Parsons who was engaged to study the problem in 1911. The commissioners estimate that the cost of the plan will be $9,415,000, which does not include an extension into the state of Connecticut which would be a necessary part of the scheme.

The main feature of the plan is a new line for the New York, New Haven & Hartford from the south, on the west side of the Connecticut river, which line would join the Boston & Albany at the point where it crosses the river. The Union station would be remodeled so as to permit passengers to cross from one side to the other beneath the six main tracks. At present the station is on the track level. Other features of the plan are a new connection to the Central New England about 4 miles west of Springfield; a connection from the Boston & Albany east of the passenger station northward to the Boston & Maine at Chicopee; a connection between the main line and the Highland division of the New Haven road, and the elevation of the Boston & Albany tracks near the river to permit two streets to cross beneath the tracks.

To Begin Work on Large Interchange Yards at Chicago.

The Belt Railway of Chicago has announced plans for beginning work at once on the improvements in the Clearing yards just outside of Chicago, including auxiliary yards and tracks, and several changes in the present alinement of the Belt, which will be necessary to put into effect the plan for using the Clearing yards for the interchange of through freight in the Chicago terminal district. The principal features of the plan by which thirteen of the principal railways entering Chicago become joint stockholders in the Belt, and have executed an operating agreement giving them equal rights to use the main tracks of the Belt for the movement of trains between their respective connections and yards and the clearing yards, were described in the *Railway Age Gazette* of March 22, 1912, page 693.

The Clearing property, including a hump classification yard with a capacity of 5,000 cars, has been acquired by the Chicago & Western Indiana, which owned the Belt, and leased to the Belt company, as reorganized, for a period of 50 years. The present yard, which has been lying practically idle for many years, is to be rebuilt and enlarged. The additions to it will include a group of receiving and departure yards located at the east and west ends of the present yard, which will be widened, additional ladder tracks in connection with the gravity mound, additional thoroughfare tracks connecting the west end of the yard with the main tracks of the Belt about one-half mile north of the present yard, new receiving and departure yards connecting the east end of the present yard and Hayford and a roundhouse, shops and office building to be located near the yard. Condemnation proceedings were started on March 8 to acquire about 150 acres of ground necessary for carrying out these plans, and it is expected that 3,000 men will be at work by April 1. When completed the work now planned will represent the first of a series of four parallel units planned to be built ultimately, and the first unit will have a capacity of about 10,000 cars. Later a large L. C. L. clearing house is to be built having a capacity sufficient for all of this class of traffic interchanged between the owners of the Belt and possibly for other roads in addition.

Transfers of through freight from east to west, west to east, and west to south, will be made in the yards at Clearing, thereby removing a large amount of interchange from the congested downtown terminals.

Louisville & Nashville Passenger Bulletin.

This is the title of a monthly circular issued by the passenger department of the Louisville & Nashville, at New Orleans, for the information of the station agents of the company in the territory south of Birmingham. It is a four-page sheet 8½ in. x 11 in., and quite similar in style to the bulletin of the Canadian Pacific, which was noticed in the *Railway Age Gazette* of February 21, page 330. A prominent feature is the "blue ribbon roll," a list of 33 stations, giving the name of the agent at each, where there was a marked increase in the sales of tickets during the month of January, as compared with January of the preceding year. There is a special paragraph about E. W. Speed, agent at Marianna, Fla., who is such a good solicitor that he secured, by February 13, the promise of 42 persons to go over the Louisville & Nashville to the inauguration of the president at Washington. Marianna, according to the atlas, has less than 2,000 population; though it is a county seat. To go north over the Louisville & Nashville passengers from Marianna have first to travel 135 miles westward. The bulletin contains a short article by the division passenger agent on courtesy and one from an assistant superintendent of the same nature. Reprinting a circular which was issued by the general passenger agent two years ago, the bulletin gives the following hints for the guidance of—

Experienced and Inexperienced Ticket Sellers.

"Complaints reach us from time to time that passengers, who have made inquiries of agents or experienced ticket sellers, during the day hours, concerning tickets which they desire to purchase for night trains, are unable to obtain such tickets at night, various reasons for failing to provide them being assigned —such as inability of men on duty at night to find tickets or tariffs, unfamiliarity with tariffs, not being permitted to sell interline tickets, etc.

"It is the duty of agents to assist passengers in all legitimate ways to obtain the benefits of any fares or arrangements authorized by tariffs, and pains should be taken to provide the tickets desired or to enable night men to carry out representations made by employees on duty in the day time. When inexpedient for night men to sell any particular tickets for trains departing at late hours, they should be issued during the day, but,

even if night men are capable of issuing any tickets which may be called for, and passengers, especially when contemplating journeys of considerable length, prefer to complete their arrangements during the day, they should be accommodated. It is preferable, on the whole, that local tickets for comparatively short trips should not be issued, day or night, until the last train preceding that for which they are desired has departed, but such condition is not arbitrary, and should not be carried to the extent, reported in some cases, of agents positively refusing to sell tickets after departure of last preceding train, and compelling passengers to wait until half an hour or less before the time of departure of train on which tickets were to be used.

"It should be the rule for each and every employee who has given any passenger special information, based on painstaking examination of tariffs or schedules, and who may not be on duty when tickets to which such information relates are called for, to acquaint other employees with the particulars, so that no misunderstanding may exist. It often transpires that passengers receive certain information from one employee, and, supposing that other representatives of the company are in possession of like information, they apply for tickets without entering into details as completely as when making first inquiries, and discover later that they have not obtained tickets of the character or by the route selected when original inquiries were made."

Boston Not the Whole of Massachusetts.

The universal electrification of railroads is an ideal beautiful to contemplate, but the proposal to have the Boston & Albany spend a great deal of money for the benefit of the metropolitan district of Boston does not inspire great enthusiasm among the rest of us along the line. Vice-President Hustis, in his statement before the legislative committee (*Railway Age Gazette*, February 28, page 400), shows how in 1912, for the first time since the lease, the deficit has been turned into a surplus. The length of the state the change has been appreciated. Nobody now complains of the Albany, and there is general confidence that Mr. Hustis is quite as much interested in serving the public as in making profits for the New York Central and the New Haven roads, who now share jointly the losses or profits of the Albany. Mr. Hustis said that the electrification for passenger service within the metropolitan district would cost over $6,400,000, and that there would be an added net loss in operation of nearly $550,000. This is a big burden for a small railroad to shoulder, particularly one just getting its feet on solid ground. The proposed electrification would again put the balance on the wrong side and would deprive all the rest of the road outside of Boston of improvements that it hopes for.—*Springfield Republican.*

Commodities, Operating Steam Railroads.

The *Railway Age Gazette* has received the following letter under a Constantinople date line, but bearing an American postmark, which indicates that "Aziz Bey" is not the earnest and unsophisticated inquirer for information that he seems:

Constantinople, February 15, 1913.

To the Editor of the Railway Age Gazette:

On examining the fifth annual report of the Public Service Commission of your state of New York, Second district, I find in Table 111-A, a list of "Commodities, operating steam railroad corporations."

We have in this country of ours quite a number of animals operating steam railroad corporations, including men, old women and asses, but so far as I am aware we do not term them "commodities."

I notice, however, that two of the commodities named in your list are "Live Stock" and "Poultry," which would seem to indicate that in your country, like ours, asses are so occupied, and possibly geese.

In another table of the same publication, 108-B, I notice that one of the railways has "Available for Service," two-thirds of one locomotive, and this appears to be a six-wheeled switcher. From another table I learn that this two-thirds of an engine was "in service" on June 30, 1911. It would be very interesting to learn the service of which an engine is capable, from which one-third has been removed. Possibly this arrangement was made by one of the commodities referred to above.

In the hope that you can give me full information on these interesting subjects, I remain,

Your most obedient servant,

Aziz Bey.

Drastic Grade Crossing Law in New Jersey.

Governor Fielder of New Jersey on Wednesday last signed the grade crossing abolition law. This was a bill which he introduced while serving as senator at the opening of the present session. The essential difference between the measure and that vetoed last year by Governor Wilson is that the present bill authorizes the public utility commission to determine what crossings shall be abolished, while the bill of last year made it compulsory upon railroads to do away with grade crossings at the rate of one for every mile of road each year.

President Rea, of the Pennsylvania Railroad had telegraphed to the governor, protesting against the approval of the bill, which provides for making the improvements at the sole expense of the railroads. Mr. Rea issued a statement showing the grave injustice done the railroads. He said:

"The Pennsylvania has long been committed to the policy of eliminating grade crossings as spedily as possible and is anxious that no laws be passed which will tend to deter, rather than encourage the rapid removal of all grade crossings.

"In the last 20 years the Pennsylvania has removed 110 crossings in the state of New Jersey, at an expense to the company of about $8,000,000, or $73,000 per crossing.

"There remain, however, some 1,200 grade crossings on the Pennsylvania system in New Jersey, the removal of which at $50,000 per crossing, would cost $60,000,000, an expenditure which would neither produce additional revenue, nor decrease expenses.

"It is to be hoped that the governor will appreciate the situation and veto the bill in the hope that one may be passed which will bring the state, the municipalities and the railroad together, insuring the apportionment of the cost in proportion to the equitable interests of all concerned."

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass. Convention, May 20, Chicago.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, Oliver building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May 21-24, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotehford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—L. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W. Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Assn.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Intercolonial Railway is to establish a car ferry between Cape Tormentine, N. B., and Carleton Point, P. E. I.

The Mobile & Ohio announces a fast live stock train to be run twice a week from Meridian, Miss., to East St. Louis. The run of 520 miles from Meridian is to be made in about 24 hours.

The Great Northern, Northern Pacific, and Minneapolis, St. Paul & Sault Ste. Marie, have announced new rates on return shipments of threshing machines, engines or their parts, second-hand, which has been used or broken, worn or damaged, at 60 per cent. of the regular rates. The rates apply from stations in North and South Dakota to St. Paul, Duluth, Stillwater and other points.

The New York, New Haven & Hartford has opened a new freight station at Pier 70, East River, at the foot of East Twenty-second street, New York. This station will accommodate the wholesale silk and cotton goods merchants, who during the past few years have moved their stores from the old dry goods district to the neighborhood of Fourth avenue, between Union Square and Thirtieth street.

A committee of the Montana legislature has been holding an investigation of the freight rate situation in the state, and has reported its finding to the legislature with the recommendation that the legislature ask the railroad commission to reduce rates on carload shipments 25 per cent., or to 40 per cent. less than the rates for less than carload shipments. The railways have promised the committee to correct some instances of alleged discrimination found by the committee.

The next regular meeting of the Western Classification Committee is to be held in St. Louis, beginning April 1. The docket is unusually large and important, because this is the first meeting since that of July 7, 1911, at which classification No. 51, which was suspended by the commission for a year, until February 15, 1913, was adopted. The Southern Classification Committee will also hold a meeting on April 7, at Cincinnati, and a preliminary meeting of the Official Classification Committee will be held in Chicago on April 15.

Liquors in Interstate Traffic.

The law passed by the last Congress, and re-passed by both houses after being vetoed by President Taft, regulating traffic in intoxicating liquors, is Public Statute No. 398. It is entitled "An act divesting intoxicating liquors of their interstate character in certain cases." It says, in substance, that the shipment or transportation in any manner or by any means of any spirituous, vinous, malted, fermented, or other intoxicating liquor, from one state to another, which said liquor is intended, by any person interested therein, to be received, possessed, sold, or used in violation of any law of the state into which it is destined, is prohibited.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association in presenting statistical bulletin number 137-A, giving a summary of car surpluses and shortages by groups from November 22, 1911, to March 1, 1913, says: The total surplus on March 1, 1913, was 58,529 cars; on February 15, 1913, 52,700 cars; and on February 28, 1912, 44,984 cars.

The total shortage on March 1, 1913, was 27,148 cars; on February 15, 1913, 30,517 cars; and on February 28, 1912, 37,142 cars. Compared with the preceding period; there is an increase in the total surplus of 5,829 cars, of which 5,796 is in coal, 1,479 in miscellaneous, and a decrease of 842 box and 604 flat. The decrease in box car surplus is in groups 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and western Pennsylvania), 4 (the Virginias and Carolinas.), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The decrease in flat car surplus is in groups 1 (New England Lines), 5 (as above), 8 (Kansas, Colorado, Oklahoma, Missouri and Ar-

kansas), 9 (Texas, Louisiana and New Mexico), 10 (as above), and 11 (Canadian Lines). The increase in coal car surplus is in all groups, except 4 (as above), and 7 (Montana, Wyoming, Nebraska and the Dakotas). The increase in miscellaneous car surplus is general, except in groups 1, 4, 5 (as above), and 6 (Iowa, Illinois, Wisconsin and Minnesota).

Compared with the preceding period; there is a decrease in the total shortage of 3,369 cars, of which 1,539 is in box, 3,841 in coal, and an increase of 1,873 in flat and 138 in miscellaneous. The decrease in box car shortage is in groups 4, 5, 6, 7, 8 and 10 (as above). The decrease in coal car shortage is in all groups, except 7 and 10 (as above). The increase in flat car shortage is in all groups, except 5 and 7 (as above). The increase in miscellaneous car shortage is in groups 1, 2, 3, 6, 8, 9 and 11 (as above).

Compared with the same date of 1912; there is an increase in the total surplus of 13,545 cars, of which 6,943 is in box, 7,800 in coal, 1,368 in miscellaneous, and a decrease of 2,566 in flat car surplus. There is a decrease in the total shortage of 9,994 cars, of which 5,869 is in box, 4,798 in coal, 2,219 in miscellaneous, and an increase of 2,892 flat cars.

The accompanying table gives surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

Car Balance and Performance.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 140, covering car balances and performances for November, 1912, says:

The miles per car per day, for November was 26.0, maintaining the same figure as in October and the highest of which we have record. This figure for November, 1911, was 24.4.

CAR SURPLUSES AND SHORTAGES.

Date.	No. of roads.	Surpluses—Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages—Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

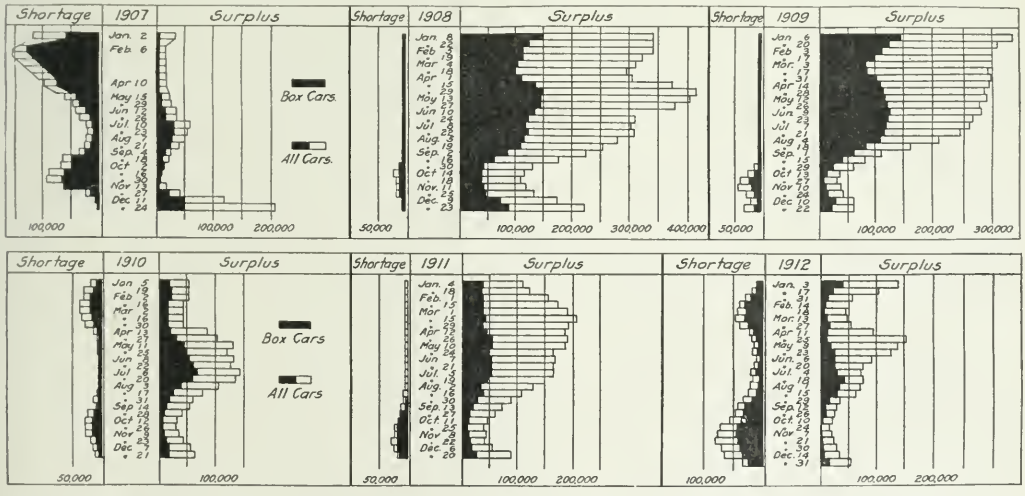
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1913.

Ton miles per car per day was 424 in November, 1912, compared with 433 in October, 1912. This is an increase of 12.77 per cent. over the figure for November, 1911, which was 376.

The proportion of home cars on line was 48 per cent., compared with 50 per cent. in October. This figure for November, 1911, was 56 per cent.

There is an increase of 2.9 points to 73.9 per cent. in the percentage of loaded car mileage compared with October, 1912. The per cent. of loaded car mileage in November, 1911, was 70.8 per cent.

The average earnings per car per day of all cars on line were $2.92, compared with $3.03 in October. This is an increase of 10.61 per cent. over the earnings for November, 1911, which were $2.64.

The table on the next page gives car balance and performance

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until June 28, certain items providing for the withdrawal of store-door and pick-up service at Washington, D. C., contained in certain tariffs.

The commission has suspended until June 14, certain items in the tariff of the Chicago, Milwaukee & St. Paul, which contain advances in rates for the transportation of grain from South Dakota points to Chicago and Milwaukee.

The commission has further suspended from February 25, until August 25, the schedules in certain tariffs, which publish new rules affecting the transportation of baggage exceeding certain dimensions both east and west of the Mississippi river.

The commission has suspended from March 12 until September 12, the operation of certain tariff schedules which contain proposed advances in rates for the transportation of lumber between points in Louisiana and Mississippi and Memphis, Tenn.

The commission has further suspended from February 26, until August 26, the schedules in certain tariffs, which advance rates for the transportation of linseed oil from St. Paul, Minn., and other points to Chicago, Kansas City, Mo., and other points.

The commission has suspended from March 1 until September 1, an item in a supplement to W. H. Hosmer's tariff, which contains proposed advances in rates for the transportation of asphalt and asphaltum from points in Kansas to St. Louis, Mo., and other points.

The commission has further suspended from February 26 until August 26, certain schedules in W. H. Hosmer's tariff, which advance rates for the transportation of pig iron in carloads, from points in upper Michigan and Minnesota to Kansas City, Mo., and other points.

The New Orleans Lumber Men's Association has filed a complaint with the Interstate Commerce Commission attacking the agreement recently made by the railways and steamship lines regarding demurrage and free time on through export bill of lading shipments of cotton, lumber and other forest products.

Illinois grain dealers have filed a petition with the Interstate Commerce Commission against a proposed readjustment of joint through rates on grain and grain products from Illinois, Iowa, and Indiana specific group points to points in eastern trunk line territory, which the shippers claim will bring about general advances ranging from one-half cent to one cent per 100 lbs.

The commission has suspended until July 8, the operation of certain tariffs, which advance rates for the transportation of grain and grain products, in carloads, from Chicago and South Chicago, Ill., and Whiting and Indiana Harbor, Ind., to points in Indiana, Ohio, Michigan, Pennsylvania and Kentucky. The advances range from ½ cent to 1 cent per 100 lbs., and affect a large number of points.

The commission has suspended from March 10 until July 8, the operation of supplements to certain tariffs which contain advances in rates for the transportation of lumber, piling and other forest products, in carloads, from Bena, Schley, Cass Lake and other points in Minnesota to Superior, Wis., and Duluth, Minn. The present rate between these points is 7 cents per 100 lbs., and the proposed rate 8 cents.

The commission has suspended until April 30, the operation of the schedules in certain tariffs which attempted to cancel the through rates now in effect for the transportation of lumber and other articles from north Pacific coast points destined to Missouri, Iowa, Illinois and points in other states east and west of the Mississippi river when moving via the Northern Pacific, Silver Bow, Mont., and the Oregon Short Line.

The commission has suspended from March 10 until July 8, the operation of a supplement to the tariff of the St. Louis & San Francisco which canceled through rates applicable to the transportation of lumber and certain articles manufactured therefrom, originating at points in Alabama, Miss., and other states, and destined to points north of the Ohio river, also providing that combination rates apply. The present through rate from Brownfield, Miss., to New York is 36½ cents per 100 lbs., and the proposed combination rate is 44½ cents. Similar increases were contemplated between other points.

Investigation of Water Connections.

In a general order to all railroads, the commission calls for a report, under oath, before April 15, showing what connections each may have in the transportation of freight or passengers by water. The information is to be used by the commission in the administration of the provision of the Panama Canal law, under which it will be unlawful, after July 1, 1914, for any railroad company to own, control, or have any interest in any common carrier by water operated through the Panama Canal *or elsewhere*, with which the railroad may be a competitor.

Investigation of Private Cars.

The Interstate Commerce Commission has begun an extensive investigation of private freight car lines, and of the business of all owners of cars other than railroad companies. The investigation will be in charge of Commissioner McChord, and the examination of carriers' and car owners' accounts will be made under the direction of George P. Boyle. Circulars containing requests for information have been sent to railroad companies, to car owners and also to users of private freight cars. All shippers or associations interested in the subject are requested

to send in any information in their possession, and the replies are wanted in Washington by March 31.

No complete record of the freight cars in the United States has ever been made. All statistics hitherto gathered by the government, or by the American Railway Association have given either estimates or else no information at all, insofar as they deal with cars owned by other than railroad companies.

Reparation Awarded.

Henry H. Sheip Manufacturing Company v. Atlantic Coast Line et al. Opinion by the commission:

The rate of 63 cents per 100 lbs. for the transportation of a carload of cigar-box lumber from Tampa, Fla., to Philadelphia, Pa., was found to have been unreasonable to the extent that it exceeded 32.5 cents. (26 I. C. C., 178.)

Joe C. Sims v. Montpelier & Wells River et al. Opinion by the commission:

The commission found that the rate of 8 cents per 100 lbs. charged for the transportation of granite and stone blocks or slabs from Louisville, Ky., to Lebanon, Ky., as part of the through rate from Barre, Vt., and Bedford, Ind., was unreasonable to the extent that it exceeded 5½ cents per 100 lbs., and ordered that rate for the future. (26 I. C. C., 275.)

Complaint Dismissed.

Wharton Steel Company v. Central of New Jersey et al. Opinion by the commission:

The commission found that the rate of $1.15 per gross ton for the transportation of pig iron in carloads from Wharton, N. J., to Harrisburg, Pa., was not shown to have been unreasonable. (26 I. C. C., 166.)

Minneapolis Steel & Machinery Company v. Chicago, Milwaukee & St. Paul et al. Opinion by the commission:

The complainant was not found to have been damaged by reason of charges assessed for the transportation of carload shipments of structural steel from Minneapolis, Minn., to Miami, Ariz. (26 I. C. C., 193.)

Public Service Commission of Washington v. Northern Pacific et al. Opinion by Commissioner Harlan:

This case was originally decided in 23 I. C. C., 256, mentioned in the *Railway Age Gazette* of May 3, 1912, p. 1021. Subsequently the Great Northern asked the commission for a rehearing. The commission again went over the record in the light of the petition for a rehearing and of the suggestions filed in support of it, but adhered to its original decision and denied the petition of the defendant. (26 I. C. C., 272.)

Motorcycle Manufacturers' Association v. Baltimore & Ohio et al. Opinion by Commissioner Prouty:

On July 1, 1910, by official classification motorcycles were given a rating one and a half times first class l. c. l. and first class c. l. For some years previous the carload rating had been second class and the complainant attacked this advance as unreasonable. The commission found that the rates in question are just and reasonable as compared with the rates on bicycles and automobiles, and with the rates on motorcycles in other parts of the country. (26 I. C. C., 127.)

New Pittsburgh Coal Company v. Hocking Valley. Opinion by Commissioner Meyer:

The commission found that the rate of 85 cents per net ton on "lake-cargo coal" from the Hocking district of Ohio to the docks at Toledo, when for transshipment to points beyond, was not unreasonable at the time the complainant's shipments were transported. The commission is without authority to award reparation in any case unless it can conclude that the rate assailed was in violation of the act to regulate commerce during the period the shipments in question moved. (26 I. C. C., 121.)

Tone Brothers v. Illinois Central et al. Opinion by Commissioner Clements.

Under Western classification pepper is rated second class, any quantity, and under Official classification this commodity is rated fourth class in carloads and second class in less than carload quantities. The complainants contend that the classification of pepper under Western classification is unreasonable, as no special provision is made for shipments in carloads. The commission decided that as the classification of pepper under Western classification was under consideration in other proceedings, and as the tonnage shipped by the complainant was extremely light, it would be inappropriate to deal with that question in this case. (26 I. C. C., 279.)

Davis Sewing Machine Company v. Pittsburgh, Cincinnati, Chicago & St. Louis et al. Opinion by the commission:

On July 1, 1910, the rating in official classification on bicycles in carloads was advanced from second class to first class. The complainant contends that the first class rating on bicycles from Dayton, Ohio, to Chicago is unreasonable. In 22 I. C. C., 291, this was heard and the commission held that the advance had not been justified. Subsequently the defendant filed a petition for rehearing which was granted by the commission. The testimony shows that rates on all vehicles were advanced at the same time that the advances in question were made; also that the prices on bicycles had advanced. The defendant maintained that if the rates from Dayton to Chicago were reduced it would necessitate numerous other reductions. The commission found that the carriers had shown the advanced rate to be reasonable. (26 I. C. C., 282.)

Linseed Oil Rate Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of linseed oil from St. Paul, Minn., and other points to Chicago, Kansas City and other points. Opinion by Commissioner McChord:

The suspended tariffs propose to advance the rate on linseed oil from St. Paul, Minn., to Peoria, St. Louis and Missouri river cities and points beyond; from Milwaukee and Chicago to St. Louis and Springfield, Ill., and between other points. Minneapolis interests contend that the proposed rate is unreasonable and discriminatory in that they would be placed at a disadvantage as compared with other producing points. The advance is also opposed by interests at Des Moines, Ia., on the ground that that city would be placed at a disadvantage as compared with Minneapolis. As a general rule oils take fifth class rates which are materially higher than the rates proposed, notwithstanding the value of linseed oil is much greater than that of other oils. The commission found also that the conditions as regards competition had materially changed since the establishment of the present rates. The complainants place but little emphasis upon the claims that the proposed rates are unreasonable in themselves and apparently base their contention upon the fact that the present rates are of long standing. They contend that the advanced rates would result in a discrimination against Minneapolis in favor of Buffalo, because that city would have a lower per-ton-mile rate for short hauls. The commission found that though it was true, as a general rule, that the ton-mile revenue decreases with increased distance, that rule had application to hauls over the same line in the same direction, and therefore it did not follow that Buffalo and Minneapolis should take the same or relatively the same per-ton-mile rate to common territory. The commission found that the revenue from the transportation of linseed oil as compared to the revenue from similar products was not remunerative to the carriers. It was decided also that the fact that the rate on flaxseed from Minneapolis to Chicago was recently increased, was an argument for higher rates on linseed oil. The commission decided that with the exception of the rate from Des Moines the defendants had shown the proposed advances to be reasonable. The order of suspension was vacated.

With regard to the rate from Des Moines it was shown that at the time of preparation of the tariff in question the carriers did not know Des Moines was a producing point and that the rates had been decided upon without particular attention to that point. The defendants practically admitted that the existing adjustment between Des Moines and Minneapolis was not entirely fair to Des Moines. The commission found that the proposed advance in the rates from Des Moines would result in discrimination against that point in favor of Minneapolis and ordered the defendants to withdraw the advanced rate from that point. The commission found that some advance from Des Moines would probably be necessary and made it clear that nothing in this decision would prevent the carriers from adjusting the Des Moines rate with the rates found reasonable from Minneapolis. (26 I. C. C. 265.)

STATE COMMISSIONS.

The Illinois railroad commission has suspended until May 1 a proposed advance of one cent per 100 lbs. in rates on grain from points in Illinois to Chicago, pending an investigation of the reasonableness of the advance.

The State Railroad Commission of Pennsylvania has notified the Pennsylvania Railroad and the Philadelphia & Reading that it is going to send accountants to make a thorough examination of their books with a view to determining the cost of carrying anthracite coal to Philadelphia.

The Texas railroad commission has issued an order directing all railways in the state to file a detailed statement showing expenditures for additions and betterments for each fiscal year since the commission's original valuation of their property. The statements are to be filed within 30 days.

The California railroad commission has announced that it has decided to assist the fruit growers of the state in presenting to the Interstate Commerce Commission their application for a reduction in the minimum carload weight for deciduous fruit moving from California in interstate commerce.

COURT NEWS.

After both houses of the Texas legislature had re-passed over the governor's veto, the bill to permit the Missouri, Kansas & Texas of Texas to absorb several subsidiary lines in Texas, a temporary restraining order to prevent the consolidation was issued by Judge Calhoun of the Texas district court, at Austin, Tex., at the instance of the state authorities. The petition for an injunction asserted that the proposed consolidation would be contrary to the state constitution.

Judge McCall in the United States Court for the western district of Tennessee, in a suit against the Yazoo & Mississippi Valley, sustains that clause of the hours-of-service law which authorizes the imposition of a penalty of $100 a day for each day that any railroad shall continue in default of the requirement that reports must be made every month, showing all cases of employees having been on duty for a longer period than 16 hours. The penalty in the hours-of-service law is enforced in accordance with the procedure set forth in the twentieth section of the interstate commerce law. The railroad company sought to show that the penalty in the case of the hours-of-service law should not be so rigidly imposed as in the case of failure to make an annual report; but the court says that when the language of a statute is plain and unambiguous its harshness should not be ameliorated by instructions of the court.

Decision on Hours of Service Act.

In two cases against the Minneapolis, St. Paul & Sault Ste Marie and two against the Northern Pacific, Judge Amidon, in the United States District Court, for North Dakota, Southwestern Division, holds as follows:

1. Hot boxes, loosened drawbars, etc., are matters which constantly arise and cannot be accepted as excuses for the violation of the federal hours of service law.

2. All substantial violations of the statute limiting the period of continuous employment of men engaged in railroad service must be regarded as serious—much more serious than violations of the safety appliance and the 28-hour live-stock statutes.

3. Courts must look at the subject matter of laws to ascertain whether the public welfare is seriously or only slightly involved in their violation.

4. Fatigue is as truly a physical cause of accident as are open switches and broken rails.

5. A substantial violation of the statute here involved can never justify a merely nominal fine.

Proposed Russian Railroad.—The Russian Ministry of Ways of Communication has decided to make an investigation in regard to the projected line from Saratov to Novotcherkask. This line would be 400 miles long, would traverse the grain territories of the Don Cossacks territory, and would be of great importance in connection with the future South Siberian Railway, as it would create a direct transit route to the Black Sea for the Siberian agricultural products.

Railway Officers.

Executive, Financial and Legal Officers.

Wilbur C. Fisk, vice-president and general manager of the Hudson & Manhattan, with office at New York, has been elected president to succeed William G. McAdoo, resigned. Mr. McAdoo also resigned as director.

Henry William MacKenzie, whose election as comptroller of the Seaboard Air Line, with office at Portsmouth, Va., has been announced in these columns was born on December 30, 1876, in Hampton county, S. C., and was educated in the common schools. He began railway work on May 1, 1891 with the Florida Central & Peninsular, and was a clerk in various accounting branches of that road until it was taken over by the Seaboard Air Line in July, 1900. He was then bookkeeper for the comptroller of the Seaboard Air Line until February, 1902, and then was general bookkeeper. In March, 1906, he was made assistant to comptroller of the same road, which position he held at the time of his recent election as comptroller.

Samuel C. Stickney, who has been appointed assistant to the president of the Erie, with headquarters at New York, as has been announced in these columns, was educated at the Massachusetts Institute of Technology. He began railway service in Minnesota, as a rodman on location and construction. He was then for one year—1886—locating engineer in Iowa on the Chicago, St. Paul & Kansas City, now the Chicago Great Western. In 1887 he was appointed superintendent of construction in Illinois, and from 1888 to 1890 was engineer of maintenance of way of the same road. He went to the Chicago Union Transfer Railway in 1890, as chief engineer. From 1892 to 1894, he was assistant to president of the Chicago Great Western, and from 1894 to 1909, was vice-president and general manager of the same road. He entered the service of the Erie in 1909, and now becomes assistant to president of that road as above noted.

Operating Officers.

William Lamb, trainmaster of the Illinois Central at Clinton, Ill., has been transferred to Waterloo, Ia., as trainmaster of the Waterloo terminals and Albert Lea district, succeeding John H. Rightmeyer.

G. A. Law, trainmaster of the Chicago, Burlington & Quincy at Aurora, Ill., has been appointed assistant superintendent of the Hannibal division, with headquarters at St. Louis, Mo., to succeed F. Cone, transferred.

Max Fiedler, general foreman of the Globe, Ariz., shops of the Arizona Eastern, has been appointed an assistant superintendent, Globe division, with office at Globe, succeeding D. Reid, transferred to the Phoenix division.

F. Ringer, engineer of maintenance of way of the Missouri, Kansas & Texas at Parsons, Kan., has been appointed superintendent of the McAlester district, with headquarters at McAlester, Okla., to succeed J. F. Hickey, resigned to accept other service.

E. L. Martin, J. F. Sanders and H. G. Harden, assistant superintendents of the Louisiana lines of the Southern Pacific, with headquarters at Lafayette, La., have resigned. George B. Herrington succeeds Mr. Martin, and W. S. Middlemas takes the place of Mr. Harden.

W. J. Stoneburner has been appointed general superintendent of the Alabama, Tennessee & Northern and the Tombigbee Valley, with office at York, Ala., in charge of the operating, the maintenance of way and the mechanical departments. He has served in various capacities on different lines, including the positions of superintendent of the Quincy, Omaha & Kansas City, 11 years; superintendent of the Missouri, Kansas & Texas, Northern Texas division; vice-president and general manager of the Texas City, Terminal & Transfer Company, and in the industrial department of the Missouri, Oklahoma & Gulf.

F. H. Hammill, who recently was appointed assistant general superintendent of the Chicago & North Western, with headquarters at Boone, Ia., was born January 23, 1872, at Rockford, Ill. He was educated in the public schools at Rockford, and began railway work as a telegraph operator for the Chicago & North Western. He was subsequently for fifteen years with the

Chicago, Milwaukee & St. Paul as telegraph operator and freight brakeman, ten years as train despatcher, and two years as chief despatcher. Mr. Hammill returned to the North Western in March, 1902, as trainmaster, later was assistant superintendent, and for seven years was superintendent. He was made superintendent of the Sioux City division on January 23, 1906, one year later was transferred to the Northern Wisconsin division in a similar capacity, and the past five years was superintendent of the Iowa division, from which position he was recently promoted to assistant general superintendent, as above noted.

Traffic Officers.

W. H. L. Nelms has been appointed commercial agent of the Georgia & Florida, with office at Atlanta, Ga.

F. C. Moore, general eastern freight agent of the Chicago & Alton, has been appointed general eastern agent, with headquarters at New York City.

Edward Dowdle has been appointed traveling freight agent of the Union Pacific system, with office at St. Louis, Mo., to succeed J. F. Jutz, transferred.

L. Moore has been appointed traveling immigration agent of the Northern Pacific, with headquarters at Kansas City, Mo., to succeed H. B. Bryning, resigned.

C. R. Alvarez has been appointed commercial agent of the Georgia, Florida & Alabama, with office at Jacksonville, Fla., succeeding R. H. Dozier, resigned.

Tom O'Connell, contracting agent of the Wabash, has been appointed traveling freight agent, with office at Detroit, Mich., succeeding S. C. Lockman, promoted.

L. F. McFarland, formerly district passenger agent of the Chicago Great Western at Kansas City, Mo., has been appointed traveling passenger agent of the Southern Pacific, with office at Kansas City.

H. F. DeTurk has been appointed traveling freight agent of the Lake Erie & Western, with headquarters at San Francisco, Cal., and Arthur Corr has been made traveling freight agent, with office at New York City.

A. B. Chown has been appointed traveling passenger agent of the Grand Trunk, with office at Pittsburgh, Pa., succeeding C. E. Jenney, transferred, and the office of D. P. Drewery, traveling passenger agent at Cortland, N. Y., has been transferred to Buffalo.

The following have been appointed traveling freight agents of the Lake Erie & Western: F. C. Sheahan, Davenport, Ia.; E. J. Lewis, Minneapolis, Minn.; J. A. Sands, Kansas City, Mo., and N. D. Hoke, Philadelphia, Pa., and the position of soliciting freight agent formerly held by Mr. Lewis is abolished.

S. W. Bradford has been appointed commercial freight agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern at Monroe, La., in place of C. G. Johnson, who has been transferred to Jefferson City, Mo., as commercial agent, succeeding F. M. Curry, resigned to engage in other business.

Claude M. Harwood, traveling passenger agent of the Grand Trunk, with headquarters at Detroit, Mich., has been appointed city passenger and ticket agent at that place, succeeding George W. Watson, who has been transferred to Bay City, Mich., as passenger agent in place of F. C. Wherrett, who succeeds Mr. Harwood.

H. C. Strohm, who has been connected with the general passenger department of the Baltimore & Ohio at Chicago for several years, has been appointed traveling passenger agent of that company, with headquarters at Omaha, Neb., succeeding Edward Emery, formerly the traveling representative in that territory, promoted to general traveling agent, with headquarters at Baltimore, Md.

Engineering and Rolling Stock Officers.

W. G. Reid has been appointed general foreman of the Globe, Ariz., shops of the Arizona Eastern, succeeding Max Friedler, promoted.

H. W. Fenno, resident engineer of the Lake Shore & Michigan Southern at Erie, Pa., has been transferred to Chicago as resident engineer.

J. C. Hill has been appointed roadmaster of the Louisiana lines of the Southern Pacific, with office at Morgan City, La., in place of J. W. Moore, resigned.

N. C. Bettenberg, locomotive foreman of the Great Northern at St. Paul, Minn., has been appointed master mechanic, with headquarters at Crookston, Minn., in place of J. W. Smith, transferred to Duluth, Minn.

Abram Lucas, general foreman, locomotive department of the Chicago, Milwaukee & St. Paul at Milwaukee, Wis., has resigned to go to the Jacobs-Shupert U. S. Firebox Company, Coatesville, Pa., with office at Chicago.

William Welland has been appointed roadmaster of the Cotter district of the St. Louis, Iron Mountain & Southern, with headquarters at Batesville, Ark., in place of R. Cantrell, transferred to Aurora, Mo., as roadmaster of the Carthage district.

G. W. Seidel, superintendent of shops of the Chicago, Rock Island & Pacific at Silvis, Ill., has been appointed superintendent of motive power of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., to succeed C. E. Gossett, deceased, whose title was general master mechanic.

Victor King Hendricks, whose appointment as assistant chief engineer of the St. Louis & San Francisco, with headquarters at Springfield, Mo., has already been announced, was born May 28, 1869. He was graduated from the Rose Polytechnic Institute in June, 1889, and began railway work the following year as rodman for the Fairhaven & Southern, with which road he remained until January, 1892, as draftsman and transitman on construction. He was then for a year assistant engineer in charge of construction of the Bellingham Bay & Eastern, and from March to October, 1893, was a draftsman at the Indiana & Lafayette Bridge Works, when he returned to railway work as assistant engineer for the Terre Haute & Indianapolis. In January, 1894, he was made engineer maintenance of way of the Logansport division of that road, and in December, 1898, was promoted to engineer maintenance of way of the Terre Haute & Logansport, which was formerly known as the Logansport division of the Terre Haute & Indianapolis. Mr. Hendricks went to the Baltimore & Ohio in June, 1902, as assistant to engineer maintenance of way, and three years later was made division engineer at Baltimore, resigning January, 1907, to become assistant engineer maintenance of way of the St. Louis & San Francisco lines. From February, 1910, to October, 1911, he was office engineer of those lines, and then he was advanced to principal assistant engineer in charge of timber preservation of the St. Louis & San Francisco and the Chicago & Eastern Illinois. He now becomes assistant chief engineer of the St. Louis & San Francisco, as above noted.

V. K. Hendricks.

L. I. Stone has been appointed assistant engineer of the London division of the Grand Trunk, with headquarters at London, Ont. H. A. Palmer has been appointed assistant engineer of the Toronto Terminal, and James Boyd has been appointed assistant engineer of the Hamilton division with headquarters at Hamilton.

R. Q. Prendergast, whose appointment as master mechanic of the Indianapolis division of the Cincinnati, Hamilton & Dayton, with headquarters at Indianapolis, Ind., has already been announced, began railway work as a machinist apprentice with the

Baltimore & Ohio at Benwood, W. Va. After completing his apprenticeship he was made foreman at Cameron, W. Va., and subsequently was transferred to several of the large shops on the Baltimore & Ohio system, including the position of erecting shop foreman of the Mt. Clare shops. He left the Baltimore & Ohio to go to the Cumberland Valley at Chambersburg, Pa., and later became general foreman of the Delaware & Hudson at Carbondale, Pa. He resigned about five years ago to accept the position of master mechanic of the Denver & Rio Grande at Pueblo, Colo., which he held until his recent appointment as master mechanic, as noted above.

Frank Gilbert Jonah, who, on March 1, was made chief engineer of the St. Louis & San Francisco, with office at St. Louis, Mo., was born October 6, 1864, in Albert County, New Brunswick. He was educated in the high school at Moncton, N. B., and under private tuition. In May, 1882, he began railway work as a student in the chief engineer's office of the Intercolonial Railway, remaining there five years, during which time he acted in all capacities in field surveys of branch lines. The following two years he was assistant engineer in charge of government lines in Nova Scotia, and from 1889 to April, 1890, was assistant engineer of the Intercolonial Railway. On the latter date he became assistant engineer of the St. Louis Merchants' Bridge Terminal Railway, and four years later was appointed resident engineer of the St. Louis, Peoria & Northern. In December, 1899, he was made engineer maintenance of way of the Chicago & Alton, and from May, 1901, to March, 1903, he was chief engineer of the Blackwell, Enid & Southwestern. He was then for three months assistant engineer for the New Orleans Terminal Company, when he was appointed chief engineer of the St. Louis, Brownsville & Mexico, remaining in that position until October, 1904, when he was made locating engineer of the St. Louis & San Francisco. He returned to the New Orleans Terminal Company as terminal engineer in May, 1905, and on January 1, 1910, he accepted the office of engineer of construction of the St. Louis & San Francisco. He now as chief engineer assumes also the duties of chief engineer of operation.

Purchasing Officers.

E. B. Dailey, assistant mechanical engineer of the Union Pacific at Omaha, Neb., and H. B. Henry, who has been in the office of the director of maintenance and operation of the Harriman Lines at New York, have been appointed assistants to the director of purchases of the Southern Pacific Company, both with offices at New York.

Special Officers.

Marcus A. Dow has been appointed general safety agent of the New York Central Lines, with headquarters at New York, succeeding George Bradshaw, resigned, effective March 16.

OBITUARY.

C. I. Kerr, trainmaster of the Chicago, Rock Island & Pacific, with headquarters at Herington, Kan., died suddenly on March 5, at Topeka, Kan.

Arthur W. Moss, superintendent of the Schuylkill division of the Pennsylvania Railroad, died on March 12, at Reading, Pa. He was born in Philadelphia, on May 4, 1859, and began railway work as an apprentice in the Altoona shops of the Pennsylvania.

John W. Crissey, assistant engineer of construction of the Lake Shore & Michigan Southern, with headquarters at Cleveland, Ohio, died on March 7, at Chicago, of pneumonia. Until a month ago Mr. Crissey had been resident engineer of the Lake Shore at Chicago, when he went to Cleveland to take charge of track elevation work.

William E. Rogers, for nine years a member of the New York state railroad commission, and for five years its chairman, having been appointed by Governor Grover Cleveland (1884), died at his home in New York City, March 11, at the age of 68. He served in the army in the civil war and in the engineering corps afterward, and after 1872 was engaged in railroad construction. Mr. Rogers' later activities have been in the legal profession.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The International & Great Northern is making inquiries for 10 locomotives.

The Missouri Pacific has ordered 5 mikado locomotives from the Baldwin Locomotive Works.

The Chicago, Peoria & St. Louis has ordered 10 consolidation locomotives from the American Locomotive Company.

The Midland Pennsylvania has ordered 1 eight-wheel passenger locomotive from the Baldwin Locomotive Works.

The Seaboard Air Line is in the market for 25 Pacific type freight locomotives, 7 Pacific type passenger locomotives, 5 six-wheel locomotives and 1 dummy locomotive.

The Buffalo, Rochester & Pittsburgh is said to have ordered 12 mikado locomotives, and three switching type locomotives from the American Locomotive Company. This item has not been confirmed.

The Citizens' Gas Company, Indianapolis, Ind., has ordered 1 six-wheel switching locomotive from the American Locomotive Company. The dimensions of the cylinders will be 19 in. x 24 in.; the diameter of the driving wheels will be 44 in., and the total weight in working order will be 133,000 lbs.

The Chicago, Terre Haute & Southeastern, mentioned in the *Railway Age Gazette* of February 14 as being in the market for 5 locomotives, has ordered 5 consolidation locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 25 in. x 32 in. cylinders, and in working order will weigh 244,000 lbs.

The Chicago & Western Indiana, mentioned in the *Railway Age Gazette* of March 7, as being in the market for 5 switching locomotives, has ordered 5 eight-wheel switching locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 24 in. x 30 in. cylinders, 57 in. driving wheels, and in working order will weigh 212,000 lbs.

CAR BUILDING.

The Georgia Railroad is in the market for 8 or 10 passenger cars.

The International & Great Northern is making inquiries for 1,000 freight cars.

The Atlantic Coast Line is in the market for 4 passenger and baggage cars, 12 coaches, and 4 mail and express cars.

The Seaboard Air Line, mentioned in the *Railway Age Gazette* of March 7, as being in the market for 1,500 freight cars, is now in the market for 1,800 freight cars. This inquiry comprises 1,000 steel underframe, 30-ton box cars, 300 all-steel 50-ton phosphate cars, 250 all-steel 50-ton hopper cars, and 250 steel underframe 40-ton flat cars.

The Pennsylvania Railroad, mentioned in the *Railway Age Gazette* of March 7, as being in the market for 307 passenger cars, has ordered 105 steel, suburban coaches from the Pressed Steel Car Company; 45 coaches, 25 express refrigerator cars, 25 baggage cars and 5 horse cars from the American Car & Foundry Company; and 72 steel, through coaches and 20 steel, combination passenger and baggage cars from the Standard Steel Car Company.

IRON AND STEEL.

The Boston & Maine has ordered 1,000 tons of structural material from the Pennsylvania Steel Company.

SIGNALING.

The Philadelphia & Reading has let to the Union Switch & Signal Company a contract for an interlocking plant at Palo Alto, Pa.; total cost of the work about $37,000.

Supply Trade News.

J. H. Tweedy, Jr., has been elected a director of the Bucyrus Company.

John G. Johnson has been made a director of the Baldwin Locomotive Works, Philadelphia, Pa., succeeding E. C. Converse, resigned.

The H. W. Johns-Manville Company has purchased about 110 acres of land in the Calumet district near Chicago, adjacent to the Illinois Central, as a site for a large new plant.

Abram Lucas, general foreman of the locomotive department of the Chicago, Milwaukee & St. Paul, with office at Milwaukee, Wis., has resigned to go to the Jacobs-Shupert U. S. Fire Box Company, Coatesville, Pa., with office at Chicago.

The Raymond Concrete Pile Company, New York, has received a contract for placing 2,047 standard Raymond concrete piles for the foundation of the new grain elevator of the Chicago, Rock Island & Pacific at Kansas City, Mo.

The Isthmian Canal Commission will receive bids until March 26, on miscellaneous supplies, including electric traveling cranes, rails, angle bars, track bolts, switches, frogs, tie plates, track chisels, babbitt metal, etc. (Circular No. 764.)

The Street locomotive stoker, made by the Locomotive Stoker Company, New York, has been specified on the 40 Mallet locomotives ordered by the Norfolk & Western, and also on the 60 mikado locomotives and 10 Mallet locomotives ordered by the Baltimore & Ohio.

Burton W. Mudge & Co., Chicago, have been made agents for the Industrial Works, Bay City, Mich. This office will handle the products of the Industrial Works, including wrecking, locomotive and freight station cranes, pile drivers, transfer tables and grab buckets.

Richard F. Hawkins, of Springfield, Mass., died at his home in that city March 5, at the age of 76. Mr. Hawkins was a well known bridge builder and the proprietor of the R. F. Hawkins Iron Works. His firm was the successor of Stone & Harris, and inherited the Howe truss bridge.

The Bethlehem Steel Company, South Bethlehem, Pa., has declared a dividend of 5 per cent. on its preferred stock. This is the first dividend declared by the company since February, 1907. The dividend is payable quarterly in 1913. The last previous annual dividend on the preferred stock was 6 per cent.

The Brier Hill Steel Company, Youngstown, Ohio, is offering $5,000,000 7 per cent. cumulative preferred stock, redeemable at 105 after 1923. This company is spending about $4,000,000 in the construction of an open-hearth plant, blooming and finishing mills, and other equipment, which will add greatly to the output.

The Meeker Grip Nut Company, 1170 Broadway, New York, has just been formed to make and sell Meeker grip nuts. The officers of the company are as follows: President, Fred J. Lancaster; vice-president, Walter Schulze; and secretary and treasurer, Samuel G. Meeker. George Owens has been made manager of the sales department.

Walter H. Lienesch, formerly consulting engineer for the Illinois Traction System, has gone to the International Interlocking Rail Joint Manufacturing Company, Chicago, to take charge of the engineering department; and Burton E. Reed, formerly with the Vandalia Railroad, has been made assistant to the general manager of the same company.

The Mead-Morrison Manufacturing Company, Boston, Mass., maker of coal handling machinery and steam and electric hoists, has purchased about 10 acres of land near the tracks of the Boston & Albany at East Boston, upon which it will immediately erect a large plant. This plant will consist of a plate shop, erecting shop, power plant, pattern shop, foundry and general offices. The shops will be equipped with four 10-ton cranes and one 25 ton crane. It will be completed in about four months.

The General Electric Company, Schenectady, N. Y., has received an order for the entire rolling stock apparatus equipment which will be required for the electrification of the Melbourne suburban system of the Victorian State Railways, Australia. This order comprises 400 motor car equipments, consisting of four motors each; 800 control equipments, 400 of which are for trailer cars, and 400 compressor equipments. This is believed to be the largest single order ever placed for electric railway apparatus.

The Smith Locomotive Adjustable Hub Plate Company, of Pittsburg, Kan., will equip some mountain type locomotives which are to be built for the Missouri Pacific with its adjustable hub plate and is now conducting a test on two heavy passenger locomotives operating in the Cascade mountain territory of the Great Northern. The company's hub plate has also been installed on 15 consolidation locomotives for the Kansas City Southern now being delivered, and on 40 Mikados just being completed for the Missouri, Kansas & Texas at the Schenectady plant of the American Locomotive Company.

George M. Basford.

George M. Basford, assistant to the president of the American Locomotive Company, has resigned to accept a position as chief engineer of the railroad department of Joseph T. Ryerson & Son, Chicago. His headquarters will be at the New York office, 30 Church street, and the appointment will be effective March 15. Mr. Basford was graduated from the Massachusetts Institute of Technology in 1889. Directly afterwards he entered the Charlestown shops of the Boston & Maine, later going to the Chicago, Burlington & Quincy as a draftsman at Aurora, Ill. From there he went to Omaha, Neb., to take a position in the motive power department of the Union Pacific, and was also for some time connected with the test department of that road. Leaving the motive power department service he became signal engineer of the Chicago, Milwaukee & St. Paul, after which he was superintendent of construction of the Johnson Railway Signal Company, was for a short time with the Union Switch & Signal Company, and was signal engineer of the Hall Signal Company. In 1895 he left signal work to become mechanical department editor of the *Railway & Engineering Review*, and in 1897 was made editor of the *American Engineer & Railroad Journal*. In September, 1905, he accepted a position with the American Locomotive Company as assistant to the president, which position he now leaves to enter the service of the Ryerson company.

George M. Basford.

Mr. Basford is the father of the Railway Signal Association. Shortly after taking up editorial work in Chicago he called together a number of those interested in signaling, to consider the formation of a Railway Signaling Club, which later developed into the national association. For the first two years, 1895 and 1896, he was secretary-treasurer of the organization and a most active factor in its upbuilding.

Few men associated with the railway interests can number so many friends—real friends—as can Mr. Basford. And this he richly deserves, for he has been untiring in aiding others, either with advice or by helping them to better their condition. He has an unerring engineering instinct, which enables him to discard those things which are superficial and quickly get at the heart of a problem. It was this instinct, coupled with an extensive experience, and with his splendid character which made him such a power as an editor—for many years the *American Engineer* was informally designated as "Basford's paper," and still is by some, although it is seven and a half years since he left it. And when we recall that for a considerable part of his eight or nine years' work on that paper he had no editorial assistant, no stenographer, and that the

office was not equipped with a telephone, we marvel at the powerful influence he was able to exert through its pages in securing a more fitting recognition of the real importance of the motive power department in the railway organization.

In the fall of 1903 Mr Basford was in receipt of a signal honor, the like of which has never been conferred upon a man in the railway or railway supply field before or since. In a quiet way fifty-eight of the railway and railway supply men who were known to be close personal friends of Mr. Basford's joined together and presented him with a volume of personal letters expressing their appreciation of him, and accompanied by a substantial check to defray the expenses of a trip abroad. The following is taken from an informal presentation address made by W. S. Morris, who was then with the Erie Railroad: "The gentlemen around you are not only your personal friends, but they are here to represent a host of admirers, whom you can with pride claim also as friends. We are here to tender not only our admiration of the efforts God has infused within your character and ambition, but to thank you in behalf of the many who have been instructed and benefited by your industry and faithfulness to the science through which we all claim kin to one another. In all probabilities this is the first time in the history of this generation, at least, that one has been so honored by the mechanical fraternity of this country, and we assure you it is extended with every thought of true manliness and absolute worthiness on the part of him to whom these words are addressed. To be plain, Mr. Basford, your friends feel that you have well earned some token of recognition at their hands, and we beg that you will accept this volume, which contains the sentiment, individually, of those whom the gentlemen here present have the honor to represent, and this, which is intended to give you a much needed rest in the way of an extended trip to Europe; and, also, although perhaps selfishly, we hope you may find some time to tell us of your travels and give some hints of interest which may be found on the other side."

Mr. Basford is widely known because of the impetus he gave to the development of the movement for educating and training apprentices and workmen, for he had a keen realization of the fact that the most vital problem confronting the railways is that of *men*. In 1905, after he had given several years of careful study to the situation he presented a paper before the Railway Master Mechanics' Association on "The Technical Education of Railroad Employees—The Men of the Future." The principles which he outlined in this paper attracted wide attention, not only in the railroad field but in the industrial world as well, and were taken as the foundation of such modern apprenticeship systems as those on the New York Central Lines and the Atchison, Topeka & Santa Fe. And it may be said at this date, almost eight years after the presentation of the paper, that apprenticeship systems on the railways have proved successful in so far as they have followed the fundamental principles laid down in Mr. Basford's paper. The preparation of this paper might well be studied by young men who are ambitious to make their efforts felt in the railway field, and it affords a marked contrast to some of the papers and reports which are often presented before railway clubs and technical associations. It was the result of years of study of conditions on the railroads in this country and a practical experience in mechanical department work. Foreign methods had been carefully looked over on his trip abroad and then the whole scheme was carefully planned and outlined. The paper was then drafted roughly and was rewritten and rewritten until every sentence was carefully rounded out and every superfluous word removed, so that the thought was clear and forceful throughout. It was then submitted for criticism to a number of leading railway officers and industrial managers, and their comments were carefully considered in its revision, although it may truthfully be said that such revision as was made was very slight indeed. And dominating it all was a broad spirit of fellowship for his fellow man, which is so characteristic of Mr. Basford. It is little wonder that it marked the real corner-stone of railway apprenticeship education in this country, and it is to be regretted that more railroads have not adopted and lived up to its spirit.

It would be hard to comment intelligently upon Mr. Basford's work as assistant to the president of the American Locomotive Company, for necessarily a large part of it was in special assignments and would be very little known outside of the officers of the company. Of one definite duty however, which was assigned to him during the entire time of his association with that company we may speak authoritatively, and that is the matter of publicity. Many years ago when an editor Mr. Basford said that the day would come when the advertising pages of the railway technical papers would be read first, for the advertiser when he awakened to the real possibilities of advertising would have a distinct advantage over the editors, because he could display his data to so much better advantage, not being tied down to the standards of typography that the editor must observe; and to Mr. Basford belongs the honor of being the first to consistently make such use of the advertising pages as to secure the close attention of railway officers and indeed to make many of them tear out and preserve the ads. of his company, so valuable was the information presented therein. Most of our readers are familiar with this work. The campaign was carefully planned and developed, just as the editor of a paper would plan and develop his editorial policy, and was based upon supplying to the railways information which they greatly needed, and presented in such a way as to make railway men read it and feel its forcefulness. This feature, which was quickly observed by other companies, is being adopted by many of them and has brought about a new era of publicity in the railway field.

During the winter of 1908-9 while the Railway Business Association was in its early stages of development an arrangement was made with the American Locomotive Company whereby Mr. Basford gave part of his time to the work of that association. That his efforts were fruitful is indicated by the following paragraph in a letter written by George A. Post, president of the association (a copy of which Mr. Post has kindly furnished us) when it became necessary for Mr. Basford to withdraw from active personal participation in the work, because of the pressing demands of his duties with the American Locomotive Company: "Whatever may be the ultimate verdict as to the usefulness and necessity for this association, there can be but one judgment of what you did in an emergent situation, when you brought to it the vigor of your push and industry, the good cheer of your persuasive personality and the impetus of your alert and fecund mentality. To work with you has been an unalloyed pleasure; to confer with you has been to draw inspiration, and to part with your services is a distinct loss which I shall constantly deplore. If, in carrying the burdens devolving upon me in this work, no other dividend of the like were mine than that afforded by the opportunity to feel that I am heart-hitched to George Basford thereby, I shall always feel that the Railway Business Association did a splendid thing for me."

Mr. Basford's hobby has always been the locomotive, and his efforts in its development were recently summed up by one of his friends as follows: "He has persistently striven to impress upon every one connected with the work, both through his paper and through his personal contact, with a possibility of improving locomotive practice by rational and progressive engineering methods, and is largely responsible for the improvement that has taken place not only in the general design of the locomotive, but also in the improvement in the construction of its various parts which has so largely increased its efficiency and economy in operation. The care which Mr. Basford took in carrying out the experiments on locomotive front ends and nozzles, which led to the completion of these experiments by the Master Mechanics' Association, is only one example of his endeavors to place the design of the locomotive on a thoroughly sound foundation. The success of these experiments was no doubt a strong factor in the adoption of the locomotive testing plant, and the knowledge we now possess as to what engines are actually doing, and what results can be obtained from them. Not only in locomotive design, but in shop practice and road work generally, Mr. Basford has energetically encouraged his friends and acquaintances, including all the important mechanical men in the country, to continually improve their results. I do not think you will make any mistake in crediting him with a large share of the development in the last fifteen years."

Possibly this sketch might well be closed with the following brief summation of his personality by another one of his friends: "He has a clear conception of mechanical and oper-

ating needs. A way of keeping himself in the background and furnishing his numerous friends with good ideas from his generous store. Taking great pleasure in the advancement of young men and helpful to all with whom he comes in contact."

TRADE PUBLICATIONS.

MACHINE TOOLS.—The Betts Machine Company, Wilmington, Del., has published a small illustrated folder on its extra heavy, double-drive, 8 ft., boring and turning mill.

SPARK ARRESTERS.—Burton W. Mudge Company, Chicago, have issued an illustrated folder describing the construction and advantages of the Mudge-Slater spark arrester.

RAILWAY MATERIAL INSPECTION.—Morgan T. Jones, Chicago, has published an interesting booklet entitled "Railway Material Inspection." Copies may be obtained on application.

WABASH.—The passenger department has issued an attractive illustrated folder entitled "Steel," describing the new all-steel passenger equipment which has been placed in service recently between Chicago and St. Louis, St. Louis and Kansas City, and Detroit and St. Louis.

AIR COMPRESSERS.—The Ingersoll Rand Company, New York, has devoted form No. 575 to its class P. E., direct connected, electric-driven, air compressers. This booklet in addition to illustrations and descriptions furnishes instructions for installing and operating these compressers, and also includes a duplicate part list.

BALL BEARINGS IN MACHINE TOOLS.—The Hess-Bright Manufacturing Company, Philadelphia, Pa., has published a handsome booklet on ball bearings in machine tools. The booklet says that the function of the Hess-Bright ball bearings is to save repairs and to maintain original accuracy and alinement of spindles, etc., quite as much as it is to save power.

ELECTRICAL EQUIPMENT FOR BUILDINGS.—The Sprague Electric Works of General Electric Company, New York, has published in bulletin No. 115, illustrations and descriptions of its electrical equipment for buildings. Several installations are illustrated, including the air compressor equipment of the Chicago & North Western passenger station at Chicago.

CULVERTS.—The Canton Culvert Company, Canton, Ohio, has devoted a very attractive booklet to its Acme Nestable corrugated metal culverts and other products. These culverts are illustrated and described in detail. A table giving the diameters of gages, thicknesses, weights and carrying capacities is included. The booklet also illustrates a number of strength tests to which these culverts have been submitted.

NEW YORK CENTRAL LINES.—The passenger department of this company has issued an unusually attractive folder on the Grand Central Terminal, New York. This bulletin contains many colored views of the terminal and illustrates also some of the chief points of interest in the city. One group of illustrations shows the various steps in the evolution of the Grand Central Terminal. The folder also gives an account of the evolution of the terminal and a description of its present advantages. A map of the city and a condensed guide to the chief points of interest are also included.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—The publication committee of this association has issued a Year Book for 1913, containing a comprehensive list of exhibitors at the annual exhibit to be held at the Coliseum and the First Regiment Armory in Chicago next week, in connection with the convention of the American Railway Engineering Association, and pointing out the value of the exhibition to railway men from an educational standpoint. Eight thousand copies of the book have been mailed to railway men, together with an invitation and tickets to attend the exhibit. The frontispiece is a large photograph of the interior of the Coliseum during the 1912 exhibit. This is followed by a list of the officers and directors of the association from 1904 up to date, an article devoted to the history and policies of the association, illustrated by photographs of different features of the exhibits at the Coliseum during recent years, and a list of the exhibitors for the 1913 exhibit.

Railway Construction.

ASHERTON & GULF.—This company has applied to the Railroad Commission of Texas for authority to issue $550,000 of bonds on 32 miles of its completed line. It is announced that as soon as these bonds are issued work on the extension west from Asherton to Del Rio via Eagle Pass, about 100 miles, will be started. (October 18, p. 774.)

ATCHISON, TOPEKA & SANTA FE.—The Dodge City & Cimarron Valley has been opened for business from Dodge City, Kan., southwest to Hugoton. (September 22, p. 599.)

An officer writes regarding the report that a branch line is to be built through the San Luis Rey valley, Cal., that the company will build a 4-mile line from Oceanside up the valley to reach a section devoted to the cultivation of sugar beets, and the line will not be further extended.

BEAUMONT & GREAT NORTHERN.—See Missouri, Kansas & Texas.

BILLINGS & CENTRAL.—According to press reports from Billings, Mont., the Billings Land & Irrigation Company has made financial arrangements to build under the name of the Billings & Central a 20-mile line to Crooked creek. Surveys are now being made, and it is understood that the construction work will be started at once. The line is eventually to be extended north to a connection with the Chicago, Milwaukee & St. Paul at Roundup.

BURRARD WESTMINSTER BOUNDARY RAILWAY & NAVIGATION COMPANY.—This company is applying to the Canadian parliament for an extension of time to build lines as follows: From the north side of False creek, Vancouver, B. C., crossing False creek by a bridge southeasterly through Vancouver, Hastings, South Vancouver, Burnaby and New Westminster to the Fraser river bridge, thence northeasterly through New Westminster and Coquitlam to Port Moody, and westerly to the proposed location of the Vancouver, Westminster & Yukon railway bridge at the second narrows of Burrard Inlet, thence westerly through Hastings back to Vancouver; from the south end of the proposed Vancouver, Westminster & Yukon bridge, northerly, crossing the bridge along Seymour creek to the northerly boundary of North Vancouver, thence easterly to the north arm of Burrard Inlet, and from North Vancouver westerly to Howe Sound; from the north end of the Fraser river bridge at New Westminster, crossing the bridge and thence southerly to the international boundary between Semiamu bay and Sumas; from the south side of False creek, through Vancouver and South Vancouver to Point Grey, returning in a southeasterly direction to the starting point; from Port Moody easterly to Dewdney trunk road through Coquitlam, Maple Ridge and Mission to the Stave river, and from the Fraser river bridge line in an easterly and northerly direction through Yale, Lillooet and Cariboo to Tete Jaune, joining the proposed Vancouver, Westminster & Yukon branch to Edmonton, Alta. A. G. Kitto, Vancouver, B. C., is solicitor for applicants.

BUTTE, ANACONDA & PACIFIC.—A new branch called the Southern Cross Line has been opened for business, from Anaconda, Mont., to Southern Cross.

CANADIAN NORTHERN.—Construction work has been commenced on the Lulu Island branch, at mile 6 below New Westminster, B. C., and about a mile farther west, there will be a trestle two miles long, crossing a muskeg. It is anticipated that this line will be completed about the end of May. The Northern Construction Company are the general contractors. About 89 per cent. of the grading between Port Mann and Kamloops, B. C., has been completed, and about 39 per cent. between Kamloops and Albreda Summit on the divide between the Upper Fraser and North Thompson rivers. The tunnel work between New Westminster and Kamloops is about 93 per cent. completed. Up to the present time, about 15,250,000 cu. yds. of material have been handled on the main line between New Westminster and Kamloops. T. H. White, Vancouver, is chief engineer in British Columbia.

CANADIAN NORTH WESTERN.—The Canadian parliament is being asked to incorporate this company to build from a point in or near Lethbridge, Alta., northeasterly to a point at or near

Winnipeg, and from Winnipeg to a point at or near Pas, Man., passing near Dominion City, Manitou, Brandon and Grand View, and another line from Lethbridge, Alta., northeasterly through Alberta and Saskatchewan to Pas, Man., via North Battleford and Prince Albert, Sask., Brosseau, Tansey & Angers, Ottawa, are solicitors for applicants.

Central Canada.—Incorporation has been asked for in Alberta to build from a point in township 74 or 75, range 18 or 19, west of the fifth principal meridian, to or near Peace River Landing, Alta., thence in a generally westerly direction to a point in township 81, range 4, west of the sixth principal meridian, and a branch line from a point near Peace River Landing northerly towards the Battle river, to a point in township 94, range 22, west of the fifth principal meridian. The capital stock of the company will be $500,000, and the headquarters will be at Edmonton, Alta.; the provisional directors include J. D. McArthur, Winnipeg, Man.; J. K. McLennan, A. C. Galbraith, S. B. Woods and J. T. J. Collisson, of Edmonton.

Dallas, Cleburne & Southwestern.—See Missouri, Kansas & Texas.

Denison, Bonham & New Orleans.—See Missouri, Kansas & Texas.

Dodge City & Cimarron Valley.—See Atchison, Topeka & Santa Fe.

Edmonton, Stony Plain & Wabamun.—This company, with a capital of $750,000 and headquarters at Edmonton, Alta., has asked for incorporation in Alberta to build railway lines, from Edmonton to Stony Plain, and thence westerly to Lake Wabamun. The provisional directors include A. Boileau and E. S. McQuaid, of Edmonton, and A. V. Pujebet, Paris, France.

El Paso & Southwestern.—The Huachuca branch of the Western division has been opened for business from Lewis Springs, Ariz., west to Fort Huachuca, 13 miles. (November 29, p. 1063.)

Grand Rapids & Northwestern.—An officer writes that this company was organized in Michigan and will have terminals in the cities of Milwaukee, Wis., and Manitowoc, on the west shore of Lake Michigan, also at Ludington, Mich., and at Grand Rapids. The company proposes to operate car ferries across the lake from Ludington, Mich., to Milwaukee and Manitowoc and build a railway from Ludington southeast to Grand Rapids, about 98 miles. Valuable terminal rights and privileges in the city of Milwaukee, including ferry slips, have been secured, and the company has exclusive terminals and water front property over a mile and a half long on Ludington Harbor upon which it intends to build all necessary terminal tracks and ferry slips. It is the intention to standardize the old Mason & Oceania Railroad grade, which the company now owns. Work will be started at once to realine and widen eleven miles of this old grade and resurface seven miles of new grade. Contracts are now being let to build the line. J. N. Tittemore, president, Walter S. Syrett, vice-president in charge of construction, and T. R. Philbin, chief engineer, Chicago.

Houston & Brazos Valley.—This company has amended its charter to provide for an extension from Velasco, Tex., to Bryan Heights, on the west side of the Brazos river.

Louisiana Southern.—This road has been extended from Pointe-a-la-Hache, La., to Bohemia, 5 miles.

Mason & Oceania.—See Grand Rapids & Northwestern.

Meridian & Memphis.—An officer writes that track laying is now under way from Meridian, Miss., northwest to Union, about 32 miles. There will be 3 steel bridges on the line varying in length from 100 to 200 ft. each. J. T. Schley, president, Mobile, Ala.; L. W. Duffee, chief engineer, Meridian, Miss. (December 6, p. 1116.)

Midland Continental.—An officer is quoted as saying that work will be carried out this summer north of Jamestown, N. D., on a section of 150 miles. The road is now in operation from Edgeley north to Jamestown 50.1 miles, and the plans call for building north to Pembina, about 230 miles from Edgeley. (May 10, p. 1078.)

Missouri, Kansas & Texas.—This company is planning to build extensions, it is said, to a number of lines that have been taken over by the M. K. & T., under the provisions of a bill that was recently passed by the legislature of Texas. The bill provides for an extension of the Texas Central northwest from Rotan, Tex., to a point in Parmer county on the Texas-New Mexico line, about 200 miles; the branch from De Leon to Cross Plains is to be extended west from the latter place to Sweetwater, 75 miles, and a branch built from Dublin, north to the coal fields of Palo Pinto county, 50 miles. An extension of the Wichita Falls & Southern is to be built from Newcastle south to Cisco, 60 miles. The Denison, Bonham & New Orleans is to be built from Bonham south to Wolfe City, 20 miles. The Dallas, Cleburne & Southwestern is to be built from Cleburne northeast to Dallas, 50 miles, and the Beaumont & Great Northern is authorized to build an extension from Weldon, northwest to Jewett, 50 miles. This extension is now under construction.

Missouri, Oklahoma & Gulf.—This road has been extended from Wagoner, Okla., north to Joplin, Mo., 113.6 miles. (September 17, p. 491.)

Montour Railroad.—An officer writes that this company is a consolidation of the Montour Railroad, the Pittsburgh & Moon Run Railroad, and the North Star & Mifflin Railroad. The line extends from Montour Junction on the Pittsburg & Lake Erie, near Coraopolis, Pa., to Mifflin yard, the terminus of the Thompsons Run branch of the Union Railroad. The road was built to connect the coal fields belonging to the Pittsburg Coal Company with the Pittsburg & Lake Erie, the Pittsburg, Cincinnati, Chicago & St. Louis, the Wabash, the Baltimore & Ohio, the West Side Belt and the Union Railroad. A contract has recently been given to John Marsch, Chicago, to build an extension of 35 miles from North Star to Mifflin yard. The company will do the track laying and the ballasting with its own forces. Contracts for all other work have been let, except for bridges and track material, which will be let in a short time. (February 28, p. 411.)

Mountain Valley & Plains.—According to press report financial arrangements have been made and construction work will be started in the near future. The company was chartered in 1909 to build from Cimarron, N. Mex., east through the Panhandle of Texas, to Guthrie, Okla., about 450 miles. The incorporators included E. C. Gray, Higgins, Tex.; D. W. Herrington, Dalhart; H. F. Wannamaker, Amistad, N. Mex., and C. L. Johnson, Arnett, Okla. J. H. Conlin, chief engineer, Dalhart, Tex.

Nacogdoches & Southeastern.—An officer writes that the company has arranged to build an extension from the present terminus at Dunham, Tex., to a connection with the Angelina & Neches River, between 2½ and 3 miles. (February 21, p. 373.)

Newton, Kansas & Nebraska.—According to press reports this company, which was organized last year, has made arrangements to build from Milton, Kan., north via Newton, and Abilene to Fairfield, Neb. T. H. McManus, president, Newton. C. M. Barnes, of Oklahoma, M. Cassidy, of Guthrie, and capitalists of Kansas City are back of the project. (November 15, p. 973.)

Niagara, Welland & Lake Erie (Electric).—An officer writes that the plans call for building from Welland, Ont., northeast to Niagara Falls, also from Welland south to Port Colborne, thence east following the north shore of Lake Erie to Fort Erie, opposite Buffalo, N. Y., in all about 31 miles. The company now operates about a mile and a half of track in the city of Welland and extensions will be made soon to outlying sections of the town, each one mile in length, also a line at Dainville, two miles. There will be one swing or bascule bridge to have a 50-ft. span, and a 300-ft. trestle, probably three transformer stations, and one car barn will be constructed. T. R. Cummins, Welland, is engineer.

Norfolk, Yorktown & Washington.—According to press reports, plans are being made for a line on which work is to be started soon from a point in Gloucester county, Va., north to Fairfax, about 156 miles. P. T. Hoven, president, L. C. Steele, vice-president and treasurer.

Ocilla Southern.—An officer writes that at the present time the company cannot give any definite information regarding the

report that an extension is to be built from Nashville, Ga., east about 50 miles to Waycross. It has not yet been decided whether the extension will be built or not. (February 28, p. 411.)

Oklahoma Northern.—An officer of this company, which was recently incorporated to build from Vinita, Okla., northwest to Coffeyville, Kan., about 42 miles, writes that work will be started within the next 60 days and will be carried on by the company. More than nine miles of the grade has been finished out of Vinita northwest. Arrangements have been made for the use of the Missouri, Kansas & Texas terminals at both Vinita and at Coffeyville. A. King, vice-president and general manager, 574 Brandies building, Omaha, Neb. (March 7, p. 459.)

Pecos Valley Southern.—According to press report this company is planning to build an extension from the present southern terminus south to Alpine, Tex., about 50 miles. Also to build on the north from Pecos northeast towards Tehoka.

Southern Railway.—President Finley announces that the main line is to be double tracked between Armour and Cross Keys, Ga., this section having heretofore been operated as a single track gauntlet in the double track between Atlanta and Gainesville. The grades will be reduced and much of the curvature of the present line will be eliminated. Work is to be commenced as soon as practicable and pushed to completion.

Temiskaming & Northern Ontario.—A contract for the construction of a line from Iroquois Falls on the main line to Iroquois Falls on the Abitibi river, about seven miles, has been given to Macdougall & McCluskey, Cochrane, Ont. The work is to be completed by June 1. (November 29, p. 1064.)

Texas Central.—See Missouri, Kansas & Texas.

Texas Roads.—The Interstate Development Company has been organized in Arizona to promote the construction of a railroad between either Dallas, Tex., or Fort Worth and Port Arthur. This proposed new line, it is said, will traverse a territory that is rich in agricultural and timber resources. The general offices of the railroad company will be at Lufkin, Tex. The officers of the Interstate Development Company are Dr. R. B. Bledsoe, president; W. M. Glenn, vice-president; W. R. McMullen, treasurer, and Colonel P. A. McCarthy, secretary, all of Lufkin. Arrangements are being made for financing the proposed line. The promoting company will secure the right-of-way, make necessary surveys and raise bonuses along the route.

Wichita Falls & Southern.—See Missouri, Kansas & Texas.

Williamsport, Nessle & Martinsburg.—Incorporated in West Virginia with $250,000 capital and principal office at Martinsburg. The plans call for building from Williamsport, Md., southwest to Martinsburg, W. Va., about 15 miles.

RAILWAY STRUCTURES.

Ashtabula, Ohio.—See an item in General News regarding the construction of new car shops for the Lake Shore & Michigan Southern at Ashtabula.

Bellville, Tex.—See item under Caldwell, Tex.

Caldwell, Tex.—The Gulf, Colorado & Santa Fe has let a contract to Street & Born, for the erection of passenger stations to cost over $20,000 each, at Caldwell, Cameron and Bellville, Tex., to be completed this year.

Cameron, Tex.—See item under Caldwell, Tex.

Prince Rupert, B. C.—The Grand Trunk Pacific has been authorized by the Railway Commissioners of Canada to build bridges as follows: Across Porphyry creek, Prince Rupert East, B. C.; across Eagle creek, Sask.; across Boulder creek, and across Trout creek, Prince Rupert East, B. C.; across Little Shuswap river, west of Winnipeg, Man.; across Telkwa river, Prince Rupert East, B. C., and across Fiddle creek, Wolf Creek West, B. C.

St. Paul, Minn.—The Chicago, Rock Island & Pacific will spend $500,000 this year, it is said, building new terminals, shops and roundhouses at St. Paul.

Railway Financial News.

Atlantic Coast Line.—This company has sold to a syndicate of New York bankers $3,500,000 unified mortgage, 4 per cent. bonds of 1909-1959. White, Weld & Company, New York, are offering these bonds at 87, using about 4.70 per cent. on the investment. Including the bonds recently sold there are now $20,144,000 of a total authorized issue of $200,000,000. The bonds are secured by a mortgage on 4,221 miles of railroad and are a first lien on 274 miles of this railroad.

Atlantic, Northern & Southern.—The sale of this road, which took place on March 1, has been set aside and a re-sale has been ordered for March 21.

Boston & Maine.—White, Weld & Company, Harris, Forbes & Company, and Kissel, Kinnicutt & Company, all of New York, have bought $7,500,000 20-year debenture 4½ per cent. bonds. These bonds are a legal investment for savings banks in Massachusetts, Maine, New Hampshire and Connecticut.

Cambria & Clearfield.—Stockholders of the Pennsylvania Railroad, at the annual meeting on March 11, voted to ratify the action of the directors in taking over the Cambria & Clearfield.

Chicago, Burlington & Quincy.—This company has sold $5,000,000 general mortgage 4 per cent. bonds.

Grand Trunk.—Joseph Ramsey, Jr., has brought a suit against the Rail & River Coal Company for an amount in the neighborhood of $500,000, which he claims is due him as commission on the sale of coal land in Belmont county, Ohio, to the Grand Trunk Development Company. The purchase of this coal land, it is understood, was negotiated for by Charles M. Hays, but final contracts were not signed before Mr. Hays' death.

Kansas City, Mexico & Orient.—The Kansas City *Journal* says that a claim of $1,045,000 held by the American Car & Foundry against the Kansas City, Mexico & Orient has been settled by the payment by the receivers of $845,000. The payment is to be made partly in cash and partly in receivers' certificates.

Keokuk & Des Moines.—A dividend of 3½ per cent. has been declared on the preferred stock, payable April 1. In 1910, 1911 and 1912 each 2½ per cent. was paid.

Lake Shore & Michigan Southern.—J. P. Morgan & Co., New York, have bought $12,000,000 one-year 4½ per cent. notes of March 15.

Louisville & Nashville.—J. P. Morgan & Co., New York, have bought $4,000,000 Louisville & Nashville unified 4 per cent. bonds and $4,500,000 Atlanta, Knoxville & Cincinnati division 4 per cent. bonds.

Missouri, Kansas & Texas.—The directors have authorized the sale of $19,000,000 2-year 5 per cent. notes to Speyer & Co., New York. The M. K. & T. has $16,000,000 2-year notes maturing May 1, and $1,500,000 1-year notes maturing July 1. The sale of the new notes will provide for refunding of these two issues.

New York State Railways.—The New York Public Service Commission, Second district, has authorized this company, which is controlled by the New York Central & Hudson River, and which operates a system of street and interurban railways in New York state, to issue $2,748,000 first consolidated 50-year mortgage bonds at 91½. The proceeds of this sale are to be used to pay off notes and maturing bonds of this and subsidiary companies.

Pennsylvania Railroad.—See Cambria & Clearfield.

Union Pacific.—No action was taken at the conference held by directors of the Union Pacific on March 11, on the dissolution plan. One of the directors is quoted as saying: "I cannot say that the plan is definitely abandoned. The situation remains unchanged. There are no arrangements for any further Union Pacific meetings this week." The underwriting syndicate by which Southern Pacific stock was to be sold to Union and Southern Pacific stockholders at par expires on Saturday.

Railway Age Gazette

DAILY EDITION

Vol. 54. CHICAGO—MARCH 13, 1913—NEW YORK No. 11a.

Published Daily by

Simmons-Boardman Publishing Co., Transportation Bldg., Chicago, Ill., on the occasion of the annual convention of the American Railway Engineering Association.

NEW YORK: 83 Fulton Street CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and the four Maintenance of Way Convention Daily issues, North America, $1.00; foreign (excepting daily editions), $2.00.

Application made at the Post Office at Chicago, Ill., for entry as mail matter of the second class.

WE GUARANTEE, that of this issue 10,800 copies were printed; that of those 10,800 copies, 9,869 copies were mailed or delivered by messenger to regular paid subscribers; 750 copies were distributed among members and guests of The Railway Signal Association and at the Coliseum; 131 copies were mailed to advertisers; and 50 copies were set aside for office use.

CONTENTS:

NOTICE OF COPYRIGHT.

This and all subsequent issues of the Daily Railway Age Gazette published in connection with the 1913 spring meeting of the Railway Signal Association and the 1913 annual meeting of the American Railway Engineering Association are copyrighted under the United States copyright law by the Simmons-Boardman Publishing Company, publisher of the Railway Age Gazette, and all persons are hereby warned against making unauthorized use of any of the contents of The Daily, whether reading matter or illustrations.

It is well known that we have from year to year incurred much expense for the purpose of furnishing our readers with early, complete and properly edited stenographic reports of the proceedings of the conventions of these associations. Some other publications have appropriated large parts of these edited reports of the proceedings and republished them without credit to this paper. We have copyrighted all of the reading pages of The Daily for the purpose of stopping this practice.

We desire in this connection expressly to disavow any desire or purpose to interfere with the publication or use by the associations or their members of either their own reports of the proceedings, or of the reports made by the Daily Railway Age Gazette. So far as the proceedings of the conventions are concerned, our copyright covers them only as they are reported by the Daily Railway Age Gazette. And the associations and their members individually are hereby authorized to make any use they desire of our reports, except that they must not be republished without the express permission of the Simmons-Boardman Publishing Company, in any publication or periodical except those issued by the Railway Signal Association or the American Railway Engineering Association.

The number of Signal Association committees is increasing gradually from year to year as various subjects connected with signaling assume importance enough to warrant their study by separate committees. At the same time the reports are not decreasing much, if any, in length, and the number of meeting days in a year has probably reached its maximum under existing conditions. The result is that better use has to be made of the six available meeting days. Accordingly, this year some of the committee reports are presented for such final action at this meeting as will not require them to be submitted again until the annual convention next October. They will skip the June meeting altogether. This plan was followed to some extent last March. It is a decided improvement over the old way of letting the committees report progress at each of the stated meetings, which, in most cases has resulted only in doing over again in June a considerable part of what had already been done in March. Under the new plan about half the committees can get, at the March meeting, as much discussion as their reports need before the final presentation in October. And in June the rest of them can do the same.

The answer to the question, "Who will be who in the signal business five years hence?" is to be found in the futures of the young men. Upon them depend the future of the Railway Signal Association and the future of the signal business. It is highly gratifying, therefore, to see so many of them taking an active interest in the work of the association. There is a comparatively large number of new faces among the committee members and several among the committee chairmen. R. C. Johnson and R. B. Elsworth, both assistant signal engineers of the New York Central, E. G. Stradling, signal engineer of the Monon, and W. N. Manuel, signal supervisor of the Grand Rapids & Indiana, are the newest among the latter, and all of them are doing good work. Nobody gets paid in real money for his loyalty to a voluntary association of this kind, nor for his work on the committees, which often requires a great deal of time and a vast amount of painstaking effort. But the work itself has a double benefit. It secures greater opportunities for preference in the association, for responsibilities naturally gravitate to those who show themselves capable of carrying them. And at the same time, by attracting the attention of signalmen all over the country, it advertises individual ability in a way that even a strict interpretation of professional ethics would have no quarrel with.

Manufacturers in general, and a good many members of the Signal Association, seem to have a wrong idea as to the significance of a favorable vote on matters that are brought before the stated meetings and the annual meeting of the association. For example, there is a growing feeling that if a design or a set of specifications receives a favorable vote

at any meeting, this vote represents the approval of the organization; and it is generally considered that whatever was thus voted upon has become the standard practice of the association. As a mater of fact the R. S. A. constitution provides that nothing can be adopted as the standard practice of that body until it has been approved by letter ballot by two-thirds of the members and representatives; and no proposition can be submitted to letter ballot until after it has been presented at an annual meeting, and ordered submitted by a majority vote of those present. In other words, the annual meeting of the association is the only one that can pass upon a standard, and even its power to do this is limited, as it can do no more than order the proposition submitted to letter ballot. The discussions at stated meetings are in the nature of considerations of the various subjects by the members as a committee of the whole, and whatever votes they may take, or whatever actions they may decide upon, amount to nothing more than an expression of the approval or disapproval of the committee of the whole on the work of the particular committee. It is a long process to get anything approved by the R. S. A.; and manufacturers who may desire to make apparatus to conform to standard specifications should refrain from making the extensive changes that are often necessary in previous designs, until they are certain that the apparatus in question has received not only the favorable votes at the meetings, but also the approval by letter ballot which alone can make it the standard and approved practice of the association. And, at that, "there's many a slip" between a favorable vote at a stated meeting and a favorable vote by letter ballot, as a number of the committees have found.

THE COMMITTEE REPORTS.

The committees that submitted reports at yesterday's meeting were the same as last year with the exception of two—those on Contracts and Automatic Block Signaling. These were not represented in the list of reports, the committee on Manual Block and the Special Committee on Methods of Recording Signal Performance having taken their places.

The reports this year were more carefully compiled and in better shape than in some previous years, principally for the reason that the new manual was available as a guide in making the specifications in practically their finished form to start with. An additional reason for the improvement is the fact that it is not intended that some of the reports shall receive any further discussion before they are submitted for final approval at the annual meeting. This is particularly true of the work of Committee V on Manual Block, which is probably the most complete of all the seven that were discussed. It goes deeply into the matter of rules, paying special attention to the elimination of hand signaling at interlocking plants and providing as a substitute the use of a caution card.

Another matter of interest covered in the revised rules of Committee V is the prevention of fires. It usually happens that interlocking stations which are built of wood are located at the most isolated points, while those that are constructed of brick or concrete stand in the midst of municipal fire fighting facilities. This makes the fire menace a serious matter. The committee would add it to the signalman's list of things to look out for and guard against.

New rules were submitted for signal supervisors, signal foremen and also for maintainers, there being five times as many for the latter to become familiar with as for either of the other two. The most difficult to obey of all the maintainers' half hundred will undoubtedly be the rule that requires the maintainers to "know that section foremen understand that new rails should not be put in or electric connections broken without facilities to restore promptly the working order of the signals" when rails are bonded for an electric circuit. It implies not only that the maintainers must know that the section foreman knows, but also that he must see to it that the section foreman knows and likewise that he does as he knows—which is a matter of great difficulty.

The Committee on Wires and Cables submitted specifications for a class of material which is rapidly going out of style. A wire connected signal is rarely installed nowadays.

Mr. Elsworth's committee on Storage Battery and Charging Equipment presented an interesting summary of the principal facts concerning the use of Edison storage batteries for automatic signaling. This part of the report was written by G. E. Beck, signal supervisor of the Lake Shore, and is submitted merely as information, the committee's specifications having been confined to lead type stationary storage battery for automatic signaling.

THE SIGNAL ASSOCIATION.

The stated meeting of the Signal Association began at 9:30 o'clock, the appointed hour, yesterday morning. This is the first time a March meeting has been "on time" in several years. The attendance at the start was considerably better than last year, and at noon, when it had reached its height, was larger than at any previous meeting for a long time, and considerably in excess of that at some of the recent annual conventions.

The subjects taken up during the morning hours were the specifications proposed by the sub-committees of the Power Interlocking Committee. They were passed for the most part without much discussion. The principal objection advanced was that the specifications for train drops, annunciators and bells should not exclude apparatus which is now used in connection with telephone engineering practice. The general form of the specifications was such that commercial apparatus would be excluded if they were adopted, and it was the general consensus of opinion that the committee should go further into the matter and make provision for the use of this kind of apparatus in cases where signal engineers might decide that it was cheaper or better than apparatus which had to be especially made to conform to the specifications.

The second committee report was that on Manual Block. The discussion centered about the substitution of caution cards for hand signaling at interlocking plants. In order to sound out the feeling of the members on the subject, a resolution that the caution card be used in addition to hand signaling was offered, and after considerable argument for and against, was adopted by a small majority. The discussions on the manual block report were interesting, and some of the opinions expressed might have been carried further with benefit to those on both sides of the argument, had there been time.

The third report to be considered was that by Mr. Mock's committee on Standard Designs. The designs were accepted for the most part without much discussion, a few of them being referred back to the committee. The committees on Alternating Current Signaling, on Wires and Cables, and on Storage Battery and Charging Equipment "marched up the hill and then marched down again," as it were, only a few moments being given to the reports of each of them.

The last report, that of Mr. Manuel's committee on Method of Recording Signaling Performance, took up considerable time at the end of the meeting. The discussions were on the various forms presented, and they were illuminating and helpful to the committee.

Altogether, the meeting was one of the most successful that the association has had for some time, and it is to be

congratulated, both upon the interest shown by the individual members of the committees in their assignments, and the good start they have made toward an effective disposal of the large amount of work they have assumed this year.

KEEPING TAB ON THE SIGNALS.

Mr. Manuel's committee, on Methods of Recording Signal Performance, has made a fine start, particularly in the matter of finding a standard basis for computing the efficiency of signals. There are now almost as many schemes for keeping track of what signals do as there are kinds of bootlegs—that is to say, almost as many as there are railroads. In the absence of any concerted effort to establish a uniform basis, each road has been left free to make an arbitrary selection. The committee has gathered together a good many of these arbitrary bases, and finds "considerable detail with no semblance of uniformity." It has gone ahead, nevertheless, with the effort to formulate a system that will be acceptable as a standard "medium of exchange" where the efficiency of apparatus has to be taken into account, either in the relations between different roads or between signal departments and signal companies.

One road's contract specifications already require a guarantee of 25,000 operations per failure, and another puts the figure at 18,000. The committee's basis of 15,000, while it is exceedingly conservative, may by implication, at least, fail to reflect as much credit on the signal mechanisms now available as they deserve. A higher figure might be more creditable by indicating their ability to meet a more rigorous requirement.

A standard basis of computing efficiency will give most signal departments a better means than they now have of keeping their operating forces in touch with what the signals are doing, and in addition it will establish such a common standard for recording signal performances as will enable signaling information to be disseminated to the public in a more understandable form. The interest of the public in safety matters is increasing. And it is possible that no large part of its interest in automatic stops—which are not in use—has grown up simply because it was permitted to do so as a result of the absence of any effort to arouse interest in the signal devices that are in use. These, having been tried out and found satisfactory, ought to have much more interest for the public than something which has not yet had an opportunity to prove up except in a few special situations. The fact that signals are not more interesting to the public is due as much as anything to lack of publicity. Every effort to explain signals and signaling in words of one syllable helps to make more publicity possible.

THE NEW SIGNAL MANUAL.

The first edition of 530 copies of the Signal Association Manual, which were published last year, has been entirely exhausted and there is a demand for a considerable number of extra copies. Two hundred more copies will be printed; meanwhile so much new material has been developed that it will be necessary to increase the book, which is published in loose leaf form, from 614 to 800 pages. It is estimated that the additional copies of the original manual will cost about $1200 and that the 200 new pages which will be published can be furnished to the members at about one cent a sheet.

Another revision of the manual will probably not be made within the next three years; such additions or revisions as may be made in the meantime will be referred to in the proceedings until it is found advisable to publish a new edition.

PROGRAMME OF AMERICAN RAILWAY ENGINEERING ASSOCIATION.

The following is the programme for the convention of the American Railway Engineering Association. The programme is subject to change by a two-thirds vote of the convention or by time required for consideration of reports.

Morning Sessions—9:00 a. m. to 12:30 p. m.
Afternoon Sessions—2:00 p. m. to 5:30 p. m.

Tuesday, March 18.

President's Address.
Reports of Secretary and Treasurer.
Reports of Standing and Special Committees.
XII. Rules and Organization.
X. Signals and Interlocking.
XV. Iron and Steel Structures.
V. Track.
IV. Rail.
Reception at 8:00 p. m. by Board of Direction to members and guests.

Wednesday, March 19.

XVI. Economics of Railway Location.
VII. Wooden Bridges and Trestles.
Special. Uniform General Contract Forms.
XVII. Wood Preservation.
III. Ties.
IX. Signs, Fences and Crossings.
VIII. Masonry.
Annual Dinner at 7:00 p. m.

Thursday, March 20.

XIX. Conservation of Natural Resources.
II. Ballast.
VI. Buildings.
VIII. Water Service.
XIV. Yards and Terminals.
Special. Grading of Lumber.
I. Roadway.
XVIII. Electricity.
XI. Records and Accounts.
New Business.
Election and Installation of Officers.
Adjournment.

Friday, March 21.

Visit to National Railway Appliances Exhibition in the Coliseum and Armory.

THE SPEAKERS AT THE ANNUAL A. R. E. A. DINNER.

The annual dinner of the American Railway Engineering Association will be given in the Gold room of the Congress hotel on Wednesday evening, at 7 o'clock. The speakers will be B. A. Worthington, of Chicago, president of the Chicago & Alton; George A. Post, of New York, president of the Railway Business Association; Rev. R. W. Dickie, of Montreal, Canada, and P. G. Rennick, of Peoria, Ill. Mr. Worthington will speak on Looking into the Future; Rev. Mr. Dickie on Internationalism, and Mr. Rennick on the Twentieth Century Pattern.

UNIFORM BLOCK SIGNAL LAWS HEARING.

The railway commissions of Illinois, Indiana, Wisconsin and Minnesota, by a committee of their representatives, held a final hearing on the subject of the proposed uniform block signaling laws for steam and electric railways in those states, on March 12, in the offices of the Illinois Railroad and Warehouse Commission in the Insurance Exchange, Chicago, F. G. Ewald represented the Illinois commission; D. F. Jurgensen,

the Minnesota commission; J. N. Bidwell and E. J. Larson, the Wisconsin commission, and H. O. Garman, the Indiana commission. The signal engineers of all the roads in the four states mentioned were present; and although this hearing was to have been the last one before the recommendations were brought before the various commissions to their state legislatures, there were a number of suggestions made by the signal engineeers present which it was thought advisable to take into further consideration. For that reason the hearing was not considered conclusive; and it is probable that another hearing will be held at a later date after the suggestions have been embodied in the proposed uniform rules. This matter has been under way for several years and the committee of representatives of the four commissions named have spent considerable time in investigations of, and hearings concerning, up-to-date practice in signaling and interlocking on both steam and electric railways.

RESOLUTION REGARDING THE LATE J. C. YOUNG.

At the morning session of the Railway Signal Association F. P. Patenall offered the following:

"The sad news of the sudden death of J. C. Young having reached the members of the association but a few weeks before this meeting, the following minute is offered to be spread upon the record of the meeting and a copy to be sent to his family:

"James C. Young, member and director of the Railway Signal Association and signal engineer of the Union Pacific, died on February 25, 1913. By this minute we express the feeling of loss to the association and to those connected with him in his work, which his death has occasioned, and tender to his mother and sister our profound sympthy. We hope that the memory of his upright and useful life as a gentleman and a railroad officer will be of as much comfort to his mother and sister, as it is an example to his friends and associates."

The members stood and the minute was adopted in silence.

RECEPTION AND ADDRESS BY WILLIAM McNAB THIS EVENING.

The board of direction of the American Railway Engineering Association will give a reception to the members and guests of the association in the Gold room of the Congress Hotel this evening at 8 o'clock. After the reception William McNab, principal assistant engineer of the Grand Trunk, and a past-president of the association, will deliver an address on the Panama Canal. Mr. McNab made a visit to the canal a short time before last year's convention, but has since kept closely informed regarding developments there. His address will be illustrated with stereopticon views secured from the authorities at Washington.

ANNUAL MEETING; RAILWAY APPLIANCES ASSOCIATION.

The annual meeting of the National Railway Appliances Association for the election of officers and the transaction of such other business as may come up will be held in the ballroom of the Coliseum annex on Tuesday at 11 a. m.

NEW R. S. A. BOARD MEMBERS.

W. H. Elliott, signal engineer, New York Central & Hudson River, was elected to the Board of Direction of the Railway Signal Association, at the board meeting on Sunday, March 16, to fill the unexpired term of J. C. Young, signal engineer of the Union Pacific, who died February 27, 1913.

Proceedings.

The stated meeting of the Railway Signal Association was called to order at 9:30 a. m. on Monday, March 17, in the Florentine room of the Congress Hotel, Chicago, by President B. H. Mann, signal engineer of the Missouri Pacific.

POWER INTERLOCKING.

The committee submitted specifications for annunciator bells push buttons for bells, train drops, etc., floor pushes, and fuses, asking for full discussion so that the complete reports on these subjects can be presented for final consideration at the annual convention at Nashville in October. The specifications for fuses include a diagram of dimensions for cartridge enclosed fuses.

Sub-committee "C," of which I. S. Raymer, assistant signal engineer, Pittsburgh & Lake Erie, is chairman, was instructed to prepare plans for wire ducts, terminal boxes, and manholes. The time of this sub-committee since its appointment has been given to drawing up specifications for steel and iron pipe conduit and the collection of data covering the field work for the installation of wire ducts. The specifications for steel pipe conduit and wrought iron pipe conduit were submitted at this meeting.

The committee consists of R. C. Johnson (N. Y. C. & H. R. R.), chairman; F. B. Wiegand (L. S. & M. S.), Burt Anderson (A. T. & S. F.), W. H. Arkenburgh (Union Switch & Signal Co.), M. H. Collins (H. & M.), J. R. Decker (M. C.), A. B. duBray (Frisco), B. B. Gray (P. L. W.), W. H. Harland

ROBERT C. JOHNSON,
Chairman Committee on Power Interlocking.

(N. Y. O. & W.), H. H. Harman (B. &. L. E.), E. C Hitchcock (N. Y., N. H. & H.), L. E. Kinch (P. R. R.), M. H. Loughridge (N. Y. W. & B.), J. W. MacCormack (K. C. T.), W. N. Manuel (G. R. & I.), G. A. Motry (B. & O.), H. H. Orr (C. & E. I.), F. W. Pflegling (U. P.), A. B. Pollock (P. R. R.), W. M. Post (P. R. R.), I. S. Raymer (P. & L. E.), D. W. Rossell (N. Y. C. & H. R.), T. C. Seifert (C. B. & Q.), F. G. Smith (C. & E. I.), O. R. Unger (M. P.), G. A. Ziehlke (U. P.).

Discussion on Power Interlocking.

The report of the sub-committee A was read by A. B. du Bray, chairman, by paragraphs.

T. S. Stevens (A. T. & S. F.): Has due consideration been given to the advisability of using some other contact material than platinum in annunciator bells?

Mr. du Bray: We considered most of the contact materials and decided that platinum best served our purpose.

Mr. Stevens: Is it really necessary to specify that the coils of the annunciators shall be in accordance with association specifications? The association's specifications for coils, as now designed, are intended for use in instruments of far more importance than annunciator bells. The question arises as to whether we are not saddling an undue expense on the railroads by this clause in specifications. In paragraph 1-K, Binding Posts, Nuts, Washers, etc., are specified

in accordance with Railway Signal Association drawing 1070. Has due consideration been given to the fact that this will increase the size of annunciator bells and material, and therefore possibly increase their cost unduly?

The Chairman: We decided we would get the best results by having four coils, and as long as we were going to have four coils we thought it best to live up to the balance of the relay specifications with reference to coils. With reference to paragraph K, we frequently have heavy wires on those binding posts, and we thought we would better have the standard posts.

Mr. Stevens: That will be all right as soon as we have developed a line of material which will comply with these specifications. At first it will knock out all commercial annunciator bells.

The President: We realized in the committee that, as far as we knew, there was nothing on the market that would pass these specifications, but we did not see why there was any reason it should not be made to cover the specifications.

W. N. Manuel (G. R. & I.): I suggest the diameter of the screws be mentioned, and, under "contacts," I suggest that the area of the contacts be specified, for the reason that with the bells we are using now the contacts are very frequently punctured by the short contacts. I believe the bells would give better service and would be of longer life.

A. G. Shaver (C. R. I. & P.): It seems to me that the specification on annunciator bells is too much in detail in some respects. For example, a nickel-plated gong is specified, and again pressed steel cover; the current requirement is stated in amperes for certain resistances of bells and it is arranged to allow those being put in by the purchaser. I should think it would be a good plan to specify the energy that a bell must work with, and if done in that way, then, as certain types of bells require the same amount of energy, regardless of what the resistance might be, we would not need to bother about stating the current every time we wanted to order a bell. In section 2, paragraph (b) I think is wrongly stated.

J. C. Mock (M. C.): I understand that the paragraphs in the specifications for push buttons, train drops, etc., relating to annunciator bells should be similar for each specification. Does this one permit the use of outfits such as telephone companies use, or will your specifications make the instruments so large that they will cut out all of that standard telephone equipment? Will the telephone people be able to supply it?

The Chairman: Not from material they have in stock at present.

Mr. Stevens: I think the question I raised and the question Mr. Mock has raised is a rather serious one, and one which this convention will have to consider seriously at the annual convention. We are practically cutting out commercial material of all kinds and specifying something which will have to be developed, without any possibility of checking the price. I doubt very much whether the material we are specifying warrants the rigid specifications we are attempting to put before the association.

Mr. Shaver: I am in sympathy with that same line of argument. It seems to me the specifications are pretty rigid and go too much in detail.

The Chairman: We considered that quite a long time in committee meetings and decided that we would make specifications which, in our estimation, were A-1, and that if anybody wanted to put in some cheaper apparatus, that they could put in something that was now on the market. If they wanted to put in a first class proposition they could specify R. S. A. specifications.

B. H. MANN, President.

F. P. PATENALL, Vice-President.

C. E. Denney (L. S. & M. S.): I believe the question would be satisfactorily covered if the specifications, after approval, are referred to the committee on standards to design a push button. The price will be lower by making it a standard article.

Mr. Mock: I would suggest that the committee be asked to draw a specification which would permit the use of any high grade equipments, such as the telephone companies now supply. The telephone companies are making very good and very compact designs. I have not the slightest notion that the standards of the committee can improve on them for the use of signal work; if you tell us that we must have a standard R. S. A. binding post and ⅜-in. air gap, you have practically settled the question of size. I think it is quite a serious matter now in all our big plants to provide the room for these appliances.

A. H. Rudd (Penn.): Could not the heading of these specifications be changed so as to show that they shall apply only to certain work; for instance, the bell is provided with a ⅜-in. air gap, and that is the same as the air gaps which

are required to protect against lightning troubles, etc. The practice on many roads is to place these annunciator bells on a local circuit right in the cabin, and there is no chance of lightning getting at them, and in that case a cheaper bell could be used. I think the same remark applies to the specifications for annunciators and push buttons. It seems to me that if a specification could be divided so that while it does specify for the best class of material, which is to be used on certain kinds of work, where they either have circuits of high voltage or where they have circuits exposed to lightning, and this better grade of material was to be used in such cases, yet other grades of material could be used in cases where the conditions were not so exacting, and then that would give us a chance to use cheaper material on the inside and local circuits, which would serve the purpose.

Mr. Shaver: I move that the committee consider the specification with regard to revisions, such revisions as may be necessary, in view of what has come up at this meeting.

Mr. Stevens: I second the motion. I know that we will not use these specifications. We do not think the specification as provided for this type of apparatus is necessary. Mr. Mock has raised a very clear fact that all our communications with each other through the medium of the telephone are made with these identical articles which we are trying to specify here, and the telephone company has developed these things into the smallest possible articles they can get hold of, and they work. Why should we design a great big piece of apparatus, probably expensive—we cannot tell that until it is developed—to do the same work the telephone people are doing with probably a cheaper instrument, at least one of far less bulk?

L. S. Rose (C. C. & St. L.): I think the committee is right. The cost of these articles and the maintenance of them should be taken into consideration. When the telephone company wants to make a change they put in a new machine, and it has been our practice, when we have a coil burned out of a bell, to put in a new bell. If we can get a form of wound coil we can repair the bell, by putting in a new coil, and save the rest of the bell, and as far as our R. S. A. standard binding posts, nuts, etc., are concerned, we will have a lot of these parts on the railroads, with which to repair our machines, and everything will not be special. I think that the committee is on the right track.

After these specifications have been in use a little while you will find that all the supply houses will be making these patents of push buttons, annunciators, etc., without these specifications, and we will have a better chance to judge whether we are getting our material for the right price or not, where now we take some special design, and we do not know whether it is economical, because we cannot compare it with anything else. I sustain the committee.

J. Beaumont (C. G. W.): There is no compulsion as to using this material in places where possibly somewhat inferior apparatus would fill the conditions, but the work of the R. S. A. is based on the theory that we want the best material to fit certain conditions, and these conditions are taken care of by such apparatus as are developed from the work of its committees. I move, as an amendment to the original motion, that the specification be accepted by the Association.

T. S. Stevens: It is not a question of always using the best. It we can use apparatus which is being used now on the train dispatching telephone service throughout the country, surely it is good. I am arguing in favor of commercial material that is good, and is on the market, and that has been the process through which this association has got up all its specifications, basing it first on something that is commercial and gradually developing the thing to a higher point, if they find it necessary in the case of this commercial material.

(The president then put to vote the amendment motion, which was not carried, and the original motion to recommit the matter to the committee was then put and carried.)

Mr. Du Bray: The next is the specifications for floor pushes.

W. H. Elliott: I suggest a modification of the clause (e) I think it might be expressed more clearly as follows: "Floor push shall be mounded on the underside of the floor with operating button raised a sufficient distance above the top of the floor.

Mr. Du Bray: We will accept that.

Mr. Stevens: I move that the section, "Specifications for Floor Pushes," be accepted with the same consideration that applied to the previous paragraph.

Mr. Shaver: I ask the committee why in Section 1, in paragraph (h), it should not be arranged so that there may be a normally open contact or a normally closed contact? While I am aware that in most cases a normally open contact is desirable, yet in some cases a normally closed contact is desirable. I want to call attention to paragraph (b) in Section 2, on "Testing." I find too many of us in preparing specifications are not careful about the inspection clause. A floor push is not a very expensive piece of apparatus, and I am not so sure it is going to pay us to send an inspector to look over ten floor pushes at the place of manufacture. The same applies to other apparatus of such a nature, and I believe it should be stated in such a way that we are not obligated to send someone to inspect ten or more push buttons if we do not want to do it. The expense of sending a man to make these inspections will oftentimes equal the cost of the apparatus.

The President: The committee is willing to change the word "will" to "may."

The motion was then carried.

Mr. Du Bray: The next specification which we desire to bring up is that for fuses. Before we get into this I would like to say that the drawing as shown on page 10 is not quite right. The note, "Dimensions of Above Type to Be Specified by Purchaser," applies only to the screw contact fuse and not to the ferrule contact type. The fuse covered by the National Code specifications will meet the specifications here, and there is nothing in these specifications that will make an article special for signad use. It is in accordance with the National Code; in fact, a great deal of this matter is copied directly from the Code, and the balance of it is more or less of a rearrangement of the Code specifications. In some cases we have limited the capacities to what we think is necessary in signal work and cut out all other fuses.

Mr. Stevens: I suggest an asterisk with a footnote saying at the bottom, "Specifications of the National Board of Underwriters."

Mr. Du Bray: It is the intention of the committee to make such acknowledgment.

Mr. Stevens: I move that the specifications be accepted.

Mr. Shaver: In paragraph (d), under Section 1, does the word "Link" refer to a wire fuse or a ribbon fuse?

Mr. Du Bray It can be either one.

Mr. Shaver: In Section 1, under paragraph (e), the reading is, "The fusible wire shall be attached to the terminals in such a way as to secure a thoroughly good connection and to make it difficult for it to be replaced when melted." I imagine possibly the committee refers to the replacement of this by the maintainer, and I do not see why that restriction should be placed on it. Only recently we have discovered that a lot of the average type fuses can be refilled at a whole lot less cost than the original fuse cost, and that they are just as good.

Mr. Du Bray: That clause is taken from the Code, and it reads the same in the Code as it does here.

Mr. Shaver: I want to call attention also to the fact that only recently we have had a lot of trouble in getting fuses, due to the National Electric Code standards being changed, and if the Committee has not recently investigated the requirements of the National Code I suggest that it do so and change their specifications accordingly. It is certain they have not been well settled as to what they require.

Mr. Du Bray: That particular type of fuse known as the screw contact type seems to have no existing standard. The fuse manufacturers will make them in any way to suit the purchaser's requirement. You can get a 75-ampere fuse that is approximately 2 in. long, and you can get a 10-ampere fuse that is 5 in. long, of the same general construction, and it seemed to be the idea that the fuse was made to meet some existing condition, and several of the fuse people advised they would make the fuse in any way that it was ordered.

Earl B. Smith (N. Y. C. & H. R.): I think there should be something here with reference to the refilled fuse, as we use it with pretty good success. We do not use the asbestos filling, but the ventilated cartridge and end gap. In fact, we find the fuse does not deteriorate as much when it is refilled, we seem to get a better surface, and it does not seem to absorb the dampness, which ordinarily deteriorates the fuse.

Mr. Du Bray: We did not feel that we were putting anything in the specifications that would prevent their being refilled.

Mr. Denney: I ask if the condition of the fuse after blowing will be apparent? I have in mind the fuse of an interlocking machine that blows through the operation of the lever, and if the leverman does not find out promptly that the fuse is blown, he will probably report a failure and unnecessarily delay trains.

H. S. Balliet (N. Y. C. & H. R.): While these detectors are

used on inclosed fuses, they are far from reliable in the signal business. I have gone through that, and there is no doubt about it, in my mind, that we ought to have an addition to what is shown in these specifications, a type of fuse suggested by Mr. Denney, so that we will know more definitely that it has blown. That is something that we should know quickly, very quickly, in congested territories.

Mr. Stevens: I move that the section of the specifications just presented by the committee be accepted, with the understanding that the committee will take into consideration the various suggestions which have been made in this discussion.

(The motion was carried.)

The report of sub-committee was then presented by I. S. Raymer, chairman.

Mr. Shaver: I raise this question with regard to pipe coating. Is it supposed the threads will be galvanized or not, or treated in any way or not? This is not brought out here, and, in some cases I know of, they are treated, and in other cases they are not treated. If the thread is not treated to prevent rust, that is the weakest part of the conduit, and it seems to me that it should receive some consideration.

Mr. Denney: I agree with Mr. Shaver, and believe that eliminates hot galvanizing. The inside coating should certainly be hot galvanized.

Mr. Patenall: Does the acid bath remove entirely all the blisters and scales on the interior of the pipe, and such being the case, would it not be rendered smooth, contrary to what Mr. Denney says?

Mr. Raymer: I believe it is the practice with the manufacturers who put on the coating to use enamel inside, whether it has been hot galvanized, sherardized or electro-galvanized. They usually put the enamel on to give a smooth inner surface for the pulling through of the wire.

Mr. Denney: The acid bath is given before the hot galvanizing, and you cannot hot galvanize and have a smooth surface. I would move that the clause 4 be revised, eliminating the words, "hot galvanized, electro-galvanized, sherardized," so as to make it read: "The interior surface of the pipe shall be enameled."

Mr. Balliett: I second that motion.

Mr. Stevens: I do not think that should carry. I am not prepared to discuss the effect of hot galvanizing on the interior of conduits, but I am confident we are using a lot of that material. I believe sherardizing is a better process, but I think you will find that the most serviceable conduit on the market, as Mr. Raymer says, is either galvanized or sherardized first, and then enameled, so whatever we do, we must remember that the enameling will not effectively protect against rust. The conduit will scale, will have pits on the surface, and the only way we can protect against that rust is either by galvanizing or sherardizing.

Mr. Denney: I disagree with Mr. Stevens. Enameling would be one of the best means of protecting the outside of the pipe, if you could put it on and keep it on while the pipe was being handled. You can properly enamel the inside and nothing happens to remove it. A great deal of conduit that is used in buildings is enameled inside, and so far as I know, it is all enameled inside. It is not enameled on the outside because it will not stand the shipping and assembling, and hot galvanizing on the inside would make an unsatisfactory surface for pulling wires through.

Mr. Raymer: I believe it is possible to hot galvanize and enamel on the interior, also to sherardize and enamel, but do not believe it is quite practical to electro-galvanize and enamel on the interior. We were agreed to let it stand as it is, but added enamel on the interior, after either of the other finishes have been put on.

C. A. Christofferson (N. P.): I suggest an addition to paragraph 3 stating that all cutting and threading must be done before the conduit is galvanized or sherardized, whichever process may be used, in order to have the thread properly covered.

Mr. Raymer: The sherardizing people, I believe, after applying their process, put the product through a paraffine bath, and then enameled the interior if desired.

F. P. Patenall: It seems to me that some tests should be applied before we finally decide this question. It is further evident that pipe properly sherardized will leave a very smooth surface; but I am doubtful, in view of practice with which I am familiar, where steel conduits have been put in without enameling, whether it is desirable to also give them a coat of enamel after sherardizing them. It seems to me that one of these operations is sufficient if we can secure what we are after.

The President: The committee agrees to look into this

T. S. STEVENS, Vice-President.

C. C. ROSENBERG, Secretary.

matter, bearing in mind the discussion which has taken place at this meeting.

J. Beaumont: I move that the specifications be accepted. This will carry certain details to be presented at the next conventions.

C. E. Denney: I offer an amendment, that we accept the specifications as presented at this meeting and that we instruct the committee to revise the specifications and submit a further report to the June meeting. The specifications should be made more definite.

Mr. Raymer: These specifications covering the different kinds of coating embody these various processes, so that the man who draws up a requisition or a specification can cross out the one he does not want.

Mr. Balliett: I second Mr. Denney's amendment.

Mr. Mock: I have had a good deal of experience during the last two or three years in the purchase of this kind of pipe. Some of it was plain black and some other galvanized. For the committee to say what is best is as difficult as to say whether wrought or steel pipe is best under all circumstances.

The Chairman: Mr. President, the committee is not prepared to recommend any one basis of coating pipe. There are several manufacturers making different kinds and we do not care if they are any one of the manufacturers. We have not had sufficient experience to determine that one process is superior to others.

Mr. Shaver: It is a fact that this specification is made up in such a way that it is necessary to use hot galvanized, sherardized or enameled, whatever we may want. If we are getting bids on something of that kind, it is our lookout to see that we prepare our bids on sherardized, electro-galvanized and the like. I believe the committee will be glad to take this into consideration and see if any of these things can be eliminated, but in order to meet the wishes of most of the members as they have expressed themselves in the past, it seems to me they have prepared the specification all right. I think it is very difficult to tell whether one type is better than any other at this time. I do not believe the committee or any member can do it.

The President: The question is on the amended motion, unless it is withdrawn, based on the discussion, which takes into consideration the fact that the committee is willing to consider this question, but the committee do not feel in the state of the art that we can tie the specification down any tighter than it is.

C. E. Denney: I will withdraw the motion with the understanding that the committee will consider this at the annual meeting.

The motion was carried.

Specifications for wrought-iron pipe conduit material was next presented.

T. S. Stevens: In view of the discussion on the specification for steel pipe conduit, which will equally apply to this, I move their acceptance, with the idea that the committee will give consideration to the past discussion that has been had on the specifications for steel pipe conduit.

The motion was seconded.

Mr. Raymer: The specifications for wrought-iron pipe conduit are practically the same, except for the material used in the pipe and the comment that steel pipe conduit will apply to wrought iron pipe.

Mr. Denney: Have there been any tests by the committee showing whether steel or wrought iron is preferable for any particular uses?

Mr. Raymer: We use practically the same test as used in specifications for signal pipe, which are now acceptable to the Association and printed in the Manual.

Mr. Shaver: As a matter of information, I would like to know from the committee whether they have found it possible to get wrought-iron pipe conduit? Is it being furnished commercially at this time?

Mr. Raymer: Yes, sir, I believe you can obtain it.

The motion was carried.

MANUAL BLOCK.

Sub-committee "B" was assigned the preparation of, and submitted, rules for the maintenance and operation of interlocking plants and block signals. Standard code rules of the American Railway Association were accepted as the basis, but for economical reasons were not printed in the report excepting only such of them as are recommended for revision. Such additional rules as are suggested for adoption were also included. Six of the present rules for signalmen were subjected to revision, the principal point covered being the elimination of hand signaling and the substitution therefor of caution cards. Complete rules for maintenance to govern supervisors, signal foremen, and maintainers are given; 13 for the supervisors, 11 for the foremen, and 50 for the maintainers.

The committee consists of T. S. Stevens (A. T. & S. F.), chairman; L. R. Mann (M. P.), E. T. Ambach (B. & O. S. W.), Hadley Baldwin (C. C. C. & St. L.), J. Beaumont (C. G. W.), M. W. Bennett (G C. S.), E. A. Black (L. S. & M. S.), C. Drake (C. & N. W.), J. A. Fleissner (C. M. & St. P.), M. J. Fox (C. B. & Q.), G. A. Guyer (N. Y. C. & H. R.), B. A. Hinman (N. Y. C. & H. R.), H. K. Lowry (C. R. I. & P.), G. S. Pflasterer (N. C. & St. L.), W. N. Spangler (P. R. R.).

Discussion on Manual Block.

Mr. Rudd: I would suggest that rule 620 be changed. It says "If a signal fails to work properly its operation must be discontinued and until repaired the signal secured so as to display the normal indication." That is probably all right for an interlocking signal. A considerable mileage in this country is automatic, and, at normal, clear. I would like to suggest if there is not some way of getting these amended rules to the committee on operation of the American Railway Association, before our annual meeting.

Mr. Rose: This rule 620, I understand, is for manual block and the rule is for the signal man. Ought not that reference to train movements be cut out of here?

Mr. Beaumont: I would like to answer that by saying that the rules as submitted, both the amendment to the present rules of the A. R. A. and the proposed rules only have reference to interlocking. These rules have no reference to manual block or automatic signals.

Mr. Rose: That is not the point. I don't care whether it is manual block signal or interlocking signal, but I think the rule governing what the train men should do ought not to be mixed in with rules for signal men.

Mr. Stevens: The Rule 629 referred to, in rule 620, specifies some definite action on the part of signal men which they have to know about, and that later the rules for the engine men and train men are handled to bring about this desired result. Practically the thing we are introducing here is the issuance of a caution card instead of the usual hand signals which have been in use up to the present time.

Mr. Rose: I do not believe it is necessary to issue a caution card to get a train by an interlocking signal in the stop position, especially if that signal is 1,000 ft. from the tower and the towerman or signalman is the block operator also. We have a means of doing that by hand signals, and the towerman is required to use a certain colored flag or lantern for his hand signal. The responsibility for passing the signal in the stop position on hand signals is up to the towerman and also to the man that accepts that signal. He is responsible if he gets off of the track and it would tie the railroad up if for every train the towerman had to go to the home signal and hand up a caution card. I do not believe it would be a bit safer.

(Sections 620, 629 and 630 was then read.)

Mr. Beaumont: Under "Proper Operating Conditions," the train movement through the interlocking plant is accomplished by the signalman setting up the route and indicating to the engineman, by means of a fixed signal, that the train may proceed. The act of forwarding the train through the interlocking, under proper operating conditions, is accomplished by the co-operation of the signalman and the engineman, subject to the check of the interlocking apparatus. The removal of the protection provided by the latter, whether by derangement of the machine or other cause, creates a condition necessitating extreme caution to insure the safety of the train movement. The proposed rule, under the principles of which a number of prominent lines are now operating, will, we believe, if adopted, have the effect of still further safeguarding traffic under such unusual conditions as follows:

First, it will cause the train to approach the interlocking signal under conplete control; second, it will cause the signalman to pass over the track to a point beyond the home signal; third, as the signalman is compelled to fill out an order for the engineman to proceed, he will exercise more care in examining the route before giving such authority; fourth, it will give the engineman information as to the nature of the trouble and thus enable him to act intelligently; fifth, it will create a record of an unusual condition for the benefit of the division superintendent, and thus enable him to check such defects more closely; sixth, it will insure co-operation between the signalman and the engineman; seventh, it will prevent a repetition of accidents that have occurred in the past due to misunderstanding of hand signals or verbal orders; eighth, it will restrain

enginemen from passing signals set at stop without written authority.

There are many other points in favor of this method of operation too numerous to mention, which, with the reason above given, seem to point to the advisability of adopting a uniform practice. It is evident that where two or more railroad companies are operating trains through a common interlocking plant, that standard practice could govern, and that such standard practice should be based upon the safest and most reliable methods. Your committee has given this matter such earnest consideration as to lead to the recommendation of the rule proposed as fully covering the conditions, at the same time establishing uniform practice, and therefore recommend its adoption.

Mr. Rose: I do not believe it will work very well on the railroad. That might do all right for an interlocking plant where the towerman had one or two trains a day and he had nothing else to do but pull the levers, but upon the road I am connected with the towerman is also the block operator, especially in the manual block territory. He has to report the passage of trains by his station; he has to obtain permission from the signalman in advance before he admits a train; he has to report the train entering the block; he has to give the clear block to the man in the rear, and we have some home signals that are 800 or 900 ft. from the interlocking cabin, and I don't believe it is necessary to go to all that machinery to get a train by an interlocking signal. Most of the causes for failure to get the interlocking signal clear are on account of some small adjustments. Sometimes the towerman cannot get it clear because he does not have the route lined up properly. In all cases the train stops at the home signal before it proceeds on the hand signal, and while we have had trains derailed there have been no serious accidents, because the trains move through the interlocking limit slowly; they do not run by home signals at 60 or 70 m. p. h. I believe a practical way to do this, just as safely as proposed, is by a scheme of hand signals with lights or flags that are different from the usual flag or lamp carried by the trainmen. At some joint interlocking plants we have two schemes, so that an engineman on one road will not be mixed where a signal is given for a train on the other road. I won't say that we have not had any trouble with it, but it amounts to one or two pairs of wheels on the ground. With Mr. Beaumont's scheme the responsibility is put on the towerman. With our scheme it is put on the engineman, if he accepts such a signal and gets into trouble without knowing that the route is all right. While that sounds very nicely, I think it would tie us up too much. It is too severe.

Mr. Stevens: All of Mr. Rose's remarks were presented before the committee for argument. The responsibility is not placed with the towerman. In the first place the rule which is now in effect with reference to trainmen is still retained in effect, and in the second place the man receiving a caution card, if he understands what the caution card means, is not relieved of anything anywhere. The argument that won the chairman over was this: It is the only way that you can tie the engineman and the towerman together; it is the only practical way that you can make sure that the engineman knows that whatever indication is given is intended for him personally and not for some other chap on the railroad. Now the argument was also presented to the committee that there would be lots of places with home signals at long distances, where the practice would be unduly restricted. I believe you will all acknowledge that these places are few and far between. The places where this rule would not be unduly restrictive are far greater in number than those where it would be unduly restrictive, and in handling subjects of this kind, previous to this discussion, many earnest thinkers have thought that it was better to have a rule even if it has to be abrogated to certain specific cases than to adopt a rule for all these specific cases which will apply to them all. Have a good rule if you can, which will take care of 75 to 80 per cent. of your cases, because then some officer of the railroad will have to be asked for permission to abrogate that rule at the places where it cannot be used. That is the position the committee takes with reference to this rule.

Mr. Rose: I do not believe in putting in a rule that will not be lived up to ninety-nine times out of one hundred. There is one thing we have to look out for and that is getting trains over the road. A good many hard-headed officers will not be willing to work under this rule. I do not believe we should put such a rule in the book. Make it a rule for the train to stop at the home signal, then you have your safety. No train is going to get up speed, run off a derail and kill a lot of people. The roads that are operating under this rule, I think, are not working a manual block system.

W. H. Elliott (N. Y. C. & H. R.): While I believe the rule is a good one, it has been our experience that it is impracticable to have it carried out, and in framing our new set of signal rules, practically the same wording that is used here was used. The use of hand signals as authority to pass fixed signals at stop is prohibited. In the discussion that took place among operating officials, assistant general managers and superintendents, it was finally agreed that it was necessary to use hand signals at certain times, as it was not practicable to get a caution card to the engineman, and for that reason we have in our set of rules a hand signal rule. We call for the issuance of the caution card under normal conditions of failure, but in certain exceptional conditions we allow the signalman to give a hand signal. This rule, if adopted, works out, according to my experience in this way, that where the signal is a great distance from the tower and on a modern plant with 18 or 20 crossovers, signals must of necessity be 900 ft. or more, in certain cases, from the tower. The signalman, instead of writing his card and taking it out to the engineman, calls for a trainman to come in, or waits for the trainman to come in, writes out the card and sends it to the engineman. What is the result? The man is trusting to luck. He may have his lock levers reversed and the route practically set out, but he does not know it. The engineman, on a dark night, cannot tell which way the switches are set, and he is going ahead without any assurance that the route is properly set and located. For that reason, while I believe such a rule is desirable, if you can enforce it, I do not believe it is practicable and that it is wise to have a hand flagging rule, carefully worded, to prescribe its use, and have that in the set of rules.

Mr. Denney: The committee has gone from one extreme to another, from all hand signals to all caution cards. There is a middle ground, and I believe they can fix the rule by inserting another paragraph, something along those lines—"for blank movements," or "at blank locations, hand signals may be used," with the idea that it will be filled in by the road. It is not a difficult or impossible thing to handle regular train movements, through movements, by caution cards, and they are the more important movements, because you are handling more equipment and the best grade of equipment; but it is possible, under certain conditions, to authorize hand signals for switching movements, and I am satisfied that the proper enforcement of a caution card rule, which I am in favor of, requires a modification, not by the time card. You have no rule, if you modify it on all divisions by the time card as you see fit, but make the rule, or a part of the rule provisional so that the road may use it as they see fit. There is no weaker rule than the rule that is modified by the time card. And the committee, if it believes, that the rule will at some places have to be modified by time cards, should revise the rule.

Mr. Rose: I have heard it said that you cannot railroad by the book of rules, but the time is coming when we are going to railroad by the book of rules, and it is very close.

Mr. Mock: I am in sympathy with the rule giving the railroads some leeway, and I think that is the chairman's thought in the presentation of his argument in favor of the rule. He says the railway officials should be permitted to abrogate the rule in special cases.

A. R. Fugina (L. & N.): I do not believe it is necessary to tie up the operation of an interlocking plant in order to issue caution cards. I have handled this proposition with our operating people recently, and made a canvass of the entire situation and I find the operative people as a rule are against it on our railway. Investigations brought out that they had no cases on their railroad within a reasonable number of years on which they had had accidents due to trains coming together on account of hand signals. I believe it is by far the most general practice to operate by hand signals through the interlocking plants, and I believe where we do have accidents, it is usually due to some other weak condition on the railroad; that if the operating rules are properly observed and the men are taught to observe the rules, there will be no trouble.

Mr. Denney: I want to modify my suggestion to the extent of making the supplement to this rule refer to locations. Make it refer only to specified movements, so that the rule will be uniform over the entire line. What I say is not with the intent of discrediting caution cards for through movements or for any movements that can be governed by them, and that can be determined by the road putting the rule in effect. It is the business of this association, and its members to reduce the number of caution cards that are to be issued, and they will be reduced as maintenance is improved. While you have an important train that is making a through movement and it should go by high speed, or medium speed sig-

nals of an interlocking plant, they should not be authorized to make a movement at a speed at which they would, if the route was not right, be led into a serious derailment; they should be given the caution card, and it should be done after the man knows the route that he is given is right. The additional time for giving the card is fully warranted in a given case.

E. B. Smith (N. Y. C.): We have been using this card a good many years under very busy traffic conditions. While our new card is not used in the form of a caution card, it is a proceed card and can be used for closing in of trains, that is with the direction of traffic. We found it a very good rule and we would have had lots of trouble if we did not have it. In fact, if you take this rule you will not have the engineer and the operator jointly responsible for the same thing. You make your operator responsible. He feels that he has that responsibility and he will look at the route. If your operating department is working with you you will have no trouble at all, because if there is anything that happens it is up to the operator and nobody else, and it is a clear cut case against him. We operate this rule and also use a card for each home signal. If he had three on this route to pass he would have to have three cards to get past them. While it does not delay us much, it is good for the maintenance end. When a man gets a card the operator has to report it and the engineer has to turn it in. Therefore we get hold of it, and if we have a failure, we can trace it. On a four track busy railroad, as in our case, with a switch out of commission, that is the time we need the card because we have the operator check the maintainer on the line, to see that the route is operated properly and to see that the man has gone where he is supposed to go. The operator in that case is responsible for the whole movement.

Mr. Stevens: We are willing to have this rule put in.

Mr. Rose: This rule might be all right on a 4 track railroad or on some great railroad that has an automatic block system from one end to another, but you are making this rule for everybody. I contend that 99 per cent. of the railroads of the country are not going to live up to that rule. If the operator hears someone blowing a whistle at the home signal he will not look at any of the switches until he gets through. He will hike right out with his ticket.

W. N. Manuel (G. R. & I.): There is not any question in the minds of any of the members but what there is need for more co-operation between the runner and the signal man, where part of the interlocking plant is out of service. In some cases that I have heard of, a route has been lined up for the crossing road, and trainmen have accepted hand signals. That is certainly dangerous and it could be taken care of by the use of the caution card. Certainly there could not be any harm in saying, "Unless otherwise provided for, hand signals should not be used."

Mr. Denney: I would suggest that the committee, supplement Rule 629 and revise it to provide about as follows: "Hand signals may be used for the following blank train movements, and must be given on the track on which the movement is to be and in such a way that there can be no misunderstanding on the part of the engineman or the trainman as to the signals, or as to the train or engine for which they are given." That would make this a combination of the old rule and the new rule, and allow for flexibility to be determined by the road adopting the rule, in toto or in part.

Chas. A. Cotton (A. T. & S. F.): Is it intended that the head brakeman should do his own flagging? If he comes in on the hand signal without doing his flagging he is called in for investigation.

Mr. Elliott: I would like to suggest to the committee the substitution of the word "set" for the words "line up" in the next to the last paragraph.

Mr. Rudd: The Pennsylvania has some small lines, and some big ones, almost as big as the New York Central. We have 100 per cent. block signalling where passenger trains are run and part of it is automatic, part of it is manual block. We do not permit our men to pass the manual block system at stop position without a card. At many of the interlocking signals we have the block system. As I remember it, we require a man to get the card before he passes an interlocking signal set at stop. It is not always necessary for the signal man to fill out the blank. At some of our plants where the signals are half a mile from the cabin, the signal is located at the telephone station or the bridges and the man fills out the card, on advice of the operator. I cannot state absolutely that we require a card to pass every home signal, but as I remember that is the case. It certainly is the case where the interlocking signal is the block signal. We have found it possible to operate in that way. If you adopt a rule that you should use a caution card at all points, you will not get rid of your trouble. A fellow will not always look at his switches, but will run out with his ticket and let them go. You can bank pretty fully on a man that issues a hand signal from the cabin, that he is not going out on the route. So I do not see that it is a very great argument against the card. You certainly will not be any worse off and you may be better off. I do not think that it is the province of this association to make rules. That is the province of the American Railway Association. They are working on amended rules now. I believe the way for us to handle this under the present extraordinary circumstances, is instead of our trying to formulate a rule, to pass a resolution at this meeting, that it is the sense of our signal association that caution cards should be substituted, or ordered substituted, for hand signals, to enable an engineman to pass an interlocking signal at stop, and that we should send that resolution to the secretary of the American Railway Association.

Mr. Beaumont: The committee has simply carried out the instructions assigned to them, namely, have drawn up for your consideration rules governing operation and maintenance of interlocking plants, and block signals. I fully agree with Mr. Rudd. Insofar as the A. R. A. is concerned, such rules as they make should be based upon the best practice, should be based upon the experience of the fellow who knows what is wanted, and if you decide that this association should not make operating rules, you should also decide that this association should recommend to the men who make the rules, what they believe to be the best practice.

Mr. Rudd: I do feel that the A. R. A. would not take it in bad part if we should give them the benefit of our experience and I do not believe it would handicap them seriously. I think we ought to tell them what we think. If they do not agree with us they can turn it down. If they adopt it, we will be so much ahead of the game.

Mr. Stevens: As the chairman understands it, we will consider that the operating rules are eliminated from the report. We will this afternoon present a resolution to this association simply stating that in the opinion of this stated meeting the process of getting trains by home signals, which are not working by caution cards are preferable to that of getting them by hand signals. That will be the purport of the resolution practically.

Mr. Rudd: And that if you please the purport of rules 663 and 667.

Mr. Stevens: Yes.

Mr. Shaver: If we will instruct our men and choose good men, we can have no fear that good results will be obtained in handling an interlocking plant, in case of a failure or in case where a caution card or hand signalling might be necessary. I do not see that there is any particular objection to the use of a caution card by those who want to use it. At the same time hand signaling might be just as good, and perhaps it is more desirable in some situations. I do not believe that we should restrict our practices to one particular thing. I know of places where such a rule could not be used and get trains over the road.

Mr. Beaumont: To clear the matter, the committee will consider the modification of the rule, so the recognized practice will be both ways. That is the only way that we can meet the feeling of the association. In other words the caution cards shall be recognized in the rules as being a method of handling the trains instead of hand signals. That is hand signals can be included in a modification, or alternative in the rule itself. If that will meet the objections raised and will dispose of the matter, we will be very glad to have it that way.

Mr. Denney: I have one further suggestion. The committee has done the work as shown in the proceedings. This afternoon they can submit some revisions. I think a motion could be put this afternoon, advising the American Railway Association of the work done to-day, and ask them if they wished the work of the committee continued along the same lines or along revised lines, or if they wished the work discontinued.

A. H. Rudd: Mr. Shaver makes the statement that there are places where trains cannot be gotten over the road if the card is used. That is a pretty strong statement.

Mr. Fugina: It seems to me, if there is a demand for a rule of this kind it should come from the interlocking people. They are handling the movements over those plants. Whether we should hamper them by suggesting a rule for handling traffic over the plant is questionable. Now, if a rule can be lived up to, and is lived up to, it will be all right, but there are many rules that are not lived up to. I do not think we should consider this rule at all.

Mr. Stevens: I move that we pass on to the rules for supervisors, with the understanding that this subject will be brought up again for discussion this afternoon.

The motion was carried.

C. J. Kelloway (A. C. L.): Rule 702. I would like to suggest that the first part of the rule read, "They shall be responsible for the safe condition and proper maintenance of signals and interlocking plants. They must make temporary repairs of such defect as may endanger or delay the movements of trains, and promptly report defective conditions to the——." I move that the last part of that paragraph be struck out, as rule 703 takes care of it.

Mr. Beaumont: I want to say that we have copied verbatim under "Supervisors" the standard rules of the A. R. E. A. We consider that these rules have been adopted by a superior association, in a way, and we thought we would better accept these instead of making modifications that better accept these instead of making modifications that might possibly improve them. A number of the members of the committee believe as Mr. Kelloway does, and in order to save time, if you are going to revise the rules, I would suggest referring the entire matter back to the committee.

C. J. Kelloway: I will include this in my motion.

J. C. Mock: I second the motion.

Mr. Stevens: The committee did not discuss the rules of the A. R. E. A., because they thought they were a senior association. The rules ought to be accepted, and afterwards, if it be the sense of this association that some of these rules can be revised, the suggestion ought to be made to the A. R. E. A., and the rules ought not to be revised here.

Mr. Beaumont: In order to bring the matter clearly before the house, I move an amendment to the original motion, namely, the adoption of the A. R. E. A. rules for supervisors of signals, as adopted by the A. R. E. A. supervisors.

The motion was seconded.

J. C. Mock: It is not intended by this motion to criticise the action of the A. R. E. A. Perhaps the same action by this committee to the Engineering Association would be entirely proper. If we see fit to suggest revisions to the Engineering Association, I think that is quite proper. These rules do come very close home, and it is very proper that this association should scan these rules, much more so than the A R. E. A. rules, which we are operating under.

The President: Are you ready for the motion to refer these rules back to the committee for further consideration, in as much as these rules do not now meet the views of the members of this association?

The motion was carried.

Signal foremen rules were next considered.

Mr. Stevens: I don't believe that we can improve on any of these rules very materially.

Mr. Beaumont: The rules for signal foremen as presented are a copy of the A. R. E. A. I believe they fully cover conditions. The committee has been very careful in drawing up rules for maintainers which fully cover the ground. Considering those rules, the rules for signal foremen are certainly right, and I move the adoption of the report covering signal foremen.

The motion was seconded and carried.

Maintainer rules were then considered.

Mr. Fugina: Seven hundred and fifty-nine does not look like a good rule to me—"and that small parts are properly secured from theft." How about the large parts?

Mr. Beaumont: Too heavy to carry away.

Mr. Denney (Reading Section 760): I think that should read: "and should report if insufficient men are on duty."

The President: The committee accept the suggestion.

Mr. Fugina: The operating rules cover a great many of the points in Rule 761. That is the action that the signal man should take when different things occur. I wonder if the committee considered those rules in connection with these. There might be some conflict. I know that our operating rules require that in case of storm the signal man shall see what is the proper way to handle the situation. This practically puts it up to the maintainer, and the same with reference to 761.

Mr. Stevens: We maintain that, regardless of any rule issued to the signal men by the operating department, it is still a track duty of the signal foreman to know that these conditions exist.

Mr. Manuel: If a signal man is located over a vast territory, it will be impossible for him to see that a signal plant is taken care of by track men. I think that ought to be up to the track man. I do not believe the signal forces should have anything to do with it.

Mr. Beaumont: That has reference to 760.

The President: The committee have been willing to consider suggestions that have been made. Perhaps they will consider this in that way.

Mr. Smith: Why not have the maintainer cooperate with the track forces or signal forces? If our men are notified to get on the ground, we also have the maintainer men cooperate with them. I think there should be cooperation between the three men.

Mr. Stevens: The point is, where are you going to obtain your information from on a division? Where is the head of the signal forces to obtain his information from? You can not issue instructions to the section man. He is not reporting to the signal foreman or supervisor or someone else on the division in charge of signal work. What we wanted to do was to provide a way in which the supervisor would be kept in touch with the situation at the time of stalls. There are telephones and telegraph along the line, and several ways to find out what is happening at a point where a man is standing. We cannot specify those things, but we simply say that the plant is being taken care of during stalls.

J. A. Peabody (C. & N. W.): I believe this is a good rule just as it stands. The maintainers themselves must, in a heavy snow storm, take general charge, see that sufficient men are on hand or ask for them and take charge of them, and distribute them so as to get the best results.

Mr. Denney: Referring to 763, would that not be more definite as to the kind of record the committee recommends be kept? It says, "Showing failures or other unusual occurrences." That would become a log book.

Mr. Stevens: That is a very good thing to keep in mind, failure being the principal thing.

Mr. Denney: Isn't it proper to indicate what the record shall cover? I presume it is primarily intended to cover delays to trains and not an indefinite statement, "or other unusual occurrences."

Mr. Stevens: The principal thing is failures. We encourage the keeping of any other history which might be useful. We have failures first. We are specific about that and we put the other in to show the man that it will be appreciated if there is any unusual occurrence, which may be interesting at some future time, if he will make a record of it.

Mr. Denney: I think you could amplify your provision in regard to keeping a record, showing what the committee recommends.

The President: I know personally in a recent case that the facts that a towerman kept a record of a fire started in an adjoining building a few minutes before a certain train passed saved the insurance to the company. The statement was made that the train set it on fire. Shouldn't you leave it to each road to say what it shall keep? The committee will consider that.

Mr. Fugina: In 767 we have that same thing I spoke about before. We say that this must be signed by each signal man on duty. I think we should have a rule to the signal man that would conform to this.

Mr. Beck: In connection with rule 768, I should like to know what the intentions of the committee are in regard to the tests. The application of $\frac{3}{8}$ in. on the point, in the average derail connection, will allow the point to roll.

Mr. Beaumont: The committee gave that considerable thought. It is pretty hard to specify a test that will be satisfactory. We will ask for constructive criticism on that point. The committee have recommended the best rule they thought it possible to suggest.

Mr. Smith: Wouldn't $\frac{3}{8}$ in. on a hundred-pound rail cover it? We have got to lock up so tight on the rolling, it is not good maintenance, and you have several failures you would not have, because you have to pull the point very tight.

Mr. Waldron: I think with a 100-lb. rail it is practically impossible to maintain the $\frac{3}{8}$ in.

Mr. Beaumont: It is the standard test.

Mr. Rudd: It is one of the most serious propositions that we have been discussing for the past two or three years with our power operator plants. We have been making a weekly test in our terminals and we find that with a $\frac{3}{8}$ in. tester, or perhaps a $\frac{1}{4}$ in. tester, that the lock bars the locking of the dogs in the lock rods, and will shear out the bars. We have tried case hardening. We have found that our inspection tests, to avoid trouble, caused more trouble than if they were not made, and we are making them less frequently now. We have not been able to find any way to prevent the rod shearing. We have not solved it yet. A $\frac{3}{8}$ in. on a power operating plant is practically impossible.

Mr. Beaumont: The rules show pretty much in detail how the various points would be maintained, but it was the thought of the committee, while lost motion is objectionable in certain ways, yet in certain pointed locks there was no

objection to a certain amount of lost motion. Yet we found it difficult to specify how much would be allowed for this, that and the other. Consequently we considered those essential points, and made this paragraph in regard to point locks, etc.

Mr. Waldron: If this lost motion was of such a nature that it would cause an accident, would you not have the maintainer rectify it at once, refer to some place in your rules where such would be the case?

Mr. Denney: The reducing of clearances should not be up to the maintainer, and this paragraph should be revised to provide that the standard clearance or the provided clearance should not be reduced.

Mr. Rose: I move that rule 774 be sent to the American Railway Engineering Association, with the request that this association would like to have that rule interpretated under the rules for section foremen, and that this committee revise the reading of the rule, so that the maintainer will report conditions of bad drainage rather than attempt to correct it.

The motion was seconded and carried.

The resolution concerning signalmen was presented at this point, as follows:

Mr. Beaumont: The committee has drawn up a resolution to be submitted, as follows: "Resolved by the stated meeting of the R. S. A., held at Chicago, March 17, that a recommendation be made to the A. R. A. that a rule be provided permitting the use of a caution card to move a train against an interlocking signal displaying stop indication, where such stop indication is brought about by an interruption in the interlocking apparatus." I move its adoption.

The President: Does the committee understand that if this resolution carries, they will eliminate from this matter as it will be presented to the convention rules 620, 629, 630, 631, 663 and 667?

Mr. Beaumont: Yes. The A. R. A. rule now provides that a hand signal shall be given, as shown in 620 and 629. All we desire in connection with that rule and with the point aimed at through this resolution is recognition of the caution card for that kind of a movement. It will not discredit the present practice of using hand signals as presented to the A. R. A.

Mr. Stevens: We are in favor of the resolution, unanimously, as to the members of the committee here present. We prefer the resolution should be submitted and adopted and that the rules as presented should be adopted.

The resolution was adopted and the report of the committee was accepted, and the committee retired.

STANDARD DESIGNS.

The committee submitted drawing 1058, for a cast-iron anchor post for use in concrete foundations; drawing 1099,

J. C. MOCK,
Chairman Committee on Standard Design.

showing the proper location of detector bars and clip bolts, the former with reference to the height of the bar above and below the rail, and the latter with reference to the distance from the bottom of the rail at which the drilling is to be done; drawing 1225, stuffing box for one-inch pipe, with full details; drawing 1226, stuffing box for wire, with details; drawing 1250, connections for a double-slip switch and movable-point frog; and drawing 1251, showing lock rod and operating connections, and giving details of the insulation of front and lock rods complete for single switches with plunger locks, for movable-point frogs with switch and lock movements, and for double-slip switches with switch and lock movements; and details of operating rods for single switches, single slip switches, and movable-point frogs.

The committee consists of J. C. Mock (M. C.), chairman; C. C. Anthony (P. R. R.), G. E. Ellis (K. C. T.), W. A. Hanert (N. Y. C. & H. R.), C. J. Kelloway (A. C. L.), F. P. Patenall (B. & O.), M. E. Smith (D. L. & W.), R. E. Trout (Frisco).

Discussion on Standard Design.

Mr. Mock: The committee has discussed and recommended certain variations from the dimensions on certain drawings. The first one is on the tang piece. We found the manufacturers were up against a rigid inspection that required 31/32 in. as the diameter of the tang ends. The inspectors did not allow any variation from that and the difficulty of manufacture required a certain leeway. Our recommendation is that the minimum diameter be 15/16 in. and maximum 63/64 in., and the nominal diameter on the drawing is 31/32 in. We ask if that is favorable. The idea is that the manufacturers will feel that they are within the specifications when they manufacture according to that variation.

The recommendation was adopted.

Mr. Mock: In cold rolled steel pins the allowable variation which we recommend for 1¼ in. crank pins is .002 in. undersize. For ⅞ in. turnjaw pins, turn to gage, not larger than ⅞ in., less one-thousandth inch, and when smaller than ⅞ in. not less than three-thousandths of an inch, and that is a variation of .002 in.

The recommendation was adopted.

Mr. Mock: In our meeting with the manufacturers of wrought iron pipe I may say that we found a necessity for a change in the specifications in regard to the tensile strength and the elastic limit. We desire to move that the specifications for the tensile strength shall be 48,000 lbs. per sq. in. for the maximum and 40,000 lbs. per sq. in. for the minimum, and that the elastic limit be 30,000 lbs. per sq. in. for the maximum and 22,000 lbs. per sq. in. for the minimum. The elongation is to be 12 per cent in the measured length of 8 in. That is for wrought iron pipe.

The recommendation was adopted.

T. S. Stevens: May we know just what results you expect to bring about by this reduction in tensile strength?

J. C. Mock: Briefly, the process of manufacturing wrought iron is through puddling furnaces; you get muck iron from the puddle and then it is reheated and given a silicon bath, and then taken out and rolled, so that the silicon is mixed in with the iron, and that forms a sort of scale on the iron. It is contended by the manufacturers, and I imagine with scientific correctness, that the scale preserves the iron against rusting. As we know, wrought iron pipe costs more than steel pipe, but it is in the long life of the wrought iron pipe that its advantage lies. The process of manufacture, however, in the case of wrought iron is that they cannot get the high tensile strength or high elastic limit that they can in the steel pipe, which is homogeneous.

I. S. Raymer (P. & L. E.): I investigated the properties of wrought iron for pipe, when I was looking up the question of conduits, and the information I got shows that the manufacturers of genuine wrought iron wish to have the maximum for tensile strength at 48,000 lbs. and the minimum at 40,000 lbs., as recommended by the committee.

Mr. Mock: The committee would like to have the association members to think about the subject of galvanizing hook bolts and see if they have now any trouble from rusting and the weakening of the parts where the hook bolt comes in contact with the pipes. The other question, which seems to be with us always, is the question of arm spacing. The committee have looked over the vote on this subject, and their analysis does not, in our opinion, justify us in assuming that we have a two-thirds majority vote in favor of 6 and 7 ft. spacing. I think the 6-ft. spacing will not be satisfactory between the top and second arms, because you will have no air gap between the second arm at clear and the top arm at stop. It is desirable to keep the bottom arm 22 ft., in our opinion, although we are not an absolute unit on that point. You can have the third arm about 9 ft. 6 in. below the second arm, and not change the kind of pole; that is, you do not have to go to three sections of pole. It will not increase the number of standards; but that is the limit. So that unless we change the poles, the ladders and all the work we have done up to this date, you should keep in mind that if we have 7 ft., which almost everybody believes is the right distance

between the top and second arms, we should not have anything above 9 ft. 6 in. between the second and third arms. If you do that, you are getting to 6 in. section of pipe.

Mr. Shaver: Mr. Mock spoke of making the lower arm 9 ft. 6 in. below the second arm. Does that mean increasing the pole two feet more?

Mr. Mock: Yes.

Mr. Denney: I move it is the sense of this meeting that the standards should be completed on the 7-ft. and 6-ft. basis.

The motion was carried.

T. S. Stevens: I move the adoption of 1058 for presentation to the annual meeting.

The motion was carried.

Mr. Mock: Ten hundred and ninety-nine is really a specification for the angle of the bar and the spacing and location of poles in the rail where the clip must be fastened. It does carry with it an indication of the design that was adopted as standard last year for a bar, but the chief purpose is to standardize the angle and the location of bolts. Those are 5-in. centers and through the center.

Mr. Mock: Twelve hundred and twenty-five, the drawing of a stuffing box. We had some trouble in getting the equipment of the stuffing box down to a place where we could locate 2¾-in. centers. This does it. The committee expect to follow this up with a series of water type apparatus, where you have street car work and other work of that character.

C. J. Kelloway: I have used it for about twelve years. It answers the purpose. I move that drawing 1225 be adopted as the sense of this meeting for presentation to the convention.

The motion was carried.

Mr. Mock: The next is stuffing box for wire. Wee presented this drawing last year, but we provided for two wires in a pipe. After a pretty thorough canvass of the situation, it was decided by the committee to eliminate the one showing two wires in the pipe, and it is aimed to have only one wire in the pipe. It is merely a question of elimination in this case. I move ts adoption for presentation to the convention.

Mr. Beaumont: I think we should standardize this drawing because many lines prefer to use ½-inch pipe, and with this statement that this standard stuffing box could be used on ⅜-in. pipe with the use of a bushing. I think that would be better than adopting a ⅜-in. stuffing box, where there might be objections by lines that wanted to use ½-in. pipe.

The motion was carried.

J. C. Mock: The next drawing represents a double slip switch. This drawing, with the details of the lock rod, is in use, and is very satisfactory to the road using it. You will appreciate, of course, that the space between the ties is very limited, if you have to insulate between the rails, and that there are a great many limitations to the forms which you can use; you are pretty well tied down to certain forms of rods and forgings for this sort of a switch. The committee presents it for the purpose of getting the discussion and opinions of the Association for guidance.

Mr. Elliott: As near as I can see, the switch lock rods and front rods are patterned after the Pennsylvania standard. I believe they are getting good results, and that if a little time was given, or additional drawings were furnished, which would show the details of the parts, something along this line might be adopted with good results. By having the two front rods attached to points on the same side of the track, additional clearance is provided between the two inner rails, which is not had if the front rod is connected to both points of the one switch. It seems as if with this design insulation might be well provided. The only suggestion I have to make is that the throw of the switch points be made five in., the throw of the frogs four in., and that ties plates be shown on all ties.

The President: Can Mr. Elliott's point be met by any of these detailed parts? Can the throw of the switch be made 5 in. with those details?

Mr. Kelloway: There is no objection to that; in fact, I see no reason why you should move the frog points four in. and switch points five in. If the frog is safe at four in., certainly the switch is at five in.

L. S. Ross: I think you would get all you can. If you can't get five in. take four, but where you can get five in. you should take it.

J. C. Mock: This adjustment is a turnbuckle, with both right-hand threads, so that you cannot change the spread of the switch points unless you take off one of the feet. It is simply to bring it into adjustment in assembling and is not a standard turnbuckle.

L. S. Rose: I do not see any use in having anything there. The facing point lock rod, or the lock rod the plunger goes through, is adjustable, and you can work it from there. With that sort of adjustment I do not believe it is necessary to have this adjustment in the front rod. No adjustment has been provided in the end rod. All you can do is to make a kink in the switch point between the throw rod and the front rod.

W. H. Elliott: That point seemed to me a good one. It is not our practice with the ordinary single switch, and is not necessary; but in a double slip where you are crowded for room, and it is exceedingly difficult to make adjustments, it will undoubtedly help.

A. C. Rudd: We used to use 3½ in. on frogs and 4½ to 5 on switches, but we have now a standard, over the lines east and west of 4 in. on everything. With this adjustment in the operating rod, you can get a bigger throw, if you want to, because you can draw your points together. Instead of a 4-in. throw, you can get 4½ or 5, and can use the standard on the road by pulling the points closer together; I advocated not over a 4-in. throw, because it makes it easier for the leverman, if you have a 5-in. throw, you have just that much more to travel, and that much less leverage. If you make it 4-in., you gain on the leverage, and from the signalman's standpoint, you get a better operating switch with 4 in. than with 5. Four in. is plenty, and there is no need of having it five.

J. C. Mock: Why have you both right-hand threads instead of right and left?

A. C. Rudd: So that if you have to disconnect in order to adjust, the track man won't come in and open and close it; and so that the signalman is responsible for the throw.

Mr. Peabody: I believe that, both from a track and signal standpoint, the longer the throw of the switches, the better. There is a point that I think has been overlooked, and that is, the smaller the throw of the switch, the smaller the distance at the end of the switch between that and the main rail. The longer the switch point is, the smaller that distance will be, and the more shock from every wheel that passes through your switch, and the more wear on your road.

J. C. Mock: That is true. I believe you have endeavored to get a 5-in. throw on switch points. The detail at this time as far as we wish to present it to you, is given on drawing 1251. These are drop forgings at the end and it does give a rather low lock rod. It is necessary to have the drainage, and get pretty well down on the tie with this lock rod. It might be regarded as an objection to have the rod turned edgewise, as compared with the flat rod, but the flat rod is really not practicable, in our opinion.

L. S. Rose: I am not ready to agree to that adjustment. You can vary the throw of the switch by your adjustment, by the amount of lost motion you have in that basket, without changing the distance between the two points at all. If the switch is properly constructed so that it will fit, I do not see any use of having that adjustment, and it is an element of weakness. The turnbuckles get rusty and sometimes break. After they have been used a while you have to heat them and burn the rust off to get any adjustment. They are convenient when you are first setting the switch up, but after you get it up, I do not see that it makes any difference; if the relation between the front rod and the throwing rod is properly made when the switch is installed, there is no need of that adjustment. One other thing I would like to present to the committee—we have recently built some slip switches where we staggered the points. Instead of throwing the points at both ends of the slip together, we are throwing one switch at one end, with one switch at the other end. In that way we are able to effect locking between the switches and the center frogs, and prevent a train from getting in on the center frogs unless they are absolutely set; that is, the frog will have to be set properly before the switch can be thrown to make the through movement.

Mr. Kelloway: How would you adjust a No. 1 rod? Say you have a front rod that is set up for a 5-in. throw; you find a switch that has only 4½-in. throw; how would you adjust your front rod to fit the switch, if your No. 1 rod isn't adjustable?

Mr. L. S. Rose: We have an adjustment at the lug. You can take a switch of two points and move 5 in. or 4 in.; it depends how far apart your gage is at the point of the switch and in the stock rail and in the running rail.

Mr. Waldron: Mr. Rose and Mr. Peabody advocate a 5-in. throw, although it has been shown that the adjustment is so arranged that they can have a 5-in. throw if they want it. Some of us may not use switches where we would use a 4-in. throw; we must get along with less. I think it would be better to have some standard that will suit all parties. Take the layout as presented here; you can accommodate

Mr. Rose and Mr. Peabody, and also those of us who have to use less than the 4-in. throw. Shouldn't we adopt the 4-in. throw as we have it presented here?

Mr. Denney: I would like to ask Mr. Rudd, if the adjustment is not applied to the front rod because it connects two of the switch points that are not a pair; the head rod connects the pair of switch points that are used in running the train over, while the front rod connects one point of each pair, and the distance between these points cannot be distinctly determined until the switch is set up.

Mr. Denney: I would like to ask Mr. Rudd if this layout develops any lost motion, and if so, where.

Mr. Rudd: No more than any other arrangement of interlocking. The place where the insulation is made in this rod is a matter of considerable thought. I didn't like it myself, but finally had to come to it because we found it was so good.

Mr. Waldron: We have found in slip switches, etc., that it prolongs the life of the point, and also the stock rail, by having the switch point on the curved side extended a foot to a foot and a half beyond the other point, and then have a check rail beside it. That induees a new feature of locking up the point, and while we have tried to get around it, and think we have, I wondered if the committee cared to go into that detail.

Mr. Stevens: There is more involved in the slip switch than in the single switch, and it is proper that the committee should decide this first.

Mr. Rudd: The Pennsylvania had much trouble with slip switches. We waited several years for the R. S. A. to put out a standard, and we couldn't wait any longer, and we developed this, and it is entirely satisfactory to us. It would be very nice to have another one gotten up with staggered points. Some roads won't use them in their main tracks. We use them in the yard, and it makes a saving to have one point ahead of the other, but it is not thought advisable in some cases to stagger the points on the main line. I think the association should go slowly, and if they can get the A. R. A. to adopt staggered points all the way through, and submit this in the meanwhile, we will use this until you give us something better. I think you should make a drawing of the single switch.

Mr. Denney: I move it is the sense of this meeting that in the switch ends of a double slip, each two points acting as a pair should be connected by two nonadjustable rods.

Mr. Elliott: Do you refer to the front rods?

Mr. Denney: I refer to the front and head rod on each pair; in other words, a slip will be made up of two switches, each pair of points in a switch being directly connected and not adjustable.

W. H. Elliott: I am against it. I think one of the good points about this design is that the front rods are connected to the points of the different switches, not to the same switch, because it provides additional clearance where it is very much needed, between the two inside points.

Mr. Denney's motion was lost and the original motion was carried.

ELECTRIC RAILWAY AND ALTERNATING CURRENT SIGNALING.

This committee submitted specifications and requisites of apparatus and material for alternating current automatic block signal systems on all railways except those using direct or alternating current for propulsion—in other words, on steam roads—and certain additions to existing specifications. In the data for a signal system the blanks under the sections as previously approved by letter ballot have been filled in with certain alternative specifications as required by existing practice, the quantities given in each case being representative of satisfactory systems, and being submitted as a guide for the design of systems applicable to the conditions to be met. The specifications cover the subjects of supply and distribution of power; signals of the electric motor; solenoid, electro-pneumatic and light types; control apparatus, including line circuit and track circuit relays and circuit controllers; electric locks, and switch indicators.

The committee consists of H. S. Balliet (N. Y. C. & H. R.), chairman; J. E. Saunders (A. T. & S. F.), W. P. Allen (P. R. R.), J. A. Beaddy (N. & W.), L. R. Byram (C. R. I & P.), J. D. Elder (K. C. T.), E. C. Grant (U. P.), W. W. Morrison (N. Y. C. & H. R.), C. R. Peddle (J. R. T.), W. Y. Scott (B. & M.), E. B. Smith (N. Y. C. & H. R.), F. S. Starratt (S. P.), F. E. Wass (N. Y. C. & H. R.).

Discussion on Alternating Current.

Mr. Balliet: I move that the specifications beginning on page 29 be accepted as printed. (The motion was seconded.)

Mr. Stevens: As to 76-d, I do not see why any special load is specified.

Mr. Balliet: The literature for the annual meeting will read as follows: The normal load on the signal transmission line at a point adjacent to the place of delivery shall be approximately . . . K. V. A. . . . K. W. This load will increase to . . . K. V. A. . . . K. W. to last one minute after interruption.

Mr. Stevens: I move an amendment to clause 440-h and all similar clauses as follows: For continuous operation at ten per cent under normal frequency without excessive heating.

Mr. Balliet: That is agreeable to the committee.

Mr. Stevens: For the sake of record, I wish to say there are one or two other clauses in which the same correction should be made.

The Chairman of Committee VIII stated to us yesterday that a new method is to be employed for stating requirements of certain instruments and those are to be tabulated instead of written out. I think clause 601 is rather hard to understand because it really means that line circuit relays shall consume not more than 10 volt amperes 7½ watts per phase at 110 volts 25 cycles, or 25 amperes 15 watts per

H. S. BALLIET,

Chairman Committee on Electric Railway and Alternating Current Signaling.

phase 110 volts 60 cycles. It is hard to get that from that sentence, but I believe the chairman will take care of it.

Mr. Balliet: The committee developed at a more recent meeting that even the experts outside of the committee, our conferees, had difficulty in getting the points, in carrying it through, when they read this literature, so that the committee proposes to submit at the annual meeting in tabulated form sections 440, 601 and 602, which reduces the printing to about one half a page, and makes it possible at a glance to get the thing in mind.

The previous motion was carried.

WIRES AND CABLES.

The committee submitted a set of revised specifications for galvanized steel wire for connection to mechanically operated signals, which is recommended for approval. The specifications cover the material, with reference to the form and quality of the wire, the galvanizing treatment and the properties, as to size, diameter, breaking strength, and percentage of elongation in a given length.

The committee consists of W. H. Elliott (N. Y. C. & H. R.), chairman; E. L. Adams (L. S. & M. S.), W. I. Bell (P. R. R.), W. L. Dryden (S. I. R. T.), A. B. Himes (B. & O.), D. W. Richards (N. & W.), J. V. Young (B. & M.).

Discussions on Wires and Cables.

Mr. Elliott: I move that the recommended revised specifications for galvanized steel wire on page 39 be adopted. There are modifications in the first three paragraphs; clauses 4 to 7 inclusive remain unchanged. The revised specification reduces the weight from 380 lbs. to 370 lbs. for the No. 8 wire, and from 320 lbs. to 300 lbs. for the No. 9 wire. It also

increases the elongation in 10 in. from 6 to 8 for the No. 8, and from 5 to 8 for the No. 9. A three mill variation from the normal diameter is also allowed as to size.

Mr. Elliott: The wording of the specification has been changed to practically conform with that adopted in other specifications, and the requirements as to variation in size,

W. H. ELLIOTT,
Chairman Committee on Wires and Cables.

difference in weight and difference in tensile strength and elongation have been adopted. The twist test has not been changed.

The motion was carried.

STORAGE BATTERY AND CHARGING EQUIPMENT.

The committee submitted as information a discussion in regard to the use of Edison storage batteries for automatic signaling. This comprised a short description of this type of storage battery with principal reference to its application to track and line circuits and methods of housing, with a table of general information. The committee also submitted specifications for lead type stationary storage batteries for automatic signaling, and a plan (drawing 1240) of a

R. B. ELLSWORTH,
Chairman Committee on Storage Batteries.

motor panel which provides for mounting charging line rheostats and motor starting apparatus.

The committee consists of R. B. Ellsworth (N. Y. C. & H. R.), chairman; H. W. Lewis (L. V.), J. G. Bartell (L. V.), G. E. Beck (L. S. & M. S.), T. N. Charles (C. N. O & T. P.), J. Fred Jacobs (C. R. R. of N. J.), T. L Johnson (D. L. & W.), A. H. McKeen (O. W. R. R. & N. C.), T. J. O'Meara (N. Y. C. & H. R.), F. A. Purdy (O. S. L.), A. H. Yoxum (P. & R.).

Discussion on Storage Battery.

Mr. Ellsworth: The discussion of the design of storage battery on pages 47, 8 and 9, is printed as information. This was in answer to inquiries, and covers what may be done and is actually being done. No action is required unless there is some objection to the subject matter. The committee is making no recommendation at this time.

The specifications on page 50, items a and f with the following explanatory notes, is in a tentative form. The committee has not fully decided as to just what they want to recommend to the association and they are furnishing this information so the association may be aware of what the committee is doing, and so that we may bring out criticisms either written or verbal at this time.

Mr. Stevens: At the annual convention I asked that the Plante process be defined, and I think that is still desirable.

Mr. Ellsworth: The committee has investigated that subject considerably. In going over the matter the definition given by the Signal Dictionary seems to be supported by all the information which we could get from the various text books. That information is given on page 326.

On 51 we prepared a motor panel plan, twelve-forty, which is supplemental to the panel that has already been adopted, shown on 1,174. This panel is for the control of the motor generator which is used for the charging of the storage batteries. I will move the adoption by this meeting of panel R. S. A., plan 1,240.

Motion seconded.

Mr. Shaver: As I understand it, this is a main service switch. In a great many places they only allow us to put it at the board; it has to be put at the wire entrance. I am doubtful whether it would be well to show this, because the requirements in nearly all the cities are that it be placed right at the entrance of the wires to the building.

Mr. Ellsworth: In most cases the insurance is carried by the railroads, and the underwriters' rules are not obligatory. In many cases also the apparatus is placed on a separate building.

The motion was carried.

METHOD OF RECORDING SIGNAL PERFORMANCE.

The committee was instructed to investigate and report on the basis of methods now used on various railways in recording interruptions to traffic by signals, and in computing the efficiency of signal performance. A letter was sent to 50 railways reported by the Interstate Commerce Commission as having automatic block signals in service, in which the following information was requested:

(1) Copies of forms now in use, together with instructions issued as to the proper method of filling them out;

(2) Formula used in computing signal performance;

(3) Suggestions as to desirable alterations in or additions to the method used;

(4) Opinion as to whether or not comparative cost per mile or per signal blade should enter into the computations of comparative efficiency as between divisions, systems or railways; and

(5) Any general comments on methods now used, forms that have been presented to the association, or information that would guide the committee in best serving the association and the railways.

From the replies and report forms received sufficient information was obtained to warrant the preparation of the three signal report forms, "A," "B" and "C," which were submitted.

Form "A" is a blank, postcard size, addressed to the supervisor of signals, and intended to be filled out by the conductor or engineman and given to the operator or signalman at the first open telegraph office for telegraphic transmission to the dispatcher and subsequent mailing to the supervisor. Or it may be telephoned direct to the dispatcher by using a portable phone. It contains the information shown on all other forms except as to indicators; track being repaired; handcar in block; line wires down; lightning storm; or a signal clear which failed to go to the stop position.

Form "B" is used by the dispatcher in recording information transmitted from forms "A" and "C," and by operators and signalmen in receiving and transmitting similar information to the maintainer. The dispatcher, after receiving the mantainer's report, sends copies to the superintendent and signal supervisor.

Form "C" is intended to be filled out and given to the operator or signalmen for transmission to the dispatcher.

Copies are mailed to the supervisor, and on some roads to the signal engineer. The maintainer also keeps a copy for his records.

The committee submitted also a brief report of the various factors involved in computing the efficiency of signal performances. Complete forms showing classifications of failures and methods for computing efficiency will be presented at the June meeting. The data received in reply to the circular letters involves such a large amount of detail which is so much in need of classification and uniformity that more time is necessary for their consideration than could be spared at this meeting. The committee proposes as a basis upon which to design forms for the classification of causes and

W. N. MANUEL,
Chairman Committee in Method of Recording Signal Performance.

for computing the efficiency of signal performances the following:

F, failures: 10.
S, total number of signals: 100.
T, trains stopped: 50.
O, total number of trains operated: 1,500.
P, total number of signal operations: 150,000.

Formulae.

Signal operations, 150,000.
Trains stopped per failure, 5.
Signals per failure, 10.
Trains operated per failure, 150.
Signals operated per failure, 15,000
Trains operated per train stop, 30.
Signal operations per train stop, 3,000.
Maintenance efficiency, 90 per cent.
Operating efficiency, 96 per cent.

The committee consists of W. N. Manuel (G. R. & I.), chairman; J. W. Hackett (N. Y. C. & H. R.), C. A. Cotton (A T. & S. F.), B. F. Dickinson (W. J. & S. S.), S. B. Keller (B. & O.), George J. Patton (D. L. & W.), J. B. Weigel (Frisco), L. L. Whitcomb (L. S. & M. S.).

Discussion on Methods of Recording Performance.

Mr. Manuel: This shows the results we wanted to obtain first, but on account of lack of uniformity between the various reports presented, it was impossible within the short time we had to work it up. We started in with telegraphic reports, started in to show typical forms in use to-day.

Mr. Denney: I move the adoption of Form A. (Seconded.)

Mr. Waldron: On page 41, Form A, No. 5, lightning storms. That is a peculiar way of putting it and is new to me.

Mr. Manuel: On some roads they have found it desirable for enginemen to report weather conditions at the time of the failure, and that was included in the blank.

Mr. Shaver: With regard to Form A it has been our practice to use a card for the conductor to indicate stops at signals. We have asked them not to report delays due to trains in the block. I am about ready to change my mind on that. We have had considerable difficulty on account of maintainers who have been called out on supposed trouble that did not occur, and I suggest to the committee that that be shown on the record. The conductor fills out this card when the train is stopped, and he does not always learn until his train has passed through the block or is nearly through that there was a train in the block, and nine times out of ten they either have to change the card or tear it up. It does not show what the cause of the failure is.

W. J. Eck (Southern): I am unable to check the formula for Maintenance Efficiency. It is stated $\frac{E-F}{S}$. I think it should be $\frac{S-F}{S}$.

Mr. Manuel: That is right.

Mr. Eck: With regard to Form A, I would suggest that the paragraph appearing at the bottom of the back of the card be moved up and inserted between the lines S and U, to be followed with a heading, entitled, "Operator's Record." The note, appearing on the front of the form under the words, "Deliver immediately," should be printed on the back of the form following the line beginning "Sent by," etc. I believe the form as shown would confuse the engineman and he would attempt to fill out the part reserved for the operator.

Mr. Manuel: Under D it reads, "Signal at ——." There is a doubt in the minds of some members whether that means the geographical location of the signal or the position of the signal blade.

Mr. Rose: The same cards have been in use for a year on one road that I know of, and have generally given satisfaction. I would leave "D" out. That is intended, as I understand it, for signaling at interlocking plants, and the operator can report that matter himself without the conductor or engineer putting it in.

Mr. Denney: Not only signals at interlocking plants, but at any outlying point as a train order or any signal which has no number are covered by this line. I do not think the objection is proper.

Mr. Rose: Mr. Denney brought up a point I had not thought of, that the line might refer to a switch signal. Some roads have stop signals at outlying switches, and there would be no one there to report, and in that case it might be well to leave it in.

The President: On page 521 of the March journal is shown a form of engine man's signal report which was adopted by letter ballot as standard.

Mr. Stevens: This standard has been in force for only a few weeks and yet there is a movement on foot to change it. If we contemplate adopting any new forms with the possibility of their being carried at the annual convention, I think we ought to keep out of the manual the forms submitted in 1912, and I think a motion to that effect is in order.

Mr. Denney: I move that the forms corresponding with the forms now submitted and approved by last year's letter ballot shall not be included in the manual.

The Secretary: Can we legitimately do that?

Mr. Stevens: Not at this meeting.

Mr. Elliott: The matter is adopted as the standard of the association, but that does not mean that the executive committee or editing committee can not hold it out.

Mr. Patenall: It seems to me doubtful whether a stated meeting can reverse the action of the annual meeting.

Mr. Denney: In view of the fact that the committee which has been assigned to this subject has made a report which supersedes the form previously reported, I do not see why we should not approve it and take any necessary action to keep the previous cards out of the manual.

The President: The committee does not ask to have this approved. They would like to have it received as information.

Mr. Mock: If it is permissible, I suggest to the Board of Directors that they withhold from the manual those forms which were balloted upon and which carried. That is as far as we need to go, I think.

Mr. Denney: I move the approval by this committee of Form A.

Motion seconded and carried.

Mr. Rose: I move that the meeting approve Form B as presented by the committee.

Motion seconded and carried.

Mr. Elliott: I move the approval by this meeting of Form C.

Motion seconded and carried.

Mr. Manuel: The committee would like a discussion on the table intended to show a method for computing efficiency of signal performance.

Mr. Rose: The last paragraph says: "One road arbitrarily assumes five train stops per failure," but these reports that we have concluded to send to letter ballot show the number of trains delayed in the maintenance report, so that instead of assuming five, you will have the actual number if you take these blanks.

Mr. Manuel: The card says, "Do not report delay due to train in block."

Mr Rose: On the maintenance report of failure, it says, "Trains delayed," and he will report to his superior officer the number of trains delayed and you will have the actual performance and not the assumed performance. Sometimes you have only one train delay, and sometimes a good deal more, depending upon how swift he is to get around to it.

L. R. Mann (Mo. Pac.): In the maintenance efficiency, has the committee considered the matter of taking the total number of signals, the number of switches, and the number of track circuits and figuring maintenance efficiency on that basis?

Mr. Manuel: The committee went into signal indication only.

Mr. Elliott: We have gotten up on the New York Central a new blank which endeavors to cover that point. There are two records kept, one is of signal efficiency and the other is of the operated units of the interlocking plant, not included in the signal efficiency report, and while appearing on the same sheet is entirely different subject matter.

Mr. Manuel: It would be desirable to take into account track circuits, the length of track section and all of that data, if it would not complicate the forms too much. Some men like to have the reports very simple, and others like to have them complicated, and there is no semblance of uniformity between the roads.

Mr. Shaver: I have been trying to think out what this formula for maintenance efficiency means. I do not see why the number of failures should be subtracted from the number of signals. Take the case of ten signals and ten failures, the percentage would figure out nothing, yet there would be a certain efficiency.

Mr. Elliott: Our practice is, to divide the number of signal operations by the number of failures, and such a record has been kept by us for the last ten years and has been very satisfactory. It has furnished, I believe, a very accurate method of comparing the operations of different sections of signals, or the signals on different divisions.

Mr. Shaver: We have certain divisions where the signaling is very much the same, and the track circuits, the number of signals, and the general design are suitable for a comparison. We have divided the number of interruptions, as we call them, into three classes, A, B and C. A are those for which the maintainers are strictly responsible. B represents those for which the track department, or some department other than the maintenance force on signals are responsible, and C interruptions are due to constructive defects in design, etc., over which the maintainer has no control. We have figured out from our records, percentages which we call, excellent fair, good and poor, and we class our performances each month on that basis, and that gives us a basis for comparison between divisions and between months on the same territory. While that will answer for ourselves, it does not necessarily answer for other railroads.

Mr. Denney: The report does not take into consideration the number of miles protected by a given number of signals, and I want to offer the thought that the efficiency of signal operation might be determined by multiplying the number of signal operations by the number of miles of track protected, divided by the number of failures, and the efficiency of train operation might be determined by multiplying the number of trains operated by the number of miles of track protected and divided by the number of train stops. This is an attempt to include the number of tracks, stations, switches, and all the other conditions which enter into the calculation. The liability of a failure increases as long sections are installed, and the number of trains stopped by signal failures varies in different territories depending upon the density of movement.

Mr. Manuel: The next subject treated by the committee is entitled "Signal Movement Defined." I might add, for information, that where counters are used, you take a chance of the signal jumping and operating the counter. The maintainer, in adjusting the signal with the counter may work it a number of times. The signals operate a good many times when they are not registering, for the reason that the yard man may throw his switch, or a number of things might happen that will not be counted when the signal is really giving protection.

Mr. Denney: I think the only satisfactory way of taking the record, is from the counter. The counter may get out of order, and not register enough, or there may be some improper operation of the counter, which will run the counter high, but if you take the record of the counter readings for a division or number of sections in the same territory, you can easily pick out the records which are not correct.

Mr. Elliott: Our practice is based on counting the number of signal movements.

Mr. Mock: I have not used the counter because I think you get the record too high, and the efficiency too high.

Mr. Manuel: The next section relates to Failures.

Mr. Elliott: I move that this committee make recommendations for decisions as to what signal failures shall be.

Motion seconded and carried.

Mr. Manuel: The next section is headed "Relative Cost." There was no discussion.

Mr. Manuel: The final section of the report is headed "Conclusion."

Mr. Patenall: I move that the committee be instructed to continue their work in this direction.

Motion seconded and carried.

A. E. R. A. BLOCK SIGNAL COMMITTEE MEETING.

The Joint Committee on Block Signals of the American Electric Railway Engineering and Transportation and Traffic Associations will hold its second meeting of the year to-day. The morning session will be given over to an inspection of the exhibits at the Coliseum, and the afternoon session in part to conferring with representatives of the various signal companies, and in part to an executive meeting of the committee. The members are J. M. Waldron, signal engineer, Interborough Rapid Transit Company; John Leisenring, signal engineer, Illinois Traction System; Gaylord Thompson, chief engineer Ohio Electric, and C. H. Morrison, signal engineer, New York, New Haven & Hartford, of the Engineering Association; and C. D. Emmons, general manager, Chicago, South Bend & Northern Indiana Traction Company; J. J. Doyle, general manager, Washington, Baltimore & Annapolis; B. E. Merwin, general superintendent, Aurora, Elgin & Chicago; and C. F. Conn, of the Transportation and Traffic Association. The meeting will be held in the Congress Hotel.

SIGNALING CONTRACTS IN INDIANA.

The Terre Haute, Indianapolis & Eastern, the Fort Wayne & Northern Indiana and the Union Traction Company of Indiana awarded contracts last week to the General Railway Signal Company for the signaling which the Railroad Commission of that state has ordered installed by July 1, of this year. Automatic block signals of the light type, arranged for both permissive and positive block operation as conditions require on the various stretches of track to be protected, will be employed. The installation will provide for the protection of about 30 miles of track on each of the three roads.

SIGNALS ON A "SAFETY FIRST" EMBLEM.

The Southern Railway recently adopted a "safety first" emblem which uses a modern upper quadrant automatic block signal as a feature of the design. This is one of the first emblems of this kind which recognizes the very important part played by the signals in securing safety on railways. One of the principal objects of the safety first campaigns has been to reduce the number of industrial accidents among employes, but as the movement extends to the broader question of safeguarding transportation in all the many phases in which the human element is employed, the importance of block signaling, and particularly of automatic block signaling is rapidly coming to the front. The signals deservtion Bureau gnition such as the Southern Railway is giving th Railwa

DINNER TO APPLIANCES ASSOCIATION OFFICERS.

The officers and directors of the National Railway Appliances Association were the guests of A. P. Van Schaick, president of the association and district sales agent of the Lackawanna Steel Company, at a dinner last night at the Union League Club. Following the dinner there was an informal discussion of the association's past and future work. There were present as Mr. Van Schaick's guests: T. R. Wyles, L. R. Ashhurst, Jr., W. H. Baldwin, Philip W. Moore, C. W. Kelly, N. M. Hench, H. M. Sperry, John N. Reynolds, Bruce V. Crandall and T. W. Snow and Robert E. Belknap, past presidents. In honor of the day the table decorations were shamrocks imported direct from the "ould sod" and green flowers, and the menu was typical of the day.

VISITORS FROM FAR-AWAY PLACES.

The fact that Chicago is a good convention city, on account of its central location, is shown by the large attendance of signal engineers and signalmen from far distant points. C. R. Hodgdon, signal engineer of the Canadian Pacific; J. H. Cormick, signal engineer of the Canadian Northern; E. W. Newcomb, signal engineer of the Oregon Short Line; A. H. McKeen, signal engineer of the Oregon-Washington Railroad & Navigation Co., Fred Stuart, signal engineer of the Sunset Lines, and "Bob Morris, signal engineer of the El Paso & Southwestern, are present from the far west and the south. Charles Kelloway, signal engineer of the Atlantic Coast Line; Chas. Stephens, from the Chesapeake & Ohio, and W. J. Eck, signal engineer of the Southern are present from the far southeast. And almost all of the New York and New England contingent are among those present.

HOW TO GET TO THE COLISEUM.

In order to make it possible for all railway men in attendance at the conventions to reach the Coliseum quickly and easily when they desire to see the exhibits, three large 16-passenger motor buses are kept in continuous operation between the Congress hotel and the Coliseum, between 10 a. m. and 10 p. m., each day up to and including Friday. These cars are for the exclusive use of the guests of the National Railway Appliance Association without charge, the drivers being instructed to honor N. R. A. A., A. R. E. A. and R. S. A. badges or passes to the Exhibition. Railway passes also are honored. The cars leave the Congress street entrance to the hotel and the main entrance to the Coliseum at intervals of about five minutes and make stops at the Blackstone hotel whenever passengers desire.

ADMISSION TO THE COLISEUM.

A new departure has been made this year in the method of admission to the National Railway Appliances exhibit at the Coliseum. In previous years complimentary tickets have been freely issued, but those not possessing these passes could purchase tickets at the door. This year no tickets are sold and a sign is placed on the entrance stating that the display is for railway men only. Complimentary tickets have been distributed more widely than before, but if any railway man has not received a ticket his pass or his American Railway Engineering Association membership badge will admit him. The aim is to exclude the general souvenir hunting public and confine the show to those directly interested, in this way enabling both the railway men and the exhibitor to gain the desired ends most effectively.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.

The National Railway Appliances Association, which has to do with the destinies of the railway supply fraternity at these annual gatherings, is one of the very few associations of its kind that enjoy the dignity of being regularly incorporated bodies. It was organized under the laws of Illinois in April, 1911, and succeeded the Road and Track Supply Association.

The chief function of the association is to organize and conduct the splendid exhibition of railway appliances that is now held at the Coliseum and First Regiment Armory every March in connection with the annual convention of the American Railway Engineering Association and the stated meeting of The Railway Signal Association.

A. P. VAN SCHAICK,
President.

The officers and members of the board of directors of the National Railway Appliances Association are: President, A. P. Van Schaick, Lackawanna Steel Company, Chicago; Vice-President, T. R. Wyles, Detroit Graphite Company, Chicago; Treasurer, John N. Reynolds, Railway Age Gazette, Chicago; Secretary, Bruce V. Crandall, Chicago; Honorary Director, Robert E. Belknap, the Pennsylvania Steel Company and Maryland Steel Company, Chicago; H. M. Sperry, General Railway Signal Company, Rochester, N. Y.; Philip W. Moore, the P. & M. Company, Chicago; N. M. Hench, Carnegie Steel Company, Pittsburgh, Pa.; C. W. Kelly, Fairbanks, Morse & Company, Chicago; L. R. Ashhurst, Jr., William Wharton, Jr., & Company, Inc., Philadelphia, Pa.; and Walter H. Baldwin, the Adams & Westlake Company, Chicago. The photographs of all eleven are reproduced herewith.

T. R. WYLES,
Vice-President.

President Van Schaick has been district sales agent of the Lackawanna Steel Company at Chicago for the last three years. Prior to that, and for five years, he was president of the W. K. Kenly Company, Chicago, dealers in railway supplies. His first position of importance in the railway supply industry was with the Pittsburgh Plate Glass Company. He was identified with the sales department of

Treasurer.

OFFICERS AND DIRECTORS OF THE NATIONAL RAILWAY APPLIANCES ASSOCIATION.

that concern in Chicago for four years before going with the W. K. Kenly Company.

T. R. Wyles, vice-president, is a director and second vice-president of the Detroit Graphite Company, with office in Chicago. He is a Canadian by birth, and was just 41 years old on January 14 last. After leaving school, and until 1891, he worked in various capacities in Richmond, Va., and St. Louis, Mo. From 1891 to 1896 he was a stenographer in the purchasing department of the American Refrigerator Transit Company at St. Louis, and during the latter year was transferred to Chicago as contracting freight agent of the company. He resigned in 1897 to become agent for the Detroit Graphite Company and was made second vice-president in 1907.

THE EXHIBIT.

The four previous exhibitions of railway appliances given by the National Railway Appliances Association have set such a high standard of excellence that it would be difficult to commend the fifth annual exhibition now in progress at the Coliseum and the First Regiment Armory more highly than to say that it equals any of the four that preceded it. There is probably no basis of comparison which would be unfavorable to the 1913 "show" and in some ways it is declared by the exhibitors and railway men in attendance to establish a new record.

The floor area occupied is the same as last year, including the main floor of the Coliseum, the Coliseum Annex and the First Regiment Armory. The number of companies exhibiting is also practically the same as last year. The success of any exhibition of this kind, however, depends more on the character of the individual exhibits than on the aggregate space occupied or the total number of companies represented; for the visitors in increasingly large proportions are the men who buy and use the materials exhibited. Such men feel that the time spent in examining the devices shown is profitable to the extent that they receive new ideas or are set thinking along new lines. Realizing the "show me" attitude of the men in attendance, practically all of the companies prepare educational exhibits. Reception booths with beautiful decorations and comfortable chairs are even less in evidence than in former years and full-size samples, operating models, stereopticon exhibits or collections of photographs are present in nearly every booth. The plan of locating most of the large track work exhibits in the Armory which was successfully adopted last year has been followed in the assignment of space this year with the result that both the companies going to the Armory and those remaining in the Coliseum are benefited.

As has always been the case, the signal supply companies occupy much space, while not many important new developments in signal mechanism and interlocking machines are shown, a good deal of attention is being paid to the accessory devices, and exhibits of all the necessary mechanisms for complete signal installations are shown.

Water service men should find much of interest, for tanks, water softeners, stand pipes, and oil engines for pumping service are prominently displayed. While the oil engines are a comparatively new development, there are four types on exhibit. Practically every motor car manufactured for railway use is shown, including both the complete cars of special designs for various purposes and hand cars equipped with a gasoline engine. Bridge and building department officers are interested by the exhibits of paint, roofing, and insulating materials, doors and hangers. The office engineer and designer are appealed to by the makers of rules, calculators, draughting and blue printing supplies, while the field engineers find instruments, tape and other necessary field equipment. Two exhibits include steel bunks of improved design which should be appreciated by men who are finding it advisable to give laborers better accommodations in order to hold them.

As usual, several full-size switch layouts are shown, while steel and concrete ties in a variety of designs, tie plates, rail anchors, screw spikes, rail joints, switch stands, derails and other devices are present in abundance.

In general appearance, the first glance over the Coliseum or Armory shows little change from last year's exhibition. For the third time, flags and bunting are used exclusively this year for roof decoration in the Coliseum, while the memory of St. Patrick is honored by the green in the ceiling decorations of the Armory. The central feature of the Coliseum is a pagoda of ornamental design covering four drinking fountains, which are both convenient and sanitary. Music is provided during the afternoon and evening by the Ellis Brooks band.

The opening of the exhibits was announced for Saturday morning and while the crowd on Saturday was not large, all exhibits were in place by noon of that day, so that the visitors on Monday were not annoyed by the trucking of machinery into the booths and the preliminary setting up of which precedes any working exhibit. The crowd Monday was always there and by posting a sign at the main entrance "No admission to the public; for railway men only," and by refusing to sell tickets, the officers of the association assured the exhibitors the presence of the class of visitors that they most want to see.

THEY WILL BE ELECTED.

The Nominating Committee of the Railway Signal Association held a meeting at the Congress hotel last night. The names of the nominees for the various offices is a profound secret. But it is known that, whoever they are, they will be elected, as usual. A. R. Fugina, signal engineer of the Louisville & Nashville; H. S. Balliet, assistant manager of the Grand Central Terminal, New York; G. W. Hulsizer, signal engineeer of the Chicago & Alton, and Bert Howland, of the Missouri Pacific, were the members of the committee present.

WIRELESS EXPERIMENTS ON THE LACKAWANNA.

The Delaware, Lackawanna & Western is planning the installation of wireless telegraph apparatus at the stations in Scranton, Pa., and Binghampton, N. Y., with a view to testing the feasibility of the wireless telegraph for train dispatching purposes, and for communication between moving trains and stations. The Union Pacific has been experimenting in this direction for some time, but as yet has come to no definite conclusions on the subject.

A WESTERN SIGNALMAN GOES TO AN EASTERN ROAD.

J. E. Saunders, assistant signal engineer, Atchison, Topeka & Santa Fe, has resigned to become office engineer in the signal department of the Delaware, Lackawanna & Western, with headquarters at Hoboken, N. J. He assumes the duties of his new position on March 18, and reports to M. E. Smith, signal engineer of the Lackawanna.

C. A. MORSE GOES TO ROCK ISLAND.

Charles A. Morse, chief engineer of the Atchison, Topeka & Santa Fe system, at Topeka, Kan., has resigned that position to become chief engineer of the Rock Island Lines, with office at Chicago, effective on April 1. He succeeds J. B. Berry, who will remain in the service of the Rock Island

in a special and consulting capacity. Mr. Morse will be tendered a complimentary dinner by officials of the Santa Fe at Topeka on Saturday. A committee consisting of C. F. W. Felt, chief engineer of the A. T. & S. F. railway, R. J. Parker, general superintendent, and E. L. Copeland, secretary and treasurer, is in charge of the arrangements. Mr. Morse has been chief engineer of the system since November, 1909, and was previously chief engineer of the lines east of Albuquerque. He has been with the Santa Fe since January, 1886.

TWO A. R. E. A. SUB-COMMITTEE MEETINGS.

The sub-committee on poles, of the power distribution committee of the American Electric Railway Engineering Association, will hold a meeting on Wednesday, March 19, at the offices of Ralph H. Rice, assistant engineer for the Board of Supervising Engineers, in the Borland Block, La Salle and Monroe streets, Chicago. The sub-committee on rubber insulated cable, of the same committee, will hold a meeting at the same place on Thursday, March 20. Mr. Rice and Gaylord Thompson, chief engineer of the Ohio Electric Railway, are members of both sub-committees, and Mr. Thompson is also a member of the A. E. R. A. Joint Committee on Block Signals.

ART AT THE COLISEUM.

Something happened to the wall back of an exhibit at the north end of the Coliseum. It looked like a radiator had leaked upstairs. Various ways of improving the appearance of the apace were suggested. One man wanted to put a frame around it and give it a name, claiming that it was a perfect facsimile of the famous Futurist-Impressionistic picture, entitled "Harvesting the Tie-Treating Plants." Finally the trouble was settled by getting a real painting, in oil, to fit the space. The painting is worth seeing. It is at the north end, just left of the middle of the wall.

SECOND-CLASS APPLICATION FOR R. S. A.

The Railway Signal Association has made application for entry at the post-office at Bethlehem, Pa., under the second-class privilege for its publications. This, if it is secured, will cut the postage bill down to one-eighth of what it is at present. It is a good move, and Secretary C. C. Rosenberg is urging the members to support it by paying their dues while they are here this week. Uncle Sam requires the dues to be paid in advance in order to obtain the second-class privilege.

ILLINOIS CENTRAL MEN AT THE COLISEUM.

Arrangements have been made by the Illinois Central for all roadmasters, supervisors and water service men, who can get away from their duties, to spend at least one day at the Coliseum. This includes all men on the system as far south as New Orleans and as far west as Omaha.

CHICAGO ENGINEERS' CLUB INVITATION.

The Chicago Engineers' Club extends to all visiting members of the A. R. E. A. the courtesies of the club which is located at 314 Federal street.

JOINT COMMITTEE MEETING.

Committee 1, of the Railway Signal Association, and Committee 10, of the American Railway Engineering Association, will hold a joint meeting at 6:15 Tuesday evening, in Club Room 6, at the Congress Hotel. The membership of these committees is practically identical. Committee 10 will submit this morning the same report on uniform signaling practice that was presented to the Railway Signal Association last fall, and was adopted by letter ballot of that organization by a vote of 746 to 10.

PRESIDENT'S DINNER.

An informal dinner was given to the officers, directors and committee on Arrangements of the A. R. E. A., by the president, Chas. S. Churchill, in the English room of the Congress hotel.

THE STRAUSS DIRECT LIFT BRIDGE.

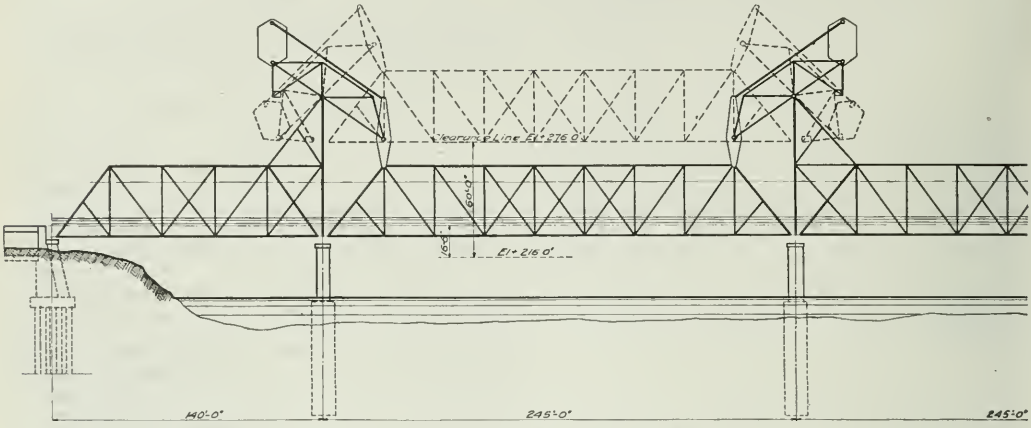
The vertical lift bridge is particularly adapted to long spans, with a relatively small lift. It has long been used in a small way, but during recent years, has been adopted for a number of larger structures. To do away not only with the operating cables and cable-driven locks, but also with the counterweight cables, which have been generally adopted in other designs of vertical lift bridges, the Strauss Bascule Bridge Co., Chicago, has developed a vertical lift bridge which substitutes for the counterweight cables a series of counterbalanced levers, and for the operating cables a rack and pinion drive. This design is of the same general type as the modern bascule bridge, and possesses essentially the same characteristics. The Strauss Co. does not urge the new design as a substitute for the bascule, but believes that the direct lift type has special advantages under certain conditions and will be capable of a wide application. Although it was put on the market only one year ago, three large railway bridges are already under construction, which will have movable spans of this type, one other is under contract and still others are proposed and awaiting final decision.

The Arkansas river bridge, near Pine Bluff, Ark., is to be used by the St. Louis Southwestern and an electric road, and carries, in addition, two roadways and two sidewalks. The movable span has a length of 245 ft. and a weight of 500 tons, the height of lift being 50 ft. This bridge is designed to open in one minute, the lifting apparatus being interchangeable to any span. The Chicago, Burlington & Quincy bridge over the Illinois river at La Salle, Ill., is a single track span 150 ft. long, with a height of lift of 32 ft. In this case an old span will be converted into a lift bridge without interruption to traffic. The Fraser River bridge at Fort George, B. C., for the Grand Trunk Pacific, is a single track span, 105 ft. 6 in. long, carrying, in addition to the railroad, two 12 ft. highways. This bridge has a lift of 40 ft. The Northern Pacific bridge over the Steilacoom Creek Waterway in Washington, which is under contract, is a double track span 96 ft. long, with a lift of 43 ft. In this design the towers are connected above the clearance line by a cross channel strut.

One of the claims in the patent covering the new Strauss design describes it as one "comprising a vertical movable span, fixed supports at each end of said span, a plurality of pivoted levers at each end carried by said fixed supports and connected with said span so as to move it vertically when the levers are moved." This broad claim covers practically any construction of a lift bridge employing rigid arms or links in place of cables or chains. This allows various types to be designed, and the possibilities of meeting special conditions are evident. Among these types are included a single tower design in which the entire operation is effected from one end, as in a single leaf bascule; an underneath counterweight design in which all the operating parts are beneath the roadway corresponding to a deck bascule, and the suspension lift design in which the lifting trusses form part of a suspension system which carries the live load. This latter bridge is not only economical, but is well adapted for long span structures of esthetic design.

The moving truss of the Strauss vertical lift bridge is a simple span with stiff chords, having a lifting mechanism at each end mounted on braced tower posts between which the span moves as it is lifted. The lifting mechanism is the usual parallel link mechanism of the Strauss bascule, with the addition of a hanger connecting this mechanism to the

Since the hangers support the movable span at points between the ends of the span, the span length for dead loads is reduced. This also permits the erection of the span in the open position without the use of falsework, as the hanger points can be used as points of support from which the two halves of the span can be erected as cantilevers. If an old



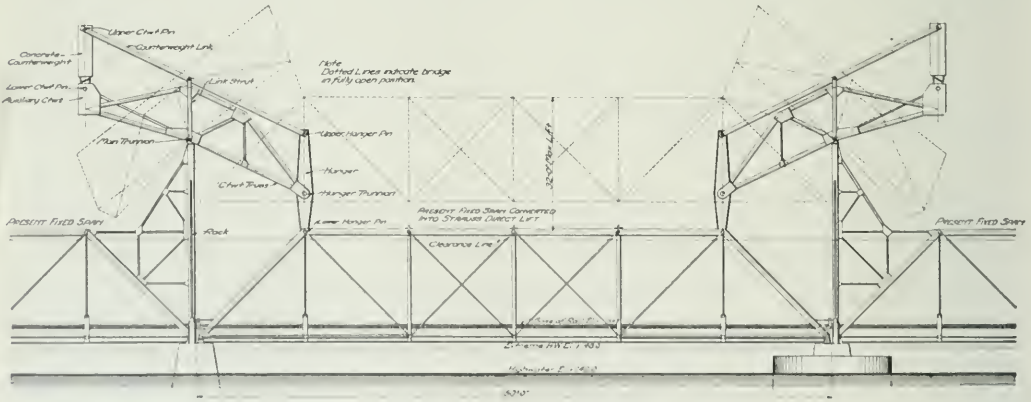
Elevation of Arkansas River Vertical Lift Span.

span. The details of frame, links and trusses are exactly the same as those used in the Strauss heel trunnion bascule type. The center of gravity of the counterweight at each end of the span moves in a vertical line, thus exerting a constant moment and maintaining the span in exact balance in all positions. There are no unbalanced horizontal forces. A secondary fixed counterweight on the lifting frame brings the center of gravity of this frame into coincidence with its fulcrum, so that there is no unbalanced moment.

The operating mechanism comprises a rack on each tower

span is in existence at the site, it may be retained in service, while the new span is being completed above it. The other methods of erecting movable spans as on falsework or by floating are, of course, applicable to this design, but when it is necessary to erect it in the open position, the fact that this can be done without the use of expensive steel falsework is an evident advantage. It is also possible to erect each tower and each half of the moving span individually and connect them together subsequently.

The equilibrium of the moving parts of the bridge is

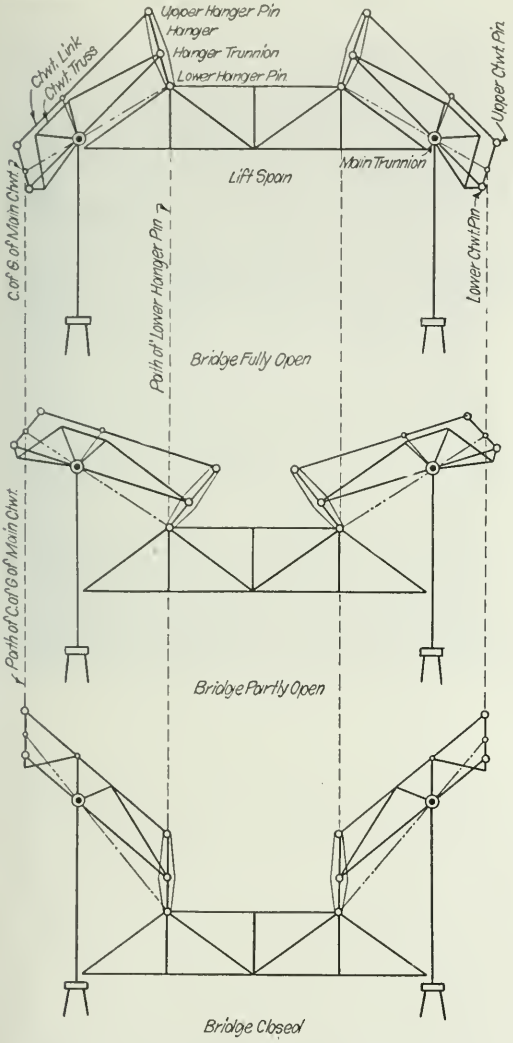


Elevation of Strauss Direct Lift Bridge for C., B. & Q.

post with corresponding pinions on the span, the motors and gearing also being located on the span and connected through an equalizing shaft, so that the four corners of the span move together at all times. The operator's cabin may be located either on the span or on the fixed portion. The end lock used in the single leaf bascule bridges is applied to each end of the vertical lift span, and is controlled from the operator's cabin.

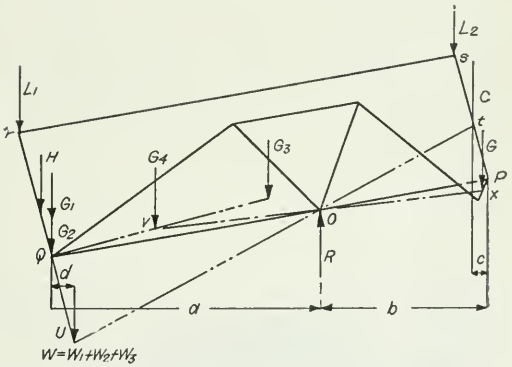
demonstrated in the line drawing shown herewith. The conditions for perfect balancing are: First, that the moment of all the weights about the fulcrum O must equal zero for all positions of the bridge, and, second, that the moment of the main counterweight and one-half the link at s about the point P must be equal and opposite to the moment of one-half the span, the hanger and one-half the link at r about the point Q. To demonstrate the equilibrium, let W equal the weight of

one-half the lift span, H the weight of the hanger, and L the weight of the link. It is assumed that the weight W is divided into three portions, the first W_1, of such a magnitude that when combined with L_1, one-half of the weight L which acts at the point r, the resultant of W_1 and L_1 or G_1 will be applied at the point Q. The second portion W_2 of the weight W, is of such magnitude that when combined with the weight H, the resultant of W_2 and H or G_2 will also be



Three Positions of Strauss Vertical Lift Bridge Illustrating Movement of the Parts.

applied at the point Q. The third portion W_3 of the weight W, is assumed as acting at the point U, which is the connection of the hanger to the moving span. The forces W, L_1, and H are then considered as being replaced by an equivalent system of forces composed of W_3 at U and $G_1 = L_1 + W_2$ and $G_2 = H + W_3$ acting at Q. If G_1 is the weight of the counterweight truss, the resultant of G_1, G_2, and G_3 will be a force G_4, equal to the sum of the other three and applied at their center of gravity, v. The auxiliary counterweight G is applied at a point x on the line vO extended, its weight being such that its moment about the point O balances the moment of G_4 about that point. The main counterweight C_1 is applied at such a point and is of such magnitude that when combined with L_2 the resultant C of C_1 and L_2 is applied at the point t on the line UO extended, the moment of this force about the point O being equal to the moment of W_1 about the same point. From similar triangles, $\frac{c}{d} = \frac{b}{a}$, and from the fact that the moment of C about the point O is equal to the moment of W_1 about that point, it can be shown that $\frac{W_1}{C}$ also equals $\frac{c}{d}$. From this equation $W_1 \times d = C \times c$. Since G_1 and G_2 are applied at the point Q and have no moment about it, the condition of equilibrium between the moments of W, H and L_1 about Q, and of C_1 and L_2 about p, is realized. Since the moment of all the forces about O has been made equal to zero, both conditions of equilibrium are therefore realized. The system of forces is made up entirely of vertical forces, so that the main trunnion reaction R is ver-



Demonstration of Equilibrium of Strauss Vertical Lift Bridge.

tical. The hanger is capable of resisting bending, so that it can receive a vertical pin reaction at U and equilibrium can exist without a horizontal component of this pin reaction.

The principal advantages claimed by the designers for the Strauss type of direct lift bridge are as follows: The fixed trunnions and parallel link counterweight are of the same design as in the Strauss bascule. The bridge is free from binding and power loss, due to long sliding guidings. All four corners of the span move absolutely level. The design eliminates all cables, chains and equalizing devices. The points of wear and those requiring inspection are few and easily accessible. The operating parts are completely enclosed and protected from the weather and other extraneous influences. The operating machinery is direct acting, safe and dependable. Both the counterweights and lift span are integral parts of the structure and cannot break loose from their supports. All parts of the structure have the same length of life, eliminating such items of cost as cable renewals, while the annual cost of cable lubrication, maintenance and inspection is eliminated. The entire moving structure is balanced in all positions, resulting in a low power consumption. The supports of the lifting span at points between its ends reduce the dead load stresses and allow erection in the open position without falsework.

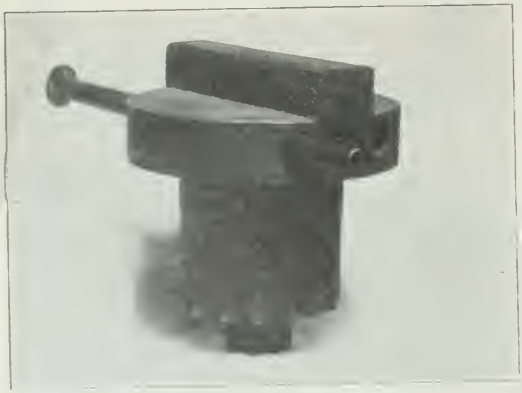
CONTINUOUS RAIL CROSSING.

The continuous rail crossing designed by the Alexander Crossing Co., Clinton, Ill., has been installed at two places, one of the crossings having been in service three years and eight months and the other one year and two months. In both cases it is stated that the operation of the crossing has given no trouble, the maintenance cost has been very much decreased and the shock to equipment passing over the crossing has been shown by tests to be much less than that occasioned by the crossing of the ordinary type.

The crossing is of very rigid construction, the foundation consisting of a solid slab of reinforced concrete 18 in. thick extending down 2 ft. 7½ in. below the base of rail under the entire crossing. This slab of concrete is covered with two layers of 3-in. oak timbers, over which a ½ in. steel plate, the exact size of the foundation, is laid. Under each rail intersection is placed a base casting having a total depth of 7 in., which incloses two layers of oak timbers. The ends of the main track rails and the intermediate or connecting rails are carried directly on these base castings. A number of bolts are embedded in the concrete foundation to hold the base plate and the castings firmly in place.

The continuous rail is secured by the use of crossing frogs consisting of 10-in. sections of rail designed to swing so as to come in line with either of the main track ralis. This revolving section is made of manganese steel and has a total height of $11\frac{7}{8}$ in., the portion below the head section being shaped to form a pinion, the hub of which has a bearing on the base casting. This pinion is provided with a cut spur gear to mesh with a spur rack which is operated by a pipe line from the interlocking tower. A bolt lock is provided to hold the revolving section firmly in place in line with either main track rail, these locks being also operated by pipe lines from the interlocking tower.

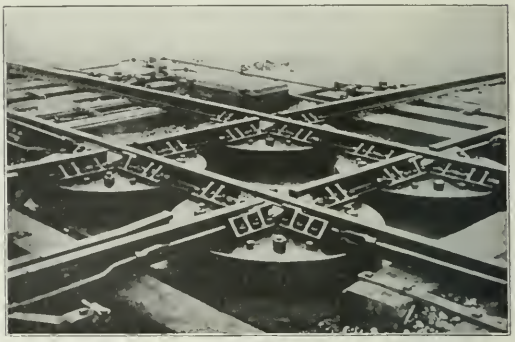
In addition to the revolving rails at each rail intersection, there are four intermediate sections of standard T rail to complete the crossing. These are held firmly in position on the



Revolving Portion of Alexander Crossing Frog, Showing Holes for Bolt Locking.

base castings by specially constructed angle bars of a very heavy section, the bolts which hold these bars being embedded in the concrete foundation. The full length main track rails can be carried up to the crossing, the end of each rail being supported on the base casting and firmly held by angle bars and bolts in the same manner as the intermediate rails. The main track rails are so rigidly attached to the base casting that expansion of the rail will not close the joint between the main track rail and the swinging rail, which would prevent the operation of the latter.

The first crossing of this type was installed at Thayer, Ill., at the crossing of the tracks of the Illinois Traction System and the Thayer Junction Railway, July 3, 1909. At the end of 19 months' service the cost of maintenance was reported by the companies using the crossing as less than $10. The Illinois Traction System operates 40 or more electric cars over this crossing daily and the Thayer Junction, three or four trains daily. The second crossing was installed at



Alexander Continuous Rail Crossing at Champaign, Ill.

Champaign, Ill., in the northbound main track of the Illinois Central at the crossing with the Cleveland, Cincinnati, Chicago & St. Louis. At this point there is a heavy traffic on both roads and all trains maintain a fair speed. There has been no delay to traffic on account of the operation of the crossing, even during the severe snow and sleet storms during the past two winters. About two months after the installation of this latter crossing, a test was conducted by the railway department of the University of Illinois, using the University test car to determine the comparative vibration caused by passing over the Alexander crossing in comparison with a crossing of standard type. These tests made it clear that there is very much less vibration and shock on the Alexander crossing. It is stated that the cost of maintenance for this crossing since its installation has been only 10 cents.

QUICK WEIGHING ATTACHMENTS.

BY F. E. KAEPPEL.

Several devices designed especially for the quick weighing of freight in local freight houses have been put on the market within the past few years. They are especially intended to eliminate the delays now incident to heavy weighing. When one stops to consider that weighing is so essential to the revenue of railways it is rmarkable that these developments have been delayed as long as they have. The manipulation of a scale beam by hand, the placing of the loose weights on the hanging poise, and other operations, cause a considerable loss of time and also give opportunity for errors.

These recent devices, commonly known as quick-weighing indicators, aim to relieve these conditions, and while they undoubtedly have not reached their final stage of development, they nevertheless possess enough merit to justify their installation in many large freight houses already. These machines are really attachments to the scales, and perform no work other than to indicate the weight on the scale levers, which was formerly accomplished by the scale beam itself. The advantages are apparent. In the first place, compare the delay in the old method of weighing in obtaining the balance and handling the weights as against the instantaneous action of the indicator. It has been estimated that the elimination of this delay alone may result in a saving of from 20 to 25 per cent in labor. However, the most important feature of the quick-weighing device is not the saving in time, but the increased accuracy. There has grown up a

system on many railways of accepting the shippers' weights on freight wherever stenciled without reweighing it, as the time consumed in reweighing does not justify the expense. With the quick-weighing indicator, however, the roads are now reweighing all freight received regardless of the shippers' weights and the size of packages. With an indicator properly working, it is practically impossible to obtain any except the correct weights, and the only way for an operator to make a mistake is to enter the figures incorrectly.

One interesting feature of these machines is the fact that results are obtained without the use of springs, and there is practically no oscillating on the part of the indicator. The capacity of these devices varies from 1,000 to 2,000 lb. on the dial, with an auxiliary beam to provide for the overweight to the full capacity of the scale. However, these auxiliary beams are seldom used in freight houses, where 90 per cent of the freight handled weighs less than 1,000 lb.

Five or six manufacturers have operating devices on the market, the general construction of which varies widely, but the method of obtaining the results of which are practically identical. Some of these machines are connected directly to the shackle of the scale levers, entirely eliminating the former beam equipment. Others are attached to the steel-yard rod, so that if the indicator is out of commission at any time, weighing can be continued on the beam as formerly. Among the present quick-weighing indicators are the Kron, Springfield, Streeter-Ammet, McFarlane, Fairbanks and Howe, all of which have been thoroughly tried out in this service.

Quick Weighing Indicator on a Freight House Platform Scale.

AN INTERESTING AND UNUSUAL ACCIDENT.

A short time ago a passenger train consisting of an engine, baggage car, mail car and two sleepers was derailed on a western road, and a 100-ton wrecker was sent out to clear the track. After working two or three hours an opposing passenger train appeared, and the wrecking outfit, consisting of an engine, convoy and wrecker, was ordered to a nearby passing track to let this train by. To reach this siding it was necessary for the wrecker to pass a through truss span. Owing to oversight on the part of the engineer, the boom of the wrecker was left up, and while running about 10 miles per hour this boom caught in the end of the bridge, pulling out the end portal and cross-bracing and lifting the span off the bridge seat after the engine and convoy had passed safely. The span dropped about 25 ft. into the creek below, carrying the wrecking outfit with it. Although six persons were on the wrecker, no one was injured.

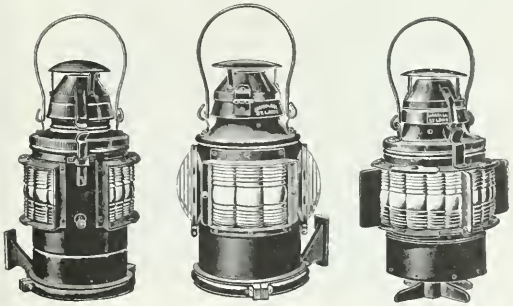
This accident happened about 10 o'clock in the morning. The crew immediately started pulling the bridge apart and putting in a temporary track up the dump. With the assistance of two engines and a deadman, through which a line from the auxiliary hoist was attached, the wrecker was pulled up a 25 per cent. grade to the main track, and at 5 o'clock in the evening was again at work on the derailed engine of the passenger train. During all this time, even while the wrecker was in the stream, fire had been maintained under the boilers, and after it had been gotten back onto the main line, a careful examination showed that less than $5 worth of damage had been done to it.

Wrecked Bridge Before Pulling Wrecker Up Inclined Track.

This wrecker was made by the Industrial Works, Bay City, Mich.

HANDLAN'S RADIUS LENS SIGNAL LAMPS.

The Handlan radius lenses used in the signal lamps illustrated herewith were designed to impart the same amount of reflected light to observers viewing them from any position within the arc covered. The switch lamp is especially efficient for locations on curves. The spread of light not only covers an arc of 79 deg., but also radiates above and below the center line of the lens, thereby displaying clear indications on grades, and from stands located on tangent track in which the lamp has drooped over or is otherwise out of focus. These lamps are furnished with any combination of colors, can be constructed to hold either forks or staff, and are optionally equipped with either one-day or long-time burners.



Engine, Tail and Switch Lamps with Handlan Radius Lenses.

The engine lamps are equipped with green and white lenses, having an arc of 130 deg., the combined arc of a pair of these lamps upon a locomotive exceeding 225 deg. By this method employees are given the same uniform intensity of light regardless of their location. These lamps are adapted to be used on either side or front, and have an interior steel blind to obscure the lens not in use, which eliminates all expensive, intricate interior parts and colored glasses.

The tail end marker was designed to afford equal protection to rear ends of trains, both on tangent track and curves. These lamps are supplied with ruby radius lenses, covering an arc of 80 deg., and three standard 5-in. diameter lenses of any colors. They are equipped with one-day burners.

The engine lamp has been adopted as standard on the Frisco Lines, the Missouri, Kansas & Texas, the Mobile & Ohio and the Denver & Rio Grande, besides being tested at present on 24 other lines. The switch lamp is undergoing test on various lines, while some railways have purchased them in considerable quantities for use on curves. Sample lots of the tail lamps have been purchased by several lines for test. All of these lamps are equipped with Handlan's top draft ventilation, and are made by the Handlan-Buck Manufacturing Co., St. Louis, Mo.

A NEW FLEXIBLE HOSE.

Users of hose or flexible connectors for steam and pneumatic service would welcome a high pressure hose that would not kink, flatten, puncture or collapse at inopportune moments. A new coupling known as the J-M Flexible Metallic Combination Hose is said by the manufacturers to fulfill these conditions. This connector consists of durable rubber hose, protected against outward injury by a stout metal armor. The armor is made in the form of a ribbon, with crimped edges, forming, when wound, a continuous, interlocking flexible spiral, which is said to be practically pressure-tight in itself, without the inner tube. As the interlocking construction of the spiral restricts the curvature, sharp bends are impossible. Consequently the inner tube cannot kink or flatten, and is always open to its full diameter, permitting an unrestricted flow of steam, gas or liquid.

Owing to its unusual strength, the armor is practically proof against damage from the outside. Service tests show that it will resist a crushing strain of 300 to 800 lbs. to each four turns of the spiral, depending on the size of the hose, while it is capable of withstanding the highest internal working pressures. It is claimed that this hose cannot be put out of service unless both the outer armor and inner tube are punctured at the same time. In case the armor is dented or jammed, it will still serve as an efficient protection to the inner tube, and can be restored to its original condition. The substantial construction of the armor permits the use of a much lighter inner tube than is ordinarily used. This means a decided saving when it becomes necessary to renew the rubber hose. The inner tube is never subjected to any pulling strain, as the armor is stretched to its maximum length before the former is inserted. All the working strain comes on the armor, which is tested to resist an end pull or thrust of 1,000 to 2,000 lb.

Another advantage of the new hose is that its exterior surface, unlike ordinary single types of hose, does not become excessively hot when used for steam service, drills, or blowing out boilers, and can therefore be more conveniently handled. There are no rough edges in the metal armor of J-M Combination hose to cut or chafe the inner tube—no cracks or spaces between the spirals to permit the tube to work out or blow through, and, as the exterior is smoothly finished, it cannot cut or scratch the hands.

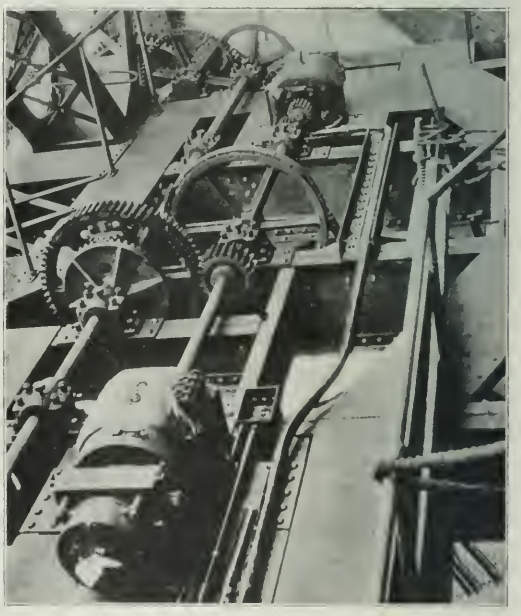
Specially designed couplings of malleable iron or brass are furnished with each length of hose. These couplings are virtually a union of three pieces: An outer sleeve into which the metal armor is threaded and riveted fast, the internal nipple, tapered on one end to fit tightly inside the inner tube, and the lock or binding nut, which serves to wedge the internal nipple well into the inner tube and hold it tightly against the inner walls of the outside sleeve. The outer end of the internal nipple can be furnished in male or female type, threaded to meet any standard requirement.

J-M Combination hose can be furnished in any length, any inside diameter up to 12 in., of any metal, and for all working pressures. It is also made with an inside pressure-tight metallic lining, as well as outside metal armor, for suction service, oils, etc. For boiler wash-out, round-house work and other places where steel would corrode, copper armor should always be used.

The H. W. Johns-Manville Co., New York, have published an interesting circular on this new coupling, which they will forward on request to anyone interested.

TWO MOTOR-OPERATED RAILROAD LIFT BRIDGES.

Practically all the railroad lift or draw bridges erected in the last few years, where electric current is available, are motor operated. Experience has proved that motors are fully as reliable as any other form of drive, and they are



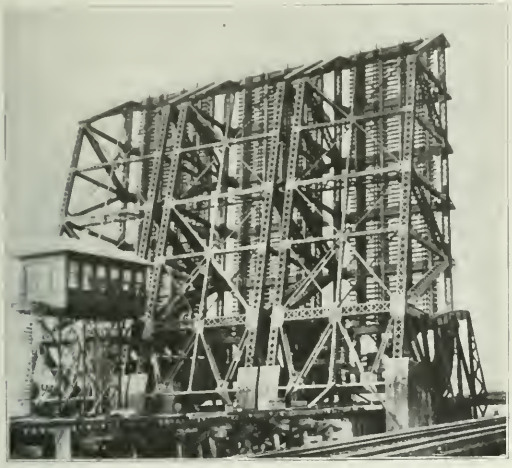
Motors Applied to Bronx River Bridge.

more economical, as there is no maintenance expense when the bridge is not being operated. The control of motors is also simpler than that of any other form of drive, and many protective devices can be installed.

Two interesting installations of motor-operated railroad bridges are those that carry the six tracks of the Harlem river branch of the New York, New Haven & Hartford over the Bronx and the Hutchinson rivers and over which approximately two hundred trains pass daily. Each bridge is made up of three leaves, each leaf carrying two of the six tracks. The Bronx river bridge is near the Westchester avenue station, and the Hutchinson river bridge is between

Baychester and Bartow stations. Both are the Scherzer type rolling lift bridges.

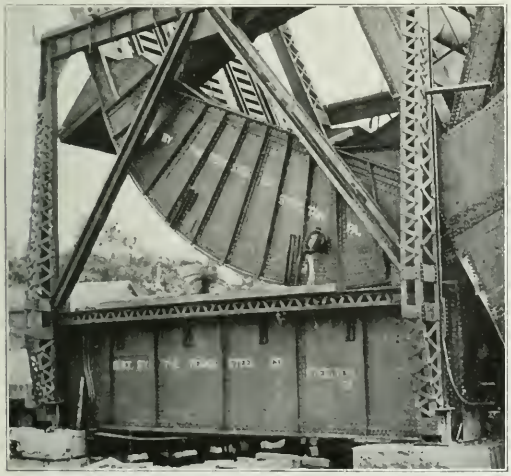
Since the channels spanned by these bridges are only about 100 ft. wide, the rolling lift construction was adopted, because this type requires no center pier and involves no obstruction or widening of the channel. The number of



Six-Track Scherzer Rolling Lift Bridge Across Bronx River.

daily openings varies, averaging five in the case of the Bronx river bridge during winter months and 12 during other months. The number of openings of the Hutchinson river bridge is less.

The complete electrical equipment is of Westinghouse make. Each leaf is operated by two 25 horsepower, 550 volt,



Method of Conveying Conductors to Moving Parts.

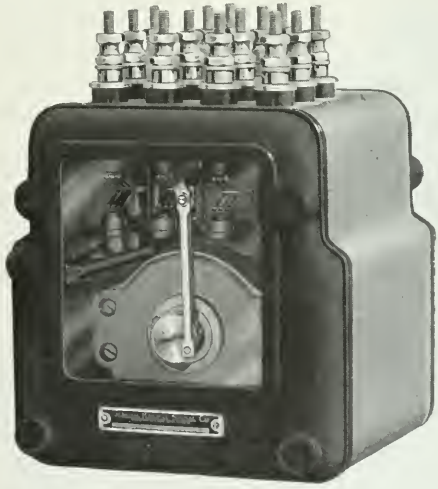
direct current motors, mounted on the moving leaf and geared to pinions which project from the side and mesh with racks on the stationary part of the bridge. Under ordinary circumstances the two motors on each leaf are operated together as one unit, but either can be controlled separately, and either has sufficient capacity to move its leaf, although, of course, more slowly than if the two motors were working together. Both motors are provided with electric brakes, and each leaf has a separate emergency brake.

The motors, brakes and other apparatus on the bridge itself are weatherproof, and designed for successful operation through an angle of 90 deg., through which angle the bridge moves vertically. The conduit carrying the current to the moving part of the bridge can be seen near the lower left-hand side of one of the photographs, passing to the under side of the roll-way, and, when the bridge is open, as shown, lying along a trench to the point where the conduit is carried up into the bridge itself. As the bridge swings down, the point where the cables enter the leaf moves upward, and the slack cable rises out of the trench.

The bridge is controlled from a tower. To open the bridge the signals are first set against trains, de-rails are opened, and bridge rail lock mechanisms are released. The controllers are then operated, and the upward movement of the bridge begins. At four points in its travel, signal lamps are lighted and bells are rung. If the power is not shut off when the leaves are at the proper height, a circuit breaker is tripped automatically. When the bridge is open, the navigation lights on the river change from red to green. The leaves are arranged in case of emergency to be manually operated by means of an endless chain over a wheel on the counter shaft. Considerable time is required for this, and it has never been necessary since either of the bridges were put into service.

THREE POSITION MOTOR RELAY.

The illustration herewith shows the new three-position direct current motor relay which has been designed by the General Railway Signal Company for use in wireless control automatic block signaling. The pickup, drop-away, contact pressure, and opening are the same as the G. R. S. model 9 tractive type.



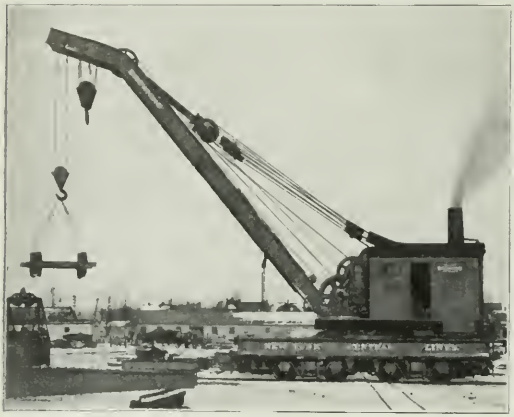
New Three-Position Direct Current Motor Relay for Wireless Signal Control.

For use in cut sections the track control is broken through one set of contacts only instead of through the neutral and polar contacts as when polarized relays are used. This means that the sections can be employed to as great a length as is possible with the ordinary neutral relays. Furthermore, this relay is much less subject to the influence of large flashes of current or lightning than any other form of polarized relay.

A LARGE RAILWAY STYLE WATER TOWER.

What is believed to be the largest steel tank on a short steel tower of a style commonly used by railways is being completed at Lakewood, O., a suburban city, close to Cleveland. It has a capacity of 560,000 gal. and height to bottom of tank of about 18 ft. The total height is 70 ft. and the diameter 46 ft. The bottom of the tank is constructed of compound curve, the largest radius of curvature being about 24 ft. The twelve columns are each supported by a pier 10 ft. square at base and 6 ft. high. No roof is used on this tank. The two balconies are for ornamentation and also for convenience in inspection. The initial cost of tanks of the size illustrated approximates five cents per gallon.

This structure illustrates the tendency of engineers to abandon the steel stand pipe having a flat bottom resting on a masonry pier. A large portion of the cost of flat bottom stand pipes is included in the extra masonry required to support them. The water in the lower portion is usually not available for service and failures due to rustling out of metal sometimes occur. The structure shown was designed and built by the Des Moines Bridge & Iron Co., Pittsburgh, Pa.



New Wrecking Crane for New York Central Lines.

LOCOMOTIVE CRANES IN THE CONSTRUCTION OF THE GRAND CENTRAL TERMINAL.

A large portion of the rock from the excavation for the new Grand Central Terminal, New York, was handled by seven cranes built by the Browning Engineering Co., Cleveland, O. These machines had been in constant use since the terminal work began, eight or nine years ago, and after the completion of the work will be sent to various yards for handling coal, cinders, etc. Some of the cranes are of 10 tons and some of 15 tons capacity, being equipped with booms of variable lengths. They were used to handle the rock after blasting, in most cases loading it onto flat cars.

These machines were particularly adapted to the handling of this rock, since in many cases the pieces resulting from the blasting were too large to be handled by a steam shovel dipper and the use of the cranes allowed these large rocks to be handled without further breaking. The cranes were also used to handle concrete into the forms and the cement, sand and stone around the mixing plants; also cinders, ties, rails and other heavy material throughout the course of the work. In the construction of the buildings, they were used to set the columns and girders and were frequently used for switching cars on the temporary tracks.

Browning Cranes Handling Rock Excavation for the New Grand Central Station, New York.

At the Coliseum

LIST OF EXHIBITORS.

The following is a complete list of all exhibits, in place or being installed, in the Coliseum and the First Regiment Armory. Spaces numbered from 1 to 212, inclusive, are in the Coliseum, and, unless otherwise indicated, the space numbers in the list are in the Coliseum. Exhibits in the Armory are so indicated:

Adams & Westlake Company, Chicago, Ill.—Signal lamps, railway hand lanterns, folding lavatories, car lighting fixtures, car baggage rack and car window devices. Represented by W. H. Baldwin, G. L. Walters, A. S. Anderson, C. B. Carson, W. J. Pierson, H. G. Turney, J. T. Ross, T. A. Galt. Spaces 83, 84, 102 and 103.

Ajax Forge Company, Chicago, Ill.—Manganese steel one-piece guard rail, Manganese frogs, guard rail clamps, adjustable switch rods and rail braces. Represented by F. B. Bradley, H. G. Elfborg and H. C. Hutchins. Spaces 230, 235, 236, Armory.

American Guard Rail Fastener Company, Philadelphia, Pa.—Vaughan automatic rail anchors, Vaughan guard rail clamps, anchor guard rail clamps, tie plate guard rail fasteners. Represented by David F. Vaughan and Charles Z. Vaughan. Space 119.

American Hoist & Derrick Company, Chicago, Ill.—American railroad ditcher. Represented by Frank J. Johnson, William L. Manson and C. C. Austin. Space 47.

American Lock Nut Company, Chicago, Ill.—Absolute lock nut. Represented by F. M. Bobo, B. A. Radcliffe, W. W. Smith, W. J. Hamlin, E. J. Murdock. Space 162.

American Rail Joint Company, Toronto, Canada.—Reinforced angle bars and rail joints. Represented by T. D. Beddoe. Space 148.

American Steel & Wire Company, Chicago, Ill.—Right-of-way fencing, galvanized steel fence posts, steel farm crossing gates, signal wire, switch ropes, telegraph and telephone wires, insulated wires and cables. Represented by J. W. Collins, B. H. Ryder, L. P. Shanahan, C. J. Boon, M. E. Evans, F. J. Conkling, J. W. Meaker, H. A. Parks and C. H. Knight. Spaces 261, 262, 267, 268, Armory.

American Vulcanized Fibre Company, Wilmington, Del.—Rail joint insulation, fibre plate, end posts, bushings, steel ties, shims and other fibre products. Represented by John Barron, C. C. Bell and J. H. Burn. Space 117.

Asphalt Ready Roofing Company, New York, N. Y.—Roofing materials, Hudson asphalt shingles, Protection brand roofing. Represented by H. H. Huested and W. A. Hemenway. Space 167.

Associated Manufacturers' Company, Waterloo, Ia.—Jerry boy section motor car, gasoline engines, magnetos. Represented by A. H. Ambrose and Alfred Grove. Space 161.

Atlas Preservative Company of America, New York, N. Y.—Descriptive matter of Atlas products, particularly Atlas "A" weed killer and track preservatives. Represented by R. N. Chipman and Jacob Kramer. Space 169.

American Valve & Meter Company, Cincinnati, O.—Poage automatic water columns and tank fixtures, Fenner drop spout, Anderson economy switch stands, interlocking switch stands and safety switch locks. Represented by J. T. McGarry and F. C. Anderson. Spaces 130, 131 and 132.

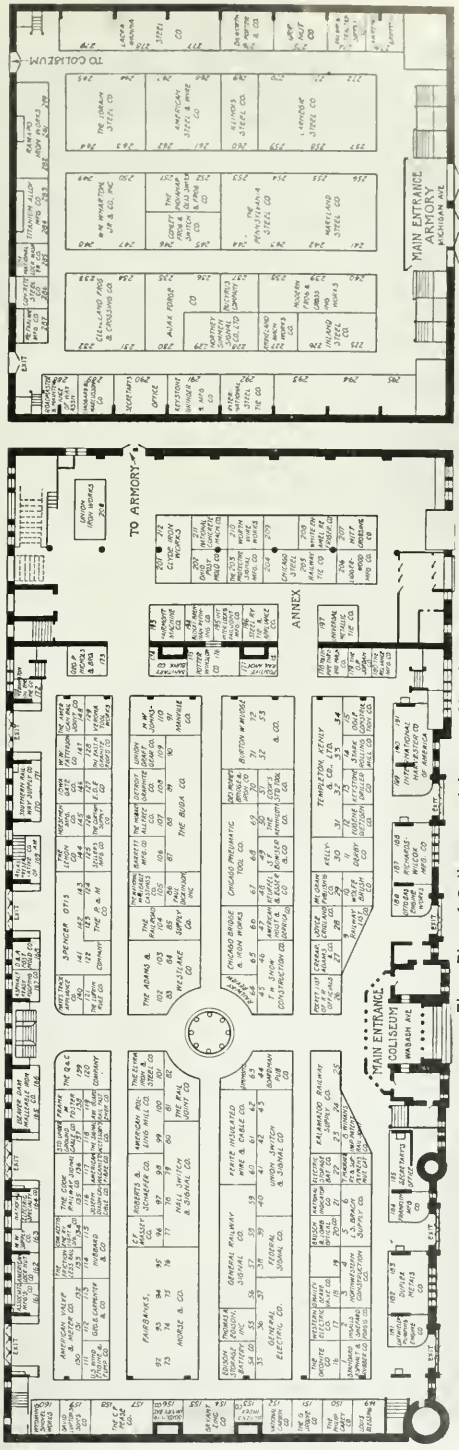
Barrett Manufacturing Company, Chicago, Ill.—Bridge waterproofing, Barrett specification roofs, Barrett Tarrok subfloors, Hydronon, the dampproofing paint, waterproofing for buildings. Represented by H. B. Nichols, W. S. Babcock, Henry Olmsted, Jr., B. B. Breder and J. J. Ross. Space 106.

Beaver Dam Malleable Iron Company, Beaver Dam, Wis.—Tie plates and rail braces. Represented by D. P. Lamoreux, Lawrence Fitch and Frank Bell. Spaces 165 and 166.

Bausch & Lomb Optical Company, Rochester, N. Y.—Engineers' and surveyors' instruments. Represented by W. Louis Johnson, Chas. A. Bengston and Harold D. Skelton. Space 20.

Blessing Louis, Jackson, Mich.—Reinforced concrete railway tie, "Safite" rail fasteners and noiseless rail joint. Represented by Louis Blessing and Fred M. Hall. Space 149.

Blocki-Brennan Refining Company, Chicago, Ill.—Carboxide Elastic Metal Preserver. To protect steel and iron structures against weather conditions, sulphur and acid fumes. Represented by Jas. C. Cleary, Glenn E. Plumb, W. F.



Floor Plan of Coliseum and Armory, Showing Arrangement of Exhibits.

Brennan, Gordon E. Douglas and Rudolph Braocker. Space 194.

S. F. Bowser & Company, Inc., Fort Wayne, Ind.—Oil storage systems, self-measuring and power-driven pumps, oil tanks large and small, gasolene storage, self-registering pipe line measures, oil filtering and circulating systems. Represented by J. L. Handy, W. T. Simpson and E. H. Briggs. Space 49.

L. S. Brach Supply Company, New York, N. Y.—Lightning arresters, insulating compounds, handy die stocks, railway crossing signals, Brach handy pipe vise, Brach hydrogrounds, Brach vacuum arrester testing sets, Brach lightning arrester cabinets, Brach iron arrester cases, Brach volt meters, solderall and solderall torches and Brach duplex shunts. Represented by L. S. Brach, A. G. Brach and H. E. Gifford, Jr. Spaces 5 and 6.

Bryant Zinc Company, Chicago, Ill.—Crossing signals, relays, channel pins, annunciators, Waterbury batteries, and Orangeburg fibre conduit. Represented by Stanley C. Bryant, J. P. Costigan, E. M. Deems, J. W. Cremerius, A. F. Klink and H. F. Worden. Spaces 154 and 155.

Buda Company, Chicago, Ill.—Motor cars, track drills, bumping posts, jacks, switch stands, car replacers, electric storage battery, shop truck, electric crossing gate, automobile engines, etc. Represented by H. C. Beebe, W. C. Dyer, H. S. Evans, R. B. Fisher, J. J. Gard, J. T. Harahan, Jr., L. Hamill, Wm. P. Hunt, Jr., E. Johnson, W. Krause, G. J. Slibeck, M. E. Towner, T. H. Wheeler. Spaces 87, 88, 89 and 90.

Bucyrus Company, South Milwaukee, Wis.—Pictures of locomotive piledrivers, steam shovels, drag line excavators, wrecking cranes and unloading plows. Represented by P. E. Dutcher. Space 237, Armory.

Buyers' Index Company, Chicago, Ill.—Publication "Railway Supply Index-Catalogue." Represented by Lloyd Simonson, Norman F. Rehm, Alex Smith, C. W. Cozzens, D. J. Beaton and F. B. Cozzens. Space 153.

Philip Carey Company, Cincinatti, O.—Carey Flexible cement roofing, ceilboard, Deco veneer, waterproofing materials, etc. Represented by Allan Wallace, J. E. Fitzpatrick, N. S. Kenney, E. P. Tingley and P. A. Johnston. Space 150.

Carnegie Steel Company, Pittsburgh, Pa.—Full set steel switch ties, United States steel sheet piling, steel wheels, gear blanks, axles, Duquesne rail joints, hot and cold worked splice bars, automatic stereopticon showing views of steel tie track and steel piling installations. Represented by N. M. Hench, L. C. Lustenberger, Robert Coe, C. F. W. Rys, John McLeod, John S. Unger, Edwin S. Mills, C. B. Friday, G. W. Landrus, G. E. Dix, H. van Zandt, C. E. Dinkey, J. W. Dix and H. D. Williams. Illinois Steel Company representatives: W. H. C. Carhart, George Baker, D. T. Buffington, H. L. Baker, D. E. Sawyer, H. C. Griswold, J. P. Walker, C. E. Haywood, W. J. Totten, T. W. O'Brien, J. B. Arnold, B. E. Hamilton and P. Carhart. Spaces 257, 258, 259, 260, 269, 270, 271 and 272 Armory.

George B. Carpenter & Company, Chicago, Ill.—Railway supplies. Represented by H. W. d'Evers and H. S. Hanson. Spaces 112 and 113.

Chicago Bridge & Iron Works, Chicago, Ill.—Steel towers and tanks. Represented by George T. Horton, Horace B. Horton, Robert H. Murray, Merle J. Trees, Elwood G. Ladd, Charles S. Pillsbury, Clinton M. Ladd, Kenneth I. Small and H. B. Murphy. Spaces 65 and 66.

Cleveland Frog and Crossing Company, Cleveland, O.—Frogs, switches, switch stands and rolled manganese rail crossings. Represented by George Stanton, L. G. Parker, W. S. Moore, George Arnold, Jr., and G. A. Peabody. Spaces 231, 232, 233 and 234.

Clyde Iron Works, Duluth, Minn.—One 8¼ in. by 10 in. double cylinder, double drum erectors' hoist with four independent winch heads; one 7 in. by 10 in. double cylinder, double drum contractors' hoist complete with bull wheel swinging gear, and various sizes of blocks and sheaves. Represented by A. E. Holcomb and G. P. Miller. Spaces 201 and 212.

Chicago Pneumatic Tool Company, Chicago, Ill.—Rockford railway motor cars, pneumatic and electric tools, rail bonding outfits, etc. Represented by C. E. Walker, J. C. Campbell, P. F. Flavin, M. O'Connor, W. F. Delaney and J. W. McCabe. Spaces 67, 68 and 69.

Chicago Steel Railway Tie Co., Chicago, Ill.—Steel and concrete railway ties. Represented by Walter R. Carmody, T. P. Inglesby and John Hemmingway. Spaces 204 and 205.

Commercial Acetylene Railway Light & Signal Company, New York, N. Y.—Flashing signals, commercial acetylene headlights, acetylene signal lighting, A. G. A.-Dalen signal devices, Oxy-Acetylene welding. Represented by C. E. Lee, H. G. Doran, E. T. Sawyer and F. A. Barbey. Space 134.

Concrete Steel Company, Chicago, Ill.—Reinforcing bars, safety tread and bar bending machines. Represented by Fred C. Harper, John G. Ralston and T. M. Davidson. Space 286 Armory.

Conley Frog & Switch Company, Memphis, Tenn.—Three designs of Conley frogs. Represented by J. E. Conley, F. W. Lange and J. W. Buzick. Spaces 245 and 246 Armory.

Cook Railway Signal Company, Denver, Colo.—Automatic block signals, automatic crossing gates and "Revivo" dry storage batteries. Represented by W. J. Cook, George R. Simmons, M. W. Breuer and N. Fallek.

Cook's Standard Tool Co., Kalamazoo, Mich.—Track drills, bonding drill, track tool grinders, chucks, drill bits, track jacks, car jacks and cattle guards. Represented by Eugene Cook, Walter Reynolds and E. B. Cook. Space 51.

Crerar, Adams & Company, Chicago, Ill.—Calumet heavy duty track drills, Eureka bonding drill, Hercules steel trucks, Calumet expanders, Shelby seamless steel tubing. Represented by Russell Wallace, W. J. Clock, C. J. O. Swift, W. H. Dangle, J. A. Martin, G. D. Bassett and T. W. Barrett. Space 27.

The Curtain Supply Company, Chicago-New York.—Ring 88 curtain fixture, Rex all-metal curtain rollers, Rex steel sash balance, vestibule curtains, including Rex release handle, Rex steel vestibule roller, No. 6 roller, vest hook, Rex vestibule curtain opening shield and C. S. C. O. diaphragms and fireproof hoods. Represented by W. H. Forsyth, S. W. Midgley, F. M. Egolf and Randolph Reynolds. Space 126.

D. & A. Post Mold Company, Three Rivers, Mich.—D. & A. cement fence machines, special molds for line, anchor and brace posts, D. & A. post manufactured by Pennsylvania Railroad Company, post reinforcements and fence fasteners. Represented by G. H. Dougherty, L. R. Dougherty, O. Dougherty and L. A. Dougherty. Space 168.

David Lupton's Sons Company, Philadelphia, Pa.—Steel sash and window operating device. Represented by C. P. Pond, R. A. Sanborn and G. J. Wagner. Space 159.

Des Moines Bridge & Iron Company, Pittsburgh, Pa.—Steel water towers, steel coaling stations, steel standpipes and novelty beam and tank calculator. Represented by W. W. Hendrix and A. C. Pearsall. Space 70.

Detroit Graphite Company, Detroit, Mich.—Paints for railroad service. Represented by T. R. Wyles, L. D. Mitchell, B. O. F. Randolph, A. H. Kuerst, E. Booth, J. J. Hogan and C. C. Potter. Space 108.

Eugene Dietzgen Company, Chicago, Ill.—A complete line of improved railroad transits and levels. Represented by C. E. Cole and G. C. Moore. Space 12.

Paul Dickinson, Inc., Chicago, Ill.—Smokejacks, Aeolus ventilators and cast iron chimneys. Represented by A. J. Filkins, J. A. Meaden, George M. Kenyon, Wm. H. Dayton, F. C. Webb and G. H. Vrooman. Space 86.

Dilworth, Porter & Company, Ltd., Pittsburgh, Pa.—Railroad spikes and tie plates. Represented by W. H. Schleiter and Joseph Dilworth. Space 276 Armory.

Joseph Dixon Crucible Company, Jersey City, N. J.—Dixon's silica graphite paint and graphite productions. Represented by H. W. Chase, R. R. Belville and F. B. Gibbs, Jr. Space 116.

Drouve Company, G, The, Bridgeport, Conn.—Skylights and window operating device. Space 151.

Duplex Metals Company, Chester, Pa.—Copper clad wire and accessories. Represented by C. B. Semple, W. T. Kyle, L. M. Gordon, R. C. McCall, Elgin Braine and B. F. Cameron. Spaces 182 and 183.

E. D. E. Company, Chicago, Ill.—Flaxlinum insulation for refrigerator cars, ice houses and fireproof Flaxlinum insulation for steel passenger cars. Represented by Frank M. Gilmore and Frank J. Burns. Space 127.

Eastern Granite Roofing Company, New York, N. Y.—Granite roofing, Evertite roofing, Tisbest roofing and Palmold roofing. Represented by H. Henning, A. E. Roever and W. F. Sachs. Space 128.

Edison Storage Battery Company, Orange, N. J.—Storage batteries for railway signals, car lighting, telegraph and telephones. Represented by H. G. Thompson and George W. Daves. Space 54.

Edison, Thos. A., Inc., Orange, N. J.—Primary batteries. Model working exhibit, showing B. S. C. O. gravity and storage batteries working on track circuits. Represented

by E. E. Hudson, F. J. Lepreau, P. A. Garrity and E. McGall. Space 55.

Electric Storage Battery Company, Chicago, Ill.—"Chloride," "Tudor," "Exide," "Hycap" and "Ironclad-Exide" batteries to be used in car lighting, telephone, telegraph and signal operation; storage battery locomotives, central station batteries, commercial industrial trucks and operation of drawbridges. Represented by G. H. Atkin, T. Milton, H. N. Beck, R. J. Baird, T. A. Cressey and P. G. Downton. Space 22.

Elyria Iron & Steel Company and the Hart Steel Company, Elyria, O.—Tie plates and compromise rail joints. Represented by Guilford S. Wood, A. W. DeRocher, W. T. Bentz and J. H. Allen. Space 101.

Fairmont Machine Company, Fairmont, Minn.—Motor cars, bridge building, 4-speed cars, section and inspection car. Represented by F. E. Wade and H. E. Woolery. Space 193.

Federal Signal Company, Albany, N. Y.—Federal electric interlocking, Federal electromechanical interlocking machine, Federal switch guard, Federal top post signal mechanism, 3-position solenoid dwarf signal, Mercury time release, hand time release, track model, battery charging switch, switch box, etc. Represented by A. H. Renshaw, J. T. Cade, C. Hurze, H. G. Thompson, J. J. Hubbard, H. C. Ware, H. P. Ober, John Kelly, W. H. Richard and A. C. Dunne. Spaces 38 and 39.

Franklin Manufacturing Company, Franklin, Pa.—Franklin asbestos lumber smoke jacks, asbestos train pipe covering, "Franklin" 85 per cent. magnesia sectional boiler lagging, and cotton and wool waste. Represented by E. R. Rayburn, L. B. Melville, R. J. Evans and H. S. Hayden. Space 184.

The Frictionless Rail, Boston, Mass.—Rail for track curves. Represented by F. A. Barbey, J. W. Manama, S. W. Simonds, G. H. Bryant and T. F. Dwyer, Jr. Space 133.

Fairbanks, Morse & Company, Chicago, Ill.—Motor cars, combined oil engine and pump, 9 HP oil engine direct-connected to 5½ Kw generator, steam pump, cattle guards, scales, standpipe, bonding drill, chain hoists, double-acting deep well cylinder, electric motor, jacks—ratchet, hydraulic and ball bearing, Eclipse engine and trench pump. Represented by S. F. Forbes, A. A. Taylor, E. M. Fisher, L. H. Matthews, D. J. Higgins, F. M. Condit, J. L. Jones, F. H. Douglas, Geo. A. Akers, C. T. Fugivy, K. B. Brown, W. W. Adams, A. M. Fenwick, D. K. Lee, F. V. Roy, E. E. Pendray, L. Norvell and H. E. Vergosen. Spaces 92, 93, 94, 95, 73, 74, 75 and 76.

General Electric Company, Schenectady, N. Y.—Electrical equipment for steam railways and railway supplies. Represented by H. L. Monroe, W. J. Clark, A. W. Jones, F. Rhea, W. O. Kellogg, W. H. Coleman, J. Roberts, H. M. Jacobs, G. F. Gray, L. W. Shugg, A. P. Jenks, L. A. Crawford, C. H. Jones, B. F. Bilsland and H. K. Ferguson. Spaces 35, 36 and 37.

General Railway Signal Company, Rochester, N. Y.—Power signaling, consisting of electric interlocking using dynamic indication, alternating current block signals, A. P. Block system, Selective signal system for telephone train despatching, model 4 switch machine, 110-volt model A signals, direct-connected and base of mast types, model 2A dwarf signal, light signals, direct and alternating current, model 2A block signals, signal transformers, alternating and direct current relays and indicators, model 5 form A switch box, 3-position relays and signal accessories. Represented by W. W. Salmon, G. D. Morgan, M. Wuerpel, H. M. Sperry, F. W. Moffett, M. F. Geer, S. N. Wight, A. G. Moore, M. R. Briney, L. Thomas, C. O. Poor, F. H. Jones, W. K. Howe, F. L. Dodgson, W. S. Henry, J. H. Campbell, S. M. Day, O. A. Ross, L. B. Somerby, A. Thomson, L. E. Dodge and H. C. Frey. Spaces 56, 57, 58 and 59.

Gordon Primary Battery Company, New York, N. Y.—Gordon primary battery. Represented by O. S. Flath, G. A. Nelson and W. M. Kinch. Space 156.

Griffith, Lawrence, Yonkers, N. Y.—The Griffith shoulder tie plate insulated rail joint. Represented by Lawrence Griffith. Space 273, Armory.

Grip Nut Company, Chicago, Ill.—Grip lock nuts, grip holding nuts, monogram bolt fastener and the D. P. journal box dust guard. Represented by W. E. Sharp, Blake Hooper, E. V. Lea and C. Beaumont. Space 275, Armory.

Hall Switch & Signal Company, New York, N. Y.—Automatic signals, relays, switch boxes, electric interlocking machines, switch machine and auxiliary appliances used in signal work. Represented by W. H. Lane, W. J. Gaillingham, Jr., H. J. Mullineaux, H. B. Taylor, H. L. Hollister, R. Connell, O. B. Frink and C. R. Sloan. Spaces 77, 78, 79 and 80.

Hayes Track Appliance Company, Richmond, Ind.—Hayes derails, models A, CX, E and H, with operating and target stands. Represented by S. W. Hayes, W. Harding Davis, E. L. Ruby, E. W. Brown, E. C. Knapp, J. McCulloch, Jr., Wellington B. Lee, Arthur Gemunder and F. C. Stowell. Space 140.

Hitt Crossing Company, Champaign, Ill.—Space 207.

Hobart-Allfree Company, Chicago, Ill.—Smyth and Freeland derailers, Newton car replacers, one eight-size model of piston valve cylinders. Represented by B. F. Hobart, E. H. Allfree, F. R. Cooper and W. H. England. Space 107.

Hoeschen Manufacturing Company, Omaha, Neb.—Mechanical highway crossing bells. Represented by H. Hoeschen, H. P. Ryner, A. H. Snedeker, R. A. Fry and George H. Fisher. Space 145.

Hubbard & Company, Pittsburgh, Pa.—Railroad track tools, shovels, spades and scoops, Pierce specialties, pole line material and washers. Represented by R. L. Mason and O. W. Youngquist. Spaces 114 and 115.

Haggard & Marcusson Company, Chicago, Ill.—Tiger steel bunks. Represented by Henry H. Marcusson. Space 289, Armory.

Indianapolis Switch & Frog Company, Springfield, O.—RNR solid manganese frog, "Indianapolis" manganese crossing, RNR frog crossing, "Indianapolis" portable electric welder, electric welded joints, reclaimed manganese frog and armor plated rail frog. Represented by E. C. Price, J. A. Foulks, W. H. Thomas and J. C. Jameson. Spaces 251 and 252 Armory.

Ingalls-Shepard Forging Company, Harvey, Ill.—Represented by W. E. Foster. Space 2.

Inland Steel Company, Chicago, Ill.—Open hearth steel products, tie plates, railway track bolts and track spikes, rivets, Vismera rust and corrosion-resisting iron sheets and products, concrete reinforcing bars, rail carbon, plain and hot twisted, medium open hearth steel, plain and cold twisted, steel barrels and steel fence posts. Represented by H. L. Hart, R. C. Coombs and A. C. Roeth. Spaces 225 and 226 Armory.

International Harvester Company of America, Chicago, Ill.—Oil engines and tractors for railroad construction work. Represented by A. F. Young and C. C. Mangrum. Spaces 189, 190 and 191.

International Interlocking Rail Joint Manufacturing Company, Chicago, Ill.—Interlocking rail joint (Barnhill joint). Represented by J. McWeeny, W. H. Lienesch and B. E. Reed. Space 195.

International Steel Tie Company, Cleveland, O.—Steel railway ties and steel crossing ties. Represented by Wm. P. Day, J. J. O'Donnell, L. C. Shank, George Harpham and W. C. Mahon. Space 292 Armory.

Iowa Gate Company, Cedar Falls, Ia.—Right of way and stock yard gates (metal). Represented by Jack Hyland, Jos. B. Clay and John H. Meyer. Space 146.

O. F. Jordan Company, Chicago, Ill.—Jordon spreader. Represented by M. J. Woodhull and F. C. Rutan. Space 179.

Johns-Manville Company, H. W., New York, N. Y.—Asbestos smoke jacks, shingles, roofings, passenger and freight car insulation, pipe coverings, boiler lagging, cork insulation, cork tile, waterproofing materials, mastic flooring, packings, sectional conduits, fibre conduits, electrical materials. Represented by J. E. Meek, J. C. Younglove, B. J. Feeney, E. T. Wade, L. L. Cohen, Geo. Christenson, Chas. Craig, F. W. Doty, M. H. Farnsworth, C. D. Folsom, C. W. Gearhart, R. A. Hamaker, L. E. Hassman, W. J. Hennessey, F. J. Horne, P. C. Jacobs, D. L. Jennings, W. H. Lawrence, H. L. Leach, H. T. Morris, C. E. Murphy, H. M. Newell, H. G. Newman, G. A. Nicol, H. B. Sewell, J. H. Trent and H. A. Waldon. Spaces 91 and 110.

Joyce Cridland Company, Dayton, O.—Lifting jacks. Represented by Chas. D. Derby, Geo. W. Llewellyn and Frank I. Joyce. Space 28.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.—A general line of track and railway supplies including motor cars, track drills, light velocipedes, etc. Represented by John McKinnon, D. A. Stewart, C. A. Wallace, W. N. Sidnam, E. R. Martin, H. N. Whipple, E. Hicks and W. Winterle. Spaces 23, 24 and 25.

Kelly-Derby Company, Chicago, Ill.—Pumps, engines, motors, well cylinders, rubber, wire cloth and crucibles. Represented by C. W. Kelly, R. E. Derby, W. L. Bergboffer, S. D. Baldwin, Robert McGowan and J. E. Bond. Spaces 11 and 30.

Kennicott Company, Chicago, Ill.—Working models of water softener and filter. Represented by Cass L. Kenni-

cott, E. J. Flemming, W. D. Hawkins, F. S. Dunham, T. G. Windes, Jr., and Wm. N. Jewell. Space 50.

Kerite Insulated Wire & Cable Company, New York, N. Y.—Kerite insulated wires and cables. Represented by R. D. Brixey, Azel Ames, P. W. Miller, J. W. Young, Joseph A. Renton, B. L. Winchell, Jr., and G. A. Graber. Spaces 60, 61 and 62.

Keuffel & Esser Company of New York, Chicago, Ill.—Drawing materials, measuring tapes, surveying instruments, etc. Represented by Rudolf Link, James J. Carlisle, H. B. Huster, Edw. C. Harris, J. C. Hess and Carl W. Strassburger. Space.

Keystone Driller Company, Beaver Falls, Pa.—Downie deep well pumps and well drilling machinery. Represented by E. O. Eyer and G. R. Conyne. Space 13.

Keystone Grinder & Manufacturing Company, Pittsburgh, Pa.—Portable automatic tool-grinding machines. Represented by Wm. L. Munk, G. H. Hommel and S. S. Newman. Space 291, Armory.

Lackawanna Steel Company, Buffalo, N. Y.—Rails, structural material, cabinets of rolled sections, illuminated views of mills, shops, mines, etc, rail joint splices, hook shoulder tie plates, rail joint plates and Lackawanna steel sheet piling. Represented by C. R. Robinson, E. Armstrong, A. P. Van Schaick, C. H. Hobbs, J. L. Hench, F. E. Abbott and A. H. Weston. Spaces 277, 278 and 279 Armory.

Lehon Company, The, Chicago, Ill.—Waterproof canvas, roofing, insulating papers, sill covers, saturated burlap Represented by Tom Lehon and D. B. Wright. Space 144.

Lidgerwood Manufacturing Company, Chicago, Ill.—Hoisting engines and boilers. Represented by F. B. Knight, G. N. Crawford, W. G. Wilmont, E. C. Reeder and W. R. Elden. Space 206.

Lorain Steel Company, Johnstown, Pa.—Track material, frog crossings, switches of both rolled and cast manganese, switch stands, rail braces and guard rail clamps. Represented by A. S. Littlefield, S. P. McGough, H. H. McDonald, Arthur S. Littlefield, Charles G. Donnell, Carroll Burton, George W. Reese, Wm. Lynam, J. E. Decker, W. W. Kingston and A. L. Verner. Spaces 263, 264, 265 and 266 Armory.

Luitwieler Pumping Engine Company, Rochester, N. Y.—Non-pulsating deep well pump, triplex pump.—Represented by R. J. Bauereisen. Space 181.

Lufkin Rule Company, Saginaw, Mich.—Measuring tapes and rules of every description. Represented by S. B. McGee and F. G. Brown. Space 121.

M. W. Supply Company, Philadelphia, Pa.—Vaughan rail anchors. Represented by David L. Vaughan. Space 163.

McGraw Publishing Company, New York, N. Y.—Copies of the Electric Railway Journal, Engineering Record, Electrical World, Metallurgical and Chemical Engineer, Electric Railway and Lighting Directories, and other special publications. Represented by Hugh M. Wilson, L. E. Gould, E. J. Hunt, Sam Hobson, S. T. Henry, W. E. Kelly, E. M. Haas, W. W. DeBerard, F. Nicholas, E. J. Mehren, C. W. Stark, H. L. Fischacher, E. B. Cooke, Henry Barnes and Lyon Gardiner. Space 29.

Burton W. Mudge & Company, Chicago, Ill.—Motor cars for inspection, section and spike driving service; right of way gates. Represented by Burton W. Mudge, Thomas H. Garland, Robert D. Sinclair, A. R. Dyer, Robert M. Smith, Blake C. Howard, George W. Bender, Ira W. Winchell, S. S. Lawson, Clive Hastings, H. L. Goodwin, Lathrop Resseguie, Fred S. Wilcoxea, Royal D. Hawley and A. P. Grenier. Spaces 52, 53, 71 and 72.

C. F. Massey Company, Chicago, Ill.—Reinforced concrete railway supplies such as culvert pipe, battery wells, signal posts, telephone booths, etc. Represented by C. F. Massey, A. Christ, Jr., O. J. West, Chas. Gilman, R. A. Peterson, E. M. Hathaway, T. W. Scott and H. W. Wilder.

Morden Frog & Crossing Works, Chicago, Ill.—Solid and built-up manganese frogs, manganese crossing, manganese switch points, Unity, Security and G. L. M. switch stands, guard rails, guard rail clamps, compromise joints, rail braces, etc. Represented by Irving T. Hartz, Arthur C. Smith, Harry M. Macke, William J. Morden, W. Homer Hartz and B. T. Gibbs. Spaces 238, 239 and 240 Armory.

National Carbon Company, Cleveland, O.—Columbia track batteries types 71 and 73, Columbia dry batteries, Columbia multiple batteries, Columbia blue label flashlight batteries and flash lights. Represented by M. H. Moffett, Chas. S. Pflasterer, W. O'Connor and L. W. Fisher. Space 152.

National Concrete Machinery Company, Madison, Wis.—National Concrete fence posts. Represented by Victor E. Rogers and W. L. Casady. Space 221.

National Corrugated Culvert Company, Middletown, O.—Corrugated culverts and flumes. Represented by G. F. Ahlbrandt and Paul T. Defrees. Spaces 99 and 100.

National Electric Specialty Company, Toledo, O.—"Vac-M" (Vacuum) lightning arresters, Signal types No. 1 and No. 2 for automatic block signal work and police and fire alarm telegraph. Giant type for telephone and train dispatching; high tension transmission telephone lines, and toll lines. Telephone exchange type for ordinary subscribers' stations and local lines. Also Paragon ground cones. Represented by F. S. Chapman, V. A. Chapman, J. T. Greene, C. F. Wall and P. H. Chapman. Space 164.

National Indicator Company, Long Island City, N. Y.—Train indicators, station indicators, train departure bulletins, gate signs. Represented by J. Hutchinson and T. M. Wilders. Space 21.

National Lock Washer Company, Newark, N. J.—Nutlocks and testing appliances. Represented by John B. Seymour, Alvin T. Thompson, Chas. P. Williams and A. H. Handlan, Jr. Space 285 Armory.

National Malleable Castings Company, Cleveland, O.—Tie plates, rail braces, anti-rail creepers and bridge washers. Represented by C. L. Johnston, Chas. H. McCrea, J. J. Byers, H. J. Hiatt, L. W. De Witt and T. W. Ashton. Space 105.

George P. Nichols & Bro., Chicago, Ill.—Electrical turntable tractor. Represented by George P. Nichols, Samuel F. Nichols, R. M. Gustonand and Henry Fries. Space 173.

Northey-Simmen Signal Company, L't'd, Indianapolis, Ind.—Apparatus for automatically drawing a graphic train chart in dispatcher's office; cab signal apparatus. Represented by F. Erichsen Brown, P. J. Simmen, C. E. Chatfield and Ed Moore. Spaces 228, 229, Armory.

Ogle Construction Company, Chicago, Ill.—Model coaling station and hoisting machine. Represented by R. A. Ogle, C. F. Bledsoe, E. G. Wendel and Otto Albertz. Space 15.

Ohio Post Mold Company, Toledo, O.—Molds for cement fence posts. Represented by Asa M. Smith and E. S. Smith. Space 202.

Okonite Company, The, New York City, N. Y.—Okonite wires and cables of all kinds, Okonite and Manson tapes, Candee pot heads. Represented by Lewis G. Martin, J. D. Underhill, W. G. Hovey, J. M. Lorenz, R. H. Baker and H. Cox. Space 16.

O'Malley-Beare Valve Company, Chicago, Ill.—Multiplate valves. Represented by Edward O'Malley, Thomas O'Malley and H. A. Crews. Space 18.

Spencer Otis Company, Chicago, Ill.—Economy steel tie plates, Kron automatic springless scales. Represented by H. H. Hart, W. I. De Remer, T. W. Blatchford, Hunter Micheals and Oiever Oleson. Spaces 122, 141, 142, 143.

Otto Gas Engine Works, Chicago, Ill.—Otto kerosene engine. Represented by W. Y. Shaw and D. S. Faulkner. Space 186.

The P. & M. Company, Chicago, Ill.—The P. & M. rail anticreeper, bond wire protector, Crane guard rail retainer and the Smith tie renewer. Represented by Philip W. Moore, L. W. Kent, Alvar R. Sutter, Geo. E. Johnson, David T. Hallberg, John Ritchie, R. Harris, J. Edgar Johnson, Royal D. Hawley, Robert J. Mercur and Fred. A. Preston. Spaces 123 and 124.

W. W. Patterson Company, Pittsburgh, Pa.—High grade, hand made tackle blocks. Represented by W. W. Patterson, Jr. Space 147.

C. F. Pease Company, Chicago, Ill.—Automatic blue printing and direct blue line printing machines, paper coating machines, motor driven trimming tables, etc. Represented by C. F. Pease, P. M. Morgan, T. K. Murney, E. R. Thompson and L. M. Campbell. Spaces 157 and 158.

Pennsylvania Steel Company, Philadelphia, Pa.—No. 30 Manard anvil face frog dies, 160 32'; No. 20 Manard anvil face frog; No. 18 Manard anvil face frog; No. 16 Manard anvil face frog; No. 10 solid Manard frog; No. 10 spring rail frog with rolled Manard stiff rail; 30-ft switch complete having rolling Manard switch points; No. 10 Manard spring rail frog main line switch stands, low Steelton positive switch stand; low New Century switch stand with detector attachment; Intermediate New Century switch stand with semaphore attachment; Intermediate New Century switch stand; drop tests of joints, using iron, steel and Mayari steel bolts; drop tests of open hearth rails. Represented by G. S. Vickery, G. W. Parsons, C. A. Alden, C. A. Langdon, W. H. Allen, F. H. Ogden, W. H. Philler, W. M. Henderson, John C. Jay, Jr., C. S. Clark, R. E. Belknap, R. W. Gillespie, R. W. Reed, N. E. Salsich, J. G. Miller and R. C. Hoffman, Jr. Spaces 241, 242, 243, 244, 253, 254, 255 and 256 Armory.

Pocket List of Railroad Officials, New York, N. Y.—Pocket List of Railroad Officials. Represented by J. Alexander Brown, Chas. L. Dinsmore and Harold A. Brown. Space 26.

Positive Rail Anchor Company, Louisville, Ky., and Marion, Ind.—Rail anchors. Represented by W. M. Mitchell, John C. Haswell and R. H. Johnson. Space 177.

Potter Winslow Company, Chicago, Ill.—Railway supplies in concrete. Represented by G. H. Macdonaugh and A. C. Hudelburg. Spaces 175 and 176.

Protective Signal Manufacturing Company, The, Denver, Colo.—A railroad highway crossing signal, annunciator for tower service; telephone selector. Represented by W. C. Neahr and D. B. Turner. Space 203.

Q. & C. Company, The, New York, N. Y.—Bonzano rail joints, Vaughan rail anchors, Bonzano rolled steel compromise joints, guard rail clamps, insulated rail joints, Samson rail benders. Represented by C. F. Quincy, F. F. Kister, T. B. Bowman, J. A. Wescott, E. M. Smith, H. A. Hawes, C. D. Walworth, J. A. Bodkin, A. R. Horn, W. A. Duckworth, J. J. Quinn and A. E. Stokes. Spaces 120 and 139.

Rail Joint Company, The, New York, N. Y.—Continuous Weber and Wolhaupter rail joints. Represented by L. F. Braine, Percy Holbrook, Benj. Wolhaupter, W. E. Clark, U. C. Armstrong, Fred L. Poor, H. C. Holloway, Geo. C. Isbester, Sumner Collins, E. L. Van Dressar, E. A. Condit, Jr., W. A. Chapman, J. G. Miller, R. W. Smith, W. S. Boyce, C. B. Griffin, Frank M. Hill and Chas. Jenkinson. Spaces 81 and 82.

Railroad Supply Company, Chicago, Ill.—Tie plates, derailers, high crossing alarms, electric signals and signal supplies. Represented by M. J. Comerford, R. D. Hawley, P. F. Hawley, F. C. Webb, H. M. Buck, Geo. M. Kenyon, A. H. Smith, E. H. Bell and E. W. Vogel. Spaces 85 and 104.

Railway and Engineering Review, Chicago, Ill.—The Railway and Engineering Review, a weekly magazine devoted to railway and engineering subjects. Represented by Willard A. Smith, Harold A. Smith, R. S. Richardson, C. L. Bates, A. E. Cherrifield. W. M. Camp and Robert R. Greig. Space 64.

Railway List Company, Chicago, Ill.—Railway publications. Represented by W. E. Magraw, C. S. Myers, L. F. Wilson, K. L. Van Auken, J. M. Crowe, Dalton Risley and W. R. Toppan. Space 9.

Railway & Traction Supply Company, Chicago, Ill.—Hercules steel bumping posts, Wyoming track sander, Wyoming vestibule curtain release. Represented by W. S. Barbee and E. C. Holmes. Space 274, Armory.

Ramapo Iron Works, Hillburn, N. Y.—Switch stands, switches, frogs, guard rail clamps, special switch slide plates, etc. Represented by J. Edgar Davidson, Wellington B. Lee, Arthur Gemunder, James B. Strong and W. C. Kidd. Spaces 280, 281 and 282 Armory.

Reliance Manufacturing Company, Massillon, O.—Nut locks. Represented by Howard J. McGinn, A. W. Carpenter and Frank C. McLain. Space 180.

The Remington Oil Engine Co., New York City, N. Y.—Ten-horsepower kerosene oil engine and duplicate parts. Represented by Frank W. Chaffee and A. L. Abbott. Space 172.

Rhineland Machine Works Company, New York, N. Y.—Ball bearings. Represented by D. D. Davis and Elmer Hendrickson. Space 227 Armory.

Richards-Wilcox Mfg. Company, Aurora, Ill.—Railroad door hangers, parallel door hardware, Underwriters' fire door hardware and grindstones. Represented by E. J. G. Phillips, W. D. Jameson, A. J. Eggleston. Spaces 187 and 188.

Roadmasters' & Maintenance of Way Association, Sterling, Ill.—Booth for the reception of visiting roadmasters and supervisors. Represented by L. C. Ryan, W. A. Kannally, Harry Clark and A. M. Clough. Space 288 Armory.

Roberts & Schaefer Company, Chicago, Ill.—Photographs of Holmen reinforced concrete and frame constructed locomotive coaling stations. Represented by Clyde P. Ross, W. B. Ouard, E. E. Barrett and J. S. Shannon. Spaces 97 and 98.

Sanitary Bunk Company, Indianapolis, Ind.—A sanitary double deck steel spring bunk. Represented by L. H. Mummert. Space 174.

Sellers Manufacturing Company, Chicago, Ill.—Sellers anchor bottom wrought iron tie plates and Sellers wrought iron angle bars. Represented by J. M. Sellers, R. A. Van Houten and G. M. Hogan. Space 125.

Signal Accessories Company, New York, N. Y.—Signal material. Represented by F. C. Lavarack and C. H. Burt. Space 118.

Simmons-Boardman Publishing Company, New York, N. Y. and Chicago, Ill.—The Railway Age Gazette, Maintenance of Way Daily, The Signal Engineer and American Engineer. Represented by Edward A. Simmons, Samuel O. Dunn, Lucius B. Sherman, Henry Lee, Roy V. Wright, John N. Reynolds, Frank S. Dinsmore, H. H. Marsh, Arthur E. Hooven, E. T. Howson, R. E. Thayer, A. D. Cloud, H. H. Simmons, Harold F. Lane, F. H. Thompson, C. W. Garrison, Kenneth G. Cloud, Harold D. Horton, L. G. Dennison and T. E. Crossman. Spaces 44 and 63.

Snow Construction Company, T. W., Chicago, Ill.—Screw spike car, Snow oil crane, Snow bucket type coal chutes and Snow water crane, Johnson water tank lug, Dupree water tank lug, Hess artesian well cylinder, Crescent oil engine. Represented by T. W. Snow, R. E. Gurley, M. D. Miller and R. A. Blake. Spaces 45 and 46.

Southern Railway Supply Company, St. Louis, Mo.—Saunders corrugated car stopper. Represented by W. D. Achuff. Spaces 170 and 171.

Standard Asphalt & Rubber Company, Chicago, Ill.—"Sarco" No. 6 waterproofing and other "Sarco" asphalts for various purposes, including practical illustrations of methods of application, etc. Represented by Norman Malcolm, C. V. Eades, R. E. Kartrock, J. M. Woodruff, G. Schomburg, W. A. Hewey, H. J. Smith and T. P. Stypzynski. Space 1.

Standard Underground Cable Company, Pittsburgh, Pa.—Railway signal wire in all forms. All copper and Colonial copper clad, both bare and insulated; underground cable and cable terminals. Represented by J. R. Wiley, H. P. Kimball, A. A. Anderson, W. M. Rogers, Russell E. Green, J. L. Lyon and Elbert F. Norton. Space 137.

Stark Rolling Mill Company, The, Canton, O.—Flat sheets, roofing, culverts and drains made of anti-corrosive Toncan metal. Represented by A. T. Enlow, J. T. Hay and D. B. Coey. Space 14.

Steel Railway Tie and Appliance Company, Denver, Colo.—Shane steel railway tie and safety fastener. Represented by George H. Shane, Robert E. Foresman, George F. Kiser, A. H. Williams and Bert F. Kiser. Space 196.

Templeton, Kenly & Company, Ltd., Chicago, Ill.—Simplex car and track jacks. Represented by Alfred E. Barron, Arthur C. Lewis, Charles A. Crane, Jr., Lionel B. Morton, Harry M. Hood and Walter B. Templeton. Spaces 31, 32, 33 and 34.

Titanium Alloy Manufacturing Company, Niagara Falls, N. Y.—Samples of Titanium products. Represented by H. H. Cook, Charles Vickers and J. M. Sherrerd. Spaces 283 and 284 Armory.

Toledo Pipe Threading Machine Company, Toledo, O.—Pipe threading and cutting tools. Represented by W. W. Vosper, S. S. Thornberry and R. H. Irwin. Space 178.

Union Draft Gear Company, Chicago, Ill.—Draft gear. Represented by J. R. Cardwell, L. I. Canfield, J. W. Hathaway, W. G. Krauser and J. E. Tarelton. Space 109.

Union Iron Works, Hoboken, N. J.—Pile hammers and derrick excavators. Represented by M. S halscha and W. G. Schalscha. Space 200.

Union Switch & Signal Company, Pittsburgh, Pa.—Mechanical, electro-mechanical, electric and electro-pneumatic interlockings, automatic block signals (A. C. and D. C.), Keystone insulated joints and other signal accessories. Represented by S. G. Johnson, G. A. Blackmore, W. H. Cadwallader, J. S. Hobson, L. F. Howard, J. P. Coleman, H. W. Griffin, H. A. Wallace, T. H. Patenall, J. W. White, J. J. Cozzens, W. W. Talbert, Aaron Dean, M. D. Hanlon, W. E. Corey, H. McCready, A. C. Livermore, E. R. Coe, W. P. Newbert. Spaces 40, 41, 42 and 43.

Universal Metallic Tie Company, Salt Lake City, Utah.—Metal railroad crossties. Represented by Burton S. Rupp. Space 197.

Verona Tool Works, Pittsburgh, Pa.—Track tools and nut locks. Represented by W. H. Remmel, Henry Fischer, E. Woodings, Rex Gray and James C. Barr. Space 129.

Western Electric Company, Chicago, Ill.—Railroad telephone, selectors, arc lamps. Represented by E. W. Hamlin, J. O. Kich and G. H. Porter. Space 17.

Wm. Wharton, Jr., & Company, Inc., Philadelphia, Pa.—Manganese steel frogs and crossings, split switches, switch stands, guard rail clamps, enlarged photographs, models, etc. Represented by Victor Angerer, L. R. Ashhurst, Jr., A. E. Borie, George R. Lyman, R. C. McCloy, H. F. McDermott, W. McLain, J. C. Robinson, W. S. Stothoff and L. W. Jones. Spaces 247, 248, 249 and 250 Armory.

White Enamel Refrigerator Company, St. Paul, Minn.—Full sized section of refrigerator car showing Bohn patented all steel collapsible bulkheads, hatch ventilators and plugs. Represented by A. D. Thomsen. Space 208.

Winans Improved Patented Rail Joint Company, Portland, Ore.—Rail joints. Represented by A. Winans. Space 8.

U. S. Wind Engine & Pump Co., Batavia, Ill.—Water col-

umns, water tanks, steel frames for water tanks, switch stands, semaphores, pumps and pumping machinery. Represented by L. E. Wolcott, C. E. Ward and J. P. Prindle. Space 111.

Wolfe Brush Company, Pittsburgh, Pa.—Railroad paint brushes, railroad brooms and railroad cleaning brushes. Represented by C. N. Struble, W. T. Hogan and W. G. Lange. Space 10.

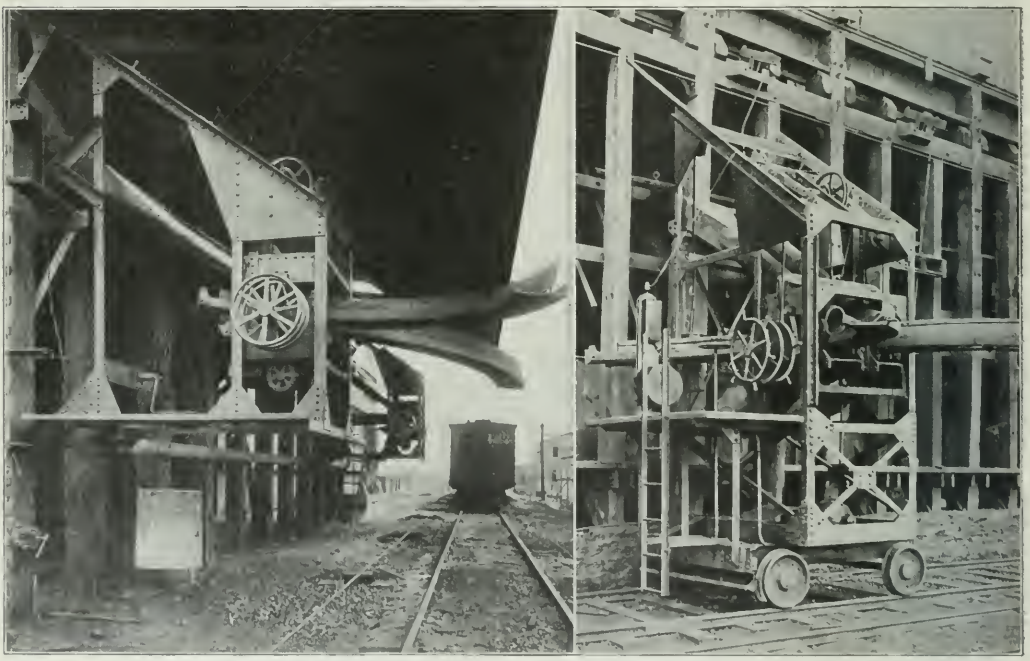
Worth Wire Works, Kokomo, Ind.—Cinch fence stays for right-of-way fences. Represented by O. H. Buck, Timothy Harrison, Forest Craig, H. D. Buck and H. L. Green. Space 210.

Wyoming Shovel Works, Wyoming, Pa.—Track shovels and locomotive scoops. Represented by G. E. Geer. Space 160.

A NEW BOX CAR LOADER.

A new machine for loading anthracite coal into box cars has been developed by Fairbanks-Morse & Co., Chicago, which has been very extensively tried out experimentally, and is now in service at three points. The machine could probably also be adapted to the loading of bituminous coal, coke or similar substances, although as yet no installations for these purposes have been made. The supporting carriage is designed to travel either on its own rails or to be suspended from the structure of the bin it serves. The carriage is of steel with an operating platform suspended on one side at a height which allows the operating levers to be readily handled. The essential feature of the loader is the use of two horizontally curved spouts which receive the coal from two discharge pipes leading from the lip screens of the loading pocket and discharge it in the car, the point of discharge being governed by the distance which the spouts are pushed into the car. These chutes are bronze-lined to reduce the friction, and it has been found that the coal acquires a sufficient velocity in the down spouts to carry it to the ends of the horizontal chutes.

The chutes are supported on a carriage which is capable of vertical movement within the supporting carriage, allowing the chutes to be regulated for the various heights of box cars in use. After this height is adjusted to suit the door of the car, the spouts are extended into the door until their ends are about 25 ft. apart, and as the loading proceeds the spouts are withdrawn, keeping their ends just clear of the pile. The loader may be operated entirely by hand or entirely by electric motor, or by a combination of hand and electric power. The machine shown in the accompanying photograph is propelled from one discharge chute to another by an electric motor and the movement of the chutes is accomplished by hand through the operation of three wheels, shown in the foreground. One of these wheels raises and lowers the chutes to suit the height of the car doors, the second controls the movement of the spouts in and out of the car, and the third tilts the spouts to control the velocity with which the material leaves their ends. All moving parts are carefully counterbalanced so that very little power is required to adjust them, one man being able to handle the whole machine readily. So far as is known, the capacity of the machine is limited only by the capacity of the lip screens which deliver the material from the storage pockets. The ordinary loading rate with this loader is six to eight minutes for a 40-ton car.



New Box Car Loader with Two Types of Carriage.

EXCURSIONS FOR FRIDAY.

While Friday is reserved by the Association for visiting the Exhibition at the Coliseum and Armory, it is probable that some members will find ample time to see the exhibits before Friday and would like to see some points of local interest about the city on that day. If such members will communicate their desire to the arrangements committee, of which F. R. Coates is chairman, parties can be arranged.

Railway Age Gazette

DAILY EDITION

Vol. 54. CHICAGO—MARCH 19, 1913—NEW YORK No. 11b.

PUBLISHED DAILY BY

Simmons-Boardman Publishing Co., Transportation Bldg., Chicago, Ill., on the occasion of the annual convention of the American Railway Engineering Association.

NEW YORK: 83 Fulton Street CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.
