Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada.....6.00
Foreign Countries (excepting daily editions).....8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

VOLUME 54. JANUARY 3, 1913. NUMBER 1.

CONTENTS

THE Interstate Commerce Commission has approved the California three-dollar demurrage rate for freight cars carrying interstate shipments, as noted in another column of this issue, and this is good news; but the approval appears to have been given with some reluctance. The railways have, indeed, "abundantly sustained" their claim that the high demurrage rate now imposed on intrastate freight is a benefit to the public, and it would have been impossible to maintain any rational argument for the continuance of the one-dollar rate; but Commissioner Lane slightly qualifies his approval of the decision, and Chairman Prouty dissents from it. Mr. Lane attributes the good conditions in California not to the rate but to Mr. Mote's efficient management of the demurrage bureau. What kind of instrument or weapon Mr. Mote could have used if he had not had available the money penalty is not clear, at this distance; but no one will quarrel with Mr. Lane on that point. Mr. Prouty objects to disturbing the uniform rate ($1) even on "the extreme edge" of the territory. His main argument is that, though exceptions are to be recognized, one dollar a day is, on the whole, sufficient. But there is one big exception that he overlooks; periods of widespread congestion, such as now prevails. In dull times a dollar a day is sufficient; and where track room is plenty and switching complexities are not burdensome even a smaller sum might be fair, were it not for the dilatory habits which such practice would encourage. But when cars are in urgent demand everywhere a charge of three dollars a day for a freight car is not too high; it is in many cases too low. The Canadian Railway Commission has done a good thing in giving emphasis to the feasibility of making demurrage rates higher at one season than at another.

A CORRESPONDENT, whose letter is published in another column, takes issue with our statement made in commenting on The New Haven Monopoly that "in the West . . . the movement for regulation of railways was born," and points to the fact that the Massachusetts railroad commission was created in 1869. That is true. And there was a railroad commission in Maine in 1857, and very early in one or two other states; but nevertheless the first active agitation for the regulation of railroads was the granger movement in the West in 1875-9. Our correspondent finds fault with the Massachusetts commission for not having more effectively "regulated" railroads. There is no gainsaying the fact that the Massachusetts commission has been a conservative commission, ever since it has been given the power to *order* a reduction in rates; but we can hardly agree with our correspondent that it has not been an effective and generally an efficient regulative body. The ideal aimed at in appointments to this state commission has been to have one "business man," one railroad man and one lawyer or economist; and it has had on it many strong men whose probity and judgment could be trusted. The system of radical versus mild regulation is too complicated a question to go into here, but the principles of representative government rest on the election of public spirited governors who will appoint, as they have done in Massachusetts, public spirited men to carry out their policies. When the Hadley Securities Commission was making its exhaustive study of the past experiences of railroad regulation in this country, the acts and methods of the Massachusetts commission were cited by men of widely varying opinion, but with almost unvarying respect. Of course, this inquiry was primarily on the question of the regulation of the issue of securities by railroad companies, and Massachusetts is one of the few states that has carried out for a number of years a consistent policy of regulation. The point that Mr. Carter makes in regard to the ineffectiveness of radical laws if unenforced by public opinion is a good one, but the implication that he makes that the Massachusetts railroad commission has failed in its duty, because it has not found it necessary to exercise all of the powers given it by law, we should hesitate to agree with.

THE problem of fuel economy has been given close attention on European railways, and especially in Germany, as indicated by the article by H. W. Jacobs in this issue. Two things are largely responsible for this—the high price of fuel and the relatively low cost of labor as compared to conditions in America. The question of fuel economy is being given more and more attention in this country, and several roads now have departments whose entire energies are given over to the promotion of the more efficient use of fuel. Splendid results have been obtained by closer inspection of the coal at the mines, by studying and re-arranging its distribution, by improving coaling facilities, by using more care in designing locomotives and equipping them, and by educating the enginemen to the proper use of the fuel. It is interesting to note, however, that some of the

most important improvements in fuel economy have resulted not so much from the desire to save or conserve the fuel as to accomplish other objects. For instance, superheaters were first introduced on switching locomotives not so much to save fuel as to reduce the smoke nuisance. Superheaters, brick arches and other devices are being introduced rapidly and extensively on both passenger and freight power, not so much because of the fuel saving which results from their use as from the fact that the resulting improvement in the steaming capacity of the boiler makes it possible to get the trains over the road on time, or to haul heavier trains in the same time. Steaming capacity of a locomotive boiler has been likened to the lung capacity of an athlete, and the greater steaming capacity made available by the above means makes possible higher sustained speeds, or greater hauling capacity. The human factor is a most important item in the efficient firing of a locomotive, and the great problem has been to educate the enginemen to the proper use of the fuel. One thing that has helped to secure the co-operation of the enginemen has been not so much the interest or desire to save money for the company as the fact that the more intelligent use of fuel has greatly reduced the physical exertion required of the fireman. It might be well to emphasize this feature even more than it has been, in order to encourage and stimulate the fireman to still greater effort—and that of a mental rather than a physical nature.

EVER since James J. Hill called attention about five years ago to the necessity for large expenditures for increased railway facilities, and especially for terminals, this subject has been given much attention by the public generally, and by railway men in particular. Mr. Hill's recent address before the Railway Business Association on the same subject serves to again call attention to this condition and to emphasize its importance. In this connection it is worth while to consider the possibility of increasing the capacity of existing terminals by making careful studies of the methods of operation and observing the influence of the types of engines, number of riders and methods of returning them in hump yards, location of scales, lengths of track, etc. When designing a new terminal much time is devoted to a study of operating conditions and to the development of plans to meet those conditions. With the completion of the yard these studies usually stop until extensive improvements and additions are again necessary. That marked improvements can frequently be made in the operation of existing facilities will be evident from the following instances. While studying the economies of a proposed cutoff a few years ago, one eastern road found that the old line was not being operated to the best advantage, and important readjustments of pusher limits and tonnage ratings were made which affected very material economies without any expenditure. In another instance the operating department complained about the poor results that were being secured from the operation of a recently completed hump yard, and the men in charge of its design were called upon to investigate. After a careful study it was found that the principal difficulty arose from the use of light engines which did not have sufficient power to handle entire trains. The use of old engines for yard work, which are too light and in too poor condition for road service, is common and seriously decreases the efficiency of yard operation, especially during busy seasons when slight delays may cause serious congestion. While instances such as the above are by no means common, they are to be found often enough to warrant a study of old yards at intervals to see if the best results are being obtained. It is [illegible] to enlarge a terminal as soon as it becomes congested, for usually the demands for improvements elsewhere on the system are such that it must continue to be operated under unfavorable conditions for some time. It is not unusual for a careful study of the operating conditions similar to that made when designing a new yard to reveal opportunities for important improvements and increased capacity with a slight rearrangement of the yard. It also frequently happens that the traffic conditions for which the yard was designed have gradually changed since its construction, increasing the expense of operation, in which case such a study may show that a more or less extensive rearrangement is justified to suit the new conditions.

THE NEED FOR A HIGHER DEMURRAGE RATE.

THE recent action of the Canadian railway commission authorizing the Canadian Pacific, Grand Trunk, Canadian Northern and Michigan Central railways to increase their demurrage rates, contains an important suggestion for railway men and railway regulating authorities in this country as to a means of obtaining relief from shortage of the freight car supply. The order of the Canadian commission permits an advance from $1 per car per day to $2 for the first 24 hours after the expiration of free time and $3 for each succeeding day, effective from December 15, 1912, to March 31, 1913. The Canadian railways had asked for a rate of $2, $3 and $4 for the first, second and third days, respectively, but the $4 rate was not approved by the board.

At the last meeting of the American Association of Demurrage Officers a resolution was unanimously adopted in favor of an increased demurrage rate throughout the United States, and the railways of Michigan have recently submitted to the state railway commission the question of increasing the demurrage rate on interstate traffic. In view of the success that has attended the well known experience with a high demurrage rate in California, the subject seems likely to be brought into greater prominence before next season of heavy traffic. The movement also should be greatly helped by the Interstate Commerce Commission's approval of the California rate, which has just been issued. Beginning January 6, the California roads are free to carry out their plan, proposed early in the year, for an increase in the interstate demurrage rate from $1 to a parity with the state rate, which has been $3 since May 1, 1911, and was $6 from June 19, 1909 to May 1, 1911.

While the purpose of the Canadian commission's order is the same as that of the higher rate in California, viz.: to increase the car movement by eliminating unnecessary detention of cars by shippers and consignees, the fact that it is not to be applicable during the entire year and that it involves the idea of a sliding scale, increasing with the period of detention, would seem to be calculated to make it more acceptable to shippers.

Undoubtedly any effort to increase demurrage rates generally would encounter the opposition of shippers, particularly of those who pay the most demurrage, and who, of course, are those who have not provided themselves with sufficient loading and unloading facilities for handling their business promptly. These constitute the class which a higher demurrage rate is intended to reach and whose opposition is least entitled to consideration, while the general body of shippers can have no reason for protesting against an advance on the grounds that it will increase the revenues of the carriers, because a higher demurrage rate is intended to reduce the amount of demurrage payments by making the rate prohibitive.

Freight car shortages may be due to lack of enough cars to handle promptly the maximum traffic of the country or to failure to obtain the most efficient use of the available supply of equipment. One of the greatest causes of freight car inefficiency is the economic waste of using expensive cars and track room for warehouse purposes. To require the railways to own enough cars in addition to the average requirements of business to enable them to handle promptly the "peak load" of the traffic in addition to allowing many cars to be used as warehouses would involve an economic waste that somebody must make good; and that somebody, in the long run, is the shipping and consuming public. A large surplus of cars throughout the greater part of the year is expensive to own and to maintain, besides increasing the cost of operating the cars in service by clogging side tracks and terminals.

The responsibility for the proper use of equipment must be divided between the carriers and the shippers and any means of increasing efficiency of car service will be of advantage to both.

Many shippers have made praiseworthy efforts to co-operate with the carriers in reducing the effect of the extraordinary pressure upon their facilities during the past few months. They can make the co-operation permanent by assuming a greater responsibility for cars while in their possession.

The demurrage rate has a dual function. It is to be regarded first as compensation to the carrier for the use of the car beyond the time contemplated in the freight rate, and, second, as a penalty to compel the prompt release of equipment in order that it may be available for further transportation service.

A freight car's chief value consists in its movability. To use it as a warehouse when it is required for transportation deprives it of its value, for which a rate of $1 per day is not compensatory during a time of heavy business, for the highest rate ever proposed is less than the earning capacity of a car at such a time. Moreover, the present demurrage rate was adopted at a time when the average capacity of cars was from 10 to 20 tons, while the capacity of cars today ranges from 30 to 50 tons and averages probably 37 tons. The increase in the capacity of equipment has been accompanied by an increase in its cost, so that a car which is detained by a consignor or consignee today represents a materially greater investment to the carrier than the equipment employed 25 years ago, while it also possesses a correspondingly greater earning capacity.

A demurrage charge falls short of its purpose if it fails either to yield the carrier proper compensation for the service which it covers or to accomplish the prompt release of cars and reform of methods. The insufficiency of the present rate in the latter respect has been thoroughly demonstrated. Just so long as it is cheaper for the shippers to pay demurrage than to provide themselves with proper facilities, cars will be kept out of service needlessly in addition to the natural and unnatural delays incident to operation for which the carriers are automatically penalized by a decrease of their earning capacity.

That a high demurrage rate is an effective remedy for car detention has been abundantly proved by the experience in California. E. E. Mote, manager of the Pacific Car Demurrage Bureau, has compiled tables showing comparative results for the period of 32 months from November 1, 1906, to June 30, 1909, when the rate on all traffic was $1, for the period of 22 months from June 30, 1909, to April 30, 1901, when the rate on state traffic was $6 and on interstate traffic $1; and for the period of ten months from May 1, 1911, to February 29, 1912, when the rate on state traffic was $3 and on interstate traffic $1. The number of cars held overtime at all California stations during the first period was 184,172, while the number held overtime during the corresponding time of the second and third periods together, when the higher rates prevailed, was 113,343, a decrease of 38½ per cent., and the number of cars handled during the second and third periods had increased 1,114,192 or 46½ per cent. The percentage of detention during the first period was 7.82 per cent.; during the second period the detention of cars on which the demurrage was $6 was 1.06 per cent.; during the third period the detention of cars on which the demurrage was $3 was 1.48 per cent., and during the second and third periods together the average detention amounted to 1.21 per cent. During the second period the detention of interstate cars subject to the $1 rate was 5.68 per cent., during the third period 5.32 per cent., and for the second and third periods together 5.56 per cent.

The net collections of demurrage during the first period throughout California amounted to $566,298, while during the second and third periods together the net collections amounted to $344,146, a decrease of $222,152 or over 39 per cent. During the first period the detention in excess of free time averaged 3.32 days per car, or 611,345 car days; during the second and third periods together the average detention of all classes of cars was 2.40 days or 170,164 car days, a decrease of .92 days per car and of 441,181 car days or 72.16 per cent.

These figures demonstrate beyond all question that the increased demurrage rate has been in no respect a burden upon the shipping and receiving public, but has been a very positive advantage to the railways and the shipping public as a whole. The Interstate Commerce Commission has said in the case of New York Hay Exchange Association vs. Pennsylvania Railroad Company, 14 I. C. C., 178: "The railway serves the entire public as a common carrier. In order to do this acceptably it must have the use of its equipment. The whole shipping public is interested in the prompt release of freight cars. It frequently happens that great inconvenience results from the insufficient supply of car equipment, so that it is for the interest of the entire public that cars should be promptly discharged." Cars are intended for moving freight, and the demurrage charge should, therefore, be high enough to force their release.

BLOCK SIGNALING FROM DIFFERENT POINTS OF VIEW.

THE signal engineer who wrote in our issue of December 13, page 1131, has aroused some pretty vigorous discussion. We cannot give space to all of the letters received, but the one printed last week and the others in this issue are fair samples. It seems desirable to summarize a few of the statements and arguments.

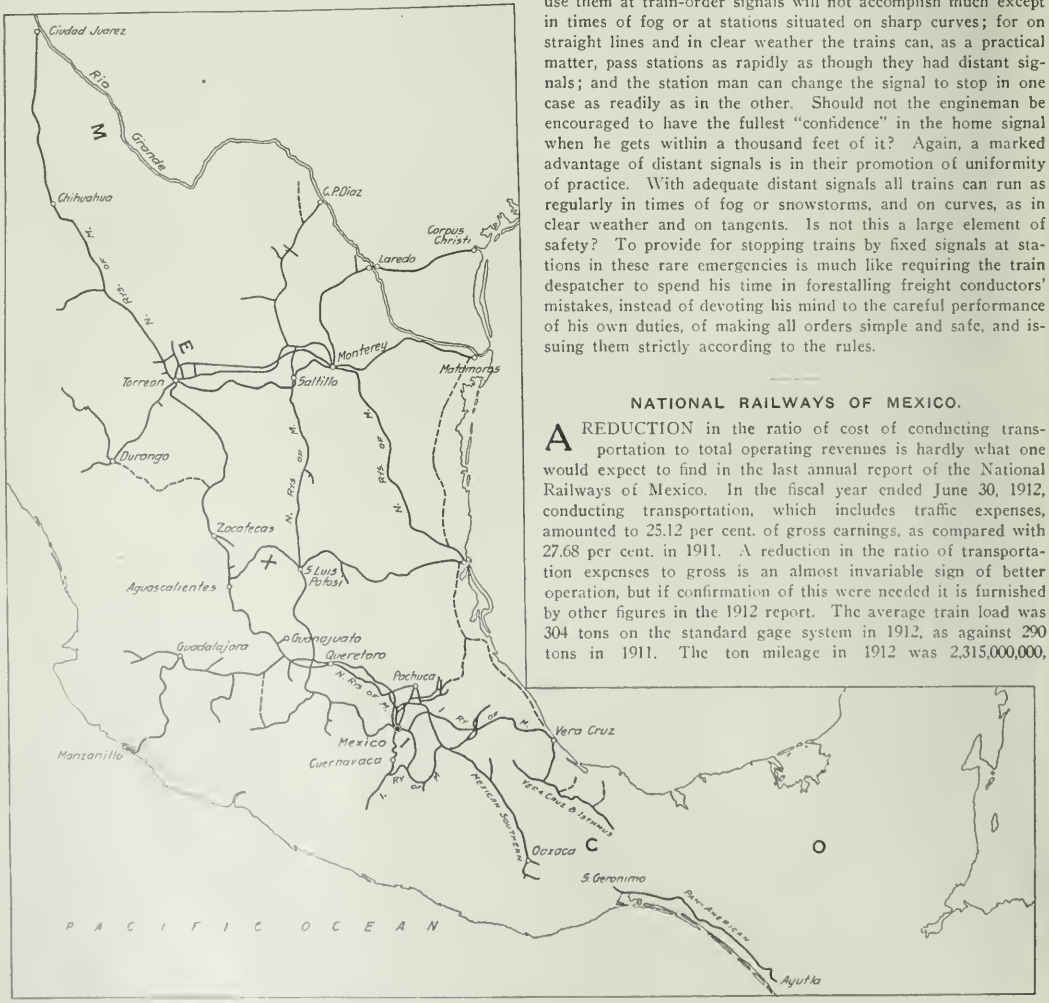
Taking matters chronologically, the first issue is, manual versus automatic signals. It is claimed, in substance, that the manual system is the safer. Can this be proved? With both systems there have been false clear signals, and a truly accurate, instructive and useful comparison is hard to make. But it is fair to assume that for the highest safety, either system needs something more than it now possesses. It is to be remembered that the public demands perfection, for a single bad collision in the United States, once in ten years, which would be such an infinitesimally small percentage of failures that the figures would be meaningless, would alarm the whole traveling community. And this demand of the public is not so unreasonable, after all; for the enterprising railroad president who is fully alive to this phase of his duty also aims at perfection; he calls on his subordinates to strive for perfection.

The problem, stripped of secondary matters is, simply, the prevention of collisions on the main line. Perfection of apparatus is an element of the question which we must not take up in this place for lack of time; and moreover, everybody aims to find a scheme of operation which will provide for safety in spite of failures of apparatus. The first point is obedience to signal indications. Our methods of discipline of enginemen, designed to enforce this obedience, are not perfect. Wise and competent managers will go on improving these methods. But the significant fact of the situation is that in England where, it is generally admitted, the percentage of obedience on the part of enginemen is very high, probably higher than in this country, the most advanced railway officers are looking to the automatic stop. They are not yet using it; we do not say that they will use it; but they recognize that moral or mental discipline alone is not sufficient. They recognize that the perfect engineman cannot be either discovered or trained. The small percentage of best enginemen now in the service became best by some process that the superintendent cannot copy. And signalman as well as the engineman is called on to be perfect; and the English roads, with the best signalmen in the world, nevertheless are making increased use of the "lock and block" or controlled manual system. While we cannot here go into the details of the subject we think it will be agreed that, with the manual system, the efficiency both of the signalman and the engineman must be improved by something more than mental and moral instruction or training. The human brain is the greatest machine known; but we recognize its limitations.

On the subject of automatic stops, we have nothing to say at this time, except to call attention to the statement of Mr. Winsor, of the Boston Elevated, who, speaking from an experience of ten years, says that the stops do enforce obedience to the visual signals. The last lines of his letter ought to have been printed in italics. Can anyone gainsay that testimony? It seems to us that this evidence—which is not the only evidence of the kind—

forever banishes from our discussions the old claim that a stopping apparatus is sure to weaken the engineman's sense of responsibility, and thus increase danger. The every-day function of a stop being that of disciplinarian, the apparatus would be very highly efficient even if it failed as often, say, as automatic signals fail—once in from one million to six million movements. We must honestly admit that, if a stopping apparatus weakens discipline the real trouble is in a grossly negligent method of managing the stops. It is true that stops located out in the wilds of the mountains are not so easily managed as on lines in New York, Boston or London, either as regards maintenance of apparatus or discipline of men; but if we use that as an argument we must then admit that we are going to put up with a lower degree of safety on the thin lines in the mountains. Safety costs money, wherever we go.

The third point that we wish to notice is our correspondent's argument against distant signals. His position seems to be that the utmost possible provision should at all times be made for giving stop signals in emergencies. If a station agent is ever likely to want to stop a train to prevent a collision, all trains should be required to slacken speed at the station so as to give the agent every possible chance. This road is a deceptive argument, resting on the assumption that emergencies should be dealt with after they arrive instead of being prevented. Ordinarily, we pursue that course only after every other resource has failed, or when there are other reasons to support our action. Steel passenger cars are in most cases probably better than wooden cars in a collision; but their use would hardly be justified on that ground alone; they are desirable for other reasons. They would be a detriment if they caused any relaxation of effort to prevent collisions. A railroad manager may be justified in getting along without distant signals if he is willing to slacken speeds, as is necessary to run at all times by the use of home signals alone; but if he does this, let the issue be plainly met. Distant signals are useful simply to facilitate fast running. A horse railroad, or one where trains run uniformly at six miles an hour, could get no profit out of them if they could be had for a cent apiece. Moreover, that committee which decided not to use them at train-order signals will not accomplish much except in times of fog or at stations situated on sharp curves; for on straight lines and in clear weather the trains can, as a practical matter, pass stations as rapidly as though they had distant signals; and the station man can change the signal to stop in one case as readily as in the other. Should not the engineman be encouraged to have the fullest "confidence" in the home signal when he gets within a thousand feet of it? Again, a marked advantage of distant signals is in their promotion of uniformity of practice. With adequate distant signals all trains can run as regularly in times of fog or snowstorms, and on curves, as in clear weather and on tangents. Is not this a large element of safety? To provide for stopping trains by fixed signals at stations in these rare emergencies is much like requiring the train despatcher to spend his time in forestalling freight conductors' mistakes, instead of devoting his mind to the careful performance of his own duties, of making all orders simple and safe, and issuing them strictly according to the rules.



National Railways of Mexico.

NATIONAL RAILWAYS OF MEXICO.

A REDUCTION in the ratio of cost of conducting transportation to total operating revenues is hardly what one would expect to find in the last annual report of the National Railways of Mexico. In the fiscal year ended June 30, 1912, conducting transportation, which includes traffic expenses, amounted to 25.12 per cent. of gross earnings, as compared with 27.68 per cent. in 1911. A reduction in the ratio of transportation expenses to gross is an almost invariable sign of better operation, but if confirmation of this were needed it is furnished by other figures in the 1912 report. The average train load was 304 tons on the standard gage system in 1912, as against 290 tons in 1911. The ton mileage in 1912 was 2,315,000,000,

as against 2,438,000,000 in 1911. The miles run by revenue trains amounted to 11,169,000 in 1912, a decrease from 1911 of 10.34 per cent. In this year a good part of Mexico was supposed to be, and was actually, in a partial state of revolution.

Not only is this showing of importance to security holders of the National Railways of Mexico, but it is of especial interest to railroad men in the United States because of certain labor problems which the National Railways has had to solve. In 1910 4.12 per cent. of the total number of employees were foreigners, while at the end of 1912 but 639 men, or 2.05 per cent., of the total number of employees were foreigners. The greater part of foreign (mostly American) trainmen, including enginemen and firemen, went on a strike during the past year, and, as President Brown puts it, "the diminution in the number of foreign employees is principally due to the voluntary separation from our service in April last of the major part of the foreign trainmen." That the company was able to make a saving in wages in the transportation department is not surprising, but that there should also be better train loading and other evidences of more efficient operation is an important factor in the consideration of the future of the company. The good showing in the operating department may be a result of the use of Mexican employees more extensively or it may be in spite of it, but it is worthy of note. Ever since the consolidation of the Mexican Central and the National Railroad, forming the National Railways, the policy of the management has been to utilize as far as possible and develop native industry, and it would seem that this policy is meeting with success.

The Ferrocarriles Nacionales de Mexico (National Railways of Mexico) operate 6,008 miles of road, of which about 383 miles is narrow gage. Of the total main line and branches, about 758 miles is laid with 85-lb. rail, 1,549 miles with 75-lb. rail, and 1,546 miles with 56-lb. rail, the remainder being laid with various weights. The operating ratio in 1912 was 62.55, as compared with 63.42 in 1911. Maintenance of way consumed 18.46 per cent. of gross in 1912 and 18.02 per cent. in 1911; maintenance of equipment, 15.76 per cent. in 1912 and 14.19 per cent. in 1911; conducting transportation (including traffic expenses) 25.12 per cent. in 1912 and 27.68 per cent. in 1911, and general expenses, 3.21 per cent. in 1912 and 3.53 per cent. in 1911. The freight traffic density is 339,452 ton miles per mile of road, and the passenger density 78,344 passenger miles per mile of road. The average train load has already been mentioned. On about half of the total mileage oil is used as fuel, and the cost of fuel for locomotives in 1912 amounted to $2,231,000,* as against $2,666,000 in 1911.

Of the total tonnage carried in 1912, 49.76 per cent. was furnished by mineral products, 23.48 per cent. by agricultural products, 11.56 per cent., by products of forests, 11.19 per cent. by general merchandise† and 4.01 per cent. by live stock and animal products. The average receipts per ton per mile are high, amounting to 1.502 cents in 1912. The average receipts per passenger per mile, on the other hand, are low, amounting to 1.439 cents in 1912.

During the last half of the fiscal year operation was interfered with to a considerable extent by the insurrection in the northern states of Mexico; but notwithstanding, total operating revenues in 1912 amounted to $30,724,000, as against $30,967,000 in 1911; and net revenue amounted to $11,507,000 in 1912, as against $11,328,000 in 1911. After the payment of interest and rentals there was a balance of $1,243,000 available for dividends in 1912 and $1,279,000 in 1911. The full 4 per cent. dividends were paid on the first preferred stock calling for $1,154,000. During the past four years interest charges have increased somewhat, amounting in 1912 to $8,702,000. The operating deficit of subsidiary lines has increased to a marked extent. In 1909 this totaled $11,427; in 1912, $417,167. The increase from $232,000 in 1911 to $417,000 in the deduction from income on account of the deficit of subsidiaries was in part offset in 1912 by a reduction in the amount appropriated from income pending charges on account of operating expenses. The amount so appropriated in 1911 was $1,074,000, and in 1912, $700,000.

During the year $1,386,000 was spent for additions and betterments, of which $453,000 was spent for increased weight of rail and $337,000 for additional ballast. The directors have approved the plans for a passenger station at Mexico City to cost in the neighborhood of $2,000,000. Plans for a freight station at Mexico City have not as yet been completed, but are under consideration.

At the time that the Mexican Central and the National Railroad of Mexico were consolidated the plans for making the operation of the combined properties more economical included the abandonment of certain parallel lines, and during the past year it was decided to abandon 289 miles and permission has been secured from the bondholders for this abandonment of property. Of course, the economies that may be expected to result can only be estimated, but should be considerable. In San Luis Potosi there are now two terminals, both of which are inadequate, and a new union terminal has been planned and work was begun during the past year.

Unlike the United States, Mexico had poor crops, so that there was no very heavy fall movement of crops to make demands on equipment. As a matter of fact, however, the equipment situation on the National Railways was worse at the end of the year than at the beginning. At the beginning of the year there were 652 standard gage locomotives in service, and at the end of the year 643; there were 441 standard gage passenger coaches, and at the end of the year 427; there were 18,471 freight cars, and at the end of the year 17,596. During the year orders were placed for 33 passenger train cars and 150 tank cars. When good crops, however, bring a return of prosperity, it is probable that the National Railways will find it necessary to make rather heavy orders for new equipment.

Like American railroads, the National Railways of Mexico have found considerable difficulty in doing new financing, and the £1,000,000 ($5,000,000) notes which fell due during the year were paid and to raise money it was found expedient to make another short term loan. A loan of $13,000,000 was raised in the United States at 5 per cent. for one year, the company depositing $12,500,000 prior lien bonds and $6,000,000 guaranteed general mortgage bonds. The cash position of the company was considerably better at the end of the year than at the end of the previous year. There was on hand $9,164,000, of which $3,660,000 was for payment of principal and interest on bonds, while at the end of 1911 there was $7,770,000 cash on hand, but of this amount $7,006,000 was for the payment of principal and interest on bonds. At the end of 1912 there was $24,423,000 notes payable, comparing with $16,405,000 notes payable at the end of 1911.

The following table shows the principal figures for operation in 1912, as compared with 1911:

	1912.	1911.
Average mileage operated	6,009	6,132
Freight revenue	$21,929,804	$22,598,874
Passenger revenue	6,774,194	6,328,555
Total operating revenues	30,723,896	30,967,211
Maint. of way and structures	5,670,017	5,580,965
Maint. of equipment	4,843,560	4,394,194
Conducting transportation (including traffic expenses)	7,717,811	8,570,708
General expenses	986,250	1,093,804
Total operating expenses	19,217,628	19,639,673
Taxes	239,304	206,773
Operating income	11,266,965	11,120,766
Gross corporate income	12,096,291	11,593,212
Net income	1,242,288	1,278,936
Dividends	1,153,316	1,153,316
Surplus	88,972	125,620

Letters to the Editor.

AUTOMATIC STOPS AS SURPRISE CHECKERS.

Boston, Mass., December 16, 1912.

To the Editor of the Railway Age Gazette:

The position taken by the Signal Engineer whose letter is printed in your issue of December 13, regarding automatic stops and distant signals, is readily understandable. His experience has shown him that automatic devices, such as block signals and automatic stops, are subject to failures, some of which are unexplainable and some of which are unquestionably due to the failure of the maintainer. His experience also, no doubt has impressed him with the fact that some enginemen will expect an automatic device, primarily installed to check their work, to do their work for them.

I believe that the automatic stop is a very valuable device for two reasons: (1) that it will, under proper conditions and when properly installed, prevent an engineman who is incapacitated from overrunning a signal; and (2) that it will, when properly designed and installed, give a continuous surprise check on all enginemen. An engineman who at any time fails to obey a signal equipped with an automatic stop will have his brakes automatically applied and, if the installation is properly designed, this fact will come to the attention of his superiors.

This last is, in my mind, the greatest advantage of automatic stops. The failure of an automatic stop will not, if it is properly designed, in any way interfere with the proper working of the signal. The only results that can happen in case an automatic stop fails to work properly are, (1) to stop the train when the signal is clear; and (2) to fail to stop the train if the signal is adverse, and the engineer does not himself stop the train. In the first case the result is a delay, and a report of the occurrence; and in the second case there is no failure to stop the train unless the engineman also fails to observe the signal. The engineman will not shift to the automatic stop his duty to stop the train, as the fact that he did so would in every case come to the attention of his superiors.

Automatic stops are subject to failures, and such failures may be extremely annoying, but they can do no harm. The Boston Elevated, on which automatic stops have been used more than ten years, has had no difficulty in having failures recorded, and finds no more disposition on the part of the men to hide such failures than to hide any other failures that should be reported. While there have been comparatively few cases where the automatic stops have unquestionably prevented an accident, they have resulted in an obedience of signals to such an extent that the overrunning of signals is practically unknown.

Paul Winsor,
Chief Engineer M. P. & R. S.

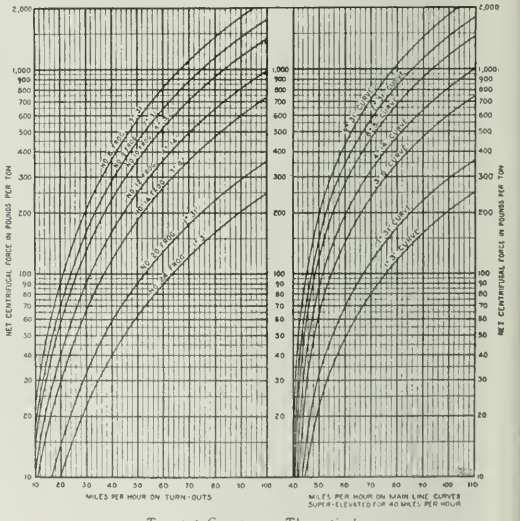
DISCIPLINE VERSUS AUTOMATIC TRAIN CONTROL.

New York, N. Y., December 6, 1912.

To the Editor of the Railway Age Gazette:

Owing to recent newspaper discussions regarding automatic train control or automatic stops as adjuncts to signal systems, and to the criticisms by more or less ill-informed people, of railroads for not immediately rushing into such schemes, it may be well to consider first, speed on turnouts and second, the applicability of mechanical devices to control such speeds, and in general, to control the speeds of trains where there are already block signals in operation.

The following discussion of the physics of this problem is so elementary that it would seem unnecessary, except for the fact that some of the [illegible] and so-called scientific papers—who are loudest in their condemnation of railroad engineers for knowing nothing about centrifugal forces—seem themselves to have no correct apprehension of the forces involved. The fundamental principle involved is Newton's first law: "Every body continues in its state of rest or of uniform motion in a straight line unless it is compelled by forces to change that state." Therefore, a moving mass, such as a railroad train, if uninfluenced by external forces would continue indefinitely at a uniform speed in a straight line. To deflect it from a straight line or tangent some force must be brought to bear. There is no mysterious force in a moving body which suddenly appears when it is taking a curvilinear motion and disappears when on a tangent or which acts upon a turnout and not upon the main line. It is the confusion of thought brought about by this misconception which obscures the problem. When it is desired to deflect a train which is moving on a tangent the curved outer rail furnishes the radially directed pressure which achieves the result. The more rapid the motion of the train and the greater the deflection in a given distance, the greater is the pressure which the rail must exert to attain the desired result. Furthermore, the diverting force of the rail is not on the same plane with, nor at the same height as the center of gravity of the mass deflected. The consequence of this is, that in endeavoring to resume its rectilinear motion, the mass is subject to a radial overturning moment. All this is very elementary, but its clear conception is necessary to the following statement, that so far as the so-called centrifugal force is concerned, there is no difference in the effect upon a moving train between a main line curve and a turnout or other curve under the same conditions of curvature. Therefore, theoretically, there is no reason why a train should not take a turnout curve at the same speed at which it takes a main line curve of the same curvature, so far as centrifugal forces alone are concerned.



Turnout Curves are Theoretical.

Force Which Must Be Exerted on Outer Rail to Deflect a Moving Train.

But the requirements of the case necessitate a difference of construction of a turnout from a main line curve, as it is always possible to super-elevate the outer rail of a curve on a main line, a thing which cannot usually be done on a turnout. This super-elevation must be fixed for some average speed so that for a fast moving train the resultant of all the forces shall remain well within the base furnished by the rails, and for slow moving trains no undue portion of the load shall come upon the inner rail. The common practice on single track western roads is to

super-elevate for a speed of 40 miles an hour, at which speed the resultant of the weights and forces is normal to the plane of the track near its center, and the curve can be taken at any speed in excess of this which does not throw this resultant beyond the outer rail. The turnout, however, cannot usually have super-elevation and must, therefore, be taken at a speed somewhat slower than a main line curve of the same curvature. For example, a train traveling at 50 miles an hour can take the lead to a turnout having a No. 14 frog with the same safety with which it could take a 9 deg. 31 min. main line curve, although this might be excessive in either case; and a train could take a turnout having a No. 20 frog at 50 miles an hour as safely as it could take a 4 deg. 14 min. curve at the same speed (see diagram). Owing, however, to the want of continuity of the rails, brought about by the introduction of the frog, and to reversal of curvature, the speed on a turnout is usually reduced to about one-third the speed on a curve of corresponding degree on main line. In point of fact the turnouts are really safe for a higher speed than this, as the overturning moment diminishes as the square of the velocity, and a restriction of one-third speed or one-ninth the moment should be well within the safe limit, with proper maintenance. If, however, the question should be asked as to what is the safe frog and turnout curve, the answer must be, that on any curve there is a limiting speed beyond which it is unsafe to run and the use of a long turnout is no more protection against reckless running than is low curvature on the main line.

This suggests the thought of mechanical adjuncts, such as automatic controls, to prevent reckless running. So far as developed none of these have yet proven successful in service tests under the operating conditions of a steam railroad, and if they should be required, they should be applied not only at turnouts, but at all curves, at the beginning of each down grade and at any other places where reckless running is possible. The function of the engineer then becomes merely opening the throttle. The machine does the rest—maybe—and the responsibility of running past signals or diminishing the speed to a safe one, on a curve or turnout, is shifted from the engineer, who has a personal interest in the safety of his train, to the track maintainers, and to the equipment maintainers, with the consequent impossibility of fixing the responsibility for a resulting accident on any particular person. The assertion is frequently made and is doubtless true, that it is after all a question of cost, but such cost does not appear to be justified by the present development of automatic control. If developed in the near future, it is a question whether the expenditure should be undertaken by any road when so much money is required for the extension and perfection of block signals, the elimination of grade crossings, increase of number of tracks, more extensive terminal facilities, etc.; all of which are urgently needed and are taxing the resources of all of the railroads in the United States. Many things may be desirable which are impracticable. For instance, to avoid accidents due to broken rails, policing of the track might be extended to having a watchman stationed at each rail; but it is to be hoped that the state and national commissions will not require this at present. Through the use of carefully designed, properly located and maintained automatic signals, surprise tests and efficient track maintenance, some of the principal trunk lines have now reduced their fatal accidents to an extremely small number per annum. To require such roads to impress on the already efficient engineers of their fast and heavy trains the idea that observation, care, knowledge of their runs, and obedience to rules, may all be abandoned and an automatic machine substituted for their intelligence—their functions being restricted to merely starting a train after it is once stopped—would be to undo the successful work of recent years of the best operating men in this country and to introduce new dangers in operating. Under such conditions the railroads would very properly employ a cheaper grade of men to run their engines and would have good grounds for doing so, just as in the case of the electrically controlled roads in certain subways and tubes, "a motorman can be made in two hours." A possible future development of a successful automatic train apparatus, applicable to the severe conditions of the steam roads, will inevitably lead to the abolition of expensive men on the railroads, and the substitution therefor of machines plus laborers.

It appears that our real trouble is our lack of help from the public in such matters. When it comes to navigating a ship, in case of disobedience of rules, neglect of duty or inefficiency, the government takes in hand the delinquent officer and suspends him, or deprives him of his license and prevents him from making a living at his profession. The engine runner holds the same relations to the public, as does the officer of a ship, and should be controlled in the same way. If the government, through its lawmakers would inflict a similar penalty on a reckless locomotive engineer, who disobeys the rules for the safety of the public, established by all of the leading roads in the United States, revoke his license and otherwise hold him responsible to his fellow citizens for want of care in most responsible duties, this would furnish a powerful incentive to vigilance. Instead of this the public says, in effect, to the railroad corporation: "If your men do not obey rules and an accident results it is your fault for not supplying some mechanical apparatus to take their places. We do not know what such an apparatus is, or whether such an apparatus can be made, but it is your duty to find one and apply it."

JOHN D. ISAACS,
Consulting Engineer, Harriman Lines.

WHY NOT EXPERIMENT ON THE PANAMA RAILROAD?

CHICAGO, Ill., December 14, 1912.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In reading your editorial on the Interstate Commerce Commission's report on the Westport derailment, it has occurred to me that the government has an exceptional opportunity to put the recommendations of the commission to practical test for the benefit of the railroads of the country. To the best of my knowledge there are no automatic stops on the Panama Railroad. There is a fine chance to "try it on the dog" going to waste. There has been some expression of a desire on the part of the railway officers of the country for a railway laboratory. The Panama Railroad could be used for this purpose to great advantage, and also to the great benefit of inventors who are now trying to get Congress to pass bills which will compel the roads to use their devices. Friendly congressmen should find no difficulty in loading the government road to its capacity with these devices, thereby making both votes and valuable contributions to knowledge.

BYSTANDER.

AUTOMATIC STOP DIFFICULTIES.

PITTSBURGH, Pa., December 25, 1912.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

That ten thousand dollar offer for an automatic stop, noted in your issue of December 20, page 1169, was, indeed, an "easy one." You might well have used even stronger language in showing how far behind the times that fifteen-word specification is. Signal engineers are acquainted with at least a dozen devices that would answer that requirement. You might also have used more emphatic language in your statement of the elements of the real automatic stop problem. Unfortunately, the devices which meet the requirement in that advertisement, when we take the specification literally, cannot be depended upon to work with that certainty and reliability which is required in a device which, to serve the purpose, must operate invariably.

But lack of mechanical certainty is only one of the reasons why, up to the present time, a stop that will satisfy the requirements has not been produced. Several of these stopping devices may work with a fair degree of regularity, but experience has shown that devices of the kind are apt to fail when they are most needed

to check the action of the engineman. The road using such devices would, in the event of a failure of the device to work, be in the position of having provided at great expense a reputed "safety device" without really increasing in any reasonable degree the safe movement of its trains.

Under the varying conditions of service and the peculiar construction required by this class of apparatus, several of the train control devices have to be provided with a hand release, placed in the cab of the engine, convenient to the hand of the engineman, to permit him, when necessary to do so, to cut out the stopping device and release the brakes, allowing the train to proceed. Then the assumption is that the engineman may safely be depended upon not to "press the button" and release the brake when there is danger ahead; but experience has shown that the engineman cannot be relied upon to operate the release only when there is no chance of an accident resulting.

Under this general condition accidents are to be expected, notwithstanding an expensive device may have been installed. "Familiarity breeds contempt" is an old saying; and when, in addition, an engineman "gets the habit" of working the release, dependence for safe working cannot be placed on a train control or automatic stopping apparatus using a device of the kind as a necessary or permissible part of its equipment.

Then, again, the stopping devices that have been developed to the highest degree of efficiency require the use of the overlap, with its restriction of the capacity of a track measured by the number of trains that may be run in a given time; with the consequent complications of the signal apparatus and controlling circuits, and with the objectionable operating methods or practices which must be followed at interlockings. To be successful, from an operating standpoint, the train control device should work with safety and reliability without requiring the use of the overlap.

It is the opinion of many experienced signal engineers that the conditions which will be found necessary in the operation of trains when an automatic stop is in use will prove to be so difficult that but slight, if any, additional protection may be expected or will be secured by the use of the stopping device. Great difficulty will be experienced in maintaining the train control apparatus in perfect working order; and with the difficulty, if not impossibility, of securing reliable working with a device requiring a hand release in the cab, to be operated at will by the engineman, the advantages of being able to stop a train in a few (rare) instances will be more than offset by the increased hazard in every-day operation. It is hoped the New Haven will revise its specifications, stating more clearly and exactly the conditions as to permissible restrictions of traffic and the requirements essential to reasonably complete protection to be met. This side of the question must be fully dealt with before a train control device can be agreed on which can be considered as working with that degree of safety and reliability which will warrant its installation on the tracks of a trunk line railroad. C. S. N.

THE MASSACHUSETTS COMMISSION.

Boston, Mass., December 26, 1912.

To the Editor of the Railway Age Gazette:

I have read with much interest and entire approval of your piece "The New Haven Monopoly," as re-printed in the Springfield *Republican* of the 24th inst., but you say—"in the West where the movement for regulation of railways was born." Will you not give me the date of this birth? We have had a Railroad Commission in Massachusetts since 1869, and it was given the initiative and made its duty to regulate railroads in every particular, and it seems to me it should be called to account, first as our laws are ample and mandatory, although you would not learn suspect it from the campaign that has been carried on here. I have followed public service corporation questions for twenty years and no state in the Union has so little excuse for bad conditions as ours and the whole trouble has been the excellent laws have not been enforced. Mr. Mellen could not be more truly sized up than you have done. Now why not do the same with our Railroad Commission? Is ours a government of laws or not? If public officials do not obey the laws how can you expect the people to? These laws affect life and limb, to say nothing of convenience and comfort, and they have been our laws for forty years. They were built on publicity and that has been ignored grossly, so that even legal lights like Mr. Brandeis seem to have completely lost sight of them. I have finally got Governor Foss to call upon the Commission for a full explanation and it ought to be interesting and bring the matter to a head. John H. Carter.

HEAVIER LOCOMOTIVES VERSUS GRADE REDUCTION.

Baltimore, Md., December 23, 1912.

To the Editor of the Railway Age Gazette:

I noticed an editorial reference in the issue of the *Railway Age Gazette* for November 1, page 821, calling attention to the proper design and selection of locomotives to suit particular operating and physical conditions, referring particularly to the Mallet locomotive and its limitations. While it must be admitted that a careful investigation and an analysis of conditions are necessary, and will oftentimes be a check on the promiscuous purchase of a type of motive power which, because of good results in certain work, is high in favor, I cannot admit that such an analysis will result in obviating the necessity for heavy expenditures to reduce grades, etc., as suggested by Mr. Beyer in his paper before the American Society of Mechanical Engineers, abstracted in your issue of December 13, page 1145.

As a general rule, capital expenditures for reducing grades, eliminating curves, etc., are confined to certain critical points of an operating division. As a chain is limited by its weakest link, so is the train load limited by the maximum grade on a division. This may be very short, but reducible at considerable expense, or there may be several maxima, similarly reducible. To attempt to largely save this expense by putting locomotives of greater tractive effort into service would probably not be seriously considered, as a short analysis will indicate.

It is not denied that increased capacity of motive power will result in increased train load. Economy in that direction has been improving steadily for years, and there now seems to be a feeling that the limit is not far off. Such increase cannot, however, prevent the rating of a train from being controlled by certain critical points above referred to. If the train is fully rated for the low grade portion of a division, it cannot be operated over the critical grades, and, conversely, if rated for the maximum grades, it is operated far below its capacity over the remaining territory. Such operation is far from efficient, and there seems to be no possible way to radically improve the situation except by reducing grades. Of course, results are being obtained without this, where the cost would be prohibitive, by operating certain districts as helper grades. This, however, saddles operation with the cost of helper service, and on a busy line would capitalize at an enormous figure. No type of road engine could save this expense. In short, the object of reducing a critical grade is not to enable a given standard engine to haul more cars, but to make possible an increased haul for *every* engine, without breaking load at the foot of the grade, or being operated below capacity before reaching it. Theo. Bloecher, Jr.

Belgian International Exhibition.—At the International Exhibition at Ghent next summer, all the leading Belgian industries will be represented. The field to be covered is a very wide one, including as it does railway and colonial enterprises, coal mines, iron works, copper mines, stone quarrying, blast furnaces, steel works, glass blowing, zinc works, plate glass manufactures, sugar refineries, rails and rolling stock. Besides all these, Ghent will show a marvelous field of activity in textile trades, while the horticultural and agricultural side of the exhibition will also be well worth seeing.

THE HOPATCONG-SLATEFORD CUT-OFF.

Second Article, Describing Very Heavy Bridge Work, Including Largest Concrete Railway Bridges Ever Built in this Country.

By C. W. Simpson,
Resident Engineer, Delaware, Lackawanna & Western.

One of the distinctive features of the Hopatcong-Slateford cut-off of the Lackawanna, the general description of which was published in the *Railway Age Gazette* of December 6, is the almost exclusive use of concrete for structures. Out of a total of 67 structures at stream, highway and railway crossings only one is of steel. With a few exceptions these structures are of the arch type, with spans varying from three to 150 ft.

Fig. 1—Slab Type Highway Bridge Over Tracks

In some instances where there was not sufficient clearance to permit the use of the arch type, a reinforced flat slab type was used.

The structures may be classified roughly under four heads: reinforced slab or beam type, semi-circular arches carrying the railroad embankment and tracks, elliptical spans carrying the highways over the railroad, and long concrete bridges composed of several arch spans.

SLAB TYPE STRUCTURE.

The slab type is very well illustrated by two structures at Slateford, Pa., one designed to carry a highway over six tracks,

Fig. 2—Typical Slab Type Culvert for Waterway.

four of which have been laid, and one carrying four tracks across Slateford Creek. The highway structure is composed of three 37 ft. spans; the center line of the roadway being at an angle of 55 deg. 8 min. with the tracks. Each span consists of a 12 in. slab resting on eight longitudinal beams 20 in. deep, 10 in. wide at the bottom and 14 in. wide at the top, spaced 5 ft. center to center. The slab and beam concrete was placed at the same time so that they form "T" beams. Each beam is reinforced with six 1 in. square bars and the floor slab with ½ in. square bars spaced 4 in. center to center. The bottom of the face beams was curved to give the appearance of a very flat elliptical arch. The connection between the floor system and the piers and abutments is stiffened by 22 in., 45 deg. corbels. The piers are 2 ft. 1½ in. thick at bottom, 1 ft. 10 in. thick under the corbel, and 25 ft. high above the footings.

As the narrowness of the piers made it inadvisable to have a transverse construction joint in the floor system, the concrete was placed continuously from end to end, and two longitudinal construction joints, midway between beams, divided the floor into three construction sections. A railing composed of concrete posts and two lines of 2 in. pipe protect the roadway, which was paved with a 3 in. coating of Amiesite placed directly on the floor slab.

The structure over Slateford Creek is composed of two 14 ft. slab spans carried on two plain abutments and one plain pier, on gravel foundation. The pier is 2 ft. 6 in. thick above the ground surface and 4 ft. 6 in. thick at the bottom of foundation. The slab is 2 ft. thick and is stiffened at the pier and abutments by 24 in., 45 deg. corbels. The slab reinforcement consists of 1 in. square bars spaced 4 in. center to center,

Fig. 3—Typical Arch Culvert for a Highway.

with every third bar bent up at the quarter point. The top of coping is level with the top of the rail.

THE SEMI-CIRCULAR ARCH.

The semi-circular arch type is best illustrated by the arch over the Morris and Sussex turnpike near Andover, N. J. This is a combined highway arch and culvert, under an embankment 90 ft. high. Originally the stream and highway were 300 ft. apart, but the stream channel was changed so that both could pass through the same structure. The arch barrel is 221 ft. long, has an inside diameter of 33 ft. and varies in thickness according to the depth of the embankment over it. Thus the crown thickness at the center is 2 ft. 9 in., while at the ends it is 2 ft. 6 in., and the abutments are 22 ft. 2 in. broad at the center and 17 ft. 10 in. at the ends. The arch ring is reinforced longitudinally with ¾ in. square bars spaced 2 ft. center to center near both the inside and outside surfaces. The culvert occupies the entire width between abutments, the roadway being carried on a 1 ft. 4 in. slab, reinforced transversely with ¾ in. square bars spaced 6 in. center to center and longitudinally with ½ in. bars spaced 2 ft. center to center. The slab was built as an integral part of the abutment and is

divided into two spans by a center pier 2 ft. wide, making the culvert a double box with 15 ft. 6 in. span. Beyond the arch barrel the culvert is carried along the wing walls until it clears the roadway.

ELLIPTICAL ARCHES.

A good example of the overhead highway arches is shown in one of the accompanying photographs. All arches of this type provide clearance for four tracks, requiring a minimum span of 56 ft. The highway at this point makes an angle of 74 deg. 15 min., with the tracks, requiring a span of 58 ft. 2 in. The intrados is a semi-ellipse having a rise of 9 ft. 6 in. The barrel is 18 in. thick at the crown and is reinforced longitudinally by 1 in. square bars spaced 12 in. center to center, near the upper and lower faces, and transversely by 1-in. square bars spaced 24 in. center to center. Spandrel walls, with a 2 ft. 6 in. coping, retain the spandrel filling and the roadway is protected by a concrete railing surmounting the coping. The concrete for the arch ring was placed continuously from springing line to springing line, and the spandrel walls, up to the bottom of coping, were placed at the same time.

Fig. 4—Elliptical Arch Carrying Highway Over Tracks.

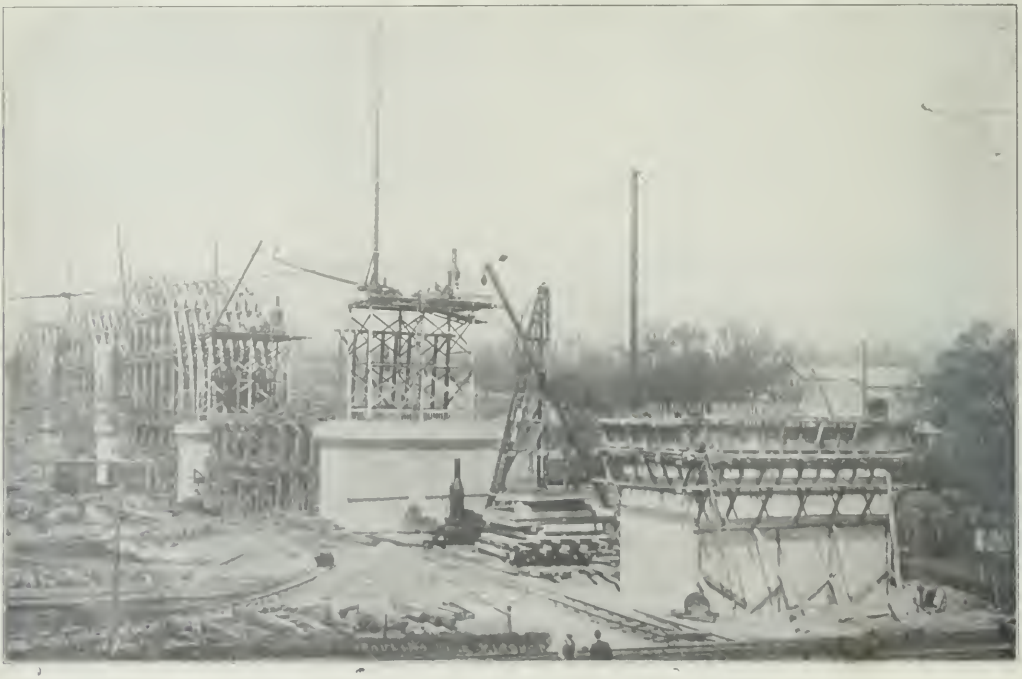


Fig. 5—Early Stages in Construction of Paulins Kill Viaduct.

THE PAULINS KILL VIADUCT.

There are two structures of the fourth type; one at the crossing of the Paulins Kill river, the New York, Susquehanna & Western, and a highway at Hainesburg, N. J.; and one across the Delaware river, the old line of the Delaware, Lackawanna & Western, and two highways near Slateford, Pa. These bridges have been said to be the largest concrete structures yet erected for railroad purposes in America.

The Paulins Kill bridge is composed of five 120 ft. and two 100 ft. semi-circular arch spans, carrying a floor system composed of 13 ft. semi-circular spandrel arches. The abutments are a modification of the "U" type, being composed of three longitudinal walls carrying a reinforced floor slab. The embankment is allowed to take its natural slope between these

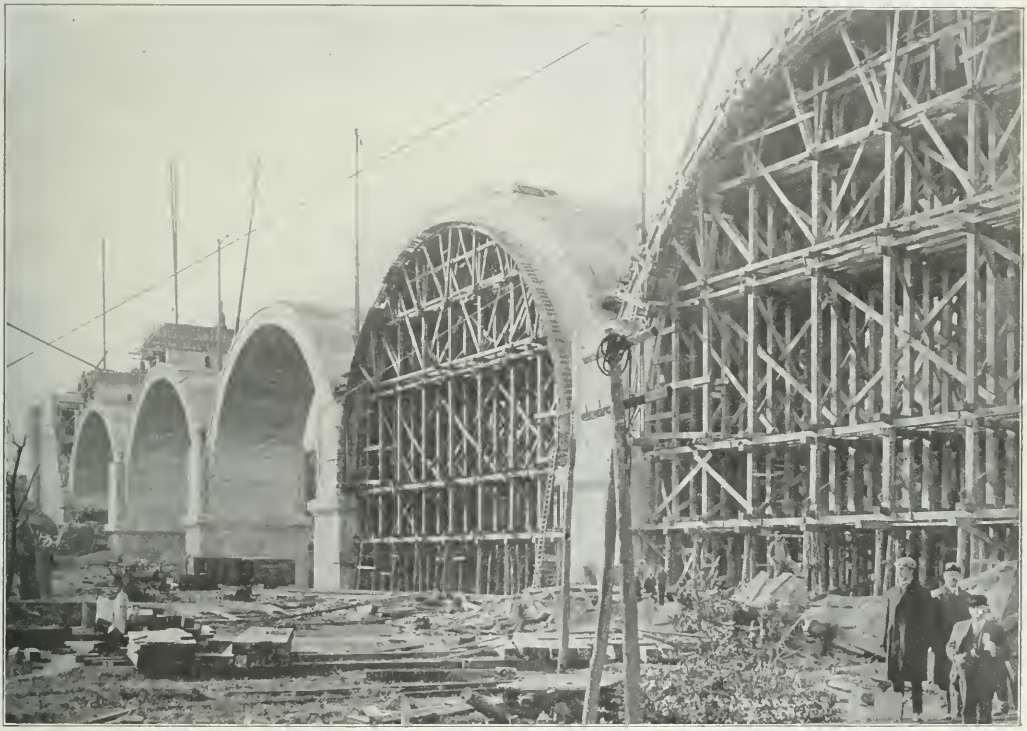

Fig. 6—Completing Arch Rings and Starting Spandrel Walls on Paulins Kill Viaduct.

walls so that they do not act as retaining walls and carry only the load transferred to them by the floor slab. The walls are stiffened by reinforced struts, extending from wall to wall. The viaduct is 1,100 ft. long end to end of masonry, and is 34 ft. wide face to face of arches, with the pier pilasters projecting 4 ft. The top of the coping, which is level with the top of rail is 120 ft. above the stream bed.

The floor is waterproofed with five layers of Neponset Water Dike felt and one layer of burlap, protected from injury by the stone filling with one course of brick. The joints in the brick protection coat were filled with a waterproofing compound. The foundations were carried to bed rock, which is near the ground surface except at the two piers near the stream, where the excavation was 35 ft. deep. These excavations were sheeted with 3 in. x 12 in. yellow pine driven the entire depth by a Vulcan steam hammer. The water was kept out of one excavation by two 6 in. centrifugal pumps, but the other excavation was so wet that the concrete was deposited by means of a tremie.

The construction work was carried on by a system of derricks, having 75 ft. masts and 65 to 80 ft. booms, operated by Mundy double drum hoisting engines. The derricks were first erected on the ground surface at each pier and from this position constructed the piers to a point about 10 ft. above the springing line. A steel tower 30 ft. high, composed of six 9 in. I beams braced with 5 in. channels was then erected on the pier and the derricks transferred to a platform at the top of the tower. From this position the derricks completed the main arches and two spandrel arches over the crown of each main arch. They were then moved to the top of these spandrel arches and from this location completed the remainder of the work.

For constructing the main arches the contractor used one set of 100 ft. and three sets of 120 ft. timber centers. These centers were framed and assembled into units that could be handled by the derricks and narrow gage rolling stock, in a timber yard equipped with circular and band saws, a planer, and other wood working machinery. A large part of the forms were built in sections at the timber yard and were erected, taken down and re-erected by the derricks.

The concrete mixing plant was located about 300 ft. north of the bridge on the west side of the stream. Stone was quarried from a hill just back of the mixing plant and conveyed in dump cars to two Farrel jaw crushers from which it was taken by bucket conveyors to two 200 cu. yd. stone bins located over the mixers. Sand was dug from a pit about one-half mile from the mixing plant by a clam shell bucket and was conveyed to the sand bins, located alongside the stone bins, in 4 yd. 3 ft. gage side

Fig. 7—The Completed Paulins Kill Viaduct.

dump cars. Measuring hoppers located below the storage bins discharged into two 1 yd. McKelvey mixers. Each mixer discharged into a hopper from which the concrete passed into 1½ yd. bottom dump buckets on 3 ft. gage flat cars. Twelve ton Baldwin locomotives hauled the cars to all parts of the work, crossing the stream on a temporary wooden bridge. A standard gage track connected the mixing plant with the N. Y. S. & W., and cement was unloaded from the original cars and placed in a cement house, on a level with the storage bins, by a derrick. This standard gage track extended under the storage bins and crushed stone for several smaller structures was shipped from this plant. This structure required 43,212 cu. yds. of concrete and 735.5 tons of reinforcing steel.

DELAWARE RIVER BRIDGE.

The Delaware river bridge, which is 1,476.8 ft. long end to end of masonry consists of five 150 ft. x 40 ft., two 120 ft. x 40 ft., and two 54 ft. x 10½ ft. elliptical arches, and is 34 ft. wide face to face of arches. The 150 ft. and the 120 ft. arches support a floor system composed of 13 ft. spandrel arches and the two smaller arches carry longitudinal spandrel walls, which retain the stone filling placed directly on the backs of the arches. The west abutment is of the ordinary "U" type, but the east

Fig. 8—The Delaware River Bridge in all Stages of Construction.

Fig. 9—The Completed Structure Across the Delaware River.

abutment is modified in that the walls are not a gravity section, but are tied together at about one-third their height by reinforced transverse ties, and are heavily reinforced to act as cantilever beams above these ties.

The east two-thirds of the bridge is straight and the longitudinal axis of this portion makes an angle of 65 deg. with the centerline of the piers and with the elements of the main and spandrel arches. The west one-third is partly on a 3 deg. 36 min. curve and partly on a spiral connecting the curve with the straight portion.

The west abutment and the pier between the two smaller arches rest on a gravel foundation, but all other foundations are carried to bed rock. The depth of the rock varied from 25 ft. in the center of the river to 60 ft. at the banks and no particular difficulty was encountered in making the excavations. The piers are of solid concrete up to the extrados of the main arches, above which the pilasters and adjoining spandrel walls form a hollow pier. In constructing the main arches the work proceeded from the east end and five arches were turned during one season. As the piers were not entirely stable under the unbalanced thrust of one arch, and as it was unsafe to leave any centers in the river during the winter, on account of large amount of ice carried during that season, the last pier was considerably enlarged below the ground line and acted as an abutment pier.

The floor system above the springing line of the spandrel arches was constructed in sections about 90 ft. long, but the reinforcing bars were continuous past the construction joints, so that there are no expansion joints of any nature from end to end of the structure. The floor was waterproofed with a ½ in. layer of a patented compound prepared and applied by the Masonry

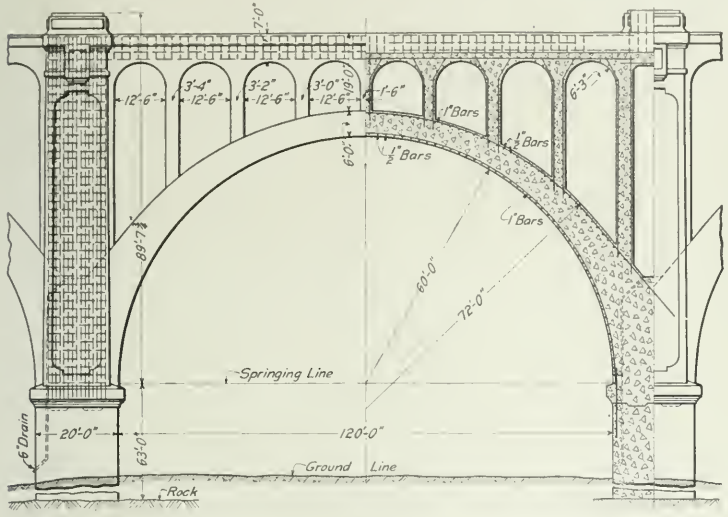

Fig. 10—Paulins Kill River Viaduct at Hainesburg, N. J.

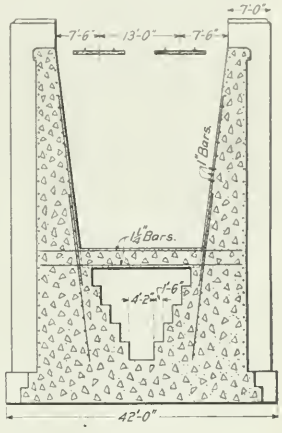

Cross Section of Abutment of Delaware River Viaduct.

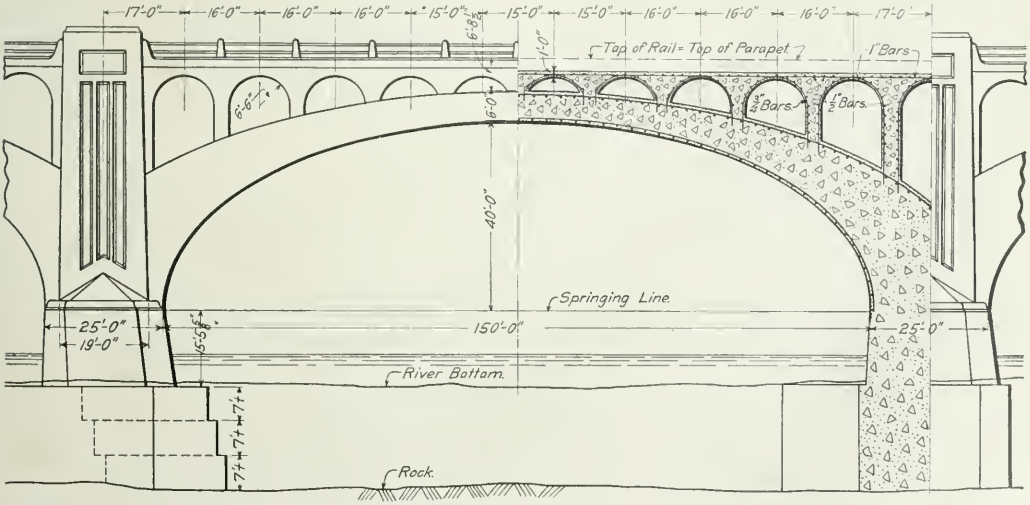

Fig. 11—Delaware River Viaduct at Slateford, Pa.

Waterproofing Company, and protected against injury from the stone filling by a 3 in. layer of concrete.

The contractors used timber centering for the 54 ft. and 120 ft. spans and two sets of steel centering for the 150 ft. spans. The steel centers for one arch consisted of ten three-hinged arch ribs, supported at the piers by short steel columns resting on I-beam grillages which were supported on the footings of the adjacent piers. These ribs were joined together into a rigid structure by lateral and cross-frame bracing. The interesting feature of these centers was the device for lowering them. This consisted of an extension member and toggle on each side of the crown pin. The extension member is built up of two channels battened and latticed together and divided at the center to allow the insertion of an iron block pierced by a threaded hole in the end of each half. A heavy screw is worked in these blocks by means of a ratchet and lever, so as to lengthen or shorten the member. By lengthening this member the horizontal axis of the toggle is shortened and the centers are lowered. The centers were designed, built and erected by the McClintic Marshall Construction Company.

The construction work was handled by a combination of derricks and cableways. The cableway was composed of two 2¼ in. cables spaced 17 ft. center to center, supported at each end by a timber tower 125 ft. high and near the center by a timber "A" frame with the legs resting on two concrete piers 30 ft. high. The "A" frame legs were spread so as to clear the bridge structure, and the concrete piers were removed after the completion of the work. The end towers were 1,950 ft. apart and rested on concrete pedestals. The "A" frame divided the cableway into four independent units operated by four 40 h. p., double drum, Florey engines with a carrying speed of 800 ft. per minute. The contractors maintained an independent organization and plant layout on each side of the river, material being received on the New Jersey side from a switch connection with the N. Y. S. & W., and on the Pennsylvania side from the old line of the D. L. & W. Sand cars were dumped from a trestle into storage piles and the sand placed in elevated bins near the mixers by derricks operating clam shell buckets. Stone was hauled from the railroad excavations or waste banks by wagons to crushers located near the mixers and the crushed stone elevated to bins by bucket conveyors. Sand and stone were conveyed to the mixers by 24 in. gage cars. Each mixing plant consisted of two one yard Smith mixers located directly below the cableway.

A large part of the work was carried out on double shifts and an electric generating plant was installed to furnish light for night work. While concreting certain portions of the main arch rings concrete was placed continuously for three days and two nights and each section of the floor system required a continuous 24 hour run. This structure required 51,376 cu. yds. of concrete and 627 tons of reinforcing steel.

The concrete used on the cut-off was of three classes, known as "A," "B" and "C." "A" concrete was a 1:2:4 mixture, used only for thin walls and reinforced slabs; "B" concrete was a 1:3:5 mixture, used for arch rings and all work where other classes were not specified; and "C" concrete was the same mixture as "B" with two man stone bedded in it, used in massive piers, abutments and walls.

The structures were designed and built under the direction of Lincoln Bush, formerly chief engineer, and G. J. Ray, now chief engineer of the D. L. & W. F. L. Wheaton was engineer in charge of construction.

Central London Railway, England.—The Central London Railway bill proposes to authorize the construction of railways from Shepherd's Bush through Chiswick to a junction with the London & South Western Railway at Gunnersbury, and to sanction working agreements, etc., to be made with the London & South Western, and the raising of additional capital for necessary expenditures.

RAILROAD ACCIDENTS, THEIR CAUSES AND REMEDY.*

By D. F. Jurgenson,

Engineer Minnesota Railroad and Warehouse Commission.

Having found the fundamental causes of preventable accidents, the problem in hand is to accomplish their removal. It may be said in this connection that there is probably no industry in existence which depends so largely upon the human element for its safe operation as does a railway system; also in none of the ordinary walks of life are employees so well compensated for services rendered as are, generally speaking, those of American railways. Their hours of labor and rest have also been regulated by legislation to their advantage. The human equation is manifestly the most important element for consideration, and probably the most intricate to solve.

In our effort to eliminate the causes of collisions we should confine ourselves strictly to questions which are pertinent to the problem. In my judgment the wreck-resisting qualities of steel and wooden cars should not enter into consideration, because to anticipate the continuation of this feature of railroad operation, with a view toward the construction of wreck-proof cars and equipment, would be equivalent to a suggestion to the public that they should not expect to obtain satisfactory relief from preventable railroad accidents.

A notable feature in practically every report of collisions is the recital that one or several employees failed to do something which they should have done, and if they had obeyed the rules of the company the collision and consequential casualties would not have resulted. In this regard there is a marked contrast in sensibility to duty and appreciation of responsibility to society between the railway employees of this country and those of European railways. Whenever the European railway employee fails in performing his prescribed duty in train operation, and his failure of duty results in death or injury to persons, he is held accountable to the state, and it is an interesting fact that there are even less fatalities in connection with the operation of railways in Germany than with that of the agricultural pursuits of that country.

Necessity for Automatic Train Control Not Established.

The necessity for automatic control of trains is not established until we have exhausted all means of prevention for errors in train operation now at our command. Some justification will then exist for seeking other fields for a remedy.

The automatic train-control device, if its realization was within the range of possibility, would at the very best be only an auxiliary to and of secondary importance to the signal system. This is so because past experiences have proven that practices not essential to the safe operation of trains are, as a general rule, not given the careful attention that the primary measures receive.

Except, perhaps, in a very few conceivable special cases, it is a question whether grave danger does not lurk in the introduction of a mechanical means that tends to make an automaton of a railway employee. This device is likely to make the employee careless of the responsibilities which he has assumed. It may cause him to feel that he is a mere supernumerary who has been practically relieved of responsibility in the handling and control of the train, vigilance over track, signals, flags, and in fact will, to a certain extent, encourage the omission of many of the duties and requirements so essential and necessary to insure the maximum of safety in train operation.

The automatic train-control device might shift the responsibility of safe train operation from the high-grade and long-experienced engineman or train operator to the less experi-

*Abstract of paper submitted as the Report of the Committee on Safety Appliances at the annual convention of the National Association of Railway Commissioners, Washington, D. C., November 19-22, 1912.

enced maintainer of mechanical devices. The successful working of any piece of mechanism is solely dependent at all times on the hand and mind creating it, so it must of need follow if the human agency fails, either directly as in the first instance or indirectly as in the second case, a calamity naturally will result.

Even if we were to realize the ideal automatic mechanical control of trains, it would still be extremely doubtful if such beneficial results could be obtained from the automaton as would be possible of attainment from the best efforts of the human agency, because it has been well demonstrated in the past that the skill of the human hand is capable of producing results which cannot be obtained by the most accurate machinery. No system of mechanical safeguards can be devised that will dispense entirely with human responsibility. Man's genius, with all its vast accomplishments in mechanical perfection, has not yet succeeded in developing the "fool proof" machine, but in every operation there appears at some point the dominating influence of the human mind. Let it relax or waver for an instant and all mechanical perfection is at naught.

AMERICAN RAILWAYS SUPERIOR IN MECHANICAL EQUIPMENT.

No railways anywhere are better equipped with mechanical devices for safeguarding human life than are the railways of this country. Cars and locomotives of the most modern construction, equipped with air brakes of the most efficient design, are in general use. Highly perfected automatic signal systems designed to preclude the possibility of collisions are in use on many lines. Their use is being extended, although not so rapidly as might be. Yet, with all these mechanical measures, lives are snuffed out by the score because some human mind failed. With all our perfection in this direction it appears as though we are encouraging carelessness among employees through overconfidence in mechanical perfection.

It is doing the American employee an injustice to contend that he is inferior, mentally and physically, to his European brother, and therefore that it is necessary to devise mechanical means to perform the services society is entitled to and which the employee is in duty obligated to render. If it is possible for the European railway manager, the American manufacturer, business man, contractor, and the government to obtain absolute reliability and precision from their employees, it ought not to be impossible for the American railway companies to get the same attention to duty and precision from their employees.

The railway employee should understand that a railway is a quasi-public corporation, and that when he accepts employment with it he becomes a quasi-public servant, and owes the same duty and responsibility to society as the company that employs him.

Since the foregoing statistics show that human fallibility is responsible for 59.7 per cent. of the deaths and 57.4 per cent. of the casualties resulting from all accidents for the period under consideration, it is apparent that serious investigation must be made to find an effective remedy. This is especially true since it has been demonstrated that it is not impossible to obtain reliability and precison from such employees in other countries and from employees in the other industries of this country.

There should be closer working relations between the managers and employees of railways for the purpose of encouraging open and free discussion on the subject of safety. The problem of making men trustworthy and dependable, if approached in the right direction, will not be found the hopeless task it is often assumed to be. Some of the railway companies have already formed "safety committees," with this very object in view. Their slogan is "safety first." They co-operate with all employees in devising measures of safety for the protection of life and limb in all branches of railway operation, and methods of this kind should be extended and encouraged.

RAILWAY EMPLOYEES SHOULD BE AMENABLE TO STATE

What has been accomplished by Germany and other European countries in checkmating preventable accidents in railroad operation by making railroad employees amenable to the state for faithful attendance to and performance of their duties, might well be done in this country. Thus far, however, when effective disciplinary measures have been suggested as a remedy for human fallibility or carelessness in railroad operation, the difference in the sociological and political conditions existing here have been set forth as an insurmountable obstacle. Even though a majority of the European countries are in advance of us on this question, a start has only been made in the direction of eliminating the human equation from railroad operation. Can it be that the American people, the most efficient on earth, should continue to be led by Europe? A new idea cannot be perfected without some experiment, and until an honest attempt is made to find out how far the methods in vogue in the European countries may be relied upon in this country, it will not be known to what extent sociological and political conditions enter as factors into this problem.

The operation of railway trains is fast developing into an important and superior vocation, and all right-minded employees are beginning to realize the necessity for the introduction of effective means to protect them from the dangers attendant on the negligent acts of incompetent, careless or indifferent employees. It is conducive to their own interests and safety to encourage and advance such projects.

To accomplish this purpose, it may be necessary for the state to go beyond the corporate entity and its executive officers and hold each individual employee responsible for the proper and safe performance of his individual duty. This may be brought about in many different ways, and it is suggested that it may be effected in the following manner:

Employees engaged in train operation should be required by law to serve an apprenticeship of a sufficient duration to qualify themselves for the position they seek. Before the applicant is permitted to serve in any capacity in train service, he should be examined by a competent state board of examiners as to his physical and mental qualification. Such examinations and tests should be graduated so as to meet the requirements of the different grades of the service, and a license must define the kind of service the applicant may perform. The state must reserve the right to revoke the license for good cause.

Many of the states have for a number of years been enforcing this very idea against the practitioners of medicine, lawyers, dentists, undertakers, electricians, horseshoers, plumbers, stationary enginemen, barbers, and others for no other purpose than to protect society, and excellent results have been secured. As far as the public is concerned it is difficult to understand how the ability and requirements of the doctor, pharmacist, dentist, and others are of greater importance to society than those of railway employees, and if it is possible to reduce indiscretions and incompetency in the classes mentioned by effective state legislation, it should not be difficult to extend similar legislation to railway employees.

The lack of uniformity and the varying degrees to which state laws affecting railroad operation are enforced in the different states is very marked. The measure of safety which the public is demanding from errors in railroad operation cannot be expected to be realized without uniform and concerted action on the part of the different states whose duty it is to care for the public interests in this respect. The advisability and fairness of some of the state laws now existing and affecting train operations are also open to question.

Because of the confusion which now exists in the different state laws, it appears that both the interests of the public and the railway companies in the matter of safety from errors in railroad operation would be materially advanced if all legislation pertaining to railroad operation was made uniform.

NINETY-TON HIGH SIDE GONDOLA CAR.

Developed on the Norfolk & Western and Equipped With Specially Designed Six-Wheel Equalized Trucks.

Cars larger than 120,000 lbs. capacity, if mounted on four-wheel trucks, involve pressures on the journal bearing which cause a large increase in the troubles with wheels and axles, as well as requiring much closer attention to prevent hot boxes. It therefore seems advisable to use six-wheel trucks under cars of extra large capacity. A six-wheel truck, as constructed for passenger cars, has been considered too expensive and complicated for satisfactory use in freight service, and with the exception of a few special cases, has not been so employed. When cars as large as 90-ton capacity, considered in connection with the usual 10 per cent. overload requirement, are to be built, a six-wheel truck is practically compulsory, and in connection with the design of such a car on the Norfolk & Western, the problem was solved by the development of an entirely new type of six-wheel truck, which permits the use of the ordinary 5½ in. x 10 in. M. C. B. journal box, while at the same time the weight is properly equalized and the truck is given the necessary flexibility.

These cars are of the high side gondola type and measure 9 ft. 6 in. in width, 6 ft. 6½ in. in height and 45 ft. 6¼ in. in powerful side stiffeners near the top chord angle of the side plates. As this car has been designed for use in a dumping machine, it will be readily seen that such construction is necessary.

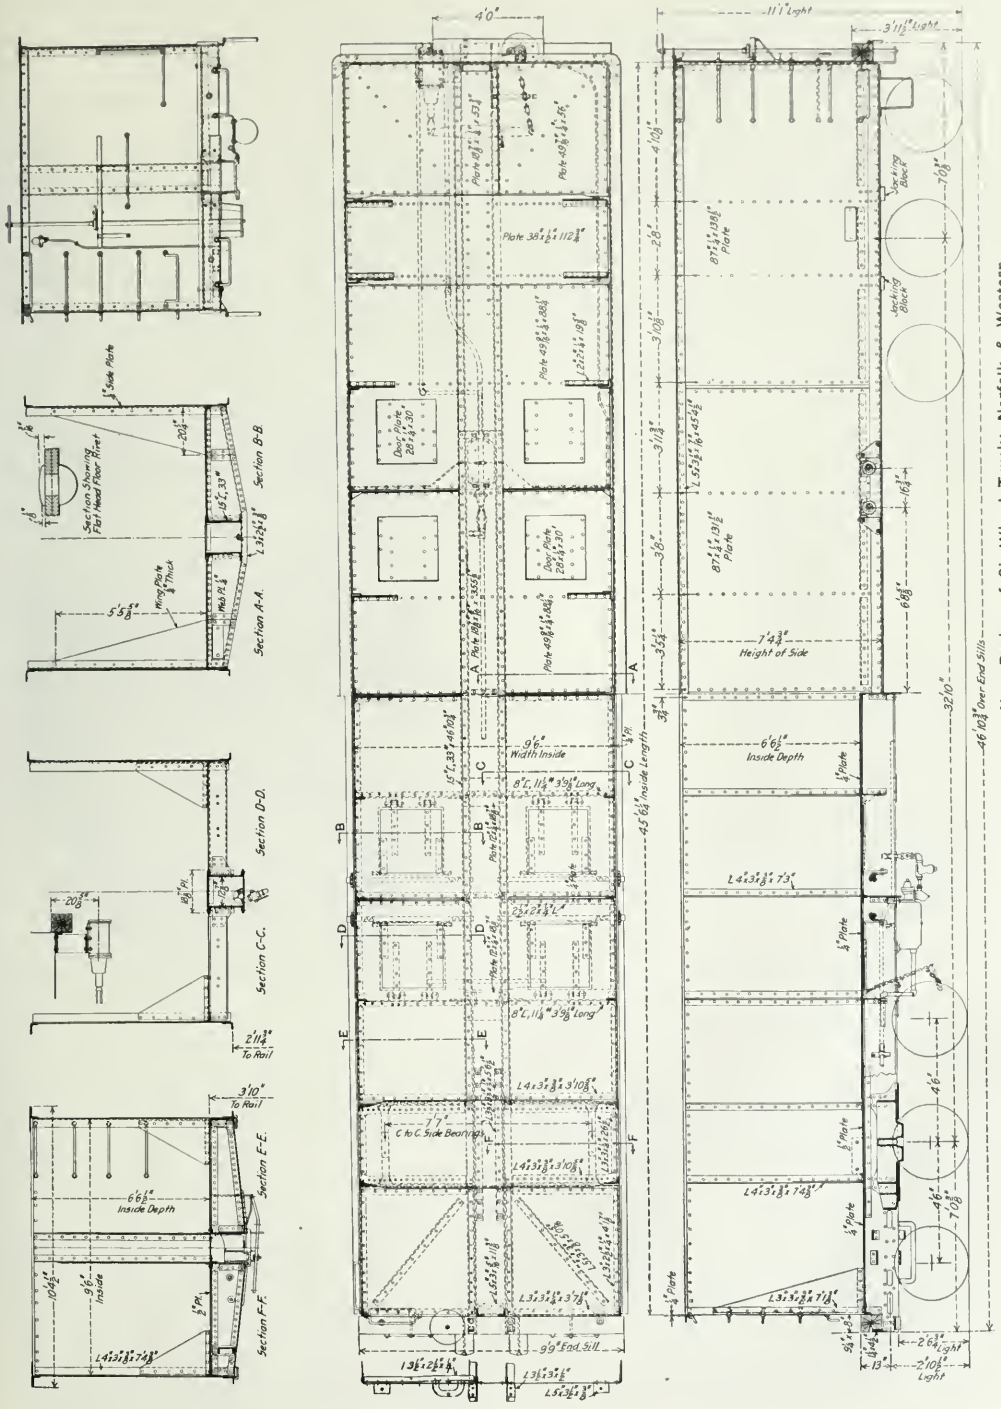
Commercial shapes are largely used, special castings being incorporated at a few points only. The center sill consists of two 15 in. 33 lb. channels which are continuous for the full length over end sills. These are set 12⅞ in. apart with the flanges extending outward and a 5/16 in. top cover plate extends continuous between the bolsters. The edges of the ¼ in. floor plates extend under this cover plate and are secured to the center sills by the same rivets. At the double body bolster there is a ½ in. plate 38 in. in width, and extending across the car, which forms the floor at this point. Between this and the end of the car the center sill cover plate is ¼ in. thick. At the bolster the center sill is reinforced at the top by 3½ in. x 3½ in. x ½ in. angles arranged as shown in the illustration. The three cross bearers each consist of a 3 in. x 2½ in. x ⅜ in. angle continuous under the center sill and secured to the bottom of the side posts at either end. They also include a ¼ in. web plate on either side

Ninety-Ton Gondola Car Mounted on a New Design of Six-Wheel Truck.

length on the inside of the body. This gives a cubic capacity of 2,829 cu. ft. level full, and 551 cu. ft. in a 30 deg. heap, making a total of 3,380 cu. ft. Pocahontas run of mine coal is taken at 58.85 pounds to the cubic foot. The first load of coal hauled in the car was 95 tons, with some corners not quite filled out. The maximum outside dimensions are 48 ft. 4⅞ in. over bumping blocks, 10 ft. 4½ in. to the top of the side of the light car, 11 ft. 1 in. to the top of the brake shaft and 10 ft. 4½ in. extreme width over the body. The cars are provided with eight small drop doors in the floor, which are operated by a simple type of winding chain and shaft mechanism. The design is of the continuous center sill type. Cross beams or diaphragms are introduced to prevent deflection of the center sills, which, in a car of this length, would prove serious. This results in transmitting the load to the sides of the car which carry it, as plate girders, to the bolsters, whence it is transferred to the center plates. The stakes are on the inside and while interfering to a limited extent with lading other than coal, ore, or similar material, have a number of advantages. With outside stakes, the punching of the upper flange of the side of the car for rivets detracts materially from the strength of the section, this portion being in tension; while with inside stakes the rivet holes are on the compression side of the member. It has also been possible, with inside stakes, to do away with body straps, which are undesirable and form a fertile source of repair bills. Inside stakes are of particular advantage in this case inasmuch as they form the means of between the center sill and side. This plate is made in two parts, the outer end for a distance of 20¼ in. consisting of an extension on the wing or gusset plate which is carried nearly to the top of the sides. The remainder is a properly shaped plate which extends only to the floor. The joint between the two is made with a splice plate ¼ in. thick. The top member of the cross bearer consists of two 2½ in. x 2 in. x ¼ in. angles extending between the center sill and the side plate. The floor plates are of such a size that the joints come at the cross bearers and the edges are riveted to the angles.

Midway between the cross bearers and also between them and the bolsters are floor beams, consisting of 8 in. 11¼ lb. channels with the outer ends riveted to the bottom of the side posts and the inner ends secured to the center sills through the medium of ¼ in. gusset plates and angles fastened on the webs of the center sill channels. The smaller wing or gusset plates are located above these floor beams and consist of triangular ¼ in. plates about 28 in. wide at the bottom and about 31 in. high riveted to the side posts and secured on top of the floor plates by angles of the proper length, the rivets holding the angles also extending through the flanges of the channels which form the floor beams. At both the floor beams and cross bearers there is a short reinforcing angle riveted to the top cover plate of the center sill, which is also the floor plate.

In view of the large weight concentrated at the center plate it was necessary to design a bolster of unusual strength and

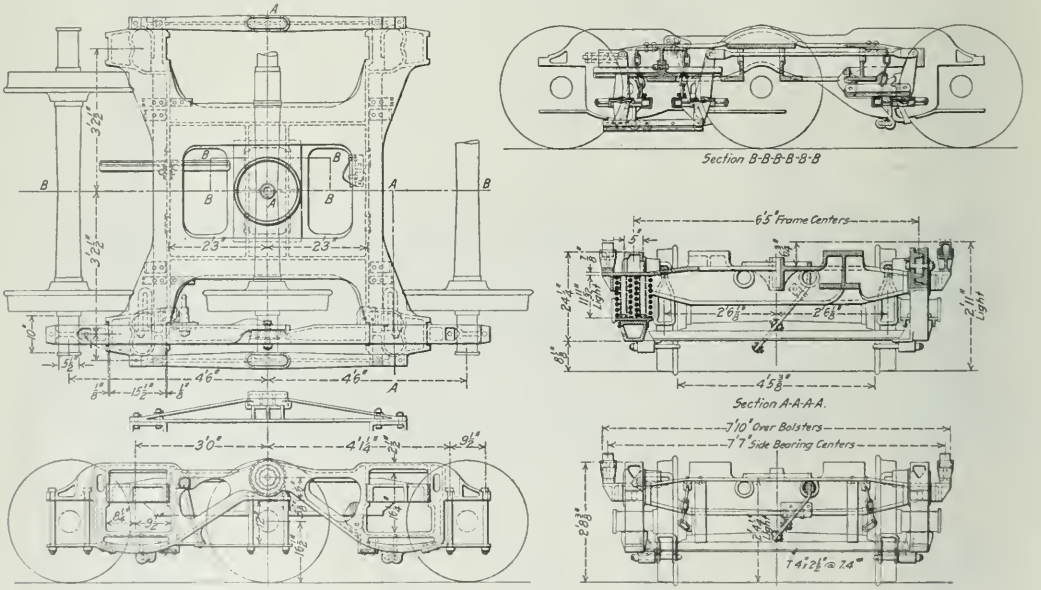


Ninety-Ton, High Side, Gondola Car Mounted on a New Design of Six-Wheel Truck; Norfolk & Western.

rigidity which would properly convey the load from the side girders, which carry the greater portion of it. Practically two bolsters, set 36 in. apart, have been employed and a large casting fitted between the center sill channels connects the two and includes the center plate. Each of these bolsters consists of a ½ in. web plate and a pair of 4 in. x 3 in. x ⅜ in. angles at the top. Similar angles at the bottom, which in both cases extend only from the side plate to the flange of the center sill channel, are also used. A ¾ in. plate, 16 in. in width at the center and tapering to a width of 8½ in., extends under the center sill and the center plate casting and is riveted on either side to the flanges of the bottom angles. At the junction of the side plate and each of the bolsters there is a jacking casting, formed to fit around the bottom end of the side post and strengthen the construction at this point. This gives four jacking points at each end of the car. A ½ in. top cover plate of sufficient width to include both parts of the double bolster extends across the car and is secured to the side plate by an angle. The side bearings are attached to angles. The end sill is of oak 8 in. x 9¼ in. and the center sill channels are cut out at the top sufficient to allow its introduction. The end sheet of the car extends behind the end sill which is also reinforced by the end posts and the angle to which the floor plates are secured.

The car has a Miner friction draft gear with Miner attachments. It will be seen that the gear is attached directly to the center sills with the usual reinforcing castings on the webs and that the coupler yoke passes below the wooden end sill, the carrier iron being bolted to the bottom flanges of the center sills. The rear casting of the draft gear has a minimum clearance of ⅛ in. from the extension on the center plate casting. The center of the line of draft is 3¾ in. above the bottom of the center sill channels.

Each car has two sets of brake rigging, including auxiliary reservoirs, triple valve, brake cylinder, etc. The reservoirs are supported below the center sills just inside of the truck and the train line passes between the two center sill channels for the dis-



Six-Wheel Equalized Truck with Journal Boxes Secured to the Side Frames; Norfolk & Western.

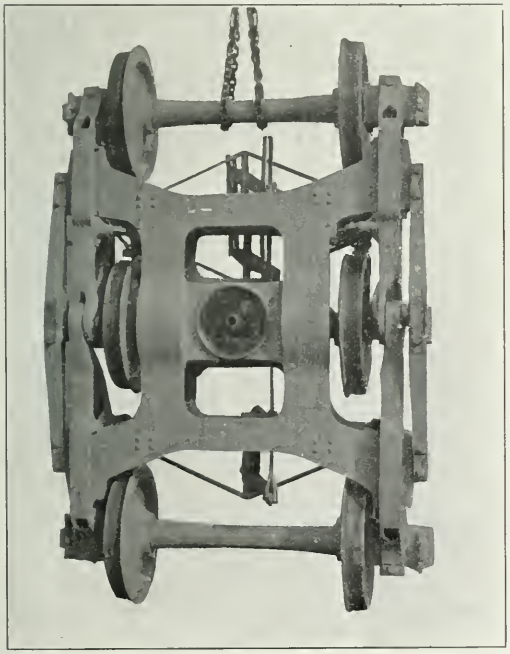
a properly shaped casting forming a bridge between the two bolsters and are located at a radius of 3 ft. 9½ in. from the truck center.

A large proportion of the load is carried by the sides of the car which consist of ¼ in. steel plates 87 in. in width and 138 in. in length. The vertical joints between these sheets are made by ¼ in. splice plates on the inside, and the double stakes at these points are set in enough to allow for them. This plate girder, of which the side plates form the web, has a 5 in. x 3 in. x 7/16 in. angle at the bottom with the flange extending outward, and a 5 in. x 3½ in. x 7/16 in. angle at the top. Both angles are continuous for the full length of the car. There are no diagonal braces and the plates are stiffened by the 4 in. x 3 in. x ⅜ in. angles forming the [illegible] which are placed as shown on the drawings. These angles continue to the bottom of the side plate and are fastened to the cross bearers and floor beams. As before mentioned the vines or gussets of two different sizes form the principal source of stiffness for these girders.

The construction at the end is practically the same as at the sides. The corner posts, however, are 3½ in. x 3½ in. x ⅜ in. tance between the bolsters. At the bolsters and to the end of the car it runs outside of the sills. The brake cylinders are located just under the end sill, there being one at either end of the car connected to the adjacent triple valve and reservoir. The hand brake is located on the opposite side of the car from this cylinder and connects to the opposite end of the same brake lever. This location of the brake cylinder is somewhat in the nature of an experiment and arrangements have been made for placing the cylinders between the trucks at about the usual locations if the present location should prove unsatisfactory.

A six wheel equalized truck without pedestals is a novelty and has been developed for use on this car by W. H. Lewis, superintendent of motive power and John L. Pilcher, mechanical engineer. It consists of a cast steel side frame in two parts and of peculiar shape arranged to carry three journal boxes at 4 ft. 6 in. centers. Directly above one of the journal boxes the castings are arranged for a swivel connection. In these two castings the openings for the ends of the bolster and for the group of coil springs are spaced at 3 ft. centers from the center axle, bringing them 18 in. from the outer axles. One of the illustra-

tions clearly shows the form and arrangement of the double cast steel bolster which carries the center plate. This rests on four nests of three double coiled springs each and has an extension beyond the side frame to allow the attachment of a bridge which carries the side bearing at the center of the truck. This bridge is bolted to the bolster extensions. Each group : springs consists of three nests of an outside coil of 1¼ in. diameter wire, 5 in. outside diameter, with an inside coil of 9/16 in. wire, 2¼ in. outside diameter. The springs work at 40,000 lbs. stress in the bar when the car is loaded to a 10 per cent. overload. The free height is 11½ in. with a total deflection, free to solid, of 1¾ in. The swivel joint in the side frame is so formed as not to give any shearing action on the bolt. This arrangement is shown in the sectional view through the center of the truck. This view also shows that the bolster is not as heavy as it might appear in the photograph. There are two 4 in. x 2½ in. tees bolted to suitably formed lugs on the bottom of the side frames and located midway between each of the pairs of wheels. These take the place of sand planks which are not feasible when the bolsters are arranged in respect to the wheels as they are in this case. It is possible that these cross ties may be omitted altogether. Tests will be made to determine this.



Top View of the New Six-Wheel Freight Car Truck.

The brake rigging on each truck is comparatively simple and arranged in a manner similar to a six-wheel passenger truck. Designs for carrying the brake beams from either the side frame or the bolsters have been prepared. The one given here shows the former. This truck has been patented by Messrs. Lewis and Pilcher.

The weight of the two trucks alone is 29,800 lbs., and of the car complete with trucks is 65,200 lbs., giving a total weight with lading, including a 10 per cent. overload, of 263,600 lbs., or an average weight per axle at the rail of slightly less than 44,000 lbs. With a 10 per cent. overload the proportion of revenue lading to total weight will be about 75 per cent., and it will be over 73 per cent. without the overload. It is expected that it will be possible to reduce the weight slightly, especially that of the trucks in later cars.

The entire car has been carefully designed with a view to ease of manufacture. To this end all plates and shapes are laid out for multiple punches, and care has been taken that if the plates, etc., come within the customary variations in shearing, no reshearing will be necessary. Duplication of parts has been carefully considered with good results.

OPERATING ORGANIZATION ON THE CANADIAN PACIFIC.

The Canadian Pacific lines west, including 7,000 miles extending from the Great Lakes to the Pacific coast, are divided for operating purposes into four divisions with a general superintendent in charge of each. These divisions are subdivided into districts in charge of superintendents. The vice-president and general manager in charge of operation on the lines west is assisted by an assistant general manager, chief engineer and other staff officers. The chief engineer approves standards and engineering practice and has direct charge of the building of new lines, reporting to the vice-president. The assistant general manager is assisted by a superintendent of motive power, engineer of maintenance of way, superintendent of car service and other staff officers. On each division the general superintendent is assisted by a division engineer, master mechanic and car service agent, the latter performing the usual duties of the superintendent of transportation, a title which is not thought to be as good as car service agent. Each superintendent has on his staff a resident engineer, district master mechanic, trainmaster, master carpenters, roadmasters, chief train despatchers, etc. The same general plan is followed in offices of all grades of having one clerical staff for the entire office and a general standard for office arrangement has been worked out which has effected a considerable saving.

The accompanying floor plan of the general superintendent's office in Winnipeg illustrates the general design of division and district offices. There is a private office for the general superintendent with smaller private offices for his assistants, and a single large room for the clerical force. A letter coming to the general superintendent, master mechanic, division engineer or car service agent, would be opened in the clerical office, most of the correspondence on all subjects being addressed to the general superintendent. If the letter treated of engineering, a reply would be written by the division engineer and placed before the general superintendent for signature. If mechanical, a reply would be dictated by the master mechanic, and if it treated of transportation, it would be handled by the car service agent. This practice enables the general superintendent to take advantage of the technical knowledge of his assistants and at the same time know exactly what is being done in each of the departments on his division and to maintain general supervision over all of the work. It also eliminates the large amount of inter-department correspondence common under the departmental organization. This system was introduced about the time that Major Hine started the unit system of organization on the Union Pacific. It is thought by the Canadian Pacific officers that the practice of allowing the technical men to retain their old titles adds prestige to their position which is not obtained in a system which calls them all assistants. The use of a single chief clerk for the entire office eliminates duplication of clerical work and friction between the chief clerks of the various departments. The clerical office is divided into departments which handle the statistics and filing for each of the departments of the division. Stenographers are used in common by the officers and all correspondence is kept in a common file.

It may be noted that on the western lines every superintendent is required to write a weekly news letter to the general superintendent. This letter, which is mailed every Saturday night, tells briefly what the weather has been, how traffic is moving,

Form for Recording Monthly Operating Costs on Canadian Pacific—Transportation Charges.

and recounts any unusual occurrences. It also gives the earnings at principal stations, the bank clearings at important cities, a brief statement as to crop conditions, new industries that may be productive of traffic, the developments being made by competing railways and any other news that may be of value in promoting economy or securing new business. These letters are summarized by each general superintendent and forwarded to the assistant general manager. This system of reports has been found very valuable in keeping the general superintendent and vice-president in close personal touch with the conditions on their territories.

Form for Recording Monthly Operating Costs on Canadian Pacific—Mechanical Department Expenses.

Each superintendent has an accountant and the necessary timekeepers. The accountant is required to furnish the superintendent a monthly statement of the detailed expenditures on his division. The forms used for these statements are reproduced herewith. These statements enable the superintendent to locate any unnecessary expense and to determine how he can best promote economies or reduce expenses in emergencies. Each superintendent is held responsible in a large measure for the financial showing made on his district. He is not asked to explain why operation was so costly, but to take immediate steps to remove the cause. These expense statements are forwarded monthly to the general superintendent who combines all the districts on his division and forwards them to the assistant general manager.

The present system of organization on the western lines of the Canadian Pacific has been worked out under the direction of George Bury, vice-president and general manager, to whom we are indebted for the above description.

Lancashire & Yorkshire Railway, England.—New railways are proposed at Southport, Bolton, Royton, Knottingley and Goole. The new Southport line will run from Ainsdale to Kew Gardens; the Bolton line will connect with the Liverpool & Bury and the Bolton & Preston lines; the Royton line will connect with the Royton branch and the Oldham, Rochdale & Royton line; the Knottingley line with the Askern branch and the Wakefield, Pontefract & Goole line; and the Goole line will connect with the Axholme Joint Railway. Widenings to be made at Liverpool, at Fazakerley and at Bolton are included in the plans, and it is intended to alter and enlarge Victoria station at Manchester.

LIMITATIONS OF COMMISSIONS' POWERS.

Supreme Court Decisions Repeatedly Hold That Commission's Orders Must Show the Evidence on Which They Are Based.

By H. T. Newcomb,
Of the Bar of the District of Columbia.

Prior to August 28, 1906, the date on which the Hepburn act took effect, the Interstate Commerce Commission was required to make a report in each case in which it issued an order and to embody in each report the findings of fact on which the order was based. In all subsequent judicial proceedings such findings were made *prima facie* evidence. This provision, except in the case of orders for the payment of money, was omitted from the revision of 1906, apparently for the reason that it was assumed that the effect of the new legislative command to all concerned to obey the commission's orders, without the intervention of judicial approval, transformed the regulative body into a legislative agency which, in consequence, became one that need not assign reasons for or justify its action. It seems to have been assumed, in giving form to this legislation, that Congress could not only delegate power over rates which it might have exercised directly, but that it had power, also, to exempt the agency on which it conferred the extraordinary administrative power of rate-making from the ordinary inquiries concerning the exercise of its power to which every administrative agency is subject, namely, whether, in a particular case, its action was in good faith, with honest and upright purpose, and reasonable according to the standards expressed or implied in the grant of authority.

This was surely a violent assumption, and, perhaps, there was nothing else in the Hepburn act so significant of the disregard, on the part of President Roosevelt and those who aided him in enforcing his will upon a reluctant Congress, of the limitations upon the power of legislative bodies to entrust to others powers partaking of the legislative character.

When a legislative body acts within the scope of its constitutional powers, there is no authority which can inquire whether it acted reasonably and in good faith or arbitrarily and with fraudulent purpose (although, of course, some constitutional powers are limited to reasonable exercise and, in such cases, the inquiry as to reasonableness is an essential part of the inquiry whether the power exists); or, stated differently, there is a conclusive presumption, which no evidence could overcome, that, when the legislature enacts that which it has power to enact, it has acted reasonably and in good faith. There is a similar presumption, but of lesser degree, in favor of the acts of administrative officers; but, in this case, whoever may attack the act is permitted, if he can, to overcome the presumption by showing that it was arbitrary, unreasonable, committed in bad faith or with an improper purpose. Congress cannot confer, upon any officer or agency of government, power to act arbitrarily, and hence the inquiry as to the nature of the act is essentially an inquiry whether it is within the grant of power.

> "It is not to be supposed that Congress would ever authorize an administrative body to establish rates without inquiry and examination; to evolve, as it were, out of its own consciousness, the satisfactory solution of the difficult problem of just and reasonable rates for all the various roads in the country." *Interstate Commerce Commission v. Cincinnati, New Orleans & Texas Pacific Railway*, 167 *U. S.* 479, 509.

In the much later case, *Interstate Commerce Commission v. Illinois Central Railroad* (215 *U. S.* 452), in a luminous and frequently cited paragraph closely connected with the assertion that, "Power to make the order, and not the mere expediency or wisdom of having made it, is the question," (215 *U. S.* 452, 470), the Supreme Court, speaking through the present Chief Justice, intimated that the question whether, "even although the order be in form within the delegated power, nevertheless it must be treated as not embraced therein, because the exertion of authority which is questioned has been manifested in such an unreasonable manner as to cause it, in truth, to be within the elementary rule that the substance, and not the shadow, determines the validity of the exercise of power," is essentially a part of the inquiry which seeks to determine whether "the administrative order is within the scope of the delegated authority under which it purports to have been made." (215 *U. S.* 452, 470.)

In a still later case, *Interstate Commerce Commission v. Union Pacific Railroad* (222 *U. S.* 541) the Supreme Court, its unanimous judgment being expressed in an opinion by Mr. Justice Lamar, somewhat amplified the foregoing, holding that an order of the commission would not be final "if the commission acted so arbitrarily and unjustly as to fix rates contrary to evidence, or without evidence to support it; . . ." (222 *U. S.* 541, 547), and, further, in pursuance of the same thought, "Its conclusion, of course, is subject to review, but, when supported by evidence, is accepted as final; not that its decision, involving, as it does, so many and such vast public interests, can be supported by a mere scintilla of proof, but the courts will not examine the facts further than to determine whether there was substantial evidence to sustain the order." (222 *U. S.* 541, 547-8.)

From the foregoing declarations of a principle that needs only to be stated to approve itself to the understanding, to the observation in the just decided case of *United States v. Baltimore & Ohio Railroad* (*decision rendered on November* 18, 1912) that the orders of the commission cannot be sustained by facts not shown by testimony or by reports and records of which it is entitled to take notice and receive as evidence in the record, is but a short step and one that could not have been avoided. In the recent case Mr. Justice Holmes, speaking for the court, said:

> "We remark that it is stated in the commission's report that they base their conclusion more largely upon their own investigation than upon the testimony of the witnesses. It would be a very strong proposition to say that the parties were bound in the higher courts by a finding based on specific investigations made in the case without notice to them. *See Washington, ex rel. Oregon R. R. & Nav. Co., v. Fairchield*, 224 *U. S.* 510, 525. Such an investigation is quite different from a view by a jury taken with notice and subject to the order of a court, and different again from the question of the right of the commission to take notice of results reached by it in other cases, when its doing so is made to appear in the record and the facts thus noticed are specified, so that matters of law are saved."

The reference to *Washington, ex rel. Oregon R. R. & Nav. Co., v. Fairchild*, in the foregoing is significant. That case came to the Supreme Court on writ of error to the Supreme Court of the State of Washington, which had decided against the claim of the railroad that its property was taken without due process of law and in contravention of the Fourteenth Amendment to the federal constitution by an order of the state railroad commission requiring certain track connections to be made with lines of other companies. After referring to the character of this order, the court, speaking by Mr. Justice Lamar, said:

> "Its validity could not be sustained merely because of the fact that the carrier had been given an opportunity to be heard, but was to be tested by considering whether, in view of all the facts, the taking was arbitrary and unreasonable, or was justified by the public necessities which the carrier could lawfully be compelled to meet. . . .
>
> "So that, where the taking is under an administrative regulation, the defendant must not be denied the right to show that, as matter of law, the order was so arbitrary, unjust, or unreasonable as to amount to a deprivation of property in violation of the Fourteenth Amendment." 224 *U. S.* 510, 523-4.

As it appeared that the state commission, when it made the order, did not have before it evidence sufficient to sustain the taking of property which it involved, and as in the subsequent

proceedings in the state courts no additional testimony was permitted, the judgment sustaining the order was reversed. The inference, otherwise possible, that this conclusion was in any degree controlled by the fact that the question arose in connection with an order requiring a physical connection to be made, rather than an order prescribing rates, is negatived by the fact that the first reference in support of the concluding sentence quoted above, was to *Chicago, Milwaukee & St. Paul Railway v. Minnesota* (134 *U. S.* 418), a rate case, that affirmed the principle expressed in the following frequently cited passage:

"The question of the reasonableness of a rate of charge for transportation by a railroad company, involving as it does the element of reasonableness both as regards the company and as regards the public, is eminently a question for judicial investigation, requiring due process of law for its determination. If the company is deprived of the power of charging reasonable rates for the use of its property, and such deprivation takes place in the absence of an investigation by judicial machinery, it is deprived of the lawful use of its property, and thus, in substance and effect, of the property itself, without due process of law and in violation of the Constitution of the United States; and in so far as it is thus deprived, while other persons are permitted to receive reasonable profits upon their invested capital, the company is deprived of the equal protection of the laws."

These extracts seem to support the view that not only would the Interstate Commerce Commission be usurping authority not within the scope of the grant of power under which it exercises all its lawful powers, if it should undertake to make an unreasonable or arbitrary order of any kind or one not sustained by evidence that it is entitled to consider, but that an attempt on the part of Congress to grant authority to make such an order, or to make any order under such conditions, would be unconstitutional and void.

The principle that every order of an administrative tribunal, federal or state, exercising rate-making power, must be sustained by a record containing evidence that the order is not arbitrary or unreasonable, and that those whom the order would bind must have notice of this evidence, was several years ago announced by the Court of Appeals of New York in *Saratoga Springs v. Saratoga Gas, Electric Light and Power Company* (191 *N. Y.* 123) as follows:

"It is also objected that any order made by the commission may be based, not only on the evidence and proceedings had at the public hearing provided by the statute as a perquisite for making any order fixing maximum rates, but on the *ex porte* statement of the officers, agents, and inspectors of the commission, of which a company may have no knowledge, and to controvert which no opportunity is afforded. We do not so construe the statute. . . . As we read the statute, the investigation and report of agents and inspectors are to follow the filing of any complaint, and to precede or to be made during the public hearing. . . . It is plain that no corporation could make its defense until it was clearly notified of what was charged against it, and the proof to support such charge was given. While the commission might not be bound by technical rules of evidence, still it was plainly intended that the whole proceeding should assume a *quasi-judicial* aspect. . . . The commission being empowered to subpoena witnesses and take testimony, its inspectors or agents could be required to appear and verify any reports made by them; or, if we assume that such reports could be received in the first instance without verification, the inspectors or agents could be compelled to attend at the instance of either party, and be examined as to the truth of the statements in their reports and their knowledge of the facts therein contained." 191 *N. Y.* 123; 18 *L. R. A. (N. S.)* 713, 724-5.

Apparently the recent expression of the Supreme Court of the United States, by Mr Justice Holmes, sanctions the foregoing and indicates its complete application to the Interstate Commerce Commission. The extent of the change in methods necessary to meet this requirement is perhaps exaggerated by contrasting [illegible] the following declaration of the latter commission, taken from its Twenty-second (1908) Annual Report.

"Practically every complaint, formal or informal, which comes before the commission requires the examination of tariff files and statistical reports of the carriers for the purpose of determining whether or not the complaints are well founded as stated. With the present unification of these several branches of the work such reports are obtained in very short time. In fact, *the information necessary to intelligent action by the commission can frequently be obtained from a verbal interview with the head of the appropriate division*, and in a great many instances no further research is necessary. In this connection it should be remembered that for the heads of its tariff and statistical divisions the commission has chosen practical railroad men.

. . . . . .

"Moreover, it must be remembered that *the commission can seldom, if ever decide a case merely upon the evidence presented to it.* In this respect it is radically different from a court. The ordinary court determines only the rights of the parties before it, but every decision of the commission involves the rights of parties who are not present. Any important readjustment of rates applies not only to the complainant, but also to all shippers under those rates, and frequently, as a commercial necessity, to carriers who are not before the commission in a particular case; and in addition to the evidence actually presented to the commission, it must consider the effect of a ruling in any given case upon carriers, shippers, or localities who are not represented. It is obvious, therefore, that the determination of almost every case requires consideration of conditions, tariffs, and statistics which are not presented to the commission, but which it must take notice of in order to faithfully perform its duty, and the proper expedition of the commission's work requires that these aids to the final determination of cases arising before it should be as easy of access as possible. It is, perhaps, not too much to say that not a single case arising before the commission could be properly decided if the complainant, the railroad, or the commission were bound by the rules of evidence applying to the introduction of testimony in courts."

Despite the foregoing, it is not believed that in many important cases the Interstate Commerce Commission has based final action upon mere verbal statements of its employees or even upon considerations of commercial policy not supported by the record actually before it. So far as it has actually assumed the right to act upon such considerations it is evident that its practice must be revised and can be revised without detriment.

It is proper to notice, in conclusion, the very superficial suggestion, not infrequently heard, that the acts of regulative tribunals are made more vulnerable to attack when they are accompanied by statements of the reasons by which they were prompted. Some one, whom the writer does not recall, advancing this view, quoted the remark of a famous magazine editor who said that when he rejected a manuscript he was always right, when he gave a reason for the rejection he was always wrong. It is true that the commission has, from the beginning, and pretty consistently, followed the plan plainly intended by the law, of stating rather fully the reasons for its orders and that, in the relatively very small number of instances in which these orders have been attacked in the courts and judicially condemned, the courts have, quite uniformly, found that the statement of reasons pointed to the error that had been made. But the decisions in *Washington v. Fairchild, supra*, and the other cases herein cited, clearly show that if no reasons had been given, the facts would have been examined and the error traced to its source in the contents, or in the omissions, of the record on which the commission acted.

Among the conservative conclusions suggested by the rule laid down by Mr. Justice Holmes in the recent case, and by the New York Court of Appeals in the Saratoga Springs case, is that the regulative process might be simplified and strengthened by restoring the requirement, abolished by the Hepburn act, that all orders of the Interstate Commerce Commission should be supported by reports containing the findings of fact on which they are based. There would then be at least a *prima facie* showing, carrying a strong presumption of authority, with which judicial inquiry concerning the legality of any of the commission's orders would begin.

North British Railway, England.—The North British Railway notice shows that the company is intending to construct 14 new railways for the purpose of giving additional facilities to the Lothian coal traffic, new railways in Linlithgow and Fife, and a pier at Arisaig. Power may be taken to restrict some of these proposed railways to the transportation of "such particular class or classes of traffic as the intended order may prescribe." It is also proposed to confirm agreements with the Caledonian Railway and the Edinburgh Corporation, to enable the Burntisland Harbor Commissioners to borrow and the company to advance further moneys, and to raise additional capital.

IMPRESSIONS OF GERMAN RAILWAY PRACTICE.

The Handling of Locomotives at Terminals, the Economizing of Fuel and the Care of Employees Are Notable Features.

By Henry W. Jacobs.

Of all the countries in Europe the traffic conditions most nearly approximating those of the United States are found in Germany. The methods there used in operating and handling locomotives will therefore be of interest to American railway officers. German passenger and freight trains and locomotives are heavier than those commonly found elsewhere in Europe, and while the most modern of the express and heavy freight locomotives are of considerable size and power, compared even with American standards, their weights and dimensions, of course, do not nearly equal those found in our largest locomotives, the primary limitations being the axle load allowed by the track and bridges and the clearance limits of tunnels.

The use of freight locomotives without a leading truck is quite common practice, but not to the extent prevailing in England where leading trucks are seldom used on freight locomotives. Tank locomotives are frequently used in both freight and passenger service, and almost universally in switching service. An example of the types of locomotives prevailing upon a dense traffic division of a German railroad is given in the following table:

Type.	Service.	No. of Locos.
0-4-0 (tank)	Switch	9
2-4-0	Passenger	2
0-6-0	Freight	14
0-6-0 (tank)	Switch	23
4-4-0	Fast passenger	36
2-4-2 (tank)	Passenger	7
2-6-0	Passenger	7
2-6-0	Freight	25
2-6-0 (tank)	Passenger	33
0-8-0	Freight	15
Total		171

On some of the lines with heavy grades I observed freight engines with five pairs of drivers, but without leading or trailing trucks. As yet very few articulated engines of the Mallet type have been used in Germany, although they are being introduced to a certain extent in Belgium, Hungary and the mountainous Balkan regions. The principal reasons why French locomotives with their great tractive effort are not used in Germany are that the topography is generally favorable to moderate grades, and also because of the limitation placed upon train length, this limit being 120 axles, with a very few districts where 150 axles can be employed. Inasmuch as the German freight cars have a rigid wheel base with only two pairs of wheels, two German cars are about equal in capacity to one American freight car with its two four-wheel trucks, and we may consider the German limitation as to train length as equivalent to what would be a limit of thirty cars with us. This does not take into account the much greater clearance of our cars and the consequently heavier load carried per axle.

The handling of the locomotives at a terminal has features of interest to Americans and offers some contrasts to our practice. There are usually two freight yards at a large terminal. Passenger trains are assembled in a portion of these yards. One freight yard is devoted to arriving trains, the other to departing trains, both being worked like a hump yard in America. A locomotive is supposed to enter upon the classification tracks itself only when coupling on to its train to depart. This, of course, lessens the shock given the cars as they come together on the classification tracks, as they are propelled only by the gravity of a light grade and meet end on against the large side spring buffers. There is consequently very much less damage to rolling stock on account of rough handling than is the case in America where in the last two or three years freight car repairs have taken the first place away from locomotive fuel as the principal item of railroad operating expense. As car by car is uncoupled from the string of cars, and allowed to drift down on the classification tracks, a head switchman calls out a number which another switchman marks in large chalk figures upon one of the buffers. These numbers can be distinguished easily at a distance of 200 feet. The switch tenders are provided with very narrow but quite confortable shelter houses placed conveniently between the tracks. I have described the operation of the freight yard to some extent because the handling of the yard, as well as of the roundhouse, comes under a man holding the title of "Ausfahrrangierbahnhof Stationsvorstand," which being interpreted means "General Foreman of the Out-going Yard and Engine Terminal."

The roundhouses themselves are quite similar to those in America, the radius, however, being smaller and the turntable pits usually being covered. The turntables are generally operated by hand. I did not see any roundhouses in Germany with the central portion covered over, as was the case in France. Practically no work in the way of repairs is done in the roundhouses, such work being confined to the "adjusting shop buildings," the roundhouses serving for inspection, cleaning, oiling, etc. In the roundhouses are also found lockers which are assigned to the enginemen and in which they keep their clothes, tools, and other belongings.

The engineer and fireman of a German locomotive, although their duties have been much lightened during the past ten years, still give great attention to the maintenance and preparation of the engine and also in looking after it at the end of a trip. The engineer is scheduled to be at his engine an hour before the time of departure of the train; the fireman two hours before. The fireman builds and prepares the fire and hostles the engine until it is taken charge of by the engineer. The engine having been thoroughly oiled and any necessary supplies provided by the engine crew, it goes direct from the roundhouse to its train, stopping only to take water. At the end of the trip the engine goes first to the coaling platform, where coal is loaded on by a gang of men especially employed for the purpose. After being coaled it goes to the ash track, and there the fireman cleans the fire. The engine is then brought into the roundhouse where the engineer not only makes out his work report, but attends to minor adjustments himself. It is not the practice to keep engines under steam for many hours in the roundhouse, this being done only where a very large modern locomotive is double and, occasionaly, treble crewed. Engines are assigned, not pooled, but full service is gotten out of the larger power by the practice of double crewing. The men must have a minimum of eight hours' rest after a run.

Premiums are given for savings in oil and small supplies, although the room for economies in this direction would seem to be less than exists in the United States because of the very thrifty nature of the German people. It was surprising to learn that the German authorities should take the trouble to keep the necessary records for the payment of these small premiums.

The fires are built with bundles of faggots and small bundles of kindling impregnated with pine pitch. Many of these faggots appear to have been gathered up where they had fallen in the great State Forests, this being a practical application of the principle of conservation, that nothing should be wasted—wood, otherwise useless, should be put to a good purpose. As a consequence of this kind of policy, Germany's annual forest growth is almost equal to her annual needs for timber.

The Germans are very much more economical in fuel than the Americans, as the following comparative figures on fuel

consumption per locomotive mile in different classes of service would indicate:

Class of service.	Pounds fuel burned per locomotive mile.	
	Prussian.	American.
Passenger	43.6	93
Freight	61.6	214
Switch	44.8	147

The above comparison is between a division of the Prussian State Railway and a division of a representative American road in a similar industrial locality.

The difficulty of mining coal in Germany makes it a much more expensive commodity than it is in the United States, and the Germans have not such rich deposits of good coal. The Prussian State Administration, for instance, has to pay about $2.75 per ton of 2,000 lbs., thus making economy of fuel in their railroad operations compared with cost of other items (such as labor, wages being about half those prevailing in the United States) a very important consideration. For this reason great care is used in the selection of the grades of fuel burned, in the utilization of the poorer grades for locomotive purposes, in the heat efficiency of the design of the locomotive, and in the care with which the locomotive is operated.

Germany was the birthplace, about 1895, of the Schmidt locomotive superheater, and from about 1901 on, after the preliminary experimental stages with this device, its application to old as well as new locomotives took on enormous strides, so that today, of the some 20,000 locomotives belonging to the Prussian State Railways, about 5,000 are equipped with superheaters.

From the poorest qualtities of coal, called "brown coal," a shaley stuff between lignite and peat, briquettes are made having a very high fuel value. These briquettes are used where it is desired to avoid smoke, such as in passenger terminals, and also when it is desired to give the engine additional evaporative efficiency—as on starting a train and in climbing a steep grade. About 25 per cent. of the fuel burned on Prussian locomotives is in briquette form, and the storage coal that is kept through the winter season and to guard against irregularities in mining and commercial demands, is largely in briquette form also, these briquettes being very conveniently piled as we would pile bricks.

Engineers and firemen are also carefully trained as to fuel and steam use, and with the assigned engines the men act as if they were footing the fuel bills themselves. This, taken in conjunction with the eagle-eyed watchfulness of the fuel performance of each train by the railway administrative officials, makes for an astounding degree of efficiency, and is in a large measure responsible for the comparatively low fuel consumption shown in the figures above quoted. In these figures there is, of course, no indication of the relative amount of work done by the locomotives, nor of their size. It may be presumed that the American locomotives would require about twice as much coal as the German locomotives. Even allowing so great a margin—which is high, as the German locomotives are the largest in Europe—the discrepancy between the consumption in the two cases is very marked; and in view of the millions of dollars expended annually by every American railroad system, for fuel, would warrant a most careful study as to causes and remedies, combined with an equal thoroughness in applying such practices as would be of benefit to American operating conditions.

One of the most modern coaling stations that I saw in Germany, but not entirely completed, handled the coal in the following manner: Upon either side of a double track was a concrete [illegible] except, the level of the platform at the top of this wall being several feet above the top of the locomotive tender. The edge of the platform was bordered by a pipe railing, [illegible] by small automatic shoots. About twenty feet back from the edge of the parapet was a pile of coal which was [illegible] from cars of the gondola type, whose sides [illegible] were cut somewhat like the sides of ballast cars, thus [illegible] the amount of hand shoveling required. Several laborers shoveled the coal from this storage pile into little hopper trucks of about half a ton capacity, which were then pushed by hand along a narrow gage track to the automatic shoots through which the contents were dumped into the tender of the waiting engine by pressure upon a single lever. The whole procedure worked with neatness and despatch, and a close record was kept of the amount of coal supplied to each locomotive. At the older coaling stations at smaller places the platforms are quite low and the coal was shoveled into straw baskets holding about 100 to 200 lbs. each which were lifted up by hand and dumped into the tenders. Finally, in connection with the fuel, it was observed that the practice of storing large quantities of coal, and particularly briquettes, was quite general. The sanding of the locomotives was done in the roundhouse by a man who carried the sand around from engine to engine in a wheel barrow.

While the wages generally among the railroad employees in Germany are low compared with our standards, some of the ordinary laborers getting as little as about 70 cents a day, the comfort and well-being of the men and their families is well looked after, it being customary to provide what are called "living colonies" where modern houses are provided at a considerably lower cost than the men could find elsewhere. These "colonies" are located with convenient access to the workshops or terminal yards where the men are employed, and are for the benefit of the men in train service, as well as for those stationed at the terminal. A visit through one of them gave somewhat the same impression as a visit through a college dormitory, so neat, orderly and well kept were they.

Not only are the ordinary employees provided with dwellings at low cost, but this is also done for the officers in direct charge of the terminal yards. These have their dwelling rooms on the upper floors of the handsome buildings that house the officers on the ground floors, and the group of buildings composing these combined offices and dwellings with their surrounding flower and vegetable gardens are located a short distance from the yard and roundhouse. As an indication of the way in which the general foreman of such a terminal is provided for, it may be said that at a place despatching over 150 trains a day the man in this position receives a salary of 6,000 marks, or $1,500 annually, and in addition is provided with ample living quarters for which a rental of $100 a year is charged. One of these foremen, after showing me his quarters, assured me that he could not do as well in the suburbs of the city for $25 a month. This makes his salary equivalent to about $135 a month.

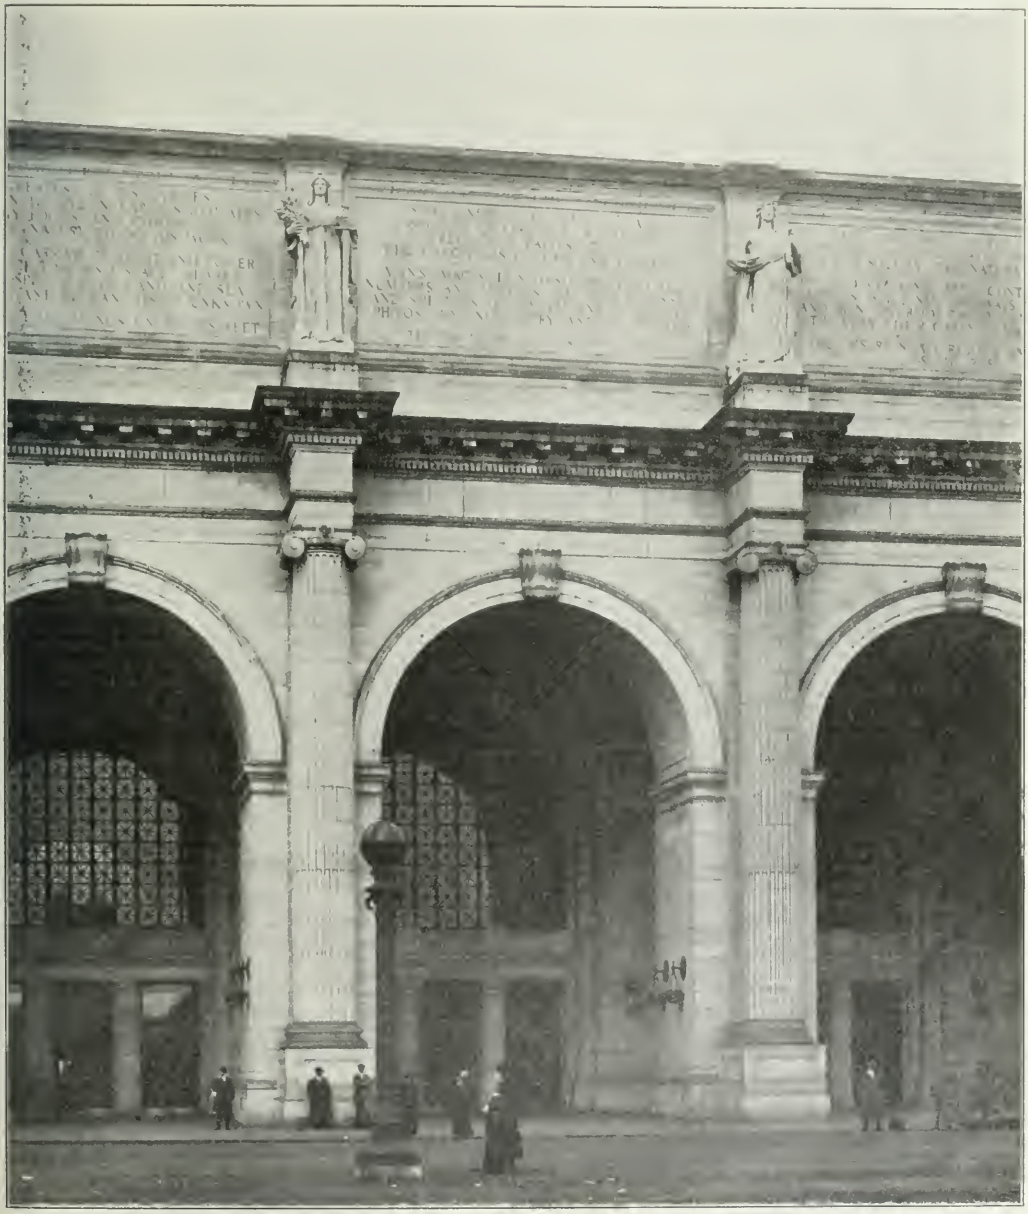
Not only is the employee of the German State Railroad well looked after during his life of activity and health, but he is taken care of during times of illness, accident and in his old age, the whole scheme being worked out in a scientific manner so that the man can devote his life with entire confidence to his chosen profession of railroading, secure in the knowledge that he cannot be discharged or demoted without proceedings similar to a court trial in the army or navy; secure also in a certain minimum increase in wages with the completion of each period of service.

Belgian Rolling Stock Output.—Belgium is very much more than the most thickly populated country in Europe, for it presents within its narrow confines a splendidly developed industrial world. Railway engineering is one of the most prosperous undertakings in Belgium. The rolling stock output is about 1,000 locomotives, 8,000 passenger cars and 25,000 freight cars. Some idea of the Belgian foreign trade may be gathered from the fact that the annual export of railway material is something like $40,000,000. One may travel anywhere on the three thousand miles of Belgian State Railways for about $2.50 for a period of five days—which gives a rare opportunity to travel at a very low cost, while the steamer services are also excellent.

STATUES ON WASHINGTON UNION STATION.

The Union passenger station at Washington, D. C., which was put in use five years ago, and which was described in the *Railroad Gazette* of November 1, 1907, has only just been finished; that is to say, the six colossal statues, which form an important feature of the facade, have only just been put in place. A view, looking from the south, made from a photograph by G. V. Buck, of Washington, and showing the general appearance of these statues, is given herewith. The main entrance to the station is through three lofty arches; and there are six massive stone columns, two of which appear in the illustration. There are two others at the left of the left or western arch, and two at the right of the right arch. Each of these columns is surmounted by a statue about 18 ft. high.

Those on the west side of the entrance represent Prometheus



Main Entrance to the Union Station, Washington, D. C.—Statues by Louis St. Gaudens.

and Thales, typifying fire and electricity; those on the east side represent Ceres and Archimedes, typifying agriculture and mechanics, while the two central figures represent Freedom and Imagination. Those on the west side represent two forces, the connection of which with railroad operation is obvious; and agriculture, nowadays, has a relation to transportation hardly less prominent than mechanics.

No less interesting than the statues are the inscriptions which accompany them, the author of which was Charles W. Eliot, President Emeritus of Harvard University. These inscriptions, not very clearly shown in the illustration, are copied in full below, including also those over the carriage and the state entrances, at the extreme west and east ends of the station. The columns flanking the carriage entrance and the state entrance are surmounted by stone eagles about 8 ft. high.

Inscription on Attic of Central Pavilion, Western Panel.

Fire—Greatest of Discoveries,
Enabling Man to Live in Various Climates,
Use Many Foods, and Compel
the Forces of Nature to Do His Work.

Electricity—Carrier of Light and Power,
Devourer of Time and Space—Bearer
of Human Speech Over Land and Sea,
Greatest Servant of Man—Itself Unknown.

Thou Hast Put All Things Under His Feet.

Inscription on Attic of Central Pavilion, Central Panel.

Sweetener of Hut and Hall,
Bringer of Life Out of Naught,
Freedom, O Fairest of All
The Daughters of Time and Thought.

Man's Imagination Has Conceived All
Numbers and Letters—All Tools, Vessels
and Shelters—Every Art and Trade—All
Philosophy and Poetry, and All Polities.

The Truth Shall Make You Free.

Inscription on Attic of Central Pavilion, Eastern Panel.

The Farm—Best Home of the Family—Main
Source of National Wealth—Foundation of
Civilized Society—The Natural Providence.

The Old Mechanic Arts—Controlling New
Forces, Build New Highways for Goods
and Men—Override the Ocean—And Make
the Very Ether Carry Human Thought.

The Desert Shall Rejoice and Blossom
as the Rose.

Inscription on Attic of Carriage Porch, South Elevation.

He that Would Bring Home the
Wealth of the Indies Must Carry
the Wealth of the Indies with Him.
So It Is in Traveling, a Man
Must Carry Knowledge with Him
if He Would Bring Home Knowledge.

In[illegible]n on Attic of State Entrance, South Elevation.

Let All the Ends Thou Aim'st at Be
Thy Country's, Thy God's and Truth's.
Be Noble, and the Nobleness that
Lies in Other Men, Sleeping but
[illegible] Dead, Will Rise in Majesty
to Meet Thine Own.

[illegible] of State Entrance, East Elevation.

[illegible] the Coming,
[illegible] the Parting Guest

[illegible] Is Sweet Society
[illegible] the Key to All
[illegible] Opens You
[illegible] Them All.

General News.

Shop employees of the National Railways of Mexico struck on December 26, because of the refusal of the management to grant an 8-hour day and an increase in wages.

The Boston & Maine has applied to the Massachusetts authorities for permission to build four main tracks through the city of Salem, on the present location, and also for such legislation as may be necessary to authorize the electrification of the road between Boston and Beverly, 19 miles.

The Baltimore & Ohio last week put in use the new double-track Sand Patch tunnel. This tunnel is through the Allegheny mountains between Sand Patch and Manila, 30 miles west of Cumberland. Its cost is approximately $1,250,000, and it has taken about two years to complete it.

Parcel post troubles at the Gary (Ind.) post office began today, when W. H. F. Parry, a brick dealer, sent two wagon-loads of paving brick to be mailed out the first thing on Wednesday morning. There were 1,000 bricks, each brick wrapped separately; and their total weight was 6,000 lbs. The bricks are being mailed as samples.—*Press Despatch, December 30.*

Bench warrants have been issued by the Criminal Superior Court at Bridgeport, Conn., for Henry J. Horn, vice-president; Benjamin R. Pollock, general manager, and Charles N. Woodward, general superintendent of the New York, New Haven & Hartford, charging them with manslaughter in causing the derailment at Westport, October 3. The warrants are based on the finding of Coroner Phelan.

By a bridge failure at Guyandotte, W. Va., on the Chesapeake & Ohio, January 1, seven men were killed and the lives of several others are believed to have been lost. A freight train crashed through a weakened bridge across Guyandotte river. A crew of thirty or more ironworkers were putting in a bridge for a second track, and the freight appears to have been running at very low speed. The cause of the accident is believed to be undermining of piling.

The Chicago, Burlington & Quincy began moving its general offices in Chicago on December 28, from the old headquarters at Adams and Franklin streets, to the company's new 16-story office building at Jackson Boulevard and Clinton street. This building was described in the *Railway Age Gazette* of December 8, 1911, page 1174. The moving will require approximately two weeks. The new structure contains 225,000 sq. ft. of floor space as compared with 75,000 sq. ft. in the old building. It has a frontage of 150 ft. on Jackson boulevard and 175 ft. on Clinton street.

The Canadian Pacific has petitioned the Parliament of Canada to amend the Act of 1906 incorporating the Toronto Terminals Railway Company. This is the Act providing for the construction of the Union Station at Toronto. The Toronto Terminals Railway Company was empowered to build a union passenger station and hotel. The Grand Trunk was authorized to transfer the union station property to the Canadian Pacific. The company was capitalized at two millions, the Canadian Pacific Railway and Grand Trunk Railway having each the right to hold half the stock. The station was to be built by February 23, 1908, or such later date as the Railway Commission might set.

A settlement has been reached between the striking Western machinists of the Grand Trunk Pacific and President E. J. Chamberlain, which will clear the way for the opening of the Transcona shops. The company agrees to reinstate all strikers who apply within 30 days. For the present the existing rate of pay and rules will prevail, 45 cents an hour for Rivers and east of Rivers, and 47½ cents west of Rivers. The company agrees that next spring, if the men so desire, the Western management will meet a committee of the men to decide upon a new agreement and a new schedule, and failing to arrive at terms the differences will be submitted to a conciliation board appointed under the Industrial Disputes Act.

At Indianapolis, December 31, sixteen officers and directors of the Cincinnati, Hamilton & Dayton and two trainmen were indicted, on charges of involuntary manslaughter, by the Marion

county grand jury in connection with the collision near that city on November 13, when 10 persons were killed, because of a misplaced switch. Those indicted were: Daniel Willard, president; George F. Randolph, vice-president, and George M. Schriver, second vice-president; W. C. Loree, general manager; H. B. Voorhees, general superintendent; R. B. White, division superintendent; O. G. Murray, George W. Perkins, L. F. Loree, H. P. Davison, Frederick W. Stevens, Joseph Wood, E. R. Bacon, F. D. Underwood, Harry Bronner and Norman B. Ream, directors; Carl Gross, brakeman, and Willis York, engineman.

The postmaster general has written to the House Committee on Postoffices and Postroads recommending legislation to readjust the method of computing payments to railroads for transporting the mails. "On account of the institution of the parcel post system," says Mr. Hitchcock, "the weight of mail to be transported probably will be increased considerably and, under existing law, no additional compensation may be paid until there has been a weighing of the mails and a readjustment of the basis of pay." And he repeats the proposition, which he suggested a year ago, for substituting space for weight as the chief factor in determining compensation. Under this plan it would be possible to ascertain without delay what, if any, additional compensation should be given the railroads on account of the parcel post.

Record Rail Orders in 1912.

According to the *Wall Street Journal* rail orders in 1912 amounted to approximately 5,000,000 tons, a large part of which will be delivered in 1913. This paper goes on to say that this is the largest tonnage of this product ever ordered in one year.

Death and Injury Benefits for Government Employees.

The solicitor for the Department of Commerce and Labor, in a report summarizing his decisions under the law of May 30, 1908, providing for compensation to certain government employees in cases of injuries, fatal or non-fatal, received in the course of their employment, presents a statement showing that in about three years more than $800,000 has been thus paid out. The report says:

"The act has been in operation since August 1, 1908. Between that date and December 1, 1911, compensation was paid in 5,564 cases of injury, in 165 of which the injury resulted in death. On account of these fatal injuries $112,879 has been paid to surviving dependents. On account of the non-fatal injuries $704,815 has been paid to the injured persons themselves. (The figures given do not refer to claims arising on the Isthmian Canal since March 3, 1911, when the Isthmian Canal Commission was authorized to handle such claims directly.) These payments have been made, not out of any special appropriation, but from the ordinary current appropriations for salaries. The salary has simply been paid as if the injured man continued at his work, until his incapacity ceased or until the year had run. Owing to the limited scope of the act there have been naturally more accidents reported than claims filed, and there have been also a number of claims filed which could not be allowed either because they were not within the act or were not properly established. In the first year, the number of injuries reported was 4,862, and the number of fatalities 233, while the number of claims submitted was but 1,805, of which 1,689 were allowed. During the second year 6,984 accidents were reported and 226 fatalities; 2,624 claims were submitted and 2,499 allowed. Legislation to extend the benefits of the act has been recommended by the Secretary of Commerce and Labor, and measures designed to enlarge the scope of the act are now pending in Congress."

October Traffic Exceeds All Records.

The receipts and the expenses of the railways of the United States for the month of October, as compiled by the Bureau of Railway Economics, are greater than for any month in their history. Net operating revenue averaged $15.71 per mile of line per day, as compared with $13.74 for October, 1911. The summary covers 220,636 miles of line, or about 90 per cent. of all the steam railway mileage of the United States. The aggregate net operating revenue for this mileage was $107,440,518. The increases were due in greatest proportion to the freight traffic, which is always greater in October than in any other month of the year.

New Subways in Boston.

The Boston Transit Commission has opened bids for the construction of section 4 of the Boylston street subway, which includes the station in Copley square. The lowest bidder was the Hugh Nawn Construction Company, $743,700; four other bids ran from $750,050 to $927,945. About half of the Boylston street subway has been finished. The commission will soon advertise for bids for work on the Dorchester tunnel, which will pass beneath Fort Point channel.

Transportation Simplified.

The San Pedro, Los Angeles & Salt Lake announces that a small open gasoline motor car, with accommodations for about eight passengers and a small quantity of light baggage, has been put in service on the St. Thomas Branch from Moapa (Nevada) to St. Thomas, about 20 miles. The car will leave St. Thomas at 8:30 a. m., making connections with train No. 2, and returning will leave Moapa at 3:25 p. m., or on arrival of main line train No. 1.

The Pullman Company on the New Haven Road.

The New York, New Haven & Hartford announces the transfer of its parlor and sleeping car service to the Pullman company under a contract dated January 1, 1913, and running twenty years. The Pullman company will take over the parlor and sleeping cars owned by the New Haven, paying, it is understood, about $3,500,000, and will gradually introduce steel cars, the first replacement being on the limited trains. All of the employees of the New Haven service will be retained, their pay and relative positions being unchanged. They will be under the supervision of A. J. Grant, Pullman superintendent, Grand Central Terminal, New York City.

The parlor and sleeping car conductors of the New York, New Haven & Hartford have adopted resolutions reading in part: "Whereas in the vicissitudes of railroad life we are about to be transferred to the employment of the Pullman Company, and whereas the majority of our number having been employed by the New Haven road upward of 15 years, and whereas there has always existed a most cordial and just treatment of us by our superior, be it Resolved, That we extend to President Charles S. Mellen and the board of directors our thanks for the just and kindly consideration and treatment of us during our long years of service, and that we extend to our beloved superintendent, A. G. Webb, our sincere thanks for his just, kindly and courteous treatment. . . ."

A Correction.

In the item entitled Exhibition Run of Drake Gas-Electric Car, which appeared in the *Railway Age Gazette* of December 20, page 1221, the statement to the effect that the average consumption of gasoline was 2½ gallons per mile should have read 2½ miles per gallon.

"Safety First" in Utah.

The safety committee of the Utah division of the Oregon Short Line, as a result of a contest, announces that prizes of $10 and less have been awarded to Mrs. Joseph Severn, Mrs. Martha D. White, Mrs. Mary Anderson, Mrs. Mary Karren and Mrs. Ella Kelson for papers on "safety." Mrs. Severn is the wife of Joseph Severn, division accountant in Assistant Superintendent Malone's office, and her essay is as follows:

What "safety first" means to me: Home, comfort, magazines and books, pretty things, a little art, a little travel, children reared in a "homey" home with the inalienable right to educational advantages; fatherly as well as motherly discipline and comradeship; an occasional romp with "Dad"; the chummy, inadvertently given good counsel of father—these things go to make up a home, the maintenance of which rests in equal exchange between railroad and employee, of money and human energy.

A desolated home—the father's life sacrificed in service; no amount of poetry or eulogy can soothe the heart-ache or picture the shock; no life insurance policy or railroad settlement can

put complacency in the place of distress. To a woman's heart such things are a mere insult when proffered as a substitute for the big, fatherly personality which has been sacrificed.

A maimed home—a limb lost, or an eye; just so much earning capacity, to speak practically; just so much of one's right to complete life snatched away. To be crippled, what fortitude it demands! Here, again, money damages are an all too poor compensation.

To live one's complete life—this is what safety means to me; the maintenance of a home in exchange for a man's best energy. This is just and right and good; and safety first, aye, a man assured that the railroad regards him as a man, not a machine, and really cares for his safety and his home, what good service will he not heartily render!

Efficiency Society.

The annual meeting of the Efficiency Society will be held January 27-28 at the Engineering Societies building, New York. The program for January 27 will include a Symposium on Organization, a Discussion on the Necessity of Charts of Organization; a Symposium on Management; a Discussion on Democracy in Industry and Securing the Consent of the Governed; and a Symposium on Efficiency in Government Organization, National, State and Municipal. The program for January 28 will include a Symposium on Industrial Relations, a Discussion on the Relations between Employer, Employee and the Community; a Symposium on Industrial Hygiene and Safeguards against Occupational Diseases and Accidents; and a Symposium on Safety, including Safety in Land Transportation. This session will be illustrated by moving pictures and lantern slides demonstrating the efficiency obtained by conserving the human elements in industry. The officers of this association are as follows: President, James G. Cannon; first vice-president, Henry R. Towne; second vice-president, Melville W. Mix; treasurer, Theodore Hetzler; assistant treasurer, Francis W. Hoadley, and secretary H. F. J. Porter.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electrical Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York. Standard Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 13 Park Row, New York. 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Convention, January 21-23, Chicago.

Associated Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago. annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursdays, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

International Railway General Foremen's Association.—Wm. Hall, Chicago & North Western, Escanaba, Mich. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances' Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—G. H. Frazier, 10 Oliver St., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C. M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La. Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio, 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago, 1st Monday in month, except July and August, Chicago.

Traffic News.

In Mexico, as well as in other parts of the world, there is a shortage of freight cars. The activities of the rebels have decreased so that mines and manufacturing plants are resuming work, but they are much hampered by lack of transportation facilities. The government is using the lion's share of the cars to move troops and military supplies.

The two passenger trains between Weehawken, N. J., and Chicago, over the New York, Ontario & Western, and the Wabash, which hitherto have run over the R. W. & O. division of the New York Central, are now running over the N. Y. C. main line, connection with the Wabash being made at Buffalo and with the New York, Ontario & Western at Earlville.

All previous records for the production of coal in the United States were beaten in 1912, if both hard and soft coal be taken into account. But the production of hard coal alone fell below that of many previous years. Assuming that the December shipments were the same as in December, 1911, the total shipments of anthracite for the year 1912 amounted to 63,781,503 tons. This is a smaller tonnage than for any year in the last six except 1909, when the shipments were 61,969,885 tons. Assuming the quantity sold to local trade and employees at 3 per cent., then the total marketable output of anthracite in 1912 was 65,694,948 tons, as compared with 72,000,000 tons in 1911. The suspension of work for about seven weeks last spring was the cause of the falling off in production.

The Union Pacific has notified its competitors between the Missouri river and Denver and also the Denver & Rio Grande and Colorado Midland that it will no longer be a party to certain tariffs showing through rates for passengers and freight over these lines. The effect of the notice is to close the Denver gateway on January 1 to the Atchison, Burlington, Missouri Pacific and Rock Island with respect to traffic from east of Missouri River for certain destinations west of Denver. It applies only to traffic east of the river and bound for the Northwest; that which will be handled by the Oregon Short Line and Oregon Railroad & Navigation. It will not apply to traffic for California points. Neither will it apply to traffic originating at points between the Missouri River and Denver. The purpose is to secure for the Union Pacific the through haul between the Missouri River and Denver on traffic originating east of the river, but which has been delivered to the Union Pacific at Denver by lines competing with it between the Missouri River and that point.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on Relations Between Railroads of the American Railway Association, in presenting fiscal bulletin No. 133A, giving a summary of car surpluses and shortages by groups, from September 13, 1911, to December 14, 1912, says: The total surplus on December 14, 1912, was 26,614 cars; on November 30, 1912, 26,135 cars; and on December 20, 1911, 88,646 cars. Compared with the preceding period, there is an increase in the total surplus of 479 cars, as follows: 231 box, 62 flat, 1,183 miscellaneous and a decrease of 997 in coal car surplus. The increase in box car surplus is in groups 1 (New England Lines), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), 9 (Texas, Louisiana and New Mexico), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). The increase in flat car surplus is in groups 1 (as above), 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 4 (the Virginias and Carolinas), 9 (as above), and 11 (Canadian Lines). The increase in miscellaneous car surplus is general throughout the country, except in groups 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 4 (as above), and 5 (Kentucky, Tennessee, Mississippi, Alabama,

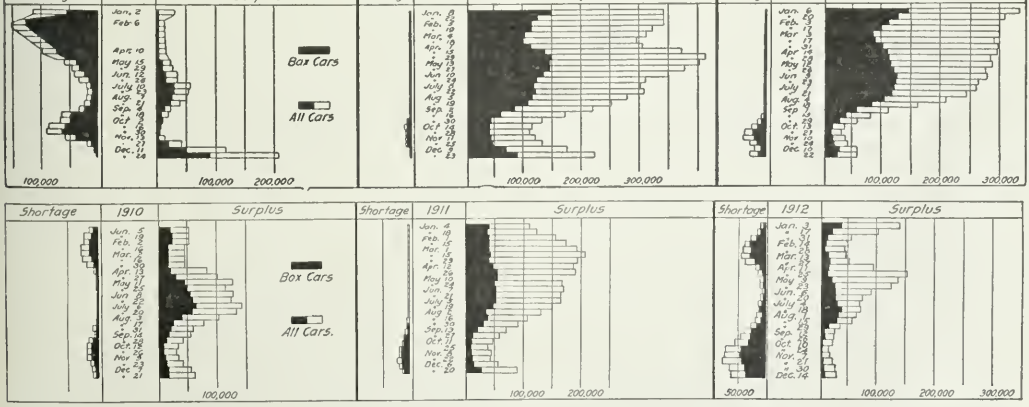
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages from 1907 to 1912.

Georgia and Florida). The decrease in coal car surplus is in groups 2, 3, 5 (as above), 6 (Iowa, Illinois, Wisconsin and Minnesota), 7 (Montana, Wyoming, Nebraska and the Dakotas), 8 and 9 (as above).

The total shortage on December 14, 1912, was 61,006 cars; on November 30, 1912, 62,536 cars; and on December 20, 1911, 11,832 cars. Compared with the preceding period; there is a decrease in the total shortage of 1,530 cars, as follows: a decrease of 2,192 box, 585 flat, 1,378 miscellaneous and an increase of 2,625 coal cars. The decrease in box car shortage is in all groups, except 3, 4, 6 and 7 (as above). The decrease in flat car shortage is throughout the country except in groups 4 and 7 (as above). The decrease in miscellaneous car shortage is in groups 1, 3, 5, 6, 8, 9, 10 and 11 (as above). The increase in coal car shortage is in groups 2, 3, 4 and 6 (as above).

Compared with the same date of 1911; there is a decrease in the total surplus of 62,032 cars, of which 17,772 is in box, 3,028 in flat, 28,807 in coal and 12,425 in miscellaneous. There is an increase in the total shortage of 49,174 cars, of which 26,866 is in box, 3,535 in flat, 13,934 in coal and 4,839 in miscellaneous cars.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report; and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1912.

Traffic Club of Chicago Favors Commissioner Clark.

The board of directors and governors of the Traffic Club of Chicago at a special meeting recently adopted the following resolutions addressed to President Taft urging the reappointment of Commissioner Clark:

Whereas, The Traffic Club of Chicago, is a voluntary association, the membership composed of representatives of the shipping public and representatives of carriers, about equally divided, to the number of nearly one thousand, and

Whereas, The Traffic Club of Chicago and its members, are vitally interested in maintaining the high standard of efficiency of the Interstate Commerce Commission, are familiar with the work of that commission, and understanding the necessity of practical and experienced men to handle the broad national matters that are involved, and having knowledge of the experience, efficiency and high order of ability of Edgar E. Clark; therefore be it

Resolved, That we do hereby earnestly request reappointment and confirmation. . . .

The President has reappointed Mr. Clark, but the confirmation, together with that of many other Republicans, was held up by a Democratic Senate.

The annual meeting and dinner of the Traffic Club of Chicago will be held on January 28. The programme has not yet been announced.

INTERSTATE COMMERCE COMMISSION.

Rates on Petroleum and Its Products Reduced.

National Refining Company v. Missouri, Kansas & Texas et al. Opinion by the commission.

The rate of 27 cents per 100 lbs. for the transportation of petroleum and its products in carloads from Coffeyville, Kans., to Joliet, Ill., was found to be unreasonable to the extent that it exceeded 22 cents per 100 lbs., which rate is prescribed for the future. (25 I. C. C., 374.)

Detroit, Mich., Discriminated Against.

Michigan Copper & Brass Company et al v. Duluth, South Shore & Atlantic et al. Opinion by Commissioner Meyer.

The defendants maintain an all-rail rate on refined copper from points on the upper peninsula of Michigan to New York that is 3 cents per 100 lbs. higher than the all-rail rate from the same points to Detroit, Mich. The complainants allege that this differential is unjust and unreasonable and that the all-rail rate of 32½ cents to Detroit is unreasonable. The commission found that the rate to Detroit is not unjustly discriminatory as compared with the rate to New York, that the defendants subject the complainants and the locality of Detroit to undue and unreasonable prejudice and disadvantage; and that for the future the differential should not be less than 10 cents; also that the rate to Detroit is not, under the present conditions, unreasonable. (25 I. C. C., 357.)

Elevator Case Decided.

H. Gund & Company v. Chicago, Burlington & Quincy. Opinion by Commissioner Lane:

At the original hearing, 18 I. C. C., 364, the complainant asked reparation upon all grain passing through its country elevators at interior points in the state of Nebraska, which grain was shipped through Missouri river points to eastern destinations, upon the ground that an elevation allowance was made by defendant to complainant's competitor for elevation-in-transit at Nebraska City; but action by the commission was deferred pending decisions of the United States supreme court in the *Elevation cases.* Since then such decisions have been rendered; but, following them, the commission cannot hold that the discrimination complained of was undue or unreasonable, because under said decisions a railroad may for competitive reasons grant an elevator allowance, although no transportation service is rendered by the shipper owning the elevator. (25 I. C. C., 326.)

Complainant Discriminated Against.

Edward G. Murray Lighterage & Transportation Company v. Delaware & Hudson. Opinion by Commissioner Harlan:

The complainant seeks an order requiring the defendant to grant it through routes and joint through rates on interstate traffic between points in the harbor of New York City and points on the rails of the defendant in the states of New York and Vermont. The defendant contends that the complainant is not a common carrier. The commission found that the complainant was as fully equipped for the handling of northbound traffic as its competitors. The commission ordered the defendant not to withhold in future the through routes and joint through rates on northbound interstate traffic consisting of bulk shipments of sulphur, resin, sand and similar articles from points in the harbor of New York City to points on the lines of the defendant in the states of New York and Vermont so long as the defendant maintains through routes and joint rates on similar traffic from and to said points with the competitors of the complainant similarly situated. (25 I. C. C., 388.)

Furniture Rates Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of furniture from Napanee, Ind., to Chicago and other destinations. Opinion by Commissioner Meyer:

The commission found that the proposed advances in rates on furniture in carloads and less than carloads from Napanee, Ind., to Chicago, Ill., and Chicago rate points and also to points in Minnesota and Wisconsin on shipments via Chicago and Chicago junction points were not unjust or unreasonable. The order of suspension was vacated. The increases range from 2½ cents to 9½ cents per 100 lbs. on carloads, and from 8 to 10 cents per 100 lbs. on less than carloads. (25 I. C. C., 331.)

In re investigation and suspension of advances in rates by carriers for the transportation of furniture in carloads between points in Arkansas, Colorado, Florida, Kansas, Louisiana, Minnesota, Mississippi, Missouri, Nebraska, New Mexico, North Dakota, Oklahoma, South Dakota, Washington, D. C., and other interstate points. Opinion by Chairman Prouty:

The advance in the proposed rates from St. Louis, Mo., to Texas common points is 6 cents per 100 lbs., from 79 cents to 85 cents, and there are corresponding increases to other Texas stations. The commission found that the proposed rates which had been suspended were not unreasonable. The order of suspension was vacated. (25 I. C. C., 289.)

California Demurrage Rate Increased.

In re Investigation and Suspension of Advances in Demurrage Charges on Interstate Traffic by Carriers Operating in the State of California. Opinion by Commissioner Clark:

Proposed increases in demurrage charges in the State of California applicable upon interstate shipments had been suspended by the commission. The commission found that upon this record the carriers have abundantly sustained the burden of proof to show that the increased charges are reasonable; and, that under

the circumstances here shown it is not unjustly discriminatory against California or against shippers or receivers in California to maintain higher demurrage charges at points in that state than are contemporaneously maintained in other states served by respondents. The order of suspension was vacated.

The report summarizes the history of the high demurrage rate in California. [The principal points of this history are given in an editorial on another page in this paper.] The railroad companies called numerous shippers and receivers of freight to testify in their favor, these witnesses recounting their experiences and giving facts and figures to sustain their testimony. The carriers also laid emphasis on the fact that the freight movement from the east to California is heavy from December to June, but light in the other half each year, while the eastbound movement is heavy from June to December and light in the other half. It was shown that the opposition to the six-dollar demurrage rate, when it went into effect, subsided after the result of the increase became apparent. The Pacific Car Demurrage Bureau presented statistical records showing that if the higher rate could have been charged on interstate as well as intrastate shipments the supply of freight cars would have been increased 3,000 cars a month. Elaborate statements were also presented showing how consignees and shippers, doing heavy business, and in large numbers had paid smaller amounts, in the aggregate, for demurrage after the introduction of the higher rate. As between shippers and consignees it appears that only 5 per cent. of the total demurrage collections come from consignors. The commission considered the demand that additional free time be given for unloading because carloads are so much larger now than in former years; but to this claim it is replied that a given quantity of freight can be unloaded from one car as quickly and as cheaply as it could be unloaded from two cars.

Commissioner Lane, concurring in the decision, says that his controlling reason is that the high rate is unopposed by the shippers. The phenomenally excellent condition that obtains in California is due, in his opinion, to the presence of an effective, powerful and authoritative demurrage bureau. Where railway officers are lax and the supply of cars is inadequate a higher rate would not be the proper remedy. It would be only a penalty imposed on the public because of the railroads' delinquency. The present opinion is to be taken as a promise to those roads who believe in doing their duty that the commission will co-operate with them; and it is not to be understood as the endorsement of any particular rate of demurrage or as the establishment of any permanent principle.

Chairman Prouty, in a dissenting opinion, agrees that there is undue detention of cars employed in interstate traffic, and that something must be done; but an increase of the rate is not the best thing to do. The inefficiency of car service in this country is due more to the railroads than to the shippers. While it is possible that the Pacific coast states may be so isolated from the rest of the country that a different rule can be applied there, the problem, he thinks, will be difficult. It is most unfortunate to break into the uniform demurrage code even upon the extreme edge.

The tariffs increasing the demurrage rates in California were suspended last February, and on June 3 a further suspension was ordered. The suspending orders are now vacated, to take effect January 6. (25 I. C. C., 314.)

Rates on Grain and Flaxseed.

Superior Commercial Club, of Superior, Wis., v. Great Northern et al. Chamber of Commerce of the City of Milwaukee v. Chicago, Milwaukee & St. Paul et al. Duluth Board of Trade v. Great Northern et al. Opinion by Commissioner Clark:

The ruling in the original report, 24 I. C. C., 96, was rescinded and the commission ordered the defendants in future to maintain rates on grain and flaxseed from points on their lines in Minnesota, South Dakota and Iowa, to Superior, Wis., in no case exceeding for equal distances their rates from the same points of origin to Milwaukee, Wis. The defendants are also ordered in future to maintain rates on grain and flaxseed from points on their lines in Minnesota, South Dakota and Iowa to Superior, Wis., via Minneapolis, in no case exceeding by more than 4 cents per 100 lbs. their rates from the same points of origin to Minneapolis, Minn. They are also ordered in future to maintain rates on grain and flaxseed from points on their lines south and west of Willmar, Minn., to and including Sioux City, Ia., and Yankton, and Huron, S. D., to Superior, Wis., in no case exceeding by more than 3 cents per 100 lbs. their present rates from the same points of origin to Minneapolis, Minn. Future rates on grain and flaxseed to Milwaukee, Wis., from points on the lines of the defendants in Iowa, Minnesota and South Dakota on and south of the Winona & St. Peter lines of the Chicago & North Western from Sanborn, Minn., to Pierre, S. D., and on the east of the line of the Chicago & North Western from Iroquois, S. D., to Yankton, S. D., shall in no case exceed for equal distances the rates from the same points of origin to Duluth or Superior. Rates on grain and flaxseed from points on the lines of the defendants in Minnesota, South Dakota, and Iowa, to Duluth, Minn., shall in the future not exceed for equal distances the rates from the same points of origin to Milwaukee, Wis. Future rates on grain and flaxseed from points on the lines of the defendants in Minnesota, South Dakota and Iowa to Duluth, Minn., via Minneapolis, shall in no case exceed by more than 4 cents per 100 lbs. their present rates from the same points of origin to Minneapolis, Minn. Rates on grain and flaxseed to points on the lines of the defendants east and west of Willmar, Minn., to and including Sioux City, Ia., and Yankton and Huron, S. D., to Duluth, Minn., shall in no case exceed by more than 3 cents per 100 lbs. the present rates from the same points of origin to Minneapolis, Minn. (25 I. C. C., 342.)

Rose Hill, Ill., Discriminated Against.

Thomas W. Gilmore & Company et al. v. Chicago & North Western et al. Opinion by Commissioner Meyer:

On carload shipments of bituminous coal from Chicago to the complainants at Rose Hill, Ill., the freight charge is 20 cents per net ton in excess of the charge for similar transportation to Ravenswood, Ill., a point in the Chicago switching district for the Chicago & North Western. On anthracite coal the charge to Rose Hill is 10 cents per ton greater than to Ravenswood. The commission found that this rate situation subjects the complainants to unjust discrimination and Rose Hill to undue and unreasonable disadvantage, and ordered that for the future the defendants shall not require the payment for the interstate transportation of coal in carloads to Rose Hill of a charge in excess of 5 cents per net ton over the charge for similar transportation to Ravenswood. (25 I. C. C., 403.)

Elaborate Report on Freight Classification.

In re suspension of Western Classification No. 51, I. C. C. No. 9. Opinion by Commissioner Meyer:

Western classification No. 51, I. C. C. No. 9, was filed December 28, 1911, to become effective February 15, 1912, and was suspended by the commission, pending this investigation, until December 14, 1912. Carriers voluntarily extended this suspension until February 14, 1913.

After discussing some of the larger and more fundamental general questions involved in this proceeding, consideration is given the individual rules in controversy, and this is followed by a discussion of the individual items in No. 51, to which objections have been raised. In connection with the discussion of both rules and items the application of the general principles involved is given additional consideration. Attention can be directed, in these headnotes, only in a general way, to a few of the most important considerations.

Classification is a public function. Public business cannot be conducted in a private way. Hearings of classification committees should be made public, after due notice to interested parties, including state commissions and the Interstate Commerce Commission. A record of facts and arguments should be made. As rapidly as items, or groups of items, have been disposed of by the classification committee they should be published in accordance with law. In the case of a protest to this commission, the record made up before the committee should be promptly submitted to the commission. On the basis of this record, supplemented when necessary by additional inquiries, the commission will be able to decide whether or not to suspend a proposed change in classification.

A compilation of classification units, expressing the relation to one another of weight, space and value, should be made, as far as practicable, for every item in the classification, and given due consideration.

The work of classification should be confined to classification

as such, entirely separate from the question of rates or revenues of carriers. Classification and rates and revenues should be treated separately. Having completed a new classification along the lines suggested, each carrier can readjust its rates on the basis of that classification in such manner as to preserve its existing revenues. The sufficiency or insufficiency of certain revenues and the level of particular rates or schedules are separate questions. A classification is a universal tariff from which the schedules of individual carriers should not depart, except in cases demanded by special conditions. Commodity tariffs in restricted number may always remain a necessity.

The classification movement since 1887, with a brief reference to conditions prior to that date, is described and mention made of the uniform classification of 1891.

The commission has repeatedly emphasized the necessity of greater uniformity in classification. Numerous quotations, bearing upon this subject, from decisions and annual reports of the commission are given. Reference is made to the past utterances of the commission with regard to the elements of classification, an enumeration of which is made.

Generally speaking, carload ratings should be established whenever carload quantities are offered for shipment and the public interest requires it. The relative merits of a system of any-quantity ratings as compared with a system of carload and less-than-carload ratings left for future consideration.

Liberal provisions should be made for mixtures. Artificial restrictions upon mixtures are restrictions upon the freedom of trade and commerce, with a tendency to militate against the small man. Mixtures result in a better utilization of car space; they lessen the demands upon terminal properties, they decrease the expense of operation and facilitate the movement of freight. A brief statement is made of the arguments for and against the incorporation in western classification of rule 10 of official classification.

An excessive difference between the carload and less-than-carload rates on the same commodity results in an undue preference to the carload shipper. Considerable diversity in the spread between carload and less-than-carload ratings is revealed. The relations between carload and less-than-carload ratings should be established in accordance with some consistent principle throughout the classification and the rate schedules which may be constructed upon it. In establishing a proper relation, consideration should be given to the relative cost of handling, the demands upon terminal properties and the utilization of equipment.

Generally speaking, freight cars should be made to fit the business. Within reasonable limits business may be required to adapt itself to the car.

Carriers should take into consideration both the physical minimum and the commercial minimum in deciding upon a classification minimum to govern carload shipments throughout the country and provide themselves with cars of corresponding sizes. What these shall be must be determined in the light of all the facts applicable to each individual case. The physical minimum is that minimum which represents the weight or bulk quantities which can be loaded into a car from the point of view of space or the theoretical number of packages capable of being loaded into a car determined by dividing the cubical contents of the car by the cubical contents of one of the packages, multiplied by the weight of the package, possibly with some consideration of the dimensions of the package. The commercial minimum is that minimum which represents the unit of purchase and sale of the commodity in question as established by custom and the conditions existing in that trade and in the territory in which it governs at the time the minimum was established. The physical minimum would consider only physical loading capacity, while the commercial minimum would consider in addition trade requirements, conditions of manufacture, distribution and consumption.

From a classification standpoint the security of a package may with propriety be considered in fixing the rating. A package which is less desirable from a transportation standpoint may be given a higher rating than one which is more desirable. The approval of this rule, however, does not sanction disproportionate and arbitrary increases in the rating of an article when offered in a less desirable package. There should be some relation between the increased rating and the increase in the risk, difficulty of handling and other proper considerations.

In the present proceeding the discussion bearing upon a graduate scale has centered about rule 6-B. The principle of this rule is correct. It promotes economical use of car space and has a tendency to check the careless shipper. The restriction of the present rule to light and bulky articles is of doubtful propriety. On the other hand, a universal graduate scale probably cannot be devised. The loading possibilities of different commodities vary so widely in their relation to differing car dimensions that it may be necessary to adopt different scales for different classes of commodities.

The rule in *Southern Cotton Oil Company v. S. Ry. Co.*, 19 I. C. C., 79, approved. It is the duty of the initial carrier not only to advise the shipper of the lower rates applying in case of release of valuation, but when informed of the shipper's desire to avail himself of such lower rates to obtain the shipper's signature in accordance with the tariffs.

"Follow-lot" shipments should be marked by the shipper whenever they constitute an overflow resulting from the failure of the shipper to designate the dimensions of cars required. Where the shipment could be loaded in a car of the size ordered by the shipper and two cars are furnished by the carrier, the marking, where necessary, should be done by the carrier.

It is the duty of the delivering carrier to collect the lawful rates on shipments and to correct any errors that may have been made by the agents of the initial carrier in billing or in the collection of prepaid charges. This includes misbilling due to wrong description of the container. A provision should be inserted that, if the classification of a shipment is properly raised at the point of destination, by reason of the character of the container, the initial carrier shall be liable for the difference, unless misrepresentation was made.

Every effort of the carriers to compel accuracy and honesty in descriptions of freight deserves support. Inadvertent and unknowing misdescriptions are unfortunate in their possible discriminatory effect; conscious misrepresentations and misdescriptions are criminal and should be rigorously suppressed.

It is the right and duty of carriers to protect other freight from commodities which are likely to damage it. Certain perishable freight may at times, for sufficient reason, be refused under proper tariff provision or the classification.

If all the pieces constituting a completed article are offered as one shipment, under one bill of lading, the freight charge should be calculated upon a rating for the completed article. This does not prevent a shipper from billing separately each constituent part at its respective rating.

Carload quantities should not be received in freight houses. Storage space should be reserved for less-than-carload shipments. But when, for sufficient reason, a carrier has actually stored and handled carload quantities as it stores and handles less-than-carload quantities, it is entitled to fair compensation for the additional service performed.

Brunswick-Balke-Collender Company v. A., T. & S. F. Railway Company, 23 I. C. C., 395, affirmed, subject to the further investigation ordered in that case. (25 I. C. C.)

By requiring a substantial minimum to be loaded of each commodity in the mixture it would become impossible to defeat the minimum weight requirements of the others by including in the shipment a nominal quantity of one. Such provision should be inserted in rule 21-B.

It would hardly be in the public interest to require carriers to load or unload large, heavy, bulky less-than-carload shipments at any one of the thousands of stations in this country where they do not, and can not, maintain crews capable of handling consignments of this character. Carriers should advise shippers at the time shipments are received what is expected of them. This rule, like all others, must have a reasonable interpretation. Section crews should assist shippers wherever possible and practicable.

"Shippers' load and count." In connection with this subject a discussion is given of carriers' liability under ordinary bills of lading and those containing similar qualifying clauses. As this subject is covered by pending legislation of Congress fixing the liability of the carriers, the commission refrains from making recommendations.

The allowance of 500 pounds for "dunnage" should be continued.

The classification should either provide for the transportation of a necessary caretaker of perishable freight free of charge or require carriers to take care of stoves and replenish fuel in transit when such protection is required.

While carriers may provide by definite tariff provisions, free

from undue discrimination, for the advancement of storage or transfer charges, the commission is without authority to compel them to do so.

In accordance with established law, classification properly may not be predicated upon the use to be made of an article. Use may, however, be considered as evidence of value. Value has a bearing upon rating in the classification.

The restriction of the mixture of machinery and machines to articles "necessary for the initial equipment" is unjustly discriminatory. If it is found necessary to restrict the mixture, this should be done by placing a limitation upon the quantity of each article that may be shipped in a mixed car.

In connection with the sliding scale of minima provided by rule 6-B, rules protecting the minimum on the size of car ordered, similar to those in effect in western trunk line exceptions to the classifications, and in accord with our decision in *Noble v. B. & O. R. R. Co.*, 22 I. C. C., 432, should be incorporated in western classification.

In instances where it is difficult to secure the actual weight of articles shipped, estimated weights per unit may be used. The standard weights per unit must be fair and should be the result of careful investigation. The simplicity and ease of determination under this system are commendable.

Individual items considered in this report are so numerous and varied that no reference can be made to them in the headnotes.

It is expected that carriers will revise No. 51 and direct the future development of classification in accordance with the views expressed in this report. (25 I. C. C., 442.)

STATE COMMISSIONS.

The Arkansas railroad commission has adopted "reciprocal" demurrage rules, to become effective January 1, providing for penalizing the railways at the rate of $1 per car for the first and second days, $2 for the third day, $4 for the fourth day, $5 for the fifth day, and each additional day, for failure to furnish cars when ordered by shippers. But the railways, so far as we have learned, continue to limit the charge against consignees to one dollar a day.

COURT NEWS.

The government has filed a complaint in the United States district court at Los Angeles in a suit against the Southern Pacific Company and subsidiary oil and land companies, attacking the railway's title to 45,726 acres of supposed mineral-bearing land in Fresno county, Cal. The action is based upon provisions of the act of Congress requiring the department of the interior to exclude mineral-bearing lands in issuing patents to railways.

Three judges of the federal court at Portland, Ore., have issued a temporary injunction on application of the railways of the state, restraining the enforcement of the law prescribing a percentage relation between the various classes of freight, which was passed by the voters at the recent election under the initiative. The railways were required to file bonds amounting to $55,000. The court overruled the demurrers of the attorney general to the petition of the railways, and stated that the entire issue should be disposed of within thirty days.

Judges Warrington, Knapp and Dennison in the United States Circuit Court at Columbus, Ohio, December 30, handed down a decision in the case of the government against the Lake Shore & Michigan Southern, the Chesapeake & Ohio, the Hocking Valley, the Toledo & Ohio Central, the Kanawha & Michigan, the Zanesville & Western, the Sunday Creek Coal Company, the Continental Coal Company and the Kanawha & Hocking Coal and Coke Company in favor of the government, declaring the roads guilty of restraint of trade in violation of the Sherman law. The government charged the railroads with attempting to control the mining, transportation and sale of bituminous coal from the mining districts of western Pennsylvania, West Virginia and Ohio. The Hocking Valley was accused of being the head of the alleged combination and, through its influence over the capital stock of other railroads and coal companies, with having decided the output of coal from these regions.

Railway Officers.

Executive, Financial and Legal Officers.

D. C. Eccles has been elected president of the Sumpter Valley, with headquarters at Ogden, Utah, succeeding his father, the late David Eccles.

George W. Perkins, chairman of the board of directors of the Pere Marquette, has resigned from the board, and Samuel M. Felton, president of the Chicago Great Western, also a receiver of the Pere Marquette, has been elected president of the Pere Marquette.

M. C. Kennedy, vice-president and general superintendent of the Cumberland Valley, has been elected president succeeding James McCrea, and Samuel Rea, president of the Pennsylvania Railroad, has been elected also vice-president of the Cumberland Valley, succeeding Mr. Kennedy, and president of the Pennsylvania Tunnel & Terminal, succeeding James McCrea.

G. L. Peck, general manager of the Pennsylvania Lines West of Pittsburgh, has been elected fifth vice-president in charge of the transportation department. C. M. South, chief clerk to first vice-president, has been appointed assistant to the first vice-president, and the following have been appointed assistant comptrollers: J. B. Brittain, first assistant to the comptroller, J. W. Orr, second assistant to the comptroller, and John Hurst, general accountant, all with headquarters at Pittsburgh, Pa.

Oswald J. DeRousse, whose appointment as general assistant to the president of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has been announced in these columns, was born on February 18, 1867, and entered the service of the Pennsylvania Railroad on July 18, 1884, as a telegraph operator, at Philadelphia. On June 28, 1885, he was transferred to the service of the New York, Philadelphia & Norfolk, in the office of A. J. Cassatt, president, where he remained until March, 1897, when he was elected secretary of that company. Upon the election of Mr. Cassatt to the presidency of the Pennsylvania Railroad, on June 9, 1899, Mr. DeRousse was transferred to Broad street station and appointed chief clerk of the office of the president, which position he held at the time of his recent appointment as general assistant to the president of the same road, as above noted.

O. J. De Rousse.

The Chicago, Milwaukee & Puget Sound will hereafter be operated as the Puget Sound Lines of the Chicago, Milwaukee & St. Paul. H. R. Williams, president of the Puget Sound, has been elected vice-president with office at Seattle, Wash., and A. M. Ingersoll, vice-president of the Puget Sound, is vice-president at Tacoma. All subordinate officers of the legal and accounting departments of the Chicago, Milwaukee & Puget Sound are appointed to the same positions, respectively, with the Chicago, Milwaukee & St. Paul.

Ivy Ledbetter Lee, whose appointment as executive assistant, to the president of the Pennsylvania Railroad, has been announced in these columns, was born at Cedartown, Ga., on July 16, 1877; after graduation from Princeton University with the degree of A. B. in 1898, he did post-graduate work at Harvard and Columbia universities. He was then engaged in editorial work until his appointment as press representative of the anthracite coal operators, the Pennsylvania Railroad and other corporations. From 1908 to 1909 he was in charge of the publicity bureau of the Pennsylvania Railroad, and since 1910 was general European manager for Harris, Winthrop & Company, bankers,

and now returns to the Pennsylvania Railroad as executive assistant to the president, with office at Broad street station, Philadelphia.

Albert John County, who has been appointed special assistant to the president of the Pennsylvania Railroad, as has been announced in these columns, was born in Dublin, Ireland, on August 1, 1871. He received his early education in that city, and was graduated from the University of Pennsylvania, Wharton School of Finance, Transportation and Accounting, in 1908, as Bachelor of Science in economics. He began railway work in July 1885, in the purchasing department of the Great Southern & Western Railway, of Ireland. On November 20, 1890, he entered the service of the Pennsylvania Railroad, as clerk in the secretary's department. In June, 1898, he was appointed chief clerk, and on December 1, 1900, was made assistant to the secretary. He was appointed assistant secretary of the Pennsylvania Railroad in February, 1901, and later of the Philadelphia, Baltimore & Washington, the Northern Central, and other companies in the Pennsylvania Railroad System East of Pittsburgh and Erie, and also superintendent of the Pennsylvania Railroad Employees' Saving Fund. Since June, 1906, he has served as assistant to Samuel Rea, vice-president, and he now goes with him to the president's office. He is also secretary of the Richmond-Washington Company. Mr. County served with Mr. Rea as one of the mediators in the New York subway situation.

A. J. County

Operating Officers.

The title of G. W. Clark, superintendent of the Central New England, with office at Hartford, Conn., has been changed to general superintendent.

J. G. Code, general superintendent of the Wheeling & Lake Erie, has been appointed general manager of the Wabash-Pittsburgh Terminal, with headquarters at Pittsburgh, Pa., succeeding H. W. McMaster, resigned.

H. W. McMaster, receiver and general manager of the Wabash-Pittsburgh Terminal, has been appointed general manager of the Wheeling & Lake Erie, with headquarters at Cleveland, O. The position of general superintendent, heretofore held by J. G. Code, has been abolished.

D. J. Evans, trainmaster of the Lake Shore & Michigan Southern at Toledo, Ohio, has been appointed assistant superintendent of the Toledo division, succeeding W. F. Schaff, promoted, and W. H. Sullivan has been appointed trainmaster of the Toledo division, succeeding Mr. Evans.

J. V. Shepherd, general manager of the Western Maryland, at Baltimore, Md., having resigned, his former position has been abolished and A. R. Merrick, superintendent of the Saginaw-Lake division of the Pere Marquette, with office at Saginaw, Mich., has been appointed general superintendent of the Western Maryland, with office at Baltimore.

Benjamin McKeen, general manager of the Vandalia, with office at St. Louis, Mo., has been appointed general manager of the Pennsylvania Lines West of Pittsburgh, succeeding G. L. Peck, promoted, and E. T. Whiteley, superintendent of the Eastern division of the Northwest system, has been appointed general superintendent of the Northwest system, succeeding A. M. Schoyer, both with headquarters at Pittsburgh, Pa. Mr. Schoyer's new position has not yet been announced, as the meeting of the directors of the Vandalia has not yet taken place.

H. W. Sheridan, superintendent of the Sacramento division of the Southern Pacific at Sacramento, Cal., has been appointed general superintendent of the Louisiana Western Railroad and Morgan's Louisiana & Texas Railroad & Steamship Company, the Louisiana lines of the Southern Pacific, with headquarters at New Orleans, La., succeeding W. M. Hobbs, resigned to engage in other business.

E. E. Gray, assistant division superintendent of the Denver & Rio Grande at Gunnison, Colo., has been appointed assistant superintendent of the First division, with office at Pueblo, Colo., succeeding R. T. McGraw, who has been appointed superintendent of the Fourth division, with headquarters at Alamosa, Colo., to succeed I. H. Luke, who takes the place of O. J. Ogg, superintendent of the Second division at Salida, Colo.

The Chicago, Milwaukee & Puget Sound hereafter will be operated as the Puget Sound Lines of the Chicago, Milwaukee & St. Paul. P. C. Hart, general superintendent of the Puget Sound, has been appointed general superintendent, with office at Seattle, Wash., and all subordinate officers of the operating department of the Chicago, Milwaukee & Puget Sound are appointed to the same positions with the Chicago, Milwaukee & St. Paul.

Traffic Officers.

E. D. Perkins has been appointed general freight and passenger agent of the Bartlett Western, with office at Bartlett, Tex., succeeding E. J. Fitzgerald, promoted.

Thomas G. Smiley, general freight agent of the Western Maryland, at Baltimore, Md., has been appointed freight traffic manager in charge of the freight traffic department, with office at Baltimore, and his former position has been abolished.

A. K. Ragsdale, traveling passenger agent of the San Antonio & Aransas Pass at San Antonio, Tex., has been appointed general baggage agent, with headquarters at San Antonio, in place of I. N. Turner, who hereafter will have charge of the ticket requisitions.

J. B. Payne, who recently was appointed assistant general freight agent of the Louisiana Lines of the Texas & Pacific, with headquarters at New Orleans, La., has been appointed assistant general freight agent with office at Dallas, Tex., succeeding H. L. Redfield, resigned.

J. T. Hendricks, whose appointment as general traffic manager of the Missouri Pacific, with headquarters at St. Louis, Mo., was announced in our issue of December 27, will also have jurisdiction over the St. Louis, Iron Mountain & Southern. A sketch of Mr. Hendricks' railway career was published in the *Railway Age Gazette* of November 1, 1912, page 857.

R. J. McKay, general passenger agent of the Chicago & Alton, at Chicago, has been appointed first assistant general passenger agent with headquarters at St. Louis, Mo., to succeed T. G. Roehm, resigned, and the office of general passenger agent is abolished. W. C. Mueller, city passenger and ticket agent at St. Louis, has been appointed general agent of the passenger department, with office at St. Louis. O. P. Bennett has been appointed general agent of the freight department, with office at Minneapolis, Minn., and A. F. Sullivan has been appointed traveling freight agent, with office at Minneapolis.

J. G. Hollenbeck, assistant general passenger agent of the St. Louis, Iron Mountain & Southern, at Little Rock, Ark., has been appointed general passenger agent of the Missouri Pacific-Iron Mountain System, with office at St. Louis, Mo., succeeding B. H. Payne, who has been assigned to other duties in the passenger department at St. Louis, on account of continued ill health. F. E. Schroeder, chief clerk to the passenger traffic manager, has been appointed assistant general passenger agent of the Iron Mountain at Little Rock, succeeding Mr. Hollenbeck, and H. H. Butler, chief rate clerk in the passenger traffic department of the Missouri Pacific, has been appointed assistant general passenger agent, with headquarters at St. Louis, in charge of rates, tariff bureau, etc.

The Chicago, Milwaukee & Puget Sound will hereafter be operated as the Puget Sound Lines of the Chicago, Milwaukee & St. Paul. R. M. Calkins, traffic manager of the Puget Sound, has been made traffic manager, with office at Seattle, Wash. J. R. Veitch, assistant traffic manager of the Puget Sound, has

been appointed assistant to the traffic manager, with headquarters at Chicago. F. D. Burroughs, general freight agent of the Puget Sound, has been appointed general freight agent, with office at Seattle. G. W. Hibbard, general passenger agent of the Puget Sound, has been appointed general passenger agent, with office at Seattle, and all subordinate officers of the traffic department of the Chicago, Milwaukee & Puget Sound are appointed to the same positions with the Chicago, Milwaukee & St. Paul.

Engineering and Rolling Stock Officers.

Michael McGraw has been appointed master mechanic of the Chicago & Alton, with headquarters at Bloomington, Ill., to succeed W. E. Ladley, resigned.

The Chicago, Milwaukee & Puget Sound hereafter will be operated as the Puget Sound Lines of the Chicago, Milwaukee & St. Paul, and E. O. Reeder, chief engineer of the Puget Sound, has been appointed assistant chief engineer, with office at Seattle, Wash.

R. E. Wallace has been appointed supervisor of locomotive operation of the Chicago Terminal and Illinois divisions of the Rock Island Lines, with headquarters at Chicago. S. T. Patterson has been appointed supervisor of locomotive operation of the Arkansas division, with office at Little Rock, Ark. F. Connolly has been appointed supervisor of locomotive operation of the Kansas City Terminal and Kansas divisions, with headquarters at Herington, Kan., and C. S. Yeaton has been appointed supervisor of locomotive operation of the Oklahoma division, with office at El Reno, Okla.

W. J. Tollerton, mechanical superintendent of the Rock Island Lines, with office at Chicago, has been appointed general mechanical superintendent of the Rock Island Lines in full charge of the mechanical department. T. Rumney, assistant to second vice-president in charge of the mechanical department having resigned, his former position has been abolished. Mr. Tollerton was born in 1870 at St. Paul, Minn., and was educated in the public schools, and in high school. He began railway work as a machinist apprentice on the St. Paul & Duluth, now a part of the Northern Pacific, and after a short while was a fireman on the Omaha Railway. He went to the Union Pacific in 1890 as foreman, and afterwards was general foreman. In 1896 he was appointed master mechanic of the Utah division of the Oregon Short Line, and in 1903 was made master mechanic of the Idaho, Utah and Montana divisions of the same road with office at Pocatello, Idaho. He went to the Rock Island in July, 1906, as superintendent of motive power in charge of lines west of the Mississippi river, with office at Topeka, Kan., and was promoted in April, 1907, to assistant general superintendent of motive power of the Rock Island Lines, with headquarters at Chicago. In May, 1912, his title was changed to mechanical superintendent.

W. J. Tollerton.

Purchasing Officers.

The office of H. W. Davies, purchasing agent of the Norfolk Southern, at Norfolk, Va., has been abolished, and Mr. Davies has been assigned to other duties.

W. G. Phelps, chief clerk to the second vice-president of the Pennsylvania Lines West of Pittsburgh, has been appointed assistant purchasing agent, with headquarters at Pittsburgh, Pa.

Special Officers.

F. G. Athearn, manager of the bureau of economics of the Southern Pacific, with headquarters at San Francisco, Cal., has resigned to engage in other business, effective January 1.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

THE LEHIGH VALLEY has ordered 10 mikado locomotives from the Baldwin Locomotive Works.

THE DELAWARE & HUDSON has ordered 15 consolidation locomotives from the American Locomotive Company.

THE CAROLINA & NORTH WESTERN has ordered 4 consolidation locomotives from the Baldwin Locomotive Works.

THE HARRIMAN LINES are closing negotiations for about 200 locomotives with the Baldwin Locomotive Works and the American Locomotive Company.

THE CUBA RAILROAD has ordered 4 ten-wheel locomotives from the American Locomotive Company. The dimensions of the cylinders will be 18 in. x 24 in., the diameter of the driving wheels will be 52 in., and the total weight in working order will be 127,000 lbs.

CAR BUILDING.

THE NEWBURGH & SOUTH SHORE is in the market for 175 freight cars.

THE MICHIGAN CENTRAL will build 400 box cars at the company's shops.

THE LEHIGH VALLEY is considering the purchase of some passenger equipment.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 500 gondola cars from the Standard Steel Car Company, and is in the market for 1,000 box cars, 200 refrigerator cars, and 50 caboose cars.

IRON AND STEEL.

THE NEW YORK CENTRAL LINES have ordered about 2,400 tons of structural material.

GENERAL CONDITIONS IN STEEL.—There has been a let up in the volume of orders placed during the past week, particularly as regards the orders placed with the independent companies. Orders on the books of all the companies are so heavy, however, that they continue to operate at as near their full capacity as possible, and they are experiencing difficulty in delivering shipments in contract time. The orders placed with the Steel Corporation have been satisfactory and a considerable increase in the unfilled tonnage on the books of that company is expected for December. Prices are firm, but there does not appear to be any indication of increases in the near future.

MACHINERY AND TOOLS.

THE GRAND TRUNK PACIFIC has called for tenders for machines, tools, motors, furnaces, cranes, etc., for the equipment of its car shops at Transcona, Manitoba. Specifications and forms of tender may be obtained at the office of W. J. Press, mechanical engineer, Ottawa, Ont. All tenders must be in by February 13, 1913.

NORTH YORKSHIRE DALES RAILWAY, ENGLAND.—This company's bill will propose the incorporation of a company to construct railways which will in effect extend the Yorkshire Dales Railway from its present northern termination at Grassington so as to make junctions with the Northallerton & Hawes line of the North Eastern Railway at Leyburn and with the Richmond branch of the same company at Scorton. Running powers will be asked for over the Midland Railway from Colne to Skipton, over the Yorkshire Dales Railway from Skipton to Grassington, over the North Eastern Railway between Leyburn and Northallerton, with the use of these stations and intermediate stations, and over the North Eastern Railway between Scorton, Darlington and Middlesbrough, with the use of these stations and intermediate stations. Working and traffic arrangements are sought with the Midland, North Eastern and Yorkshire Dales railways.

Supply Trade News.

The Dearborn Drug & Chemical Works, Chicago, has changed its name to the Dearborn Chemical Company.

The Dressel Railway Lamp Works, New York, has discontinued its office in the Peoples Gas building, Chicago.

Samuel E. Barrett, president of the Barrett Manufacturing Company, Chicago, with office in that city, died on December 29, at the Johns Hopkins Hospital, Baltimore, Md.

The Bucyrus Company, Milwaukee, Wis., has moved its New York office from 50 Church street, to 30 Church street. This office is in charge of C. S. Reed, eastern sales manager.

W. P. Steele has been appointed assistant to the president of the American Locomotive Company, New York, with office in that city. Mr. Steele will perform the duties heretofore assigned to him and such other duties as may be assigned to him by the president.

J. B. Ennis has been appointed chief mechanical engineer of the American Locomotive Company, New York, with office in that city. Mr. Ennis will perform the duties formerly assigned to the vice-president in charge of engineering, except the chief engineer will report directly to the president on construction and shop engineering matters.

Charles Kennedy, railroad representative for Brown & Company, Inc., Pittsburgh, Pa., with office at Chicago, died on December 18, at Niagara-on-the-Lake, Ont., at the age of 70. Mr. Kennedy was first engaged in building railroads in the oil country in Pennsylvania, and later became a locomotive engineman on the old Chicago, Burlington & St. Paul. He was chairman of the grievance committee at the time of the strike of the Burlington enginemen. Later he was connected with the National Tube Company and the Ewald Iron Company, at Louisville, Ky. He has been railroad representative for Brown & Company since 1898. He is succeeded by George H. Likert, formerly master mechanic of the Union Pacific.

The plant of the H. W. Johns-Manville Company, at Manville, N. J., which has just been completed, consists of nine buildings, each having an average length of 1,000 ft., and each being a separate factory capable of being operated as an independent unit. The total combined floor area of all the buildings is about 1,000,000 sq. ft. These buildings are of fireproof construction, being of brick, steel and concrete with roofs of J-M Asbestos roofing. The lighting and ventilating systems are so arranged as to afford the best operating conditions for the employees. The plant is located on a tract of 320 acres and the company's five mile railroad connects directly with the Central of New Jersey, the Lehigh Valley, and the Philadelphia & Reading. About 3,000 men will be employed at this plant, making a total of 7,000 who are now employed by the company.

C. W. Kelly, who for some years past has been connected with Fairbanks, Morse & Co. as railroad salesman for the city of Chicago and territory west, has resigned this position and has taken offices in the People's Gas building, Chicago, under the firm name of the Kelly-Derby Company. The new company will handle a general line of waterworks supplies, as well as wire cloth screens, crucible and rubber accounts. Mr. Kelly for many years before his connection with Fairbanks, Morse & Co. was connected with the Chicago & North Western in various capacities. His last seven years with the road were spent as superintendent of bridges and buildings and water service. He is a member of the board of directors of the National Railway Appliances Association and of the Bridge and Building Supply Men's Association. Mr. Derby was for several years connected with the [illegible] Wind, Engine & Pump Company, later with Fairbanks, Morse & Co. for two years, and for the past two years [illegible] president of the Tweedy, Hood & Finlen Company, which company has been merged with the Kelly-Derby Company.

TRADE PUBLICATIONS.

[illegible] Jefferson Union Company, Lexington, Mass., has published [illegible] interesting little folder which outline the work [illegible] the advantages of Jefferson unions.

Railway Construction.

Burlington Belt Line.—Organized by residents of Burlington, Iowa, to build from Burlington southeast to Beardstown, Ill., about 65 miles.

Carolina Railroad.—Incorporated with a capital of $175,000 and headquarters at Kinston, N. C., to build from Kinston north to Snowhill, about 20 miles. The incorporators include I. C. Millard, M. S. Hawkins and H. Hanley, of Norfolk, Va., and W. H. Hayes, Kinston, N. C.

Minneapolis, St. Paul & Sault Ste. Marie.—A contract has been given Foley Brothers, Welch & Stewart, St. Paul, Minn., to build an extension from Ambrose, N. D., to a point in Montana 75 miles west of Ambrose.

Moberly, Huntsville & Randolph Springs.—Incorporated in Missouri with a capital of $500,000 to build from Randolph Springs, Mo., east to Moberly in Randolph county, 12 miles. The directors include C. H. Dameron, W. T. Dameron, G. P. Dameron and W. M. Evans, all of Huntsville, Mo.

Mount Ida, Ouachita Valley & Hot Springs.—An officer writes that in addition to the work being carried out under the direction of C. C. Godman, general manager and superintendent of construction, from Mount Ida, Ark., south to a connection with the St. Louis, Iron Mountain & Southern at North Caddo Gap, 10 miles, the company has projected a 40-mile extension from Mount Ida east to Hot Springs. Work on the extension is to be carried out during 1913. G. Cox, president, Mount Ida. (September 13, p. 491.)

National Railways of Mexico.—The report of this company for the year ended June 30, 1912, shows that four contracts were entered into during the year with the Department of Communications and Public Works of Mexico. Two of the contracts modify concessions already granted and the other two relate to the construction of new lines. The amended contracts cover the line between Durango in the state of the same name and Canitis, Zacatecas, with a branch to Sombrerete, a total of about 175 miles. This work is nearing completion, and it is expected that the lines will be put in operation soon. The contracts also include the line to connect Penjamo, Guanajuato, with Ajuno, Michoacan. The work is well advanced. The new concessions call for the construction of a line from a point on the Interoceanic near San Francisco, about 28 miles from Vera Cruz, to be built via Tamos to the Port of Matamoros, in the State of Tamaulipas, and for a line from Allende to San Carlos, both in the State of Coahuila, with the privilege of extending the line to Las Vacas, in the same state. Authority has also been given to the company to take up certain portions of the existing lines to a length corresponding to some of the lines covered by the new concessions. During the year the company also carried out a large amount of betterment work, including the protection of banks and drainage, grade reductions and changes of line, tunnel improvements, improvements to bridges, trestles and culverts and putting in heavier rails to replace lighter sections; also new ballast. The unexpected difficulties encountered in the construction of the line from Durango to Llano Grande have somewhat delayed the work; it is expected that the line will be put in operation before the close of 1912. On the line from Durango to Canitas, on a section of 100 miles out of Durango about all the grading and masonry work is finished and 64 per cent. of the track laying has been finished. Work is under way on the rest of the line. The company expects to have the work finished from Penjamo to Ajuno and the line open for operation before the close of 1912. A contract was let early in 1912 to build from Allende Coahuila to Las Vacas, on the Rio Grande, opposite Del Rio, Texas, 73.32 miles. It is now proposed, however, to build only 49.71 miles to the Hacienda of San Carlos. A contract was entered into with the federal government of Mexico in March, to build a coast line from Matamoros, to San Francisco, a total of 560.48 miles. Under the terms of the contract 63 miles must be finished in two years from the time of the making of the contract, and 63 miles must be finished each succeeding year; the whole line to be completed within ten years. A contract has been let for carrying out the work on the first 63 miles from Tampico south.

NIAGARA, ST CATHARINES & TORONTO (Electric).—Application is being made to the Canadian parliament for an extension of time to build the following lines: From Port Colborne, Ont., easterly to Fort Erie and from Fort Erie to Niagara Falls; from Niagara Falls to Niagara on the Lake, thence to St. Catharines; from Welland westerly to Brantford; from the terminus of the St. Catharines and Niagara Central line to Fort Erie, and an extension via Hamilton to Toronto.

PACIFIC & HUDSON BAY.—Application is being made to the Canadian parliament for an extension of time to build from Kimsquit, B. C., at the head of Dean channel, northeast following the Dean river, Sigutla lake, Kwalchola lake, Entiaco river and the upper Nechaco river to Fort Fraser, thence via Fort St. James on Stuart lake, Fort McLeod, crossing the Parsnip river through the Pine river pass to Coalbrook, to Dunvegan along the Peace river to Peace River Landing, Alb., thence easterly via the headwaters of Bear river to Athabasca river and Fort McMurray, then crossing the Athabasca river and following the Clearwater and Churchill rivers to the proposed Canadian government Hudson Bay railway south of Washaiowaka lake and to Fort Churchill or Port Nelson on Hudson Bay. Permission is also asked to increase the capital from $5,000,000 to $25,000,000, and to authorize it to enter into agreements with other railways. W. F. Brougham, Vancouver, B. C., is acting for the applicants.

PARIS & MOUNT PLEASANT.—An officer is quoted as saying that as soon as the extension from Bogata, Tex., to Mount Pleasant, 28 miles, is put in operation it is the intention to extend the road northwest from Paris to Atoka, Okla., and to the Lehigh coal fields, about 60 miles, connecting with lines running to Oklahoma City. It is understood that an extension is to be built south from Mount Pleasant to a connection with the Missouri, Kansas & Texas, either at Daingerfield or at Pittsburg, about 15 miles. (June 7, p. 1263.)

RAILWAY STRUCTURES.

DALLAS, TEX.—It is announced that work is to be started within sixty to ninety days on a new union passenger station for the Dallas Union Terminal Company, which is to cost about $4,000,000. The city commissioners have passed the necessary ordinances, financial arrangements have been made, and the company has adopted the architect's plans. The building will be 350 ft. long, 210 ft. wide and 70 ft. high.

DULUTH, MINN.—The Duluth, Missabe & Northern will shortly let a contract for a new ore dock at the head of the lakes, to be built of concrete and steel, and to cost approximately $2,750,000. The dock will have 384 pockets of a storage capacity of 300 tons each.

MEXICO CITY, MEXICO.—The report of the National Railways of Mexico for the year ended June 30, 1912, shows that in order to provide a terminal station in the city of Mexico to accommodate all passenger and freight business, plans have been made and approved by the board of directors for a new station. No work has yet been done, but preliminary details are well advanced. Plans have also been made for putting up a new terminal station at San Luis Potosi. During the year new passenger stations were put up at Iguala, at Cuernavaca, at Colima and at Aguascalientes. New freight stations were built at Iguala and at Linares, and a combined passenger and freight station at Balsas.

ST. LOUIS, MO.—The St. Louis Southwestern has just completed a new freight house 750-ft. long, 30-ft. wide and 5 stories high, together with a yard of 10 tracks, a transfer platform 500-ft. long and a team track yard of 5 tracks.

SEATTLE, WASH.—The Chicago, Milwaukee & Puget Sound has taken out building permits for a new lumber dock and additions to its machine shops, roundhouse, blacksmith shop, woodworking shop and paint shop. Work is nearing completion on an ocean warehouse 500 x 175 ft.

SOUTH TACOMA, WASH.—The Northern Pacific has filed plans with the city for an addition to its shops in South Tacoma, including a new paint shop 144 ft. x 100 ft.

TACOMA, WASH.—The Chicago, Milwaukee & Puget Sound has filed plans with the city building inspector for new ocean docks of concrete steel construction.

Railway Financial News.

ATLANTA, BIRMINGHAM & ATLANTIC.—The federal court has appointed E. T. Lamb, general manager, as a co-receiver with H. M. Atkinson, succeeding S. L. Schoonmaker, resigned.

BALTIMORE & OHIO.—The following subsidiaries of the Baltimore & Ohio have been merged under the name of the Baltimore & Ohio Railroad in Pennsylvania: Pittsburgh & Connellsville, the Berlin Railroad, the Salisbury Railroad, the Mt. Pleasant & Broad Ford, the Ohio & Baltimore Short Line, the Somerset & Cambria, the Glenwood Railroad and the Fayette County Railroad.

CANADA SOUTHERN.—Ladenburg, Thalmann & Company, New York, are offering a part of the new $22,500,000 5 per cent. bonds at 106, yielding 4.68 per cent. income on the investment.

CHICAGO & NORTH WESTERN.—The Michigan railroad commission has authorized the issue of $10,000,000 equipment trust certificates. It is understood that no part of this issue is to be offered to the public at present.

DETROIT & CENTRAL NEW YORK.—Stockholders are to vote on January 13, on the question of leasing this road to the Delaware, Lackawanna & Western.

NEW YORK, NEW HAVEN & HARTFORD.—See an item in General News in regard to the contract with the Pullman Company.

NORWOOD & ST. LAWRENCE.—The New York Public Service Commission has authorized the company to sell $200,000 additional first mortgage bonds at 90.

PERE MARQUETTE.—George W. Perkins, chairman of the board, has resigned.

SAN DIEGO & ARIZONA.—It is rumored, according to press reports from San Diego, that Phelps, Dodge & Company, which own the El Paso & Southwestern, and a minority interest in the Rock Island Company, have bought the San Diego & Arizona, which runs from San Diego to Ysidro, Cal., 14 miles, and which started work some time ago on an extension through California, Lower California and Mexico towards Coyote Wells.

WHEELING & LAKE ERIE.—The receiver has been authorized to issue $2,425,000 receiver's certificates to pay for 1,300 freight cars, 20 locomotives, and to pay for bridge and dock work.

LONDON & SOUTH WESTERN RAILWAY, ENGLAND.—Widening between Twickenham and Richmond of the Windsor line and of the Kensington & Richmond line, and further money powers are among the chief objects of the bill to be promoted by this company. It is also proposed to cancel the existing leases of 1894 and 1902 to the company of the separate undertakings of the North Cornwall Railway known as the Launceston & Delabole and the Padstow lines, and to authorize a new lease in perpetuity to the company of the whole of the North Cornwall Railway undertaking, including the Launceston & Halwill, Launceston & Delabole, Wadebridge and Padstow lines.

NORTHERN JUNCTION RAILWAY, ENGLAND.—The Northern Junction Railway, a new company, seeks incorporation with power to construct 20 railways making connections with existing lines in the outskirts of London. The proposed lines will make junctions with the London & South Western and North & South Western Junction railways at Brentford, with the Ealing & South Harrow line of the Metropolitan District Railway near Hanwell, with the Acton & High Wycombe line of the Great Western Railway at Brentham Halt, with the Great Central Railway at Wembley Hill, with the Metropolitan & Great Central Joint Railway at Wembley Park, and with the following lines of the Great Northern Railway, *i. e.*, with the High Barnet branch at Finchley, and with the Enfield branch and the main line at Wood Green. The places to be traversed by the proposed lines will be Brentford, Ealing, Acton, Hanwell, Greenford, Perivale, Twyford, Wembley, Kingsbury, Hendon, Finchley, Friern Barnet, Hornsey, Wood Green and Southgate. The promoters ask for authority to enter into working and other agreements with the Great Central and Great Northern railways.

ANNUAL REPORT.

FOURTH ANNUAL REPORT FERROCARRILES NACIONALES DE MEXICO.

(NATIONAL RAILWAYS OF MEXICO.)

MEXICO OFFICE: SEGUNDA CALLE DE BOLIVAR, NO. 19.

NEW YORK OFFICE: NO. 25 BROAD STREET.

To the Shareholders:

On behalf of the Board of Directors and in compliance with the provisions of Article 48 of the By-Laws of the Company, I have the honor to present to you the following report relative to the affairs of the Company for the fiscal year July 1, 1911, to June 30, 1912.

EXCHANGE AND PAYMENT OF SECURITIES CALLED FOR CONVERSION.

The deposit of securities under the Plan for the Readjustment and Union of Mexican Central Railway Company Limited and National Railroad Company of Mexico has continued, though in less number. The securities remaining undeposited are shown in the following

STATEMENT OF SECURITIES DEPOSITED TO JUNE 30, 1912, IN ACCORDANCE WITH THE PLAN OF APRIL 6, 1908.

SECURITIES OF MEXICAN CENTRAL RAILWAY COMPANY LIMITED.

	Issued.	Deposited.	Per Cent.	Outstanding.	Per Cent.
Priority Five Per Cent. Bonds ..	$6,597,000.00	$5,223,000.00	79.17	$1,374,000.00	20.83
First Mortgage Bonds	264,062.50	262,715.00	99.49	1,347.50	.51
Consolidated Mortgage Bonds ...	109,020,000.00	109,001,000.00	99.98	19,000.00	.02
First Income Bonds	32,706,000.00	32,476,900.00	99.30	229,100.00	.70
Registered Income Bonds	325,200.00	317,000.00	97.48	8,200.00	2.52
Second Income Bonds	11,284,000.00	11,261,000.00	99.80	23,000.00	.20
Stock	59,127,100.00	59,064,400.00	99.89	62,700.00	.11
Total	$219,323,362.50	$217,606,015.00	99.21	$1,717,347.50	.79

SECURITIES OF NATIONAL RAILROAD COMPANY OF MEXICO.

	Issued.	Deposited.	Per Cent.	Outstanding.	Per Cent.
Preferred Stock..	$32,000,000.00	$31,998,100.00	99.99	$1,900.00	.01
Second Preferred Stock	22,043,600.00	22,002,600.00	99.81	41,000.00	.19
Deferred Stock..	11,021,800.00	11,021,800.00	100.00	....	.00
Common Stock...	284,600.00	156,500.00	54.99	128,100.00	45.01
Total	$65,350,000.00	$65,179,000.00	99.74	$171,000.00	.26

TOTAL SECURITIES OF BOTH COMPANIES.

	Issued.	Deposited.	Per Cent.	Outstanding.	Per Cent.
Bonds and Stocks.	$284,673,362.50	$282,785,015.00	99.34	$1,888,347.50	.66

NOTE.—All of the above amounts are in U. S. Currency.

As will be noted from the foregoing statement, practically all the securities comprehended in the Plan have now been deposited. This result should be a source of satisfaction to all concerned, and is due largely to the efforts of the Readjustment Managers as well as to the fact, as was mentioned in last year's report, that on July 1, 1911, that is to say, at the beginning of the present fiscal year, the First Mortgage Bonds, Consolidated Mortgage Bonds and Registered Income Bonds of the Mexican Central Railway Company Limited matured, and such as had not been deposited previously were duly paid by your Company in accordance with the obligation assumed by it on the acquisition of the properties of the Central Company.

Having regard, therefore, to the small amount of securities still outstanding in comparison with the total number called for deposit under the Plan of April 6, 1908, it may be considered that the conversion has been practically consummated.

ISSUE OF BONDS AND NOTES.

As was mentioned at the Ordinary General Meeting last year, on account of the unfavorable financial conditions prevailing, it was not thought advisable to dispose of the bonds of the Company then in its treasury, and that accordingly two series of notes had been issued, one series maturing at the end of two years, the other at the end of one year. The latter series, amounting to £1,000,000 Sterling became due in the fiscal year under review, and was paid at maturity, the $6,150,000 Prior Lien Bonds pledged as collateral security therefor being returned to the Company. The two year notes do not mature until June 1, 1913. The interest on both series of notes was paid when due.

The Board of Directors had hoped to be able to sell at a satisfactory price during the course of the present year all or a part of the treasury bonds, but unfortunately the markets for these securities showed no improvement over those of the previous year. Consequently, it was decided to defer any such sale until there was some improvement.

The inability to dispose of the treasury assets necessitated our making other arrangements for the funds to meet the financial requirements of the Company, and negotiations were successfully conducted for a loan of $13,000,000 United States currency for one year. This loan was obtained in New York, and bears interest at the rate of five per cent. per annum. The Company deposited as collateral security therefor, $12,500,000 Prior Lien Bonds and $9,000,000 Guaranteed General Mortgage Bonds.

In [illegible] of the said loan, an option until August 15, 1912, was given [illegible] the whole or any part of certain of the Company's Prior Lien [illegible] Mortgage Bonds. Said option however, was not [illegible].

Of the [illegible] obligations of the Company, I beg to advise that Note [illegible] the [illegible] issued to the Southern Pacific Company at the time [illegible] certain shares of The Mexican International Railroad Company [illegible] paid at maturity.

During the [illegible] Prior Lien Bonds were authenticated by the Trustee and [illegible] the Company to the face amount of $[illegible],68.56, in [illegible] of expenditures made to December 31, 1910, for [illegible] and in the construction of the line from Durango to Llano [illegible].

SUBSIDIARY COMPANIES.

The operation of the various Subsidiary Companies and of leased and controlled lines has been continued, particular attention having been given to improving the properties. To this end and to aid in their development and progress financial assistance was given some of them during the year, it being considered inadvisable for said companies to endeavor to obtain the necessary funds in foreign markets owing to the difficulty of sale, at satisfactory prices, of Mexican securities.

To June 30, 1912, there had been loaned to the Vera Cruz to Isthmus Railroad the sum of $3,255,733.33 (pesos), at six per cent. per annum, to enable that company to meet expenditures in connection with the construction of branch lines. To same date there had been loaned to the Pan-American Railroad Company, under terms similar to those mentioned above, the sum of $2,102,583.33 (pesos) in order that it might meet its financial requirements.

From the amounts loaned to these Companies there should be deducted from that to the Vera Cruz to Isthmus Railroad $127,990.73 (pesos), and from that to the Pan-American Railroad Company $1,157,578.72 (pesos) representing deficit from the result of operations of the former road for the year ended June 30, 1912, and of the Pan-American for the two years ended the same date, caused principally by heavy expenditures for renewals and betterments. As the shareholders are aware, under the terms of the contracts whereby the shares of said companies were acquired, this Company obligated itself to meet such deficits.

Pursuant to the terms of the contract covering the purchase of shares of the Pan-American Railroad Company, the guaranty of Ferrocarriles Nacionales de Mexico has been placed upon bonds of said Company to the amount of $136,000 (pesos) on its First Mortgage Five Per Cent. Bonds and to an amount of $2,968,000 (pesos) on its General Mortgage Five Per Cent. Bonds.

NEW CONCESSIONS.

CONSTRUCTION OF LINES AND WORKS.

The Board has satisfaction in advising that during the year covered by this report, four contracts were entered into between the Department of Communications and Public Works of the United States of Mexico and the Company. Two of said contracts modify concessions already granted, the other two relate to the construction of new lines.

The amended contracts cover (1) the line between Durango, in the State of same name, and Cañitas, in the State of Zacatecas, with a branch line to Sombrete in the latter State, a total distance of approximately 277 kilometers; the construction of which has been pushed vigorously, is now nearing completion, and it is hoped will soon be in operation. And (2) the line which will unite Penjamo, in the State of Guanajuato, with Ajuno, in the State of Michoacan, work on which is also well advanced.

Of the new concessions one is for the construction of a line from a point on the Interoceanic Railway, near the Station of San Francisco (approximately 44 kilometers from Veracruz) which will pass by Tamos (on the San Luis-Tampico Line), and terminate at the Port of Matamoros, in the State of Tamaulipas thus practically uniting, in connection with the lines of the Company already constructed, the Ports of Veracruz, Tampico and Matamoros and traversing a large extent of country adjacent to the Gulf of Mexico. The importance of this concession is obvious.

The other new concession is for a line from the station of Allende (on the former Mexican International Railroad) to San Carlos, both in the State of Coahuila, and with the right of extending said line to Las Vacas, in the same State.

As will be seen from the Balance Sheet which is to be presented, the amount expended in the construction of the new lines mentioned and of the Durango to Llano Grande line exceeds the sum of $10,000,000.00 pesos.

In these concessions authority is given the Company to take up certain portions of its existing lines to a length corresponding to some of the lines covered by the new concessions. This will permit of the suppression of parallel or unnecessary lines, and consequently the discontinuance of an unprofitable service which under the original concessions covering said lines, would have to be continued. It will also allow a more logical distribution of transportation facilities throughout the Republic, which was one of the objects of the consolidation of the National and Central lines.

To enable the Company to proceed with the work of taking up the lines referred to, steps were taken to obtain the consent thereto as required by the provisions of the Company's mortgages. It is satisfactory to report that same has been received.

In respect of important works other than the construction of lines of railway, mention should be made of the authority given by the Board of Directors for the construction of a new terminal and shops at San Luis Potosi, to provide adequate facilities to meet its growing demands as a railroad center; also of the erection of two large steel bridges on the Monterey Division across the Pilon and San Juan Rivers, at a cost of $271,103.10 and $324,840.02 (pesos), respectively.

The attention of the Shareholders should be directed to another important piece of work, namely, the construction of a large Terminal Station at the City of Mexico, which has been receiving consideration for the past three years. During the year to which this report refers, definite plans were formulated by the Executive President of the Company and drawings made for that part of the Terminal proposed to be utilized as a Passenger Station. These drawings were submitted to the Board of Directors, and in view of the recommendation of the Executive, the construction of the Passenger Station, at an approximate cost of $4,000,000 (pesos), has been authorized. Although the decision on the part of the Board of Directors was reached after the 30th of June last, mention thereof is made in this report in view of its importance. Definite plans with respect to the construction of the Freight Station have not been decided upon, and the matter is still under consideration.

The report of operations rendered by the Executive President of the Company to the Board of Directors is herewith submitted, and by examining same the shareholders will appreciate the work done by the Management in construction, maintenance and operation of the lines as well as the present physical condition of the railway lines and property of the Company.

BOARD OF DIRECTORS.

During the year covered by this report there were no changes in the personnel of the Board of Directors. The duties of the Directors resident in Mexico as well as those forming the New York Local Board, were performed with regularity and in compliance with the provisions of the By-Laws of the Company.

In accordance with Clause Fourteen of the Deed of Incorporation, the terms of office of the twenty-one Directors of the Company expire today,

and the Board of Directors for the first time will be renewed in its entirety. The Directors elected at this meeting will hold office until the Ordinary General Meeting of the shareholders to be held in the year 1915. Two Commissaries and two substitutes also have to be elected to hold office until the Ordinary General Meeting of 1913, as the terms of office of those elected last year expire on this date.

RESULTS OF OPERATION AND DIVIDENDS.

Unfortunately, as the shareholders know, a state of revolution has continued in the Republic, principally in the northern part of the country and in the States of Morelos and Guerrero, which has been the cause of attacks upon and damage to transportation lines, resulting in the interruption and suspension of traffic for a greater or less time. This has proved detrimental to the Company not only through loss of traffic, but also on account of actual damage done to its lines and property. Nevertheless, as will be seen from the Income Account for the fiscal year ended June 30 last, the gross receipts of the Company almost equaled those obtained in the previous year, the significance of which is worthy of notice, as it manifests the stability of the Company as well as the vitality of the nation. Moreover, the Management of the Company, following a policy which merits the highest praise, has endeavored to reduce the cost of operation to a minimum, and as a consequence the net results obtained during the past fiscal year exceed those of the previous fiscal year by over $1,000,000 (pesos); the net income for the year 1911-1912 reaching the sum of $21,888,033.49 (pesos), while for the year 1910-1911 it amounted to $20,504,140.19 (pesos).

In view of these results of which the Board of Directors takes cognizance from month to month, and following the custom of former years and in exercise of the authority conferred by Article 50 of the By-Laws, it authorized the payment of two semi-annual dividends of two per cent. each on the Company's First Preferred Shares, which together constitute the four per cent. maximum that these shares may receive. The semi-annual dividends were duly paid as in former years, and the Board hopes that this action will be approved by the meeting.

The Balance Sheet, the Profit and Loss Account and the Income Account for the fiscal year July 1, 1911, to June 30, 1912, which will be submitted to the Shareholders, having been approved by the Board of Directors, were passed to the Commissaries, who in turn had them audited by Messrs. Price, Waterhouse & Company, Chartered Accountants. The latter, after making a careful examination of the accounts, issued their certificate relative thereto. The Commissaries have rendered their report recommending the approval of these accounts, which report will be submitted to the meeting.

The foregoing embraces what the Board considers of sufficient importance to be brought to the attention of the Shareholders, but at the same time it would be pleased to furnish any further information or explanation that may be desired by the meeting. The book containing the minutes of meetings of the Board of Directors as well as all documents relating thereto are at the disposal of the Shareholders in order that they may be fully cognizant of the work performed by it.

The Board begs to thank the Shareholders for the confidence reposed in it, and to express the satisfaction it would afford the members to know that their actions during the time they have directed the affairs of the Company are approved.

Mexico, D. F., October 2, 1912.

LUIS. ELGUERO,
Chairman of the Board of Directors.

FERROCARRILES NACIONALES DE MEXICO.

(NATIONAL RAILWAYS OF MEXICO).

MEXICO, D. F., September 19, 1912.

Sr. Lic. D. Luis Elguero,
Chairmon of the Board, Mexico.

DEAR SIR:

I beg to submit the following report of the operations of the Company for the fiscal year ended June 30, 1912:

RESULTS OF OPERATION.

The following statement shows in a condensed form the results for the year:

	Mexican Currency.	
The Gross Earnings from all sources were		$61,447,790.71
The total Expenses of Operation were		38,435,254.74
Leaving Net Receipts of		$23,012,535.97
To which add:		
Interest and Dividends on Securities owned	$937,290.54	
Sundry interests	721,361.95	
Other Receipts	141,283.88	
		1,799,936.37
Making		$24,812,472.34
From which deduct:		
Taxes and Rentals	$548,821.21	
Operating Deficit of Subsidiary Companies	975,617.64	
Sundry Adjustments of Operating Expenses:		
Provision for expenses for repair and replacement of equipment	1,300,000.00	
Reserve for Additions and Betterments, in suspense	100,000.00	
		2,924,438.85
		$21,888,033.49
And:		
Interest on Funded Debt, Equipment and Collateral Trusts and Notes Payable		19,403,457.17
Leaving Balance carried to Profit and Loss Account		$2,484,576.32
And deducting:		
Five Per cent. of Net Profits transferred to Reserve Fund	$124,228.82	
Dividend on First Preferred Shares, four per cent.	2,306,632.00	
Government Bonds forfeited account failure to complete Jimenez to Parral line	7,000.00	
Adjustment of market value of Bonds owned	41,587.38	
		2,479,448.20
Leaving as Net Surplus for the year ended June 30, 1912		$5,128.12
To which add:		
Net Surplus at June 30, 1911		561,924.33
Which gives a total Net Surplus at June 30, 1912, of		$567,052.45

The succeeding statement, which it is thought will be of interest, gives somewhat more in detail the results for the four years that the Company has been in operation

FERROCARRILES NACIONALES DE MEXICO

COMPARATIVE STATEMENT OF INCOME ACCOUNT FOR THE FOUR YEARS ENDING JUNE 30, 1909, TO 1912

	MEXICAN CURRENCY.			
	1908-1909.	1909-1910.	1910-1911.	1911-1912.

Total	$2,861,294.25	$2,890,778.27	$3,095,828.79	$2,783,154.97
NET REVENUE	$21,067,036.42	$23,090,434.75	$20,504,140.19	$21,888,033.49
From which deduct:				
INTEREST ON BONDED DEBT, ON EQUIPMENT AND COLLATERAL TRUSTS ETC., AND ON NOTES PAYABLE	18,466,663.88	18,562,603.78	17,946,269.32	19,403,457.17
SURPLUS	$2,600,372.54	$4,527,830.97	$2,557,870.87	$2,484,576.32

NOTE.—The above figures for the years 1908-1909 and 1909-1910 include those for the Mexican International R. R. Co., which were published separately, as that line was not merged with Ferrocarriles Nacionales de Mexico until July 1, 1910.

AVERAGE LENGTH OF LINE OPERATED:

The average length of line operated during the year was 9,668.461 kilometers, or 6,007.739 miles.

GROSS EARNINGS.

As already stated, the total Gross Earnings from all sources amounted to $61,447,790.71: Mexican Currency, for details of which as well as comparison with last year, your attention is invited to the following statement:

1910-1911. EARNINGS.	1910-1911. PERCENTAGE.		1911-1912. PERCENTAGE.	1911-1912. EARNINGS.
$44,320,766.34	71.56	Commercial Freight	70.34	$43,220,949.51
876,981.93	1.41	Construction Freight	1.04	638,657.30
12,657,110.32	20.44	Passenger	22.05	13,548,386.95
235,111.63	.38	Baggage	.35	215,046.92
2,066,544.67	3.34	Express	3.37	2,070,914.81
55,705.93	.09	Telegraph	.09	54,363.19
130,726.74	.21	Rentals	.26	158,539.52
44,517.39	.07	Floating Equipment	.05	33,084.72
1,546,956.10	2.50	Miscellaneous	2.45	1,507,847.79
$61,934,421.05	100.00		100.00	$61,447,790.71

The movement of commercial freight by classes differed but slightly from that of the previous year, as will be noted from the following table:

1910-11. PERCENTAGE.		1911-1912. PERCENTAGE.
12.88	Forest Products	11.56
22.33	Agricultural Products	23.48
3.15	Live Stock and Animal Products	4.01
50.90	Mineral Products	49.76
10.74	General Merchandise	11.19
100.00		100.00

The Gross Earnings for the year show a slight falling off as compared with last year. Taking into consideration, however, the unsettled political conditions which have obtained throughout the Republic during the last five months of the fiscal year, the results can only be considered as remarkable and evidencing the wonderful vitality of the country. Notwithstanding that the earnings for the first six months of 1910-1911 were eminently satisfactory, we were able to show notable increases in the same period of the present fiscal year. On the other hand, however, our earnings for the last

six months fell off very noticeably, and this accounts for the slight decrease in the year's figures. For details by months of the earnings your attention is invited to statement No. 6 as prepared by our General Auditor.

OPERATING EXPENSES.

Careful attention has been given the upkeep of that part of the property which has not been interfered with by the revolutionists and the physical condition is superior even to that at the close of the fiscal year ending June 30, 1911.

As will be seen from the details subsequently given in this report, considerable work in the way of improving our track has been done during the year, additional heavy rail having been laid, more line ballasted, and temporary bridges replaced by permanent structures.

The percentage of Operation to Earnings during the year was 62.55 per cent., comparing favorably with the figure of last year of 63.42 per cent., and which, when consideration is given the heavy burden thrown upon the Operation by reason of the revolution, should be a source of satisfaction to the shareholders.

The Sub-Accounts for the fiscal years 1910-1911 and 1911-1912 compare as follows:

1910-11. Percentage.		1911-1912. Percentage.
28.42	Maintenance of Way and Structures	29.51
22.37	Maintenance of Equipment	25.20
43.64	Conducting Transportation	40.16
5.57	General Expenses	5.13
100.00		100.00

The comparative percentage to Gross Earnings for the two years being:

1910-11. Percentage.		1911-1912. Percentage.
18.02	Maintenance of Way and Structures	18.46
14.19	Maintenance of Equipment	15.76
27.68	Conducting Transportation	25.12
3.53	General Expenses	3.21
63.42		62.55

STATEMENTS OF OPERATIONS.

Attached to this report will be found the various statements of accounts as prepared by the General Auditor. Same give in detail the results for the year as well as financial position of the Company.

As heretofore, the books and accounts have been audited by Messrs. Price, Waterhouse & Company, of London, New York and Mexico, and a copy of their certificate as to the correctness thereof accompanied this report.

The results of operation for the year are as follows:

1910-1911. Mexican Silver.		1911-1912. Mexican Silver.	Percentage of Increase or Decrease.
$61,934,421.05	Gross Earnings	$61,447,790.71	
39,279,344.57	Operating Expenses	38,435,254.74	
$22,655,076.48	Net Earnings	$23,012,535.97	
	Which, reduced to *gold* at the average price of the Mexican dollar for the year viz., 50 cents, equals *gold*	*$11,506,267.99*	
$11,327,538.24			
63.42	Operating percentage	62.55	Dec. 0.87
19,833,846	Kilometers run by revenue trains	17,974,817	" 10.34
3.1227	Gross Earnings per revenue train kilometer	3.4186	Inc. 8.65
1.9804	Operating Expenses per revenue train kilometer	2.1383	" 7.33
1.1423	Net Earnings per revenue train kilometer	1.2803	" 10.78
6,275.94	Gross Earnings per kilometer of road operated	6,355.49	" 1.25
3,980.26	Operating Expenses per kilometer of road operated	3,975.32	Dec. 0.12
2,295.68	Net Earnings per kilometer of road operated	2,380.17	Inc. 3.55
6.55209	Average amount received for each ton of freight	6.67312	" 1.81
.01818	Average receipts per ton per kilometer	.01867	" 2.62
1.80069	Average amount received from each passenger	1.67340	Dec. 7.61
.01810	Average receipts per passenger per kilometer	.01789	" 1.17

Expressed in miles the figures show as follows:

1910-1911. Mexican Silver.		1911-1912. Mexican Silver.	Percentage of Increase or Decrease.
12,324,157	Miles run by revenue trains	11,169,012	Dec. 10.34
$5.0254	Gross Earnings per revenue train mile	$5.5016	Inc. 8.65
3.1872	Operating Expenses per revenue train mile	3.4412	" 7.38
1.8382	Net Earnings per revenue train mile	2.0604	" 10.78
10,100.18	Gross Earnings per mile of road operated	10,228.10	" 1.25
6,405.62	Operating Expenses per mile of road operated	6,397.62	Dec. 0.12
3,694.56	Net Earnings per mile of road operated	3,830.48	Inc. 3.55
6.1304	Average amount received for each ton of freight	6.67312	" 1.81
0.0186	Average receipts per ton per [illegible]	.03004	" 2.62
1.8013	Average amount received from each passenger	1.67340	Dec. 7.61
0.0187	Average receipts per passenger per mile	.02879	" 1.17

IMPROVEMENTS TO PROPERTY.

ADDITIONS AND BETTERMENTS.

From the [illegible] of the Company to the close of the fiscal year under review, the sum [illegible] on additions and betterments the sum of $21,980,374 [illegible] Mexican Currency, of which amount $2,771,920.10 was expended by us during the fiscal year.

The particulars of the expenditures during the year are shown in the following statement:

	Mexican Currency Expended July 1, 1911, to June 30, 1912.
Right of Way and Station Grounds	$28,454.30
Real Estate, Purchase of Land at Santiago, Mexico, D. F.	20,975.42
Protection of Banks and Drainage	38,280.06
Grade Reductions and Changes of Line	23,103.95
Tunnel Improvements	110,360.09
Bridges, Trestles and Culverts	282,506.31
Increased Weight of Rail	906,143.29
Ballast	673,601.30
Sidings and Spur Tracks:	
Total Amount Expended $227,797.88	
Less: Value of Sidings Taken Up 49,427.00	178,370.88
Terminal Yards	81,492.09
Improvements of Crossings, Over and Under Grade	1,109.02
Interlocking Apparatus	3,214.96
Telegraph and Telephone Lines	2,491.76
Station Buildings and Fixtures:	
Total Amount Expended $134,283.46	
Less: Stations Destroyed and Not Replaced 6,538.39	127,745.07
Roadway Buildings	2,443.93
Shops, Enginehouses and Turntables:	
Total Amount Expended $303,528.87	
Less: Buildings Destroyed and Not Replaced 3,000.00	300,528.87
Shops, Machinery and Tools:	
Total Amount Expended $169,737.06	
Less: Value of Machinery Worn Out or Discarded 47,724.00	122,013.06
Water and Fuel Stations	170,119.04
Electric Light and Power Plants	990.77
Additional Equipment	46,578.10
Freight Cars $13,262.35	
Work Equipment 33,315.75	
Other Additions and Betterments	4.69
Change of Line and Change of Gauge between Acámbaro and Uruápan	97,274.23
Tramline between Tecajete and Hacienda de Los Arcos	3,312.29
Preliminary Survey between Honey and Gulf Coast Line	18,156.10
Sundry Betterments Expenditures pending Formal Authorization	200,700.78
	$3,439,970.36
Less:	
Adjustments of Charges, Delayed Credits, etc., for Previous Year:	
Gas Plants $2,921.84	
Equipment 62,792.60	
Locomotives $48,717.72	
Passenger Coaches 14,074.88	
Connection between Anhelo and Paredón 147.66	
Allende-Las Vacas Line 147.20	
Less:	
Floating Equipment, Sale of Tug "Colima" 42,557.98	
Sale of Tulancingo Tramways 6,000.00	$114,567.28
	$3,325,403.08
Less: Reserve to Cover Debit to Additions and Betterments that may later be transferred to Operating Expenses	553,482.98
	$2,771,920.10

BRIDGES, TRESTLES AND CULVERTS:

Permanent structures were erected during the year as follows:

Aguascalientes Division:

One 10.46 meter through plate girder span on masonry. Bridge 396-B.
One 5.18 meter "I" beam span, two on each side, on masonry. Bridge 469-B.

Cardenas Division:

Sixty-nine 4.57 meter "I" beam spans on masonry placed at various points on the Main Line.
One 4.57 meter "I" beam span, consisting of six stringers, on masonry. Bridge 291-A.
Eleven 5.18 meter "I" beam spans on masonry at various points on the Main Line.
Two 7.01 meter "I" beam spans on masonry. Bridge 268-B.
Eight 4.27 meter "I" beam spans on masonry placed in Main Line.
Three 3 meter arch culverts in place of "I" beams. Bridge 293-B.
Three 5.03 meter "I" beam spans on masonry. Bridges 308-A, 308-C and 310-D.
Two 4.88 meter spans, stringers on masonry. Bridges 311-A and 314-B.
Five bridges consisting of one span, three spans, two spans and two of one span each, respectively, of 6.17 meter "I" beams on masonry. Bridges 317-A, 335-A, 339-A, 344-A and 414-B.
Two bridges consisting of four and five 9.14 meter deck plate girder spans, respectively, on masonry and piers. Bridges 318-A and 323-A.
Two 17.07 meter deck plate girder spans on masonry. Bridges 431-A and 437-A.
One 3 meter arch culvert in place of through plate girder span. Bridge 530-A.
One 13.41 meter deck plate girder span. Bridge 531-A.
One 21.33 meter through plate girder span. Bridge 532-A.
One 13.71 meter through plate girder span. Bridge 533-A.
One span consisting of 18 rails of 37.204 kilograms per lineal meter (83 lbs.). Bridge 536-A.
One .965 meter arch culvert in place of 3.048 meter rail span. Bridge 537-B.
Two 9.14 meter "I" beam spans on masonry. Bridges 560-A and 561-A.
Six bridges of 9.14 meter "I" beam spans on masonry with center pier. Bridges 581-A, 583-A, 598-A, 601-A, 602-A and 605-A.
Three bridges of 9.75 meter "I" beam spans on masonry supported by one new pier each. Bridges 643-A, 643-B and 646-B.
In addition to the foregoing, bridges 481-A, 526-A, 551-A and 665-A, referred to in last year's report, were duly completed during the year under review.

Guadalajara Division:

In the Guadalajara Yard, wooden stringers are being replaced with "I" beams and rail girders on masonry. Work 50 per cent. completed at June 30, 1912.

Ameca Branch: Two spans of 24.84 meter deck plate girders on masonry. Bridge 41-A.

Mexico Terminal

One 10.06 meter deck plate girder span on masonry. Bridge 9-E, Cintura Line.

Mexico-Queretaro Division:

Two 3.05 meter "I" beam spans on masonry. Bridges 0-78 and 0-89-A.

In addition to the above, bridges 0-87-A and 0-88-A mentioned in last year's report were completed during the year ended June 30, 1912.

Monclova Division:

Ten 2 meter arch culverts were put in, in place of timber trestles at bridges B-1-B, B-1-C, B-G and B-1-E on Main Line, and three sidings.

Two 9.14 meter deck plate girder spans on masonry abutments and one pier. Bridge B-127-A.

Two 15.24 meter through plate girders on masonry. Bridge 134-A.

Two 4 meter arch culverts put in, in place of timber trestles. Bridge 135-A.

Two 3 meter arch culverts in place of timber trestles. Bridge 136-A.

Three 24.38 meter through plate girders on masonry abutments and two piers. Bridge 171-A.

Six 2 meter arch culverts replacing timber trestles. Bridges 172-A, 262-B, and 264-B, consisting of two arches each.

Two 9.14 meter deck plate girder spans on masonry abutments and one pier. Bridge 195-A.

Three 3.05 meter rail girder spans on masonry abutments and two piers. Bridge 264-A.

Two 5.18 meter "I" spans on masonry abutments and one pier. Bridge 269-A.

Three 5.18 meter "I" spans on masonry abutments and two piers. Bridge 269-B.

One 4 meter rail girder span. Bridge "E," Lampacitos Mine No. 4, Line.

Seven rail girder spans; two of 6.40 meters, one of 3.10 meters and four of 9.20 meters. Bridges A, B, E and F, Agujita Track, to Mine No. 7.

Northern Division:

One 5.18 meter "I" beam span on masonry. Bridge 928-A.
One 30.48 meter riveted truss span on masonry. Bridge 936-B.
One 17.07 meter deck plate girder span. Bridge 983-B.
One 7.01 meter "I" beam span. Bridge 984-B.
One 5.181 meter "I" beam span. Bridge 988-C.
One double arch culvert. Bridge 993-A.
One 5.18 meter "I" beam span. Bridge 1077-C.
One 13.41 meter deck plate girder span. Bridge 1116-A.
One 53.34 meter through pin connected truss span. Bridge 1119-B.

In addition to the foregoing, work on bridges 961-A, 986-A, 993-B, 993-C, 994-A, 994-B and 1117-A was completed during the year under review. These latter bridges were included in the report for last year.

San Luis Division:

Four 3.05 meter rail girder spans. Bridges 380-B, 448-A, 457-A and 464-A.

Masonry Boxes built at bridges 394-B, 395-C, 396-A, 396-B, 397-B, 458-A, 460-B and 468-A; also a rail and concrete box at bridge 461-A, to replace wooden boxes.

One double 3.05 meter "I" beam span in place of light girder span. Bridge 906-B.

Matehuala Branch: One double and one single 5.18 meter "I" beam spans. Bridges 658 and 864.

In addition to the above, a number of small wooden openings were replaced with masonry boxes and arches, and numerous bridges had masonry abutments raised and widened as well as being strengthened in other respects.

Torreon Division:

Two 3 meter semi-circular arch culverts to replace timber trestles. Bridges 639 and D.

Two 7.62 meter "I" beam spans on masonry. Bridges 640-A and B.

Three 7.62 meter "I" beam spans on masonry. Bridge 640-C.

Four 4.57 meter rail girder spans on masonry. Bridge 641-A.

PURCHASES OF NEW RAIL:

During the year we purchased 21,253 tons of 42.164 kilogram (85-lb. A. S. C. E.) rail and 14,000 tons of 37.204 kilogram (75-lb.) rail from native producers and 12,300 tons of 37.204 kilogram (75-lb.) rail of foreign manufacture.

The domestic rail is being used in replacements and renewals; the foreign rail in the construction of new lines.

Of the above we received from the home source in the course of the year all the 42.164 kilogram (85-lb. A. S. C. E.) rail, and 6,368 tons of the 37.204 kilogram (75-lb.) rail; from the foreign manufacturers, 9,415 tons.

RELAYING WITH HEAVIER RAIL:

This also has received serious consideration during the year, and in order to take care of increased business and to improve the track generally the following replacements of heavy for light rail have been made:

Aguascalientes Division:

From kilometer 584.064 to kilometer 585.600, a total of 1536 track meters of 27.779 kilogram (56-lb.) rail replaced with 37.204 kilogram (75-lb.) rail.

Cardenas Division:

From kilometer 322.070 to kilometer 382.809, and from kilometer 618.759 to kilometer 651.000, a total of 79.936 kilometers of 27.779 kilogram (56-lb.) rail, 11.165 kilometers of 32.739 kilogram (66-lb.) rail and 1.879 kilometers of 41.172 kilogram (83-lb.) rail replaced with 42.390 kilogram (85-lb. A. R. A.) rail.

From kilometer 291.963 to kilometer 309.070, or 7.727 kilometers of 32.739 kilogram (66-lb.) rail, and 9.380 kilometers of 41.172 kilogram (83-lb.) rail replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

From kilometer 418.550 to kilometer 438.462, and from kilometer 457.069 to kilometer 462.160, a total of 25.003 kilometers of 37.204 kilogram (75-lb.) rail, was replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

From kilometer 462.160 to kilometer 463.490, from kilometer 514.920 to kilometer 544.110, from kilometer 610.520 to kilometer 620.970 and from kilometer 661.440 to 667.000, a total of 46.530 kilometers, of which 40.970 kilometers were of 32.739 kilogram (66-lb.) rail and 5.560 kilometers of 41.172 kilogram (83-lb.) rail replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

From kilometer 413.400 to kilometer 418.550, or 5.150 kilometers of track of 37.204 kilogram (75-lb.) rail was replaced with 42.390 kilogram (85-lb. A. R. A.) rail.

At Rascón, San Dieguito, Micos, Rodriguez, Velasco, Auza, Escontria, La Labor, Espinazo, Las Canoas, Zacate, Cafetal, Tambaca, Las Cruciitas, San Mateo, Valles and Cardenas sidings, a total of 16.784 kilometers of track of 27.779 kilogram (56-lb.) rail was replaced with 41.172 kilogram (83-lb.) and 37.204 kilogram (75-lb.) rail.

Guadalajara Division:

Between Guadalajara and Orendáio, Ameca Branch, and from Guadalajara Yard, 27.779 kilogram (56-lb.) rail to the extent of 14.501 kilometers was replaced with 34.723 kilogram (70-lb.) rail.

Manzanillo Line. Between Tuxpan and Zapotilic 0.725 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 37.204 kilogram (75-lb.) rail.

Gomez Palacio Division:

From kilometer 679.452 to kilometer 680.393 and from kilometer 704.925 to 705.492, a total of 1.508 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 32.739 kilogram (66-lb.) rail.

Mexico Terminal:

At this Terminal a total of 1.635 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 32.739 kilogram (66-lb.) rail.

1.380 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 37.204 kilogram (75-lb.) rail, and fourteen switches of 27.779 kilogram (56-lb.) were replaced with 37.204 kilogram (75-lb.) switches.

4.819 kilometers of 19.842 kilogram (40-lb.) rail replaced with 27.779 kilogram (56-lb.) rail.

Mexico-Queretaro Division:

From kilometer 234.190 to kilometer 237.648 and from kilometer 237.967 to kilometer 251.209, or 16.700 kilometers of 27.779 kilogram (56-lb.) rail, was replaced with 32.739 kilogram (66-lb.) rail.

Monclova Division:

From kilometer 0 to kilometer 1.368 the old 30.507 kilogram (61½-lb.) rail was replaced with 37.204 kilogram (75-lb.) rail.

Monterrey and Gulf Division:

From kilometer 75.000 to kilometer 79.640 or 4.640 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 34.723 kilogram (70-lb.) rail.

From kilometer 79.640 to kilometer 109.640, or 30.000 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 34.723 kilogram (70-lb.) rail.

From kilometer 16.040 to kilometer 19.640 and from kilometer 109.640 to kilometer 239.640, a total of 33.600 of 27.779 kilogram (56-lb.) rail replaced with 34.723 kilogram (70-lb.) rail.

From kilometer 239.640 to kilometer 245.000, or 5.360 kilometers of 27.779 kilogram (56-lb.) rail was replaced with 34.723 kilogram (70-lb.) rail.

From kilometer 247.407 to kilometer 435.242 there were taken up 2.388 kilometers of 27.779 kilogram (56-lb.) rail and replaced with 34.723 kilogram (70-lb.) rail, in order to set new switches.

Northern Division:

Matamoros Branch: From kilometer 180.000 to kilometer 242.000 there were taken up 53.648 kilometers of 19.842 kilogram (40-lb.) rail and 7.450 kilometers of 27.779 kilogram (56-lb.) rail, a total of 61.098 kilometers replaced with 32.739 kilogram (66-lb.) rail.

In order to avoid bumping near frogs (as these were already of 37.204 kilogram (75-lb.) rail, from kilometer 87 to kilometer 319, there were taken up 0.685 kilometers of 19.842 kilogram (40-lb.) rail and replaced with 37.204 kilogram (75-lb.) rail.

Pacific Division:

From kilometer 36.388 to kilometer 49.622 and from kilometer 49.888 to kilometer 63.510, or 26.856 kilometers of 22.322 kilogram (45-lb.) rail, was replaced with 27.779 kilogram (56-lb.) rail.

San Luis Division:

From kilometer 562.000 to kilometer 575.000, or 13.000 kilometers of 34.723 kilogram (70-lb.) rail was replaced with 62.164 kilogram (75-lb. A. S. C. E.) rail.

From kilometer 575.000 to kilometer 595.832, or 20.832 kilometers of 34.723 kilogram (70-lb.) rail was replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

From kilometer 595.832 to kilometer 603.832, or 8.000 kilometers of 34.723 kilogram (70-lb.) rail was replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

From kilometer 603.832 to kilometer 740.364, or 136.532 kilometers of 34.723 kilogram (70-lb.) rail was replaced with 42.164 kilogram (85-lb. A. S. C. E.) rail.

TAMPICO TERMINAL:

At this Terminal there were taken up a total of 12.722 kilometers of 27.779 kilogram (56-lb.) rail and replaced with 32.739 kilogram (66-lb.) rail.

BALLAST:

We have followed up our policy of gradually improving our track by the placing of permanent ballast on the following Divisions during the year:

DIVISIONS.	LINEAL METERS.
Aguascalientes	11,380
Cardenas	98,743
Guadalajara	45,707
Hidalgo	940
Mexico-Queretaro	75,293
Monclova	1,977
Monterrey	95,638
Northern	15,172
San Luis	35 700
Tampico Terminal	10,215
Total	390,774

NEW SIDE AND PASSING TRACKS:

During the year new side-tracks, passing tracks, cross-overs and extensions to existing side-tracks were built to the extent of 30.073 kilometers. The following statement gives detail of weight of rail used in these new tracks, viz.:

WEIGHTS OF RAIL.	KILOMETERS.
40 lb. rail (19.842 kilograms)	0.325
45 " " (22.322 ")	2.830
50 " " (24.802 ")	1.546
54 " " (26.786 ")	6.514
56 " " (27.779 ")	13.013
60 " " (29.763 ")	0.050

			Weights of Rail		Kilometers.
61½	"	"	(30.507	")	0.368
65	"	"	(32.243	")	0.452
66	"	"	(32.739	")	0.327
70	"	"	(34.723	")	1.366
75	"	"	(37.204	")	3.008
85	"	"	(42.390	")	0.274
					30.073

From which deduct—Tracks taken up:

40	lb.	rail	(19.842	kilograms)	0.222
45	"	"	(22.322	")	1.359
50	"	"	(24.802	")	3.183
54	"	"	(26.786	")	0.558
56	"	"	(27.779	")	2.715

75	"	"	(37.204	")	0.217
85	"	"	(42.390	")	0.184
					9.621
Net increase					20.452

New Terminal Station, San Luis Potosi:

At the present time the traffic originating at, destined to or passing through this important centre is handled at two terminals, i. e., those of the Ex-National and X-Central. Both are inadequate for proper service, and in addition thereto cause unnecessary expense. A careful study of the matter having demonstrated the advantages to be derived from the construction of an up-to-date terminal, plans therefor were drawn and the works begun during the fiscal year under review.

New Stations:

We completed during the year the construction of Station Buildings at the following places:

Passenger Station at Iguala.
Freight Station at Iguala.
Passenger and Freight Station at Balsas.
Passenger Station at Cuernavaca.
Passenger Station at Colima.
Passenger Station at Aguascalientes.
Freight Station at Linares.

Thirteen sets of new Section Houses for the use of our track employees were also built in the course of the year.

Purchase of New Equipment:

Orders were placed during the year for ten first-class coaches; thirteen second-class and ten baggage, mail and express cars. Also for 150 tank-cars 12,000 gallons, 100,000 lbs. capacity. All for delivery during the latter months of this calendar year.

Construction of New Lines:

Durango to Llano Grande:

Due to unexpected difficulties encountered in the construction of this line, same has not as yet been fully completed. It is now expected, however, that the line will be finished and put in operation about the month of December next; 54.450 kilometers are now being operated. As of June 30, 1912, the amount expended on this construction was $3,966,904.06, Mexican currency.

Durango to Cañitas:

The building of this line has been carried on actively during the year. Practically all the grading and masonry work on the 160 kilometers out of Durango mentioned in last report has been completed, the percentage being, respectively, 99.83 and 99.57, while 64 per cent. of the rails have been laid.

The contract for the balance of the line, approximately 114 kilometers, was executed on April 2, 1912, and work commenced May 6. As of June 30, 13.3 per cent. of the grading and 3 per cent. of the masonry had been done. If no unforeseen difficulties are experienced, it is hoped to put the line in operation by April, 1913. To June 30, 1912, we had expended on this work $3,051,796.58, Mexican currency.

Penjamo to Ajuno:

The same remarks apply to the construction of this line. Subsequent to June 30, however, the work was seriously interfered with for some two or three weeks by very heavy floods in the section which the line traverses. Eighty per cent. of the grading and masonry was finished as of June 30, last. Unless unlooked for obstacles arise, the line should be ready for operation by December this year. The expenditures to June 30, 1912, amounted to $2,969,408.65, Mexican currency.

Allende to Las Vocos:

Under concession granted by the Federal Government on March 2, 1912, a contract for the construction of this line was let on April 12, 1912. The line runs from Allende in the State of Coahuila on the old Mexican International Road, to Las Vocas on the Rio Grande, opposite Del Rio, Texas, and will connect with the line of the Kansas City, Mexico & Orient Railway, now under construction. The total length of the line is 118 kilometers, or 73.32 miles, of which, however, it is now proposed to build but 80 kilometers, or 49.71 miles, to the Hacienda of San Carlos.

The line runs through a good agricultural country, susceptible of considerable development. Already several irrigation projects are under way. It is confidently expected that this line will prove a valuable feeder to the system. Eight per cent. of the grading has been completed at June 30th last. The amount expended to the close of the fiscal year was $57,638.39, Mexican currency.

Matamoros to San Francisco

On March 2, 1912, a contract was executed with the Federal Government of Mexico covering the construction of this coast line, which will have an approximate total length of 902 kilometers, or 560.48 miles. In accordance with the stipulations in the contract 100 kilometers of said line must be completed in two years from the signing thereof, and 100 kilometers in each succeeding year. The whole line to be completed within ten years. Careful study and consideration having demonstrated the advisability of constructing that portion of the said line from Tampico south, the contract for the building of the first one hundred kilometers from that point was executed on June 5th last.

It is fully expected that this section of the line will prove to be a source of considerable net revenue to the Company, inasmuch as it will tap the major part of the oil fields in that region, as well as a good agricultural country.

IN GENERAL.

Employees:

At June 30, 1912, there were 31,179 employees in the service of the Company, of which number 639, or 2.05 per cent., were foreigners.

The diminution in the number of foreign employees is principally due to the voluntary separation from our service, in April last, of the major part of the foreign trainmen.

Statements of Equipment:

Accompanying this report are the usual statements of Locomotives and Cars on hand at the close of the fiscal year. It will be noted that we have suffered severely in the loss of cars through the activities of the revolutionists.

Express Service:

The operations of the Campañia Mexicana de Express, S. A., for the year have been more satisfactory, having regard in this connection also to the disturbances to business through uncertain conditions.

Fuel Oil:

The benefits which we expected to derive from the substitution of oil for coal as fuel have been fully borne out by the year's results, as will be noted from the decrease in cost of fuel shown in Statement No. 7, of the General Auditor.

It is, of course, economically impossible for us to use oil exclusively on our system, bearing in mind the long distances in some cases from the source of supply, and the proximity of coal in those districts. Where we have found it economical to use oil, same is being used. Of the total mileage of the system, approximately 50 per cent. is operated by oil and 50 per cent. by coal.

New Terminal Station, Mexico City:

Since the organization of the Company, the advisability of constructing a Terminal Station in the City of Mexico sufficient in size to accommodate all our Passenger and Freight business for years to come, has been given the careful consideration of the operating officers, and plans therefor have been drawn, and approved by the Board of Directors. No work has as yet been done in this connection, but the preliminary details are well advanced and the construction can be commenced as soon as the opportune time arrives.

Parallel Lines:

One of the considerations weighing in the merger of the Companies now forming this Company was the suppression of certain lines, principally of the old National Railroad Company and the old Mexican Central Railway Company, which parallel each other, the traffic of the region not being sufficient to sustain both tracks.

After careful and mature deliberation the Committee appointed to investigate the matter recommended the abandonment of the following lines:

		Kilometers.	Miles.
Mexican International	Anhelo to Ixtla	21.00	13.05
"	Horizonte to Bermejillo	22.53	14.00
"	Sauceda to Matamoros	210.00	130.49
National R. R.	Saltillo to K. 931	17.00	10.56
"	Jarita to Columbia	32.00	19.88
Mexican Central R. R.	Tepenacaseo to Tularcireo	7.00	4.35
"	Cuyamaloya to K. 155 (Pánuco)	36.00	22.37
"	Hercules to Adjuntas	15.00	9.32
"	San Luis to Estanzuela	9.00	5.59
"	Sandoval to Somoriel	20.00	12.43
Coahuila & Pacific	Encantada to Saltillo	22.00	13.67
"	Agua Naval to Torreón	10.00	6.21
Hidalgo Railway	K. 15 (near Tultepec Station) to Mogotes	43.00	26.72
		464.53	288.64

In accordance with the provisions of Section 22 of Article V, of our morteages, the consent to the suppression of the concessions covering the said lines was requested, and received. The Department of Communications and Public Works having also signified its approval thereto, the necessary steps are now being taken looking to the said abandonment. It is confidently expected that same will benefit the property very materially by reduction of expenses.

Oil Industry:

Considerable impetus has been given to the development and production of oil in the Tampico and Tuxpan districts during the past year. New wells have been sunk in numerous places with gratifying results, while the old wells keep on producing as satisfactorily as heretofore. In all it is now computed that there are forty organized companies engaged in developing this industry, and the handling of the output should bring good results to the Company as soon as the line now being built south from Tampico is completed. The prospects of this business for the future look very promising.

Crops:

It is with regret that I have to advise that the outlook for the present crops is not at all satisfactory. The unusually heavy rains throughout the agricultural belt have had a very damaging effect, and as a consequence the yield is now expected to be below normal.

Statements of Accounts:

Accompanying this report I hand you a letter from the General Auditor, dated September 6, 1912; as also the ten statements of accounts as enumerated therein. A list of the Directors and Officers of the Company as at the close of the fiscal year is attached hereto.

Respectfully submitted,

E. N. BROWN,
President.

VOLUME 54. JANUARY 10, 1913. NUMBER 2.

CONTENTS

THE Supreme Court of the United States, in refusing to approve of the distribution of the controlling stock of the Southern Pacific to Union Pacific stockholders, has used a blunt, common sense kind of reasoning that we have learned to associate with the decisions of this court that is in sharp contrast to the popular conception of the complexities of the highly trained legal mind. The court in the Union Pacific case says that "the ultimate determination of the affairs of the corporation rests with its stockholders and arises from their power to choose a governing board of directors." In theory, this was equally true in the Standard Oil case. If a certain group of men owned a controlling interest in the Standard Oil Company of New Jersey stock, and subscribed pro rata for their proportion of stock of each of the Standard Oil subsidiaries, under the plan of dissolution approved by the Supreme Court, this same group could elect a board of directors for each one of the subsidiaries which would carry out their policies. In the case of the Standard Oil Company, however, while this possibility existed in theory, the court was not of the opinion that it constituted a practical danger, and it is probable that most business men would agree with the court. It was not at all inconceivable that different individuals could gain control of different subsidiaries of the Standard Oil Company of New Jersey. On the other hand, the Supreme Court says in regard to the distribution of 46 per cent. of Southern Pacific stock to Union Pacific stockholders that "after such distribution as is now proposed, stockholders of the Union Pacific Company may dominate and control not only the Union Pacific Company, but the Southern Pacific Company as well," and that "this transfer . . . will not so effectually end the combination as to comply with the decree heretofore ordered to be entered by this court."

OF course, Southern Pacific stock could not be distributed to Union Pacific stockholders without substituting for this stock some other security—collateral or cash—under the Oregon Short Line bonds, which are at present secured by S. P. stock and some other investment stocks, unless the Oregon Short Line bonds were retired. In a published analysis of the effect of the Supreme Court's decision in the Union Pacific case, F. J. Lisman & Co. have brought out two quite interesting circumstances bearing on the case. They point out in the first place that the Union Pacific would hesitate a long time before retiring a 4 per cent. bond issue at par or at a premium, since in such a transaction the railroad company would be an inevitable loser. The company could not, in the present state of the bond market, issue securities to raise new capital for improvements, etc., on a 4 per cent. basis. On the other hand, the bankers' analysis points out that if the Union Pacific route from Omaha to Ogden is competitive with the Southern Pacific from New Orleans to San Francisco, the Central Pacific route from Ogden to San Francisco appears to be competitive with the Southern Pacific's New Orleans to San Francisco line. In other words, if the Union Pacific and Southern Pacific compete, so do the Central Pacific and Southern Pacific. The Southern Pacific owns the controlling stock of the Central Pacific. The suggestion is obvious that the situation can be met without the retirement of the Oregon Short Line 4's by an exchange, on some equitable basis, of Central Pacific stock for Southern Pacific stock. There is a further point that has not been generally discussed that deserves mention—regardless of what is done by the Union Pacific with its Southern Pacific *stock*, the Southern Pacific will still be a heavy debtor to the Union Pacific. On June 30, 1912, the Southern Pacific owed the Union Pacific $12,000,000 on demand loans, and in addition the Union Pacific owned $26,017,000 bonds of the Southern Pacific.

WE note with much regret the resignation of F. G. Athearn as manager of Bureau of Economics of the Southern Pacific. Mr. Athearn did not have a big title; but he is a very able man and was doing a very important work. As manager of the Southern Pacific's bureau of economics he labored zealously and effectively to establish better relations between the road, on the one hand, and its patrons and employees on the other. Being an educator—he maintained a connection with the University of California and also had charge of the Southern Pacific's student employees' course of study—his methods in dealing with patrons and employees were educational in the best sense. He sought to give the company the public's point of view and to give the public the company's point of view. He constantly furnished the press with a large amount of real news about the Southern Pacific, and in a single year he made 108 speeches on railway affairs, a great majority in California. Recently when a referendum on several railway measures was taken in Arizona Mr. Athearn, under the direction of President Epes Randolph of the Arizona Eastern and the Southern Pacific Lines in Mexico, conducted a campaign on behalf of all the railways against the measures with such effect

that 40 per cent. of the voters voted against them; and they probably would have been defeated if the campaign had lasted a little longer.

THERE are, roughly speaking, two theories regarding the way the public relations of railways should be handled. Many men still think that the policy of seeking more or less secretly to manipulate and dominate politics is the only effective means of protecting large corporations against the attacks of demagogues and strike legislators. Many other persons, including most of those now prominent and influential in the councils of American railways, think that these methods are not only intrinsically wrong, but that they have forever lost their effectiveness, and that the only means by which railways can hope to establish and maintain in future satisfactory relations with the public and regulating bodies is, first, to try to give the public everything in the way of service and rates to which it is entitled, and, second, to seek, by the dissemination of literature on railway subjects and by public appearances of their responsible officers before railway commissions and legislative committees to so educate the public and the regulating authorities regarding railway affairs that they will be disposed to give the roads a square deal. Mr. Athearn is one of those who oppose attempts at political manipulation and favor educational methods. The experience of the past five or six years shows that, regarding the matter from a purely practical standpoint, those who advocate these methods are right. The special committee on Relations of Railway Operation to Legislation has used no other methods; and it has done the most effective work ever done on behalf of American railways regarding public regulation. That these methods have not been more extensively and effectively used has been partly due to the fact that there are still many men of influence in railway affairs who have shown and still show incapacity to adapt themselves to the conditions that have developed in recent years. If Dr. Osler's prescription could be followed and a large number of these gentlemen could be quietly chloroformed the immediate future of the railways would be greatly improved. Another reason why educational methods have not been more extensively and effectively used is that the number of men adapted to using them who have been developed is inadequate. Mr. Athearn is one of these men; and it is too bad that when so few of them have been developed any of them should be leaving railway service. When a nation or any kind of business sorely needs a particular type of men in its service, and it cannot get them, or cannot keep them after it does get them, it is evident that there is something wrong with its organization or management. The railways of the United States have developed innumerable good and many great executives; but in handling their public relations, and in developing and keeping men capable of handling them, they have quite commonly exhibited a very remarkable quality of ineptitude.

WHILE the orders for rails placed during the past few weeks probably have not exceeded those of similar periods in recent years to the extent which those for cars and locomotives have, they are unusual for their size at this season of the year. Most of the larger roads have now placed their orders for the major portion of this year's requirements, although supplementary orders will undoubtedly be given when the needs and the business prospects for the year are more definitely determined. The orders already placed are much heavier than those of the same roads for previous years and are nearly double those of last year, indicating that the railways are spending more for maintenance this year than previously, and that they are turning their attention to the deferred maintenance as fast as their earnings will permit. The order for 200,000 tons of rails representing an expenditure of approximately $6,000,000 given a few days ago by the Harriman Lines, is indicative of the amount of money which is being spent for this one item, for while the order is probably the largest individual order so far, other systems are making purchases equally as large in proportion to their mileage. Aside from the size of the orders, the early placing of them is unusual and the proportion of the season's requirements placed on January 1 far exceeds that of former years. Last year the ordering of rails had scarcely begun at this time and the roads did not enter the market actively until early spring and summer. Contrary to the general rule, there has been no period of dullness this year between the completion of the 1912 rolling and the beginning of work on the 1913 requirements. Even then it will be impossible for the mills to roll all orders promptly and deliveries will be slow, in spite of the fact that they are exerting every effort to keep up with the output and are establishing new records in several instances. The anticipation of late deliveries has undoubtedly been a primary reason for the early placing of orders, but at the same time they would not have been placed had the railways not been optimistic regarding the outlook for this year. Another interesting feature connected with the orders placed so far is the increasing use of the new specifications of the American Railway Engineering Association. As these specifications were not formally adopted until the annual meeting in March of last year, it was too late for many of the roads to incorporate them with their orders, although the Rock Island and Wabash did adopt them for their 1912 orders. Among other roads adopting them this year with slight modifications in some instances are the Baltimore & Ohio, the Louisville & Nashville, the Erie, and the Atchison, Topeka & Santa Fe, so that the tonnage of rails rolled under these new specifications this year will far exceed those of last year.

THE COMMISSION'S DECISION ON WESTERN CLASSIFICATION NO. 51.

AFTER having suspended Western Classification No. 51 since February 15, last, the Interstate Commerce Commission has issued its opinion and report, a synopsis of which appeared in last week's issue, ordering the carriers to revise it and direct the future development of classification in accordance with the views expressed therein. The importance and detail technicality of the varied issues passed on by the commission in a report of over 100 pages preclude any satisfactory estimate of the effect on the classification as a whole. It would seem that the carriers have been sustained on the larger proportion of the items reviewed, but on the other hand, it is apparent that a great deal of the work that has been done looking to uniformity of classification will have to be done over.

That the commission has at least had an abundant opportunity for recognition of the magnitude of the task is indicated in Commissioner Meyer's opinion. The number of changes in No. 51 against which protest had been made was estimated at from 1,500 to 2,000 out of the thousands of items involved. After nearly a year of investigation he says, "Where the number of changes is as great as is involved in this one proceeding, it is apparent that no body of men can in a relatively short time give such consideration of each item as will enable them to express their conclusions with reference to each with that degree of confidence as to their correctness that would be desirable." Therefore, the commission says that it will hold itself in readiness to modify any of its conclusions or suggestions as soon as sufficient reliable information making such modifications just and proper may become available.

Undoubtedly one of the most significant features of the report is the declaration by the commission as to the necessity of affording wider publicity and fuller public hearings in connection with the future development of classification, and the recommendation that the classification committee submit proposed changes in smaller installments, giving ample public notice of hearings to interested parties, and inviting representatives of the interested state commissions and of the Interstate Commerce Commission, to participate in all such hearings with a view to avoiding in the future such unwieldy proceedings as the recent investigation.

The commission says that in recent years there has been a tendency toward greater publicity in classification matters, and since the investigation was instituted the carriers have invited the Interstate Commerce Commission to send a representative to classification meetings. This should silence the critics who have attempted to surround all classification procedure in the minds of the public with an idea of mystery because the work has been done by representatives of the railways alone, taking no note of the fact that the shippers have been given every opportunity to furnish information and to state their views. The presence of a representative of the commission should give assurance that public rights are not disregarded.

It has become quite common for railway officers to suggest that various perennial controversies be referred to the Interstate Commerce Commission for arbitration, and the railways have got beyond the idea that they can settle such important questions as those involved in the making of rates and classification entirely among themselves. There is room for grave doubt, however, whether the participation of state commissioners would not operate to make an unwieldy proceeding of every item in the classification, to the extent of seriously interfering with the obtaining of satisfactory results within a reasonable time.

State commissioners are notoriously, perhaps necessarily, advocates of sectional views. A classification, and particularly one covering many roads, and a large territory, must be based on considerations of the requirements of commerce as a whole. The entire proceedings during the commission's investigation have demonstrated for the hundredth time that most of the difficulty encountered in all classification work arises from the impossibility of reconciling the selfish viewpoints of individual and sectional interests with the welfare of the entire shipping public, to say nothing of the requirements of the carriers.

The commission apparently intends to see that future work on classifications shall proceed in accordance with certain more definite principles than have prevailed in the past. This is seen in its suggestion that in future items or groups of items be published as fast as they are disposed of by the classification committee, and that a record be made which may form the basis for an investigation by the commission. It is extremely doubtful if the necessity will ever arise for the suspension of an entire classification at one time again.

BOX CAR DESIGN.

A VISIT to a large freight car repair plant, and particularly to that part where the greater proportion of the box cars are repaired, is most instructive. From the maintenance standpoint the greatest difficulty has undoubtedly been caused by troubles with the draft gear, and this largely because of the manner of fastening the gear to the draft sills and the lack of strength in the sills themselves. On the more modern cars with steel underframes the trouble has been quite largely overcome, especially in cases where draft gear of larger capacity than standard has been introduced. A number of roads are applying steel sills or steel draft sills to old box cars when they pass through the shops for heavy repairs and where the condition of the other parts of the car is such as to warrant this expenditure. That the results obtained are satisfactory is indicated by the increasing numbers of such cars which are being so equipped on roads which have gone into the matter extensively.

Another weak point which is most noticeable at the repair tracks is that of weak box car end construction. The standard construction on cars built until comparatively recently was to use a light inside lining and the standard outside sheathing fastened to the wooden end and corner posts, thus making the end only a very little stronger, if any, than the sides of the car. This gave trouble in two ways—it did not provide adequate resistance to prevent the lading from bursting or bulging out the ends under the severe shocks met with in shifting the cars, or even in rough service on the road; also, combined with poor draft gear attachments and badly designed end sills, cracks and openings developed which were responsible for considerable losses due to the leakage of grain and similar commodities. In many cases the end of the car may appear to be tight and leakage-proof when standing still, but the vibrations during transit open up the cracks and allow the grain to leak out. Many provisions have been made to reinforce the ends to prevent this. The end construction used on the Santa Fe box cars was illustrated on page 959, of the April 26, 1912, issue of the *Railway Age Gazette*. In this case a ¼ in. steel plate is fastened to the end sill and extends up under the sheathing. A heavier inside lining is used than is the common practice, and the sheathing is bolted to the frame and held by clamps. A reinforced box car end used on the Central of Georgia was described in the issue of May 10, 1912, page 1035, and the end on the Canadian Pacific cars with an outside steel frame was illustrated in the issue of May 10, 1912. A recent development which gives considerable promise is the all-steel end. Two different types have thus far been placed on the market, one in the shape of a heavy steel plate, corrugated with concentric rings; the other type used on the New York Central & Hudson River is illustrated elsewhere in this issue. The advantages of such ends are increased strength, no leakage and greater inside length of the car because of the elimination of posts, inside lining, etc.

That the side doors can be made burglar, cinder and waterproof was demonstrated in the second article in the series on "Defective Box Cars and Damaged Freight," which was published in the April 19, 1912, issue of the *Railway Age Gazette*. The past year has witnessed a marked improvement in the practice of applying side doors to box cars, both in the building of new cars and in the repairing of old ones. As in the case of box car ends there has been a tendency to develop doors of all-steel construction, although only a few have thus far been placed in service.

One of the most troublesome problems in box car construction is the roof, which should be maintained in a leakage-proof condition. Since the publication of an article on this subject in our issue of May 3, 1912, more and more attention is being given to this part of the equipment. The practice of submitting the roofs to leakage tests before assigning the cars to certain classes of service has been given more consideration, as has also the realization that the railways must do their part in systematically attending to the maintenance of the roofs, if satisfactory results are to be obtained. There is also a tendency to place the different types of roofs in comparative service in new orders of cars and in sufficient numbers of each kind to permit of a fair comparison being made. The stresses to which a box car roof is subjected, even with the strongest of framing in the body of the car, are such that it must be given a reasonable amount of attention when it is placed in service, and must not be practically neglected as is commonly the case on some roads.

It is rather surprising, when we consider the comparative ease with which experiments can be made to determine the relative frictional resistance of trucks on the track, that more attention has not been given to this subject. The American Steel Foundries retained Prof. Endsley, of Purdue University, to determine the relative resistance of square and loose trucks a couple of years ago. It seemed advisable to extend the investigations made at that time still further, and the results of a second series of tests are now being made public and are presented in abstract elsewhere in this issue. They indicate that better truck construction and more attention to the mating of wheels and other details are necessary if we are to secure the best results from operation. Every effort is being made to develop as powerful locomotives as possible within the limitations of clearance and weight of the different roads. If by more attention to the car truck construction it will be possible to reduce the train resistance an appreciable amount the demands upon the locomotive will be reduced in the same proportion. It is difficult to estimate exactly what expenditure would be justifiable in improving such

conditions, but it would undoubtedly be a large one, for it would not only permit more cars to the train for the same locomotive capacity, but would probably also be responsible for a considerable reduction in the cost of maintenance of the equipment.

CRIMINAL INDICTMENTS OF RAILROAD OFFICERS.

A DOZEN railroad officers, an engineman, a brakeman and a lot of directors are now awaiting trial in Connecticut, New York and Indiana, charged with being criminals. The president of the New Haven road and the president and chairman of the Grand Trunk are accused of breaking the anti-trust law, and the others of manslaughter, or worse, in causing deaths of passengers. Mr. Mellen and the Grand Trunk officers, if they committed the crime charged, did it directly and personally, and the same probably is true of the engineman and the brakeman on the Cincinnati, Hamilton & Dayton; but in the case of all of the others the supposed crime is of a pretty shadowy nature. The legal representatives of the state propose to punish these officers and directors for misconduct or neglect which was participated in by many others; for acts, decisions or omissions which are made criminal only by legislative or judicial fiats, the real effect of which is uncertain until the lawyers have thrashed them out in court.

We do not propose to discuss the merits of these indictments, or of the laws under which they have been made; but, by way of preparing for the next stage of these proceedings it will be of interest to glance for a moment at the conditions which have led up to this unusual situation.

A grand jury is bound to find probable cause; but the members, in dealing with numerous questions of the application of statutes, must of course, be guided by the state's attorney. State's attorneys are supposed to prosecute only where they see a reasonable prospect of being able to secure conviction. But as even the Supreme Court of the United States is often said to be guided by changes in public sentiment, it is to be expected that these prosecuting officers will be sensitive to public opinion, especially where their own tenure of office depends on a popular election. And public opinion nowadays manifests itself in queer ways. In Massachusetts and Rhode Island the people (if the newspapers truly represent the people's views) desire to punish the Grand Trunk—which, surely, desires to get from those states all the traffic that it can, even at the very low rates which it must give, in competition with lines more favorably situated—for trying to find an economical way of carrying out its purpose; a way more economical than to build from 100 to 250 miles of road at a cost of 15 to 25 millions, when all of the prospective traffic must be carried at extremely low rates. In arguing against permitting the Grand Trunk to use Boston & Maine tracks Governor Foss, of Massachusetts, says: "A railroad which must create traffic over its lines to pay cost, upkeep and expenses, affords to the public the benefit of real facilities and real competition. A traffic agreement, by its terms, destroys this competition and makes sure the absence of these facilities. It leaves traffic to go, as formerly, over the existing lines, which the railroad controlling the traffic must pay for and support." In other words, to make a carrier compete energetically with others, compel it to maintain a costly and measurably useless plant.

And these New England states, aiming apparently to punish a wrong spirit rather than to secure economical transportation, seem to have convinced Attorney General Wickersham that to refrain from making a wasteful expenditure is a crime. With the Interstate Commerce Commission and five state commissions empowered to regulate rates—or, at all events, to use their ample powers of investigation, argument and criticism to expose every unjust rate—with these six semi-judicial bodies constantly "on the job," the only way that we have found to settle this purely economic question is to threaten three railroad officers, two of them subjects of the King of England, with imprisonment!

To some people the Federal indictment at New York looks as though the prosecutors were satisfied to hit anywhere, the discovery and description of the essential and important offense being immaterial. The Connecticut charges against the officers of the New Haven road, in connection with the Westport derailment, are even more awry. As to the danger of short crossovers, where adequate fixed signals are provided for the protection of trains, and the culpability of officers who are slow in the construction of long crossovers, the wildest anti-corporation lawyer would scarcely think of calling such officers criminals—except for the benefit of the galleries. Failure to make passenger cars fireproof, or to provide a larger force of trainmen or porters, may be things for which a railroad management deserves to be called to account, but, if prosecutions for manslaughter are the proper instrumentality by which to do this, the lessons of the past must be all wrong. The cause of the Westport derailment was the failure, incompetence, mistake, neglect or sickness of the engineman. Insofar as the selection, promotion or discipline of the engineman had been improperly managed some officer or officers should be held to account. But to get at the real issue by prosecuting Messrs. Horn, Pollock and Woodward as criminals, to the exclusion of other officers, is as illogical a dragnet proceeding as could be imagined.

The indictments against the officers and directors of the Cincinnati, Hamilton & Dayton are based on the alleged neglect of the company to comply with an order of the railroad commission to install automatic block signals; but since the action of the prosecutor it has been discovered that there was no such disobedience. Chairman Wood of the railroad commission has made public the orders issued by the commission relative to the installation of block signals on the road, and they show that the commission approved the manual block system in use on the line between Glenwood and Indianapolis until January 1, 1913.

But the point is that the block-signal order is not the real issue. With the improvement of the block signal system, probably this switch at Irvington would have been provided with additional safeguards; but misplaced switches sometimes cause trouble on lines equipped with automatic block signals. Should the settlement of the question whether a certain improvement shall be completed in 12 months or in 18 months decide whether or not a railway director should go to jail? The trial of the engineman and brakeman who are held responsible for leaving the switch wrong may make clear the whole situation in connection with the Irvington collision; but from the reports thus far published it appears that the neglect of the passenger engineman to watch for a switch light was a main element in the cause. This kind of neglect is not curable by prosecuting directors or officers for manslaughter; at least all efforts in that direction in the past have failed. It would seem to be the part of wisdom to try some other plan. Possibly the Indiana authorities have taken their present action because it is so popular nowadays to aim at the men "higher up," and because some of these men are so far away.

The present attitude of these public officers in New England and Indiana, and at Washington, is commendable in its purpose to put responsibility on the actual heads of the railways. The state should reach subordinates through the heads. Punishment of enginemen, conductors and brakemen in the criminal courts is very unpopular, to say the least. But if the state's control over the regulation of railroad tracks, switches and signals, and the management of difficult problems in discipline, cannot be exercised in any better way than by instituting these criminal prosecutions, the fact is a grave indictment of our whole scheme of railroad commissions. It is fifty years, more or less, since the English humorist pictured a railway director chained to the front end of the locomotive of an express train, as his idea of the way to prevent train wrecks; and it does not look as though that theory had made any progress, whatever, in the intervening half-century. The prosaic and sane but persistent inquiries of the Board of Trade into railway operating questions, combined with the policy of holding the railways to rigid financial responsibility, are the instrumentalities to which the English attribute the

great progress which has been made in that country in railway safety.

And, while the prosecuting attorneys are engaged in these erratic efforts in the criminal courts to promote the public good, the Interstate Commerce Commission, two and a half years after it received authority to investigate train accidents, presents in its annual report only one positive recommendation affecting safety, that calling for the requirement of the block system by law. (The recommendation that all passenger cars be made of steel is in the right direction, but the commissioners realize, as does every one else, that in this matter the government cannot do much; progress already is as rapid, probably, as it should be.) The rest of that part of the report dealing with safety is made up of generalities, and declarations of truths already well known.

NEW BOOKS.

Shop Notes. Edited by H. H. Winsor. 208 pages. 6½ in. x 9¼ in. Illustrated. Bound in paper. Published by *Popular Mechanics*, Chicago. Price, 50 cents.

This is the ninth annual year book of the *Popular Mechanics* Shop Notes and is a collection of the articles published during the past under that head in the monthly edition of the magazine. It includes 595 easy ways of doing things in the several trades. The items are all original and are simple in construction, making it possible for a handy amateur to duplicate them. A complete index is given in the back of the book.

Diary of a Roundhouse Foreman. By T. S. Reilly. Bound in cloth. 158 pages. 5 in. x 7 in. Published by the Norman W. Henley Company, 132 Nassau street, New York. Price, $1.00.

The book is published in the form of a diary and gives in colloquial form the experiences and trials of the engine house foreman. The hero of the story is a young college graduate who is serving his apprenticeship and has endeavored to push his way to the top. Many suggestions are given for the diplomatic handling of men.

Density and Thermal Expansion of Linseed Oil and Turpentine. By H. W. Bearce, Assistant Physicist, Bureau of Standards. Technological Paper No. 9. Published by the Bureau of Standards, Washington, D. C.

This pamphlet has been prepared in response to a demand for a more complete knowledge concerning the physical properties of linseed oil and turpentine. Samples were taken from various manufacturers in different localities throughout the country. The apparatus and method of procedure used is thoroughly described, together with the results obtained and comparisons with previous tests. A good deal of the information is given in the form of tables of density, weight and volume as determined from the tests.

Coal. By E. E. Somermeier, Professor of Metallurgy, Ohio State University. Bound in cloth. 167 pages. 6½ in. x 9½ in. Published by the McGraw-Hill Book Company, 239 West Thirty-ninth street, New York. Price, $2.00.

The information is largely based on private notes, scattered general information, technical bulletins, and original papers in technical journals. The author has endeavored to keep in mind throughout the work the mechanical and power plant engineer, the chemical engineer and chemist, and the non-technical business man who has to do with the buying and selling of coal. The work is divided into 10 chapters, the first dealing with the composition and heating value; the second with the chemical analysis; the third, fourth, fifth and sixth with the testing of fuel; the seventh and eighth with the improvement by washing and the general purchase of coal under specifications; the ninth thoroughly discusses the method and theory together with the results obtained through gas analysis by the Orsat apparatus; the tenth chapter is given over to analytical tables, giving the composition of various kinds of coal found throughout the United States. The book contains a few diagrams, clearly illustrating the various methods used in the testing of coals.

Letters to the Editor.

"BASING POINT" RATES.

LONDON, December 16, 1912.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

"One man's meat is another man's poison." It may interest American students of railway rate questions to know that in the General Manager's Report on the South African Railways for the year ending December, 1911, there is a section headed "American Rates." "There appears," it says, "to be an idea entertained by certain members of the mercantile community that the adoption of what are known as 'basing point' rates would meet the requirements of the country and facilitate its development . . . better than the present system of distribution rates."

The report gives some account of the basing point system, and of the reasons which led to its introduction in the southern states; and declares that "the sparseness of the population in this country and the long distances between points of any importance are not conducive to the adoption of basing point rates." It further states that "it is doubtful," which is at least putting it mildly, "whether small towns, not of sufficient importance to be constituted basing points, would welcome a system whereby their goods would be charged higher rates than to the basing points." The general manager concludes as follows: "The present system of distribution rates is, in my opinion, better adapted to the conditions of South Africa than the American basing point system, which was introduced to meet local conditions of a unique character."

Managers of railways in the southern states who have to defend the basing point system against assaults from outside may be interested to see that in South Africa it is the railway management that resists, and the mercantile community that demands the introduction of the basing point system.

W. M. ACWORTH.

HEAVIER LOCOMOTIVES VERSUS GRADE REDUCTION.

NEW YORK, January 6, 1913.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

From the standpoint of a stockholder and observer of railway operation I would like to make a protest against the position taken by Mr. Bloecher in the issue of the *Railway Age Gazette* of January 3, page 8. It seems impossible to believe that any one would be willing to express the opinion that grade reduction always leads to cheaper operation than increasing the power of locomotives. This I understand to be the position taken by Mr. Bloecher. As I look at this problem each division and each grade needs to be considered independently and upon its own individual merits. Undoubtedly many cases exist in which cheaper operation may be obtained by cutting off the tops of hills, while many other cases exist in which cheaper operation may be found by increasing the power of the locomotives. In the interests of the public and the owners of railroad properties I would like to appeal for an individual study, such as is suggested by Mr. Beyer in his paper which was presented in abstract in your issue of December 13, page 1145. I hope the *Railway Age Gazette* will make clear to its readers the facts concerning decreased cost of operation which has been obtained on a number of railroads during the past two or three years through the introduction of more powerful locomotives. I believe the Delaware & Hudson, the New York Central, the Virginian, the Norfolk & Western, Chesapeake & Ohio, Chicago & Alton, and many other lines are in position to supply figures and facts concerning operation which will prove the statement made by Mr. Bloecher to be altogether too general and, therefore, unwarranted. I hope to see editorial comment on this subject in the *Railway Age Gazette*.

OBSERVER.

GOVERNMENT REGULATION.

Chicago, December 24, 1912.

To the Editor of the Railway Age Gazette:

In the editorial in your issue of December 20, 1912, on "The Commission and Regulation of Operation," you make one statement which is prophetic, and that is: "And it will not be surprising if the future historian of our times writes that most of the regulation adopted hurried us along toward government ownership."

There is an excellent opportunity for the government to exercise its regulation of railways, not only to the extent of the operation, but by assuming the financial responsibilities, if it will take over either the Union Pacific or the Southern Pacific property at this time. This would be a means of carrying out amicably a ruling of the United States Supreme Court and give the government an opportunity to assume the full responsibility for the results of operation of railroad property, including the financial responsibility.

The Interstate Commerce Commission and the United States senators from each state through which the road operates should be made members of the board of directors. It is possible that by such a plan it could be developed whether government ownership is advisable, and it would also cause the Interstate Commerce Commission to hesitate in its regulations of railroads and impress upon it the due sense of its responsibilities.

L. C. Fritch,
Chief Engineer, Chicago Great Western R. R.

TONNAGE RATINGS ON NEW AND OLD LINES.

Chicago, November 21, 1912.

To the Editor of the Railway Age Gazette:

J. G. Van Zandt, in a letter in your issue of November 15, 1912, criticized some points in my article in your issue of August 23, 1912, on a method of finding tonnage rating for proposed as well as old lines.

The first point Mr. Van Zandt seems to object to is the use of averages. Practically all problems in economics are an application of general averages, especially in comparing two or more lines which are only on paper. We hope to find a train that will give an average performance over the line considered. The narrower the limits within which it must be worked out the more fortunate we are.

Bulletin 43 of the University of Illinois, compiled under the direction of Professor Edward C. Schmidt, is a very good presentation of the subject as applied to a given division. In so far as I am aware it is the most complete publication of the kind. But it must not be inferred from this that it is the only complete analysis of the subject, as a number have been made which have never gotten into print. Professor Schmidt's tests proved one thing conclusively, and that is that the best quality of maintenance is an economy, as it cuts down coal bills. The management of the road in question has improved the track standards, particularly as regards joints since that time. The truth of the matter seems to be that for speeds of 3 to 35 miles an hour, there will be no increase in resistance due to velocity unless the maintenance falls below a certain standard or the loading is not proportioned to the track structure. Since the days of Sir Isaac Newton it has always been customary to include a factor for velocity in all formulas if the problem involves the question of speed. It does not sound orthodox to omit it, but tests have shown that it has no place in this class of formulas for the highest degree of maintenance. In the beginning I think every investigator began looking for some function of the letter V, and was disappointed in not finding it. Tests made by D. E. Crawford on the Pennsylvania, A. C. Dennis on the Canadian Pacific, and those made on the Union Pacific which have been referred to by V. K. Shurtleff in various monographs on the subject fail to find a place for the letter V. These tests are much more numerous than those of Professor Schmidt, which included only 32 trains. They show the same fact that Professor Schmidt does, that for maintenance that is not exactly up to par, a wide variety of results are found. The most elaborate set of tests of this kind are those which have been made by R. N. Begien on the Baltimore & Ohio, the results of which will be published shortly by the American Railway Engineering Association. These tests prove the contention that for the present style of track and equipment the velocity does not enter into the subject for ordinary freight train speeds where the best class of maintenance is found. After mature consideration, the committee on Economics of Railway Location of this association, decided that the formula given in the manual of the association is correct for the comparison of different lines and preferred to use for that purpose a value for train resistance that is found in the best present practice. In the case of these tables I think it would be found that in comparing new lines (paper locations) the ratio between them will vary but slightly even if the Schmidt formula is used instead of four pounds per ton for speeds from 3 to 35 miles per hour.

I plead guilty to having used the method of computing available draw-bar pull recommended by the association and 11,000 B. t. u. Western coal as shown in the article. My reason for doing this was that I had never been able to run a dynamometer car on a paper location. On page 350 will be found the statement that a similar method may be used on old lines for tonnage rating. This was not gone into at length, but it would undoubtedly be better to use a dynamometer car to find what a certain class of engine is capable of doing on a given division, and also to ascertain the train resistance on that engine district also. This could be done for the four reasons with profit. The figures derived from this study can then be utilized for other schedules and loadings by the construction of tables and the use of a profile and train sheets which will give the time laid out for water, coal and passing stops.

The available draw-bar pull as computed from the tables in the Manual when 4,000 lbs. per hour of 11,000 B. t. u. coal has been used has not been found to give excessive results in my experience, although I have found that available draw-bar pull figured in this manner was less than the train resistance computed by the Schmidt formula for speeds in the neighborhood of 35 miles per hour, although there were records to show the train had been actually moved.

Paul M. La Bach,
Assistant Engineer, Chicago, Rock Island & Pacific.

THE MASSACHUSETTS COMMISSION.

Boston, January 4, 1913.

To the Editor of the Railway Age Gazette:

In the letter recently written to you I did not go into the regulation of railroads in Massachusetts at any length and shall not now, but I would like to make it clear that the keynote of regulation through the initiative by a railroad commission is the physical condition of the property and its upkeep. On rates and fares it should not act of its own volition, but wait for complaints and petitions, and in the first instance should not have much to say on operation, excepting as affecting safety. The fact is the railroads here had for years been "milked out" right under the eyes of our board, and Mr. Mellen and Mr. Van Etten (of the New York Central) inherited these skeletons. The railroad and street railway managers have always insisted, and still do, that the board should not use its initiative, and it has always coincided. I agree that the board's decisions have been of a very high order, where it has acted, but lack of action on its own initiative, as our laws said and intended, has been the trouble, and this is what must be remedied now. A people not strong enough to enforce its laws is not competent to own or operate or manage. The governor's notion of divided management, through state directors, is nonsense; we have tried that here on several roads and it worked just as it would again. Every one of us here who knows the "inside" knows that what is needed is a strong commission compelled to obey the laws. I believe you will soon see this brought about. John H. Carter.

MECHANICAL TRANSFERENCE AT FREIGHT TERMINALS.*

Essential Principles Which a Successful System Must Fulfil and Extent to Which Various Types Comply with Them.

By H. McL. Harding,
Consulting Engineer, New York.

There are three great principles in freight handling which any machinery must possess to fulfil all terminal conditions. These constitute the touchstone by which any machinery should be tested to determine its value. First, the machinery itself should be able to serve every cubic foot of space which is to be utilized. Second, the machinery should do this without any rehandling by manual labor. Third, there should be continuous rapidity.

The first principle signifies that the machinery should be able to transfer and to raise and lower freight over any portion of a designated terminal space, to distribute it to designated consignment piles and to tier it. The whole space, vertical as well as horizontal, should be served.

The second principle stipulates that the load must be raised from the floor by the machinery and not by manual labor. When it reaches its destination, it must be placed upon the floor or tiered to the desired height by machine power. If two extra handlings or rehandlings are required the economy of the mechanism is lost, as each rehandling averages in cost from 15 to 20 cents per ton, depending upon the bulkiness of the freight. The familiar traveling shop crane will fulfil these first two requirements most successfully. It will raise, transfer, lower or tier anywhere within its parallel side tracks without manual labor for rehandling. Also little floor space is necessarily left unoccupied. However, there is a third condition which the shop crane does not fulfil and which is vitally essential to terminal work. This is continuous rapidity of movement without delay or congestion. By continuous rapidity is meant the following of one load after another so successively that there will be no delay at the starting point and no congestion during transit or at the receiving end. This can be best attained, or possibly can only be attained, by a threefold division of the transporting mechanism into tractors, trailers and containers. A tractor corresponds to the locomotive, the trailer to the freight car, and the container consists of flatboards, slings, nets, hooks, light trucks or even hand-trucks containing or holding the freight or articles to be transported.

By applying the above simple principles to any new proposed freight transferring mechanism, possible mistakes may be avoided. The vertical movements are often of more value than the horizontal.

FREIGHT MOVEMENTS.

Before referring to the adaptation of any type of mechanism, the terminal freight movements or operating conditions may be briefly described. At the outbound station these movements are the receiving, inspecting, assorting, scribing, starting, calling, weighing, routing, distributing, checking, stowing and re-checking. At the inbound, they are "breaking down," inspecting checking, routing, distributing, assorting. tiering, re-checking, and later, delivery to drays. At transfer stations the movements are principally between different cars, with the inspecting, checking, routing, distributing and stowage. Often the outbound, inbound and transfer are combined at one station, with a combination of the above operations. As far as possible, transfer stations should be removed from the centers of cities where land is of great value, thereby often partially relieving the congestion at the inbound and outbound stations. At transshipment sheds, the movements are between the ship's hold or the side of the pier, to or from any portion of the pier shed and the cars or the warehouses, with the usual operations of distributing and assorting. It is often necessary to serve the second or third floors and to open storage yards for coarse freight.

The operations of assorting and distributing are controlled by the number of consignments or separate shipments. The greater the weight of each consignment, the heavier the individual loads. In outbound freight, destination subject to classification may assist in increasing the weight of the separate loads from platform to cars, provided the weighing of individual consignments does not prevent.

The average weight of separate consignments at Boston is given at about 1,000 lbs.; at the New York Central and Erie stations in New York about 800 lbs.; at Providence, R. I., 1,000 lbs., and at Worcester, Mass., 1,600 lbs. The destination weight at Providence and Worcester doubles these weights. From figures at various freight stations it may be assumed that the average weight of miscellaneous or package freight is about 1,000 lbs. per consignment. It will be far heavier at stations where the manufactured products are of metal, as at Pittsburgh, and less where they are of wood, as at Grand Rapids. The heavier the individual consignment, the fewer the trips and the less the cost per ton.

The bulkiness of consignments, unless trailers are used, will also greatly increase the cost per ton of transference. A case of hats, 5 ft. x 5 ft. x 4 ft., weighing only 100 lbs., may occupy all the space of an individual container, necessitating twenty trips per ton. With four trailers, five trips would be necessary, costing but one-fourth.

At steamboat terminals, the weight of consignments generally averages far greater than the above. For outbound steamship freight, little or no attention is paid to consignments, the stevedore stowing according to the character of the goods—heavy material below and light material above, also, as to safety of stowage and avoidance of injury to fragile materials. Inbound cargoes must be distributed according to marks and cross-marks, and are frequently assorted not only according to the shipments, but according to the grades. In one case when the labor cost for outbound was $0.36 per ton, the inbound was nearly $0.40.

ASSORTING AND DISTRIBUTING.

Wherever possible the assorting should be done at the beginning of the movement, so that the distribution can proceed rapidly without interruption. As the machinery should be able to distribute to every cubic foot of space which it is desired to serve, the comparative value of different types of machinery should depend upon the extent of this cubic service, and this can be used as a unit of value. It is evident that the assorting and distributing must be performed correctly to fulfil the third principle of continuous rapidity. Tracing the movements of outbound freight may best illustrate the necessity for this third principle in mechanical freight handling.

At two outbound stations in New York City where about 700 tons of miscellaneous freight are handled by each daily, and two-thirds of this after 1 p. m., the receiving platform being in each instance less than 300 ft. in length, the operations are as follows:

As the freight is received from the dray it is assorted by the drayman, assisted by a man furnished by the railway, into separate piles on the floor, according to consignments. At one end of the platform groceries are chiefly delivered; another location is reserved for dry-goods, and others for different classes of shipments. This greatly simplifies classification. The average weight is somewhat less than 1,000 lbs. per consignment. As soon as the drayload is received, it is inspected by the receiving clerk, receipted for, placed on hand trucks, taken to the scales which are tared for the hand truck at 165 lbs., called

*Abstract of a paper read before the Western Railway Club, Chicago, on November 19, 1912.

out, routed, checked, distributed to the proper cars and stowed, after which there is the re-checking upon the return of the truckman.

In some cities, the trucker enters the cars; in others he deposits his load at the car door for the stower and immediately returns with a waiting empty truck. This latter method avoids the truckman waiting while his truck is being unloaded, and reduces the number of truckers far more than it increases the number of stowers. The movements at the inbound house are similar, only in the reverse order. In either case only one consignment, or rather a portion of each consignment, is carried per trip, the load averaging about 250 lbs., or one-fourth of each consignment.

The movements at transfer stations are simpler, there being no weighing and no transferring first to the piles, although the piling was the earlier method. Distributing may be regarded as the chief operation. At the transfer station at Mantua, where the freight was originally assorted into piles in the transfer station and then transferred to the cars, the cost was $0.40 per ton above what it is now where the freight is trucked directly from car to car. It is not advisable to transfer to large trucks to obtain a large load, as the cost will be excessive, due to the rehandling.

When the inbound, outbound and transfer stations are combined into one, it may at first appear more complex than it is. Not only must any machinery be able to perform all the above movements to be successful, but it must accomplish them simultaneously with the greatest possible rapidity, consignment following consignment continuously, without delay or congestion.

TYPES OF MACHINERY.

The types of machinery, to which reference is here made, are those which pertain to miscellaneous or package freight, which must be moved quickly and which at present is largely moved by hand trucks. These machines consist of moving platforms, slot conveyors, portable conveyors, tiering machines, link belt conveyors, rubber belt conveyors, overhead chain and hook carriers, ramps; horse, motor, and derrick trucks; winches, elevators; cranes, such as the fixed jib crane and pillar cranes, or the movable cranes, as the gantry, walking, or traveling shop crane, transporters, overhead carriers, telphers, mantrolleys, transfers, and many others.

The general construction of the movable crane consists of a jib which can be raised, lowered and swung in a circle, a hoisting motor for raising and lowering the loads, and a traveling motor by which the whole crane can be moved. These are called gantry cranes, and are of the whole or half-arch type. There is generally a separate motor for each movement.

The traveling shop crane is not much used in freight handling, although there is a good example at the Texas City Terminal near Galveston. (See *Railway Age Gazette*, July 12, 1912.)

Applying the three principles to the platform, slot, link belt and those similar, it will be seen that in reference to package freight they fulfil the third condition as to continuous rapidity most successfully, but they fail in respect to the first condition of serving all cubic space and the second condition of rehandling. They are, however, exceedingly well adapted to moving bulk material or when the packages are of uniform size.

Winches, where there are several, may partially fulfil the third, but not the first two principles. Ramps are excellent for the purpose for which they are designed, but are not adaptable to the first two conditions, and the same is true of chutes. Overhead chain hook carriers and transporters of the usual type will also accomplish the third condition only. The traveling shop crane is a perfect adaptation of the first two principles [illegible] traveling half-arch gantry, as well as other movable [illegible] are [illegible] within a very limited range for the first and [illegible] at certain steamship terminals. As to many of the [illegible] the principles can be readily applied without [illegible] difficulties. Floor space should not be occupied for freight transference where it can be avoided.

Attention is called to the latest types, especially those used at German and English terminals. These devices consist in overhead trackage and transferring and hoisting machinery. There are two leading types which will be described. The power is electricity, preferably of direct current of 250 or 500 volts. In one type, the overhead tracks consist of an I-beam supported from the structure of the building, or if outside, upon bents. Upon this I-beam, with an intervening strip of wood between, is placed a T-rail upon which the conveying mechanism travels. In the other type, the rails are placed upon the lower flanges of the I-beam; although this type has many uses, it is somewhat more difficult to serve the whole area between the fixed side tracks.

The whole of the main side-trackage in the sheds is fixed in a permanent position; but the cross trackage is fixed or movable, being attached to a traveling crane when movable, and is so arranged that the hoisting and transferring mechanism can pass from any point of the fixed side tracks to the movable cross track, and then upon the fixed track on the other side, and thus complete the circuit of the movements.

At the rear or sides of the buildings, the overhead track is in the form of a fixed closed loop which connects the different sheds and warehouses. By means of this loop the car platforms and open space to the rear of the sheds and warehouses can be served. Coarse freight and barrels can be placed in this area, and freight can be transferred between the stations or vessels and the cars.

This conveying mechanism consists of a transfer-tractor which draws after itself from one to four trailers, each trailer supporting an electric hoist. This transfer-tractor constitutes the traveling conveying mechanism, having a speed up to nine miles an hour with its complement of trailers and six tons of freight. It is controlled in the same way as an electric trolley car, by a transfer man in the transfer-tractor cab operating a drum controller, the current being taken by a contact wheel from a wire or other conductor located parallel to the track in the most convenient location, or in some special cases by a storage battery attached to one of the trailers.

Each trailer has suspended beneath it an electric hoist, which might be called a traveling electric winch. It has all the functions of the winch except that it is movable. The normal load of each hoist is two tons at a speed of 60 ft. per min., with a reserve capacity of 50 per cent. Two hoists combined can lift four tons. One ton would be hoisted at a speed of approximately 120 ft. per min. The three hoists would, therefore, have a combined capacity of six tons, not including the reserve. The hoists are also equivalent to traveling elevators. This conveying and hoisting machinery contains no new mechanism, and can be furnished by a number of manufacturers. The transporting machinery consists of two essential features—one mechanism which conveys, and another which hoists, and this mechanism is able to transfer the freight with one conveying movement.

Unless it is too large, each hoist takes only one consignment, so that there are at least three or more consignments hoisted and conveyed at a high rate of speed. All of these are under the charge and direction of one transfer man; and also as the goods are already assorted as described at the outbound platform, no later assorting or only a limited amount will be necessary. In order to obtain a greater load for each hoist, it often happens that there can be assembled on each flatboard or in each net, sling or other container many goods of one consignment. At inbound stations, when the goods reach their destination they are either left upon the flatboard or in slings in separate piles, according to the marks, or else are lowered, each consignment being kept by itself, upon the inbound platform if a drayman should be waiting or expected. This leaving the freight in slings has been adopted at several important terminals, so that when the load is ultimately wanted no manual rehandling will be required.

If the freight is to be delivered to cars, it is either transported directly to the designated platform of the cars, or if there are no cars to receive it, it is placed where it can be held in the containers until their arrival.

The speed of hoisting with average loads is about 100 ft. per min., and the average speed of conveying, 900 ft. per min. The average load under the usual operating conditions of separate shipments is about 1½ tons per train, although the tractor and hoists have a normal capacity of six tons, and a total excess capacity of three tons additional, making a possible nine tons. A large consignment of many tons can be divided between the different trailer-hoists. To make a complete cycle, that is, hoisting the load about 20 ft., traveling 500 ft., lowering 20 ft., hoisting 20 ft., again returning 500 ft. and lowering 20 ft., it is estimated that about 20 trips per hour per transfer train can be made, that is, 30 tons per hour per train. Five trains would, therefore, transfer 150 tons per hour, the assorting being accomplished by means of the trailer hoists. Four times this amount can be transferred if the rated capacity of the hoists can be utilized.

The number of trains can be increased, operating upon the same or different loops, thereby attaining the greatest possible capacity. Should assorting not be necessary, as with cargoes of cement and iron, with few separate consignments or marks, this capacity per hour can be greatly increased with the same number of trains. The tracks are so laid out that the transfer-tractors and trailer-hoists can be concentrated upon any of the loops in any of the sheds.

It is essential for rapidity and to avoid congestion that the transporting mechanism should not wait for its loads, so that if the flatboard or other container be delayed, there is no loss of tractor time; also that one unit of power tractor can be attached to one or more units of carrying capacity. This gives a freedom of movement which can never be attained where each power tractor is permanently attached to its own carrying container.

COST OF INSTALLATION.

The transferage overhead runway, which should be made part of the shed structure, will cost the same as the other structural steel, varying with the price of the steel. The weight, including the brackets, etc., will average about 60 lbs. per lineal foot. This steel would be fabricated at the mill and erected simultaneously with the shed or warehouse.

There are various ways of computing the cost of train and track installations. One of the most satisfactory is to figure out the cost of serving a certain number of square feet of area or cubical feet of space, including a certain tonnage to be transferred within a specified time. There is also the cost per lineal foot of connecting the areas to be served. By knowing the weight of the structural steel and its cost per ton, the cost of the trackage can be closely estimated. As the sections of a terminal are developed they will be connected by overhead runways, so that the same transfer tractors and trailers can be used upon different sections.

Although the cost of transferring freight will largely depend upon its character, that is, upon the relative proportion of its bulkiness to its weight, the actual cost of hoisting and transferring should not average more than six cents per ton for a complete cycle. This does not include the expense at each end of each movement before the hoist hook is attached, and after the load is deposited, which on the average should add from six to eight cents additional.

The six cents for hoisting and transferring may be divided as follows:

Labor	15 per cent.
Interest and amortization	30 per cent.
Electricity	20 per cent.
Maintenance	20 per cent.
Incidentals	15 per cent.

It must be emphasized that all such figures must vary under different conditions or locations.

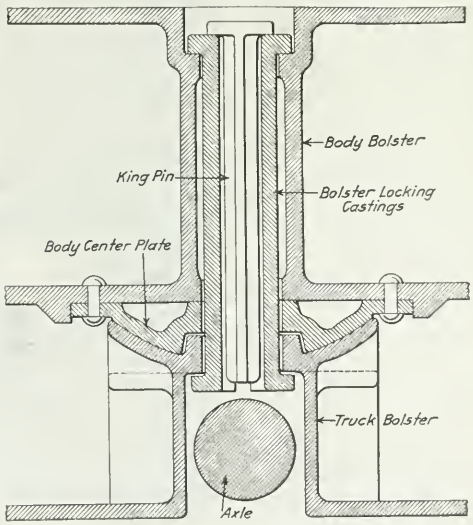
It is often desired to generalize upon the cost of machinery and its installation. To transfer a given tonnage of miscellaneous or package freight, say 1,000 tons per day, with a possible excess, at an outbound freight station of which two-thirds of this tonnage might be received within two or three hours in the afternoon, a capacity of 250 tons per hour should be provided. To be sure that there is ample capacity for contingencies and reserve, 30 carriers should be provided. This would mean that 10 tractors and 30 trailers or carrier-hoists, or 10 trains in all, corresponding to 30 motor-trucks would be required.

An investment of from $40,000 upwards would be required for these 30 carriers, and two-thirds of a mile of track, or about $1,300 per carrier, which includes the overhead trackage and the lifting as well as the transporting machinery. These figures are given as a close estimate for general guidance and may vary more or less, depending upon the specifications.

CAR AND TRUCK LOCKING DEVICE.

It is believed that if the weight of the heavy trucks used on modern passenger cars is added to the weight of the car body, it will greatly assist in preventing the raising of one underframe over the other in case of a heavy buffing shock or collision. In this way the damaging result, known as telescoping, can probably be greatly decreased.

With this idea in mind, the car department of the Grand Trunk



Device for Locking Car Body and Truck Together.

has devised a simple form of lock which will hold the truck to the car body at all times, but will not in any way interfere with its normal movements or action. This device has been made standard on that road and the Grand Trunk Pacific, and is being applied to a large order of new passenger cars now being built.

Reference to the illustration will show the form and application of the lock. It consists of two steel keys, with flanges at the top and bottom, of such a shape that they can be inserted in the somewhat enlarged center pin hole in the body and truck bolsters. Between them is inserted a center pin with ribs on each side that engage with the two keys and hold them in their proper position. When the center pin is inserted the flanges of the keys lap over the edges of the bolsters sufficient to prevent them from separating, while at the same time enough clearance is provided to allow the normal amount of free relative movement required in service. We are indebted to J. Coleman, superintendent car department, for this information.

ROSWELL MILLER.

Roswell Miller, who died at his home in New York on January 3, belonged to the older generation of railroad executives to whom so much of the credit for American railroad pioneer work is due and who are out of sympathy with public interference with the right of a railroad manager to direct the affairs of his own company. Mr. Miller was president of the Chicago, Milwaukee & St. Paul from 1888 to 1899, and since 1899 has been chairman of the board of directors. He retired from the presidency because of ill health; but before this illness, his life had been a particularly active one and his work for the St. Paul of permanent importance. He was a naturally conservative man, reticent and self-reliant. Under his management as president little or no new territory was developed by the St. Paul, but the property was improved, intensively developed and raised to the first rank among the best managed railroads in the West. Despite the fact that the management of the St. Paul was in accordance with the older ideals of American railroad management, and Mr. Miller was a president who was not only able and willing to assume the entire responsibilities of the management of his property, but personally was wholly out of sympathy and resented public interference and advice, the St. Paul became, under Mr. Miller's guidance, a road that commanded to a rather unusual extent the loyalty of its shippers, and especially of the traveling public. In developing the physical property and in molding the organization of his officers and employees, Mr. Miller set his own ideals of service and discipline, and these ideals were high.

Roswell Miller.

Roswell Miller was born in Hartford, Susquehanna county, Pa., on October 28, 1843. He was the son of the Presbyterian minister of Hartford, and was one of a large family. His early railroad experience was on the Cairo & Vincennes, of which he was at one time secretary and later general superintendent. In May, 1882, he was made vice-president and treasurer of the Chicago & Western Indiana. He had valuable early financial training, having worked in the office of J. P. Morgan & Co., in New York. In April, 1883, he was made assistant to the general manager of the Chicago, Milwaukee & St. Paul, and in the following year the general manager's health failed and Mr. Miller was made assistant general manager, with much of the duties and responsibilities of the general manager's office on his shoulders. In April, 1885, the general manager died and Mr. Miller succeeded him. Three years later Alexander Mitchell, president of the St. Paul, died, and Mr. Miller was elected president, retaining for two years the general managership. In 1890 a general manager was appointed who took over a part of Mr. Miller's duties; but the development of the St. Paul and the success of its management were due directly to Mr. Miller up to the time of his ill health in 1899.

The extension of the St. Paul to the Pacific coast was in contrast to Mr. Miller's consistent policy of development of the existing property without extension during the time he was president. This Pacific coast extension was financed through the issue of stock, and when it became evident in 1910 that the St. Paul was failing to earn the 7 per cent. dividend that was being paid on the increased capitalization, Mr. Miller was one of the directors who first recognized and acquiesced in the necessity for reducing the dividend rate. His attitude in this respect was typical of the man. He did not believe in beating about the bush; he did not believe that there was any way of educating the public to the needs of railroads; he had little faith and less sympathy with the public, of which the politician was the spokesman and representative; he could see no object in hesitating to face the facts.

Refrigerator Cars in Europe.—A short time ago we gave some details regarding the actual extent to which refrigerator wagons are being used in France for the conveyance of foodstuffs and other perishable merchandise, from which it was apparent that as regards both the number of these wagons in service and the extent to which they are employed, cold storage transport on the railways was capable of great developments. In a recent issue the French newspaper *Le Journal des Transports* took the consignors to task for not making greater use of refrigerator cars. The French railway companies have done everything in their power to develop this form of traffic. All the lines have a special tariff, which gives the owner of a private refrigerator car a reduction of 10 per cent. on the ordinary rates for carloads of roughly five tons. In view of the fact that such perishable merchandise as fruit and flowers is likely to fetch a higher market price when transported in this way, it is a little difficult to see why the benefits of this tariff are not being made use of to a much greater extent than is actually the case, especially as a very large proportion of the traffic in this form of merchandise is of the long-haul order. For instance, there is a very important and steadily increasing fruit and flower traffic between the Riviera and Paris, while the English, German and Swiss demands also increase year by year. Conservatism is probably at the root of the matter, since by far the greatest use of refrigerator cars is made by consignors of meat, fish and dairy products, while the consignors of fruits and early vegetables disdain their use, according to the report submitted by M. E. Bougault at the recent International Cold Storage Congress at Toulouse, France.

Railway Extension in Russia.—The committee for new railways in Russia, after investigating plans, has decided to recommend the construction of a railway from Lodz to Lenchitza, passing by way of Alexandrov, Egerzh and Ozorkov. At the same time the committee examined plans for the construction of various electric tramways in the district of Lodz.

TWO CONFLICTING THEORIES OF VALUATION.

Valuation Must Be Based on Market Value or on the Amount of the Investment. It Is Not Based on a Combination of the Two.

By Halbert P. Gillette,
Appraisal Engineer, Formerly Chief Engineer of the Washington Railroad Commission.

No one who has given much thought to appraisals can fail to have reached the conclusion that the *object* of the appraisal must be known before the problems can be correctly solved. If the object is rate regulation, we have still to consider the fundamental theories of rate regulation before we can safely attack all the appraisal problems. There can be only three theories of rate regulation, which the writer prefers to designate by the following terms:

1. Competitive theory.
2. The agency theory.
3. The combined agency and competitive theory.

Under the competitive theory the rates of a public service company are assumed to be regulated by the law of supply and demand acting under competitive conditions. This does not imply that there shall be actual competition. The competition may simply be potential, as when a shipper of freight by rail may be free to ship by water, or as when a user of electricity for light may be free to use gas or kerosene. Competition is still potential, and often of enormous force, even where there is no substitute for a given service in a given locality, for the user may move to another locality where lower rates prevail. There is also the potential competition of other companies who may come into an existing field where rates are high. Finally there is often severe competition for the markets of the country, as when the lumber of Oregan and Washington competes with the pine of the South, thus affecting freight rates of railways serving those districts.

In the competition of different things and of different markets—potential as well as actual—we have had a powerful and automatic regulator of rates. The potency of such competition has been far greater than is commonly believed. But this is not a subject pertinent to the present discussion. It suffices to call attention to the fact that the competitive theory of rate regulation has been until very recent years the predominating theory in America. And its past influence upon our minds has been so great that only by an effort can we free ourselves from its coerciveness when we approach problems of rate making based upon a theory that is wholly different. According to the agency theory of rate regulation, every public service company is an agent of the public, delegated to perform certain services and to collect payment therefor. Webster defines an agent thus:

"One who acts for, or in the place of, another by authority from him; one intrusted with the business of another."

Because a public service company is regarded as an agent, it may exercise the power of eminent domain, it may be required to make a periodic accounting of its stewardship, it may be required to limit its rates of charge for service, it may be protected against competition, it may be required to act in harmony with other public agents. It is always subject to control and to protection. According to the combined agency and competitive theory, an attempt is made to regulate rates in part by competition and in part by direct control. This is the present theory—a mongrel growth that marks the evolution from the competitive theory to the agency theory.

Every appraiser must adopt one of the three theories of rate regulation, whether he does so consciously or unconsciously. If he adopts the competitive theory of rate regulation, then a public service property is worth only what it will earn. In brief, its total value is its capitalized present net earnings plus or minus the present worth of any increment or loss in future annual net earnings. This is commonly called the "commercial value" of a property; and there are those who stoutly contend there is no other value. If we grant their tacit premise that competition is the only rate regulation, we must grant their conclusion that a property is worth what it will earn. But the moment we deny their premise, their conclusion is destroyed.

If the appraiser adopts the agency theory, the value that he seeks is the *investment value,* or more briefly, the investment or actual cost. An agent is certainly entitled to be recouped for all investments made in behalf of his principal. And it is equally certain that he is not entitled to receive payment for "values" not represented by actual outlay of capital on his part. Thus, if an agent buys copper at 15 cents per pound, and if it subsequently rises to 20 cents, the principal and not the agent should be the gainer by the increment in value.

In brief, then, the agency theory commits an appraiser to the policy of ascertaining the actual investment made by the agent, which investment is the "value" for rate making purposes. In such cases an appraiser follows what may be called the historical method of estimating the cost of reproduction of the property. He seeks to ascertain exactly what the public service company did to construct the given plant, and he estimates what it would reasonably have expended to create the plant and to develop its existing business. He checks his estimate against the available accounting records, or vice versa.

The appraiser who follows the agency theory is concerned with the past. His criteria are weighted average prices of preceding years and the accumulated deficits in fair return.

On the other hand, the appraiser who follows the competitive theory is concerned only with the *present* and the *future.* His criteria of value are present prices and present net earnings modified by the prospects of future change.

Having briefly stated the radical difference in these two theories, let us tabulate some of the more important appraisal corollaries that flow from each theory:

Agency Theory.	Competitive Theory.
1. Piecemeal prices allowed for piecemeal construction.	1. Only wholesale prices allowed for extensive work.
2. Weighted average prices of past years allowed.	2. Present prices, or those that may be expected in the immediate future, are used.
3. All work actually done by the company is appraised; e. g.: (a) Clearing rights of way as they existed at the time of construction. (b) Taking up and relaying pavements in streets, where it was actually done. (c) No allowance for increased value of a "seasoned roadbed" where nature has effected the solidification. (d) Pioneer surveys and other expenses necessarily incurred in pioneer days allowed.	3. Only that work that would need to be done today to produce an equivalent plant is appraised; e. g.: (a) Clearing rights of way as they exist now. (b) Taking up and relaying pavements necessary to duplicate the plant today. (c) Allowance for "seasoning" regardless of its cause or actual cost. (d) No allowance for pioneer costs now that pioneer conditions no longer exist.
4. Development cost calculated by ascertaining the actual residual deficits in fair return.	4. Franchise value calculated by capitalizing the annual net profits that may reasonably be expected.
5. No allowance for increment in values of land purchased for rights of way.	5. Allowance for all increments in land values.
6. No allowance for investments in property not now in use, or for losses in economic value.	6. No allowance for investments in property not now in use, nor for losses in economic value.

We might enumerate many other appraisal divergencies that occur in consequence of the two divergent theories of rate regulation, but the foregoing will suffice to make clear not only the fundamental difference of the two theories, but also the

rarity with which either theory is completely followed by appraisers, by commissions or by courts.

The writer maintains that, before we can ever emerge from the present jungle of contradictions in public utility appraisals, we must not only recognize the existence of these two theories, but we must decide exactly to what extent the one or the other theory shall be adopted. Possibly for the present we must continue to use a combination of the two theories, in order to tide over the present transitional period of rate regulation; but ultimately we must adopt the agency theory in its entirety, for we cannot continue to subject public service companies to strict control without giving them perfect protection from competition of all sorts. The rise or fall of prices paid for materials or labor is itself the effect of competition of one sort or another, and such a change in prices is beyond the control of the agents of the public, i. e., the public service companies. How preposterous, under the agency theory, it is to appraise a public utility during an era of low prices, such as we have just experienced, and to apply those low prices to materials that were actually purchased during normal years!

Yet this result is precisely what is prescribed by the public service laws of certain states and even by a decision of the Supreme Court. Equally preposterous, under the agency theory, is it to apply wholesale prices to a plant that was necessarily built piecemeal. Nor is it one whit less objectionable to go to the other extreme and pay a public service company for the taking up and laying of a pavement that did not exist when the company built its plant. All these are preposterous appraisal acts, if the agency theory is adopted as sound.

Subconsciously certain appraisers and certain important commissions have been working toward the agency theory of appraisals, for if we study their findings we see that the findings correspond with nearly all the conditions above tabulated under the agency theory. In fact, the Wisconsin Railroad Commission may be fairly said to have come to almost complete adoption of the agency theory of appraisal. It did not reach this position at one stroke, nor has it apparently realized fully whither its decisions were trending In the early appraisals of the steam railways of Wisconsin we find, for example, no development costs or going value allowed. The agency theory had not carried the commission that far at that time. The writer mentions this fact in no spirit of criticism, for in his appraisal of the railways of the state of Washington the writer was by no means consistent with the agency theory, although the writer was careful to secure and present to the railroad commission the actual costs of construction and equipment, so that, in this way, the commission really had before them an appraisal based on the agency theory, as well as the cost of reproduction.

It would seem that some appraisers have fancied that a value for rate making is a sort of composite picture of actual cost, cost of reproduction, present value and market value of stocks and bonds. The writer is at loss to find any logical relation between these four things. They certainly are not factors whose combination can be made to yield a correct answer to the appraisal problem. The actual cost is, in fact, an appraised value arrived at according to the agency theory; whereas the market value of stocks and bonds is an appraised value arrived at according to the competitive theory. Hence we have two distinctly antagonistic values.

There can be but one value for rate making purposes, and it must be based upon some well defined theory. This is the conclusion toward which the science of rate regulation has been slowly trending It seems to the writer inevitable that the agency theory will eventually be adopted in its entirety for the appraisal of public service property created in the future. In other words, the actual cost of the property, including the accumulated deficits in fair return, will be the "rate making value." Even increments in land value will be regarded as profits, that is, as part of the fair return. This is for future expenditures when public service company expenditures will be carefully scrutinized; that is, when the principal (the public) will carefully watch its agent (the public service company).

But what of the past? Upon what theory shall we base our appraisals of public service company property that has been built during an era of competition? Shall we apply the newly adopted "agency theory" to property that was built and operated upon a "competitive theory" basis? These are difficult questions to answer, quite as difficult, in their way, as was the slavery question. When a newly evolved code of morals made it reprehensible to own slaves, there were many who advocated freeing the slaves without giving compensation to their owners. It would have been more just had the general public been taxed to purchase freedom for the slaves, and it would also have been more economic than the war that made them free. Similarly, if it now seems unfair to have permitted public service companies to have capitalized their profits, we should realize that this is a new point of view—so new that we still see no injustice in permitting private companies to do the very same thing *ad libitum*. May it not, therefore, be both just and, in the end, a matter of public economy to appraise the franchise values of existing public service companies by capitalizing their net profits? The early decisions of courts all leaned in that direction, and a very recent decision of an important public service commission is distinctly in favor of capitalizing net earnings to ascertain total values of public utilities.

Certain it is that the capitalized net earnings of one class of public service property have been almost universally recognized as being a "fair value," namely the capitalized earnings from land and land entities (like water) owned by public service companies. All land values are based on capitalized land rentals, and appraisers are a unit in conceding that public service companies are entitled to the "unearned increment" on their land. Why, then, should they deny the companies the right to possess the earned increment on their business? In other words, why should land rentals be capitalized (which is essentially what is done in appraising land at its present value) while other profits are excluded from capitalization? The only logical answer to this question is that the "competitive theory" still holds as to land, whereas the "agency theory" has partly displaced the "competitive theory" as to the other property of public service companies. This is tantamount to the adoption of a mongrel theory that is a mixture of the two theories and for which there is really no logical defense except that it is expedient to compromise.

In view of the relative novelty of the agency theory, in so far at least as its actual application to public service companies is concerned, is it not more logical and fairer to apply the competitive theory in its entirety to public service company property that has been created prior to the general adoption of the agency theory? In other words, should not the present "commercial value" of the property of public service companies, including all capitalized profits, be regarded as belonging rightfully to the owners of the companies? In brief, should not the competitive theory be applied in appraisals of existing public utility property?

On the other hand, should not the "agency theory" be applied in its entirety to all future relations between the public and the public service companies? An appraiser of public utility property hereafter created would then seek merely the actual investment in the plant plus deficits in fair return—the development cost.

Those who have written and talked on the subject of appraisals have often started their discourse with a definition of the term value. But they seem rarely to have perceived that the definition of "value" rests upon one of two theories, which theories should themselves be defined. Market value rests on one theory; investment value rests on another theory. The first is predicated upon competitive conditions, the second upon agency conditions. It has seemed to the writer that these two theories should be the very first things to consider before any definitions of value are adopted, and before an appraisal for rate making is even begun.

ERECTION OF KENTUCKY & INDIANA BRIDGE.

Details of Superstructure of Ohio River Crossing at Louisville, Including Two 620-ft. Simple Trusses Erected Cantilever.

The Kentucky & Indiana Terminal Railroad placed its new bridge over the Ohio river at Louisville, Ky., in service on Sunday, December 8, the formal opening being held November 27. This bridge is used by the Southern Railway; the Baltimore & Ohio Southwestern; the Chicago, Indianapolis & Louisville and an electric line connecting Louisville and New Albany, Ind. The old bridge was a single track structure built in 1886 and much too light for present day loading, handling from 175 to 180 movements a day over the gauntleted single track. The new bridge has been built at a cost of approximately $2,000,000, the work covering a period of over two years.

A description of the substructure of the bridge was published in the *Railway Age Gazette* of August 4, 1911, and a second article giving detailed information concerning the use of concrete piles in the foundations of two of the piers was published in the issue of September 8, 1911. This substructure work required the building of eight piers and two abutments, the maximum height of piers being about 122 ft. One of the typical piers contains 4,251 yds. of concrete and the north abutment contains 3,620 yds. The most interesting feature in the construction of these piers was the use of long steel spouts for dropping concrete to place from the deck of the old bridge. By the use of short tapered sections of pipe, which were described in detail in the first article mentioned above, the batches of concrete were made to drop for the entire distance, which reached a maximum of 115 ft., without enough separation of the constituent materials to injure the quality of the concrete. A photograph of this pipe in use is reproduced in one of the accompanying illustrations.

The superstructure of the bridge consists of five through trusses and a swing span carrying two steam and two electric tracks, gauntleted. The two long spans over the main channels are 620 ft. center to center of piers and the trusses used on these spans are the heaviest simple trusses ever built, the weight of each being 4,400 tons. A truss 373 ft. long spans a small island between the two main channels and an approach truss 275 ft. long is used at each end. The swing span is 400 ft. long, providing two clear channels each 172 ft. wide. The south approach consists of a steel viaduct 1,281.3 ft. long and the north approach consists of a fill 550 ft. long, a deck girder span over the tracks of the St. Louis division of the Southern and a 150 ft. deck truss. The trusses are 32 ft. center to center, and the maximum vertical distance between center of chords is 110 ft.

There is little unusual in the design of the superstructure, all compression members being latticed plate and angle sections and the diagonal tension members being I-bars pinned to the gusset plates. The heaviest section handled weighed 72 tons, being the lower half of the end post of one of the 620 ft. trusses. As an indication of the size of these trusses, the end pins are 21 in. in

diameter and 7.5 ft. long, weighing 5.2 tons. The bridge received three coats of paint, the first a shop coat of 20 lbs. of red lead per gallon of boiled linseed oil, the second a field coat of the same quantity of red lead and the third Atcheson graphite. In applying the field coats an ingenious method of stirring the paint was devised which proved simple and efficient. Three-quarter

Dropping Concrete 115-ft. Into Bridge Piers.

inch pipes tapped into the main air line on the bridge were carried down to paint barrels, the lower end of these pipes being held in the paint near the bottom of the barrel so that the escaping air bubbled up through the pipe and prevented the settling of the lead.

The bridge deck will be laid with ties treated 30 min. in open vats. A hot application of creosote oil was first made and this was followed by a cold treatment. The ties were dapped in a special plant shown in one of the illustrations. A 35 h. p. auto-

Erecting Deck Truss on False Work with Derrick Car.

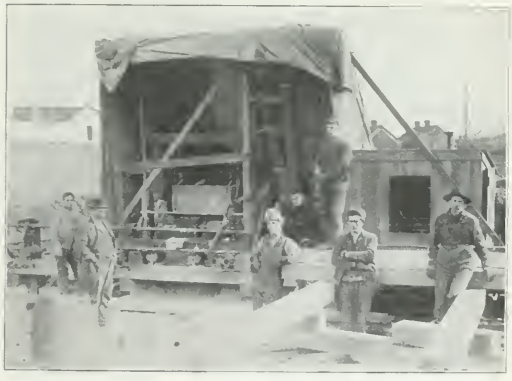
mobile engine was installed to run the dapping saws and proved very economical for this purpose. It operated at 1,600 r. p. m. and by exercising a little care to keep the cylinders cool, all trouble with the engine was eliminated. It was possible to dap 60 ties per hour with the plant shown. It was also used for guard rails and proved as efficient with beveled ties as straight ones. The stops which automatically regulated the points for dapping, could be set at any desired point, thus eliminating all measuring and greatly increasing the speed of the work. In placing the guard rails on the deck three wood boring machines were used to drill the bolt holes.

For tightening the bolts a "Little David" bolt tightening machine manufactured by the Ingersoll-Rand Company was used, with which it was possible for one man to tighten 17 bolts per minute. The single bolt tightening machine was able to place the bolts as fast as the holes could be bored with three machines. The tracks for steam service are tie plated and laid with 85 lb. rail. The electric tracks are laid with 75 lb. rail. An overhead trolley is provided to supply the operating current to the electric cars. The highways, which are carried on brackets outside the trusses, are floored with creosoted timbers covered by the waterproofing course, on which is laid a layer of concrete, then a layer of sand and then the pavement of creosoted blocks.

The steel for the bridge was stored in yards on both sides of the river and was handled in the yards and on the bridge by two 30-ton, one 40-ton and one 50-ton locomotive cranes. The lighter members were carried out for erection on 10-ton trucks operating

New Approach Viaduct on the South End of the New Bridge; Old Approach Seen to the Left.

on a track laid on the highway of the old bridge, which is closely adjacent to the new structure. The members which were too heavy to be carried out in this way were towed out into the river on barges. Compressed air for the pneumatic tools was supplied by a four-inch air line carried the entire length of the old bridge on the abandoned highway. It was provided with "U" expansion joints at intervals of 500 ft. The compressor plant was located



Tie Dapping Machine Operated by Automobile Engine.

on the south shore and contained two Ingersoll-Rand compressors supplying 800 cu. ft. of free air per minute. To expedite the erection, a telephone line was carried across the old bridge with instruments located at convenient points about 600 to 700 ft. apart. Connection could be secured from any point on the bridge with any other point, or with the office of the erecting engineer, the

compressor plant or the storage yards. The smaller equipment used for the erection work was of the standard types used by the American Bridge Company on all of its large bridge erection, a noticeable feature being the attention paid to the elimination of accidents in this necessarily hazardous work. All needle beams are required to be made of four-inch I-beams, this being one of the orders of the company's safety committee, which is doing excellent work in safeguarding the lives of the men. In erecting the diagonal members in the large trusses the I-bars were packed

Operating House of One of the Big Travelers Used for the 620-ft. Spans.

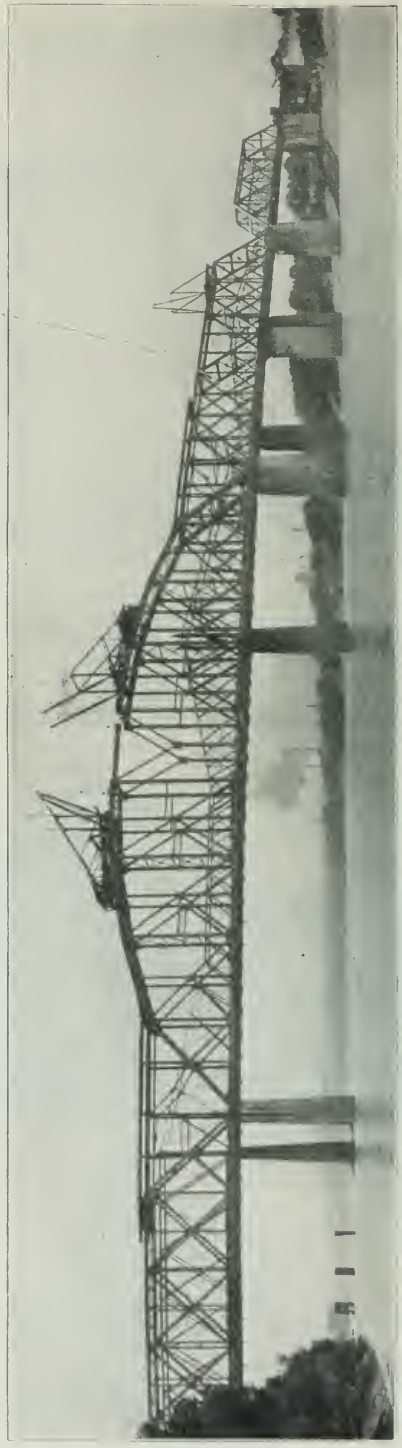
on the center pin on shore and were erected by a toggle from the gusset plate.

The plate girder span over the Southern tracks was erected by a 50-ton derrick car, shown in one of the illustrations. This car is provided with a 300-ton truck on the front end, having steel rimmed wheels and exceptionally heavy axles. All of the steel work in this span was covered with concrete for protection from locomotive gases. The only feature of interest is the use of three large holes in each panel of the girders to secure a firm bond between the concrete coatings on opposite sides of the girder.

Old Kentucky & Indiana Bridge.

The deck truss in the north approach was also erected with this derrick car, falsework being placed as shown in one of the illustrations. The shore spans on both sides of the river, and the short span over the island, were erected by travelers on falsework. On the north side the approach span was not over the river so that the falsework was supported on mud sills without the use of piling. The heaviest piece in these approach spans weighed 32 tons. The draw span was erected as a cantilever from the north end.

The two 620 ft. spans were erected as cantilevers from both



Making the Closure in the Top Chord of the 620-ft. Span over the North Branch of the River.

ends and it is thought that these trusses are as long as any ever erected in that manner. Two mule travelers, each with two booms, 120 h. p. motors, four spools and two drums on each boom, were used in the erection of these spans. Power was supplied to the motors at 500 volts from a power line carried along the old bridge, the cable having a cross section of 800,000 circular mills. In order to close the spans a special section at the middle of the bottom chord was designed which could be slewed to take up the difference in the length of the chord during erection and after the truss was closed. It was calculated in the design of this section that at the end of the erection the lower chord would be eight inches shorter than after the closure was made and the slewing of this short section was designed to bring the two pins in the section eight inches closer together in the slewed position than when it was horizontal. The details of this member are shown in one of the photographs and drawings. It weighed 19½ tons. In order to make the closure of the top chord of these long spans the outer ends of the adjacent spans were jacked up allowing the entire section of the span being erected to tilt until the closure could be made. To move the draw span in this manner for the erection of the 620 ft. span over the south channel, it was jacked up about six inches at both ends so as to make it act as a simple truss. The end next to the long span was then carried on rollers and the other end could be jacked up to effect the same result as in the case of the simple span between the long channel spans. Roller bearings were provided under both ends of this 373 ft. span over the island, as it was necessary to use it in the erection of both long spans. After the erection was completed one of these roller nests was locked by a special arrangement which was also used in certain stages of the erection.

For jacking up these spans two 400-ton and two 500-ton hydraulic jacks were used. A hydraulic pump operated by two men was used to secure the pressure and a manifold was inserted between the pump and the jacks to distribute it. The two men were able to raise a span about four inches in an hour which was sufficient for purposes of erection, although if greater speed was desired a gasolene engine with the same jack equipment could raise a span about nine inches an hour. In jacking up the spans a half inch plate was inserted every time the clearance was sufficient and when five and one-half inch clearance had been secured, a rail was used, thus eliminating the possibility of a drop in case of failure of a jack. Water gages were provided to indicate the amount that the long trusses were being moved and a bell system was installed for signaling between the gage and the jacks. A table was calculated for the use of the operators of the jack from which the effect on the long span of any given raise of the opposite end of the adjacent span could be determined.

The old bridge will be dismantled by cutting off the steel with acetylene torches. No attempt will be made to salvage the metal in the old structure. The shore span and island span will be dropped from the piers and dismantled on the ground.

This bridge, as well as all the other improvements made on the Kentucky & Indiana Terminal, has been handled under the direction of W. M. Mitchell, formerly manager and chief engineer. James B. Wilson is resident engineer on the bridge work and J. E. Greiner and J. M. Johnson are consulting engineers. The substructure was built by the Foster-Creighton-Gould Co. of Nashville and the superstructure was erected and the old bridge dismantled by the American Bridge Company. T. J. McCoy, assistant engineer in the erecting department of the American Bridge Company, was in charge of the erection.

London Electric Railway, England.—This company's bill will provide for the construction of an end-on junction between the Hampstead Tube and the City & South London Railway at Euston, new connections between the Hampstead and Highgate branches of the Hampstead Tube, and certain deviations of that tube, and a junction between the Piccadilly and South Western Railways at Hammersmith. Power to raise additional capital and to issue stock certificates to bearer will be asked for.

EFFICIENT METHODS OF HANDLING CORRESPONDENCE.

By John L. Hanna.

The question of efficient office methods in handling correspondence has, during the past few years, been actively taken up by several of the greater railroad systems. The writer was chairman of a committee which investigated the subject several years ago for the Pennsylvania Railroad, and this article is based on the report made by that committee and the results obtained from the application of the methods recommended.

Successful office operation, with prompt dispatch of the business, depends in a large measure upon the methods of conducting and filing correspondence, statistics and other records. It is only recently, however, that the importance of this has been recognized, as in the past office files and records have usually been placed in charge of young and inexperienced clerks with little education and no conception of railroad operation. Officials may come and go, but the clerk in charge of the office records, if he sticks to the job, becomes more useful and valuable year by year.

The volume of correspondence on the great railway systems has, in recent years, increased to overwhelming proportions, keeping pace with the growth of business and is largely augumented by the creation of additional offices. Some reduction in the number of letters written is imperative to afford a measure of relief to those officers who are now tied down to a desk, by reducing to a minimum the time which they are required to devote to reading and answering correspondence.

CONSOLIDATION OF FILES.

Probably the most effective means of reducing the number of letters written is the elimination of correspondence, as far as possible, between the head of a department and his subordinates, or staff officers. This is facilitated and made practicable by combining all of the files of the various staff officers with that of the department head. The principle of consolidating files to effect economies in time and the elimination of unnecessary letters, has been in use by many of our largest commercial enterprises, as well as on several railroad systems, for a number of years.

To secure the best results from this method the offices of the staff should be located as near to that of the department head as possible, to permit and encourage frequent consultation and conference. Careful consideration should be given to the re-arrangement of the offices, as in many cases they are situated without any thought of the relationship of the officers to each other. One consolidated file should be established to serve the chief and as many of the staff as the location of their offices will permit, and all files in the offices so served should be abolished. Care should be exercised in the selection of an efficient and competent file clerk.

All mail for the chief and his staff should be opened in this general file room, the previous files, if any, attached, charged and distributed to the respective officers. All incoming and outgoing correspondence, whether initialed or in letter form, should pass through the central file to permit proper record of its disposition being made and to clear the "suspense file," which will be described in detail later on. In cases where a large number of letters have accumulated on one subject, a brief summary of the contents should be prepared by some competent person and attached to the last communication prior to its being placed before the chief, thus making it unnecessary for him to read through the entire file.

To carry the principle of consolidation to its logical conclusion would mean also the consolidation of all the clerical forces as well. That is, one set of clerks and stenographers to serve, say, the superintendent of a division and all of his staff officers. This is standard practice on one well-known system and the experiment is being tried on several other railways.

ELIMINATION OF UNNECESSARY LETTERS.

The key to the reduction in number of letters written is the manner in which the correspondence is distributed to the person

who must take final action. All letters addressed to any officer included in the consolidation, requiring the attention of any other officer or subordinate, should be initialed to the proper party and sent at once to the file room. The central file takes a record of same on a simple form and sees that it is promptly dispatched. Your gain, under this arrangement, is in getting the correspondence into the hands of the party who takes action, at once, and the time formerly consumed in dictating and signing letters can be devoted to other purposes.

If this initialed letter requires no answer, it is simply noted and placed in the common file to which all have equal access. Should an answer be required it is prepared for the chief's signature, all letters between the staff officers being eliminated, so far as possible. The preparation of replies by the staff is not always satisfactory to the chief, but we find this condition can be overcome by having the staff officer first confer with the chief before writing a letter for his signature and in a very short time he should be able to prepare a letter from the chief's point of view, which will be signed by him when presented. This method is particularly effective with a division superintendent's organization.

In the consolidated file room all letters written on any particular subject, by the chief or any staff officer, will be filed together, so when papers are called for the file will produce everything written upon the subject. The possibility of two or more officers of the staff writing conflicting letters on the same subject is avoided.

Some officers take up with their subordinates, by correspondence, matters they should answer themselves. One prominent officer has stated that in his opinion too many unnecessary letters are written by the minor officers in order to place themselves on record, in the mistaken assumption they thereby relieve themselves of responsibility.

Through the medium of the central file it is possible for the several officers included in the consolidation to become more or less acquainted with the work of the other departments, and this enhances a spirit of co-operation, with a fuller realization that the primary object of the system is to expedite the handling of the business of the company.

In 1910 our committee had a count made of the number of letters written daily in all offices. On the twenty-one divisions, which have since adopted these methods, the number written by the superintendents and their staff officers was 2,700,000 per year, and what is known as "inter-staff" correspondence was a large proportion of this total. In response to a recent inquiry to ascertain the reduction that had been made, the estimates varied all the way from 10 to 60 per cent., but the average of all was 20 per cent. Using this as a basis these twenty-one divisions are writing approximately 540,000 fewer unnecessary letters per year than in 1910.

PROMPTNESS IN ANSWERING LETTERS.

The machinery of each office should be so adjusted that the cogs in every wheel fit into the cogs of the wheel in the next office lower down, that the whole may work in perfect unison. As far as the handling of correspondence is concerned the central file automatically does this for the offices included in the consolidation. One of the most important cogs in this machine is the method of keeping track of unanswered letters. Each office from the highest to the lowest should be compelled to maintain a so-called "suspense file."

The method which we have found most effective is to make an extra carbon copy on paper of some distinctive color (we use pink) of all letters written which require an answer. These are filed behind guide cards marked with the title of the officer to whom the letter is addressed. Immediately upon receipt of reply the "pink" copy is removed from this file. Opportunity must be given to clear the suspense file before the mail is distributed, or duplication of work results. Correspondence unanswered should be systematically hurried by the file clerk going over the "pink" copies daily. He should prepare, at least weekly, for forwarding to each of the subordinate addressees of the office, a statement showing date and subject of each unanswered letter. Statements exhibiting unusual delays should be signed personally by the head of the office, with request that these delays be explained. This method shows up who the delinquents are and if improvement does not ensue, persistently bad cases should be made the subject of discussion at staff meetings.

COURTESY TO THE OUTSIDE CORRESPONDENT.

Criticisms or suggestions from the public often result in improvement to the service, as there are many details of operation that do not come under the direct observation of the officials. Any communications, therefore, from the outside correspondent should receive prompt acknowledgment and courteous attention by the officer to whom they are originally addressed. If information is requested that, for any reason, cannot be furnished at once, the correspondent should be so advised, or if in the nature of a complaint it should be promptly investigated and the conditions corrected if possible, always advising correspondent of action taken.

PRESS COPYING OF LETTERS.

With a good filing system press copying of letters is unnecessary. Under modern methods the carbon copy of a letter written is filed with the other papers on the same subject and the press copy book should therefore be abolished. In those offices where the responsible officer wishes to read the letters that have been written and sent out over his signature, during his absence from the office, an extra carbon copy may be made of all letters and placed chronologically in binders.

While some economy is effected by discontinuing press copying its principal advantage is that it facilitates the despatch of the mail, as a letter can be sent out the minute it is signed. No need to hold over until the following morning, for copying letters signed late in the evening as is often the case, for many busy officers sign their mail the very last thing.

There has been a general hesitancy about abolishing the press copy book, due to a prevailing opinion that a carbon copy will not be accepted in court as secondary evidence, where the original letter cannot be produced. This has been investigated by President Taft's "Commission on Economy and Efficiency," and in a brief which they had prepared the conclusion is reached that "By the overwhelming weight of judicial authority the carbon is held to be primary evidence, and is thus placed upon a much higher evidential plane than the press copy, and its introduction as evidence is not dependent upon notice to the opposite party to produce the original or submit explanation as to its non-accessibility." This conclusion would seem to knock out the last prop in favor of continuing the press copying of letters.

UNIFORM SYSTEM OF FILING.

During the past three years the Pennsylvania Railroad has inaugurated a uniform method of filing in more than two hundred of its offices. The advantages of such a system is well expressed in the following extracts from the report of the President's "Commission on Economy and Efficiency," who investigated these methods, viz.: "The commission made a study of methods pursued in handling correspondence by railroads and industrial concerns. The results of this study show the subject is receiving careful attention from managers of large corporations, and its importance is coming to be fully recognized. The trend is away from the elaborate and in the direction of the simple system. * * * It is important, in the opinion of the commission * * * that the whole system of handling and filing correspondence should be uniform. Under such an arrangement the correspondence files throughout the branches of the service would become one comprehensive system, with each letter bearing the same file reference regardless of point of origin. Uniform classification would also permit file clerks experienced in one part of the service to be useful in another and result in their training along similar lines." Further the commission also recommends

"That all correspondence * * * be filed upon a subjective classification arranged as nearly as possible upon a self-indexing basis, and where numbers are regarded as essential that a logical arrangement of numbers under a decimal or analogous system should be employed."

The system inaugurated in the two hundred offices referred to above is the "Railroad Correspondence File," better known as the "Decimal System," which was compiled by W. H. Williams, with revisions and supplements by the writer of this article. This self-indexing classification was reviewed at length in the *Railway Age Gazette* on September 15, 1911, so that it will be unnecessary to describe it further here.

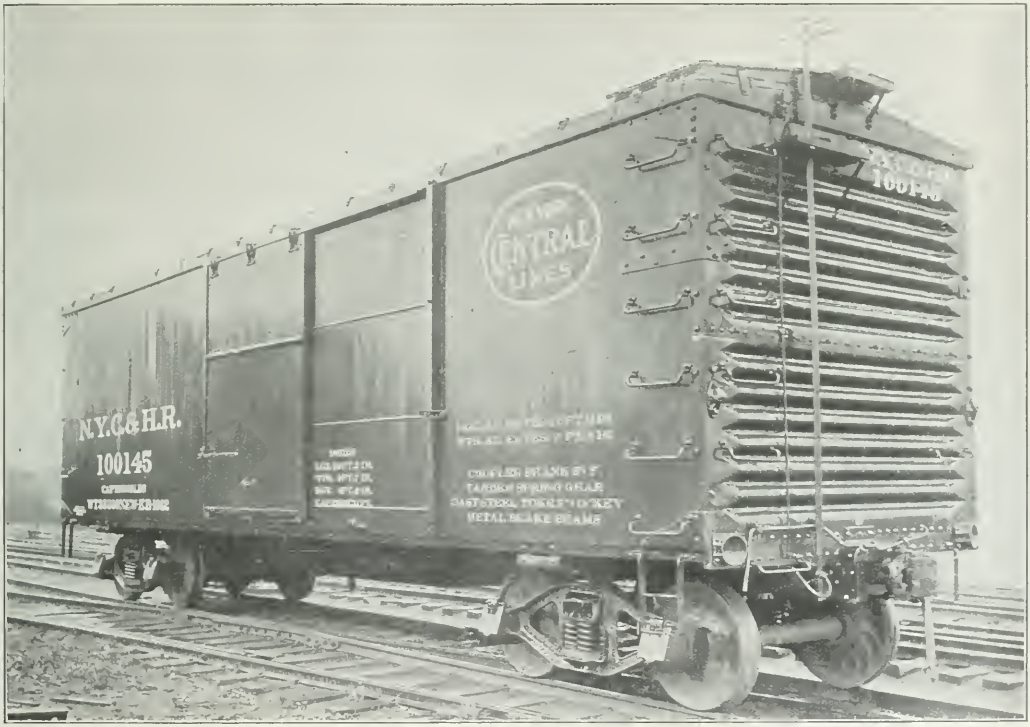
SUPERVISION.

In conclusion attention is called to the importance of supervision. Any system will not in itself improve present practices. The introduction of methods such as recommended in this article should be placed in the hands of some competent person, who should personally supervise the inauguration and interest the employees in charge. As he will meet with some opposition from those wedded to old practices, or who prefer to go along the lines of least resistance, his position should probably be strengthened with some minor title, carrying with it sufficient authority to obtain results.

Wm. C. Endicott, late Secretary of War, in "Business Methods of the War Department," very aptly says: "The difficulty of overcoming bias in favor of existing systems is great, as routine and custom run in grooves which deepen with age. Reports and rules may point the way to improvements, and orders enforce them for a time, but persistent effort and efficient supervision is the only hope of accomplishing enduring results."

STEEL END FOR BOX CARS.

In the series of articles on "Defective Box Cars and Damaged Freight," published in the *Railway Age Gazette* during the spring of 1912, special attention was given to the poorly designed ends, in the issue of April 26, 1912, page 954. Not only is there a considerable loss of grain and similar materials because of leakage, due to weak ends, but much damage is often caused by shifting loads which break through the ends of the cars. The New York Central reinforced the wooden ends with the heaviest wooden construction, but still found considerable difficulty because of damage caused by shifting loads. As a last resort the steel end shown in the accompanying illustration was experimented with and has proved so successful that it has been placed on several hundred cars and will probably be used exclusively on new equipment and in rebuilding and strengthening old cars.



Steel End Applied to a New York Central & Hudson River Wooden Box Car.

Its great strength, as compared to the wooden end, prevents damage to both the car and the lading because of shifting loads and thus reduces the time the car must be held out of service for repairs. The steel construction is lighter than that of wood; the old style wooden end on a certain class of New York Central cars weighed 1,863 lbs.; a better design of reinforced wooden end weighed 1,790 lbs.; and the steel end for the same class of car weighs 1,607 lbs. No end posts are used with the steel end and the inside length of the car is thus increased by about one foot, with a corresponding increase in the cubical contents of the car. There is no possibility of the ends becoming loose and thus allowing grain or similar lading to leak out, as is so often the case with the wooden construction. If the end is seriously

damaged it has a considerable value as scrap, while the wooden end is valueless.

The end is made in two parts to facilitate erection on the repair tracks or where an overhead crane is not available. If desirable the two parts may be riveted together in advance, if it is desired to apply them at shops where there is a good crane service. The two-part end has the additional advantage of reduced expense for replacement if one-half should be seriously damaged and need renewal. Since the lower half of the end is usually subjected to the greater punishment due to shifting loads, it is made slightly heavier than the upper half, being ¼ in. thick, as compared to 3/16 in. for the upper half. The reduction in thickness of the upper half is estimated to save about 300 lbs. in the weight of the car. The lower half of the end is said to be equivalent in strength to a flat steel plate ⅞ in. in thickness.

ACCIDENT BULLETIN NO. 44.

The Interstate Commerce Commission has issued Accident Bulletin No. 44, containing the record of railroad accidents in the United States during the three months ended June 30, 1912. The number of persons killed in train accidents was 148, and of injured 3,294. Accidents of other kinds bring up the total number of casualties, excluding "industrial" accidents, to 19,486 (2,302 killed and 17,544 injured). The total number of industrial accidents to employees was 24,177; 93 killed and 24,084 injured.

Adding the casualties to employees in industrial accidents to the figures given in the larger table, the total number of employees killed, including those not on duty, is 736, and injured 35,263; and this makes the total number of persons killed, all classes, 2,395, and injured 41,628.

Experimental Steel Box Car on New York Central & Hudson River with Special End.

The illustrations show the door as applied to a wooden car and to a steel box car that is now being tested out on the New York Central. When applied to a wooden car, the lower edge of the end is flanged and fits under the floor plank of the car, effectually preventing any possibility of leakage of grain at the end. The door is manufactured by the Imperial Appliance Company, Chicago.

Flowers in Railway Workshops.—Mrs. Bowen-Cooke, wife of the chief mechanical engineer of the London & North-Western, of England, opened the yearly chrysanthemum show in the town hall, at Crewe, England, a short time ago. Many of the exhibitors were employees of the London & North-Western. C. J. Bowen-Cooke, commenting on the fine exhibits, said nothing gave him greater pleasure, when passing through the various shops of Crewe railway works, than to see beautiful little bunches of flowers arranged on the men's benches. On one occasion one of the foremen asked him if he objected to this, and he replied that, on the contrary, it pleased him immensely. No one could put their heart and soul into their work better than those on whose benches those flowers were so artistically displayed.

Table No. 1a.—*Comparison of principal items with last quarterly bulletin and with one year back.*

	Bulletin 44.	Bulletin 43.	Bulletin 40.
1. Passengers killed in train accidents	14	33	21
2. Passengers killed, all causes	52	71	58
3. Employees (on duty) killed in train accidents	99	209	107
4. Employees (on duty) killed in coupling	46	49	37
5. Employees (on duty) killed, total (Table 1b)	554	884	512
6. Total, passengers and employees (items 2 and 5, above)	606	955	570
7. Other persons killed (including trespassers, nontrespassers, and employees not on duty), all causes	1,696	1,428	1,646
8. Employees killed in industrial accidents	93	98	87

As compared with the corresponding quarter of 1911, passengers killed in train accidents are decidedly fewer; but the number of employees killed in coupling increased from 37 to 46. Other items in Table 1A show no marked changes.

The total number of collisions and derailments in the quarter now under review was 3,398 (1,145 collisions and 2,253 derailments), of which 118 collisions and 257 derailments affected passenger trains. The damage to cars, engines, and roadway by these accidents amounted to $2,700,911.

Electric railways reporting to the commission (not included in the foregoing statistics) had 71 persons killed during the quarter and 1,018 injured; and there were 28 collisions and 17 derail-

ments. Train accidents are charged with 3 fatalities The total number of passengers killed from all causes was 7 and of employees 11 (6 in industrial accidents). The number of trespassers struck or run over by cars was 49; 26 killed and 23 injured.

YEARLY TABLES.

The summaries for the year ended June 30, 1912, show that the total number of casualties to persons for the year was 180,123; 10,585 killed and 169,538 injured. These figures include 400 employees killed and 92,363 employees injured, under the head of "Industrial accidents" (accidents to employees in and around shops, on boats and wharves, at stations, freight houses, etc., and all accidents not occurring in connection with the movement of locomotives or cars). The annual tables include statistics received after the quarterly bulletins were printed.

The principal table for the year, No. 1B, is reprinted herewith. The corresponding table for the preceding year was given in the *Railway Age Gazette* of November 10, 1911, page 959. The principal comparisons for the two years are shown in Table 1c, as follows:

ANNUAL TABLE 1C.—*Summary of casualties, years ended June 30.*

	1912.		1911.	
	Killed.	Injured.	Killed.	Injured.
Passengers:				
In train accidents	139	9,391	142	6,722
Other causes	179	6,995	214	6,711
Total	318	16,386	356	13,433
Employees on duty:

Total	5,434	5,687	5,284	5,614
Total	10,185	77,175	9,957	70,922
Industrial accidents	400	92,363	439	79,237
Grand total	10,585	169,538	10,396	150,159

YEARLY TABLES.

The summaries for the year ended June 30, 1912, show that the total number of casualties to persons for the year was 180,123; 10,585 killed and 169,538 injured. These figures include 400 employees killed and 92,363 employees injured, under the head of "Industrial accidents" (accidents to employees in and around shops, on boats and wharves, at stations, freight houses, etc., and all accidents not occurring in connection with the movement of locomotives or cars). The annual tables include statistics received after the quarterly bulletins were printed.

The principal table for the year, No. 1B, is reprinted herewith. The corresponding table for the preceding year was given in the *Railway Age Gazette* of November 10, 1911, page 959. The principal comparisons for the two years are shown in Table 1c, as follows:

Annual Table 2B.—Detail Causes of Derailments Due to Defects of Equipment.

Cause of accident.	1912				1911			
	Number.	Number of persons killed.	Number of persons injured.	Damage to road and equipment and cost of clearing wrecks.	Number.	Number of persons killed.	Number of persons injured.	Damage to road and equipment and cost of clearing wrecks.

EMPLOYEES IN SERVICE.

The total number of railway employees in service June 30, 1912, was 1,729,144, or 81,111 greater than the number correspondingly reported for 1911.

Employees in service of steam railroads on June 30, 1912.

Class of employees.	Number of persons.
1. Trainmen (enginemen, firemen, motormen, conductors, brakemen, rear flagmen, train baggagemen, train porters performing duties of trainmen)	245,653
2. Other persons employed on trains (dining-car employees, train porters, when actually employed by the respondent carrier)	11,461
3. Yardmen (all employees in yard train work and switching)	104,125
4. Switch tenders, crossing tenders, and watchmen	32,876
5. Bridgemen and trackmen	479,221
6. Other employees (station and miscellaneous employees, shopmen, etc.), excluding all officers, clerks, indoor employees, and others engaged in work in which they are not specially exposed to railway accidents	328,345
7. Total	1,201,681
8. Employees excluded from item No. 6 above	527,463
9. Total persons employed by steam roads on June 30, 1912.	1,729,144

Ratios of Casualties.

Class.	Number employed, June 30.	Killed. 1912.	Injured. 1912.	Number employed for one killed.	Number employed for one injured.
Trainmen	245,653	1,182	30,592	208	8.0
Yardmen	104,125	481	13,383	216	7.8
Switch tenders, crossing tenders, and watchmen	32,876	125	439	263	74.9
Trackmen and bridgemen	479,221	828	22,099	579	21.7
Total employees specially exposed to railroad accidents	1,201,681	3,635	142,442	330	8.4
Total employees in service	1,729,144	3,635	142,442	476	12.1

The bulletin contains accounts of investigations, by the commission's inspectors, of the following train accidents:

Collisions.

Detroit, Jackson & Chicago	Dexter, Mich.	April 15
Illinois Central	Iowa Falls, Ia.	April 21
Delaware, L. & W.	Baldwins, N. Y.	May 21
New York, Susq. & W.	Macopin Lake Junction	June 4
Chesapeake & Ohio	Silver Grove, Ky.	June 8
Chicago, Ind. & Louisville	Bedford, Ind.	June 8
New York, Chicago & St. Louis	Crayton, Pa.	June 22

Derailments.

Missouri Pacific	Lyndon, Kan.	Jan. 14
Wabash	West Lebanon, Ind.	Mar. 7

Nashville, C. & St. L.	Dalton, Ga.	June 12

PROSECUTIONS UNDER THE 28-HOUR LAW.

The law forbidding the confinement of animals in cars without feed or water for a longer period than 28 hours (36 hours under certain conditions) is the subject of a chapter in the annual report of the solicitor of the department of agriculture.

The Agricultural Department reported to the attorney-general during the last fiscal year 631 cases of apparent violation of the law, which is 33 more cases than in the preceding year. Nearly 1,000 cases were pending at the close of the fiscal year, some having been carried over from the preceding year. Penalties were recovered in 357 cases and 98 cases were dismissed. Penalties aggregating $28,400 were recovered during the year. The inspectors of the department say that there is no determined effort on the part of the railways in general to obey the law.

The report gives a list of the cases which have been prosecuted, with names of roads and amounts of penalties. The solicitor says that to recover the minimum penalty of $100 does not operate as an effective deterrent. He calls upon the court to fix penalties and in many cases insists on the maximum of $500. The report gives also the substance of eight decisions of the courts affecting the administration of this law.

The law prohibiting interstate movement of diseased live stock and regulating the movement of interstate shipments from quarantined districts has also been the subject of much attention from the department during the past year. One hundred and thirty-five alleged violations of these laws have been dealt with. Seventy-one suits have been decided during the year in favor of the government, usually by pleas of guilty. The government has lost a considerable number of cases because the courts have decided that as the carriers who were prosecuted had received the animals outside of the quarantined district and had transported and delivered them wholly outside that district, penalties could not be enforced.

ANNUAL TABLE No. 2.—COLLISIONS AND DERAILMENTS, YEARS ENDING JUNE 30.

	1912				1911				1910

FREIGHT CAR TRUCK EXPERIMENTS.

Effect of Degree of Curvature, Condition of Rails, Wheels and Trucks and the Use of Summer and Winter Oils.

In 1910 Professor L. E. Endsley, of Purdue University, made an extensive series of experiments at the Granite City, Ill., plant of the American Steel Foundries on the frictional resistance of various types of freight car trucks. A full account of these experiments was published in the *Railway Age Gazette* of March 24, 1911, page 691. The results showed that a truck constructed in such a way that it would remain square and hold the axles radially with the curve would pass over the curve with considerably less resistance than a truck otherwise constructed. In order to obtain additional information another series of tests has been conducted by Prof. Endsley, the results of which are briefly summed up in the following article:

The tests were conducted on an arch bar truck and an Andrews side frame truck. The arch bar truck conformed closely to standard practice in its design and details of construction, and was the same as truck *B* used in the previous tests, weighing 22,886 lbs. The Andrews side frame truck was of standard design with the exception of a heavier cast steel bolster, which brought the weight of the truck, with 650 lb. wheels, up to 12,034 lbs., which with the cast steel block, gave a total weight of 22,400 lbs. A 13-in. channel was used as a spring plank and was fastened to each side frame by eight tapered bolts instead of being riveted, as is customary. The truck was tested both with and without these bolts. When the bolts were removed, the side frames were spaced apart the proper transverse distance by a boss on each end of the spring plank, which fitted into recesses drilled in the center of the spring seat of each side frame. These two conditions are called the square and loose trucks. Thirty-two different wheels were used in such combinations as to make ten sets. In seven sets cast iron wheels were used, while the Davis cast steel wheels were used in the other three. New, medium new and old wheels were used so as to obtain as wide a variation in wheel conditions as is met with in practice. The wheels were in some cases mated, and in other cases where non-mated, the difference in circumference in one case being as much as $\frac{5}{8}$ in.

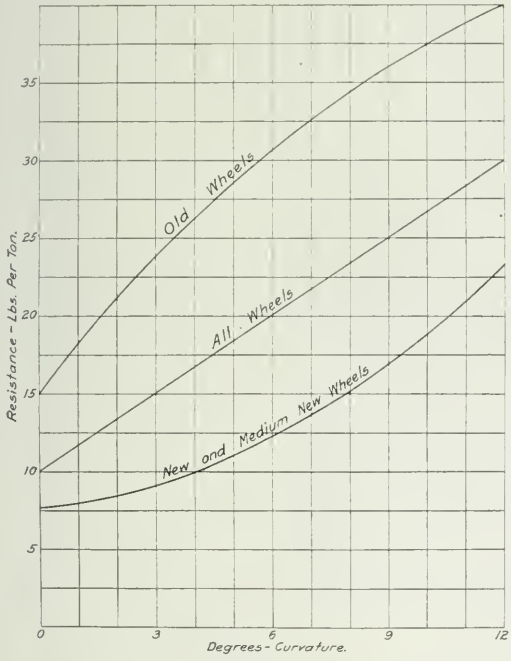

Fig. 1.—Resistance Curves with Different Conditions of Wheels and on Various Curves.

Tests to the number of 184 were made with the Andrews side frame truck and 146 with the arch bar truck. One of the principal objects of the tests was to obtain sufficient data on which to establish a conclusion as to the effect of different degrees of curvature on frictional resistance. The curves in Fig. 1 were obtained by finding the average resistance in pounds per ton for all truck and wheel conditions for new, medium new and old wheels, as recorded on the Andrews side frame truck. The straight line for all wheels which was established from the results from ten different sets of wheels, conforms to the generally accepted theory that the frictional resistance, for average operating conditions, increases in direct proportion to the degree of curvature. Figs. 2, 3 and 4 show the difference in frictional resistance of different arrangements of wheels on new and old rails.

Wheel Conditions and Truck Resistance.—The condition of the flanges and the tread of a set of wheels has quite an influence on the frictional resistance of a truck regardless of its type. Table I shows to what extent the frictional resistance was affected by wheel contours. The sets of wheels are divided in five groups, as follows: Mated wheels (sets A, C and D); non-mated new (sets B and E); non-mated old (sets F and G); non-mated medium old (set H); and special, no coning (sets I and J).

TABLE 1.—AVERAGE RESISTANCES FOR DIFFERENT GROUPS OF WHEELS.

Track.	Wheel Set. A-C-D	B & E	F & G	H	I & J
Tangent	6.90	7.53	12.82	9.96	14.25
3 deg. curve.....	8.43	7.99	19.50	14.08	21.27
6 deg. curve.....	10.40	11.43	30.03	20.22	33.79
12 deg. curve.....	20.10	25.20	37.70	28.16	45.97

From these values it is obvious that the condition of the mating and of the contours of the wheels has a very important bearing on the friction resistance of a truck. The flanges and treads of the first two groups of wheels were in good condition. The three remaining groups produced considerably more friction, due to the high and sharp flanges and to the absences of coning.

Square and Loose Trucks.—The Andrews side frame truck was tested in both the loose and the square condition and all of the ten sets of wheels were used. Fig. 5 shows resistance for all wheels tested on the new rails. The resistance curves for new and medium new wheels are shown in Fig. 6. From Fig. 5 it will be seen that the saving in favor of the square truck varies from 3.54 per cent. on a straight track to 30.47 per cent. on a 12 deg. curve, and taking 4 deg. as the average main line curve, the saving is 20.72 per cent. in favor of the squared truck, which checks very closely with the 1911 report.

Use of Winter and Summer Oils.—Tests were also made to determine the frictional resistance due to the use of winter and summer oils. They were made in the first week in November. The Andrews side frame truck with mated Davis cast steel wheels was used; the truck was square and was run on a tangent track. The analysis of the oil was as follows:

	Summer Oil.	Winter Oil.
Flashing point (degs. F.).....	386	240
Burning point (degs. F.).....	420	317
Specific gravity (Baumé)	21.5	24.5
Loss at 100 deg. F. for 3 hours.....	0.001	0.017
Ash (per cent.).....	0.05	0.03
Cold test (degrees at which it flows).....	55	32
Viscosity at 350 deg. F. (time in seconds for 100 c. c. to flow from Dudley pipette.....	39	34

One hundred and forty-six tests were made and the average resistance for the summer oil was taken at 14.77 lbs. per ton and 8.41 lbs. per ton for the winter oil, the average temperature for the former being 41 deg. F., and for the latter 48 deg. F.

CONCLUSIONS.

From the experiments made the following conclusions seem to be justified:

First.—The curve friction of a freight car truck is almost directly proportional to the degree of curvature. If the wheels under the truck are new and in good condition, the increase of frictional resistance due to curvature is not so great on the flat degrees of curvature as it is on the sharp degrees. If the wheels under the truck are old and have flange heights approaching M. C. B. limits, just the reverse is true; that is, with old wheels the increase of frictional resistance due to curvature is greater for flat degrees than for sharp degrees of curvature.

Second.—The frictional resistance of a truck equipped with wheels of average contour on new rails is from 10 to 25 per cent. less than for the same wheels on old rails. In the case of high flanges, on old wheels, however, this statement does not hold true.

Third.—A truck equipped with old wheels and high flanges gives a frictional resistance of approximately 100 per cent. higher than that given when the truck is equipped with new wheels. The wheels should be exactly mated in order to give least resistance. The coning on the wheels is of great value in reducing the flange friction on low degrees of curvature.

Fourth.—A truck constructed so that it will not get out of square will have less friction both on a tangent and on any degree of curvature than a truck that does not remain square.

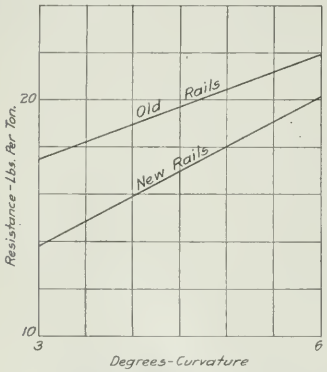

Fig. 2—Resistance Curves of All Wheels on Old and New Rails.

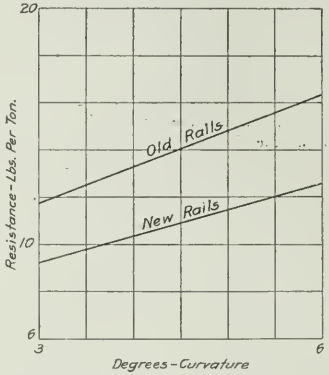

Fig. 3—Resistance Curves of New and Medium New Wheels on Old and New Rails.

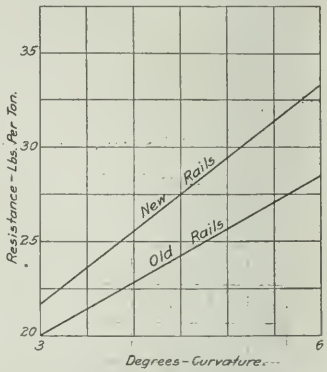

Fig. 4—Resistance Curves with Old Wheels on New and Old Rails.

Fifth.—While the experiments with the winter and summer oils were not carried as far as they could have been, the results show that when the atmospheric temperature is from 40 to 50 deg. F. a truck lubricated with winter oil had about 43 per cent. less friction than one lubricated with summer oil, all other conditions being equal.

The Illinois Central furnished the wheels and axles, and the Missouri Pacific the old rails used on the 3 deg. and 6 deg. tracks. L. W. Wallace, assistant professor of car and locomotive design at Purdue University, and L. C. Farquhar assisted Professor Endsley.

FRANKLIN K. LANE.

Franklin K. Lane, of California, a member of the Interstate Commerce Commission since 1905, has been elected by the commission to serve as chairman, succeeding Charles A. Prouty. The chairman, it will be recalled, is elected for one year beginning January 13. In the rate advance cases Chairman Prouty wrote the opinion of the commission refusing the application of the eastern railroads to make increases in rates, and Commissioner Lane wrote the opinion in the western case. While Mr. Prouty's opinion in these cases was generally considered a rather closely reasoned expression of opinion, Commissioner Lane laid himself open to easy refutation in regard to a good part of what he had to say.

Mr. Lane's style is somewhat florid, and for this reason, probably, his critics have at times had a show of justice in accusing him of being more concerned with producing an effect than with dealing out strict justice. As contrasted with Mr. Prouty, Commissioner Lane has not hesitated to place himself on certain occasions in the position of a prosecutor or, as he would probably prefer to call it, a regulator of the railroads, rather than an impartial judge.

Franklin K. Lane.

Mr. Lane was born in Prince Edward Island on July 15, 1864. He was the son of Dr. C. S. Lane, and moved to California when a small boy. He went to public school at Napa and to the high school at Oakland, Cal. After leaving high school he went into newspaper work and at the same studied law. He was graduated from the University of California with the class of 1886 and took a three-year course at Hastings Law College, doing the three years' work in a year and a half. After graduation he was engaged in the practice of law and was corporation counsel for the city of San Francisco from 1897 to 1902. He was a candidate for governor of his state in 1902. He received his party's vote in the legislature of California for United States senator in 1903, and was appointed a member of the Interstate Commerce Commisison in December, 1905. At one time he ran for mayor of San Francisco, but was defeated by the labor union candidate.

Commissioner Lane, in his opinion in the rate advance cases and a number of times since in public utterances, has spoken strongly of the necessity for railroads to earn a sufficient return on the money at present invested in their property to make similar future investment attractive when compared with industrial enterprises and with railroad enterprises in other countries. Mr. Lane's early training was not of a kind calculated to make an unbiased and non-partisan administrator; but, on the other hand, since 1905 he has had an opportunity to deal with large questions—to inform himself very fully of the problems that are presented by the transportation question in this country—and it may well be that with the added responsibility of the chairmanship he will take a rather broader view of his responsibilities and of the responsibilities of the commission to the country as a whole. The position is one of really great responsibility and possibly never more so than in this coming year. With a return of prosperity, another year of large crops and the natural development of the country, which has been retarded since 1908, the railroads of this country will need all of the co-operation that the Interstate Commerce Commission can give them to handle the business offered adequately and satisfactorily. They will need all of the moral support that the commission can give in raising capital for improvements, which have been awaiting the end of this industrial depression, and the commission will necessarily have to accept some responsibility, together with the managers of the railroads, for the provision of sufficient facilities to furnish satisfactory service.

While Mr. Lane's activities have been such as to cause him to be looked upon chiefly as a "friend of the people," he is to be credited with a signal service which will be remembered by railroad officers with very definite appreciation—his championship of the uniform demurrage rules for freight cars. This reform in the freight service was not popular with shippers, though it was really in their interest, and Commissioner Lane helped the railroads to win success in a hard campaign.

PANAMA TOLLS.*

The sentiment in Congress and elsewhere in favor of relieving the coastwise shipping from the payment of Panama tolls seems to be due largely to the belief that if tolls are collected from the steamship lines the freight rates which they charge and the rates of the transcontinental railroads will be higher by the amount of the tolls, and the public will thus pay more in added freight rates than it will gain in tolls received. This argument, however, assumes an improbable adjustment of rail and water rates. The rates of the steamship lines and the railroads will not be higher if Panama tolls are collected from the coastwise line.

In order to bring about this adjustment of rail and water rates there must be, first, active, rate controlling competition among the water lines, and, second, it must be the policy of the railroads to fix rates so as to compete actively with the carriers by water for practically all traffic moving between the two seaboards. Will these conditions exist? Steamship lines, when operating between common termini, adjust services and rates by "conferences."

Whether there be canal tolls or not, rates by water carriers will be such as the traffic will bear; the upper limit of what traffic by water will bear will be the lower limit to which rates are brought by the railroads; and the tolls will be paid by the owners of the steamship line instead of by the shippers in additional rates.

*From an address by Emory R. Johnson, special commissioner on traffic and tolls, before the Western Society of Engineers, Chicago, January 8, 1913.

General News.

W. C. Brown, president of the New York Central lines, will be the principal speaker at a highway improvement convention to be held at Springfield, Ill., on January 31.

The "Banner Limited," of the Wabash, running between Chicago and St. Louis, is now made up wholly of steel cars. This is the first of ten new solid steel trains to be put in service by the Wabash.

The federal grand jury at New York City this week resumed its inquiry into the alleged illegal doings of the New York, New Haven & Hartford and the Grand Trunk. Two clerks of the New Haven road were examined at length concerning the steamer lines owned by the New Haven.

An aviator, Faller, at Berlin, Germany, on January 4, remained up in the air for more than an hour, with five passengers; and on January 5, he ascended with seven passengers and remained up seven minutes. The seven passengers, with the aviator, weighed 1,242 lbs.

Governor E. M. Ammon of Colorado, proposes to recommend the abolition of the state railroad commission and the establishment, in place of the commission, of a public utilities court. Mr. Ammon believes that the public body which regulates the railroads ought to have the powers of a court.

The railway commission of Canada has issued a general order, No. 96, prescribing specifications for automatic audible signals at highway grade crossings. Besides having a bell, to be rung on the approach of every train, such signals must bear the word "danger," in letters 6 in. high, and be illuminated so that this word will be visible in the night.

The Committee on Rules of the lower House of Congress has decided to lay on the table indefinitely the resolution, proposed by Congressman O'Shaunessy, of Rhode Island, calling for an investigation of the New York, New Haven & Hartford and the Grand Trunk. The majority of the committee believe that the Department of Justice, which is prosecuting these roads, should have a free hand, with no interference by Congress.

At hearings before the Senate Committee on appropriations at Washington this week, representatives of numerous mercantile bodies presented arguments in favor of the continuation of the Commerce Court. B. A. Dean, of Auburn, N. Y., appeared for the National Hay Association; Luther M. Walter, of Chicago, for the Railroad Commission of Louisiana, the Yellow Pine Manufacturers' Association and others; and E. E. Williamson, of Cincinnati, for interests in that city.

The fourth annual meeting of the American Society of Engineering Contractors will be held on Tuesday, January 14, in the United Engineering building, 29 West Thirty-ninth street, New York. In addition to the transaction of routine business, William L. Bowman, civil engineer and attorney-at-law of New York, will read a paper entitled "Legal Hints to Contractors" and Edward F. Croker, ex-chief of the New York Fire Department, will give a talk illustrated by lantern slides on "Fire, Its Effects and Its Prevention."

Senator Bristow, of Kansas, has introduced in Congress a bill to provide for a national commission with authority to regulate industrial concerns doing an interstate business, in the same way that the Interstate Commerce Commission regulates interstate carriers. In the legislature of the state of New York Senator Healy has introduced a bill to consolidate the two public service commissions of the state, which now have authority over the First district and the Second district respectively, into a single commission of seven members. There are now five men on each commission.

A strike of conductors and motormen at Yonkers, N. Y., last week has resulted in the complete suspension of street railway traffic in that city for more than seven days. It appears that some months ago the street railwaymen's union induced the city government of Yonkers to pass an ordinance forbidding the employment in that city of any motorman who has not had fifteen days' experience or instruction in that work, on lines within that city. The company, therefore, has made no effort to engage men from other cities to take the place of the strikers. The street railway men are now trying to get similar ordinances adopted in Mount Vernon, N. Y., New Rochelle and in White Plains.

President Miller, of the Chicago, Burlington & Quincy, has announced that it is proposed within the next few months to transfer the auditing department, now in the general office in Omaha, to the new general office building in Chicago, a change which will affect about 200 employees. Mr. Miller gives as the reason for the change the very large increase in recent years in the volume of statistical information required both on account of the increase in business and the demands of public authorities, which require a concentration of the department where it can be most efficiently managed. Mr. Miller's announcement was given in confirmation of rumors which have caused vigorous protests for several days by the Omaha newspapers and by the Commercial Club, which seem to feel that "the great city of Omaha is being reduced to the condition of a way-station."

The Tennessee state legislative board of the Brotherhood of Firemen, which has outlined its wants for presentation to the new legislature, will include among other requests one that the pay of members of the legislature shall be $8 a day; also one that railway crossing flagmen shall not be required to work over eight hours a day. These unselfish requests are accompanied by the usual demands for the repeal of laws which are thought to be unjust to labor unions and for an electric headlight bill and a bill forbidding railway black-lists. The president of the legislative board for the ensuing year is H. V. Reid, of Memphis, and the secretary is D. J. Bennett, of Jackson. Mr. Reid says that the brotherhood desires the repeal of the fellow servant law of Tennessee, which prevents employees from suing for damages for injuries in cases where a fellow servant is partly responsible for the injury.

A committee of officers of the Panama Railroad was appointed on December 18, 1912, by Col. George W. Goethals, to review plans for some proposed transmission line bridges, to consider the various features of proposed telephone and telegraph lines, to report on the adjustment of the proposed signals to the new conditions, to consider possible forms of intercommunicating systems from both the operating and military viewpoints, and to make a preliminary study of the proposed electrification of the Panama Railroad. This committee consists of Edward Schildauer (chairman), Lieut. Frederick Mears, Capt. W. H. Rose, C. L. Bleakley, W. R. McCann and W. H. Fenley, the last named the signal engineer of the road. A sub-committee consisting of Messrs. Fenley and McCann was also appointed to make a preliminary report on electrification, as all of the other propositions to be considered by the committee will be fundamentally affected by the kind of motive power that is employed.

St. Paul Electrification.

The Secretary of the Interior has this week granted the Great Falls Power Company, of Great Falls, Mont., authority to construct over government lands a transmission line for electric power which is intended to provide for the electrification of the road of the Chicago, Milwaukee & Puget Sound for a distance of 450 miles, from Harlowtown, Mont., to Avery, Idaho. The grant is for fifty years and is subject to readjustment every ten years; and the government retains rights in relation to the regulation of rates and service. The permit cannot be transferred without the approval of the Secretary of the Interior.

The officers of the Chicago, Milwaukee & St. Paul say that preliminary plans for this electrification are now being made. The line in question includes the sections over the Bitter Root, the Rocky and the Belt mountain ranges. The maximum grade on this part of the road is 1.7 per cent. eastbound, and 2 per cent. westbound. Included in this section are the St. Paul Pass tunnel, nine thousand feet long, the Donald tunnel and several smaller tunnels. From Lombard east to Summit, 44 miles, there is a continuous ascending grade averaging 1 per cent.

Power will be delivered to the railway line at five points, Bowen, Harlowtown, Deer Lodge, and at three points between Deer Lodge and Avery. It is expected that the overhead trolley will be used, with a working current of probably 2,400 volts;

and the alternating current on the transmission line will probably be 100,000 volts. It is expected that the work will be begun within two years.

A "Clear Failure."

It seems to us perfectly clear that the present controversy between the New England States and the New Haven railroad makes it manifest that State regulation of great industrial combinations is a failure. We think there must be and will be a steady trend towards federal regulation. Moreover, if it is wrong for the New Haven to control the water transportation of Long Island Sound and of the Maine coast or of the suburban electric lines, there ought to be some authority which can tell the railway so before it buys its steamships and trolley lines. That authority, it seems to us, can be exercised efficiently only by the federal government.—*The Outlook:* Lyman Abbott, Editor; T. Roosevelt, Contributing Editor.

The New York Barge Canal.

John A. Bensel, State Engineer of New York, in his annual report, says that the cost of the barge canal system will be more than $101,000,000, which is the amount appropriated to build it. More funds must be appropriated within the next two years. The additional expense is due principally to the increase in the cost of lands and waters taken for canal purposes above the estimate of 1903 and the increased price of labor and materials. The new canal will be ready to open in 1915, and at the rapid rate at which work is going on, the Champlain canal will be completed next year. If progress on the Scotia dam is rapid the canal between the Hudson River and Oswego will be ready in 1915.

A large number of bridges must be built along the canal, and the demands of the highway traffic call for bridges of greater width and length than were provided for in 1903. In the 1903 estimate there was included an item of $729,644 for machinery for locks, which were to be twenty-eight feet wide. The locks are being made 43 feet wide, which will increase their cost and the cost of the operating machinery. Poughkeepsie, Newburgh and other cities along the Hudson desire to have barge canal terminals.

"To the People of Texas."

The above is the headline of a half-page display advertisement, signed "General Managers Texas Railroads," which has lately appeared in the newspapers of that State. We quote a portion of this manifesto:

"If you owned several thousand acres of land covered with valuable timber remote from market and desired to have that timber cut and hauled to a city where you could sell it to the best advantage; and if you should make a contract with Bill Jones to get that timber to market; he to furnish the wagons and teams and hire all labor, and you to pay all his expenses incurred in carrying out the contract, such as wages, repairs, damages, etc., and in addition thereto, pay him a fair return on the value of his outfit, would you want his expenses to be reasonable or unreasonable? Would you force him to employ more men than he needed? Would you want to put him to any unnecessary expense? And if he could, by borrowing money and buying new wagons and better teams and improving the roads, reduce the expense of getting your timber to market, without additional cost to you, would you be willing for him to do so? And if any man, or set of men, should, for selfish and pecuniary gain, undertake to increase Mr. Jones' expense (which you must in the end pay), would you encourage and help them do that? Or would you assist Mr. Jones in holding down the expense to as low a sum as possible, consistent with justice and fair dealing?

"What would be your answers to the foregoing questions? Why, of course, you would say, 'I have bound myself to pay all the expenses of every character incident to, or connected with, the business, and I want these expenses to be as small as possible. And if Mr. Jones can, by improving the roads over which the logs are hauled, and by getting better wagons and teams decrease the costs, I not only want him to do so, but I will help him. And I will certainly not do anything to increase the expense, but, so far as I can, will keep others from doing so.'

". . . You act through agencies created by you, the Legislature, Courts and Commissions, and these agents should, and we believe will, look out for and protect you against unnecessary and unjust expense. The Legislature can help the railroads decrease the expenses without additional cost to you. In spite of all we can do to prevent it, the expenses of operating the railroads are increasing more than the revenue, and unless these expenses are arrested an increase in freight rates will be the result. We sincerely regret this condition, and will do all we can to prevent it, but we need your aid and cannot succeed without it. . . ."

The Right to Run Past Signals.

The cable reports that Knox, an engine driver on the Northeastern Railway of England, has been suspended for running past signals. He had just been put back on his run after a strike in defense of the right to get drunk on his own time. It remains to be seen what position the union will take in support of the right to run past signals at discretion. In support of "personal liberty" to drink there was a strike which cost the Northeastern $250,000, and the British journals estimated the aggregate loss of all trades which were embarrassed by the tying up of the Northeastern at $5,000,000. The strikers won a nominal victory, for investigation showed that Knox had not been "drunk in law," and he was ordered reinstated. But the victory cost the strikers a week's wages for breach of their contract of employment, and it is now "up to them" to say what they are willing to pay to vindicate the right to run past signals. This is a more interesting question here than the "personal liberty" question which was the subject of many stump speeches by the British walking delegates and the politicians in sympathy with them and hungry for the labor vote.

The claim of locomotive engineers to indulge at discretion is preposterous, and yet the public opinion of railway riders and unionists in this country tolerates a more dangerous fault. Our railway administrators do not venture to enforce discipline about signals. It has been stated publicly that one of the roads now on trial before its passengers and the Interstate Commerce Commission for its accidents has a record of eighteen such drivers as Knox, and has not disciplined them for fear of the union.

Is not improvement in discipline quite as valuable as ordering the railways to carry full crews, to install safety appliances of uncertain value and in unlimited quantities, and to do many other things at an aggregate cost of hundreds of millions of dollars which the roads are not allowed to charge rates to cover? If the Interstate Commerce Commission is to press the railways on these points should it not also take charge of the unions?—*New York Times.*

Governor Foss on the Massachusetts Railroad Problem.

Governor Eugene N. Foss, of Massachusetts, in his inaugural address, called for immediate action looking to rigid regulation of railways, declaring this to be the alternative to national ownership and operation of the railroads of the country. He said:

"The greatest problem before the American people is to maintain the government above railroad domination. This problem has reached a crisis in Massachusetts. It is clear that if a commonwealth does not control the railroad situation the demand for control by ownership and operation by the federal government will soon become irresistible.

"The only way to postpone government ownership is to retain in the commonwealth the power to regulate the transportation system, to assert that power at once, and to apply it without delay."

Governor Foss urged the dissolution of the holding company, through which the New Haven controls the Boston & Maine. Continuing, he said:

"In my two previous inaugural addresses I urged upon the Legislature this dissolution, and the last Legislature appointed a commission to report to the next session upon the desirability of prohibiting holding companies in this Commonwealth. Since the appointment of that commission events have occurred which have brought into high relief considerations which far outweigh any arguments on one side or the other which that commission may adduce in support of its recommendations. . . . The expressed will of the people in the November election, the overt act of the New Haven [in the Grand Trunk matter] and the decisions of the Supreme Court of the United States are a combination which leaves no loophole for independent opinion on the part of the Legislature.

"If the Boston & Maine and the New Haven are not com-

peting lines, and if the people of New England believe that this section can best be served by a consolidation of these lines, then the full responsibility of such a combination should be assumed, and proper arrangements should be made in Greater Boston and elsewhere for bringing about an actual physical connection of these railroads. . . ." Governor Foss would like to see the six New England States co-operate in their dealings with the railway problem.

Firemen's Wages.

The committee representing the eastern railroads on Monday of this week submitted to the representatives of the firemen a proposal that the questions of wages and other conditions now at issue between the companies and the men be settled mainly on the lines of the award recently made by the arbitration board in the matter of enginemen. The main feature of this offer is a minimum rate, but with modifications for locomotives weighing over 70 tons on the drivers. As in the case of the enginemen, the proposed schedule would increase the pay of firemen on many smaller roads, but not much on the larger systems. The principal rates are: passenger engines, $2.40 per 100 miles; over 70 tons and up to 87½ tons, 10 cents additional; 87½ tons and over, 15 cents additional, but with a maximum of $2.70. Through freight, $2.75; engines weighing over 70 tons, 10 cents additional, with a maximum of $3; engines weighing over 87½ tons, 15 cents additional with a maximum of $3.25; switching engines $2.45. Mr. Carter, president of the firemen, in a letter written on Tuesday rejected the offer of the companies and suggested that no more time be lost in "useless conferences," but that matters be at once submitted to arbitration under the Erdman act. He said that the firemen would waive the clause in that act requiring a settlement in thirty days and would be willing to make the time limit sixty days. He submitted a tentative draft of an agreement to arbitrate. The roads replied that they wanted seven arbitrators, not three, which is the number provided for by the Erdman act.

Guyandot Bridge Failure.

The failure of a bridge at Guyandot, W. Va., on the Chesapeake & Ohio, January 1, was noticed in our last issue, page 28. An officer of the road sends us the following details of the accident:

"This bridge is about three miles east of Huntington, W. Va. It has heretofore consisted of three iron, single-track, through-truss spans, each about 150 ft. long, erected about twenty years ago. On account of the introduction of heavier engines these spans are being replaced by heavier steel, double track, through truss spans. Traffic continues to move over the bridge during the erection of the new spans. The west span was completed about December 1. The trusses of the middle or channel span had been taken down and the track and floor system of the new span were carried on falsework. This falsework consisted of piles driven through 7 to 17 ft. of sand to bedrock. The third span of the old bridge at the east end had not been disturbed.

"The steel bridge was being erected by the railway company's forces, and the foreman in charge of the work as well as the general bridge foreman had been in the employ of the Chesapeake & Ohio for more than twenty years in their respective positions; were experienced, capable men and knew the character of the Guyandot river.

"On the day of the accident fifteen trains had passed over the bridge between 6 a. m. and the time of the accident, 10:40 a. m. The bridge was carefully watched by the bridge gang during the passage of all of these trains to see if there was any settlement. None was observed even when the train preceding the one that fell passed over the bridge, one hour previous to the accident. At that time there was nothing to indicate that the falsework had been undermined and there was no settlement at any point.

"The wrecked train was a westbound manifest freight, consisting of a Mikado locomotive and 39 loaded box cars; and while it was crossing the bridge at a speed of four or five miles an hour the falsework suddenly settled on the up-stream side, and the engine and one car turned over up-stream and fell into the river, carrying the falsework down with them.

"The Guyandot river enters the Ohio about one mile below the bridge. The track is 55 ft. above low water, and 75 ft. above bed rock. Ordinarily there is but little current in the Guyandot at this point, but snow and rains on December 30 had caused a rise in the river, so that on January 1 it was about 8 ft. above low water mark, and the Ohio being low, there was a swifter current in the Guyandot than at any time since the track had been carried on falsework. The watershed of the Guyandot is heavily timbered and extensive logging operations have been carried on for many years. The logs are floated down the Guyandot and into the Ohio river, to be sawed at mills along that river. There were some logs running on the day of the accident, and it is believed that some oak or other heavy logs had lodged against the bottoms of the piles and caused eddies that undermined them, resulting in the accident.

"The engineman went down with the engine and was killed. Before crossing the bridge the train had been flagged by the bridgemen on the east side, and while it was standing there the fireman and one of the brakemen walked out on the bridge to the point where the bridge men were at work; and instead of returning to the east side to get on the train, they went to the west side, because it was a more convenient place to get on, and not through any fear they had of the bridge. These men fortunately were saved. At the time of the accident there were fifteen bridgemen on the bridge and six of them were carried down and were lost, making the total number of employees killed seven. One other employee had his hand broken, but there were no other injuries of importance. No persons other than these employees were killed or injured.

"The supervisor of bridges and buildings of the division, a man of forty years' experience, and especially well acquainted with this river, had examined the bridge before the passage of the wrecked freight train and pronounced it safe."

The John Fritz Medal.

The John Fritz medal of the four national engineering societies was presented to Captain Robert W. Hunt on Thursday evening, December 5, 1912, in the Engineering Society's building, New York, for meritorious work in connection with the development of the Bessemer process for the manufacture of steel. Captain Hunt is at the head of the Robert W. Hunt & Co. testing and inspection bureau of Chicago. He was born at Fallsington, Bucks county, Pa., on December 9, 1838, and began work in a rolling mill at Pottsville, Pa. In 1860 he established the first chemical laboratory in America in connection with an iron and steel manufacturing plant, at the works of the Cambria Iron Company, Johnstown, Pa. Suspending this work temporarily while participating in the Civil War, he resumed it with the same firm in 1865 in an experimental Bessemer plant. He aided greatly in the development of the Bessemer process at various mills until 1888, when he organized the testing and inspection bureau bearing his name.

In addition to being president of the American Society for Testing Materials at the present time, Captain Hunt has been president of the American Institute of Mining Engineers at two different times, has been president of the American Society of Mechanical Engineers and of the Western Society of Engineers. He has given special attention in recent years to the steel rail problem and is one of the leading authorities on this subject.

Signals Imperfectly Displayed; Stop!

The Railroad Commission of Indiana has issued the following circular, and calls on the railways, steam and electric, to say that they will obey it:

"Information has come to the commission that many railroad companies have not required strict compliance with the rule that: 'A signal imperfectly displayed, or the absence of a signal at a place where a signal is usually shown, must be regarded as a stop signal, and the fact reported to the proper official.' The proper construction of this rule is that when switch signal lights are found to be out, the train or car shall stop, the switch examined and the light relit. Trains or cars should stop in all cases where the lights are out; not slow down, but stop. The commission recommends that this strict construction of the rule shall be enforced by all companies."

This order seems to have been occasioned by the collision at Irvington, November 13. This collision occurred at 3 a. m., killing 15 persons. It was at a misplaced switch, a passenger train running into a freight train standing on a side track; and, according to the published reports, there was no light on the switch; and the line was straight so that the absence of the light should have been discovered by the engineman of the passenger train.

Western Society of Engineers.

The annual meeting of the Western Society of Engineers, Chicago, was held January 8-9. The annual dinner and business session was held on Wednesday evening. The new station of the Commonwealth Edison Company, in which 20,000 k. w. turbo-generator units, the largest in operation, have been installed, was visited on Wednesday, while on Thursday the new plant of the Corn Products Refining Company, Argo, Ill., was visited. The session closed with a smoker at the society's rooms on Thursday evening.

Albert F. Reichman, resident engineer of the American Bridge Company, New York, with office in Chicago, since 1900, and formerly in charge of the bridge engineering office of the Chicago, Milwaukee & St. Paul, was elected president of the club; A. Bement, first vice-president; B. E. Grant, second vice-president; J. H. Hayford, third vice-president; C. R. Dart, treasurer, and F. E. Davidson, trustee for three years.

Central Railway Club.

The annual dinner of the Central Railway Club, was held on January 9, at the Hotel Statler, Buffalo, N. Y. The speakers comprised Riley Williams, vice-president of the Schuylkill & Canastoga Valley Railroad; George M. Basford, of the American Locomotive Company, New York; A. J. Grymes, manager of the marine department of the Erie; William McClellan, electrical engineer of the New York Public Service Commission, Second district; and the Hon. Devoe T. Hudson, Buffalo, N. Y.

American Society of Mechanical Engineers.

At the meeting of the American Society of Mechanical Engineers, to be held January 14, there will be a report of the committee on meetings in New York, followed by a discussion of this report. F. A. Waldron, industrial engineer, will then present a paper on the numerous phases of scientific management not closely related to labor problems. This paper will be followed by a discussion. An informal dinner will precede the meeting.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRICAL RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 13 Park Row, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Convention, January 21-23, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—C. P. Conard, 75 Church St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursdays, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, Chicago & North Western, Escanaba, Mich. Next convention, July 22-25, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCES' ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—G. H. Frazier, 10 Oliver St., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C. M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 1868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La. Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Wells-Fargo Express Company announces at San Francisco that it will soon make rates to compete with the new parcel rates of the post office department.

For the convenience of the growing Yellowstone Park and Pacific northwest travel, arrangements have been made by the Denver & Rio Grande with the Oregon Short Line to interchange passengers passing through Colorado and Utah at Salt Lake City without extra charge. The Ogden interchange will also continue as heretofore. This new arrangement becomes effective February 1.

Industrial Commissioner P. H. Burnett, of the Lehigh Valley, announces a two-day meeting of farmers in the court house at Towanda, Pa., January 10 and 11. E. H. Dollar, president of the New York State Dairymen's Association, and others, will tell of up-to-date farming methods; and the problems of farmers' wives will be discussed by Miss Martha Van Rensselaer, of Cornell University.

On January 6 a daily time table for a "Seeing the Canal" train was put in effect on the Panama Railroad. On three days of the week it provides for a trip over the Pacific division in the morning, and through Culebra Cut in the afternoon. On the return from the Pacific division trip a lecture, illustrated by the use of models, is delivered at the tourist station at Ancon. On three days of the week the trip includes a visit to Gatun.

The Lehigh Valley and the New York, Chicago & St. Louis were fined $1,000 each by the federal court at Chicago on December 30, on charges of paying rebates to A. Booth & Co., Chicago, on shipments of fish and oysters, Booth & Co. having been fined a similar amount some time ago. The Chicago, Rock Island & Pacific and the Illinois Central were also fined $1,000 each on charges of issuing annual passes instead of trip passes to care-takers in charge of banana shipments from the south to Chicago.

J. M. Daly, general superintendent of transportation of the Illinois Central, addressed the Traffic Club of Chicago at its monthly luncheon on January 8, on the subject of "Car Efficiency." The programme of the entertainment committee of the Traffic Club provides for a ladies' night on January 14, and a monthly luncheon on January 22, at which Professor P. G. Holden, director of the agricultural extension department of the International Harvester Company, will speak on "Greater Efficiency in Agricultural Production."

The Industrial Bureau of the New England Lines, which is run by the New York, New Haven & Hartford and the Boston & Maine, jointly, reports that during the first 18 months of its activities 68 new manufacturing concerns have been established in New England, employing 3,600 persons and representing an investment of over $2,600,000. A circular has been issued giving the names and locations of some of the principal new industries. The manager, W. H. Seeley, says that the local boards of trade have very effectively co-operated with the bureau.

The number of freight cars moved over the Middle division of the Pennsylvania Railroad in the twelve months of 1912 is reported as 2,075,912, this being the count made of the cars in trains passing Denholm. This is less than the number recorded in 1907, which was 2,225,789, but the tonnage has been greater during the past year, as an overwhelming majority of the cars now carry about 50 tons, whereas five years ago 20-ton, 30-ton and 40-ton cars were common. The heaviest freight movement of the past year was in March, when the number of cars recorded was 203,920.

Robert E. Strahorn, for several years past prominently connected with the Harriman Lines in Oregon, and now one of the vice-presidents of the Oregon-Washington Railroad & Navigation Company, was this year chosen president of the National Apple Show at Spokane, an instance of amicable relations between the mercantile community and railroad officers quite in contrast with those in some other parts of the country—New England, for instance. Mr. Strahorn not only presided with acceptance over the doings of the annual apple exhibit, but was also the leader in a new and forward step, viz., in securing the co-operation of prominent men in the apple growing industry, in effecting a permanent organization which called a convention for December 16, to consider means of improving the marketing and distribution of the fruit products of the northwest. Something of this kind had become an absolute necessity, because of the very rapid increase in the fruit production of Washington, Oregon and Idaho. The convention of December 16 brought together 400 representatives of the fruit growing interests, as well as a large number of prominent railway officers. These fruit growers are dyed-in-the-wool shippers, and Mr. Strahorn frankly told them that he was likely to say or do things which would not please men who had always looked upon reductions in freight rates as the most important desideratum in their business; but they stood pat, unanimously, and Mr. Strahorn is at the head of a committee of nine, which is to take up the questions indicated.

"Progressive" Commissioners.

"Suspends freight advances" is a headline relating to the work of the Interstate Commerce Commission that has become so familiar of late as almost to warrant keeping it standing in type. The suspensions thus effected have usually been crystalized into refusals to permit the advances referred to to take effect. If the commission would use somewhat greater discrimination in its action, there would be greater confidence that the policy of holding rates down was being applied with wisdom and in a way that would not damage the carriers' best interests. Recent indications that the commission is again divided within itself with regard to the general freight rate question show the difficulty of the subject. The so-called "progressive" element in the body needs to proceed with caution in order that it may not incur the danger of having its policy reversed instead of modified, in consequence of public demand.—*Journal of Commerce, New York.*

Summary of Revenues and Expenses of Steam Roads in October.

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for October are as follows: The railways whose returns are included in bulletin No. 42 operate 220,636 miles of line, or about 90 per cent. of all the steam railway mileage of the United States. The total operating revenues for the month of October, 1912, amounted to $290,795,383. This includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources. Compared with October, 1911, the total operating revenues of these railways show an increase of $34,986,768. These total operating revenues per mile of line amounted to $1,318 in October, 1912, and $1,177 in October, 1911, an increase for 1912 of $141, or 12.0 per cent. This increase was the resultant of increases in each revenue account as follows: freight revenue, 14.8 per cent.; passenger revenue, 3.5 per cent.; other transportation revenue, 8.6 per cent.; non-transportation revenue, 21.4 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted in October to $183,354,865. This was $20,116,643 more than for October, 1911. These operating expenses per mile of line amounted to $831 in October, 1912, and $751 in October, 1911, an increase for 1912 of $80 per mile, or 10.7 per cent. Four of the five primary operating expense accounts showed increases in 1912. In the cost per mile of maintaining way and structures, i. e., track and buildings, there was an increase of 11.6 per cent.; in the cost per mile of maintaining equipment an increase of 14.9 per cent.; in transportation expenses per mile an increase of 9.5 per cent., and in general expenses per mile an increase of 5.4 per cent. Traffic expenses per mile decreased 1.3 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted in October to $107,440,518. This was $14,870,125 more than for October, 1911. Net operating revenue per mile of line amounted to $487 in October, 1912, and $426 in October, 1911, an increase for 1912 of $61 per mile, or 14.4 per cent. The net operating revenue for each mile of line for each day in October averaged $16, and for October, 1911, $14. It should be recalled that net operating revenue represents gross income before anything has been taken out for taxes, rentals, interest on bonds, appropriations for betterments, or dividends.

Taxes for the month of October amounted to $10,281,961, or $47 per mile, an increase of 2.8 per cent. over October, 1911.

The operating ratio for October, that is, the per cent. of total operating revenues which was absorbed in operating expenses, was 63.1 per cent., which is comparable with 64.3 per cent. in September, 1912, and 63.8 per cent. in October, 1911.

The eastern group of railways shows an increase in total operating revenues per mile of line as compared with October, 1911, of 11.8 per cent., the southern group an increase of 8.9 per cent., and the western group an increase of 13.4 per cent. Operating expenses per mile increased 11.0 per cent. on the eastern railways, 9.6 per cent. on the southern railways, and 10.9 per cent. on the western railways.

For the eastern group of railways net operating revenue per mile increased 13.4 per cent., for the southern group it increased 7.3 per cent., while for the western group it increased 17.2 per cent.

The increase in taxes per mile was 5.0 per cent. in the southern group, and 7.2 per cent. in the western group; in the eastern group there was a decrease of 2.2 per cent.

Comparison of the returns for the four months of the fiscal year with those of the corresponding months of the previous fiscal year reveals an increase in total operating revenues per mile of 9.0 per cent., an increase in operating expenses per mile of 8.2 per cent., and an increase in net operating revenue per mile of 10.3 per cent. This net operating revenue per mile of the eastern group of railways increased 9.2 per cent., as compared with the corresponding period of the previous fiscal year, and that of the western group increased 15.1 per cent., while that of the southern group decreased 1.9 per cent.

When the returns for the ten months of the calendar year 1912 are compared with those of the corresponding months of 1911, they show an increase in total operating revenues per mile of 5.2 per cent., an increase in operating expenses per mile of 6.0 per cent., and an increase in net operating revenue per mile of 3.5 per cent. There was an increase in net operating revenue per mile of 4.3 per cent. in the eastern group, an increase of 6.1 per cent. in the western group, and a decrease of 5.5 per cent. in the southern group.

The diagram shows the variations in total operating revenues, operating expenses and net operating revenue per mile for the several months of the calendar year 1911 and of the calendar year 1912 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:

PER CENT. OF TOTAL OPERATING REVENUES.

	October,		Fiscal year ended June 30,		Calendar year ended December 31,	
	1912.	1911.	1912.	1911.	1911.	1910.

Total operating expenses	63.1	63.8	69.1	68.6	68.3	67.8

INTERSTATE COMMERCE COMMISSION.

The commission has suspended until April 25 certain schedules in F. A. Leland's tariff, which advance the rate for the transportation of cotton linters from points in Texas to Minneapolis, Minn., and other points.

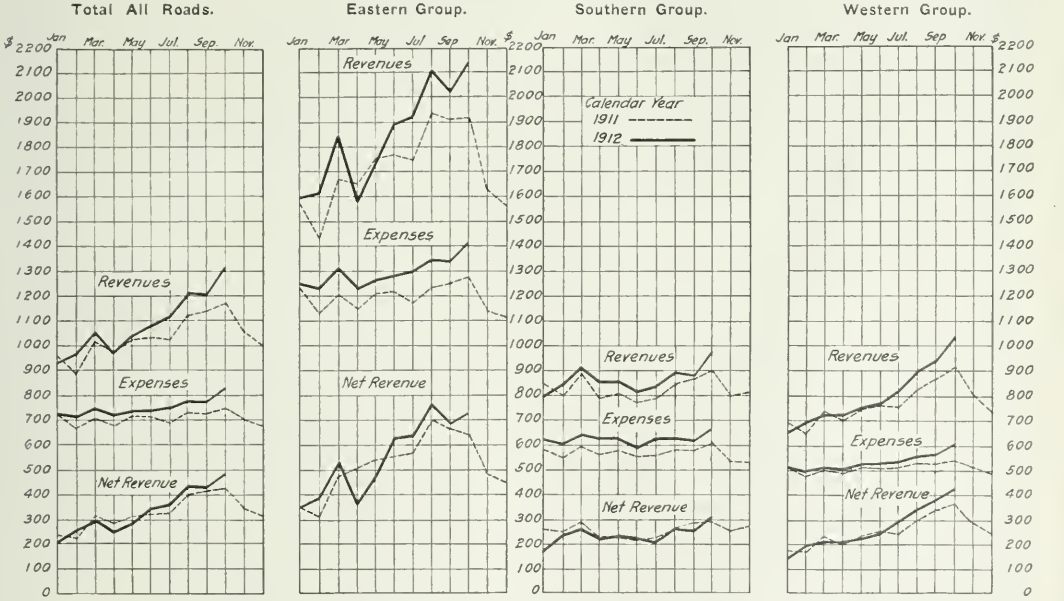
The commission has further suspended the supplement to the tariff of the Tennessee Central, which advances rates for the transportation of phosphate rock, in bags, from points in Tennessee to Norfolk, Va., and other points.

The commission has further suspended from January 2, until February 15, certain tariffs, which advance rates for the transportation of salt from Kansas points to stations located on the Wichita Falls & Northwestern in the state of Oklahoma.

The commission has further suspended from December 31, until June 30, schedules in certain tariffs, which advance rates for the transportation of various commodities from eastern shipping points to points in California, Oregon, Washington and British Columbia.

The commission has further suspended from December 30, until June 30, certain tariffs which advance rates for the transportation of lumber, in carloads, from producing points in Tennessee, Mississippi and other states to destinations north of the Ohio river and to Canadian destinations.

The commission has further suspended from December 30, until June 30, the supplements to tariffs of the Chesapeake



Monthly Revenues and Expenses Per Mile of Line in 1911 and 1912.

& Ohio and the Norfolk & Western, which advance rates for the transportation of pig iron, in carloads, from Buena Vista, Va., and other points to Philadelphia, Pa., and other destinations.

The commission has suspended from January 1, until March 31, an item in a supplement to the tariff of the Minneapolis & St. Louis, which advances rates for the transportation of flax tow, flax moss, and flax fiber from St. Paul, Minn., and other points to St. Louis, Mo., and other points. The present rate from St. Paul to St. Louis is 12½ cents per 100 lbs., and the proposed rate 18 cents per 100 lbs.

The commission has suspended from January 1, until May 1, various items in Hosmer's tariff, which advance rates for the transportation of butter and eggs, in carloads and less than carloads, from Topeka, Kan., to Mississippi river crossings and stations in Illinois, Indiana and Kentucky. The advances which have been suspended amount to about 11 cents per 100 lbs. on carloads and 15 cents on less than carloads.

The commission has suspended, until May 1, certain tariffs, which advance rates for the transportation of some twenty commodities between Missouri river points. Taking Omaha and Kansas City as representative points, the advances on certain commodities are as follows: Sulphuric acid, 2½ cents per 100 lbs.; blue vitriol, 2½ cents per 100 lbs.; canned goods, 2½ cents per 100 lbs.; furniture, 3 cents per 100 lbs., and malt, 7½ cents per 100 lbs.

Confirming the general principle of an order entered and announced on January 26, 1911, the commission has held that when a carrier, in obedience to the requirements of the Fourth Section, has, after August 17, 1910, corrected discriminations against intermediate points, it may not lawfully restore such discriminatory rates unless, upon formal application, the commission finds justifying circumstances and authorizes a deviation from the long and short haul rule.

The commission has ordered that an inquiry be held into the rates, practices, rules and regulations of the Great Northern, the Duluth, Missabe & Northern, and the Duluth & Iron Range, governing the transportation of iron ore from producing fields in the state of Minnesota to the docks at Duluth, Minn., and Superior, Wis., when destined to points beyond the docks and without the state of Minnesota, and when such transportation forms a part of the carriage of such ore to a point or points without the state of Minnesota.

The commission announces that as a result of correspondence with the Pennsylvania Railroad relative to complaints received from New York, Pennsylvania, Maryland and Wisconsin, directed against the recent order of the Pennsylvania Railroad forbidding the presence of blind persons on the railroad company's passenger trains, unless accompanied by a caretaker, the road has modified its rule so that blind persons who are capable of traveling alone will not be required to have a caretaker, and they will be assisted by station men and trainmen when necessary.

Complaint Dismissed.

French Paper Company et al. v. Michigan Central et al. Opinion by the commission:

The commission found that the rate of $1.90 per net ton on bituminous coal from points in West Virginia to Niles, Mich., was not shown to have been unreasonable.

Lindsay Brothers v. Pere Marquette. Opinion by the commission.

The complainant contended that the defendant's rate and minimum weight for the transportation of sleighs in carloads from Wayne, Mich., to Milwaukee, Wis., was unreasonable and unduly discriminatory. The commission found that the evidence was not conclusive. (25 I. C. C., 368.)

Corporation of the Cathedral of the Incarnation v. Long Island Railroad. Opinion by the commission:

In taking advantage of the low price of coal, the complainant ordered at one time an unusual quantity of coal for delivery upon its private siding. Due to the lack of facilities for accommodating the unusual number of cars delivered, certain demurrage charges were assessed, which the complainant alleges were unjust and unreasonable. The commission found that the defendants can not be required to be at all times prepared to furnish more than the reasonable facilities necessary for the usual amount of business done at a particular point upon its line, and in this case it can not be said that such facilities were not furnished the complainant. (25 I. C. C., 399.)

Board of Railroad Commissioners of the State of Montana v. Chicago, Burlington & Quincy et al. Opinion by the commission:

The commission found that the double first-class rating applied to the transportation of two rocking chairs, set up, with rockers detached and tied to back, from Lincoln, Neb., to Helena, Mont., was not excessive or unreasonable. (25 I. C. C., 371.)

Ford Manufacturing Company v. Illinois Central, et al. Opinion by the commission:

The complainant contends that the rate of 27½ cents per 100 lbs. for the transportation of roofing paper from Vandalia, Ill., to Toronto, Ont., is unreasonable and seeks reparation. The commission found that the evidence was not conclusive. (25 I. C. C., 432.)

In re investigation and suspension of advances in rates by carriers for the transportation of petroleum oil and other commodities from Wellsville, N. Y., and other points to Cincinnati, Ohio, and between other points.

The proposed increased rates on petroleum and its products from refineries in the so-called Buffalo group to points in southern Ohio and Indiana were found to be unreasonable and unjustly discriminatory. The tariffs under suspension are required to be withdrawn. (25 I. C. C., 349.)

Fullerton Lumber & Shingle Company, Limited, v. Bellingham Bay & British Columbia et al. Opinion by the commission:

Unjust discrimination, if any, in combination rates charged for the transportation of lumber from points in Washington to points in Canada exists wholly as to the rates for transportation in Canadian territory, over which this commission has no jurisdiction. The joint rates complained of were not found to be unreasonable. (25 I. C. C., 376.)

Wisconsin Lime and Cement Company v. Cleveland, Cincinnati, Chicago & St. Louis et al. Opinion by the commission:

The complainant contracted for the delivery at Englewood, Ill., of paving brick to be shipped over defendants' lines from Danville, Ill. At the time of the contract there was a published rate of 65 cents per ton on the traffic in carloads, from Danville to Englewood, and a part of the brick was moved under that rate. By permission of the commission, upon application by defendants, the rate was increased to 80 cents per ton upon five days' public notice, and the remainder of the brick was moved under the increased rate. Damages are claimed in an amount equivalent to the additional charges which the complainant was required to pay. The commission found that as no violation of the act to regulate commerce by defendants was shown, no grounds exist for an award of damages. (25 I. C. C., 366.)

Reparation Awarded.

A. Leach v. Northern Pacific et al. Opinion by the commission:

The commission found that the charges assessed on an emigrant movable outfit, including 15 head of live stock, loaded into a single car, were unreasonable in that they exceeded the tariff charges for two cars of emigrant movables. (25 I. C. C., 275.)

Arabol Manufacturing Company v. South Brooklyn Railway et al. Opinion by the commission:

Joint rates for the transportation of seventeen carloads of sizing from Bedford, N. Y., via Weehawken, N. J., to Carthage and other New York points were found to have been unreasonable to the extent that they exceeded the aggregate of the intermediate rates. (25 I. C. C., 429.)

Conifer Lumber Company v. Louisville & Nashville et al. Opinion by the commission:

The commission found that the routing instructions on a carload of lumber shipped from Brewton, Ala., to New Haven, Conn., and reconsigned to East Cambridge, Mass., were not followed and that the complainant had been deprived of its privilege of reconsigning the shipment through action of the Baltimore & Ohio Southwestern, and that therefore the shipment had been misrouted. (25 I. C. C., 272.)

REVENUES AND EXPENSES OF RAILWAYS.

Reparation Awarded.

Paducah Cooperage Company v. Illinois Central. Opinion by the commission:

The minimum weight of 20,000 lbs. applicable to shipments of barrels in carloads from Paducah, Ky., to New Orleans, La., was found to have been unduly discriminatory to the extent that it exceeded 12,000 lbs. subject to rule 24-C of the Southern classification, which provides for a graded increase in the minimum on larger cars. (25 I. C. C., 372.)

Bar Iron Rates Reduced.

W. C. Norris v. St. Louis & San Francisco et al. Opinion by the commission:

The commission found that the rate of 40 cents per 100 lbs. on bar iron in carloads from St. Louis, Mo., to Tulsa, Okla., was unreasonable, and unduly discriminatory as compared with a rate of 34 cents per 100 lbs. on sucker rods and pull rods, minimum weight 40,000 lbs. The commission ordered that in future this rate should not exceed 31½ cents per 100 lbs., minimum weight 40,000 lbs. (25 I. C. C., 416.)

Flaxseed Rates Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of flaxseed from Minneapolis, Minn., and other points to Chicago, Ill., and other destinations. Opinion by Commissioner Lane:

The tariffs under suspension advance the proportional rates on flaxseed in carloads from Minneapolis and other points to Chicago and other points. The commission found that the proposed advances are just and reasonable. The order of suspension was vacated. (25 I. C. C., 337.)

Fourth Section Applications Denied.

In re Southern Railway and Louisville & Nashville. Opinion by Chairman Prouty:

The applications to continue to disregard the fourth section from points upon the Cumberland Valley division and the Clear Fork branch of the Louisville & Nashville and from points upon the Clear Fork branch of the Southern Railway to the Buffalo-Pittsburgh territory, via Cincinnati were denied; but with reference to the circuitous routes via Norton and Knoxville no order will now be made, pending readjustment via the short-line routes. (25 I. C. C., 407.)

Anacostia, D. C., Discriminated Against.

Anacostia Citizens Association v. Baltimore & Ohio et al. Opinion by Commissioner McChord:

The denial of free store-door pick-up and delivery of certain less-than-carload traffic to the citizens of Anacostia, D. C., which is a section of southeast Washington, D. C., while such free service is extended to other sections of the city of Washington, was found to be unjustly discriminatory in so far as the Philadelphia, Baltimore & Washington is concerned, but not with respect to the Baltimore & Ohio, which maintains a freight station in Anacostia. Defendants, by arranging to place their baggage checks at the residences of passengers in certain sections of Washington to the exclusion of passengers located in Anacostia, unjustly discriminate against the latter and are ordered to remove the discrimination. (25 I. C. C., 411.)

Grape Fruit Rates Reduced.

Lindsay & Company, Ltd., v. Great Northern, et al. Opinion by the commission:

The complainant contends that the through rate of $1.80 per 100 lbs. for the transportation of grape fruit from Jacksonville, Fla., to Helena, Mont., is unreasonable and seeks reparation. The commission found that the rate complained of was unreasonable to the extent that it exceeds $1.62½ per 100 lbs., and prescribed that rate for the future. Reparation was awarded. (25 I. C. C., 424.)

Rates on Lumber and Crossties Reduced.

Charles P. Ball Lumber Company v. Texas & Pacific, et al. Opinion by the commission:

The complainant contends that the rate of 27½ cents per 100 lbs. for the transportation of lumber and crossties from points in Louisiana to Avery, Tex., is unreasonable and seeks reparation. The commission found that the rates charged on these shipments were unreasonable to the extent that they exceeded 21¼ cents per 100 lbs. from all points of origin except Mansfield, La., and that the rate from the latter point was unreasonable to the extent that it exceeded 22½ cents per 100 lbs., and prescribed these rates for the future. Reparation was awarded. (25 I. C. C., 437.)

Whiskey Rates Reduced.

Julius Kessler & Company v. Louisville & Nashville. Opinion by the commission:

The commission found that the joint rate of 75 cents per 100 lbs. on whiskey in glass, any quantity, from Athertonville, Ky., to Mobile, Ala., and New Orleans, La., was unreasonable to the extent that it exceeds the combination of rates to and from Louisville, Ky., which are 65½ cents per 100 lbs. (25 I. C. C., 397.)

Rates on Distillers' Dried Grain Reduced.

S. J. Greenbaum Company v. Chesapeake & Ohio Railway Company et al. Opinion by Commissioner Clark:

The commission found that the rates on distillers' dried grain in carloads from Midway, Ky., to Norfolk or Newport News, Va., when for export, were unduly discriminatory as compared with rates on same commodity to same destinations from Louisville, Ky., and prescribed the latter rates for the future. (25 I. C. C., 352.)

Rates on Furniture Reduced.

Southern Furniture Manufacturers' Association v. Southern Railway et al. Opinion by Commissioner Lane:

The commission found that the rates on bedroom furniture and chairs from points in Carolina territory to Pacific coast points, north Pacific coast terminals, and points taking the same rates, were unjustly discriminatory as compared with rates upon the same commodities to the same destinations from Virginia cities and points in eastern and New England territories, and those rates were prescribed for the future. The fourth-section application seeking authority to continue lower rates on furniture and chairs from Basic City, Galax, Burkeville and other points in Virginia to Pacific coast terminals and Pacific slope points, than are concurrently maintained upon the same commodities from Carolina territory to the same destinations, was denied. Reparation was not awarded. (25 I. C. C., 379.)

Demurrage Charges and Inadequate Facilities.

Benisch Brothers v. Long Island Railroad. Opinion by the commission:

The defendant has a hand derrick at its Atkins yards, East New York, for unloading heavy freight, that is not of sufficient capacity to unload all the heavy freight received there within 48 hours of arrival. Collection of demurrage and track-storage charges on heavy freight which was delayed in unloading beyond that time, under such circumstances, was found to be unreasonable. Reparation was awarded. (25 I. C. C., 439.)

Reconsignment Charges at Detroit, Mich.

The Detroit Reconsigning Case. Opinion by Commissioner Harlan:

Upon the facts shown of record, the proposed charge of $2, for reconsigning carload shipments received at Detroit to points within the switching district, found to be unreasonable unless the consignees are advised of the arrival of the cars at Toledo on the tracks of the carriers making delivery at Detroit, so that the consignees may have an opportunity to give their reconsigning orders before the cars reach the latter point. When tariffs, carrying out these views have been filed an order will be issued permitting the proposed charge to be made under the conditions suggested. (25 I. C. C., 392.)

STATE COMMISSIONS.

New cartage tariffs of 50 cents a ton and 15 cents for packages known as "smalls" have been prescribed by the Canadian Railway Commission at the conclusion of the hearing on the application of the railways for authority to increase the rates to 60 cents and 20 cents, at Toronto, Hamilton and Montreal, and 50 cents

and 15 cents at other points. The shippers made a compromise offer of 40 cents on some classes and 45 cents on others of freight, and 15 cents for "smalls," so the decision splits the difference.

COURT NEWS.

See editorial columns for decision of the Supreme Court relative to distribution of Southern Pacific stock owned by the Union Pacific.

The Supreme Court of the United States, in an opinion by Chief Justice White, reversing the Supreme Court of Minnesota, holds the reciprocal demurrage law of that state invalid, its provisions being in conflict with those of the interstate commerce law relating to the same subject.

The Supreme Court of Vermont has declared void the law of that state regulating demurrage on freight cars, in which there is a provision allowing four days' free time for unloading. The court says that this Vermont act conflicts with the interstate commerce law.

The federal court at Louisville, Ky., has granted an injunction on the application of the Western Union Telegraph Company to prevent the Louisville & Nashville from removing the telegraph company's equipment from the road. The contract between the telegraph company and the railway expired last August, and it is said the telegraph company will now institute proceedings to condemn the right of way along the railway.

The Supreme Court of the United States, reversing the Supreme Court of Nebraska, sustains the contention of the Chicago, Burlington & Quincy that the road is not liable, under the law of Nebraska, for damages to a horse shipped from a point in Iowa to a point in Nebraska. The road's defense was based on the claim that its liability for the loss of freight in transit had been fixed by the interstate commerce law, and that the federal law was supreme.

The Supreme Court of Indiana has affirmed a decision of a lower court sustaining the law of Indiana requiring all locomotives and cars to be equipped with grab irons. The Southern Railway was fined $100 for a violation of this law, and in defense claimed that the conviction was unconstitutional because the federal government had passed a law regulating the use of grab irons. The court holds that the state law is not a regulation of interstate commerce, but is a police measure for the protection of trainmen at work within the state, and therefore valid.

The Supreme Court of the United States, reversing the Supreme Court of Kentucky, holds that a shipment made by express from Cincinnati, Ohio, to Augusta, Ga., is subject to the federal law and not to state laws. In the case in question a bill of lading had been issued by the Adams Express Company in which there was a provision that the carrier should not be liable for more than $50 on any shipment unless the value of the same had been disclosed by the consignor. The federal supersedes state laws and the federal law allows carriers to insert reasonable conditions of liability in bills of lading.

The Supreme Court of Colorado has rendered a decision sustaining an order of the Colorado railroad commission of November 29, 1911, on complaint of the Breckenridge Chamber of Commerce, ordering the Colorado & Southern to restore through freight and passenger service on its South Park branch narrow gage line between Denver and Leadville, by way of Breckenridge and Como, a distance of 21 miles, on which service had been abandoned on account of the expense of conducting a light traffic over Boreas Pass, 11,400 ft. high. The cessation of service on this line required freight and passengers from Breckenridge and Leadville to travel by a very roundabout route over the Denver & Rio Grande instead of by the direct route. The court held that the law imposes on the Colorado & Southern the duty of furnishing adequate facilities to the public on its entire system, not a part, and that it cannot be excused from performing its full duty merely because by ceasing to operate a part of its system the net returns would be increased, so that it cannot be said that requiring the road to perform its duty to the public by furnishing an adequate service between Denver and Leadville, although a pecuniary loss is entailed, is unreasonable or deprives it of any constitutional rights.

Railway Officers.

Executive, Financial and Legal Officers.

W. E. Crane has resigned as vice president of the Ft. Smith & Western.

F. A. Clark, auditor of the Erie at New York, has been appointed general auditor.

George W. Seevers, general counsel of the Minneapolis & St. Louis, has resigned, to engage in the general practice of law at Oskaloosa, Iowa.

G. H. Hunt has been appointed freight claim agent of the Chicago Great Western, with office at Chicago, succeeding J. H. Howard, resigned.

H. B. Helm, second vice-president and treasurer of the Louisiana Railway & Navigation Company, has been appointed first vice-president, with headquarters at Shreveport, La., succeeding C. B. Rodgers.

T. B. Koons, freight traffic manager of the Central of New Jersey, with headquarters at New York, now has the title of vice-president and freight traffic manager, having been elected vice-president on January 1.

J. H. Howard, freight claim agent of the Chicago Great Western, has been appointed freight claim agent of the Chicago & Alton, with headquarters at Chicago, succeeding S. R. Murphy, acting freight claim agent.

E. W. Huben, assistant superintendent of the Orange & Northwestern, with office at DeQuincy, La., has been appointed auditor and general freight and passenger agent, with headquarters at Orange, Tex., succeeding E. H. Golden, resigned.

At a meeting of the board of directors of the Grand Rapids & Indiana, held on December 23, Edward B. Taylor was elected vice-president, in charge of the treasury and accounting departments, with office at Pittsburgh, Pa., and T. H. B. McKnight was elected treasurer, both with headquarters at Pittsburgh, Pa., succeeding W. R. Shelby, retired. H. F. Schieman was appointed assistant treasurer, with office at Grand Rapids, Mich. Effective January 1.

C. E. Hildum, auditor of disbursements of the Erie and the New York, Susquehanna & Western, at New York, has been appointed auditor of freight accounts, succeeding C. D. Ward, transferred, and A. P. Disbrow, chief clerk in the office of the auditor of disbursements, succeeds Mr. Hildum.

W. L. Seddon.

William Little Seddon, whose appointment as assistant to president of the Seaboard Air Line, with headquarters at Norfolk, Va., has been announced in these columns, was born on October 14, 1862, in Stafford county, Va., and was educated at the University of Missouri. He began railway work in 1898 in the engineering department of the Seaboard Air Line, and the following year he was appointed resident engineer. In 1900 he became assistant engineer of the Seaboard Air Line, remaining in that position until 1905, when he was appointed chief engineer, and on January 1, 1913, was promoted to assistant to president of the same road, as above noted.

Albert McElevey, assistant comptroller of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., has been retired under the regulations of the pension system,

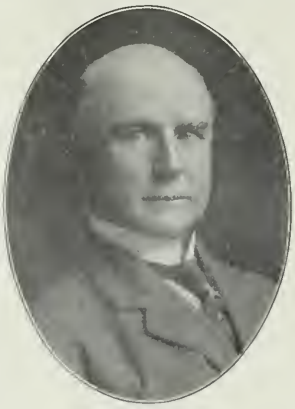
and J. H. Walker has been appointed general accountant, with office at Pittsburgh, succeeding John Hurst, promoted.

W. S. Cooke, auditor of the Mobile & Ohio and the Southern Railway in Mississippi, with office at Mobile, Ala., has been appointed assistant to comptroller of both companies. W. W. Middleton has been appointed auditor in charge of freight, passenger and station accounts, and J. H. Patterson has been appointed freight claim agent.

H. B. Chamberlain, vice-president of the Tennessee Central, with office at Nashville, Tenn., and W. K. McAlister, have been appointed receivers of the Tennessee Central. S. W. Fordyce, Jr., vice-president, at St. Louis, Mo., has been appointed general counsel, and Walter Stokes has been appointed general attorney for the receivers. (See Operating Officers.)

H. R. Payne, vice-president of the Union Tank Line Company, having retired, William M. Hutchison, secretary and treasurer, with headquarters at New York, has been elected vice-president, succeeding Mr. Payne. Mr. Hutchison retains the office of treasurer. E. F. Cook has been elected secretary, succeeding Mr. Hutchison, and E. L. Gridley has been appointed assistant treasurer, all with offices at New York.

Moorhead Cowell Kennedy, whose election as president of the Cumberland Valley, succeeding James McCrea, has been announced in these columns, was born on March 10, 1862, at Chambersburg, Pa. In 1880 he graduated from the scientific department of Phillips Academy, Andover, Mass., and in 1884 from the John C. Green School of Science of Princeton University, with the degree of civil engineer. From 1887 to 1889 he was in the banking business in Kansas, and in June, 1889, entered the service of the Cumberland Valley as assistant to the president. Three years later he was elected vice-president of the same road, and on January 1, 1903, was given entire charge of its operation, and in addition to his duties as vice-president was made general superintendent, which position he held at the time of his recent election as president of the same road.



M. C. Kennedy.

Operating Officers.

Charles W. Karcher has been appointed car accountant of the Boston & Albany, with office at Springfield, Mass.

William J. Kleck has been appointed assistant superintendent of transportation of the Texas & Pacific, with headquarters at Dallas, Tex.

R. J. Lockett has been appointed superintendent of the Ft. Worth Belt Railway, with office at Ft. Worth, Tex., succeeding W. S. Woodward, resigned.

L. A. Boyd has been appointed superintendent of the Raleigh, Charlotte & Southern, with headquarters at Biscoe, N. C., succeeding Frank Page, resigned.

W. F. Hayes has been appointed superintendent of time service of the Missouri, Kansas & Texas System, with headquarters at Dallas, Tex., effective January 1.

D. B. Carson has been appointed assistant general manager of the Nashville, Chattanooga & St. Louis, and will perform such duties as are assigned to him.

Hermann Hall, division engineer of the Louisiana Southern, has been appointed general superintendent, with office at New Orleans, La., succeeding W. H. DeFrance, resigned.

A. B. Newell, president of the Tennessee Central, with headquarters at Nashville, Tenn., has been appointed general manager for the receivers. (See Executive Financial & Legal Officers.)

H. S. Smith, assistant trainmaster of the Baltimore & Ohio Southwestern, at Seymour, Ind., has been appointed trainmaster, with headquarters at Seymour, succeeding C. A. Plumly, transferred.

A. M. Schoyer, general superintendent of the Northwest system of the Pennsylvania Lines West of Pittsburgh, has been appointed general manager of the Vandalia, with office at St. Louis, Mo.

M. J. Kennelly, formerly division superintendent of the Chicago, Rock Island & Pacific, has been appointed general manager of the Kansas City, Mexico & Orient, succeeding Edward Dickinson, of Kansas City.

Grant Hall, assistant general manager of the western lines of the Canadian Pacific, at Winnipeg, Man., has been appointed general manager of the western lines, in charge of maintenance and operation, with office at Winnipeg.

L. W. Karnes, trainmaster of the Wabash at Springfield, Ill., has been transferred to Decatur, Ill., as trainmaster in place of E. A. Sollitt, who has been appointed assistant superintendent of the Detroit division, with office at Detroit, Mich.

L. J. Ferritor, formerly superintendent of the Northern and Southern divisions of the Chicago & Alton, has been appointed superintendent of the Scranton division of the Delaware, Lackawanna & Western, with headquarters at Scranton, Pa.

J. M. Doughty has been appointed assistant division superintendent of the Galveston, Harrisburg & San Antonio at Victoria, Tex., in place of J. F. Hough. J. H. Walsh has been appointed assistant division superintendent at San Antonio, Tex.

E. C. Sicardi has been appointed superintendent of car service of the Union Tank Line Company, with headquarters at New York, and hereafter all correspondence relating to the movement and operation of Union Tank Line cars should be sent to him.

E. F. Kearney, superintendent of transportation of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, has been appointed general superintendent of transportation, with office at St. Louis, Mo., and his former position has been abolished.

H. S. Badgett, trainmaster of the Orange & Northwestern at DeQuincy, La., has been appointed assistant superintendent, with headquarters at DeQuincy, succeeding E. W. Huben, promoted. Steel Campbell has been appointed trainmaster at Anchorage, La.

F. D. Batchellor, division engineer maintenance of way of the Baltimore & Ohio Southwestern, at Seymour, Ind., has been appointed to the position, recently created, of an additional assistant to general superintendent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton.

L. M. Jones has been appointed assistant to general manager of the Norfolk Southern, in charge of purchases, fuel and statistics, with office at Norfolk, Va., and C. W. Akers has been appointed superintendent of the Southern division, with headquarters at New Bern, N. C., succeeding Virgil Walker, resigned.

J. W. Eber, general superintendent of the Toronto, Hamilton & Buffalo, at Hamilton, Ont., has been promoted to general manager, with office at Hamilton, and his former position has been abolished. A portrait of Mr. Eber and a sketch of his railway career were published in the *Railway Age Gazette* of July 5, 1912, page 34.

J. J. McCullough, inspector of terminals of the Northern Pacific at St. Paul, Minn., has been appointed superintendent of the Puget Sound division, which has just been created and extends from Keith, just north of Seattle, to the yard limits of South Tacoma, including the terminals at Tacoma and Seattle. Mr. McCullough will have offices at Tacoma and Seattle, Wash.

William O'Herin, heretofore superintendent of machinery and equipment of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., has been appointed assistant to the general manager of the Missouri, Kansas & Texas Railway System, the Beaumont & Great Northern, the Texas Central and the Wichita Falls Lines, with headquarters at Dallas, Tex.; effective January 1.

Frank E. Clarity has been appointed superintendent of transportation of the Denver & Rio Grande, with headquarters at

Denver, Colo., and will have charge of all matters pertaining to the movement of traffic, and the distribution and movement of equipment that have heretofore been handled by the assistant general manager and the car accountant. B. M. Loser, chief despatcher, at Glenwood Springs, has been appointed assistant superintendent of the Third division, succeeding E. E. Gray, transferred.

W. A. Whitney, superintendent of the Western division of the Southern Pacific, at Oakland Pier, Cal., has been appointed superintendent of the Sacramento division, with office at Sacramento, succeeding H. W. Sheridan, resigned to accept service with another company. J. D. Brennan, superintendent of the Stockton division, at Stockton, succeeds Mr. Whitney. C. H. Ketcham, assistant superintendent of the Western division, at Oakland Pier, succeeds Mr. Brennan and B. A. Campbell succeeds Mr. Ketcham.

W. Franklin Eckert, whose appointment as superintendent of the Wilmington & Columbia division of the Philadelphia & Reading, with headquarters at Reading, Pa., has been announced in these columns, was born on October 26, 1861, at Locust Dale, Pa. He began railway work on January 1, 1881, as a telegraph operator on the Philadelphia & Reading, and in May, 1886, was made train despatcher. In September, 1900, he was appointed assistant trainmaster and later in the same month was made chief train despatcher of the New York division, and now becomes superintendent of the same road, as above noted.

Charles H. Ewing, whose appointment as general superintendent of the Philadelphia & Reading, with headquarters at Reading, Pa., has been announced in these columns, was born on May 28, 1866, in Chester county, Pa., and was educated in the high schools. He began railway work on August 1, 1883, in the engineering department of the Philadelphia & Reading as a rodman, and was later transitman and then assistant engineer. From 1889 to 1892 he was assistant supervisor and supervisor of track, and then for two years was engineer of the New England division. He was appointed chief engineer of the Central New England in 1894, and left that position in 1902 to become division engineer of the Philadelphia & Reading. He was appointed engineer maintenance of way of the same road in 1905, and on October 17, 1910, was made superintendent of the Atlantic City Railroad, and now becomes general superintendent of the Philadelphia & Reading, as above noted.

C. H. Ewing.

Robert S. Parsons, who has been appointed assistant general manager of the Erie lines east of Buffalo and Salamanca, with headquarters at New York, graduated from Rutgers' College in 1895 with the degree of civil engineer. The same year he entered the engineering department of the Erie, and until 1901 held various positions in the engineering department. From 1901 to 1905 he was engineer maintenance of way, and in 1905 was appointed superintendent. He was subsequently transferred in the same capacity to various divisions, and at the time of his recent appointment was superintendent of the New York division of the same road at Jersey City, N. J.

W. B. Wood, superintendent of the Cleveland & Pittsburgh division of the Pennsylvania Lines West of Pittsburgh, Northwest System, has been appointed superintendent of the Eastern division, Northwest system, with headquarters at Allegheny, Pa., to succeed E. T. Whiter, promoted. I. W. Geer, superintendent of the Logansport division, Southwest system, with office at Logansport, Ind., succeeds Mr. Wood, with headquarters at Cleveland, Ohio. H. E. Newcomet, division engineer of the Cleveland & Pittsburgh division, Northwest system, has been appointed superintendent of the Louisville division, Southwest system, with headquarters at Louisville, Ky., in place of F. J. Kron, who succeeds I. W. Geer.

Harry Ward McMaster, who has been appointed general manager of the Wheeling & Lake Erie, as already announced in these columns, was born September 29, 1860. He received a common school education and entered railway service in 1873 as an operator and agent for the Detroit, Lansing & Northern. From 1878 to 1882 he was operator and train despatcher of the Grand Rapids & Indiana and the following two years was train despatcher of the Chicago & North Western. He then went to the Union Pacific, where he remained five years as chief train despatcher and trainmaster, leaving in 1889 to become chief train despatcher and trainmaster of the Northern Pacific. In May, 1900, he was appointed superintendent of the Toledo division of the Wheeling & Lake Erie, and from November, 1904, to September, 1905, was superintendent and superintendent of telegraph of that road and the Wabash Pittsburg Terminal at Canton, Ohio. He was then promoted to the general superintendency of those roads and the West Side Belt, which position he held until he was appointed receiver of the Wabash Pittsburgh Terminal on May 29, 1908, and one month later receiver also of the West Side Belt. He now resigns as receiver of these to become general manager of the Wheeling & Lake Erie, as stated above.

H. W. McMaster.

Joseph A. Gordon, whose appointment as general superintendent of the Pere Marquette, with headquarters at Detroit, Mich., has been announced in these columns, was born November 10, 1865, at Cincinnati, Ohio. He was graduated from St. Xavier College, Cincinnati, in 1884, and began railway work soon after with the Cincinnati, Hamilton & Dayton, where he remained until 1887 as telegraph operator and clerk in the local freight office at Cincinnati. During 1888 he traveled in Europe, returning to railway service the following year as clerk in the auditing department and station agent of the Cincinnati, Hamilton & Dayton at Cincinnati. From 1890 to November, 1893, he was chief clerk to the superintendent of the Cincinnati division; then was promoted to trainmaster of that division, and in March, 1896, was made superintendent of the Wellston division. In May, 1902, he was transferred to the superintendency of the Southern division, and on November 4, 1904, was appointed general superintendent of that road. From September, 1909, to April 10, 1910, Mr. Gordon traveled on the Pacific Coast and in Mexico, and then accepted the position of superintendent of the Kansas City division of the Chicago Great Western. He was transferred to

J. A. Gordon.

the Chicago division as superintendent February 15, 1911, resigning December 15, 1912, to become general superintendent of the Pere Marquette.

Anthony Douglas MacTier, whose appointment as general manager of the Eastern lines of the Canadian Pacific, with headquarters at Montreal, Que., has been announced in these columns, was born on December 27, 1867, at Blairgowrie House, Scotland, and was educated at Sedbergh school, Yorkshire, England. He began railway work in May, 1887, in the general baggage agent's office of the Canadian Pacific, and was later in the general superintendent's department. He was then in the department of the superintendent of sleeping, dining and parlor car stores, and later in the car service department. In April, 1896, he was appointed general baggage agent, and in November, 1899, became general fuel agent. He was appointed assistant to the vice-president of the Canadian Pacific in June 1907, and now becomes general manager of the Eastern lines of the same road.

Albert J. Stone, general superintendent of the Erie lines east of Buffalo, N. Y., and Salamanca, with office at New York, has been appointed general manager, with office at New York. Robert S. Parsons, superintendent of the New York division, at Jersey City, N. J., has been appointed assistant general manager, lines east of Buffalo and Salamanca. Henry O. Dunkle, general superintendent of the lines west of Buffalo and Salamanca, at Cleveland, Ohio, has been appointed general manager of the lines west. Edgar W. Batchelder, assistant general superintendent of the lines west at Marion, Ohio, has been appointed assistant general manager, lines west, and the offices of general superintendents are abolished. John B. Dickson, general agent at Chicago, has been appointed superintendent of the New York division and branches, and of the New Jersey & New York, with office at Jersey City; A. C. Elston, superintendent of the Buffalo division at Buffalo, succeeds Mr. Dickson, and Franklin G. Robbins succeeds Mr. Elston.

Perry Seymour Sampson, who was appointed superintendent of the St. Louis division and St. Louis terminals of the Chicago & Eastern Illinois, with headquarters at St. Louis, Mo., effective November 15, 1912, was born at Brazil, Ind., June 12, 1865. He was educated in the public schools of Brazil, Ind., and Sedalia, Mo., and began railway work in June, 1882, as operator and clerk in the maintenance of way department of the Pittsburgh, Cincinnati, Chicago & St. Louis at Richmond, Ind. In May, 1884, he went to the Grand Rapids & Indiana as operator and bill clerk and one year later entered the service of the Baltimore & Ohio in a similar capacity, resigning in 1886 to engage in other business. Mr. Sampson again took up railway work in December, 1889, with the Chicago & Eastern Illinois; eight months later he was promoted to conductor; in January, 1894, was made train despatcher, and in September of the following year was advanced to chief despatcher of the Indiana division. He was transferred to the Illinois and St. Louis divisions as chief despatcher in April, 1903, and in March, 1905, became trainmaster of construction of the Illinois division. In November of that year he returned to the Indiana division as chief despatcher and in April, 1908, was promoted to superintendent and track supervisor of that division, with headquarters at Brazil. He was transferred to the superintendency of the Illinois division on July 1, 1911, which position he held at the time of his recent appointment, as noted above.

P. S. Sampson.

Traffic Officers.

B. S. Barnes has been appointed foreign freight agent of the Erie, with office at New York.

Harry J. Bills, traveling passenger agent of the Lehigh Valley at Chicago, has been transferred to Kansas City, Mo.

W. H. Tayloe has been appointed traffic manager of the Chesapeake Steamship Company, with office at Baltimore, Md.

E. A. Senneff has been appointed agent of the Erie Despatch, with headquarters at Spokane, Wash., succeeding H. L. Tibbetts.

E. L. Jones has been appointed general agent of the traffic department of the Minneapolis & St. Louis, with office at San Francisco, Cal.

Hugh C. Couch has been appointed soliciting freight agent of the Atchison, Topeka & Santa Fe, with headquarters at Dallas, Tex.

Charles Scott has been appointed general freight and passenger agent of the Lexington & Eastern, with headquarters at Lexington, Ky.

G. H. Geagan, general freight and passenger agent of the Tremont & Gulf, at Winnfield, La., has resigned, and his former position has been abolished.

B. J. Libbe, special agent of the traffic department of the Chicago & Alton, has been appointed general agent of the freight department, with office at Chicago.

George F. Clough has been appointed commercial agent of the Lake Shore & Michigan Southern, with office at Cleveland, Ohio, succeeding George T. Rowe, deceased.

T. J. Cumming, traveling freight agent of the Georgia Southern & Florida, at Cordele, Ga., has been appointed commercial agent, with office at Valdosta, Ga., succeeding B. P. Miller, resigned.

W. E. Van Dreser has been appointed Northwestern agent of the Traders Despatch, with headquarters at Minneapolis, Minn., in place of George B. Norris, resigned to engage in other business.

U. G. Soule has been appointed commercial agent of the Southern Railway, with office at Denver, Colo., succeeding W. H. Tayloe, general agent, resigned to accept service with another company.

G. F. Snow, traffic agent of the Bangor & Aroostook at Bangor, Maine, has been appointed general agent of the freight and passenger departments, with headquarters at Presque Isle, Maine, and his former position has been abolished.

T. D. Hobart, coal and coke freight agent of the Norfolk & Western at Roanoke, Va., has been appointed general coal freight agent, with office at Roanoke. He will have charge of all matters pertaining to coal and coke rates.

Elbert Blair, commercial agent of the Missouri, Kansas & Texas of Texas, at Denison, Tex., has been appointed general freight and passenger agent of the Texas Central, with headquarters at Waco, Tex., in place of W. E. Seifer.

W. H. Bissland, assistant general passenger agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, at St. Louis, Mo., has been appointed general baggage agent, with office at St. Louis, succeeding Benton Quick, deceased.

F. S. Fisher, commercial agent of the Missouri, Kansas & Texas of Texas, at Waco, Tex., has been transferred to Denison, Tex., in a similar capacity to succeed Elbert Blair. L. T. Fowler, chief clerk in the office of commercial agent at Ft. Worth, Tex., succeeds Mr. Fisher.

H. R. Lewis, division freight agent of the Baltimore & Ohio at Baltimore, Md., has been appointed general freight agent, with headquarters at Baltimore, succeeding T. W. Galleher, deceased, and W. R. Askew has been appointed division freight agent, with headquarters at Baltimore, succeeding Mr. Lewis.

E. A. Oliver, live stock and freight agent of the Pittsburgh, Cincinnati, Chicago & St. Louis at Union Stock Yards, Chicago,

has been relieved of the duties of freight agent and hereafter will be in direct charge of the solicitation of live stock traffic at Chicago and territory tributary thereto, under the immediate direction of the general western freight agent.

N. R. Williams, traveling passenger agent of the Chicago, Peoria & St. Louis, has been appointed general agent of the freight department, with headquarters at Minneapolis, Minn., succeeding O. P. Bennett, resigned. S. B. Wade, traveling freight agent, with office at St. Louis, Mo., has been appointed commercial agent, with headquarters at Little Rock, Ark.

W. D. Skinner, assistant traffic manager of the Oregon-Washington Railroad & Navigation Company, has been appointed traffic manager of the Spokane, Portland & Seattle, the Oregon Trunk, the Oregon Electric and the United Railways, with headquarters at Portland, Ore., succeeding W. E. Coman, resigned, whose title was general freight and passenger agent, and which office is now abolished.

J. G. Carlisle, division freight agent of the Central of Georgia at Macon, Ga., has been appointed assistant general freight agent, with headquarters at Savannah, succeeding J. B. Parker, resigned. T. L. Collings, commercial agent at Atlanta, succeeds Mr. Carlisle. F. E. Ellis, contracting freight agent at Atlanta, succeeds Mr. Collings. H. R. McLean, commercial agent at Athens, succeeds Mr. Ellis, and B. R. Bloodworth has been appointed acting commercial agent, at Athens.

L. H. McArthur, traveling passenger agent of the Cincinnati Hamilton & Dayton, with headquarters at Dayton, O., has been appointed city passenger agent of the Baltimore & Ohio Southwestern at Kansas City, Mo. George F. Scheer has been appointed traveling passenger agent, with office at St. Louis, Mo. H. C. Stevenson, division passenger agent at Chillicothe, O., has been appointed traveling passenger agent, with headquarters at Denver, Colo., in place of S. M. Shattuc, deceased.

E. E. Carter, division freight agent of the St. Louis & San Francisco at Wichita, Kan., has been appointed general agent at that point; W. B. Craig, local agent at Tulsa, Okla., has been appointed general agent at that place; R. C. Mills has been appointed general agent, with headquarters at Oklahoma City, Okla.; S. B. Haas, division freight agent at Ft. Smith, Ark., has been made general agent, with office in that city; M. J. Conley, local agent at Joplin, Mo., has been appointed general agent at Joplin; and Warren Baker, division freight agent at Cape Girardeau, Mo., has been made general agent at that point. The above changes are in accordance with a new plan of the Frisco to have general agents in charge of both traffic and operating matters at points where formerly only traffic representatives have been located.

S. S. Bridgers, who has been appointed assistant general freight agent of the Norfolk & Western, with office at Roanoke, Va., was born in 1874 at Petersburg, Va., and was educated in the public schools and at the Virginia Polytechnic Institute. He began railway work in 1891 on the Chesapeake & Ohio and the following year went to the Norfolk & Western. He was in the general offices at Roanoke until 1900 when he was made commercial agent at Indianapolis, Ind., and three years later was transferred in the same capacity to Pittsburgh, Pa. For one year from 1908 he was division freight agent at Roanoke, Va., of the same road and was then appointed assistant general freight agent at Columbus, Ohio, which position he held at the time of his recent appointment as assistant general freight agent at Roanoke, Va., of the Norfolk & Western; also as manager of the Great Southern Despatch, the Southern States Despatch and the Shenandoah Despatch Fast Freight Lines.

Engineering and Rolling Stock Officers.

Lloyd B. Jones has been appointed assistant engineer of motive power of the Pennsylvania lines west of Pittsburgh, with office at Toledo, Ohio.

Fred Mertsheimer, superintendent of motive power and car department of the Kansas City, Mexico & Orient, with office at Wichita, Kan., has resigned.

J. B. Randall, assistant master mechanic of the Louisville, Henderson & St. Louis, at Cloverport, Ky., has been appointed master mechanic, and his former position has been abolished.

H. A. Cassil has been appointed division engineer of the Baltimore & Ohio Southwestern, with headquarters at Seymour, Ind., succeeding F. D. Batchellor, promoted. (See Operating Officers.)

R. J. Middleton, assistant engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been appointed engineer of track elevation, in charge of the Bloomingdale Road elevation in that city, effective January 1.

H. F. Passel, division engineer of the Cincinnati, Hamilton & Dayton, at Dayton, Ohio, has been appointed division engineer, with headquarters at Indianapolis, Ind., succeeding T. B. Conlyn, resigned, and H. G. Snyder succeeds Mr. Passel.

Seely Dunn, who formerly was manager of the Southern Car Service Association, and later engaged in the railway equipment business at New Orleans, La., has been appointed division engineer of the United Fruit Company, with headquarters at New Orleans.

John McMullen, shop superintendent of the Erie at Buffalo, N. Y., has been appointed mechanical superintendent of the Erie and subsidiary companies in charge of the car department, with headquarters at Meadville, Pa., succeeding E. A. Wescott, assigned to other duties. Adam Trautman, shop superintendent at the Kent, Ohio, car shop of the Erie, has been appointed shop superintendent of the Buffalo, N. Y., car shop, and William Miller has been appointed shop superintendent of the Kent car shop, succeeding Mr. Trautman.

G. R. Barry, division engineer of the Pennsylvania Lines West of Pittsburgh, Central system, at Zanesville, Ohio, has been appointed division engineer of the Logansport division, Southwest system, with headquarters at Logansport, Ind., to succeed E. B. Taylor, Jr., transferred. S. W. Hodgin, division engineer, Southwest system, at Cambridge Ohio, has been appointed division engineer of the Richmond division, Southwest system, with office at Richmond, Ind., to succeed F. N. Crowell, who has been appointed division engineer of the Cincinnati division, Southwest system, with office at Cincinnati, Ohio, in place of E. F. McCrea, transferred. R. C. Harris has been appointed supervising engineer, Southwest system, attached to the staff of the general superintendent, with office at Columbus, Ohio. Effective January 1.

Purchasing Officers.

J. R. Mueller has been appointed purchasing agent of the Hocking Valley, with office at Columbus, O., to succeed C. B. Duffy, deceased.

S. E. Keillor, formerly with the Duluth, Rainy Lake & Winnipeg, has been appointed storekeeper, with office at Duluth, Minn., of the Duluth, Winnipeg & Pacific, which has leased the D. R. L. & W.

L. B. Wood has been appointed general storekeeper of the Sunset Central Lines of the Southern Pacific, with headquarters at Houston, Tex., succeeding R. L. Pries, who at his own request, on account of ill health, has been made storekeeper at Houston.

Special Officers.

Frank Anderson, industrial commissioner of the St. Louis & San Francisco, has been appointed to the newly created position of director of development, with headquarters at St. Louis, and the former office is abolished. The industrial, agricultural and immigration work, heretofore carried on through several departments, will hereafter be under the direct supervision of the director of development.

OBITUARY.

P. Sid Jones, district passenger agent of the Louisville & Nashville, at Birmingham, Ala., died on January 2.

Robert Lee, district passenger agent of the Oregon-Washington Railroad & Navigation Company, with headquarters at Tacoma, Wash., died in that city on December 29.

W. W. Wentz, formerly general superintendent of the Chicago, Rock Island & Pacific at Little Rock, Ark., and who retired from railway service in 1904, died on December 28, at Chicago, aged 56 years.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Chestnut Ridge is in the market for 1 locomotive.

The Central of Brazil is making inquiries for from 10 to 12 locomotives.

The Stewart Iron Company, Sharon, Pa., is making inquiries for 1 locomotive.

The Rutland has ordered 7 locomotives from the American Locomotive Company.

The Denver & Salt Lake has ordered 2 locomotives from the American Locomotive Company.

The Solvay Process Company has ordered 1 locomotive from the American Locomotive Company.

The Harriman Lines' order will comprise 50 locomotives from the American Locomotive Company and 208 locomotives from the Baldwin Locomotive Works.

CAR BUILDING.

The Norfolk & Western is in the market for 1,250 freight cars.

The Chicago, Milwaukee & St. Paul is figuring on over 6,000 freight cars.

The Ft. Dodge, Des Moines & Southern is in the market for 200 box cars.

The American Refrigerator Transit has ordered 1,000 refrigerator cars from the American Car & Foundry Company.

The New York Central Lines have ordered 1,000 box cars from the American Car & Foundry Company, for the Cleveland, Cincinnati, Chicago & St. Louis.

IRON AND STEEL.

The Chicago, Indianapolis & Louisville has ordered 4,000 tons of rails from the United States Steel Corporation.

The Duluth, Missabe & Northern has ordered 22,000 tons of steel from the American Bridge Company for its proposed ore dock at Duluth.

General Conditions in Steel.—Although the volume of orders placed since the first of the year has been characteristic of the holiday period, they have been heavier than expected. It is believed that the Steel Corporation booked about 1,000,000 tons of new business during December, and that the unfilled tonnage for that month will show an increase of about 75,000 tons.

SIGNALING.

The New York, Chicago & St. Louis has ordered from the Western Electric Company apparatus for telephone train despatching, between Fort Wayne and Stony Island, 145 miles, and between Fort Wayne and Bellevue, Ohio, 125 miles.

The Missouri, Kansas & Texas plans during the present year to install automatic block signals on about 100 miles of its lines, as follows: Atoka, Okla., to the Red river, three miles, double track; Red river to Denison, Tex., 4.5 miles, single track; Hillsboro to Granger, Tex., 94 miles. Two mechanical interlocking plants are to be installed; one of 23 functions at Elgin, Tex., crossing of the Houston & Texas Central, and one of 12 functions at West Point, Tex., crossing of the San Antonio & Aransas Pass. An electro-pneumatic interlocking of 29 functions is to be installed at Denison, crossing of the Houston & Texas Central.

Great Eastern Railway, England.—New lines and sidings, additional dock lines and a river wall are contemplated at Ipswich by the Great Eastern Railway. Additional capital powers for these and other purposes will also be asked.

Supply Trade News.

Stewart B. McEldowney, superintendent of the Chicago Steel Car Company's plant at Harvey, Ill., died on January 1, at Chicago.

S. W. Midgley, western representative of the Curtain Supply Company, Chicago, has been made western sales manager of that company.

The Hobart-Allfree Company, Chicago, has opened a factory at Chicago where the Freeland and Smyth derailers, switch stands, targets, car replacers, etc., will be assembled and shipped.

The Epping-Carpenter Company, Pittsburgh, Pa., which makes pumping machinery and condensers, has opened a branch office at 728 Monadnock building, Chicago. This office will be in charge of R. E. Burke, who was formerly with the International Steam Pump Company.

J. E. Chisholm has been made a representative of the Universal Flexible Packing Company, Pittsburgh, Pa., with offices in the Old Colony building, Chicago; and George R. Argo has been made representative of the same company, with office in the Third National Bank building, Atlanta, Ga.

William B. Hall has resigned as vice-president and general manager of the Illinois Car & Manufacturing Company, to promote the interests of the Union Railway Equipment Company, of Chicago, which has taken over the patented devices invented by Herman Pries, superintendent of the Haskell & Barker Car Company. Mr. Hall was formerly superintendent of equipment of the Mather Horse & Stock Car Company for 16 years.

Samuel E. Barrett, chairman of the Barrett Manufacturing Company, with office at Chicago, who died at Baltimore on December 29, as was mentioned in the *Railway Age Gazette* of January 3, was born in Massachusetts in 1836. He served through the Civil War as an officer in the Union army, and later came to Chicago and organized the Barrett Manufacturing Company, manufacturers of roofing materials. Mr. Barrett was also a stockholder and a director of several Chicago banks. He retired from active business in 1906.

The officers of the J. G. White Engineering Corporation, New York, the incorporation of which was mentioned in the *Railway Age Gazette* of November 22, page 1012, are as follows: Chairman of the finance committee, J. G. White; president, Gano Dunn; vice-presidents, E. G. Williams, A. S. Crane and H. A. Lardner; secretary, H. S. Collette; and treasurer, R. B. Marchant. During the year ended October 1, 1912, the departments of J. G. White & Company, Inc., which have been organized into the J. G. White Engineering Corporation, were at work on contracts aggregating in cost over $28,000,000, and on appraisals and reports upon properties aggregating over $400,000,000. The officers of the J. G. White Management Corporation, the incorporation of which was mentioned in the *Railway Age Gazette* of November 22, page 1012, are as follows: President, J. H. Pardee; vice-presidents, F. H. Reed and S. L. Selden; secretary and treasurer, T. W. Moffat. The parent organization, J. G. White & Company, Inc., controls the new companies and will continue as an active financing and owning company.

H. F. Ball has opened an office in the Hudson-Terminal building, 30 Church street, New York, as a special consulting engineer. Mr. Ball entered the service of the Pennsylvania Railroad as an apprentice at Altoona, Pa., in 1884. Four years later he entered the drafting room at Altoona and in 1890 was appointed chief draftsman of the car department of the Lake Shore & Michigan Southern. Two years later he was placed in charge of the car shops at Cleveland, as general foreman, and in 1894 was appointed general car inspector. Five years later he was made mechanical engineer of the Lake Shore, which position he held until his promotion to the position of superintendent of motive power in February, 1902. In 1906 he left the Lake Shore to accept the vice-presidency of the American Locomotive Automobile Company; a few months later his jurisdiction was extended over the American Locomotive Company, as vice-president of engineering. This position he resigned a short time ago, as announced in our issue of November 8, 1912. Mr. Ball's

tenure of office, as vice-president of engineering of the American Locomotive Company, has been co-incident with some of the most important improvements made in locomotive construction, as well as the great increase in power and weight which characterize the present day locomotive. It covered such radical changes in design, as a substitution of the Walschaert for the Stephenson valve gear, the use of superheated for saturated steam, and the successful development of the Mallet locomotive. Mr. Ball was president of the Central Railroad Club in 1900 and of the American Railway Master Mechanics' Association in 1905-6.

TRADE PUBLICATIONS.

LATHE CHUCKS.—The Skinner Chuck Company, New Britain, Conn., has published a new catalog and price list of its independent, universal and combination lathe chucks. Illustrations, brief description and dimension tables are included.

CHICAGO & NORTHWESTERN-UNION PACIFIC.—The department of tours of the Chicago, Union Pacific & Northwestern line has issued an especially attractive booklet describing its winter vacation tours to the Pacific Coast and the Hawaiian Islands.

ELECTRIC DRILLS.—The Chicago Pneumatic Tool Company has published bulletins E-22, E-26 and E-27, illustrating and describing heavy duty electric drills for alternating current; universal electric drills operating on direct or alternating current; and heavy duty electric drills for direct current; respectively.

REFRIGERATION-HEATING-VENTILATION.—The Moore Patent Car Company, St. Paul, Minn., has published an attractive booklet entitled Perishable Products Transported Scientifically and Economically, illustrating and describing in detail the construction of its cars. An interesting table is included showing the comparative tests of the Moore system vs. end ice box cars moving in the same train.

RIVETERS.—The Vulcan Engineering Sales Company, Chicago, has published an attractive catalog of Hanna pneumatic riveters, screen shakers, revolving dumping riddles, mold dryers, etc., made by the Hanna Engineering Works, Chicago. The design and construction of these riveters are described in great detail and their advantages are set forth in a most convincing manner. The entire product and sales of the Hanna company are controlled by the Vulcan Engineering Sales Company.

NEW LINES FOR URUGUAY.—A series of railways are being projected by the Uruguayan government to link up the existing roads and to supply localities not now with means for transportation. The two first railways will extend through the departments of Colonia, Soriano, Durazno, Rocha and Maldonado, with a narrow-gage railway between Carmelo and Palmira and Dolores and La Laguna. A European syndicate with $15,000,000 capital has offered to co-operate with the government in the construction of these railways.

RAILROAD POLICY IN WESTERN AUSTRALIA.—In the state of Western Australia new railways are designed and constructed on plans which are not submitted to the commissioner of railways who is responsible for their operation and maintenance. This lack of co-operation would not be so bad were it not for the fact that the policy has, for its guiding principle, that the paramount consideration shall be the least first cost. As a consequence these lines are built with steep grades, light rails and ties, insufficient ballast, defective drainage and the omission of the water supply, and the results are small loads, limited speeds, excessive maintenance costs, and haulage of water. Mr. Short, the commissioner, draws attention to this in his report for the year ending June 30 last, and says that 15 miles an hour is the maximum speed for such roads. Trains, consisting partly of tanks of water for the engine can only crawl up the steep grades; in descending them, or on the level, they are prevented from improving their average speed by the character of the permanent way. In the meantime the trainmen are paid excessive overtime, and there is an excessive number of men employed for maintenance, all of which unnecessary expense would be sufficient probably to cover interest many times over on the extra amount which a first-class railway would have cost in comparison with the cheap railway which exists.

Railway Construction.

ALABAMA, TENNESSEE & NORTHERN.—We are informed that this company and the Tombigbee Valley railroad built about 30 miles of new lines in Alabama during 1912, to connect up their lines in Choctaw county between the towns of Ward and Silas.

ASHLAND & WESTERN.—An officer of this company, which operates a line from Custaloga, Ohio, northwest to Ashland, 25 miles, has given a general contract to the West Virginia & Ohio Construction Company, of Ashland, Ohio, for work on an extension building under the name of the Lorain, Ashland & Southern, from Ashland north via Wellington to Lorain. Track has been laid from Lorain south to Wellington 20 miles. There remains a section of 23 miles yet to be built between Wellington and Ashland, and work on this section will be sublet. There will be about 300,000 cu. yds. of earth to be handled and 270,000 yds. of borrow, also 12,000 cu. yds. of concrete to be constructed. The maximum grade southbound will be 26 ft. to the mile, and northbound the ruling grade will be 77 ft. to the mile, and the curvature outside of the terminals will be 2 deg. The company expects to develop a traffic in coal, ore, manufactures and miscellaneous freight.

BRITISH COLUMBIA & WHITE RIVER.—The Canadian parliament has been asked for an extension of time to build from a point in British Columbia on the international boundary at Bear creek, a tributary to the Chilkat river, northwest towards the Alsek river and thence through the Shakwak valley to Lake Kluane, thence along Lake Kluane and via the Donjek valley to the White river, thence to the boundary between the Yukon territory and Alaska between the 62nd and 64th parallels. Barnard & McKeown, Montreal, are solicitors for the applicants.

BUCTOUCHE RAILWAY & TRANSPORTATION COMPANY.—See Moncton & Northumberland Strait.

CALGARY, EDMONTON & FORT MCMURRAY.—Application has been made in Canada for a charter to build lines as follows: From Calgary, Alb., north via Edmonton, passing east of Lac La Biche to Fort McMurray, and following the Athabasca river to Chipewyan, thence west of Slave river and passing through or near Fort Smith to Fort Resolution on Great Slake lake; from Fort Smith southwest to Fort Vermilion, thence southerly on the west side of Peace river to Peace River Landing, and southwest to Dunvegan; from a point on the Red Deer river north of the 52nd parallel to Red Deer. Christie, Greene & Hill, Ottawa, Can., are solicitors for the applicants.

CANEY RAILWAY.—Incorporated in Kentucky with $10,000 capital to build from a point on the Chesapeake & Ohio in Floyd county, Ky., following the middle branch of the Big Sandy river to Beaver Creek, and reaching coal fields in eastern Kentucky. The incorporators include J. Salisbury, M. Flannigan, W. T. Hite, W. W. Brown and W. P. McVay. The headquarters of the company are at Prestonburg.

CLINTON & OKLAHOMA WESTERN.—See Oklahoma Roads.

HURON LAKE SHORE.—Application is being made to the Canadian parliament for incorporation to build from Sarnia, Ont., northeast through the counties of Lambton, Huron, Bruce and Grey, to Meaford. W. B. Converse, Montreal, Que., is solicitor for the applicants.

LAKE ERIE & YOUGHIOGHENY (Electric).—Incorporated in Ohio with $3,000,000 capital to build a line to connect Youngstown, Ohio, with Conneaut. A. W. Jones, J. H. Ruhlman, G. J. Chapman, W. H. Ruhlman and G. M. Brown, all of Youngstown, are interested.

LORAIN, ASHLAND & SOUTHERN.—See Ashland & Western.

MANITOBA-ONTARIO ROADS.—Incorporation has been asked for in Canada to build a railway from Fort William, Ont., northwest via the Lake of the Woods to Winnipeg, with branches to the international boundary between Ontario and Minnesota, and from the main line northerly to the National Transcontinental (Grand Trunk Pacific), also to operate steamships, etc. Lewis & Smellie, Ottawa, Ont., are solicitors for the applicants.

MICHIGAN CENTRAL.—An officer writes that during the year 1912 this company constructed 2.42 miles of third and fourth

main track in the state of Michigan, which will be used exclusively for freight business. On the Detroit, Delray & Dearborn branch the company built 1.7 miles of second track in Michigan, and has also constructed a double track freight line from that branch to Junction yards at Detroit, 2.46 miles, which is known as the connecting branch. On the Detroit Belt Line 1.37 miles of second track in the city of Detroit was constructed.

Moncton & Northumberland Strait.—The Buctouche Railway & Transportation Company, which was incorporated in Canada in 1910, to build from Buctouche, N. B., north to Richibucto Harbor, and from West Point, P. E. I., east to Coleman, on the Prince Edward Island Railway; also to operate steamers and car ferries, between the two provinces, is applying to change its name as above, and for authority to extend the authorized line from Richibucto harbor to Chatham, N. B., or to Loggieville; also to build a line from Painsec, N. B., to Cape Tormentine. E. G. Evans is general manager, Moncton, N. B.

Oklahoma Roads.—Work is now under way building a four-mile line from Cheyenne, Okla., to a connection with the Clinton & Oklahoma Western. Grading has been finished on about two miles, and it is expected that the line will be open for traffic in February. The chamber of commerce of Cheyenne is back of the project.

San Pedro, Los Angeles & Salt Lake.—An officer writes, regarding the reports that this company will build a low grade line via the Cajon Pass, Cal., that location work is now under way between Riverside and Daggett over the San Bernardino mountains via Cajon Pass. The distance between these two places is 100 miles. It has not yet been determined whether construction work will be started in the near future.

Southern Traction.—An Officer writes that the general contract for constructing and equipping these lines has been given to the Southern Engineering & Construction Company, Dallas, Tex. Work is now under way from Dallas south via Ferris to Corsicana, 55.5 miles, also from Dallas via Lancaster, Waxahachie, Italy, Milford and Hillsboro to Waco, on 97.5 miles. About 30 miles have been finished and are now in operation. (October 25, p. 815.)

Springfield & Central Illinois Traction.—According to press reports this company will begin construction work about April. The company was organized in 1910, to build from Springfield, Ill., south via Pawnee, Morrisonville, Hillsboro, Coffeen, Greenville, Carlisle and Centralia; with another line from Greenville west via Alhambra, Edwardsville and Grant City to St. Louis, Mo., and a third line from Coffeen, Ill., southeast via Vandalia, Kinmundy, Louisville and Olney to Mount Carmel. Isaac A. Smith, president and general manager, Security building, St. Louis, Mo. Charles Olson, Beavercreek, Ill., is said to be interested. (February 16, p. 321.)

Tombigbee Valley.—See Alabama, Tennessee & Northern.

RAILWAY STRUCTURES.

Galveston, Tex.—The Gulf, Colorado & Santa Fe has awarded a contract for the construction of the new union station and general office building to the American Construction Company of Houston. The building will be of steel and concrete construction, six stories in height, and will cost approximately $500,000. It will include a waiting room 62 ft. x 100 ft. The building will have a frontage of 100 ft. and a depth of 125 ft.

Howell, Ind.—It is reported that the Louisville & Nashville will spend about $200,000 in enlarging its shops at Howell.

Mechanicsville, N. Y.—The Boston & Maine has started work on a new eastbound classification yard and engine facilities consisting of engine house, machine shop, coaling plant, etc. The grading is completed and work on the foundations is under way.

Parsons, Kan.—The Missouri, Kansas & Texas has awarded a contract to the Gray-Wimmer Construction Company of St. Louis, for the rebuilding of its passenger station.

Roodhouse, Ill.—The coaling station of the Chicago & Alton at Roodhouse was destroyed by fire on the night of December 31.

Railway Financial News.

Baltimore & Ohio.—A mortgage has been filed in Pennsylvania on the property of the B. & O. in that state to secure an issue of $40,000,000 bonds.

Chicago, Milwaukee & St. Paul.—The *Commercial & Financial Chronicle*, in reply to an inquiry as to the exact legal procedure by which the C. M. & St. P. has taken over the Chicago, Milwaukee & Puget Sound, has received the following from General Counsel Burton Hanson:

"By purchase, the St. Paul company has acquired the fee ownership of the railway lines and property of the Chicago, Milwaukee & Puget Sound Company. The entire capital stock of that company heretofore held by the St. Paul company will continue to be held by the latter as a muniment of title and for the purpose of continuing the corporate existence of the Puget Sound company for such length of time as may be thought advisable, but the lines of railway formerly owned and operated by that company, by the conveyance to the St. Paul company, will be owned and operated by the latter company. As part of the consideration of the purchase, the St. Paul company assumes and agrees to punctually pay, when due and payable, all bonds issued under the first mortgage of the Puget Sound company, as well as all other existing obligations of that company."

Chicago & North Western.—The Michigan railroad commission has given its consent to the issue of $10,000,000 equipment trust certificates, the issue of which was approved by the directors some time ago.

Oklahoma Central.—This property, which is in the hands of a receiver, has not as yet been sold under foreclosure, as was stated in the *Railway Age Gazette* of December 27.

Tennessee Central.—On application of S. J. Fordyce, Jr., of St. Louis, vice-president, E. B. Chamberlain, vice-president, and W. K. McAlister, formerly of the supreme court of Tennessee, have been appointed receivers.

Union Pacific.—See editorial comments on page 45.

Attorney General Wickersham has notified the officers of the Union Pacific that he sees no objection to the Union Pacific's receiving the quarterly dividend of 1½ per cent. on its Southern Pacific stock ($126,650,000).

Wabash-Pittsburgh Terminal.—Judge Orr, on January 3, in the federal court, has authorized the sale of the Wabash-Pittsburgh Terminal at the discretion of the special master, W. H. McClung. The upset price is fixed at $6,000,000.

Western Maryland.—After a meeting of the board of directors on January 7 it was announced that the regular quarterly dividend of 1 per cent. would be passed. E. D. Adams, chairman of the board, representing the Deutsche Bank, in a statement given out after the meeting, said that the directors had provided during the past year $13,000,000 at a net cost to the company of less than 6 per cent. In part the statement says:

"The Western Maryland system is now in process of transformation and evolution, from a local railway, mainly tributary to and dependent upon the city of Baltimore, to a seaport terminal link in one of the largest railway systems of the country. Such a transformation necessarily involves large increases in operating expenses, alike (1) in the maintenance accounts by reason of the changes required to be made therein under the Interstate Commerce Commission rules in respect to property abandoned or replaced in the course of improvements, (2) in traffic expenses through expenditures necessarily made in advance to promote traffic for the new line, and (3) in transportation expenses by reason of the innumerable difficulties of carrying on construction and improvement work and current traffic simultaneously. In the present case these difficulties have been augmented by the fact that the betterment of the old line did not proceed in due coordination with the construction of the new line.

"The conditions that now obtain are unquestionably abnormal and temporary. Substantial improvement in operating conditions is not, however, to be anticipated until the betterments of the old line are near completion, which may be expected during the latter part of spring, though it is the opinion of the operating officials that October will be found to have been the period of maximum expense."

Railway Age Gazette

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,141 copies were printed; that of those 8,141 copies, 6,687 were mailed to regular subscribers and 348 were provided for counter and news companies' sales; that the total copies printed this year to date were 24,401 copies—an average of 8,133 copies a week.

VOLUME 54. JANUARY 17, 1913. NUMBER 3.

CONTENTS

AN interesting decision of the Colorado supreme court was noted in last week's issue, in which the court sustained an order of the Colorado Railroad Commission requiring the Colorado & Southern to restore freight and passenger service between Denver and Leadville, Colo., over its narrow gage South Park branch. The company had attempted to close the 21-mile section between Como and Breckenridge during the winter months on account of the expense of operation through a mountainous, sparsely settled country over the 4 per cent. grade over Boreas Pass, 11,400 feet high. It showed during the proceedings in the case that during the winter this line is subject to heavy and continuous snow storms, necessitating a very heavy expense, that in 1911 there was a deficit of nearly $80,000 on the line from Como to Leadville, that its taxes in Summit county amount to $25,000 a year, that the traffic over the line is inconsequential with no prospect of improvement, and that there are less inhabitants along it now than there were ten years ago. On the other hand by the closing of this line the few shippers at Breckenridge were deprived of railway facilities which they had previously enjoyed, freight and passengers being compelled to travel by a very roundabout route over another road in order to reach Denver, and the court held that the law imposes upon the carrier "the duty of furnishing facilities to the public on its entire system, not a part"; that it "cannot be excused from performing its full duty merely because, by ceasing to operate a part of its system, the net returns would be increased." Having once undertaken to serve the public the railway cannot abandon an unprofitable portion of its business without surrendering its charter. In connection with this decision and exposition of the law as it stands as the expression of public policy in this country, it is interesting to note the following paragraph in the recent annual report of the National Railways of Mexico: "One of the considerations weighing in the merger of the companies now forming this company was the suppression of certain lines, principally of the old National Railroad Company and the old Mexican Central Railway Company, which parallel each other, the traffic of the region not being sufficient to sustain both tracks." The report goes on to state that a committee appointed to investigate the matter recommended the abandonment of lines amounting to 288.64 miles and that the necessary steps are now being taken looking to said abandonment. Although some communities must be deprived of railway conveniences by this step, the Department of Communications and Public Works has signified its approval. As the Mexican government holds a controlling interest in the National Railways of Mexico it is interested in the economical operation of the property.

THE space-interval principle as applied in the running of trains is not the severely rigid thing that it is often thought to be. One old railroader says that in his first dim apprehension of the block system, 50 years ago, he conceived of every block section as exactly one mile long. That was the way it was presented in what he had read about its introduction in England. But today we have some railroads divided into blocks of 800 ft., while in other cases trains are kept apart 20 miles. A theorist, considering the problem entirely apart from cost, and studying simplicity only, could easily fall into the error of making every automatic block as short as possible, say 500 ft., and every manual block as long as possible, say 100 miles. The short automatic block would be favored by the absence of track-circuit troubles and by the attractiveness of the idea of increasing the capacity of the road; and the long manual block would please the manager who wished to down the telegraphers' union! A St. Louis correspondent writes on this subject as follows:

> I notice that in an editorial in your issue of December 27 you say, in substance, that there are very few railways which are so poor that they could not afford to adopt the block system, if they would make their block sections long. Taking this view of the matter, what would you say to the problem raised by the following situation: a single track line, 80 miles long, without a single intermediate telegraph office and with a time-table showing only one meeting point in this distance. The reader naturally assumes that when you advocate the block system on a line of very light traffic you mean the manual block system; and this implies the employment of operators at the stations. But, surely, you would not think of establishing and maintaining a telegraph office on a desert, where there are no trains to meet and no station business to be done. Theories always have to submit to conditions.

That *is* a pretty thin line, and no mistake! Forty miles is the longest block section that we have heard of as being actually used. This problem cannot be fairly considered without a fuller knowledge of the conditions; but there are a few fundamentals concerning which there will be no question. It is true that a

road using the space interval with only two trains a day might be paying a high price for safety. The ultimate argument for the space interval is that it provides for systematic practice in place of loose and unmanageable practice; and it is to be admitted that sometimes we have to pay for "system." Running regular passenger trains is a system that is often very costly; empty seats by the thousand and empty cars by the dozen have to be run daily in order to adhere to a system. Conditions, to a considerable extent, do submit to a theory. But our 80-mile line is not so hopeless, after all. The road surely must have a telegraph or telephone line for its whole length. Since 1850 all enterprising roads have had that much, and since about 1870 both enterprising and unenterprising have had it. The state should require at least that degree of enterprise as a minimum. What do those conductors do when an engine breaks down 40 miles from headquarters? With telephone lines the space-interval principle can be availed of without station attendants. A telephone at that single meeting point, with conductors trained to use it, would enable the despatchers to enforce the space interval. Change these 40-mile block sections to 2-mile sections and we can see this machinery in operation on electric roads today. The reader also will recall an account in the *Railway Age Gazette* some time ago (December 2, 1910, p. 1034) of the use of the electric train staff, without station attendants, on the Delaware, Lackawanna & Western. The block system everywhere! This is the only satisfactory ideal. And it is not so difficult of attainment as we usually think.

THE outlay for passenger terminals in large cities has assumed such vast proportions within recent years, and is increasing so rapidly, that an occasional pause for consideration of the ultimate tendency of the movement may well be worth while. The recently completed Pennsylvania station in New York, the North Western terminal in Chicago, the Northern Central station in Baltimore, the Union station in Memphis and the Harriman lines station in Seattle, not to mention the Grand Central terminal now nearing completion in New York, and the Union station at Kansas City, now half completed, represent a cost of several hundred million dollars. Furthermore, the new stations in prospect for the near future, including the Union station, the Illinois Central station, and the Chicago & Western Indiana station in Chicago, the proposed Union station at St. Paul, the Dallas Union station, the Denver Union station, the Illinois Central station at Memphis, the Harriman lines station at Spokane, plans for all of which are being actively prepared or have been approved, show clearly that the end is by no means in sight. Nor is the movement confined to the larger cities. The terminus of a railway is but one of hundreds of ambitious communities that are continually urging schemes for municipal improvements at the expense of the railways, which seem small in proportion to the large figures which represent railway activities as a whole, but which would amount to an immense total if extended proportionately to other communities. Nor is the sense of proportion a prevailing characteristic of civic ambition. Rivalry between cities and towns becomes an important factor and public sentiment demands that a new station shall not only provide ample facilities for the accommodation of passengers, but shall be constructed in such a way as to be a credit to the community, in accordance with the community's usually exaggerated idea of its own importance. To construct merely an entirely adequate station from the utilitarian standpoint is regarded as an affront, yet communities are not especially grateful to the railways after their demands have been complied with. Because of the semi-public nature of railway services some of these demands are justified. For many others the railways themselves are to blame, because in their efforts to outshine each other they have set examples for demands from other communities which are very difficult to resist. The Grand Central terminal represents an exceptional case. The entire project represents an investment and has been so developed that the rentals from facilities leased to outside parties will absorb the fixed charges. In the case of most of the great passenger terminals, however, there is no expectation that the increased facilities will bring in a commensurate return. Moreover, especially in view of the reduction in passenger fares in many states in recent years these large expenditures for passenger facilities with the resulting fixed charges, impose a very heavy burden on some of the weaker roads, for they are often required to participate in the cost of union stations if they are to secure any part of the competitive business, while the amount of such business they may expect by no means justifies the outlay. Mr. Fritch, in his paper before the Canadian Railway Club, brings out some interesting comparisons between these enormous station expenditures and the passenger earnings of the roads. Of greater significance is his statement that these enormous outlays for passenger stations are being made at the expense of proper freight terminal development. Many shippers have already called attention to this fact in discussions of the freight rate question. It is undoubtedly true that the public would be better served, and that the railways would be in a far better position to effect needed economies in operation if greater attention were given to the development of adequate freight terminal facilities, and less to the establishment of monuments to the ambition of cities and towns or to the vanity of the railways, in the shape of magnificent passenger stations.

THE RAILROAD CLEARING HOUSE.

THE American Railway Clearing House did not prove a success largely because of opposition of railroad accounting officers. In considering the two plans described elsewhere, one for a general clearing house, the other for a number of district clearing houses, this important fact should be given due weight. A joint committee has been appointed representing both financial officers and accounting officers, to consider these plans, and it is hoped that a plan can be worked out which will meet the requirements of a situation that badly needs remedying and at the same time prove acceptable to the accounting officers.

The question of a clearing house for the settlement of balances between railroads in this country is a very important one. It was a problem that E. H. Harriman was deeply interested in up to the time of his death, and the experience with the American Railway Clearing House has shown that despite the difficulty of the problem, nevertheless a clearing house is a feasible undertaking. A possible solution of this problem must not only overcome actual physical difficulties, but also prejudices and predilections. The officer in charge of the accounting department of a railroad is personally responsible to his president and, through him, to the board of directors. It is natural and proper that the ethics of the profession do not permit the shifting of this responsibility. This explains what otherwise might seem a prejudice against permitting any outside voice in the affairs of the accounting department.

There are two plans for a clearing house which have been worked out in detail and which will be considered by the joint committee of accounting and financial officers. These plans provide in the one case for a general clearing house to be established in Chicago or some other city; in the other for 12 or more district clearing houses to be established at financial centers through the country. It is obvious at once that the district clearing house plan will permit of a quicker settlement between local roads than will a general clearing house. This district plan will also give the stronger roads control of the local clearing house in their territory. The accounting officer with financial headquarters at New York will have a feeling that he has under his own thumb, "where he can get at it," the clearing house which settles the bulk of his accounts with other roads. Since, moreover, the great bulk of the settlements between one road and all other roads is between that road and other roads in its own territory, the district clearing house plan will, compared with

the present method of individual settlements, save a very large amount of transfer of funds from one city to another.

The general clearing house will not be under the control of any one group of roads. Its operations will be simple and complete. The argument has been put forward that the operating costs of the district clearing houses will be less than those of the general clearing house. It is hard to believe this. On the face of it, the clerical labor involved in making between one hundred and two hundred clearing sheets, which will be the aggregate under the district plan, will be very much greater than that involved in making a single comprehensive clearing each month. While the expenses of operation will not be large, probably, in either case, after all the reason for adopting a clearing house plan at all is to eliminate clerical labor and to simplify the settlement of balances. Let us assume that the general clearing house delays the settlement of 90 per cent. of the amount of the balances by a full 30 days. This delay is not cumulative. The total balances under either the general clearing house or district clearing house plan are cleared each month. A road which always has a credit balance will suffer; a road which always has a debtor balance will benefit by this delay; but there are few roads which are always in one class or the other. Under the general clearing house plan three or four roads having connections at New York may settle between each other directly, not submitting these accounts to the clearing house at all. Each road can work out its own problem to its own best advantage while making use of the general clearing house.

Unquestionably the chance for error in making a clearing is much greater where a large number of roads are involved, as would be the case with a general clearing house, than would be the case in each district clearing house. But, after all, banks have found that they can successfully make a clearing between their members each day, and the chances for error in the New York clearing house, for instance, are probably fully as great as would be the case with a general railroad clearing house.

As to the transfer of funds from one city to another, the general clearing house plan provides that local depositories in the different financial centers may be used, and it is hard to see why such a plan as this does not have every advantage, as far as saving of transfer of funds is concerned, that a district clearing house plan has. In either the general clearing house plan or the district clearing house plan it will be necessary to have a working fund, and it should be just as easy for the manager of the clearing house to see that his balances are distributed between the 12 or 15 depositories selected, as it will for each district clearing house manager to have sufficient working capital in his bank to carry out his partial clearances day by day. The advantages of district clearing houses as compared with one general clearing house narrows down to one plausible reason, which is the desire of each member to influence the management of the local clearing house in his own district.

To offset the natural predilection of the accounting officer to have the clearing house "where he can get at it," as provided for in the district clearing house plan, are the advantages of a general clearing house that will be a simple, complete machine without local prejudices and not under the control of any one group of roads. Further than this, it will, or should, accomplish the object, the desire for which has led to the consideration of a clearing house plan, namely, to reduce to a minimum the clerical labor and banking complications of settlement between the eight hundred or more railroads which now settle accounts individually.

Regardless, however, of what plan is eventually adopted, the credit for the fact that a workable plan for a clearing house has been devised and presented to the Society of Railway Financial Officers, and that a joint committee of this society and of the committee of twenty-five of the Association of American Railway Accounting Officers has been appointed to consider this and other plans, is due to the Financial Officers' president, T. H. B. McKnight.

BRIDGE ERECTION BY END LAUNCHING.

THE endwise launching of fully erected bridges of long spans has never gained much favor among American bridge engineers, although the method is more or less common in other countries. This fact cannot be explained by any hesitancy on the part of engineers in this country to move completed structures, for there are numerous examples of daring handling of new and old spans both by floating and skidding, especially of draw spans. The sidewise moving of a span erected on falsework alongside an old bridge is frequently adopted for locations where it is essential that the interruption to traffic in replacing a bridge be kept to the minimum. The most plausible explanation of the disfavor in which end launching is held is found in the wide application of the cantilever method of erection for locations where it is impractical to use falsework. The extent to which the latter method has been developed is illustrated by its use for two double track trusses, 615 ft. 2¼ in. long, center to center of end pins, in the Kentucky & Indiana bridge over the Ohio river, described in the *Railway Age Gazette* of January 10, 1913.

In general, end launching is applicable under the same conditions which make cantilever erection necessary; namely, deep water, swift current, extreme variation in tide, sudden freshets or the presence of ice or drift. End launching has two advantages over the cantilever method of erection in that the truss members do not have to be designed for erection stresses and that in locations subject to extremely high winds the danger of erection on shore is much less than over the river channel.

The Monongahela river bridge, having a span of 475 ft., the erection of which is described elsewhere in this issue, is probably the longest and heaviest span ever erected by end launching, although at least four other bridges with spans of 400 ft. or over have been erected in this manner during the last decade.

The Canadian Pacific erected a 415 ft. single track through truss over the French river in 1908 by end projection, the total weight of the span being 1,282 tons. The Tornea Railroad in Finland launched a 410 ft. span weighing 800 tons in 1902, and in replacing the Canadian Pacific bridge over the St. Lawrence river at Lachine, Que., during the summer of 1912, the same method was used in erecting the two channel spans of 408 ft. each. These spans had a weight of 1,365 tons each. The Northern Railway of Costa Rica erected a 400 ft. span over the Reventazon river in 1909 by end launching, the weight of this bridge being only 580 tons. A slightly heavier bridge, although of only 340 ft. span, was erected by the Southern & Western Railway in Queensland, Australia, in 1895.

Three distinct methods of supporting the shore end of the span to be launched have been used. With the Monongahela river bridge two 4-wheel trucks supported this end; similar trucks with 8 wheels each were used on the Southern & Western bridge in Queensland. The more common method, however, seems to be to support the rear end on bearing plates sliding on skidways which usually consist of rails laid on the approach structure or on timber blocking. The Lachine bridge of the Canadian Pacific was supported on six shoes attached to a distributing truss in order to avoid too great concentration of the load on the approach span. In the other bridges mentioned above, two sliding plates were used; in one case the plates were surfaced with brass, and in both cases the sliding rails were oiled or greased to reduce the sliding friction. The bridge in Costa Rica was moved over three sets of stationary rollers mounted on the shore abutment, a temporary pier in the middle of the river and a temporary abutment at the center of the span in its erection position.

In all cases except this Costa Rica bridge the river end of the span was supported by a scow. These scows varied in length from 98 ft. to 200 ft. for the various bridges, and in width from 19 ft. to 37 ft., the general standard being about the same as that described in detail for the Monongahela river bridge. The power for moving the bridges usually consisted of hoisting

engines located on the shore back of the span in its erection position, the power being applied in most cases to the rear truck or sliding shoe. In the Monongahela river bridge the engines were located on the scow and pulled on lines attached to "dead men" on the river banks. In the bridge erected in Finland, hydraulic presses were used and in the Queensland structure one 10-ton and two 5-ton hand winches furnished the power. Experiments made at the Lachine bridge showed that the sliding friction amounted to about 13 per cent., and the starting friction found in some of the other bridges ranged as high as 20 to 25 per cent. In most cases the moving time was less than the six hours which was consumed in the launching of the Monongahela river bridge. The travel of the Lachine bridge was 12 ft. per min.

The general principle of erecting spans on shore and launching them endwise into position has been adapted to the erection of a number of high viaducts in Europe and South America. One of these over the Sarine river in France was 1,095 ft. long and 249 ft. above the water. The structure consisted of seven spans which were erected consecutively on shore, the first one being pushed entirely across the river. After the projection of the first one it was used as a cantilever during the erection of the first steel tower. When this tower was complete, rollers were placed on its top and the second span was launched from the shore, pushing the first one beyond the erected tower. The second tower was then erected in the same manner and this process was continued for the entire length. This bridge was erected in 1859. A similar viaduct in Chile, consisting of five deck spans 228 ft. long at a height of 328 ft. above the river, was erected in a similar manner, the pier towers in this case being erected from below in advance of the superstructure. The total weight of these five spans was 750 tons, the greatest deflection during erection being 20⅞ in. This bridge was erected in 1890. An even more daring use of this method was the railway bridge over the Danube river near Vienna, where five spans with a total length of 1,312 ft. and a total weight of 2,000 tons were launched complete.

KEEPING A GOOD LOOKOUT.

WHEN a switch light is not burning, a train approaching the switch in the night should be stopped, and the trainmen should relight the lamp; "not slow down, but stop." This is the law and the prophets as laid down by the Indiana Railroad Commissioners, in their circular, noticed last week, page 72. It may be called the law, for those commissioners probably can get the legislature to endorse whatever rule of that kind they may see fit to adopt; and the rule may be very fairly classed as one coming from the prophets, for the reason that in substance it has been common in American railroad practice for two or three generations. The rule has been common, we say; observance of it has not. That is to say, the rule making enginemen responsible for passing a switch that is wrong has been kept in the book when, all the time, it was known both by the officers and the enginemen, that, at innumerable switches situated on sharp curves, and at all switches in times of fog or blinding snow storms, the rule could not be properly observed without a great reduction in the speeds of passenger trains; and in the great majority of cases such reduction was neither ordered nor expected. Moreover nearly all switch targets are so small that even in the day time the regular observance of a rule like this, by runners of passenger trains, would be a severe and unreasonable strain on their vigilance.

The remedy for this anomalous condition, recognized very slowly, was the introduction of distant signals at all facing-point switches, but the policy of the railroads in this matter was as varied as could be imagined. On double-track lines facing points were got rid of to a considerable extent; on some roads very extensively. The New York Central introduced distant signals, set about 1,000 feet back, several years before it adopted the block system; while, on the other hand, the Lake Shore & Michigan Southern tolerated unprotected facing points long after it began running very fast trains.

All over the country single track lines, with all their switches facing-point for half of the trains, have attempted and still attempt, the impossible combination of speed and safety without providing the distant signal. The advocate of distant signals admits, of course, that the liability that a given switch will be left wrong is extremely small. And the prudent manager, if he believes the expenditure for distant signals unwarranted, aims to keep the schedules of passenger trains slow enough to permit the engineman properly to limit his speed at switches; and it is to the fact that the great majority of managers are disposed to be prudent that we owe our comparative freedom from "open switch" disasters.

The only practicable way in which to carry out the Indiana rule is to provide distant signals everywhere, so that the engineman can always detect the absence of a light before he runs into danger; and without slackening speed. It is strange that this fundamental condition has been so persistently ignored. Without distant signals the best enginemen in the world will find themselves unable to keep up the habit of mind by which they will always do the right thing, except possibly where speeds are always very low. And where a system of automatic block signals takes the place of the distant signal, it is highly desirable that the signals be always located within a moderate distance from the switch, say not more than three or four thousand feet.

To always look at every switch just as soon as it comes in sight is a severe tax on the mental discipline of the engineman, especially where switches are not near together, and traffic is not heavy. On busy lines, where block signals are encountered at short and regular intervals, the engineman forms a habit of constant vigilance; he cannot do otherwise. On thin lines he has varied temptations to laxity, and he cannot keep himself keyed up to the top notch without some aid in the nature of surprise tests. He ought to arrange some kind of a test for himself so that, if possible, he would never make a mistake; but most enginemen do not do this, at least not with sufficient effectiveness, and so the superintendent has to do it; and it is by no means an easy thing to manage. In connection with a new scheme of surprise checking, which has just been adopted on the New York, New Haven & Hartford, Mr. Stone, the chief of the locomotive enginemen's brotherhood, has made a vigorous protest. The New Haven proposes to change switch lights so that they shall show red when they ought to show green, and thus test the alertness of the runners; and Mr. Stone seems to believe that this test will be made under unnecessarily dangerous conditions. Declaring that the making of such tests ought to be made a criminal offense, he says: "No one can measure the effect of such a shock on an engineman as, flying through the night with a fast train, and coming to some curve or obscure place, or running out of a patch of fog into a clear place and see a switch light as 'red as blood' staring him in the face, the headlight shining on a string of cars or on another train, standing on a siding. A man lives years in such seconds and will not get over the effect of it in months." Mr. Stone says that this kind of testing has been done in the West, and was not reasonably managed; and he rightly protests against unnecessary frightening of men on locomotives.

Everyone will sympathize with the view here expressed. But what does Mr. Stone propose instead? Surely, every engineman desires perfect safety. Where a switch can be seen only a short distance ahead, the railroad company is bound, of course, to put in distant signals, or else provide for low speed. But then there is the problem of making up time on other parts of the road to compensate for what is lost by slackening at switches. It is often perfectly feasible to thus make up time; but the whole responsibility for thus varying the speed falls on the enginemen; and then there comes in another difficulty, that of getting the runners to do this invariably with good judgment. So we come back to the question of surprise surveillance. Where is the genius of the foot plate who will tell the world the one best

way to perform this part of the engineman's duty; the perfect vigilance and care which every engineman would like to be credited with? In the management of the fire and the water, and in all the mechanical features of the engineman's work we have everything explained in print, down to the last detail; so that the dullest person, if he can read, may seek the highest perfection. But in the vital matter of keeping a good lookout, the only instruction that is furnished is of the same kind that was in vogue when the Rocket made her first trip. Surely, every reputable engineman means to support his superintendent with consistent loyalty; and he knows that, from the superintendent's standpoint, uniformity of practice is essential. Is there not a way to secure, in this matter of vigilance, a high degree of uniformity and at the same time a high degree of perfection?

NEW BOOKS.

Railroads: Rates and Regulation. By William Z. Ripley, Ph.D. Nathaniel Ropes, Professor of Economics in Harvard University. Board cover, 6½ in. x 8¾ in., 659 pages. Longmans, Green & Co., New York. Price, $3.00 net.

The readers of the *Railway Age Gazette* need no introduction to Professor Ripley as a writer on railway economic subjects. He has been a frequent and valued contributor to our columns, and some of the contents of the present volume and the one on "Railroads; Finance and Organization," which is to follow it, have appeared under his signature in this paper. Probably there is more reliable information in this book on the subjects dealt with than in any other that has appeared; and it is presented in a very clear and interesting way. Professor Ripley has been a painstaking student of railway rates and regulation for the last quarter century. He is very familiar with the entire literature of the subject; and he has crowded his book with specific illustrations which will be invaluable to the student.

No class of men have the same opportunity to regard economic questions impartially as have professors in the universities. They also have excellent opportunities to study the statistics and other data bearing on economic problems, and to meditate regarding underlying economic principles. They do not have equal opportunity to study the daily transactions of business at close range. Furthermore, economists are human, and to be human is to have more or less bias. Perhaps the feeling is due to our own environment, but we feel that most professors of economics in this country who discuss railway matters show a bias against the railroads. We think Professor Ripley shows less of it than most of them, largely, no doubt, because he knows more about railways than most of them. But we think he shows some of it. In fact, he seems to concede this; but he adds that "if bias there be, it will in all likelihood be found to favor the welfare of the 'dim inarticulate multitude.' . . . It is this helpless and unorganized general public always in need of an advocate, which, perhaps, most strongly appeals to the academic mind." Bias tends to mislead the judgment; and it is a little hard to understand how that which tends to mislead the judgment can work to the benefit of the "dim inarticulate multitude." The multitude needs advocates; but in a democratic country it needs unbiased instruction even more.

Perhaps Mr. Ripley puts a little too much stress on past faults of railway management and not quite enough on the remarkable reforms that have been introduced in it within the last decade. But this is not unnatural, for few people realize how generally railway managements have cordially welcomed the opportunities that the agitation and regulation of recent years have afforded them to raise their entire business to a higher plane. His book will be a healthy one for railway men to read largely because it does present a point of view different from their own.

In his opening chapter Mr. Ripley gives a concise history of transportation in the United States. He then takes up the theory of railroad rates and in his discussion gives adequate consideration to the two main underlying principles of rate making—the cost of the service and the value of the service. His chapters on rate-making in practice, personal discrimination and local discrimination abound with apt illustrations drawn from numerous sources, especially the decisions of the Interstate Commerce Commission. He believes, as does this paper, that in order to prevent unfair discrimination competing railways ought to be allowed to make reasonable agreements regarding rates and that the Interstate Commerce Commission should be given power to fix minimum as well as maximum rates. His chapter on freight classification is an excellent analysis. He concludes that immediate uniform classification is not desirable, but that steps should be taken to bring about steadily a closer approach to uniformity. He describes favorably the trunk line rate system, which is to a large extent on a distance basis, and this is followed by more or less condemnation of the Southern basing point system and of the transcontinental rate system. Inasmuch as Mr. Ripley contends pretty strongly for the principle that rates ordinarily should be based on distance, and also that the Interstate Commerce Commission should be made practically the final judge of the facts in rate cases, it is not surprising to find that he refers to the decisions of the Supreme Court interpreting the original Intersate Commerce Commission law as "emasculations" of the law, or that he finds a good deal to criticize in the decisions of the Commerce Court, especially that in the intermountain rate case.

Some of his comments on the Commerce Court seem unfair and misleading. For example, he says "The Commerce Court held it to be its proper function as a court of law to review in the broadest way all cases which came before it on appeal." The Commerce Court has not so held. The principles on which it has stated it has based its important decisions seem identical with those laid down by the Circuit Courts and the Supreme Court. The Supreme Court, in the case of Interstate Commerce Commission vs. Illinois Central, 215 U. S. 452, which is often cited as a precedent for narrow court review, indicated that great weight must be given to the commission's findings of fact, but added that the power of the court extended to the determination not only of relevant and pertinent questions of statutory power and of constitutional power and right, but also to the question "whether even although the order be in form within the delegated power, nevertheless it must be treated as if not embraced therein, because the exertion of authority which is questioned has been manifested in such an unreasonable manner as to cause it in truth to be within the elementary rule that the substance and not the shadow determines the validity of the excise of the power." The Commerce Court does not seem to have held that it has any wider jurisdiction than that which the Supreme Court in these cases has indicated that the courts possess. In the case of the A. T. & S. F., et al., vs. I. C. C., et al., for example, the Commerce Court said that in cases where there is substantial conflict in the evidence or testimony on which the finding of the commission is based it would feel bound by the finding unless clearly and palpably against the weight of the testimony. And in the Louisville & Nashville case the Commerce Court said that "not only is the commission vested with a discretion which cannot be disturbed, and which we intend unqualifiedly to respect, but it is entitled to select the testimony which it will believe and rely upon it accordingly as it addresses itself to the discriminating judgment of the commission; but it is not within the authority of the commission to reduce the rates in this or any other case not merely against the weight of the evidence produced to sustain them, but without anything substantial to warrant the conclusions reached or the reasons assigned therefore."

Professor Ripley seems to us to have a tendency to assume that whenever the courts overrule the commission, the courts must be wrong. The legislation under which the commission acts makes it a detective to exercise surveillance over the railways and a prosecuting attorney to prosecute them as well as a judge to judge them; and therefore the chances that it will not be impartial seem much greater than that this will be true as to the

courts. It may be that as Mr. Ripley and many other economists believe, the Interstate Commerce Commission should by specific statutory provision be made the final judge of the facts in rate cases. But this has not been done; and the courts must construe the law as it is and not as it may be thought it ought to be. If the law is defective or ambiguous, that is not the fault of the courts that construe it but of the congress that passed it. And in many ways the law has been, and is, defective and ambiguous. More fairness and expertness, and less petty politics, in the drafting and administration of laws in this country would reduce very greatly both the work our courts must do and the odium they must incur in performing their duties. It seems to the *Railway Age Gazette* that Professor Ripley's comments on the review ot the commission's decisions by the courts constitute a grave defect in an otherwise excellent book.

Following his discussion of recent legislation and of the decisions of the commission and of the courts under it, Professor Ripley has a very interesting chapter on some current transportation matters, such as the conflict between federal and state authority, the control of water carriers and the opening of the Panama Canal. He is a believer in increased federal control, regards with skepticism the agitation for federal development of inland waterways and is optimistic regarding the effect that the Panama Canal will have on commercial and industrial development generally.

How to Invest Money Wisely. By John Moody. Published by the office of John Moody, 35 Nassau street, New York. Flexible leather. 77 pages. Price, $2.

This is a handy little book devoted to the subject of making diversified investments. The subject is covered in a simple, non-technical way that should appeal to the average investor, and the book, beside laying down general principles, contains carefully selected examples that illustrate the author's meaning. There is no attempt to give anything that a thoroughly well informed investor should not already have known, but there are comparatively few investors who have small sums to invest to whom a study of such a book as this will not be of very great value. The book is divided into three parts, the first part describing the principles of making diversified investments; the second part describing the principles which should govern investing money with the hope of making not only interest on the investment, but a profit as well, and the third part describing and giving examples of classes of investments.

Supplement to Manual of the American Railway Engineering Association. 129 pages. 6 in. x 9 in. Illustrated. Bound in paper. Published by American Railway Engineering Association, Chicago. Price, $1.

The last complete edition of the Manual of the American Railway Engineering Association was issued in 1911. This supplement contains all revisions and additions adopted at the annual convention held in Chicago last March, and used in connection with the 1911 edition brings it up to date. The manual contains the complete standards of good practice relating to maintenance of way work which have been adopted by the association up to this time, and is a valuable reference book.

The Work of the Bond House. By Lawrence Chamberlain. Published by Moody's Magazine Book Department. 157 pages. Price, $1.35.

Mr. Chamberlain is a bond man with Kountze Brothers, New York, and has written not only a very instructive, but a quite readable little book describing the services to the community that are performed by the American bond house. Mr. Chamberlain describes the work of the soundest of bond houses. The standard that he sets for what an ideal bond house should be is high indeed, but not higher than is the ideal which quite a number of American bond houses aim at. There are three especially instructive chapters on buying municipal bonds, buying railroad bonds and buying corporation bonds. These chapters are particularly interesting at present when the question of whether or not capital is seeking to avoid railroad investments is so often discussed.

Letters to the Editor.

ORDERING AND HANDLING NEW MATERIAL.

St. Paul, Minn., December 19, 1912.

To the Editor of the Railway Age Gazette:

I have read with considerable interest the article on "Efficient Organization for Handling Salvage," published in your issue of December 13, page 1139. During the last ten years there has been a great deal written on handling and disposing of scrap material. It would seem fair to assume that on most roads this subject has been given considerable attention and that they now have adopted systems whereby the greater part of the reclaimable material is saved and the scrap properly disposed of. It is true, no doubt, that there is still room for a very great improvement, which would mean a still larger saving, but it would seem that the time has come when more attention should be given to the new material.

In buying a suit of clothes greater attention is given to getting the best value for the money invested and the care it is to receive than to its disposition after it has served its purpose, and this, to a large extent, should also apply to the store department, meaning a more efficient organization for ordering and handling the new material. If more attention was given to this part of the store department there would be less unused material to consign to the scrap dock that would have been a total less except for its scrap value. It is possible to find castings, bar iron and other large material covered with rust in almost any storehouse, which shows that it has probably been there for years, and if you were to inquire why this material had been ordered the answer would probably be that there was a change in standards, or that it had been ordered by the mechanical department. But is this always the case? Has not some of the over-stock and obsolete material on hand been ordered through a mistake upon someone's part?

I have only mentioned the large material, but if you were to make a careful inspection of all racks, bins and pigeon holes you would find a part of the scrap material in the storehouse instead of on the scrap dock, and this material represents a total loss. In going through the shops have you not also observed a great amount of new material that is scattered around promiscuously and apparently not given any attention, when a place should be provided and proper care taken of it? When a storekeeper or general storekeeper signs a requisition for material, how often does he personally know if that quantity or kind of material is actually required? It is quite true that to a large extent he will depend upon his foreman or section clerk for this information, but what kind of an organization has he for ordering, inspecting and handling this material? What system has been established for educating the man who actually places the order as to the quantity of material that should be ordered and carried? Is this man closely scrutinizing each item before ordering it, and is he thoroughly familiar with the material in his section or department? When the new material is received does he know that it is all right and that it is the best of its kind for the price that has been paid? It may be said that this man is not supposed to be an expert on material. If he is not, who is the man in the store department who is making investigations as to the kind of material that is being purchased, and if it is the kind that will give the best service? What system is there for standardizing material? In this day when there are so many manufacturers of nearly every article, has sufficient attention been given to make sure that this man is not specifying material for which the company will be compelled to pay a certain percentage for its past reputation instead of for its present value?

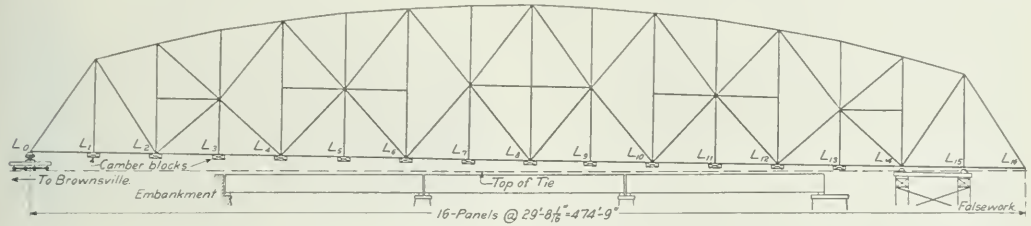
The ordering, inspecting, handling and accounting of the new material are the main points that are confronting the storekeepers today. For each of these a better system could be established that would result in a very great improvement, and it would seem that there is unlimited opportunity for the store department to make a study of these subjects and outline more perfect systems that will show great savings.

A Reader.

ERECTION OF MONONGAHELA RIVER BRIDGE.

Because of Unfavorable Conditions Long Span Was Erected on Approach and Moved into Position on Barge and Trucks.

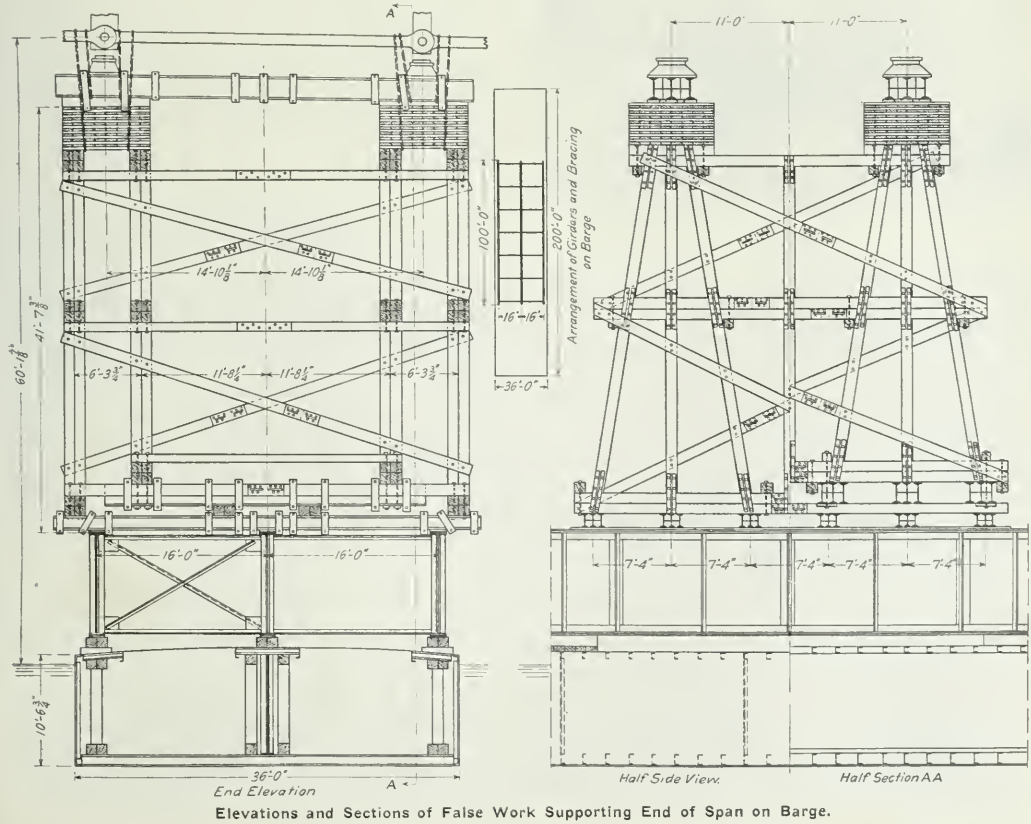
The Monongahela Railroad is now completing an extension into the West Virginia coal fields on which an unusual method was adopted for erecting a through truss bridge across the Monongahela river. The Monongahela Railroad is controlled jointly by the Pittsburgh & Lake Erie and the Pennsylvania and built under the charter of the Buchannon & Northern. This line extends south from the connection with the old line on the east bank of the Monongahela river to a point about three miles north of the state line near New Geneva, where it crosses the river and continues down the west bank to Fairmont, opening



Outline of 475 ft. Truss.

extends from Brownsville, Pa., south to within seven miles of the Pennsylvania-West Virginia state line with numerous branches to the various coal fields. The extension proceeds from the south end of the present line southerly to Fairmont, W. Va., that portion of the road south of the state line being up large areas of coal lands hitherto undeveloped along the entire route.

The crossing of the river is made on a steel structure consisting of three 95 ft. deck plate girder spans on the east end, one pin-connected through truss span 475 ft. long across the channel



Elevations and Sections of False Work Supporting End of Span on Barge.

and two deck plate girder spans 95 ft. long on the west end. The superstructure was designed for a single track while the stone masonry piers and abutments were built for two tracks, the steel being erected on the line of the north track. The center line of the bridge runs approximately east and west at this point with the east end towards Brownsville.

As this crossing is in the mountains close to the headwaters of the stream and but a short distance below the mouth of the Cheat river, another mountain stream, it is subject to rapid and wide variations in level, rises of 4 to 20 feet in a few hours being comparatively frequent. For this reason, and also because the Monongahela river is a navigable stream, it was not considered advisable to erect the long span on falsework and it became necessary to resort to other methods. It was decided to erect the three deck girder spans on the east end by the ordinary methods and to then erect the truss on these spans and the adjacent embankment with one end of the truss extending over the forward pier into the channel, mount this end on a barge and the opposite end on trucks and move it into final position in one operation.

The channel span was a single track pin-connected through truss 475 ft. long with a maximum height of 75 ft. center to center of chords. It weighed 1,751 tons, and was designed for

Towing Barge Up-Stream with Upper End Supported on Two Smaller Barges.

Cooper's E-50 loading. The trusses were spaced 22 ft. between centers, while the structure was divided into 16 panels each 29 ft. 8¼ in. long.

All steel for this span was unloaded in a material yard at the end of the east approach fill. Previous to its erection the three girder spans on the east end of the bridge were set in place and three additional temporary spans of the same length were erected beside them on the same piers, spaced 23 ft. center to center of girder spans. The truss was then erected on these girder spans, being centered on them, or 11 ft. 6 in. south of its final center line. The fourth panel point from the west end was located over the forward channel pier and all but the three end panels were erected by a traveler in the usual manner. Falsework was then placed in the stream under the two panel points next to the pier and the rest of the structure was erected over the water on this. No falsework was placed under the end panel point, the end post, shoes and bars being placed by booms on the traveler. After the erection of the entire truss was completed, the cantilever portion was reinforced with wire cable diagonals to take care of the reverse shears and the falsework in the stream was removed.

PRELIMINARY ARRANGEMENTS.

While this span was being erected a large steel barge had been designed and built at the Ambridge plant of the American Bridge Company for use in floating the span across the channel. This barge was 200 ft. long, 30 ft. wide and 10 ft. 6¾ in. deep. To get it to the bridge site it was necessary to pass it through two locks which were 154 ft. and 164 ft. long, respectively, or considerably shorter than the barge. To get it by these locks the front end of the barge was mounted on two auxiliary wooden scows 50 ft. x 20 ft. and 60 ft. x 20 ft., placed side by side with their long axes parallel to the steel barge. Five bents of falsework of various heights to support the barge in its upraised position were placed on the scows and properly braced. The scows were then sunk and drawn to their proper position under the barge. They were then pumped

View During Record Flood When River Was 29 ft. Above Normal Stage.

out, raising the upper end of the barge about 10 ft. out of the water and it was taken up stream in this position.

While this was being done arrangements were made with the government whereby it built temporary cofferdams a sufficient distance above the upper ends of the locks to permit the closing of the lower gates behind the barge. The permanent head gates and the tail gates were then opened, the barge floated in with its front end projecting over the head walls of the lock, and the tail gates closed. The temporary cofferdam was then broken and the water allowed to flow in, raising the level to that of the upper pool, after which the barge proceeded on its way.

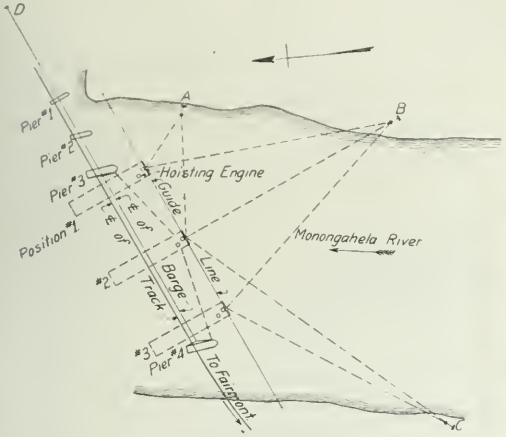
Coincident with this the railway company dredged immediately in front of the two channel piers to permit of sinking

Barge in Mid-Stream Showing Location of Engines and Girders.

the barge under the cantilever end of the span. Also, four "dead men" or anchors each 12 ft. square were placed on the banks as shown on the accompanying drawing.

Upon arrival at the bridge, the barge was anchored near the east channel pier and three 100 ft. plate girders 9 ft. 11½ in. deep were placed lengthwise on it, the girders being spaced 16 ft. center to center of webs and centered both longitudinally and transversely on the barge. These girders were supported on 12 in. x 12 in. timbers 7 ft. 3 in. long, resting on and capped by timbers of the same size, the lower timbers lying horizontally on the channel beams forming the transverse ribs on the bottom of the barge. These girders supported falsework de-

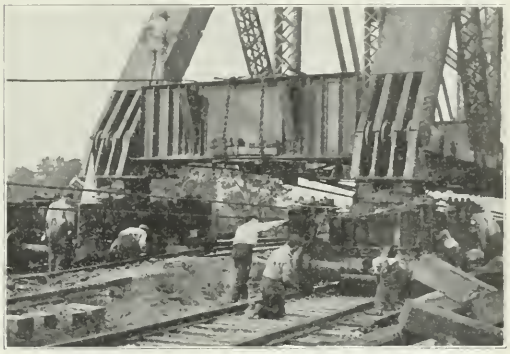
signed to support the second and third panel points on each side of the truss. The falsework was designed for a height from water level to center of pins of the truss of 60 ft. 1⅞ in., although a considerable variation from this distance was provided for by blocking at the top to take account of the changes in water level of the stream. The falsework consisted of two three post framed bents under the two trusses, the bents being 22 ft between centers and 36 ft. long between centers of end



Location of Anchors on Bank for Moving Barge Across the River.

posts. The trestle itself was 37 ft. 7½ in. high from top of girders to bottom of blocking. The weight of the span was transmitted to the falsework through cast shoes under the panel points, each resting on three 24 in. I-beams supported directly on the blocking. Four pumps with boilers were placed on the barge for raising and lowering it while two hoisting engines with drums were placed on the up-stream end to handle the cables leading to the "dead men."

After everything required had been placed on the barge and carefully tested, a time was selected when the stage of the river was approximately that assumed in the design of the staging and the barge was floated to its proper position under the end of the span after having been filled with water until it floated with the lower edge of the deck six inches out of the water. The blocking above the falsework had previously been arranged so that with the barge at its elevation, the cast shoes cleared the lower side of the span about six inches. When in position, the water was pumped from the barge until it rose



End Shoes Supported on Heavy Double Trucks.

two feet out of the water, picking the span up free of the camber blocking. To insure accuracy in raising the barge, markers with large black letters on a white background were placed on each side of the barge at its center with the bottom indicating the proper elevation.

When supporting the end of the span, the load carried by the barge was estimated at 1,350 tons exclusive of the weight of the barge itself, which amounted to 300 tons. This consisted of the reaction of the end of the bridge itself, estimated at 955 tons, the three girders weighing 125 tons, the falsework weighing 230 tons and 50 tons for the engines, pumps and boilers. With the capacity of the pumps estimated at 3,040 gal.

Span Approaching Final Position Before Lowering onto Piers.

per minute it required one hour and 40 minutes to raise the barge the 18 in. when lifting the span off its supports.

At the time of erection the east end panel point of the span was placed on two trucks under the end posts. Each truck consisted of two four-wheel trucks carrying six 24 in. I-beams on which was placed an American Bridge Company standard turntable center with the top bearing blocks modified to carry the end shoe directly. These two trucks ran on standard gage tracks spaced 22 ft. center to center.

As soon as the span was raised free of the camber blocking and was supported entirely on the trucks and the barge, it was securely tied to the barge by 1½ in. steel cables fastened to the upper chord panel points U-12 on both trusses and to the end posts midway of their length. To prevent lateral movement of the span, similar cables connected the lower panel points L-14 and L-15 to the ends of the barge.

At this point everything was in readiness to move the span across the channel, and while in this condition two very high floods were encountered, in one of which the water rose 26 ft. above the normal stage, and in the other it rose 29 ft. in six hours with the current moving at the rate of 25 miles per hour. In this latter flood the water reached the highest stage on record and it was with difficulty that the barge was prevented from filling with water due to its tilting to one side as the end of the span rose. A wooden watertight bulkhead three feet high was quickly constructed around the barge to prevent the flood waters from entering it. The strain placed on the cables in holding the barge in position made this also a source of great danger while the raising of the end of the span to this elevation changed the distribution of the load upon the supports from what had been calculated and introduced high stresses in certain of the members. Fortunately, the entire equipment withstood the force of the flood successfully, and as the flood subsided the span was lowered on the camber blocking which had in the meantime been raised two feet higher than before. This returning of the span to the camber blocking after it had been lifted free from it is of itself an unusual occurrence in bridge erection, and possibly this is the first time it has been done.

On July 30 the span was finally moved into place. In addition to the two engines on the end of the barge which were connected with the cables to the "dead men" on the shore, a third engine was placed on the span directly above the other two with a line leading back over the center of the bridge to an anchor on the bank to control the movement of the span if either of the other engines became disabled. To insure that the barge moved across the channel in a straight line, a ⅞ in. wire rope guide line was stretched tightly across the river between white post markers. A white line one foot wide was painted across the end of the barge where this line crossed it and it was the duty of the engineer to keep the cable within the limits of this mark. Men were also stationed at each marker on shore as a further check on the accuracy of the movement of the barge across the channel. In moving across the channel, lines *A* and *B*, shown on the accompanying sketch, carried the barge the first half of the distance, but on reaching the center of the channel line *A* was dropped and line *C* was picked up and carried it to the final position. The moving of the span began at nine o'clock in the morning and was concluded about three o'clock in the afternoon, the river being about six feet above the stage estimated and the current six miles per hour.

After being carried across the channel, the span was 11 ft. 6 in. to the south of its final position and about 12 ft. above its final elevation. It was at first planned to deposit this span on blocking on the pier by filling the barge with water and lowering it, remove two feet of blocking on the falsework, raise the barge to take the span off the pier, remove two feet of blocking on the pier and repeat this operation until the span was lowered to the proper level. However, because of the unfavorable river conditions it was thought advisable to free the span entirely from the barge as soon as possible and it was placed on blocking on the pier. Four 500-ton jacks which were coupled together with flexible copper tubing to a header to which was attached a hydraulic pump to operate the four jacks as one unit were placed under the end of the span. This pump was driven by steam and was capable of raising the jacks under load nine inches in five minutes. In this manner this end of the span was lowered to nests of rollers two feet above grade and the span was then drawn to its permanent alinement by block and tackle, moving the span on the rollers. When in its final position, the span was lifted off the rollers by the jacks and was lowered to its final seat.

The work was done under the direction of J. M. Schoonmaker, president, and D. K. Orr, chief engineer of the Monongahela Railroad. J. C. Bland, engineer of bridges of the Pennsylvania Lines West, had general charge of the design and erection. The details of the erection of the structure were planned and carried out by the American Bridge Company, under the direction of H. V. Greene, district erecting manager, and J. L. De Voe, engineer in actual charge of operation.

Barge Arriving at Pier Preparatory to Lowering Span onto Blocking.

English General Manager Knighted.—Frank Ree, general manager of the London & Northwestern Railway of England, has been knighted by the king. Sir Frank has been general manager for the past three years, and has been in the service of the road 39 years. He is a member of the Military Railway Council.

THE PROPOSED RAILROAD CLEARING HOUSE.*

A Joint Committee of the Accounting and Financial Officers Are to Immediately Formulate a Clearing House Plan.

There are four inter-railroad accounts that are now almost universally settled monthly by draft. These are charges for per diem, interline freight charges, interline passenger charges and loss and damage charges. Charges for car repairs are generally, although not always, settled by vouchers. The payments for trackage rights are usually covered by some special arrangement. The amount of money involved in these intercompany accounts is large. On December 31, 1911, the total amount due from other companies, exclusive of advances and loans and rentals covered by lease, to the Pennsylvania Railroad was $6,641,577, and the corresponding total due by the P. R. R. to other companies was $3,933,946.

It is estimated in a study of the subject that W. H. Williams, of the Delaware & Hudson, has made, that the monthly settlements of balances between all roads for interline freight is about $54,390,000, for interline passenger about $9,445,000, for per diem $19,326,000, and for freight claims $586,000.

In addition to the labor involved in determining separately the amount that a company owes each other railroad company with which it has dealings, for per diem, freight charges, passenger charges and loss and damage charges and the amount that each other company owes it on each one of these accounts, there is under present arrangements the necessity for an individual settlement each month on each of these accounts between all roads having dealings with each other. Each one of these settlements is made by draft. The work of determining the amount of the inter-railroad charges and the work of preparing the drafts for amounts due is done by the accounting department. The collection of drafts drawn by a railroad company, and the acceptance and payment of drafts drawn on that company is the work of the treasurer's department.

Under this method there are at least seven entries in the books made between any two roads even if they settle only *balances* on each one of the four accounts mentioned. In case they do not settle balances, but draw drafts as soon as they have figured out what is due them, the number of entries involved may be as many as fourteen. Moreover this involves paying a draft drawn by a road which possibly, at the very time that it is drawing the draft, owes the road on which the draft is drawn more money than it is owed. The situation in the time of money stringency, such as was experienced in 1907, makes a situation that is intolerable. At that time there were probably millions of dollars tied up and lying idle for months at a time, at the very time that each road and each banking community most needed to have available all of the funds that were owed to it.

The expense under this method of settling accounts is impossible to estimate accurately; there are, besides the clerical labor involved, all expenses of collection. It has cost a road as much as $1.25 to collect a $14 per diem charge owed to it Each company is under the necessity of keeping on hand large working balances ready to meet drafts that may be drawn against it. There is no way of determining when these drafts will be presented, since they come in day by day.

The names of the different railroads with which any one railroad has dealings do not appear on the general ledger of that company; but there is, generally, an auxiliary ledger in which an account is kept with each one of the roads for each one of the four accounts; and, in case of many railroads, there is in addition a balance book compiled from the auxiliary ledger to be used in checking up drafts presented against the company or drafts drawn by the company against other roads.

In England much of the elaborate machinery for determining railroad charges and for the settlement of inter-railroad accounts is done away with by having these charges cleared through a central association. This association has charge of the settlement of accounts for interline tickets and interline freight charges, and has charge of the distribution of equipment as well as the settlement of accounts for the charges for the use of equipment. The work of such a central clearing house in a country where distances are so great as in the United States would be vastly more complicated than in a small country like England. The Committee on Car Efficiency, now the Committee on Relations Between Railroads of the American Railway Association, inaugurated a plan for a clearing house for the settlement of car hire balances as between railroads some years ago. Since July, 1912, however, the plan has been abandoned, but its existence proved at least that a clearing house is practicable.

The maximum number of roads belonging to this clearing house was about 100. The clearing house, however, cleared their accounts with nearly 1,500 railroads and private car lines which were debtors and creditors of the member roads. In 1911, when the clearing house was doing its largest business, there was cleared in one month a total of $4,214,488. This clearing house did not have a large reserve fund, the practice followed being to make drafts on all debtor roads immediately after the first of the month, at the same time forwarding statements of amounts due creditor roads with authority for the draft. The expenses for operation for this clearing house in 1911 averaged about $1,100 per month.

About five years ago the Society of Railway Financial Officers was formed, and later a committee was appointed to consider the question (which had been referred to this society by the railroad presidents) of a general railroad clearing house for the settlement of all balances between companies now settled by draft, and also all other indebtedness as might be agreed on between the roads.

In 1912 this committee made its report to the society, and suggested a plan of organization for a clearing house, which plan was approved by the executive committee of the society and a committee of thirteen was appointed to consider this plan and any others that might be presented and to put a plan in operation.

Since the work of the clearing house would involve the cooperation of both the accounting department and the treasurer's department of each member road, the question has been considered by the Association of American Railway Accounting Officers and a sub-committee of the Committee of Twenty-Five has been appointed to work with the Clearing House Committee of Financial Officers to formulate plans for a clearing house. The plan that has already been considered and approved by the executive committee of the Financial Officers provides for a single general clearing house, and was the work largely of T. H. B. McKnight, treasurer of the Pennsylvania Lines West. In addition to this plan there is up for consideration before the joint committee an alternated plan providing for district clearing houses. The board of directors of the clearing house is to be made up of six accounting officers, six financial officers, and a chairman who is to be *ex officio*, the president of the Society of Railway Financial Officers. The vice-chairman of the board is to be chosen by the board.

The management of the clearing house is to be in the hands of this board of directors. The clearing house is to have a paid secretary, a paid manager and an assistant manager. The manager, assistant manager, whose work will be that of a chief clerk, and certain other clerical help will devote all their time to the work of the clearing house.

* From a forthcoming book on Railroad Accounting by W. E. Hooper, to be published by D. Appleton & Co.

The general clearing house would be located at Chicago, and it would be necessary to hire offices there. The American Railway Clearing House paid but $450 a year rent, but the rent was low because the A. R. A. furnished the offices. If the entire 813 roads reporting to the Interstate Commerce Commission were to join the clearing house, a suite of offices would be required that would cost possibly $5,000 a year.

EXPLANATION—This form, in full cap size, to be used by the Accounting Department of each member road (unless Form A2 is adopted instead) to advise the Clearing House of the adjusted balances on its books at the agreed date which are to be settled in the next clearing. To be made on typewriter, and one or more carbons to be retained by the Accounting Department and in connection with Form A2 to form the basis of entries, charging and crediting the Clearing House.

Under the district clearing house plan there would be 12 separate clearing houses located at New York, Atlanta, Chicago, Cleveland, Denver, Houston, Montreal, New Orleans, Philadelphia, St. Louis, St. Paul and San Francisco. Each local clearing house would have a local committee of four members each, two financial officers and two accounting officers. There would be a clearing house committee of 24, two from each local clearing house committee, one a financial officer and one an accounting officer. From this clearing house committee there would be elected by letter ballot, each member road having a vote, an executive committee of three, of which one would be president. The members of all committees would serve without pay, and each member of the local committee would in turn act as manager or chairman pro tem of the district clearing house and should draw checks payable to members or the district clearing houses, these checks to be countersigned by one other member of the committee. It is suggested that it might be possible to have a clerk loaned by member roads to each local clearing house. Rents for district clearing houses would not be, of course, anywhere near twelve times as much as the rent for a single central clearing house, but would amount to possibly twice as much, or between $9,000 and $10,000.

The work of the clearing house or district clearing houses is to be confined entirely to the settlement of balances among member roads. The clearing house will have nothing whatsoever to do with the adjustment of these balances. The accounting department of a member road will arrive at the debit and credit balances for per diem, freight, and passenger accounts, and loss and damage claims, in exactly the same way that it now arrives at these figures. The accounting department of a road will then draw up a statement under the general clearing house plan showing what is owed by each member road to its road on consolidated balance for all four accounts, and what the accounting road owes each member road on consolidated balances for all accounts. The form from which this statement is made up in the general clearing house plan is shown as Form A2, and statement itself for this report such as has been suggested, is shown herewith as Form A1. It should be noted that the debit or credit on Form A1 against each other road is a net figure, and is a net for the aggregate of all the accounts which are to be cleared through the clearing house. At the end of the month or at some agreed date this statement is to be sent by each one of the member roads to the clearing house. From this statement the clearing house manager and his assistant will make up a clearing house sheet; such a sheet for 14 roads is shown herewith. On a certain date, say the twenty-fifth of the month following that for which the accounting has been done, the clearing house will col-

EXPLANATION—This form—full length—to be used in the Accounting Department to consolidate into one balance for reporting to the Clearing House the *balance* in the various accounts named. It may be found best to use this form for the report to the Clearing House, thus saving one blank and giving the Clearing House a little more information to assist it in checking up any discrepancies between the reports of two companies. To be made in typewriting with one or more carbon copies, from one of which, when advice of corrections or correctness has been received from the Clearing House, journal entries may be made charging and crediting the Clearing House as per suggestion above.

In the last line all credit balances to be in black and all debit balances in red.

General Clearing House Sheet.

lect or deposit in banks drafts against roads which show a debit balance and will a few days later send out checks to roads having a credit balance.

In this way the clearing house will accept no responsibility for the correctness of the adjustment as between different roads, that being handled as it now is by the accounting officers of the roads. The clearing house will act as a great automatic machine, which will clear just what has been put into it, no more and no less. In this way each individual member of the clearing house can clear through this institution as much or as little as it desires. It will not be necessary to confine the accounts to be settled through the clearing house to the four mentioned, nor will it be necessary to include all other member roads in the statement sent to the clearing house.

Instead of having an auxiliary ledger with at least four separate accounts with each other road, each member road will have an account only with the clearing house, and for such accounts as it does not wish to settle through the clearing house. The saving in labor cost in the treasurer's office is obvious, as is the saving in collection charges, and the fact that two entries a month will be necessary in the accounting department where in many cases four hundred or more were necessary before, would indicate a very considerable saving in this department.

Journal entries may be made up from the totals of the figures on Form A2 as follows:

Other Companies in Current Freight Accounts.
Other Companies in Current Passenger Traffic Accounts.
Other Companies in Current Car Service Accounts.
Sundry Individuals and Companies in Settlement of Freight Claims.
General Expenses (for one month's proportion of clearing house expenses).
} To Railway Clearing House.

Railway Clearing House to
- Other Companies in Current Freight Accounts.
- Other Companies in Current Passenger Traffic Accounts.
- Other Companies in Current Car Service Accounts.
- Sundry Individuals and Companies in Settlement of Freight Claims.

Under the district clearing house plan each road would forward each month to the district clearing house of which the road is a member a statement covering balances due to and from members of that clearing house, separate statements being shown for each class of settlement made during the month, as, for example, interline freight interline passenger, per diem, etc. Each road will also send each month to each district clearing house of which it is not a member a statement covering the balance due on the reporting road's interline freight, etc., to members of each of the clearing houses of which it is not a member, separate statements being shown for each class of settlement. In addition, each road will send to each district clearing house of which the road is a member a statement covering balances due to and from members of each of the clearing houses of which it is not a member, separate statements being shown for each class of settlement. District clearing houses are to clear between their member roads first and then with each other, a statement being made up by each district clearing house showing balances due to or from each member, separate statements being made for each class of settlement. Each district clearing house is to make a statement showing balances due to or from each member in account with a foreign clearing house, each class of settlement being covered by a separate report.

As soon as a district clearing house receives all of its members' reports for any one class of settlement, it will clear among its own members for this class of settlement. It will clear with other clearing houses as it receives their reports. By clearing first with the local members and for each class of statement as it comes in, the object aimed at is to save time.

Under the general clearing house plan it will be necessary to wait until the statements from all the member roads which are to be included in that particular month's clearings have been

received. On the other hand, there will be but one large clearing house sheet, while if district clearing houses are adopted there will be a large number of clearing house sheets made out each month by each clearing house. District clearing house sheets would not be large. Since, however, the size of the sheet increases by the square of the number of members, the sheet for a general clearing house would be very large.

The sheet shown herewith is for 14 roads only. A large room would be necessary with a long desk running entirely around the room, permitting a complete longitudinal section of the sheet to be exposed on this desk. It would be a simple matter to cut the clearing sheet into ten sections, showing at one time only ten rows vertically, fastening the ten sections one below the other. We will say now that the Atchison, Topeka & Santa Fe's report came in showing the balances due by the Atchison and to the Atchison in account with each other member road. This report is arranged vertically in two columns as is shown on Form A1. Two clerks could take this report and enter *across* the clearing sheet each credit under the name of each one of the member roads. This would complete line No. 1 all the way across the 150 ft. or so of the clearing sheet. In the meantime other clerks could be at work entering the reports of other roads, three or four men each with an assistant could thus be at work simultaneously in making up the clearing sheet. When the reports from all of the roads had been entered the horizontal lines and the vertical columns could then be footed on an adding machine. If this total made up in

Manager.

the case of the Atchison from all the debits and credits shown by each one of the *other* roads in account with the Atchison checked with the total debit and total credit, shown by the Atchison on its own record, the work would prove itself automatically. A clerical force of 8 or 10 men would be necessary only for a few days each month and could be hired for night work only. The regular force of the clearing house ought not to exceed seven, including the manager and his assistant.

There are three sorts of mistakes that the general clearing house manager might find in the reports. There might be a mistake in the footing or in entering the net credit or debit balance. This kind of a mistake could be corrected by sending the road Form B shown herewith. The second type of mistake would be a difference between the figures shown by one road and those shown by another road for the same balance. For instance the Atchison might show on its report that the Lake Shore & Michigan Southern owed it $250,000, while the Lake Shore's report might show that this company owed the Atchison $200,000. In this case the clearing house would pay the smaller balance on which both reports agree, namely the $200,000, and would notify both roads of the differences in their report (Form C) and this difference could be carried over and adjusted in the next month's clearings. There might also be errors due to the omission of amounts. This would be corrected through the use of Form D.

The general clearing house or the district clearing houses would need some working capital; the amount, however, would be small when compared with the aggregate amounts that are now carried by roads, because of the fact that they do not know when drafts will be presented against them, or from what quarter. It is estimated that if one hundred roads join the clearing house, a working fund of $25,000 would probably be ample for the clearing house needs. Each road on joining the clearing house will be required to subscribe its share of the working fund, the amount to be based on the road's earnings in the previous year. In addition to the expense

Manager.

of carrying this sum without interest there will be the expenses already mentioned which in the case of the general clearing house will include the salary of the manager, and his assistant and the clerical help necessary in the clearing house. This expense would not be very large, probably $1,000 a month ($10 a month per road) would be an outside figure for a clearing house with a hundred members.

The risks that each road would have to take of other roads defaulting or refusing to honor drafts would not be as large as under the present system. The clearing house can in all probability make an arrangement with one of the large surety com-

EXPLANATION—Notice of correction to be sent by the Clearing House to the Accounting Department of a member road when its report on Form A1 or A2 contains a charge or credit against another Company, and the report of the other Company on the same form contains no corresponding credit or charge, and the Clearing House is unable to reconcile the difference up to the time for closing the Clearing Sheet.

panies for a blanket bond which would cover any amount defaulted up to say $400,000, such a blanket bond would be very much cheaper than if each road joining the clearing house were required to give a bond for itself. If a road failed to meet a draft drawn against it by the clearing house, the worst that can happen would be a default of one month only, the road could be at once suspended from the clearing house and other member roads notified that they should omit it from future monthly statements. The amount of the default in excess of the amount of that road's deposit for the working fund could then be at once recovered on the bond.

Now as to the matter of distribution of the working fund of

the general clearing house and of its banking arrangements, banks could be selected in ten or fifteen financial centers over the country and accounts opened by the clearing house in these banks. It would only be necessary for the clearing house manager to use ordinary forethought and judgment in keeping track of what funds he would be required to pay from each one of his banks and to deposit drafts in these banks accordingly. Of course, if necessary, he can transfer in advance to any one of these banks a part of the working funds of the clearing house in case the checks to be drawn on that bank are heavier than can conveniently be met by the deposit of drafts on roads in that territory. For instance, during the cotton season roads in the cotton belt are heavy creditors, and it might be necessary in that case not only to deposit drafts against all roads having debit balances in Houston and New Orleans territory with Houston and New Orleans banks, but also to deposit a part of the clearing house working funds and possibly, also drafts on roads in other territories. The expense of collection in this latter case would be part of the general expenses of the clearing house. In case roads in one section of the country were most of the time in the debtor class it would be necessary to withdraw all of the working fund from the bank in that section and transfer from time to time money from that bank to other depositories.

The general expenses of the clearing house would be charged each month to the member roads on the basis that the total of their debits and credits bore, that month, to the total debits and credits of all roads for that month. Forms E and F show method of advising member roads of the amount of these expenses.

Enc. Manager.

EXPLANATION—Advice of the Clearing House to the Accounting Department of a debtor road that its report on Form A1 or A2 is correct, giving the amount added to its debit balance for its proportion of expenses of Clearing House for the previous month and the amount of the settled balance for which draft will be made. On receipt of this notice the Accounting Department can make its journal entries and advise Treasurer exactly how much he will have to pay Clearing House.

All employees and officers of the general clearing house would be bonded. Banks acting as depositories of clearing house general funds, would be instructed to honor clearing house checks drawn in favor of railroad companies only. The drafts drawn by the clearing house manager would, of course, be paid by the company on which they were drawn, only in case they were correct, and were drawn to clearing house depositories for account of the clearing house. The amount of expenses could be transferred to the credit of the manager by the board of directors each month for the expenses of the clearing house, and this sum the manager could check out, as required; it would be comparatively small, of course.

There is one objection that was raised by accounting officers, as soon as this general clearing house plan was proposed. Many of the larger roads have certain connections with which they have very large traffic balances each month, and it is a great advantage to have these balances settled very promptly. The objection to the central clearing house was that such balances which are now settled within a comparatively few days after the close of the month could not be settled through the clearing house quite so promptly. The answer to this objection is that there is no reason why companies should put such balances through the central clearing house at all.

If the Erie and the Delaware & Hudson find it of advantage to settle their traffic balances between each other, these balances can simply be left out both by the Erie and by the D. & H. in the statement sent to the clearing house. If half a dozen roads centering at New York desire to have their own clearing houses as between themselves, for certain accounts they can perfectly well do so, leaving out these accounts in the statement sent to the general clearing house. The central clearing house will deal, however, only with member roads and not with other clearing houses.

EXPLANATION—Advice of Clearing House to the Accounting Department of a creditor road that its report on Form A1 or A2 is correct, giving the amount deducted from its credit balance for its proportion of expenses of Clearing House for the previous month and the amount of the settled balance for which check will be sent. On receipt of this notice the Accounting Department can make its journal entries and advise the Treasurer exactly how much he will receive from the Clearing House.

FUEL ECONOMY ON THE ROCK ISLAND.

BY W. J. TOLLERTON,

General Mechanical Superintendent, Rock Island Lines, Chicago.

The cost of fuel is one of the main operating expenses of a railroad, and is a subject that is being given more consideration by the different roads each year. While several means of one kind or another have been tried with success, the principal manner of effecting savings is in the education of the enginemen in the proper method of handling a locomotive. On the Rock Island Lines the system adopted is along educational lines, which is followed up by district and division officers, under the general supervision of the general mechanical superintendent. A synopsis of the system is as follows:

LOCOMOTIVE FUEL.

The proper handling of locomotives is directly under the supervision of the road foremen of equipment, of whom there are one or more on each division. It is their duty to ride with the engine crews, principally on freight and switch engines, instructing them in the performance of their work. It is the aim to have the one-shovelful system of firing followed entirely. The road foreman furnishes a report to the master mechanic, giving the condition of the various engines ridden and performance of the crew, as well as advising the engine house foreman of any defects which should be repaired. He also furnishes a weekly report to the master mechanic, a copy of which is sent to the general mechanical superintendent, giving a list of the engines ridden, performance of the crew, and other items of interest, together with suggestions as to increasing the efficiency of the service.

The road foremen endeavor to hold at least one meeting a month with the engine crews on each division, at which fuel economy, lubrication and other items which enter into the everyday life of the men are fully discussed. The division superin-

tendent, master mechanic, trainmaster, chief despatcher and other officials attend these meetings when convenient and talk to the men. A report of these meetings is made to the master mechanic, a copy being sent the general mechanical superintendent. A copy is also sent other road foremen for their information. Boxes have been placed at the larger terminals, in which the enginemen deposit suggestions for consideration at the next meeting. It is also the practice to occasionally appoint one or two committees from the men to prepare a paper on some particular subject to be presented at the next meeting.

Another duty of the road foremen is to examine the firemen on progress examinations, the first year being principally on combustion; the second year on combustion and machinery, and the third year on air.

A monthly report is compiled on each division and posted in the various roundhouses, etc., showing the performance of individual engineers as regards fuel consumption, as follows:

Passenger Service.

Rank.	Engineer's Name.	Tons Coal Consumed.	Cost of Coal.	Passenger Car Miles.	Lbs. Coal per Pass. Car Mile.	Three Months' Average.

Freight Service.

Rank.	Engineer's Name.	Tons Coal Consumed.	Cost of Coal.	1,000 Ton Miles.	Lbs. Coal per 1,000 Ton-Miles.	Three Months' Average.

Switch and Work Service.

Rank.	Engineer's Name.	Tons Coal Consumed.	Cost of Coal.	Engine Miles.	Lbs. Coal per Engine Mile.	Three Months' Average.

Six miles are allowed per hour in switch and work train service.

Numerous sub-divisions are made to allow of better comparison of the performance of various engineers; for instance, through service is separated from local service. Separation is also made indicating men above and below the average performance. These reports are made up in the offices of the master mechanics. A copy is placed in the hands of the road foreman for his guidance, as to men who are making a poor performance, and, therefore, apparently most in need of instruction.

A monthly report is also compiled in the office of the general mechanical superintendent, giving the following information for the system during the present month and the corresponding month of the previous year:

Passenger Service.—Tons coal consumed; locomotive mileage; miles run per ton; cost per mile run; passenger car miles; pounds coal per passenger car mile, and cost per passenger car mile.

Freight Service.—Tons coal consumed; locomotive mileage; miles run per ton; cost per mile run; gross freight ton miles; pounds coal per 1,000 ton miles; cost per 1,000 ton miles, and average weight of train (tons).

Total.—Tons coal consumed; locomotive mileage; miles run per ton; cost per mile run, and average cost of coal per ton.

A similar report is prepared covering performance of locomotives using oil as fuel, the gallons of oil used being the basis. The accounting department also issues a monthly report containing somewhat similar information for each district and division in connection with other operating statistics.

The proper drafting of locomotives, which has a large bearing on the economical use of fuel, is directly in the hands of the road foreman, the instructions being that no changes are to be made in the draft appliances of locomotives without the approval of the road foreman or master mechanic.

Firing Up Engines at Terminals.

At points where smoke ordinances are in effect, wood is used for firing up locomotives at terminals; at other points fuel oil and shavings mixed are in use, with good results. The cost of this method of firing up is about one half that of wood. It is the practice to have a meeting of the hostlers and other roundhouse employees, whenever convenient, to interest them in the economies to be effected through doing their work properly.

Coal Chutes.

The economical handling of fuel at the coal chutes is directly under the supervision of the road master, who is held responsible for their proper operation. The fuel agent, with the co-operation of the district officers, furnishes self-clearing cars to the mechanical chutes and flat bottom cars to the shoveling chutes. A monthly statement is prepared in the general mechanical superintendent's office, showing the cost of handling coal at each chute on the system. This statement compares the cost of labor, the tons handled and the average cost of labor per ton with the same month of the previous year. The cost of supplies is also included in the statement.

The types of coal chutes are divided as follows: Type 1—Ordinary chute, trestle approach, shoveling into pockets necessary. Type 2—Trestle approach, self-dumping cars can be used. Type 3—Belt or conveyer type, self-dumping cars can be used. Type 4—Gravity chute, bucket hoist; self-dumping cars can be used. Miscellaneous—Cranes, buckets, air hoists, etc. A recapitulation is made for divisions and districts.

Fuel for Stationary Plants and Pumping Stations.

All stationary plants of modern construction are equipped with mechanical stokers and other appliances for burning slack coal, the use of which in the territory traversed by the Rock Island Lines represents a considerable saving over the cost of run-of-mine or lump coal. The balance of the stationary plants have had special grates installed and are now able to burn slack coal with good results, except at some of the northern plants, where, on account of heavy requirements on the boiler, it is necessary to use engine coal during winter months.

Practically all the pump stations use slack coal during the entire year with good results. The use of this grade of fuel has assisted in making a noticeable reduction in the cost of pumping water per year.

Auxiliary Organization.

With a view of effecting further economies in the use of fuel, lubricants and locomotive supplies, an auxiliary department has been organized, in charge of a superintendent of locomotive operation who reports to the general mechanical superintendent, and has jurisdiction over the supervisors of locomotive operation, through the master mechanic.

Supervisors of locomotive operation are appointed for each division, and their entire time will be devoted to effecting economies in the use of the above mentioned supplies, particularly locomotive fuel, through soliciting the co-operation of all employees in their economical use. It will be their duty to instruct engine crews in the proper manner of handling the locomotive at terminals and en route, the proper method of reporting work needed; to instruct hostlers and other employees in regard to loading locomotive tenders; discuss with the district and division officers the condition of the power, in order that its efficiency may be improved, and through instructive methods reduce operating costs and improve the service. The supervisors of locomotive operation do not have jurisdiction over the road foremen of equipment, but are to co-operate with them in order that the greatest results may be obtained.

NEW YORK REPORT ON CORNING COLLISION.

Discusses Duty of Maintaining Discipline; and the Responsibility of Employees' Unions; Also Use of Steel Cars.

The facts of the rear collision at Corning, N. Y., July 4, last, when 40 persons were killed, are already well known; but the report concerning it issued by the Public Service Commission of the state of New York, Second district, which has just come out, is of special interest by reason of the high qualifications of the men who made it, the impartial character of the recommendations and the broad scope of the investigation; and we reprint extended extracts, substantially verbatim, from a summary given out by the secretary of the commission.

The report discusses the use of steel cars and automatic stops and urges their further study. The commission, however, considers it to be unwise to devote so much attention to the possible protection which might be afforded by steel cars and by automatic appliances that the main lessons of this collision should be lost sight of; and these are, first, that no permanent safety can be expected except through the appreciation by employees, of the importance of their duties and the need of careful attention to every detail of their work; and second, by the railway managers of the necessity of strict discipline and removal of men from the service who fail to meet a reasonable standard of performance of duty in matters involving safety.

The shielding by the faithful majority, or by any part of it, of the careless and inefficient minority from the results of its shortcomings is much to be condemned. It arises from a mistaken sense of loyalty to a fellow workman, and in the end its most disastrous consequences are visited upon the very people whose generosity and good nature are invoked to set it in motion. The reckless engineman is much more likely to kill or maim a fellow employee than he is to harm a passenger. To secure a radical improvement in the absolute prevention of railroad accidents it is the clear duty of organizations of employees, for the protection of themselves as well as the public, to co-operate vigorously and efficiently with the management in the strict enforcement of all rules affecting safety, in the proper punishment of whoever may be guilty of violating those rules, and in the removal from service of all who do not show themselves imbued with a constant desire to place safety above every other consideration. . . . Managers and superintendents should enforce discipline in such matters at any cost, and should never permit any reasonable ground for the charge that their desire for speed is more powerful than their desire for safety.

There should be greater care in the selection of the roundhouse foremen, traveling engineers, and trainmasters. These positions should be made attractive enough to secure good men who are not only competent in the technical side of their work, but who are capable of dealing justly and fearlessly in matters of discipline. The authority of these men should be sustained by the officers above them unless they are proved to be in the wrong, and as long as they do faithful work they should be secure in their positions and be as well protected against arbitrary removal as locomotive enginemen are now protected through the organization of their brotherhood. A high degree of efficiency in these elements appears to have been reached by the railways of England, and it is to be hoped that there is no prohibitive reason why such a condition should not be attained by the railways of this country. There is no doubt that the large majority of railway men perform their duties with great care and efficiency, and have a record to be proud of. The work of enginemen in particular is performed under conditions of stress, of which the general public seems to have a most inadequate appreciation. The mere observation of signals upon high speed trains under varying conditions of light, storm, and fog is a severe strain. The slightest inattention while running at the rate of a mile a minute may result in the missing of a signal. A single error in observation may result in a disastrous accident. The insistent demand of the public for high speed under all circumstances is a keen spur to railroad managers to wink at if not demand high speed under all conditions.

Enginemen are prone to believe that a strict observance of the universal rule that in cases of doubt the course of safety must be adopted imperils their positions and livelihood. Only words of praise should be applied to the general average performance of duty by enginemen. There are, however, in every class of men those who do not average up to the recognized standard of efficiency and faithfulness. . . . More train wrecks are occasioned by such men than by all other causes combined.

The investigation of the Corning accident shows clearly that the primary cause was the entire failure of Engineer William H. Schroeder of the second train to observe signals. The train into which he ran was protected by a full stop signal 250 ft. east of the rear of the train, by a flagman 2,550 ft. east, and by a caution signal nearly 4,500 ft. east. All three signals were disregarded, and Engineer Schroeder appears to have run at full speed into the rear of the train ahead without making any effort to stop.

Schroeder's contention was that the fog was so dense as to make it impossible for him to see signals clearly. The evidence produced shows that the fog had lifted sufficiently to allow the signals to be seen with reasonable clearness, and had it been as dense as Schroeder stated, no excuse has been developed for his running at the rate of 65 miles per hour. No evidence was given to indicate that any pressure was brought to bear upon him to make time with his train under dangerous conditions, or in any way to exceed the limits of safety. Since the accident the railroad company has prohibited the use of intoxicants by its employees, or the use of their time while off duty in a manner that will unfit them for efficient performance of duties. The commission approves of this order, and in securing its enforcement believes that the company is entitled to the full co-operation of the Brotherhood of Locomotive Engineers and associations of trainmen. The actions of Engineer Schroeder should be considered as much an offense against the Brotherhood of Locomotive Engineers, of which he is a member, as they are against the railway and the public.

Flagman Lane had gone back a sufficient distance to give a reasonable warning under the circumstances of this case. He violated the rules by failing to take torpedoes with him, but the testimony indicates that the weather was sufficiently clear to justify him in refraining from the use of torpedoes under the company's rule that they shall not be used in block signal territory except in foggy or stormy weather. The commission remarks that the operating rules should be so amended that the flagman may feel distinctly at liberty to use torpedoes under circumstances appearing to create special danger, but adds: It should be remembered that safety from collision of modern high speed trains is rendered possible only by complete signal systems and by the observance of such signals by engineers. It is certainly well in many situations to use flagmen to supplement the protection given by signals. . . . Trains are, however, frequently run in present high speed railroad practice so closely together and at such high speeds as to make it impossible for a flagman to afford any protection of value under certain limiting conditions. The main reliance must be placed upon the signals and upon their observance by the engineers, and it is possible that the practice in this country may eventually follow that of some of the railroads in England, on which flagging has been abandoned under all ordinary conditions of train service.

The delays to the preceding freight trains and other elements which contributed to this accident, have been considered. These

conditions, however, are such as must occur frequently in the operation of any great railroad, and the signals and their observance by employees should be such as to afford reasonable safety under these conditions.

The commission has given much thought to the possible improvement of signal systems, especially the overlap and the automatic stop. The full block overlap has received especial attention in connection with preceding accidents; but in this accident the flagman constituted an additional signal, and although the distances were shorter than would be afforded by the full block overlap, there is no reason to believe that such an arrangement would have prevented the accident. The signals were sufficient if ordinary care had been used to observe them.

. . . Unless some satisfactory method can be found to diminish accidents due to carelessness of employees it appears evident that the use of automatic stops must be given much greater consideration than in the past. The perfection of an automatic stop device and experimentation by railroads as to its workings in practical use under the most unfavorable conditions cannot be too strongly urged. . . . But the use of an automatic stop will unavoidably create new dangers against which additional precautions must be devised. Its presence will have a marked tendency to cause a percentage of enginemen to rely upon the stop rather than the observation of signals. No device involving the intricacy and delicate adjustment of an automatic stop will at all times be in perfect working order under the weather conditions prevailing in this country, and an occasional failure is inevitable. If reliance is placed solely upon it, disaster at times must be expected. The problem, when considered in all its bearings, is a most serious one. Collisions are possible on almost every mile of railroad in the United States. If it should prove to be necessary to install automatic stops at each point of possible danger, the expense of installation and maintenance would be enormous, and we believe that the railroad development of the country generally is far from the point at which such a complete installation can be considered. The difficulty of maintaining present safety devices is very great, and the fear of railroad men that the increase of such devices may only change the location of the danger point has a solid foundation. There is an unusual element of danger in a so called safety device which fails to operate. If an air brake fails to work, or a signal shows a false "clear" indication, imminent danger is created from the fact that employees have learned to trust implicitly in these devices, and the speeds of trains and the intervals between them are regulated on the supposition that the automatic devices will work satisfactorily, or that when they fail it will be on the side of safety. There is danger, therefore, that the use of automatic stops may only shift the burden of responsibility from the experienced and skilful engineer, with his many years of training as a fireman, to the signal maintainer, and that much chance for accident may still remain. It should also be considered that the records of this commission show a large number of accidents caused by the defective operation of the emergency brake, especially on long trains. In many cases a lack of uniformity in the action of valves appears to have caused a collision within the train itself, which buckles weak cars and has frequently blocked adjacent tracks with the wreckage thus produced. It is certain that the widespread installation of types of automatic stops which involve the emergency application of the brakes would produce some accidents of this class. We also have in mind the fact that the remarkable record of safety from collisions in English railroad operation is made under the protection of signal systems operated manually and without any automatic checks, such as are afforded by the electric track circuit or the automatic stop.

This collision is the only one involving death of passengers which has occurred in over twelve years on the main line of the Lackawanna railroad under the daily operation of heavy traffic. Other railroads have also attained a high degree of safety. For instance, the Long Island Railroad, whose reports to this commission show a yearly movement of 34,000 passenger trains, has not had an accident involving the death of a passenger in nineteen years.

The report of Supervisor of Equipment Buchanan makes certain recommendations in reference to steel cars, and these recommendations are submitted by the commission for discussion and criticism, with the statement: "We think that they deserve consideration because of the careful personal examination which Mr. Buchanan has made of this and other wrecks."

Steel cars certainly appear to afford additional protection to life in accidents of this character, but there is room for discussion of their value as compared with wooden cars having steel underframes, and an exhaustive examination of this matter is imperatively demanded. The construction of American wooden cars appears to be far superior in safety to the passenger cars used in England or in Europe generally, and the efforts to afford safety and comfort in the car construction of this country as compared with foreign practice is indicated by the great weight of American equipment in proportion to passengers carried. It is shown that in January of this year the passenger cars under construction were about 77 per cent. steel, 16 per cent. wood with steel underframes, and 7 per cent. wood.

The indications are, we think, that the use of steel cars will increase rapidly in this state through the ordinary processes of addition and replacement, and through the necessities of electric operation in tunnels such as those at New York.

The enormous cost which would be required to replace the present equipment of wooden cars in advance of the natural movement in that direction, coupled as it would be more or less with a diversion of funds needed for the prevention of accidents to a purpose that only minimizes the effect of accidents which ought not to have occurred, is an important consideration.

Though an all steel car train may be desirable, and all steel car trains on some roads are run, doubtless for the purpose of adding safety, it is quite another thing to require that a carrier shall not use its steel cars except where all other cars in its train are of that description. Mr. Buchanan's recommendation in that respect is therefore not accepted. We think two, or perhaps three, steel cars at the rear of a train might afford much protection; or even one such car, depending upon the severity of impact in a collision. A single steel car at the head of the train at Westport would probably have prevented the fire which destroyed the wooden cars.

An enormous amount of money has been expended by the railways to diminish the fire risk through the equipment of practically all cars with steam heating appliances, and the use of safe methods of lighting. The separation of the fire in the locomotive from the nearest car by the steel tender, which is at least partly filled with water, is ordinarily a fire protection of great value. The whole subject is one which requires much more careful investigation than has yet been given to it, before any governmental action would be warranted. Our study of the present accident renews the conviction that the question of supreme importance now is how to prevent accidents of this character rather than merely to minimize the effect of such accidents by replacing equipment which is already much heavier, stronger, and more costly than that used in other countries.

Transvaal Railways.—The commencement of railway construction in the Transvaal dates from the year 1890, when, under the authority of the republican government, a short line was laid at the Rand. On the amalgamation of all the South African government railways, on May 30, 1910, which necessarily followed the political union, the mileage amounted to 7,039, of which 380 miles were on the 2 ft. gage. Since then over 500 miles have been added and about 900 miles are under construction, mostly near completion. On nearly all the South African railways great improvements have been effected, such as easy grades and curves, and in increasing the strength of the permanent way. The total mileage last year amounted to 7,548 miles.

ELECTRIFICATION OF HEAVY GRADES.

This May Be Found Less Expensive Than Grade Reduction or the Introduction of More Powerful Steam Locomotives.

By C. L. de Muralt, M. Am. Soc. C. E.,
Professor of Electrical Engineering, University of Michigan.

In a previous article published in the *Railway Age Gazette*, October 4, 1912, page 623, it was shown that one of the main advantages of the electric locomotive lies in its great working capacity. Due to this quality it can haul the heaviest trains over the most severe grades at the same speeds as on the level. The working capacity of any given locomotive is dependent on its tractive effort, its boiler power, and its engine power. The first is limited by the weight on drivers, the second by the size of the boiler, and the third by the size of the steam engine or electric motor as the case may be.

It was also shown that the tractive effort and boiler power

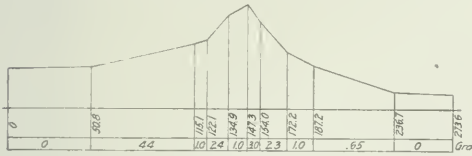

Fig. 1—Profile of Mountain Division of A. B. C. Railway.

limitations may be entirely removed in the case of the electric locomotive, because the boiler is in the far off power house where it can be built as large as necessary, and because, with the great flexibility of the electric drive, it is possible to turn any required number of axles into driving axles and thus make use of any desired weight for tractive purposes. The limitations to engine power are not serious, because, with careful design, it is always possible to make the engine or motor sufficiently strong to slip the wheels. Thus it is seen that sufficient power may be concentrated in an electric locomotive so

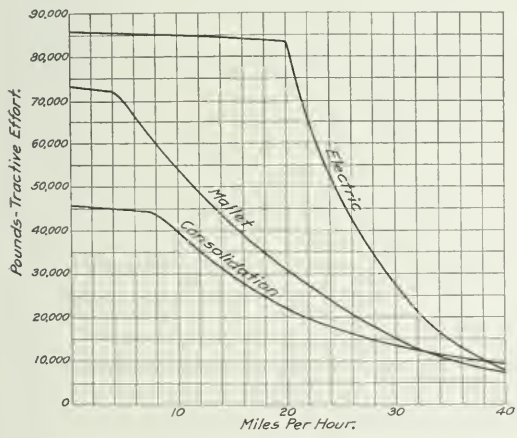

Fig. 2—Tractive Effort Developed by Consolidation, Mallet and Electric Type Locomotives at Various Speeds from 0 to 40 miles per hour.

that any train may be taken up any grade found in railway practice, in the composition in which it arrives at the bottom of the grade. Furthermore, with the proper type of electric motor, this can be done at the same speed at which the train runs on the level. This feature is likely to prove of great value in the case of roads where a severe grade has produced a congestion of traffic.

Let us investigate how electrification compares in such instances with grade reduction or with the use of Mallet locomotives, or with both together. For this purpose we may take the case of a typical western road crossing the Rocky mountains. The profile of the mountain division of this road is represented by Fig. 1. During the past two years this division has handled an average of about 5,400,000 ton-miles daily, of which about 4,300,000 is freight and about 1,100,000 passenger ton-mileage. Freight trains at present show a maximum weight of 950 tons, which is reduced at the bottom of the main grade to about 700 tons, and even with this reduction

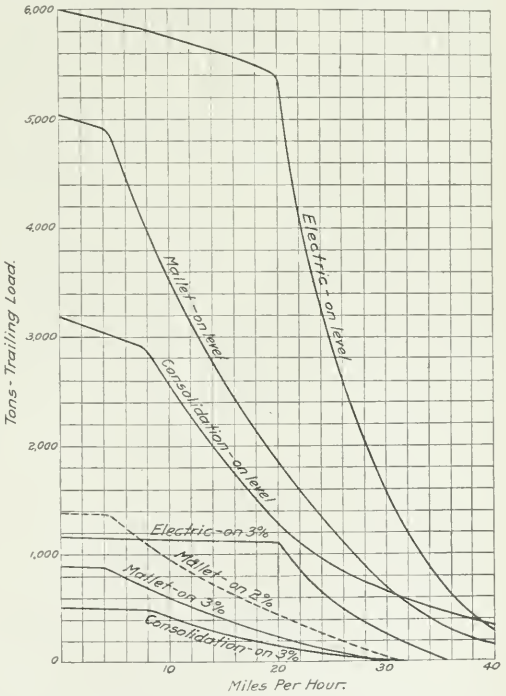

Fig. 3—Trailing Load in Tons Which Can Be Handled by the Different Locomotives on Various Grades.

the speed over the grade is very low. Traffic conditions are becoming more and more congested. In order to increase the daily tonnage capacity of this road it is proposed to raise the present maximum tonnage per train from 950 to 1,100 tons, and to arrange so that this weight of train may be handled unbroken over the entire line at a reasonable speed. To make this possible it is proposed to reduce the ruling grade from 3 per cent. to 2 per cent., and to purchase Mallet compounds for operation on the heavy grade section.

The capital required for these improvements is estimated at $2,100,000, from which may be deducted about $240,000, this being the present value of the 24 consolidation locomotives

now on the heavy grade section, which would be replaced by the Mallet compounds and could, therefore, be transferred to other divisions. The net cost of the improvement may thus be put down as $1,800,000. By these means it is expected to raise the capacity of the road from 5,400,000 ton-miles to about 10,000,000 ton-miles per day; viz., 8,500,000 freight ton-miles and 1,500,000 passenger ton-miles.

The purpose of this inquiry is to see whether these proposed means offer as great a return on the new capital invested and the same operating advantages as electrification would do. Let us first look at the characteristics of the three types of locomotives involved. The table below gives the most important data with reference to the three engines, and the curves shown in Figs. 2 to 4 give some information concerning their working capacity.

Table I.

	Consolidation.	Mallet.	Electric.
Wheel arrangement	2-8-0	2-6-6-2	0-8-8-0
Total weight, lbs.	380,000	500,000	360,000
Weight on drivers, lbs.	194,000	307,000	360,000
Weight per driving axle, lbs.	48,500	51,200	45,000
Total length, ft.	70	84	74
Length of rigid wheel base	15 ft. 8 in.	10 ft.	8 ft. 8 in.
Total heating surface, sq. ft.	3,480	5,770	.....
Tractive effort, lbs.	46,000	73,000	86,000
Coefficient of adhesion, per cent.	23.8	23.8	23.8

Fig. 2 shows the tractive effort developed by each at any speed between zero and 40 miles per hour. Fig. 3 shows the

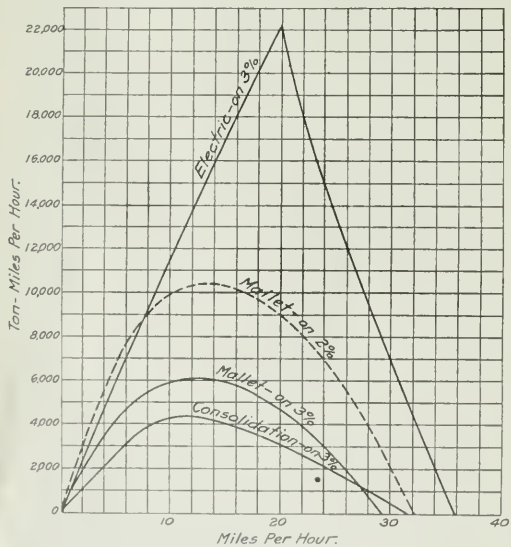

Fig. 4.—Ton-Miles of Trailing Load of Which the Different Engines Are Capable at Various Speeds.

trailing load in tons which each can handle on the level as well as on the 3 per cent. grade; and Fig. 4 indicates the number of ton-miles of trailing load which each of the three engines is capable of handling per hour when running at any speed between zero and 40 miles per hour on the ruling grade.

The principal advantage of the Mallet over the present consolidation lies in the increase of weight on drivers, which produces a corresponding increase in the tractive effort. By referring to Fig. 2 it is seen that the maximum tractive effort of the Mallet is almost 60 per cent. greater than the consolidation. At first glance this would seem to indicate a 60 per cent. increase in traffic capacity, due to the 60 per cent. heavier train which can be handled by the Mallet locomotive. On closer observation it is found, however, that this increased hauling capacity is only securable at low speeds and the ton-miles moved per hour at speeds between 10 and 14 miles per hour, as shown by Fig. 4, are seen to be not proportional to the increase in tractive effort, but only about 35 to 40 per cent. greater for the Mallet than for the consolidation. Table II gives the hauling capacities of the three types of engines on the 3 per cent. grade at speeds of 4, 10 and 20 miles per hour.

Table II.

	Consolidation.	Mallet.	Electric.
Trailing tons at 4 miles per hour..	510	880	1,160
Trailing tons at 10 miles per hour..	430	590	1,140
Trailing tons at 20 miles per hour..	150	240	1,100

If we take the most favorable points for each type of locomotive, with reference to actual service capacity, the consolidation is seen to be at its best at about 11 m. p. h., and can then move about 4,400 ton-miles per hour. The Mallet is at its best at about 13 m. p. h., and at that speed is capable of moving 6,100 ton-miles per hour. And the electric locomotive is at its best at about 20 m. p. h., when it can handle about 22,000 ton-miles per hour. At the maximum point the Mallet can therefore haul about 39 per cent. more than the consolidation, and the maximum service capacity of the electric is five times as great as that of the consolidation and 3.6 times that of the Mallet.

The explanation of this tremendous increase lies of course in the fact that the electric locomotive can not only haul a greater tonnage than the Mallet or the consolidation, but it can haul this greater tonnage at a much higher speed. When we consider that, in addition to its larger hauling capacity at high speeds, the electric locomotive is independent of the coal bunker, the water tower, and the roundhouse, and can operate for long periods of time without housing or attention, it will be realized that its actual relative daily service capacity is even larger than is indicated by the above figures for trailing ton-miles capacity.

To handle an 1,100-ton train at a speed of 20 m. p. h. on a 3 per cent. ruling grade is quite feasible with an electric locomotive, as can be seen from the curve in Fig. 3. If the same thing were to be attempted with steam engines, it would take 8 consolidations or 5 Mallets; in other words it appears almost, if not entirely impracticable. However, it was proposed to reduce the grade from 3 per cent. to 2 per cent. for Mallet operation. The trailing load which can be hauled by the Mallet engine on a 2 per cent. grade is indicated in Fig. 3 by the dotted line, and its service capacity on the same grade is similarly represented in Fig. 4.

Fig. 3 shows that an 1,100-ton train may be handled by a Mallet locomotive on the 2 per cent. grade at any speed up to about 7½ m. p. h., and Fig. 4 shows that at that speed the service capacity is about 8,700 ton-miles per hour, or rather more than twice the service capacity of the consolidation on the present 3 per cent. grade. This confirms indirectly the estimate, referred to above, of the expected increase in the capacity of the road from 5,400,000 to about 10,000,000 ton-miles per day due to the grade reduction and use of Mallet locomotives.

The increase in capacity through electrification of the line, without grade reduction, is seen to be considerably greater. The maximum service capacity of the electric engine on the 3 per cent. grade is 22,000 ton-miles per hour. Suppose, for the sake of argument, we take only 75 per cent. of this, or 16,500 ton-miles. We still find the service capacity of the electric engine on the 3 per cent. grade to be about twice as great as that of the Mallet compound on the 2 per cent. grade. Or, putting it another way, if the use of the Mallet engine combined with a grade reduction from 3 per cent. to 2 per cent. will increase the capacity of the road from 5,400,000 to about 10,000,000 ton-miles per day, the use of the electric engine without grade reduction will increase it to about 20,000,000 ton-miles per day.

Now let us look into the financial aspect of the matter. The heavy grade section of the division in question is found to have

72 miles of main line, 26 miles of second track, and 16 miles of sidings, or a total trackage of 114 miles. A distinctly conservative or ample figure to use is $9,000 per mile of track for a suitable overhead contact line, including the necessary substations, feeders, etc., or $1,026,000 for the 114 miles of track. Suitable electric locomotives of 180 tons each can be bought for about $70,000 each. Eight of them are required, which makes the cost of the locomotives $560,000. The total new investment for electrification may, therefore, be put down as $1,830,000, which includes 15 per cent. for engineering and contingencies. From this should be deducted the same $240,000, corresponding to the present value of the 24 consolidations now on the line, as above in the estimate of the cost of grade reduction and Mallet compounds. The net cost of electrification is thus found to be about $1,590,000, or $270,000 less than the cost of grade reduction plus Mallet compounds. Add to this the fact that there will be a probable annual saving of not less than $50,000, due to difference in maintenance of locomotives, saving in wages to engine men, saving in cost of electricity as compared with cost of coal and saving in cost of water, oil and supplies, and the financial advantages are clearly seen to be with electricity as motive power.

Of course, these are figures applying to a specific case, but the case is rather representative of what is to be found on many of the heavy grade divisions all over the country. It may, therefore, well be said that, in all cases where a heavy grade has produced a traffic congestion, a careful investigation into the merits of electrification will be warranted and it will often be found that electrification will not only be less costly than grade reduction or the purchase of more powerful steam locomotives, or both combined, but electricity will often offer a very much greater increase in traffic capacity than either of those other means or the two means combined.

ANNUAL REPORT OF NEW JERSEY PUBLIC UTILITY COMMISSION.

The Board of Public Utility Commissioners of the state of New Jersey has sent to the governor its third annual report. The report, signed by Robert Williams (president), Thomas J. Hillery and W. M. Daniels, is devoted largely to matters concerning gas companies and telephone lines.

The order issued by the board last year, requiring the railroads terminating on the Hudson river opposite New York City to sell commutation tickets to those New Jersey terminals instead of requiring season ticket passengers to buy to New York City, has been appealed to the Court of Errors and Appeals, and the matter is now under review by that tribunal.

The board has made an extensive investigation of highway grade crossings throughout the state and has classified the crossings according to whether they are dangerous in the first, second, third or fourth degree. All crossings in the state are classed either A, B, C or D. In a number of cases the commission has already recommended the installation of gates, the stationing of flagmen at crossings or changes in surroundings, so as to make the crossings safer. It does not appear that in any case has the commission ordered an automatic audible signal installed. The board reaffirms its views, expressed last year, regarding the abolition of grade crossings, of which there are more than 3,000 in the state. The unreasonableness of requiring the abolition of grade crossings faster than the railroads, especially the poorer roads, can afford the expense, is clearly set forth. The state "will be more than fortunate if by the end of two decades it sees the removal of all the really dangerous crossings." Some of the smaller railroad companies are unable to spend any money at all for this purpose. One road is so poor that the board has reluctantly consented to a discontinuance of daily passenger service during a part of the year. Within the past two years new grade crossings have been forced on certain railroads against their will.

RAILWAY TERMINALS*.

By L. C. Fritch,

Chief Engineer, Chicago Great Western.

The problem of terminal facilities has become so complex with the marvelous growth of traffic on American railways, that its solution requires the best skill which experience and training can command. It is well known that less attention has been given to the matter of terminals and less provision made for this development than any other branch of the transportation service. There has been a vast development in improvements in alinement and grades, and in rolling stock and equipment, but in the handling of traffic in large terminals practically the same methods are employed that have been the custom since the advent of the railways. Passenger terminal facilities have received far more attention than freight terminal facilities, and it may be said unwisely so. The freight traffic on most railways in America yields the larger proportion of gross revenue and is possibly the only traffic which yields net revenue on many lines. Notwithstanding this, there are many instances where vast sums are, or have been, expended in providing elaborate passenger terminals and only insignificant appropriations made for handling the more important freight traffic. There is a surprising lack of information as to the cost of terminal charges in handling traffic, both freight and passenger. A statement recently made by an executive of a prominent railway system entering Chicago, that the terminal expenses of his line in freight service at Chicago averaged $21 per car, if it is a fact, is an illustration of the enormous cost of handling traffic in large and congested terminals, and points to the necessity of an investigation into what causes such abnormal expense and the application of a remedy. These high costs are largely due to the antiquated facilities and methods employed on most railways in large commercial centers.

The public would be better served and the railways would effect vast economies if greater attention were given and larger appropriations made for the development of adequate freight terminal facilities and less to the establishment of monumental passenger terminals, of which numerous examples might be given. The new passenger terminal facilities of the New York Central in New York City will probably cost $200,000,000 when completed. This sum would build 2,000 miles of double track road at $100,000 per mile. The fixed charges, taxes and depreciation will amount to nearly $20,000,000 per annum, and including operating expenses and maintenance perhaps $3,000,000 per annum more, or a total of $23,000,000. Only two roads are served by these facilities—the New York Central & Hudson River and the New York, New Haven & Hartford. The total annual gross passenger receipts of these two lines are about $55,000,000, but only a portion of this is strictly New York City traffic. Assuming that 50 per cent. of the entire passenger earnings of these two lines accrues on New York City traffic, which seems large, it would amount to $27,500,000, or if the estimate of charges and expenses is correct, the terminal charge at New York City alone is equal to 80 per cent. of the gross passenger receipts.

Another illustration is found in the new passenger terminals of the Pennsylvania Railroad in New York City, estimated to have cost to December 31, 1910, $113,000,000. Assuming the annual fixed charges, taxes and depreciation at 10 per cent., or $11,300,000, and operation and maintenance at $2,000,000, gives a total of $13,300,000. This terminal serves only two lines, the Pennsylvania and the Long Island roads. The annual gross passenger revenue of these two lines is $37,000,000. If 50 per cent. of these earnings accrued from New York City traffic, it would equal $18,500,000. In the case of the Pennsylvania Railroad proportion, 30 per cent. would probably be more nearly correct, and in the case of the Long Island about 75 per cent.

*From an address before the Canadian Railway Club at Montreal on January 14.

On this basis the earnings accruing in New York City would be about $14,000,000. On the basis of these estimates, the terminal charges are about equal to the entire gross receipts from passenger traffic. The vast sums invested in passenger terminals may be appreciated from the statement that the combined value of the passenger terminals in which the Pennsylvania Railroad is interested in the cities of Washington, Baltimore, Philadelphia and New York, aggregates $178,000,000. This is equal to an average of nearly $800,000 per mile of road for the 223 miles from Washington to New York. Only one of these terminals, the Washington terminal, is a joint terminal. The fixed charges alone on this investment average $40,000 per mile for the line between New York and Washington.

Another illustration may be cited in the case of the Chicago & North Western passenger terminal in Chicago, estimated to have cost about $30,000,000. If fixed charges, taxes and depreciation equal 10 per cent. per annum, or $3,000,000, and operating expenses $500,000, the total annual terminal charges would be $3,500,000. The passenger revenue equals about $18,500,000 per annum, and estimating that 30 per cent. accrues in Chicago traffic, it equals $5,550,000. This would make the terminal charges 65 per cent. of the gross passenger revenue.

The railroads entering Kansas City, Mo., are now constructing a terminal at an estimated cost of $45,000,000, of which about 75 per cent. is devoted to passenger service, and 25 per cent. to freight service. Some of the roads which will use this terminal will pay out more for the use of the facilities than their entire gross receipts from passenger traffic derived from Kansas City.

It must be borne in mind that in all the cases cited the charges cover only terminal expenses, and to these must be added the road expenses and other charges to determine the total cost of handling the traffic. It is assumed that the above statistics are but approximately correct, but they are quoted to emphasize the fact that too much attention has geen given to the development of expensive passenger terminals and not enough to freight terminals in our large commercial centers. In the building of most of our modern passenger terminals the desire seems to have been to erect monumental structures where architecture has been the prime consideration, instead of giving first consideration to principles of sound engineering and utility.

The total annual freight revenue of all the railways of the United States is about $2,000,000,000, while the annual passenger revenue is about $750,000,000, or slightly over one-third. The possibilities for economies in handling the vast freight traffic in terminals constitute a field which has been developed to only a very limited extent, largely due to the attention given to the development of passenger terminals, with only limited appropriations for freight terminals. The time has come, however, in many localities where by reason of the marvelous growth of traffic the old facilities are grossly inadequate and the methods employed are such as cannot cope with the demands made by commerce for the prompt handling of the business.

There must be almost a revolution in the processes and methods so long in vogue in handling the vast freight tonnage of a city, for example like Chicago, to meet the growing needs of its commerce. A city of limited area is adequately served by a single freight station for each railroad, but as the city expands and from a few square miles in extent reaches an area of 195 square miles, as in Chicago, the facilities likewise must expand to meet the demands of the traffic.

In my opinion the time will come in all large commercial centers when union freight stations will be established, at any of which freight may be forwarded and received for any point on any line entering the particular city. If union passenger stations are a convenience to the traveling public, then union freight stations are a necessity to the shipping public and the economies possible by such a plan will be incalculable.

If union freight stations are not provided in the near future in our large cities, then in my opinion the railroads will face a demand which will be one of largely added expense to them and that will be store-door delivery of all less than carload freight, similar to methods now used in some European countries. The establishment of union freight stations at various centers of traffic in large commercial centers, at which freight would be handled for all roads, would result in tremendous saving in teaming freight through city streets, and also in saving in cost of operation of freight stations. It would also conserve large areas in cities by reason of duplication of freight stations where land values are high as against consolidated stations using less area per unit of service. The effect of large areas in the centers of cities occupied by railroads upon the future growth of cities is amply illustrated in the case of Chicago. The area devoted to railroad uses in Chicago practically circumscribes the entire city's business district, making expansion and growth impossible except in one direction and then only along a narrow strip.

There has been a plan just proposed to remedy to some extent the evils of this condition by changing the course of the Chicago river, South Branch, and consolidating the passenger and freight terminals in one general district or area, thus reclaiming for the growth of the city large areas not now available for such purpose. The plan is a commendable one, and is in line with the suggestion made elsewhere that the necessity for properly serving large commercial centers with adequate railway terminals in the future will demand union freight terminal facilities in order to eliminate the economic waste of valuable space now practiced, and also in relieving congestion in city streets due to unnecessary teaming. The difficulties of bringing about such a revolutionary plan are duly appreciated. Various railway corporations own valuable terminal facilities and points of vantage which cannot be readily replaced, but in the best interests of all concerned, especially of the general public, there must be concessions made by some and a result finally secured in the way of economics and improved service which would amply recompense any temporary advantage possessed by a few lines.

It has been my thought that the only practicable means of bringing about the real solution of the railway terminal situation at Chicago would be to merge all the terminal properties of all lines within a given zone into one consolidated terminal company, which would operate all the facilities, rendering equal service to all lines, and by this means subserving the greatest public good. While this may seem a tremendous undertaking at first thought, yet upon analysis, it is perfectly feasible, especially from the fact that all lines terminate at Chicago, consequently only a small portion of the ends of main lines used must necessarily be included in the plan and no line would be affected adversely, as might be the case if through lines existed and these lines were interrupted. The economic possibilities of such a plan from the standpoint of operating efficiency and economy and the great benefit to the public can scarcely be estimated. A preliminary step looking toward such a plan would be the acquisition of all the existing belt lines now operating in the Chicago district, of which there are four or five principal ones. These should all be acquired and owned by all the railroads entering Chicago, giving to all lines equal rights to use in common facilities reaching all facilities and industries located on such belt lines. Some of these belt lines are at present congested with traffic and need extension of facilities, while other belt lines in many cases parallel to the congested lines are little used. Common ownership would make the highest and best use of existing belt lines, rendering the need of extension of facilities on the congested lines unnecessary. Millions of expenditure would thus be saved in addition to the saving in operating all belt lines in common for all lines at actual cost on the basis of use.

Pan American Railway in Uruguay.—The Pan-American Transcontinental Railway of Uruguay, an American company, has practically completed the line from Durazno to Trinidad.

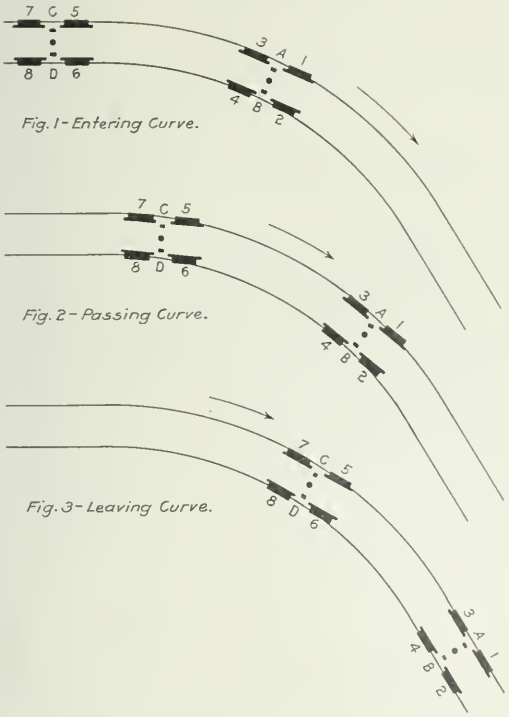
DERAILMENT OF TRUCKS ON CURVES.

A Study of the Action of the Different Wheels of a Car in Entering Upon, Passing Over and Leaving a Curve.

By Arnold Stucki.

The *Railway Age Gazette* has recently published a number of communications on tender derailments. Nothing has been said, however, as to derailments on curves, where cars are in the best possible working condition; nor has anything been said concerning rigid steel equipment, which often leaves the rail at points over which thousands of the older and more flexible cars have passed in safety. Derailments due to the dropping of brake beams, defective material, broken parts, inoperative brakes, worn or sticking details, weak springs, etc., will of course occur to some extent under any conditions, and the remedy in each case of this kind is obvious.

Many of us have seen the inside wheels on curves rise clear



Showing Position of Freight Car Trucks on Different Parts of Curve.

of the rail under high speed, the cause being an excessive spread of the side bearings. This difficulty is now quite thoroughly understood by those who are concerned in the design of cars. The following notes, however, refer more to the frequent derailments on curves which apparently have no specific cause.

The conditions of a car operating over a curve are divided into three distinct periods, viz., entering, passing and leaving the curve. The outer rail on a curve is elevated so that at a certain critical speed the centrifugal force is balanced and the load on all four wheels is equalized. The speed under which this condition takes place will be designated as normal speed. When the car is operating over the curve at the normal speed the load is carried on the center plates and the trucks are free to swivel. If the speed is greater than normal the car will tilt outward, and if it is less than the normal the car will tilt inward. In both of these cases the side bearings toward which the car body tilts assist the center plates in carrying the weight of the car body. This pressure on the side bearings grips the truck and prevents it from swiveling freely.

When the car enters a curve, the front truck being on a partially elevated track and the rear one on a level track, it is subjected to a severe twist, and if the framing is rigid, as it is in the case of most of the high capacity steel equipment, the load is carried by two side bearings diagonally opposite each other. This is not so true of passenger cars because they have two sets of springs in tandem and the body is long and therefore more or less flexible. On freight cars and tenders, however, where the distance between truck centers is comparatively short, this holds true and causes trouble.

ENTERING A CURVE.

If the car frame and springs are sufficiently flexible the load will be equal on all of the wheels when the car enters a curve at normal speed. The truck will therefore be free to swing and wheel 1 (Fig. 1), the only one which hugs the rail, will not be pressed against it very hard and there will be no danger of its climbing the rail. If on the other hand the car frame is rigid the whole load will rest on the side bearings *A* and *D*, thus gripping the trucks and causing a heavy pressure between the wheel flanges and the rails. The only reason that the wheels will not climb in their efforts to swivel the trucks is because of the excessive vertical load which comes on them. None of the other wheels will hug the rail.

When entering a curve at high speed the car will list to the outside, gripping the truck proportionately to the speed, but also holding down wheel 1 with a proportionately greater vertical load. The pressure between the rail and the wheel flanges is, however, increased by an additional item, which unfortunately does not add anything to the load on the wheel—it takes more force to deflect the momentum of the truck. The danger at wheel 1 is therefore greater than when operating at normal speed. If in addition to this condition the car has a rigid frame and the load rests on only two points it is clear that the danger will be still greater, although there will be a heavier vertical load resting on the wheels in question.

If the car enters the curve at a speed lower than the normal it will list inward, gripping the track at the inside side bearing, causing wheel 1 to hug the rail and resist the swiveling of the truck, which causes a high pressure between the rail and the flange. Under this condition there is very little vertical load on the wheel, and following the path of least resistance the tendency will be to climb the rail. If the car has a rigid frame the vertical load on wheel 1 will be increased and the tendency to climb the rail will thus be largely overcome. In other words, there is less tendency for a car with a rigid frame to be derailed when entering a curve at slow speed than there is with one having a flexible framing. This conclusion is borne out by practice.

PASSING A CURVE.

In passing along a curve at normal speed the conditions on both of the trucks are practically the same, i. e., wheels 1 and 5 hug the rail, while the others do not. As there is no tendency for further swiveling of the truck it makes no difference whether the car frame is rigid or flexible. Under normal speed the loads on all the wheels are the same, and the trucks are free to swivel

because the body of the car is free from the side bearings. There is therefore little danger from the wheels climbing.

At high speeds the car lists outward, gripping the truck at the side bearings and pressing wheels 1 and 5 hard against the rails. Since there is a heavy vertical load on these wheels there will be no danger of derailment unless other imperfections come into play.

At slow speeds the car will list inward, owing to the elevation of the track and will grip the truck hard, this in turn pressing wheels 1 and 5 hard against the rail. At the same time there is very little if any vertical load to hold these wheels down, and derailments are often caused in this way. One wide awake superintendent of motive power, suspecting this condition, quietly had the speed limit signs taken down in a yard with a number of curves and the trouble was overcome.

LEAVING A CURVE.

On leaving a curve at normal speed wheel 5 only hugs the rail and the trucks are both free to swivel. With a rigid car, however, the load is partly carried on two side bearings diagonally opposite each other, because of the front truck being on level track and the rear one on that part of the track with one rail elevated; but fortunately a fair share of the vertical load comes on wheel 5 and it is prevented from climbing the track.

At high speed the rear truck is gripped by pressure on the side bearing, but the front truck is free. The rear truck will thus derail easier than the front one, and this has been borne out by actual experience in many cases. With a rigid car the relative positions remain about the same with the exception that the diagonal loading adds to the already strained conditions.

In leaving a curve at a slow speed and assuming that the car frame is fairly flexible all of the wheel flanges on the front truck are free of the rail. With a rigid car, however, the diagonal loading will grip the truck and hold it in the same relative position as with the car on the curve. Wheel 2 will hug the inside rail for some time until the track is level enough to relieve the uneven loading. This explains why the inside rail at the end of the curve where double tracks are used are worn for some considerable distance. The rear truck on a flexible car is under the same condition as when the car was passing around the curve and great danger exists because of the trucks being gripped by listing inward and pressing wheel 5 hard against the rail without having a very heavy vertical load on it. With a rigid car, however, these conditions are very much improved.

SUMMARY.

The accompanying table shows the conditions to which each wheel of the truck is subjected under the different situations as above outlined. Under normal conditions there would be no pressure between the wheel flanges and the rail. Under other conditions it would vary in intensity, as noted above, and the letters p, P and **P** are used to denote this pressure, the smallest letter, of course, denoting the least pressure. In the same way the load on the different wheels is designated as O, l, L and **L**, and the danger of the wheel climbing by O, d, D and **D**. As may be seen there are six places where great danger exists of the wheel climbing the rail, and in fact where there is practically nothing to prevent it from so doing. There are also twelve instances where the wheel may climb the rail if it is complicated by other imperfections in the truck or track construction. It is therefore quite evident that the side bearings should be made frictionless to minimize these tendencies.

BURLINGTON ADOPTS NEW TRAIN AUDIT SYSTEM.

The plan of train auditing which has been in force on the Chicago & North Western for the past two years has been adopted by the Chicago, Burlington & Quincy, effective January 1, and is now under consideration by several other western roads. J. E. White, who has been chief train auditor of the North Western since the inception of the system, and who has developed the plan to its present state, will have charge of the work on the Burlington as well. A company called the White Audit System has been formed to handle the system under Mr. White's direction.

The main features of the plan, which is similar to the system generally used in auditing stations, are as follows: Conductors are required to have in their possession at all times checkable evidence of the transportation of every passenger on the train; each train auditor carries a commission of authority signed by the operating vice-president and the general auditor, upon exhibition of which the conductor will permit him to take and examine all forms of transportation in his possession, and the records in connection therewith. The train auditors may board trains at any point, and having made a count of the passengers then on the train, see that all are accounted for. Before leaving the train the auditor fills out his report showing the condition

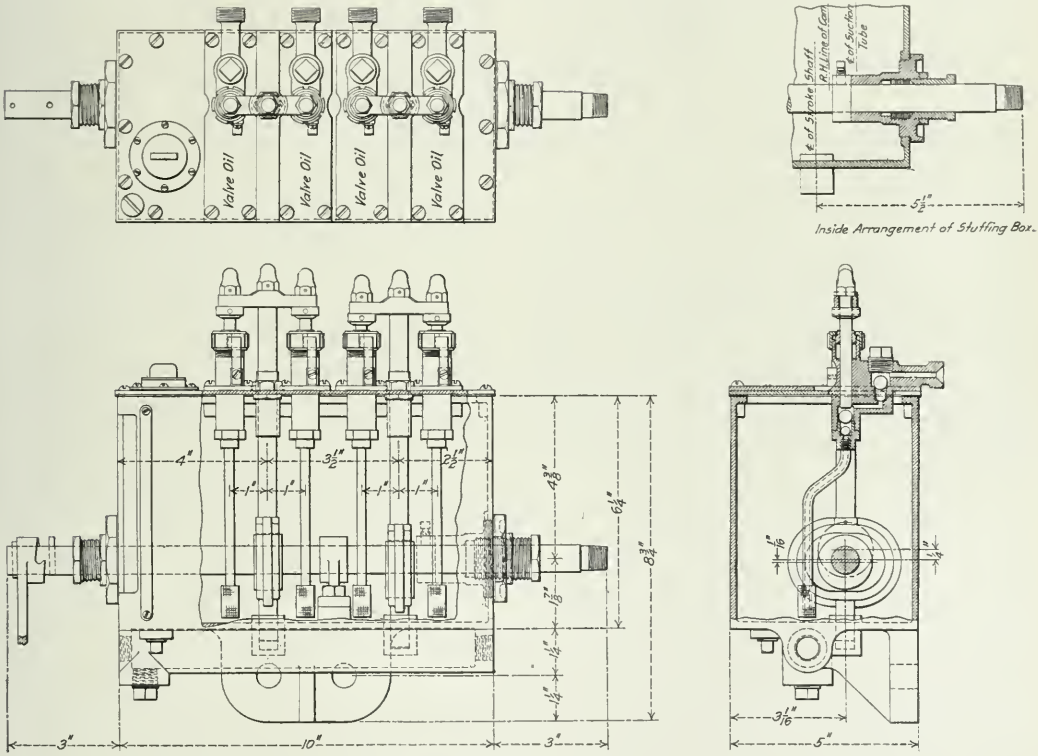
of the transportation and records, and gives the conductor a copy of it.

Tickets of ordinary issue are treated by the conductor in the usual manner, but for the purpose of assisting the conductors, and as far as possible reducing their work in connection with tickets honored but not taken up, local tickets have been provided, having conductors' train checks, which are to be detached by the conductor for his run, the check detached being accepted by the train auditor as transportation for the passenger. Book tickets, on which the destination is to be written or stamped, and some other forms of local tickets are also provided with train checks to be handled in the same manner as card tickets. Mileage detachments and cash fare receipts are handled as usual. Pass signature slips are required of all holders of annual passes, and of all trip passes which are not taken up by the conductor. The conductor is required to show on a form

FORCE FEED LUBRICATOR.

A new design of force feed lubricator has been ordered by the Pennsylvania Lines West of Pittsburgh from McCord & Company, Chicago, for 50 consolidation locomotives. The chief improvements are that the sight feed, the bleeder test and the stroke regulator have been eliminated and the design of the driving shaft stuffing boxes has been changed to that shown in the drawing. It was found that with this type of lubricator both the sight feeds and the bleeder tests were not necessary and that the rate of oil supply could be determined sufficiently accurately at the outset so as not to require the need of a stroke regulator.

The lubricators previously applied to the Pennsylvania engines have been operated from the valve rod which proportioned the number of strokes per minute to the travel of the



Four Feed Locomotive Lubricator.

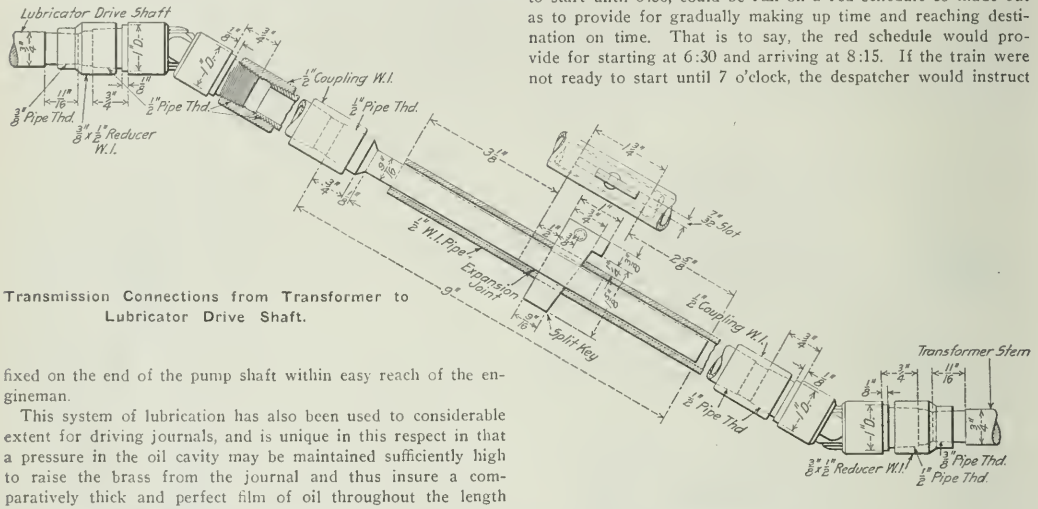
Inside Arrangement of Stuffing Box.

"Transportation honored but not taken up," all tickets not provided with a check to detach, showing the initial point and destination of ticket, form and number. It is not expected that this feature of the plan will add materially to the work required by conductors under previous conditions, in view of the large number of tickets which will be handled only by the first and second conductors. The duties of the train auditor are simple. Being familiar with forms and tickets he is able quickly to ascertain the condition of transportation and whether or not the conductor has his train in proper shape for audit. The check is made absolutely in the open, thereby removing the odium that has frequently been connected with the checking of passenger trains. The White Audit System has in its employ 30 or 40 men, enabling it to make frequent changes on the various roads.

valve. The new application has a constant number of strokes per mile, the transformer connecting arm being connected to the link at a point 6 in. above the link support. The other end of this arm is connected to a transformer made up of a ratchet wheel and a system of bevel gears which drives the transmission rod. The transformer may be located on the running board or at any convenient position. The transmission rod has two universal joints and a slip joint to allow for the longitudinal expansion and contraction. Its construction is clearly shown in the drawing.

The two left hand pumps of the lubricator have strokes of ⅛ in., and lubricate the stoker and the air pump. The two right hand pumps have strokes of ½ in. and lubricate the steam valves. They are capable of pumping against a pressure of

3,000 lbs. per sq. in. The advantages claimed for this system of lubrication are the positive feed while the engine is working, the elimination of pressure in the oil reservoir which makes it possible to fill the lubricator while in full operation, economy in oil consumption as the oil is only fed while the engine is running, no necessity for adjustment on the part of the engineman and the opportunity of forcing an additional supply of oil to the various bearings should it be deemed necessary by the engine man. This latter operation is performed by a crank fixed on the end of the pump shaft within easy reach of the engineman.



Transmission Connections from Transformer to Lubricator Drive Shaft.

This system of lubrication has also been used to considerable extent for driving journals, and is unique in this respect in that a pressure in the oil cavity may be maintained sufficiently high to raise the brass from the journal and thus insure a comparatively thick and perfect film of oil throughout the length of the journal. Where axle pressures have become so great it would seem that this system of lubrication would become a necessity; in fact, there are some cases where before it was installed it was impossible to keep the driving bearings from running hot. There are about 200 of these lubricators in service at the present time.

SYMBOL TRAIN SCHEDULES.

This is the title of a patent—No. 1,043,696—that has been granted to E. A. Hardy, of Caliente, Nev., which is a division terminus on the San Pedro, Los Angeles & Salt Lake. Mr. Hardy says that his scheme of schedules is the product of years of experience and has the endorsement of well-known despatchers.

Readers of the *Railway Age Gazette* will recall an account, published in the issue of November 1, last, page 840, describing "contingent schedules" for freight trains, in use on the Virginian Railway; and also an account of another arrangement, with a similar purpose, proposed by G. W. Turner, and described in the issue of December 13, pages 1131 and 1135. Mr. Hardy's scheme is somewhat similar to these. On the Virginian Railway schedules, made out at uniform speed, are prescribed for through freight trains once in four hours throughout the day, in each direction, to be used if needed; and, so far as possible, every through freight train is run on one of these schedules, though they are not a part of the time-table. When no regular train is due and no contingent schedule is due for four hours a train is relieved from the necessity of flagging back, in case of an unusual stop. Mr. Turner's proposition is to have contingent schedules made out at different rates of speed so that the despatcher can use them for extra trains of any kind, and in both of these plans the main object is to relieve the despatcher from the necessity of sending schedules by telegraph, and thus saving his time as well as promoting safety. Mr. Hardy's principal claim for his arrangement is the saving of time in the despatcher's office and the elimination of chances for error.

Instead of printing his schedules on a separate sheet, as is done on the Virginian Railway, he would print them in red on the time-table. By having enough schedules, showing suitable rates of speed, he could use them for delayed passenger trains. For example, a passenger train starting at 6 a. m. and due at the farther end of the division at 8:15 a. m., and not being ready to start until 6:30, could be run on a red schedule so made out as to provide for gradually making up time and reaching destination on time. That is to say, the red schedule would provide for starting at 6:30 and arriving at 8:15. If the train were not ready to start until 7 o'clock, the despatcher would instruct the conductor and engineman to use that red schedule and run thirty minutes late on it.

The principal rules relative to the symbol schedules are the following:

No train will move under any symbol unless directed by train order. Regular trains moving under symbols will retain their time card rights unless otherwise directed by train order. Extra trains moving under symbols have no right, other than those given them by train order.

No rule of the standard code has to be changed, nor is there any alteration in the standard forms of train orders.

Proposed Railroad for Uruguay.—The plans of the Trans-Uruguay Railway, an American company, have been studied by the Uruguayan government officials and are now ready for final action by the assembly. This road, which extends from the east coast of Uruguay to the northwest corner, with several subsidiary lines, and which also has a port at Atlantica, capable of sheltering the largest ocean vessels, is considered one of the most important propositions ever submitted in Uruguay; and with the very liberal guaranties given, together with the fact that its construction is largely the president's own plan and wish, its success is practically certain.

Construction in Japan.—Work on the Miyazaki section of the Kiushu division is making satisfactory progress. The section from Yoshimatsu, on the main line, to Kobayashi, a distance of 16.74 miles, was opened in September, 1912, and the 30-mile section from Kobayashi to Yamaguchi via Takata-shinden and Miyakonojo is expected to be completed about one year later. The Kagoshima-Sendai section from the present southern terminus of the line via Higashi-ichiki, a distance of 30 miles, will probably be opened to traffic in March, 1914. Both the Miyazaki and Sendai branches will open some new timber and mining country.—*Consular Report.*

General News.

The Pennsylvania Railroad is to have "first aid" outfits carried in all baggage cars, so that each passenger train will carry two separate outfits, one in the baggage car and one on the locomotive.

Seventeen persons were killed by the explosion of the boilers of the steamboat James T. Staples, at Bladen Springs, Ala., on the Tombigbee river, January 9. Twenty-two persons were injured.

The Richmond, Fredericksburg & Potomac has notified the governor of Virginia that it will no longer contest the claim of the state for taxes which has been in litigation for about ten years. It is said that the amount of back taxes now to be paid will be about $338,000.

The New York, New Haven & Hartford announces that the line between Stamford, Conn., and New Haven, 40 miles, will be ready for electric propulsion by July 1, next. With this extension trains can be hauled by electric locomotives from New Haven to New York, 74 miles.

The Toledo & Ohio Central has replaced its colored male cooks and waiters on dining cars with white women. The new waiters wear white dresses and they are said to be a success. The Toledo & Ohio Central runs cafe dining cars on two trains each way daily between Toledo, Ohio, and Charleston, W. Va.

Swift & Company, the meat packers, have announced to their employees that compensation for accidents and injuries will be paid to the firm's employees everywhere, regardless of state laws. There are fourteen states of the Union and four provinces of Canada where laws of this kind are in force and where Swift & Company compensate employees in accordance with the laws.

The Colorado & Southern is to reopen its line from Como to Breckenridge, in compliance with the order recently made by the state supreme court; but has asked the court for a stay of the order for 30 days, because of the severe weather conditions prevailing in the mountains. An officer says that it is possible the case will be taken to the United States Supreme Court.

The Interstate Commerce Commission has issued a revised rule concerning the inspection of cars containing explosives when transferred from one railroad to another. Cars must be very carefully inspected on the outside, so as to avoid unnecessary opening of the doors. If the contents of a car must be inspected at night electric flashlights should be used, and naked lights are forbidden.

The new governor of Indiana, Samuel M. Ralston, in his inaugural address calls for stricter regulation of the railroads and recommends the passage of a public utilities law. A bill has been introduced in the legislature providing for the abolition of the present state railroad commission and creating instead a public utilities commission, to have extensive powers like those exercised by the commissions of New York and certain other states.

W. A. Garrett, vice-president of the Chicago Great Western, has issued 10,000 copies of a circular addressed to all transportation employees of the road, reprinting the news item published in the *Railway Age Gazette* of January 3, quoting a paper by Mrs. Joseph Severn, on "what 'safety first' means in the home," which won the first prize in the contest conducted by a safety committee on the Oregon Short Line. Employees of the C. G. W. are asked to hand the circulars to the "home folks."

The Senate Committee on Appropriations has reported the bill carrying appropriations for the legislative, executive and judicial branches of the government with an amendment to continue the Commerce Court for the remainder of the fiscal year ending June 30, 1913. The appropriation bill of last winter provided for the court only until March 4. It is believed that the sentiment against the court has largely altered since last winter and that a number of members of the Interstate Commerce Commission are not now opposed to it.

At Sacramento, Cal., January 8, there was unveiled a bronze tablet, at Front and K streets, commemorating the fiftieth anniversary of the beginning of work on the Central Pacific Railroad. The monument stands on the spot where Governor Leland Stanford turned the first shovelful of earth. Dr. David Starr Jordan, president of Stanford University, delivered an address in the presence of a large number of veteran railroad men. Trains on the Southern Pacific everywhere were stopped for five minutes at the time of the unveiling.

In the federal court at Buffalo, N. Y., January 13, the grand jury reported indictments against the New York Central, the Erie, the Lehigh Valley and the Grand Trunk for violations of the interstate commerce law. The Erie, indicted on 51 counts, is charged with failure to collect demurrage on anthracite coal, during 1910, 1911 and 1912 for Williams & Peters, sales agents for the Hillside Coal & Iron Company and the Pennsylvania Coal Company, both companies being owned by the Erie. The Lehigh Valley is charged with leasing a coal yard to the Yates-Lehigh Coal Company for $250 a year when the fair rental would be $1,600 a year. The New York Central is indicted on charges of not collecting demurrage.

A man who robbed the city ticket office of the Buffalo, Rochester & Pittsburgh, at Pittsburgh, Pa., last Saturday, holding up the agent with a revolver, told the agent that he was the same person who had robbed the city ticket office of the Erie, at Cleveland, the day before; and he left at Pittsburgh the keys of the Cleveland office. At Cleveland he told the agent that he was the one who had robbed the office of the same road on Broadway, New York City, near Thirty-third street, on January 3. At Cleveland the robber tied the agent to a chair. At all three places he got considerable sums of money. At Philadelphia on Monday, the 13th, there was a similar robbery of an office of the Lehigh Valley, and the police officers believe the robber's statement is true.

Two officers of the Erie road have been arrested and attachments issued for two others for tearing up 2,000 ft. of the tracks of the Cincinnati, Bluffton & Chicago at Simpson, six miles from Huntington, Ind. A. Burgett and C. J. Rist were held on charges of contempt of court and released on bond. Attachments were issued for T. Mackrell, superintendent of the Chicago division, and J. Burke, of Cleveland, engineer of maintenance of way. The Cincinnati, Bluffton & Chicago extends from Huntington to Portland, Ind., and is being operated under a receivership. About a year ago Erie workmen tore up some of the road's tracks and an injunction was issued forbidding them to interfere with the line, which the Erie asserts was built on its right of way. The C. B. & C. admits using the Erie right of way, but claims that it was justified by contract.

"Safety First" is the title of a display advertisement published by President Mellen, of the New Haven road, last week. Prefacing the statement with the remark that no railroad in the country is fully equipped with No. 20 crossovers and that he has ordered the material for the half million dollar expenditure that will be necessary to comply with the Connecticut commission's order (to establish long crossovers), he says that, beginning probably February 2, the schedules of some of the passenger trains will be lengthened in order to provide for the stops which are necessary at short crossovers under the commission's order. The New Haven recognizes that its main line should be the safest railroad in the United States. The rebuilding and electrification carried on during the past two years have been accomplished with safety. Mr. Mellen asks the newspapers to suspend their criticism until he can make the changes now undertaken, as criticism has possibilities of demoralization in the personnel.

Clerks of the New York, New Haven & Hartford to the number, it is said, of 1,600, have secured an increase of pay. Last week it was said that they were taking a strike vote, but the committee in charge reported Saturday night that a compromise had been reached. The men affected appear to be those in the general offices and at the larger stations. The most important concession which has been made to the men is an increase of 15 cents a day to all now drawing less than $25 a week and establishing the minimum rate per day at $2. All clerks who have been in the service one year get one week's vacation at the end of that year. Those who have served more than two years get 10 days, and all who have worked more than five years will have two weeks each year. On each point the company met

the man about halfway. The minimum which the clerks asked was $2.25 a day, and they got $2, which is a substantial increase over the present minimum of $1.75. The vacation schedule is practically what was asked. The demand for an eight-hour day was refused, but the other sections of the adjustment are said by the men to be reasonably satisfactory.

Attorney-General Wickersham is to begin civil proceedings under the Sherman anti-trust law against certain anthracite carriers. The suit will be directed against the so-called minor combinations of coal carrying roads and coal companies in the Pennsylvania fields, charges against which were dismissed by the Supreme Court without prejudice in its recent decision because they were held to have been improperly incorporated in the government's original general bill against the "trust." By direction of the Attorney-General, J. C. McReynolds has been studying for several weeks the effect of the Supreme Court's decision upon conditions in the hard coal fields, and he has recommended pursuing the matter further. The combinations referred to are those alleged to have been created in 1898 by the absorption of the New York, Susquehanna & Western by the Erie; in 1901 by the acquisition by the Reading Company, which owned the Philadelphia & Reading Railway and a coal company by a similar name, of the Central of New Jersey with its coal companies; in 1899 by the acquisition by the Erie of the Pennsylvania Coal Company, which is said to have been projecting a new railroad, the Delaware Valley & Kingston.

Electric Railway Statistics for 1912.

Statistics compiled by the *Electric Railway Journal* from official sources show that the mileage of new electrical track built and placed in operation during 1912, including portions of steam railways electrified, was 950.29 miles as compared with 1,191.58 miles in 1911. The total new track for 1912 is the smallest for any year since 1909. The total number of electric railway cars ordered during the year was 6,001, as compared with 4,015 in 1911. The total includes 4,531 city passenger cars, 783 interurban passenger cars and 687 freight and miscellaneous cars.

Unfilled Tonnage of the Steel Corporation.

The report of the United States Steel Corporation shows that on December 31, 1912, the unfilled tonnage was 7,932,164 tons as compared with 7,852,883 tons on November 30, 1912, an increase of 79,281 tons. The unfilled tonnage on October 31, 1912, was 7,594,381 tons; on September 30, 1912, 6,551,507 tons; and on December 31, 1911, 5,084,761 tons. The increase in December was just about what had been expected, so it did not come as a surprise. The unfilled tonnage on December 31, 1912, has been exceeded only three times, namely, March 31, 1907, when there were 8,043,858 tons; on December 31, 1906, when there were 8,489,718 tons; and September 30, 1906, when there were 7,936,884 tons.

Quiet in New England.

The Federal Grand Jury at New York has continued its investigation into the affairs of the New York, New Haven & Hartford, but the daily papers now give this news in two-inch items. Congress has definitely decided to take no action in this matter. The following is from the *Hartford Times:*

"We have read the message of Governor Haines to the Maine Legislature and it is as silent in regard to any popular grievances against the management of railroads in Maine as is the message of Governor Baldwin of Connecticut. We have also noted the message of Governor Fletcher of Vermont and the proceedings of the legislature of that state, and we have failed to discover any evidence of popular hostility to railroad management.

"Here are three of the New England states, therefore, in which the campaign of attack on the New York, New Haven & Hartford railroad and its allied New England lines has no official encouragement. The situation in New Hampshire is practically the same and throughout the whole of central and western Massachusetts the sentiment of the people is practically unanimous in favor of letting Mr. Mellen go forward to develop the [electric] railway facilities of that state on a broad and generous plan. That plan has now received the official indorsement of a legislative committee which has spent six months in studying the subject.

"Practically the whole outcry against the New Haven road in New England comes from the two cities of Boston and Providence. In Providence there is resentment against the New Haven because it is supposed to have been a party to the stoppage of the Palmer-Providence extension of the Grand Trunk. In Boston the opposition is really confined to a very few people and is largely personal in its nature—that is, it comes from people who find personal profit in engaging in it. This little group of lawyers and politicians who carry on the crusade against New England's railroad interests will presently be exposed in all their littleness and their nakedness, and the consequence of this exposure will be to the advantage of the people of all these six states."

Mileage of Roads Block Signaled.

The table given below, which is made up from that published in our statistical number (December 27, page 1267), shows all railroads, over twenty miles long, appearing in that table, on which the block system is used for 75 per cent. or more of the total length of road used for passenger traffic. A correspondent has called our attention to the fact that in the short table of this kind which was published in our statistical number on page 1238, we did not state that the figures were from a statement made a year ago, and that, therefore, it does not correctly show the situation at the present time. The table now given shows percentages as of January 1, 1913.

Baltimore & Ohio	100
Bessemer & Lake Erie	97
Buffalo, Roch. & Pitts.	100
Chesapeake & Ohio	98
Chicago, B. & Quincy	97
Chicago, Ind. & Louisville	100
Chicago, M. & Puget Sound	97
Cornwall & Lebanon	100
Delaware, L. & Western	77
Durham & Southern	100
Erie	77
Chicago & Erie; Columbus & Erie; Erie & Jersey; Genesee River	100
Grand Trunk	100
Lehigh Valley	100
Monongahela	100
N. Y. & Long Branch	100
N. Y. Central & H. R.	100
Lake Erie & W.	100
Lake Shore & M. S.	100
Michigan Central	100
Pittsburgh & Lake Erie	97
New York, Phila. & N.	83
Norfolk & Western	85
Pennsylvania—	
(All east of Pittsburgh)	100
Pennsylvania Co.	77
Pitts. C. C. & St. L.	80
Quincy, Omaha & K. C.	100
Queen & C.—	
Cincinnati, N. O. & T. P.	100
Richmond, F. & P.	100
St. Louis & S. F.—	
Orange & N. W.	100
Wabash	96
Washington Southern	100
Washington W. P. Co.	100

The reader will understand that in the case of some of the single track lines here shown the companies report that the block system is not used regularly for freight train movements, where no passenger train is involved. As compared with completely signaled roads, these companies may perhaps be said to enjoy in this table a better standing than they are entitled to. On the other hand, some other roads, as, for example, the Southern Pacific and the Union Pacific and their controlled lines, which do not appear in the table at all, have a large mileage of road equipped with automatic signals; but they have also a large mileage of roads carrying a light traffic, not block signaled, which reduces their percentages.

Large Figures.

The New York State Public Service Commission, First District, announces that both of the transportation companies which are to operate the dual system of rapid transit in New York City and contribute to the cost of construction of the new lines, have filed applications for the approval of bond issues needed to finance the project. The Interborough Rapid Transit Company proposes to issue bonds to the amount of $170,000,000. Its petition states that the company has made a contract with J. P. Morgan & Company for the purchase of the entire issue at 93½ and accrued interest. At this rate the company wants permission to issue 5 per cent. bonds, payable in 1966, sufficient to raise $150,797,500. Of this amount the company will use $74,000,000 in cash for its contribution toward the construction of new subways and subway extensions and the purchase of equipment for the same; $16,154,000 to pay for the extension, and $10,800,000 for third-tracking of its elevated lines; $34,668,900 to refund all outstanding bonds; $15,000,000 to pay off outstanding short term notes, and $174,600 to be reserved to pay off outstanding liens on real estate.

The Brooklyn Rapid Transit Company, through the New York Municipal Railway Corporation, which was formed to enter into the proposed contract with the city, desires to issue $100,000,000 of first mortgage 5 per cent. sinking fund gold bonds,

$65,000,000 to be issued immediately. Of the proceeds the company is to apply $13,500,000 toward the cost of construction of new subways and subway extensions; $1,000,000 to pay for the proposed connection between the Fourth Avenue subway and the Broadway subway at Canal street; $26,000,000 for the purchase of equipment; $6,500,000 for the construction of additional tracks on its elevated railroads; $8,000,000 for the extension of such elevated railroads, and $10,000,000 for the reconstruction of these lines.

The Popular Parcel Post.

The postmaster-general has issued a statement showing that the number of parcel post packages sent through 50 leading post offices during the first week of the new service was nearly two million. As the fifty cities making the reports handle about half the postal business of the United States it is estimated that between 3,000,000 and 4,000,000 parcel post packages were mailed from January 1 to January 7. New York sent 448,000, and Chicago 438,000 packages; Boston, 174,000; Philadelphia, 147,000; St. Louis, 145,000; Jersey City, 60,000; Detroit, 45,000; Baltimore, 42,000; Cincinnati, 37,000, and San Francisco, 35,000.

The statement says that the packages were received, despatched and delivered without confusion or delay. In order to achieve this the postmaster-general was obliged to use practically the entire appropriation of $750,000 allowed by Congress, and he asks for another appropriation of the same amount for the remainder of the current fiscal year.

The volume of packages mailed by the parcel post service continues to increase. Postmaster Edward M. Morgan, of New York City, announced that for the 24 hours beginning with midnight January 7, and ending at midnight January 8, a total of 105,547 packages were mailed in the boroughs of Manhattan and the Bronx, as follows:

At General Post Office	23,940
At Grand Central Station	16,180
At Pennsylvania Terminal	13,932
At branch stations	51,495
Total	105,547
Number of packages insured	2,062
Total number of parcels delivered	21,268
Of which:	
Delivered by carrier	1,711
Delivered by wagon	19,557

The first claim for damage was filed at New York, January 9, for a negative, 10 x 12, which was broken in transit between New York and Chicago. It was valued at $5, but the government had insured it for $50, at a cost of 10 cents.

The Firemen's Demand for Higher Pay.

The efforts of Messrs. Knapp and Neill to find a ground for arbitration between the eastern roads and their firemen, have failed, after a week of conference, and Mr. Carter, the leader of the firemen, announced on Wednesday that they would at once vote on empowering the officers of the brotherhood to order a strike. The railroad stood out for an arbitration board of seven men, while the firemen insisted on following the federal mediation law which provides for a board of three men. Aside from the question of the number of arbitrators, the only reason made public by the firemen to sustain their position is that in an arbitration conducted voluntarily and not under the Act of Congress there is no way to exclude false testimony or to punish perjury.

Surprise Tests on the New Haven.

The New York, New Haven & Hartford has issued a new order in regard to surprise tests of enginemen, and the requirements, as outlined in the order, are printed in the *Locomotive Engineers' Journal*. Mr. Stone, grand chief engineer of the brotherhood, criticises some of these tests as dangerous. He refers particularly to turning switch lights so as to indicate red when an engineman is approaching the switch at high speed. Enginemen in such circumstances, he says, have troubles enough already. The New Haven road requires these tests to be made only where the engineman will have a long view of the switch light; but Mr. Stone says that a road, in the west, a few years ago, tried this method and, within a few months, it was found that local officers making such tests selected the worst places that they could find. After two men had been injured by jumping off engines it was discontinued. Mr. Stone calls for national legislation making it a criminal offense to test enginemen in the way described.

Among the things to be done to test men on the New Haven road are the following: Train orders improperly made out; clearance blanks improperly made out; train orders improperly repeated; markers improperly displayed; wrong whistle-signal given to come in; fixed signals clear with red flag in tower; lights removed from signals; blade removed from signal; signal arms half way between stop and clear; train order signals turned to the stop position after the engine has passed; block signal at clear when passed and then changed to stop, while work is being done at the station; and changing of switch light to show red instead of green.

Holiday Travel at Chicago.

The Chicago & North Western has compiled the following figures showing the large amount of passenger traffic handled in and out of the new passenger terminal in Chicago, Friday, December 20, and Saturday, December 21, 1912.

Passengers handled through Terminal, Friday, Dec. 20	51,127
Passengers handled through Terminal, Saturday, Dec. 21	54,489
Friday, Dec. 20, regular sleepers (standard)	44
Friday, Dec. 20, regular sleepers (tourist)	5
Total number of regular sleeping cars	49
Extra sleepers handled (standard)	23
Extra sleepers handled (tourist)	1
Total number of sleepers handled out of Terminal, Friday, Dec. 20	73
Saturday, Dec. 21, regular sleepers (standard)	44
Saturday, Dec. 21, regular sleepers (tourist)	5
Total number of regular sleeping cars	49
Number of extra standard sleepers handled	14
Total number of sleepers handled, Dec. 21	63
Regular number of parlor cars out of Chicago	28
Regular number of parlor cars into Chicago	28
Extra parlor cars into Chicago, Friday, Dec. 20	15

Of these 15 there were 7 from Madison (students) and 4 from Milwaukee.

Proper Basis for Mail Pay.

The present plan of compensation has never worked to the disadvantage of the Government, but has failed to do justice to the railways by reason of infrequent weighing; absence of pay for nearly 40 per cent. of the space occupied as traveling post offices; the performance, without pay, of side and terminal messenger service, and the unjustifiable reduction in pay by the Act of Congress of March 2, 1907, supplemented by Order No. 412 of the Postmaster-General, changing the divisor.

The present law is based upon correct principles, but should be so amended as to provide—

(*a*) For the repeal of the Act of March 2, 1907. Notwithstanding the large increase in every other item connected with the administration of the Post Office Department, the railroads' pay has been singled out as the one element in these operations for concentration of economies. This, too, in the face of the fact that the operating expenses of the railroads have been greatly augmented by the requirements of the law with reference to steel cars, and a general increase in cost characteristic of all business operations.

(*b*) For annual weighings, and a definite and just method for ascertaining daily average weights. The railroads must provide car space and facilities for the maximum weight offered at any time, yet they are paid only for the average weight carried. The Postmaster-General's order covering the divisor has unfairly reduced this average. The parcel post will take from the express service traffic for which the railroad companies now receive compensation transferring it to the mail service; no provision for payment to the railroad companies for the increased tonnage to be handled in mail cars, although such provision was made for the star routes and the city wagon service.

(*c*) For pay for apartment cars on some basis that will compensate for the service. The Postmaster-General has recognized the justice of such a change.

(*d*) For a fair allowance to the railroads for the side and terminal messenger service. The necessity for this is also emphasized by the establishment of the parcel post which will undoubtedly add greatly to the expense of the service.

(*e*) That all rates of pay should be definite and not subject

to the discretion of the officers of the Post Office Department. Other inequities exist under the present law, but are due to the administrative methods rather than to the law itself.—*Committee on Mail Pay, R. Peters, Chairman.*

Judge Archbald Found Guilty.

Robert W. Archbald, of Scranton, Pa., one of the judges of the United States Commerce Court, and for twenty-nine years a judge in state and federal courts, was, on January 13, found guilty by the United States Senate of "high crimes and misdemeanors"; was stripped of his office and forever disqualified from holding positions of public honor or public trust. This conviction is the result of the trial that has been pending in the Senate several months.

On five of the thirteen charges brought against him by the House of Representatives, Judge Archbald was found guilty. On the first charge the vote was guilty, 68 to 5, and Senators Burnham, Penrose, Oliver, Paynter and Catron were the only members of the Senate who voted to support Archbald. The first five charges were as follows:

First—That Judge Archbald influenced officers of the Erie Railroad, then a litigant in his court, to grant him a favorable option on its share of the Katydid culm dump, near Scranton.

Second—That he attempted to effect a settlement between the Marion Coal Company, of Scranton, and the Delaware, Lackawanna & Western Railroad of a case then pending before the Interstate Commerce Commission on a basis that would have given him a share of the fee earned by George M. Watson, attorney for the Marion Coal Company. On this he was not convicted.

Third—That he attempted to influence the Lehigh Valley Railroad Company to relinquish a lease on "Packer No. 3," near Shenandoah, so that he might lease it on favorable terms from the Girard estate, of Philadelphia. *Convicted.*

Fourth—That Judge Archbald secured from Helm Bruce, attorney of the Louisville & Nashville Railroad, private letters and arguments to sustain an opinion in favor of the railroad in a suit before the Commerce Court. *Convicted.*

Fifth—That Judge Archbald influenced officers of the Philadelphia & Reading Coal and Iron Company to grant a lease on a coal property to Frederick Warnke, for which service Warnke gave him a note for $500. *Convicted.*

On the remaining eight charges the vote was less than two-thirds, and so did not result in conviction. These had to do with trying to influence officers of the Lehigh Valley to buy an interest in coal lands, accepting gifts from litigants and appointing a railroad attorney a jury commissioner.

The President-Elect and the Labor Unions.

Woodrow Wilson, governor of New Jersey, in his annual message to the legislature, delivered this week, again calls attention to the need of abolishing large numbers of grade crossings in the state. Recognizing the great difficulty of meeting the cost of such improvements he says:

"No invariable rule can be laid down which will not lead to all sorts of impossible situations and the eventual interference of the courts. The proper solution of this very difficult matter is to empower the Board of Public Utility Commissioners to order the abolition of such grade crossings in such ways and at such a rate as will adjust their orders to each particular case and set of circumstances."

And the governor again calls for a full-crew law, apparently in disregard of the temperate utterances of the Public Utility Commissioners last year (*Railway Age Gazette*, February 16, p. 275). He says: "Permit me to urge another piece of legislation which seems to me essential both to the safety of travel and to the fair protection of certain classes of railway employees. I refer to the so-called full-crew bill, whose failure to pass the last legislature was so much deplored by all who had noted its introduction and its significance. It is of the highest consequence that railway trains which pass through the state should be manned by adequate crews; and to me, for one, it is a matter of chagrin that they should now carry smaller crews through New Jersey than through Pennsylvania. This is a matter which we cannot afford to neglect. If it cannot be satisfactorily handled in an act, it might also very well be put in the hands of the Public Utility Commissioners by addition to their powers."

Exhibit of the National Railway Appliances Association.

The annual exhibition of the National Railway Appliances Association, in connection with the convention of the American Railway Engineering Association will be held in Chicago, March 15 to 21, inclusive. Both the Coliseum and the First Regiment Armory have been leased to provide for the constantly increasing demand for space, and although it is yet several weeks before the exhibition will be held, most of the space has been allotted.

All railway officials who would be interested in the exhibit will this year receive a special invitation in the form of the association's year book, published this year for the first time, 3,000 copies of which will be distributed among all classes of railway officials.

Following is a partial list of the exhibitors who have reserved space:

Adams & Westlake Co., Chicago.
Ajax Forge Co., Chicago.
American Guard Rail Fastener Co., Philadelphia, Pa.
American Hoist & Derrick Co., Chicago.
American Lock Nut Co., Chicago.
American Railway Signal Co., Cleveland, Ohio.
American Rolling Mill Co., Middletown, Ohio.
American Steel & Wire Co., Chicago.
American Valve & Meter Co., Cincinnati, Ohio.
American Vulcanized Fibre Co., Pittsburgh, Pa.
Asphalt Ready Roofing Co., New York.
Associated Manufacturers' Co., Waterloo, Iowa.
Atlas Preservative Co. of America, New York.
Barbey, F. A., Boston, Mass.
Barrett Manufacturing Co., New York.
Beaver Dam Malleable Iron Co., Beaver Dam, Wis.
Blessing, Louis, Jackson, Mich.
Bowser & Co., S. F., Fort Wayne, Ind.
Brach Supply Co., L. S., New York.
Bryant Zinc Co., Chicago.
Bucyrus Co., South Milwaukee, Wis.
Buda Co., Harvey, Ill.
Buyers' Index Co., Chicago.
Cambria Steel Co., Pittsburgh, Pa.
Carey Co., Philip, Cincinnati, Ohio.
Carnegie Steel Co., Pittsburgh, Pa.
Carpenter & Co., Geo. B., Chicago.
Chicago Bridge & Iron Works, Chicago.
Chicago Pneumatic Tool Co., Chicago.
Chicago Railway Equipment Co., Chicago.
Chicago Steel Railway Tie Co., Chicago.
Cleveland Frog & Crossing Co., Cleveland, Ohio.
Clyde Iron Works, Duluth, Minn.
Commercial Acetylene Railway Light & Signal Co., Chicago.
Concrete Steel Co., Chicago.
Conley Frog & Switch Co., Memphis, Tenn.
Cook's Standard Tool Co., Kalamazoo, Mich.
Crerar, Adams & Co., Chicago.
Curtain Supply Co., Chicago.
D. & A. Post Mold Co., Three Rivers, Mich.
Des Moines Bridge & Iron Works, Pittsburgh, Pa.
Detroit Graphite Co., Detroit, Mich.
Detroit Switch Lock Co., Detroit, Mich.
Dickinson, Paul, Inc., Chicago.
Dietzgen Co., Eugene, Chicago.
Dilworth, Porter & Co., Pittsburgh, Pa.
Dixon Crucible Co., Joseph, Chicago.
Drouve Co., G., Bridgeport, Conn.
Duplex Metals Co., New York.
E. D. E. Co., Chicago.
Eastern Granite Roofing Co., New York.
Edison, Thomas A., Inc., Orange, N. J.
Edison Storage Battery Co., Orange, N. J.
Electric Storage Battery Co., Chicago.
Fairbanks, Morse & Co., Chicago.
Fairmont Machine Co., Fairmont, Minn.
Federal Signal Co., Albany, N. Y.
Foster, Frank M., Columbus, Ohio.
Franklin Manufacturing Co., Chicago.
General Electric Co., Schenectady, N. Y.
General Railway Signal Co., Chicago.
Hall Switch & Signal Co., Chicago.
Hart Steel Co., Elyria, Ohio.
Hayes Track Appliance Co., Richmond, Ind.
Hobart-Allfree Co., Chicago.
Hubbard & Co., Pittsburgh, Pa.
Indianapolis Switch & Frog Co., Springfield, Ohio.
Inland Steel Co., Chicago.
International Harvester Co. of America, Chicago.
International Steel Tie Co., Cleveland, Ohio.
Iowa Gate Co., Cedar Falls, Iowa.
Johns-Manville Co., H. W., New York.
Jordan Co., O. F., Chicago.
Joyce-Cridland Co., Dayton, Ohio.
Kalamazoo Railway Supply Co., Kalamazoo, Mich.
Kennicott Co., Chicago.
Kerite Insulated Wire & Cable Co., New York.
Keuffel & Esser Co., Chicago.
Keystone Driller Co., Chicago.
Lackawanna Steel Co., Buffalo, N. Y.
Lehon Co., Chicago.
Lidgerwood Manufacturing Co., Chicago.
Lorain Steel Co., Chicago.
Lufkin Rule Co., Saginaw, Mich.
Lupton's Sons Co., David, Philadelphia, Pa.
Lutz-Lockwood Manufacturing Co., Aldene, N. J.
Massey Co., C. F., Chicago.
McFarlane Manufacturing Co., St. Paul, Minn.
McGraw Publishing Co., New York.
MacRae's, The Railway & Supplymen's Mutual Catalog, Chicago.
Morden Frog & Crossing Co., Chicago.
Mudge & Co., Burton W., Chicago.

M. W. Supply Co., Philadelphia, Pa.
National Carbon Co., Cleveland, Ohio.
National Electric Specialty Co., Toledo, Ohio.
National Lock Washer Co., Chicago.
National Malleable Castings Co., Chicago.
National Surface Guard Co., Chicago.
Nichols & Brother, Geo. P., Chicago.
North Western Construction Co., New York.
Ogle Construction Co., Chicago.
Okonite Co., New York.
O'Malley-Beare Valve Co., Chicago.
Otis Co., Spencer, Chicago.
Otto Gas Engine Works, Philadelphia, Pa.
P. & M. Co., Chicago.
Patterson Co., W. W., Pittsburgh, Pa.
Pease Co., C. F., Chicago.
Pennsylvania Steel Co., Steelton, Pa.
Pocket List of Railroad Officials, New York.
Potter-Winslow Co., Chicago.
Q. & C. Co., New York.
Rail Joint Co., New York.
Railroad Supply Co., Chicago.
Railway List Co., Chicago.
Railway and Engineering Review, Chicago.
Ramapo Iron Works, Hillburn, N. Y.
Reliance Manufacturing Co., Massillon, Ohio.
Richards-Wilcox Manufacturing Co., Aurora, Ill.
Roberts & Schaefer Co., Chicago.
Sanitary Bunk Co., Indianapolis, Ind.
Sellers Manufacturing Co., Chicago.
Signal Accessories Co., New York.
Simmons-Boardman Publishing Co., New York.
Snow Construction Co., T. W., Chicago.
Southern Railway Supply Co., St. Louis, Mo.
Standard Asphalt & Rubber Co., Chicago.
Standard Underground Cable Co., Pittsburgh, Pa.
Stark Rolling Mill Co., Canton, Ohio.
Steel Railway Tie & Appliance Co., Denver, Col.
Templeton, Kenly & Co., Ltd., Chicago.
Titanium Alloy Manufacturing Co., Niagara Falls, N. Y.
Toledo Pipe Threading Machine Co., Toledo, Ohio.
Union Draft Gear Co., Chicago.
Union Iron Works, Hoboken, N. J.
Union Switch & Signal Co., Chicago.
U. S. Wind Engine & Pump Co., Batavia, Ill.
Verona Tool Works, Chicago.
Western Electric Co., Chicago.
Wharton, Jr., & Co., Wm., Inc., Philadelphia, Pa.
Winans Improved Patent Rail Joint Co., Portland, Ore.
Wolfe Brush Co., Pittsburgh, Pa.

Central Railway Club.

The annual meeting of the Central Railway Club was held in Buffalo on Thursday, January 9. At the professional session in the afternoon Arthur Hale presented a paper on Freight Car Tactics. The following officers were elected for the ensuing year: President, W. F. Jones, general storekeeper, New York Central; first vice-president, W. Elmer, Jr., superintendent of motive power, Pennsylvania; second vice-president, H. C. Manchester, superintendent of motive power, Delaware, Lackawanna & Western; third vice-president, E. J. Devans, superintendent, Buffalo, Rochester & Pittsburgh. Executive members: E. M. Tewkesbury (So. Buffalo R. R.); George A. Bowman (B. R. & P.); and E. P. Mooney (Ingersoll Rand Company). Secretary-treasurer, H. D. Vought.

During the evening the annual banquet was held at the Hotel Statler. H. H. Vreeland of New York acted as toastmaster, and addresses were made by Arthur Hale, A. J. Grymes, manager marine department of the Erie, and William McClellan, electrical engineer of the New York Public Service Commission, Second district.

Railway Supply Manufacturers Association.

The Railway Supply Manufacturers Association has issued circular No. 1, giving detailed information concerning the exhibit arrangements for the Master Mechanics and Master Car Builders' conventions, which will be held at Atlantic City, N. J., next June. The exhibits will again be on Young's Million Dollar Pier, and 87,361 sq. ft. of exhibit space has been provided, an increase of 5,597 sq. ft. The price of space is 40 cents per sq. ft., as usual. Space will be assigned on February 11, 1913, at the office of the secretary, J. D. Conway, Oliver building, Pittsburgh, Pa.

International Refrigeration Exposition.

Arrangements have been perfected for the holding of an exposition of refrigeration in connection with the third annual International Congress of Refrigeration in September, at Chicago. The exposition will be held in the amphitheater at Forty-second and Halsted streets, and will include exhibits of the various devices pertaining to refrigeration, as well as refrigerator cars and refrigerating machinery.

Railway Business Association.

Announcement has been made that it has been decided to hold the annual dinner of the Railway Business Association in the second week in December instead of in the third week, as was done last year, because some of the members and guests, especially from the West, found it difficult to attend the dinner in New York and get home in time for Christmas.

Cleveland Engineering Society.

At the meeting of the Cleveland Engineering Society, held on January 14, James L. Stuart, constructing engineer, Pittsburgh, Pa., presented a paper on Business Methods in Construction Work.

Railway Club of Pittsburgh.

At the regular monthly meeting of the Railway Club of Pittsburgh, to be held January 24, W. M. Prall, superintendent of car service, Pennsylvania Lines West, will present a paper on Terminal Service.

Kansas Engineering Society.

The annual meeting of the Kansas Engineering Society will be held January 21-22, at Topeka, Kan. T. J. Strickler, Topeka, is secretary.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRICAL RAILWAY MANUFACTURERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 13 Park Row, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Convention, January 21-23, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursdays, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

International Railway General Foremen's Association.—Wm. Hall, Chicago & North Western, Escanaba, Mich. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances' Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meetings with Am. Ry. Eng. Assoc.

New England Railroad Club.—G. H. Frazier, 10 Oliver St., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C. M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La. Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Rampo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Travelling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man., 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The railways operating between Kansas City and Denver have reduced their time freight schedules between the two cities from 72 to 48 hours.

The Baltimore & Ohio has notified the State Railroad Commission of Pennsylvania that it will no longer contest the order of the commission, issued December 3, 1910, requiring the road to charge no higher fare from points east of Connellsville to points west of that place than the aggregate of the fares to and from Connellsville.

A joint committee, representing the industrial traffic managers of the Business Men's League of St. Louis, and the Local Freight Agents' Association of St. Louis and East St. Louis, has issued a joint circular urging all shippers to exercise greater care in the marking of freight, and containing several rules, the observance of which would tend to prevent loss and damage claims and delays to freight.

The Merchants Association of New York City announces the usual reduction in fares for merchants coming to New York to make their spring purchases. The rates, full fare one way and half fare the other, apply at trunk line points more than 100 miles from New York City, and the dates are January 18 to 21, inclusive; February 15 to 18; March 1 to 4; March 15 to 18. The return trip must be made within fifteen days.

The increase of single-trip and round-trip suburban fares on the Illinois Central in Chicago on January 1 has elicited protests from several business men's associations in districts along the line who have held a mass meeting, addressed a petition to the management asking a restoration of the old rates, and filed a complaint with the Illinois Railroad and Warehouse Commission. In their newspaper interviews the protestants speak as if all of the suburban rates had been advanced, whereas there has been no change in commutation rates for 10-ride and 25-ride tickets, nor for monthly tickets.

The Alabama-New Orleans Transportation Company is working on plans for the operation of a line of self-propelled steel barges from the Warrior river coal fields in Alabama to the Warrior and Alabama rivers, Mobile bay, Mississippi sound and the Lake Borgne canal to the Mississippi river and New Orleans. It is proposed to carry coal, principally, on the going trips and general cargo on the return trips. The company has recently installed a ship-building plant at Violet, La., for the construction of its own barges, and this work is now under way. It is also preparing extensive land and water terminals at a cost of about $500,000 for the handling of coal, both by water and rail and in storage.

Citrus fruit shippers of southern California at a meeting with the traffic officers of the Southern Pacific, Atchison, Topeka & Santa Fe, and San Pedro, Los Angeles & Salt Lake, last week asked the railways to come to their assistance, in view of the destruction of a large part of the crops by cold weather, by making an emergency reduction in rates on fruit shipments to the east and north at once, in order that a portion of the crop, which is only slightly damaged, may be sent to market for what it will bring. There are now blanket rates applying to practically all points east of the Rocky mountains of $1.15 per 100 lbs. on oranges and $1 on lemons. Some of the shippers asked for a reduction as great as 50 per cent. The railway men took the position that the part of the crop that escaped the frost could stand the present rates, and that the portion that has been damaged should not be shipped at any price, except under special conditions.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on Relations Between Railroads of the American Railway Association, in presenting the statistical bulletin No. 135, giving a summary of car surpluses and shortages by groups, from September 27, 1911, to December 31, 1912, says: The total surplus on December 31, 1912, was 50,659 cars; on December 14, 1912, 26,614; on December 20, 1911, 88,646 cars. Compared with the preceding period; there is an increase in the total surplus of 24,045 cars, of which 7,365

is in box, 1,100 in flat, 10,221 in coal and 5,359 in miscellaneous cars. The increase in box car surplus is general throughout the country, except in group 6 (Iowa, Illinois, Wisconsin and Minnesota). The increase in flat car surplus prevails throughout the country, except in groups 9 (Texas, Louisiana and New Mexico), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona). It will be noted that there is an increase in coal car surplus in every group. Doubtless the observance of the holiday season by the miners has contributed to this. The increase in miscellaneous car surplus prevails throughout the country, except in groups 7 (Montana, Wyoming, Nebraska and the Dakotas), and 9 (as above).

The total shortage on December 31, 1912, was 33,601 cars; on December 14, 1912, 61,006 cars; on December 20, 1911, 11,832 cars. Compared with the preceding period; there is a decrease in the total shortage of 27,405 cars, of which 12,435 is in box, 1,046 in flat, 10,667 in coal and 3,257 in miscellaneous cars. The decrease in box car shortage appears in all groups. The decrease in flat car shortage is shown in groups 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 4 (the Virginias and Carolinas), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 9, 10 (as above), and 11 (Canadian Lines). The decrease in coal car shortage is general, except in group 7 (as above). The decrease in miscellaneous car shortage prevails throughout the country except in groups 7 and 9 (as above).

Compared with the same date of 1911; there is a decrease in the total surplus of 37,987 cars, of which 10,407 is in box, 1,928 in flat, 18,586 in coal and 7,066 in miscellaneous. There is an increase in the total shortage of 21,769 cars, of which 14,431 is in box, 2,489 in flat, 3,267 in coal and 1,582 in miscellaneous.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and totals for the country for the corresponding dates for previous years; and the diagram shows the total bi-weekly surpluses and shortages from 1907 to 1912.

CAR SURPLUSES AND SHORTAGES.

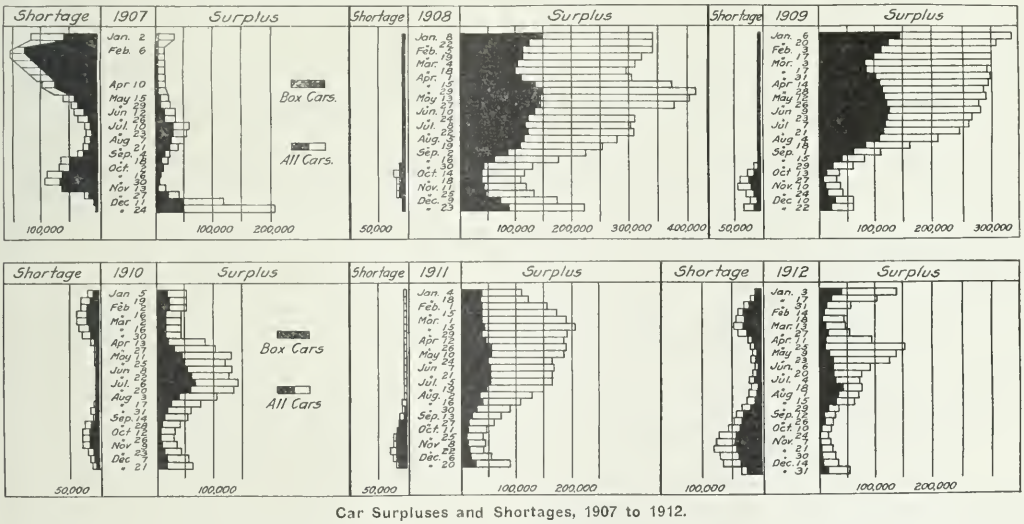
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1912.

E. B. Thomas to the Farmers.

There are many ways in which railroads aid agricultural work. Some of them run special instruction trains and hold exhibitions; others issue numerous pamphlets; others attract settlers. All these things have their place; but I think that the method we have adopted is perhaps more practical and more serviceable to the farmers themselves—those who are already settled—than any other. For the essence of the plan is that the road's agriculturist shall give practical not theoretical advice; that he shall become acquainted with the particular problem of the particular man, and point out just what should be done and what should not be done in special cases.

In the section traversed by the Lehigh Valley is located much of the best land to be found anywhere in the United States. You all know how far some of the apples which are grown in the east surpass the far-famed western product. It does seem a pity that here in New York and Pennsylvania, so near the

large cities which constitute such insatiable markets, there is so much land that is either not cultivated in the most remunerative manner or not cultivated at all.

Any fair-minded man, from a very brief examination of rate schedules, will conclude that the proportion of the market price of agricultural products that goes into the freight rate is far from too large; transportation is the only article having a relation to the cost of living that has not advanced in price. The farmers frequently complain that they get far too small a price for their milk, considering what it is sold for in New York. The railroad company gets 32 cents for transporting a can of 40 quarts from the most distant zone, 190 miles or more from New York City. Some of our milk is shipped from as far as 400 miles from the city. The railroad rate of 4/5 of a cent a quart I hardly think that anybody can justly call an exorbitant rate, especially when the character of the service is considered —the refrigeration, the collecting at the various milk stations, the quality of the equipment necessary, and the fast schedule upon which milk trains are operated. These rates have not been increased in over fifteen years. Hence they could not have been a factor in the increased retail price of milk. The point I wish to make is that, if the cost of food products has become unduly high, it is not because the railroad or the farmer is getting too much out of it.

I suggest that you think seriously of a plan that has been proposed, for farmers to co-operate and establish storage plants where they can keep their products at a time of over-supply. I know, of course, that there will be some to remind us that there were not enough cars last autumn to ship the vegetables to market, and it is true that a scarcity of cars was felt. But it is absolutely impossible for enough cars to be kept in service to meet such a situation as the one I mention.

In the quality of railroad service, naturally, the farmer is vitally interested. On no railroad is the service perfect. In this world things never are. But, speaking for the Lehigh Valley, I can say that the management makes a sincere effort to give just as good service as possible to the farmers. Traffic is handled more safely and rapidly now than ever before. But that is not to say that we are standing still, content with things as they are.

The rapid development of the railroad industry has been attended by many changes calculated to excite not only unjust but even just criticism. In a new country, under new conditions, and without experience of the past as a guide, there has been developed a system of transportation such as the world had never dreamed of. To say that such a vast industry could have been developed, with the multitude of minds and the millions of capital which it required, without some individuals having seized upon the opportunity to increase their own fortunes, would be to say that human nature had changed. No enterprise of this magnitude in the history of the world has ever been conceived and carried on without individual benefit to its promoters. To say that it could have been done in the development of the railroads is to insist that the men who were engaged in it are fit only for that place where the only method of transportation is wings and the sound of the whistle is replaced by the music of harps. . . .—*E. B. Thomas, President of the Lehigh Valley, before the Farmers' Institute at Towanda, Pa., January* 11.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended from January 1 to May 1, an item in a supplement to Hosmer's tariff, which provides that the joint through class rates named in the tariff will not apply between Missouri river points, Mississippi river crossings and certain stations on the St. Louis, Iron Mountain & Southern between St. Louis, Mo., and Memphis, Tenn., and that the combination of locals will apply in lieu thereof. Taking Kansas City, Mo., as a representative point of origin, and Williamsville, Mo., as a representative destination, the cancellation of existing rates would result in an advance of 28 cents on first class with corresponding advances on the lower classes.

The commission has suspended from January 7 until May 7 certain items in supplement to the tariff of M. P. Washburn, which advance rates for the transportation of ground iron ore, in carloads, from Chattanooga, Tenn., and certain other points to New York, Boston, Mass., and certain other points. The present tariff provides a rate of $3.79 per gross ton from Chattanooga to Boston, all rail, and a rate of $3.57 per gross ton from Chattanooga to New York, all rail. The items which have been suspended advance the rates to $6.60 per gross ton to Boston and $5.95 per gross ton to New York, making an advance of $2.81 per gross ton to Boston and $2.38 per gross ton to New York.

The commission has suspended from January 5 until May 5 items in a supplement to Emerson's tariff, which change the rates on classes and commodities from New Orleans, and points in that vicinity, to Rock Falls and Sterling, Ill. Up to the present time Chicago rates have been applicable to this traffic. The suspended items provide for application of the Dubuque, Ia., basis of rates on traffic from New Orleans to Sterling and Rock Falls, which change would result in an advance of 5 cents per 100 lbs. on the first and second classes, no change on the third and fourth classes, an advance of 3 cents on fifth class and 4 cents on sixth class, an advance of 5 cents per 100 lbs. on sugar in carloads, and similar advances on other commodities.

The commission has suspended from December 31, until April 30, certain tariff schedules which eliminate through rates for the transportation of lumber from points in British Columbia and Alberta, Canada, and Oregon, Washington and other states to eastern points via Denver, Pullman and Pueblo, Colo., in connection with the Atchison, Topeka & Santa Fe; Chicago, Burlington & Quincy; Chicago, Rock Island & Pacific; and Missouri Pacific, and provide for application of combination rates, leaving through rates in effect on shipments moving over the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line to eastern points only via the Union Pacific. The present rate from Portland, Oregon, to Chicago via the Colorado gateways is 65 cents and the proposed rate is 89 cents, an advance of 24 cents. The present rate from Portland to New York is 85 cents, and the proposed rate is $1.08½, an advance of 23½ cents.

Salt Rates Not Advanced.

In re investigation and suspension of advances in rates by carriers for the transportation of salt from Kansas points to stations located on the Wichita Falls & Northwestern in the state of Oklahoma. Opinion by Chairman Prouty:

The effect of the tariff under suspension is to cancel joint rates on salt from the salt fields of Kansas to points in Oklahoma on the Wichita Falls & Northwestern, thereby advancing rates when shipped by these routes from 5 cents to 10 cents per 100 lbs. The commission found that as the carriers did not justify the proposed advances, the advances are unjust and unreasonable and that the present through route should be maintained. (25 I. C. C., 610.)

Minimum Weight and Car Sizes.

Riverside Mills v. Georgia Railroad et al. Opinion by the commission:

Charges collected for the transportation of two shipments of cotton-factory sweepings from Augusta, Ga., to Lockland, Ohio, were found to have been unreasonable. Reparation was awarded.

Carload minimum weights should be established with reference to the loading capacity of the car. If carriers desire to protect themselves from unduly low charges per car, they should do so by regulating the rate, and not by prescribing minimum weights which can only be loaded in cars of unusual size.

It is incumbent upon carriers to furnish cars that will ordinarily contain the minimum weight which they have established, or to publish a rule that will provide for charging shippers on that basis, when unable to furnish such cars. (25 I. C. C., 434.)

Complaint Dismissed.

Manufacturers & Merchants' Association of New Albany, Ind., et al. v. Aberdeen & Asheboro et al. Opinion by Commissioner Clements:

The petitions for modification and extension of the original order in this case (24 I. C. C., 331), mentioned in the *Railway Age Gazette* of July 26, 1912, page 179, filed by the complainants, and for setting aside of the original order, filed by the defendants, were denied as to all contentions of both parties, except as to complainants' request for reconsideration of question of reparation. (25 I. C. C., 116.)

STATE COMMISSIONS.

The New York State Public Service Commission, Second District, has consented to the discontinuance of passenger stations at six places on the Greenwich & Johnsonville. The company has found that there is no further need for passenger service at these stations because the people now travel by the Hudson Valley electric road.

The railway commissioners of Canada have issued a circular directing that engines running tender first, except suburban tank engines, equipped with pilot on tender, shall not exceed a speed of 20 miles an hour. The board has been impressed with the number of injuries to enginemen (in some cases fatal) apparently due to engines being run tender first at excessive speed.

The New York State Public Service Commission, First district (New York City), has sent to the legislature its annual report. The report is made up largely of an account of the doings of the commission in relation to rapid transit, which includes a list of the contractors who are doing the new work now under way, with information about the contracts. On the subject of grade crossings, of which there are 477 in Greater New York, the commission explains the reasons for its request for large appropriations from the state treasury. The companies operating surface railways in the city have introduced many additional gates and have taken other measures for protection, and the number of persons killed and injured has been diminished during the past five years, as shown by the following statement of the total numbers killed each year, namely: 1908, 21; 1909, 23; 1910, 16; 1911, 30; 1912, 10.

The annual report of the Indiana railroad commission, following the usual statistics, contains a recommendation for legislation to prevent trespassing on railway tracks by providing for a penalty to be imposed on persons who use the tracks as a thoroughfare. The commission also recommends legislation making it a misdemeanor for persons to pass under or over railway gates at highway crossings when the gates are down. The report shows that during the year 1912, 447 persons were killed on the steam and electric railways of the state and that there were 7,249 casualties altogether. The commission classifies 305 of the deaths as preventable and 4,103 of the casualties as preventable. The report states that when the signaling now ordered by the commission is installed, 64 per cent. of the steam railway mileage in the state will be equipped with block signals. Automatic block signals have been installed on 1,313 miles since the enforcement of the block signal law and manual block signals have been installed on 1,393 miles.

Massachusetts Commission's Views.

The Massachusetts Railroad Commission in its annual report considers the status of the New York, New Haven & Hartford, in the light of recent public discussions concerning the re-

Reparation Awarded.

Switzer Lumber Company v. Kansas City Southern Railway Company. Opinion by the commission:

The commission found that the rate of 18 cents per 100 lbs. for the transportation of lumber in carloads from Stables, La., to Ashdown, Ark., was unreasonable to the extent that it exceeded 10 cents. (25 I. C. C., 611.)

Arabol Manufacturing Company v. South Brooklyn Railway Company et al.

The commission found that the joint rates for the transportation of seventeen carloads of sizing from Bedford, N. Y., via Wechawken, N. J., to Carthage and other New York points were unreasonable to the extent that they exceeded the aggregate of the intermediate rates. (25 I. C. C., 429.)

In re investigation and suspension of advances in class and commodity rates by carriers operating between stations in the states of Missouri, Kansas and Nebraska.

Rates between points on the Joplin branch of the Missouri Pacific and points upon its Northern and Virginia branches may be constructed by combination in the same manner as from points upon its line between Kansas City and St. Louis. The order of suspension was vacated. (25 I. C. C., 401.)

lations of the company to the state and to the road's patrons. Unlike former utterances of the Massachusetts commission this chapter is made up of statements which are couched in such general terms that they may be called vague. The substance of this long deliverance is all contained in the following seven paragraphs extracted by the *Boston Journal:*

"The people of this state have a right to demand railroad facilities commensurate with the profitable character of the business in this territory."

"It is the consensus of intelligent opinion that the system has already exceeded the proper limits of combination, and that unless it proceeds to voluntarily divest itself of some of the properties now held there is but little doubt that some other effectual means will be found for accomplishing that result."

"Indifference on the part of the railroad companies to the legitimate transportation needs of the communities which they serve, may imperil the continuance of the present relationship under which the companies are permitted to exercise functions of a public character."

"The New York, New Haven & Hartford Railroad as a result of excessive expenditure . . . in transactions outside the functions of a steam railroad has adopted economies in operation which have resulted in serious inconvenience to shippers and the general public."

"In so far as the present conditions can be attributed to the operation of the policy of monopoly, the results have been such as to cause a growing distrust in the wisdom of that policy."

"It seems imperative that some action be taken by the public authorities . . . to assert a more effective control over this railroad system, and to secure from it the proper performance of the obligation it has voluntarily assumed."

"There is a widespread feeling that this railroad system has become so large and is made up of so many heterogeneous elements that it is difficult to operate it efficiently under single control."

COURT NEWS.

The Pennsylvania Supreme Court has ordered a reargument of the case of the Pennsylvania vs. the State Railroad Commission, on the question of jurisdiction to determine the constitutionality of the full crew act. The reargument is to discuss the point whether the court or the commission alone can enforce the provisions of the act.

The federal court at Portland, Ore., has issued an injunction on the application of the Oregon-Washington Railroad & Navigation Company, restraining the enforcement of an act recently passed by the state legislature, limiting the hours of service for trainmen to fourteen hours a day. The court held that the state has no authority to enforce such an act, because it is in conflict with the federal statute.

The Atchison, Topeka & Santa Fe, St. Louis & San Francisco and Chicago, Rock Island & Pacific have filed bills in the federal court at Topeka, asking an injunction to prevent the enforcement of a rate law passed by the legislature of Kansas in 1905, which establishes maximum rates for the transportation of crude oil and its products. The provisions of the law have never been put into effect, but the complaints charge that it is now proposed to enforce it.

Following the decision in the case of the government against the coal carrying railroads of Ohio, reported in the *Railway Age Gazette*, January 3, page 35, the United States Circuit Court at Columbus has ordered the railroads interested to sell their stock in the Sunday Creek Coal Company. The order also says that the joint ownership of the Kanawha & Michigan by the Lake Shore & Michigan Southern and the Chesapeake & Ohio must be terminated.

The Butler County Railroad, a line in western Pennsylvania, and the Louisiana & Pacific, both classed as "tap lines," have petitioned the Commerce Court for an injunction restraining the Interstate Commerce Commission from enforcing its orders of May 14 and October 30, 1912, in which tap lines are excluded from the privilege of joining in through freight rates, on the ground that they are not common carriers. The petitions aver that the Interstate Commerce Commission has no authority to issue orders of the kind complained of.

Railway Officers.

Executive, Financial and Legal Officers.

A. E. Macdonald has been appointed general claim agent of the Canadian Northern and the Duluth, Winnipeg & Pacific.

M. K. King has been elected vice-president of the Canton Railroad, with headquarters at Baltimore, Md., succeeding J. Wm. Middendorf, resigned.

John F. Auch, whose election as vice-president and freight traffic manager of the Philadelphia & Reading, with headquarters at Philadelphia, Pa., has been announced in these columns, was born on March 18, 1858, in Pennsylvania. He began railway work in October, 1875, as night operator on the Philadelphia & Reading at West Spring Mills, Pa., and in 1879 was appointed station agent at Chalfont. In 1885 he was made chief clerk to the division freight agent of the Philadelphia & Atlantic City, now a part of the Reading system, with office at Philadelphia. From 1886 to 1888 he was division freight agent at the same place, and then was appointed traveling freight agent of the Atlantic City Railroad and the New York division of the Philadelphia & Reading. In 1889 he was appointed chief clerk to the general freight agent, and in April, 1891, was made division freight agent at Harrisburg. Three years later, he was promoted to assistant general freight agent at Philadelphia, remaining in that position for 14 years, until his appointment as general freight agent on May 1, 1908. He was promoted to assistant freight traffic manager on November 1, 1909, and on December 27, of the same year, was made freight traffic manager, which position he held at the time of his recent election as vice-president and freight traffic manager of the same road, as above noted.

J. F. Auch.

Operating Officers.

E. M. Wrenne has been appointed assistant superintendent of the Nashville, Chattanooga & St. Louis.

J. W. Anderson has been appointed an assistant superintendent of the Oregon-Washington Railroad & Navigation Company, with headquarters at La Grande, Oregon.

W. H. DeFrance, heretofore general superintendent of the Louisiana Southern, has been appointed assistant general manager of the Alabama-New Orleans Transportation Company, with headquarters at New Orleans, La.

John E. Epler, general bonus supervisor of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., has been appointed acting assistant general manager of the Chicago & Eastern Illinois, with headquarters at Chicago.

J. W. Knightlinger, trainmaster of the Southern Pacific at Roseville, Cal., has been appointed assistant superintendent of the Louisiana Western and Morgan's Louisiana & Texas Railroad & Steamship, with headquarters at New Orleans, La.

R. R. Beasley has been appointed superintendent of The Direct Navigation Company, a subsidiary company of the Sunset-Central Lines of the Southern Pacific Company, with headquarters at Houston, Tex., succeeding Thomas L. Morse, retired.

F. M. Nowell, superintendent of the Scranton division of the Delaware, Lackawanna & Western, at Scranton, Pa., has been appointed trainmaster, with headquarters at Scranton, and

H. J. Mullaghy, trainmaster, has been transferred from Scranton, to Binghamton, N. Y.

D. J. Hackett has been appointed superintendent of the Canada division of the Michigan Central, with office at St. Thomas, Ont., succeeding F. W. Cowley, acting superintendent, who has been appointed trainmaster, succeeding J. S. Graney, acting trainmaster, assigned to other duties.

Frank E. Nicoles, division superintendent of the Chicago, St. Paul, Minneapolis & Omaha at St. James, Minn., has been appointed superintendent of the Eastern division, with headquarters at Eau Claire, Wis., succeeding T. W. Kennedy, who has been assigned to duties in the general manager's office at St. Paul, Minn.

W. H. Coppage has been appointed superintendent of the Louisiana Railway & Navigation Company, with headquarters at Shreveport, La., succeding A. G. Abell, resigned. H. L. Graham, trainmaster of the Eastern division, has been transferred to the Western division, with headquarters at Shreveport, and A. P. Maguire has been appointed trainmaster of the Eastern division, with headquarters at Baton Rouge.

Frank Johnston Kron, whose appointment as superintendent of the Logansport division of the Pennsylvania Lines West of Pittsburgh, with headquarters at Logansport, Ind., has been announced in these columns, was born August 29, 1869, at Kittanning, Pa. He began railway work December 5, 1888, on the Eastern division of the Pennsylvania Lines West of Pittsburgh at Pittsburgh, Pa., and on January 1, 1900, was transferred to the Erie & Ashtabula division at New Castle, Pa. He was made trainmaster on that division August 15, 1902, and April 10, 1905, was promoted to superintendent of the Marietta division at Cambridge, Ohio, where he remained until March 1, 1910, when he was transferred to the superintendency of the Louisville division at Louisville, Ky., which position he held at the time of his recent appointment, as noted above.

Henry Oliver Dunkle, who has been appointed general manager of the Erie lines west of Buffalo and Salamanca, with headquarters at Cleveland, Ohio, was born at Pittsburgh, Pa., and was educated in the high schools. He began railway work in 1879 with the Baltimore & Ohio as an operator, and was later a train despatcher on the same road. From 1882 to 1889 he was consecutively train despatcher, chief despatcher and trainmaster on the Pittsburgh & Western, now a part of the Baltimore & Ohio. In 1890 he was appointed superintendent of transportation of the South Carolina, now a part of the Southern, at Charleston, S. C. From 1892 to 1895 he was trainmaster and chief despatcher of the Baltimore & Ohio at Akron, Ohio, and from 1895 to 1903 was superintendent of the Pittsburgh & Western at Pittsburgh, Pa. He went to the Erie in May, 1903, as superintendent of the Meadville division, and the following January was appointed general superintendent of the same road at Cleveland, Ohio, which position he held at the time of his recent appointment as general manager of the lines west, as above noted.

H. O. Dunkle.

Frederick McQ. Falck, whose appointment as superintendent of the Atlantic City Railroad, with headquarters at Camden, N. J., has been announced in these columns, was born on July 5, 1874, at Atlanta, Ga. He was educated in the Elmira, N. Y., schools and at Cornell University, and began railway work on June 1, 1898, as assistant supervisor on the Philadelphia & Reading, at Shamokin, Pa. From May, 1900, to December, 1901, he was supervisor at the same place, and then was transferred in the same capacity, first to Philadelphia and later to Trenton, N. J. In May, 1903, he was appointed division engineer on the Shamokin division, with headquarters at Tamaqua, Pa., and was transferred in the same capacity in June, 1905, to the Reading division, remaining in that position until his appointment as assistant superintendent of the Wilmington & Columbia division in March, 1910. He was promoted to superintendent of the same division the following October, which position he held at the time of his recent appointment as superintendent of the Atlantic City Railroad, as above noted.

Alfred M. Schoyer, who on January 1, became general manager of the Vandalia, with headquarters at St. Louis, Mo., as already noted in these columns, was born at Allegheny City, Pa., November 1, 1859. His entire railway service has been with the Pennsylvania Lines West of Pittsburgh, with which company he began work in 1872 as messenger. He was successively until 1892, telegraph operator, train despatcher and chief train despatcher on the Eastern division of the Pennsylvania Company. He was then appointed superintendent of telegraph of the Pennsylvania Lines West of Pittsburgh, which position he held until November 1, 1899, when he was made superintendent of the Eastern division of the Pennsylvania Company, with office at Allegheny, Pa. Mr. Schoyer became general superintendent of the Northwest System, with headquarters at Pittsburgh, Pa., on January 1, 1902, which position he held when he was appointed general manager of the Vandalia, as mentioned above. From 1893 to 1899 he was superintendent of telegraph of the Vandalia as well as of the Pennsylvania Lines West of Pittsburgh.

A. M. Schoyer.

D. Crombie, assistant to vice-president of the Grand Trunk at Montreal, Que., has been appointed general superintendent of transportation. C. G. Bowker, joint superintendent at St. Thomas, Ont., has been appointed general superintendent, Eastern lines, including Montreal division (Districts 1, 2, 3, 4), Montreal terminals, Belleville division (Districts 5, 6, 7, 8, 9, 10), and Ottawa division (Districts 30, 31, 32). H. E. Whittenberger, superintendent at Toronto, has been appointed general superintendent, Ontario lines, including, Toronto terminals, Barrie division (Districts 11, 12, 14), Hamilton division (Districts 13, 16, 17, 19), London division (Districts 17, 18, 20, 21, 24), St. Thomas division (Districts 18, 19), and Stratford divisions (Districts 15, 22, 23). U. E. Gillen, superintendent at Montreal, has been appointed general superintendent Western lines, including Districts 25, 26, 27, 28, 29 and P. O. & N. Railway. W. H. Farrell, assistant superintendent of the Eastern division at Montreal, Que., has been appointed superintendent of freight service. Frederick Price, superintendent of car service at Montreal, Que., has been appointed superintendent of passenger service, and his former position has been abolished.

Alvie R. Merrick, whose appointment as general superintendent of the Western Maryland, with headquarters at Baltimore, Md., has been announced in these columns, was born on December 9, 1874, at Port Austin, Mich., and was educated in the grammar school at Bad Axe, Mich. He began railway work on June 1, 1891, as a passenger brakeman on the Saginaw, Tuscola & Huron, now a part of the Pere Marquette, and five years later went to the Chicago & Grand Trunk, now a part of the Grand Trunk. In 1899 he returned to the service of the Saginaw, Tuscola & Huron as freight conductor, and in 1901 was made passenger conductor. He was appointed trainmaster on the Toledo division of the Pere Marquette in March, 1902, and later served in the same capacity, first on the Ludington divi-

sion and then on the Chicago division, until he was made superintendent of the Saginaw district of the same road in March, 1904. When the Pere Marquette was re-districted in December, 1911, he remained at Saginaw in charge of the Saginaw division, comprising the Toledo-Ludington and S. T. & H. divisions. When the territory was again re-districted in May, 1912, he was put in charge of the Saginaw-Ionia S. T. & H. division, and now becomes general superintendent of the Western Maryland, as above noted.

H. E. Newcomet, whose appointment as superintendent of the Louisville division of the Pennsylvania Lines West of Pittsburgh, has been announced in these columns, was born April 27, 1874, at Philadelphia, Pa. He was graduated from the University of Pennsylvania in 1894, and began railway work in February, 1896, as assistant on engineer corps of the Pennsylvania Lines West of Pittsburgh. From 1898 to 1899, he was an assistant engineer of the Cleveland & Pittsburgh division, and was then for two years an assistant engineer on the Cincinnati division. In 1901 he was promoted to division engineer of the Indianapolis & Vincennes division, remaining with that division until 1903, when he was transferred to the Cincinnati division as division engineer. Two years later he became division engineer of the Erie & Ashtabula division, and in 1906 he was appointed division engineer of the Cleveland & Pittsburgh division, which position he held when he was advanced to the superintendency of the Louisville division, with headquarters at Louisville, Ky., as above noted. Mr. Newcomet has been continuously in the service of the Pennsylvania Lines West of Pittsburgh since February, 1896.

H. E. Newcomet.

L. J. Ferritor, whose appointment as superintendent of the Scranton division of the Delaware, Lackawanna & Western, with headquarters at Scranton, Pa., has been announced in these columns, was born in 1865 at Athens, Ohio, and began railway work as a telegraph operator on the St. Louis, Kansas City & Northern, and was later traveling agent and operator in the trainmaster's office of the Omaha division of the Wabash, St. Louis & Pacific, now a part of the Wabash. In 1880 he was appointed train despatcher, and from 1885 to July, 1896, was chief despatcher of the same division. He went to the Grand Trunk in July, 1896, as trainmaster of the Middle division at Stratford, Ont., and from 1898 to May, 1899, was assistant superintendent of the same division at London, Ont. From May, 1899, to February, 1904, he was joint superintendent of the Southern division of the Grand Trunk and the Buffalo division of the Wabash at St. Thomas, Ont., and from February, 1904, to August, 1905, was superintendent of the Eastern division of the Wabash at Peru, Ind. He was appointed superintendent of the Middle division of the same road in August, 1905, with headquarters at Decatur, Ill. In 1910 he became superintendent of the Northern and Southern divisions of the Chicago & Alton, and resigned from that position in October, 1912.

L. J. Ferritor.

Traffic Officers.

M. K. Butler has been appointed traveling freight and passenger agent of the Georgia & Florida, with headquarters at Moultrie, Ga.

Archibald Fries has been appointed general freight agent of the Sharpsville Railroad, with office at Pittsburgh, Pa., succeeding D. G. Gray, resigned.

H. W. Askew, commercial agent of the New Orleans, Mobile & Chicago, has been appointed division freight agent, with headquarters at New Orleans, La.

George A. Lee has been appointed assistant general passenger agent of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at Minneapolis, Minn.

C. Frank O'Hara has been appointed traveling agent of the Chicago, St. Paul, Minneapolis & Omaha, with office at Duluth, Minn., succeeding O. C. Scherer, promoted.

W. A. Huckstep has been appointed soliciting freight agent of the Georgia Southern & Florida, with office at St. Louis, Mo., succeeding C. N. McNulty resigned to accept service with another company.

The title of Warren Brown is changed from southeastern freight and passenger agent to that of general agent of the El Paso & Southwestern system and the Morenci Southern Railway, with headquarters at Memphis, Tenn.

H. C. Conley, division freight agent of the St. Louis & San Francisco, at Oklahoma City, Okla., has been appointed assistant general freight agent, with headquarters in that city. S. M. Childs has been appointed district passenger agent, with office at Indianapolis, Ind.

F. A. Miller, general passenger agent of the Chicago, Milwaukee & St. Paul, has been appointed passerger traffic manager, with headquarters at Chicago, and H. E. Pierpont, general freight agent, has been appointed freight traffic manager, with headquarters at Chicago.

J. L. Cox, assistant general freight agent of the Southern Railway in Mississippi, at Columbus, Miss., is now assistant general freight and passenger agent, having succeeded to the duties of Harvey E. Jones, Jr., assistant general passenger agent, resigned to become general agent in the passenger department at Mobile, Ala., of the Mobile & Ohio, and N. V. Hutchinson, traveling freight agent at Columbus, Miss., is now traveling freight and passenger agent.

W. H. Parnell, traveling passenger agent of the Southern, at Norfolk, Va., has been appointed district passenger agent, with office at Houston, Tex., succeeding F. R. McMillin, promoted to chief advertising clerk, with office at Washington, D. C. J. D. Ruden, traveling passenger agent, at Atlanta, Ga., has been transferred to Norfolk, succeeding Mr. Parnell, and Edward E. Barry has been appointed traveling passenger agent at Atlanta, succeeding Mr. Ruden.

H. R. Lewis, who has been appointed general freight agent of the Baltimore & Ohio, with office at Baltimore, Md., was born on March 25, 1872, at Mattoon, Ill., and entered the service of the Baltimore & Ohio in August, 1896, as a clerk in the freight tariff department. He was promoted to chief rate clerk of the general freight department on March 1, 1898, and became chief clerk of that office on February 1, 1907. In April, 1912, he was appointed division freight agent at Baltimore, which position he held at the time of his recent promotion as general freight agent of the same road.

W. N. Hill, freight soliciting agent of the Southern, at Atlanta, Ga., has been appointed commercial agent, with office at Dallas, Tex., succeeding William Humphries, transferred. R. P. Kimbrough, freight soliciting agent at Atlanta, succeeds Mr. Hill. J. H. King succeeds Mr. Kimbrough. Emerson Lucas, freight soliciting agent at Nashville, Tenn., has been appointed commercial agent, with office at Washington, D. C., succeeding

M. M. Emmert, promoted. H. W. Watson, traveling freight agent at Nashville, succeeds Mr. Lucas, and J. C. Hext, freight soliciting agent at Savannah, Ga., succeeds Mr. Watson.

W. R. Askew, whose appointment as division freight agent of the Baltimore & Ohio, with office at Baltimore, Md., has been announced in these columns, was born on November 20, 1873, at Baltimore, and began railway work in January, 1888, as a messenger in the freight offices of the Baltimore & Ohio, at Camden Station, Baltimore. He then held various positions in the general freight department, until he became a rate clerk in September, 1899, and was promoted to chief rate clerk on February 1, 1907. In April, 1912, he was made chief clerk of the freight department, and now becomes division freight agent of the same road.

The industrial department of the Baltimore & Ohio has been extended over the Cincinnati, Hamilton & Dayton, and now includes all lines of the Baltimore & Ohio system. Harry O. Hartzell, industrial agent at Pittsburgh, Pa., has been appointed assistant general industrial agent, with headquarters at Baltimore, Md., and he will have charge of the activities of the department over all lines. Howard L. Gallcher, traveling freight agent at Columbus, Ohio, succeeds Mr. Hartzell, at Pittsburgh, and the authority of H. A. Treudley, industrial agent at Cincinnati, has been extended over the C. H. & D. lines. Mr. Hartzell was born in Baltimore, Md., on August 11, 1875, and after attending the public schools and Baltimore City College began railway work as a messenger and junior clerk in the offices of the Western Maryland. In December, 1895, he went to the Baltimore & Ohio as private secretary to the assistant general freight agent, and in September, 1898, was made contracting freight agent, becoming traveling freight agent, at Baltimore, in May, 1905. He was appointed assistant chief clerk of the general freight department on February 1, 1907, of the same road, and was promoted to industrial agent at Pittsburgh in November, 1910.

Engineering and Rolling Stock Officers.

N. A. Alquist has been appointed general car inspector of the Missouri, Kansas & Texas, with office at Parsons, Kan.

H. C. Van Buskirk has tendered his resignation as superintendent of motive power and car department of the Colorado & Southern, owing to ill health.

S. U. Rhymer, signal supervisor of the Chicago & Alton, has been appointed general signal inspector, a newly created position, with headquarters at Bloomington, Ill.

J. H. Tinker, master mechanic of the Chicago & Eastern Illinois, at Danville, Ill., has been appointed acting superintendent of motive power, succeeding S. T. Park, effective February 1.

A. M. Lupfer has been appointed chief engineer of the Spokane, Portland & Seattle, the Oregon Trunk and the Spokane & Inland Empire, with headquarters at Portland, Oregon, succeeding R. Budd, resigned to accept service with another company.

The motive power department of the Baltimore & Ohio System has been reorganized. The present superintendent of motive power, who report to the general superintendents, now have the titles of division superintendents of motive power. A superintendent of motive power has been appointed for each general manager's territory, reporting to these officers at Baltimore and at Cincinnati on operation and maintenance and to the general superintendent of motive power on standards and shop methods. A. P. Prendergast, superintendent of motive power at Cincinnati, Ohio, has been transferred to Baltimore, Md., reporting to General Manager C. W. Galloway, and M. J. McCarthy, assistant superintendent of motive power of the Cleveland, Cincinnati, Chicago & St. Louis at Beech Grove, Ind., has been appointed superintendent of motive power of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, with headquarters at Cincinnati, reporting to General Manager W. C. Loree.

W. R. Hillary, division engineer of the Pennsylvania Lines west of Pittsburgh, Northwest System, has been appointed supervising engineer of the Central System, with headquarters at Toledo, Ohio. M. P. Tucker, Jr., has been appointed division engineer of the Akron division, Central System, with office at Akron, in place of R. C. Harris, promoted. A. C. Watson has been appointed division engineer of the Zanesville division, Central System, with headquarters at Zanesville, Ohio, to succeed Mr. Tucker. Jos. A. Rothrock has been appointed assistant division engineer of the Zanesville division, with office at Zanesville, in place of E. H. Kersting, transferred. R. C. Miller has been appointed division engineer of the Toledo division, Central System, with office at Toledo, Ohio, succeeding G. R. Barry, transferred. R. R. Metheany, Jr., has been appointed division engineer of the Marietta division, Central System, with headquarters at Cambridge, Ohio, to succeed S. W. Hodgin, transferred.

William Thomas Dobyns, whose appointment as engineer of maintenance of way of the Southern Railway, with headquarters at Greensboro, N. C., has been announced in these columns, was born on March 26, 1867, at Floyd, Va. He began railway work on August 27, 1886, as a section laborer on the East Tennessee, Virginia & Georgia, now a part of the Southern Railway. Two years later he was made foreman, remaining in that position for five years, when he was appointed track supervisor on the Southern Railway. He remained in that position until 1898, and was then made roadmaster on the Atlanta, Knoxville & Northern, now a part of the Louisville & Nashville. In January, 1903, he became roadmaster on the Virginia & Southwestern, at Bristol, Tenn., which position he held at the time of his appointment on December 1, 1912, as engineer of maintenance of way of the Northern district of the Southern Railway.

W. T. Dobyns.

Purchasing Officers.

J. E. Mahaney, general storekeeper of the Oregon-Washington Railroad & Navigation Company, with office at Albian, Oregon, has been appointed purchasing agent of the Spokane, Portland & Seattle, the Oregon Trunk, the Oregon Electric and the United Railways, with headquarters at Portland, Oregon, to succeed F. A. Bushnell, resigned to accept service with another company.

Special Officers.

C. M. Haines has been appointed traveling immigration agent of the Gould Lines, with headquarters at Ft. Worth, Tex., succeeding Will L. Sargent, resigned. He will represent the St. Louis, Iron Mountain & Southern, the Texas & Pacific and the International & Great Northern. Heretofore Mr. Haines has been connected with the Agricultural and Mechanical College of Texas.

OBITUARY.

Frank H. Lacy, the commercial agent of the Atlanta & West Point, at New Orleans, La., died on January 10, at that place at the age of 67.

J. M. Ellison, passenger agent of the Denver & Rio Grande at Colorado Springs, Colo., died in that city on January 6, aged 70 years. He had been in the service of the Denver & Rio Grande for 34 years.

Samuel D. Coykendall, president of the Ulster & Delaware, died on January 14, at his home in Kingston, N. Y. He was born at Wantage, N. J., in 1837, and with his father-in-law, Thomas Cornell, formed the towing business now known as the Cornell Steamboat Company. He became president of the Ulster & Delaware in 1895.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The St. Louis Southwestern is said to be considering the purchase of 20 locomotives. This item has not been confirmed.

The New York, New Haven & Hartford has ordered 50 Pacific type locomotives and 25 switching locomotives from the American Locomotive Company.

The Duluth & Iron Range has placed an order for a number of locomotives which includes 2 mikado locomotives from the Lima Locomotive Corporation.

The Oahu Railway & Land Company, Honolulu, Hawaii, has ordered two consolidation locomotives from the American Locomotive Company. The dimensions of the cylinders will be 15 in. x 20 in., the diameter of the driving wheels will be 38 in., and the total weight in working order will be 102,000 lbs.

The Harriman Lines have ordered 189 locomotives and 25 additional tenders from the Baldwin Locomotive Works and 57 locomotives from the American Locomotive Company. The order from the Baldwin Locomotive Works comprises 99 passenger mikado locomotives, 30 freight mikado locomotives, 55 switching locomotives and 5 Mallet (2-8-8-2) locomotives. The order from the American Locomotive Company comprises 49 Pacific type locomotives and 8 ten-wheel locomotives. The allotment of these locomotives will be as follows: Union Pacific, 40 locomotives from the Baldwin Locomotive Works and 10 locomotives from the American Locomotive Company; Southern Pacific, 51 locomotives from the Baldwin Locomotive Works and 14 locomotives from the American Locomotive Company; Oregon-Washington Railroad & Navigation Company, 16 locomotives from the Baldwin Locomotive Works and 6 locomotives from the American Locomotive Company; Oregon Short Line, 15 locomotives from the Baldwin Locomotive Works and 5 locomotives from the American Locomotive Company; Sunset Central Lines, 37 locomotives and 25 additional tenders from the Baldwin Locomotive Works, and 12 locomotives from the American Locomotive Company; Chicago & Alton, 30 locomotives from the Baldwin Locomotive Works and 10 locomotives from the American Locomotive Company.

CAR BUILDING.

The Illinois Central is in the market for 60 passenger cars.

The Chicago, Rock Island & Pacific is in the market for 50 passenger cars.

The Southern Railway is in the market for 200 box cars and 200 coal cars.

The Carolina, Clinchfield & Ohio is making inquiries for from 500 to 2,000 freight cars.

The Pittsburgh & Lake Erie has ordered 500 coke cars from the Pressed Steel Car Company.

The National Railways of Mexico have ordered 30 tank cars from the Pressed Steel Car Company.

The Toledo & Ohio Central has ordered 1,000 general service cars from the Ralston Steel Car Company.

The Louisville & Nashville is said to have ordered 2,000 hopper cars from the Pressed Steel Car Company, and 500 hopper cars from the Mount Vernon Car & Manufacturing Company. This item has not been confirmed.

IRON AND STEEL.

General Conditions in Steel.—Although steel orders in the aggregate are smaller than they were in the corresponding period of December there has been a very large amount of steel for delivery in the third quarter of this year contracted for. The mills are operating at almost full capacity and it will be difficult for them to increase their output beyond the present level. The consensus of opinion is that steel prices will be held around current quotations for the next six months, unless conditions are disturbed through unfavorable political developments.

Supply Trade News.

The Church-Davidson Company, Chicago, has been appointed general time inspector for the Pere Marquette and the Copper Range.

The name of the Chicago Tie & Timber Treating Company, of Waukegan, Ill., has been changed to the Chicago Creosoting Company.

J. W. Johnson, manager of the Chicago office of the General Electric Company, Schenectady, N. Y., died in Chicago, January 14, at the age of 62.

The Pennsylvania Equipment Company, Philadelphia, Pa., is in the market for a second-hand, 15-ton capacity Browning locomotive crane.

J. R. McKee, O. D. Young and Anson W. Burchard, all of New York, have been elected vice-presidents of the General Electric Company, Schenectady, N. Y.

Holders of certificates of deposit for preferred and common stock of the Allis-Chalmers Company, Milwaukee, Wis., are called upon to pay on or before January 15, the third instalment of the stockholders' assessment as arranged under the reorganization plan. On each share of preferred stock $6 is due, and on each share of common stock $3 is due.

Fred Gardner, for several years railroad representative for J. T. Ryerson & Son, Chicago, resigned on January 1, and is now representing the Jacobs-Shupert Firebox Company, Oxweld Railroad Service Company, Burden Iron Company, Boss Nut Company, and other railroad specialties, with office at 339 Railway Exchange building, Chicago.

The Terry Steam Turbine Company, Hartford, Conn., has sold several Terry forced draft sets for Taylor stokers operating in various plants of the New York, New Haven & Hartford, and has also received a duplicate order for forced draft sets for the Zylonite plant at the Hoosac tunnel. This latter will have a capacity of 40,000 cu. ft. per minute.

The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., among recent orders has received the following: 27 equipments of No. 308 motors and type A B control for the Long Island Railroad for interurban service; and one quadruple equipment and type H L control for use on an electric locomotive for the Oakland, Antioch & Eastern.

Joseph P. Ord, formerly a vice-president of the General Electric Company, Schenectady, N. Y., died in New York on January 9, at the age of 60. Mr. Ord graduated from Yale University in 1873, and was subsequently admitted to the bar. After serving in the accounting department of the West Shore, Mr. Ord went to the General Electric Company, where he was largely instrumental in building up the business of that concern.

The United States Air Brake Corporation, Brisbane building, Buffalo, N. Y., was incorporated in New York, October 10, 1912, with $1,000,000 capital to make its new Q-R (quick release) locomotive air brake equipment, and also to make all kinds of unpatented air brake parts, giving special attention to air brake hose and hose connections. The officers of the company are as follows: President, Edward H. Eddy; vice-president, F. H. Dukesmith, and secretary-treasurer, Jacob Dilcher. See also notice under Trade Publications.

James F. Whiteford, bonus supervisor of the Atchison, Topeka & Santa Fe, with office at Topeka, Kan., has resigned to become counseling engineer for Suffern & Son, in particular charge of their engineering work in Europe, with headquarters in London, England. Mr. Whiteford was born in 1876, and received his early education in the public schools of Illinois, and continued his education through correspondence. He entered railroad service as machinist apprentice with the Chicago, Burlington & Quincy in 1892, and remained for several years as general machinist, gang foreman and engine house foreman at various shops on that road. Later he went to the Union Pacific and served as gang foreman, erecting foreman and general foreman of the locomotive repair shop at Omaha, and chief inspector of mechanical equipment. In 1905 he became

associated with Harrington Emerson and H. W. Jacobs in the installation of the betterment work on the Atchison, Topeka & Santa Fe, having entire supervision of this work in the roundhouse department. During this time he materially assisted in the development of the efficiency system of wage payment. Since 1908 he has had general supervision of the betterment work on various grand divisions of the Santa Fe, including assignments of special investigations on betterment work.

The United States Steel Corporation has made public its wage increase plan which provides for an increase of $12,000,000 a year. The statement issued by Chairman Elbert H. Gary is as follows: "In accordance with the recent announcement made by the chairman respecting an advance in wages, many of the subsidiary companies of the Steel Corporation have made up their schedules, which together aggregate an increase in wages of about $1,000,000 per month, commencing about February 1. These benefits largely apply to the workmen receiving the lowest daily wages. Some of the mining companies are not included, for the reason that wages have been heretofore adjusted by those companies and are now above the average." The increase in wages is in line with the policy adopted by E. H. Gary and the management of the corporation to advance wages when conditions justified such action. Chairman Gary has always advocated fair and reasonable wages for the workmen of the Steel Corporation, and it is due largely to the position taken by him that the corporation has experienced no labor difficulties to speak of since the great strike shortly after the corporation's organization. Certain shareholders, at times, have made the claim that the employees were receiving more than their proportion of the corporation's income, but the policy pursued seems to have been a wise one in so far as the establishment of harmonious relations between employer and employee is concerned. The employees of the Steel Corporation last year received the highest average wage since the organization of the company. The average amounted to $819, compared with $800 in 1910, $776 in 1909, $729 in 1908, $765 in 1907, $729 in 1906, $711 in 1905, $677 in 1904, $720 in 1903 and $717 in 1902. The advance of $1,000,000 monthly just announced amounts to an increase of approximately 8.5 per cent. to the men benefiting. Wages in 1911 aggregated a total of $161,419,000. The advance just made probably brings the average wage to around $865 per year per man. The advance, of course, means that the corporation has added $12,000,000 per year to its expenses. Including the present advance the Steel Corporation is paying to its employees close to $35,000,000 more per year than would have been the case if wages had continued since organization without change. The increase in wages, expenditures for profit sharing, pensions, welfare work, etc., increased taxes, the advance in expenses in general and lower steel prices explain why the Steel Corporation is making less money than at the time of organization in the face of the fact that capacity within that period has been practically doubled.—*Taken from the Wall Street Journal.*

TRADE PUBLICATIONS.

PNEUMATIC TOOLS.—The Chicago Pneumatic Tool Company has issued bulletin 34-F, containing a mechanical description of the design and construction of class G Chicago pneumatic compressors.

AIR BRAKES.—The United States Air Brake Corporation, Brisbane building, Buffalo, N. Y., has published bulletin No. 1 on its new Q-R locomotive air brake equipment. This equipment is designed to permit of alternate control of locomotive and car brakes to avoid the severe shock caused by the slack in long trains, and particularly to save the engine tires from becoming overheated or flattened. The booklet describes clearly and concisely the advantages of this brake equipment, its operation and construction.

WEIGHT OF RAILS ON AFRICAN RAILWAYS.—At first 45-lb. rails were used in Africa; on the introduction of steel, however, the same section was retained, but the weight was 46¼ lbs., and this remained the standard weight of rails for many years. Later on, 60-lb. rails were substituted, and now, on the more important lines of the railways in Africa 80-lb. rails are being adopted.

Railway Construction.

ALBERTA INTERURBAN.—The Canadian Minister of Railways has approved the route map for a line from Calgary, Alta., to Cochrane, 45 miles. The residents of Calgary voted to grant the company a right of way into the city for 25 years.

ALTON, ST. LOUIS & CAIRO (Electric).—According to press reports this company, which was organized early in 1909 to build from Alton, Ill., south through Madison, St. Clair, Monroe, Randolph, Jackson and Union counties to Cairo, in Alexander county, about 130 miles, with a branch to Waterloo and Columbia, in Monroe county, will build the line in 50-mile sections. It is understood that the first work to be carried out will be on the section from East St. Louis. T. N. Chase is president, and W. R. Borders is vice-president. The headquarters of the company are in the Navarre building, St. Louis, Mo.

CANADIAN PACIFIC.—The Minister of Railways has approved route maps of revision of route on second track work between Calgary, Alta., and Vancouver, B. C., as follows: West of Calgary, 21 miles; Ross Peak to Mill Creek, B. C., 20 miles; Chase to Salmon Arm, B. C., 25 miles.

Application is being made to the Dominion parliament for authority to build a line from the Toronto-Sudbury line between Bolton Junction and Palgrave, Ont., through Peel and Halton counties to a junction with the Toronto-Windsor line near Campbellville.

The Dominion parliament has been asked to authorize the building of a line from south of Forsythe street, Hochelago ward, Montreal, Que., northerly to a junction with the Canadian Pacific line near L'Epiphanie.

CHESAPEAKE & OHIO.—The Piny River & Paint Creek has been opened for business on the Hinton division from Beckley Junction, W. Va., to Cranberry, six miles, and the Loup Creek branch of the Hinton division has been extended from Price Hill Junction, W. Va., to Mount Hope, one mile.

CHICAGO AND NORTH WESTERN.—On the Galena division a new branch has been opened for business from Churchill, Ill., to Seatonville, six miles.

CINCINNATI, LICKING RIVER & VIRGINIA.—According to press reports this company, which was incorporated last year, is making surveys from Cincinnati, Ohio, south, and through Magoffin, Johnson, Floyd, Knott and Letcher counties, Ky., in the eastern Kentucky coal field. As soon as surveys are finished construction work will be started. It is said that capital to finance the project has been secured. The plans call for building via Jenkins, thence through the Cumberland mountains at Pound Gap to Wise, Va. J. B. Walker, president; P. G. Stuart, vice-president, Winchester, Ky., and F. C. Buskirk, secretary and treasurer.

LIBERTY & CALLICOON.—The New York Public Service Commission, Second district, has granted this company a certificate of public convenience and necessity. The plans call for building from a point near the New York, Ontario & Western, in Liberty, N. Y., to Jeffersonville, via Loomis, White Sulphur Springs and Youngsville, in Sullivan county, about 14 miles. The commission has authorized the company to issue capital stock to the amount of $200,000 and bonds for $250,000. The proceeds are to be used for the construction of the line, and the charter provides that it may be operated either by steam or electric power.

MISSISSIPPI ROADS.—An officer of the Finkbine Lumber Company, with headquarters at Wiggins, Miss., writes that the company is building an 8½-mile logging line.

MISSOURI, KANSAS & TEXAS.—Announcement is made that this company will spend over $2,000,000 during the present year for improvements and general betterments in Texas. The main line will be reballasted and the present rails on 170 miles will be replaced with those of 85-lb. section. Many side tracks, team tracks and passing tracks will be built. The banks are to be widened and the drainage improved. The plans include new trestles and culverts, and several water and fuel stations. A number of stations and inspection houses are to be put up.

NORFOLK & WESTERN.—The Williamson & Pond Creek has been opened for business from Williamson, W. Va., to Pond

Creek, five miles, to Morocoal, Ky., 10.7 miles, and to McVeigh, 11.8 miles.

Oregon Short Line.—The Teton branch of the Montana division has been opened for business from Ashton, Idaho, on the Yellowstone branch southeast to Driggs, 37.2 miles.

Pennsylvania Railroad.—Work on the Allegheny Valley has been authorized to include three double-track tunnels, ranging in length from 2,500 to 3,500 ft., and costing about $1,500,000. The improvements will eliminate three sharp curves and shorten the distance between Oil City, Pa., and Pittsburgh 14 miles.

Philadelphia & Reading.—An officer writes that contracts have been let for laying additional tracks to Charles F. King, Pottsville, Pa., for a westbound track between Yardley, Pa., and Woodbourne, 3¼ miles, and to P. F. Brendlinger, Philadelphia, Pa., for a westbound track between Skillman, N. J., and Hopewell, 2½ miles, and an eastbound track between Stoutsburg and Hopewell, 2 miles.

Rio Grande Valley Traction.—A contract has been given to the Stone & Webster Engineering Corporation, of Boston, Mass., it is said, to build from El Paso, Tex., down the valley of the Rio Grande to Ysleta. (August 9, p. 271.)

St. Louis, Brownsville & Mexico.—The Austwell branch has been opened for business from Heyser, Tex., south to Austwell, 17.5 miles.

San Antonio, Fredericksburg & Northern.—Incorporated in Texas with $30,000 capital and headquarters at Fredericksburg and at San Antonio. The plans call for building from a point on the Kerrville branch of the San Antonio & Aransas Pass, about four miles northwest of Waring in Kendall county, Tex., north to Fredericksburg in Gillespie county, about 25 miles. R. A. Love, F. Crane, R. L. Cunningham, J. H. Haile and E. D. Campbell are directors. F. Richards is chief engineer.

Tennessee, Kentucky & Northern.—An officer of this company, which operates a line from Algood, Tenn., north to Livingston, 19 miles, writes that contracts are to be let about April 1, to build extensions as follows: From Livingston north to Stearns, Ky., and from Algood south to Sparta. The maximum grade will be 1½ per cent., and maximum curvature 5 deg. The company expects to develop a traffic in forest products, coal and merchandise. (December 27, p. 1288.)

Texas Roads Electric.—Residents of Smithville, Tex., are back of a project to build an interurban line between Smithville and Austin, about 50 miles, and between Smithville and Rockport, about 140 miles. Eastern capitalists are said to be interested in the project.

RAILWAY STRUCTURES.

Indianapolis, Ind.—Plans are being prepared for improvements in the union station, to cost approximately $120,000, on which work will be begun shortly.

Maybrook, N. Y.—The Central New England improvements to engine facilities, consisting of roundhouse, power house, machine shop and coaling plant, are about completed, and the roundhouse is in operation. The company is also constructing a new eastbound classification yard.

San Antonio, Tex.—Plans are being prepared by the International & Great Northern for a new 14-stall roundhouse and machine shops.

Scott City, Kan.—The Scott City Northern recently completed improvements which were begun last September. The work included widening of cuts and banks and replacing tile and timber drainage openings with concrete structures. New buildings have been put up at Scott City, including a two stall engine house, a freight house, a storehouse and a blacksmith shop.

Westchester, N. Y.—Work is well under way on an eastbound classification yard, and improvements to provide additional transfer facilities for the New York, New Haven & Hartford, at Westchester, New York City.

Yoakum, Tex.—The San Antonio & Aransas Pass is erecting three additional buildings at its shops at this point, 50 x 150 ft., 50 x 100 ft., and 50 x 80 ft.

Railway Financial News.

Atlanta, Birmingham & Atlantic.—Clark, Dodge & Co. and White, Weld & Co., both of New York, are offering an additional $500,000 receiver's 5 per cent. certificates of July 1, 1912-July 1, 1913, at 99½, yielding over 6 per cent. interest on the investment. There is a total of $5,000,000 receiver's certificates authorized, of which, including those now offered, there are $4,700,000 outstanding. These certificates are secured by a first lien on the 329 miles of main track and on the terminal properties in Atlanta, Ga., and Birmingham, Ala.

Baltimore & Ohio.—The directors have authorized an issue of $63,250,000 4½ per cent. convertible bonds of March 1, 1913-1933. The bonds are convertible any time up to 1923 into common stock at $110. Stockholders are offered the privilege of subscribing at 95½ to the new bonds to the extent of 30 per cent. of their holdings. The entire issue has been underwritten by Kuhn, Loeb & Co. and Speyer & Co., both of New York.

Robert Garrett has been elected a director, succeeding Samuel Rea, resigned.

Chicago, Milwaukee & St. Paul.—The office of chairman of the board, which was held by Roswell Miller until his recent death, has been abolished.

Chicago, Peoria & St. Louis Railroad.—This company has taken over the property of the old Railway company and the receivers have been discharged.

Chicago & Western Indiana.—J. P. Morgan & Co., the First National Bank and the National City Bank, all of New York, are offering the unsold portion of $10,000,000 3-year 5 per cent. mortgage notes of the Chicago & Western Indiana at par.

Denver, Northwestern & Pacific.—Newman Erb is quoted as saying that the foreclosure sale of the property will take place within 60 days.

Illinois Central.—Kuhn, Loeb & Co., New York, have bought $8,000,000 4½ per cent. equipment trust certificates, maturing semi-annually from August 1, 1913, to February 1, 1923.

Kansas City Terminal Railway.—J. P. Morgan & Co., New York; Lee, Higginson & Co., Boston, and the Illinois Trust & Savings Bank, Chicago, are offering $4,000,000 first mortgage 4 per cent. bonds of 1910-1960 at 95. This is part of a total $10,000,000 first mortgage bonds recently issued by the company, of which the $6,000,000 not offered in this country have been sold in England and Europe.

Maine Central.—Stockholders have voted to increase the capital stock from $15,000,000 to $25,000,000, and stockholders are offered the privilege of subscribing for new stock at par to the extent of two-thirds of their present holdings.

Minneapolis & St. Louis.—This company has made arrangements with Speyer & Company, New York, for the retirement of $1,000,000 of the $4,000,000 5 per cent. secured notes maturing February 1, 1913, and for the refinancing of $3,000,000 of these notes through the issue of $3,000,000 new 6 per cent. notes. Holders of the old notes wishing to take new notes will receive $15 in cash per $1,000 note.

Norfolk & Western.—Samuel Rea has resigned as a director.

Northern Central.—Waldo Newcomer and Phillip A. Small have been elected directors, succeeding Samuel Rea, resigned, and A. L. Snowden, deceased.

Southern Pacific.—Otto H. Kahn, Mortimer L. Schiff, Frank A. Vanderlip, Charles A. Peabody, Robert W. Goelet, Marvin Hughitt, Robert S. Lovett and L. J. Spence have resigned, and James N. Wallace, J. N. Jarvie, Cornelius N. Bliss, E. P. Swenson, Clarence H. Kelsey, J. Horace Harding, W. P. Bliss and George H. Leighton have been elected directors in their stead.

Union Pacific.—It is said that the dissolution plan for the Union Pacific-Southern Pacific will be ready for presentation to the new attorney general, who goes into office March 4.

Wheeling & Lake Erie.—The receiver has sold $2,000,000 5 per cent. equipment trust obligations and $460,000 6 per cent. 2-year receiver's certificates.

Railway Age Gazette

Including the Railroad Gazette and the Railway Age

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE, BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY, 83 FULTON STREET, NEW YORK.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 10,225 copies were printed; that of those 10,225 copies, 8,771 were mailed to regular subscribers and 348 were provided for counter and news companies' sales; that the total copies printed this year to date were 34,626 copies—an average of 8,657 copies a week.

VOLUME 54. JANUARY 24, 1913. NUMBER 4.

CONTENTS

MAINTENANCE OF WAY SECTION.

*Illustrated.

FOR many years the railways adjusted their passenger rates to accord with varying conditions of transportation. Then many of the state legislatures reduced the prevailing rate from three to two cents a mile, frequently explaining such action on the ground that a single flat rate is preferable to "discriminating" rates. Since that time the railways naturally have refrained from making many new rates less than two cents a mile, but suburban commutation fares to and from large cities have been retained in most cases at the old figures, the density of such traffic of course justifying a lower rate than the average. On January 1 the Illinois Central advanced its suburban fares in Chicago for single-ride tickets to the two-cent-a-mile basis prescribed by the state legislature, without disturbing the low commutation rates for 10-ride and 25-ride and monthly tickets, which are used by all regular patrons of the suburban service, for the purpose of inducing a larger sale of the commutation tickets, and thereby reducing congestion at its ticket windows. The advance does not affect those who are dependent upon the road for their daily transportation to and from their work, and who make up the bulk of the traffic, but falls upon the occasional passenger for whom nearly empty trains are run throughout the day. In this case the usual complaint of the suburbanite has been magnified by several local business men's associations, and aldermen up for re-election, into charges such as that the advance is a menace to the real estate business and that it is discrimination against the territory served by the Illinois Central, and especially against those who cannot afford to buy ten rides all at once. Therefore, the corporation counsel has submitted an opinion that the city council has the power to regulate the suburban fares of steam roads within the city limits, and the local transportation committee has appointed a committee to investigate the entire subject of suburban rates with a view to reducing them by ordinance. Railway regulation by a federal government and at the same time by the various state governments is sufficiently complicated now. To add regulation of rates by city councils would seem to be an entirely unnecessary complication.

THE collision at Irvington (Indianapolis), Ind., November 13, caused the death of eleven passengers and four employees, and on account of it officers and directors, as well as trainmen, were indicted on criminal charges and are now under bonds. The salient facts of this case are already well known; but the report of Chief Inspector H. W. Belnap, of the Interstate Commerce Commission, dated December 31, and made public this week, is an illuminating rehearsal of important collateral facts which are of particular interest. The disaster affords one more striking illustration of the acts or omissions of a half dozen men converging on a single point and causing a disaster which any one of the half dozen, if he had done his best to make things safe, would have prevented. The names of the men on the train are given in the report, but the derelictions or mistakes of officers, though shown, are not connected with any particular person. We note the main elements of the cause of the collision in the order in which they are given by Mr. Belnap: *(1) The manual block system is in use, but for the protection only of following movements. (2) The freight (eastbound) had been delayed about an hour by being stalled on a grade of 1 per cent. It had to double a short hill. (3) The engineman of the freight on backing into the side track sounded the whistle to call in the head brakeman and had the fireman cover the headlight, before the switch had been set straight. (4) The engineman got down on the ground and started to close the switch himself, but before he got to it he met Brakeman Gross (who had been east to protect the train) coming in, and Gross, on being asked, said that the switch was closed. The rear brakeman, having been sent by the conductor, came up just then, asked the same question and received the same answer. The conductor had gone back to the station some 2,000 ft. back of the engine. (5) The switch had not been closed and its light was not burning. (6) Gross

*Mr. Belnap's closing paragraphs, embracing his conclusions, are given in another column.

said that as he was coming in he "saw a light near the switch and supposed some one was closing it"; the headlight being covered he assumed that everything was all right. He walked around the switchstand, but did not observe it carefully nor look at the rails. He was carrying a red and a white lantern and the light was not very good. (7) The passenger engine was working steam when it entered the side track. (8) The switch lamp was designed to burn 8 days (192 hours) and was usually attended to twice a week. It was burning at 5 p. m., 10 hours before the collision; but in that 10 hours three trains had reported it not burning. It had plenty of oil. (9) The rule (104A) puts on the engineman the duty of seeing that the switch is set straight in a case like this. (10) The conductor and both brakemen had had occasion to turn this switch, but none of them lighted it. (11) The rule requiring an imperfect fixed signal to be taken as a stop signal specifically includes switches among fixed signals; but the superintendent of the division said that the rule had not been "interpreted" to cover switch lights, and trains were not expected to stop because of the absence of such a light. Therefore, says Mr. Belnap, the engineman of the passenger train was following the customary practice. (12) Failures of switch lights are frequent. (13) Sixteen trains had had to double this hill in two months; coal was reported poor. (14) The engineman had just been promoted and had made only six trips as a runner. (15) The head brakeman (Gross) had been in the service only 19 days; he had had two months' experience elsewhere as switchman (yard brakeman). (16) The fireman was making his first trip over the road but had had 11 months' experience elsewhere. The engineman had been helping in the care of the fire. (17) The city of Indianapolis imposes a speed limit of 30 miles an hour, but this limit is not observed at this place. (18) The passenger engine had had an electric headlight, but it had been off two months for repairs.—As we have said above, this is an illustrative case, of a striking character. Railroad officers will need no assistance in drawing the moral.

At the meeting of the New York Railroad Club, held on the evening of January 17, a paper was presented advocating the use of an electrically controlled air brake for steam railway service. While, both in the paper and the discussion which followed, special emphasis was placed on the greater rapidity of application that can be obtained at the rear of a long train, by means of such a control, the advantages to be gained were not considered to be those of decreasing the distance run in making the stop, but in the reduction of the shock incident to the present method of brake application, because of the greater uniformity in the retardation of all of the cars of the train. Even at high speeds the percentage of reduction, in stopping distances, would not be great in an emergency application; but it is in service work that the advantages will be the most pronounced, because under present conditions the difference in time of brake application on the front and rear cars increases with the length of the train. The first advantage to be gained would, therefore, lie in the elimination of rough stops. Then, as shocks are decreased, so would be the tendency of the wheels to slide flat. The discussion was directed more particularly to passenger train work, and the subject was reviewed from the operating and mechanical points of view; the application of the electrically controlled brakes to the cars of the subway and Westchester lines was elaborated on especially in the case of the latter, where 200 per cent. braking pressures are used. And finally the use of such a brake on freight trains was advocated on the ground that there would be a great reduction in shock, and consequently in damage to cars and lading, if the time of application of brakes to the last car of a 100-car train were to be cut down to a simultaneous application to all of the cars from the present required time of 6 or 7 seconds. While no instances were cited of the application of this electric control to steam railway work, it was evident, from the attitude of all who took part in the discussion, that the improvement would be welcomed as a means of obviating some of the present annoyances incident to the use of the air brake.

SOFT ANSWERS TO HARD QUESTIONS.

"A SOFT answer turneth away wrath." This is the title or the main theme of a circular issued by a western road and recently quoted in the newspapers, calling on trainmen and other employees to more carefully heed the rule requiring them to be uniformly courteous in their intercourse with passengers. With the noticeable accession of religion in railroad circles which seems to have taken place lately, this and other quotations from holy writ are increasingly popular. This, no doubt, is a good thing; for it is always salutary to go back frequently to the fundamentals, and the Bible is a good place in which to find rock-bottom truth.

But only a little observation is necessary to remind the superintendent (if he has overlooked the fact) that the passenger brakeman—the man whom we always have in mind when we talk about courtesy to passengers—has a very difficult task, and that mere softness will not enable him to get very far in his efforts to give wholly satisfactory service. In other words, a hundred—or even 20—passengers will in the course of a day ask him a variety of perplexing questions which a college education would not enable him to answer rightly; and if he is going to make a success of carrying out the superintendent's ideal he has got to engage in a perpetual study. It is the fashion nowadays to tell the station agent that he is the representative of the company in all things; and so far as courteous attention to passengers is concerned the brakeman is as much so as the agent; and both of them do, indeed, encounter people all the time whose simple questions about trains or fares or facilities are supplemented by criticisms, expressed or clearly implied, which impugn the general policy of the company as incisively and as comprehensively as anything ever published in Washington by Lawyer Brandeis or any other hired critic seeking to incriminate a whole board of directors.

In short, the brakeman has to frame answers which the general manager himself can frame with only partial success, and has need for a diplomatic mind like that of the secretary of state. He needs to consult not only Proverbs 15:1 but to bear in mind that the superintendent, if he had thought so far, would have quoted also 15:2—"The tongue of the wise uttereth knowledge aright." The company expects every employee to be not only gentle, but wise. A trainman—or even a conductor who gets $200 a month—may speak very amiably, yet leave passengers unsatisfied because of his lack of knowledge; knowledge of simple facts which he might have acquired by a little study. A passenger is not entitled to be informed about branch line or stage line connections a thousand miles away, or about prices of meals on steamboats in the Danube or the Amazon river; but a conductor can greatly promote the popularity of his road by being posted on all these small details throughout his own vicinity.

Another bit of Scripture that the superintendent needs to remember is found in the 13th verse of that chapter—"A glad heart maketh a cheerful countenance." And nothing else makes it with complete success. Nowadays we tell the employee to stand up for the company (when it is criticised). But this implies that he himself likes the company. If he is dissatisfied with his pay, or his boss, or his surroundings, he will make a sorry job of trying to answer critics. Moreover, if he is 90 per cent. satisfied—and if, on being questioned at headquarters, he professes, carelessly, to be 100 per cent. satisfied—that remaining 10 per cent. of dissatisfaction will be sufficient to neutralize most of the superintendent's exhortations, unless the man has been made to reflect on the subject and systematize his thoughts.

To make all employees so well pleased with the company

and its policy that they will habitually praise it may seem to be a pretty large task; but will any one deny that this is an important feature in the campaign to promote politeness? Assuming that most employees who deal with passengers are fairly well satisfied with their lot there is still a considerable task to insure that they will act on this feeling habitually and will not let their words and their attitude be influenced by some grievance about a minor matter or by the unfriendly spirit of some fellow employee.

And there is still another verse in that fifteenth chapter of Proverbs which the brakeman may notice if he reads the chapter: It speaks of "the revenues of the wicked." The feeling that the capitalist gets more than a just share of the profits, and, therefore, should be classed as "wicked," is not found exclusively among the farmers in the back towns; it exists among railway employees. Frequently a labor-leader takes it as the text for a speech, and there are employees who, if they were to read this verse as referring to railway revenues, would see nothing inappropriate in the use of the word "wicked." Not that there are many such. Those who actually formulate ideas of enmity to the company are probably very few. But the root idea is common, without doubt, and to counteract its influence demands very much more than the occasional promulgation of a circular.

But, assuming that an employee has a good opinion of the company, that good opinion needs training and cultivation. If he is going to advertise the road's virtues, he needs to know about its weaknesses also, and how properly to estimate both good and bad features. The public knows—or thinks it knows—the bad ones, and the public's feeling cannot be ignored. After meeting a few criticisms which he knows to be justified, or even partly justified, the untrained trainman, finding difficulty in defending a part of his road's policy, when he has to admit that other parts are indefensible, relapses into the very common state of mind which simply evades the issue. He tells passengers, in substance, that it's none of his business to answer their questions. The general passenger agent himself, unless his road is one of those referred to by Mr. Thomas, where whistles have been superseded by harps, has to make some apologies and explanations when he confronts passengers face to face; and it is futile to expect trainmen and station men to praise the road as the G. P. A. would like to have them do it, unless he instructs them in his methods.

It is highly desirable that all employees who deal with passengers (or freight customers) be intelligent, polite and discreet. It is obvious that to make them so the company should do everything practicable in the way of instruction. Even were all employees well gifted in this respect at the outset it would still be desirable to have systematic instruction for the purpose of promoting uniformity. Why should not the traveling passenger agents give station men and trainmen courses of lectures? Would that be giving too much importance to a secondary matter? We think not. Politeness is, indeed, secondary to safety, and it may be said that we have not yet completed the education of our employees in that primary feature; but in practice the men are required to secure to passengers *both* safety and comfort; and two sides of a man can be cultivated simultaneously. The traveling men make it their business to show people the good qualities of the road and, where necessary, to explain those which are not good. If they are successful they ought to be able to talk instructively to those who have not had time to study the art of advertising so thoroughly.

The typical employee—the passenger trainman—is entitled to all the instruction in diplomacy that the company can reasonably give to him, for many of the questions that confront him have to be looked at from at least four sides: the wishes of the passenger, the actual rights or needs of the passenger, the wishes (instructions) of the company and the actual rights of the company. And usually he must decide quickly. Take the typical case of a passenger in a crowded car who cannot find a seat. He wants a seat, right there, at once. He may have no right to one, for the company may have done its best to provide an adequate supply, only to be thwarted by uncontrollable circumstances. Or, there may be a seat three cars in the rear and the trainman has got to decide whether he ought to go and find that seat or send the passenger alone. Sending the passenger implies the need of an apology for having to inconvenience him. The trainman has a duty to apologize for a lack that he himself is not responsible for. Or, perhaps, he knows that some trainmaster or other officer would have put on another car had he not been dull or careless. Trainmen usually do not know how to defend the company in cases like that. Still less do they know how to get out of the matter gracefully if they know that the superintendent habitually demands too strict "economy" in the use of cars. If a trainman tries to escape an unpleasant duty in such a case by referring passengers to the conductor he may be doing worse than to use his own imperfect talents, for the conductor, though he have twice the ability of the trainman, may just then have ten times as many perplexities.

Again, take the case of the passenger who unexpectedly finds that he must wait an hour or two for a delayed train. It may be that the company should be defended, or excused; or it may be that it deserves censure. The passenger, if an experienced traveler, possibly may know some of the causes of delays better than does the station-employee who has to deal with him. It is a difficult situation, yet it may be one of the best of opportunities to influence the public in the right direction, if only the right thing be said.

Giving soft answers is a great art!

REPORT OF THE FEDERAL BOILER INSPECTOR.

THE first annual report of the chief inspector of locomotive boilers has been presented to the Interstate Commerce Commission, and incorporated in its twenty-sixth annual report to Congress. The information included, and the manner in which it is presented is hardly as fair to the railroads as it might be. This has been shown by many of the abstracts and quotations taken from it by the press. In the first place, in connection with the statement that the law requires that the railroads file rules and instructions for the inspection of locomotive boilers, it says, "notwithstanding this notice only 170 out of an approximate 2,200 carriers complied therewith." This would seem to indicate that the railroads deliberately disregarded the law, whereas as a matter of fact, and it is recorded in the minutes of one of the hearings before the Interstate Commerce Commission, this was done so that a uniform set of rules could be established to the mutual benefit of the government and the railroads.

Under the heading of "Accidents resulting from the failure of locomotive boilers and their appurtenances," are classified the numbers and kinds of such accidents. Although these pertain to the boiler of the locomotive they were not all "failures" in the true sense of the word. An analysis of these causes shows that about 90 per cent. of the deaths were due to low water in the boiler, which is a man failure, rather than one of design, and although the crown sheet failures are classified as to the contributory defects, the fact remains that low water was the prime and only cause of such explosions. Aside from explosions, 759 other accidents are listed, resulting in 10 killed and 796 injured. These are listed under items which do not contribute to boiler structural weakness, but are of the class of mechanical defects that are inherent in all branches of human endeavor, in which perfection cannot be obtained. This, of course, is not and should not be urged as an excuse, and every endeavor should be made to reduce the number and results of preventable accidents.

There was no comparison made of the number of accidents with previous years to show the effect of the government inspection, and in fact it would be almost impossible to obtain information on all the items mentioned in the report. There were some figures, however, presented at one of the hearings

on the number of shell and firebox explosions during the years 1905 to 1909, which compares with the present figures as follows:

	Number		Killed		Injured	
	Av. for 1911-12.	Av. for 1905-9.	Av. for 1911-12.	Av. for 1905-9.	Av. for 1911-12.	Av. for 1905-9.
Shell Explosions....	3	3.1	27	6.1	41	4.7
Firebox Explosions..	94	51.3	54	26.5	168	30.

The figures for 1905-9 are the average per year and to be strictly comparable they should be increased in proportion to the number of locomotives, which was 43,787, as against 62,074 reported in 1911-12.

There is no clue to the extent of any of the damages or injuries. There were 243 defective squirt hose and connections which resulted in 245 injuries. This one item is nearly one-third of the preventable accidents. Burst water glasses is the next largest similar item, being 165 in number, resulting in one killed and 168 injured.

Another point which may be easily misunderstood is that of the defects. From the reading of the report it would seem that railroads had been grossly negligent, for out of 74,234 engines inspected, 48,768 were reported defective. Since the object of the law is to promote safety this statement could be interpreted that so many engines were unsafe for use. Analysis again shows that most of these defects were of a nature that in no way impaired the safety of the boiler. Again, in a large number of cases the engines were inspected just after completing a trip and before an opportunity had occurred for them to be repaired by the terminal mechanics. If all such defects were eliminated, and those engines were reported that were actually in service, or ready to go into service, the total number of defects would have been greatly reduced.

An attempt has been made to classify the number of defects found on each road, which as coming from a government inspector would lead one to consider it as being strictly accurate; but under staybolts broken we find that one of the largest roads in the country had only 25 reported from a total of 3,621 locomotives owned, which from the face of it to a practical man is wholly absurd, for there is no question, and, with the present construction of boilers, no getting away from breaking a large number of staybolts. While this statement may be correct in that only 25 were found broken, it would lead one to believe that the inspection had been carried on at a time most fair to the road. As against this we have 1,745 staybolts broken on a road owning 1,236 engines. From this it would seem that most any number of defects could be found if the engines were inspected at a time when the roads themselves did not have them in actual service, and acknowledged that they were out of repair.

It is also stated that 3,377 locomotives were ordered out of service, but the statement is not made that anyone of these 3,377 was found in actual service. Here again is another point for misinterpretation. The fact that only five of these cases were appealed to the chief inspectors shows that the railways realized the condition of the locomotives, and in many cases might not have used them until they were placed in proper condition. Considerable more comprehensive information as to the correct status of the locomotives in this country could have been given had the chief inspector confined his report to the violations, or intended violations of the law. As the defect report stands it is a very incomplete report of the total number of defects that all the locomotives in this country may have during one year of their existence.

While it is unfortunate that the report is such as to admit of misinterpretation, there are, on the other hand, reasons for congratulation on the work of the chief inspector of locomotive boilers for the first year of this new department. It would be impossible to organize and develop the work of such a department without some mistakes being made and that as few misunderstandings have occurred in putting the regulations into effect speaks well for chief inspector of locomotive boilers and the co-operation between his department and the railways generally.

Letters to the Editor.

GOVERNMENT OPERATION OF RAILROADS.

Eastern Railway of New Mexico;
Amarillo, Texas, January 15, 1913.

To the Editor of the Railway Age Gazette:

The suggestion of Mr. L. C. Fritch that the government take over the Union Pacific or the Southern Pacific, to use in demonstrating proper railway regulation, with the proposal to appoint members of the Senate from states through which the road runs, and the Interstate Commerce Commissioners, as directors, presumably with Franklin K. Lane as president, is very interesting.

Then, following the recent precedents set by Indiana and by New England, if the patrons of these government roads wish to reach the men high up, in case of accidents, we may expect to see them indict the president and the directors on criminal charges.

Perhaps, if politicians see their perilous position of responsibility for mistakes of subordinates government regulation may not be so popular. Possibly, however, they might claim immunity under the law that you cannot sue the king.

Avery Turner.

SALES OF INTERNATIONAL SIGNAL STOCK.

New York, January 14, 1913.

To the Editor of the Railway Age Gazette:

In a recent issue you published a letter from Mr. Ray, chief engineer of the Delaware, Lackawanna & Western, that might lead your readers to infer that this company was trying to sell stock to the public, and such an impression would do us a very grave injustice.

The facts are these; more than six years ago, our own stockholders set aside a reserve fund of $200,000 of treasury stock, and not until our inventions had been so perfected as to be "approved for test" by the Block Signal and Train Control Board was any offering of it ever made, and then only to our own stockholders.

At the annual meeting in September, every stockholder present joined in signing and issuing a statement to those unable to attend the meeting, urging each of them to subscribe for their pro-rata of this reserved treasury stock as soon as possible; and this appeal was mailed to each stockholder with the report of the annual meeting.

This was just as legitimate—to urge them to hurry up their subscriptions—as would be any other lawful act authorized by a meeting of the stockholders.

None of this treasury stock has ever been offered to the general public; nor have we allowed one line of advertising or descriptive matter to be published regarding our automatic train stop. Had we been "stock jobbers," such an article would have brought us hundreds of buyers, but we refused offers of reputable papers; nor will we allow any advertising until our train stop has been thoroughly tested and proved successful.

Our bulletin No. 16 was mailed only to stockholders of this company, and *not* to "railroad employees" (unless they were also stockholders), nor to the general public. As we construe it, the bulletin sets forth very clearly that the installation of the Lackawanna is purely for testing purposes, and its success or failure has no binding action of any kind on that railroad, and we certainly do not agree with any opinion that it was misleading. Mr. Ray's letter does not mention the fact that his road asked for and received from us a signed agreement fixing the prices at which future equipment could be bought from us in case our apparatus was desired by it.

Only treasury stock, and not personal stock, was offered for subscription. Every cent of the proceeds from its sale goes directly into the company treasury for a working capital, and not into the pocket of any individual. And this treasury stock

is offered only to present stockholders, who have been kept informed of company conditions by the various bulletins; and the bulletin specifically states that the subscriptions are being solicited for the very purpose of making this testing installation and supervising the tests. The inventor has been for years an associate member of the Railway Signal Association, and we have the very highest of bank, trust company, and business references. We invite the fullest investigation of both ourselves and our automatic train stop.

The International Signal Company,
Jean F. Webb, President.

CONTINGENT SCHEDULES ON THE VIRGINIAN.

Norfolk, Va., January 13, 1913.

To the Editor of the Railway Age Gazette:

G. W. Turner, in the December 13 number of the *Railway Age Gazette*, takes exception to a statement made in the article on our contingent schedules to the effect that a flagman has served no useful purpose unless he has actually stopped or warned a train which otherwise would have come into collision with the train he is protecting. As to this, the only point that may be discussed is, whether the flagman should go out (provided he is furnished reliable and authorized means of so determining) when there is no train to be stopped. The Virginian contingent schedule gives the men in charge of a train this authorized information which, with respect to following trains, is equal to an absolute block; and without doubt there exist on certain portions of every railroad conditions of train movement where this system of moving extra trains could be utilized to advantage.

We are making no argument against the flagman going back to protect the rear of his train. The only claim is that there should be no greater need, under certain conditions, for such protection, than there is for sending a flagman ahead, under practically the same conditions, to protect the head end of his train.

The only agencies (with the exception of the staff), so far as I know, which are depended upon for moving trains against each other on single track are time schedules and train orders, with the red flag as an auxiliary when a train fails to clear. Block signals are regarded as aids, but for well known reasons are seldom depended on as absolute protection for either the front or rear of a train.

Now, if a time schedule is regarded as paramount, and the red flag auxiliary protection for the front of a train, by what process of reasoning is it determined that the red flag becomes paramount and the time schedule worthless for the protection of the rear of a train, where an oversight is much less certain to result in a collision? Why is it thought that men may be depended upon to avoid numerous opposing trains, but not the one following train with which they might become involved by our schedules?

Is it not possible that it is due to the obsession of fixed opinion, proceeding from continuous habit of thought in one direction? I can say for the Virginian Railway that when protection is required, our men protect more promptly and in much better form than they did under the old conditions; and in view of the fact that trainmen have knowledge of following as well as of opposing trains we consider our plan is in complete harmony with the "safety first" proposition.

Referring to the example given where trains running late on contingent schedules 30 and 31 are used to illustrate a condition where it is claimed that failure to deliver a meeting order to C. S. No. 31 would result in opportunity for collision, I will say that failure of delivery of the order to either or both trains, whether on time or late, and regardless of where the order is placed or where the trains are directed to meet, could not possibly result in collision, except by the most palpable oversight and direct violation of the rules. This is due to the fact that until a meeting point is provided by train order, the two trains are clearing each other. If C. S. No. 30 received the order and C. S. No. 31 did not; C. S. No. 30 would proceed to the meeting point stipulated in the order, while C. S. No. 31 would continue to clear the time of C. S. No. 30, thus giving no opportunity for collision.

The presumed difficulty about starting the wrecker on short notice on account of trains not protecting rear is more imaginary than real. It is no more difficult to get notice of the wrecker to trains of the same direction than to trains of the opposite direction. The same line of reasoning might be used as argument that trains from the opposite direction ought not to be run at all. As a matter of fact the schedules might, under certain conditions, be of considerable assistance in getting the wrecker started against opposing trains.

As to the small road proposition, an examination of published statistics, which are available to everyone, will disclose a several times greater density of traffic on the Virginian Railway than on any one of the larger systems mentioned by Mr. Turner.

The speed schedule plan submitted by Mr. Turner does not, from my point of view, work out to a successful conclusion. I doubt whether everyone will agree that the matter of figuring out the numerous run late schedules would be as simple a process as represented. That, however, is only a matter of opinion, and my criticisms will be confined to what I consider to be defects of the system.

In all of the examples of orders submitted by Mr. Turner, the westbound trains are given right over all eastbound extras and in order No. 5 right is given over all trains; copies of the orders to be placed at Pablo or distant terminal for trains not yet in existence and at intermediate points for trains already in existence. In view of the fact that the eastbound trains then on the road would not be clearing the schedules of the westbound trains until advised of their existence and there being no restriction placed upon westbound trains except the schedules, it would be impossible, without danger of collision, to start a westbound train from Farley until the notification order has been signed for and actually delivered to all of the trains over which right is given. To simply place the order would not be sufficient; actual delivery must be effected.

It is apparently the intention to run trains on high speed schedules and slow speed schedules indiscriminately, according to class of traffic and the time they are ready to start. To start a high speed train behind a slow speed train without giving notice to the slow would be unsafe and in violation of the rules. It would, therefore, be necessary before starting a train on a high speed schedule from Farley to place copies of a notification order to all slow speed trains of the same direction then on the road; and such orders would have to be actually signed for and delivered before the train could be moved from Farley. Additional provision would have to be made for work trains. Under the circumstances how would it be possible to start trains "on a moment's notice," as is claimed?

Suppose a train about to leave Pablo receives a copy of order No. 5, how are the men receiving the order to determine whether engine 400 is running eight hours late on schedule A of yesterday (in which event it would be already overdue) or the schedule of today or of tomorrow? If I am right in assuming that no time limit is placed on the rights conferred by the order, I should say that the only safe conclusion would be that the train is already overdue and the opposing train would not be justified in leaving Pablo.

I may not have a correct understanding of all of the details in connection with the proposed speed schedule plan, but the objections I have mentioned would, if sustained, appear to me to be sufficient to seriously impair its usefulness as a system.

A. T. Woodruff,
Train Rules Examiner, Virginian Railway.

CANADA'S MOST SUCCESSFUL RAILWAY YEAR.

A Detailed Study Showing the Growth of Mileage, Facilities, Traffic and Earnings During the Year Ended June 30, 1912.

By J. L. Payne,
Comptroller of Statistics, Ottawa.

During the year ended June 30, 1912, the railways of Canada built 142.53 miles of second track and 599.39 miles of yard track and sidings. This may not seem like much construction work, and it will probably be regarded as an odd way to begin an article which is intended to present a picture of the most prosperous year in the history of Canadian railway interests. But, properly appraised, these additions mean a great deal, and the singling out of such facts will not appear at all peculiar to modern railway men. Moreover, they imply other conditions equally satisfactory. Additional second track and more facilities for the expeditious handling of traffic are today the outstanding needs presented by the general transportation problem of this continent. The manager of every large railway is in despair over this matter; and his perplexity is intensified by the self-reproach that such a situation could have been saved by foresight and faith. Land which could have been had at a moderate figure forty, twenty, or even ten years ago, is now held at a prohibitive price. Real estate is advancing rapidly in Canada, too; but it may still be acquired at relatively low cost, and optimistic, perspicacious railway men are getting hold of it for sidings and terminals. In doing this they are slightly anticipating their needs; but they are showing sound judgment. Railway expansion in Canada is proceeding at an unprecedented rate, and the day is near at hand when this elbow room at terminals, and these longer and more numerous sidings will justify themselves in net earnings.

It is worth while to give the particulars which are lacking in the foregoing paragraph. The addition of 142.53 miles of second track brought the total up to 1,752.49. Again this may seem a small matter; but that mileage was equal to 6.5 per cent. of the total first track mileage of the Dominion, and was 86 miles more than were added in 1911. Six years ago there were but 1,067 miles of second track in Canada, or 4.7 per cent. Of yard track and sidings there were 4,092 miles in 1907, and 6,149 in 1912. This increase was from the ratio of 18.2 per cent. to 23.0 per cent. of first track mileage. While single track mileage increased 19 per cent. in six years, second track increased 64 per cent., and yard track and sidings 50 per cent. This was good business, and its real significance will be better understood when it is pointed out that in 1910—which is the last year for which official figures for comparison are available at the moment—yard track and sidings in the United States had increased but 30 per cent. during five years. In other words, it is the rate at which Canada is coming that gives these figures special value. And this matter of relative progress will be found to be the conspicuous feature in all aspects of Canada's railway advancement in 1912.

There is another feature of railway administration in Canada which is distinctly on the side of betterment. During the past four years the expenditure on maintenance of way and structures has represented an average of 21.50 per cent. of the total operating expenses. This has been better by 2 per cent. than the railways of the United States have averaged during the same period, and it reflects a disposition to secure efficiency. The upkeep of equipment has also been equal to over 20 per cent of operating expenses, and that percentage is understood to demonstrate sound railway management the world over; but it falls below the United States average. In the light of what has been done in this regard in Canada in the past, it points to safe policy. In 1907 the outlay on way and structures was $930 30 per mile of line; in 1912 it was $1,179.11. The total expenditure for maintenance of equipment in 1907 was $965.01 per mile; in 1912 it was $1,115.41. This is also below United States figures; but the ratio of increase has been greater on the Canadian side of the line. The point which these facts emphasize is, that the railways of the Dominion are not fattening immediate net earnings by neglecting either roadbed or equipment, in which they are merely true to the best traditions of prudence. They are living up to the highest standards in all that makes for the economical handling of traffic.

First track mileage was increased by 1,330 miles during the year, bringing the total up to 26,727. In no preceding year had such a large addition taken place. Eighty-three per cent. of the new mileage put in operation was in the western provinces, and, with avidious appetite, they are crying out for more. As a matter of fact, 1,623 additional miles of line were in actual operation in 1912, and 1,738 had been completed; but officially these 3,361 miles were regarded as being under construction. Had they been taken into the count, the operating mileage of Canada would have reached 30,088, or a larger total than that of Great Britain. There were altogether in the official sense 8,826 miles under construction on June 30, 1912; but the definition of that term would not be strained if it were said that more than 10,000 miles were actually in process of being built. "Under construction" applies to work lying all the way between the exploratory survey and the opening of the road for traffic. It might be observed, however, that, while the preponderance of this prospective mileage is in the West, slightly over 40 per cent. of it is located in the East. Turning again to the relative idea, it is encouraging to Canadians to realize that, measured by population, they are building railways at twice the rate of their progressive neighbors to the south. They are still maintaining the unique position of having the highest mileage per capita of any country in the world, yet see room for further growth in the fact that by the territorial test they are at the very foot of the list.

Without any qualification, it may be said that the Canadian people are at this juncture concerned more in securing two things than anything else—markets and transportation facilities. To get these they have not only made very considerable sacrifices; but, with perfect cheerfulness, are prepared to make still larger drafts upon the public treasury and the national credit. The burdens arising out of what has already been done to aid railway construction are represented in cash subsidies of $208,072,074, contributed by the Dominion government, by the provincial governments and by municipalities; in land grants aggregating 56,052,055 acres, and by guarantees aggregating $245,070,045. For 1912 the increase in cash subventions over 1911 amounted to $5,892,818, in land of 6,000,000 acres and in guarantees of $96,733,688. The government is also constructing the eastern division of the Grand Trunk Pacific at a cost which the minister of finance announced in parliament would probably reach $243,000,000. An expenditure of $117,000,000 has already taken place. These items added together make $696,142,119, without placing any money value on the land grants. It is impossible to say what the latter are worth; but the holdings of the Canadian Pacific and the Canadian Northern in the West would realize not less than $150,000,000 at prevailing prices. During the past year railway lands averaged $13.70 per acre, and the sum received from sales amounted to $18,200,000. The Canadian Pacific had an average of $15.99 for 669,639 acres; but received $40.25 per acre for 3,270 acres of irrigated land. The Canadian Northern averaged $15.17 per acre, as compared with $12 in 1911. Guarantees have been the popular form of

aid during recent years, and governments of the western provinces have assumed obligations in that regard beyond $150,000,000. In the majority of instances the guarantee is of both principal and interest for a long term of years. In the case of the Grand Trunk Pacific, the Dominion government not only guarantees the interest on bonds, but makes up the difference between the sale price and par.

Canadian railways hauled 89,444,331 tons of freight in 1912, or 9,560,049 more than in 1911. This was the largest increase in any year. There were also 41,124,181 passengers carried during the year—a gain of 4,025,463 over the preceding year. This larger volume of traffic created a heavy tax on equipment and, in the autumn months, the movement of the western harvest was marked by considerable congestion. Nevertheless, the conditions in that regard were much better than in 1911. This was due in part to more rolling stock, but chiefly to better organization. The additions to equipment in 1912 embraced 265 locomotives, 13,760 freight cars and 433 passenger cars. The demand for new freight cars has been far beyond the capacity of domestic industries, and during the year orders were placed in the United States for over 14,000 units. The total equipment orders of the Canadian Pacific during the past year had a money value of $48,000,000, which is said to have been double the amount ever given within such a period by any railway in America. These orders included 467 locomotives, 26,653 box cars, 94 sleepers, 25 diners, 57 tourist cars and a great deal of other rolling stock. The available supply of cars in the Dominion for freight service reached a total of 140,918 on June 30 last, and on that date the official statistics show a material increase in carrying capacity. For example, in 1907 there were but 9,790 cars of the 80,000 lbs. class in Canada; in 1912 there were 21,951. Of the 100,000 lbs. class, the number during the same period had grown from 3,448 to 7,135.

There was a betterment in passenger density over 1911 of 6.291, and passenger miles increased by 304,282,712. Gross earnings per passenger train mile were $1,390, as compared with $1,263 five years ago. Per freight train mile the advance was from $2.069 in 1907 to $2.494 in 1912—equal to 20 per cent. Per mile of line, the number of passengers carried was 1,539—a gain of 79 over the preceding year. A comparative summary of these and other statistical data is as follows:

	1911.	1912.
Number of passengers	37,097,718	41,124,181
Passengers carried one mile	2,605,968,924	2,910,251,636
Passengers one mile per mile of line	102,597	108,888
Passengers per mile of line	1,460	1,539
Average passenger journey—miles	70	71
Passengers per train	60	62
Earnings, passenger service	$58,317,998	$65,048,187
Average receipts per passenger	$1.360	$1.375
Average per passenger per mile—cents	1.944	1.943

There was a gain in 1912 of 3,509,712,232 ton miles over 1911, while freight density was increased by 99,947. The average revenue per ton per mile declined from .777 in 1911 to .757 in 1912, which scarcely gives support to the persistent complaint that freight rates are being advanced. As indicating the activity in freight movement during the year, loaded cars had a mileage of 1,102,719,543, as compared with 946,946,917 in 1911. There was an appreciable betterment in the average load of both cars and trains, and in the number of cars per train, while the length of haul went up by 18 miles. The following summary of facts for 1911 and 1912 will give a concise view of the freight situation:

	1911.	1912.
Tons hauled	79,884,282	89,444,331
Tons hauled one mile	16,048,478,295	19,558,190,527
Tons, one mile per mile of line	631,829	731,776
Average haul, miles	200	218
Average tons per train	305	325
Average cars per train	18.03	18.19
Average tons per car	16.91	17.87
Average per ton per mile—cent	.777	.757

One or two things occurred during the year which emphasizes the part played by transportation facilities in the economic life of nations and communities. Canada is essentially an agricultural country, with large live stock and dairly interests, and yet in 1912 she imported several million pounds of mutton from Australia, and several million pounds of butter from New Zealand. It would have been impossible to go farther for such products. It cost, however, half as much to bring a pound of mutton from the Antipodes to the Pacific coast as it did to deliver it from the butcher shop in Vancouver to the home of the consumer. That is to say, this mutton was brought from Sydney to Vancouver at a freight cost of slightly over two cents a pound; and the special committee which investigated the meat problem at Washington declared that it cost four cents per pound to maintain a delivery service between the retailer and his customers. The New Zealand butter was brought to Vancouver by steamer, and thence by rail as far east as Montreal, where it sold at 40 cents per pound to consumers. The freight cost by water and land was less than four cents per pound. That this was not a mere spasm in trade, is demonstrated by the fact that this winter millions of pounds of New Zealand butter will be delivered in Canada under contract. A more striking illustration of what transportation facilities do could not well be found. It demonstrates very clearly that the producer and his market are not separated by miles, as is popularly assumed, but by freight charges. One should not say: "New Zealand is 10,800 miles from Montreal"; but rather, "New Zealand is 3.8 cents per pound from Montreal." If either the butter or the mutton had been produced 150 miles away from Ottawa, and it could not have been moved by either steamer or railway, the cost of hauling that distance would have been greater than it actually was from New Zealand or Australia.

The record gross earnings of $219,403,753 were the inevitable result of increased traffic. A betterment of over 16 per cent. in total revenue for 1912 suggests material expansion in production and marketing. Freight yielded over 75 per cent. of the year's gain, although, as has been said, the ton-mile rate was lower than 1911. This gain was chiefly in the hauling of 3,500,000 more tons of agricultural products, and 2,750,000 more tons of manufactures—indicating a larger harvest and greater industrial activity in the Dominion. There were further earnings of $21,221,775 from outside operations, with a balance to the good of $5,888,157. These operations were principally in the conduct of steamship business and hotels; for it must be borne in mind that Canadian railways are getting to be large owners and operators of steamers. The Canadian Pacific alone has a fleet of 70 vessels, of which 16 are on the Atlantic and 3 on the Pacific. The remainder are in service along the Pacific coast, on the Great Lakes and on the lakes and rivers of British Columbia. The Canadian Northern has two large steamers on the Atlantic, and the Grand Trunk Pacific has two on the Pacific coast. It is obvious that railway traffic in an exporting and importing country like Canada must create business on the ocean; and railway owners of Canada seem disposed to control things at both ends. Railway hotels are also multiplying, and would seem to be profitable. The Canadian Pacific has made the largest investment in this regard; but both the Grand Trunk and Canadian Northern are following the tempting example set. Earnings from express business have increased by 61.5 per cent. in five years. All the leading railways carry on a service of that nature, first paying themselves liberal rates for "express privileges," and then declaring attractive dividends from what is left over. They also earn millions out of their telegraphs, which are spread over the whole country, and some of them control large electric railway interests. Whatever else may be said, it must be admitted that these railway hotels, steamers, and express and telegraph services are the best in the country. The railways conduct such interests with splendid skill.

Gross railway earnings in 1912 showed an increase of $30,670,259 over the preceding year. Thirty years ago the total earnings were less than this increase. These gross earnings equalled $8,209 per mile of road, as compared with $6,397 five years ago. In 11 years the aggregate earnings per mile have

more than doubled. Revenue came from the following sources in 1911 and 1912:

	1911.	1912.
Passengers	$50,566,894	$56,543,664
Mails	1,869,414	1,914,720
Express	4,674,135	5,294,388
Baggage, parlor cars, etc.	1,207,555	1,295,415
Freight	126,570,534	149,961,140
Station and train privileges	826,252	1,086,687
Telegraphs, rents etc.	3,018,710	3,307,739
Total	$188,733,494	$219,403,753

It will be observed that while there were substantial increases in all the divisions, passengers and freight scored heavily. Per ton, gross earnings from freight rose from $1.561 in 1911 to $1.655 in 1912. In this regard the gain in five years has been equal to over 12 per cent., which is largely accounted for by the hauling of a larger volume of high class commodities, as was pointed out in a preceding paragraph.

Operating expenses in 1912 were equal to 68.7 per cent. of gross earnings, and amounted to $150,726,540. In this connection there was exhibited a further rise in the cost of running a train one mile. That cost has almost doubled since 1899. It was then 77.9 cents; it is now $1.493. An analysis of items making up the total expenses of operation reveals a persistent advance in the cost of fuel and labor. The conditions in regard to employees would seem to be the same on both sides of the line. The unions co-ordinate and the process of leverage is identical. Just where the upward movement will stop nobody seems to know. Operating cost in 1912 amounted to $5,639 per mile of line.

It would take up a good deal of space to deal comprehensively with the financial position of Canadian railways. The salient facts alone can be given place. The official statistics show a capitalization in 1912 of $1,588,937,526, of which $770,459,351 was represented in stocks and $818,478,175 in bonds. This liability would be equal to $59,454 per mile of line if the whole sum were divided by the mileage given in a preceding paragraph; but neither the divisor nor the dividend would in that case be correct. After deducting from capital figures duplication and dead liability, and excluding the mileage of government owned lines, the true quotient in the calculation is $50,832 per mile. That is a relatively low figure. It is slightly below the actual cost per mile of government owned lines in Canada. It is well secured. Against it stands a steadily swelling volume of gross and net earnings. The former have increased by 128 per cent. in ten years, and the latter by 141 per cent. Dividends have gone up from a total of $12,760,435 in 1907 to $31,164,791 in 1912. The dividend payments of the past year were equal to 4.05 per cent. on the entire stock liability—good or bad, alive or dead. The railway bonds, in so far as they are a real liability—that is, when duplication has been eliminated—are gilt edge. Both principal and interest are safe. Thirty per cent. of them are backed by government guarantees. The capital liability of Canadian railways is growing at the rate of about $100,000,000 a year, and in this growth the United States has both a direct and indirect interest. To the extent of nearly $100,000,000 it has been created by American ownership on the northern side of the boundary, and Americans are the holders of an enormous volume of Canadian railway stocks and bonds. The indirect interest arises from the fact that every mile of railway built in Canada means a call upon American producers for more or less of the equipment and operating necessaries. For example, the United States supplies 95 per cent. of the lubricating and signal oil used by Canadian railways.

Canada, by every proper test, is going ahead rapidly. In many parts, particularly in the West, the activity is spoken of as "a boom." Whether or not the term applies depends wholly upon the point of view. Certainly real estate is selling at high figures in the more promising centers. But what has created these centers? The railways in every case. And, while the railways have primarily brought about this new scale of values in real estate—real estate which yesterday was worth but a few dollars an acre for farming purposes—the foundation of what is taking place in the West is the rising tide of immigration. Now, as in the past, and as it always will be, the so-called value of land is vested in the people on the spot. As people gather in communities the rise in land values is merely an expression of permanency, and that permanency cannot exist without transportation facilities; which is another way of saying that Canada's boom must be reflected in railway expansion. The ground work of development has been laid; for history is sure to repeat itself in the sense that what happened in the American West between 1860 and 1890 will happen in the Canadian West between now and 1930. An established flow of population creates accretive power; and in the case of Canada that power rests on the fact that free farming lands will be a thing of the past when the public domain of the West is taken up.

The part which Americans are taking in the peopling and development of the Canadian West, and of Canada generally, is quite important. Hundreds of thousands have crossed the line during the past six or eight years to take up farming land, and many others have come over to share in the money making chances which arise in new and rapidly growing communities. Upwards of 1,500 miles of railway are now being operated in Canada, representing a capital outlay of $100,000,000, which are mere extensions of American systems. Millions of tons of freight move annually across that imaginary line called the international boundary. It is very much an imaginary line so far as the railways are concerned; for trains move backward and forward over it with the same freedom they cross state lines. Canadian railway corporations own thousands of miles of line in the United States. Reports to Ottawa are made on precisely the same forms, and governed by the same classifications, on which reports are made to Washington. For railway purposes the line is unrecognizable; but it is there, and the fact that it will remain there need not in any sense hamper the growth of international transportation interests. Those interests will and must increase. The flag is scarcely an element in the matter, even as a sentiment. Trade follows the ship and the railway. Canada is the second best customer of the United States, and the United States is Canada's second best customer. The prosperity of Canada means more business for the United States, whether that prosperity is demonstrated in additional railway mileage, in swelling population or in larger production. Hence, the story of Canada's best and most encouraging railway year must be a matter of genuine, and not entirely unselfish satisfaction to those who live south of the forty-ninth parallel.

Reference to accidents can hardly be avoided. In 1912, Canadian railways killed 568 persons and injured 3,780. Of the killed, 47 were passengers. One passenger in every 872,855 was killed, which was an abnormal ratio. One passenger in every 84,792 was injured, which reflected a very bad year in respect of casualties of that class. A study of accidents to employees over a period of years, reveals the somewhat surprising fact that relatively the same number suffer injuries every year from practically the same causes. That is to say, in proportion to numbers there are about the same number killed and injured every year from say jumping on or off trains, from coupling or from other avoidable causes. It might be supposed, the number of accidents would have more or less direct relation to train mileage, as representing the measure of risk; but such a law cannot be found in an analysis of casualty statistics. Accidents at highway crossings were numerous in 1912, notwithstanding the steady elimination of grade crossings and the installation of many warning devices. The high proportion of trespassers killed tells the story of fatal haste at city crossings when the protective gates are down. The killing of 235 trespassers in other ways rather shows that Canadian railways will soon learn to sympathize with American roads in the matter of the tramp nuisance.

The number of employees reached 155,901 in 1912—an increase of 14,677 over 1911. The additions were equal to 31 per 100 miles of line, and brought the total up to 583. The salaries and wages bill for the year was $94,237,623, including outside oper-

ations; but making a deduction of $6,937,984 on that account, the total for comparison with other years was $87,299,039. This was $12,685,901 higher than the figures for 1911, and the total was equal to 58 per cent. of operating expenses. On the basis of the statistical family, it has been estimated that one person in six gets a livelihood, directly and indirectly, out of the operation of railways in Canada. The calculation would not have to be strained to bring the ratio up to one in five. As an example of the indirect interest, it is probable that the supplying of 15,000,000 ties in 1912, at a total cost of $6,500,000, represented an income of $700 for 9,285 persons; or the livelihood of 46,000 souls on the statistical basis. Incidentally, it might be observed that the cost of ties has more than doubled in fifteen years, and the use of treated sleepers has commenced as a matter of economy. The average cost per tie in 1912 was 44.7 cents.

Looking back over what has been written, it will be observed that Canadian railways in 1912 made entirely new, and in some respects surprising, records in practically every statistical aspect. The additions to mileage of first track, second track, and yard track and sidings, the increase in traffic, the additions to equipment, the gains in all the earning divisions, the multiplication of employees, and the betterments in trainload and efficiency tests in general were the largest in the history of the Dominion.

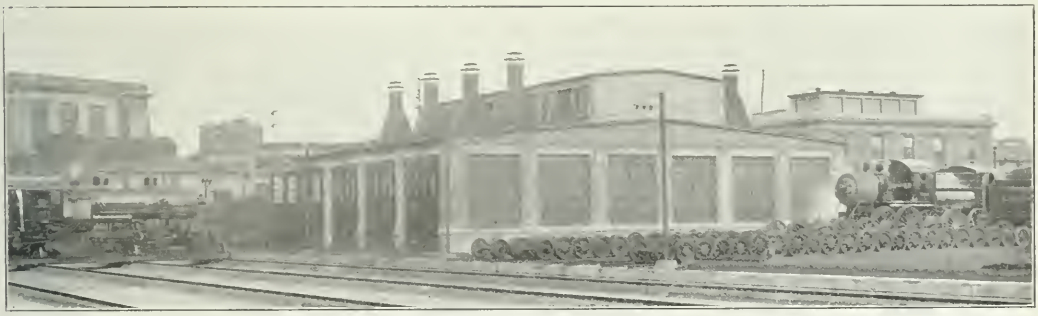
By every standard of appraisement the year showed unexampled prosperity. More important, however, than these immediate results, is the warranted assumption that an era of extraordinary expansion in railway interests has begun. The railway people are keenly alive to their trackage and equipment needs in view of swelling immigration and the rapid development of the western provinces. They are adding to their transportation facilities on a scale which mirrors their optimism, and yet, build as quickly as they may, it is not probable that they will be able to get ahead of their needs. Traffic keeps up with new mileage. This is a situation which represents the fruition of long-cherished hopes; but Canada does not close her eyes to the fact that in this growth the United States has a genuine interest. It does not mean rivalry. It means, as has been said, larger business on both sides of the line.

There is one further feature of the Canadian railway situation which calls for a closing observation. No matter what expansion may take place or how many new lines may be built, the tendency to centralization seems likely to continue. The smaller roads will be absorbed by the larger. During the past year this process has been actively in operation. The annual report of the Canadian Pacific to its shareholders is largely taken up with the story of absorption. There are some who profess to see danger in this; but there will always be another side to the matter. Whatever else may be true, the change of control carries with it development and efficiency. Strength succeeds weakness. In the last analysis transportation facilities are bettered.

A FIRING-UP HOUSE FOR REPAIRED LOCOMOTIVES.

Where there is an engine house located conveniently in relation to a large repair shop, the locomotives are generally placed in it for firing-up after the erecting shop work is completed and preparatory to the trial trip. While this avoids the inconvenience of smoke and dirt in the erecting shop, it frequently interferes with work in the engine house, particularly if the latter be located at a busy terminal. In some cases this has been avoided by providing a special shop, or running shed, for the purpose.

The Delaware, Lackawanna & Western has just completed what is termed a "firing-up" house in connection with the locomotive repair shop at Scranton, Pa. This building is located directly across the transfer table from the main machine and erecting shop, and is used for housing the locomotives while the tenders are coupled on and made ready for service and while they are being fired-up, and also for making the running repairs reported by the engineer after the trial trip. It is 85 ft. long and 70 ft. wide and has four tracks, each having a 50 ft. pit of concrete construction. It is heated by steam, is piped throughout for hot water, etc., and is lighted by electricity, with extension lights for the convenience of the workmen. The entire structure is of steel, concrete and brick, with the exception of the floor, which is of creosoted blocks. A large monitor extends across the center, and smoke jacks of steel and concrete have been installed at both ends of each pit, so that locomotives may be either headed or backed in. We are indebted to H. C. Manchester, superintendent of motive power and equipment, for this information.



Separate Building for Finishing and Firing Up Repaired Locomotives; Delaware, Lackawanna & Western.

RAILWAYS IN NATAL.—In Natal a small beginning was made in 1860 on the 4 ft. 8½ in. gage, altered subsequently to the Cape gage (3 ft. 6 in.). The main line leading to Johannesburg, a very heavy one, was opened in 1895. When the line reaches the Transvaal, it attains a level of over 5,000 ft. This main line has several branches, and the total mileage at the date when the railways were taken over by the union, two and a half years ago, was 998 miles.

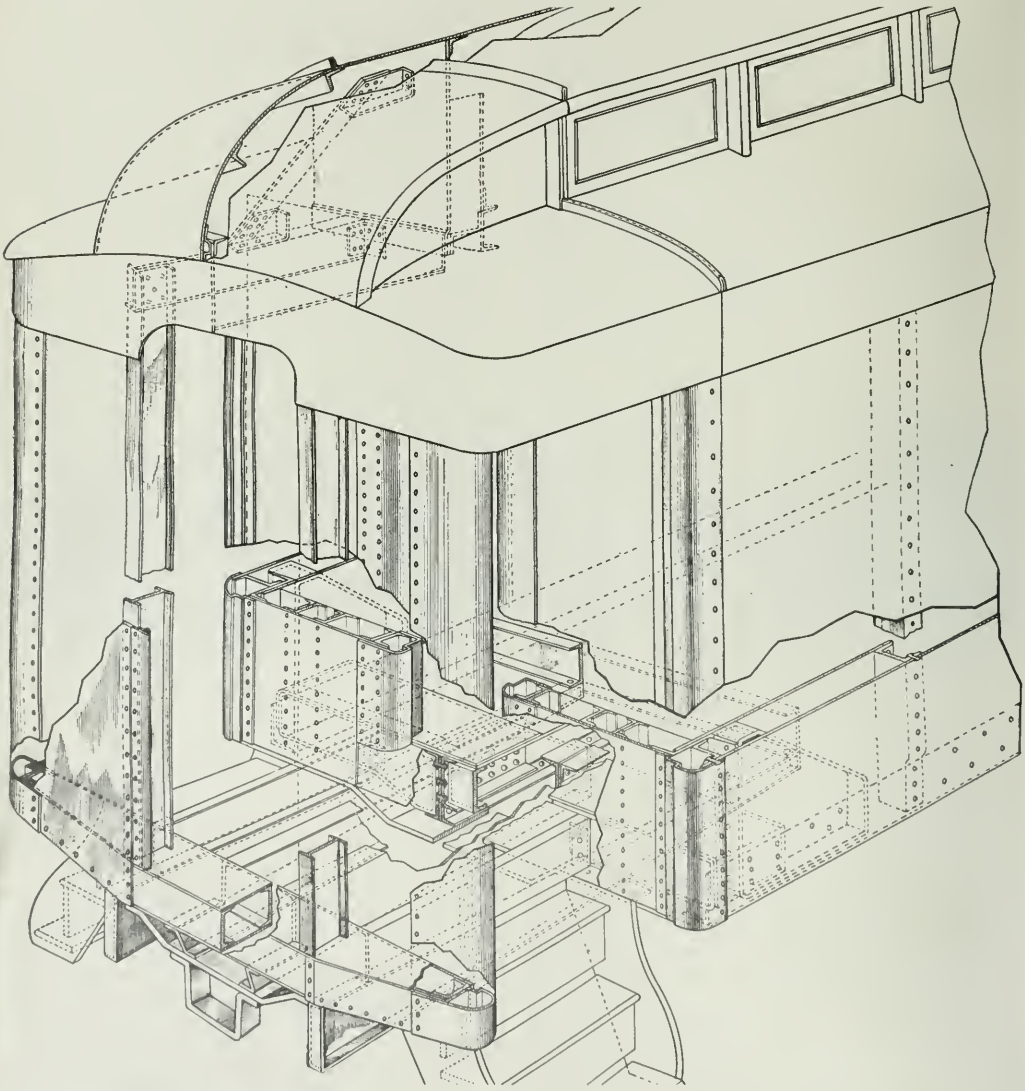
RAILROAD DEVELOPMENT IN URUGUAY.—For the first time in its history the earnings of the Central Uruguay Railway for the past year exceeded $1,000,000. The extensions to the northeast have been completed to the city of Melo, not far from the border of Brazil. The Eastern Railway has opened the line to Maldonado, with a corresponding increase in its business. Work has been begun on the Midland Railway, between Tres Arboles and Piedra Sola, and applications for concessions have been made for new railway lines between Melo and Acegua and from Salto to Rivera.

A COLLAPSIBLE PLATFORM AND VESTIBULE.

The Barney & Smith Car Company, Dayton, Ohio, has recently applied for letters patent on an interesting innovation in the construction of vestibules and platforms for passenger cars. This has for its chief purpose the protection of the ends of the car body in collisions and wrecks.

The device includes the entire platform and vestibule, from the end of the car body to the nose piece of the platform, and is so constructed that in case of a shock more severe than encountered in ordinary service, the platform and vestibule will collapse or crush, forming a cushion space of nearly 8 ft. between two cars, before the car bodies come together. In an eight car train this would amount to about 50 ft. of cushion construction, planned to absorb the shock and damage before the car bodies containing the passengers could be seriously disturbed.

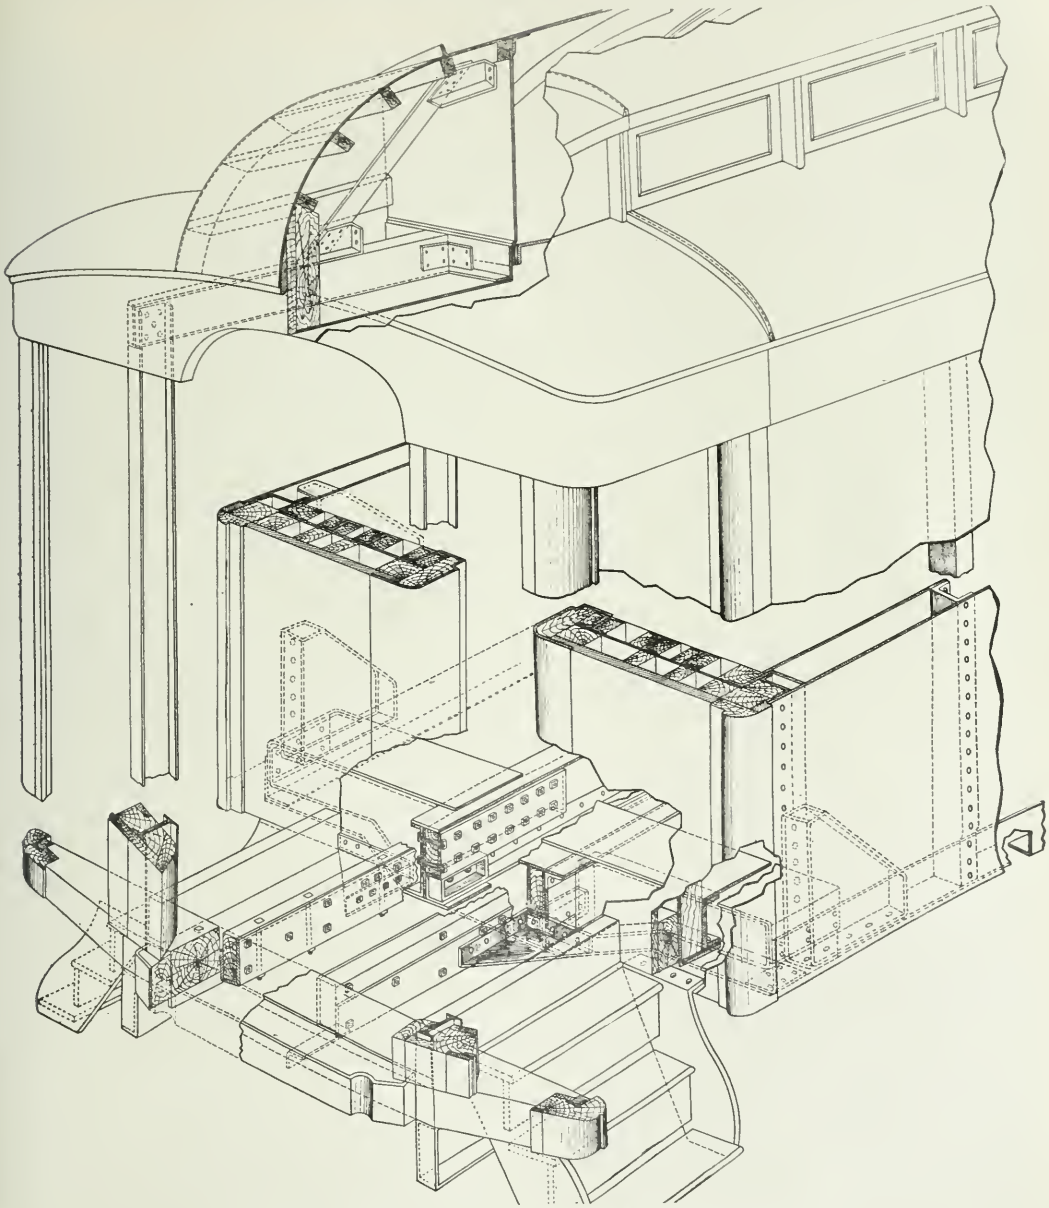
This is accomplished by stopping the center sills at the end of the car body proper and fastening platform extensions to them. The connection between the extensions and the center sills is made of such strength that the rivets will shear when the car receives a shock more severe than the maximum service shock. The steps, vestibule doors and hood will of course collapse when the rivets shear on the sill extensions, and these will further tend to absorb the energy of the shock.



Collapsible Platform and Vestibule on an All-Steel Car.

One illustration shows a car of steel construction throughout, while the other shows one with the collapsible extension made of wood. This wood construction may be used with all-steel, all-wood or composite car bodies. It will be noted that the end of the car body is designed for great strength, by

using a number of heavy steel sections to form the door posts, corner and intermediate posts, and that the intermediate posts have been further reinforced by angles riveted to the inside. These angles in practice would be about 4 ft. 6 in. long, as it is claimed that in case of the cars attempting to telescope the position and prevent parts of the vestibule from piercing the end of the car This end plate, which is made in pieces securely riveted together, is also so designed and fastened to the roof members that in case of collision, if the shock were not wholly absorbed by the collapsible platform, the entire end of the car



Steel Car Equipped With a Wooden Collapsible Platform and Vestibule.

point of greatest shock is never greater than 18 in. or 20 in. above the floor line. The entire end of the car body proper is covered by a heavy steel plate, extending from the upper part of the roof to the bottom of the end sill. This is to further strengthen the end of the car, hold the end posts in proper roof would be pulled downward, forming a protection by forcing the next car or locomotive to be thrown upward and over in place of going through the end of the car.

The entire platform, vestibule, hood and sill extensions are a unit, detachable and separate from the car body proper, and

can be applied, if necessary, after the car is built. In case of collision it is presumed that these parts would be the only ones greatly damaged and could, therefore, be removed and replaced at a minimum cost and delay.

As may be seen from the drawings, extra heavy steel beams are used for vestibule center posts. These beams are securely fastened above and below, the idea being that should one of the cars attempt to ride over the other the beams, if they were hit about the line of the nose piece, would be of sufficient strength to cause the rivets in the sill extensions to shear off. In order to further prevent one car riding the other there has been designed an anti-climbing device. This consists of pressed steel shapes placed below the nose piece, and forming a part of the detachable vestibule. The ends of the car proper are further strengthened at the side by pressed steel triangular shaped pieces with flanges at the edge. These extend to a height of about 30 in., and serve to protect the end of the car should it get a cornering blow and also to reinforce the side and end.

The illustration showing the collapsible vestibule and platform of wood construction shows an auxiliary wood end outside the steel end. This has been designed to serve as a cushion to further prevent the end of the car body from giving way in case of a wreck. This illustration shows two walls, the end of the car proper, reinforced with wood, and the wall of the vestibule, which rests directly against the car end. The shock absorbing qualities of the wood are utilized to advantage in this design. In general, the entire device is based on protecting the car bodies from damage and destruction, thereby saving the lives of the passengers.

TRAIN ACCIDENTS IN DECEMBER.[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of December, 1912:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
3d.	Penn.	Dresden, O.	rc.	P. & P.	11	8
6.	West. Md.	Pen Mar Park	bc.	F. & F.	5	2
15.	Balt. & O., S. W.	Lexington, Ind.	bc.	F. & F.	2	0
26.	Lehigh Valley	Lehigh Gap	rc.	F. & F.	1	0

Derailments.

Date.	Road.	Place	Cause of Derailm't.	Kind of Train.	Kil'd.	Inj'd.
1.	Cin., H. & Dayton	Hamilton	boiler	F.	1	1
1.	New York Cent.	Hoffman's	journal	P.	0	1
6.	Lehigh Valley	Jenkins June.	acc. obst.	F.	1	0
11.	C., C., C. & St. L.	Sanford, Ind.	d. switch	P.	1	32
12.	Balt. & Ohio	Glencoe	runaway	F.	0	6
24.	Central Ga.	Americus	d. track.	P.	0	25
24.	St. Louis I. M.	Hot Springs	exc. speed	P.	0	16
30.	St. Louis & S. F.	Memphis	b. rail	P.	0	28

As a result of the collision near Dresden, Ohio, on the 3d, nine passengers and two employees died, and three employees and five passengers were injured. This accident was reported in the *Railway Age Gazette* of December 6. The cause of the collision was failure of the flagman to get back a sufficient distance to stop the second train.

The trains in collision at Pen Mar Park, Pa., on the 6th, were a train of empty passenger cars eastbound and a freight train westbound. Both engines and many cars were wrecked. Four trainmen and a trespasser were killed and two trainmen were injured. The cause of the collision was improper handling of train orders on the part of the train despatcher and two conductors.

[1] Abbreviations and marks used in Accident List: rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——d. t. Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——ml, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

The freight trains in collision at Lexington, Ind., on the night of the 15th, were No. 99 and No. 94 of the C. C. C. & St. L., which company uses the B. & O. S. W. tracks at this point. Both engines were damaged and two tramps were killed. The trains were to meet at Lexington. The collision was due to No. 94 coming in at uncontrollable speed, the "air failing to hold."

The trains in collision at Lehigh Gap, Pa., on the morning of the 26th were eastbound freights. One brakeman was killed. Four cars took fire and were burnt up. The collision was due to excessive speed under a caution signal, the train passing a home signal set against it.

In the derailment of a double headed freight train by a boiler explosion, near Hamilton, Ohio, on the night of the 1st, the engineman was killed and the fireman was injured. The explosion of the boiler of the second engine threw the leading engine and cars of the train off the track and 12 of these cars were wrecked. The cause of the explosion was low water.

The train derailed at Hoffman's, N. Y., on the 1st, was westbound passenger No. 45, running at full speed. Of the 200 passengers on the train, nearly all were shaken, but the cook of the dining car is the only person reported injured. The cause of the derailment was the breaking of a journal of the rear truck of the tender, and it is said that the train ran about a mile after the truck had dropped so as to drag on the rails, being finally thrown off at a switch.

The train derailed at Jenkins Junction, Pa., on the morning of the 6th, was a westbound freight, and the engine was overturned. The cause of the derailment was a car from an eastbound train which had jumped the track and fouled the westbound line. The engineman was killed.

In the derailment of a passenger train at Sanford, Ind., on the 11th, three employees were injured, one fatally, and 30 passengers were injured, none severely. The cause of the derailment was a switch out of adjustment; but it was protected by an automatic block signal, which signal was disregarded.

The train derailed near Glencoe, Pa., on the morning of the 12th, was a heavy freight descending a steep grade. The train consisted of two engines and 42 cars of coal, and the derailment was due to the train becoming uncontrollable; and one of the engines was overturned at a curve. Six trainmen were injured, two of them fatally.

The train derailed near Americus, Ga., on the 24th, was westbound passenger No. 9, known as the Seminole Limited. Four passenger cars left the track, but none of them was overturned. Twenty-four passengers and one trainman were injured. The cause of the derailment was irregular track, following very heavy rains.

In the derailment of a passenger train near Hot Springs, Ark., on the 24th, the engine and five cars were overturned. Fifteen passengers and one trainman were injured. The cause of the derailment is believed to have been excessive speed on a six-degree curve, combined with a tender truck which was too rigid.

The derailment near Memphis, Tenn., on the 30th, was due to a broken rail. One passenger car fell into a river; 28 passengers were injured.

Electric Car Accidents.—Of the accidents reported in the newspapers as occurring on electric railroads in the United States in the month of December, only two appear to have been attended with fatal results. At Ashtabula, Ohio, on the 10th, a street car was struck by a freight train on a crossing and eight passengers were killed. On the 28th, at Cincinnati, a street car was derailed on the Central bridge over the Ohio river and fell 40 ft. to the ground below. Nine persons were injured, two probably fatally. On the same day near Annapolis, Md., on the Washington, Baltimore & Annapolis, a collision between a passenger car and a freight train wrecked the passenger car; and five men were injured, all of them were trainmen.

FREIGHT CAR TACTICS OR REGULATIONS.*

"There Is No One Freight Car Question; There Are At Least Sixteen." Tactics Are Needed to Govern Rather Than Rules.

By Arthur Hale.

I have selected the title of Freight Car Tactics not from its military significance, but because tactics are usually broader than rules and are planned to meet variable conditions; they are employed with a good deal of discretion. The point I want to make is that in handling freight cars, especially between railway systems, you are handling them under varying conditions, and the people who handle them ought to have more or less discretion. Or, what would be better, the rules must be made in such a varied way that they will work properly under varied conditions. I have here a list of sixteen such conditions. There are a great many more under which freight cars may be interchanged between railways, and under which they may not be interchanged, when possibly they ought to be interchanged.

The first great variation is in the situation of a freight car on what is called an originating railroad and its situation on a distributing road—the difference between the delivery of a loaded car by an originating railroad to a distributing road, and the return of the empty car from the distributing road to the originating road. This is probably the most striking variation, but it is not the only one of importance. The situation is entirely different today, when there is a car shortage, from the situation six months ago, when there was a car surplus. So far there are two pairs of situations: the situation on the originating road and on the distributing road; the situation in period of car surplus and a car shortage; and that makes four combinations. There is also a difference when a car is on a railway that is well equipped and in good condition from the situation when it is on a railroad in a state of congestion. There are two more situations. Multiply them and you have eight.

And there is, furthermore, a difference of condition with a freight car which is what has been called a legal-tender car—a car like a box car, which is good for a load anywhere in the country—and a car of special design, such as a refrigerator car which is no special good unless you want to ship something which is to be protected from heat or from cold. It is no good to have refrigeration in a car if you are going to ship hay in it or merchandise. Sometimes it is rather bad to have the refrigerating arrangements in. Between the special car on the one side and the legal-tender car on the other, the most important difference is that out of the legal-tender car we expect to get 80 per cent. or 90 per cent. of loaded mileage, whereas out of the special car we expect to get little more than 50 per cent. The coal car is usually returned empty. The legal-tender car is one that can be loaded almost anywhere and which is now running a large percentage of its mileage under load—a situation which we want to preserve in this country. If you admit those as two more we have sixteen general situations to be considered. There are a lot more. But the point is that there is no one freight-car question. There are at least sixteen and probably more. Any set of rules that governs such a variety of questions is or should be more a set of tactics than a set of laws.

One great difficulty about these car questions is that when two railway men get talking about it, one may be talking about one question and the other about another. When a railway man thinks of the car question today he very probably thinks of the special cars which he wants to load tomorrow, and he thinks that the rules ought to be framed so as to take him out of his present difficulty. Take the officer of an originating railway, of a railway that originates more freight than it receives—supposing it to be a coal railway, and most coal railways are originating railways—you will find that he is thinking about his coal cars and in discussing the car question will feel that the important thing is that his coal cars be returned to him promptly in a period of car shortage. That is about the only phase of the car question he considers, and he will be for a set of rules that will secure that, without thinking at all of the box car, of the time of car surplus, or of the question whether railways may or may not be congested. So that one present difficulty and one past difficulty in our trying to make rules or tactics to cover this car question has been that we have been dealing with a lot of men who have been looking at the subject from varying points of view.

Let me insist a little on this division of railways, between originating and distributing roads. Of course every railway originates some freight and every railway distributes some freight to the consignees on its line. But very few railways receive exactly as much as they deliver. And railways will line up on this car question quite broadly, as originating railways who are always loading a majority of cars away, and distributing railways, to whom a majority of loaded cars are coming. The problem as between two such roads, today, if there were no other problem, would be very simple. You would only have to make a rule which would put a proper incentive on the return of the empty car from the distributing road to the originating road. And that is about all that they have done in Europe, for instance. They have been so successful in putting on very stiff penalties to secure the immediate return of an empty car from the distributing road to the originating road, that they have succeeded in getting the empty mileage of their cars in interchange up to 50 per cent. That is to say, they do not do much to load their cars back because the penalty is so very high against loading them wrong.

That penalty is a continuous penalty. In England, for instance, suppose I am loading my car to your road. It goes 100 miles on your road. You are allowed three or four days for that movement and pay a mileage for it. After the three or four days that are allowed, you pay three shillings a day—that is, 75 cents a day for a car that will hold but 10 tons. You pay that 75 cents a day until the car comes back to my lines, no matter what happens to it. If you use it in your own business it is three shillings a day. If you divert it to another road it is three shillings a day. The penalty is so severe that the English railways never think of loading a car back unless they happen to have a load at the particular station at which it is unloaded. They do not have any freight car tactics. They have freight car laws, and the cars come back. But, I believe they have a great many more cars than they ought to have and a great many more cars in proportion than we have.

I agree that in times of car shortage the English practice is not so bad, but in times of car surplus there is not so much difference between an originating and a distributing road. When there is a surplus of cars the empties come back and there are plenty of cars everywhere. But the minute there begins a shortage of cars then the distributing road which is accustomed to filling all the orders of all its consignees always keeps on doing so and uses the foreign cars with which to fill those orders. That means that the proportion of cars on the distributing road increases, and it holds more than a hundred per cent. of the number of cars it owns. Of course, there is the same increase in orders for cars on the originating road, but the originating road has not got so many cars because the distributing road is holding them. And the more orders there are for cars in gen-

*Mr. Hale prepared a paper on Freight Car Tactics for presentation before the Central Railway Club at its annual meeting on January 9, 1913. At that meeting, however, he departed from the printed paper in order to secure a more logical presentation, and has very kindly furnished us with the revised notes from which this article is extracted.

eral the fewer cars there are upon the originating road. That is the argument of the car owner in the condition that now prevails. That argument has been thought out and worked out into these very drastic plans that they have in England, and in France, and it has led to the very prompt return of the car and a corresponding unnecessary multiplication of equipment.

But when you turn the thing around, when you come to a period of car surplus, then you find the situation is entirely changed, because then in order to earn per diem on its car the originating road will be grievously tempted to return the foreign car empty to the distributing road and to force its own loaded cars upon the distributing road, and the distributing road cannot avoid that burden. The distributing road then is paying more per diem than it really should. And when you get to the situation which I think was reached some years ago, when railways were loading cars against each other—were returning foreign cars empty and loading their own cars—you get a doubling of empty mileage that is most unfortunate, because it is an additional expense that happens when the roads are making least money.

I will not undertake to go through all the other variations, but I will lay some stress on the situation on a road in a state of congestion. I have heard it said that when there is a car shortage the more engines you have the less cars you will have, and there is a good deal in that. Because if you have a lot of engines you are probably not congested. If you are not congested you will move your cars promptly to the delivery points; you will get rid of your cars, and the roads which are congested or which are not in as good shape as you, will not be able to return them to you. I have seen that happen on divisions of a single railroad. I have seen a division that had its power in good shape simply run out of cars while a division whose power had run down got so congested that more power had to be given it to get the cars away. The same thing happens as between railways. There are railways not so very far from Buffalo which have been congested with great and unfortunate regularity in the last few winters, and the result of the congestion has been that every road has been delivering more cars to them than it received. They seem to have used their power solely in taking cars off the interchange tracks. The amount they have been paying out in per diem for cars which have been standing around and not moving has been simply tremendous.

This variation in the car question is very much the same between the divisions of one railroad, between the stations on one division, or between the industries at one station—very much the same as it is between the railways in the United States. The man in charge of the distribution of cars on a large railway has to take all these variations into account. He considers whether there is a car shortage or a car surplus; he considers whether his divisions are congested or not; he considers which of his divisions are originating and which are distributing, and he considers whether the particular cars are cars which should go back empty or cars which should be loaded back. The man in charge of distribution on the large railroad takes all these things into consideration every day and issues orders every day or every hour to get the best possible results out of his cars. If you should ask him to write down the rules under which all those cars will move he would be at a considerable disadvantage. He would say: "Why, I want a little time for that. I should want to look over my correspondence and see what I have done." He has many of his rules in his head; he has some of them written down; where they are general they are written down, but a great many of them are not general. You cannot get the best use out of your equipment on a railroad by putting it all down on paper and telling your men to follow general instructions. You have to follow it up. You have to have reports, in the first place, to know the situation. You cannot step into an office and distribute cars unless you have got a hundred men all over the road telling you where the cars are. That is the first thing you have got to have And when you do get the reports, while you have as many general instructions out as you can, yet there has got to be something different done every day to keep the cars moving properly. It is just the same on a division with a car distributor. He depends largely on his reports; he has some general instructions out, but he has to send out a great many individual instructions to get anything like good movement out of his cars.

Now what is the moving power on the railways we have been discussing? What is the moving power really that pushes through those orders and gets results? It is discipline. The only reason why the superintendent of a division is able to get empty cars moved from the place where they are not needed to the place where they are needed is the discipline of his division. People know that they have got to do what they are told, and they go ahead and do it without asking questions or they know the reason why. It is the same with a large railway. The general superintendent or the general superintendent of transportation orders so many empties from one division to another, and they go or he knows the reason why. Here we have on these railways this variable situation met in a variable way and backed up by discipline and with results.

Now you come to the arrangements between the railways. It is just as important that the cars be properly distributed between the railways as it is between divisions on a railway. It is more important from some points of view. But there is no possibility of such a thing as discipline—and you come to the American Railway Association, you come to our committees and you say, "Gentlemen, please make us some rules under which these cars will be properly distributed between the railways." Now don't you think that is a little hard? We have found it very hard and we have not been very successful. But we have done some things, we are going to do more, and I hope we shall be able to do the right thing. If we do not, why, the Interstate Commerce Commission probably will, or they will try to.

The first thing that we did was to get away from charging cars. We used to do that a long time ago. And that was rather worse than nothing, for this reason: that it was a direct penalty on the return of the empty car. In the old days before 1902, when mileage was paid on cars you could hold an empty foreign car on your siding for an indefinite period and did not have to pay anything. But the minute you moved it a hundred miles toward home you had to give the owner 60 cents. Now, why should you fine yourself for returning an empty car? And a great many people did not do it. But we got hold of that question and after a number of failures the per-diem system went into effect. In 1902 we began to charge the munificent sum of 20 cents a day for the use of cars. That, of course, was not enough. It was gradually increased. It went into effect just after a period of car shortage. You never can do anything in this matter, however, until you have a period of car shortage. And there was such a period in 1901 and 1902 which enabled us to get the per-diem rules through. That gave us 20 cents a day, gradually increased until we came to the great car shortage of 1906, and then the rate was pushed up to 50 cents. At the time there was an investigation by the Interstate Commerce Commission and that investigation waked up a good many railroad men, as well as others, who had not thought much about the question. The rate was put up to 50 cents, although after the panic of 1907 it was thought advisable to drop it. There was that recognition by the railways of the difference of situations between a car shortage and a car surplus, a recognition which has not always obtained since then, but which I think will be finally recognized.

During that big car shortage we did get the rate up. But more than that we initiated the series of reports which are necessary for the carrying out of any set of rules that approach tactics. It was in 1907 and under the pressure of that great car shortage that the American Railway Association started the reports of car shortages and car surpluses which have been in effect ever since. We have finished out the sixth year. It also initiated the monthly bulletins which give the performance of the cars, which show for each railway the number of miles the car

is run, the number of ton-miles the car is carried, the number of dollars the car has earned per day, and they further show—and this is possibly of more importance—they show which railways are using more cars than they own and which railways are using less cars than they own. If a railway shows that it has on its line only 80 per cent. of the cars that it owns, as certain originating roads do nowadays, that railway ought to be helped; and if a railway shows that it is using, say 20 per cent. more cars than it owns, that is a railway that ought to do something or perhaps ought to be helped, but in a different way from the road which has lost the use of its cars.

Those reports have been published regularly and form about the only information we have on the subject. They have been supplemented in the last month by a semi-monthly location sheet or car-balance sheet which is made by every railway to the Interstate Commerce Commission and of which a copy is sent to the American Railway Association as well. These reports do not seem like much, but I think they have had a good effect. It is true we have had a serious car shortage this last fall, but I think it would have been a great deal worse if we had not had every two weeks the figures showing what the car shortages were, and if the railways had not been able by looking at these figures to see that a car shortage was infallibly coming. The railways ordered a good many cars this last year, something over 212,000. I do not think they would have ordered them if it had not been that the reports of the American Railway Association were showing week by week that the surplus of cars was dropping down and the shortages were beginning earlier than usual. Of course, it may be that they ordered more cars and not enough locomotives. That is another question. But they certainly ordered more cars and before they really felt the grip of the car shortage.

The railways have done one other thing, and this is in the direction of the tactics of which I spoke. They have appointed what is known as the Commission on Car Service. It is formed of three members of the executive committee of the American Railway Association, and to that commission any railway can go and say, "another railway has injured me by detaining my cars and by misusing my cars, and I wish my wrong righted." The commission has the power of fining the railways at fault an unlimited amount. In fact, the only limit made is a minimum rate of $2.00 per misuse. That commission has been in existence for only about two months, but four railways have appeared before it and those four railways have made forty-seven different complaints. It was quite in the power of the commission to examine the records of the railways at fault and assign summary punishment to them, but it has not done that as yet. It has tried to handle matters in a broad way and rectify the situation rather than handle the matter technically. The first thing the commission noticed was that every one of these complaints was in regard to coal cars. There was not one complaint as to box cars. The commission has managed to get certain coal cars home, by its own individual efforts, but the first general and the first important result of the work of the commission was the signing in Chicago, by the presidents of the Chicago roads, of what we call the Chicago declaration, under which the Chicago roads have agreed to give a preference to the handling of empty coal cars. It was a recognition by the Chicago roads that they had a public duty before them: it was their duty to see that the coal mines were kept running and that there would be plenty of coal this year. The coal mines have been kept running and there is plenty of coal. That was done within a couple of weeks after the first case was brought to the commission and after the commission had had a chance to look into the matter in a broad way. That had such a good effect in the vicinity of Chicago; it had such a good effect on the coal lines of Indiana and Illinois that the commission has now asked the presidents of all the railways in the United States to sign a similar declaration, with the idea of meeting the first want, which is a prompt handling of the cars which can carry coal. The presidents are very generally signing the declaration.

The record of the commission so far has not been the record of a judge; it has not assessed all the penalties it could; its record is the record of an administrator. Or, if I can come back to the subject of my talk, the record of a tactician. It has been taking a particular case and has been applying a particular remedy.

I hope people will remember that the car question is not one question but a great many questions; that its answer is not one answer but there are a great many answers to be given to the separate questions; and I hope people will realize that in the handling of cars, even between railways, we need more than a set of cold rules, laws and penalties; we need possibly strategy —but that seems a large word. I feel we need a certain amount of tactics.

WEIGHING METHODS ON THE ST. LOUIS & SAN FRANCISCO.

E. D. Levy, assistant general manager of the St. Louis & San Francisco, was one of the railway witnesses at a hearing before the Interstate Commerce Commission at New Orleans on December 17, in its general investigation of methods and practices in the weighing of carload freight. The following abstract from Mr. Levy's statement to the commission contains an interesting description of some of the methods employed by the St. Louis & San Francisco in the effort to obtain the greatest possible accuracy in the weighing of freight, as well as similar views of a practical railway official on deficiencies in the present weighing practices.

Our standard track scale is a 50-ft., four section, extra heavy pattern, 150-ton scale with type registering beam. We have 16 of these in actual operation—all installed during the year 1911. We expect to install six more of these during the year (1912). Our scale pits are being constructed with waterproof membrane. The decks are supported by ties and are also water and dust proof. The live rails are supported by cast stands, which rest on steel construction. This overcomes the trouble of water and dirt on the platform changing the balance of the scale. We have a total of 66 track scales on the Frisco as follows:

19—	150-ton	50 ft.
1—	80-ton	44 ft.
1—	82-ton	42 ft.
41—	80-ton	40 ft.
2—	80-ton	38 ft.
1—	60-ton	40 ft.
1—	60-ton	36 ft.

All weighmasters are sworn under the rules of the Western Railway Weighing Association or Southern Weighing and Inspection Bureau. We have 34 weighmasters carried on association payrolls; and others are carried on our own rolls. All weighmasters are instructed to see that cars are properly spotted, cut at one end, that the beam is allowed to balance naturally, that the scale is in good working order, and that full information called for on all scale tickets is secured in all cases. This information consists of date weighed, gross, tare and net weights, the weather condition, the amount of refuse, ice in tanks, racks, blocking, dunnage, stakes, temporary fixtures, grain doors, etc., the capacity of car and signature of weighmaster.

All scales are equipped with type-registering beams and our rules provide that in all cases cars should be weighed by the weighmaster without the waybills being before him; the waybills are retained in the agent's office, or in the yard office. The cars are placed on the scales and the weighmaster registers a ticket in the type-registering beam, and sends it to the yard office where it is applied to the waybill, or if it is a check weight, and confirms the weight as provided in our tariff, it is filed. By using the type-registering manifold scale tickets and type-registering beams errors in transposing figures are eliminated, also errors in reading beams.

Our tariffs provide that all cars originating on this line, or

received from connections, which do not bear authorized weighing association track scale stamp, or agreement of such association, should be track scaled en route, and at certain places, namely, St. Louis, Kansas City, Harvard, Chaffee, Ft. Smith, Yale, Springfield, Hugo and Jasper. We check weigh shipments of lumber to check against our track scale weights at other points, and track scale weights of other roads, and at certain other points we check weigh shipments of coal for special reasons. Where the difference between the first track scale weight and the second track scale weight does not exceed 1,000 lbs., the weight is not changed and the waybill is indorsed with a rubber stamp reading, "Check weighed OK."

A report of every car check weighed is made to my office, where we maintain a weighing bureau, consisting of a chief, two clerks and a force of four traveling scale inspectors having tool cars; they have, in addition, steel test cars, two weighing about 45,000 lbs., and two weighing 70,000 lbs., and having a wheel base of slightly less than 10 ft., so they can test each section of our modern four section track scales. The bureau in my office checks the weight differences obtained on our track scales, makes an investigation, and very often is able to locate the error, and in that way cause our weighing service to be maintained at a high standard. The weighing or any other branch of the service that is not supervised and checked will soon deteriorate.

The force of scale inspectors is kept constantly busy inspecting and testing scales and supervising the installation of new scales. We test our scales with our own inspectors on an average of once in sixty days, and the weighing bureau checks to see that all scales are given periodical inspection. When the inspectors make a test of a scale they send in a report on a prescribed form, and all matters requiring attention are given prompt handling. Superficial inspection is given the scales each morning when the weighmaster comes on duty—he sees that the platform is swept off, and that it is free from bind, and that the scale beam is in proper balance.

As a remedy to improve present conditions we suggest that shippers of all commodities be required to show on bills of lading or shipping tickets the actual or estimated weight of commodity to be shipped, and if estimated the basis for the estimate shown on face of bill of lading or dray ticket; in case of lumber, whether dry, half dry or green, and the estimated weight per foot, age and dimensions. The railroad should then weigh the freight at the first track scale and if the weight comes within the variation of tolerance prescribed, then the weight given by the shipper should be accepted.

In check weighing carload shipments, we make no correction when the weights agree within 1,000 lbs. If in weighing, it is found there is a variation of more than 1,000 lbs., or whatever variation is prescribed, the shipment should be again weighed on the scales carefully, and the scales carefully balanced, and if the shipment passes another scale en route it should be billed to be weighed on that scale. If a second weight confirms the shipper's weight it should be allowed to stand. If it confirms the first track scale weight it should stand.

In the event of a variation between shipper's weight and railroad weight, the agent should be charged with the duty of convincing the consignee of the actual weight, if the consignee is not willing to accept railroad weight before the property leaves his possession. In other words, hold an ante-mortem investigation instead of a post-mortem investigation. Under present practices when an overcharge claim is received on lumber, for instance, the lumber is out of existence, it is the part of some building or may be in the roof or sides of box cars; the car in which the shipment was transported may be thousands of miles away. There is no chance to prove the weight of lumber or correctness of the tare weight of the car. If the car is located, the tare produced would not conclusively prove the tare weight a year ago, especially in cases where the amount of overcharge was not great. Under this plan agents could secure from the superintendent authority to bill car empty to the first track scale for light weight if there is no scale at destination. Under the plan proposed the agent would have a number of ways of arriving at the actual weight. He could call upon the consignee to produce his invoice; he could call upon disinterested lumbermen to pass upon the degree of dryness, and in extreme cases he could go so far as to measure part of the lumber and find out how much it weighed per foot. At points where association inspectors are located they could be called upon to do this. Agents should be authorized to determine and agree with consignee upon actual weight, in the same manner as we now require our agents to handle claims for visible loss and damage, i. e., either deliver the freight in good order and secure receipt, or arrive at the correct amount of damage and pay the consignees in full settlement of claim. This has been found more satisfactory than the post mortem settlements. Under this plan if the railroad weights are sustained the consignee must pay all expense, including demurrage if any; if the shipper's weight is sustained the railroad pays it.

We firmly believe that track scales and other scales used by railroads and shippers for determining the weight of freight carried in interstate commerce will never be the proper machinery for producing those weights until the Interstate Commerce Commission or some other competent governmental authority assumes a direct supervision over them. As far as this railroad is concerned, and I believe the same applies to all other railroads, we do not want to assess freight charges on any more freight than is actually transported, but we do want to assess charges on every pound that is transported; the great majority of shippers and receivers of freight, want to pay lawful charges on every pound of freight shipped, but no more.

There are two sides to the weighing proposition; one is the weighing machinery and the other the human agency performing the weighing. There are also two sides to the complaints on the weights of freight transported by the carriers; one is the overcharge against shippers, and the other is the undercharges for which the carriers suffer. If a railroad clerk or weighmaster produces a weight in excess of the actual weight he does not personally profit, but if a shipper or receiver of freight can return an incorrect weight less than the actual amount transported he profits individually. I know the large majority of shippers and receivers of freight are honest, but in the administration of weights we find that the dishonest man is as much a factor we have to contend with as the incorrect weighing machinery and careless weighmasters.

We also find that shippers have inferior weighing machinery and through ignorance think that it is correct. This same thing might be said of some railroads, all of which leads back to the theory that we will not have correct weights until the Interstate Commerce Commission, or some other competent governmental authority, assumes jurisdiction not only over weighing machinery, but over the people who perform the weighing.

We feel that it is not only desirable, but necessary that the commission should prescribe certain standards with reference to scales, specify certain foundation construction, weight of the different parts of track scales, also wagon scales, hopper and platform scales; that the commission should have a force of competent inspectors to see, after promulgating their specifications and rules, that they are complied with, and should order out of commission those scales not meeting the specifications and not competent to produce good results. Such a course might cause this railroad, and a number of others, to spend a large sum of money to bring the weighing machinery up to proper standard. If that be true, then we should spend the money and would do it. As a matter of fact there would be no loss to the carrier, because experience has demonstrated that where we put in modern track scales our weights are so superior that in a short time the cost of the scale is paid for.

There are a great many inferior scales on the market. The

scale manufacturers will sell the purchaser any kind of a scale he wants. They will sell a good scale if the purchaser is willing to pay for it; if not, they will sell him one that will "fit his pocketbook." These scales are often badly installed, the method of installation may absolutely prevent a scale from giving satisfactory service. There is no one to inspect and pass on these scales at the present time.

POSTAL CAR LIGHTING.

The specification for the lighting of full postal cars, as approved by the postmaster-general, has been issued by the Special Committee on Relations of Railway Operation to Legislation in bulletin No. 44, with an explanation of the various points considered. The lighting system is to be either electricity or gas with provision for emergency lighting, as specified later. The fixtures, wiring, equipment, etc., are to be according to the railway's standard practice. Each electrically lighted car equipped for axle generator or head-end system of lighting shall be equipped with storage battery of sufficient capacity to furnish for 12 hours the intensity of illumination specified hereinafter without any charging whatever of the battery during this period. Each car using gas or straight storage electricity as the primary system of lighting shall be equipped with storage capacity sufficient to furnish light for 36 hours at the intensity of the illumination specified hereinafter.

Location of Light Units.—The light units for illuminating the bag rack and storage portions of the car shall be located on the center line of the postal apartment. Direct lighting units shall be located at such uniform height that the shadow of the paper boxes is not cast on any bag rack label, nor higher than approximately 3 in. above the back rod of rack. In no case shall any light unit (except oil lamps, the lowest point of which may be 6 ft. 9 in. from the floor) be mounted at a height of less than 7 ft., measured from the floor to the lowest point of the light unit (spacing between adjacent units in the bag rack portion of the car shall not exceed 8 ft. 6 in. in case of any direct system of lighting, nor 14 ft. in case of any indirect system).

Light units for illumination of the letter cases shall be mounted at the same height from the floor as the units in the body of the car, and as far from the front of the face of the letter case as possible, without the body of the distributor throwing any shadow on his work. In standard construction, where the letter case table is 17 in. wide, the above distance is 20 in. Where the car construction does not permit the above distance to be employed, a lesser distance, but not less than 16 in. may be employed. Separation between adjacent letter case units shall be such as to provide an illumination intensity at all points within the requirements hereinafter specified.

If an indirect lighting system be employed, the provisions of the above paragraph will be waived. In such case, the only requirements imposed for location of units of letter cases are those involved in providing for sufficient vertical and horizontal illumination intensities to meet the provisions of these specifications as hereinafter stated, all units in the car burning. For the purpose of these specifications an indirect system is here defined as any system in which at least 85 per cent. of the horizontal illumination on the 46-in. plane of utilization is received, either directly or indirectly, by reflection of the light from the deck of the car.

In the case of incandescent electric or mantle gas lamps, the design of light unit, except letter case units, shall be such that no portion of the bare lamp filament or the bare mantle is visible to the eye when the unit is observed at an angle of 70 deg. or greater from the nadir. (In general, light units are preferred which emit no light or only a small amount of light between the angles of 50 deg. and 100 deg. from the nadir.) The control of the lights in the postal apartment shall be independent of any other lights in the car, and the letter case units shall be controlled independently of any other light units in the postal apartment.

Initial Illumination Values.—All horizontal illumination values shall be taken on a plane 46 in. above the floor line. Vertical illumination values shall be taken on the vertical plane on the face of letter case as specified below. New lighting installations shall be such as to give initial illumination values in foot candles within the following limits:

Location.	Minimum.	Maximum.
Bag-rack portion:		
Center of car, horizontal	4.70	10.00
Mouth of bags, illumination measured 18 in. from side of car, horizontal	2.50	10.00
Letter cases:		
Over table, horizontal	4.70	16.00
Face of case, vertical	2.08	16.00
Storage portion, not behind obstruction, horizontal, measured not less than 18 in. from side or end of car	2.50	10.00

Illumination requirements at letter cases as above specified shall be entirely fulfilled by letter case units, other units in the car not burning; but letter case units may be considered as contributing to the specified illumination values for the body of the car.

If globes or reflectors of opal glass, rough crystal glass, prismatic glass, or aluminized metal, and those giving similar results (excluding heavy density opal with glazed reflecting surface, mirror glass, porcelain enameled metal and those giving similar results) be employed, the minimum values specified in the above table may be reduced 20 per cent. and the maximum values increased 20 per cent.

Above illumination values are based on an allowance of 40 per cent. for depreciation in service. Less efficient maintenance must be compensated for by increased initial installation.

If an indirect lighting system be employed, the minimum and maximum values in the above table may be respectively decreased and increased 40 per cent. in the bag rack and storage portions of the car, and 25 per cent. at the letter case locations specified in the above table.

Service Illumination Values.—While the car is in active service the lighting installation shall be maintained at all times to give illumination values (in foot-candles) not less than the following minimum values:

Location.	Minimum.
Bag-rack portion:	
Center of car, horizontal	2.80
Mouth of bags, illumination measured 18 in. from side of car, horizontal	1.50
Letter cases:	
Over table, horizontal	2.80
Face of case, vertical	1.25
Storage portion, not behind obstructions, horizontal, measured not less than 18 in. from sides or ends of car	1.50

Illumination requirements at letter cases as above specified shall be entirely fulfilled by letter case units, other units in the car not burning; but letter case units may be considered as contributing to the specified illumination values for the body of the car.

If globes or reflectors of opal glass, rough crystal glass, prismatic glass, aluminized metal, and those giving similar results (excluding heavy density opal with glazed reflecting surface, mirrored glass, porcelain enameled metal, and those giving similar results) be employed, the minimum values specified in the above table may be reduced 20 per cent.

If an indirect lighting system be employed the minimum values in the above table may be decreased 40 per cent. in the bag rack and storage portions of the car, and 25 per cent. at the letter case locations specified in the above table.

A light failure is defined as the condition where for a period exceeding 30 minutes the primary lighting system fails to give sufficient illumination to permit distribution of mail matter to be continued. It will be considered that whenever the lamp

voltage falls below 80 per cent. of the normal operating lamp voltage such a condition of light failure has been reached.

A car movement is defined as the use of a postal car by a crew of postal clerks over the length of their run in one direction. Where a car covers more than the run of one crew, each separate run shall be considered a car movement.

The percentage of failure of the lighting system is defined as the ratio of the total number of failures to the total number of car movements of each primary system of lighting (gas and electrically lighted cars to be considered separately) on each railway system. The determination of percentage of failure shall be based on the operating performance of each car for the preceding twelve months period. Only such failures as are promptly reported by the railway mail service to the operating railroad shall be considered in computing the percentage of failure.

Emergency Lighting.—If the percentage of failure of the primary system of electric or gas lighting does not exceed 1 per cent., candle lamps will be accepted as a suitable emergency light. If the percentage of failure of the primary system of gas or electric lighting exceeds 1 per cent. and is not greater than 4 per cent., an emergency system of suitable oil lamps, gas or electric lights, maintained by independent storage capacity, may be required. Such emergency system must provide illumination values not less than 50 per cent. of the minimum operating illumination values specified above for the primary system, with the exception of letter cases and center line of car through bag rack portion where the illumination shall not be less than 60 per cent. If the percentage of failure of the primary system of electric or gas lighting exceeds 4 per cent., a new installation or a second complete primary system of lighting will be required on cars so failing.

ANNUAL REPORT OF THE NEW YORK PUBLIC SERVICE COMMISSION, SECOND DISTRICT.

The sixth annual report of the New York State Public Service Commission, Second district, shows 924 corporations, municipalities, and individuals engaged in serving the public in some capacity, under the jurisdiction of the commission. Of these, 183 are steam railroad corporations, 125 are street railroad corporations, 7 express companies, 1 sleeping car company, 301 electrical corporations, 73 manufactured gas corporations, 58 natural gas corporations, 29 acetylene gas corporations, 18 gasolene gas corporations, 126 telephone corporations, and 8 telegraph and cable companies. The steam railroads have 8,458 miles of main line and the electric railroads have 1,909 miles. The total capitalization of the corporations under the jurisdiction of the commission is $4,822,222,727.

During the year 1912 the commission handled 2,853 applications and complaints, being the greatest number for any year since it came into existence. In 1908 there were 1,606, and in 1911 there were 2,321. The commission devoted 288 days to public hearings, during which days 504 separate hearings were given. During the year the commission authorized the issuance of stocks to the amount of $30,602,055, and bonds to the amount of $96,817,446: a total of $127,419,505. Every mile of steam railroad track in the state has been personally inspected by representatives of the commission, the total main line, sidings and yards equalling 17,816 miles of track. The inspections made last year indicate a higher plane of maintenance than has existed heretofore in the history of the state. The development of new and better appliances which are being adopted not only by the larger railroads, but by the smaller ones when renewals become necessary, is adding safety and facility to transportation.

The rail situation indicates steady improvement with respect to weight. The use of treated ties with tie plates and screw spikes is rapidly increasing on many of the principal roads. The extension of the automatic signal system has been continued on the New York Central, the Buffalo, Rochester & Pittsburgh and on branches of the Delaware, Lackawanna & Western.

No railroad fires of any importance in the forest preserve have been caused by locomotives since the order of the commission of April 1, 1909, requiring oil-burning engines.

The commission has made extensive investigations into street railway service in the cities of Buffalo, Rochester, Yonkers and Newburgh, and important and substantial improvements are to follow each of these investigations.

The commission recommends to the legislature the re-passage of the law vetoed by the governor last year without specific reasons therefor, empowering the commission to suspend increases in railroad rates pending investigation as to the reasonableness of such advances. The commission feels that the best time to investigate increases in rates is when the increases are proposed to be made. The best time for the carrier to justify increases is when the reasons or causes underlying the action are fresh in the minds of railway officers.

Recommendation is made that the Public Service Commission's Law be amended, authorizing the commission to protect shippers in cases where the agent of a railroad quotes an erroneous rate. In such cases the carrier should be liable to a forfeiture of $250 to the state. The forfeiture provision is held to be necessary to prevent future lax methods.

Attention is also called to the fact that it is possible for telephone corporations to organize with a property value less than $10,000 and begin business without any reference to the commission, thereby defeating one of the real purposes of the supervision of telephone corporations. Further, no means is provided for ascertaining whether or not a certain corporation was originally within the jurisdiction of the commission or whether since its formation, in the natural process of its development, it has grown so as to have an investment in the business in excess of $10,000.

Victorian Government Railways.—The lines owned and operated by the state of Victoria, Australia, includes 3,622 miles of steam railway, all of 5 ft. 3 in. gage, except 122 miles of 2 ft. 6 in. gage, and an electric line 5¼ miles in length. The railway also operates the state coal mines at Wonthaggi, producing about 200,000 tons of coal per year. The gross revenue of the railway in the fiscal year ended June 30, 1911, amounted to $23,827,406, while the working expenses were $14,558,977, leaving a net revenue of $9,268,429, or 4.31 per cent. on a capital account of $215,005,737.

Western Australia Railways.—The Western Australia Government Railways have cost about $60,000,000 and extend to about 2,300 miles. The first line was commenced in 1871 by a private company, and was followed by a line to the north of the settled districts from Geraldton to the copper districts of Northampton. Construction has since proceeded rapidly, the main feature of the northern system being an inland line from that port. The goldfield line from Fremantle through Perth to Laverton, and a southern line from Northam near Perth on the latter line to Albany, was subsequently made, and all the southwest corner of the state has now been fairly filled up with a network of lines. The cost has been about $26,425 per mile, the country generally being easy. The gage is 3 ft. 6 in. The chief difficulties encountered have been in connection with the water supply. There were, at the date of the last report, over 350 miles under construction, including an isolated line in the north of the state, 114 miles long, from Port Hedland to Marble Barr. There are 507 miles of new lines authorized. The Midland Railway, 277 miles long, connecting the northern and southern systems, is owned by a private company. The Western Australian railways are at present entirely isolated from all the other Australian systems.

Maintenance of Way Section.

THE protest raised by Dr. Von Schrenck in his paper before the Wood Preservers' Association against the improper treatment of timber under the stress of urgent requirements, or at the direction of the party for whom the work is being done, may well be given serious consideration. While directed primarily at the conditions existing at plants doing work by contract, it also applies to those plants owned and operated directly by the railways. Those in charge of these plants owe it to their clients or employers to fully explain the injurious effects which will follow a deviation from the best accepted practice and to discourage this wherever possible, for the premature removal of such ties from the track will be remembered and charged against the plant long after the special instructions have been forgotten.

THE ninth annual convention of the American Wood Preservers' Association, held this week in Chicago, reflected the exceedingly promising condition of the association and its remarkable growth during the last two years. It was organized at St. Louis in 1904, when 24 men met at the Transportation building on the World's Fair grounds and perfected plans for a permanent organization. The first regular meeting was held at St. Charles hotel, New Orleans, on January 17, 1905. Following this the annual meetings were held in Chicago, in 1906; Memphis, Tenn., in 1907; Kansas City, Mo., in 1908, and at Chicago annually since that time. The membership list has grown to a total of 157, a net gain of 53, or over 50 per cent. more than that of last year. Twenty-nine railways are now represented by 45 members, the rest of the membership representing commercial treating plants, lumber companies and other manufacturing concerns. This membership is scattered over 29 states and four foreign countries. As the larger portion of the treated timber is consumed by the railways, the importance of this rapidly growing association to the railways can be readily realized.

THE severe climatic conditions encountered in most parts of the country at this season of the year introduce a special class of problems affecting nearly all branches of construction and maintenance of way work. The next contest will be on "Winter Methods" and will relate to the handling of these special problems. Contributions describing methods, new or not generally in use, for overcoming any of the many difficulties encountered in the prosecution of construction or repair work, or in the routine maintenance work of keeping the tracks, water stations and other facilities in service, will be eligible. The unusually severe conditions encountered last winter are still fresh in the minds of all and the methods used then, as well as those developed this winter, will be of interest if they depart from common practice. Prizes of $25 and $15 will be paid for the first and second best papers received, while all others accepted and published will be paid for at our space rates. All contributions should be sent to the Civil Engineering Editor of the *Railway Age Gazette*, Transportation building, Chicago, and must be received by February 25.

THE judges of the contest on "The Storing and Handling of Maintenance of Way Material," who were H. M. Eicholtz, division superintendent, Chicago & North Western; A. F. Blaess, assistant engineer maintenance of way, Illinois Central, and C. G. Delo, engineer maintenance of way, Chicago Great Western, awarded the first prize to A. S. Markley, master carpenter, Chicago & Eastern Illinois, Danville, Ill., and the second prize to E. K. Coggins, chief clerk to roadmaster, Southern, Knoxville, Tenn. Five other papers were received from A. Palm, roadmaster, Central California Traction Company, Sacramento, Cal.; M. Ganley, roadmaster, Atchison, Topeka & Santa Fe, Argentine, Kan.; M. Riney, foreman bridges and buildings, Chicago & North Western, Baraboo, Wis.; R. O. Gillies, roadmaster's clerk, St. Louis & San Francisco, Ft. Scott, Kan., and Joseph J. Morgan, New York Central & Hudson River, Kingston, N. Y., all of which are published in abstract in this issue. The economical handling of material is an important one for maintenance of way officers to consider, and it is well worth their attention, as it offers opportunities for large savings or waste, depending on the way the work is performed. While more elaborate than the average modern installation, the Pittsburgh & Lake Erie storehouse at McKees Rocks, described elsewhere in this issue, is typical of the results of a careful study of this problem. The papers presented have far from exhausted the subject and we invite further contributions describing more particularly definite methods and installations, and the results which have been secured by their use.

ENGINEERS in charge of timber preservation may not all agree with Mr. Weiss in his comparison of zinc chloride and coal tar creosote for preserving cross ties, presented before the convention of the American Wood Preservers' Association this week, and abstracted elsewhere in this issue. Mr. Weiss finds six points of superiority for creosote, namely; it does not leach, it does not weaken the ties, it does not corrode the spikes, it does not cause leakage of signaling currents, its penetration can be readily tested, and it is somewhat cheaper on the basis of assumptions made in the paper as to the life of treated ties. On the other hand, he found five points in which creosote is not as desirable as zinc chloride, namely; it evaporates from the ties, it does not penetrate the wood as easily as zinc chloride, its composition is far from uniform, it is combustible and it is more difficult to handle. In the matter of toxicity the paper shows the two preservatives to be about equal. If the factors enumerated are of equal importance, there would seem to be cause for a careful study before deciding that either process is the more desirable and some question might be raised as to whether the rapid increase in the use of creosote during recent years and the lack of growth in zinc chloride treatment has resulted from such study or from other influences. The advocates of zinc treatment maintain that some of the poor showings made by zinc-treated ties in the early days of wood preservation can now be directly traced to poor timber or improper operation of the plant, rather than to any inferiority of the process. The fact that the Baltimore & Ohio is now building a new plant for treating ties with zinc chloride and that a large western road, which discarded the zinc process a few years ago, is reported to be considering its readoption, indicate that some timber treating engineers have reached the conclusion that the comparisons of the two preservatives are not all in favor of creosote.

THE specifications for Portland cement, published elsewhere in this issue, differ in several important respects from existing specifications, the most prominent of which are those adopted by the joint committee of the American Society of Civil Engineers, American Society for Testing Materials, American Institute of Architects, Engineer Department of U. S. Army, Association of Portland Cement Manufacturers, and the American Railway Engineering Association. The Lackawanna specifications are based upon an extended study, both in the field and laboratory, extending over the past two years. One conclusion reached as the result of this study was that a large part of the difficulty encountered with cement can be traced to the presence of the coarser particles. As a result, these new specifications require that 95 per cent. of the cement by weight shall pass through a number 100 sieve as compared with 92 per cent. in the specifications referred to, and 80 per cent. through a number 200 sieve instead of 75. Largely because of

this increased fineness it was possible to require a higher tensile strength. Instead of the required strength of 175 lbs. for neat cement after 24 hours, 200 lbs. is required, the other figures for neat cement remaining as in the earlier specifications. In the 1; 3 mixture the strength in the seven day test is raised from 200 to 250 lbs., and in the 28 day test from 275 to 375 lbs. Another important deviation is in the substitution of the auto clave test for the more common boiling test. The investigation showed that many samples which would pass the boiling test would not pass this auto clave test, and it is believed that the latter will reject many samples which pass the boiling test, and in that way will remove a large portion of the cement which would ultimately cause failures if placed in structures. While this test may be regarded by some manufacturers as unnecessarily severe, in view of the extent to which this road is going into this class of construction, and the size of the structures which it is building, it is better for it to reject several worthy cements than to allow one poor cement to pass. The results of the enforcement of this specification will be followed with much interest by engineers in general.

THE systems in general use for the handling of maintenance of way material vary so widely on the different roads that it is not to be expected that all the ideas advanced in the papers received in the contest on The Storing and Handling of Material will receive the unanimous approval of all our readers. The handling of this material is now passing through a process of development and on certain roads considerable attention is being given to a study of the comparative advantages of the different methods, for each of the systems possesses certain advantages, as well as disadvantages. The handling of material and of scrap is, however, not being given the amount of general attention which its importance would appear to justify. The extent to which the maintenance department should maintain its own storehouse and handle its stock, as compared with the handling of it directly by the store department, is a much argued question with merit on both sides. It is interesting to note that on several roads where the maintenance of way department has studied this subject carefully, the material is being handled directly by that department. This practice is, however, not in general use. The amount of emergency and reserve material to be held out along the line by the smaller gangs also varies widely, although there is a strong tendency now to reduce this to the minimum and to concentrate a moderate amount at some central point. With the train service now existing on most lines, the emergency material can thus be concentrated and greatly reduced in amount without running much chance of incurring delays. The reduction in the number of standards, especially for rail and track fastenings, is also being closely watched as another means of reducing the amount of capital tied up in reserve material. The practice of handling scrap varies widely, although the supply department in most cases handles it, sorting and classifying it for sale. On some roads the maintenance of way and mechanical departments collect and sort their own scrap, turning it over to the purchasing department for sale. The method of collecting the scrap itself is subject to some variations in practice. One reader says that it is the practice on his road to run scrap cars whenever there is a sufficient amount of material to warrant it. Other roads run their supply and scrap cars at stated times, so that those concerned may know when to expect it and can plan accordingly.

THE USE OF SLOW ORDERS AND FLAGS.

NOT long ago we received a letter from a railway officer interested in fuel economy protesting vigorously against the frequent use of slow orders by maintenance forces on the ground that every time a train was forced to materially reduce speed, or to stop, it required a consumption of from 500 to 1,500 lbs. more coal than would otherwise have been required. Laudable as the agitation for fuel economy is, and much as we desire to promote this, it would seem that this criticism borders on dangerous ground. As similar remarks have been heard on other occasions, it is well to consider what they involve.

The ideal conditions are, of course, that the track shall at all times be safe for trains at full speeds. However, this condition is more to be hoped for than realized even on the best maintained roads. There are certain sources of delays which can be avoided by the expenditure of a sufficient amount of money, among which can be placed much of the bridge renewal and track improvement work. There are other causes of delays which are unavoidable with the present methods of railroading. Among these are broken rails, washouts, storms, and certain classes of bridge erection.

The problem of reducing or eliminating the delays referred to in the first class is essentially an economic one, depending on the amount of money a road is justified in spending to eliminate a certain amount of delay to traffic. On the main line of the Pennsylvania between Philadelphia and New York, the time which the maintenance forces are allowed to hold a track is limited to 12 min. In such a place the cost of doing work increases very greatly, for the time lost by a gang because of traffic conditions may far exceed that spent in working, but is justified by the very heavy traffic which must be kept moving. A careful check, made a few days ago, of the time of a gang engaged in putting in a floor system for a large bridge which was being rebuilt under traffic, showed that this gang was able to work only about 2½ hours daily. Delays such as these run into money the same as do the coal bills referred to above. These lines of heavy traffic density are, however, not typical of the conditions existing on the average railroad in this country and the frequent use of the slow order becomes economical.

From their very nature, the second class of delays, the unavoidable slow orders, are a necessity as a measure of safety to compensate for the weakening of the track structure either during alterations or repairs, or from other causes. While the number of accidents due to neglect to put out slow orders or flags where the conditions are known are small and reflect to the credit of the maintenance men as a body, their supervisors and superior officers cannot do other than insist upon the use of such precautionary measures whenever there is a possibility of accident due to weakened conditions, and these men should know that they have the support of their operating officers whenever such an order or flag is put out. While engineers will seldom intentionally run by a stop flag, on many roads they will regularly exceed the limits set on slow orders, forcing the supervisors and foremen to set these limits lower than would otherwise be necessary.

Closely associated with the use of the slow order is the use of the flag for absolute stop. This is especially important at this season of the year when broken rails are most prevalent. Many section gangs are reduced during the winter months to two or three men, and in such cases they can do little else than flag until assistance arrives, when a broken rail is discovered, or the track suddenly becomes unsafe. All foremen engaged in maintenance work must not only be impressed with the importance of flagging, but also with the sending of flags out a sufficient distance to fully protect all trains. It is only a few weeks since the engine and forward car of a fast passenger train on the main line of an important road ran off the track at a point where a broken rail was being taken out because of a "short flag." With the large and increasing proportion of foreigners employed in many of the gangs today, it becomes doubly important for the foremen to fully realize the necessity of proper flagging and their superiors can well emphasize this.

In a departmental organization it is natural that the transportation officer will be interested in the continual movement of trains without delay. He is, therefore, apt to criticise the foreman who stops or slows down trains without ascertaining all the facts in the case. He must be careful with his criticism for this censure from a superior officer may cause a foreman to take a chance the next time. It is far better to cause a delay than an accident.

Letters to the Editor.

LIGHT VERSUS HEAVY TREATMENT OF TIMBER.

CLEVELAND, Ohio, December 13, 1912.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

On page 748 of your issue of October 18 there appeared an article by E. A. Sterling on "The Development and Status of the Wood Preserving Industry in America," in which he gives a summary of the various processes or treating methods now in use in this country. He divides the different kinds of treatment into three classes: high artificial pressure processes, atmospheric pressure processes and low artificial pressure processes. Each of these is again sub-divided between "full-cell" and "empty-cell." This classification is, in my opinion, incomplete and indefinite. In the first place, he omits to mention in his summary the "boiling in oil process," which is used to a considerable extent in Oregon and Washington. Again, he does not describe how "full-cell" and "empty-cell" treatment is secured or performed with "low artificial pressure processes" as he does for all the others mentioned in his schedule, nor does he make clear what he means by "high artificial pressure" and "low artificial pressure." Is it not true that the pressure in the impregnating cylinders may be anywhere from one pound to 250 pounds? Therefore, where is the distinction between the two processes?

If there is any, when and by whom was the dividing line established? In regard to the so-called "full-cell" and "empty-cell" processes, I desire to repeat here what I have often expressed, that there can be no such distinction between different treating processes. These so-called "empty-cell" processes are nothing more than "partial dose" processes, injecting only a limited quantity of creosote oil into the timber.

I would summarize the methods in use in this country at present, as follows:

ARTIFICIAL PRESSURE PROCESSES.

Full Dose.—Impregnation done in closed cylinders. Preservatives injected into the wood to total refusal, after the wood is put into a receptive condition by air seasoning, or boiling in steam or oil. Preservatives mostly used are creosote oil, zinc chloride, crude oil and other chemicals and solutions. Penetration and diffusion as thorough as the condition of the wood and process of treatment will admit.

Partial Dose.—Impregnation done in closed cylinders. Duration and amount of pressure regulated so as to inject a limited quantity of preservative into the wood, creosote being the only preservative used in this process. Penetration usually scant except in sapwood and the variation in the absorption in individual ties is very large.

ATMOSPHERIC PRESSURE PROCESSES.

Light Dose.—Impregnation done in open tanks. Preservative usually creosote oil, crude oil or carbolineum. Quantity absorbed depending upon the temperature and nature of the solution, character and condition of the wood. Treatment only superficial.

The Lowry and Rueping processes come within the category of "partial dose" artificial pressure processes.

Mr. Sterling states that the present tendencies are towards lighter impregnation with creosote and that no less than 16 plants use a light impregnation creosote process. While not specifically so stated, the impression left on my mind after reading this article, and I think on that of most readers, is that it is economical to treat ties with a partial dose of creosote. I do not believe these light doses are economical, and feel sure that some railway companies treating their ties in this manner are making a great mistake. Treating railway ties with light doses of creosote oil has been shown by experience to be a very unwise thing to do. For motives of economy some of the French railways undertook to reduce the quantity of oil injected into their ties, from full dose to partial dose, and met with unfavorable results. Why should we not profit by past experience and treat ties to refusal, instead of repeating these mistakes?

In France, where the creosoting of ties is an old industry, heavy treatment has been the rule, forcing into the timber all of the creosote that it would take. In England, also, the creosoting of ties is an old industry, but, on the average a somewhat smaller quantity of creosote per unit volume of timber has been used than was common in France. In comparisons of the practical results obtained in the two countries it has always been reported that the life obtained from creosoted ties in France was longer than in England, purely and simply because of the larger amount of material used per unit of the treated timber. If the long-standing results of experience in these countries have been correctly represented, and if any significance attaches to them, we fail to see the logic in much of the supposedly experimental work that has been done in this country. If the life of the timber depends upon the amount of preservative injected, as long-time experience seems to teach, then skimping the material might be expected to result as skimping usually does in other engineering work, no matter under what name or disguise the art is practiced. The old adage, "Anything worth doing at all is worth doing well," is eminently fitting in the treatment of ties and timber.

W. F. GOLTRA.

GAGE OF AFRICAN RAILWAYS.—The first railway in South Africa was a short line, constructed by a company, from Cape Town to Wellington, with a branch to Wynberg, amounting in all to about 63 miles in length. It was begun in 1859, and opened in 1863, and was taken over by the government in 1873. This line was on a gage of 4 ft. 8½ in. When, however, the Cape Colony decided to embark on a policy of railway extension, the question arose whether a narrower gage would not be more suitable to the requirements of the country. The decision in 1869 to construct many extensions in India on the 3 ft. 1 in. gage no doubt influenced the Cape government in the adoption of a somewhat similar gage. This decision practically settled the question for nearly the whole of Africa. Thus, when the political union of South Africa was accomplished, the physical union, through uniformity of railway gage, had been already attained. The gage fixed on was 3 ft. 6 in., and the Cape Town to Wellington line having been converted, construction was pushed forward from three ports—Cape Town, Port Elizabeth and East London.

QUEENSLAND RAILWAYS.—The first section of the railways was opened in 1865 from Ipswich to Granchester, the government in this case being the first builders. The 3 ft. 6 in. gage was adopted. The principles guiding extension in Queensland were different from those of the older states, the general scheme being to run lines inland, more or less parallel to each other, from the several ports of Brisbane, Rockhampton, Townsville, Cairns, Cooktown, and Normanton, reaching, respectively, Cunnamulla, Longreach, Cloncurry, Charleston, Laura, and Croydon. A line in a southerly direction from Towoomba to Wallangarra forms the main line connecting with that from Sydney. A short line direct from Brisbane to the border at Tweed Heads will in the future form a second main line to Sydney when the North Coast Railway of New South Wales is completed. There have been considerable engineering difficulties in the construction of some of the Queensland railways, especially on the Cairns line, 48 miles of which cost about $140,000 per mile. The total mileage reached 3,868 at the date of the last report. Over 1,605 miles were under construction, and 618 were authorized, and in addition there are 215 miles of private railway lines. The government lines in Queensland have cost an average of $35,270 per mile.

NOTES ON STAKING OUT TRACK CONNECTIONS.

Solutions of Maintenance Engineering Problems Which Avoid Errors Resulting from the Use of Field Book Methods.

By W. H. Wilms,
Assistant Engineer, Cleveland, Cincinnati, Chicago & St. Louis, Indianapolis, Ind.

The ordinary field book is of slight value to the engineer engaged in maintenance work in the solution of track problems. None of the problems presented in such books have been solved with a view to practical application. Following the methods outlined in these books, it is not uncommon, for instance, to see new sidings staked with the initial curve tangent to the center of the track from which the turnout leads, although a little study will show that the curve is not necessarily tangent to the frog, and unless it is tangent, an elbow must be thrown in the curve, or a piece of tangent introduced, depending on whether the curve beyond the frog is of less or greater degree than the curve back of the frog. In either case, the siding presents a bad appearance and in case of an extremely sharp curve and close quarters, the engineer would probably find the siding could not be operated until relocated. The only field book that has attempted to treat track problems with a view to practical application by means of a so-called "reference curve" makes such problems really more complicated than they are. In the following notes only such problems as commonly occur in practice are given, leaving it to the ingenuity of the engineer to modify these methods to meet his particular requirements in more complicated cases. While no claim to originality is made in the solution of these problems, it is believed a number of them will be new to not a few engineers.

SWITCH LEADS.

From both the operating and maintenance standpoints the installation of turnouts leading from curves is to be avoided whenever practicable. When the installation of a turnout on the outside of a curve is unavoidable, the switch leads should be made straight wherever it is possible to do so, as the benefits

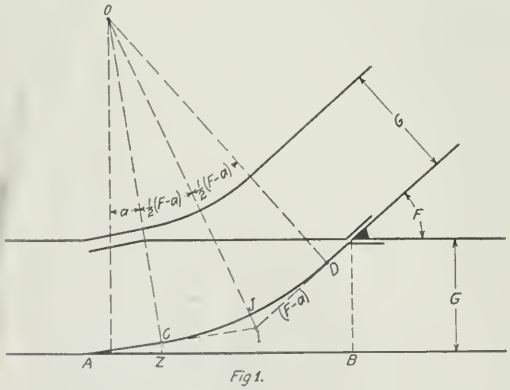


Fig 1.

in safer operation and decreased maintenance of the switch by using straight leads are very pronounced. Often a slight change of alinement or the substitution of a different size frog will readily effect this.

Of equal importance is the reduction to a minimum of the curvature in the leads of a turnout on the inside of a curve. This also can often be effected by slight changes in alinement and the substitution of a higher frog number.

Also, for similar reasons, the alinement of the turnout track immediately beyond the frog is of importance. Where a curve is necessary it should, if possible, be of the same degree as the curvature in the lead; otherwise there results the objectionable feature of a change in curvature in a very bad place, which not only looks bad but is apt to be a constant source of trouble in operation and maintenance. This is especially true where the curvature is sharp and connections close.

In order to obtain a solution to such problems as the above where the alinement of the switch lead is taken into consideration, it is quite necessary to know the actual length and degree of curve of the leads of the road's standard turnouts from straight track. Knowing the length of switch rail, spread at heel of switch and length of frog from theoretical point to toe,

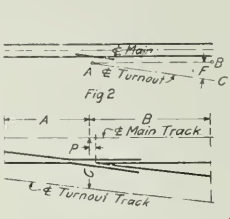

Fig 2

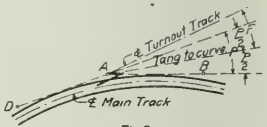

Fig 3.

No	Angle	A	B	C	D	p	Lead

Fig 4.

the length and curvature of the lead are readily obtained from the following formulas:

(From Manual of Am. Ry. Eng. Assoc.)

F = Frog Angle
W = Length of Wing Rail of Frog
S = Length of Switch Rail
H = HeelDistance of Frog
G = Gage of Track
R = Radius of Center Line of Lead Curve
a = Switch Angle

$$\text{Lead Dist. AB (Fig. 1)} = (S - W)\frac{\sin \tfrac{1}{2}(F - a)}{\sin \tfrac{1}{2}(F + a)} + G \times \cot \tfrac{1}{2}(F + a)$$

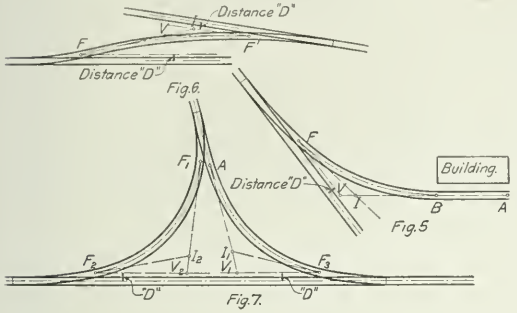
$$\text{Radius of Lead Curve} = \frac{G - H - W \times \sin F}{\cos a - \cos F} - \frac{G}{2}$$

Having once computed this data from the road's standard frog numbers, the engineer should place it in his field book for future reference.

SIGNIFICANCE OF STAKES.

Due to the fact that many track foremen and supervisors have to work to stakes set by many different engineers, some of whom make it a practice to set stakes indicating the location of a frog on the rail line at the theoretical point and others who set such stakes on the center line of track opposite the actual point, costly mistakes sometimes result. To avoid such trouble, it is a good plan to have some definite system of marking and setting stakes, and after the tracks have been staked out to go over the layout with the track foreman and explain to him the significance of the stakes, so that when track laying begins there will be no chance for mistake or confusion. In most cases it is unnecessary to take into consideration the difference between the theoretical and actual points in the location of a frog. There are a few cases, however, where a failure to observe this difference would result seriously. For example, in the location of the frogs of a No. 10 crossover between parallel straight tracks, 13 ft. center to center, where the track is straight between frogs, the distance from theoretical to actual point of a No. 10 frog with a ½-in. point is 5 in. Now, if stakes are set for theoretical

points and the foreman sets the actual point of frogs to these stakes—a thing he is very likely to do unless the significance of the stakes has been explained to him—there will result a total error in the position of the two frogs of 10 in., resulting in a gage of only 4 ft. 7½ in. in the straight track between the frogs. This is no hypothetical case, but along with other mistakes of its kind is almost of constant occurrence with young and inexperienced engineers. To avoid such trouble, stakes marking position of frog should be set for actual point and plainly marked to that effect. When the location of a frog in the existing track is not definitely fixed by conditions, the point of the frog should be so located as to bring the heel or the toe at



a rail joint. If this is done, only one rail cutting is necessary, and no short rails are required.

GRAPHICAL SOLUTION OF TRACK PROBLEMS.

A great many track problems can be readily solved by graphical methods. With careful and accurate drafting on a large scale—say 10 or 20 ft. to the inch—many complicated problems are readily solved with all the accuracy usually required in track work. In a great many problems a solution can be easily and quickly effected by making a few trials in the field. In such cases it has been the writer's practice to carry with him in the field a few curve templets, scale, triangle and drawing paper, and by locating the critical or determining points and plotting them to scale, he has generally been able to decrease the number of trials necessary for a solution to one or two.

In staking out tracks to and around existing structures the young and inexperienced engineer may not appreciate the importance of proper clearance and many a track has been staked and afterward built 6 in. to a foot or more too close to an existing structure.

GENERAL METHODS.

The ordinary method of locating turnouts where the position of the frog in the main or body track is not a critical feature is as follows: Set up the instrument at *A* (Fig. 2), this point being in the center line of the turnout track opposite the point of the frog. Foresight is taken on point *B* gage distance from the center line of main or body track, with the vernier set at minus the frog angle so that when the reading is turned to zero the line of sight is in the center line *A-C* of the turnout track. If, now, the turnout track is to proceed on a curved alinement, deflections may be turned either right or left and the curve located. A stake set back a distance from *A* equal to the length of the lead locates the switch point and the track foreman lines the curve between the heel of the switch and the toe of the frog, either by eye or by using a series of ordinates from the main track rail. If the main or body track is curved (Fig. 3), a backsight *D* and a foresight *B* are set, making the distance *A-D* equal the distance *A-B*. The angle between the line *A-B* and the line *D-A* extended is bisected to obtain a line parallel to the tangent to the main track rail at the point of frog and the frog angle *F* is then turned off from this tangent line. The work of locating the turnout track is thus done with one set up of the instrument, entirely independent of any theoretical assumption regarding the curve in the lead.

To make the curve (if any) in the turnout track tangent at the heel of the frog instead of at the point, which many would consider better practice, it is only necessary to have a table as in Fig. 4, and using the offset *D*, proceed as before.

In locating close connections between tracks and sharply curved branch tracks running into or along buildings where the exact position of the frog is a critical feature of the work, this position may usually be obtained as follows: Let *A-B* (Fig. 5) be the center line of a branch track whose position for the distance *A-B* is determined by the building. Extend line *A-B* towards the main track to point *V* at distance *D* from the center line of the main track. Measure the angle *V* and the distance *VB*. Let *I be* the point of intersection of the line *AV* with the line *FI*, angle *IFV* being the frog angle. Now the criterion for the minimum degree of curvature in the curve *FB* is that the point of intersection *I* shall be equally distant from the points *F* and *B*. This makes the curve *FB* a simple circular curve. To solve the problem, let $FI = IB = T$ and let measured distance $BV = M$.

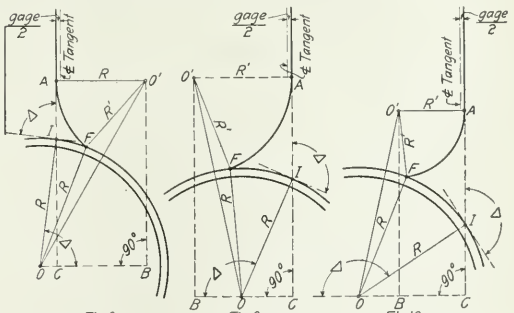
Then $VI = M - T$; and in triangle *FIV* we have:

Angle I = angle V + angle F, and

$$\frac{T}{\text{Sin V}} = \frac{M - T}{\text{Sin F.}}$$

from which the tangent distance T may be obtained. After thus solving triangle *FIV*, first for T, then for distance *FV*, the frog may be located by measurement from the established point *V*. This method of treatment is applicable to crossovers between non-parallel tracks (Fig. 6), to wye tracks (Fig. 7), and to crossovers between parallel tracks where frogs or unequal angles are used.

In applying the problems, as found in the field books, where a turnout from a curved track is to form a connection with an established tangent, the engineer is restricted to the use of



[Case 1. Curves in Opposite Directions. Δ less than 90°.]

[Case 2a. Curves in Opposite Directions. Δ greater than 90°, R¹ greater than R cos Δ.]

[Case 2b. Curves in Opposite Directions. Δ greater than 90°, R¹ less than R cos Δ.]

but one curve, the degree of which is that of the theoretical curve of the turnout, which equals the degree of curve of turnout from a straight track, plus or minus the degree of the curve of the track from which the turnout springs. The use of this one curve will rarely prove desirable on account of its being either too sharp or too flat.

Four general cases of the problem present themselves, as shown in the illustrations, Figs. 8, 9, 10, 11, 12, 13. The necessary field work in each case consists in measuring the angle between the center line of tangent and the tangent to the center line of the curve at the point of intersection; or better yet, the angle between a line offset one-half the gage from the center line of the tangent and the rail which will pass through the frog, as the latter will simplify the problem, and the radius of the

rail is determined simultaneously by measuring the middle ordinates for one or more chords.

Having the angle of intersection, as described above, the radius of the curved track, and the angle of the frog to be used, and having selected a radius for the connecting curve, the essentials of the location are the distance between the point of intersection and the point of the frog, the central angle of the connecting curve and the distance between the point of intersection and the *B. C.* of connecting curve.

The following solutions offer ready and accurate methods of obtaining the above-named points:

In Figs. 8, 9, 10, 11, 12 and 13 let *CA* represent a line offset one-half the gage from the center line of tangent, which is to be connected with the gage line of the rail of the curved track by means of a frog having an angle of *F* and a curve whose radius is *R*. *O* and O^1 are the centers, *I* the point of intersection wher the angle Δ has been measured, and the other notations are as shown in the diagrams. The rail opposite the frog and the switch rails are not shown as they have no bearing on the problem. Required to determine the angle *I O F*. Then measure on the curve:

Arc F I = R × angle I O F in minutes × a constant (= 0.00029089).
Or chord F I = 2R × sin ½ I O F.

The distance OO^1 is determined by solving the triangle OFO^1 of which the angle *F* and its including sides *R* and R^1 are known. This also determines the angles FO^1O and FOO^1.

In cases 1 and 3, Figs. 8 and 11, O B = B C + O C = R^1 + R cos Δ
In cases 2a and 4a, Figs. 9 and 12, O B = B C — O C = R^1 — R cos Δ
In cases 2b and 4b, Figs. 10 and 13, O B = O C — B C = R cos Δ — R^1.

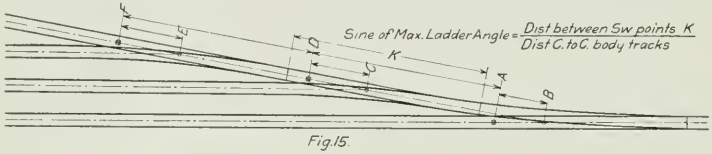


Fig. 15.

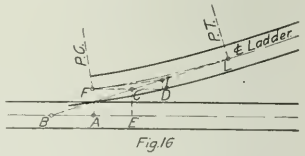

Fig. 16

It should then be noted that when *O B* is computed to be greater than *O* O^1, impossible conditions have been imposed; the radius of the connecting curve has been taken too large.

Having determined the angle O^1 *O B* from the right triangle *O B* O^1, in which *O B* and *O* O^1 are known, the angle *I O F* is found as follows:

In cases 1 and 2a, I O F = Δ — (F O O^1 + O^1 O B).
In cases 3 and 4a, I O F = 180° — (Δ + F O O^1 + O^1 O B).
In case 4b, I O F = O^1 O B — (F O O^1 + Δ).
In case 2b, I O F = Δ — (180° — O^1 O B + F O O^1).
In cases 1 and 2a, A O^1 F = O^1 O B — F O^1 O.
In cases 3 and 4a, A O^1 F = F O^1 O — O^1 O B.
In case 4b, A O^1 F = F O^1 O (180° — O^1 O B).
In case 2b, A O^1 F = 180° — (O^1 O B + F O^1 O).

To determine the distance AI:

In cases 1 and 2, A I = A C — I C = O^1 B — I C,
O^1 O sin O^1 O B = R sin Δ.
In cases 3 and 4, A I = I C — A C = R sin Δ — O^1 O sin O^1 O B.

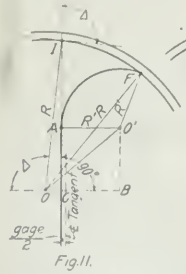

Fig. 11.

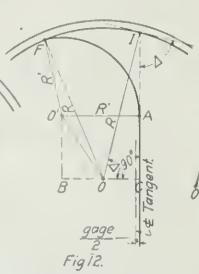

Fig. 12.

Fig. 13.

[Case 3. Curves in Same Direction, Δ greater than 90°.]

[Case 4a. Curves in Same Direction, Δ less than 90°, R^1 greater than R cos Δ.]

[Case 4b. Curves in Same Direction, Δ less than 90°, R^1 less than R cos Δ.]

The engineer should be careful to add or subtract one-half the gage to the center line radii, as the case may require. The point *A* which is the *B. C.* of the connecting curve, and the point *F*, which is the theoretical point of frog *P. T.* of the connecting curve can now be readily fixed in the field and the entire connection staked out.

While the writer realizes that it is better practice to place the frog end of the connecting curve at the heel of the frog, to impose that condition in the above problem would complicate it beyond measure. In inserting 10 or 15 ft. frogs in a curved track, the trackmen cannot help slightly changing the original alinement of the track at that point, and energy spent in making a closer solution than that outlined above will surely be wasted.

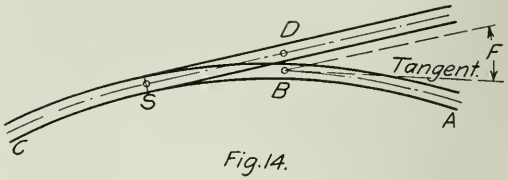

Fig. 14.

METHOD OF OBTAINING STRAIGHT LEADS.

Theoretically, a turnout leading off the outside of a curve, the degree of which is equal to that for the turnout from straight track will have a straight lead. Practically, however, the lead will not be straight, but curved to a greater or less extent. This is due to the fact that switch rails and frogs are straight and not curved as is generally assumed. When it is possible to do so, it is desirable from both the operating and maintenance standpoints to obtain absolutely straight leads. To obtain straight leads in turnouts leading off the outside of a curve where the main curve is also being staked at the same time, the following method will prove effective. (See Fig. 14.)

After staking out the main curve *ABC* to *B*, the point decided upon for the location of the frog, set up the instrument at *D*, this point being in the center of the turnout track opposite the point of frog. The frog angle is now turned off from a line through *D* parallel to the tangent to the curve at *B*, and the point *S* is located a distance equal to the length of the switch lead from point *D*. The instrument is now set up at *S*, and the main curve is continued from the line *DS*, or switch lead, after which the alinement of the turnout beyond the frog can be proceeded with.

Where conditions permit, it is desirable to have the alinement of crossovers between frog points straight. In the case of crossovers between parallel curved tracks, it is not generally possible to meet this requirement using standard frog numbers, a special frog being necessary in such cases. The writer has known of a number of instances where this requirement of straight track between the frogs of a crossover was of sufficient importance to justify the ordering of the special frog necessary, frog points being comparatively close together in most crossover work.

LADDER TRACKS.

In order to obtain the maximum car capacity of the body tracks connected to a ladder track, the angle of the ladder track should be made the greatest possible under the conditions.

The criterion for maximum ladder angle is given by the formula (see Fig 15):

$$\text{Sine of maximum ladder angle} = \frac{\text{Distance between switch points } K}{\text{Distance center to center of body tracks.}}$$

In order that road engines may operate over the ladder track it is desirable that the curve beyond the main track frog be made as light as possible. In a number of extensive ladder layouts the writer has used two and three degree curves in such places with very good effect. The method of staking out such ladder tracks is as follows.

After locating the position of the main track frog the point of intersection of the center line of the ladder track with the center line of the main track, *B*, is found by measuring off the distance *AB*. The instrument is set up at *B*, the ladder angle turned off and the frog points along the ladder located by measuring the computed distances from *B*. At the same time the points of intersection of the center line of various body tracks with the center line of the ladder track are located by measuring the distance *DC, FE,* etc., from the frog points. The curve beyond the main track frog is now located. The instrument is then set up at the points *C, E,* etc., and the body tracks staked out by foresight established at the opposite ends of these tracks by measuring over the respective track centers of each track from the main track. The curves connecting the various body tracks to the ladder track being very short, it is sufficient to locate only their middle and end points.

To compute the distance AB (Fig. 16), let
T = Tangent Distance of Curve FL
ICD = Ladder Track Angle
Then
DI = T sin F
FD = T cos F
CD = DI cot ICD
FC = FD—CD
AB = BE—AE
= gage × cot ICD—FC.

While the writer believes that the above method of laying out ladder tracks represents the best practice, there are a number of engineers who prefer to make the ladder angle equal to the angle of the frog to be used in the ladder track, thus making the ladder track frogs line up straight with the body tracks. The central angle of the curve beyond the main track frog is then simply the difference between the angles of the main and ladder track frogs. However, the writer sees no justification in sacrificing valuable ground space and consequent car capacity for the little, if any, advantage that is gained by eliminating the slight curve beyond the ladder track frogs. Those who favor this method claim that by the elimination of this curve in the body tracks, switching operations are rendered more safe by reason of the better views afforded trainmen. However, the writer believes this apparent advantage is more imaginary than real.

ERIE ANNUAL TRACK INSPECTION.

The annual track inspection of the Erie has recently been completed and the awards have just been announced. These awards are based largely on the results of records made by the track inspection car described in the *Railway Age Gazette* of June 21, 1912, these records showing the location and number of low joints, lurches and irregularities in the surface of the track. The question of the amount of money expended on the various sections and subdivisions is also carefully considered. Those sections and subdivisions are selected which appear to have sufficient merit to warrant consideration for the prizes, and are carefully studied with reference to their locations from a physical standpoint, the amount of traffic carried, general condition of the right-of-way, structures and other conditions that in any way affect the awarding of prizes. The study of conditions, taken in connection with the amount of money spent for the work performed and the record of the inspection car, form the basis for the awarding of the prizes.

The first prize of $200 for supervisor on main line was awarded to W. L. Madill, Binghamton, N. Y., and the second prize to C. Joyce, supervisor at Paterson, N. J. The first prize of $200 for supervisors on branch lines was awarded to T. Beam, at Shops, Pa., and the second prize of $100 to W. E. Stenson, Wayland, N. Y. In addition, 23 prizes ranging from $125 to $25 were awarded to section foremen having the best and second best sections on various subdivisions.

ANNUAL TRACK INSPECTION OF THE NEW YORK CENTRAL.

The report of the annual track inspection on the New York Central & Hudson River for 1912 was recently issued. The track of each supervisor and each section foreman is graded. No prizes are awarded to the supervisors, but the foreman receiving the highest rating on each main line subdivision receives a premium of $3 a month, while the foreman having the best section on each main line division, except the electric division, receives an additional premium of $2 a month. On branch lines the foreman having the best track on each subdivision receives a premium of $2 a month, while a premium of $3 a month is awarded to the foreman having good yard sections. The object of this premium system is to reward the foreman for individual efforts during the year rather than for the appearance of their section on the day of the inspection. For this reason certain sections receiving high marks were excluded in the awarding of premiums because of extra gang work, or new construction, or because the foreman had been in charge of the section for only a short time. Supervisor A. M. Clough of subdivision 23 on the Western division at Batavia, N. Y., received the highest rating, while Supervisor C. E. Doty of subdivision A of the electric division at New York received second highest rating. Section Foreman Michael Burke of subdivision 23 on the Western division received the highest individual rating for a main line section. Premiums were awarded to 34 main line section foremen, to nine foremen of branch line sections and to 10 foremen in charge of yard sections.

ABSTRACT OF ENGINEERING ARTICLES SINCE DECEMBER 20, 1912.

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the regular weekly issues of the *Railway Age Gazette* since December 20, 1912:

An editorial commenting on the possibility of a better utilization of existing freight terminals was published in the issue of January 3, page 2.

The Hopatcong-Slateford Cut-off. The second article written by C. W. Simpson, resident engineer of the Delaware, Lackawanna & Western, covering the work on the recently completed Lackawanna cut-off, describes the unusually heavy bridge work, including two of the largest concrete railway bridges ever built in this country. The detailed description of these bridges, as well as of other concrete structures on this cut-off, was published in the issue of January 3, page 9.

An editorial comment on the very large rail orders which have been placed for the coming year was published in the issue of January 10, page 46.

Tonnage Ratings on New and Old Lines. A letter by Paul M. La Bach explaining some features of this question brought out in the discussion of a former article by him appeared in the issue of January 10, page 50.

Mechanical Transference at Freight Terminals. An abstract of a paper by H. McL. Harding, read before the Western Railway Club, giving the essential principles which a successful system of mechanical transference must fulfil and the extent to which various types comply with these essentials, was published in the issue of January 10, page 51.

Two Conflicting Theories of Valuation. An article by Halbert P. Gillette, takes the ground that valuation must be based on market value or on the amount of the investment, but that it should never be based on a combination of the two. Mr. Gillette's article appeared in the issue of January 10, page 55.

Erection of Kentucky & Indiana Bridge. The erection of the super-

structure of the Kentucky & Indiana bridge over the Ohio river at Louisville, Ky., involved some unusual features, the principal one being the erection by cantilever method of two 620 ft. simple trusses weighing 4,400 tons each. An unusual method of making the closure in the bottom chord of these trusses had to be adopted and the use of jacks for raising adjacent spans to secure closure was also unique. An illustrated description of this work was published in the issue of January 10, page 57.

Erection of Monongahela River Bridge. On account of the rapid and wide variations in the level of the Monongahela river, and the necessity for keeping the stream open to navigation, it was decided to erect a 475 ft. single track truss over the main channel, carrying the extension of the Monongahela Railroad, by end launching after the span was completely erected on shore. The details of the barges carrying the river end of the span, the trucks carrying the shore end and other interesting features of this work are described and illustrated in the issue of January 17, page 95.

An editorial on bridge erection by end launching which reviews the use of this method in other countries and comments on the fact that it has not been used in this country, appeared in the issue of January 17, page 91.

Electrification of Heavy Grades. An article by C. L. de Muralt discussing the problem of main line electrification and expressing the opinion that in some cases this may be found less expensive than grade reduction or the introduction of more powerful steam locomotives appeared in the issue of January 17, page 107.

Railway Terminals. An abstract of an address before the Canadian Railway Club by L. C. Fritch, chief engineer, Chicago Great Western, including some interesting data as to the cost of passenger terminals and a clear analysis of the economic features of such expenditure appeared in the issue of January 17, page 109. An editorial comment on this paper was published in the same issue, page 90.

NEW DELAWARE, LACKAWANNA & WESTERN SPECIFICATIONS FOR PORTLAND CEMENT.

The Delaware, Lackawanna & Western has probably gone into concrete construction to a greater extent than any other railway in this country. No other road has built any structures approaching the Paulins Kill viaduct and the Delaware river bridge on the Hopatcong-Slateford cut-off, described in the *Railway Age Gazette* of January 3, either in general dimensions or in quantities of materials used. These structures will be exceeded in size by two structures on the new cut-off being built north of Scranton on the same road, the larger of which, the Tuckhannon viaduct, will require over 150,000 cu. yds. of concrete. Concrete is being extensively used on this road, not only in bridges, but for station buildings, signal towers, fence posts, and many other purposes. For this reason it is not surprising that the officers in charge have gone into this subject thoroughly, and therefore the following specifications for Portland cement are of much interest.

SPECIFICATIONS FOR PORTLAND CEMENT.

Definition.—The cement shall be the product obtained by finely pulverizing clinker produced by calcining to incipient fusion, an intimate mixture of properly proportioned argillaceous and calcareous substances, with only such additions subsequent to calcining as may be necessary to control certain properties. Such additions shall not exceed 3 per cent., by weight, of the calcined product.

Specific Gravity.—The specific gravity of the cement shall not be less than 3.10.

Fineness.—Ninety-five per cent. of the cement, by weight, shall pass through the No. 100 sieve, and 80 per cent. of the cement, by weight, shall pass through the No. 200 sieve.

Time of Setting.—The cement shall not acquire its initial set in less than one hour and must have acquired its final set within ten hours.

Soundness—Force Autoclave Test.—Three neat briquettes to be made up in the usual manner and allowed to remain in the damp closet for 24 hours. At the expiration of that time, the briquettes are to be removed from the molds and placed in the autoclave, sufficient water being added to partly or wholly cover the briquettes. The autoclave is then closed, the burners being of sufficient size to raise the pressure to 295 lbs. in not more than one hour. The pressure of 295 lbs. shall be maintained for one hour longer, or a total time of two hours. The pressure is then to be gradually released and the briquettes taken out and placed in the moist closet, where they shall be allowed to remain for one hour. At the end of that time they are to be broken in the standard cement testing machine in the usual manner. The average tensile strength of the three briquettes taken from the autoclave must show a tensile strength of not less than 500 lbs. per sq. in. They must also show an increase of not less than 25 per cent. over the average tensile strength of three briquettes broken at the end of 24 hours. A bar of neat cement, 6 in. long by 1 in. square, shall be made up at the same time the briquettes are made; this expansion bar to remain in the moist closet for 24 hours and to be removed along with the briquettes and tested with the briquettes in the autoclave, as indicated above. After one hour in the moist closet, this expansion bar shall not show an expansion greater than one-half of 1 per cent.

Tensile Strength.—The minimum requirements for tensile strength for briquettes 1 in. square in section shall be within the following:

NEAT CEMENT.

24 hours in moist air	200 lbs.
7 days (1 day in moist air, 6 days in water)	500 lbs.
28 days (1 day in moist air, 27 days in water)	600 lbs.

ONE PART CEMENT, THREE PARTS SAND.

7 days (1 day in moist air, 6 days in water)	250 lbs.
28 days (1 day in moist air, 27 days in water)	375 lbs.

The average of the tensile strengths developed at each age by the briquettes in any set made from one sample is to be considered the tensile strength of the sample at that age. Any results that are manifestly faulty will not be included. The sand briquettes will be thoroughly tamped in the molds by using an iron die to fit inside the sand briquette mold, this die to be struck a number of blows with a wooden mallet.

Composition.—In the finished cement, the following limits shall not be exceeded:

	Per Cent.
Loss on ignition for 20 minutes	4
Insoluble residue	1
Sulphuric anhydride (SO_3)	1.75
Magnesia (MgO)	4

Insoluble Residue.—The insoluble residue shall be determined on a one-gram sample which is digested on the steam bath in hydrochloric acid of approximately 1.035 specific gravity until the cement is dissolved. The residue is filtered, washed with hot water, and the filter paper contents digested on the steam bath in a 5 per cent. solution of sodium carbonate. The residue is then filtered, washed with hot water, then with hydrochloric acid, approximately of 1.035 specific gravity, and finally with hot water, then ignited and weighed. The quantity so obtained is insoluble residue.

Inspection.—All cement which is used by the above named company, or any contractors doing work for the company, must be sampled at the mill. The inspector will take a sample from each and every car and properly seal the cars with the company's seals. In no case must cement be shipped from any mill without the company's inspector being present. Should it be necessary at any time to ship cement without inspection at the mill, but which inspection will be made at point of destination, the shipper must so notify the chemist and engineer of tests, and receive special orders from him for the shipping of the cement. The inspector must have access to all parts of the mill, either day or night, when any contract is being filled for the company. The shipper must furnish the office of the chemist and engineer of tests with analysis and physical tests showing results obtained upon the bin from which shipments are made. Samples taken from every car will be sent to the laboratory for further test and inspection. Any sample which fails to meet any or all of the above requirements will be condemned and returned to the shipper, who must pay freight charges in both directions. Samples of cement obtained from cars which continue to show a lower result at the end of the 28-day sand test than is shown in the 7-day sand test will be sufficient cause for the canceling of any contract which at that time may be in force.

THE STORING AND HANDLING OF MATERIAL.

Seven Contributions to the Contest Which Discuss Various Phases of This Problem in the Maintenance Department.

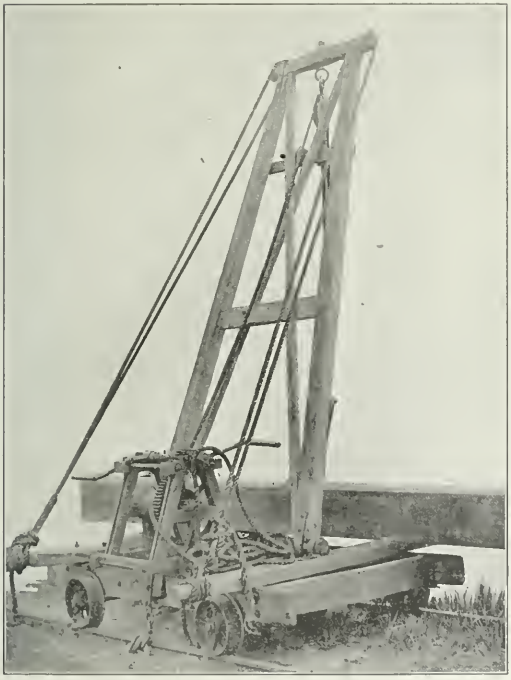
FIRST PRIZE: ADVANTAGES OF DERRICKS FOR HANDLING MATERIAL.

By A. S. Markley,

Master Carpenter, Chicago & Eastern Illinois, Danville, Ill.

The necessity for handling large quantities of material of various kinds required in maintenance of way work has given rise to the development of steam derrick cars for the economical handling of such material, especially timber and piling. We have in such service a dismantled Bay City pile driver converted into a derrick car. It is equipped with a 7 in. x 10 in. double cylinder engine, shaft driven, with a double drum and its own power mast of standard clearance with a 36 ft. boom of 10 tons capacity at 20 ft. radius. This derrick is equipped with a standard engine tank and pilot car and is self propelling, being able to move five loaded cars on a level track.

With this machine we have been able to reduce the cost of



Hand Derrick Car for Lifting Heavy Timbers.

loading and unloading lumber in large quantities to 25 to 35 cents per M. We can unload and load piling, separating it into the various lengths, for 0.5 cents per lineal ft. With the old method of rolling it on and off cars and switching cars by hand to distribute the material to the various piles it cost $1 to $1.75 per M. board ft. for lumber, and 5 to 15 cents per lineal ft. for piling. One big advantage of this car is that we are enabled to do our own switching of cars placed on the bridge yard track, eliminating all delays due to waiting for switch engines.

We are also using the car for loading and unloading material of all kinds on the main line where traffic is not too heavy and there is no side track near the work. When a sufficiently large amount of material is to be unloaded to justify it, a temporary track is put in, eliminating delay to trains and at the same time delivering the material at the time it is needed. We frequently bring such material out on the main line with this car, advising the despatcher of our intention beforehand, and protecting against all trains by flagging with regular bridge men. After 43 years' experience I find that bridge men are fully as capable of protecting the derrick car on the main line as regular trainmen are. I have yet to learn of an accident resulting from a failure of bridge men to properly flag trains.

As this derrick will run eight miles an hour it can readily get out of the way of traffic. On branch lines where trains are few it is possible for it to run 10 or 15 miles pulling the bridge equipment with it and saving considerable time. An engineer and two men can load and unload material with it and it is never necessary to use over four men besides the engineer.

Our yard is so arranged that all material is piled as nearly as possible in the order in which it is used; stringers, caps, piles and guard rails are placed in adjoining piles in this order so that all material usually needed at one time can be loaded together, eliminating the moving of cars as much as possible. The tracks are of sufficient length to allow the unloading of material at both sides of one track. Empties are stored on an adjoining track, while obsolete bridge material is stored alongside it.

We also use a hand derrick for handling timber along the main track in the field. Five men can handle material with this derrick; ordinarily it would require 10 men or more without it. It will readily pick up and carry three hard pine stringers packed 32 ft. long. This derrick, shown in the photograph, is built on an ordinary push car and is provided with a crab on a concave drum which fleets itself in hoisting or lowering timber. A chain extends from the car to the rail with a clutch to prevent the car from overturning. This entire derrick, exclusive of the car, did not cost over $20.

SECOND PRIZE: THE STORING AND HANDLING OF ROADWAY MATERIAL.

By E. K. Coggins,

Chief Clerk to Roadmaster, Southern Railway, Knoxville, Tenn.

Each superintendent should have a storehouse centrally located on his division, preferably at headquarters, for the handling of roadway material. This storehouse should be within trucking distance of the freight house and should be of sufficient size to allow ample floor space so that the different kinds of material can be kept in special piles. Shelves, racks, bins and lockers should be provided in which to keep the smaller articles such as light hardware, etc., while a separate room should be provided for the storage of cement, lime, plaster and similar material. Platforms around the building will furnish ample space for heavy and bulky material such as frogs, switches, guard rails and roadway signs and will also allow room for the storage of building material such as brick, roofing slate and tile. In connection with this platform there should be a shed in which dry and dressed lumber and other material which should be protected from the weather can be stored.

A scrap and lumber yard should be located as near this storehouse as conditions will allow, this yard to have a track through the center with sufficient room on either side for assembling, assorting and separating the different classes of rail and roadway scrap that are accumulated on the line and which must be consolidated for shipment on sale orders. Bridge material such as girders, I-beams, trestle timbers and all other surplus heavy rough building material can be received, stored and distributed from this point to the best advantage.

The work of handling the heavy material can, of course, be

done more economically and satisfactorily if proper facilities are arranged for. A rail loader and a car equipped with a hoist or derrick should at least be available at all times. The local section forces should not be required to furnish the labor to handle this material. A better way is to organize a small force with a good foreman for this work, and any spare time can always be spent in assisting the track men. A handy man familiar with the different classes of material should be placed in charge of the storehouse. Such a man would be kept busy receiving and forwarding shipments, checking invoices and keeping the proper records of all transactions.

It is necessary for each track supervisor to have a place at his headquarters where he can store a small stock of emergency material, tools and supplies. The handiest and best location in nearly, if not all cases, is found at the rear of the freight depot where small local shipments can be handled with the least expense and trouble and can be gotten out on the line quickly in case of emergency.

Each section should be provided with a good tool house in which to care for the material furnished for repairs. The importance of this does not seem to be realized as section gangs on many roads are provided with nothing more than a 3 ft. x 6 ft. tool box in which to store supplies. Any experienced foreman will vouch for the statement that enough is lost in a short time in broken shovels, track gages and other light tools, which are piled in a box with heavy track jacks and claw bars, to build a standard tool house. A greater loss, however, can be checked up in such items as track bolts, frog, switch and signal repair parts that are piled behind and under the tool boxes. These are neglected for a short time and soon become so rusty that they cannot be used and are placed in scrap and a new supply furnished, a portion of which is likely to reach the same destination at an early date. Time as well as material is lost from this cause. A crew will wait 10 or 15 min. for one of their number to replace the contents of the box, thrown out in search for a cotter key, chisel or some other small article. At times the hand car is covered with snow and must be cleaned off. Perhaps a fire will have to be made to thaw out the bearings before it will "roll," and it is often necessary for all "hands" to walk and push the car, which would not have happened had it been sheltered in the tool house and protected from the storm.

Shipping material and tools in small local shipments to the different sections has always been found unsatisfactory. As a rule train crews do not like to stop at a way station for a keg of spikes, and if they have only a small amount of company material for that station they will carry it by. Switches are hard for trainmen to handle and a great many switch points are thrown from the cars and broken. A much better plan is to run a material and supply car over the division once each month at a stated time, which the section men can meet to draw their supplies. The roadmaster or supervisor should accompany this car and issue only the amounts required. Old tools can be exchanged for repaired ones and any surplus can be taken up and distributed to other points where needed or returned to the storehouse. At the same time two or more cars, if necessary, should be carried for the purpose of picking up all mechanical and roadway scrap that section forces have gathered during the month, which should be piled at their headquarters ready for loading.

HANDLING MAINTENANCE MATERIAL ON THE SANTA FE.

By M. Ganley,

Roadmaster, Atchison, Topeka & Santa Fe, Argentine, Kan.

All track ties are piled, on receipt, as close to the place where they are going to be used as possible and are then protected from fire and high water. Where high water must be considered, due consideration should be given to the location, as it is important to handle ties a second time to get them where they are to be used than to send a force of men to move them hurriedly in case of high water.

Where bolts are not to be used for some time they should be stored at stations and kept under cover to protect them from the water. Switch material is handled in the store department yard where each different class of material is piled in separate piles in proper order, with switch point fastenings, for instance, at one end of the row, and switch points, guard rails and fittings in proper order, the frogs being at the far end of the row. Bolts are stored with the section of rail that they fit. With such an arrangement it is almost impossible even for foreigners to make a mistake and get the wrong kind of material. Switch material is shipped to the store department and unloaded by track forces who charge the labor to the store department. This department carries the stock of material while the track department keeps the yard in shape.

Our yard is not large enough to warrant the installation of any labor saving devices and the main economy is gained by close co-operation between the store and track departments. The roadmaster makes a monthly check of material on hand with the storekeeper and then gives him an idea of what material will be required the coming month and how to order it to take care of the needs. Also, as material is accumulated on the division from time to time which is of no value to the track department, it is loaded and turned over to the store department to send to some other division where it may be needed. By this co-operation between the two departments the accumulation of a large amount of dead stock at different points is prevented and the material charge is reduced accordingly.

SMALL MATERIAL YARDS.

By M. Riney,

Foreman, Bridges and Buildings, Chicago & North Western, Baraboo, Wis.

We have adopted the following method of handling our bridge material on the Madison division, storing it at four different points. Where possible we block up old bridge stringers to about the level of the floor of a car and pile stringers and caps on this. Our season's supply of material comes in between March 1 and June 1, usually badly mixed in flat, gondola and box cars. It is unloaded by a gang of three or four men and is held at these points to be sent out as required by the district bridge foremen. The cost for unloading the material averages about 70 cents per thousand board feet. It usually costs about 40 cents per thousand board feet to load it again as it is usually loaded on flat cars. A distinct saving is thus made in the cost of handling the material and it is also easier to keep the weeds and grass away from the timber. Air spaces are provided between each layer of material by using small 1 in. x 4 in. boards between the adjacent timbers.

When material is desired for bridge renewal it is handled by the pile driver crew, as our yards are not large enough to warrant the use of a derrick. At two of these yards we hold emergency material including piling, stringers, caps and ties sufficient for a ten span pile bridge. If this material is not called for during the season it is used for temporary bridge work and is replaced with new material.

HANDLING MATERIAL IN SMALL YARDS.

By A. Palm,

Roadmaster, Central California Traction Co., Sacramento, Cal.

The cost of handling material by hand is practically the same per pound or per foot in small yards as in large ones. While planning to install machinery to reduce this cost of handling in large yards, it is always well to consider that some provision should be made to reduce the cost in the smaller yards as well. The following notes refer particularly to methods for reducing the cost of handling material in yards where the installation of machinery on a large scale is out of the question.

A small hand derrick on an "A" frame can be used to handle frogs and other cumbersome material. With it a couple of

men can load and unload such material with ease and safety, while the cost is low in comparison with what it is when such material is handled by hand. I have in mind a device similar to the American rail loader, with a cylinder operating by air pressure with a switch tank and air compressor mounted on the floor of the car. A gasoline engine similar to that used on hand cars is installed on this car to drive the compressor and to propel the car. The wheels should be without flanges to allow the car to be moved from one place to another by laying a few planks in front of it for a runway. With a machine of this type three or four men could load or unload and store as much material in a given time as 12 or 14 men could do by "main strength and awkwardness." It would probably reduce the cost of handling material at least 60 per cent.

The machine could be easily loaded on a flat car and taken out on the road to load or unload rails, distribute new rails and concrete pipe, etc. As the wheels would be without flanges it would propel itself from one car to another after loading or unloading the car ahead of the machine. It could be kept in use almost constantly and would save its cost several times during the first year.

HANDLING SUPPLIES THROUGH THE STORE DEPARTMENT.

By R. O. GILLIES,

St. Louis & San Francisco, Fort Scott, Kan.

It does not seem to me advisable for railways to maintain material yards for the storage of surplus material as it is better and quicker to ship the material directly to the point where it is to be used. On large railways the material is standardized as far as possible and the store department should carry it in stock to be shipped when ordered. The cost of loading this material at the storehouse, together with the cost of unloading at a material yard, loading it again for shipment where needed and unloading it at destination is expensive. A large portion of this cost can be avoided by eliminating the second handling.

We have recently received instructions to do away with material yards. It is now the practice to order both cross and switch ties for the year sent to one point, usually the road-master's headquarters, where they are held on cars until a statement is furnished showing the contents of the car. The cars are then rebilled to the points where the ties are required. The statement of contents is generally received before the car reaches the division. In addition to saving money by eliminating the rehandling, we also avoid having excess surplus material on hand. By having the section foremen render a monthly report showing the material on hand, received by shipment, received from tracks repaired or taken up, material used or shipped and material on hand at the end of the month, we know just what stock we have on hand. In case of an emergency we can go through these reports and instruct the foremen on a section having the required amount of material on hand to ship it to the point needed.

All scrap rail is held at a central point ready to ship on sales orders. Four scrap cars go over the subdivision on local trains, two cars each way, whenever there is sufficient scrap on hand to warrant it. All foremen are notified to meet the train and load what scrap they have. When the two locals meet, the one that is going toward the station where the scrap is held for orders takes all the cars to that station. When the cars reach this point the section force sorts the scrap, placing the mechanical scrap on one car and the track scrap on another and billing them to the general storehouse. Scrap rail is sorted from the miscellaneous scrap and is held in a convenient place for a sales order. This material is also picked over by the mechanical department, and material fit for further use is removed before the cars are sent to the general storehouse. On one such inspection recently $1,000 worth of good material was culled from the scrap cars.

SYSTEMATIC CLASSIFICATION OF MATERIAL.

By JOSEPH J. MORGAN,

New York Central & Hudson River, Kingston, N. Y.

One of the greatest difficulties in the shipment of material is the failure of the foremen to explicitly state what they require. Frequently the storekeeper is doubtful as to just what material the foreman refers to on his requisition. This results either in delay in shipping the material or in the wrong material being shipped, and in either case requires additional labor. This condition can be improved on, if not entirely eliminated, by having all items of material carried in stock listed and classified as to size, weight, etc., in alphabetical order, each item being numbered. This list should be printed on heavy cardboard in heavy type. Each foreman should be furnished with one of these lists and instructed to place it in the tool house or some other convenient place for reference in ordering material. On some roads foremen are supplied with perforated order books arranged so that in making out orders two copies are made, one being kept by the foreman for record. With a few additions such a book would do very well. A column should be added with a heading, "Item number per classified list." In this column reference should be made by the foreman to the classified list giving the item numbers of the articles desired as shown on the list. This system might prove somewhat difficult for the foremen to grasp at first, but after they became familiar with the item numbers this trouble would vanish.

In handling staple material, such as bolts and spikes, which are usually received in large quantities, they should not be unloaded when received at headquarters, as is the general rule, but arrangements should be made to have the car or cars placed in way freights and a sufficient supply unloaded by each section gang to take care of their needs, thus eliminating to a large extent the numerous requests from foremen and the rehandling of this material. Of course there would undoubtedly be exceptions to this program on account of the delays in releasing cars in some locations. The proper handling of material for special work should also receive careful attention, and a little foresight in this connection would do away with much extra labor. When material is to be used in connection with a special piece of work, the requisition should state that it should be shipped directly to the work.

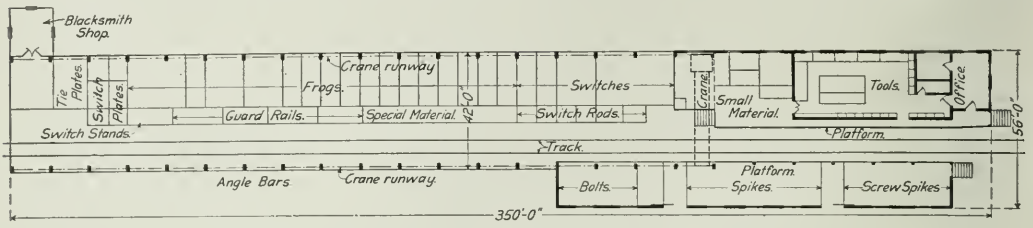
SOUTHERN PACIFIC'S MANUFACTURE OF TRACK FASTENINGS.

For a number of years the Southern Pacific has been converting all forms of scrap iron into tie plates, angle bars, spikes and other track fastenings. Owing to the gradual consolidation of many lines having different patterns and weights of rail, a large number of different kinds of fastenings have been required from time to time. Most of these have been wanted in small numbers and could not be bought economically in the open market as they were no longer being rolled. Also the market for the constantly increasing stock of scrap iron is limited in the western states, and it was decided to use this material for the manufacture of these special fastenings which could not be readily bought. Accordingly arrangements were made to convert this scrap material into these special patterns of fastenings and the necessary equipment was installed in the Sacramento shops. The output varies greatly with the demand and with the amount of scrap available, but practically all the scrap is now utilized for this purpose. About 1,700,000 tie plates are made each year in addition to angle bars and other fastenings. While no definite figures of the savings can be arrived at, because these figures are dependent on the assumed prices with which the various departments are credited for the scrap received at the mill, it is known that there is a fair profit in actual cash besides the convenience of being able to secure these special fastenings when needed.

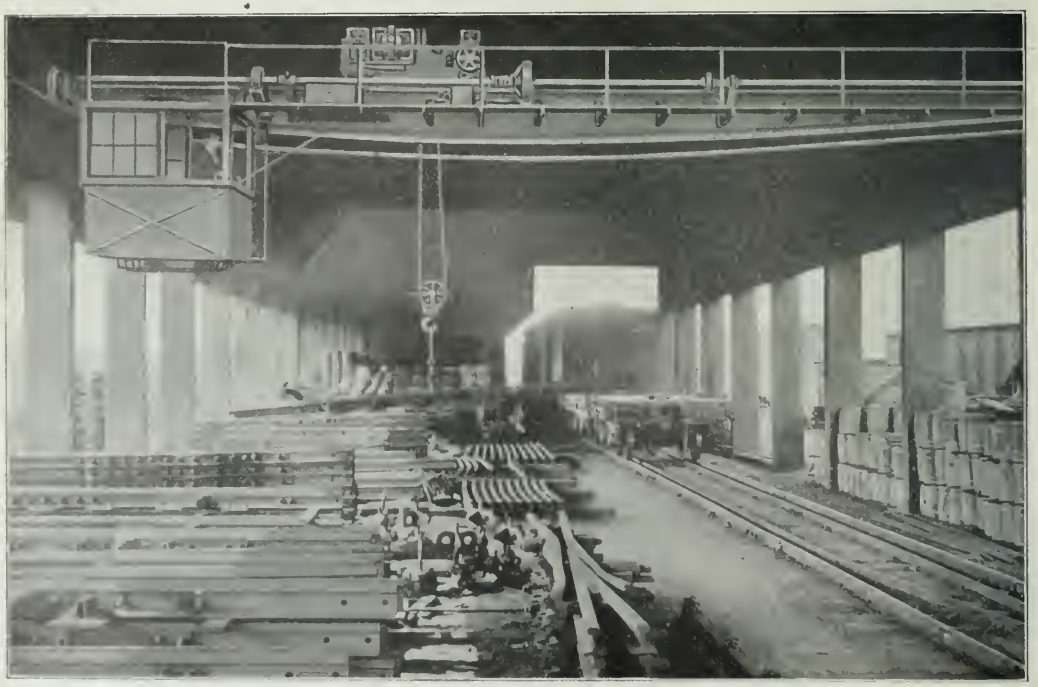
HANDLING TRACK MATERIAL ON THE PITTSBURGH & LAKE ERIE.

Much attention has been paid to the storing and handling of track material on the Pittsburgh & Lake Erie, a prominent result of which is the maintenance of way storehouse at McKees Rocks, Pa. At this storehouse all the track material required on the division between Pittsburgh and Youngstown, Ohio, comprising three supervisors' districts, is handled. The storehouse consists of a building 238 ft. x 42 ft., partially enclosed, with an enclosed storeroom and office 112 ft. x 42 ft. on the north end. The building is of frame construction, the open portion being enclosed from the roof down to a point 13 ft. above the ground with a galvanized corrugated iron siding. The heavier materials, as frogs, switches and guard rails, are stored in this open area, each class and weight by itself so that any material can be secured at once without rehandling. The smaller materials, as guard rail clamps, emergency lights, nut locks, etc., are stored on the platform at the north end of this shed, while the various tools are kept in the enclosed portion of the building next to the office. Track bolts and spikes are stored on the platform on the opposite side of the track which passes through the building.

The open portion of the building, in which the heavier materials are stored, is served by a five-ton Shaw traveling electric crane which moves on an overhead track with a span of 38 ft. 6 in. between rails. The crane is equipped with a 10 h. p. motor for movement transversely, a 15 h. p. motor for the large hoist and a 10 h. p. motor for the small hoist. The crane handles all heavy material and is operated by the supervisor's clerk from the office, assisted by two blacksmith's helpers from the maintenance of way blacksmith shop who place the clamps on the material and steady it when moving. It requires about 50 hours per month of the clerk's time and 200 hours of the laborer's time to handle the material, practically all of which is unloaded and loaded from gondola and flat cars, except bolts and spikes, which are shipped in box cars. In contrast with this, before the crane was installed, a gang of from 20 to 25 men was required an average of four days a week during the summer to handle the material, spending the rest of their time on regular track work. Not only has the installation of the crane greatly decreased the cost of handling the material, but



Plan of Pittsburgh & Lake Erie Storehouse at McKees Rocks, Pa.



Pittsburgh & Lake Erie Maintenance Storehouse at McKees Rocks, Pa.

it has also permitted its loading at any time during working hours, for the men required are now always present; it has also eliminated the frequent injuries common in handling heavy material.

One car of miscellaneous track material and small supplies is loaded for each of the three supervisors' divisions monthly. Special shipments for definite pieces of work and emergency material are sent out continually, no emergency material being stored elsewhere on the division. All rail and track fastenings for relaying work are shipped from the mills direct and unloaded at the point required, but all bolts and spikes pass through the storehouse, although they are not necessarily unloaded from the cars if required on the line in carload quantities at the time of receipt. During the past season 1,140 kegs of bolts, 2,500 kegs of track spikes, 327 frogs and 388 switches complete have passed through the storehouse in addition to proportionate amounts of miscellaneous track material.

A space at the end of the open building and a small building adjacent are devoted to a maintenance of way blacksmith shop for light repairs of frogs, switches and track tools, one blacksmith and two helpers being employed. The storehouse crane serves this end of the shop and handles the heavier materials for the blacksmith shop.

SCRAP YARD.

All scrap on the division is collected monthly and brought to a central yard about one mile west of the storehouse. At this point a platform 700 ft. x 40 ft. is provided with a track on one side level with the platform and another on the opposite side depressed so that the top of a gondola car is level with the platform, the topography of the land favoring this arrangement. As the cars of scrap come in they are weighed on the high track before unloading. The material is sorted and classified in separate piles for sale, that suitable for repair purposes being turned over to the blacksmith. The purchasing department is advised from time to time of the accumulation of this material and it is loaded on its instructions into cars on the low track. Beyond the rear end of the platform the two tracks converge, with the high track about 3 ft. above the low one, so that material can be transferred from car to car if desired without going over the platform. The amount of scrap received here amounted to 22 cars during the month of November, 1912, although the monthly average is only about 12 cars.

These installations were worked out under the direction of Edwin F. Wendt, assistant engineer, Pittsburgh & Lake Erie, and are in charge of W. E. Davin, supervisor at McKees Rocks, Pa.

THE APPEARANCE OF TRACK.

By George J. Sharkey,
West Shore, Kingston, N. Y.

There are many little considerations in closing a summer's track work which, if taken care of, add distinctly to the effectiveness of the season's work by improving the appearance of the track. All clay and rock cuts and ditches should be thoroughly cleaned, the ditches to be well sloped and graded to insure a free run of water. The material from the cuts can be used economically in widening shoulders or strengthening riprap. The right of way should be systematically mowed, never allowing the weeds and grass to gain any headway. No ties should be piled along the right of way, as they can be burned as the work progresses just as easily as at the end of the season. The trackwalker, foreman or other members of the section gang can pick up waste paper and other debris as they walk over the track and touch a match to it in some safe place. A complete picking up of scrap at least monthly and storing for sale or sending to the scrap platform, adds considerably to the credit revenue, prevents a further waste by the weather and greatly improves the appearance. Clean station platforms and dust-free driveways at freight houses should be considered. A little cleaning up on Fridays around stations adds to Saturday's and Sunday's dressing up and leaves a strong impression. Well maintained fences, cattle guards and crossings are most essential. A little wire here and a little paint there work wonders. A neat ballast line either on stone or gravel gives a simple yet effective set off to the track.

The opinion gained of a track both by the traveling public and the officers is governed largely by the appearance. If an officer finds things scattered and unkempt he will undoubtedly look further to find things to criticize, while if he finds things in a shapely order, he will invariably overlook a little discrepancy here and there, feeling that everything could not be reached at once, but that each will be taken care of in turn. If the subject of appearance is given constant attention the usual inspection will be invited, instead of scorned, and the usual rush before inspection will be eliminated.

A BLOW TORCH FOR CLEANING SNOW AND ICE FROM SWITCHES.

A gasolene blow torch has recently been devised and put in service for removing snow and ice from frogs, switches and interlocking connections. It operates in a manner similar to the ordinary gasolene blow torch and can be handled by one man. It is made of heavy brass tubing 2 in. in diameter and about 5 ft. long., with a burner at one end of the tube and a gasolene valve and pressure pump at the other end. A controlling valve is placed inside the tube to regulate the flow of fuel. This tube has a capacity of three quarts of gasolene, or sufficient to last about three hours. The flame is about 2 in. in diameter and about 12 in. long. The over-all length of the device is 5 ft. 9 in., and it weighs about 8 lbs.

Using Blow Torch and Pick for Removing Ice.

The torch is designed for the purpose of thawing ice, snow or sleet about switch points, derails, frogs and other movable track connections, and is of special assistance in automatic signal territory, or in power interlockings where switch adjustments must necessarily be accurate. It was tested a few days ago in the Chicago Great Western yards at Chicago, following a sleet storm. One man using the torch cleaned 160 switches in three hours. This work would have required about five men for an equal time using picks and brooms in the old way. The torch is manufactured by the T. Turner Brass Works, Sycamore, Ill.

AMERICAN WOOD PRESERVERS' CONVENTION.

Abstracts of Papers Presented at the Ninth Annual Meeting Held This Week in Chicago, with Resume of Discussions.

The ninth annual convention of the American Wood Preservers' Association was held at the Hotel Sherman, Chicago, January 21-22-23, 1913, with about 200 members and guests in attendance at the various sessions. The officers of this association for the past year were: President, E. A. Sterling, forest and timber engineer, Philadelphia, Pa.; first vice-president, A. M. Smith, Ayer & Lord Tie Co., Argenta, Ark.; second vice-president, H. M. Rollins, Gulfport Creosote Co., Gulfport, Miss.; third vice-president, G. B. Shipley, Pittsburgh Wood Preserving Co., Pittsburgh, Pa.; secretary and treasurer, F. J. Angier, superintendent timber preservation, Baltimore & Ohio, Baltimore, Md.

In his opening address, President Sterling called attention to the shortage in the supply of creosote which has become more pronounced during the past year and to the action he had taken to prevent the placing of a 10 per cent. import duty on creosote oil, as outlined in the proposed Underwood tariff revision bill, basing his plea upon the fact that the wood preserving industry is so closely allied with the conservation of timber resources that the placing of this tax on creosote would work to the harm of that industry and thereby to the conservation of the forests. He also advocated the taking up by the association of a limited amount of committee work, believing that the association is now strong enough to take up some of the more serious problems confronting the industry and to work out solutions for them.

The annual report of the secretary-treasurer showed a total membership of 157, a net gain in membership of 53, or over 50 per cent., within the past year, while the finances were in an equally prosperous condition.

THE PRODUCTION AND SUPPLY OF COAL TAR CREOSOTE.

By E. A. Sterling,

Consulting Timber Engineer, Philadelphia, Pa.

In 1912 the consumption of creosote in the United States on the basis of the average 7½ per cent. increase of the previous four years, exceeded 78,000,000 gal., of which about three-fourths was imported. In the same year R. P. Perry* estimated that 165,000,000 gal. of coke oven and gas works tar would be produced, and an additional 375,000,000 gal. would go to waste in beehive coke ovens. The tar actually produced would have yielded, if distilled to hard pitch, approximately 50,000,000 gal. of creosote; while the tar which was not even recovered would have given us another 112,000,000 gal., or a theoretical grand total of 162,000,000 gal. The first 50,000,000 gal. includes the water gas creosote derivable from part of the gas works tar. This amount is indeterminable, but it will serve the purpose to reduce the total figure on this account by 12,000,000 gal., making it 150,000,000 gal.

We thus have a potential creosote supply nearly double our present requirements, or enough to treat about 1,500,000,000 board ft with 10 lbs. per cu. ft., whereas in 1911, 882,000,000 ft were treated with straight creosote. Actually we are producing only about 15 per cent. of our potential creosote supply, or 30 per cent. of our consumption, and are drawing on the European market for the balance, which amounts to about 45 per cent. of what we are wasting at home. This waste is not wanton nor deliberate, but merely a result of economic conditions.

The available supply of creosote obviously depends first on the amount of coal tar produced, and, secondly, on the manner and completeness with which it is distilled. We have not produced creosote up to the limit of our tar production because it has not been profitable to distill to hard pitch, and we have not recovered all the tar possible on account of the capital outlay involved and the lack of a market for certain coal tar products. In the United States the present outlook for an increased production of tar and creosote is promising.

Gas works tar is produced in many of the larger cities, and while the use of electricity for lighting and the manufacture of petroleum gas tend to keep down the output of gas works coal tar, indications are that the present output will remain fairly constant, or, if anything, increase. The increasing cost of petroleum will discourage water gas installations and to that extent increase the output of coal gas.

Coke oven tar is the largest source of creosote and it is mainly in this kind of tar that we may look for an increased output. Quite recently at some of the larger iron and steel manufacturing and distributing centers there have been extensive developments in by-product ovens. The more notable examples are at Birmingham, South Chicago, Joliet, Gary, Milwaukee and South Bethlehem. It is stated that during 1912 new by-product ovens went into operation which have a capacity of 35,000,000 gal. of tar per annum, although this output may not be immediately reached.

The refining of coal tar in the United States has developed along different lines than in Europe. We have concentrated largely on pitch, while Europe has specialized on coal tar by-products, each country catering to its market. A fundamental handicap in this country until recently has been the lack of a market for the pitch, which is the largest constituent. Gradually the soft and medium pitch came into use for roofing papers, road binders, paving block filler and other purposes; while more recently the hard pitch has been in demand as a binder for briquettes, for electric carbons, and cast carbon forms of many kinds. The lighter oils, such as benzol, naphtha, toluol, crude carbolic acid, etc., find various uses, while the heavy oils constitute the creosote for wood-preserving purposes.

It is probably in the manufacture of the more refined coal tar products that domestic developments will be most tardy, for as yet it has not been profitable to compete against Europe in the production of colors, perfumes, extracts and the numerous and varied oils and compounds derivable from coal tar. On the other hand, we are far ahead of European distillers in our knowledge of roofing and waterproof pitches and road binders.

With the development of a market for pitch and other tar products which makes it profitable to refine coal tar and to convert beehive coke ovens into by-product ovens, some other developments which, in the face of an increased tar output, tend to change the distillation methods so as to result in a decrease in the amount of creosote produced. These developments are an increasing use of refined tar for road purposes and of crude tar for fuel. On the other hand, the increasing demand for disinfectants, which can be made from tar, and the growing use and higher value of the middle and heavy oils used for wood-preserving purposes, may be expected to counteract the tendency toward the use of crude or refined tar. Still other important developments, which may cause the production of domestic creosote to increase more rapidly than the production of tar itself, are pending.

Whether the tar distillers in Europe can supply their local market and continue to take care of our increasing demands, depends on the rather complicated situation as regards European trade arrangements, and on the developments along the many diversified lines of coal tar use and distillation. We can, perhaps, draw certain conclusions from the fact that the exports of creosote from Great Britain have dropped from 150,000,000 tons to about 115,000,000 tons in 1912; while in Ger-

*Paper read at "Tar Distillation in the United States," presented at the [illegible] Congress of Applied Chemistry

many, although the distillers are largely increasing their output and the amount of creosote exported in 1912 increased 25,000 to 30,000 tons, the production has not fully kept pace with the increased demand from many sources.

In Europe, as in the United States, there is an increasing use of tar for road purposes, and there are other developments which tend to disturb the tar market and force prices upward. Gas works tar has probably contributed a larger percentage of the total than in the United States, but it is likely that water gas will be produced in some of the larger gas works where coal tar has previously been the principal output, unless petroleum prices advance too sharply. In Germany the adoption of the Diesel engine has introduced a new factor and German distillers are advocating the use of creosote oil for fuel in this type of engine. Moreover, the German government is using increasing quantities of coal tar fuels in the navy, so it remains to be seen how these various developments will affect the available supply of wood-preserving oils.

The most definite conclusions we can draw from a limited survey of the foreign field is that Europe will be in position to continue the export of large quantities of creosote, but that the increasing demand and the various developments in the coal tar industry promise to strengthen prices, and in some cases materially reduce the supply available for export.

The procuring of an adequate supply of creosote at reasonable cost may be safely considered a vital factor in the wood-preserving industry in the United States, even though other preservatives, particularly zinc chloride, are used in large quantities. Even before there was any question as to the creosote supply being inadequate, the factor of transportation made itself strongly felt. Plants on or near the Atlantic and gulf seaports were always sure of a foreign supply, and could at the same time draw on the domestic market. Inland and Pacific coast plants are more or less handicapped unless located near some of the large producing centers. With comparatively few large sources of production, and most of these east of Chicago, rail freights figure strongly in the delivered cost. On the Pacific coast the question of procuring a supply of creosote oil has always been difficult to solve, and it is not certain how much the Panama canal will improve the situation.

Up to a year or two ago it is not likely that railroads or commercial treating companies were often deterred from building plants by uncertainty as to their oil supply. Plant construction for a time went ahead at a rapid rate on the assumption that the creosote supply would take care of itself, which it largely did. It may do the same in the future and the indications are favorable, but at present it would be unwise to start a large development without looking into the situation carefully.

There is very little which wood preservers can do about the question of creosote supply. They can, however, do considerable in the matter of consumption. First of all, it would no doubt help both the domestic and foreign producers in meeting the requirements, if the consumers would anticipate their needs as far ahead as possible. In the matter of consumption the tightening up of the market should strongly stimulate investigations of preservative mixtures and of new preservatives. Crude oil, water gas creosote, and refined tar in mixture with creosote will bear further investigation, while blast furnace oil, of which some of the English roads are using considerable quantities, should be tested out further. Crude oil is being given a thorough trial by the Santa Fe, and since the sources of suitable cheap asphaltic oil are in regions where creosote is high in price, its use with reasonable restrictions should reduce the drain on creosote. Water gas or oil tar creosote has not received general recognition as a wood preservative and investigations have demonstrated that it lacks the high antiseptic qualities of coal tar creosote, yet it is not unlikely that it will eventually be used. The most rational way of using it, in the light of our present knowledge, would be to add a comparatively small percentage of it to coal tar creosote for the purpose of cheapening the latter.

It would also be profitable to look closely into our treating methods and eliminate excess injections of oil where it is reasonably certain, because of mechanical wear or for other reasons, that the lighter treatments would be sufficient. Even a 10 per cent. economy in the use of creosote throughout the country would go a long way towards keeping within the limits of supply.

A COMPARISON OF ZINC CHLORIDE WITH COAL-TAR CREOSOTE FOR PRESERVING CROSS-TIES.

By Howard F. Weiss,
Director, Forest Products Laboratory, Madison, Wis.

Although a great many preservatives to preserve cross-ties have been tested, zinc chloride and coal-tar creosote are now by far the most extensively used in the United States. The author has frequently been called upon to compare these two preservatives; in fact, the number of such requests has been so large that it has led to an examination of the merits and deficiencies of each preservative. This paper aims to present the information which has thus been collected and to invite discussion. Please note, however, that only cross-ties are considered, and the data which follow should not be confused with poles, piling or other products.

According to statistics gathered by the Federal government, the number of cross-ties treated with zinc chloride in the United States shows no increase in the past four years, while the number treated with creosote has increased rapidly, as shown by the following figures.

	1907.	1908.	1909.	1910.	1911.
Zinc chloride	9,864,765	8,640,230	8,051,054	9,195,861	9,445,961
Creosote	5,750,874	9,620,420	9,943,360	14,841,843	16,510,721

This in itself might be looked upon as an answer to the query: "Which is the better of the two?" But after a careful investigation it appears that this question cannot be so easily dismissed. I asked twelve leading operators of wood-preserving plants for their opinion as to why the number of Burnettized ties in this country did not increase. Their replies, which are instructive and certainly worth careful thought, group themselves as follows:

Poor workmanship in Burnettizing, either through ignorance or otherwise.
The zinc leaches from the ties, or the railroads fear that it will.
The salesmen of coal-tar creosote are more industrious than the zinc salesmen.
Zinc-treated ties cause trouble with the automatic signal apparatus.
The empty-cell creosote processes reduce the initial cost of treating with creosote.
Railroads consider creosote cheaper in the long run, and because ties are growing scarcer they want to give them the treatment which makes them last the longest.
Railroad engineers have concluded that zinc chloride has a tendency to corrode spikes.
Tie treatment is now largely east of the Mississippi, where the climate is moist, while Burnettizing began west of the Mississippi, where the climate is dry.
Heavier tie-plates are now being used, warranting a more permanent preservative treatment.

The factors which I have considered in comparing the two preservatives under discussion may be grouped as follows:

(1) The toxicity of the preservative—that is, its ability to prevent decay.
(2) The ability of the preservative to penetrate the tie.
(3) The permanency of the preservative in the tie.
(4) The effect of the preservative on the strength of the tie.
(5) The effect of the preservative on the corrosion of spikes and plates, and the operation of block signals.
(6) The financial saving due to the use of the preservative.

Of somewhat lesser importance are:

(7) The uniformity in composition of the preservative and ease of securing it.
(8) The combustibility of the preservative.
(9) The ease of handling the preservative and ties treated with it.
(10) The ease with which the penetration of the preservative can be determined.

(1) Zinc chloride relies upon its toxic properties solely to protect ties from decay. Creosote, in addition to this, has more or less of a waterproofing effect, which also acts as a protection against decay. According to the toxic tests made by Malenkovic, zinc chloride offers about twice as much resistance to fungus attack (penicillium) as coal-tar creosote free from phenol. Tests made at the Forest Products Laboratory show that ordinary coal-tar creosote has about the same toxicity as zinc chloride,

0.4 per cent. being sufficient in each case to prevent fungus growth (Fomes annosus).

(2) In the author's opinion, the ability of the preservative to penetrate the wood during treatment is given, in practice, too little consideration. All toxicity data show that both zinc chloride and coal-tar creosote are powerful fungicides, and that small quantities of them will inhibit decay. It is good practice, therefore, to diffuse the preservatives thoroughly through the tie so that as many of the wood cells as possible will be poisoned. A tie might contain 10 or 12 lbs. of creosote per cu. ft. and yet be poorly treated if the oil is not well diffused; in fact, not nearly as well preserved as a tie having only 4 or 5 lbs. of the oil per cu. ft., but with the oil uniformly and deeply distributed.

It is well known that water solutions will penetrate wood more easily and thoroughly than oils; for example, in making what are called the "penetrance tests" at the Forest Products Laboratory it took about three minutes to force zinc chloride solutions through 6 in. of hemlock parallel to the grain, while creosote took over 30 minutes. Again, under similar conditions in treating red oak and maple ties we forced about 50 per cent. more by volume of zinc chloride solution into them than we did coal-tar creosote. Any process which aims to impregnate ties with only a certain amount of preservative irrespective of the penetration secured is, in the author's opinion, operated on an incorrect basis; and any specification which will enable ties to be treated in this manner is a poor specification. In treatments with zinc chloride I believe a strong preliminary vacuum should be drawn, and the solution admitted to the cylinder without breaking the vacuum, after which pressure should be applied and held to "refusal." The absorption of dry salt can then be controlled by varying the concentration of the solution rather than by varying the amount of solution forced into the ties. Unfortunately, this simple treatment can not be used with creosote (except with certain resistant ties) because too much oil would be absorbed and the treatment would become too expensive.

(3) Permanency, as applied to preservation, involves two phenomena, volatilization and leaching. Zinc chloride under conditions of use is non-volatile. Creosote, on the other hand, evaporates from the tie. The rate at which it evaporates depends on many conditions, such as its composition, method of injection, atmospheric conditions during seasoning, etc. This objection to creosote has led in some cases to the use of tar as an adulterant, the idea being that such a mixture will hold in the tie the more volatile constituents of the oil. It is quite probable that tar will do this, but there are strong objections to such practice, and it is the author's opinion that it should be adopted only after we have secured much more convincing data than we now have.

Creosote is practically insoluble in water, while zinc chloride is readily soluble. From tests made in the Forest Products Laboratory it appears, however, that certain amounts of zinc chloride can not be leached out of wood even by very severe soaking. Just how much of the zinc chloride thus remains is not known to the author, but tests on this point are now under way at the laboratory. It is claimed that the leaching of zinc chloride in ties can be retarded by air-seasoning them after treatment, or by coating them with an oil. I have no conclusive data on either of these claims.

(4) With decay largely eliminated from properly preserved ties, and with the tonnage of our roads constantly increasing, the problem of prolonging the life of ties from rail and spike cutting is becoming more and more acute. Obviously, a preservative which will decrease the strength of ties when injected will be subject to serious criticism. Tests made by the Forest Service some six years ago on loblolly pine ties indicate that the presence of zinc chloride did not weaken the wood under static loading, but tended to make it brittle under impact, while no decrease in strength was noted for ties treated with creosote. Tests made since then indicate that both preservatives weaken the wood, although, if *properly injected*, the weakening thus caused is too small to be of practical importance. In one case a decrease of 40 per cent. in the bending strength of wood creosoted by a commercial plant was, however, observed.

(5) Some pieces of flange steel of equal dimensions, weight and quality were immersed, respectively, in coal-tar creosote and a 6 per cent. solution of zinc chloride for three weeks and constantly heated at 98 deg. C. At the end of this time the steel in the creosote lost .0064 gram, while that in zinc chloride solution lost 1.4636 grams. Of course this was a very severe test, not comparable to what takes place in the track; but even at atmospheric temperatures the corrosion of steel spikes and plates in contact with zinc-treated ties is probably greater than with creosoted ties. Whether it is of sufficient intensity to be a real detriment is not known to the author. The consensus of opinion among those who claim experience seems to be that if the zinc ties are properly seasoned before placing in the track the corrosion is of no appreciable consequence.

The presence of zinc chloride in wood is very liable to decrease the resistance of the tie to the passage of an electric current; consequently, if the flow of current is away from the track a marked corrosion of the spikes will occur. This action may, however, take place in untreated ties, especially when wet. Zinc chloride, being deliquescent, tends to keep the ties moist, while creosote tends to waterproof them; hence deterioration of spikes subject to the passage of electric currents is more likely to take place in ties treated with zinc chloride than in those treated with creosote.

The electrolytic action of zinc chloride and creosote in ties is a subject about which much discussion has occurred, particularly in connection with the operation of automatic block signals. The most accurate tests known to me, bearing on this subject, were made by J. T. Butterfield, of Purdue University, in 1910. His tests concluded that ties treated with creosote offer greater resistance than those treated with zinc chloride, and less resistance than untreated ties, as follows:

Kind of Wood.	How Treated.	Ratio of Resistance (Treated to Natural).
Loblolly pine	Full cell process	0.34
Shortleaf pine	Full cell process	0.79
Red oak	Burnett process	0.16

It is the experience of several signal engineers that zinc-treated ties will cause trouble with the block signals if they are placed in the track unseasoned, or if the length of blocks is too great. A shortening of the circuit to about 1,000 or 1,200 ft. has, in many instances, remedied these difficulties.

(6) A discussion of all factors finally simmers down to a discussion of cost. Because of the scarcity of authentic service records generalities must still be used. The numerous test tracks now placed throughout the country will, it is hoped, furnish us with accurate data upon which to base decisions. Quoting from a report of the Wood Preservation Committee of the American Railway Engineering Association: "Creosoting at present can not be relied upon to preserve ties more than 15½ to 19 years, an absolute maximum, unless the ties are protected against mechanical deterioration. If badly injected they perish from decay in 5 to 12 years. Burnettizing, when well done, can be relied upon to preserve ties from 10 to 14 years. There are great differences in the thoroughness with which the work can be done."

From records at hand it is assumed that a tie which, in an untreated condition, would last 5 years, when properly treated with zinc chloride will last, on an average, 12 years, and with creosote 17 years. The cost of the tie untreated is assumed as 45 cents; the cost of creosoting, 30 cents; the cost of Burnettizing, 15 cents, and of placing in the track, 15 cents. We then have:

Cost of untreated tie in track, 60 cents.
Cost of Burnettized tie in track, 75 cents.
Cost of creosoted tie in track, 90 cents.
Life of untreated tie in track, 5 years.
Life of Burnettized tie in track, 12 years.
Life of creosoted tie in track, 17 years.

From these values, figured at 5 per cent. compound interest, we find:

Annual cost of an untreated tie, 13.86 cents.
Annual cost of a Burnettized tie, 8.40 cents.
Annual cost of a creosoted tie, 8.01 cents.

And if figured without interest:

Annual cost of an untreated tie, 12 cents.
Annual cost of a Burnettized tie, 6.25 cents.
Annual cost of a creosoted tie, 5.29 cents.

From which it may be deduced that both preservatives are very economical to use in comparison with untreated ties, and that of the two, creosote is ultimately slightly cheaper. Under the assumptions here made zinc-treated ties must last about 12½ years in order to have the same annual charge as creosoted ties, while the creosoted ties must last 15½ years to have the same annual charge as the zinc treated ties. The author leaves the reader to manipulate these figures in any way he sees fit.

(7) The zinc chloride produced in the United States is, for a commercial product, extremely uniform in its composition and the quality can be readily duplicated and obtained. Creosote, on the other hand, varies considerably in its composition, and is not easily secured in satisfactory grades. The American Railway Engineering Association recently drew up three specifications for creosote to be used in tie preservation, and more discussion has taken place over what kind of an oil should be used than over any other feature of wood preservation. It is the author's opinion, however, that these conditions are changing for the better and that the future looks bright.

(8) Zinc chloride is non-inflammable; creosote is inflammable; hence a zinc chloride plant presents a lower fire risk than a creosote plant. Zinc chloride-treated ties can be considered more fire resistant than untreated ties. When freshly treated, creosoted ties are easily ignited, but their resistance to inflammability increases as their seasoning progresses. Inflammability tests gave a temperature of ignition for zinc-treated wood of 287 deg. C., 19 per cent. of the wood, by weight, being burned. Freshly creosoted wood tested under the same conditions ignited at 176 deg. C., and 40 per cent. of its weight was burned. When, however, it was air-seasoned for 90 days after treatment the temperature of ignition was 216 deg. C., and the loss in weight 27 per cent.

(9) Zinc chloride solutions can be readily handled at much lower temperatures than coal-tar creosote and do not present the many difficulties of heating that accompany the operation of creosote plants; on the other hand, they cause a great plant depreciation, due to their corrosive action. Several cases have come to my attention where trouble was experienced in getting track men to handle creosoted ties, supposedly on account of their disagreeable nature and their effect on the health of the men. Such objections can, however, be avoided. I have heard of no complaints against zinc-treated ties in this connection.

(10) The presence of creosote in the ties can be detected more readily than the presence of zinc chloride and a knowledge of the depth of penetration is highly important. A chemical analysis of the treated ties is not feasible for daily use, so that the best method of detecting the depth of penetration in zinc-treated ties is to cut a section and apply chemicals to produce color changes, or to heat the freshly-cut section in an oven above the boiling point of water. However, a careful inspection of the treating plant and process is worth as much, if not more, than a critical examination of a few ties.

SUMMARY OF RESULTS.

All the factors discussed above show that there are good grounds for hesitating in the selection of a preservative to be used in treating ties, and that the conditions peculiar to each road, or even parts of the same road, should affect such a decision. No sweeping generality can have much practical significance. The more noteworthy points brought out by this study are:

Zinc chloride and coal-tar creosote, when used under normal conditions, are both effective preservatives of cross-ties, and there is little choice between them as far as [illegible] are concerned.

Creosoted ties in general cost initially more than Burnettized ties, the cost of treatment being from about 2 to 3 times as great.

Creosoted ties last, on an average, longer in the track than Burnettized ties, hence require less frequent renewals and changes in the roadbed.

If creosote advances appreciably in price it will very probably result in stimulating the number of ties treated with zinc chloride.

DISCUSSION.

E. B. Fulks, American Coesosoting Company, thought that the evaporation of creosote is not serious as only a small portion of the oil disappears and this is confined to the outer surface of the tie. Sufficient oil still remains to prevent decay. Experiments with evaporation are usually greatly accelerated as the test samples are exposed to the air on all sides while with ties only one surface is exposed. Realizing that this evaporation does take place, some men mix certain proportions of high grade tar with the creosote, which tar acts as a filler near the outer surface of the timber to retard this evaporation. He defended the use of this tar as an aid to creosote and not as an adulterant.

W. F. Goltra advocated the consideration of crude oil on the same basis as zinc chloride and creosote, believing it to be equally efficient as a preservative with the other two materials. He questioned Mr. Weiss' assumptions as to the average life of creosoted ties, giving statistics to show that with the treatment of 22 lbs. per tie which Mr. Weiss considered, a maximum life of 10 years was all that could be expected. On this assumption the comparison of annual charges for the two methods would show an advantage for zinc chloride of 2½ cents.

Walter Buehler, Kettle River Company, said that experience showed that ties saturated with petroleum are effectively preserved against decay but when allowed to dry out, lose their immunity from decay.

G. E. Rex, A. T. & S. F., in reply to questions regarding the results secured from crude oil, said that of 14 ties treated experimentally in 1901, two have decayed up to the present time, although four others have been removed for examination. The two which decayed were loblolly pine and the fact that such decay appeared would indicate that crude oil has not the necessary antiseptic qualities.

H. F. Weiss said that his objections to the use of tar in creosote are that it has not been fully tested in service, that it reduces the penetration in the wood and that it collects on the surface of the ties, making them difficult to handle.

EXPERIMENTAL TREATMENTS, WITH REFERENCE TO THE EFFECT OF INITIAL AIR PRESSURE ON PENETRATION OF CREOSOTE.

By R. S. Belcher.

Chemist, Texas Tie & Lumber Preserving Co., Somerville, Tex.

The question of the extent to which initial air pressure retards penetration of creosote oil, has been of considerable interest to me, and to satisfy my curiosity I made six runs in the experimental cylinder, with and without initial air pressure. Sawed and hewed longleaf, shortleaf, and loblolly pine ties were used, all the ties having been seasoned five months. It was one of the objects of these test runs to ascertain the absorption and penetration of two runs having the same differential; that is, one having, say, 75 lbs. oil pressure and no initial air pressure, and the other having 100 lbs. air pressure, and 175 lbs. oil pressure, the excess of oil pressure over air being the same in both cases.

In Run 1, 100 lbs. oil pressure was pumped on the ties with no air pressure to oppose it except the air naturally in the wood cells, the average absorption of this run being 54.60 lbs. per tie, or 16.72 lbs. per cu. ft. In Run 2, 75 lbs. air pressure was used

to oppose 175 lbs. of oil pressure, the absorption being 21.15 lbs. per tie, or 6.56 lbs. per cu. ft.

Run 3 had an initial air pressure of 100 lbs. and an oil pressure of 175 lbs., while Run 4 had no initial air pressure and 75 lbs. oil pressure. The absorption in Run 3 averaged 9.10 lbs. per tie, and 3.37 lbs. per cu. ft., while in Run 4 the absorption was 20.50 lbs. per tie or 7.68 lbs. per cu. ft.

Run 5 had the same treatment as Run 2, namely, 75 lbs., air pressure and 175 lbs. creosote oil pressure. The absorption on this run averaged 11.30 lbs. per tie or 4.24 lbs. per cu. ft., being less than the absorption of Run 2 on account of the fact that the ties treated were heart ties, while Run 2 was composed of sap ties. The excess of oil pressure over air pressure in Run 5 was 100 lbs., as compared with 75 lbs. in Run 3.

In Run No. 6 it was the object to see how quickly 5 lbs. per cu. ft. could be put into the ties, and what kind of penetration would be secured, no initial air being used. When sufficient creosote had been pumped from the measuring tank to give 5 lbs. per cu. ft., the treatment was stopped. This took exactly five minutes from the time the cylinder was filled, and the pressure had gone up to 100 lbs. The cylinder was then immediately drained and a vacuum drawn to dry the ties. This run had an absorption of 15.60 lbs. of creosote per tie, or 5.13 lbs. per cu. ft. The penetration was considerably better than was expected, but it was very uneven and the sap wood was not entirely treated.

It would seem that while initial air pressure lowers the amount of creosote absorbed by the timber, it interferes with the penetration very slightly, if at all, thus securing the maximum penetration with the minimum quantity of oil, and that the benefit derived from initial air pressure is greater proportionately in timber with a large percentage of sap wood than in timber which is mostly heart wood. This being the case, it would follow that best results can be expected in so far as maximum penetration with small amounts of oil is concerned, by using reasonably high oil pressure, and as high air pressure as possible, and yet leave in the timber the required amount of creosote.

DISCUSSION.

B. Kuckuck, of C. Lembeck & Co., advocated treating timber to refusal to insure thorough treatment. This is expensive when creosote is used and it has been diluted with other materials, but timber filters liquids. By using initial air pressure it is possible to dilute the creosote with air and so distribute it throughout the timber at moderate cost.

G. B. Shipley, Pittsburgh Wood Preserving Company, said that considerable experience had shown him that better penetration was secured with an initial pressure than with full cell treatment. This initial pressure varies with the different kinds of timber.

THE REQUIREMENTS FOR SUCCESSFUL TIMBER TREATMENT.

By Hermann von Schrenk,
Consulting Timber Engineer, St. Louis, Mo.

Timber treatment has grown so rapidly in the United States that the amount of material treated every year is ten times what it was seven or eight years ago, and the number of men engaged in the industry has correspondingly increased. As the use of treated wood has increased, some facts as to the treatment of timber have become more or less axiomatic. Briefly stated, in order to get good results from treated timber the following points must be observed: Only perfectly sound timber should be treated. In order to obtain the best results, properly seasoned material should be used. A good preservative is essential to long life. Proper injection as to quantity and penetration is essential. Proper subsequent handling of the timber is essential.

In my investigations I have found that the premature failures of so called treated timber were almost without exception due to the non observance of one or more of the above principles. I am perfectly sure that in the early days a good deal of timber was treated which was sap rotten. It was not realized ten years ago, as it is today, that timber may be very badly decayed in the interior and yet show absolutely no evidence on the outside. With the best intentions, therefore, many sticks of wood were doubtless treated which we would unhesitatingly throw out today. Many of the failures were, however, due to the fact that timber was treated because of certain contract requirements and in spite of a better knowledge of the person responsible for the actual treatment. The lessons to be drawn from failures are very obvious, and I believe we should take cognizance of them, particularly in view of more thorough knowledge of all the factors surrounding the operations which make for successful treatment.

While there is no doubt very general agreement among the men engaged in the timber-preserving industry as to the fundamental conditions enumerated above, we all know that frequently, under stress of business circumstances, they are not adhered to. The consumer frequently makes demands which cannot be fulfilled, and if they are, they are bound to result in speedy and ultimate failure.

The inspection of material before treatment should be made with greater care. I believe that every treating company should be empowered to refuse to treat material which it knows to be defective. In other words, I do not think that anyone is warranted, under any circumstances, in treating material which he knows to be unfit because of various defects. A defective stick was never improved by any kind of treatment.

The same holds true for improperly seasoned material. The excuse is frequently given, in demanding treatment of absolutely green material, that emergencies have arisen which necessitate such treatment. Unfortunately, with the increased use of timber in its various forms, the tendency to require and do such rush work seems to be increasing. It is frequently inconvenient to wait six or eight months, or more, to properly season material; besides, it costs considerable for interest charges. What has been said about the inspection of the material before treatment holds equally for the preservative used and the manner of treatment.

I may be treading on delicate ground when I refer to the relation which should exist between a treating company and its customer. I have no hesitation, however, in saying that I believe it to be the duty of the man who knows how timber should be treated to protest vigorously against any requirements which necessitate his treating a customer's material in a manner which he knows to be wrong. I wish to protest against the tendency which requires the actual treating operation to be conducted in accordance with any demands which may be made by the customer, because not only does this give disappointing results so far as any particular piece of work is concerned, but also because it reacts on the company doing the work and on the industry as a whole. The people as a whole are apt to forget when the piece of so-called treated material fails, that that particular piece of material was treated under unusual conditions, no matter how much these conditions may have been justified at the time. I wish to protest against the tendency to do rush work under "necessity." We might as well face the problem now and say that successful treatment of timber can only be accomplished by observing certain laws, and that when one or more of these laws are broken, the consequences will be swift and certain. I know that there are difficulties which both the consumer and the timber-preserving company have to meet, and, as in all other affairs, that there are emergencies which will warrant doing exceptional things. I know also, however, that frequently requirements are made in the best of faith which it is hard to object to. I believe it would be perfectly proper for this association to give expression to some of the sentiments herein expressed. I would favor the passage of some resolution emphasizing the necessity for a careful observance of the principles referred to.

DISCUSSION.

C. G. Crawford, American Creosoting Company, and J. H. Waterman, C. B. & Q., strongly endorsed the position taken by Dr. Von Schrenk, the latter stating that unfit ties are very carefully culled at the Galesburg plant. These ties are used for steam shovel tracks and sill ties.

J. B. Card and other members favored thorough seasoning of all ties received at the plants green, believing air seasoning cheaper than steaming.

PRESERVATION OF LUMBER FOR CAR CONSTRUCTION.

By J. H. WATERMAN,

Supt. Timber Preservation, C. B. & Q., Galesburg, Ill.

Observation leads me to make the statement that treating lumber with creosote for car construction will be necessarily limited, on account of the fact that it is impractical to paint timber after it has been creosted. Most roads in this country have a standard color for their cars, and they would not want to change that color to black in order to please the wood preservers. If any road should desire to change their stock car color to black, then the creosoted timber would be ideal, for the cars would be permanently painted, providing the timber was framed before it was treated.

So far the Burlington has treated only car sills and car decking. We have treated a total of 23 runs of fir car sills with the following results:

Average absorption, per cu. ft., 11.41 lbs.
Board feet treated, 326,204.
Average steam pressure, 15 lbs.
Average time steamed, 2 hours 23 minutes.
Average initial vacuum, 23 in.
Average time initial vacuum held, 1 hour 37 minutes.
Average solution pressure, 175 lbs.
Average time solution pressure held, 17 hours 26 minutes.
Average final vacuum, 20 in.
Average time final vacuum, 1 hour.

To date we have treated 39 runs of fir car decking as follows:

Average absorption, per cu. ft., 14.33 lbs.
Board feet treated, 1,013,472.
Average steam, 15 lbs.
Average time steamed, 57 minutes.
Average initial vacuum, 24 in.
Average initial vacuum held, 1 hour 6 minutes.
Average solution pressure, 175 lbs.
Average solution pressure held, 13 hours 10 minutes.
Average final vacuum, 21 in.
Average time final vacuum, 1 hour.

In the sap wood of the sills we got a thorough penetration; in the hardwood not to exceed 1 in. all around. The car decking, when dry, was thoroughly penetrated with creosote. This car decking is 1¾ in. thick.

We feel that it is not only practical, but that it pays, to treat the car sills and car decking for stock cars. It would be impractical to treat car decking for box cars on account of the odor. They could not be used for flour and many other lines of merhandise, which would absorb the odor. For stock cars it also acts as a disinfectant, and from that point, I believe, it would be effective. There is no question but that it lengthens the life of the timber very materially; how much I am not able to say, for we have only practiced treating car sills and decking for about one year. The treated lumber is being used as sills in all new stock cars that we build with wooden sills, and as decking in all of them.

DISCUSSION.

G. B. Shipley advocated the empty cell or zinc chloride processes as cheaper and giving life equal to mechanical life.

HISTORY OF WOOD PRESERVATION.

By W. F. GOLTRA,

President, W. F. Goltra Tie Co., Cleveland, O.

Numerous ingredients have been proposed for the preservation of timber from decay. The chief ones which have been tried, some of which have been recommended, are as follows:*

Acids: sulphuric, tar, vitriolic; carbonates of barytes, potash and soda; chlorides of mercury, sodium and zinc; sulphates of alumina, barytes, copper, iron, lime, magnesia, soda, zinc; muriate of soda; nitrate of potash; fish, whale and other animal oils; linseed, cedar and other vegetable oils; petroleum and crude oils and other mineral oils; oils from distillation of tar obtained from coal (creosote), wood and petroleum; molasses and low syrups; wax, glue; resins and gums of different kinds; quick lime or hydrate of lime.

Active progress in timber preservation dates from the year 1832. During this year Mr. Kyan patented in England the process of corrosive sublimate, or bichloride of mercury, for preventing decay of timber, although Sir Humphry Davy had previously used a weak solution of sublimate, to be used as a wash where rot made its appearance. Corrosive sublimate has the strongest antiseptic properties among metallic salts; therefore its action is highly preservative, but it has several disadvantages. This process is usually called "Kyanizing," after the name of the inventor. It consists of steeping the wood in a solution of corrosive sublimate, the strength of which is usually 1 lb. of salts to 99 lbs. of water. The work is usually performed in open masonry pits, without pressure, because of the corrosive effects of the chloride of mercury on metal. It is a very slow process compared with those in which the wood is impregnated under pressure. The process is still used in a small way for impregnating railroad ties in Southern Germany, and there are a couple of small plants in our New England States. Kyanizing was introduced in England in 1836, but has gone out of use long ago. The process is suitable for treating timbers on a small scale only. Chloride of mercury corrodes iron and steel, and therefore retorts made of this material are impractical. Simple immersion being found imperfect as a means of injecting the sublimate, Mr. Kyan made an attempt to improve the efficiency of the solution by forcing it into the wood by pressure process. Wooden closed tanks were substituted for the open ones and forcing pumps were added to the equipment.

In 1838 Sir William Burnett, formerly director general of the medical department of the English navy, made known his invention which consists of destroying the tendencies of certain vegetable and animal substances to decay by submitting them to the action of chloride of zinc. The degree of dilution recommended by Mr. Burnett is one part by volume to fifty parts of water. At first the method of impregnation was by immersion in open tanks. In 1847 a powerful cylinder of Burnett's construction, hermetically closed, was laid down adjoining the sawmills in Woolwich dockyards. With this it was possible to treat large timbers and to apply a pressure as high as 140 lbs. per sq. in and by creating a vacuum, extract the moisture from the pores of the wood, which were afterwards filled with chloride of zinc. This process is usually called "Burnettizing," after the name of the inventor. Chloride of zinc is not considered as strong an antiseptic as chloride of mercury, and even considerably less than sulphate of copper, but it is much cheaper than either of these, being, in fact, the cheapest of all the preservatives. In general, no reaction takes place between chloride of zinc and iron when spikes are driven into zinc-treated ties, but the drawback in its use is that it is, like chloride of mercury, easily soluble and therefore apt to leach out of the wood impregnated with it. The substance is, therefore, unsuitable for timber to be used in water, such as piling and dock timbers, but it is an excellent preservative for railroad ties and other timbers not constantly exposed to the action of water. This process is in use on many railroads in Europe and America.

Modifications of zinc chloride processes have been proposed to correct the principal objection above mentioned. One of them is known as the B. M. process (Bruning-Marmetschke process for preserving wood, H. Bruning, manager, Schopfurth, Germany), which consists of adding aluminum sulphate to zinc chloride, it being claimed that zinc chloride salts are made more permanent in the wood.

The modern creosoting process was invented by Mr. John

*The details of the earlier processes, most of which were never developed successfully, were given at considerable length in the first third of the paper.

Bethell, of England, and patented by him in 1838. Mr. Bethell's patent relates more particularly to the method of treatment than to the kind of preservative employed. This consists of the use of closed vessels to contain the timber, in which a vacuum was first produced, the timber being partially surrounded by the chemical, and being preferably placed in an upright position. It was then fully surrounded by the chemical and pressure applied to force it into the wood. Mr. Bethell mentions dead oil of coal tar as one of the preservatives which can be used.

Previous to the time of Mr. Bethell's invention practically all impregnation of wood was accomplished by immersion in open tanks or open boilers, and it may be said that he is the inventor of what is commonly known today as the pneumatic pressure process—or, at any rate, he was one of the first to use this process to any appreciable extent.

Rutger's zinc-creosote process, patented in Germany in 1874, consists of four operations: steaming the timber; producing a vacuum and admitting the preservative fluid; applying pressure, and applying a final vacuum to hasten the drying of the material. The preservative is a mixture of creosote oil and zinc chloride. A modification of this process, known as the Card process, has been employed at several plants in the United States. It consists in forcing an emulsion of zinc chloride and creosote into the wood at one operation. J. D. Card proposed injecting a small amount of tar oil, then immediately thereafter injecting a solution of zinc chloride. He claimed that by this means he secured a much better distribution of the oil in the wood than was possible with the ordinary injection of the same amount of oil and at the same time thoroughly protected the interior of the stick with zinc chloride. Mr. Card introduced the Wellhouse process on the Atchison, Topeka & Santa Fe at the Las Vegas, N. M., works built in 1885. This process consisted of the injection of zinc chloride, followed by injections of solutions of glue and tannin, the object of the two latter being to plug up the ducts of the timber by artificial leather formed by the glue and tannin. This treatment has been in use in this country for a number of years with satisfactory results.

Another treatment used considerably in this country is the Allardyce process, which consists of an injection of a 2 per cent. solution of zinc chloride into the wood, followed immediately by an injection of about 3 lbs. of creosote oil per cu. ft. A number of ties treated in this way by the International Creosoting & Construction Co., at Beaumont, Tex., were laid in track in 1900, and a large percentage of them are still in service.

THE PIECEWORK OR UNIT SYSTEM OF HANDLING TIES AND TIMBERS.

By W. W. Eldridge,

General Piecework Inspector, Chicago, Burlington & Quincy.

Our company has been using the piecework system of handling ties and timbers at both our plants for several years with what we consider the best of results.

The object of piecework is to get one dollar's worth of labor for one dollar, and to give one dollar for one dollar's worth of labor, or in other words, to increase the efficiency in handling ties and timbers so as to get the largest possible output at the least cost. The advantages of the piecework system are numerous. In the first place it reduces by approximately one-third the number of men required to do the work, and hence makes a corresponding decrease in the amount of supervision needed. It gets the "cream" of the laborers. There is no place for the "drone" in the piecework system. It systematizes the work and assists materially in accounting, figuring costs, etc. It places each individual workman in business for himself, and enables him to secure pay for what he does. Being paid for what he does, it is natural for him to combine mental ability with physical strength, in order to accomplish all possible. Knowing that he is getting paid for what he does, and that in proportion as his efforts are increased his earnings are increased, he is able to make better wages than his fellow-workmen in other lines on a day-rate; hence he is satisfied with his job at all times, and when a "shortage of labor" comes, he will stay with you. All of these advantages tend to promote efficiency.

The installation of the piecework system is no small task. A great deal of tact and good judgment must be exercised, and unless it is established on good business principles it will be a failure rather than a success. Be open with your men in everything you do in connection with their work, as it is of the utmost importance that the men fully understand what you expect of them, and what they can expect of you in return. You must have confidence in your men and they in you to obtain the best results. Every detail should be fully explained to them.

The installation of the piecework system would need to be worked out to fit conditions peculiar to each individual plant, hence it would be useless for me to attempt to outline what rates should be applied, but there are several important underlying principles that should apply to all.

Select a competent foreman, wide awake and energetic, familiar with every detail of the work, and thoroughly acquainted with the most practical way to handle ties and timbers so that he can impart his knowledge to his men. He should not be a slave driver, but should be firm and diplomatic in all his relations with his men. The men should understand that his word is law, but if for any reason they deem his demands unreasonable they should be at liberty to put the case up to the general foreman or other higher authority for final decision. In my opinion the superintendent or manager personally should make the final decision, if necessary to carry it that far.

Care should be exercised in perfecting an organization to place the men to the best advantage, and to see that there are no more men in the gang than needed, and yet enough to handle the work without delay to other parts of the organization.

Price schedules should be made to cover every operation. These schedules may be based on any of the following units, depending entirely upon your own views and the existing conditions:

Ties; per tie, or per tram loaded.
Lumber, switch ties and crossing plank; per 1,000 ft. B. M.
Piling; per pile, or per lin. ft.

We have found the following a very good plan:

Unloading and storing ties on ground, per tie.
Loading trams for treatment; per tram.
Unloading treated ties from trams to cars; per tram.
Unloading treated ties from trams to ground; per tram.
Piling, when handled with derrick; per pile.
Piling when handled by hand; per lin. ft.
Paving blocks; per sq. yd.
Lumber; per 1,000 ft. B. M. in all cases.

In wording the schedules particular attention should be given to the phraseology to see that it is clear, concise and easy to understand. All the work which the men are expected to perform under any schedule should be fully covered. In handling ties and lumber of all kinds a distinction should be made between hard and soft wood, as pine or fir weighs approximately 3 lbs. per ft., while oak weighs 5 lbs. per ft. You would not expect any man to handle 5,000 lbs. for the same price as 3,000 lbs.

A competent man should be selected to make the schedules and establish the rates of pay. To get the best results he should have a knowledge of handling men and material. He should be competent to recommend practical changes or improvement of conditions, tools or other devices that will facilitate the handling of the ties or timber. Often a dollar judiciously spent to improve conditions means many in return. In establishing prices it is important that all the facts and figures bearing on the operation be accumulated in order that prices may be established on an intelligent basis. To accomplish this the party getting the information should be on the ground personally, to watch the operation from start to finish, and to make notes as to the number of men, kind of material handled, how handled, time consumed by each man, degree of efficiency, or anything else that would have an important bearing on the word-

ing of the schedule or the base rate. Prices should be based on three things; the authorized hourly rate, degree of efficiency obtained under the day rate system, and the conditions and tools furnished.

All prices should be made on a basis that is fair to the employer and the employee. Once a price is established it should never be changed unless there is a change in conditions. Suitable blanks should be provided for keeping the time and checking material in and out. These will be turned in to the timekeeper daily.

In establishing the piecework system, it is a good plan to start with one gang. Advise them daily of their earnings and arrange it so that the rest of the men working on a day rate will know what this gang is earning. They will immediately begin to get interested and ask for the piecework system, and in a short time the entire force will be working on the piecework basis.

Foremen should be on a monthly basis. In no case should a foreman have supervision over more than twelve men, and eight or nine men is better, in my opinion, when handling ties or lumber by hand. The duties of the foreman are to instruct his men what to do, give them the benefit of his experience in handling material, keep them supplied with work at all times, see that it is properly done, and keep track of their time and the material handled, checking it personally in all cases.

When unloading ties to season, also loading trams for treatment, each man works as an individual. When handling treated ties the men generally work in pairs or gangs of three, each man getting an equal proportion of the earnings of the gang. If a man is taken out of the gang during the day and another put in his place, the foreman should make proper record so that the earnings can be properly apportioned. When unloading ties to season at our plants we make no effort to sort them. The sorting as to kind of wood and grade is done when loading them on trams. When unloading switch ties by hand we find a gang of four men the best, and when handling switch ties, piling and lumber with a locomotive crane, three men in addition to the engineer. In all cases I would advocate the same rate from start to finish of an operation, unless some unusual condition arises. The men get the same for the last tie as for the first.

In storing ties to season in eight to one piles, the maximum height of the pile should be 16 to 18 ft. Treated ties when piled on the ground should be in solid square piles eight to ten ft. high.

Someone has said that the efficiency of a timber-treating plant should be based on the number of retort hours worked out of the total possible retort hours. In obtaining efficiency in plant operation the fact must not be lost sight of that good and effective treatment is the first or primary object, and in securing such treatment your supervision, organization and system of handling must be the best possible. This is what we claim to have under the piecework system. During the year 1912 at our Galesburg plant each of the three retorts were in actual operation 98¾ per cent. of the time. This means that out of a total of 7,488 possible retort hours for each retort they were operated 7,394.4 hours, holidays excluded.

DISCUSSION.

George E. Rex, Santa Fe, told of the universal application of piecework in Santa Fe plants. In the Albuquerque plant five Mexican laborers who would earn about $35 a month at day rates now earn from $100 to $125 a month on a piecework basis.

W. A. Fisher, Atlanta Coast Line, reported the use of a piecework system on that road, the laborers being negroes. The men can often finish a good day's work early and go home better satisfied.

Several members spoke of the difficulty in fixing a fair piecework rate for handling material with machines. A representative of the Philadelphia & Reading told of the handling of ties by locomotive cranes in its plant, for which no piecework rate has been established.

TESTS TO DETERMINE THE EFFECT UPON ABSORPTION AND PENETRATION OF MIXING TAR WITH CREOSOTE.*

By F. M. Bond,
Forest Products Laboratory, Madison, Wis.

Adequate depth in the penetration of a preservative is recognized as of fundamental importance in the wood-preserving industry, and this has been the principal goal of many preservatives and processes. Recognizing the importance of this factor, there have been developed at the Forest Products Laboratory an apparatus and method of testing which render it possible to make accurate comparisons of the penetrating qualities of a preservative, considering the great variability to be found in wood. An investigation has been begun upon some of the factors which are believed to determine largely the penetrating power of creosotes and mixtures of creosotes and tars into specimens of a single species of wood.

Clear heart commercial longleaf pine specimens, approximately 2 by 4 in. in cross section and of various lengths, were used A hole one inch in diameter and approximately one inch deep was bored in the center of one 4-in. face of each specimen. The specimens were cut in series, each set being of adjoining material, comprising as nearly as possible different portions of the same growth rings. All of the specimens were air dried under cover before being tested and contained a very small amount of moisture when they were treated.

The impregnating oils were all derived from or consisted of one or more of the following: A commercial creosote, a gas-house coal tar containing approximately 30 per cent. of free carbon and of 1.273 specific gravity, a by-product coke-oven coal tar containing approximately 16 per cent. of free carbon and of 1.232 specific gravity, and a by-product coke-oven coal tar containing approximately 6 per cent. of free carbon and of 1.184 specific gravity.

It was the purpose to use oils as nearly as possible like those used in practice. The creosote was purchased from regular stock and the tars were collected direct from the producing apparatus by a representative of the Forest Service.

The free carbon was removed from a portion of each of the tars and the amount of free carbon in the tars was determined to the nearest one-half of 1 per cent. by careful quantitative filtering. The percentage of free carbon in a given mixture was regulated by mixing in the proper proportions a tar containing the normal amount of free carbon with the tar of the same origin from which the free carbon had been removed.

The specific gravities and viscosities were obtained very accurately.

The apparatus was designed to expose the wood in the 1-in. hole to the preservative under conditions similar to those which obtain during the pressure period of the usual timber treating cylinder, except for the fact that only a given surface of the specimen under test is subjected to the impregnating oil. In order to compare the relative penetrations of the oils, at approximately 24 hours after treatment, each specimen was sawed transversely and longitudinally through the center of the hole. The fresh areas of treated wood which were thus exposed, were measured by means of a planimeter and the penetrations were determined by using these values, together with measurements of the depths of the holes in the specimens, which were obtained by the use of a steel scale.

The following series of oils for each of the three tars were tested at a temperature of 160 deg. F. and a pressure of 75 lbs. per sq. in. for their relative absorptions and penetrations in two sets of matched specimens, using tar from which the free carbon had been extracted in each case: All creosote, 75 per cent. creosote, equal parts of creosote and tar, 75 per cent. tar, and all tar.

For each of the three tars there was tested at a temperature

*The experiments described are still in progress.

of 160 deg. F. and a pressure of 75 lbs. per sq. in. a series of mixtures, each of which contained 50 per cent. of creosote and 50 per cent. of tar by volume, but different percentages of free carbon. Two sets of matched specimens were used in each series.

A series of mixtures, each consisting of 50 per cent. of creosote and 50 per cent. by volume of one of the tars containing the normal percentages of free carbon, or of one of the tars from which the free carbon had been removed, was tested at a temperature of 160 deg. F. and a pressure of 75 lbs. per sq. in., using two sets of matched specimens. This series included, of course, mixtures of each of the carbon-free and the normal-free carbon tars.

While data obtained under a given set of conditions upon well-matched specimens of wood are comparable, provided one condition only whose result is unknown be varied at a time, results from different sets of matched specimens are not necessarily comparable. Pieces of wood will behave differently when there is a variation in either the number of annual rings per inch, the ratio of the amounts of summerwood and springwood, the amount of resin present, or a number of other characteristics. Experiments upon specimens which are matched as described in this paper are in reality conducted at different points along the same piece of straight-grained wood, which is sawed into short lengths simply for ease of handling. There is, therefore, a minimum of the variability common between different pieces of wood. When the results of tests upon sets of matched specimens of diverse origin are compared, however, the variability between the wood of the two sets may be greater than the variations in the factor which is being examined, thus obscuring the results.

The data which have been obtained seem to indicate at this time the following:

The difficulty of penetration into longleaf pine of mixtures of creosote and a given tar from which the carbon had been removed was in proportion to some direct function of the amount of tar in the mixture.

There was no apparent relation between the amounts of carbon-free tar in mixtures of creosote with the three tars and the corresponding absorptions and penetrations into longleaf pine.

There was no apparent relation between the viscosities and specific gravities of mixtures of creosote with the three carbon-free tars and the corresponding absorptions and penetrations into longleaf pine.

The difficulty of penetration into longleaf pine of mixtures of equal parts of creosote and a given normal tar was in proportion to some direct function of the amount of free carbon in the mixture.

There was no apparent relation between the amounts of free carbon in mixtures of creosote with the three normal tars and the corresponding absorptions and penetrations into longleaf pine.

There was no apparent relation between the viscosities and specific gravities of mixtures of creosote with the three normal tars and the corresponding absorptions and penetrations into longleaf pine.

The free carbon appeared to occur in agglomerations of different sizes in the three tars.

There was no apparent penetration of the free carbon into longleaf pine.

The free carbon appeared to form mats of different degrees of density and imperviousness on the surfaces through which the oils entered the wood.

The tar producing the free carbon mat which appeared to be of greatest density and imperviousness was the tar in which the number of the smaller free carbon agglomerations appeared to be relatively greatest and was also the tar of which the normal amount of free carbon appeared to produce the greatest difference in penetration into longleaf pine, although this tar contained the smallest percentage of free carbon.

The tar producing the free carbon mat which appeared to be of least density and imperviousness was the tar in which the free carbon agglomerations appeared to be of greatest size, and was also the tar of which the normal amount of free carbon appeared to produce the least difference in penetration into longleaf pine, in spite of the fact that it contained the largest percentage of free carbon.

DISCUSSION.

S. R. Church, Barrett Manufacturing Company, questioned the conclusion that the penetration of a mixture of creosote and tar was in proportion to some function of the amount of tar in the mixture, and E. B. Fulk, American Creosoting Company, thought the number of test specimens too small to warrant any of the conclusions made. Both speakers emphasized the possibility of variation in other factors having concealed the true variation due to tar content.

Walter Buehler, Kettle River Company, told of an experience tending to prove that the waterproofing of wood necessary for satisfactory service of paving blocks can be secured better by treatment with a mixture of tar and creosote than with creosote alone.

C. G. Crawford, showed that the conclusions drawn should not be applied to ties of timbers containing heart wood.

ADZING AND BORING TIES AND THE COST OF INSTALLING PLANTS OF THIS KIND.

By James A. Lounsbury,
Vice-President, Greenlee Bros. & Co., Chicago.

The folly of paying 20 to 35 cents per tie for chemical treatment and then to so mutilate the ties by hand adzing and spike driving as to greatly reduce the beneficial effect of the treatment is too obvious to require argument. Hand adzing is resorted to commonly to correct defects in the tie surface, but this is at best only a partial remedy, and its effect on the impregnated part of the tie is destructive. The advantage of having a full and perfect bearing for the rails over the whole width of the face of every tie is evident. It reduces rail cutting, decreases the danger of half moon breaks in rail bases, reduces disturbance of the ballast and gives added firmness and stability to the track. Where plates are used it is a practical necessity to give them a full bearing on the ties, as the increased surface makes it more difficult for them to properly seat themselves under traffic. If their bearing on the tie is not parallel with the bottom of the rail they increase the danger of rail breakage, as they form an anvil upon which the impact of rapidly moving loads is received. If the point of support is along one edge of the rail base only, the danger to the rail is apparent.

Many tests made by the U. S. Bureau of Forestry, by several universities, and independently by a number of the railroads, have demonstrated conclusively that common square spikes have increased holding power when driven into previously bored holes. It is unfortunate that there are almost no reliable data showing the comparative resistance to lateral pressure of spikes driven directly and those driven into previously bored holes. This is of even more importance than the resistance to vertical pull, as upon it depends the maintenance of gage and the prevention of rail spreading under high speed trains. It is probable that the resistance to flange pressure is increased in much greater proportion than the resistance to vertical pull, because the spike in a bored hole has a backing of solid wood instead of being surrounded by torn and broken down fibres, as is the case when driven directly. The use of screw spikes, of course, makes pre-boring absolutely necessary. A number of roads are already committed to this form of rail fastening, and its extended use is only a matter of time. At present probably 75 per cent. of the ties that are bored are for square spikes.

Of chief interest, however, to the members of this association, is the great advantage from a treating standpoint of having the adzing and boring of ties done before the treatment takes place. The vital points of a tie are the parts under the rails and contiguous to the rail fastenings, and this is where the impregnation should be most thorough. In air seasoning the ties become case hardened on the outside, and this hard skin is more difficult of penetration than the portion immediately beneath.

In adzing previous to treatment this more resistant portion is removed for a distance of 12 to 14 in. in length for each rail bearing. This permits the chemical to penetrate more freely transversely to the grain. The holes bored for the spikes give the chemical free entrance into the interior, allowing it to radiate from each hole by end grain penetration, thoroughly saturating these portions even when the tie as a whole is not given a heavy treatment. How much this saturation of the parts of the ties subject to earliest failure will increase their life cannot be measured until sufficient time has elapsed to allow accurate comparative data to be obtained, but there is no doubt that it will greatly increase the efficacy of the treatment and produce results far out of proportion to the cost of the adzing and boring operation. It is stated by engineers who have had several years' experience with adzed and bored ties that the saving in time and labor in putting the ties in track is sufficient to pay the cost of the adzing and boring, leaving all the other advantages a net gain.

The adzing and boring of ties has been standard practice in Europe for upwards of 20 years, and the results have proved its economy. Owing to the abundance of cheap labor in those countries, the development of machines of the highest labor-saving capacity has not been rapid. Their ties are more carefully made, and therefore machines are not required to meet such wide variations as in this country. In England the majority of ties are sawed from dimension stock and vary little in size. A range of 1½ in. difference in thickness is all that is provided for in their machines, while ours must be designed so that ties from 5 in. to 10 in. thick, and from 7 in. to 14 in. wide, may be run promiscuously. Again, their ties being practically of the same width, no provision need be made for centering so that the holes will always be properly placed in the face of the ties. With our extreme variations in width, and the fact that no two ties are alike in shape, that crooked and straight ties must follow each other through the machine, it is necessary to center each tie over the boring bits so that the holes shall be accurately placed in relation to the center line of the face of the tie. In other words, the machine must take ties as they come, of all sizes and shapes, and automatically adjust itself to variations and irregularities, without human aid and without decrease in its rate of production.

Two distinct patterns of adzing and boring machines are built for different methods of mounting. One is designed for installation on a stationary foundation, and the other, a more compact form, for mounting in a car. As more machines are specified for stationary mounting, this type is known as the standard pattern. It is more open in design and accessible in its working parts than the more compact car type. The question of which method of mounting is preferable must always depend upon yard and plant conditions, and each case must be decided on its merits. It is probably true, however, that there are more treating plants in which the stationary mounting will give the higher economy in operation than those in which the movable type will give the better results.

The location of the stationary machine in relation to the retort house, power house, etc., in the case of plants already built, must, of course, be governed by the space that may be available, because it must be made to fit into conditions as they exist. In laying out a new plant the location is subject to control, and can be made where the least switching and handling of ties will be involved.

Wherever possible the machine should be placed between the stacking yard and the cylinders, so that all ties must pass it in their movement between those points. The narrow gage tracks should be arranged so that trams from any part of the yard may be brought to the machine with the minimum amount of switching, and by-pass tracks must also be provided by which timbers not to be machined, such as switch ties, bridge timbers, piling, etc., can pass the tie machine without interfering with its supply. The tram track on the in-feed side of the machine should be about 1 ft. higher than that on the delivery side, and should run out to a spring switch, so that an unloaded tram, given a start, will run by gravity past the spring switch, reverse its direction and return on the discharge side of the machine ready to be loaded for the cylinder. The space required between these supply and delivery tracks should never be less than 32 ft. centers when the ties are to be taken from the tram and placed on the machine conveyor by hand. If the dumping hoist and the skid are employed the minimum distance between track centers is 46 ft. These dimensions apply only to the machine without the cut-off saw attachment. If the latter is required, 6 ft. should be added to the track center distances.

Where drainage will permit, the best form of foundation is to enclose a space 11 ft. x 20 ft. with a concrete wall, the interior being excavated and a cement floor laid. The side walls should be 7 ft. to 8 ft. high to give good head room below, as in the basement so formed the 50 horse power motor for driving the machine is placed, together with the shavings exhaust fan. The top of the foundation should be about 3 ft. above the grade line, making the actual excavation only about 5 ft. deep. Steel I-beams and a 4 in. plank floor form the support for the machine. The weight of the latter is 20,000 lbs. This form of foundation is not always necessary, but is the most advisable when conditions permit.

The smallest building which will accommodate the machine and appliances is about 25 ft. square. This, however, leaves the men unloading trams on the in-feed side, and the tram loaders on the discharge side exposed to the weather. It is better to provide a building 25 to 30 ft. wide, and long enough to span both the supply and delivery tracks so that the tie handlers may work under cover. Of course, in the South the matter of protection is not so important, and can be arranged to suit local conditions.

One of the most important facts to be borne in mind in considering the installation of a machine of this kind is that, in order to bring the cost of the adzing and boring operation down to the lowest point it is necessary that it be operated continuously at its full capacity, and that there shall be no irregularity in the tie supply nor any interference with the quick handling of trams at either side of the machine.

Machines designed for mounting in cars perform the same operations in practically the same way, but, as stated before, the dimensions are held down in order to bring them within the limit of width of a wide box car, having extra wide doors through which the conveyors extend. The original installations (two machines on the Santa Fe and one on the Northern Pacific) were all of this type. The car used for this purpose should be of steel under-frame construction, 40 ft. long, 9½ to 10 ft. wide, of 40,000 lbs. capacity, and not less than 9 ft. high in the clear. The cars are usually made self propelling from the same source of power which drives the machine, a clutch being provided by which the machine is disconnected and the car axle drive thrown into gear when the car is to be moved. As the car is commonly designed to move only from stack to stack in the tie yard only, the speed is kept down to about three miles an hour.

The kind of power to be used in these movable plants is often a somewhat troublesome problem. Electric drive is by far the most reliable and satisfactory if it is available. In yards using electric switching locomotives and strung with trolley wires the application of electric power is easy, but where this is not to be had, some other power must be used, usually a self-contained gasolene engine of about 60 horse power installed in the car with the machine. This gives satisfactory results, but requires more careful management than would be necessary with an electric motor.

The track arrangement in a yard already laid out is, perhaps, the most important factor in determining the comparative merits of the stationary and car mounting. The usual system, a three-rail track between the tie piles, would make it necessary for the trams to follow directly behind the machine car, a position which is not convenient for loading by the machine con-

veyor, as a right-angled change of direction must be made by the ties in their progress from the machine to the tram. The Somerville plant of the Santa Fe has a temporary track 60 to 90 ft. long which is placed between the tie pile and the three-rail track, and upon this the machine car is placed. One rail length after another is moved forward and laid ahead of the car. This leaves the tram track clear, and trams can be brought up to the side of the machine car, allowing the conveyor to discharge the machined ties directly into them. On the feeding side the ties are thrown down from the top of the piles and placed directly on the in-feed conveyor, so that one handling is saved by the movable machine arrangement. This, however, is offset by the time lost in changing the position of the car. On an average it is probable that about one-third more ties can be put through the stationary machine in a day than through the movable plant.

The cost of installing machines for adzing and boring ties is a difficult thing to cover without definite specifications. It is more an engineering problem than a manufacturing one, as the conditions are not the same in any two cases. The cost of the machine itself may vary as much as $1,500, depending on what is wanted in the number of boring spindles, the lengths of conveyors, and whether or not the machine is to be provided with cut-off saws, branding device, dumping hoist and other special features. The cost of the power plant may also vary between wide limits—a steam engine and boiler, or a gasolene engine, costing much more than an electric motor. The building may be sufficient to protect the machine only, or may be large enough to cover both tracks and give protection to the tie feeders and loaders. One machine in the South is placed on a foundation of heavy creosoted timbers laid on top of the ground and is covered by an open shed. Another on the Pacific Coast is placed on the end of a dock of piling, 18 ft. above the ground, into which the piles are driven. It is all a question of the governing local conditions, and how much money the purchaser is willing to spend. Some plants have been installed complete for $10,000, and the cost of others has run as high as $15,000, but in the long run the most thorough work is the cheapest, the saving in operation and maintenance paying large interest on the additional cost.

Does adzing and boring pay? It is believed that the increase in life that may be expected from ties adzed and bored before treatment will not be less than one-third, but to be conservative we will consider that it is only 15 per cent., or say 21 months of added service. In the case of a railroad using 1,000,000 ties a year, costing when treated, delivered and put in track 85 cents each, the total saving in tie renewals will amount to something over $100,000 a year.

DISCUSSION.

G. E. Rex, Santa Fe, favors the use of adzing and boring machines very strongly. On one grand division of the Santa Fe untreated hard wood ties are being adzed with good results, although the greatest benefit of the process is secured on ties to be treated. The Santa Fe has operated two machines for 19 months. They can adze 3,000 ties a day at a reasonable cost.

Other members also reported favorable results from the use of adzing machines; some of whom mentioned minor mechanical changes which should be made to the machines to secure the best results.

NATURAL AND ARTIFICIAL SEASONING OF DOUGLAS FIR FOR TREATMENT.

By F. D. Beal,

Manager, St. Helens Creosoting Co., Portland, Ore.

This subject is one on which a large amount of knowledge is yet to be obtained. Although we have been treating Douglas fir for about 24 years, we cannot say that we have yet developed a method of seasoning that is wholly successful under all conditions.

The wood, when air seasoned, is so hard and refractory that sufficient penetration by pressure treatment alone can not be obtained to insure the full protection of the wood for a sufficient length of time to make the treatment a paying proposition. Therefore, it was decided very early in the treating of Pacific Coast timber that some means of artificial seasoning would have to be resorted to in order to prepare the wood for the reception of the preservative.

The first move was to take up the steaming and vacuum process; that is, turning saturated steam directly on the timber and raising the temperature to a point to insure the thorough heating of the interior wood and the vaporizing of all sap, moisture, etc. The writer used to think they were vaporizing the wood itself, judging by the pitch, resin, etc., that came out through the drains. This was carried on until the maximum vaporizing point was reached. A vacuum pump was then started, heat being maintained in the cylinder by the circulation of superheated steam through the steam heater pipes in the bottoms of the cylinders. This process was carried on until the balance of the moisture was fully extracted from the cylinder. In this manner the wood would take the preservative under pressure very readily, but the strength was so impaired as to practically condemn it for use in structures.

Various other schemes were tried out with very little success until in 1894 John D. Isaacs conceived the idea of using a modification of the "Boulton method" of seasoning by immersing the unseasoned timber in creosote oil, using the oil as a medium for conveying the heat to the timber. The temperature of the oil is raised above the boiling point of water, thus vaporizing the moisture in the wood and allowing it to pass off through vent pipes into condensers through which cold water is circulated. This eliminates the use of a vacuum pump. In this manner, the timber was dried or seasoned with a lower degree of heat and left in good condition for the reception of the preservative under pressure. This method of seasoning has been carried on continuously on the Pacific Coast for over 20 years, and although there is some decrease in strength, the material is in much better shape and lasts longer than that air seasoned or steamed.

At present experiments are being carried on at St. Helens, Ore., at the St. Helens Creosoting Co.'s plant, under the direction of George E. Rex, of the Santa Fe, on the seasoning of 10,000 Douglas fir ties. The ties were selected and 5,000 of them which were weighed were tagged and numbered so as to keep a record of them. They were then placed in water during the months of May and June, 1912. They were cribbed in piles of about 60 ties, all being laid in one direction and separated by 1 in. strips nailed to the ties, their length being parallel to the current of the running fresh water, allowing the water to pass through the entire length of the ties.

These ties were left in the water until about September 15, when they were taken out and re-weighed to ascertain the amount of water absorbed. They were then placed in open piles to air season. When it is found that the ties are sufficiently dry they will be treated by the pressure process, without any artificial seasoning.

The object of these experiments is to find some process of seasoning without the application of heat which will allow the Douglas fir to retain its natural strength as much as possible and will not cause the excessive checking and splitting which occurs when lumber of this species of wood is seasoned in the open air, and will leave the wood in condition to receive preservative treatment. The idea of putting the ties in the water was to allow them to water season so as to wash out all of the saps and natural wood moisture. By piling them in open piles the moisture that was absorbed during the immersion is allowed to evaporate and it is hoped the wood will not check or split. At this writing, November 20, 1912, the theory is working out admirably. The ties as yet show no evidence of splitting or checking in any manner.

One pile of the ties was selected to be weighed every 15 days

to determine the rate of seasoning. The weights per tie and per cu. ft. are shown in the following table.

	Weight Before Placed in Water.	Weight on Taking from Water Sept. 21, 1912.	Weight Oct. 5, 1912.	Weight Oct. 21, 1912.	Weight Nov. 5, 1912.	Weight Nov. 21, 1912.
Total weight. ...	8,328.5	9,389.0	8,169.0	8,045.0	8,038.0	8,155
Weight per tie.	120.7	136.07	118.39	116.59	118.2	118.18
Weight per cu. ft.	38.79	43.73	38.05	37.47	37.99	37.98

It was at first intended that the ties should be treated in the creosoting cylinder about November 1, but on account of the excessively heavy and continuous rain for the past month the seasoning has been retarded and it has now been decided to postpone the treatment until about February 1, 1913.

EFFICIENT HANDLING OF TIES AND MATERIALS AT TREATING PLANTS.

By A. M. SMITH,

Superintendent, Ayer & Lord Tie Co., Argenta, Ark.

We have been unable to find any method for handling ties better than hand labor. There are times when we can use machines to materially reduce the cost of handling. While we are using the machines the laborers having nothing to do, leave, and when we cannot use the machines we have no laborers and the loss through delay is greater than the amount previously saved. For handling lumber and piling we use traveling cranes, as more than 95 per cent. of this material comes to us and is loaded out in open cars. The machines we use have a lifting capacity of about one ton at a radius of 35 ft., and can be used for light switching service when necessary. Experience has taught us that switching with these machines should be avoided as much as possible. We use on the end of the hoisting or lifting line two pairs of hooks of suitable size for handling timbers and piling, one pair for piling with a spread of about 16 in. at the points and one pair for timbers and boards that will open to 30 in. at the points. For very small lumber we use two slings, made of round chains, and handle it in weights of about one-half to one ton.

We handle piling one piece at a time for lengths up to 60 ft. at the rate of 200 to 400 piles per day with a crew of five men to each machine. In handling lumber with the same machine and crew, the cost is from 10 to 25 cents per thousand feet. We use six of these machines at our Southern plants, and frequently work part of them both day and night. For night work, a head-light is placed on the machine so that the light is always under the boom.

PREPARING TIMBER FOR TREATMENT IN THE GULF STATES.

By R. L. ALLARDYCE,

Superintendent, International Creosoting & Construction Co., Texarkana, Tex.

In air seasoning ties I would require 90 days as a minimum and would prefer four months. The ties should be in open stack and I have found that better results can be obtained by stacking six or seven on two instead of on one as the German method calls for. The stacks should be at least three or four feet apart to allow the air to circulate freely and to give the bottoms of the alleys a little sunlight, otherwise the bottoms of the stacks become damp and moldy. In stacking on both sides of the tracks care should be taken that the stacks are directly opposite each other, making, if possible, a continuous alleyway across the yard, as this insures a better circulation of air. Ties that are loaded for treatment on damp days or in the early morning should have an initial vacuum of a half to one hour before treatment, as we have a very heavy dew to contend with at times. During this period of vacuum the closed steam coils should be used lightly to heat the ties to an even temperature, thus eliminating the dropping down of the warm oil on cold ties.

In steam seasoning there is less capital tied up, as the material is treated as it is received in the yard, and the cost is lowered by eliminating one handling. The interest on the purchase price of the material that is tied up for three or four months in air seasoning should also be considered a saving in the steaming method.

It is practically impossible to properly air season heavy materials. Caps or stringers of long leaf left in stack for five or six months, unless protected with S irons, will open up and the inspector will reject them on account of season checks. The cullage on this class of material is quite an item to commercial plants when the non-steaming method is used, for when the material is received at the plant it is up to specifications; six months later it is cull on account of season checks.

By steaming material that must be treated green all of the material is seasoned the same, and it gets a more even penetration; in the non-steaming method some of the material will season out faster than others, and in treating will absorb more of the preservative than required, while the slow seasoning pieces will not have the required amount in them. I have obtained good results from steaming, and do not know of any disadvantages.

The safe high temperature depends on the class of material that you are treating as well as its cross section. For this reason it would be almost impossible to give a factor of safety unless you could see the material to be treated. In this the operator should be governed by the sap drainage from his retort, as the flowing of the sap is a very important point in governing the steaming of the material regarding the temperature to be used as well as the duration of the steaming period. At times the sap will almost stop flowing, and it will be necessary to raise the temperature slightly to facilitate this flow.

OTHER PAPERS.

S. J. Record of the Yale School of Forestry presented a paper on sap in relation to the properties of wood, in which he said that the prevailing theory that sap in growing timber is down in winter and up in summer is erroneous. There is more sap in growing wood in winter than in summer, but this presence of sap is not important in the securing of sound timber. Decay depends principally upon the presence of fungi, and the reasons that summer cut woods decay more rapidly are that wood seasons more rapidly, causing checking and warping. The fungi are more active in warm weather and the sap is more conductive to fungi growth.

C. P. Winslow, Forest Products Laboratory, read a paper on the transmission of air pressure in cross ties. The tests described were made at the Forest Products Laboratory on red oak, soft maple, eastern hemlock and douglas fir ties. Pressure of 84 lbs. in the cylinder was applied in one series of tests and vacuums of 26 in. in another. The pressure in the interior of the ties was measured by inserting small pipes ending in a small air chamber in the center of the tie. The results obtained indicate that red oak transmits air most readily and douglas fir is least permeable. Little difference was found between eastern hemlock and soft maple, the indication being that the former is the more permeable. Tests showed five to ten minutes as sufficient to hold maximum pressure or vacuum in the cylinder to insure maximum condition in the ties. After successive applications of pressure, the permeability seemed to be increased. After successive vacuums the opposite effect was noted.

Papers of interest to our readers, but which lack of space prevents printing in this issue, will be abstracted in the February Maintenance Section. Among them are the following: "Timber for Creosoted Block Paving," by Harry G. Davis, manager paving department, Chicago Creosoting Company; "Treatment of Douglas Fir with Creosote Oil," by G. A. Coleman, Coleman Creosoting Company; "Notes on Analysis and Testing of Coal Tar Creosote," by L. B. Shipley, Barrett Manufacturing Company.

Other papers were presented on "The Care and Treatment of Floors," by George W. Saums; "Laying Wood Block Pave-

ment," by H. S. Loud, chief engineer, United States Wood Preserving Company, New York; "The Preliminary Treatment of Timber to Insure a More Even and Satisfactory Impregnation with Creosote," by David Allerton, the Kettle River Company, Madison, Ill., and "How Nearly Does the Modern Yellow Pine Block Pavement Approach to the Ideal Pavement; What Improvements Can We Suggest," by H. L. Collier; and "Mutual Interest of Railroad and Commercial Companies in the Work of the Association," by L. B. Moses, Kettle River Company.

The annual banquet was held at Vogelsang's restaurant on Wednesday evening.

ONE-PIECE COMBINED RAIL BRACE AND TIE PLATE.

The one-piece combined rail brace and tie plate shown in the photographs is made of a ⅜-in. flat steel plate bent and forged to shape. The plate is shown punched for screw spikes, although it can be punched equally well for the ordinary drive spikes. The lower part of the upper portion is bent at such an angle that when the screws are driven tight it is in contact with the

One Piece Combined Rail Brace and Tie Plate.

upper side of the flange of the rail, while the upper portion of the brace supports the head and web as with the ordinary pattern. Two hundred of these braces have been in use since last August on wyes connecting the Chicago Junction Railway with the Chicago & Western Indiana at Butler street, and with the Chicago, Rock Island & Pacific and Lake Shore & Michigan Southern at Wentworth avenue, and on a sharp curve near Western avenue, where they have given satisfactory service and have greatly decreased the amount of attention previously required. This device has been patented by Robert D. Townsend, 5821 Michigan avenue, Chicago.

Combined Rail Brace and Tie Plate on Chicago Junction—C. R. I. & P. Wye, Chicago.

General News.

The government has sued the New York Central & Hudson River in the Federal court in Buffalo, N. Y., for alleged violation of the twenty-eight hour law, relative to feeding and watering live stock in transit.

The Cincinnati, Bluffton & Chicago has sued the Erie Railroad for $35,000 damages on account of the tearing up of the tracks of the C. B. & C., near Huntington, Ind., on January 12, for which certain officers of the Erie were arrested.

The Illinois Central has announced that 26 new experimental farms will be established along the lines of the system, including 15 at various points on the Central of Georgia. These will make a total of 27 experimental farms on the Illinois Central and 30 on the Central of Georgia.

The result of the strike vote now being taken by the brotherhood of firemen of the eastern roads is not to be made known until February 10. In the meantime, representatives of the conductors' and the brakemen's brotherhoods are now asking some of the principal roads for increases in pay.

A joint "Safety First" meeting will be held in Decatur, Ill., on the evening of January 25, by employees of the Wabash, the Cincinnati, Hamilton & Dayton, the Vandalia and the Illinois Central. C. W. Egan, general claim agent of the Baltimore & Ohio, will deliver an address, illustrated by stereopticon views.

Oklahoma manufacturing institutions have recorded themselves in favor of a workmen's compensation law. The measure probably will follow the Washington law, virtually giving state insurance, based upon the number of dependents rather than upon the earning capacity of the insured.—*Manufacturers' News.*

The state of Texas has begun suit in court against the Gulf, Colorado & Santa Fe, and the Galveston, Harrisburg & San Antonio, to collect penalties aggregating $700,000 for running trains behind time, in violation of the law of that state under which a penalty is imposed if a passenger train is more than thirty minutes late.

The first-aid-to-the-injured car of the American Red Cross Society is going over the Lehigh Valley, stopping at all division and terminal points, and employees are invited to attend lectures and demonstrations by first-aid experts. Two physicians who were pioneers in this form of relief are in charge of the car. Men on other railroads and in nearby manufactories are invited.

The anthracite coal railroads have petitioned the Supreme Court of the United States for a modification of the decree recently issued in which the roads are forbidden to make contracts, with coal operators, to buy their coal at a percentage of the selling price. The roads desire to continue the 65 per cent. contracts with those coal companies to which lands have been leased by the railroad companies.

Representatives of several commercial organizations of Omaha, Neb., held a conference with Vice-president C. G. Burnham, of the Chicago, Burlington & Quincy last week, to protest against the removal of the auditing force from Omaha to new office building in Chicago. It was announced that the company would adhere to its decision to concentrate the statistical force in Chicago in the interest of efficient management.

The principal railroads in Louisiana have filed a suit in court to enjoin the state railroad commission from enforcing its order requiring linen covers to be put on the seats in all passenger cars. The roads say that to provide these covers would cost several thousand dollars in the first place, and would involve a constant large expense for washing and care. The plush seats used are not unsanitary or uncomfortable, and there is no necessity for the linen covers.

Dr. C. G. Elmore has been appointed sanitary inspector of the Chicago & North Western. He is to inspect and inquire into the sanitary condition of passenger cars and stations, and for the present his efforts will be concentrated at Chicago, where he will inspect all cars arriving at or departing from the passenger terminal. He will make detailed reports and will hold

frequent conferences with the foremen of the various coach yards to suggest improved methods.

A dock on which is a coal trestle, at the foot of Erie street, Buffalo, occupied by the Delaware, Lackawanna & Western, and claimed by the government of the United States, was taken possession of by a company of soldiers last Saturday, the Secretary of War having been advised by the attorney-general that the government was the owner of the property and that the railroad company was a trespasser. The land is valued at $1,000,000, and has been a subject of litigation for many years.

An Atchison, Topeka & Santa Fe train leaving Chicago on December 30, 1912, received 887 sacks of mail from Sears, Roebuck & Company, mail order merchants, going to postoffices in the state of Kansas. An extra full baggage car was required to carry this merchandise. While the government receives its full postage revenue from such excess mail, the mail carrying railway does not receive any compensation unless that amount of mail was included in the average ascertained at the last quadrennial weighing.

A wholesale flour dealer of New York City is said to have secured 50 carloads—10,000 barrels—of flour from the Central of New Jersey without having given up the bill of lading, which, according to the way bill, the railroad agent should have demanded. Having put the flour in storage, the merchant at once borrowed on it $28,000; and now he cannot be found. It is said that the railroad clerk who surrendered the flour without securing the bill of lading had also been serving in the capacity of bookkeeper for the flour merchant.

The Delaware & Hudson has increased the pay of shopmen, blacksmiths, machinists, boilermakers and helpers. The increase affects the pay of many hundred employees. The three principal railroads centering in Boston have increased the pay of freight handlers in that city, said to be about 4,000 men altogether. Men heretofore receiving $2.14 a day will now receive $2.30; this for ten hours. The rate for overtime will be increased from 30 cents to 34½ cents an hour. Certain improvements have been made in the working conditions also.

The federal court at New York City has appointed a new grand jury to go over the cases against President Mellen, of the New Haven road, and Chamberlin, of the Grand Trunk, for alleged violation of the anti-trust law, and it is probable that these men, together with Chairman Smithers, of the Grand Trunk, will be again indicted. The indictments reported a few weeks ago were made by a grand jury, one member of which lived in New Jersey, outside the district in which the action was taken, and Mr. Mellen's lawyers have presented the claim that this fact invalidated the indictment against Mellen.

A committee representing locomotive enginemen employed on the Chicago & Alton, has filed a claim for back pay at the rate of 25 cents an hour, in addition to the scale they have received, because of the discovery that they have been for several months running locomotives weighing in excess of 215,000 lbs., the weight on which their pay has been based. Since the contract with the engineers was signed in December, 1911, the Alton has bought a number of heavy mikado freight engines. Recently the weight of the engines was stenciled as 215,000 lbs. The enginemen now demand 25 cents an hour back pay for every trip on which they have run an engine weighing 215,000 lbs. or over, and the company is asked to weigh all of the engines and check up the trips.

George Bradshaw, general safety agent of the New York Central Lines, reports that during the six months ending November, 1912, the number of employees killed, in all branches of the service, on all parts of the New York Central Lines, 58, was 14 less than in the corresponding period of 1911, a decrease of 19.4 per cent. This decrease occurred notwithstanding a large increase in the volume of business done by the roads and a consequent increase in the number of persons employed. Mr. Bradshaw has prepared a table showing the percentages of persons injured in the principal shops of the companies for three months ending with November as compared with the three months immediately preceding; and at practically all of the shops there is a large decrease.

The Northern Pacific has announced the establishment of a department to be known as the Bureau of Efficiency, for the purpose of promoting safety and welfare of employees and of patrons of the company, and to supervise the work of making more effective all efforts for safeguarding persons and property. Charles T. Banks, special representative of the third vice-president, will be in charge of the bureau, with headquarters at St. Paul. The superintendent of each division will act as the local representative to whom employees are asked to offer suggestions and report dangerous conditions or practices. Employees are requested to confer freely with the superintendent on all subjects relating to the prevention of injuries or accidents, and to make suggestions for the improvement of the service for working conditions as they now exist.

If the people of New England want the New England railroad lines to give up their steamship lines to New York City, I am perfectly willing to do so and will accept the best possible bid I can get for the steamship lines. The people and shippers of New England may awaken to find that their shipping facilities and terminals thereby have been diminished and not increased, for with the sale of our steamship lines go half of our terminals in New York City, which half can be reached only by steamers. . . . The New England lines have spent about $20,000 in advertising from Maine to Omaha, and Minneapolis to New Orleans. "Sail from Boston, but first see New England," and I think it is good advertising for the benefit of New England and its railroad lines and for the benefit of all the people in New England.—*C. S. Mellen.*

The strike of the 200 enginemen and firemen of the Bangor & Aroostook, in northeastern Maine, which began January 18, is said to have seriously crippled the freight service of the road. The company announced that it would be able to continue business in spite of the strike; and so far as passengers are concerned seems to have done so with considerable success, but shippers are complaining that freight is seriously delayed. Some of them have gone to the state legislature to try to get assistance in inducing the company and the strikers to arbitrate the complaints of the men. The strikers asked for the same rates of pay as those which were granted recently by the arbitration board in connection with the 54 principal eastern roads, but the Bangor & Aroostook, which was not represented in the committee of 54, replied that it could not afford to pay the rates approved by the arbitrators. At Boston this week it was reported that there had been an advance in the price of potatoes because of the probable shortage of that commodity, in consequence of the strike.

Grand Trunk Extensions.

The lines of the Grand Trunk Railway system in Quebec and eastern Ontario are now connected with the Grand Trunk Pacific west of Winnipeg; and a train load of wheat was sent east on December 27. The Grand Trunk Pacific line is not yet completed for the whole distance, the present connection being made over the Temiskaming & Northern Ontario. The T. & N. O. extends from North Bay northwestward to Cochrane, 253 miles, and the Grand Trunk track has just been finished from Cochrane westward. The G. T. P. is now in operation from Winnipeg westward to Edson, which is 130 miles west of Edmonton, and 923 miles west of Winnipeg.

Transportation Enterprise in Texas.

The record of new railroad construction in Texas was given in the *Railway Age Gazette* of December 27. Of interest also is a record of the extension of electric lines, as gathered by the Commercial Secretaries & Business Men's Association of that state. Interurban companies have built and put in operation 85 miles and graded an additional 143 miles. The new interurban projects now under course of construction aggregate 445 miles, and there are in operation in the state 267 miles. Sixty-three miles of the new construction during the year was in North Texas, while 22 miles was in the southern part of the state. The two leading lines opened during the year are the Dallas-Waxahachie and the Fort Worth-Cleburne line. Both of these lines traverse portions of the most densely populated and best agricultural sections of the state and, as in other states, the electrics lie in sections which already have the best steam railway facilities. But in the southern part of the state the interurban makes its appearance as a pioneer in transportation. A company started there intends to make a living on the shipments of fruits and vegetables which are harvested in that section the

year round. This line will connect the cities of San Benito, Santa Maria, Monte Christo, Mission and Point Isabel.

The following table shows the location and length of Texas interurban lines:

Dallas to Sherman and Denison	76 miles.
Dallas to Fort Worth	35 miles.
Belton to Temple	13 miles.
Bryan to College Station	6 miles.
Galveston to Houston	50 miles.
Fort Worth to Cleburne	32 miles.
Dallas to Waxahachie	31 miles.
San Benito to Rio Grande Valley	14 miles.
Riviera to Riviera Beach	10 miles.
Total	267 miles.

Texas lines now operating motor car service are as follows: Texas & Pacific, Terrell to Mineral Wells; Texas Midland, Terrell to Paris; Gulf, Colorado & Santa Fe, Dallas to Cleburne; Galveston to Beaumont; St. Louis & San Francisco, Brownsville to Sam Fordyce; Brownsville to Mission; Victoria to Bloomington; Victoria to Port O'Connor; Beaumont to Houston; Sherman to Dallas; Quanah, Acme & Pacific, Quanah to Paducah; Quanah to Oklahoma points.

A Kind Word for the Railroads.

There is absolutely no reason why a woman with a tongue in her head need have the least fear or even apprehension about traveling alone. The big railroads are both mother and father to the unprotected female. In the stations are cozy couches on which the weary traveler can rest, and the mother with a fretty baby will be delighted at the sight of the little crib. It is possible almost to take a bath, with the wonderful lavatory facilities. Towels and soap, individual equipments of sanitary value, can be obtained for a nickel each. The matrons at the stations are women of refinement who watch over the women travelers with kindly solicitude. Argus like, they eye the loiterers or the young girls who regard the waiting rooms as good places in which to rouge and powder, until they are gently but firmly chased out.—*Leslie's Weekly.*

Fundamentals of National Efficiency.

I am afraid that neither the public nor the government is awake to the real state of things. In our endeavors to control corporations we too often try to lessen their efficiency instead of increasing it. We are appalled by a railroad accident, and we suggest that every engine should have two engineers instead of one. A fast train runs off the track, and a government officer suggests that people ought not to want to travel so fast. If these views prevail the day of America's greatness is done. A people that believes in divided responsibility and waste of time has no future. For there is competition between nations, whether there be competition within the nation or not. If we are content to take things easily, Germany will be only too glad to get ahead of us.—*President A. T. Hadley.*

A Model Statute Against Trespassing.

In response to a request from the governors or railway commissions of several states that a draft of an appropriate law against trespassing be prepared and submitted for their consideration, President Miller, of the Chicago, Burlington & Quincy, has had drawn up a proposed statute to be submitted to the state authorities. The suggested form for the proposed law is as follows:

"It shall be unlawful for any person to trespass by being upon, going upon or walking along, without right, any railroad track, right-of-way or station grounds.

"It shall be unlawful for any person, not being a passenger or employee, but a trespasser, to get on or off, or to ride upon, any railroad train, car or engine, or part thereof.

"Any person convicted of the violation of either of the preceding sections shall be punished by a fine of not less than $10 or more than $100 or by imprisonment in jail not exceeding thirty days, or both."

The requests for the draft of such a statute were elicited by a letter Mr. Miller addressed last year to the governors of the states traversed by the Burlington urging more stringent legislation against trespassing.

The Special Committee on Relations of Railway Operation to Legislation has issued a bulletin reprinting a portion of the address by C. C. McChord of the Interstate Commerce Commission delivered at Milwaukee on October 1, last, in which he called attention to the need for additional legislation against trespassing, and the article published in the *Railway Age Gazette* of December 20, on "Why 5,000 Trespassers are Killed Yearly."

Full Crew Law Proposed in Illinois.

Some people who have nothing to do with railroading, but who spend a lot of time in meddling with other people's affairs have decided that Illinois should have the "full crew law." Indiana has one and we suppose of course Oregon has one. Oregon has everything that Kansas used to have. The term "full crew" means that a freight train shall have more men connected with it than are necessary to operate it. It is a plan of the union to legislate extra men into jobs. No fair man who has ever given the matter consideration would maintain for a moment that such legislation as the "full crew law" is necessary in Illinois.—*Manufacturers' News.*

A Trip to the Panama Canal.*

The services of our civilians (railroad men, by the way), who initiated our work, are very cordially commended on the isthmus. After getting the work started the transfer of it to the army was no doubt a good move, because it has given stability to the whole affair; the organization and discipline are splendid. This illustrates the value of appointments for life in the army and navy, and of military standards of conduct, instead of the scattering of energy through the temporizing and terrorizing methods connected with governmental work at home in nation, state, county and city. The physical work is a much simpler problem than it was for General Dodge to build the Union Pacific Railroad in 1867-1869, or for the Pennsylvania Railroad Company to get from New Jersey to Long Island under the Hudson river, the East river and New York City, and to build its splendid terminals in New York; and less difficult than to build the subways in New York City.

In computing the value of what we got for the $40,000,000 we paid to the French, our government jots down the stock of the old and inadequate Panama Railroad at $9,000,000, which is nearly $200,000 a mile, and we are spending about $200,000 a mile more to relocate and rebuild most of it. The average capitalization of United States railroads is about $60,000 a mile. The gross earnings of the Panama Railroad are about $92,000 a mile per annum—as against $11,000 a mile average in the United States. The first class passenger rate is five cents a mile and its average rate per ton mile four cents—as against an average of three-fourths of one cent per ton mile in the United States, and when the railroad was threatened with congestion the company simply notified prospective patrons that they would not take any additional business.

The railroads of the United States are spending more every year for improvements, additions and new equipment to take care of expanding business than the whole expenditure in ten years on the isthmus. Two railroad companies alone have invested in terminals in New York City and vicinity in the last few years one-half as much as the entire cost of the canal. The City of New York is spending for a new water supply about half the amount of the canal cost, and you can see this immense work in a very agreeable motor trip from New York City. Please understand that I do not disparage the canal work at all. It is superb. To say anything less would be not only ungracious but unfair. It is well to have enthusiasm, but it is also well to have perspective and it is fruitless to travel if you do not compare this and that, and assemble conclusions, and so I could not forget that our railroads at home also represent the achievements of our own countrymen, who have always hanging over them the burden of sustaining their credit—a spectre unheard of in the Canal Zone.

It is expected that the first boat will be put through the canal about September, 1913, and that they will be ready for general business about a year later. I think that the effect on commerce of the United States, at least for the first few years, has been very much over-estimated by people all over the country. The tonnage per annum which government representatives estimate will go through the canal for the first few years is far less than that which goes through the Soo canal connecting Lake Superior

*From a memorandum by Frank Trumbull.

with Lake Huron; it is not even as much as that now being hauled by the Chesapeake & Ohio Railway. The canal will cost about $375,000,000 and the result of that expenditure is placed without money and without price at the disposal of our coastwise commerce—to compete with the railroads. Outside of any question of violating the integrity of our pledge to other countries (concerning which Great Britain has already filed a protest) the ordinary railroad mind is, perhaps, too dense to perceive why after giving the United States' boats a monopoly of the coastwise commerce as against outsiders, and guaranteeing the canal against all railroad-owned boats, we should also pay the owners of the coastwise commerce lines a rebate. By rebate I mean the remission of tolls. The practical effect of this "special privilege" is, of course, to increase the burden on other commerce, or to increase the deficit from year to year in the interest account and maintenance and operating cost of the canal—a deficit which must be made up out of the public purse by taxation. Part of the latter is paid by the railroads through the federal income tax, and, indirectly through the protective tariff, and part by the people of States like Iowa, Kansas and Montana, far away from the seacoast, who would perhaps be glad to have more railroad employees. Query: Why are railroads expected to be self-supporting and the canal not expected to be? The interest and cost of maintenance and operation of this 50-mile canal will at first amount to at least one dollar per ton of steamer contents. The Chesapeake & Ohio Railway furnishes the equivalent of a canal in the shape of a highway across the Allegheny mountains, and besides, carried the freight itself in its own vehicles an average distance of 256 miles for $1.04.

School Children Warned.

The St. Louis & San Francisco has addressed to school principals in every important town in its territory, a statement showing that in the years 1901 to 1910, inclusive, 103,452 trespassers were killed or injured on the railways of the United States, of which 13,000 were under the age of 14 and 20,600 were between the ages of 14 and 21. The principals are requested, in the interest of the physical welfare of their pupils and for their educational value, to read these statistics to the children with such comments as the principals may see fit to make, and, if possible, to post these figures in conspicuous places. It is further suggested, in order to impress upon the children the injury done to the communities as well as the individual victims and their families and the importance and value of the exercise of care, that the children be requested to write essays upon "Safety First" and particularly upon the dangers of trespassing upon railroad property, either by walking on the track, playing in the yards, or riding moving trains.

Report on Irvington Collision.

The Interstate Commerce Commission has issued the report of Chief Inspector H. W. Belnap on the butting collision between a passenger train and a freight which occurred on the Cincinnati, Hamilton & Dayton at Irvington, within the limits of the city of Indianapolis, Ind., November 13, about 3 a. m., resulting in the death of 11 passengers and four employees and the injury of six passengers and five employees. Westbound passenger train No. 36 ran over a misplaced switch, and into the head of an eastbound freight train standing on a side track. The principal points in this report are given in a condensed form in our editorial columns. The conclusions of the inspector are that engineman Yorke, of the freight, failed to close the switch or to make sure that it had been closed; that brakeman Gross is equally responsible, he having failed to see that the switch was closed and also erroneously stated that the switch had been closed, when asked about it. Yorke also exercised poor judgment in calling in the flagman before the switch had been closed. The conductor and both brakemen displayed a lack of alertness in not relighting the switch. In conclusion the report says:

"Measures should at once be taken to provide that switch lamps be kept burning at night, and that employees be required to obey the rules in the absence of a switch light. In addition to reporting switch lamps found not burning, any employee who uses switches at night on which the lamps are not burning should be required to light them.

"It cannot be considered safe practice to require or permit a train to be operated over a busy railroad by a crew all of whom on the head end of the train are inexperienced or new men; and in all cases where newly promoted enginemen are used an experienced fireman should be furnished.

"The tonnage rating of engines should be fixed so that an engine can haul a train over the road without being required frequently to double hills. When trains are required frequently to double hills, the attention of employees, anxious to make reasonable time and to avoid delaying other trains, is diverted from their usual duties, and ordinary precautions are overlooked. Under these circumstances there are unusual opportunities for disastrous errors to occur.

". . . Had automatic block signals, or any form of signals employing continuous track circuits, been in use the open switch would have been indicated by such signals and, had they been obeyed, the accident would have been averted."

The Railway's Share of the Cost of Living.

Secretary Wilson shows that the proportion of the consumer's price that goes to the retailer as his compensation for delivering milk from the railway station to the residence of the consumer is more than six times as great as that received by the railway for carrying it from the dairy station to the city. When the farmer receives fifty per cent. of the consumer's price, the freight charge on butter is about five-tenths of one per cent. of the consumer's price; on eggs, six-tenths of 1 per cent.; apples, 6.8 per cent.; beans, 2.4 per cent.; potatoes, 7.1 per cent.; grain of all sorts, 3.8 per cent.; hay, 7.9 per cent.; cattle and hogs, 1.2 per cent.; live poultry, 2.2 per cent.; wool, three-tenths of one per cent. These percentages given by the Secretary are averages for the United States and, of course, do not hold good as to all shipments of the commodities mentioned, as there would necessarily be wide differences due to variations in the distances shipped and to other circumstances. They demonstrate, however, that, generally speaking, railway freight charges are relatively a small factor in the margin between the price received by the farmer and that paid by the consumer, and that the greater proportion of this margin goes to those who handle the products after they leave the hands of the carrier.—*W. W. Finley.*

The Train Despatchers of New York Harbor.

[*From The New York Sun.*]

One of the most serious things that could happen to New York would be to have the marine departments of its railways tied up for twenty-four hours; it would start a famine. The railroad fleet of tugs, lighters, barges and car floats numbers more than 2,000 craft. They carry from one land terminal to another about nine-tenths of all the freight that comes into and goes out of New York, or 10,000 cars daily. The movements of the units of this fleet are as carefully timed and regulated as the progress of the trains that bring the merchandise into the terminals at Jersey City, Hoboken and Weehawken.

Most of New York's daily supply of food lands at the docks during the night and is distributed by breakfast time. One day last winter when a gale blew at from seventy to ninety miles an hour for a long time the boats had a severe time.

The tugboats have engines of from 1,200 to 1,500 horsepower. The boilers carry a steam pressure of more than 185 lbs. The tugs, car floats, steam lighters and other craft that bustle about on the water day and night seem to move with as little system as a hansom cab, but as a matter of fact, you could look at a marine despatcher's sheet and, if you knew how to read it, you could tell within a few hundred feet just where each tug and each barge or lighter or float was at any moment of the day or night.

The marine despatcher has not the same worries as the despatcher on a single track line ashore. He doesn't have to bother especially about sidings and meeting points. But he has plenty to worry about just the same. The manufacturing industries around the harbor are just as fussy about getting their freight on time as they would be if they were waiting for it inland. All the big railroads have their chief despatchers tucked away some distance from the docks. Though the rivers are out of sight the chief despatcher carries their courses in his mind's eye, and issues his orders over the telephone to his assistants along the docks. He can get into communication instantly with the road's general offices, with all its freight stations in the city and with a score or so of

his assistant tug despatchers at the river ends of the railroad freight piers. The despatchers in this department, like all other train despatchers, work in three tricks of eight hours each. Night and day, year in and year out, their offices are always open and always busy.

The chief despatcher gets word from some point a hundred miles inland, for instance, that ten carloads of apples, say, are coming in a certain freight train. These apples must be at a certain pier on the North River by 1 a. m. The shipper and the consignee have impressed on the general freight agent that they expect those apples to bring a fancy price because the market is bare. . . . Finally the train is reported within a few miles of the New Jersey terminal. The chief despatcher calls up one of his assistants along the waterfront. He knows that an especially swift and powerful tug is due to pass close to there in a few minutes and will ask for orders.

The assistant runs up the signal lights. The night is rainy and a heavy fog is creeping over the river. A man with a megaphone stands on the pier end. Suddenly he hears a hoarse shout from somewhere out in the murk. It is the tug asking for orders. A moment more and he sees the shadowy bulk a hundred feet away, steaming slowly. He megaphones his order to the captain to go to such and such a pier. . . . Only when the tugs change crews—the boats themselves are in service night and day—do they tie up at the piers. They get all their orders on the run, through flags and signal boards by day, through varicolored lanterns by night and through the megaphone when the visible signals will not give complete enough instructions. . . . In less than five minutes from the time the train halted in the yard the ten cars of apples are aboard the car float. In twenty minutes more they are across the North River alongside the pier. . . . When the weather is fine and the winds are still the despatchers can smoke their pipes tranquilly, but when fog or snow blots out the shore lights and those on the water the telephone and the telegraph chatter incessantly and feverishly. The men are tired out when their eight-hour trick is done.

The most trying time that New York's railroad fleet ever knew was one day and night last winter, when it had to battle with a hurricane. Never before had such a storm been known or had navigation been so difficult. For a time the wind blew at the rate of ninety miles an hour. There was no rest for the men in the boats or the men ashore while that storm lasted. Moving the heavy floats across the water was slow and perilous work. The cakes of ice that were hurled against the river craft were a foot thick, but the gale tossed them about like shavings. It was bitter cold, and the boats and men were sheathed in ice. Every tug that the railroads had was pressed into service and toiled under a full head of steam. New York's day's rations were landed at her water gates at the usual hours between midnight and morning. The general public was not aware that anything unusual had been done, but the railroad men, from the general managers in their offices down to the stokers with aching backs and tired eyes, agreed that that bit of work was the greatest triumph of marine railroading. New York lives from hand to mouth as regards both fuel and food.

Firemen's Wages.

Railroad officers are generally willing to concede that the firemen's work has been largely increased in recent years; but in many instances the railroads have already voluntarily increased the pay since the introduction of Mikado locomotives. In some cases firemen are relieved at 75 miles, while at the same time drawing pay for 100 miles. On another road firemen's wages on Mikado locomotives have been advanced to $3.25 per day, where formerly they were $2.95 on all engines. The chief of the firemen's brotherhood, however, objects to any arrangement whereby a fireman is relieved at 75 miles in the middle of a division of perhaps 150 miles in length on the reasoning that it deprives a man of an opportunity for making overtime. He, therefore, demands two firemen to lighten the work, for which he expects the railroads to pay them two full days' wages. The railroads cannot see any reason in this.

"The whole question," said one general manager, "is simply one of unionism versus right or equity. Carter wants two firemen on all heavy engines because it will increase the membership of his organization. The trainmen's organizations have been instrumental in enacting the full crew bill because it adds another member to their organization for each train. Neither of these organizations will allow the extra man on the train to serve as a general utility man. The railroads would be willing to accept the full crew bill requirements if the extra man could be utilized to help the fireman, or if the extra firemen at times could help the train crew. But the men's duties have to be defined in order that there may be no uncertainty as to which union they are eligible to join.

"The railroads would be willing to put a day laborer on all locomotives to relieve the firemen. It takes no particular intelligence to shovel coal. Again the unions will not permit this. The extra man on the engine must be a firemen and draw a fireman's wages. We general managers are sometimes at a loss to know where our authority begins. We are beginning to realize where it ends."—*Wall Street Journal.*

American Institute of Consulting Engineers.

The annual meeting of the American Institute of Consulting Engineers was held on January 14, in New York. Prof. George F. Swain, of Harvard University, addressed the meeting on the subject of Education. The address was followed by a discussion in which Rudolph Hering, General C. A. Bingham, Prof. Gardner F. Williams of Ann Arbor, Mich., and Frank J. Sprague took prominent parts.

National Railway Appliances Association.

All railway officers who would be interested in the exhibits will this year receive a special invitation in the form of the association's year book, published this year for the first time, 8,000 copies of which will be distributed among all classes of railway officers, and not 3,000 copies, as mentioned in last week's issue.

Railway Supply Manufacturers' Association.

The assignment of space for the exhibits which will be held in connection with the Master Mechanics' and Master Car Builders' conventions at Atlantic City next June, will take place on February 14 and not on February 11, as mentioned in last week's issue.

MEETINGS AND CONVENTIONS.

The following list gives nomes of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday in March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufactureres' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Enginfering Contractors.—J. R. Wemlinger, 13 Park Row, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussells, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, Chicago & North Western, Escanaba, Mich. Next convention, July 22-25, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCES' ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—G. H. Frazier, 10 Oliver St., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in montb, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York, convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

A bill has been introduced in the Minnesota senate prohibiting railways from making lower rates per mile for mileage tickets than for regular tickets.

George J. Charlton, passenger traffic manager of the Chicago & Alton, has been re-elected chairman of the executive committee of the Western Passenger Association.

Professor P. G. Holden, director of agricultural extension of the International Harvester Company, addressed the Traffic Club of Chicago at a luncheon on Tuesday, January 21, on the subject of "Greater Efficiency in Agricultural Production."

The Lehigh Valley reports that the quantity of milk carried in the cars of that road to New York City during the year 1912 was considerably larger than in 1911, the total number of cans being 1,821,522, an increase of 60,864 cars. The volume of this traffic is steadily increasing.

The National Industrial Traffic League has established permanent headquarters at Chicago, with offices in the Tacoma building. D. B. Chindblom, who has been assistant to H. C. Barlow, traffic director of the Chicago Association of Commerce, has been appointed assistant secretary of the league, and will be in charge of the office.

At the annual meeting of the Illinois and Iowa Demurrage Bureau, held at Peoria, on January 14, a resolution was passed recommending an increase in demurrage rates in Illinois for the purpose of promoting increased car efficiency by reducing undue detention of cars by shippers. William Rotchford, of Peoria, was re-elected manager.

For seven days—from January 25 to February 1—the Texas & Pacific will run an agricultural inspection train starting at Port Allen, La., and stopping at nineteen of the largest towns on the road in Louisiana. The lectures will be managed by the Louisiana State University, the State Department of Agriculture and the United States bureau of Farm Demonstration.

The annual report of the Suez canal shows that during the year 1912 the number of vessels passing through the canal was 5,373, and the receipts 135,720,000 francs ($27,145,000), an increase over the preceding year of 404 vessels, and an increase in receipts of 1,710,000 francs. Since the beginning of the present year the rate of toll charged vessels passing through the canal has been reduced to 6¼ francs per ton.

Representatives of the Transcontinental Freight Bureau held a conference with representatives of shippers for several days last week at Chicago at the suggestion of the Interstate Commerce Commission, for the purpose of adjusting differences in connection with a new tariff advancing many of the transcontinental freight rates which had been suspended by the commission. An agreement was reached on a large majority of the disputed points.

The Chesapeake Steamship Company is building two new steamers for its line between Baltimore, Md., and West Point, Va., and when these are finished, trips will be made every day between these two places. In connection with the expected increase in traffic, the Southern Railway is making extensive improvements on its track between Richmond and West Point, replacing with heavier rails all of the old 54-lb. and 60-lb. rails now in use.

The New York State Superintendent of Public Works reports that the aggregate amount of freight carried on the canals of the state during the past year was 2,606,116 tons, which was about 500,000 tons less than in 1911. Of the tonnage during the past year, only about one-fifth was through freight. The number of boats using the canals is diminishing and seems likely to continue to diminish until the completion of the barge canal, when larger vessels can be used.

The Local Freight Agents' Association of Chicago has issued a circular addressed to shippers, calling attention to the large amount of losses to shippers and railways through damage to freight because of improper packing and marking, and the use of inadequate containers. The Chicago Association of Commerce has organized a special committee, including representatives of railways, transfer companies and shippers, to make an

investigation of the subject and ascertain the prevalence of any condition which requires preventive measures.

Representatives of the principal commercial associations of Illinois have adopted resolutions expressing an appreciation of the work of the Illinois Railroad & Warehouse Commission in bringing about harmony between the railways and shippers, and expressing the wish that if the board cannot be re-appointed by the incoming Democratic administration the new board to be appointed will emulate the example which has been set. The resolutions were signed by the Chicago Association of Commerce, Wholesale Grocers Exchange, Business Men's League of St. Louis, Bloomington Chamber of Commerce, Manufacturers' & Shippers' Association of Rockford, Peoria Commercial Club, Quincy Freight Bureau, and several large corporations, and were concurred in by the Illinois Freight Committee representing the railways.

As a result of the protest of several business men's associations on account of the increase in single trip suburban fares on the Illinois Central in Chicago to two cents a mile on January 1, the corporation counsel of Chicago has submitted an opinion that the city has the power to regulate suburban fares on steam roads within the city limits. On Saturday, January 18, representatives of the protesting organizations appeared before a meeting of the local transportation committee of the city council, which appointed two sub-committees, one consisting of three aldermen and six business men to negotiate with the Illinois Central for a restoration of the old fares, and the other a committee of aldermen to investigate suburban rates on all roads entering the city with a view to the passage of an ordinance prescribing maximum rates. John G. Drennan, district attorney, represented the Illinois Central at the meeting and contended that the city has no jurisdiction over the railroad rates, which are fixed by the state.

Traffic Club of Chicago.

The speakers for the sixth annual dinner of the Traffic Club of Chicago, to be held in Chicago on January 28, will be as follows: James Hamilton Lewis, John H. Atwood and Wilbur D. Nesbit. George A. Blair, general traffic manager of the Chicago & Alton, will act as toastmaster.

Traffic Club of New York.

At the regular monthly meeting of the Traffic Club of New York, which was held on January 21, instead of January 28, Franklin Matthews delivered an illustrated lecture on Panama, Its Canal and Romantic History.

Car Location.

The accompanying table, which is taken from Car Location, bulletin No. 1-A, of the American Railway Association, gives a summary of the location of freight car equipment by groups on November 30, together with surpluses and shortages on the same date.

Car Balance and Performance.

Arthur Hale, chairman of the committee on Relations Between Railroads of the American Railway Association, in presenting the statistical bulletin No. 136, covering car balance and performance for September, 1912, says:

The miles per car per day for September was 24.4, an increase of .1 over August, 1912. This figure for September, 1911, was 23.8.

Ton miles per car per day was 396 in September, 1912, compared with 385 in August, 1912; this is an increase of 7.61 per cent. over the figure for September, 1911, which was 368.

The proportion of home cars on line was 53 per cent. compared with 56 per cent. in August. This figure for September, 1911, was 64 per cent.

There is an increase of 28 per cent. in the percentage of loaded car mileage, compared with August, 1912. This figure for September, 1911, was 71.2 per cent.

The average earnings per car per day were $2.73, compared with $2.60 in August. There is an increase of 6.23 per cent. over the earnings for September, 1911, which were $2.57.

The table on the following page gives the car balance and performance in the month covered by the report and the diagram shows car earnings and car mileage and different car performance figures monthly from July, 1907.

INTERSTATE COMMERCE COMMISSION.

The commission has decided that all bridge companies whose bridges are used by interstate carriers shall make owners' reports to the commission.

The commission has suspended from January 10 until May 10 an item in a supplement to the tariff of the Chicago Great Western, which advances from $3 to $5 per car the switching charge at Faribault, Minn.

The commission has further suspended from January 18 until July 18, the supplements to certain tariffs, which advance rates for the transportation of grain between points in the state of Iowa and Chicago and other points.

The commission has further suspended from January 4 until May 3 certain items in supplements to Leland's tariff, which advance rates for the transportation of sand and gravel from points in Louisiana to points in Texas.

The commission has further suspended from January 4 until May 3 certain items in tariffs, which advance rates for the transportation of tin plate and sheet metal from eastern shipping points to points in Oregon, Washington, and other destinations.

The commission has further suspended from January 11 until July 11 certain schedules in certain tariffs, which contain advances in rates for the transportation of newsprint paper from Sault Ste. Marie, Ontario, to various points in the United States.

Car Location on November 30, 1912.

Freight Car Mileage, Earnings and Performance, 1907 to 1912.

The commission has further suspended from January 8 until July 8 certain schedules of the tariff of the St. Louis & San Francisco, which made changes in the rules governing the concentration and re-shipment of cotton and cotton linters at Memphis, Tenn.

The commission has vacated its order of suspension in the proceeding, which involved advances in rates for the transportation of cotton linters from points in Texas to points in Minnesota and Wisconsin. The carriers have now withdrawn the advanced rates.

The commission has suspended from January 15 until May 15 schedules in certain tariffs which advance from 50 cents per net ton to 60 cents per net ton rates for the transportation of cement in carloads from Nazareth, Pa., and other points to Phillipsburg, N. J., and other points.

The commission has suspended from January 10 until March 31 an item in a supplement to the tariff of the Chicago, Burlington & Quincy, which cancels joint rates with the Chicago, Zeigler & Gulf for the transportation of petroleum oil and its products from Whiting, Ind., to Zeigler, Ill.

The commission has suspended from January 8 until May 8, certain schedules in the tariff of the Missouri Pacific, which advance rates for the transportation of soft coal and soft coal briquettes from southern Illinois mines to stations on the Gould Southwestern Railway in Arkansas.

The commission has vacated as of January 28 its order of suspension in the proceeding in which the original order suspended advances in class rates from stations on the Kansas City Southern to Topeka and Lawrence, Kansas. The carriers have withdrawn the proposed advances and restored the former rates.

The commission has vacated the suspension order in the proceeding which involved advances in rates for the transportation of cottonseed from points in Oklahoma to Kansas City, Mo., and other points. The carriers have filed tariffs which withdraw the advances under suspension and restore the rates formerly in effect.

The commission has suspended from January 21 until May 21 an item in the tariff of the Southern Pacific which advances from 50 cents per ton to $1.30 per ton the rate on oranges in carloads from Folsom, Cal., to Brighton, Cal. This local rate is used in combination with the rate from Brighton to make a through rate to the interstate points.

The commission has vacated the suspension order entered in the proceeding which involved advances in rates for the transportation of mixed shipments of hay, rice straw, straw, grain and grain products between Memphis, Tenn., and points in Arkansas. The carriers have withdrawn the advances under suspension and restored the previous rates.

The commission has suspended from January 15 until March 31 items in certain tariffs which advance export rates on lumber and articles taking the same rates in carloads from Alexandria, La., to New Orleans, La., from 7 to 9 cents per 100 lbs., and it has also advanced the lumber rates from points in Arkansas, Louisiana and Texas to St. Louis, Mo., and other points in Illinois.

The commission has vacated the suspension of tariffs involved in the proceeding which related to new regulations and practices governing the handling of hay and straw at the Thirty-third Street station of the New York Central & Hudson River and at the Thirty-sixth Street station of the West Shore, in New York. The carriers have filed tariffs which restore the old regulations and practices, and the commission has therefore vacated the proceeding.

The commission has suspended from January 15 until March 25 supplement 1 to Beck's tariff, which advances the rate for the transportation of freight from western points to stations in Rhode Island on the line of the Rhode Island company. Heretofore points on that line have taken the Boston rate basis. The suspended tariff provides for application to points on this line of arbitraries above the Boston rate basis, ranging from 3 to 8 cents per 100 lbs. on several classes of freight.

The commission has suspended from January 11 until May 10 a supplement to the tariff of the Kansas City Southern. The present tariffs of the Kansas City Southern provide for refrigeration of shipments of strawberries between points on its line, including transportation from southwestern Missouri points to Topeka, Kan., of shipments of 10,000 lbs. or more. The suspended supplement withdraws the privilege as to lots of 10,000 lbs. and provides for refrigeration only on carload lots.

The commission has suspended until April 30 certain items in Countiss' tariff which provide for cancellation of an existing route on class and commodity freight including lumber and fruit from points west of Huntington, Ore., via the Oregon-Washington Railroad & Navigation Company in connection with the Atchison, Topeka & Santa Fe; Chicago, Burlington & Quincy; Chicago, Rock Island & Pacific, or the Missouri Pacific from points in Oregon via Denver or Pullman to eastern points.

The commission has suspended from January 1 until May 1, an item in a supplement to the tariff of the Delaware & Hudson, which eliminates the present milling-in-transit privileges on corn milled or mixed at Oneonta, N. Y., and destined to stations on the Boston & Maine. The effect of the item which has been suspended would be to require payment of local rates into and out of Oneonta on corn milled at that point and destined to Boston & Maine stations instead of the existing joint through rate from point of origin to Boston & Maine stations. On the traffic involved this would result in advances ranging from 6 to 13 cents per 100 lbs.

The commission has suspended from January 21 until May 21 certain items in a supplement to the tariff of the Illinois Central which canceled joint rates for the transportation of lumber from points in Mississippi on the Gulf & Ship Island Railroad and New Orleans Great Northern Railroad to trunk line territory, leaving combination rates to apply. The existing rates from points on the Gulf & Ship Island and New Orleans Great Northern are 33 cents to New York, 31 cents to Philadelphia and 30 cents to Baltimore. The application of a combination of local rates would result in an advance of 50 cents to the points named and in similar advances to other points in trunk line territory.

The Interstate Commerce Commission is to make a general investigation of the telephone business throughout the United States. The attorney-general of the United States has recently considered the question of proceeding against the telephone companies under the anti-trust law, but has decided not to do so; and he has sent to the Interstate Commerce Commission the facts which he has gathered. The attorney-general says that there are about 20,000 independent telephone companies in the country, operating about 4,000,000 telephones; this in addition to the 4,500,000 instruments of the American Telephone & Telegraph Company. Independent companies have asked the department of justice to proceed against the American company, but the attorney-general seems to have found no cause for taking such action.

Reparation Awarded.

Lafayette Taylor v. Norfolk & Western. Opinion by Commissioner Harlan:

The former rate of $1.20 a ton for the transportation of coal from the Thacker and Kenova coal fields of West Virginia to Barden, Ohio, was found to have been unreasonable, and reparation was awarded on the basis of the subsequently established rate of $1. The latter rate, also complained of as unreasonable, was found not to have been excessive. (25 I. C. C., 613.)

Elevator Decisions.

In the matter of Keystone Elevator Company. Opinion by Commissioner Lane:

The commission ordered the Pennsylvania Railroad to cease and desist from leasing the elevator property located at North Philadelphia, Pa., to the Keystone Elevator & Warehouse Company so long as the stockholders of the latter are owners wholly or in part of the property passing through this elevator, and also to cease from paying any allowance for terminal services to this elevator company upon any property passing through the elevator belonging wholly or in part to any stockholder of said elevator company, unless such railroad's published tariffs

shall at the same time offer such allowance to all other shippers using said or any other elevator in the city of Philadelphia. (25 I. C. C., 618.)

Empty Barrel Rates Increased.

Classification of Empty Barrels. Opinion by Commissioner Lane:

The advance objected to is change in the rating of empty tight cooperage barrels in carloads in southern classification from sixth to fifth class. The commission found that the carriers have justified the proposed advance, and the order of suspension will be vacated. (25 I. C. C., 641.)

Grain Rates Unreasonable.

Wichita Board of Trade v. Atchison, Topeka & Santa Fe, et al. Opinion by Commissioner Lane:

The complainant asks that the joint rates on grain and grain products from points in Kansas on the Union Pacific to points in Texas via the Atchison, Topeka & Santa Fe and via the Chicago, Rock Island & Pacific be reduced to the basis of rates prescribed by the commission in *Farmers, Merchants & Shippers Club v. A., T. & S. F.*, 12 I. C. C., 351, to apply on grain from points in Kansas on the Atchison, Topeka & Santa Fe and the Chicago, Rock Island & Pacific to points in Texas. The commission found that the present case is not controlled by the case cited. The rates attacked, however, are found to be unreasonable in so far as they exceed rates made on the basis prescribed in the above case with an arbitrary added to allow for a two-line haul. The carriers will be given an opportunity to publish and file such rates. No order will be entered at this time. (25 I. C. C., 625.)

STATE COMMISSIONS.

The Pennsylvania State Railroad Commission has investigated the freight rates on coal from the Clearfield region to Lancaster, and to points between Harrisburg and Lancaster, and recommends that they do not exceed $1.40 per gross ton.

The Nebraska Railway Commission, in its annual report, recommends legislation extending the commission's power to include the awarding of reparation in cases where rates are found to be excessive or discriminatory, to provide that no new tariff or freight classification may be made effective until approved by the commission, and to provide for the punishment of shippers, railway officials or employees guilty of false billing of freight.

The annual report of the Oregon railroad commission recommends legislation giving the commission power similar to that possessed by the Interstate Commerce Commission to suspend proposed advances in rates pending an investigation, and placing the burden of proof to sustain the reasonableness of such rates upon the carriers. The commission also repeats its previous recommendation for legislation giving the commission power to regulate the issuance of securities of public service corporations and asks authority to prevent the construction of grade crossings.

The New York State Public Service Commission, Second district, reports that shippers of fruit and vegetables, in the fruit district south of Lake Ontario, deal unfairly with the railroads. Delays in shipments are numerous. Market conditions in the fall of the year are uncertain and the prices are constantly changing, so that the situation fluctuates with great violence from day to day. The inability of the railroads to furnish cars results in what is usually termed "car shortage"; but a thorough investigation was made during the past shipping season, and it was found that a considerable number of shippers seem to think that they had the right to use cars as warehouses for any length of time they might see fit. The commission tells them that this is not only a wrong to the railroad, but a greater wrong to other shippers, who are thereby deprived of cars. The commission has frequently remonstrated with shippers, but the practice continues. During the month of November, the commission found 122 cases where cars were held for periods of from 5 to 25 days idle upon sidetracks, and gives a list of these in full in its report. It has also discovered 9 cases in September, 23 in October, and 30 in December.

COURT NEWS.

In the federal court at Macon, Ga., on January 18, the grand jury reported indictments against the Seaboard Air Line for violation of the law in the transportation of coal from Briceville and Oliver Springs, Tenn., to Helena, Ga. The coal came from points on the Southern Railway, and the government charges that it was billed through on a joint rate to points beyond where it was actually unloaded; so that the Seaboard secured a considerable part of the amount paid for transportation when it should have received little or nothing.

In the federal court at Boston the grand jury has returned two indictments against the New York, New Haven & Hartford for illegal transportation of milk from points in Connecticut to Boston. The company is charged with carrying milk cheaper for certain shippers than for others. The officers of the road say that the indictments are based on a question of interpretation of the language of tariffs which have been in effect ten years; also that the practice now complained of has been open and uniform during this time. The alleged offenses took place more than two years ago.

In the federal court at Buffalo, N. Y., the Grand Trunk and its general agent, Frank P. Dwyer, have been indicted for conspiracy to violate Section 6 of the Interstate Commerce law, in connection with the transportation of theatrical companies from Detroit to Buffalo, and from Buffalo to Toronto. The indictment charges that by means of a contract which ostensibly was for advertising in the programs of theaters rates for transportation of theatrical companies were unreasonably reduced. The contract for the season of 1910-1911 called for monthly payments by the Grand Trunk of $300, a sum grossly in excess of the true value, the amount of which was reached by deducting one-quarter of a cent a mile from the regular published rate. The facts in this case are similar to indictments recently returned in Chicago against the New York Central Lines, upon which a plea of guilty was entered and a fine of $40,000 paid by the carriers.

Commerce Court Overruled.

The Supreme Court of the United States, in a decision by Justice Lamar, in the case involving rates on freight from New Orleans to certain cities in Alabama, ordered reduced by the Interstate Commerce Commission, has sustained the Commerce Court in its opinion that the court may consider the question whether, in a given case, the commission has called for, secured or heard the evidence with due care and fulness; but holds that in this case the Commerce Court was wrong in deciding that the commission had neglected material evidence. The government attempted to establish in the commission a right to make rates without substantial evidence being presented at a hearing to show the unreasonableness of rates about to be replaced. The court decided that in making rates the commission could not rely on information gathered in investigations by itself, but must base them on evidence presented at a hearing where the railroads would have an opportunity to present their side. Justice Lamar quoted the government's contention that the Hepburn law in providing that rates should be set aside if, after a hearing, the commission should be of the opinion that the charge was unreasonable, meant that the commission's findings as to unreasonableness of rates were not subject to review by the courts; and in reply pointed to that clause in the law which required a "full hearing" to be accorded. The universal course of decisions in this country is that an administrative order by the government is void if issued without a hearing, or if the hearing was inadequate or unfair. On the government's further contention that Congress required the commission to obtain information to enable it to perform its duties, and that, therefore, when it issued an order, it was presumed to have obtained information to support its findings, Justice Lamar said:

"Such a construction would nullify the right to a hearing, for manifestly there is no hearing when the party does not know what evidence is offered or considered, or is not given an opportunity to test, or explain, or repudiate it. The information gathered may be used as the basis for instituting prosecutions for violations of the law and for many other purposes, but is not available as such in cases where the parties are entitled to a hearing."

Railway Officers.

Executive, Financial and Legal Officers.

H. V. Wallace has been appointed co-receiver with the Continental Trust Company, Denver, Colo., of the Denver, Laramie & Northwestern, in place of Marshall B. Smith, resigned.

C. A. Goodnow, assistant to the president of the Chicago, Milwaukee & Puget Sound, has been appointed assistant to the president of the Chicago, Milwaukee & St. Paul, with office at Chicago.

Tilghman B. Koons, whose election as vice-president and freight traffic manager of the Central of New Jersey, with headquarters at New York, has been announced in these columns, was born May 29, 1852, at Treichlers, Pa. He began railway work as a telegraph operator on the Delaware, Lackawanna & Western in 1872, and in the early part of 1873 went to the Lehigh Valley as clerk in the general freight agent's office, at Mauch Chunk, Pa., remaining with that road until 1879, when he resigned on account of ill health. In the later part of 1880 he went to the Central of New Jersey as soliciting freight agent, with headquarters at Elmira, N. Y. From 1887 to 1898 he was successively general agent, division freight agent and division freight and passenger agent, with office at Mauch Chunk, Pa. In September, 1898, he was made general freight agent at New York, and on December 23, 1902, was appointed freight traffic manager, which position he held until his recent election as vice-president and freight traffic manager of the same road. Mr. Koons has been in the continuous service of the Central of New Jersey for the past 33 years.

T. B. Koons.

George L. Peck, who, on January 1, became fifth vice-president of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., as already noted in these columns, was born July 10, 1858, at Sandusky, Ohio, and was educated in the public schools. He began railway work in June, 1873, with the Northwestern Ohio, now a part of the Pennsylvania Lines, and from July, 1876, to February, 1881, was chief train despatcher for the Pennsylvania Lines at Toledo, Ohio. He was then until December of that year a train despatcher for the Columbus, Hocking Valley & Toledo, and was chief train despatcher on the Pennsylvania Lines at Toledo from the latter date until March, 1882, when he became trainmaster of the Toledo division. In April, 1894, he was promoted to superintendent of the Richmond division, and in January, 1896, was transferred to the superintendency of the Pittsburgh division. Mr. Peck was appointed general superintendent of the Southwest System, with headquarters at Columbus, Ohio, on January 1, 1901, and in June of that year became general manager of all Pennsylvania Lines West of Pittsburgh, which position he held until he was elected fifth vice-president in charge of the transportation department, as above mentioned.

G. L. Peck.

Percy R. Todd, vice-president of the Bangor & Aroostook, with office at Bangor, Me., has been elected president, succeeding Arthur Holland, resigned. Mr. Holland remains as chairman of the executive committee of the board.

Walter E. Hackett has been appointed treasurer of the Chicago, Kalamazoo & Saginaw, the Detroit & Charlevoix, the Detroit Terminal Railroad and the Toledo Terminal Railroad, and has also been appointed local treasurer of the Michigan Central, the Toronto, Hamilton & Buffalo and the Detroit River Tunnel Company, with headquarters at Detroit, Mich., succeeding John E. Griffiths, deceased.

Operating Officers.

Y. M. Martin has resigned as trainmaster of the Missouri, Kansas & Texas at Waco, Tex., to engage in business at San Antonio, Tex.

W. D. Danley has been appointed superintendent of the transportation department of the Chicago, Peoria & St. Louis, with headquarters at Springfield, Ill., effective January 13.

C. E. Cate has been appointed assistant superintendent of the Sonora division of the National Railways of Mexico, with headquarters at Empalme, Sonora, Mex., succeeding C. J. Anderson, promoted.

Frank M. Lucore, assistant to the general agent of the American Railway Association, with office at Chicago, has been appointed assistant general manager of the Sunset-Central Lines of the Southern Pacific Company, in charge of distribution of equipment, with headquarters at Houston, Tex. Mr. Lucore was born April 12, 1869, and was educated in the common schools of Nebraska. He began railway service in 1888 as a clerk in the car accountant's office of the Burlington & Missouri River, and was subsequently to January, 1898, chief clerk in the same office. He was then acting car accountant until June, 1899, when he was made car accountant of that road. He was appointed assisting car accountant of the Chicago, Burlington & Quincy, with headquarters at Chicago, on July 1, 1903, where he remained until he became assistant to the general agent of the American Railway Association in the spring of 1907. This position he now leaves to go to the Sunset-Central Lines of the Southern Pacific, as above noted.

F. M. Lucore.

C. S. Ruttle, superintendent of the Detroit, Bay City & Alpena, has been appointed general superintendent, and will continue as general freight and passenger agent, with headquarters at Bay City, Mich. A. C. McDaniel, auditor and car accountant, has been appointed superintendent also, with office at Bay City.

Mott Sawyer, superintendent of the Bellingham Bay & British Columbia at Bellingham, Wash., has been appointed superintendent of the Columbia division of the Chicago, Milwaukee & St. Paul, with headquarters at Malden, Wash., the former road having been purchased by the Chicago, Milwaukee & St. Paul.

S. H. Charles, trainmaster of the Missouri, Kansas & Texas at Parsons, Kan., has been appointed superintendent of the

Oklahoma district, with headquarters at Oklahoma City, Okla., to succeed W. E. Brown, resigned. Mr. Charles is succeeded as trainmaster by C. I. Evans, road foreman of engines at Parsons. Effective January 15.

A. B. Ramsdell, superintendent of the St. Louis division of the Chicago, Rock Island & Pacific, at Eldon, Mo., has been appointed superintendent of the Kansas division, with headquarters at Herington, Kan., succeeding G. W. Rourke, who has been transferred to the Illinois division, with headquarters at Rock Island, Ill., in place of H. L. Reed, who succeeds Mr. Ramsdell.

William Boas Wood, who recently became superintendent of the Eastern division of the Northwest System of the Pennsylvania Lines West of Pittsburgh, with headquarters at Allegheny, Pa., was born September 11, 1876, at Harrisburg, Pa. He attended the Sheffield Scientific School from 1894 to 1897, and began railway work in October of the latter year in the chief engineer's office of the Pittsburgh, Cincinnati, Chicago & St. Louis. On September 1, 1899, he was made assistant engineer of the Cleveland & Pittsburgh division of the Pennsylvania Lines West of Pittsburgh, and on January 1, 1901, was appointed engineer of maintenance of way of the Cincinnati & Muskingum Valley, remaining in that position six months, when he was transferred to the Cleveland & Pittsburgh division of the Pennsylvania Lines West in a similar capacity. Mr. Wood was promoted to superintendent of the Richmond division of the Pittsburgh, Cincinnati, Chicago & St. Louis on July 1, 1903, and was made superintendent of the Cleveland, Akron & Columbus on January 1, 1906. Six years later he again returned to the Cleveland & Pittsburgh division of the Pennsylvania Lines as superintendent, which office he held when he was advanced to the position of superintendent of the Eastern division, as noted above.

John Joseph McCullough, whose appointment as division superintendent of the Northern Pacific, with headquarters at Seattle Wash., has been announced in these columns, was born June 17, 1871, at De Soto, Ill. He attended the common schools from 1878 to 1885 and began railway work in May, 1888, as freight brakeman on the Illinois Central. Four months later he went to the Minneapolis & St. Louis, at Minneapolis, Minn., in a similar capacity and was promoted to freight conductor in 1891, leaving in 1894 to go with the Great Northern in yard service at Superior, Wis., and Duluth, Minn. He was made general yardmaster of the Lake terminals in 1896, resigning in September, 1900, to become general yardmaster of the Erie at Susquehanna, Pa., and three months later was transferred to the eastern terminals as general yardmaster and trainmaster, where he remained until 1906. He was then employed by the Minneapolis, St. Paul & Sault Ste. Marie at Minneapolis as yardmaster, and in November, 1907, became connected with the Northern Pacific as general yardmaster at Billings, Mont. In June, 1908, he was made assistant trainmaster on the Rocky mountain division; three months afterwards became senior trainmaster on the Montana division at Livingston, Mont., and in April, 1910, was promoted to inspector of terminals of the entire system, with headquarters at St. Paul, Minn., which position he held at the time of his recent appointment as superintendent of the Puget Sound division, as above noted.

J. J. McCullough.

The Western Maryland announces changes in superintendents' territories as follows: C. A. Steiner, with office at Cumberland, Md., is now in charge of all territory west of George's Creek Junction, Md., and of the first and second districts south of Knobmount, W. Va.; F. L. Brendel, with office at Baltimore, Md., is in charge of all territory east of Edgemont, including the Baltimore terminal, and H. H. Berry, with office at Hagerstown, is now in charge of all territory west of Shippensburg, Pa., up to and including the switch at George's Creek Junction.

Traffic Officers.

E. F. Tillman has been appointed general live stock agent of the Frisco Lines, with headquarters at Ft. Worth, Tex.

A. T. Stewart, assistant to Vice-President J. M. Johnson of the Missouri Pacific, has been appointed assistant to the general traffic manager, with headquarters at St. Louis, Mo.

Henry Edwards Pierpont, general freight agent of the Chicago, Milwaukee & St. Paul, has been appointed freight traffic manager of that road, with headquarters at Chicago, effective January 15. He entered the service of the Chicago, Milwaukee & St. Paul in 1883 as a telegraph operator, and occupied various positions in the station and auditing departments, including the position of freight agent at Kansas City, Mo., until 1893, when he became division freight and passenger agent at LaCrosse, Wis. He remained in that position until January 1, 1896, when he was made assistant general freight agent, with office at Chicago. He filled the latter office ten years, being advanced to general freight agent on January 1, 1906, from which position he is now promoted to that of freight traffic manager, with headquarters at Chicago.

H. E. Pierpont.

W. M. Coble has been appointed soliciting agent of the Macon, Dublin & Savannah, with office at Jacksonville, Fla., and R. E. Phillips, traveling freight agent at Atlanta, Ga., has resigned, and his former position has been abolished.

N. J. Ferguson, traveling freight and passenger agent of the Quebec, Montreal & Southern, with office at Montreal, Que., has been appointed general freight and passenger agent, with headquarters at Montreal, succeeding D. I. Roberts, resigned.

Gay W. Norman, traveling passenger agent of the Grand Trunk, with office at Kansas City, Mo., has been appointed traveling passenger agent, with office at Chicago, succeeding M. J. Corcoran, resigned, and W. M. Lewis succeeds Mr. Norman.

Thomas Grayson Smiley, who has been appointed freight traffic manager of the Western Maryland, with headquarters at Baltimore, Md., as has been announced in these columns, was born on May 26, 1864, at Baltimore. He was educated at Knapp's Institute, Baltimore, and began railway work on March 1, 1880, as a messenger in the general freight office of the Baltimore & Ohio. He has since seen service in the freight traffic department of that and other roads, including the Columbus, Hocking Valley & Toledo, now the Hocking Valley; the Cleveland, Cincinnati, Chicago & St. Louis; the Ohio Southern, now a part of the Detroit, Toledo & Ironton, and the Western Maryland. In the early part of 1907, he was promoted from freight tariff agent of the Western Maryland to assistant general freight agent, and in July of the same year was made general freight agent of the same road, which position he held at the time of his recent appointment as freight traffic manager, as above noted.

O. S. Lewis, division freight agent of the Cincinnati, Hamilton & Dayton, has been appointed division freight agent of the Baltimore & Ohio Southwestern, with office at Cincinnati, Ohio,

to succeed W. C. McLaughlin, who has been appointed freight tariff agent of that road and the Cincinnati, Hamilton & Dayton, with office at Cincinnati, in place of J. W. Allison, who succeeds Archibald Fries as assistant general freight agent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton at Cincinnati. Edward Hart, Jr., assistant general freight agent of both roads at St. Louis, Mo., has been appointed western general freight agent of the Baltimore & Ohio Southwestern, with headquarters at St. Louis, and the former office is abolished. P. D. Freer succeeds O. S. Lewis as division freight agent of the Cincinnati, Hamilton & Dayton, with office at Dayton, Ohio.

Frederic A. Miller, general passenger agent of the Chicago, Milwaukee & St. Paul, has been appointed passenger traffic manager, with headquarters at Chicago, effective January 15. Mr. Miller was born April 10, 1858, at Harford, Pa., and began railway work in August, 1874, with the Cairo & Vincennes, now a part of the Cleveland, Cincinnati, Chicago & St. Louis, filling the positions of cashier and ticket seller at Cairo, Ill., and freight and ticket agent and clerk in the general freight and passenger office until 1878, when he was made general passenger agent of that road. He resigned in 1882, and for one year was union ticket agent of the Wabash, St. Louis & Pacific, the St. Louis, Iron Mountain & Southern, and the Mobile & Ohio at Cairo. Mr. Miller then went to the Chicago, Milwaukee & St. Paul as clerk in the general passenger department. Two years later he was made general agent at Chicago, and from 1887 to October, 1900, he was assistant general passenger agent. He was then appointed general passenger agent, and now becomes passenger traffic manager, as noted above, having completed thirty years of service with the St. Paul road.

F. A. Miller.

Engineering and Rolling Stock Officers.

George W. Robb, master mechanic of the Grand Trunk Pacific, has transferred his office and staff from Rivers, Man., to Transcona, Man.

A. L. Grandy, division engineer of the Pere Marquette at Saginaw, Mich., has been appointed chief engineer, with headquarters at Detroit, Mich.

Benjamin T. Payne has been appointed general bonus supervisor of the Atchison, Topeka & Santa Fe, with office at Topeka, Kan., effective February 1, succeeding John Epler.

J. O. Ely, assistant engineer of the Louisville & Nashville, at Knoxville, Tenn., has been appointed roadmaster of the Lexington and Eastern division of the Louisville & Nashville.

W. A. Hawley has been appointed division engineer of the Erie & Ashtabula division of the Northwest System of the Pennsylvania Lines West of Pittsburgh, with headquarters at New Castle, Pa., succeeding W. R. Hillary, promoted.

D. Patterson, master mechanic of the Kansas City, Mexico & Orient, with headquarters at Wichita, Kan., will hereafter handle all matters pertaining to the motive power and car departments, and the office of general superintendent of motive power and car departments heretofore held by Fred Mertsheimer is abolished.

E. F. McCrea, division engineer of the Cincinnati division of the Southwest System of the Pennsylvania Lines West of Pittsburgh, has been appointed division engineer of the Cleveland & Pittsburgh division, Northwest System, with headquarters at Cleveland, Ohio. E. G. Johnston, assistant engineer, Southwest System, at Indianapolis, Ind., has been appointed assistant division engineer of the Eastern division, Northwest System, with headquarters at Pittsburgh, Pa.

A. P. Prendergast, who has been appointed superintendent of motive power of the Baltimore & Ohio at Baltimore, Md., as has been announced in these columns, entered the service of the Baltimore & Ohio, in 1885, as an apprentice in the shops at Wheeling, W. Va. After completing his apprenticeship he pursued a technical course while employed at Pittsburgh and Youngstown, Ohio, later becoming gang foreman in the Baltimore & Ohio shops at Wheeling, W. Va., and then machine shop foreman at Cumberland, Md., where he also served as roundhouse foreman. He was later made general foreman of locomotive and car repairs and then promoted to master mechanic at Grafton, W. Va. He was subsequently transferred to the Riverside shops at Baltimore, and on January 1, 1910, became master mechanic at the Mount Clare shops, Baltimore. On November 16, 1910, he became superintendent of motive power of the Baltimore & Ohio Southwestern at Cincinnati, Ohio, and in May, 1912, his authority was extended over the Cincinnati, Hamilton & Dayton.

OBITUARY.

I. T. Preston, general agent of the Frisco Lines at New Orleans, La., died on January 14.

Earl P. Douglas, formerly agent of the Star Union Line at Des Moines, Ia., died in that city on January 19, aged 76 years.

F. G. Hudson, general attorney for the St. Louis, Iron Mountain & Southern for the state of Louisiana, with headquarters at Monroe, La., died on January 17, at Hot Springs, Ark.

George W. Parker, general agent of the Illinois Central at St. Louis, Mo., died in that city on January 19. He had been in railway service since 1862, when he was made district attorney in Illinois for the St. Louis, Alton & Terre Haute. He was subsequently general counsel, vice-president, vice-president and treasurer, vice-president and general manager, and from 1885 to 1890, president of that road. Later he became general agent of the Illinois Central. Between 1869 and 1874 he built the St. Louis & Cairo Short Line, which was sold to the Illinois Central in 1896. In 1886 and 1887 he was president of the American Railway Association.

William Greene Raoul, for many years prominent in the railroad business in Georgia and in Mexico, died on January 19, at Atlanta, Ga. Mr. Raoul was elected vice-president of the Central of Georgia in June, 1880, and from January, 1883, until January, 1887, was president of the same company. From April, 1887, to April, 1904, he was president of the Mexican National and of the Texas Mexican, and also of the National Railroad of Mexico. Prior to 1880 he had been successively assistant roadmaster, roadmaster, superintendent, and general superintendent on railroads in Georgia. He was for a time president of the Atlantic & Birmingham.

John Thomas Wann, formerly auditor of the Erie, died at his home in Buffalo, N. Y., on January 12, at the age of 75. He was born in Ireland, and educated at the Royal Academical Institution, Belfast, and began railway work in 1871 in the accounting department of the Atlantic & Great Western, now a part of the Erie. From 1872 to 1874 he was secretary to vice-president, and then for six years was secretary to receiver of the same road. Upon reorganization of the Atlantic & Great Western in 1880, Mr. Wann remained with General Devereaux, who was the president of the Cleveland, Columbus, Cincinnati & Indianapolis, with general offices at Cleveland, Ohio, and was secretary of that company up to February, 1890, when he returned to the A. & G. W. (the New York, Pennsylvania & Ohio) as auditor. In November, 1895, he was appointed auditor of the reorganized Erie Railroad Company, and went to New York. He was the chief accounting officer of the Erie up to his resignation in the fall of 1902, from active business. He was a man of high character, of dignified, though affable manners, and of wide acquaintance with the leading railroad men of his time.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

P. WELSH, Vancouver, B. C., is making inquiries for 1 locomotive.

MITSUI & COMPANY, New York, are making inquiries for 3 locomotives.

THE ST. LAWRENCE BRIDGE COMPANY has ordered 1 locomotive from the American Locomotive Company.

THE PENNSYLVANIA LINES WEST, have ordered 40 consolidation locomotives from the American Locomotive Company, 15 passenger locomotives from the Baldwin Locomotive Works, and 10 switching locomotives from the Lima Locomotive Corporation. The consolidation locomotives will be equipped with superheaters, will have 26 in. x 28 in. cylinders, 62 in. driving wheels, and in working order will weigh 254,000 lbs.

CAR BUILDING.

THE NORTHERN PACIFIC is in the market for 6 postal cars.

THE NEW YORK, CHICAGO & ST. LOUIS is in the market for four all steel passenger coaches.

THE LOUISVILLE & NASHVILLE is said to be in the market for 500 gondola cars. This item has not been confirmed.

THE DULUTH, MISSABE & NORTHERN has ordered 1,000 freight cars from the Western Steel Car & Foundry Company.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has ordered 2,000 freight cars from the Haskell & Barker Car Company.

THE DULUTH & IRON RANGE has ordered 800 steel ore cars from the Standard Steel Car Company, and 200 ore cars from the American Car & Foundry Company.

THE CAROLINA, CLINCHFIELD & OHIO, mentioned in the *Railway Age Gazette* of January 17, as being in the market for from 500 to 2,000 freight cars, is not in the market for any freight equipment at the present time.

IRON AND STEEL.

THE CHICAGO & ALTON has ordered 1,100 tons of steel from the Wisconsin Bridge & Iron Company.

THE TEXAS & PACIFIC has ordered 1,050 tons of structural steel from the Phoenix Bridge Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 250 tons of structural steel from the American Bridge Company.

SIGNALING.

The New York State Public Service Commission has ordered the installation of an interlocking plant at Cheektowaga, where the Lehigh Valley and the Erie are crossed by the International (electric) railway. The International is required to pay the whole expense of installation, maintenance and operation. It appears that the International is bound by a contract with the Lehigh Valley to install crossing protection upon demand of the chief engineer of the L. V. This demand was made and a plant was constructed at an expense of about $5,000, which cost was paid by the International. After the construction of this plant, and when it was about ready to be put in use, it was inspected by the electric railroad inspector of the commission, who pronounced the same dangerous to operate by reason of its proximity to the tracks of the Erie; the situation being such that a car moving south and crossing the Erie tracks might be halted by the derail so that the rear end of the car would remain upon the Erie tracks, thereby exposing it to being run into by a passing train of the Erie. The result was that the signals were not put in use. The commission is now satisfied that the interlocking should be installed so as to include in its operation the crossing of the Erie.

Supply Trade News.

Harry Lowman, formerly with the mechanical department of the Southern Railway at Washington, D. C., has entered the sales department of the Chicago Car Heating Company.

The Epping-Carpenter Company, Pittsburgh, Pa., manufacturer of pumping machinery, has opened a branch office at 131 State street, Boston, Mass., in charge of James J. Hart, formerly with the International Steam Pump Company and the Warren Steam Pump Company.

W. W. Talbert has been appointed sales engineer of the Union Switch & Signal Company, Swissvale, Pa., in the central district, with headquarters at Chicago, succeeding W. M. Vandersluis. J. F. Talbert has been appointed superintendent of construction for the central district, succeeding W. W. Talbert.

The annual convention of the sales and factory organizations of the Chicago Pneumatic Tool Company, was held at the show rooms of the company, 1337 South Michigan avenue, Chicago, on January 9, 10 and 11, concluding with a banquet on Saturday evening, January 11, at the Chicago Automobile Club. Nearly 100 of the company's representatives were present. The meeting was opened on Thursday morning with an address by President W. O. Duntley, and the succeeding meetings were divided into sessions devoted respectively to the air compressor department, railroad department, Cleveland plant, general sales department, Detroit plant, electrical department and commercial automobile department.

George Myrick Sargent, of Evanston, Ill., the founder of the first plant in the United States for the exclusive manufacture of brake shoes, and at the time of his death a director of the American Brake Shoe & Foundry Company, died at Atlantic City, N. J., on January 16, at the age of 83. Mr. Sargent patented and developed in 1878 an improvement in brake shoe manufacture, which was finally developed into the American Brake Shoe & Foundry Company. He was born in Sedgwick, Maine, March 29, 1830, and after being engaged for several years in various lines of business in the east entered the iron industry at Moline, Ill., in 1870 as part owner of the Moline Malleable Iron Works. In 1876 he removed to Chicago and invented and designed an improved brake shoe, subsequently known as the Congdon, and organized a company for its production under the name of George M. Sargent & Co. In 1878 it was incorporated as a stock company under the name of the Congdon Brake Shoe Company, and in 1893 a new corporation was organized to carry on the business under the name of the Sargent Company, with Mr. Sargent as president. The company operated two plants, one for the exclusive manufacture of cast iron brake shoes, and another, which after 1896, was devoted almost entirely to the production of couplers, knuckles and steel brake shoes. This business was successfully carried on until 1901, when the American Brake Shoe & Foundry Company, promoted by W. D. Sargent and others, was organized and when it purchased the Chicago Heights plant. Shortly afterward the original plant of the company at Fifty-ninth street, then devoted to steel casting work, was acquired by the American Steel Foundries. Mr. Sargent was elected a director of the American Brake Shoe & Foundry Company. He was also for several years president of the Live Poultry Transportation Company, and in 1901 he was elected vice-president for Illinois of the National Association of Manufacturers. He was for many years a well known figure in railway and supply business circles,

George M. Sargent.

and up to 1895 had attended 17 conventions of the Master Car Builders' and Master Mechanics' associations.

The Standard Heat & Ventilation Company, Inc., 141 Cedar street, New York, has recently been incorporated and has bought the rights of the Ward Equipment Company, New York, and the Safety Car Heating & Lighting Company, New York, relating to car heating and ventilating, and will make and sell the devices in these special lines hitherto furnished by the two latter companies. The Safety Car Heating & Lighting Company will also act as its agent. The company has now at its disposal a new plant especially equipped for the manufacture of railway car heating and ventilating appliances. The directors of the company are as follows: C. B. Adams, Wm. Barbour, R. M. Dixon, A. W. Kiddle, W. B. Albright, J. F. Deems, W. L. Garland, A. C. Moore and John E. Ward. The officers of the company are as follows: President, J. F. Deems; vice-presidents, A. W. Kiddle and A. L. Whipple; treasurer, A. C. Moore, and secretary and assistant treasurer, John J. Clapp.

The general contracting firm of James Stewart & Co., New York, has been incorporated under the same name, with $3,750,000 capital. The $3,750,000 stock is divided into $1,000,000 7 per cent. cumulative first preferred stock, $1,500,000 7 per cent. cumulative second preferred and participating stock, and $1,250,000 common stock. All of the stock has been issued except $250,000 of the common stock, which will be held in the treasury. There will be no public offering of the shares, as Alexander M. Stewart and James C. Stewart, who constituted the old firm, have together with their friends, purchased all stock available. The officers of the new company will be A. M. Stewart, president; J. C. Stewart, vice-president; Henry W. Lohmann, second vice-president and western manager; C. F. Transom, third vice-president and chief engineer; W. A. Rowan, treasurer, and J. B. A. Fosburgh, secretary. The balance sheet of the new corporation shows total net assets of $2,857,109 after payment of all obligations, of which $1,637,997 is cash and liquid items, the balance of $1,219,112 being in real estate and equipment. The company has $20,000,000 worth of business booked at present; during 1912 its net earnings were in excess of $350,000. Average net earnings for the past five years were in excess of 10 per cent. on its present capital.

TRADE PUBLICATIONS.

Electric Fans.—The General Electric Company, Schenectady, N. Y., has published its 1913 catalog of electric fans, illustrating and describing fixed and oscillating desk and bracket fans for alternating and direct currents; also ceiling fans and ventilating fans.

Pneumatic Compressors.—The Chicago Pneumatic Tool Company has published in bulletin No. 34 F a detailed description of the design and construction of class G, Chicago pneumatic compressors. This bulletin is 28 pages long and shows many illustrations and diagrams.

Southern Railway.—The land and industrial department of this company has published a list of mines and quarries in the territory served by the lines of the Southern Railway, showing their location and the kind and amount of output. It has also published a list of live stock shippers and slaughter and packing houses, showing the location, kind of stock handled and the annual output.

Electric Products.—The Sprague Electric Works of the General Electric Company, New York, has published bulletin No. 115, on its electric products. This bulletin supersedes bulletin No. 114, and points out the advantages of Sprague electric direct current generators and switchboards, direct current and alternating current motors, exhaust fans, electric hoists, etc. The bulletin is attractively illustrated.

Railway Electrification in Italy.—In the course of an interesting article in the *Elektrische Kraftbetriebe und Bahnen*, it is pointed out that the remarkable progress in the electrification of railways in Italy is due in no small measure to generous subventions by the government. According to the importance of the lines—be they suburban, interurban or main lines—the Italian government grants subventions. Of the sum allocated one-tenth is devoted to construction and nine-tenths to operation.

Railway Construction.

Asherton & Gulf.—According to press reports a contract has been let for building an extension of about 10 miles to Carrizo Springs, Tex. The line is now in operation from Artesian Wells northwest to Asherton, 32 miles. (October 18, p. 774.)

Athabasca & Grande Prairie.—Application has been made in Canada for a charter to build from some point at or near the junction of the Solomon river with the Athabasca river in Alberta, northwesterly to a point at or near the junction of the Smoky river with the Muskeg river in the same province, thence north to Dunvegan, passing through Grande Prairie at a point on the westerly side of Bear Lake. Pringle & Guthrie, Ottawa, Canada, are solicitors for applicants.

Baltimore & Virginia.—An officer writes that the company may let contracts soon for building a section of the line. The plans call for building from Baltimore, Md., south through Anne Arundel and Calvert counties to Drum Point, on the Patuxent river. Part of the grading has been finished ready for tracklaying, and a small amount of track has been laid. The plans include putting up a few trestles, also some terminal docks and shop buildings. The company expects to use gasolene motor cars on the line. H. M. Thompson, Baltimore, may be addressed. (August 25, p. 390.)

Brantford & Hamilton (Electric).—An officer writes that the company will carry out work with its own men on an extension from the present line at Langford, in Brantford township, Ont., north and westerly to Galt, about 17 miles. (December 27, p. 1288.)

Canadian Central & Labrador.—Application has been made to the Canadian parliament for incorporation by this company to build from Cochrane, Ont., northeast, to a point at or near Cape St. Lewis on the Atlantic coast, with a branch to a point at or near the mouth of the Hamilton river, Que., and a branch to the city of Quebec. Smith & Johnston, Ottawa, are solicitors for the applicants.

Canadian Northern Pacific.—A contract has been given to the Northern Construction Company for building an extension of the Lulu Island line from New Westminster, B. C., to Steveston, about 12 miles. (October 18, p. 774.)

Cape Girardeau & Northern.—Incorporated in Missouri with $2,500,000 capital as a consolidation of the Chester, Perryville & St. Genevieve, and other roads formerly in the Hauck system, a total of 100 miles. It is understood that an extension will be built from Farmington, Mo., north to a point in the lead belt, probably to Flat river. J. R. Byrd, St. Louis, is president, R. H. Schultz, general manager. The general offices of the company are at St. Louis.

Central Illinois Public Service Company.—According to press reports, this company, which operates a 14-mile line from Mattoon, Ill., east to Charleston, is planning to build a network of interurban lines, including a line from Mattoon, west via Pana and Taylorville, to Springfield, about 80 miles.

Chester, Perryville & St. Genevieve.—See Cape Girardeau & Northern.

Chicago, Terre Haute & Southeastern.—This company has given a contract to the Crowley-Salisbury Construction Company, Davenport, Ia., to build a branch to coal fields in southern Indiana. The work on the new branch will be mostly rock excavation.

Cincinnati, Louisville, Lexington & Maysville (Traction).—An officer of this company, which started work some time ago on a line from Covington, Ky., south, writes that grading has been finished on 15 miles, and contracts are to be let at once. The plans call for building from Cincinnati, Ohio, to Lexington, Ky., and from Louisville east to Maysville. The maximum grade will be 3¼ per cent., maximum curvature 4 deg. There will be one 500-ft. bridge and another 200 ft. long, also a number of station buildings. W. T. S. Blackburn, president, Dry Ridge, Ky. (May 31, p. 1220.)

Cuyuna Northern.—According to press reports this company will build an 8-mile extension from the Cuyuna Mille Lacs mine

in Minnesota, to a point on the Northern Pacific between Cedar Lake and Aitkin. It is understood that the work is to be started in the near future. (March 15, p. 525.)

EASTERN MIDLAND.—Incorporated in Pennsylvania with $400,000 capital, to build from Matamoras, Pa., southwest to the Delaware Water Gap, about 40 miles. The incorporators include A. D. Thornburg, Aspinwall; H. C. Miller, McKeesport, and H. Hunt, Bellevue.

LAKE ERIE & YOUNGSTOWN (Electric).—This company has increased its capital stock from $300,000 to $4,800,000, and will issue $4,500,000, ten-year 5 per cent. bonds. Construction work on the line from Youngstown, Ohio, north to Conneaut Harbor, about 60 miles on a private right of way has been under way for some time. (May 10, p. 1077.)

NEW YORK ROADS.—Bids are wanted January 28, by the New York Public Service Commission, First district, New York City, for the construction of Section No. 2 of the Woodside, Astoria and Corona Rapid Transit Railroad of New York City. It is to be a two and three-track elevated railroad in Second or Debevoise avenue, beginning 300 ft. south of Beebe avenue and extending to a point about 300 ft. south of Ditmars avenue, with five local stations and one express station.

NORTH EASTERN.—See North Railway.

NORTH RAILWAY.—This company, which was incorporated in Quebec in 1906 as the the North Eastern, is applying for a Canadian charter, and for an extension of time to build from the east shore of Lake Temiskaming near Ville Marie, east, passing the southern bays of lakes Des Quinze, Victoria and Kakebonga to the city of Quebec, and to build extensions as follows—from the main line to Ottawa and from Montreal to Quebec; from Quebec and Montreal to the boundaries of the states of Maine, New Hampshire and Vermont, with power also to build a bridge across, or a tunnel under the St. Lawrence river for railway and other traffic. Pringle & Guthrie, Ottawa, are solicitors for the applicants.

PACIFIC & PEACE RIVER.—This company is applying in Canada for an extension of time to build the authorized line from Bella Coola on Burh channel, B. C., thence via the Bella Coola river to a point at or near Fort Fraser, or from a point at or near Dean channel to Fort Fraser, thence north passing east of Stuart lake to a point at or near Fort St. James and north to Fort McLeod, through the Pine pass to Peace river at or near Dunvegan, about 480 miles. J. A. Ritchie, Ottawa, Ont., may be addressed. (March 22, p. 701.)

RALEIGH, ATLANTIC & WESTERN.—Application has been made for a charter in North Carolina to build a line northwest and southeast from Raleigh, N. C., in all about 52 miles. J. H. Pou, Raleigh, is said to be interested.

SAN ANTONIO & AUSTIN INTERURBAN.—This company, with a capital of $25,000, has asked for charter in Texas, to build from San Antonio, Tex., north via Davenport, New Braunsels, San Marcos, Kyle, Buda and Manchaca to San Antonio, about 85 miles. The incorporators include W. B. Tuttle, vice-president of the San Antonio Traction Company; Frederick Terrell, R. R. Russell, F. C. Gross, San Antonio; W. C. Barber, San Marcos, and G. W. Littlefield, Austin.

SAN ANTONIO, UVALDE & GULF.—This company has increased its capital stock from $230,000 to $280,000. Work will begin at once, it is said, on an extension from a point in Atascosa county, near the Live Oak county line, south through the counties of Atascosa, Live Oak and San Patricio, to Mathis, about 50 miles.

SOUTHERN RAILWAY.—This company will at once start work on extensive improvements on the line between Richmond, Va., and West Point, 39 miles. The line will be relaid with heavy rail, replacing lighter sections. The track will be reballasted, sub-structures strengthened and the entire roadway put in condition to handle heavier traffic. It is expected that the work will be completed within six months.

SUMPTER VALLEY.—According to press reports this company has made two surveys over different routes for an extension from the present southern terminus at Prairie City, Ore., south to Burns in Harney county, about 70 miles.

TOPPENISH, FORT SIMCOE & WESTERN.—According to press reports this company, which was organized some time ago to build from Toppenish, Wash., west, will resume work this spring on the section to White Swan, 20 miles.

TWIN FALLS, OAKLAND & SAN FRANCISCO.—According to press reports this company has been organized to build from Twin Falls, Idaho, south to Wells, Nev., about 100 miles. Dr. T. O. Boyd is president; D. J. Roberts, vice-president and general manager; G. D. Aiken, second vice-president and assistant general manager; A. J. Teadey, secretary, and H. J. Failing, treasurer. The headquarters of the company are at Twin Falls.

WASHINGTON ROADS.—According to press reports the McCoy-Loggie Timber Company, of Bellingham, Wash., will build a logging road up North Fork, about six miles, connecting with the Northern Pacific near Saxon. Work is to be started early this spring. It is expected that the cost of the line will be about $100,000. Eugene Loggie is manager.

WEST TENNESSEE TRACTION.—An officer writes that contracts are to be let soon and the company expects to begin work about April 1, on a line from Memphis, Tenn., northeast via Bartlett, Arlington, Brandon, Mason and Brownsville to Jackson, 86 miles. Financial arrangements are partially completed to build the first section from Memphis to Arlington, 21 miles. This section has been located, the rights of way secured and terminal arrangements made at Memphis. A contract to use the tracks of the Memphis street railway company into Memphis has been entered into. D. P. Bennett, president, D. G. Sargent, vice-president and general manager, Memphis. (December 27, p. 1288.)

RAILWAY STRUCTURES.

BUFFALO, N. Y.—The New York Public Service Commission, Second district, has ordered the Delaware, Lackawanna & Western to eliminate its crossing of the tracks of the Buffalo Creek, the Pennsylvania Railroad and the New York, Chicago & St. Louis near Smith street, between the Abbott road and the Buffalo river, Buffalo, by elevating the tracks of the D. L. & W. After the approval of the plans by the commission the D. L. & W. is required to complete the work by January, 1914. The expense of the elimination is to be borne by the D. L. & W. except that the sum of $10,000 shall be paid by each of the other three roads. The crossing consists of seven parallel tracks running in a northerly and southerly direction, of which the New York, Chicago & St. Louis owns and operates two, the Pennsylvania Railroad two, and the Buffalo Creek three. Running in an easterly and westerly direction and crossing the above-mentioned seven tracks at grade there are two tracks owned by the D. L. & W.

BUTTE, MONT.—Plans and specifications have been prepared, and bids have been asked for a new passenger station for the Great Northern, which will cost approximately $125,000. The building will have a frontage of 120 ft., and will be 180 ft. long.

CHICAGO, ILL.—The Central Terminal Railway, a subsidiary of the Canadian Pacific, has acquired 13 additional parcels of property in the vicinity of West Fifteenth and South Union streets for its new freight terminal. The company is also purchasing land for auxiliary yards at Harvard street and Forty-eighth avenue. Thus far it has acquired for both sites 252 parcels of land for a total stated price of $2,480,681.

PORTLAND, ORE.—The Spokane, Portland & Seattle is planning to erect an eight story freight terminal building some time during the year.

SAN ANGELO, TEX.—It is expected that work will be started shortly on a new eight-stall roundhouse for the Gulf, Colorado & Santa Fe.

VAN BUREN, ME.—An officer of the International Railway of New Brunswick is quoted as saying that the Maine legislature has passed a bill giving the International a franchise for a railway bridge across the St. Johns river from St. Leonard's, New Brunswick, to Van Buren, Maine. The New Brunswick government has already granted similar rights on the Canadian side, and the bridge will be built during the coming summer. The building of an international bridge at St. Leonard's will give the International direct connection at Van Buren with the Bangor & Aroostook.

Railway Financial News.

Atlantic, Northern & Southern.—Judge Arthur, in the district court at Atlantic, Iowa, on January 13, ordered the resale of this company and declared forfeited the money paid from time to time by Leslie W. Shaw, of Philadelphia, Pa., on account of the purchase price of $402,000 bid at the time of the sale September, 1912.

Boston & Lowell.—The Massachusetts railroad commission has approved the issue of $1,000,000 twenty-year 4½ per cent. bonds for refunding a like amount, due February 1, 1913.

Brooklyn Rapid Transit Company.—This company's subsidiary, the New York Municipal Railway Corporation, has applied to the New York Public Service Commission for authority to execute a first mortgage to the Central Trust Company, New York, as trustee, to secure an issue of not exceeding $100,000,000 of 53-year 5 per cent. bonds dated July 1, 1912. The proceeds will be used for new equipment for the construction of subways and for the strengthening and construction of elevated lines.

Chicago & North Western.—Kuhn, Loeb & Company, New York, have bought from this company the following securities, have resold the equipment issue and will offer the other blocks in the near future: $5,700,000 equipment trust certificates of 1912 ($10,000,000 authorized); $2,500,000 Des Plaines Valley first mortgage 4½ per cent., due March 1, 1947; and $1,120,000 St. Paul Eastern Grand Trunk first mortgage 4½ per cent. bonds of 1913-January 1, 1947.

Cleveland & Pittsburgh.—The New York Stock Exchange has listed $2,019,100 additional 4 per cent. special guaranteed betterment stock issued to pay for improvements as follows: Right-of-way and track elevation, $303,816; second, etc., track and yards, $219,503; station buildings, $2,587; docks and wharves, $1,240,106; freight cars, $55,936; passenger cars, $192,465; balance on account of 1910 improvements, $4,688.

Cleveland Short Line.—The directors have voted to increase the common stock from $3,750,000 to $4,750,000, the proceeds to be used in completing the line under construction. The Lake Shore & Michigan Southern owns all the $3,750,000 common and $3,525,000 preferred stock.

Erie & Central.—Stockholders of this company, the stock of which is owned by the Delaware, Lackawanna & Western, have voted to lease the road to the Delaware, Lackawanna & Western for 99 years from July 1, 1913.

Hudson & Manhattan.—Kuhn, Loeb & Company, New York, Robert Fleming & Company, London, and Harvey Fisk & Sons, New York, as readjustment managers, have prepared a plan for the readjustment of the finances of this company. This plan will reduce the fixed charges by over 25 per cent. and will provide for the payment of $21,157,000 Hudson Companies' notes which mature between February 1, 1913, and February 1, 1914. The company has not been earning the interest on its 4½ per cent. first mortgage bonds. Bondholders and stockholders to become parties to the readjustment must deposit their bonds (with February 1, 1913, coupon attached) and their stock or voting trust certificates with the Guaranty Trust Company, New York, or with Robert Fleming & Company, London, on or before February 14, 1913. It is said that between 85 and 90 per cent. of the Hudson & Manhattan bondholders have already signified their willingness to participate in this plan.

Laramie, Hahn's Peak & Pacific.—A bondholders' and noteholders' protective committee has been formed consisting of Alexander J. Hemphill, Henry Sanderson, W. Frederick Snyder and Lawrence Barnum, with the Guaranty Trust Company of New York as depository, and Hornblower, Miller & Potter as counsel, and L. B. Franklin, 28 Nassau street, New York, as secretary. This committee calls for the deposit only of the first refunding mortgage 6 per cent. bonds and the collateral trust 7 per cent. notes. Another committee, consisting of Frank D. Pavey, chairman; Thomas E. Eaton, Robert H. Gault, James W. Green, William B. Randall and Charles H. Thomas, requests deposits of first refunding bonds with the New England Trust Company, Boston, Mass., and the Security Transfer & Register Company, New York.

Minneapolis, St. Paul & Sault Ste. Marie.—William A. Read & Company, New York, are placing at par and interest new 4½ per cent. equipment notes series E, dated January 1, 1913, and due $159,000 semi-annually from January 1, 1913, to January 1, 1923, both inclusive. The total issue is $3,180,000. The pledged equipment is all new and of large capacity, consisting of 25 locomotives, 49 steel passenger and mail service cars, 1,500 steel frame box cars, 400 steel underframe ballast and flat cars, 300 ore cars and 20 cabooses.

New York Central Lines.—J. P. Morgan & Company, the First National Bank, and the National City Bank, all of New York, are offering $12,540,000 4½ per cent. certificates issued under the New York Central Lines equipment trust of 1913. The certificates are offered in series having progressive dates of maturity, from January 1, 1914, to January 1, 1928, at prices to net about 4.65 per cent. The certificates are guaranteed by the New York Central & Hudson River and five of its principal controlled lines. Of this issue $24,000,000 certificates are authorized.

New York, Chicago & St. Louis.—An annual dividend of 4 per cent. has been declared on the $14,000,000 common stock, payable March 1 to holders of record January 31, comparing with 3 per cent. paid in each of the three preceding years.

New York, New Haven & Hartford.—Morton F. Plant, of New London, Conn., and Lawrence Minot, of Boston, Mass., have been elected directors. They succeed George MacCulloch Miller, who retired on account of age, and Augustus S. May, treasurer of the company, who served temporarily.

Northwestern Pacific.—The control of this company has passed from the Atchison, Topeka & Santa Fe to the Southern Pacific in accordance with the agreement recently made between the two latter companies. The Southern Pacific will have the control for one year at the end of which time the Atchison, Topeka & Santa Fe will again assume control.

Pennsylvania Railroad.—This company has acquired the Cambria & Clearfield, which operates about 399 miles in Pennsylvania. The road has been part of the Pennsylvania for some time, the Pennsylvania owning practically all of the capital stock and operating the road under lease.

Scott City Northern.—Dewey Dunn and W. H. Wagner were appointed receivers on January 11 in proceedings brought by Attorney-General Dawson, of Kansas, on the ground of alleged over-capitalization and insolvency and mismanagement of its officers. The line extends from Scott City to Winona 53 miles, and has a capitalization of $1,325,000 each of stock and bonds.

Southern Pacific of Mexico.—The following directors have resigned from the board: F. V. S. Crosby, R. L. Gerry, R. S. Lovett, Alex. Millar and W. V. S. Thorne. Julius Kruttschnitt succeeds R. S. Lovett on the board and is chairman of the executive committee. The other vacancies were filled by the election of L. J. Spence, F. W. Mahl, W. A. Worthington, and W. F. Bull. Alex. Millar also resigned as secretary of the board, the vacancy not being filled.

Tennessee Central.—A protective committee has been formed for the general mortgage 5 per cent. bonds due 1954, consisting of Alexander J. Hemphill (chairman), Graham H. Harris, Breckenridge Jones, Walter T. Rosen, and Albert H. Wiggin, with Lewis B. Franklin, 28 Nassau street, New York, as secretary, and Roberts Walker and Van Vorst, Marshall & Smith as counsel. Deposits are requested to the Guaranty Trust Company of New York. According to press reports Federal Judge E. T. Sanford on January 18 ordered the receivers to issue $330,000 6 per cent. receivers' certificates, the proceeds to be used for new equipment and improvements.

Virginian.—Stockholders will vote at the annual meeting on February 1 on the question of reducing common stock from $34,850,000 to not less than $31,271,500.

Samuel L. Fuller has been made a director of this company, succeeding Franklin Q. Brown.

VOLUME 54. JANUARY 31, 1913. NUMBER 5.

CONTENTS

*Illustrated.

WHATEVER the reason assigned for not paying employees in cash—whether it be that it necessitates running extra trains over the road, the employment of highly paid paymasters, the interference with employees' work, or the danger of handling large amounts of cash out on the road—the underlying and controlling objection is based on the dislike of operating men to interference from the treasury department. It was this desire to get rid of annoyances that has led many roads to change from a system of payment by cash to a system of payment by check. The treasury department itself has been largely responsible for this distrust of its methods. On the Pennsylvania Lines West this prejudice and dislike have been almost entirely overcome simply through a common-sense policy of co-operation which the paymasters have pursued. In working out the system that is being used on these lines and which is described elsewhere in this issue, the co-operation of the division superintendents was sought and obtained, and the result has been that employees are being paid not only in a manner that is satisfactory to the treasury department, but also to the operating department and to the employees themselves. There is no more complicated network of lines in the country than those of the Pennsylvania Lines West, and it probably required consistent thought and effort and a great deal of patience to lay out the routes and times of payment in such a manner as to interfere least with the employees' work and with the regular operation of trains. Whether or not the effort and the patience required are too great a price to pay for the advantages of the cash system of payment is a question that each general manager has to decide for himself. If, however, he is willing to expend the effort and patience, the experience of the Pennsylvania has demonstrated quite clearly that it is entirely possible to pay all classes of employees in cash promptly and entirely satisfactorily.

THE method of dealing with attachments and liens against employees' wages illustrates possibly better than anything else can the spirit which lies behind the system of paying employees in cash on the Pennsylvania Lines West. There is nothing in the law of any of the states through which these lines run which would compel the railroad company to notify an employee of an attachment obtained on his wages. It would be easy to argue that employees should not run into debt and that a man who had his wages attached was not deserving of consideration. This is not the argument that is accepted in regard to employees on the Lines West. The railroad company goes to considerable trouble and some expense to notify a man whose wages have been attached of the fact and he is advised to consult at once with the nearest company's solicitor. Men are not permitted to make an assignment of their wages. If a man urgently needs money before the end of the month, it is possible for him to obtain it from the railroad company. In dealing with loan brokers the company advises its men to make a tender of the amount due, with legal interest, and if the loan broker refuses this tender, the company assumes the burden of paying the employee the wages due him and fighting the case, if necessary, against the broker. It was at one time the practice to discharge a man who was found to be in debt to a loan broker, but this had the effect of helping the loan broker. A Pennsylvania employee was considered a preferred risk simply because after he had once gotten in the grasp of the money lender the severest possible pressure could be brought to bear to compel the payment of any interest, no matter how exorbitant, through the fear of exposure. Now this fear has been removed and the employee who has been unfortunate and has gotten himself in trouble can feel that the company is his friend rather than the money lender's instrument of vengeance. Of course the man who habitually gets in debt is not a desirable employee and is not retained. The attitude in regard to money lenders and attachment of wages for bills is only one of a number of ways in which the company is making a consistent effort to gain the loyalty of its employees through a consideration for their convenience in the matter of receiving their wages that, it would seem, is bound to have a very considerable effect.

IN his paper on Freight Car Tactics, which was published in our issue of January 24, Arthur Hale spoke of the box car as a legal-tender car, because it may be interchanged generally by the railroads and used for transporting practically any kind of commodity. In the discussion of this paper at the annual meeting of the Central Railway Club, attention was directed to the fact that although the American Railway Association has established standards as to the size and capacity of such cars, nothing has been done towards the establishment of standards for their physical condition. A little less than a year ago we called attention in a series of articles on Defective Box Cars

and Damaged Freight, to the fact that an extremely large proportion of the box cars had roofs, sides or ends which allowed moisture to leak through into the car and thus unfitted it for safely transporting such commodities as flour, cement, grain, etc. Very many of the cars have defective sides, ends or floors which allow grain or similar material to leak out and can only be prepared for transporting such materials safely by going to considerable expense, which must be incurred as often as the cars are used for such service. It was suggested, therefore, that if box cars are to be considered as legal-tender cars there are a great many counterfeits in circulation. Such a large proportion of the merchandise transported in box cars can be damaged by these defects that it would seem advisable for the American Railway Association to outline certain physical conditions which must be complied with in order that the cars may safely be used for such purposes, and then that some distinction be made between the cars in 100 per cent. condition and less, so that the poor cars can be discriminated against, thus forcing the roads that own them to put them in better condition. Two causes are responsible for the cars being in defective condition. Either they were poorly designed or constructed, because of ignorance or a desire to save money in the first cost, or they have not been properly maintained. In the first case it would be necessary to spend considerable money in rebuilding and placing them in proper condition, but this would probably be saved many times over before the cars became useless, by the reduction in the expense of maintenance and in the damage to the lading. The second cause would, of course, be overcome by seeing that proper attention was given to the maintenance of the cars. As a rule this has always resulted in a net decrease in the total cost of maintenance over any given period of time. In the interests of efficiency and economy of the individual roads and the railroads at large some steps should be taken toward keeping the legal-tender cars in 100 per cent. condition. It would prove to be no small task, but in the end would undoubtedly be a wise and far reaching investment.

AN EXAMPLE OF GOOD REGULATION.

THE report of the New York State Public Service Commission on the Corning collision, noticed in the *Railway Age Gazette* of January 17, page 105,* embodies such an excellent treatment of its subject that it may be said to mark a decided advance in governmental efficiency in the matter of safety on railroads. Our forty-three state commissions have made very slow and irregular progress in their function of correcting the neglect of railways, and the activities of the federal government in the same direction have been characterized by many and serious mistakes, though producing at the same time some beneficial results. In the case of the state governments the responsibility for inefficiency may be traced quite directly back to the voters, for the most of the weakness of state bodies has been due to the employment of the elective system, instead of having commissioners appointed; too short tenure of office, low salaries and the evils incident to adherence to political instead of business principles. But in the Corning report we see the fruits of the course opposite to this; a shining example, in fact. The voters of the state of New York had seen the evils of corrupt government so clearly that in 1906 they chose, as governor, Charles E. Hughes, incorruptible, farsighted and thoroughly public spirited. Mr. Hughes, in selecting men for the public service commissions, got the very best men that he could find available, and in this he was aided by a law providing much better salaries than are usually allowed for commissionerships. One of the five commissioners at Albany is a mechanical engineer with railroad experience. The commission, in selecting its inspectors, also sought men of railroad experience, judicial temperament and fitness for the several kinds of work to which they were assigned. Both the governor and the commission had a good degree of success in their quest for competent men; so that we have here an illustration of how very simple are the means and methods needed for good government when men wholly devoted to the public interest follow persistently a rational course.

The Corning report may almost be called an essay on safe train-running. Not the least of its merits is the lucid arrangement, secondary matters being put in their proper secondary place. "The question of supreme importance is how to prevent accidents," rather than merely to minimize the effect of the accidents. Every state railroad commissioner will find profit in reading this report a second time. The paragraphs addressed to the brotherhoods lay down the law—the moral law—in no uncertain terms. That many employees in all departments (thoughtlessly or otherwise) habitually shield fellow employees who are careless or incompetent, is all too well known. That a brotherhood which formally declares adherence to high ideals is bound to take vigorous action to repress every kind of conduct which violates those ideals is a solemn truth; and the Commission does a valuable public service in so frankly calling attention to these conditions.

On the main issue, discipline of employees, the report goes at once to the normal starting point; that is, the offices of the assistants to the superintendent, on whom devolves the immediate responsibility for discipline. There is no possible substitute for strong men in these positions. These officers must not only be strong—"capable of dealing justly and fearlessly"—but they must feel secure in their places. It will not be out of place to add, what has been said in these columns many times, that these men, like the division superintendent, should be kept in one place long enough to give the position the benefit of the incumbent's individuality, and the knowledge and ability that depend on this. Too frequent promotions may be almost as injurious as too frequent changes for other causes. All this implies the need of better salaries, of course.

This part as well as much of the rest of the report, is in general terms, and evidently is intended to apply not alone to the road on which this collision occurred. The commission has been studying the conditions very carefully throughout the state of New York for five years. Moreover, the writer of the report recognizes, as a practical matter, whatever theorists might say, that roundhouse foremen, trainmasters and road foremen cannot surely be depended on to reform themselves; he addresses himself to the higher officers: "There should be greater care in the selection," etc. Again, we read: "Managers and superintendents should enforce discipline at any cost." This phrase—"at any cost"—is a reminder of the fact, known to all operating officers of the larger roads, that rigid discipline, which is absolutely fundamental in such an exacting business as running express engines, is costly, in more senses than one, and that if it is to be administered successfully it must be reasonably uniform on all of the divisions of a road.

As has been suggested, a main purpose of this editorial is to make readers want to go over that report a second time. We shall not take the time to enlarge on all of the points which merit commendation. Not the least of these is the declaration that the main reliance (for protection against rear collisions) must be on the fixed signals; that we put too much dependence on the flagman and his uncertain methods. We ask of him impossible things. The exposure of the utter baselessness of Schroeder's explanations and excuses is another point of interest. Many investigations are deficient in this feature. The commission holds that questions of steel cars and fire dangers call for much in-

*The full text of the report, which has since been issued, contains a number of photographic illustrations showing the situation at the place where the collision occurred, and also showing the damage done to the steel cars. The commission, in discussing the condition of engineman Schroeder on the morning of the collision concludes that the fear that Schroeder was not fit for his duties was the reason why the fireman was in the engineman's cab; the explanations given by the fireman attributing some other reason, or reasons, are believed to be entirely inadequate. Inspector Buchanan, in his report, discusses the question of having a third man on the locomotive to make sure that a good lookout shall be kept. He decides against that proposal and adds that inquiry from the larger railroads indicates that the "Mother Hubbard" type of engine is being eliminated from future plans.

vestigation before any governmental action would be warranted. We need not enlarge on the difference in the tone of this paragraph as compared with that which pervades the discussions on this subject in some other quarters before the House Committee at Washington, for example. Indeed these New York Commissioners are in some respects so cautious and conservative that if they were in the position of the Commerce Court they would be in imminent danger of having their heads cut off!

SOME MORE REASONS WHY RAILWAYS ARE UNPOPULAR.

THE railways of the United States are more popular than a few years ago. They are so because they have set out to make themselves so. They have tried to popularize themselves by correcting things that are wrong and remediable in their service and rates, and by explaining things that merely seem wrong or are not remediable. But the roads are not nearly so popular as they want to be, and ought to be for their own good and the public's. This is largely because there still exist conditions that need to be changed. More people come in contact with railways as passengers than in all other ways. The way passengers are served, will, therefore, make a road more "boosters" or critics than anything else. And the way passengers are still treated by the roads and their employees in many instances makes thousands of critics.

This paper published a few years ago (*Railway Age Gazette*, November 19, 1909) an article entitled "Some Reasons Why Railways are Unpopular," in which were given specific examples of the sort of shortcomings of the railways or their employees we now have in mind. Recently many roads have conducted campaigns among their employees on the subject of consideration for and courtesy to passengers. In many passenger cars and stations, placards are tacked up stating that the managements desire their patrons to be given every reasonable consideration and attention, and asking patrons to report to headquarters all cases of incivility, etc. These things have had a wholesome effect. But it is still true that a large part of the employees who deal with passengers are not as civil as they ought to be and that many are careless or incompetent.

Furthermore, there are serious defects in the passenger service of numerous roads which the managements alone can correct. This is especially true on branch lines. One of the most serious shortcomings is the glaring disproportion between the amount of attention given and money devoted to providing through passenger service and local passenger service. When we observe the kind of local service given on most branch lines and on many main lines we do not wonder that public sentiment in communities outside the cities often becomes hostile to the railways or that the people of these outside communities often encourage the development of electric interurban lines and flock to them when they are opened.

Take, for example, the difficulty that people at towns and small cities often meet in getting proper sleeping car accommodations. Our experience has been that in most cases when the agent at a country station is asked to wire reserving a lower berth he fails to do so, and the passenger has to take an upper berth, or gets none. The passenger in that case criticises the railway management. Why shouldn't he? The agent represents the management; and the management is properly held responsible for his faults of omission and commission. Here is a specific instance which illustrates what often happens: A traveler going from a good-sized city to a small town had to change trains at 3:30 o'clock a. m. He asked the ticket agent at the point of origin to telegraph for a lower berth for him on the train to which he was to change. When this train came in he hurried, carrying two heavy pieces of baggage, toward the rear where the sleeping cars were. None of the doors of the sleeping cars was open; and he had to carry his baggage back to the chair car and go through the train back to the sleeping cars. He finally found a porter who was awake, but who knew nothing about his reservation. The ticket agent should have wired for the reservation, but apparently did not. And the doors of at least one of the sleeping cars should have been opened, anyway; for the rules require this at every station where a stop is made. In this case complaint was entered, and both the railway management and the Pullman Company took prompt action.

Here is another experience of the same traveler: Desiring to leave New York for Chicago he telephoned for a drawing room on a through sleeping car operating over two lines connecting at Buffalo. When the ticket was delivered it was not for a drawing room, but a section, and it was returned. Then the ticket agent said that the drawing room could not be reserved until the next morning, one hour before the time for the train's departure. Repeated inquiries as to why at last elicited the information that the agent was preparing to sell the passenger a drawing room on a car that went to St. Louis, in consequence of which, without previous warning to him, he would have had to change cars at Buffalo. Naturally, he got angry and went by another route. And if he had gone the way he originally planned and had found he had to change at Buffalo, he naturally would have been indignant. Think of such things happening in connection with transportation between two such points as New York and Chicago!

Recently an eastern business man who was traveling from one end of the continent to the other reserved a drawing room from one of the large interior terminals to the Pacific Coast. When he got on the train he found the same drawing room had been sold to other persons who were in possession of it and refused to give it up. He stood on his rights, insisted on having a drawing room, and the railway had to put an extra sleeping car on the train and haul it 2,400 miles. That was pretty expensive for the railway. But who ought to bear the expense and annoyance caused by the carelessness or incompetency of railway employees?

The dining car service of the railways of the United States is the best in the world. But things occasionally happen in dining cars that are enough to try the soul of patience. There is a certain railway president who has a disconcerting way of turning up in unexpected places. He turned up for breakfast at 7:30 o'clock one morning recently in a dining car on one of his own trains. He found the car cold and unclean, the cooking poor and almost every feature of the service unsatisfactory. When he finished breakfast he called the dining car conductor and told him to hand in his resignation at the end of his run. The astonished conductor asked for an explanation. The president replied that if that morning's service was a sample of what was being given on that car, and the conductor did not know why he should resign, that was a conclusive argument for discharging him. The result was that the conductor was not discharged, but that he became a chastened and a more efficient employee. Railway presidents and vice-presidents are mighty busy men. They haven't time to become regular inspectors of dining car service. But the spreading of the news of a few incidents like that over a railway helps a lot.

A short time ago a man and his family had to travel across country on local trains from a station on one main line of a certain railway to a station on another of its main lines. The distance was relatively small, but the circumstances were such that, carrying a good deal of hand baggage, they had to change trains several times. When the ticket agent at the point of origin sold their tickets he said they would have to make three changes and would arrive at their destination at 6 p. m. When they reached the point where they made the third change they found that they would have to make still a fourth change farther on and that instead of reaching their destination at 6 p. m. they would reach it almost two hours later. The agent at the point of origin, without looking the matter up, had carelessly assumed that they would catch a certain train at the

point of their third change, when in fact that train was regularly scheduled to leave one hour earlier than their train was scheduled to arrive. There is a good deal of difference between making three expected changes of trains and four changes, one of which is unexpected, and between arriving in a strange place at 6 p. m. and at 8 p. m. A ticket agent who will sell tickets over such a route without making absolutely certain that he is giving passengers correct information is careless or incompetent. And every man who travels much as an ordinary passenger can testify from his experience that such things happen every day on railways all over this country.

We propound the following conundrum: Why is a station bulletin board? Theoretically, its purpose is to give information to passengers regarding the time of arrival and departure of trains. In practice, the number of bulletin boards at country stations that regularly give correct information is small. And when at 9:30 a. m. the waiting impatient traveler, noting that his train is bulletined to arrive at 9 a. m., inquires of some station employee when it will be along he will in a majority of cases get a curt answer. The answer may not be curt enough to make the basis of a complaint to the management, but it is likely to be quite curt enough to give the inquirer a feeling of resentment that will later manifest itself in some form of antagonism to the railway.

Speaking of bulletin boards brings to mind our old friend, the late passenger train. The muck-raking author of an article in one of the current magazines greatly exaggerates the proportion of late trains in this country and makes their lateness the basis for some bitter and unjust criticism of the managements of American railways. But the facts are, that many trains in all parts of the country are late; that while there are good explanations of this condition there is no good excuse for it and that it does furnish a good text for muck-raking the roads. The best management of the best railway cannot prevent trains from being late occasionally. Any good management can keep them from being late chronically. If a road's trains are chronically late it is a sure sign either that the published schedules are too fast, or that there is not enough effort made to keep trains on time. If the published schedules are too fast, the only fair way to treat the public is to lengthen them. If the schedules are not too fast, they can ordinarily be maintained.

The main cause of late trains is unnecessary delays at stations. The employees of the roads, of the express companies and of the postoffice department often fail to plan for putting their traffic on and off the trains promptly; they often move with leaden feet while putting it on and off; and in consequence often a train departs late. When one train—especially on a single track line—leaves a station late, the first step has been taken toward demoralizing the whole train service, if the lost time is not made up at once by fast running; and if it is attempted to make it up by fast running there is likely to be an accident that will cause more and greater delays if not something worse. The speed of trains should be strictly regulated according to the character of track and equipment; and such regulation could be carried out and trains ordinarily kept on time if more were done to reduce the many needless delays at stations. Numerous trains that make long through runs and arrive on time at terminals arrive late at many intermediate stations. Every time a train arrives or departs late at any place it makes critics and enemies for the roads. Are critics and enemies so much more to be desired at intermediate places than at terminal points.

There are many roads that make great efforts to keep their trains on time; but there are so many through sleeping car routes over connecting lines that the better managed and equipped roads have to share the odium caused by the shortcomings of their weaker brethren. When will the managements of all American railways get the courage to make slow schedules for slow trains or exercise the necessary supervision to keep all trains on time except under extraordinary conditions? And how can any management hope to make its railway really popular with its patrons until it regularly does what it promises to do and what they pay it for doing? Some of the state railway commissions recently have been agitating regarding this matter of late trains and threatening to bring suits to have the roads heavily fined for not maintaining their schedules. Can any one say that the public and public officials have not a right to complain when trains are chronically late?

The incidents and conditions mentioned all point to the need for more and better supervision of station and train service. This better supervision should begin with the selection of employees, it should extend over their training, and it should include incessant inspection and disciplining in order to make sure that they are doing, and will do, what they have been instructed to do and what the rules require them to do. This need for more and better supervision is, of course, much greater on some roads than on others. But it exists more or less on practically all. Most of the additional supervising could be done by the present officers if they would constantly keep their eyes open for defects of service and promptly apply the obvious remedies. One trouble is that many railway officers are so used to the existence of conditions which annoy their patrons that they actually do not notice them. Another trouble is that the very fact that a man is an officer of a railway prevents him from seeing some things that others see because employees are all on their good behavior when he is about. Also, there is a considerable number of men in official positions on railways—as in all other businesses—who have got into ruts and lack the energy or disposition to get out of them and do things that they haven't been used to doing. All of these classes of officers need an awakening as a necessary prerequisite to the awakening of the employees under them. Probably in order to get adequate supervision of station and train service most roads would have to incur some additional expense. But isn't it worth while? There is no better asset of a business than pleased patrons; and there is no worse liability than disgruntled patrons.

NEW BOOKS.

Traveling Engineers' Association. Proceedings of the twentieth annual convention. Illustrated. Bound in leather, 410 pages, 6 in. x 9 in. Published by the Traveling Engineers' Association, W. O. Thompson, Secretary, Buffalo, N. Y. Price $1.50.

At the last convention of the Traveling Engineers' Association, held in Chicago, August 27-30, 1912, a number of the more important and interesting problems in connection with locomotive and train operation were presented for discussion. In each case the author of the paper, and especially the members discussing it, approached the subject with the evident intention of obtaining the greatest benefit possible in the time at their disposal. In consequence both the papers and the discussions were most valuable. They are given complete in the proceedings. The committee on subjects wisely provided but six topics, as follows: Benefits to be derived from chemically treated waters in connection with the increased efficiency of locomotives; Fuel economy and the relation of mechanical appliances, such as superheaters, mechanical stokers, brick arches and the handling of trains; Handling of long passenger and freight trains with modern air brake equipment; Inspection of locomotives and form of work reports that should be required of engineers on arrival at terminals; How to interest enginemen in the economical use of fuel and lubricants, and the advantages and disadvantages of lead on modern locomotives. The volume includes a copy of the constitution and by-laws, a list of members with their addresses, and a list of the subjects presented for discussion at each of the previous conventions. The subjects which will be presented at the 1913 convention are also given.

LIFT BRIDGES OVER THE BUFFALO RIVER.

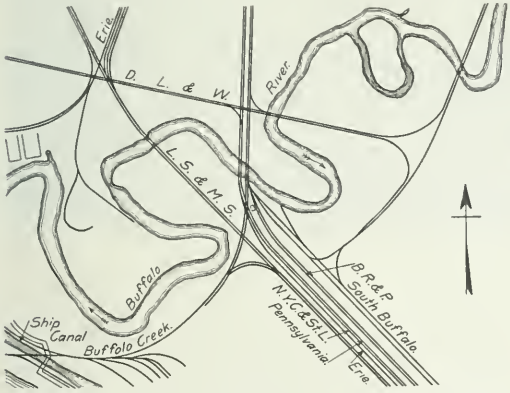
The Construction of Three Movable Bridges Replacing Fixed Spans to Allow Navigation of a River at Buffalo.

By Emile Low.*

The main harbor of the city of Buffalo comprises the Buffalo river and the City Ship canal, the former a natural stream, and the latter an artificial waterway. From a stream originally less than 10 ft. deep, the Buffalo river has gradually been deepened by dredging to 23 ft. below mean lake level, this depth now being available at the Lake Shore & Michigan Southern bridge. A contract for deepening the river to 23 ft. above this bridge has been let to the Great Lakes Dredge & Dock Company, Chicago, and in order to utilize this section for navigation and industrial purposes, movable bridges are being substituted for the present fixed spans. Work is now in progress on three railway bridges used by five roads, the Lake Shore & Michigan Southern, the New York, Chicago & St. Louis, the Pennsylvania, the Buffalo Creek, and the Buffalo, Rochester & Pittsburgh.

LAKE SHORE & MICHIGAN SOUTHERN BRIDGE.

The previous crossing of the Lake Shore & Michigan Southern comprised two fixed spans of 110 ft. each. As the new bridge is to occupy the site of the old one, a temporary double track pile bent trestle with three plate girder spans was built south of and parallel to the old bridge. At the bridge crossing, solid limestone is found at an elevation about 36 ft. below mean water level. The abutments rest on pile foundations, 30 ft. piles being driven to rock. The substructure comprises two abutments, A at the west end and B at the east end, and four piers Nos. 1, 2, 3 and 4. The substructure is of 1:2½:5 concrete. The entire



Location of Three New Movable Bridges Over the Buffalo River.

structure with the exception of the steel work is being built by company forces.

The following table shows the approximate estimate of materials required in the foundation:

	Concrete.				Reinforcement.					
	Total Yardage.	Cement. Sacks.	Sand. Cu.yds.	Broken Stone. Cu.yds.	¾ in. sq. Lin.ft.	1¼ in. sq. Lin.ft.	Cross Girders.		Castings.	
West Abut. A.	390	2,030	180	360	80	760	...	..	..	..
Pier 1	590	3,070	270	540	...	...	6,480	1	2	4
Pier 2	590	3,070	270	540	...	260	6,240	..	..	..
Pier 3	620	3,225	285	570	...	...	6,240	1	2	..
Pier 4	620	3,225	285	570	...	...	6,240	1	2	4
East Abut. B.	370	1,925	170	340	75	760	...	..	..	..

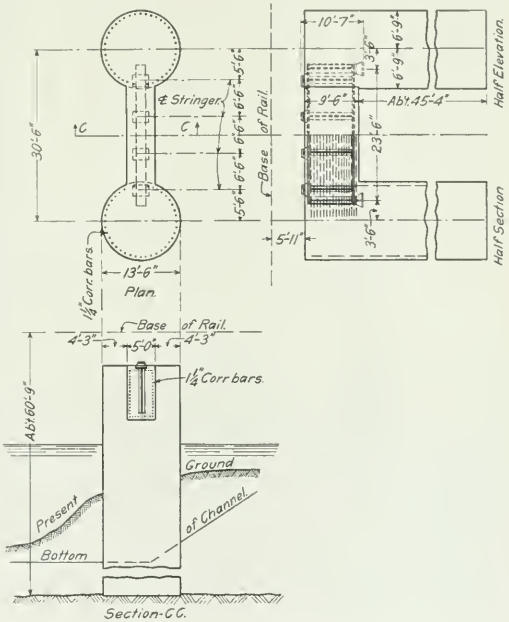
*Consulting Engineer, Buffalo, N. Y.

The two abutments are of the U type, with battered front faces and vertical backs, abutment B being at right angles to the center line, and abutment A having a skew of 79 deg. 16 min. 38 sec. The respective heights are 28 ft. 3½ in., and 27 ft. 8¼ in. Abutment B has 75 supporting piles in 5 rows of 15 each. The foundation course is 15 ft. 6 in. wide, 38 ft. long and 4 ft. 6 in. high. The height of the retaining wall above the foundation



Details of Cylinder Piers for Lake Shore & Michigan Southern Bridge.

course for abutment B is 23 ft. 9½ in., and the bottom thickness, 12 ft. 6 in., a little less than half the height. The U stems are very short, only 4 ft. The embankment will spill around the abutments in the usual manner. The only reinforcement in the U abutments is in the foundation course, there being 76 corrugated bars, ¾ in. sq. and 10 ft. long, spaced 6 in. center to center. The piles project into the foundation course 12 in., and the corrugated bars are laid in a row 3 in. above the tops of the piles.

The piers are concrete cylinders in pairs. Piers 1 and 2 are on a skew of 79 deg. 16 min. 38 sec. from the center line. Piers 3 and 4 are at right angles to the center line. The height of the cylinders varies from 51 to 52 ft., owing to the variation in the level of bed rock. The diameter of the cylinders is 13 ft. 6 in., and the distance between their centers is 30 ft. 6 in. at right angles to the center line. The cylinders are connected at the top by reinforced concrete girders or struts, 9 ft. 6 in. deep. The width for pier 1 is 5 ft. 6 in., and for piers 2, 3 and 4, 5 ft. The reinforcement for each cylinder consists of 80 corrugated bars, 1¼ in. square, 30 ft. long, placed vertically in the periphery and 6 in. back from the face. The spacing is approximately 12 in. center to center. In addition, the tops of the cylinders of

pier 2 are reinforced by 52 corrugated bars ¾ in. square, 5 ft. long, placed vertically in the line of the diameter and at right angles to the center line.

The strut connecting the cylinders of pier 2 is reinforced by 48 corrugated bars, 1¼ in. square, 30 ft. long, placed 6 in. from the side and bottom faces and 12 in. below the top faces. The spacing is about 6 in. center to center. The struts in piers 1, 3 and 4 contain an imbedded steel plate girder. Pier 1 contains 56 corrugated bars, 1¼ in. square, 30 ft. long and piers 3 and 5 have 48 bars of the same dimensions. The plate girders are 25 ft. long and 8 ft. high, and rest on cast iron pedestals imbedded in the concrete at the proper elevation. The plate girders also carry the pedestals supporting the superstructure.

The cylindrical piers were constructed inside circular cofferdams composed of Lackawanna arched-web steel sheet piling. The light section was used, each piece building 14 in. of wall, and weighing 35 lbs. per sq. ft. of wall. The weight per lineal foot of piling bar is 40.83 lbs. Each cylinder, 18 ft. in diameter, consisted of 50 sheet piles, each 45 ft. long. To furnish a template or guide for driving the cylinders, five wooden piles were first driven, one in the center, and four at the corners of an inscribed square. Diagonal braces connected the circumferential piles, crossing at the center pile. A circular wooden frame or ring, 6 in. deep, and made up of three layers of 2 in. lumber was then attached to the top of the piles, around the outside of which the steel sheet piles were driven.

The steel sheet piling was driven by a revolving pile driver mounted on a suitable car body or frame. A special tender accompanied the pile driver, supplying water and fuel. The enclosed material in the steel cylinders was removed by an orange peel dipper operated by a revolving derrick, mounted on a car, the excavation being completed while the cylinder was filled with water. Owing to the hardness of the material immediately overlying the bedrock, a layer of several feet in thickness had to be left in for future removal.

The next work was to brace the interior of the cylinders to prevent collapse when the water should be pumped out. This was accomplished by building heavy circular frames or rings of timber made up of two courses of old 9 in. x 18 in. stringers, bolted together. The frames were 17 ft. 6 in. in diameter, with a central opening 10 ft. 6 in. square. Four hook eyes were placed at the corners of the square for handling.

These heavy frames were placed in the cylinders by the revolving derrick, large vertical posts, about 5 ft. high, securely held by diagonal bracing or inclined struts, having first been attached to the top of the first one. A second ring or frame was then laid on top of the posts of the first one and both were driven down by the pile driver. This procedure was repeated until five frames had been driven in place, the lowest one being stopped about 5 ft. above bedrock by the remaining material. The cylinder was then pumped out and the remaining material down to bedrock removed in large buckets. Octagonal forms were then built inside the cylinders, resting on the bedrock, which were filled with concrete dumped into vertical chutes reaching to the bottom.

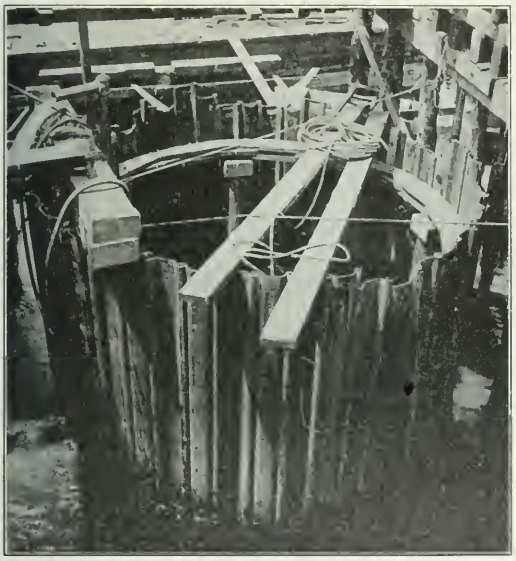
After the foundation had been placed, the lower frame was removed and another course of concrete added, octagonal in cross-section as before. At an elevation of about 21 ft. below the completed top of the cylinder (or about 5 ft. below water level) the cross-section was changed to a circle. The octagonal forms were left in place. The forms for the upper parts of the piers were built at Collinwood, Ohio, near Cleveland, and consisted of staves 10 ft. 6 in. long held in place by three hoops. To prevent deformation during transportation and handling, temporary rings were placed in the interior which were removed after the forms were placed in position on the octagonal foundation courses. The forms were built similar to a water tank, but without a bottom. There were 100 staves in each, each stave being 5¼ in. wide and 2¾ in. thick. The diameter of the forms was 13 ft. 6 in., the same as that of the finished pier. Two forms in height were used, the upper one having suitable openings on one side to allow the placing of the steel plate and reinforced concrete girder connecting the upper portion of the two cylinders forming each pair.

Track Pile Driver and McMyler Derrick With Orange Peel Bucket; Lake Shore & Michigan Southern.

The concrete mixing plant was installed on three flat cars. On one were built the storage bins for holding the sand and broken stone, with a platform for the cement. Another carried the inclined plane up which the loaded material car was run to the mixer, which was installed on a third car. The mixer is one built by the railway company and is a cylinder revolved in a vertical plane. It has two openings, opposite to each other and closed by hinged doors. The concrete materials are dumped into a chute above, dropping into the mixer; the door is closed and the mixer revolved a sufficient number of times; the lower door is then opened and the mixed concrete allowed to drop into a chute under the car and leading to the work. The concrete is made in large batches, the charging car having a capacity of about 31 cu. ft. Usually a batch contains 5 bags of cement, more being used for foundation work than above ground and water.

The sand for concrete was obtained from pits at Irvington, on the shore of Lake Erie, 28 miles west of Buffalo, and the broken limestone, partly from Kelley Island, in Lake Erie, near Sandusky, Ohio, and partly from Akron, N. Y., 22 miles east of Buffalo. The engineering department of the Lake Shore & Michigan Southern prefers broken stone to a natural mixture of sand and gravel, owing to the difficulty of securing a properly graded mixture.

The superstructure consists of a 50 ft. deck girder, a 112 ft. 6 in. through girder, a Strauss trunnion bascule bridge with a movable span of 131 ft. 6 in., and a tower span of 49 ft., and a 56 ft. deck girder in the order named going east, all spans being double track. The front end floor beam is on a slight skew,



Circular Cofferdam of Lackawanna Arched Web Steel Sheet Piling Showing Template Around Which Piles Are Driven; Lake Shore & Michigan Southern.

while the trunnion end of the bridge is of necessity square. One bottom chord is therefore slightly longer than the other, while the top chords are of equal length.

The bridge is operated by means of two pinions, one on each side, turning in bearings secured to the tower, which engage cast steel racks bolted to the operating struts. The operating machinery consists of two 50 h. p., a. c. motors connected to the operating pinions through a train of reduction gears and an equalizing gear. The motors are each provided with a solenoid brake, and one motor driven emergency brake, which is normally set, is provided. This brake is released by a motor, and is held in release as long as current is applied to this motor. Cutting off the current, or any failure of current will result in the instantaneous application of the brake. The emergency brake may also be released mechanically when the bridge is to be operated by hand. In addition to electrical operation, hand operation is also provided for. By means of hand cranks placed in the tower, the operating machinery can be actuated by two men. The operator's house is located on shore close to the bridge and contains the controllers for the leaf motors and other electrical apparatus and indicating devices.

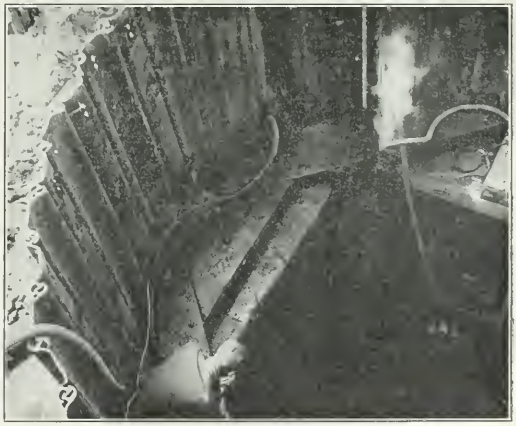
The break in the floor between the fixed portion and the moving leaf is located in front of the main trunnion, and the live load, therefore, does not tend to open the bridge. Front end locks are provided, however, which hold the bridge firmly to the rest pier. The movement of the latch bars automatically stops the motors and sets their brakes at each end of their travel. Hand operation is also provided for operating the locks in case of emergency. The operating and lock motor circuits are connected with the interlocking system, so that current is not available for operation until the signals have been set at "danger," and these signals cannot be set at "clear" until the bridge is closed and the locks driven in. In like manner current is not available for the leaf motors until the locks have been withdrawn.

An automatic cut-off is provided which will throw the circuit breakers out and cut off the current from the leaf motors and set their brakes when the bridge has reached the nearly fully open position. A foot switch is provided, which will enable the operator to release the motor brakes and allow the bridge to "coast" if desired. In closing the bridge current is available to hold the leaf down firmly on its seat until the locks are fully driven in. Mechanical indicators will be located at the pivot end and front end of the bridge, placed on the stationary and movable parts, so that they can be seen from the operator's house, and to which the operator can sight and thus determine the nearly closed and open positions of the bridge. Electric light indicators are also provided in the operator's house showing the operator the various positions of the locks and the bridge leaf. The movements of the locks and bridge itself open and close the circuits of these indicator lights.

This bridge was designed by B. R. Leffler, bridge engineer, and is being built under the supervision of G. C. Cleveland, chief engineer of the Lake Shore & Michigan Southern.

THE BUFFALO CREEK RAILROAD BRIDGE.

This bridge lies about 2,000 ft. southeast of the Lake Shore & Michigan Southern bridge, and about 100 ft. east of the



Interior View of Cofferdam Steel Sheet Piling With Timber Ring In Place for Bracing Against Water Pressure; Lake Shore & Michigan Southern.

bridge used by the New York, Chicago & St. Louis and the Pennsylvania. It consists of four spans, a Strauss bascule span 213.5 ft. long, two through plate girder spans, 89 and 88.5 ft. respectively, and one deck plate girder span, 38 ft. long, the total length between back wall faces being 429 ft. There are two abutments and three piers, abutment 1 and pier 2 being at right angles to the center line, and piers 3, 4 and 5, and abutment 6 having a skew of 54 deg. 53 min. 30 sec. The elevation of bedrock is about 47 ft. below mean lake level.

The concrete piers are supported by bearing piles driven to bedrock. The piles of piers 2, 3, 4 and 5 are 25 ft. long, and of abutment 1, 30 ft. long. The foundation of abutment 1, and

piers 2 and 3, which support the Strauss bascule span, are spread considerably beyond the upper neat lines. The number of supporting piles is 140, 164 and 132 respectively. Piers 4 and 5 and abutment 6, contain 116, 96 and 40 piles.

The cofferdams were all built of Lackawanna steel sheet piling, straight web section, 12¾ in. x ⅜ in., weighing 35 lbs. per sq. ft. of wall and 37.187 lbs. per lin. ft. of piling bar. The length used was 34 ft. It was usually driven 8 to 9 ft. below the bottom of pier elevation and allowed to project 3 to 4 ft. above water level, the depth of water ranging from 8 to 10 ft. The cofferdams were built 5 ft. wider and longer than the neat dimensions of the masonry. The steel sheet piling was driven by a two-ton drop hammer. The wooden supporting piles for the abutment and piers were driven with a steam hammer, weighing 4,500 lbs., with a 3 ft. fall. The material being soft, the piles were easily driven to rock. In abutment 1 and pier 2, the piles "heaved up" 3 ft. and had to be redriven two or three times. In pier 3, this heaving amounted to only 1½ ft.

The new bridge occupies the same site as the old, which consisted of two 135-ft. three-truss double track iron spans designed for a load of 2,000 lbs. per lineal foot. To maintain the traffic, a double track pile bent trestle was built south of and parallel to the old bridge. A similar trestle to the north carries temporarily the traffic of the New York, Chicago & St. Louis and the Pennsylvania, the new bridge of the Buffalo Creek Railroad lying between. In excavating the material from within the cofferdams, the inside piles of both trestles settled as much as 6 in., the stringers requiring jacking up and readjustment. This subsidence was caused by the flow of the soft material, the piles of the temporary trestles depending wholly on skin friction, not being driven to bedrock.

The substructure consists of 1:3:6 concrete. The mixer was a

Cofferdam, 30 ft. x 60 ft., of Straight Web Section Lackawanna Steel Sheet Piling; Buffalo Creek Railroad.

Ransome, of about 3½ cu. yd. capacity, the usual charge being two bags of cement, 6 cu. ft. of sand and 10 cu. ft. of broken stone, the sand and stone being measured in wheelbarrows, gaged by known measures. The concrete in some cases was mixed on shore, run out in cars and dumped directly into the forms. In others it was deposited by buckets, and in others through chutes.

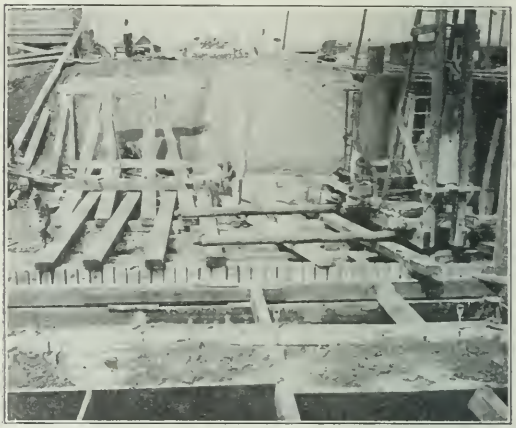
Abutment 1 and pier 2, which are built at right angles to the center line, have a foundation area of 20 ft. x 53 ft., and 24 ft. x 54 ft. respectively. Owing to the skew of the crossing, piers 3, 4 and 5 are longer, the foundation area being 18 ft. x 58 ft., and 14 ft. x 57 ft. respectively. The spacing of the piles in the rows is 2 ft. 6 in. to 3 ft., the rows being on 3 ft. centers.

The superstructure in general is similar to that for the L. S. & M. S. over the same river. The length on center line of bridge is 165 ft., one truss being a panel length longer than the other, since the skew is greater than in the L. S. & M. S. bridge.

The plans of the substructure were prepared by S. M. Kielland, engineer, Buffalo Creek, and the work was done by the A. P. Chapman Co., Buffalo, N. Y. The plans of the superstructure were prepared under the direction of the late Chas. W. Buchholz, consulting engineer, and F. A. Howard, engineer bridges and buildings of the Erie. The steel work is being fabricated and erected by the American Bridge Company.

THE NEW YORK, CHICAGO & ST. LOUIS BRIDGE.

This bridge, which is also used by the Pennsylvania, crosses the river about 100 ft. north of the Buffalo Creek Railroad crossing, the two bridges being parallel. The present bridge is a double track steel structure of two spans, the length of each span under copings being about 135 ft. The old steel work was



Cofferdam of Wakefield Sheet Piling; New York, Chicago & St. Louis.

partly dismantled and used temporarily as a platform from which to conduct operations connected with the building of the new bridge.

The superstructure of the new bridge consists of two through plate girder approaches, each 89 ft. long, and a Scherzer rolling lift bridge with plate girder track span. The moving span is skewed at the front end, and square at the rear end, with unequal truss lengths, the short truss being 154 ft. 7 in., and the long truss 175 ft. 5¼ in. center to center of bearings. The span length of the bascule on the center line of the bridge is 165 ft. ⅛ in. The track girder span is 40 ft. The lift bridge over the main river channel has a width of 100 ft. between the fender lines, the clear river width under each of the plate girder spans being 62.5 ft. The water surface width of the river is 256 ft., and the bottom width 190 ft., with a water depth of 22 ft. at mean lake level, the distances given being those at right angles to the current.

The bridge will be operated by two 75 h. p. motors having a speed of 475 r. p. m. on a three phase 25 cycle alternating current at 445 volts. These motors and the machinery through which the power is transmitted to the main operating pinions are located upon a machinery platform placed above the clearance line and between the trusses at the rear end of the bridge just in front of the counterweight box. The power of the motors is transmitted through gearing to the main operating pinions, the shafts of which pass through each truss at the center of roll which is at the center of the segments. The centers of the shafts driving the pinions at any position of the bridge are always equi-distant from the surface of the track plates, and the motion of the pinions is horizontal and parallel with the surface of the track plates.

Racks with which the main operating pinions engage and by means of which the bridge is actuated are located outside of the plane of the trusses on independent fixed rack supports. These rack supports are bracketed out from each end of the track girders with diagonal braces running from the center of the rack girder down to the end posts of the rack supports at points opposite the tops of the track girders. The simplicity and efficiency of this operating mechanism makes possible a great saving in the machinery.

As an auxiliary equipment for operating the bridge when electric current is not available a gasolene engine will be provided. This engine will be located in the operator's house and the power will be applied to the machinery through friction clutch couplings. The bridge can also be operated by hand.

When in the closed position the bridge is locked by a lock bar of forged steel 10 in. x 1½ in., this bar engaging with a casting anchored to the masonry of the front pier. The lock is actuated by a hand lever in the operator's house through a pipe connection with a device at the break between the movable span and the fixed span to allow for the connection being broken when the bridge is operated.

An air buffer is provided at the front end of the moving span for seating the bridge on the front pier without shock or jar. This buffer is of simple design, with a 12 in. bore and a 24 in. stroke. It is attached to the front floor beam at about the center line of the bridge, the plunger coming in contact with a casting anchored to the masonry of the front pier. Bumping blocks are provided at the rear end to prevent the bridge moving beyond the fully opened position.

The front lock mechanism is interlocked with the signal system and with the bridge operating mechanism, so that the lock cannot be opened and the bridge operated until the signals are set at danger and the derails opened, and the bridge must be closed and locked before the signal can show clear and the derails be closed.

The operator's house, which is located on supports at one side of the track girder span, will contain all of the equipment for controlling the operation of the bridge. It will also have a mechanical indicator so placed as to be in full view of the operator showing the positions of the bridge at all times during operation. A bell will also be provided to be rung automatically by the bridge as a warning to the operator before the fully opened and fully closed positions of the bridge are reached.

Owing to the proximity of the Buffalo Creek Railroad bridge, the piers of the two bridges are on the same axes, the angle of skew being the same. As the bridge is being built on the site of the present one, traffic is diverted and temporarily maintained over a pile bent trestle erected to the south.

The substructure consists of three piers and two abutments, numbered from the east to the west, all masonry being of concrete, founded on piles driven to bedrock, which is reached at a depth of 45 ft. below mean water level. Abutment 1 and pier 2 are the main supports of the Scherzer rolling lift bridge, and were built inside timber cofferdams, built of Wakefield sheet piles, each composed of 2 in. x 10 in., and one 2 in. x 12 in. plank, 30 ft. long, assembled in the usual manner. Pier 3 located in the river was also built in a wooden cofferdam consisting of square timbers 12 in. x 12 in., grooved on opposite sides. The grooves were 2 in. square in cross-section, and when the timbers are in juxtaposition, a timber tongue, 2 in. x 4 in. was driven into the groove to render the cofferdam watertight. The timbers of the structure were driven by a floating pile driver. The concrete is a 1:2:5 mixture. A Ransome mixer was used, the charge being one bag of cement, two wheelbarrows of sand and four wheelbarrows of broken stone, gaged to give the required proportions. The cement and concrete aggregates were delivered in standard cars and wheeled up an incline to discharge into a hopper over the mixer which was placed about 6 to 8 ft. above track level. The concrete was made wet and delivered to the work in wooden chutes.

This bridge is being built under the direction of E. E. Hart, chief engineer of the New York, Chicago & St. Louis.

A PROPOSED NEW ENGLAND RAILROAD COMMISSION.

At the invitation of Governor Foss, of Massachusetts, a conference was held in Boston last Saturday, attended by the governors of all the six New England states except Maine, the governor of which was unable to accept the invitation. Governor Foss proposes a "New England railroad conference" to be composed of two citizens from each state; and, after the conference of Saturday, he gave out the following outline of the purposes which it is hoped to accomplish:

The conference will consider and report upon the general subject of railroad development and operation, and in particular will investigate the following phases of the railroad question:

1. The establishment of a permanent conference composed of the heads of the state commissions having supervision over railroads.

2. The question of creating state directors representing the various New England states in the management of the railroad system, and the general question of the participation of the public in the ownership or operation of transportation facilities, and the form of such participation.

3. The consideration of means whereby the projected Grand Trunk extension may be completed.

4. Means of providing through transportation by way of Boston, and the consideration of the best method of accomplishing this, whether by tunnels or belt lines, or both.

5. The project of electrifying the terminals and providing adequate electric traction throughout crowded urban and suburban districts.

6. A reasonable plan of interchangeable mileage tickets to be applied over the entire New England railroad system.

7. A plan of uniform legislation providing for the unification of the corporate entity which manages the railroads in a manner which will make the legal fact of unification correspond with the actual control now exercised. This will involve a consideration of the whole question of whether the Boston & Maine shall remain a part of the New Haven system or can better serve New England as a separate system, the question of the elimination of the Boston Railroad Holding Company, and the question to what extent, so far as the federal laws and the fixed policy of the several states permit, the railroad shall own and operate steamship and trolley lines.

8. A plan to co-ordinate and unify all lines and services.

9. Reduction of all leases of lines to absolute ownership.

10. The consideration of means to make the railroad corporation amenable in its entirety to public control, in the manner of a domestic corporation doing business in each state.

11. The consideration of uniform charters to the railroad corporation in each of the states in which it operates lines, with uniform reservations of power of control by the state.

Governor Haines, of Maine, in a letter to Governor Foss, written after reading the report of what was done at the Boston conference, commented at length on each of the eleven paragraphs of the resolutions adopted at the conference; and he called attention in rather plain language to some of the weaknesses of Governor Foss's proposals. The state of Maine already has a terminal of the Grand Trunk, and the relations between the state and the railway company appear to be quite satisfactory. Governor Haines says that a permanent cenference "can do no harm and might do some good." He does not see how directors of a railroad can be appointed by a state which owns nothing in the property. He does not believe in state ownership. He has not much interest in the crowding of passengers in suburban trains, but he does expect that Maine, with its abundant water power, will soon have all its railroads operated by electric power. The legislature of Maine is now considering the establishment of a public utility court to take the place of its railroad commission, and therefore it does not seem desirable at present that the Maine commission should take part in a New England organization.

THE PAYMENT OF EMPLOYEES IN CASH.

A Description of the Method Used on the Pennsylvania Lines West Where About $4,800,000 Is Paid Out in Cash Each Month.

Every officer and employee of the Pennsylvania Lines West, from the president to the switchmen and crossing men are paid in cash monthly; payments are made between the fourth business day and the twentieth of each month. It is not of much moment to the president whether he receives his salary in cash or by check, but it is of a great deal of importance to the switchmen.

The one point at which the employee comes most closely in contact with the company, is at the time he receives his wages. At this time he forms an impression of the attitude of the company; it becomes personal to him as something distinct from his particular boss. Unconsciously his own attitude toward the outside public reflects, to a certain extent, the attitude of the company towards himself. If this attitude is courteous, if, in the company's relations with the employee, there seems to be a real attempt to deal perfectly fairly, the man is inclined to feel that this is the attitude which he should take toward the company's patrons. On the other hand if the employee gets the idea that the company is dealing with him in a sharp manner and that regardless of justice the company will see that its own interests are preserved, then when the employee represents the company in its relations with the general public his attitude will reflect this feeling.

In the payment of wages, there are three objects to be attained. The employee should get the wages which he has earned as quickly and as conveniently as possible. Some means should be adopted by which the company can be sure that the employee earning the wages actually receives what he has earned and gives a valid receipt. The third object is that payment shall be made by a different department than the one which prepares the pay roll and hires the employee. There are three common methods of payment. Checks may be delivered by the company's agents to the employees; these checks having been prepared and certified to by the auditor and made out and sent to the agents by the treasurer's department. Second, checks made in the same way may be delivered directly to the employees by the treasury department. This necessitates running a pay car. The third method is to have the treasury department pay directly in cash to each employee. This also necessitates the running of a pay car. The following is a list of some of the roads that now have one or other of the two check systems in use and those using the cash system.

On the Pennsylvania Lines West there are five pay cars; three starting from Pittsburgh, one from Columbus and one from Terre Haute. These five cars between the fourth and the twentieth of each month distribute about $4,800,000 cash. Each car is in charge of a paymaster, who has a clerk, and in addition there are three or more guards on the pay car. In point of complication, the Pennsylvania Lines West presents as difficult a problem for the routing of pay cars as any system of lines in the country. The lines, of course, lie in territory east of the Mississippi river, so that there is not, possibly, the same danger of an organized attack on the pay car as would be the case on some lines in the West; on the other hand, the problem

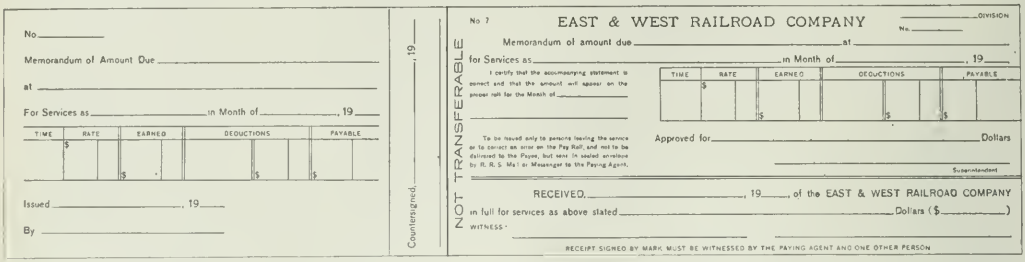
Pay Roll No. 2.

of paying employees and especially train crews, without unduly delaying traffic is far more difficult on these lines than would be the case on western lines where traffic density is much less.

Of the three cars running from Pittsburgh, one goes over the Eastern division, Western division and the Fort Wayne side of the Chicago Terminal division. The second car pays over the Erie & Pittsburgh division; the Cleveland & Pittsburgh and the Marietta division. The third car pays over the Pittsburgh division of the Panhandle; the Cincinnati & Toledo division of the Panhandle and over the Akron and Zanesville divisions. The car leaving Columbus runs over the Indianapolis division, the Indianapolis Terminal division, the Louisville division, the Richmond division, and the Logansport division. The car leaving Terre Haute runs over all of the divisions of the Vandalia and the Panhandle side of the Chicago Terminal.

There are two forms of pay rolls used; the one shown herewith as No. 1, is for agents and their forces, operators and employees of the transportation department, working by the month or day, and for all employees in the maintenance of way department and in shops. No. 2, is for all transportation employees in train service; the object in having the second form for trainmen is to provide space for different rates paid, so that a full thirty names may be shown on each roll. The rolls are made up on a typewriter, two carbons and an original being made. One carbon is sent to the pension department and one is retained in the superintendent's office, while the original roll on stiff paper is sent to the auditor's office, after having been signed by the superintendent and approved by the general manager. It is there audited and approved for payment and is sent to the treasury department. It reaches the treasury department on the third business day of the month, and on the same day the paymaster receives the treasurer's check for the cash that he will need the next day. He begins paying at 6:30 in the morning on the fourth day. Where the employee is known to the paymaster no witness' signature is required; where the paymaster does not know the employee and in all cases where the employee must sign his name by mark, a witness' signature is required.

A diagram of the arrangement of pay car is shown here-



This form is issued by the superintendent and is sent to an agent of the company before whom the employee must present himself and be identified.

Form Used to Pay Employees Who Leave the Service.

his hands, and at the same time, the employee has the portion of the roll to which he puts his signature directly in front of him. The paymaster stands behind the 53-in. counter and faces the rear doors of the car. He has an unobstructed view of the entire car back of the counter. Employees enter the car at the rear door at the left. There is a guard stationed between the two doors at the rear and one or two guards are placed where seats are shown outside of the pay

counter. The employee steps up to the paymaster's clerk, gives his name and signs his name on the line opposite the amount due him; the clerk calls off the amount due, this is repeated by the paymaster, who counts out the money from the drawer under the counter, the amount is again repeated by the clerk, is verified by the paymaster and is pushed across to the employee, who steps to one side, counts his money, and passes out by the rear door at the right. When gangs of

men are being paid, the foreman enters first, signs his name, receives his pay and steps inside the curved railing shown on diagram; the members of the gang follow in the order in which their names appear on the roll; after each one of the gang has been paid the foreman signs each roll once, as witness for the men in that gang. As the clerk calls each man's name, the foreman answers present for him. It is almost impossible for the wrong man to be paid under this system, if the rules are carefully followed. The foreman has the man that he is identifying directly in front of him and only a foot or two away.

In paying officers, instead of calling out the amount due, the clerk writes the amount on a slip of paper and hands it to the paymaster, who counts out the cash and lays the slip of paper on top of the amount and passes it across the counter.

Train crews have precedence over all other employees; there is room so that a line of trackmen can step to one side and let road enginemen and trainmen pass directly to the clerk and paymaster with no delay. It is a fact that on the Pennsylvania Lines West, from 300 to 350 employees are paid in an hour. There is not the least hurry or confusion, and almost never does a question arise that cannot be answered almost instantly and satisfactorily by the paymaster. It will be noticed that there is room for three men to stand across the counter; one is signing his name, one is receiving his money, and one counting his money. Where the lower class of employees sign their names and receive from $30 to $75, the paymaster is a little ahead all of the time of the employee who finds his money waiting for him by the time he is finished with the pen; where the employee is of the higher grade, and makes less of hard labor in signing his name and receives from $100 to $200, the paymaster is usually a fraction of a second behind the man in getting the cash across the counter.

The underlying objection that railroad men generally have had to the payment by cash is that the treasury department has not been broad enough, or shown common sense enough to co-operate with the operating department. It would seem that it would not take a high order of intelligence to realize that in making payments of wages the treasury department is not conferring a favor on the operating department, or on the individual employee. It has been a spirit of co-operation in the running of the pay car that has made payment in cash on the Lines West an unquestioned success. The system is by no means capable of running itself; the paymaster must be a high-class man, who can be trusted with large sums of money, but fully as important, he must be a man who can enter into the spirit that lies back of the use of the cash system; this spirit is somewhat intangible, of affording every possible facility to the men. At terminals and shops an old coach is attached to the rear of the pay car so that men waiting to be paid may be protected from the weather.

The object in having a treasury department is to have money paid by a different department than the one which authorizes

Check Used to Pay Into Court Judgments Obtained In Attachment Proceedings.

but it may be suggested by saying that the burden of seeing that the employee gets his wages easily and quickly rests not on the employee, but on the paymaster. In running the car, the operating department is consulted and every effort is made to put the employee to as little trouble as possible, the car stops at each crossing, at each point where it is most convenient for men to reach it, and is handled at all times with the sole object

car distributes pay checks directly to employees, this danger is done away with; the operation of a pay car in this case is a little less costly than under the cash system, but on the other hand, the convenience to the employee is very greatly less. The company receives a valid receipt in either case and the expense of preparing the checks from the rolls is considerable.

The most fruitful source of danger of fraud on the one

hand, or of inconvenience to the employee on the other hand, is in cases where a man leaves the service, or, for some other reason, must be paid before the rolls are made up, and before the pay car makes its trip. Under the cash system on the Pennsylvania Lines West, Form No. 7 is used in such cases. This form is issued by the superintendent, requires the signature of superintendent and the counter signature of some one designated by him, and is sent in a sealed envelope to the paying agent, who is authorized to give cash to the employee on proper identification and is then permitted to remit the signed receipt as cash with his other cash. Where an employee has been unable to meet the pay car and it is found necessary to pay him before the pay car makes its next trip, a check (Form 6) is sent directly to the employee.

A very important use of this check on the Pennsylvania Lines West is in cases where employees are, because of sickness or from some other unavoidable cause, in urgent need of money. In such cases a check may be sent before the end of the month, and the relief granted is often of very great importance, while the loyalty gained from such treatment is a matter that can hardly be measured in dollars and cents.

In a case where the employee misses the pay car one month, a copy from the pay roll (Form 3) is made and is sent out each month on the car for two years, or until the pay has been received and receipted for by the man who has earned it. The man signs this duplicate in the same way as he would the pay roll and it is then attached to the pay roll to which it belongs.

The forms used in connection with the attachment of employees' wages or liens obtained on the wages are shown herewith, the explanation of the use is given with each form.

Some conception of the labor involved in paying out nearly a million dollars from each car in small denominations in 16 days may be gained when it is said that 145,000 pieces of money are handled in one day by the paymaster. The silver is in a drawer at the right hand side of the counter, and the bills, which are in three piles, 5's, 10's and 20's, in a drawer at the left hand side of the counter. Silver dollars and change are used to pay fractions of $5, and unless a man has particularly asked for larger denomination bills, nothing larger than a $20 bill is used to pay with.

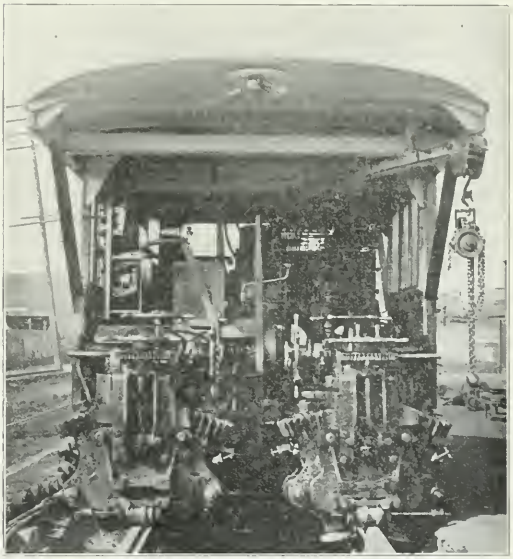
The paymasters receive a day or two in advance their checks for daily requirements. These checks vary from $80,000 to $150,000, and are drawn to the paymaster's order by the treasurer. They are drawn on a bank in a town which the paymaster will reach on the day he needs to cash the check and the paymaster keeps the bank informed ahead of time of the denominations of bills which he wants. A consistent effort is made to get clean bills. By paying in no higher denomination than a $20 bill, although it takes a little more of the paymaster's time, the employee is given his wages in a form that is most convenient for him. He does not have to wait to go to a bank to have a $50 bill changed; he has some large and some small bills, and, most important of all, he is not dependent on the saloon keeper for favors, as is the case where checks are used. Neither does he have to ask a favor of the railroad company's agent, as is the case where checks are used and companies' agents are authorized to cash these checks.

The success of such a system as that used on the Pennsylvania Lines West for the payment of employees depends on the care in working out the details, in the training of men, and the perfection with which every minutest detail is gone through with. We have become accustomed to accept without question the fact that a variation of a hundredth part of an inch in some piece of machinery will throw the entire machine out of order. A system of paying by cash where such large quantities of cash are handled requires a machine that is as delicately and truly adjusted as a watch. Every detail and every measurement of a pay car must be studied and adjusted and readjusted until it exactly fits and meets its requirements. A delay of a fraction of a second in turning over the rolls in the clip will add up to a strikingly large figure when multiplied by the number of times that the rolls have to be handled in 16 days by the paymaster's clerk. The paymaster has no way of checking up the amount of money which he pays out until the end of the 16 days. It is therefore, absolutely essential that each transaction, that is, each payment, shall be perfectly made. To do this at the rate of 300 payments an hour without confusion and without hurry requires a high class of man for paymaster, as well as a minutely worked out system.

A CONTINUOUS RAIL.

A composite rail consisting of a base section and a separate top section which staggers joints and which can be rigidly attached to the base, has been developed by the Continuous Rail Company, and has been tested with satisfactory results in street railway tracks in Leeds, England; Paris, France, and Chicago, Ill. While a number of advantages that the rail possesses for street railway work do not apply to main line service on steam roads, there are advantages claimed for such service that are attracting the interest of the steam railway engineers to whom designs have been presented.

For use in paved streets the combined rail can affect a very great saving, because in renewing, only the top section of the



Electric Machine Used for Crimping Flanges of Continuous Rail on Base Section.

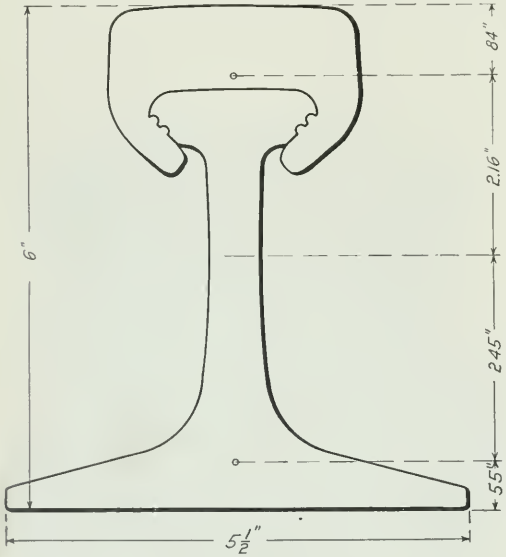
pavement need be disturbed to allow the lips holding the top section to the base to be cut away and those on the new section to be rolled into contact. For electric lines the increased conductivity resulting from the action of the alternate sections as a mechanical bridge over the joints of the other sections, allows a material saving in copper bonding.

The principal advantages urged for such a rail in main lines of steam railways are the absence of open joints and the ability to renew the worn heads without displacing the base of the rail. For exposed track the joint in the top section would be placed at a distance from the joint in the base equal to about 10 per cent. of the length of the rail, or 3 ft. in a 30 ft. rail. To allow for expansion and contraction, the lips holding the top section on the base would only be bent into contact and would not be crimped tightly to the base over this short sec-

tion between the two joints, making a slip joint. This would allow free longitudinal movement between the base and the top section for the last 3 ft. of the "taking off" rail, the receiving rail being made fast. The joints in the head section of the rail would be supported by a solid base rail, eliminating low joints and the tendency to extreme wear and breakage at the joint. It is also claimed that the danger from broken rails would be very materially decreased, as a break in either the base or the head could scarcely occur directly above or below a joint in the other portion of the rail and a break resulting from a defect in either section would still leave the rail strong enough to carry traffic. The higher original cost of the continuous rail is offset by the fact that the worn head can be removed and a new one put on without taking out of service the heavy base section.

It has been shown by examination of continuous rails in service that the quality of the metal is better than that in standard rails, because in the continuous rail the head section is so rolled in the mills that the tread receives the direct pressure of the rolls at each pass.

In laying the rails the top section is dropped over the base



Section of Continuous Rail With Removable Head.

section and a machine for bending the lips is then run over the track, making the connection shown on the drawing. When these lips are first bent the metal along the inner edge of the section is in compression and that along the outer edge in tension, tending to draw the lips away from the base section. The operation of rolling is continued, however, until the metal in the lips is caused to flow transversely and becomes materially elongated so that the stresses are reversed, bringing compression along the outer edge and tension along the inner edge. As the result of this cold rolling process, the lips of the upper section are converted into springs to grip the head of the lower section. In a test made by R. W. Hunt & Co., a pressure of 72,330 lbs. was required to start a slipping movement of the head section over the base in a test piece 12 in. long cut from a rail that had been laid in the track. To remove the worn head a rolling cutter is substituted for one of the rollers and the machine is passed back and forth along the rail until a cut through about two-thirds of the thickness of the lip is made. It is then possible to break the remaining thickness, remove the old top section and place the new one.

A section of the continuous rail corresponding to the New York Central 100-lb. rail is shown in the accompanying drawing. The area of the base section is 7 sq. in., and of the top section, 3.74 sq. in., giving the combined section a weight of about 108 lbs. As shown in the sketch, the proposed section is so designed that the neutral axis is an equal distance from the top and bottom of the compound rail. The moment of inertia of this section is 50.76, and the section modulus 16.92.

Although no continuous rail has been installed on steam roads, it is thought that the first development for such lines will be the combination of open-hearth base and rolled manganese top. It is claimed that such a construction would insure a better grade of metal in the tread than can be secured with solid manganese rails, would offer all the improved wearing qualities of solid manganese rails at a lower price and in addition, would provide for the renewal of the manganese tops at a comparatively low cost.

PROTEST AGAINST FREIGHT CLASSIFICATION BY GOVERNMENT.

The National Industrial Traffic League has issued an appeal to its members to use every influence against the passage by Congress of the bill, already passed by the Senate, to require the Interstate Commerce Commission to formulate a uniform classification. In its circular the league says:

"We fear a legislative-made classification would be too rigid and not sufficiently flexible to meet the varying conditions existing in different territories and constantly arising under the varying demands of commerce. We believe the right of initiative in the making of the classification of freight should continue with the carriers through a proper body constituted for that purpose; that the work of the classification committee, or committees, should be subject to review upon formal complaint as to any specific item or items, or, upon its own initiative, by the Interstate Commerce Commission as now authorized by the act to regulate commerce."

New Zealand Railways.—The railway system in New Zealand comprises about 2,761 miles. Broadly, the system in the north island consists of the north and south trunk line running fairly central, and connecting Auckland and Wellington, the capital, with loops and important branches to east and west ports with some short spurs. In the south island the main line is an east coast one, with several branches running inland, more especially in the south. In the north and east of the south island the lines are at present isolated, but construction now in hand will lessen this defect. Many of the lines have entailed expensive construction, even with the economy in rough country that the narrow gage undoubtedly gives. Up to the date of the last report of the railways the cost has been an average of $53,615 per mile.

Tasmanian Railways.—Tasmania possesses 477 miles of railway on the 3 ft. 6 in. and 2 ft. gage, there being 25 miles of the latter. The main line from Hobart to Launceston, which was the first railway to be constructed, was opened in 1876 by the Tasmanian Main Line Railway Company, and was operated by that company until 1890, when it was purchased by the government. It is 113 miles long. Another, the Launceston & Deloraine, 45 miles long, was projected by a private company, helped by the government, but had to be taken over by the latter in 1872. A third line of private ownership opened in 1884 was that of the Emu Bay Company, which is still in their hands. The extensions since the above date are chiefly branches of the main line. The average cost per mile of the Tasmanian railways, some of which are through rough country, has been $42,660. The gross receipts last year were $1,389,580, the working expenses $1,077,650, and the net receipts $311,930.

LOCOMOTIVE TENDER DERAILMENTS.

More Contributions to the Controversy Which Started Last September. A Suggestion as to the Westport Wreck.

In the *Railway Age Gazette* of September 27, 1912, page 569, E. W. Summers of Pittsburgh, Pa., in a communication entitled "A Fortunate Wreck," commented upon tender derailments. A number of our readers took exception to his theories, while others agreed with him in whole or in part, the controversy extending over a couple of months.* Because of the heavy demands on our space it was not possible to publish several communications which were received during the latter part of the year, and which have an important bearing on the subject. Three of them are presented herewith in the order in which they were received:

"G. E." REPLIES TO MR. SUMMERS.

Under date of November 11, "G. E." wrote as follows:

In Mr. Summers' further discussion† of the subject of tender derailments, he disagrees with my statement that the velocity of the wheel is practically unaltered. Let us consider the simple case assumed by him, of a single wheel rolling along the track at a velocity of 88 feet per second, striking an obstruction one-

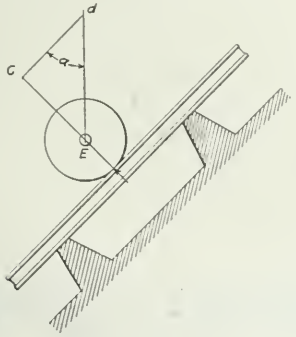


Fig. 1.

half inch high. Its kinetic energy before striking (neglecting that due to rotation) is about 240,796 foot pounds. To raise the wheel ½ in. a portion of this amounting to $\frac{2{,}000}{2 \times 12}$ is expended, leaving 240,713 foot pounds. The velocity corresponding to this energy is $\sqrt{\frac{240{,}713 \times 2 \times 32.16}{2{,}000}} = 87.98$, or about ¼ in. per second less than when it struck the obstruction. Now the average velocity as it rolls onto this half-inch elevation, can be roughly taken as one-eighth inch per second less than 88 feet. The time required will be $\frac{1}{3 \times 88} = \frac{1}{264}$ seconds, so the distance lost will be approximately $\frac{1}{8 \times 264} = .00047$ inch. If the wheel is urged along by the momentum of the rest of the truck, the loss is but a small part of this. Is is enough to slew the truck?

Referring to Fig. 1 (the same as Fig. 3, page 783, October 25, 1912), let us assume the weights to be free to move to the left, just as the wheel of Figs. 1 and 2 (September 27, 1912, p. 570), is free to rise. If v is its velocity, the component of the velocity perpendicular to the rail is $v \sin a$. Then the effect of the blow will be practically the same as if the weight struck the rail perpendicularly with a velocity of $v \sin a$. The energy of the blow would, therefore be $\frac{w\, v^2 \sin^2 a}{2g}$. But Mr Summers says the force of the blow (by which we must understand him to mean the energy of it) is reduced in proportion as the sine of the angle a is less than 1. This would make it $\frac{w\, v^2 \sin a}{2g}$. If Mr. Summers was correct, we might have the weight strike two rails perpendicular to one another, the blows being $\frac{w\, v^2 \sin a}{2g}$ and $\frac{w\, v^2 \cos a}{2g}$. In other words, we would put $\frac{w\, v^2}{2g}$ foot-pounds of work into the weight, and get back $\frac{w\, v^2}{2g}$ (sin a + cos a). We would build a "perpetual motion" machine at once.

Notwithstanding these differences in calculations, Mr. Summers is certainly correct in calling attention to the danger in high speeds over the track he describes, and I have no desire to disparage his design of truck.

Since the tender frame and the truck bolsters are held in the same relative positions, notwithstanding the location of the side bearings, it is difficult to see how the spacing of them can have any effect upon tender derailments. The thousands of six wheel trucks and of recent four-wheel trucks for steel cars, having side bearings far outside the journals, carrying loads with high centers of gravity, have reputations for safety which cannot be assailed.

FROM MR. SUMMERS.

Under date of November 25, 1912, E. W. Summers, president of the Summers Steel Car Company, Pittsburgh, Pa., wrote as follows:

I am pleased to have the criticism and endorsement of Prof. Lewis E. Moore, of the Massachusetts Institute of Technology, as published in your issue of November 15, 1912, page 919, on my tender derailment articles.

This computation, coming from one of his position and standing, in such an institute as "Boston Tech.," should be accurate and be received as such by the readers of these communications. I have not attempted to make an accurate calculation of the forces set up and am willing to accept the results as found by Professor Moore. I can not agree with some of his assumed conditions; viz. (1) that "If the obstruction is practically unyielding, it will cause the wheel to rise over it. When the center is directly above the obstruction, *the wheel will be moving in a direction parallel to its original direction, in that case, horizontal.*" (Italics mine.) It will not do this, its trajectory at that high velocity will be a curved line for a distance after the center of the wheel is directly above the obstruction. (2) Quoting from Prof. Moore's communication, second column, page 920, "The actual fact of the matter is that the center of gravity of the train and of each car of the train must move in a practically straight line on straight track of uniform grade. The rocking which is so often noticed is caused by a transverse rotation of the car about its own center of gravity, *the center of gravity itself moving in a straight line.*" (Italics mine.)

If you have a *straight track* of *uniform grade*, the car will move in a straight line parallel with the track. The irregularities in supposedly straight track cause the car to rock, pitch, twist, pound and do all kinds of stunts. There is a tendency to rotate about its own center of gravity when a force is applied at one side of its center of mass, and this undoubtedly is what happens within the limitation of the possible lateral movement between the parts of the truck and the car body or tank.

In Fig. 2 is a cross section through an ordinary tender tank and center bearing truck. Fig. 3 shows the same tank in cross

Railway Age Gazette, October 11, page 667; October 18, page 723; October 25, page 783; November 8, page 874; November 15, page 919; December 13, page 1130. See also article by A. Stucki in the issue of January 17, 1913, page 111.

†*Railway Age Gazette*, October 25, 1912, page 783.

section carried on a balanced side bearing truck. In each case the center of gravity of the tank and its load, exclusive of the truck, is located at about 7 ft. above the rail. In Fig. 2 the center of gravity is 4 ft. 8 in. above the center plate and 3 ft. below the top of the tank. The tank is often known to sway sideways at the top from 4 to 6 in. each side of its central position. In the illustration it is shown 5 in. to one side. If this rotation was to take place about its center of gravity, the bottom of the tank or the center plate would have to move sidewise in the opposite direction about 7¾ in. This is a physical impossibility; only a small part of 7¾ in. movement can take place through the play of parts of the truck.

In Fig. 3 there is no center support, and a lateral movement can take place. The maximum movement of 2¾ in. is shown, but this does not occur when moving at high velocity. For slow movements the center of rotation is about the intersection of the

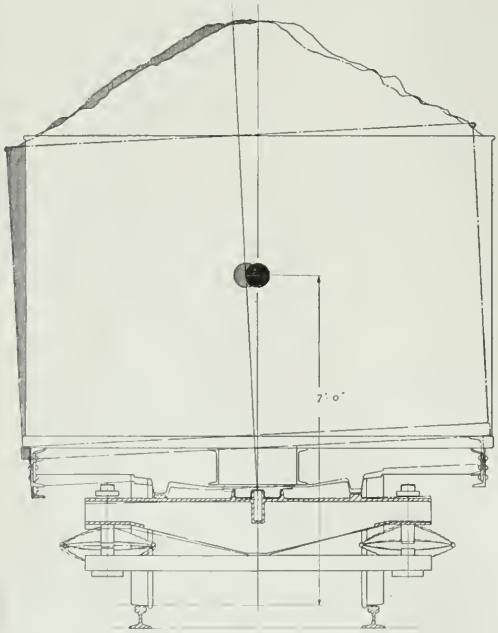

Fig. 2—Cross Section Through an Ordinary Design of Tender and Center Bearing Truck.

center lines of the inclined hanger bars extended until they meet above the center of gravity position of the tank.

A lateral movement of the heavy shaded parts of the truck can take place by reason of the horizontal springs which are attached to the king pin. The cradle member, upon the outer ends of which the car is supported through the inclined hangers, is pivoted about the king pin. On account of the inertia of the tank and its load, the center of gravity with this construction can and does move in a straight line when traveling at high velocity. The cradle moves sidewise and the vertical truck springs give in such a way as to permit the tank or car body to actually *rotate about its own center of gravity*. This "phase of the question of dynamics" will bear close analysis.

With the side bearing truck illustrated in Fig. 3, the distortion of position shown by the shaded parts at the side and above the tank is that which the parts will assume when standing on a track having a warped surface of about 7 in. in the length of the tender, or from centers of trucks. This shows clearly the flexibility of connection between truck and tank. Rocking in the ordinary sense does not occur with cars carried on this kind of a truck and the vertical hammering between side bearings, common with the ordinary center bearing truck, is entirely eliminated.

The vertical reaction of 352,000 lbs., and the horizontal one of 86,000 lbs., as found by Professor Moore, due to lifting 2,000 lbs. ½ in. in 1/264 of a second will have an increase limited only by the strength of the resisting structure when subjected to the condition shown in Fig. 2, if the left hand wheels are compelled to make an abrupt upward change in direction due to track conditions.

In Figs. 2 and 3, I have purposely chosen a tank having a height of top and center of gravity much lower than many that are in use, rather than to show extreme conditions.

Within the limitation of remaining on the track the results of excessive reaction are shown on the treads of wheels. Quoting the statement of a prominent steel wheel maker, as follows:

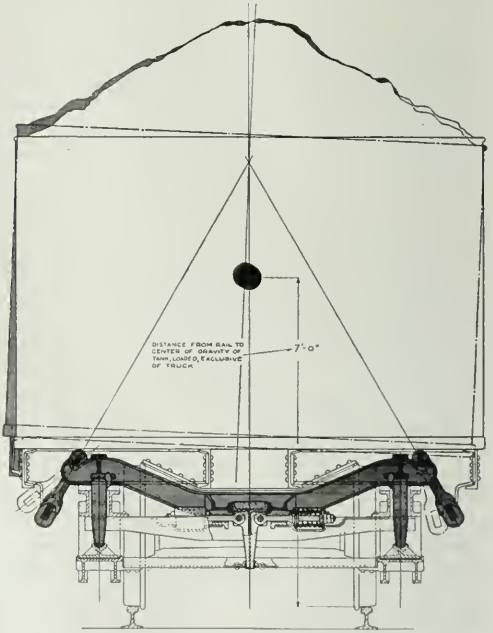

Fig. 3—Cross Section Through Tender With Balanced Side Bearing Truck.

"Over 90 per cent. of the trouble commonly known as 'shelling,' 'spalling,' or 'flaking' of wheels, no matter whether they are solid steel or steel tired wheels, occurs in connection with wheels in service under tenders."

PROF. MOORE ON THE WESTPORT WRECK.

Under date of December 10, 1912, Lewis E. Moore, assistant professor of civil engineering at the Massachusetts Institute of Technology, wrote as follows:

I have been thinking over the Westport accident in connection with my letter on tender derailments published in your issue of November 15, and have been particularly struck by the fact that the tender in this case left the rails at a point about as far beyond the crossover as the distance between the two curves in the crossover. The idea of rhythmic oscillations in cars, engines and tenders under certain conditions, which I advanced in the letter above referred to, is interesting in this connection. Let us consider for a moment what would happen under such circumstances. When the tender entered the crossover it would careen sharply to the left, owing to its being carried on springs,

and also owing to its high center of gravity. In this position, the left hand wheels (on the outside of the curve *A*, Fig. 4) would be held hard down on the rails and the right-hand wheels would have the load materially lightened on them and might even raise from the rails, although I am quite certain they would not in the first oscillation. Raising from the rails would not, however, produce a derailment under these conditions, because the wheels on the *outside* of the curve would be held down hard on the rails. As the tender entered the curve *B* just before leaving the crossover, it would be recovering from its careen to the left and swinging to the right like an inverted pendulum. This curve to the left would accentuate the careen to the right, which the tender had already begun under the action of the springs in trying to resume their normal shape. This would cause the right-hand wheels to bear down hard on the outer rail of the curve *B*, and would probably lift the left hand

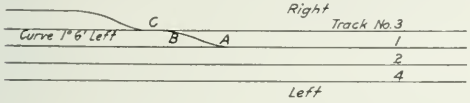

Fig. 4—Arrangement of Tracks at Westport.

or inner wheels up from the track for an instant, but would not cause a derailment, because of the fact that the *outer* wheels would be held down hard on the rails. The tender would then swing back again in a pendulum like fashion toward the left and ordinarily would come to rest after a series of oscillations. What may have happened on this swing toward the left in this Westport case is of interest. As the tender oscillated again toward the *left*, it started around a curve also to the left, and when it reached its extreme of oscillation at *C* was bearing heavily on the left-hand or *inner* wheel. The right-hand or outer wheels, upon which outer wheels devolved the duty of keeping the tender from leaving the rails, were *raised* a little; it need not have been over an inch from the track, for a passing instant, and of course could not longer perform their function of keeping the tender following the curve and the derailment occurred.

In support of this theory, I have endeavored to make a rough mathematical or rather mechanical investigation with the following results: In the first place, it would be impossible for the centrifugal force alone to raise the wheels from the track on a curve such as the one in this crossover. The weight of the tender was about 67 tons fully loaded, and if the radius of the curve in the crossover be taken as 900 ft., and the center of gravity of the tender be assumed as 8 ft. above the rail and the speed 45 miles an hour, or 66 ft. per second, the centrifugal force would be $\frac{W}{g}\frac{v^2}{r} = \frac{134{,}000 \times 66 \times 66}{32.2 \times 900} = 20{,}200$ lbs., and the forces acting on the tender would be as shown in Fig. 5. This set of forces alone could not possibly cause derailment unless the rails should spread, which did not occur in the case under discussion. The tender is not, however, rigid on the wheels and the centrifugal force (Fig. 5) will push it over to the left compressing the left-hand springs and relieving the right-hand ones. The springs then try to assume their original shape, which has a tendency to make the tender oscillate to the right.

If the tender strikes a curve to the left of the 900 ft. radius at this time, the forces acting on the body of the tender will be as shown in Fig. 6. The wheels and springs are removed in this figure and the tender body above the springs is shown diagrammatically. The vertical forces are unbalanced as far as rotation about the center of gravity is concerned and tend to turn the tender in a right-hand direction, *aided now by the centrifugal force*. The result of this combination of forces is that the distance through which the tender will oscillate before the springs stop it is much greater than before, and probably will be enough to lift the left-hand wheels off of the track, but will not cause a derailment because the right-hand wheels keep it following the curve. At the extreme point of the oscillation, the tender will be in the position shown in Fig. 7. If the track be straight from this point on, the action of the springs will be to rotate the tender to the left, compressing the left-hand springs and reducing the pressure on the right-hand ones until very likely the right-hand wheels will be lifted off the track and the forces will be as shown in Fig. 8. If, however, a curve to the left be encountered during this oscillation, the tender will surely leave the track when the right-hand wheels lift, as it depends upon the flanges of the right-hand wheels to make it follow the curve.

For the action outlined above to occur as shown the time of oscillation of the tender must be such that the springs will be throwing the tender to the right when the curve *B* is struck. If the elapsed time interval be great enough for the tender to have swung from left to right and to have started back to the left again as the tender enters the curve *B* the centrifugal force and the action of the springs will mutually counteract each other, and the tender will be steadied by the curve *B* instead of being made to oscillate more violently.

In this case the distance from the beginning of the crossover to the point of derailment was about 200 ft., with the end of the crossover a little over half way from the beginning of the crossover to the point of derailment. In this distance the tender would make about 2½ oscillations, a half one first to the left, then a full one to the right and a full one to the left, or one full swing in about 100 ft., or say 1½ seconds at a speed of 45 miles an hour.

If the radius of gyration of the tender about its axis of rotation were about 7 ft., the time of vibration *T* would be

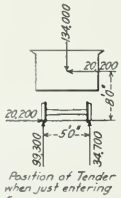
$$T = \pi \sqrt{\frac{K^2}{ag}}$$

where K^2 = the radius of gyration of the tender about its axis of rotation.
a = distance from center of gravity of tender to axis of rotation.
g = acceleration of gravity, or 32.2 ft. per second per second.

For our purposes, considering the approximations that we must make, *K* may be taken equal to *a*, and if both be taken as 7 ft.

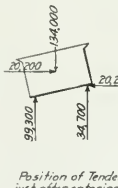
$$T = 3.14 \sqrt{\frac{7 \times 7}{7 \times 32.2}} = 1.46 \text{ seconds.}$$

The value of 7 ft. for the radius of gyration is entirely reasonable, owing to the fact that the centrifugal force, acting as it



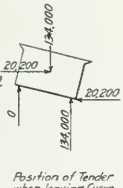
Position of Tender when just entering Cross-over

Fig. 5.



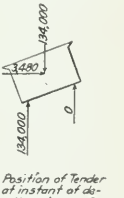
Position of Tender just after entering Curve B.

Fig. 6.



Position of Tender when leaving Curve B.

Fig. 7.



Position of Tender at instant of derailment near C

Fig. 8.

does through the center of gravity, gives the tender a translatory motion sidewise which combines with the spring action to cause rotation about a "virtual axis" below the center of gravity of the tender, and thus makes the radius of gyration greater than that about the gravity axis of the tender.

Of course the centrifugal force on the curve after leaving the crossover will tend to counteract the swing of the tender to the left, but this force is comparatively small, being only

$$\frac{13.4000 \times 66 \times 66}{32.2 \times 5{,}200} = 3{,}480 \text{ lbs.}$$

and will be overcome by the reaction of the springs.

The sloshing of the water in the tender will, of course, make

an exact solution impossible, but it should be noticed that the action of the water will augment the effects pointed out above. As the tender strikes the right hand curve *A*, the water will slosh over to the left, then to the right as the left-hand curve *B* is struck, and then to the left in an attempt to seek its level after coming out of the crossover. It would just about be clear over to the left of the tender again at the point *C*, where the wheels left the rails as its oscillation also would be rhythmic.

This solution is different from that in the report, but it only requires the wheels to lift less than an inch, whereas the solution given in the report* required the wheels to lift a foot off of the rails and to run for some distance in that position. The centrifugal force could not possibly do this unaided in this case unless it produced oscillations similar to those herein outlined. The report states that the tender was careened to the right and remained in this position while it was "going from the west end of the crossover to the point where the main rail meets the facing switch." If this were the case and it was careened as much as the report assumes, why did it not leave the track where the trailing point of the crossover met the stock rail of track No. 3? The extra width of rail head necessary to produce a derailment under the theory outlined in the report existed at this point.

If the oscillation theory I have given is correct, as I am sure it is, the only effect the facing point switch from track No. 3 to the siding had on the wreck was to deflect already derailed wheels further from the main track.

SUPREME COURT SUSTAINS NEW ORLEANS-MOBILE RATE REDUCTION.

The decision of the Supreme Court in the case of the Interstate Commerce Commission against the Louisville & Nashville, in which the commission appeals from the decision of the Commerce Court, in the New Orleans rate case, was noticed in last week's issue, page 185. The Commerce Court disapproved the commission's order reducing freight rates from New Orleans to Mobile and Montgomery. The commission is now sustained in its decision that the road, having maintained low rates for many years, is bound to continue them, having failed to show sufficient reason for an advance which was made in 1907. The Commerce Court held that the commission had reached its decision without giving proper weight to the evidence; but the Commerce Court is now overruled.

The decision of the Supreme Court, handed down by Justice Lamar, January 20, deals with the subject under nine heads. Under the first he emphasizes the right of all parties to a rate controversy to have a full hearing. A finding without evidence is arbitrary and baseless. The plea of the government, in behalf of the Interstate Commerce Commission, if allowed, would mean that the commission had a power possessed by no other officer, administrative body or tribunal under our government. The commission could disregard rules of evidence and capriciously make findings by administrative fiat. Such authority is inconsistent with rational justice and comes under the constitution's condemnation of all arbitrary exercise of power. Ten decisions are cited to the effect that administrative orders, quasi-judicial in character, are void if a hearing was denied; or if that granted was inadequate or manifestly unfair, or if the finding was contrary to the indisputable character of the evidence.

2. The Interstate Commerce law calls for methods of procedure that "conduce to justice."

3. After hearing, the commission may set aside a rate shown to be unreasonable. If there was no evidence to show unreasonableness, there was no jurisdiction to make the order. The court will not review the commission's conclusions of facts by passing upon the credibility of witnesses or conflicts in the testimony, but the legal effect of evidence is a question of law. A finding without evidence should be set aside "by a court of competent jurisdiction."

4. The law requires the commission to obtain information [without hearings] to perform its duties; but, says the court, such information, while properly used as a basis for instituting prosecutions and for other purposes, is not available where a party is entitled to a hearing. The fact that the commission is not limited by strict rules as to the admissibility of evidence makes it all the more obligatory to preserve the essential rules of evidence. The commissioners cannot act upon their own information as could jurors in primitive days.

5. There was water competition from New Orleans to Mobile, from the beginning, when the road was built, in 1871. In 1887 the rate from New Orleans to Montgomery was adjusted in accordance with the award of Judge Cooley. This award took into consideration rates from points on the Mississippi river in Kentucky to Montgomery, and in certain other territory. The increases which are the subject of controversy were made in 1907. The decision discusses only typical rates. The through rate on class 3, from New Orleans to Montgomery, 68 cents, was 13 cents higher than the combination of the locals from New Orleans to Mobile, 25 cents, and Mobile to Montgomery, 30 cents. New Orleans merchants, to get the advantage of the lower rate shipped goods to Mobile, had them unloaded and then reshipped to Montgomery. When the commission ordered that the through rate should not exceed the sum of the locals the road advanced the local from New Orleans to Mobile from 25 to 38 cents. On December 31, 1909, the commission directed the old locals to be restored, and a corresponding reduction made in the through rate. In evidence before the commission were reports of the railroad company showing earnings and expenses in detail, and tariffs of other railroads for comparison. The commission took the testimony of merchants from New Orleans who had lost business by the increase in rates. The commission found that the rate per ton per mile to Montgomery was higher from New Orleans than from Memphis; that many departures had been made from the Cooley award, and that westbound rates to New Orleans had not been increased. It was held that the old low local rate out of New Orleans had been so long in force as to create a presumption that it was reasonable and compensatory.

6. The court holds it not necessary to review all of the facts in the suit; only the most salient points are mentioned. The validity of the commission's order does not necessarily depend upon the correctness of all of the findings. The question is whether there was substantial evidence to support the commission's order.

7. In the conflict of evidence as to whether comparisons with other rates were proper, the court holds that the value of such evidence varies according to circumstances, but the weight to be given to it is to be decided by the body experienced in such matters and familiar with the complexities, intricacies and history of rate making in each section of the country. As to whether the lower rates westbound were justifiable, the commission was authorized to judge.

8. The abnormally low rate forced by water competition furnished no just standard of reasonableness. Water competition was not potential for some years prior to the increase made in 1907. When made, the increase was not because of the absence of water competition, but to make the sum of the locals correspond with the through rates.

9. The reduction ordered by the commission will upset the Cooley award, under which rates had been adjusted throughout a large section; but that was a matter properly to be decided by the commission. The commission's order was not arbitrary, but was sustained by substantial, though conflicting evidence. The courts cannot settle the conflict, nor put their judgment against that of the rate making body; and the decree of the Commerce Court is, therefore, reversed.

*Railway Age Gazette, November 29, 1912, page 1035.

THE USE OF HIGHLY SUPERHEATED STEAM.

As the Demands for Power Are Increased in the Operation of a Superheater Locomotive, the Efficiency Increases.

By Gilbert E. Ryder.*

Since the success of the locomotive superheater became established in this country, about 2½ years ago, there have been over 6,000 applied to new and existing locomotives in operation on more than 100 railroads. The type best adapted to American practice has proved to be the fire tube superheater furnishing steam with from 200 degs. to 250 degs. superheat. With this high degree of superheat the steam has a specific volume roughly 30 per cent, larger than that of saturated steam at the same pressure. In passing from the superheater into the cylinders some of the superheat is lost and the specific volume is reduced to a point approaching that of saturated steam. There is, however, at the moment of cut-off, or at the point where the expansive action of the steam commences, fully 100 degs. of superheat in the steam, which is enough to carry it through the expansion and out the exhaust without any condensation. The entire elimination of all losses through condensation, together with the somewhat increased specific volume of the steam, effects, under average conditions, a saving of 30 per cent. in the steam consumption per indicated horsepower and a corresponding saving in fuel of 25 per cent. as compared with a saturated locomotive of the same type, operating under the same conditions.

The increase in hauling capacity is obtained by the increase

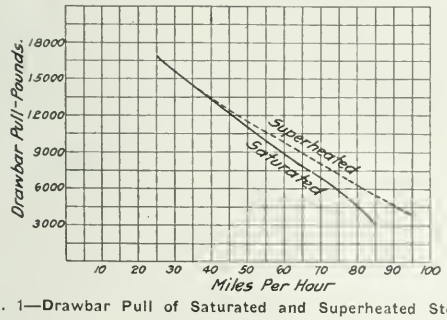


Fig. 1—Drawbar Pull of Saturated and Superheated Steam Locomotives.

in efficiency of the locomotive, made possible principally by the entire elimination of condensation and in a small part by the increase in specific volume of the steam. To illustrate the increase in drawbar horsepower obtained, it is convenient to assume two locomotives of the same dimensions and working under the same conditions of boiler pressure, cut-off and speed, developing the same indicated horsepower, one using saturated steam and the other using highly superheated steam. Under average conditions the superheater locomotive will burn at least 20 per cent. less coal per indicated horsepower. Then, if the same amount of coal is burned in the superheater engine as in the saturated engine, and if the efficiency of the boiler is the same, and the engine efficiency remains constant, the indicated horsepower developed would be 25 per cent. more than that of the saturated engine. That is, if a given amount of coal is burned in a superheater locomotive, say 80 lbs., a certain horsepower will be developed; then, in order to develop the same power, 100 lbs. must be burned in a saturated locomotive.

Only about 70 per cent. of the cylinder power, or the indicated horsepower, is available at the drawbar of the tender in the operation of saturated steam passenger locomotives at average speeds. By the addition of the superheater, the weight, dimensions, etc., of the locomotive are not changed materially and therefore, its efficiency as a whole, will increase over the saturated locomotive at corresponding speeds, because the cylinder power is greater, while the actual machine and tender friction remain practically constant. For example, a saturated locomotive developing 1,000 h. p. at the cylinders on a given amount of coal, 30 per cent, or 300 h. p., being consumed in the engine and tender, will have available at the tender 700 drawbar h. p. A superheater locomotive of the same dimensions operating at the same coal rate, will develop 1,250 h. p. at the cylinders. The loss between the cylinders and the drawbar will practically remain the same, or 300 h. p., which will leave 950 h. p. available at the drawbar, which is approximately 35 per cent. greater than that developed by the saturated locomotive. This example shows clearly what increase in hauling capacity is possible by superheating. Results of test and road conditions have verified these figures many times.

It requires greater cylinder power to maintain a certain drawbar horsepower at the higher speeds. When the saturated locomotive has reached its limit in indicated horsepower, the superheater locomotive still has a margin in cylinder power because of the lower steam rate and consequent increased boiler capacity. In other words the engine efficiency, or the percentage of the indicated horsepower which is available at the drawbar, varies with the speed at which the locomotive is operated. The hauling capacity of the locomotive at different speeds depends on the tractive effort that can be developed and sustained at these speeds. The maximum sustained tractive effort depends in turn primarily on the boiler capacity. To show the supremacy of the superheater locomotive, as far as sustained tractive effort is concerned, the curves in Fig. 1 compare the drawbar pulls in pounds of a saturated and a superheated locomotive of the same general dimensions, at speeds ranging from 25 m. p. h. to 84 m. p. h. for the saturated locomotive, and to 95 m. p. h. in the case of the superheater locomotive. At 80 m. p. h., the sustained tractive effort of the superheater locomotive is about 33 per cent. above that of the saturated locomotive, and represents the increased hauling capacity available at the drawbar at this speed obtained by the use of highly superheated steam. In connection with these curves it is interesting to note that the limit in speed of the saturated locomotive with the train that it was pulling was very nearly reached at 85 m. p. h., indicated by the fact that the curve falls rapidly from 75 to 85 m. p. h. The same reference to the other curve would indicate that the limit of the superheater locomotive with its train, which was the same weight, was not reached at 95 m. p. h., the conditions limiting the speed probably being those of track, rather than that of insufficient boiler capacity.

The supremacy of the superheater over the saturated engine, or the increased hauling capacity obtained by it is clearly shown by a comparison of the curves in Fig. 2. While they show the drawbar horsepower of the saturated and superheater locomotives sustained at various speeds, considered in Fig. 1, they are representative of results that may be expected by the introduction of the superheater. The maximum drawbar horsepower of the saturated engine was developed at about 33 m. p. h., while the superheater locomotive developed its maximum drawbar horsepower at 50 m. p. h.

The increased hauling capacity realized in actual service by the use of highly superheated steam varies widely. The ton mile basis, however, which is generally used, is not altogether reliable and does not show the true increase in hauling capacity

*Locomotive Superheater Company, New York.

that is obtained. For example, we may consider a saturated locomotive operating a train of eight cars, weighing say 500 tons, over a 100 mile division, which would represent 50,000 ton miles. By the introduction of the superheater it is found possible to haul ten cars over the same division in the same time, burning the same amount of coal. When the superiority of the superheater locomotive is considered on the ton mile basis, the increase in ton miles, due to the superheater, in this case is 20 per cent., while in reality, there may have been many points on the division where the superheater locomotive was developing a drawbar horsepower much more than 20 per cent. in excess of that developed by the saturated locomotive.

In order to utilize to the fullest and most economical extent, the increased capacity of the boiler obtained by the superheater, the diameter of the cylinders should be increased in proportion to the increase in boiler capacity. It is not enough to merely increase the cut-off or the length of admission, because if this only is done, the steam will not be used at the same efficiency. That is, the cut-off coming later in the stroke, the steam does not have an opportunity to expand through the necessary range to insure its most economical use. The terminal temperatures and pressure are high, and consequently, the losses are greater. When superheaters are applied to existing locomotives the adhesive factor and the strength of the parts to withstand the greater piston thrusts must be taken into account. It is generally possible to increase the cylinder diameter to some extent without danger. This fact makes the superheater an economical remedy for locomotives where cylinders are too large for the boiler, or, in other words, for locomotives deficient in boiler capacity.

In the rating of locomotives the boiler capacity is in most cases either directly or indirectly the limiting factor and the maximum starting effort that the locomotive is capable of exerting is of secondary importance. Passenger locomotives and freight locomotives into the rating of which the speed element enters, are rated according to the ability of the boiler to furnish steam and maintain a certain tractive effort at the desired speed. The maintained tractive effort is only a fraction of the maximum starting effort of the locomotive, so that in almost all cases, it may be said that the tonnage rating is in reality based on the capacity of the boiler. Then, inasmuch as the increased hauling capacity is based upon the ability of the boiler to furnish sufficient efficient steam, the superheater installed in the boiler provides a reserve source of power which is amply sufficient to meet the demands that are made upon it. In fact, it has been said that the superheater locomotive cannot be overloaded, but that it will pull all that it can start. It is also a fact, that as the demands for power are increased in the operation of the superheater locomotive, the efficiency increases, which makes it possible to "beat it," under conditions where a saturated locomotive must be favored.

All parts of the locomotive require a certain amount of attention in order that they be properly maintained. There are, however, some parts, the maintenance of which is more vital to the efficiency of the engine than others. The superheater may be considerably neglected without resulting in a complete engine failure, but any neglect will affect its efficiency and the ultimate results in economy that may be realized will not be obtained. One instance, which I recall was that of an engine in passenger service, running out of Chicago. For some time this engine had been reported as not steaming well. The front end was examined and there were found to be three holes each of about ⅛ inch diameter in the unit pipes, having been cut by the action of the steam from a leak in the front flue sheet flange. Had there been a leak of this size in the steam pipe of a saturated engine, it would have been impossible to operate it all. The superheater locomotive, however, had a sufficient margin in steam capacity to make the schedule time over the division, although the economy that should have been obtained was not being realized. This incident is mentioned to bring out the importance of making periodical inspections and tests of the superheater, and particularly of the front end, in order to find any leaks that will affect the economy of the operation before they have become so large that the engine must be taken out of service to repair them. The practice of making an inspection every thirty days will insure a better economy in the performance of the engine, as well as prevent any small leaks becoming so large as to necessitate extensive repairs.

Another point to be carefully watched in the maintenance of the superheater locomotive is that of keeping the large flues clean so that the flow of gases through them will not be retarded or altogether stopped. The water heating surface in the boiler of the superheater locomotive is less than that of the boiler of the same design for saturated locomotives, and the large flues constitute a large percentage of this surface. The flue cleaning periods cannot be fixed to apply to all operating conditions; the quality of the coal used principally governs the fixing of these periods.

From a maintenance standpoint, the care of the flues necessitates the use of the flue roller, prosser expanders and beading tool. In using these tools, experience has proved that the prosser should be given the preference, using the roller only when absolutely necessary, and omitting the beading process

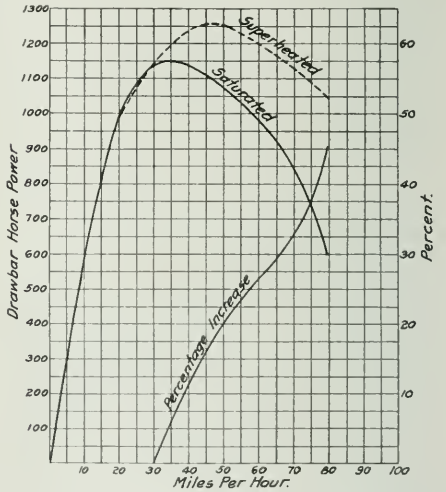

Fig. 2—Drawbar Horse Power of Saturated and Superheated Steam Locomotive at Various Speeds.

unless the condition demands that it be used. The designs of tools that have given the best satisfaction in carrying out this work, are the roller consisting of five rolls, and prosser of not less than twelve sections. Specific flue conditions, of course, demand that specific methods be used in caring for them, but the above applies in general.

The firing should be light and regular, on account of the fact that the coal economy is improved by the superheat, thereby necessitating the burning of a smaller amount of coal to develop the same power. The aim of the fireman on a superheater locomotive, in order to get the best results, and to make the work easier for himself, should be to maintain a fire that will result in the highest firebox temperatures. This practice will insure, as far as combustion is concerned, the highest degree of superheat and therefore, the best efficiency for the locomotive. In running locomotives equipped with superheaters the engineer should, in addition to satisfying himself that all parts are operative, carry the water in the boiler as low as operating conditions will permit.

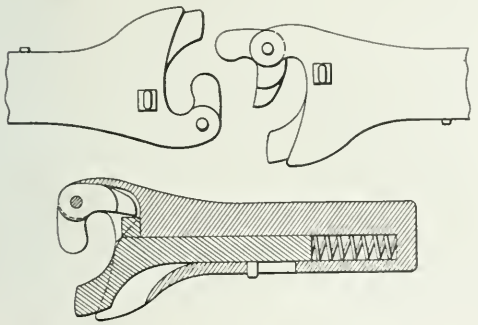
DISCUSSION.

In the discussion of Mr. Ryder's paper special emphasis was laid on the necessity of keeping the superheater flues clean and

of having the engine house foremen enforce this rule. The Chicago & North Western provides its inspectors and flue cleaners with flash lamps for this purpose. The greatest economy of superheater locomotives has occurred on long hard passenger runs. It was the consensus of opinion that it would pay to replace the slide valves with piston valves on old power in order to use superheated steam. In some cases this has been done without making an entirely new cylinder casting. The fact was also brought out that the stroke of an engine could be made shorter when superheated steam is used. The superheater damper has been removed on some locomotives, but it has been found that the superheater tubes deteriorate more rapidly when this is done.

A NEW DESIGN OF CAR COUPLER.

The aim of the inventor of the Stark coupler, which is shown in the illustration, was to obtain a coupler which would be automatic in all coupling conditions. The principal feature of the device is the plunger shown in the sectional view. This is intended, when struck by another coupler, to compress the spring at the bottom of the pocket and permit the opposing knuckle to enter. When pulling, the tongue of the knuckle forces the locking pin against the plunger and a series of corrugations on the faces between the plunger and the locking pin prevents the plunger from moving. It is claimed for this coupler that with the two knuckles in any relation whatever, there is no difficulty in coupling cars on either straight track or track with any degree of curvature. It is patented by C. H. Stark, Strasburg, Virginia.



New Design of Automatic Coupler.

VICTORIAN RAILWAY DEVELOPMENT PLAN.—Hitherto it has been the policy of the Victorian Railway Commissioners to construct lines on routes favorable to immediate profit bearing on the capital outlay. In order, however, to assist remote and isolated districts the government recently introduced into the Legislative Assembly a bill entitled The Developmental Railway Bill. The object of this bill is to permit the construction of lines in isolated districts even where the lines are likely to be operated at a loss for a number of years. Power is to be given to the Legislative Assembly to order the construction of one of these proposed lines at a time. A fund is also to be accumulated from the money received from the sale of Crown lands and added to that now in hand for the railway construction account, and this will be devoted to meeting deficits arising out of the working expenses and the interest on cost of construction for a period of 20 years. The bulk of the permanent way and other materials, rolling stock, etc., will more or less be provided locally, but there are certain types of plant, machine tools, etc., which will have to be imported for the local repair shops on the route.

General News.

The Wabash Railroad has increased the pay of shopmen in most cases from 6 to 10 per cent.

The Pennsylvania Railroad has notified all of its connections and also the Pullman Company, that wooden sleeping cars will no longer be accepted to be moved in Pennsylvania trains.

A full crew bill has been introduced in the legislature of New Mexico requiring an additional brakeman on passenger trains of more than five cars, and freight trains of more than 40 cars, and a fireman's helper on Mallet engines.

The Georgia Railroad, after extended conferences, has raised the pay of conductors and trainmen, about 300 men altogether. Train porters and switchmen are included in the advance. Many of the men will receive 10 per cent. increase, and some of them more than that.

A hearing before a master in chancery was begun at Chicago on January 27 in the suit by the federal government against several Oregon and California railways to cancel land grants of timber property on the ground that the railways have violated their government contracts for the disposition of the lands.

A. L. Ruthven, inventor of an automatic train stop, has been tried in the Federal court at New Orleans and has been convicted and sentenced to three years imprisonment in the Federal prison at Atlanta, Ga., for using the mails to defraud. He was selling stock at two dollars a share. Ruthven was also indicted in Canada.

The Clinchfield Railway Club has been organized with a membership of about 250 employees of the Carolina, Clinchfield & Ohio. All classes of employees are eligible to membership. The club has leased rooms at Erwin, Tenn., including two reading rooms and a hall, which will be provided with railway and general literature, newspapers and periodicals.

Isaiah Hale, safety commissioner of the Atchison, Topeka & Santa Fe, has announced a series of free lectures and entertainments for employees of the company, with moving pictures, lantern slide, music, readings and talks on the value of "Safety First," to be held at various towns on the lines of the road during the next two months. The moving pictures will illustrate accidents to trains and in shops and yards.

A committee of the Indiana senate has been holding hearings on a proposed bill providing for the separation of grades on the railways of the state, requiring the road community to pay 25 per cent of the cost and the railways the other 75 per cent. It is provided that the railway commission shall not make more than one order of this kind against a railway in any one year, and that no more than one grade separation shall be ordered for each 200 miles of track.

The Northern Pacific has offered to give its abandoned right of way and old roadbed between Tacoma, Wash., and Vancouver to the state of Washington for the proposed Pacific automobile highway. The property cost the railroad company more than $2,000,000, and the consideration asked is $1. The company had intended to build four steel bridges across the Cowlitz and Tottle rivers. The substructures for these bridges are in good condition and would be available for bridges for the proposed highway. Some of the roadbed has stood for 30 years and there is a graded right of way on which $1,000,000 was spent in 1899 and 1890.—*Exchange.*

As was noted last week the conductors and trainmen of the principal eastern roads are presenting demands or requests for increases of pay. In Canada, according to the press despatches, this movement is participated in by the enginemen as well as the conductors and brakemen; but the committees of employees will not call upon the officers of the Canadian roads for some little time yet. On the Bangor & Aroostook, where the enginemen struck last week, the conductors and trainmen are now demanding an increase in pay. The B. & A. relieved the congestion of freight on its line last Sunday, and seems likely to be able to vanquish the striking enginemen and firemen.

The New York Railways Company, operating surface street railways in New York City, has announced an increase of pay

of employees which aggregates $150,000. The general manager, in announcing this increase at a social meeting of employees, said that the company intended also to establish a number of stores at which the employees could buy the necessaries of life at cost. These stores will be available not only for the employees of the New York railways, but also for those of the Interborough Rapid Transit Company, the lines of which are operated in the same interest. The first store will be at Fiftieth street and Eighth avenue, Manhattan.

A statistician in Pennsylvania calculates that in the year 1912 120,000,000 tons of water were pumped out of the mines of the Lehigh Valley Coal Company, about 15 tons of water for every ton of coal produced. This is believed to be about the average proportion for all the companies operating in the anthracite region. The output of water from the Pennsylvania anthracite mines long ago overtook and passed the output of coal, but no one thought twelve or fifteen years ago that the pumping problem would be as serious as it now is. The cost of pumping is one of the most important elements in the increased cost of mining. As the richer and more accessible veins of coal have been exhausted, shafts have been sunk lower and lower. In his last annual report the chief of the Pennsylvania Department of Mines gives the number of pumps used for pumping water out of the anthracite mines as 901, and their total capacity as 929,248 gallons a minute.

Indiana, the legislature of which is one of the most fertile fields for new railroad laws, is coming to the front in good shape for 1913. Representative Cunningham, of Miami county, proposes to compel railroads to install "automatic fireboxes" on locomotives! If this scheme should succeed we may next hope, perhaps, to have some legislative provision which will automatically deal with hot boxes—preventively. Two bills have been introduced to require railroad companies to pay employees twice a month. There is a movement among employees in opposition to this proposal, but certain employees drawing moderate pay say that the opposition comes from a few railroad men who receive high pay and who, therefore, can readily get credit at the stores for a month at a time. The Brotherhood of Railway Trainmen is fathering a bill to regulate the promotion of brakemen and firemen to the position of conductor and engineman, by requiring two years' experience in each case.

George Bradshaw, general safety agent of the New York Central Lines, has issued to the members of the safety committees on those lines a circular letter asking each member, on all of the committees, to speak, within thirty days, to three employees in his own branch of service, explaining briefly the purpose of the safety movement. Committee members are asked to impress on the individual the importance of the rules and regulations, to call attention to typical risks and to cite examples which will impress the argument presented. And each person spoken to is to be requested in turn to go and talk with three other employees; and thus Mr. Bradshaw's idea, if carried out, will soon extend the safety propaganda to everybody in the service. The New York Central Lines' committees now number sixty, and on them there are about 900 members; and although the movement was started only last May, Mr. Bradshaw feels highly gratified with the results already accomplished.

For the second time in their history—of 35 years—the elevated railroads of Manhattan, New York City, have had a train accident in which a passenger was killed. This was a rear collision on the Third avenue line Saturday afternoon, January 25, the leaving train being at a standstill. The other was running slowly but the rear car of the leading train and the front car of the following one were badly crushed at the ends, and a policeman riding in the second train, sitting immediately behind the motorman's box was stunned, and his body was jammed under the seat in the motorman's box. The car took fire immediately from a short circuit and it is believed that the policeman was burned to death. From the testimony of a passenger it seems that the motorman had neglected to keep a good lookout, the train ahead having been in sight for some distance. Seven years ago a number of passengers were killed at Fifty-third street and Ninth avenue, when a car fell off the elevated structure because of too high speed on a sharp curve. Aside from that case the present is the first train accident in which a passenger has been killed. For many years these roads have carried over 500,000 passengers a day, and many times a million in one day.

Governor Advocates State Ownership of Pere Marquette.

Governor Ferris of Michigan has been quoted in the newspapers as urging that the state take over the ownership of the Pere Marquette.

"My legal knowledge on the subject of state ownership of railroads is exceedingly meager," he said, according to the reports. "But under certain conditions, it seems to me, it would be wise for Michigan to own the Pere Marquette Railroad. This system, so called, forms a network throughout Michigan. If the state can legally take over this road it would be a godsend to the people. Furthermore, Michigan could then furnish a practical illustration of public ownership."

Government Report on Montz Collision.

The Interstate Commerce Commission has issued the report of Chief Inspector Belnap on the rear collision on the Yazoo & Mississippi Valley, at Montz, La., November 12, in which 15 passengers were killed and 249 were injured. The report contains a detailed statement of the circumstances attending the collision, but contains only a few items of importance in addition to facts already published. It appears that the flagman, whose neglect was the immediate cause of the collision, and who was only 19 years old, had worked for the company about six years and had been employed as a section foreman for two years before he entered the train service. The engineman of the freight train, who was held responsible for running much faster than 25 miles an hour, the limit of speed prescribed for his train, had been in service since 1900 and had been engineman since 1906. He had been disciplined twice for responsibility for collisions; in April, 1908, and December, 1910. Mr. Belnap calls attention to the fact that the ten minute time interval prescribed by the rule does not afford safety at night when open telegraph offices are long distances apart. Referring to the reason given by the road for not using the block system—that all the available money was being used on portions of the road where traffic conditions more urgently required the block system, he says: "This argument, of course, applies only to the automatic block system. There is no reason why a manual block system could not be introduced on this division, the maintenance of a few more night offices being all that would be required to secure the additional factor of safety afforded by such a block system."

An Automatic Train Stop on the H. & B. T. M.

The Huntingdon & Broad Top Mountain Railroad (which connects with the Pennsylvania at Huntingdon, Pa.) has in experimental use an automatic train stop, which has been installed by the Safety Block Signal Company, of Atlantic City, N. J., of which the secretary is W. F. Shaw.

Carried on the locomotive is a contact wheel which, at each signaling point, comes in contact with a rail or ramp, fixed on the sleepers between the rails, in such a way that the wheel is slightly lifted. In its upward movement this wheel actuates a valve which causes the movement of a piston, in a pneumatic cylinder, so arranged as to shut off steam and apply brakes; this in case the block section ahead is occupied and it is desired that the train be stopped. If, however, the block section is clear, an electric current, from a battery at the roadside, passes through the ramp and the contact wheel and energizes an electro-magnetic valve on the engine which prevents the operation of the piston which, if not thus held, would apply the brakes. The general principle, it will be seen, is similar to that of the cab signal used on the Great Western Railway of England. After an engine has been stopped by the automatic apparatus, the engineman can release the brakes; but only after disturbing a recording device, which will record the fact that he has taken such action. Mr. Yohn, superintendent of the road, informs us that satisfactory tests were made with the apparatus December 27. Two locomotives are equipped with this stopping mechanism.

Earnings of the Steel Corporation.

The report of the United States Steel Corporation for the quarter ended December 31, 1912, shows that the total net earnings were $35,185,557, after deducting all expenses incident to operation, including those for ordinary repairs and maintenance of plants and fixed charges of subsidiary com-

panies. This figure was about as expected. For the full year, net earnings aggregated $108,178,307, an increase of $3,872,841 over the preceding year. Notwithstanding this increase in net earnings, the surplus of $3,610,129 was $1,055,366 less than reported in 1911. This was due to an increase of $4,828,729 in depreciation and sinking funds on bonds of subsidiary companies. Last year the Steel Corporation earned approximately 7 per cent. on the preferred stock, and 5¾ per cent. on the common stock. The surplus reported for the last quarter of 1912 amounted to $7,410,979, which after deducting a net deficit for the three previous quarters of $3,800,850, left a balance of surplus for the year 1912 at $3,610,129. For the last two years the surplus has aggregated only $8,200,000, and outlays for new construction have amounted to close to $80,000,000. No appropriations from earnings for new construction have been made during that time. The net earnings for the last quarter were divided as follows: October, $12,485,412; November, $11,120,749; and December, $11,579,396.

Conditions of Firemen's Wage Controversy.

Elisha Lee, chairman of the committee representing the fifty-four eastern roads in negotiations concerning wages, has issued a circular calling attention to a statement which has appeared, in connection with the firemen's strike vote, to the effect that the responsibility for failure thus far to arbitrate the matters in controversy rests upon the railroads and not on the firemen. This statement, made under the authority of the leaders of the firemen, has been sent out with the blanks for ballots. [The ballots are to be returned February 10.] To confute it Mr. Lee says:

1. The railroads are prepared to apply to the firemen—and have already communicated this to their committee—the conclusions embodied in the award of the board, which, to the satisfaction of the country, recently arbitrated the differences between the locomotive engineers and the railroads. The roads have also signified their willingness to grant certain increases in wages.

2. The railroads are prepared to arbitrate the present case independently by a board of five or seven men appointed by some such disinterested authorities as Chief Justice White of the United States Supreme Court, Judge M. A. Knapp, and Commissioner C. P. Neill, as was done in the engineers' case.

The railroads' committee says that in the instructions to the various lodges sent out by the Firemen's Committee, there is this paragraph:

"Under no circumstances should any person voting be told that 'there is no danger of a strike,' for it is expected that every man will vote just as he intends to act. If he does not expect to leave the service of the company, if necessary, he should not deceive the officers of the Brotherhood by voting Yes."

The railroads, says Mr. Lee, stand prepared to grant certain increases; and they agree that the firemen deserve adjustments in their wages; but the amount claimed is neither warranted by conditions, nor within the power of the companies to pay, having due regard to their other obligations. Continuing, he says:

"At a recent conference between the firemen's committee and the railroad managers, President W. S. Carter, of the firemen, used this language: 'I speak the truth when I say that railroad employees are anxious that our little private troubles should not result in injury to both of us. This public that you are talking about sometimes had best not know our troubles. If there is anything in the world we absolutely refuse to do, it is to go through with what the engineers went through, which was practically a fiasco.'"

In a later circular, Mr. Lee says:

"It has been stated in the press that the firemen prepared to arbitrate under the Erdman Act, which the railroads decline to do. The strike ballot is worded so as to demand an increase in the firemen's payroll of $9,600,000, or 35 per cent. annually. Assuming, however, that the real object of the ballot is to force upon the railroads arbitration under the Erdman Act, the railroad companies wish their position made clear. The railroads are prepared to arbitrate before a commission of five or seven or nine men. . . . This was done in the engineers' controversy. It was fair. It satisfied the people of the country.

"The objection to the Erdman Act is apparent from a statement of what the act plans, namely, that arbitration shall be by a commission of three, one appointed by each side, and the third by the other two, or else by Judge Knapp and Commissioner Neill. The whole decision is in the hands of one man. It is too much power for one man to have. The Erdman Act was drafted to settle labor disputes on single railroads, not on all the railroads of a large territory.

"P. H. Morrisey, the engineers' representative on the recent Arbitration Commission, recognizes this defect of the Erdman Act. He says: 'The Act might also be amended so that the arbitration board might have three, five, seven or nine members, depending upon the magnitude of the issue, with the neutral representatives holding the balance of power.'

"The neutral members of a wage arbitration affecting railroads represent the public. It is the interests of the public, along with their employees' and their own, that the railroads are endeavoring to protect. They maintain that the engineers' arbitration board was right in saying: 'The most fundamental defect of the Erdman Act is that the interests of the public are not guarded by it.'"

American Wood Preservers' Association.

At the closing session of the convention of the American Wood Preservers' Association, Thursday afternoon of last week, a resolution was adopted petitioning the Ways and Means Committee of Congress to retain creosote upon the free list, calling attention to the injury to the wood preserving industry and to the conservation of forests as a whole if the import duty of 10 per cent. proposed by the Underwood bill be allowed to pass. In addition to petitioning the various members of Congress, a committee was appointed to appear before the Ways and Means Committee at the proper time.

Another resolution was adopted opposing a bill now before Congress for taking the control of the forests from the national government and placing it with the individual states.

The following officers were elected for the ensuing year: President, A. E. Larkin, manager Republic Creosoting Company, Minneapolis, Minn.; first vice-president, J. H. Waterman, superintendent of treating plant, Chicago, Burlington & Quincy, Galesburg, Ill.; second vice-president, E. F. Fulks, American Creosoting Company, Chicago; third vice-president, George E. Rex, manager of treating plants, Atchison, Topeka & Santa Fe, Topeka, Kan.; secretary-treasurer, F. J. Angier, superintendent of timber preservation, Baltimore & Ohio, Baltimore, Md. New Orleans was selected as the location for the next meeting.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—H. C. Donecker, 29 W. 39th St., New York.

AMERICAN ELECTRIC RAILWAY MANUFACTURERERS' ASSOC.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 13 Park Row, New York; 2d Tuesday of each month, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

Bridge and Building Supply Men's Association.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

Engineers' Society of Pennsylvania.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

General Superintendents' Association of Chicago.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussells, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

International Railway General Foremen's Association.—Wm. Hall, Chicago & North Western, Escanaba, Mich. Next convention, July 22-25, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

Maintenance of Way Master Painters' Association of the United States and Canada.—W. G. Wilson, Lehigh Valley, Easton, Pa.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

Master Car Builders' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

Master Car and Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

National Railway Appliances' Assoc.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

New England Railroad Club.—G. H. Frazier, 10 Oliver St., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Northern Railroad Club.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Electrical Supply Manufacturerers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

Railway Development Association.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York, convention, October 14, Nashville, Tenn.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

Railway Supply Manufacturers' Assoc.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

Railway Tel. and Tel. Appliance Assoc.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assn. of Ry. Teleg. Sups.

Richmond Railroad Club.—F. O. Robinson, Richmond, Va.; 2d Monday, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—C. Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

Toledo Transportation Club.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

Traffic Club of New York.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library building, St. Louis Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

Utah Society of Engineers.—R. B. Ketchum, University of Utah, Salt Lake City, Utah, 3d Friday of each month, except July and August.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock block, Chicago, 1st Monday in month, except July and August, Chicago.

Traffic News.

Wholesale dealers at New York City are said now to have on hand at freight terminals about 1,000,000 barrels of flour, which is one-third more than is usual at this time of the year—or at any time. The flour warehouses at all of the railroad terminals are crowded.

The Southern Railway is to run an agricultural instruction train over its lines in Virginia from February 6 to February 27, making stops at 36 places. The train will be made up of five cars, of which two are to be used for lectures and two for exhibits. The Virginia Department of Agriculture will cooperate with the road.

After a conference with a committee representing various local business associations, and including three aldermen, President Markham, of the Illinois Central, has agreed to restore the round-trip suburban fares in Chicago to the rates charged before January 1, when the rates were advanced to two cents a mile. The old round-trip rates will be restored on February 1, but the one-way single fares will remain at two cents a mile.

A supplement to Western Classification No. 51 has been completed by the Western Classification Committee following the recommendations of the Interstate Commerce Commission for changes in the classification following the commission's investigation. It is intended to put the supplement into effect on short notice on February 14, if it is approved by the commission, simultaneously with No. 51, which will have been suspended for a full year on that date.

The Missouri Pacific is to establish five large demonstration farms and is planning to go into this work for the benefit of the farmers on a large scale. The farms will range in size from 25 to 40 acres. They will be under the supervision of L. A. Markham, agricultural commissioner of the road, whose office is at Little Rock. Mr. Markham was formerly in the service of the agricultural department at Washington, and he will have the co-operation of that department as well as of the state agricultural colleges of Arkansas and Louisiana. Three of the farms will be in Arkansas and two in Louisiana, and probably a sixth will be established in southern Missouri. It has been decided to continue this experimental work at least three years, whether results be favorable or otherwise.

Proposed Reports of Traffic Statistics.

The Interstate Commerce Commission, having conferred with prominent railway officers and secured the co-operation of a committee of the Association of American Railway Accounting Officers, is considering the question of formulating a general scheme of traffic statistics under which reports would be made by the carriers giving information such as might be useful to the commission in considering questions before it, especially questions regarding increases or decreases in freight rates. As a preliminary to this, a circular has been issued signed William J. Meyers, statistician of the commission, calling for information from the railways to be sent in before February 10 as to the practicability of making the proposed report, and asking also for opinions as to the best method of procedure. It is desired to have records of the movement of important commodities from principal traffic centers to other traffic centers, showing both tonnage and revenue, the tonnage is shown also in carloads. In the circular now sent out Mr. Meyers presents a suggested standard list of commodities; a standard list of districts of production and of consumption and a sample statement form. Under one of the plans proposed all of these traffic statistics would be made up at the station of destination so as to insure accuracy in spite of diversions in transit and other irregularities, such as stopping in transit for manufacture or partial manufacture. The tentative list of commodities contains 98 items. The tentative list of points of origin and destination covers the whole of the United States, and also has a dozen items to represent foreign countries; for example, the districts in Massachusetts are (1) Boston, Cambridge and Lynn; (2) Brockton; (3) Fall River, New Bedford; (4) Holyoke, Springfield; (5) Lawrence, Lowell; (6) Somerville; (7) Worcester; (9) remainder of Massachusetts. Railway officers

receiving this circular are asked to make criticisms or offer alternative plans and to give an estimate of the expense of producing records under the plan proposed.

Car Surpluses and Shortages.

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 135A, giving a summary of car surpluses and shortages by groups from October 11, 1911, to January 15, 1913, says: The total surplus on January 15, 1913, was 53,230 cars; on December 31, 1912, 50,659 cars; on January 17, 1912, 102,479 cars.

Compared with the preceding period; there is an increase in the total surplus of 2,571 cars, made up as follows, 6,701 box, 450 flat, 92 miscellaneous, and a decrease of 4,672 coal car surplus. The increase in box car surplus is in groups 2 (New York, New Jersey, Delaware, Maryland and eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and western Pennsylvania), 4 (the Virginias and Carolinas), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), 9 (Texas, Louisiana and New Mexico), 10 (Washington, Oregon, Idaho, California, Nevada and Arizona), and 11 (Canadian lines). The increase in flat car surplus is in groups 1 (New England lines), 7 (Montana, Wyoming, Nebraska and the Dakotas), 9, 10 and 11 (as above). The decrease in coal car surplus is in groups 2, 3, 5, 7 and 8 (as above). The increase in miscellaneous car surplus is in groups 2, 3, 10 and 11 (as above).

The total shortage on January 15, 1913, was 24,791 cars; on December 31, 1912, 33,601 cars; on January 17, 1912, 12,194 cars. Compared with the preceding period; there is a decrease in the total shortage of 8,810 cars, of which 6,527 is in box, 658 in flat, 1,227 in coal and 398 in miscellaneous cars. The decrease in box car shortage is in all groups, except in 1, 5, 7 and 9 (as above): The decrease in flat car shortage is general except in groups 6 (Iowa, Illinois, Wisconsin and Minnesota), 10 and 11 (as above). The decrease in coal car shortage is in groups 2, 3, 7 and 10 (as above). The decrease in miscellaneous car shortage is general with the sole exception of group 1 as was mentioned above.

Compared with the same date of 1912; there is a decrease in the total surplus of 49,249 cars, of which 3,332 is in box, 4,747 in flat, 30,619 in coal, and 10,551 in miscellaneous. There is an increase in the total shortage of 12,597 cars, of which 8,699 is in box, 1,908 in flat, 934 in coal and 1,056 in miscellaneous cars.

The accompanying table gives car surplus and shortage figures by groups for the last periods covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1913.

CAR SURPLUSES AND SHORTAGES.

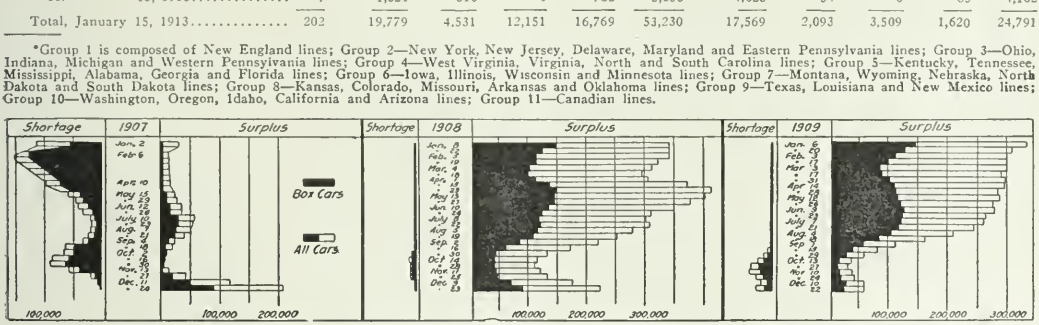
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages from 1907 to 1913.

Traffic Club of Chicago.

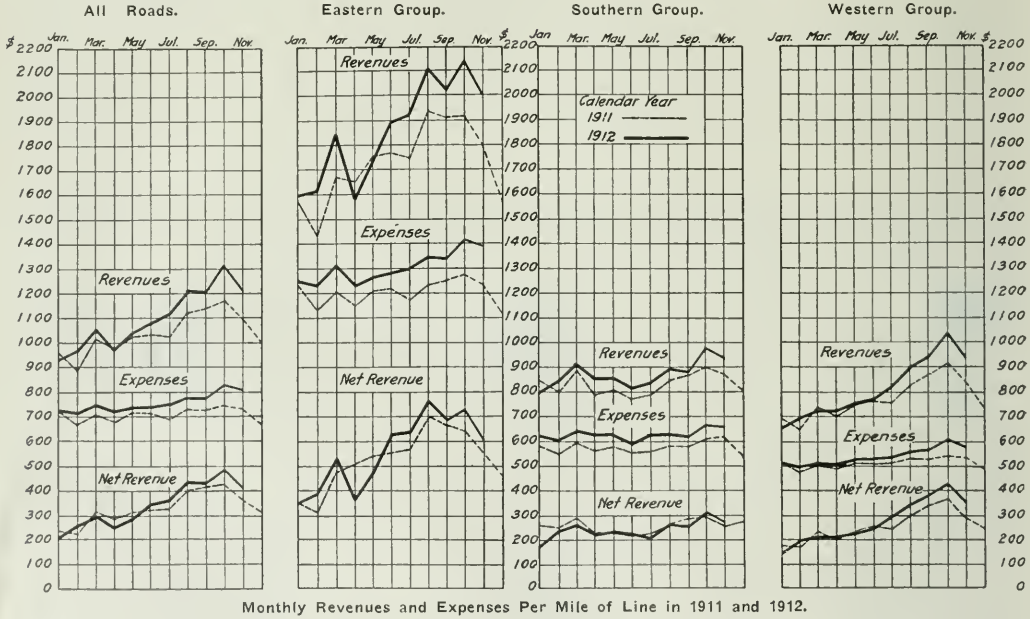
The sixth annual dinner of the Traffic Club of Chicago was the most successful in its history, there being 650 members and guests present. The speakers were John H. Atwood, of Kansas City; W. D. Nesbit and James Hamilton Lewis, of Chicago. George A. Blair, traffic manager of the Chicago & Alton, was toastmaster.

Summary of Revenues and Expenses of Steam Roads in November.

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for November, 1912, are as follows: The railways whose returns are included in this bulletin operate 221,110 miles of line, or about 90 per cent. of all the steam railway mileage of the United States. The total operating revenues for the month of November, 1912, amounted to $269,345,082. This includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources. Compared with November, 1911, the total operating revenues of these railways show an increase of $30,984,296. These total operating revenues per mile of line outside operations less taxes, amounted in November to $363.75 per mile of line, and in November, 1911, to $315.06. This was an increase for 1912 of $48.69, or 15.5 per cent. Operating income for each mile of line for each day in November averaged $12.13, and for November, 1911, $10.50. This represents the gross income available to the railways for rentals, interest on bonds, appropriations, and dividends.

The operating ratio for November, that is, the per cent. of total operating revenues which was absorbed in operating expenses, was 66.4 per cent., which is comparable with 63.1 per cent. in October, 1912, and 64.4 per cent. in November, 1911.

The eastern group of railways shows an increase in total operating revenues per mile of line as compared with November, 1911, of 11.7 per cent., the southern group an increase of 7.6 per cent., and the western group an increase of 12.1 per cent. Operating expenses per mile increased 12.6 per cent. on the eastern railways, 7.5 per cent. on the southern railways, and 8.5 per cent. on the western railways. For the eastern group of railways net operating revenue per mile increased 9.6 per cent., for the southern group it increased 7.8 per cent., and for the western group it increased 18.6 per cent. The increase in taxes per mile was 7.8 per cent. in the southern group, and



Monthly Revenues and Expenses Per Mile of Line in 1911 and 1912.

amounted to $1,218 in November, 1912, and $1,096 in November, 1911, an increase for 1912 of $122, or 11.1 per cent. Freight revenue per mile increased 12.8 per cent., and passenger revenue 6.2 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted in November to $178,971,350. This was $18,968,253 more than for November, 1911. These operating expenses per mile of line amounted to $809 in November, 1912, and $736 in November, 1911, an increase for 1912 of $73 per mile, or 10.0 per cent. All the five primary operating expense accounts showed increases over 1911.

Net operating revenue, that is, total operating revenue less operating expenses, amounted in November to $90,373,732. This was $12,016,042 more than for November, 1911. Net operating revenue per mile of line amounted to $409 in November, 1912, and $360 in November, 1911, an increase for 1912 of $45 per mile, or 13.4 per cent. Taxes for the month of November amounted to $10,206,754, or $46 per mile, an increase of 1.4 per cent over November, 1911.

Operating income, which is the net revenue from rail and 2.7 per cent. in the western group; in the eastern group there was a decrease of 1.5 per cent. Operating income per mile increased 11.3 per cent. in the eastern group, 8.2 per cent. in the southern group, and 21.3 per cent. in the western group.

Comparison of the returns for the five months of the fiscal year with those of the corresponding months of the previous fiscal year reveals an increase in total operating revenues per mile of 9.4 per cent., an increase in operating expenses per mile of 8.6 per cent., and an increase in net operating revenue per mile of 10.9 per cent. This net operating revenue per mile of the eastern group of railways increased 9.3 per cent., as compared with the corresponding period of the previous year, that of the southern group increased less than one-tenth of one per cent., while that of the western group increased 15.8 per cent.

When the returns for the 11 months of the calendar year 1912 are compared with those of the corresponding months of 1911, they show an increase in total operating revenues per mile of 5.8 per cent., an increase in operating expenses per mile of 6.3 per cent., and an increase in net operating revenue per mile of 4.5 per cent. There was an increase in net operating revenue per mile of 4.8 per cent. in the eastern group, an in-

crease of 7.4 per cent. in the western group, and a decrease of 4.5 per cent. in the southern group.

The diagram shows the variations in total operating revenues, operating expenses and net operating revenue per mile for several months of the calendar year 1911 and of the calendar year 1912 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:

PER CENT. OF TOTAL OPERATING REVENUES.

	November.		Fiscal year ending		Calendar year ending	
	1912.	1911.	1912.	1911.	1911.	1910.

* Denotes deficiency.

Interstate Commerce Commission Investigates Issuance of Passes.

Interstate Commerce Commissioner James S. Harlan, held a hearing at Denver on January 23, 24 and 25, which was announced as the first of a series in a general investigation of the practices of the railways in the issuance of free transportation. The commission states that its inquiry has already shown that "carriers have very generally obeyed the letter of the law," but that information has reached the commission that "the issuance of passes for state travel has operated to defeat the purpose of the act to regulate commerce; that passes for state travel have been issued to certain shippers and denied to others; and that the moving consideration of such passes has been the routing of interstate shipments of property." Commissioner Harlan announced that no evidence taken in the hearing would be used in any way against those testifying and that the inquiry was for the purpose of determining what new regulations are necessary to prevent discrimination, and what further steps must be taken by the commission to enforce the law in regard to the giving of passes. Several of the Colorado roads were indicted last fall at Pueblo, Colo., for alleged discrimination in issuing intrastate passes to interstate shippers, following which the roads generally ceased the practice on December 1. Colorado has no state anti-pass law.

A large number of Denver railway officials testified regarding the issuance of state passes by their companies, and all expressed the opinion that the roads would greatly prefer to cease issuing passes altogether. They said that state passes had been given not for the direct purpose of influencing interstate traffic, but to cultivate friendship among shippers or men of influence, or to promote enterprises for the benefit of the community, and that competition had extended the practice to unreasonable limits. A large number of shippers who had been given passes were called as witnesses after lists of the recipients had been put in the record, and most of them testified that the issuance of free transportation had not influenced the routing of their business, but that they had accepted or solicited passes because it was the custom. Many expressed gratification that the practice had been discontinued.

J. B. Andrews, assistant to the vice-president of the Denver & Rio Grande, said that the roads welcomed the opportunity given by the indictments to cut off the passes on December 1; that state passes had been given to friends of railway officials, to mining men, stock men, politicians and business men, but that the company had not violated the federal pass law. He quoted from records of the company showing that in the month of June, 1912, free transportation had been issued to the amount of $65,000, or approximately 16 per cent. of the passenger revenue of the road. While most of the passes had been given to politicians and office holders, many were given to ministers and other persons of influence, to people traveling on business relating to the development of the state in various ways, and for charitable purposes.

Fred Wild, Jr., general freight agent of the Denver & Rio Grande, said the giving of passes had become a custom, and that while a pass might not influence the recipient to give the road his traffic, its refusal might cause the loss of business. He admitted that small shippers and people of no prominence or influence were refused passes, and that the practice was discriminatory.

G. W. Martin, general agent of the Rock Island, said his road issued 52 passes in September in Colorado, which was probably a fair average. When his attention was called to the fact that 31 of the 52 had been issued to a town near the Kansas-Colorado state line, he said he had no knowledge as to whether they were used to cover part of an interstate journey, but that passes issued to that point enabled the users to cover as much ground as possible in trips through the state.

F. A. Wadleigh, general passenger agent of the Denver & Rio Grande, said a large proportion of the passes given through his office were issued to such men as agricultural professors and officers of various organizations engaged in development work.

John F. Vallery, general agent of the Chicago, Burlington & Quincy, said his road had discontinued the issuance of passes in Colorado five years ago, and that its freight business had suffered perceptibly.

Other railway men who testified admitted that passes were given to interstate shippers, but explained the practice with reasons other than the fact that the recipients were interstate shippers. A soliciting agent asserted, however, that he had found that some of his competitors had frequently left passes on the desks of shippers in their absence, and he had asked for passes to distribute to meet the competition.

The names of a large number of persons to whom passes had been issued by the roads were read into the record, and many of them were later called for examination. One man said he

had paid fare for many years, until he thought his tickets appeared lonesome among so many passes on the train, and that the conductor seemed to regard him as a "boob" for paying fare, so he asked for and obtained passes.

Weighing Hearing at Chicago.

Commissioner Prouty, of the Interstate Commerce Commission, held a hearing at Chicago on January 24 and 25, as part of the investigation which has been conducted by the commission during the past year into the practices of the railways in the weighing of carload freight.

A. S. Dodge, superintendent of the Western Railway Weighing Association & Inspection Bureau, submitted a series of exhibits showing the work of the bureau during the past year. In 1912, 2,402,749 cars were weighed, both loaded and empty, on bureau scales, in addition to 4,209,368 weighed using the stenciled tare, making a total of 6,612,117. Of 172,463 cars check-weighed during the year, 125,203 were loaded with lumber and 47,260 with merchandise, and only on 19,295 cars, or 11.2 per cent, was it necessary to correct the waybills on account of a variation of 1,000 lbs. or over, between the check-weight and the first scale weight. The total number of cars checked under weight agreements was 1,751,051, of which only 4,155 were check-weighed. Of these only 415, or 10 per cent, showed a variation of over 1,000 lbs. These consisted largely of grain cars subject to Board of Trade weights. Of the empty cars weighed by bureau weighmasters from January 1 to October 31, 1912, inclusive, 10,501 cars, or 59.4 per cent, showed the stenciled tare greater than the actual tare by 10,191,747 lbs., or an average of 971 lbs. per car, while on 7,171 cars, or 40.6 per cent, the stenciled tare was less than the actual tare by 6,950,445 lbs., an average of 969 lbs. per car. Thus in nearly 60 per cent of the cases the variation between the stenciled tare and the actual tare operated in favor of the shippers. These figures compare with a similar statement submitted by Mr. Dodge in March, 1912, showing that on 59 per cent. of the cars weighed in 1911 the stenciled weight was greater than the actual, or to the advantage of the shipper. Mr. Dodge also submitted a statement showing that 126,200 corrections in weight had been made by bureau inspectors during the calendar year 1912, which resulted in an increase of earnings to the carriers amounting to $236,448.01 and that $27,746.98 was collected during the year 1912 in payment of undercharges from shippers who have executed weight agreements with the bureau.

Mr. Dodge also submitted a statement of claims handled during the year, showing the percentage recommended paid, declined or otherwise disposed of by the bureau as follows:

Miscellaneous Claims.

Total number handled, 23,682.

Recommended lower scale weight	792	5 per cent.
Recommended estimated weight	140	1 per cent.
Recommended special agreement weight	1,389	8 per cent.
Recommended for various reasons	8,923	53 per cent.
Recommended payment	11,244	67 per cent.
Recommended declined	5,633	33 per cent.
	16,877	100 per cent.

Lumber Claims.

Total number handled, 14,184.

Recommended estimated weight	792	8 per cent.
Recommended lower scale weight	1,323	14 per cent.
Recommended account no scale weight	534	6 per cent.
Recommended for various reasons	1,231	13 per cent.
Recommended payment	3,880	41 per cent.
Recommended declined	5,609	59 per cent.
	9,489	100 per cent.

Grand Total.

Recommended payment	15,124	57 per cent.
Recommended declined	11,242	43 per cent.
	26,366	100 per cent.

In reply to questions by Commissioner Prouty, Mr. Dodge also testified that from one and one-half to two minutes is required to weigh a car with one end coupled, and that the time would be nearly doubled if both ends were uncoupled; whereas, three cars may be weighed per minute in motion. He was strongly in favor of a reweighing of cars for less than 1,000 lbs. variation, and was inclined to the opinion that an allowance of one per cent. would be more nearly correct. Commissioner Prouty expressed his opinion that no such allowance as even 500 lbs. should be tolerated in the case of commodities that do not shrink in transit.

Mr. Dodge also pointed out that a check of the figures submitted by Chairman Staples of the Minnesota commission at the hearing last March, showing wide variations between the stenciled and actual weights, had shown that the Minnesota commission had not taken into consideration a large number of temporary grain doors and boards found in the cars at the time they were weighed empty, which were of course not included in the stenciled weights.

Charles Ware, general manager of the Union Pacific, testified as to changes in the weighing practices of his road, which have been made to correct defects which were brought out at the hearing in Salt Lake City last year. Since that time the company has adopted as standard a 150-ton 50-ft. track scale with concrete foundations, in place of the previous standard of 100-ton 40-ft. scales. The Union Pacific has track scales at 41 points.

A scale test car has recently been constructed to travel over the line for the purpose of checking the scales, and arrangements are now being made for the installation of the necessary machinery at a central plant to which the company's scales may be shipped for repairs, thereby eliminating delays incident to returning them to the manufacturers. Mr. Ware said that it is the desire of the Union Pacific to have the best possible scales, as correct weights are as important to the railroad as to the shipper, if not more important. Arrangements are now being made to install nine new scales, and a statement submitted by Mr. Ware showed that all of the various defects reported at the Salt Lake City hearing have been corrected since that time. Only 12 out of the 41 track scales now have timber foundations, and arrangements have been made to replace these with concrete.

A. F. Epright, supervisor of scales of the Pennsylvania Railroad, was questioned at some length regarding weighing practices of the Pennsylvania, particularly with reference to the handling of coal shipments, and F. E. Church, manager of the scale department of Fairbanks, Morse & Co., added to his testimony of last March regarding the mechanical features of scale construction. Mr. Church said that in his opinion accurate weights could not be obtained where cars are weighed in motion, which precipitated a lively discussion as to the necessity for and the accuracy of motion weighing. Commissioner Prouty said there could be no doubt that motion weighing was less accurate than weighing cars cut from the train, but that there might be doubt as to the practicability of prohibiting motion weighing. In the discussion Commissioner Prouty charged H. W. Woolf, manager of the Southern Weighing & Inspection Bureau, with having attempted to influence Mr. Church's testimony by sending telegrams to the executive officers of several roads, members of the bureau, asking them to suggest to the company that some of his statements be modified at the next hearing. Commissioner Prouty expressed the opinion that this represented an implied threat of loss of business to Fairbanks, Morse & Co. Mr. Woolf denied any such intention, saying that his own experience of ten years had demonstrated that motion weighing, if properly performed, was sufficiently accurate, and that he wished to have some of the practical men employed by Fairbanks, Morse & Co. confer on the subject with Mr. Church, who had testified that he was a scale expert, but had had no experience in the actual weighing of cars.

The hearing is to be resumed at Chicago on February 26.

INTERSTATE COMMERCE COMMISSION.

The commission has suspended from February 1 until May 31, the items in certain tariffs, which advance from 30,000 lbs. to 33,000 lbs., the minimum carload weight on potatoes, effective during the period October 1 to May 31 of each year, from points in Wisconsin, Minnesota, Michigan and other states to points in Western Trunk Line and Central Freight Association territories.

The commission has decided to make a general inquiry into the issuance of free passes, and the first public hearing on the subject was held in Denver, Col., last week by Commissioner Harlan. It was in the state of Colorado that two railroad companies were indicted recently by a federal grand jury on the charge of issuing passes, for travel within the state, for the purpose of influencing shipments of freight in intrastate traffic.

The commission has suspended from January 1 until May 1, an item in a supplement to Griffin's tariff. Heretofore, this tariff has provided that refrigeration charges on perishable

fruits between Utah and Colorado common points will be performed by the carriers at a charge of 12½ cents per 100 lbs. for the amount of ice furnished. The suspended item provides a flat charge of $40 per car. It is asserted by shippers that, under the present provisions, the icing charge upon this traffic does not amount to more than $24 per car on the average, as against the proposed flat charge of $40 per car.

Reparation Awarded.

Alfred Struck Company v. Louisville & Nashville et al. Opinion by the commission:

The commission found that interior house trimmings "in the white" as carried in southern classification did not include trimmings which have been treated before shipment to a coat of priming or filler and a coat of shellac. Classification of interior house trimmings as applicable in southern classification was not shown to be unreasonable. (25 I. C. C., 656.)

Complaint Dismissed.

Philodelphia Veneer & Lumber Company, Incorporated, v. Central Railroad Company of New Jersey et al.

The commission found that rates of 31 cents per 100 lbs., all-rail, and 29 cents per 100 lbs., rail-and-water, for the transportation of imported Spanish cedar logs from New York, N. Y., to Knoxville, Tenn., were not unreasonable or unduly discriminatory. (25 I. C. C., 653.)

Preston L. Hill v. Pennsylvania Railroad et al. Opinion by the commission:

The defendant's tariff did not provide for adjustment of charges on a "punch-cancellation" commutation ticket lost by the owner, but the ticket was subject to conditions which would not entitle the owner to receive redemption money on account of loss. The commission found that the failure of defendants to provide in its tariff for the payment of redemption money on account of lost and unrecovered commutation ticket of the "punch-cancellation" variety was not unreasonable. (25 I. C. C., 650.)

Minimum Weight Reduced.

Irvin Kibbe v. St. Louis, Brownsville & Mexico et al. Opinion by the commission:

The commission found that the minimum carload weight of 22,000 lbs. on calves from Refugio, Tex., to New Orleans, La., and St. Louis, Mo., was unreasonable, and prescribed a minimum of 17,000 lbs. for the future. (25 I. C. C., 661.)

Reparation on Mohair Shipments.

National Mohair Growers' Association v. Atchison, Topeka & Santa Fe et al. Opinion by Chairman Prouty:

Following the *Wool case*, 25 I. C. C., 675, abstracted below, reparation on shipments of mohair will be awarded from March 21, 1912. (25 I. C. C., 679.)

Scrap Iron Rates Reduced.

Bartlesville Salvage Company et al. v. Missouri, Kansas & Texas et al. Opinion by the commission:

The commission found that the rate of 20 cents per 100 lbs., minimum weight 30,000 lbs., for the transportation of scrap iron from Bartlesville, Okla., to St. Louis, Mo., was unreasonable to the extent that it exceeds 17 cents per 100 lbs., minimum weight 40,000 lbs., and prescribed that rate for the future. (25 I. C. C., 672.)

Rates on Trunk Covering Materials Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of tin plate and sheet metal from eastern shipping points to points in Oregon, Washington, and other destinations.

The attempt of certain shippers to move sheet metal of commerce under the description and rates applicable to trunk-covering materials directed the attention of the carriers to an obscurity in their tariffs and to the fact that lower rates were applicable to trunk-covering materials, although they are more valuable than the sheet metal of commerce. Tariffs filed to correct the improper relation of rates on the two commodities were suspended, but the commission found that the proposed increases are reasonable and the order of suspension was vacated. (25 I. C. C., 685.)

Empty Package Rates.

Portner Brewing Company v. Southern Railway. Opinion by the commission:

The assembling of empty packages at one point by the shipper, when the filled packages were shipped to several points, in order to obtain sufficient for return carload shipments, is contrary to a rule of the southern classification. Returned empty-package rate applied only from and to the points between which the original shipment moved. (25 I. C. C., 659.)

Excessive Rates Charged Due to Error.

Seaboard Refining Company, Ltd., v. Alabama Great Southern et al. Opinion by the commission:

The complainant contends that through the enforcement by the Texas & Pacific of certain regulations for the use of track receipts or switching tickets in handling refined oil from Gretna to New Orleans for delivery to connections, it was deprived of the benefit of the through rate from points of origin in Texas and Louisiana to Chicago and Cleveland on cottonseed oil refined in transit at Gretna. Reparation is asked. The commission found that the effect of the action taken by the Texas & Pacific was to make the movement from Gretna to Chicago an entirely new movement, and also that the road did not always enforce these regulations. The commission, therefore, decided that the action of the Texas & Pacific was in error and that the through rate should have been charged. Reparation was awarded. (25 I. C. C., 702.)

Carload Rating on Tobacco Established.

John J. Bagley & Co. v. Pere Marquette et al. Opinion by the commission:

As there was no carload rating established for the transportation of long-cut, fine-cut, cut plug, and granulated smoking tobaccos in carloads from Detroit, Mich., to New York, the commission established a rating of third class with a minimum of 24,000 lbs., subject to rule 27 of official classification. (25 I. C. C., 698.)

Potato Rates Adjusted.

Chamber of Commerce of the City of Beaumont, Tex., v. Texas & New Orleans et al. Opinion by the commission:

The commission found that the rates for the transportation of potatoes and vegetables in carloads from St. Louis, Mo., to Beaumont, Tex., were unduly prejudicial as compared with rates on same commodities from St. Louis to Lake Charles, La., insofar as they exceed the differential resulting from the New Orleans combinations. The carriers were found to have justified the charging of lower rates for the transportation of potatoes, beans and vegetables in carloads from St. Louis, Mo., to Lake Charles, La., than from St. Louis, Mo., to Beaumont, Tex., and accorded limited relief from the operation of the fourth section of the act. (25 I. C. C., 695.)

Reparation on Wool Shipments.

In re investigation of alleged unreasonable rates and practices involved in the transportation of wool, hides and pelts from various western points of origin to eastern destinations.

Railroad Commission of Oregon v. Oregon Railroad & Navigation Company et al.

National Wool Growers' Association v. Oregon Short Line Railroad Company et al. Opinion by Chairman Prouty:

It is by no means true that because a rate is found unreasonable upon a given date it has been unreasonable during the two years preceding, and it can not be assumed that whenever the commission holds a given rate to be unreasonable it will, as a matter of course, award reparation upon the basis of the rate found to be reasonable as to all payments within the two-year limitation.

The commission is not satisfied that the complainant has shown that the rates as stated in the tariffs of the carriers were unreasonable up to the date of the original decision herein, March 21, 1912, mentioned in the *Railway Age Gazette* of April 19, 1912, but from that date the rates and regulations suggested by the commission are held to be reasonable, and

the rates and regulations of the carriers have been unreasonable and unlawful to the extent that they have varied from these.

Reparation from March 21, 1912, will be awarded upon the basis of the rate found reasonable by the commission. (25 I. C. C., 675.)

Advances Permitted.

Rates on knitting-factory products. Opinion by Commissioner Lane:

The tariff schedules under suspension advance the joint rates on knitting-factory products in any quantity from Chicago and near-by points to Little Rock, Fort Smith, and certain other Arkansas points and cancel the proportional rates on these products from Memphis to the same destinations applying on traffic from southeastern points, leaving in effect from many southeastern points the through first-class rates constructed on a differential basis over St. Louis and leaving in effect from other southeastern points combination rates of which the factors west of the river are the first-class rates from Memphis. The commission found that the proposed advances are justified. The order of suspension was vacated. (25 I. C. C., 634.)

Rates on Potash Not Unreasonable.

Arkansas Fertilizer Company v. St. Louis, Iron Mountain & Southern et al. Opinion by Commissioner Clements:

The complainant alleges that the rates charged by the defendants for the transportation of nitrate of soda and potash salts from New Orleans to Little Rock are unreasonable, unjustly discriminatory, and subject it and the latter place to undue prejudice and disadvantage as compared with the rates on the same commodities from New Orleans to Memphis. The record discloses that the rates under investigation apply from other gulf ports as well as from New Orleans and via many routes; and that the rates to Memphis are lower than they otherwise would be by reason of actual and potential water competition, and by reason of the location of Memphis as a Mississippi river gateway. The commission found that the evidence was not conclusive and the complaint was dismissed. (25 I. C. C., 645.)

New Theories on Rate Making.

In re investigation and suspension of advances in rates by carriers for the transportation of coal and coke in carloads from points on the Louisville & Nashville to points on the Cleveland, Cincinnati, Chicago & St. Louis and other destinations. Opinion by Commissioner McChord:

The commission found that the defendant did not sustain the burden of showing the reasonableness of the proposed increased rate from the Appalachian and the St. Charles districts in Virginia on coal to the Ohio river and to points north and south thereof, and on coke to points north of the Ohio river. The defendant was therefore ordered to withdraw the tariff naming the proposed rates and to maintain the present rates. The commission found that the motive actuating a carrier in prescribing an advanced freight rate has no bearing upon the reasonableness of the increased rate. Nor can the reasonableness of rates be proved by categorical answers, *I. C. C. v. U. P. R. R.*, 222 U. S. 541,549. Where two routes are available it is unfair to consider only the cost via the more expensive route, and when such higher cost is due to improvements and betterments under way, the expenditures which were undoubtedly made to reduce the cost of operating, such cost figures are not representative. Traffic moving during a certain year should not be made to bear the entire cost of permanent improvements and betterments. The commission went into minute details regarding the cost of hauling coal, but its conclusions differed radically from those of the defendant. The commission found that anything above the out-of-pocket cost of handling traffic is a contribution to general expenses and to that extent relieves rather than burdens other traffic. In other words, the commission holds that in fixing a specific rate only the cost of fuel, wages of crews and repairs to locomotives and cars should be taken into consideration. This means about 50 per cent. of the cost as figured by the defendant, the remaining 50 per cent. being made up chiefly of salaries of general officers and the way and structure account. While cost is an important element in determining the reasonableness of freight rates, it is not controlling, and a reasonable maximum rate is not only such a rate as pays a contributive share of all operating expenses. The carrier should make such improvements to its line as are necessary to reduce the cost of transportation, and if it does not do this, it can hardly claim that it may raise the rate because the cost of transportation is excessive. If a division as a whole is profitable, the fact that a certain portion or portions of it are not profitable does not justify increased rates. The expense which is incurred in originating traffic is a necessary incident to transportation and a condition precedent to the profitable operation of the line as a whole. The fact that one carrier does not receive proper remuneration for its share of the transportation over a joint route does not necessarily prove that the joint rate is unreasonable, but rather that the division of the joint rate is unreasonable. According to the defendant's figures, the cost to it for the transportation of coal exceeds its revenue, while according to the commission's figures the cost is only from 71 to 82 per cent. of the revenue. The commission also found that the present rate had been in effect nearly ten years and that the advance contemplated would probably exclude the Virginia operators from the northern territory. (26 I. C. C., 20.)

STATE COMMISSIONS.

The California railway commission has rendered a decision denying the application of the Southern Pacific to increase passenger fares on its ferry system between San Francisco and Oakland from 5 to 10 cents.

COURT NEWS.

The Supreme Court of the United States in a suit for damages against the American Railroad Company of Porto Rico, because of the death of an engineer, holds that the federal safety appliance act applies in Porto Rico.

In the federal court at Pittsburgh, Pa., this week, fines aggregating $12,950 were imposed for failure to unload cattle for feeding and watering within the twenty-eight hour limit, the roads fined being the Pennsylvania, the Pittsburgh, Cincinnati, Chicago & St. Louis, and the Baltimore & Ohio.

The government has withdrawn the suit which was entered in the United States District Court at Philadelphia some time ago asking that the Lehigh Valley Railroad Company be made to separate itself from the interests connected with it which mine and sell coal. The court dismissed the bill without prejudice.

Judge Baldwin, of the county circuit court at Chicago, has rendered a decision making permanent an injunction restraining the city of Chicago from enforcing an ordinance requiring the elevated railways to exchange transfers. The court held that the city had no jurisdiction over the fares of the elevated roads, because they were organized under the state railroad laws. The city is planning to appeal the case to the state supreme court.

Judge Callaghan, in the Municipal Court, New York City, in a suit against the Delaware, Lackawanna & Western has decided in favor of the plaintiff on a claim for $104 damages on a shipment of eggs contained in 297 boxes, a number of which were found to contain broken and cracked eggs. It appears that railroads usually are willing to pay for eggs broken in transit, in cases like this, but that the suit was brought because of the expense to which the consignee was put in repacking boxes which were probably damaged, but not certainly so. The cost of repacking a case of eggs is 10 cents, and it is said that in one terminal in Jersey City, in the last spring season, 86,000 cases of eggs had to be repacked. From this instance—a cost of $8,600—it is estimated that $100,000 is spent annually at the railroad terminals at New York City for repacking eggs. In the shipment on which was based the case which has just been decided, it was found that seventeen of the first twenty cases examined showed broken and leaking eggs. This proportion was so large that the consignee decided that he could not sell his eggs at a reasonable price unless he repacked every case in the lot; and the cost of examining cases which were not known beforehand to contain damaged eggs was what the railroad company refused to pay for. It is expected that the road will appeal this case to the Supreme Court of the state.

Railway Officers.

Executive, Financial and Legal Officers.

E. J. Chamberlin, president of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has been elected president also of the Central Vermont, succeeding E. H. Fitzhugh, resigned.

E. D. Sewall, assistant to the president of the Chicago, Milwaukee & St. Paul, has been elected vice-president, and D. L. Bush, general manager, has been elected vice-president, both with headquarters at Chicago. H. B. Earling, assistant general manager, has been elected vice-president, with office at Seattle, Wash., succeeding H. R. Williams, who has been made vice-president, with headquarters at New York. A photograph and sketch of H. B. Earling were published in the issue of February 16, 1912, page 317. C. B. Ferry, assistant secretary at New York, has been appointed also assistant to vice-president, with office at New York.

David L. Bush, who has been elected vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was born on July 31, 1855, at Sharon, Wis. He began railway work in December, 1872, as night operator for the Western Union Railway, and was later to January, 1877, chief operator in the train despatcher's office of that road at Racine, Wis. He was subsequently until September, 1880, train despatcher; from May 1, 1877, to January 1, 1882, also superintendent of that road and the Sabula, Ackley & Dakota, and from September, 1880, to July 1, 1887, also superintendent of the Racine & Southwestern division of the Chicago, Milwaukee & St. Paul. On the latter date he was transferred to the superintendency of the James River division, and from February 1, 1888, to February 1, 1890, was superintendent of the Southern Minnesota division. He then became superintendent of the Hastings & Dakota division, where he remained until August 15, 1894, when he was transferred to the River division as superintendent, with headquarters at St. Paul, Minn. Mr. Bush was promoted to assistant general superintendent, with office at Milwaukee, Wis., on April 1, 1898, and was made general superintendent May 1, 1903. He was appointed general manager, with headquarters at Chicago, October 1, 1909, and his election to the office of vice-president, as noted above, became effective on January 23.

D. L. Bush.

Percy R. Todd, who has been elected president of the Bangor & Aroostook, with headquarters at Bangor, Me., as has been announced in these columns, was born in 1859 at Toronto, Ont., and was educated in the Collegiate Institute, Ottawa. He began railway work as a telegraph operator with the St. Lawrence & Ottawa, now a part of the Canadian Pacific, remaining in that position until 1875, when he became Canadian agent of the Ogdensburg & Lake Champlain, now a part of the Rutland, and four years later was made general traveling agent of the National Dispatch Line at Chicago. From July to December, 1885, he was commercial agent of the New York, West Shore & Buffalo, now a part of the West Shore, at Albany, N. Y., and then for one year was chief clerk to the general freight agent of the same road at New York. He was then for three years general freight and passenger agent of the Canada Atlantic, now a part of the Grand Trunk, at Ottawa, Ont., and the following three years was general freight agent of the West Shore at New York, and from 1892 to 1901, was traffic manager of the same road at New York. He was elected second vice-president of the New York, New Haven & Hartford in 1901, with headquarters at New Haven, and in 1903 was made first vice-president of the same road. In 1907 he was elected vice-president of the Bangor & Aroostook, with headquarters at Bangor, Me., which position he held at the time of his recent election as president of the same road, as above noted.

Edmund D. Sewall, assistant to the president of the Chicago, Milwaukee & St. Paul, at Chicago, has been elected vice-president, with headquarters at Chicago. He was born on April 12, 1855, at Wilmington, Del., and was educated at Taylor and Jackson's Academy in his native town. He began railway work in 1871 as a rodman, with the engineering corps of the Wicomico & Pocomoke, now a part of the Baltimore, Chesapeake & Atlantic, and was then consecutively from March, 1872, to July, 1881, with the engineering department of the Northern Pacific, the Chicago & Canada Southern, the St. Paul, Minneapolis & Manitoba, now a part of the Great Northern, and the St. Paul & Duluth, now a part of the Northern Pacific, and was a clerk in the general freight department of the St. Paul & Pacific, now a part of the Great Northern, also clerk in the local freight office of the same road at St. Paul, Minn. From July, 1881, to September of the following year he was assistant engineer and general superintendent's clerk on the St. Paul & Duluth, and then to January, 1883, was joint agent of the St. Paul & Duluth and the Chicago, Milwaukee & St. Paul at Stillwater, Minn. He was agent of the Chicago, Milwaukee & St. Paul from January, 1883, to May, 1888, when he was made traveling lumber agent, and in December of the following year became commercial agent of the same road at St. Paul, Minn. From March, 1895 to March, 1898, he was assistant general freight agent of the Superior division at Milwaukee, Wis., and then to May 15, 1902, was general northwestern agent of the same road at Minneapolis, Minn. He was assistant general superintendent from May, 1902, to June 1, 1906, at Minneapolis and then was appointed assistant to the president of the same road, with office at Chicago, remaining in that position until his election on January 23, 1913, as vice-president of the same road. He was also vice-president of the Chicago, Milwaukee & Puget Sound from January 1, 1909, to January 1, 1913.

A. R. Whaley, general superintendent of the Electric division of the New York Central & Hudson River, and manager of the Grand Central Terminal, with headquarters at New York, has been elected vice-president in charge of operation of the New York, New Haven & Hartford, with headquarters at New York, succeeding H. J. Horn, whose duties in future will be confined to the Boston & Maine, effective February 1. Mr. Whaley has been in railway service for the past thirty-five years, having begun as a brakeman on the Providence & Worcester, now a part of the New York, New Haven & Hartford, when he was sixteen years old. During the next fourteen years he was successively conductor, station master, assistant trainmaster and general yardmaster; and from this last position he was promoted to be general agent of terminals at Providence. In 1904 he was appointed superintendent of the New York division of the New Haven road, and two years later was chosen by the two roads, the New York Central & Hudson River and New York, New Haven & Hartford, as manager of the joint operation of the New York terminal. The enormous task of tearing down the old and building the new terminal, and the installation of elec-

A. R. Whaley.

tric traction was then just being begun; and as general manager during the past 8 years Mr. Whaley has had the immediate responsibility of carrying on the business under the most trying conditions. Over 700 trains were moved in and out of the station every day with an average delay of less than a minute each. The following is from the *Wall Street Journal:*

Mr. Whaley was formerly superintendent of the New York division of the New Haven, and his return to the New Haven, which is gradually expanding its electrical zone eastward, is very natural. He will make his headquarters at the Grand Central Terminal, and in Boston. He started his railroad career when 16 years of age as a freight brakeman on the old Providence & Worcester at $1.62 a day. That was the time when brakeman on local freights worked twelve to eighteen hours a day. There were no train brakes at that time except in the muscles of the brakemen, who were happy and contented at their work. The career of Whaley from a freight brakeman to a position valued at $20,000 to $25,000 a year spans the most epoch making generation of thirty-four years in this country. As superintendent at Providence, he came to have charge of the first heavy traction electrical installation in this country which was on the line between Providence and Fall River. All the electric and terminal change-over at New York has been under him and he has had charge not only of operation but of the power houses, roadbed and equipment, and has been chairman of the committee of seven on auxiliary facilities which has passed upon the work of more than a dozen sub-committees in more than 100 meetings, everyone of which Whaley has presided over. He is the individual landlord or rent collector of the terminal. This terminal will be finished and fully thrown open to the public probably within forty-eight hours of the day Mr. Whaley graduates therefrom to go to the New Haven. Whaley believes in "system, organization and discipline, fair and firm." He says, "If you are fair you can be firm."

H. R. Williams, who was recently elected vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash., as has been announced in these columns, has been transferred to New York as vice-president in charge of the financial and transfer departments. He was born on July 14, 1849, at Palmyra, Wis., and began railway work in January, 1867, with the Chicago, Milwaukee & St. Paul. He was telegraph operator for four years at various stations, then for two years was assistant train despatcher at Milwaukee, and later for eight years was train despatcher on the Hastings & Dakota and River divisions at Minneapolis. He was then for one year trainmaster on the Hastings & Dakota and the Iowa & Minnesota divisions. From January, 1882, to September, 1885, he was superintendent of the Iowa & Minnesota division, and then was superintendent of the Southern Minnesota division at La Crosse, Wis. In February, 1888, he was appointed superintendent of the Ottumwa & Kansas City Line at Kansas City, Mo., and Chillicothe, and from June, 1890, to March, 1898, was assistant general superintendent of the Northern district of the same road. He was promoted to general superintendent in March, 1898, and in February, 1900, was made general manager of the same road. In October, 1905, he was elected president of the Pacific Railway, which was incorporated to build the Washington section of the Chicago, Milwaukee & St. Paul extension to the Pacific coast, and in January, 1909, became president of its successor, the Chicago, Milwaukee & Puget Sound, which position he held until his election on January 1, 1913, as vice-president of the Chicago, Milwaukee & St. Paul, with office at Seattle, Wash., at the time the C. M. & P. S. was taken over as the Puget Sound Lines of the Chicago, Milwaukee & St. Paul. Mr. Williams' headquarters have now been transferred to New York, as above noted.

H. R. Williams.

E. H. Fitzhugh, president of the Central Vermont, resigned that position on January 23, and also resigned from the board of directors. Mr. Fitzhugh was born February 1, 1853, at Danville, Montgomery county, Mo. He began railway work in 1873 as a clerk in the office of the master car builder of the St. Louis, Kansas City & Northern, now a part of the Wabash, at St. Louis. After serving in the car accountant's office of the same company he was made chief clerk to the superintendent of the Western division of the Wabash, remaining in that position until 1889, when he became master of transportation for the lines west of the Mississippi river on the Wabash at Moberly. In January, 1896, he was appointed secretary to the general manager of the Grand Trunk at Montreal, Que., and the following July was made superintendent of the Middle division at Toronto, Ont. From May, 1899, to March, 1901, he was vice-president and general manager of the Central Vermont. He was appointed assistant to the president of the Southern Pacific in May, 1901, at San Francisco, Cal., remaining in that position until November of the same year. The following February he returned to the Central Vermont as vice-president and general manager, and on January 1, 1905, was elected third vice-president of the Grand Trunk, and also retained his office of vice-president of the Central Vermont. In January, 1910, he was elected first vice-president of the Grand Trunk, retaining also the vice-presidency of the Central Vermont, as well as the vice-presidency of the Detroit & Toledo Shore Line. In the latter part of 1911, he was elected president of the Central Vermont Railway, the Central Vermont Transportation Company, the Southern New England Railroad Corporation, the Southern New England Railway and the Montreal & Southern Counties Railway, at which time he relinquished his duties in connection with his former position to devote his time to the companies named. Mr. Fitzhugh was the chief coadjutor of the late Charles M. Hays in the extension of the Grant Trunk system into New England; and, as will be seen from the foregoing, he had been associated with Mr. Hays throughout his railroad career. It is understood that differences of opinion in regard to the Southern New England extensions have been a principal cause leading to Mr. Fitzhugh's retirement.

E. H. Fitzhugh.

Operating Officers.

A. E. Brown has been appointed trainmaster of the Southern Pacific, with headquarters at Roseville, Cal., succeeding J. W. Knightlinger, promoted.

J. A. Barker, road foreman of engines of the Chesapeake & Ohio of Indiana, has been appointed trainmaster, with headquarters at Boston, Ind.

S. B. Moore has been appointed trainmaster of the Missouri, Kansas & Texas of Texas, with office at Waco, Tex., in place of Y. M. Martin, resigned.

Robert J. Berry has been appointed inspector of transportation of the Louisiana Lines of the Southern Pacific, with headquarters at New Orleans, La.

W. B. Allen, trainmaster of the Chesapeake & Ohio of Indiana, at Peru, Ind., has been appointed inspector of transportation, with headquarters at Peru.

J. T. Haralson has been appointed an assistant superintend-

ent of the Sonora division of the Southern Pacific of Mexico, with headquarters at Empalme, Sonora, Mexico.

Evert C. Blundell, assistant division superintendent of the Chicago, St. Paul, Minneapolis & Omaha at Eau Claire, Wis., has been appointed superintendent of the Nebraska division, with headquarters at Omaha, Neb., in place of J. R. Welch, who has been promoted to superintendent of the Minnesota & Iowa division, with office at St. James, Minn., succeeding F. E. Nicoles, promoted.

Edward T. Whiter, whose appointment as general superintendent of the Northwest System of the Pennsylvania Lines West of Pittsburgh, has been announced in these columns, was born on March 26, 1864, at Steubenville, Ohio. He was educated in the public schools of Steubenville, and began railway work March 1, 1881, as a telegraph operator for the Pennsylvania Lines. He continued in that capacity until May, 1885, when he was promoted to train despatcher, where he remained until July 1896. On the latter date he was appointed assistant trainmaster, and later he was advanced to trainmaster, which position he held until January, 1903. He was then made superintendent, and was in charge of the Eastern division of the Northwest system at the time of his recent promotion to the position of general superintendent of the latter system, with headquarters at Pittsburgh, Pa. Mr. Whiter has been continuously in the service of the Pennsylvania Lines since March, 1881.

E. T. Whiter.

Samuel H. Charles, who, on January 15, was appointed superintendent of the Oklahoma district of the Missouri, Kansas & Texas, with headquarters at Oklahoma City, Okla., as already announced, was born on February 2, 1869, at Berryville, Ark. He began railway work in December, 1884, as a messenger for the St. Louis & San Francisco, and in July of that year was advanced to telegraph operator, which position he held until August, 1890. He was then train despatcher and chief despatcher until March, 1900, and from the latter date to September, 1907, was trainmaster and assistant superintendent, when he was made superintendent. He resigned February 1, 1912, to go with the Missouri, Kansas & Texas as trainmaster at Parsons, Kan., from which position he is now promoted to that of superintendent of the Oklahoma district, as above noted.

L. A. Boyd, whose appointment as superintendent of the Raleigh, Charlotte & Southern, with headquarters at Biscoe, N. C., has been announced in these columns, was born on June 6, 1850, in Wayne county, Ind., and was educated at Alliance College, Alliance, Ohio. He began railway work in November, 1868, on the Pennsylvania Lines West of Pittsburgh as a telegraph operator at Pittsburgh. He was then despatcher at Dennison, Ohio, until 1873; train despatcher on the Little Miami division of the same road until 1880, and trainmaster on the Kentucky Central, now a part of the Louisville & Nashville until 1884. He was subsequently trainmaster and superintendent of the Indianapolis, Decatur & Western, now a part of the Cincinnati, Hamilton & Dayton, until 1892; and trainmaster on the Southern Railway and the Seaboard Air Line until 1906. His next position was superintendent until 1907, of the Northern Adirondack, now a part of the New York & Ottawa. From 1907 to 1912 he was general manager of the Raleigh & Charleston, and then was general manager of the Augusta Northern, which position he held at the time of his recent appointment as superintendent of the Raleigh, Charlotte & Southern, as above noted.

W. S. Wilson, trainmaster of the Grand Trunk at Stratford, Ont., has been appointed superintendent of transportation of the Ontario lines, with office at Toronto, Ont. P. J. Lynch, superintendent at Allandale, has been appointed superintendent of the Barrie division, with office at Allandale, including districts Nos. 11, 12 and 14. W. R. Davidson, trainmaster at London, has been appointed superintendent of the London division, with office at London, including district No. 17—(Sarnia tunnel to Hamilton and Petrolia branch); district No. 18—(Komoka to Glencoe); district No. 19—(Glencoe to Kingscourt Junction) district Nos. 20, 21 and 24. C. Forrester, trainmaster at Stratford, has been appointed superintendent of the Stratford division, with office at Stratford, including districts Nos. 15, 22 and 23. J. H. Gordon has been appointed superintendent of the Hamilton division, with office at Hamilton, including districts Nos. 13 and 16; district No. 17—(Hamilton to Niagara Falls); district No. 19—(Port Dalhousie to Port Robinson and Welland Junction to Port Colborne. G. A. Stokes has been appointed superintendent of the Toronto terminals. The office of master of transportation has been abolished. The following have been appointed trainmasters: W. J. Durkin, in charge of the 17th district (Sarnia tunnel to Hamilton, including Petrolia branch), 18th district (Komoka to Glencoe), 19th district (Glencoe to Kingscourt Junction), and 24th district, with office at London. R. H. Fish, in charge of the 20th and 21st districts, with office at Brantford. William Hall, in charge of the 13th and 16th districts, 17th district (Hamilton to Niagara Falls), 19th district (Port Dalhousie to Port Robinson and Welland Junction to Port Colborne), with office at Hamilton. C. J. McKeough, in charge of the 15th district, with office at Stratford. Walter White, in charge of the 22nd and 23rd districts, with office at Palmerston, and W. Culligan has been appointed chief despatcher at Stratford, and F. A. Rutherford has been appointed chief despatcher at London.

Miles Bronson, superintendent of the Electric division of the New York Central & Hudson River at New York, has been appointed also manager of the Grand Central Terminal, with headquarters at New York, succeeding to the duties of A. R. Whaley, who has resigned the position of general manager, as noted elsewhere. Mr. Bronson was born on May 8, 1875, in the village of Gauhati, province of Assam, British India. He began railway work in June, 1890, in the law department of the Grand Trunk, at Detroit, Mich., and held various positions with that company until May, 1895, when he became secretary to S. R. Callaway, president of the New York, Chicago & St. Louis at Cleveland, Ohio. In 1897 he was appointed superintendent of the Buffalo Terminal, which was then under construction. Before the road was opened for business, however, Mr. Callaway went to New York to succeed C. M. Depew as president of the New York Central & Hudson River, and Mr. Bronson became his secretary at New York, instead of going to Buffalo. He was later made assistant to the president. In November, 1900, he was appointed superintendent of the Harlem division, and in March, 1907, he was transferred to the River division; and in January, 1910, was promoted to the Mohawk division. In April, 1911, he was appointed superintendent of the electric division, and now becomes also manager of the Grand Central Terminal, as noted above.

M. Bronson.

Traffic Officers.

J. S. McKinnon has been appointed traveling freight agent of the Baltimore & Ohio, with headquarters at Atlanta, Ga.

R. B. Herrington has been appointed traveling freight agent of the Traders Despatch Fast Freight Line, with headquarters at St. Louis, Mo.

E. A. Ackley has been appointed freight soliciting agent of the Southern, with office at Savannah, Ga., succeeding J. C. Hext, promoted.

C. B. Sipes has been appointed traveling freight agent of the Baltimore & Ohio, with headquarters at Columbus, Ohio, succeeding Howard L. Gallcher, promoted.

William Carruthers, district freight agent of the Oregon-Washington Railroad & Navigation Company at Tacoma, Wash., has been appointed district freight and passenger agent, in charge of all traffic business between Tacoma and Vancouver, with headquarters at Tacoma.

R. D. Miller, commercial agent of the Southern, at Winston-Salem, N. C., has been appointed commercial agent at Anniston, Ala., succeeding W. G. Crutchfield, resigned to engage in other business. G. N. Lawson has been appointed commercial agent, with office at Winston-Salem, succeeding Mr. Miller.

James Edgar Davenport, division passenger agent of the Louisville & Nashville, with headquarters at St. Louis, Mo., has been appointed assistant general passenger agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with office at St. Louis, effective February 1. Mr. Davenport was born at Salem, Ill., where he began railway work as a telegraph operator for the Ohio & Mississippi, now a part of the Baltimore & Ohio Southwestern. Later he was agent for that road at Lebanon, Ill., and then went to St. Louis, Mo., as city passenger and ticket agent for the St. Louis Southwestern. Subsequently he was district passenger agent of the Toledo, St. Louis & Western; traveling passenger agent of the Choctaw, Oklahoma & Gulf, and city passenger agent of the Louisville & Nashville at St. Louis, until January 1, 1901, when he became division passenger agent of the latter road.

J. G. Hollenbeck, whose appointment as general passenger agent of the Missouri Pacific and the St. Louis, Iron Mountain & Southern has been announced in these columns, began railway service in 1895 as ticket agent of the Indiana, Decatur & Western at Indianapolis, Ind., and later became traveling passenger agent for the same road. In 1899 he became chief clerk in the passenger department of the Florida East Coast at St. Augustine, Fla., and two years later was appointed district passenger agent of the Louisville & Nashville at Atlanta, Ga. He was subsequently division passenger agent at the latter place until 1907, when he was made general agent of the passenger department of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with headquarters at Cincinnati, Ohio. He remained in that position for 18 months and was then promoted to assistant general passenger agent at Little Rock, Ark., which position he held on January 1 when he was appointed general passenger agent, with headquarters at St. Louis, Mo.

J. G. Hollenbeck.

Engineering and Rolling Stock Officers.

George O. Hammond has been appointed assistant to the mechanical superintendent of the New York, New Haven & Hartford, with headquarters at New Haven, Conn.

E. E. Finley has been appointed superintendent of maintenance of way of the San Antonio & Aransas Pass, with headquarters at Yoakum, Tex., succeeding Hans Helland, resigned.

The jurisdiction of W. J. Tollerton, general mechanical superintendent of the Rock Island Lines, with headquarters at Chicago, extends also over the St. Paul & Kansas City Short Line.

J. E. Osmer has been appointed superintendent of motive power and machinery and master car builder of the Ann Arbor Railroad and Steamship Lines, with office at Owosso, Mich., succeeding G. E. Coutant, resigned.

F. T. Chase has been appointed master mechanic of the Smithville district of the Missouri, Kansas & Texas Railway of Texas, with headquarters at Smithville, Tex. J. H. Dougherty has been appointed acting master mechanic of the Waco district of that road and the Texas Central, with office at Waco, Tex.

M. J. McCarthy, whose appointment as superintendent of motive power of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, with headquarters at Cincinnati, has been announced in these columns, was born at Susquehanna, Pa., in 1868. He served an apprenticeship with the Erie Railroad at Susquehanna, leaving that road in 1889. Subsequently he worked in various railroad shops in the West and Southwest as a machinist and foreman. He was with the Chicago, Burlington & Quincy at Burlington, Ia., for 10 years as machinist, inspector and general foreman; four years as division master mechanic of the Michigan Central at St. Thomas, Ont.; two years as division master mechanic of the Lake Shore & Michigan Southern at Elkhart, Ind.; 3½ years as superintendent of shops of the Cleveland, Cincinnati, Chicago & St. Louis at Beech Grove, Ind., and assistant superintendent of motive power of the latter road at Indianapolis, Ind., for 18 months. He held the latter position at the time of his appointment as superintendent of motive power of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, as noted above.

James Brattell Randall, whose appointment as master mechanic of the Louisville, Henderson & St. Louis, with headquarters at Cloverport, Ky., has been announced in these columns, was born on January 8, 1861, at Athens, Ohio. He received a college education, and on November 12, 1879, began railway work with the Pittsburgh, Fort Wayne & Chicago, now a part of the Pennsylvania Company, remaining with that road for five years when he went to the Indiana, Bloomington & Western, now a part of the Cleveland, Cincinnati, Chicago & St. Louis. He was then chief engineer of stations for four years with the Parkersburg Electric Light & Power Company, and later for one year was in the service of the Newport News & Mississippi Valley. On December 11, 1891, he became an engineman on the Louisville, Henderson & St. Louis, and on September 6, 1910, was promoted to assistant master mechanic, which position he held at the time of his recent appointment as master mechanic of the same road, as above noted.

J. B. Randall.

W. W. Colpitts has resigned as chief engineer for the receivers of the Kansas City, Mexico & Orient, to become associated with the firm of W. H. Coverdale & Co., consulting engineers, New York City. He will, however, retain his position as chief engineer for the receivers of the company's lines in Mexico. Mr. Colpitts was graduated from McGill University in 1899, with the degree of B.S., C.E., and in 1901 received the degree of M.S. from the same university. He began railway service in 1890 as a draftsman in the office of the chief engineer of the Intercolonial Railway. He filled various positions in the engineering departments of Canadian roads until 1898. During the latter year he was resident engineer of the Midland Railway of Nova Scotia; in 1899 he was chief clerk in the office of the president of the Canadian Pacific at Montreal, and in 1900 be-

came assistant engineer in the construction department of that road. In 1901 Mr. Colpitts went to the Kansas City, Mexico & Orient as assistant engineer; was successively division engineer and assistant chief engineer until March, 1909, when he was appointed chief engineer.

Purchasing Officers.

U. K. Hall has been appointed general storekeeper of the Oregon-Washington Railroad & Navigation Company, with headquarters at Portland, Oregon, succeeding J. E. Mahaney, resigned.

OBITUARY.

Edward Reese, roadmaster of the Chicago, Milwaukee & St. Paul, at Savanna, Ill., died on January 13, aged 62 years.

J. McGie, superintendent of the Oklahoma division of the Chicago, Rock Island & Pacific, with headquarters at El Reno, Okla., died at El Reno on Friday, January 24, at the age of 48 years.

Gaylord M. Beach, formerly special agent of the Pittsburgh & Lake Erie, with headquarters at Pittsburgh, Pa., died on January 1, at Crafton. He was born on July 10, 1831, at Mansfield, Ohio, and began railway work in 1850 as a laborer on track work on the Sandusky, Mansfield & Newark, now a part of the Baltimore & Ohio. From 1852 to September, 1857, he was in the engineering department of a number of roads, including the Bellefontaine & Indiana, the Erie, and lines now forming part of the Southern Railway. He was subsequently conductor on freight and passenger trains, then fuel agent, and later assistant roadmaster of the Cleveland, Columbus, Cincinnati & Indianapolis, and from June, 1869, to November, 1870, was superintendent of construction of the Indianapolis & St. Louis. Both of these roads are now a part of the Cleveland, Cincinnati, Chicago & St. Louis. In November and December, 1870, he was roadmaster on the Atlantic & Pacific, and the South Pacific, and then for eight years was real estate and tax agent of the Cleveland, Columbus, Cincinnati & Indianapolis. From December, 1878, to March, 1880, he was roadmaster, then to September, 1885, was in charge of the engineering department of the same road, and from October, 1882, to 1885 was in charge also of the engineering department of the Indianapolis & St. Louis. He was then for two months assistant general manager, and from October, 1885, to June, 1889, was general manager of these roads, and vice-president and general manager of the Dayton & Union. In June, 1889, he was appointed general manager of the Chicago & Atlantic, now part of the Erie, and from May, 1890, to January, 1898, was general superintendent of the Pittsburgh & Lake Erie and leased lines. He was then for one year assistant general manager, and from January, 1900, was special agent of the same road at Pittsburgh, Pa., until his retirement under the pension rules of the company on February 1, 1911.

G. M. Beach.

PRIZES OFFERED IN GERMANY.—The German Society of Mechanical Engineers offers a prize of $375 for the best treatise on annoying noises caused by city and street railways, their causes, and the best means of avoiding them; also similar prizes for a work on the heating of cars by steam, for one on cranes used in locomotive shops, and one of $500 for an investigation of car-springs, with designs and formulae. The formulae heretofore used are believed to be inadequate.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

THE SEABOARD AIR LINE is in the market for two Pacific type locomotives.

THE ERIE has ordered 10 Pacific type locomotives from the American Locomotive Company.

THE MICHIGAN CENTRAL has ordered 15 switching locomotives from the American Locomotive Company.

THE ATLANTA, BIRMINGHAM & ATLANTIC is said to be making inquiries for 5 locomotives. This item has not been confirmed.

AMSINCK & COMPANY, New York, have ordered 2 consolidation locomotives from the Baldwin Locomotive Works. These locomotives are for the Sabana Railway, Colombia.

THE DULUTH, SOUTH SHORE & ATLANTIC has ordered 12 consolidation locomotives and 3 Pacific type locomotives from the American Locomotive Company. The consolidation locomotives will have 21 in. x 30 in. cylinders, 55 in. driving wheels, and in working order will weigh 182,000 lbs. The Pacific type locomotives will have 21 in. x 26 in. cylinders, 67 in. driving wheels, and in working order will weigh 193,000 lbs. All of these locomotives will be equipped with superheaters.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 30 superheater Pacific type locomotives and 30 six-wheel switching locomotives from the American Locomotive Company and 25 mikado locomotives from the Baldwin Locomotive Works. The Pacific type locomotives will have 27-in. x 28-in cylinders, 79-in. driving wheels, and in working order will weigh 291,000 lbs. The switching locomotives will have 21-in. x 28-in. cylinders, 57-in. driving wheels, and in working order will weigh 165,000 lbs.

CAR BUILDING.

THE ILLINOIS CENTRAL has ordered 1,000 gondola cars from the Pullman Company.

THE HARRIMAN LINES have ordered 800 work cars from the Bettendorf Axle Company.

THE CHESAPEAKE & OHIO has ordered 2 postal cars from the Pressed Steel Car Company.

THE DENVER & SALT LAKE is negotiating with the American Car & Foundry Company for 100 box cars and 20 stock cars.

THE AMERICAN REFRIGERATOR TRANSIT has ordered 1,000 additional refrigerator cars from the American Car & Foundry Company.

THE PENNSYLVANIA RAILROAD is in the market for 5,000 all-steel gondola cars, 1,300 wooden-side gondola cars and 1,000 refrigerator cars.

THE FT. DODGE, DES MOINES & SOUTHERN is said to have ordered 200 box cars from the Lenoir Car Works. This item has not been confirmed.

THE PENNSYLVANIA LINES WEST are in the market for 3,000 all-steel gondola cars, 1,000 wooden-side gondola cars, 500 refrigerator cars and 500 box cars.

THE SOUTH BUFFALO has ordered 30 hopper cars from the Summers Steel Car Company. These cars will be built by the Standard Steel Car Company.

THE WHEELING & LAKE ERIE has ordered 1,000 coal cars from the Standard Steel Car Company, and 500 coal cars from the American Car & Foundry Company.

THE ALIQUIPPA & SOUTHERN has ordered 20 hopper cars from the Summers Steel Car Company. These cars will be built by the Standard Steel Car Company.

THE SOUTHERN RAILWAY has ordered 200 box cars from the American Car & Foundry Company, and 100 gondola cars and 50 hopper cars from the Cambria Steel Company.

THE LOUISVILLE & NASHVILLE, mentioned in an unconfirmed item in the *Railway Age Gazette* of January 24, as being in the market for 500 gondola cars, is in the market for that equipment.

Supply Trade News.

J. B. Rider, general manager of the Pressed Steel Car Company, Pittsburgh, Pa., has been made a director of that company.

The Carbon Steel Company, New York, has moved its general offices from 30 Church street, to the Cameron building, New York.

Frank F. Fowle has resigned his position with the McGraw Publishing Company as one of the editors of the *Electrical World*, with office in New York, and has opened offices at 68 Maiden lane, New York, as consulting electrical engineer.

J. L. Stark, who has been general inspector of the car department of the Hocking Valley at Columbus, Ohio, has resigned to become a representative of the Chicago-Cleveland Car Roofing Company, with office at Chicago. Mr. Stark is president of the Chief Interchange Car Inspectors' & Car Foremen's Association of America.

Gilbert H. Pearsall resigned as secretary of Joseph T. Ryerson & Son, in charge of railroad sales, with headquarters in New York City, on January 1, to engage in business for himself. Edward T. Hendee, who has been assistant to the president of the company, has assumed the duties heretofore devolving upon Mr. Pearsall.

TRADE PUBLICATIONS.

Metal Roofing.—The American Sheet & Tin Plate Company has published a small booklet entitled Better Buildings, which gives information relative to the uses and advantages of formed metal roofing and siding materials.

Unions.—The Jefferson Union Company, Lexington, Mass., has published an attractive illustrated folder in which it gives a brief sketch of the life and work of George Washington and discusses the construction and advantages of Jefferson unions.

Metal Saws.—The Vulcan Engineering Sales Company, Chicago, has published a well illustrated catalog of its metal saws, including cold metal sawing machines, combination saw and rotary planers, cold saws, foundry saws, etc. Concise descriptions and dimensions are included.

Tool Steel.—The Firth-Sterling Steel Company, McKeesport, Pa., has published a small booklet entitled Which Do You Believe, the object of which is to show that even very small increases in production justify paying much more than a 50 per cent. increase in the first cost of tool steel. The booklet is really a brief description of the relation of tool steel prices to manufacturing costs.

Electricity in Excavation and Construction Work.—The General Electric Company, Schenectady, N. Y., has just issued an interesting bulletin (No. A4080) devoted to the use of "Electricity in Excavation and Construction Work." The bulletin deals with both the generating of the current and its use through motors. It touches on the advantages to be derived from the use of electric power, and refers briefly to its application to the work in connection with the Panama Canal, Catskill Aqueduct, New York Barge Canal, and in general building construction.

South Australian Railways.—Railways were early in starting in South Australia, the first one, between Adelaide and Port Adelaide, being opened in 1856, with the Victorian gage of 5 ft. 3 in., which was continued on the main lines connecting with Victoria, and extending northwards from Adelaide as far as Terowie. Later the state was induced to adopt the 3 ft. 6 in. gage; hence, of the total mileage of 1,676 miles given in the last report, 835 were on the smaller gage. Unlike New South Wales and Victoria, the lines converge on several ports apart from the Capital. The average cost of the South Australian lines, which contain no very remarkable engineering difficulties of construction, amounts to $43,485 per mile. The lines authorized or in progress amount to 103 miles on the broad and 186 on the narrow gage.

Railway Construction.

Alton, St. Louis & Cairo (Electric).—An officer of this company, which was organized to build from Alton, Ill., south along the east bank of the Mississippi river to Cairo, 175 miles, writes that the line will be practically level, and will connect with several lines which now terminate at the Mississippi river. Steam will be used for the motive power for freight, and motor cars for passenger, mail and express service. Of the first 50 miles to be built from East St. Louis, Ill., to East St. Genevieve, 40 miles has been graded and only a little bridging and trestle work remains to be done. It is expected that contracts for track laying on this section will be let soon. The company expects to eventually extend the line to New Orleans. Thomas N. Chase is president, St. Louis. (January 17, p. 131.)

Altoona-Northern (Electric).—Under this name work of transforming the old Wopsononock railroad, which will extend from Altoona, Pa., to Patton, Cambria county, 20 miles, has been started. The "Wopsy" road was built 22 years ago from Altoona to Dougherty, 14 miles, to tap a coal field. Last year control of the property was secured by Sigmund Morris, and the new company was formed to build an eight-mile extension and electrify the entire road, also to change it to standard gage. The Altoona-Northern has a capital of $750,000.

Beaumont & Great Northern.—See Missouri, Kansas & Texas.

Charleston-Isle of Palms Traction.—An officer writes that contracts are to be let about July 1, to build an extension of the line now in operation from Mt. Pleasant, S. C., east to Isle of Palms, 9 miles, from the latter place east to McClellanville, about 27 miles. The company also operates a 3 mile ferry line to the city of Charleston. Contracts are also to be let at the same time for an extension from the northern terminus at Mt. Pleasant northeast to the Cooper river, and for building a reinforced concrete bridge over the Cooper river 5,000 ft. long, thence to the terminus in the city of Charleston. James Sottile is president, and W. W. Fuller, chief engineer, New Charleston Hotel, Charleston. (November 22, p. 1013.)

Clackamas Southern.—An officer writes that contracts for bridge work have been given to the Interstate Contract Company, Portland, Ore., and all other work is being carried out by the company. No additional contracts will be let for work on the line building from Oregon City, Ore., south via Beaver Creek, Mulino, Molalla and Monitor to Mt. Angel, 32 miles. Track has been laid on 6,500 ft., and the company expects to have tracklaying finished to Molalla, 19 miles, by August 1, and to Mt. Angel by December, 1913. The work involves handling from 5,000 to 8,000 cu. yds. a mile, of which 85 per cent. is earth and 15 per cent. loose rock, and there remains about 17 miles yet to be graded. The maximum grades will be 2 per cent., and the maximum curvature 15 deg. The company expects to develop a traffic in lumber, logs and farm products. It is the intention of the company to use steam as the motive power for the present, and to electrify the line within two years. Frank Busch, president, and J. L. Stacer, chief engineer, Oregon City.

Great Falls & Teton County.—See Great Northern.

Great Northern.—An officer writes that the Great Falls & Teton County is being built from Power, Mont., west and northwest to Choteau, about 30 miles. No contracts have been let to build an extension from Choteau to Bynum. (October 18, p. 774.)

Kentucky Southwestern Electric Railway Light and Power Company.—Announcement has been made that this company, which was organized some time ago to build from Paducah, Ky., south to Mayfield, thence to Murray, about 45 miles, will start work on the line early this year. It is understood that the entire right of way has been secured. H. T. Rhodes, president, and W. A. Calhoun, consulting engineer, Paducah. (September 20, p. 559.)

Minneapolis, St. Paul & Sault Ste. Marie.—This company has definitely decided upon a plan to extend its present lines by constructing about 725 miles of heavy, standard road through Montana. This northwestern extension is to connect

with the Canadian Pacific system at a point near the extreme edge of the Montana-Idaho border. Other plans of the company include building 30 miles from Plaza, N. Dak., to the Missouri river, and an extension of the Ambrose line, 80 miles into Montana. This work, definitely decided upon some months ago, will be gone ahead with. (January 3, p. 38.)

MISSOURI, KANSAS & TEXAS.—An officer writes that surveys are now being made from Waco, Tex., southeast to the Beaumont & Great Northern at Weldon, also from this line at Livingston southeast towards Beaumont. The company recently bought the Beaumont & Great Northern, extending from Livingston northwest via Trinity to Weldon.

MOBERLY, HUNTSVILLE & RANDOLPH SPRINGS (Electric).—An officer writes that contracts are to be let in April to build from Moberly, Mo., west via Huntsville to Randolph Springs, 12 miles. The plans include putting up two or three small steel bridges, a power house and terminals. C. H. Dameron, president, and J. J. Munindger, chief engineer, Huntville. (January 3, p. 38.)

MOBILE & BALDWIN COUNTIES (Electric).—Incorporated in Alabama with $50,000 capital, to build from Mobile, Ala., northeast to Bay Minette, about 25 miles, and eventually to extend the line southeast to Pensacola, Fla., an additional 50 miles. W. B. Miller, Chicago; J. P. Lowell, and M. H. Miller, Mobile, and J. R. Cross, Fairhope, Ala., are directors.

MONTEZUMA & WESTERN.—An officer writes that contracts are to be let this spring to build from a connection with the Colorado & Southern at Silver Plume, Colo., west via Montezuma to the Colorado & Southern at Keystone. The plans call for building 39 miles of narrow gage line. The total excavation will be about 690,000 cu. yds., of which 190,000 will be rock work. The maximum grades will be 3 per cent., and maximum curvature 25 deg. There will be 3,400 lineal feet of trestles and 7,600 ft. of tunnels. About one-half mile of track has been laid and about one-half mile of tunnel work has been completed. The company expects to develop a traffic in ore, timber and mining equipment. A. J. Woodruff, general manager; C. A. Hopkins, chief engineer, 707 Equitable building, Denver. (December 20, p. 1235.)

MONTOUR RAILROAD.—Contracts it is said will be let before the opening of spring to build extensions to connect with the Bessemer & Lake Erie near Homestead, Pa., about 40 miles. (November 29, p. 1053.)

NEW YORK CENTRAL & HUDSON RIVER.—Extensive improvements are now in progress at Rome, N. Y., consisting of the relocation of the main line through the city; the construction of a new passenger station, and the enlargement of the freight facilities, also the elimination of all grade crossings within the limits of the new line. This line is to be a cut-off three and a half miles long, and is being built about three-quarters of a mile south of the present location. The relocation is made necessary by the new barge canal, which crosses the old line both east and west of the city. The relocated line is parallel to and just south of the barge canal. The new line is to have six tracks, two more than at present. The R. W. & O., which now joins the main line just west of the passenger station will connect with the new line at the west end of the relocation, and cross the barge canal on an independent bridge. All highway undercrossings are to be reinforced concrete arches with spans varying from 35 to 45 ft. The freight yard will lie to the north of the new line just west of the point where it diverges from the old, and will have 16 yard tracks of about 4,500 ft. each, providing a total capacity of 1,760 cars, while a portion of the old line is retained with a new bridge over the barge canal as an industrial connection to the present yard and freight facilities. The new passenger station will be a two story brick structure 40 ft. x 210 ft., located about opposite the present station, with the second floor at the track level and a 16 ft. passenger subway having a baggage elevator and two stairways to each of the three outer platforms, access to the inner one being direct from the station. The total cost is estimated at about $2,000,000, and the work is being done by the M. A. Talbot Co., of Philadelphia, Pa., and Rome, N. Y. It is expected that the improvements will be finished during 1913.

NEW YORK ROADS.—The New York Public Service Commission, First district, will open bids on February 7, for the construction of Section No. 3 of the Woodside, Astoria and Corona rapid transit railroad. This section embraces the Corona branch, running from the Queens end of the Queensboro bridge out Queens boulevard, Greenpoint avenue and Roosevelt avenue to Sycamore avenue, Corona. It is to be a two and three-track elevated line. Bids for the construction of Section No. 2, the branch from the Queensboro bridge to Ditmars avenue, Astoria, were opened on January 28. (January 24, p. 191.)

OIL BELT OF ILLINOIS (Electric).—This company, which operates a line between Bridgeport, Ill., and Oblong, 25 miles, will issue bonds. Part of the proceeds of the bonds are to be used for future betterments and improvements. The line is now being extended 80 miles, to complete a through line from Charleston south to Mt. Carmel, 105 miles, through the oil belt, traversing Coles, Cumberland, Crawford, Clark, Lawrence and Wabash counties. W. E. Finley, president, and T. M. Mooney, secretary and treasurer, Bridgeport. (November 15, p. 973.)

OKLAHOMA ROAD.—According to press reports surveys have been made to build from Sapulpa, Okla., west to Cushing, about 40 miles. Former Governor Charles M. Haskell, is back of the project.

OMAHA, LINCOLN & BEATRICE (Electric).—An officer of this company, which operates a 6½ mile line from Lincoln, Neb., to University Place and Bethany Heights, writes that permission has been asked to issue bonds and stock to secure funds for building an extension of about 50 miles. The plans call for building northeast via Waverly, Greenwood, Ashland, Springfield, Papillion and South Omaha to Omaha.

PENNSYLVANIA RAILROAD.—An officer writes that bids are being asked for piercing three tunnels on the Allegheny division as follows: Tunnel at East Brady, Pa., to be 2,660 ft. long, will effect a saving in distance of 5 7/10 miles over the existing line; tunnel at Wood Hill, 2,870 ft. long, will effect a saving of 5 5/10 miles, and the third tunnel at Kennerdell, 3,350 ft., will effect a saving of 4 miles. (January 17, p. 132.)

PLATEAU VALLEY.—Organized in Colorado to build from Yeckel Junction, Colo., which is on the Denver & Rio Grande, near Grand Junction, east to Collbran, about 40 miles. It is understood that construction work will be started soon. Jacob Yeckel, president, and A. J. Halter, vice-president.

ROCK ISLAND, STUTTGART & SOUTHERN.—Incorporated in Arkansas with $300,000, to build from Mesa, Ark., south to Stuttgart, 22 miles. T. S. Bugbee, president; A. B. Copley, vice-president, and G. B. Pugh, secretary and treasurer.

SOUTHERN RAILWAY.—This company will let contracts soon for the construction of double track north from Monroe, Va., the southern terminus of the Washington division, to Amherst, eight miles. Contracts will also be let for the construction of double track from Twenty-seventh street, Birmingham, Ala., to the east end of the North Birmingham yard.

TIDEWATER SOUTHERN (Electric).—An officer writes that work is now under way to complete the line from Stockton, Cal., to Turlock, 50 miles. Contracts for this work were let about a year ago to the Daae Construction Company, Sacramento, Cal. Track has been laid on about 40.5 miles. There will be two steel bridges each about 240 ft. long, and about 2,000 ft. of trestle. J. H. Wallace, chief engineer, Stockton. (May 24, p. 1181.)

WESTERN MARYLAND.—All passing tracks are to be extended to 4,000 ft. clear length, and the construction of five additional passing tracks of the same length has been authorized on the 80-mile section between Hagerstown, Md., and Cumberland. This involves the construction of about 7½ miles of track at a cost of from $250,000 to $300,000.

WOPSONONOCK.—See Altoona-Northern.

NEW LINE FOR INDIA.—The Indian railway board has accorded its sanction to a survey being carried out by the Bombay, Baroda & Central India Railway for a line on the 5 ft. 6 in. gage from Gangapur, on the Nagda-Wertha section of the Bombay, Baroda & Central India Railway, to Luni, on the Jodhpur-Bikaner Railway, a distance of about 260 miles.

Railway Financial News.

Atlantic Coast Line.—The New York Stock Exchange has authorized to be listed on and after February 3 the $6,250,500 common stock which was recently offered to the stockholders at par, making the total amount to be listed $71,241,800. The proceeds of the sale of this stock will be used as follows: $6,210,000 will be paid for the company's subscription to the increased stock of the Louisville & Nashville; and $40,500 for additions and improvements.

Boston & Maine.—J. P. Morgan & Co., New York, Lee Higginson & Co., Boston, and F. S. Mosely & Co., Boston, are offering at 100¼ the unsold portion of $10,000,000 5 per cent., one year, coupon notes dated February 3, 1913. The proceeds will be used as follows: About $5,000,000 to pay for Maine Central stock; and a part of the balance to take up small note issues maturing before June.

Canadian Northern.—See Canadian Northern Alberta.

Canadian Northern Alberta.—There has been deposited in the office of the Secretary of State of Canada a trust mortgage, dated November 29, 1912, made by the Canadian Northern Alberta to the British Empire Trust Company, Ltd., the National Trust Company, Ltd., and his Majesty the King and the Canadian Northern Railway securing 3½ per cent. 50-year debenture stock, guaranteed by the Dominion of Canada.

Central Vermont.—E. A. Chittenden has been elected a member of the executive committee, and E. T. Smith has been elected a director, both succeeding E. H. Fitzhugh, resigned.

Chicago, Milwaukee & St. Paul.—Stockholders of record February 6, will be permitted to subscribe at par, not later than February 28, when payment must be made in full, for $13,957,400 4½ per cent. convertible bonds of 1912, up to 6 per cent. of their holdings. These bonds are part of an authorized issue of $50,000,000 and are of the same character as the $34,893,500 which were offered to shareholders last spring, as mentioned in the *Railway Age Gazette* of April 12, 1912. Kuhn, Loeb & Co. and the National City Bank, both of New York, have, it is said, underwritten the bonds. These bonds will mature June 1, 1932, but may be converted at par into common stock after June 1, 1917, and before June 1, 1922.

H. R. Williams, vice-president of this company, has been made also a director.

Duluth, Missabe & Northern.—This company has called for payment, February 1, at the Central Trust Company, New York, at 105 and interest, $155,000 first consolidated mortgage bonds dated January 1, 1893.

Grand Trunk Pacific Branch Lines Company.—The Grand Trunk announced in London on January 10 that it was authorized to receive subscriptions at 94 for the following bonds of this company; £240,700 ($1,203,500) 4 per cent. sterling bonds, due 1939, principal and interest unconditionally guaranteed by the government of the province of Saskatchewan; £238,600 ($1,193,000) 4 per cent. sterling bonds, due 1942, principal and interest unconditionally guaranteed by the government of the province of Alberta. The proceeds will be used for the construction in the provinces of Saskatchewan and Alberta of branch lines which will be operated under agreement by the Grand Trunk Pacific.

Maryland & Pennsylvania.—Baker, Watts & Company, Baltimore, Md., has purchased an issue of $50,000 5 per cent. equipment bonds.

Mexico North Western.—The holders of the 5 per cent. 50-year first mortgage bonds and the 6 per cent. cumulative convertible income bonds will vote on February 12 on the question of authorizing not more than £2,500,000 ($12,500,000) 15-year prior lien 6 per cent. bonds secured by a prior lien on the entire property. The directors have approved of this issue and suggest that enough of these bonds be sold to pay off the existing floating debt, approximately $5,500,000; to meet the coupons on the first mortgage bonds coming due next March, which amount to about $700,000; and also to provide for the general purposes of the company.

New York Central & Hudson River.—The New York Public Service Commission, Second district, has given its consent to the lease of the New York & Ottawa Railroad to the New York Central & Hudson River for a term of one year commencing February 1, 1913. It has been the practice of the commission to consent to the renewal of this lease from year to year.

Northern Pacific.—The New York Stock Exchange has listed $1,084,000 prior lien 4 per cent. bonds, due January 1, 1997, the proceeds of which were used for part of the cost of double track, making the total listed $109,152,500.

Old Colony Railroad.—This company, which is leased by the New York, New Haven & Hartford, has sold at auction, through R. L. Day & Co., Boston, Mass., $630,000 stock at $176 per share.

St. Louis, Iron Mountain & Southern.—The directors who were elected last spring to serve temporarily pending the execution of the company's $200,000,000 mortgage, have resigned, and the board now consists of the following: George J. Gould, chairman; B. F. Bush, president; Finley J. Shepard, assistant to the president; James Speyer, Edgar L. Marston, E. T. Jeffery, E. C. Simmons, J. G. Metcalfe, Albert H. Wiggin, Jay Gould, Edwin G. Merrill, O. L. Garrison and C. A. Pratt. A new executive committee was also elected, composed of George J. Gould, chairman; B. F. Bush, Albert H. Wiggin, E. T. Jeffery, James Speyer, Edgar L. Marston and Finley J. Shepard.

Scott City Northern.—It is understood that the securities of this company, consisting of $825,000 first mortgage bonds and $415,780 stock were purchased at auction by the Commonwealth Trust Company, St. Louis, and allied interests.

Southern Railway.—This company has sold to J. P. Morgan & Co., New York, $5,000,000 five per cent. 3-year notes dated February 1, 1913, the proceeds of which are to be used, together with other funds, to pay at maturity the $10,000,000 three-year notes which mature on February 1, 1913. The bankers now offer the holders of these maturing notes to exchange them at par for the new 3-year notes at 99¾.

Important Chinese Railway Completed.—The railway from Tientsin, the port of Pekin, south by east 674 miles to Pukow, on the Yang-tse-Kiang opposite Nanking, was completed in December when the great bridge over the Hoang-ho was finished. The northern 425 miles were built by Germans, the southern 249 by English. The Chinese government purposes to work the road on its own account. This completes rail connection from Pekin to Shanghai, except for the crossing of the Yang-tse-Kiang.

Construction in Asia Minor.—December 21 a section some 30 miles long of the Bagdad Railway was opened in the Taurus mountains, and not long before a longer section of the same line was completed east of these mountains. There is some very heavy work to be completed in the mountains before the two sections can be connected. This work is near the northeast corner of the Mediterranean sea, which will be reached by a branch line to Alexandretta. It may be supposed that the Turks have other work than railway building to occupy them at the present time; but the enterprise is in the hands of Germans and others, while of course there has been profound peace in Asia Minor.

Indian Railway Policy.—The present policy of improving existing lines prior to making new extensions is justified by past experience. Opening a settled and thickly populated country such as India by railways is a very different enterprise to opening new countries. In the latter, population and cultivation follow the railway, and traffic grows slowly with the development of the country, so that the resources of the line are not suddenly taxed, but grow gradually with the traffic requirements. It is different in India, where the country pierced is often rich and railway facilities are taken advantage of fully from the opening of the line. Much of the complaints about insufficient arrangements for traffic are due to this feature. The call on the new lines is so great that the older lines even become congested with the rapidly increased traffic. In new countries this would not happen; growth of traffic would be more gradual.

Railway Age Gazette

Including the Railroad Gazette and the Railway Age

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE, BY THE SIMMONS BOARDMAN PUBLISHING COMPANY, 83 FULTON STREET, NEW YORK.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS.

SAMUEL O. DUNN, *Editor.*

ROY V. WRIGHT, *Managing Editor.* H. H. SIMMONS, H. F. LANE, R. E. THAYER, A. C. LOUDON, E. S. FAUST, F. W. KRAEGER, A. D. CLOUD, GEORGE L. FOWLER, WILLIAM FORSYTH, S. W. DUNNING, W. E. HOOPER, B. B. ADAMS, E. T. HOWSON

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.00.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,225 copies were printed; that of those 8,225 copies, 6,771 were mailed to regular paid subscribers and 348 were provided for counter and news companies' sales; that the total copies printed this year to date were 51,076 copies—an average of 8,513 copies a week.

VOLUME 54. FEBRUARY 7, 1913. NUMBER 6.

CONTENTS

*Illustrated.

LIKE nearly all papers discussing the defects in current steel rail manufacture written recently, that by Bradley Stoughton, printed elsewhere in this issue, goes directly to the ingot. Metallurgists in general have realized for some time that the ingot is the source of most of the defects giving rise to the troubles with rails, and it is because of this that they are attaching so much importance to the ingot. Papers by Captain Hunt, Benjamin Talbott and others, published in these columns recently, also refer to the ingot problem. It is understood that the rail committee of the American Railway Engineering Association will this year report that the present specifications requiring that tests be made from three ingots of each heat is sufficient, giving little credence to the individuality of the ingot, and this in spite of the fact that more than half the defects in rail manufacture, and these the most serious, are defects in the ingots. Mr. Stoughton believes that to have sound rails it is necessary to have sound ingots, and his requirements for sound ingots are severe. It is not many years since if steel showed by analysis the desired chemical composition, and the ingot had been cropped to remove piping and pronounced segregation, it was readily accepted. In addition to these defects Mr. Stoughton calls attention to the danger of blow holes, and of sulphide of manganese and other impurities. Analyzing for oxygen or nitrogen was unheard of until recently; no consideration whatever was given to these elements. It is now known that they have a very injurious effect on the qualities of the steel. This entire discussion emphasizes the close scrutiny which every step in the process of steel making, as well as the final results given by the finished product in service, are receiving.

THAT pools to maintain the price of rails did exist is now an accepted fact. W. E. Corey, former president of the United States Steel Corporation in his testimony before the special examiner in the government's suit against the Steel Corporation, dispelled what doubts there had been. Mr. Corey said that the existence of this "arrangement" first came to his knowledge in 1901, when he was made president of the Carnegie Steel Company, before the organization of the Steel Corporation. This pool was broken up in 1904 or 1905, and since that time there has never been any agreement to advance, reduce or maintain the price of that product. The testimony showed that the agreement was not always strictly adhered to by the different manufacturers, and that in 1903 the Tennessee Coal & Iron Company was selling its open hearth rails at $2 above the agreed price. Since the breaking up of the pool certain independent companies have wanted to raise the price, but the officers of the Steel Corporation were decidedly against it, and their stand exerted a deterrent influence. The witness added that the corporation could make rails more cheaply than its competitors. His statements were straightforward and fair and, while a trifle vague at times, never evasive. They are considered damaging to the Steel Corporation, and it has even been said that they are typical of what is said by those who had been in the business but are now out of it. The testimony shows, however, that about one-fourth of Mr. Corey's fortune is invested in the securities of the corporation, and also that he is opposed to the government's suit; so the argument loses its force. Just what influence the testimony will have on the case is a matter of conjecture. The fact remains that it indicates that though the Steel Corporation was in the pool, the pool had been in existence before the corporation and that it was subsequently abolished; also, that if the corporation now indirectly fixes the price of rails, it keeps it down as well as up.

ALTHOUGH a part of a scheme of government the administration of which is controlled chiefly by political considerations, the Interstate Commerce Commission has remained a non-political body insofar as partisan politics are concerned. Except for the fact that the law provides that no more than four of the commissioners shall be of the same political party there has been no occasion for even recognizing their party membership. While the railways have frequently been the victims of party politics, as when one party or another has tried to make capital for itself by advancing some proposition for railway regulation as an issue, the principles of the republican, democratic or progressive parties have had little to do with the matter. Certainly, they have nothing to do with the determination of the reasonableness of rates. It is, therefore, peculiarly unfortunate that the leaders of the democratic party, now in power in Congress, should have allowed their zeal to recoup themselves from the patronage of the new administration for the long, lean years that have passed, to involve the appointment of an interstate commerce commissioner. E. E. Clark, whose term expired on December 31, was renominated by President Taft. Confirmation of the appointment has been held up along with a number of others which may be given to loyal democrats after March 4.

Not only has Mr. Clark come to be regarded as one of the ablest and fairest members of the commission, but it has long been the consensus of opinion among those who have been most concerned with its work that the experience gained during service on the commission should argue most persuasively in favor of repeated reappointments. Membership on the Interstate Commerce Commission is not a sinecure to be used as a reward for political services. The commission's responsibilities are greater and its work more arduous than those of almost any other department of the government, while its duties are too important to be interfered with by considerations of political partisanship. If the appointments of the members of the commission are determined by partisan considerations, it will not be long before their acts are determined by similar considerations. The success of regulation of railways depends vitally on preventing this. By withholding confirmation of Mr. Clark's nomination the Senate is acting in a way that is unjust to him, disgraceful to it and fraught with public danger.

GOVERNMENTAL investigation of railway practices affecting safety, which, unhappily, is still a useful function in every state, seems lately to have been considerably improved; and this is true notwithstanding the fact that there is much lost motion in the machinery which is engineered from Washington. A fine piece of work done by the Albany (New York State) commission was noticed in these columns last week; an example of governmental regulation which may well serve as a model. The Illinois Railroad and Warehouse Commission pointed out the need last August (*Railway Age Gazette*, August 16, p. 290) in its report on the Western Springs collision, when it uttered the significant truth that investigations confined to one accident and its immediate causes produce no permanent good results; that "we should go much further, determine real causes and devise some plan to prevent" those accidents of which so many, due to the same class of causes, follow one another year after year. The Louisiana commission in its report on the collisions at Montz, and at Alexandria, brought out in lucid fashion important facts which have instructive bearings on accidents everywhere. The Connecticut commission silenced unreasonable public clamor about alleged unsafe tracks at Westport and Green's Farms. The Indiana commission, in its brief order concerning switch lights, exposed a weakness which exists, with great potential danger, in a thousand places. The Interstate Commerce Commission's report on the Indiana collision brought out a chain of facts of a kind which, though always instructive to railway men everywhere, are rarely printed for the general benefit except as the State unearths them. It will be noted that in all these reports the one most important thing, the improvement of discipline, is dealt with only in a general way. The governmental authorities see what needs to be done in this direction, but they do not tell us just what to do. This is significant. But this silence concerning details should be as loud an admonition as any multiplication of words could be. *The task is up to the railroads.* The writer of that Corning report plainly has a very definite idea of what ought to be done to make enginemen as highly efficient as possible, but he does not describe the procedure. And why should he? Every competent superintendent knows, also

---

FROM 65 to 80 per cent of the damage to freight cars is caused by defective draft gears. This is a statement made by a master car builder of a large road who has carefully checked the performance of freight cars of exactly the same capacities and design, but equipped with different types of draft gear, and in sufficient numbers to enable a fair comparison to be made. While it is true that these figures cover only the repairs which were made on the home road, the large number of cars considered insures the proportion being fairly accurate, without taking into consideration the repairs which might have been made on foreign lines, and which it would not be possible to check. Some of the draft gears give very much better results than the others, but we are only at liberty to say that generally speaking the gears of the higher capacities and greatest travel gave the best results. The Master Car Builders' Association has made extensive draft gear tests in the past, including so called static tests in a testing machine which applied and released the load gradually, and drop tests, which allowed a weight or tup to fall and strike the gear at a comparatively high velocity. Neither of these tests approximate service conditions, and efforts have been made by both the railroads and the manufacturing interests to develop an apparatus for testing the draft gear, which would provide conditions more like those in actual service. While a fairly close approximation may have been had to this, still it is true that the Master Car Builders' Association has never had any tests on such apparatus made under its supervision, and after all the behavior of the gears in actual service under the great variety of conditions encountered is what really counts; every effort should therefore be made to determine the service results as accurately as possible. Unlike a locomotive a car sometimes receives as great an amount of repairs on a foreign road as at home and this is what complicates the situation. However, there must be a number of roads which have just as favorable conditions as the one mentioned above and it should be possible for the association to secure and place on record more authentic data on this subject than now appears in its proceedings.

THE investigation by the Interstate Commerce Commission into the practices of the railways in the issuance of free transportation should be, and apparently is being, received by railway officers with gratification. The testimony of railway men at the hearing in Denver before Commissioner Harlan showed no reluctance to tell the facts. It was full and candid, and manifested a disposition to co-operate with the commission in abolishing a bad practice. It may be considered strange that the commission selected as the place for its first hearing a state in which the railways already had taken advantage of an indictment against them for giving state passes to interstate shippers to put a stop to a practice which had got beyond their control. But it is possible that the cumulative disclosures made in Colorado following the effort of the Department of Justice to have the issuance of state transportation to interstate shippers pronounced illegal may create a public sentiment that will result in the passage of a state anti-pass law. The railways have frequently advocated state anti-pass legislation, and would have been even more urgent but for their appreciation of the danger of offending the politicians who have used most of the passes. The public has failed to grasp the fact that railways as corporations have no inherent fondness for throwing away money in the form of free transportation and rebates, and that even the genial general passenger agent, who is popularly supposed to derive his greatest pleasure in life from handing out passes is more interested in presenting a good showing in the passenger revenue statement. Even the freight solicitor long ago discovered that the efficacy of the pass as a means of capturing carload shipments is diminished or destroyed when his rival also has passes to distribute. Whatever benefit railways may have derived from the issuance of passes has been largely the negative one of averting the ill will that might have followed their refusal, or of offsetting the effect of such extension of favors by a competitor. Even the good will that may have been gained by judicious pass distribution has been more than balanced by the disfavor created among those to whom passes have been denied. The pass that is refused always looks bigger than the one that is given. While the effect of the federal anti-pass law has undoubtedly been felt in an increase of anti-railway legislation, many a railway officer experienced a profound sense of relief when the privilege of indiscriminate pass-giving was taken away. It behooves the railways in the present case to aid the commission in its investigation to the best of their ability.

THE new Grand Central Terminal, New York City, was opened last Sunday, and a seven years' task of the first magnitude was substantially completed, with great credit to all concerned. We do not mean by this that the station is finished, for there is much yet to be done; but the perplexing problems of construction and operation are out of the way, all of the most important features of the station are in use, and the architects' work is before the public for its judgment. The salient elements of this work are the arrangement of the rooms and the decorative design of the great upper concourse. New Yorkers naturally make their comparisons with the Pennsylvania station, about a mile away, which was finished two and a half years ago. As to arrangement, both designs have marked merits, and we shall not attempt to make a critical estimate of either. The only way to make an accurate comparison would be to measure the aggregate of the foot journeys of all the passengers for a day or a week—journeys necessarily long, as compared with those at a station of moderate size—which is hardly practicable. At the Grand Central a passenger entering at the main central front entrance, on Forty-second street, reaches the train level by three short and easy descents. Between these are long level stretches, making the journey in the opposite direction easy. From the lower level, used by the thousands of suburban passengers, the ascending journey is not so easy. But the inward stations, where the suburbanites will mentally formulate their criticisms each morning are not yet finished and the details of this feature are yet to be made known. The arrangement of the rooms, could not be more simple. The baggage room (on the level of Forty-fifth street) is seventeen feet higher than the ticket office floor, and is entered through the north gallery; but passengers have little or no occasion to go there (unless they go in their carriages to deliver trunks) for the baggage checkers are close to the ticket office and send and receive checks through pneumatic tubes. From an esthetic standpoint, the Grand Central headhouse will undoubtedly receive general commendation. The decorations, both outside and in, are not only beautiful but rich; yet no more so than is justified by the vast size of the structure, and by the perfection of its details as a mere building. The outstanding quality of the Pennsylvania station is dignity, with almost a suggestion of coldness; this is the main difference between the two structures. The design of the arched ceiling of the main concourse at the Grand Central, a hundred feet above the observer, is bold and unique; a blue sky over which are spread figures, in delicate gold tracery, showing the signs of the zodiac, with hundreds of other stars, some of which are made real by little electric lights placed behind them. This feature alone would make the station one of the sights of the city. From a figurative or mental standpoint (as well as physically) this decoration will be far above the heads of the great majority of the passengers, and their only sensations will be awe and wonder. But those who take an interest in stars and other celestial things will, no doubt, commend the astronomer and the mystic who, with the architect, have combined to produce a most striking effect; an effect as far removed from concrete bridges and coal burning freight engines as could possibly be imagined.

LOGAN G. McPHERSON has described, in the *North American Review* for January, the concerted movement of the railways to give the public correct information regarding their business which resulted in the establishment of the Bureau of Railway Economics, of which Mr. McPherson is director. The need for scientific gathering and analysis of railway data was shown by persistent and general misstatements regarding rates, capitalization, accidents, etc., over a long period of years, and the want of readily available material for refuting these misstatements. The railway managers felt confident that their business methods and the results would bear the most searching scrutiny and thorough discussion, if fairly done. They were aware that there were conditions existing and things done that could not be defended, but they were sure that the number of things done and conditions existing that could be defended and that merited public favor and commendation greatly preponderated. When the bureau was created the committee of six railway presidents supervising its work instructed it to get and print the facts, all the facts and nothing but the facts. This policy has been followed in the bureau's studies of valuation, capitalization, rates, wages, earnings, water transportation, etc. Its various bulletins have been valuable contributions to the scientific information regarding both our railways and those of other countries. There has been some complaint that, as has been said, they are rather dry reading, and therefore do not appeal to the popular reader. Cold facts are dull things, and it is a difficult art to make their accurate presentation interesting to the man in the street. Fortunately, in the long run, the process of educating public opinion begins, not with the man in the street, but with the man in the professor's library, the editor's sanctum, the business office and at the statesman's desk. Knowledge and ideas work, not upward from the man in the street, but downward to him from the classes mentioned, and the professor, the editor, the business man and the statesman will consume stronger meat and with less sensational seasoning than he will. The bureau's bulletins are adapted to consumption by these classes, although perhaps a little more seasoning would make them no less instructive and palatable to more people. The professor, the editor, the business man and the statesman may not transmit to others in detail the information they give, but they do afford material for thinking and discussion by these persons which are bound to influence public opinion, and thereby public action. The bulletins also furnish information that can be effectively used by railway men in the discussion of railway matters. Their greatest merits have been that the controversial tone has been absent and that so far as we know they have never contained a statement that could be refuted. That they have exerted influence is beyond question, for much of the data given has been widely published in the newspapers, and has been used by professors of economics in universities, etc. It was a wise inspiration that moved the railway presidents to provide for this work. The amount of it should be increased. The bureau is furnishing much good ammunition; there ought to be more railway people using it. The good of the railways and the good of the public demand that the truth about railway matters shall be stated with tireless iteration and reiteration in every part of the United States. When what is true is told as persistently and generally as what is false has been told over a long period of years, conditions will be much improved. The public means to act fairly. It has in many cases acted unfairly, because it has been misled as to what was fair. The only way to keep it from being misled in future is to keep on telling the facts, all the facts and nothing but the facts.

INDICTING COMMON SENSE.

THE grand jury that is investigating the New England railroad situation continues from time to time to indict President Mellen of the New Haven, and President Chamberlin of the Grand Trunk. Every time it indicts them it also indicts common sense. It indicts economy and efficiency in railway operation. It indicts the economic opinion of the age. Either that, or it indicts the Sherman anti-trust law, the Congress that passed it, the Congresses that have failed to amend it, and the public opinion that has elected and sustained these Congresses. The *Railway Age Gazette* has already commented on the relations of the New Haven and New England (December 20, 1912, page 1171). We are here concerned with the question of a competitive railroad system in New England versus a co-ordinated, unified one.

Competition was to be produced by the construction by the Grand Trunk of the Southern New England into a territory practically all of which was already well supplied with mileage. The new line for a long time would have been a bridge across

New England. It would have been expensive to build. It would have lacked adequate feeders It would have had few tracks into industries. Therefore, it would seem that it would long have been unprofitable. President Hays of the Grand Trunk thought it desirable to build it. President Chamberlin, who succeeded him, did not. He believed it better for the Grand Trunk to get in over the New Haven's tracks. If the Southern New England should be built, there would be a new railroad which the traffic of New England would have to support. It is fairly obvious that it costs more to support two railways than one. If a railroad opens new territory the traffic created, and which otherwise would not be developed, will support it. If it enters old territory already having a large mileage of railway it must live by attracting traffic already moving, or that would move, by the existing lines. In the former case it renders a public service. In the latter case it causes economic waste. The Grand Trunk extension seems, in the main, to fall within the latter category.

There are some things that would be worse than excessive railroad competition and the economic waste that it causes. One of these would be an unregulated railroad monopoly which was inefficiently managed, was arbitrary with the public and gave it poor service for which it charged high rates. The New Haven is not inefficiently managed. Its rates are not excessive. It is not unregulated, and if the public interest requires further regulating of it, this can be done. Its management has been somewhat arbitrary, but regulation and public opinion can curb this. Its service has been good in most ways and deficient in others, but will not be improved by its dismemberment. On the contrary, the railway service of New England will not be made the best it can be, or, in the long run, improved at all, by breaking up the New Haven system and developing general competition. The best service can be secured at the least cost by completing the co-ordination and unification of the existing New England railroad system. These things would make it practicable to adapt the service of each community to its needs, to route traffic by the most direct lines, to develop terminals where most needed.

This kind of co-ordination, unification and development, while incompatible with competition in construction, is not incompatible with some competition in service. Mr. Mellen's theory is that the New Haven is a great terminal yard which all the railways that want to enter New England should be allowed to use with their trains. He would let the Grand Trunk and Canadian Pacific in from Canada on the same terms. He would let the railways of the United States in on the same terms. There would be no difficulty in carrying out this plan if Mr. Mellen's terms to the other railways should be reasonable; and the fact that the Grand Trunk shows willingness to accept them indicates that they are. The advantage of competition in service would be secured, while the disadvantage of economic waste by competitive construction would be avoided. This is not merely Mr. Mellen's plan. It is opposed by those who study and discuss the New England railroad situation as agitators, but endorsed by those who study and discuss it disinterestedly and with public spirit. One of these is Professor Bruce Wyman, of the Harvard Law school. Professor Wyman says in an article in the Boston *Transcript* of January 29: "Believing in unification of our railroads as I do, I am convinced that we can get better service from a single system than we could ever hope for from separate roads."

But whatever thoughtful men who devote their lives to the study of subjects such as this may believe, a large part of the public still believes that we should go on regulating railways, both by laws that aim to compel them to compete and by administrative bodies that make it hard or impossible for them to compete. The public still believes that it can perform the great equestrian feat of riding two horses running rapidly in opposite directions. Many public men still think so too. So long as the public and public men so think, doubtless we shall keep on our statute books utterly inconsistent laws for the regulation of the railroads. And so long as this is the case the grand juries will continue to grind out true bills indicting common sense.

THE LIMIT OF THE COMMISSION'S AUTHORITY.

THE decision of the Supreme Court of the United States in the Louisville & Nashville case (I. C. C. and U. S. vs. L. & N. R. R. Co.) destroys utterly the theory advanced by the Interstate Commerce Commission and its attorneys as to the authority of the commission. This theory was concisely stated by the commission in its annual report for 1911. The making of rates, it said, is a legislative function. "That being so, the discretionary power involved in reaching the conclusion that a particular rate is or is not reasonable for the future, or that a particular discrimination is or is not undue, is a legislative discretion which cannot be reviewed by the courts." Congress, it has been contended, has so completely delegated to the commission the legislative function of making rates that the courts can no more review and set aside one of its orders that is not confiscatory than they can set aside a non-confiscatory act of Congress. The commission, it has been maintained, may even base orders on information in its possession which has not been introduced at the hearing of the case before it, and of which the parties are not apprised.

Many lawyers, economists and public men have accepted this doctrine as having been established by the Supreme Court itself; and the Commerce Court has been severely criticized because it has reversed the commission in cases in which it has believed that the commission has not given a full hearing, or has ignored the evidence, or has made unreasonable orders. The Louisville & Nashville case is one of those in which the Commerce Court reversed the commission. The Supreme Court reverses the Commerce Court, disagreeing with its conclusion that the findings of the commission were not based on substantial evidence. But the Supreme Court completely upholds the principle laid down by the Commerce Court that the orders of the commission can be made only after a full hearing and must be based on substantial evidence and that the courts may inquire whether this has been done and reverse the commission if it has not been.

The law gives the right to a full hearing. "That," says the Supreme Court, "conferred the privilege of introducing testimony and at the same time imposed the duty of deciding in accordance with the facts proved. A finding without evidence is arbitrary and baseless. And if the government's contention is correct, it would mean that the commission had a power possessed by no other officer, administrative body, or tribunal under our government. It would mean that where rights depended upon facts, the commission could disregard all rules of evidence, and capriciously make findings by administrative fiat. Such authority, however beneficently exercised in one case, could be injuriously exerted in another; is inconsistent with rational justice, and comes under the Constitution's condemnation of all arbitrary exercise of power." "Under the statute," the court adds, "the carrier retains the primary right to make rates, but if, after hearing, they are shown to be unreasonable, the commission may set them aside and require the substitution of just for unjust charges. The commission's right to act depends upon the existence of this fact, and if there was no evidence to show that the rates were unreasonable, there was no jurisdiction to make the order. In a case like the present the courts will not review the commission's conclusions of fact by passing upon the credibility of witnesses, or conflicts in the testimony. But the legal effect of evidence is a question of law."

Commenting on the contention that the commission may use private information in its possession in deciding a case, the court says that "such a construction would nullify the right to a hearing, for manifestly there is no hearing when the party does not know what evidence is offered or considered and is not given an opportunity to test, explain, or refute." All the in-

formation on which the order is based must appear in the record of the case, "for otherwise, even though it appeared that the order was without evidence, the manifest deficiency could always be explained on the theory that the commission had before it extraneous, unknown, but presumptively sufficient information to support the finding. . . . The question is whether there was substantial evidence to support the order." If there was, the courts cannot settle conflicts in the testimony nor put their judgment above that of the rate-making body.

When the bill to abolish the Commerce Court was pending, Attorney-General Wickersham suggested that if Congress considered it expedient to make the commission's findings of fact binding on the courts, it might do so by enacting a specific provision to this effect. The decision in the Louisville & Nashville case indicates that this could not constitutionally be done. As has been shown, the Supreme Court says that the exercise of such authority as the commission has claimed "comes under the Constitution's condemnation of all arbitrary exercise of power," and that "the legal effect of evidence is a question of law." It follows that whether the commission has given legal effect to the evidence or has acted arbitrarily is a question which the courts have a constitutional power to pass on, even though confiscation is not involved.

Those who believe it would be expedient for the commission to be the final judge of the facts, with uncontrolled authority to regulate rates and service according to its good judgment, so long as its orders were not confiscatory, will be disappointed by this decision. They will say that the commission is more fit to deal with these matters than the courts and that judicial interference will hamper its work. But any administrative body, however expert and impartial, is apt to make mistakes which a court, though less expert, may detect and correct. The principle of court control of the commission is similar to the principle of commission control of the traffic managers. No one in his senses doubts that the traffic managers of the railways know more about how rates ought ordinarily to be made than the commission does. But the traffic managers have at times acted unwisely or unjustly, and so the commission has been authorized to correct their errors. So the commission knows more in detail about how rates ought to be made than any court. But the commission may at times act unwisely or unfairly. It is not merely a judge of the railways, but it is required to act as a detective to shadow them, and as a prosecutor to prosecute them. As long as it has these functions, and its members are human, it will not be entirely impartial. How then can it be reasonably contended that the courts should not be allowed to inquire whether the commission has acted in disregard of evidence, or without any evidence at all, or issued orders that are palpably unjust.

The main principle on which the government of the United States rests is that it should be a government of laws and not of men; that no one should have his life, or liberty, or property taken without the right to be fully apprised of the reason and to appeal to the courts to determine if the taking is just. The doctrine that the Interstate Commerce Commission should be given arbitrary power is simply the doctrine that the property rights of the owners of railways should not be given the same protection as the property rights of other persons. It is a doctrine that is inherently wrong and unjust, and it is gratifying that the Supreme Court has repudiated and condemned it. Perhaps it may be desirable that administrative officers should be given the arbitrary authority over *all* forms of property that it has been contended that the commission has over railway property. There are some people who believe that the bureaucratic autocracy is the best form of government. But until the people of this country are prepared to come to that it cannot be rationally, consistently or equitably contended that arbitrary power over railway or public utility property alone should be given to administrative officials.

Letters to the Editor.

SAFETY APPLIANCE INSPECTORS.

Chicago, January 27, 1913.

To the Editor of the Railway Age Gazette:

Recently the equipment in the yards of a western railway was inspected by a government safety appliance inspector. The inspection occupied one hour, and was finished at 9 a. m. After it was completed the inspector was asked if he intended to inspect the equipment in the yards of another railway located in the same town, and about fifteen minutes' walk from the yards in which the inspection had just been made. He replied that the inspection of one yard was considered a day's work in government service, and that no inspector went over more than one yard in one day; he would, therefore, save the other yard for another day's work.

Government service is paid for by the public through the medium of taxation. The theory upon which government employees handle their work should be known, therefore, to all the public, and especially to the magazine muckrakers and all other reformers who are howling for government ownership of railways as the only means by which true economy and efficiency can finally be reached. Railroad men will not need more than one guess to decide how long a man who handled his work as outlined above would last in railroad service.

Master Mechanic.

BASE FAILURES IN RAILS.

Chicago, Ill., October 29, 1912.

To the Editor of the Railway Age Gazette:

I have read with a great deal of interest the report of the accident on the Wabash near Lebanon, Ind., on March 7, 1912, made to the Interstate Commerce Commission by the chief inspector of safety appliances and accompanied by a report by James E. Howard of the Bureau of Standards. While this is an exceedingly valuable and painstaking report it has some statements which, I believe, are misleading to those who are not already well informed regarding rail investigations. The initial cause of failure was a broken base due to unusual or seamy metal. The seam itself is not shown, although a good deal of space is given to a description of the manner in which the rail was subsequently broken into several pieces as the locomotive wheels passed over it. It is to be regretted that micro-photographs of the seam itself are not shown so that the reader may form an idea as to just what kind of a seam is referred to. On page 5 the statement is made, "Statistics show that a large majority of the broken rails reported are defective in much the same manner as this rail." If this means that broken rails due to seams predominate, then the statement is correct, but if it means that seams in the base or base failures predominate then it is incorrect, as the tabulation of rail failures of the American Railway Engineering Association on page 349 of Bulletin 147 of that association shows.

No one will question the statement that a large majority of rail failures are due to unsound metal, but the statements made as to means being taken to correct the trouble are misleading. On page 17 the following is found:

> Herein is exhibited a structural defect which is prevalent, to a marked degree, in many rails. It is a defect the presence of which is well recognized and admitted. It has been the cause of occasional wrecks and a large number of renewals of rails. Notwithstanding these circumstances, rails are accepted under specifications and tests in which this, the most common cause for breakage, is not guarded against. Revisions of specifications have gone on, still omitting reference to this prolific cause of rail failures.

Surely Mr. Howard must be aware of the extensive researches which are being made at the present time both by the

railroads and by the manufacturers. The belief in well informed quarters at the present time seems to be that structural unsoundness is due to defects which originate in the ingot, and every feasible scheme to secure sound ingots will be tried as soon as its feasibility is demonstrated. There is a large variety of sizes and shapes of ingots all producing unsound metal at times, but no one has come forward with an ingot that will always turn out to be structurally sound. Mr. Howard also says:

> An overwhelming majority of rail failures is reported as due to base fractures, fractures which disclose the presence of streaks and seams in the steel. This seaminess of the metal can be revealed by crosswise bending of the flanges, and such a test for structural soundness is easily made. In fact such a method of examination has been employed in the past by the undersigned to show the prevalence of streaks in rails which had or had not displayed seamy fractures in the track. Tests governing the acceptance of a finished product should undoubtedly be directed to show the fitness of that product against its most common manner of failure in service.

The tabulation above referred to shows that an overwhelming majority of rail failures do not take place in the base. It must be admitted in fairness, however, that more failures are due to base failures than were formerly reported, but this may be due to the fact that at the present time everyone is on the lookout for that special item.

Base failures may be separated into two divisions: those with a rough fractured surface as though the metal had been torn apart, and those which show a smooth surface near the bottom of the base.

This smooth surface may be so narrow as to be hardly discernible, but is frequently a sixteenth of an inch wide. It is apparent that the causes cannot be the same in both instances, and much confusion has arisen in trying to assign reasons for these failures as though they were all of the same character.

Although our knowledge of the subject is far from complete, the following reasons have been assigned as causes of failures of the first type:

(1) Professor Fay believes that sulphide of manganese is the cause of the trouble. This produces structural unsoundness without apparent surface defects. When the rail is subjected to lateral strain the bottom of the base is in tension and as the sulphide of manganese is not able to withstand stress of this nature, the metal separates in a line parallel to the longitudinal axis.

(2) The T-rail now in use is not symmetrical with respect to either its horizontal or vertical axis. It is one of the peculiarities of steel that it does not spread much under pressure but elongates much more readily. In the process of rolling more pressure is apt to be placed on the base of the rail than on the web. The result of this is that the base will be elongated more than the web, thus setting up an internal stress at the junction of the web and base. With our present type of rail having a short radius at this point this stress is concentrated within a small area of the cross section.

(3) Another cause is cold straightening or "gagging" at the mills. It has been noticed that rails checked or made a snapping noise while being straightened in the presses, and the more recent specifications reject all such rails. It has always been difficult for me to see how this can happen in a rail otherwise sound. It would not appear to be probable that a vertical force would produce a vertical fracture in uniform material. Some inspectors also state that they do not hear this sound as frequently in open hearth as in Bessemer rails. However that may be, the sound is made by the release of some internal stress either by pulling apart a seam or breaking a thread of material which was weaker than that which surrounded it.

(4) Segregation, or the separation of the constituent elements of steel taking place in the ingot, reduces the transverse ductility, and if the separation is sufficiently marked, will make a plane of cleavage or separation when the portion affected is subjected to tensile or shearing stresses.

(5) Still another cause is lack of transverse ductility. It is a fact that when subjected to tensile stresses, rolled steel is stronger in the direction of its rolling than transversely. Just what difference should be expected is in some doubt at the present time as tests do not seem to have progressed far enough to be called a final demonstration. Also the transverse forces due to a moving train are not well established, as regards magnitude. Numerous investigations are being made along this line and our knowledge of the matter will be increased in time. From our present knowledge of the subject it appears to be a fact that a majority of the rails which fail from lateral pressure are structurally unsound. This unsoundness originates in the ingot and is generally local in character.

Under the second division we have: Seams due to pipe, inclusive of foreign matter, etc., and seams due to imperfect rolling conditions. Seams due to pipe may be almost any length up to the length of the rail or small seams scattered along at intervals. The seam cannot always be told when the rail is sawed unless it is discolored. The slag inclusions, etc., are discolored and are readily told if the rail is cut at the point, but may be found anywhere in small pockets. Seams due to rolling conditions, if on the surface, are easily seen and seldom are found in the tracks, as the rail is rejected at the mill.

Another reason for seams in the base has been brought forward by some writers. They claim that the skin which is first formed on the bloom in rolling becomes wrinkled, and as the section is reduced this skin is rolled into the rail base. This occurs after the rail has cooled below the point when welding will take place. This defect in mill practice seems to be well founded and will undoubtedly be eliminated as time progresses.

The present drop tests with the addition of the latest ductility tests and chemical requirements are intended to eliminate general defects in the manufacture of rail and are fairly successful in that respect. These specifications are progressive in character and changes will be made from time to time as particular points or betterments are demonstrated. But with regard to the defects described above which are local in character, the situation is different. Tests of sample pieces do not show the trouble. In order to eliminate this kind of trouble each rail must be tested separately in such a manner as to reveal it. Mr. Howard says he has such a test. Will it be practicable for him to test 4,000 rails a day, the output of the Gary mill, by the method he refers to?

I believe the study of rail steel and concurrent troubles arising from the use thereof is only in its infancy. The man who will know all about it is not yet born. In the meantime, general statements unaccompanied by a large number of qualifying adjectives are apt to mislead those who have no exact knowledge of the subject matter under discussion. However it must be borne in mind that specifications and tests of the kind now in use and those along the same general lines will largely eliminate the local defects as found in this particular instance when a critical inspection is made at the mills.

Paul M. La Bach,
Assistant Engineer, Chicago, Rock Island & Pacific.

Clearances in Australia.—For more than seven years the railway departments of the several states have agreed to a standard uniform clearance in connection with bridges and tunnels on both the 4 ft. 8½ in. and 5 ft. 3 in. gages. As the Commonwealth government has finally decided on the 4 ft. 8½ in. gage for the Transcontinental line, together with the possibility of 4 ft. 8½ in. being adopted as the standard gage throughout Australia, the question of the minimum clearance has been considered by a special conference of the railway commissioners of the several states and Tasmania. The new scale of clearances—the size of the locomotive being the governing factor—which have been agreed on provides for an increase from 14 ft. 6 in. to 15 ft. in the vertical height clearance from the center of the track, whilst an additional space of 6 in. has been allowed for on each side of the line as far as the width of the bridges and the distance of platforms from the center of the track are concerned.

TRANSPORTATION OF FRUIT AND VEGETABLES.*

A Fast, Difficult, Expensive Service Rendered at Relatively Low Rates—Need for Co-operation Between Shipper and Carrier.

By E. D. Levy,
Assistant General Manager, St. Louis & San Francisco.

There are various kinds of refrigerator cars used for the transportation of fruits and vegetables, but when each of the various styles of cars is analyzed carefully it will be found they are all based on practically the same principle, i. e., an insulated box car, with insulated side doors and hatch plugs, containing ice bunkers. Briefly, the efficiency of the refrigerator, or the preservative features, is determined by the number of layers of insulation, its quality and thickness, and the character of workmanship in the construction of the car, side doors and hatch plugs. It is an old adage that a chain is only as strong as its weakest link. This applies to a refrigerator car because if the car is not uniformly air proof it will not protect perishable freight from heat or cold. It would be the height of folly to build an expensive refrigerator car, properly constructed and insulated, and apply ordinary box car doors. For that reason I think cars known as insulated box cars, having no ice tanks, which are insulated at the bottom, sides, top and ends, and are equipped with end and side doors similar in construction to those that are applied on common ordinary box cars, are no better for preserving freight or protecting freight from heat or cold than the ordinary box cars. The use of these so-called insulated box cars should be discouraged in the territories where the temperature falls below 32 deg. or the freezing point.

Refrigerator cars are the most expensive cars used by railroads in the transportation of freight. It costs more to build them and more to maintain them. The average weight of a modern 60,000 lb. capacity refrigerator is 46,000 lbs., or 23 tons. The average weight of a modern 60,000 lb. capacity box car is 34,000 lbs., or 17 tons. When perishable shipments are moved under ice, the average weight of the ice is about 8,000 lbs., or four tons, making the weight of the empty car and the ice 27 tons, as compared with 17 tons for a 60,000 lb. capacity box car. The average weight of fruit or vegetables in car lots is about 12 tons. The average weight of a carload of revenue freight on the road I represent, including perishable and all other carload shipments, is 26 tons. It follows, of course, to make the average of 26 tons, a great many commodities will run 40 or more tons and some as low as 10 or 12 tons. I mention these facts in order that you may understand that with a car of perishable freight, containing about 12 tons on which we collect revenue, we transport free of charge when under ice a dead weight of 27 tons, and when not under ice a dead weight of 23 tons, as compared with other carload commodities where the weight of the freight in most cases exceeds the weight of the car. To make an intelligent comparison, I will say that, with a car of fruit or vegetables under ice, we have approximately 12 tons of freight, and the dead weight of the car and ice is 27 tons, or 2¼ times the weight of the commodity transported and on which the carriers collect freight charges. With the average car of freight containing 26 tons of revenue freight, the modern 40 ft. box or coal car will weigh 20 tons, or only 77 per cent. of the weight of the commodity transported.

Another feature that is very important and must not be lost sight of is that usually the refrigerator car must be moved empty from the point where it is made empty to the point where it is again required for the loading of perishable freight.

PROPER TRANSPORTATION.

For a number of years I have been connected with a railroad that handles a large amount of perishable freight of every character, and I have come to the conclusion that proper and reasonable service, that would be fair alike to shippers and consignees and to the carriers, is an average speed of 12½ miles an hour for less-than-trainload lots from origin to destination or junction point, and an average speed of 15 miles per hour for trainload lots of ten or more cars. The less-than-trainload lots should be moved on regular through freight trains scheduled at an average speed of approximately 12½ miles an hour from point of origin to destination or to the junction point with another line. There would, of course, be some delay at the junction point which would amount to about four hours at each junction point where the cars were delivered to a connecting carrier. The 12½ and 15 miles an hour schedule sounds slow for perishable freight. But if anyone will take the time to consider the average conditions under which fruit and vegetables in car lots are transported from producing territories to consuming centers, and give due consideration to the difficulties of transportation—the fact that usually in the producing territories the commodities must be gathered up from a number of stations and taken to a nearby point and re-iced, and must be re-iced not less than once every 24 hours; that division terminals where engines and crews are changed are located at about every 125 miles of the journey; that freight trains are subject to delays of various kind, including those caused by the elements, must take water and coal, must meet and pass passenger trains and other freight trains, and that there are other unavoidable delays too numerous to mention—he will agree that a speed of 12½ to 15 miles an hour maintained from point of origin to destination or to junction point with connecting carrier is an exceedingly good performance. An average of 12½ or 15 miles an hour each 24 hours will cover considerable distance.

DIFFICULTY OF MAKING FAST TIME.

When one stops to analyze he will find that it means very fast running for a freight train to maintain this average, and for the purpose of illustrating I will use a trip from New Orleans to Denver, using the Illinois Central to Memphis, the Frisco Lines from Memphis to Kansas City and the Rock Island Lines from Kansas City to Denver. We will first deal with the less-than-train lots which are handled on regular trains. Freight trains cannot be gotten through an average district terminal in less than one hour to one hour and thirty minutes, and more often it consumes one hour and thirty minutes than it does one hour. On the Illinois Central there are two district terminals between New Orleans and Memphis where engines and crews must be changed and loads switched in and out of the train. One hour and thirty minutes for each district terminal means three hours dead time. On the Frisco there are three district terminals between Memphis and Kansas City, one hour and thirty minutes at each of which makes four hours and thirty minutes dead time. On the Rock Island, between Kansas City and Denver, there are five district terminals, and one hour and thirty minutes at each means seven hours and thirty minutes dead time. Consequently, on this journey of 1,515 miles, New Orleans to Denver, there would be ten district terminals where crews and engines are changed and the train inspected and switched. The 15 hours should be deducted from the 121 hours, leaving 106 hours for running, which, divided into the distance of 1,515 miles, makes an average speed of 14.3 miles per hour. On the basis of 14.3 miles per hour as an average speed between district terminals the train would cover a 100-mile division in seven hours.

Now, take a train lot of ten cars or more at an average speed of 15 miles an hour, and at each district terminal allow one hour for changing engines and crews, inspecting train and nec-

*Abstract of an address delivered before the Western Fruit Jobbers' Association at New Orleans, La., on January 16, 1913.

essary switching, which would make a delay of 10 hours to be deducted from the running time of 101 hours, leaving 91 hours running time, which would make an average speed of 16.6 miles per hour, and at this rate of speed the train would cover 100 miles in approximately six hours.

This average speed of 14.3 and 16.6 miles per hour is the average speed at which the train must move between district terminals, and does not take into consideration any delay for taking water and coal, meeting and passing passenger trains and other freight trains, and the countless other delays that a freight train must encounter on a single-track railroad. It is an actual fact that a perishable freight train on a busy single-track railroad does not cover a 100-mile district without encountering an average of two hours' delay. This would reduce the actual running time over each 100-mile district to five and four hours, respectively. At five hours it would mean an average speed of 20 miles an hour; at four hours an average speed of 25 miles an hour. In order to maintain this average speed of 20 or 25 miles per hour, the train must make a maximum speed of 35 to 45 miles per hour while moving. I do not mean to say that at all times when the train is in motion it will make 35 to 45 miles per hour, but I do say that to make an average speed of 20 and 25 miles an hour a train must, to offset the delays in slowing down for various reasons, run at times 35 to 45 miles an hour. When I say times I mean many times. I have known instances where freight trains ran 50 to 60 miles an hour. Anything over 40 miles an hour is very fast time for a freight train. If you have any doubt about 40 miles per hour being fast for a freight train, you would soon be convinced if you rode one at that speed over an average railroad.

THE REVENUE RECEIVED RELATIVELY LOW.

I maintain that it is to the advantage of the fruit trade as a whole that it shall not urge railroad companies to make excessively fast schedules, but urge all railroads to adopt uniform schedules so that when connected up they will provide reasonable schedules from the point of origin to the point of destination. On a reasonable schedule railroads can handle the perishable freight with some degree of profit. This they cannot do when they handle it at an excessively fast speed. We have moved many a trainload of perishable freight over the railroad at an average speed of 20 miles an hour, including all delays. I am not saying this because I am proud of it. When a freight train moves at an average speed of 20 miles an hour, including all delays, the commodity transported must pay very high rates to make it profitable to the railroads.

It is an old saying that a railroad is a merchant, the raw material it buys is freight train miles, and the manufactured product it sells is ton miles of revenue freight.

We do not figure the cost of moving a single ton one mile, but, for convenience, figure the cost of moving 100 revenue tons one mile. Assuming for the sake of easy illustration that it costs an average of $2 to move a freight train one mile, it would mean each 100 revenue ton miles would cost one-tenth of $2 or 20 cents. If the train handled but 500 revenue tons 100 miles, it would produce 50,000 net revenue ton miles, and the cost would be 40 cents per 100 revenue ton miles. If the train handled 250 revenue tons 100 miles, it would produce 25,000 revenue ton miles and the cost would be 80 cents per 100 revenue ton miles.

These illustrations are given to make it very clear that the more tons of revenue freight are hauled in a train at the same expense the cheaper the cost of hauling one ton. Fast speed with a freight train can only be made by reducing the number of tons in the train. The cost of labor and materials of all kinds, and in fact every item of cost that enters into producing revenue ton miles, has increased and is increasing. Railroads must, to meet this increased cost, sell their revenue ton miles at a higher rate or produce them at a lower cost. It is a hard matter to raise rates and it is equally hard to reduce costs. A railroad must be operated economically the same as you must conduct your business economically. As an illustration of how the decreased purchasing power of a dollar in wages has prevented our increased loading of trains from reducing our cost of producing a revenue ton mile I will say that in the year 1912 our increased loading per train mile was 69 per cent., as compared with the year 1900; and the revenue ton miles produced per dollar of wages paid employees decreased 16.3 per cent. In other words, please remember that, notwithstanding an increased loading of 69 per cent., our cost per ton was actually increased 16.3 per cent. by reason of increased wages we were forced to pay. For fear this fact may not be clearly understood, I will add that the increase in trainload indicates increased efficiency in operation, which, great as it has been, has failed to overcome the effect of increased wage scales. The economical rating of a locomotive is to give it the tonnage it can move over the railroad at an average speed of approximately 10 miles per hour from terminal point to terminal point. To make a higher rate of speed than this there must be a reduction of tonnage.

A train of fruit or vegetables weighing an average of 12 tons of revenue freight per car would have to consist of 25 cars to produce 30,000 revenue ton miles over a 100-mile district; of 50 cars to produce 60,000 revenue ton miles over a 100-mile district; and of 100 cars to produce 120,000 revenue ton miles over a 100-mile district. Twenty-five cars of perishable freight, amounting to 300 revenue tons, is a big average trainload; in fact, the average revenue trainload of the railroad I represent at the present time is about 340 net tons. The gross tons in an average train, other than perishable freight trains, are about double the revenue tons. With a train of fruit or vegetables under ice, the tare weight of cars and ice in a train of 25 cars, which produces 300 revenue ton miles, would be 2¼ times the revenue tons, or approximately 700 gross tons. In other words, with a train of ordinary freight weighing 700 tons gross, we would collect freight on approximately 350 tons. With a train of fruit and vegetables, on which we would collect freight on 300 tons, we would have to haul approximately 1,000 tons gross.

I am not going to mention the liability from a loss and damage standpoint, because if a railroad will first decide upon a reasonable schedule and then maintain that schedule, and furnish proper refrigerator cars, there should be no claims. Where claims on a carload fruit and vegetable movement are excessive it is due, I believe, to the fact that the railroad has not provided the proper equipment and has provided a fast schedule it cannot maintain, or there is a lack of organization in the originating territory. The transportation of fruit and vegetables in carloads is only profitable when the commodities can be transported at a reasonable speed. As the rate of speed is increased, unless the rate of revenue increases proportionately, the freight becomes unprofitable. This is a general statement which, in the majority of cases, will be found true.

To remove the illusion the fruit men are under when they think fruit and vegetables are entitled to excessively fast schedules by reason of relatively higher rates, I give below a table of ten common commodities of the railroad I represent, showing the weight of the revenue freight, the weight of the car and the total weight; the average earnings per ton per mile of revenue freight, and the average earnings per ton of gross weight for the fiscal year ending June 30, 1912. It is fundamental that it costs as much to haul a ton of car as it does a ton of fruit or any other commodity. This being true, the average earnings per ton of gross weight transported must be considered and not the average earnings per ton of revenue freight.

Commodity.	Net Tonnage	Tare	Gross Tonnage	Average earnings per rev. ton mile (in cents)	Average earnings per gross ton mile (in cents)
Live stock	11	17.6	28.6	1.491	0.573
Soft coal	40	18.5	58.5	0.603	0.412
Flour	17	17.6	34.6	0.834	0.410
Corn	28	17.6	45.6	0.635	0.390
Lumber	24	17.6	41.6	0.673	0.388
Cement, brick and lime	25	17.6	42.6	0.634	0.372
Fruit and vegetables, not iced	12	23.0	35.0	1.079	0.370
Iron (P. & B.)	34	17.6	51.6	0.557	0.367
Fruit and vegetables	12	27.0	39.0	1.079	0.332
Oats	22	17.6	39.6	0.536	0.298

These figures prove conclusively that we earn less per gross ton per mile on fruits and vegetables than we do on corn, flour, coal, iron, cement, brick and lime and lumber, and the fruit and vegetables must be moved at fast speed at greater expense.

I mention these facts to drive home the argument that the carriers must either be permitted to transport the fruits and vegetables at a reasonable rate of speed, which enables them to protect their expenses, or, on the other hand, be compensated with a commensurate increased rate of freight.

DISTRIBUTION OF LESS-THAN-CAR LOTS.

It is only recently that railroads in the Middle West have inaugurated refrigerator car service to protect less-than-carload shipments of fruit and vegetables from heat and cold. The railroad I represent does not run any scheduled refrigerator cars from jobbing centers to protect less-than-carload shipments of fruit and vegetables from heat, but does run, from November to March, inclusive, scheduled refrigerator cars from the large jobbing centers on certain days of each week to protect less-than-carload shipments of fruit and vegetables and other perishable freight from damage by frost. I believe the carriers should provide this service from jobbing centers wherever there is a demand for it. It is much easier to provide scheduled refrigerator car service as protection against frost in the winter months than it is to provide similar service against heat in the summer months, because in the winter months if there is not sufficient tonnage of perishable freight to justify a scheduled car other miscellaneous freight can be loaded in the same car without damage to the ordinary merchandise or the perishable freight. In the summer months when the car is under ice, and is damp, there is more or less risk in loading in a refrigerator car, certain commodities being subject to damage from dampness.

It is more expensive to the carrier to run scheduled refrigerator cars for the distribution of less-than-carload perishable freight either in the summer or winter months, compared with the ordinary box car, because merchandise is a light commodity and you cannot load sufficient quantities of the freight in the car to give a capacity load. The cubic space available for loading in a refrigerator car is much less than in a box car. The refrigerator car weighs from three to six tons more than the box car, and there is the expense of icing it in the summer months and heating it in the winter months. Consequently, this scheduled refrigerator service from jobbing centers should be limited to the actual requirements and a scheduled car should not be run each day unless there is a sufficient volume of perishable freight moving to justify it. In most cases a scheduled refrigerator car moving from the jobbing centers two or three times a week will answer all requirements.

There does not seem to be any necessity for iced refrigerator cars for the distribution of perishable freight in the summer months as a protection against heat, because there does not seem to be any great demand for them. There must be considerable necessity for refrigerator car service in the winter months as a protection against frost because there is a great demand for it.

It is to the interest of the carriers, as well as the jobbers, that the railroads provide equipment and service that will enable the perishable freight to be shipped from points where it is produced to the distributing centers and from the distributing centers to the points of consumption in all kinds of weather. When, in the absence of proper scheduled refrigerator car service from the jobbing centers, the weather becomes so cold that the jobbers cannot ship and they purchase a smaller quantity, the growers lose the sale on account of the decreased demand and some of their products perish if not sold when ready for market and are a total loss. The railroads lose the revenue on the haul of carloads to the distributing centers and lose the revenue on less-than-carload shipments from the jobbing centers to the local points of consumption.

The railroad I represent had a very costly experience the past two years in attempting to provide scheduled refrigerator cars from the jobbing centers for the protection of less-than-carloads of perishable freight against frost. A large amount of perishable freight reached destination frozen. As a result of that experience, we have provided oil stoves to be placed in each scheduled frost-proof car, to remain in the car all day from the time loading is started until just a short time before the car is pulled from the merchandise platform. We have provided canvas curtains to be fastened on each side door, opening in the middle like the flap of a tent, which affords protection while the car is being loaded. During the two previous years, we did not provide the stoves and tarpaulins in the cars and considerable of the freight was no doubt damaged during the process of loading. There was some freight damaged during the time it was being transported from the jobbers' houses to the station. We now require the freight to be delivered at the station early in the afternoon, closing the frost-proof scheduled cars an hour or two before the ordinary merchandise cars are closed, so the cars may remain with the doors closed for an hour or two with the lighted stove until the temperature is raised to a reasonable point. We do not move any loaded cars with lighted stoves in them, and immediately before the cars are sealed the doors are opened and the stoves removed. We prohibit train crews, in distributing the freight, from leaving the doors open for the purpose of furnishing light. They must use a lighted hand lamp, enter the car, close the door behind them, move all the freight for that particular station to the doorway, open the door and unload the freight as quickly as they can and close the door. In very severe weather when the temperature of the car is in danger of reaching a point that will frost the contents, we set the car out and have the agent protect it with a stove.

NEED OF CO-OPERATION BETWEEN SHIPPERS AND CARRIERS.

It is of such vital interest to the carriers and the jobbers, to say nothing of the producer and consumer, that opportunity be afforded for the free distribution of perishable freight practically each day in the year, that it behooves both the carriers and the fruit jobbers to approach this subject as all similar subjects should be approached, i. e., in a spirit of mutual co-operation, and to build up an organization that will enable both to conduct their businesses every day in the year at a fair profit. The first step in this direction should, in my opinion, be a local organization of the fruit jobbers at each jobbing center, whether it be a local branch of the Western Fruit Jobbers of America or a local organization of the fruit jobbers independent of this or any other association. This association should then appoint a transportation committee, and this committee should work out with the carriers the problems of distribution of the perishable freight. It is very unsatisfactory now to handle with the various individuals the question of scheduled cars—you can secure as many opinions as you consult men. This transportation committee should study the distribution problems from all angles, meet with the railroads and work out a system of schedules, for both winter and summer, to meet the demands of the fruit jobbers and not to be an undue tax upon the carriers. I am quite sure all of the carriers would be willing to co-operate with the transportation committee of the fruit jobbers, and where the carriers did not show a proper spirit of co-operation the fruit jobbers could, acting as a unit, convince the railroad that it was to its interest to do so or perhaps incur the loss of other business. In other words, to be plain, roads that do not give proper service for the distribution of less-than-carload perishable freight should not be favored with the routing on the carloads into the distributing centers.

Carriers do not always use the proper means for protecting perishable freight and shippers do not always use sufficient care in protecting their shipments from their place of business to the railroad station. I am not undertaking to say that the fault is all with the shippers, nor am I willing to admit it is all with the carriers. We are both lax, and what we should do is co-operate along intelligent lines to improve the methods of both and bring the distribution of less than carload perishable freight from the uncertain state which it is in to a state of high perfection where its transportation will be as regular as the United States mails, even if not as fast, and its protection from the

jobbing houses to the stores of the consumers absolutely insured.

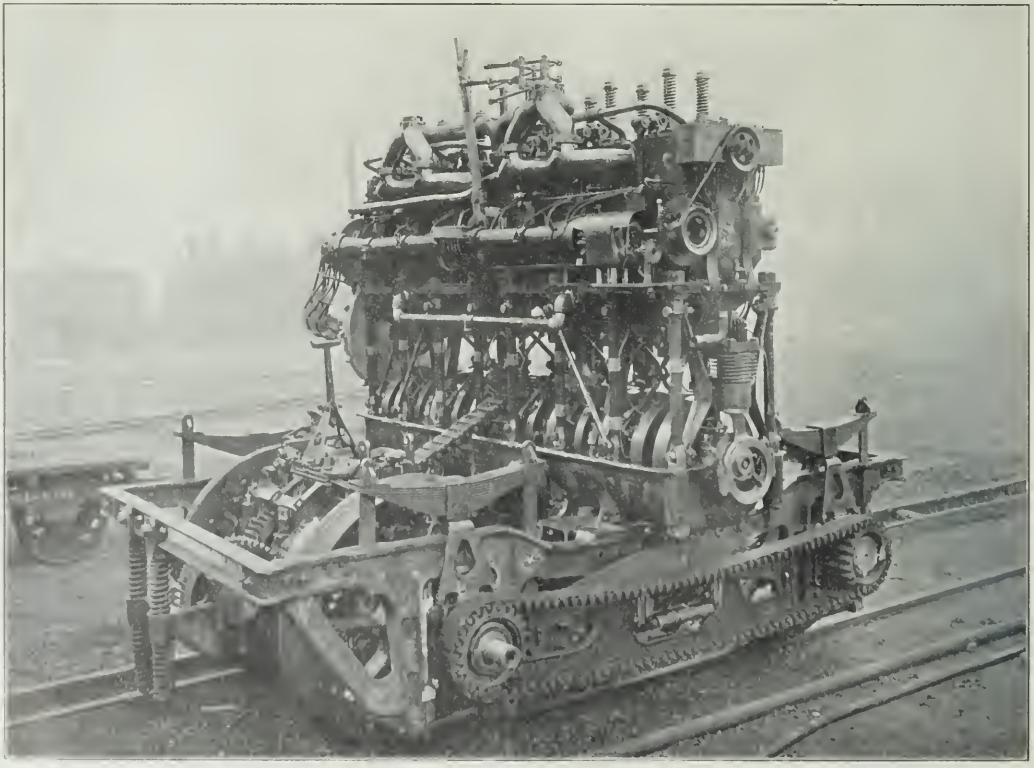
I believe that the perishable freight for the scheduled refrigerator cars should be delivered at the freight stations within a space of two hours, whichever two hours might be decided upon to be the best for all concerned, and in this way the car door would be open but a short time for loading freight, as compared with the present practice. In the winter months, the two hours that are usually the warmest should be selected and in the summer months the two hours that are usually the coolest. There is just as much liability that perishable freight will be damaged by frost in extreme temperatures in being moved from the houses of the jobbers to the freight station as after receipt at the freight station. Consequently, the jobbers should give the freight proper protection while in transit to the station, and the hours in which it is decided to deliver this perishable freight to the station should be hours that are not classed as rush hours, so the highly perishable commodity will not be held on the wagons awaiting its turn to reach the platform and after reaching the platform be held there awaiting to be handled into the cars. The wagons should be immediately received at the platform, another freight immediately unloaded and placed in the scheduled cars. It is not satisfactory to the fruit jobbers to have the freight reach destination in an unsalable condition, even though they are able to collect damages for the loss from the railroad. What the fruit jobbing interests want, and must have, is dependable service that will place these highly perishable commodities in the houses of the country merchants, if you please, in the same condition in which they left the jobbing houses, and I maintain it is possible to do this, and that it is only possible to do it by the carriers and the fruit jobbing interests working in a spirit of intelligent co-operation.

NARROW GAGE GASOLENE MOTOR CAR.

Five 30-ton, all-steel gasolene motor cars have recently been built for the Queensland government railways, Australia, by the McKeen Motor Car Company, Omaha, Neb. They have a gage of 3 ft. 6 in., and are 62 ft. 5¼ in. long over the bumpers. While in general they conform to the standard design and construction of the McKeen cars, there are some special features of interest. They are to be operated from the left side, have the side type of buffing gear and are provided with draw hooks and screw couplings in place of M. C. B. couplers. The entrance to the car is in the center and is so arranged that the passengers may board it from the ground, as well as from elevated platforms, a trap door being used as on Pullman equipment. Each car has a total seating capacity for 69 passengers, 55 in the main compartment and 14 in the smoker. The car bodies are 59 ft. over end sills and 8 ft. 9 in. wide over the sheathing. The height from the rail to the roof is 11 ft. 8½ in., and from the floor to the ceiling, 7 ft. 8⅛ in. The distance between the center plates is 34 ft. and the total wheel base is 40 ft.

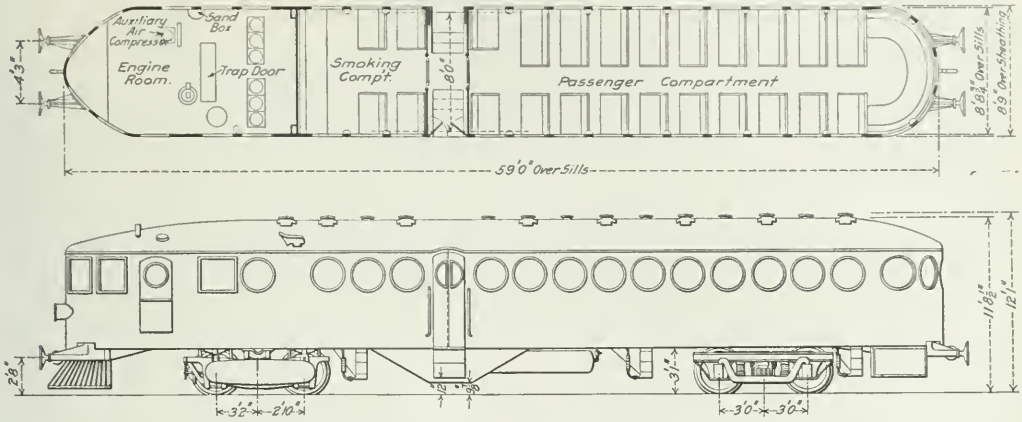
The engine consists of six 10 in. x 12 in. cylinders with a rated capacity of 200 h. p. It is started by compressed air and is reversible. The car has two speeds, direct and geared, and is operated by a multiple disc clutch. A Morse silent chain drive transmits the power from the engine to the forward axle, and from axle to axle, as shown in the illustration.

The motor truck wheel base is limited to 6 ft., which, with a specially designed front bolster, allows the cars to operate on the sharpest curves of city railways. The motor truck side frame is of cast steel, being made in one piece, and is bolted and wedged against the bed plate. The truck is unusually light and



Six Cylinder Engine of 200 H. P. Capacity for McKeen Narrow Gage Motor Car.

strong, and has four 36 in. steel tired wheels on 6 in. x 10 in. axles. The wheel centers are of cast steel. The weight on the front drivers of the forward truck is 17,900 lbs., on the rear drivers, 17,500 lbs., and on the rear truck is 24,600 lbs. These are the first narrow gage motor cars turned out by the McKeen



Narrow Gage McKeen Motor Car for the Queensland Government Railways.

Company, and will be shipped to Australia in a knocked down condition. The Stone electric system of lighting is used.

RESULTS OF PUBLIC OWNERSHIP IN FRANCE.*

By Yves Guyot,

Former Minister of Public Works, France.

I will speak here only of the latest results of the nationalization of railways in France, according to the reports submitted to the Chamber of Deputies for supplementary credits on the 1912 budget and to establish the 1913 railway budget.

The advocates of the acquisition cannot deny the progressive increase of State railroad expenditures, but, in order to attenuate the expenses of the State Western railway, they indicate as their starting point the figures of the Western company in 1908. Now the acquisition was voted by the Chamber of Deputies in December, 1906. The company had no longer any authority over its staff; its position was entirely abnormal. Moreover, it had during the year 1908 to bear expenses which, but for the acquisition, would have been nominally carried over to the 1909 accounts.

These unsatisfactory conditions of the Western company give yet stronger relief to the gravity of the increase in expenditure of the acquired railroad:

	1908. Francs.	1912. Francs.	Difference. Francs.
Gross receipts	217,645,100	244,335,000	+26,689,900
Working expenses	147,958,700	220,262,900	+72,304,200
Net revenue	69,686,400	24,072,900	—45,614,308
Capital expended	101,509,100	106,347,000	+ 4,837,900
Deficit	31,822,700	82,274,900	+50,452,200

And again it must be remembered that the real deficit for 1908 was only 28,522,675f. 68c., to which the general reporter for the budget, M. Chéron, adds 3,300,000f., an increase of expenditure resulting from the agreement which determined the acquisition annuity.

As regards the former state railroad, it can only be a question of the receipts and expenditure of its working, as the capital for the establishment of the system has not yet been determined. Since 1908 the net products of the working of this line have considerably diminished.

The receipts have therefore risen by $8,000,000, whereas the expenditure progressed by $15,000,000. Here we would make the same remark as for the Western railway.

	1908. Francs.	1912 Francs.	Difference. Francs.
Gross receipts	58,969,411	67,150,000	+ 8,180,588
Working expenses	47,583,176	63,009,900	+15,426,723
Net revenue	11,386,235	4,140,100	— 7,246,135

Mr. Chéron, having observed the annual increase of receipts to be 3 francs 50 centimes per 100 [3½ per cent.], which he considers "simply satisfactory," remarks:

"It is therefore solely on account of the very important progression of expenditure that the net product of working has fallen."

The government forecast for 1913 was:

	Francs.
RECEIPTS.	
State Western Railway	460,208,000
Old State Railway	111,911,000
	572,119,000
EXPENSES.	
State Western Railway	530,079,000
Old State Railway	108,101,000
	658,180,000

—or an excess of expenditure of 86,000,000 francs.

The Budget Commission has made every possible effort to attenuate that deficit in the working. It has brought back the evaluations of receipts to 562,000,000, that of the expenditure to 642,000,000; and thus the forecast as regards receipt insufficiency is not greater than 80,000,000 instead of 86,000,000. Judging by experience, it is probable that at the end of 1913 the second figure will be greatly exceeded.

The reporters, Messrs. Chéron and Perrissoud, anxiously ask themselves: "What is the cause of this increase in receipts and decrease in net revenue?"

The answer is plain—expenditure increases more rapidly than receipts.

When the state purchased the Western railway, it was well known that it was unable to maintain order and efficiency in the navy arsenals. Nevertheless, it did not hesitate to add to the 10,000 employees which it already employed on the old line 50,000 other employees. It was easy to foresee that the strike would certainly occur, and it did occur in 1911.

The government reinstated all the strikers; it instituted delegates' councils, who naturally, before thinking about consignees and travelers, think of the interests of their mandataries and of their own.

Deputies, ministers, and, in consequence, directors, engineers,

*From the Annual Financial Review of the New York *Times*, January 5, 1913.

controllers, station masters, and foremen of workshops all tremble before the workmen and the agents whom they are expected to supervise and to direct in their work. The increase in expenditure for the employees which has occurred since Jan. 1, 1909, is:

	Francs.
For the old line	12,171,000
For the Western line	58,306,000
Total	70,477,000

In the working expenditure, this is how the expenses have been apportioned for employees and stock, in 1904, 1908, and 1912, and forecast for 1913:

	For labor. Francs.	Other expenses. Francs.	Total. Francs.
OLD LINE.			
1904	20,554,000	17,232,000	37,786,000
1908	24,337,000	23,246,000	47,583,000
1912	35,655,000	27,354,000	63,009,000
1913	36,508,000	26,823,000	63,331,000
WESTERN LINE.			
1904	65,362,000	42,388,000	107,750,000
1908	79,076,000	68,917,000	147,993,000
1912	133,168,000	89,239,000	222,402,000
1913	137,382,000	88,355,000	225,737,000

On the old line the expenditure for labor increased by 4,000,000 for the period 1904-1908, and by 16,000,000 for the period 1904-1913; whereas the other expenses vary only in the proportions of 6,000,000 from 1904-1908 and 9,500,000 from 1904-1913. The proportion therefore reverses from 1908, at which date the line was increased, owing to the acquisition.

For the Western line the labor expenditure increased by 14,000,000 from 1904 to 1908, and the other expenses by 26,500,000. The line was run by the state in 1908. From that date until 1913 the staff expenditure increases by $58,000,000 and the other expenses only increase by 20,000,000. Consequently the working of the line is subordinated to the convenience of the employees. It is run only for the benefit of the employees, rather than for the shippers or for the travelers.

From 1907 to 1913 the receipts rose on the old line by 13,000,000, and the expenses of employees by 14,000,000; for the acquired Western line the receipts increased by 47,000,000, and the labor expenses by $63,000,000, i. e., a decrease in receipts of $1,000,000 for the old line and of $16,000,000 for the Western.

The efficiency of the labor is not in proportion to the increase in advantages in its favor; but illness frees an ever increasing number of men to rest, thus, in the offices and terminals:

	1909.	1910.	1911.
Number of employees	3,852	4,844	4,515
Number on sick leave	1,291	1,582	2,044
Per cent. on sick leave	34	36	45

Similar figures for the employees in the transportation and maintenance departments show as follows:

Men employed	56,743	58,800	63,452
On sick leave	25,924	27,974	34,772
Per cent. on sick leave	45	48	55

Thus, more than one-half of the employees of the state railroads suffered from ill-health. The explanation is very clear. In case of sickness, the men receive full pay. Laborophobia is an irresistible illness for a certain category of railway men. It is a contagious disease, the more so in that it appears to afford nothing but advantages.

This increase in expenditure and restriction of labor yielded the following result: The average receipts on the state line, per employee, is 4,000 francs, whereas on the other French lines it is 5,100 to 6,200 francs.

It is hardly probable that any effectual remedy will be invented for this state of affairs; for the budget reporters, instead of looking to the management to cure the situation, place all their trust in the men, who have, during the past years, manifested such strong prejudice in favor of higher wages and less work.

Commercial undertakings managed by the state constantly evade parliamentary control. The financial law of July 13, 1911, ruled that a financial controller should be appointed for state railroads.

But the management protested against such a measure, and the Budget Commission reporter appealed at one and the same time "for careful control of accounts, and liberty for the railroads to break away from hampering tutelage."

And, indeed, the railroad boards have already made good use of such freedom "without waiting for the appearance of a decree, they have made numerous purchases of land, and started a somewhat considerable number of undertakings." A portion of the 300,000,000 bonds which were issued was devoted to the payment of land purchases, and work commenced before any decree appeared or any credit had been voted.

The board of management of state railroads is busy with extensive projects. Instead of confining such plans within the limits of the means at their disposal, they rely on the power of the state to issue bonds. On March 12, 600,000 4 per cent. 500 franc bonds were issued. They were issued at 503 francs and the price realized by the state was 495. There had been some intention to issue a new lot of 200,000 bonds, but in the face of this result of the first issue it seemed too risky to make such an attempt.

Issuing the 4 per cent. bonds at par was equivalent to marking the 3 per cent. rente down to 75 francs, except that the state bonds (rente), being free from tax, to which, on the contrary, the railroad bonds are subject, and the said tax amounting to 12.50 per cent., the rate of the parity was in reality lowered to 87.50. It fell actually to 90 and the minister is doing all he can to raise it again; he makes use of every means of persuasion and pressure to induce the credit houses and bankers to purchase, although it was he himself who lowered the rate.

The results of the state purchase of railroads may be summed up as follows:

The working of state railroads is more costly for France than had even been foreseen by its adversaries. It has proved the powerlessness of Parliament to control such undertakings. It has set up a class of workmen and employees who consider that the line is run for their benefit and not for the convenience of shippers or travelers. It has dealt a hard blow to public credit in France.

Bulgarian Railways.—Since 1878, when it first became independent, railway construction has steadily gone forward in Bulgaria. In the year mentioned only two lines were in existence, from Routschouk to Varna, built by Turkey for strategic purposes, and from Armanli to Bellovo, which links up Constantinople with western Europe. By the Treaty of Berlin, Bulgaria took up the financial obligations entered into by Turkey towards the company which had been granted the concession for the first line, which was subsequently taken over by the government. As the result of conferences with Austria-Hungary, Turkey and Servia, a detailed scheme was drawn up for the construction on Bulgarian territory of railways which should form useful links for international traffic, with the result that by 1889 the country was traversed by a line forming part of the important international route between Paris and Constantinople. In the same year there was also begun the construction of the line from Sofia, the capital, to the port of Varna. This line, passing through Tirnovo, is the most important so far as domestic traffic is concerned. On the completion of links now under construction or projected, the capital will also obtain direct communication, by means of a second line, with the port of Burgas, which is already connected with Constantinople, via Adrianople. All the Bulgarian railways are single track, which has hitherto sufficed for the needs of the traffic, and they are also not designed for high speed running. The whole system is operated by the government, and its length is at present about 750 miles, which will be increased to about 1,080 miles when the lines now under construction are finished. The aggregate capital expenditure will then have amounted to a little over $47,500,000, and it is of interest to record that most of the lines have been constructed by Bulgarian contractors. The total number of employees, apart from the staff of the Oriental lines, is just under 2,400.

AN ANALYSIS OF STEEL INGOT MANUFACTURE.

The Influence of Common Defects on the Quality of Rails and Structural Material and Means for Correcting Them.

By Bradley Stoughton,
Consulting Engineer, New York.

Defects in steel ingots and castings may be the consequence of faulty manufacture previous to the ingot stage, of faulty manufacture during the ingot stage, or of prevailing circumstances which are not faults in manufacture; or they may result from a combination of all of these different conditions. Any one of the recognized defects may be so deleterious as to unfit otherwise excellent steel for safe use. The truth of this is being appreciated today to a greater extent than it ever has been before, as evidenced by the discussion at the conference between representatives of railroads and steel makers in New York City a year ago, the four notable papers on sound ingots before the British Iron and Steel Institute in May and in September last, the recent New York meeting of prominent railroad engineers and steel metallurgists to listen to Talbot's description of his process, the interesting discussions at international engineering congresses during the past year, and, finally, the exhaustive report of the committee on Rails and Equipment of the National Association of Railway Commissioners.

The situation, as it relates to steel for rails and structural shapes, has been stated by the president of the American Society for Testing Materials, as follows: "Without sound and homogeneous ingots it is impossible to produce sound and homogeneous rails." And the meaning of "soundness" is defined by the committee on Rails and Equipment, thus: "Sound ingots: Probably the main end to be secured by improvements in manufacture is the production of sound ingots. It has been proved that sound rails cannot be made except from sound ingots. Defective spots in the ingot due to slag, blowholes, piping, and segregation will not be removed in rolling."

In order to make complete the committee's catalog of defects, we should add the presence of combined gases, such as nitrogen and carbon monoxide. We should also divide the defect described as slag into its two normal parts, oxidized substances and sulphide enclosures. We then have the full list of six ingot defects, which, with phosphorus, comprise all the ills to which forging steel is ordinarily liable, up to the period when it is rolled or forged.

Phosphorus is taken care of by means which are beyond the scope of the present paper, and the same may be said of the special microstructural difficulties to which steel castings are subject. Solid oxidized enclosures, entrained sulphides, blowholes, combined gases, pipes and segregation, will sufficiently occupy all the attention we can give here. As it is evident from the discussions to which we have referred, and especially from the report of the committee of the National Association of Railway Commissioners that the harm done by these different defects and the means for their correction or prevention are not generally understood, this study was undertaken with the object of placing on record what information is already available, and, if necessary, amplifying the data collected. As an example of the need of this, we note that Talbot, ignoring all ingot defects except pipes and blowholes, writes as follows, in his address before the American Institute of Mining Engineers: "The cost of the aluminum addition is very small; with silicon it is considerable, and with ferro-titanium it is large, to obtain the same result. . . . . All these de-oxidizers have the same effect, when used in the necessary varying quantities to produce this."

We propose to show that the prevention of blowholes is not the only purpose of adding aluminum, silicon, ferro-titanium, and other "physics" or "cleansers," that widely-different effects are produced by them severally, and that their relative effectiveness in each respect also varies greatly.

SLAG ENCLOSURES.

The chemical analysis of slag enclosures shows that they originate either directly or indirectly from the oxidation of iron and its constituents during the process of conversion into steel. Ziegler suggests that the oxides may be soluble in the liquid steel, but this view is not favored by Heyn and Rosenhain*, who have considered it at length. It seems more probable that the oxides of iron, silicon, manganese, aluminum, phosphorus, and calcium are in the liquid bath in the form of emulsified particles which will be held in suspension for a long time unless coagulated and removed by gravity. A hindrance to their elimination by natural means is the existence of a strong surface tension between the liquid steel and the solid oxide enclosures. That gravity tends to remove them is indicated by their presence in greater proportion at the top of ingots than elsewhere. This distribution seems indeed to argue against the solubility theory without, however, being entirely conclusive. Perhaps the oxide of iron at least may be soluble, and the other oxides, which originate chiefly because silicon, manganese, aluminum, etc., is added to decompose iron oxide, are themselves entangled before they have a chance to escape. It is the generally-accepted opinion, based on chemical analysis and other data which are summarized by Hibbard*, that most of the slag enclosures arise during the recarburizing of the steel. That some arise at other times is indicated by the occasional presence of calcium oxide.

The prevalence of slag enclosures is much more universal than is usually supposed, and all authorities who have expressed themselves on the subject, seem to take a certain amount of such inclusions for granted. The presidents of the two largest rail producing companies in America include this defect as among "unavoidable contingencies of manufacture," and the president of the third largest producer gives a list of physical defects, including: "Pipe, *abnormal* slag inclusion, etc." (The italics are mine.) Acid steel seems to be less liable to the defect than basic steel, but even electric steel is adversely affected, according to Arnou, Girod and others. In short, slag inclusion is an impurity which must be reckoned with in all steel which has been purified by oxidation, and especially in all steel which has been recarburized.

More than 20 years ago, Kreutzpointer called attention to the bad effect of slag enclosures on the resistance of steel to "fatigue," while the investigations of Rosenhain, Heyn, Wedding and Law, and those of Howorth, Bannister, Oberhoffer, Job, Primrose, Fay, Matweieff, Wickhorst, Dudley, Packer, Masselon and Mars, prove beyond question the dangerous influence of these foreign bodies, not only in causing steel to be frequently brittle and unreliable, but more especially in creating microscopic fissures and flaws (generally in the interior of the steel) which continuously develop under the strains of service and often cause the sudden rupture of steel which withstood a severe test for acceptance. This ill effect of the foreign oxides is dependent not so much on their size or amount, as on their mode of occurrence between the pearlite

*International Congress for Testing Materials, New York, 1912.

crystals of the steel, where they lessen the toughness of hypo-eutectic steel by interfering with the intercrystalline ferrite upon which this toughness so largely depends, and where they increase the fragility of hyper-eutectic steel due to the intercrystalline cementite. This mode of occurrence is probably the reason why slag enclosures are more dangerous to steel containing from about 0.50 to 0.75 per cent. and more of carbon (rail steel, spring steel, etc.), because the ferrite envelope in these steels is so thin that a slag enclosure may entirely break up its continuity. In steel of lower carbon, the slag bodies may be wholly enclosed in ferrite grains which will therefore act to some extent as a cushion to their brittleness. When it becomes generally recognized that the mode of occurrence of the slag, rather than the presence of an abnormal amount of slag, may be the cause of a "slag-fracture," and when engineers have learned to know the effect of slag in causing "seams," "streaks," and "laminations," we shall have a great deal more data on the ill effects of this impurity. James E. Howard, engineer-physicist of the Bureau of Standards, writes as follows, after referring to stresses which rails must bear in service:

To meet these conditions the metal of the rail should be structurally sound, but to attain structural soundness and uniformity in the finished rail certain conditions must prevail in the ingot and during the reductions in the rail mill. Chief among these is the elimination of slag inclusions in the ingot, which, starting in a globular form, become acicular in the rail and oriented parallel to its axis.

Mr. Howard and other engineers have also laid special emphasis upon the observation that interior fissures are more liable to develop in chemically hard steel than in softer steel, and are oftener met with in open hearth steel (basic) than in Bessemer steel (acid). The committee of the Association of Railway Commissioners assign as one cause of broken rails: "Internal transverse fissures which develop without outside evidence until the final break occurs". . . . "The most dangerous form of rail failure."

Engineers Cushing and Young, of the Pennsylvania Lines, assign the presence of entrained slag in 19 defective open hearth rails which showed these transverse fissures, as the "principal" and "fundamental" cause of the defect, and Dr. Dudley, of the New York Central Lines, is a prominent advocate of the necessity for eliminating slag as one of the chief means of obtaining good rail and structural steel. The engineers of the Harriman Lines, whose reports on rails are among the most thorough and authoritative available, class slag seams with pipes, as follows:

All rails are classed as "piped" which show in the fracture a seam or lamination; while this may not always be due to pipe, but may be due to slag or gas in the lower part of the ingot, the effect is the same.

And W. H. Wickhorst writes as follows:

The split head failure consists of an internal crack in the interior of the head running lengthwise of the rail anywhere from a foot or two to several yards in length. This type of failure is confined almost entirely to metal showing considerable internal segregation of carbon and phosphorus, attended more or less with laminations and slag seams.

Many rail and structural steel failures have been traced directly to defective metal due to slag seams, and many other failures, to metal showing streaks, seams, and laminations. J. E. Howard says: "An overwhelming majority of rail failures is reported as due to base fractures—fractures which disclose the presence of streaks and seams in the steel." One engineer ascribes this type of defect to rolling rails at too low a temperature, but let us hope that this opinion will not cause an increase of the already dangerously high rolling temperature, especially as the weight of evidence seems rather to indicate slag seams as the cause of these laminations—if not directly, then partly by direct influence and partly by the effect of red-shortness which slag enclosures produce. Hibbard thinks that the hot-shortness caused by slag enclosures is even greater than the cold-shortness so produced, while Stead, Campbell, Rosenhain, and others have shown that these foreign bodies also have the bad effect of hindering the refining of steel by annealing. Heyn has shown that enclosures of Al_2O_3 in mild steel, due to deoxidation by means of aluminum, can produce extraordinary red-shortness, and I have traced the failure of a high-carbon, heat-treated steel to the same cause, the alumina in this case being spread out in the form of a web, or thin cloud, made of microscopic specks, through which the fracture extended.

The commonest oxide enclosure is the silicate of manganese, and this seems to be often combined with the sulphide of manganese in a sort of double compound. Besides these bodies, the silicate of iron, and more complex slag compounds containing silicates of iron, manganese and lime, with alumina, sulphur and phosphorus frequently occur. Finally, the simple oxides of iron, manganese, silicon, aluminum and other elements occur separately, or combined together in various combinations which have been analyzed. Several such analyses are given in Table I, but it is not certain that these represent anything more than the composite analysis of several different enclosures occurring in the same steel, because all the bodies are usually distributed in such minute particles that chemical analysis of any one of them would be impossible. Indeed, they vary all the way from specks scarcely visible under the microscope to pieces easily discernible by the naked eye. Methods have recently been studied, however, for testing some of the commonest enclosures under the microscope, in order to identify them, as to whether they may be oxides or silicates of iron or manganese, etc. A very important property of these oxide enclosures is their melting-point in relation to the melting-point of steel, because, if the enclosures become solid before the steel is frozen, they will not only fail to coalesce into larger globules which more readily escape from the bath, but also they are not wet by the liquid steel, and the consequent strong surface tension makes their upward passage through the metal slower and more difficult. Since silica and some of the silicates, especially if made less fusible by the presence of alumina, have a higher melting-point than mild steel, we can readily understand why they often become entangled therein, and also why any agent which lowers their melting-point will greatly assist in their elimination.

It would therefore seem to be the fluxing property of titanium oxide on silicates and other oxides which is the cause of its well-known effect in eliminating slag enclosures from steel ingots. Rossi has shown that titanium oxide, when properly proportioned, lowers the melting point of silicates, and its fluxing effect on clays and other minerals has been noted by many observers. The effect of a "cleansing" addition of titanium to steel ingots is shown in the accompanying photographs. In order for this effect to be realized, the titanium first attacks oxides of other elements present in the ingot—for example, protoxide of iron, manganese and carbon—and, by reducing them, deoxidizes the bath and forms titanium dioxide, TiO_2. This dioxide then

fluxes any oxides or slags existing in the metal, assists them to coalesce and thus removes them from the steel. The steel bath should be left for at least three minutes in Bessemer steel and eight minutes in open hearth steel, after the titanium addition, in order that this "washing out" of the enclosures may be completed. Between half a million and a million tons of steel were treated in this way in America during the year 1912.

Hibbard proposes another method of removing the slag

enclosures, but describes the results as only "tolerable." This method is to precipitate and coalesce the solid bodies—Hibbard calls them "sonims"—by means of a sufficiently large manganese addition, and then allow time for them to rise to the surface. Agitation, "working out," "shaking down," and similar practices aid this removal, he says. Furthermore, he

"Uncleansed." "Cleansed."

Sulphur Prints of Open Hearth Rail "Cleansed" and "Uncleansed."

finds that sonims are removed better if the steel is recarburized in the furnace, than if it is recarburized in the ladle. While the fluxing effect of manganese oxide on silica and silicates is undoubted, nevertheless all our evidence goes to show that manganese oxide, manganese silicate, and manganese sulphide, are the commonest of the solid enclosures, and, as such, are deleterious to the steel. To deliberately increase the amount of this "sonim-forming" body would seem to be working in the wrong direction, unless the results are more efficacious than Hibbard describes them to be.

Photomicrographs of Steel "Cleansed" with Titanium.

Likewise, the addition of aluminum for recarburizing is seen to be dangerous practice, because aluminum not only forms a deleterious enclosure by itself, but it increases the viscosity of other solid enclosures and thus hinders or pre-

vents their coalescence and removal, besides making the "sonims" freeze more quickly and thus increasing their surface tension against the liquid bath. To add aluminum in the ladle is worse than adding it in the furnace, and its addition in the ingot may be followed by grave consequences. Deoxidation by aluminum in ingots is a practice which can only be required when the previous manufacture of the steel was improperly or neglectfully performed; such addition is wrong and is now forbidden by specifications of several large consumers.

SULPHIDE ENCLOSURES.

Sulphides entrained in steel ingots or castings produce an effect like in kind to that already discussed under the head of oxide enclosures. The sulphide inclusions are, however, more difficult to remove from the finished steel, but their ill effects are easier to mitigate. Manganese sulphide is much less injurious to both the hot—and the cold—properties of steel than is iron sulphide, so that the addition of sufficient manganese to liquid steel will lessen the evil, and will also, to a limited degree, bodily remove some of the entrained sulphide if the bath is left in a quiescent state for a short space of time. The compound so formed is the sulphide of manganese, MnS, and also, according to the recent research of Roehl, a double sulphide of iron and manganese, $Fe_3Mn_2S_5$. Both the sulphide of manganese and the double sulphide freeze at a much higher temperature than the iron-sulphur eutectic, so that the addition of manganese also moderates the segregation. Nevertheless, manganese sulphide itself segregates to some extent, and forms globules which, while reckoned as a lesser evil than iron sulphide, is still an evil. It makes steel somewhat red-short, has been known to cause serious failures and to initiate fissures and cracks, and has a bad effect on the corrosion of steel by producing local differences of electric potential. The basic processes of steel manufacture have been the greatest remedy for sulphide evils by removing sulphur almost to harmless traces. It is of great importance, however, that the resulting basic steel be thoroughly deoxidized and quieted, in order to limit the segregation and thus keep the sulphide down to moderate proportions at all parts of the steel ingot, especially as Stead has recently shown that sulphide of manganese is a special danger to steel which has not been deoxidized, because it prevents the perfect welding of blowholes which would otherwise be entirely eliminated.

BLOWHOLE PREVENTION.

A lengthy discussion of the cause and prevention of blowholes seems scarcely warranted here, since it is now well established that blowholes may be entirely prevented by a thorough deoxidation of steel by means of aluminum or titanium. Stead says that these two metals not only prevent blowholes, but also absolutely prevent the evolution of gas. Vanadium and silicon likewise react effectively in these respects, and manganese and carbon, by deoxidizing the metal, greatly lessen the tendency to form blowholes. The gases ordinarily found in blowholes are: carbon dioxide, carbon monoxide, hydrogen, nitrogen and hydro-carbons. To prevent these gases forming blowholes, we must either eliminate them from the steel entirely and also eliminate the agents which form them anew, or else we must partially eliminate and partially cause to dissolve by increasing the solvent power of the steel for them. Iron oxide is the agent which chiefly forms blowhole gases anew, because this compound reacts with carbon when the temperature falls, and particularly when the metal is so viscous that the gas bubbles cannot escape from it. When the oxides of carbon begin to pass off, they carry with them hydrogen and nitrogen which might otherwise have remained dissolved in the steel without producing a blowhole. Thus the complete elimination of iron oxide is the secret of blowhole prevention. Doubtless this is what Talbot intends by his statement that aluminum, silicon and ferro-titanium all have the same effect when used in the necessary varying quantities. However, aluminum and titanium are admittedly more powerful in proportion than silicon, and the latter element has the disadvantage, when used in connection with a basic process, that the first ingots may be quite free from blowholes, while the later ones may be porous on account of the absorption of the silicon in the interval, by the basic slag.

If steel is so thoroughly deoxidized that no blowholes form, the volume of the pipe will be correspondingly increased, and, conversely, if we allow a sufficient number of blowholes to form, the pipe may be almost entirely avoided. For this reason, many manufacturers desire a small number of blowholes to form, so that a deep pipe will not necessitate a heavy discard from the ingot. This practice is open to certain difficulties and dangers, because the resulting blowholes are not always welded up in the subsequent rolling or forging of the steel. It is well known that a slight difference of temperature of the steel when cast, the spattering of steel against the sides of the ingot-mold during teeming, a slight over-oxidation of the steel during conversion, or error in adjusting the recarburizer, may upset the calculations to such an extent as to produce an excessive number of blowholes, or bring the blowholes so near to the skin of the ingot that they will form "fish tails" on the rolled piece, or will become oxidized so as, at the best, to weld up only in small degree. And, even if the blowholes are all well below the surface, the presence of manganese sulphide may prevent complete welding, as already noted, and thus may render the steel doubly liable to corrosion.

GASES IN STEEL.

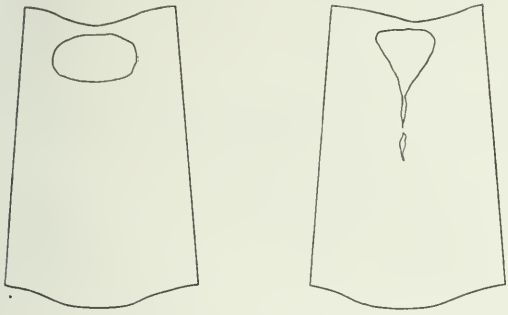
The same gases found in blowholes are also found occluded in the steel, or combined with it, where they reduce both the strength and ductility. This is specially true of hydrogen and nitrogen, as well as oxygen, although whether this latter element produces its ill effects in all its different forms,—i. e., as solid oxide enclosures, as occluded gas, and as oxides of carbon,—or only in the first form, is not yet known, because chemical analysis has not kept pace with practice so as to enable us to differentiate between the different combinations. Titanium and vanadium both seem able to get rid of it in both of its gaseous forms, and the same result is obtained by a super-refining in an electric furnace. Hydrogen is still an unconquered impurity; it may be removed by repeated heatings in vacuo, but does not seem to be effected by the usual remedies applied during the ingot-stage of steel manufacture, further than that silicon, aluminum and titanium cause it to remain dissolved in the steel instead of forming a blowhole. Nitrogen is removed in large part by titanium, which has a greater affinity for this inert element than any other known substance. Vanadium, too, perhaps, causes a partial elimination of this gas, whose effect on the steel is embrittling and harmful.

PIPES.

Titanium, vanadium, aluminum, silicon, and any other element which decreases blowholes, will increase the volume and depth of pipe. It is therefore often stated as an axiom that the purer the steel the larger will be the pipe, and many engineers prefer to see the pipe comparatively large, with the implied assurance that all the impurities are located in one part of the ingot and that this part can be cropped off. It is important, however, that we consider not only the volume of the pipe, but also the depth to which it extends. That is to say, we may have a large pipe which is located at a high point in the ingot as shown at the left, or we may have a pipe which is no larger, but which extends to a greater depth as shown at the right. The deep pipe is correspondingly dangerous because it requires so much more steel to be cut off before it will be eliminated and because it will not be so easily noticed in cropping and may thus remain as a perma-

nent defect in the steel. Aluminum and silicon have a special influence in increasing the depth of piping, on account of their causing the steel to pass quickly from the liquid to the solid state, while titanium and vanadium tend to lengthen the period of solidification and thus decrease the depth of the pipe in relation to its volume. Aluminum has a further ill-effect on the depth of the pipe, in that, if added in too large proportions, it segregates and may produce a pipe extending even from top to bottom of the ingot. In recent years many railroads have paid a bonus on rails in order to secure greater safety by having the upper 20 per cent. of the ingot discarded, so as to get rid of both the pipe and the worst of the segregation, but even then failures occur from unsound steel. Other roads have refused to pay the bonus on the ground that the price asked was disproportionate to the additional cost of manufacture and that a proper inspection would insure cropping of the ingot until all the defective metal was removed.

Getting rid of the pipe by "centrifugal casting" and by "liquid compression of the ingot" have been tried in various works, and the latter practice is in vogue on a large scale,



Two Types of Pipes in Ingots.

particularly for ordnance steel, both in Europe and America This "liquid compression" is too slow and too costly of installation for use in connection with the manufacture of steel on a large scale, such as structural steel and railroad steels, but much interest has been shown recently in processes for the production of "pipeless ingots," and three new devices have been made public: heating the top of the ingot, by Sir Robert Hadfield; semi-liquid compression in a rolling mill, by P. H. Dudley and Benjamin Talbot, and heating and stirring by thermit, by Dr. Goldschmidt. The procedure in all these processes should be, and is, to concentrate all the impurities in the pipe as far as possible, and then to eliminate this pipe by one of the devices mentioned.

SEGREGATION.

This subject is also too well known to require extended discussion here. That segregation is an evil in boiler plates and pipes, and all material which is subjected to corrosion, as well as in rails and structural steel, wire, and castings, and in 90 per cent. of all other steel made, is no longer doubted by any one It is also an evil met with more often now-a-days, when the open hearth process, with its larger size of ingots, is predominant, than when ingots were much smaller in section. The most beneficial remedy for segregation is to deoxidize and quiet the steel, and researches have proved that aluminum and titanium are especially effective in this respect. Manganese and silicon themselves segregate and therefore are more of a detriment than a remedy. Vanadium is quieting to steel, and, for this reason, is probably a preventive of segregation.

COMPARATIVE INFLUENCE OF DIFFERENT "CORRECTIVE AGENTS" ON INGOT DEFECTS.

In Table II, I have given a summary statement of the different ingot defects that have been discussed and the relative effectiveness in preventing or remedying each one, of alum inum, silicon, manganese, titanium and vanadium. This table brings out very strongly the variation that exists in these different "corrective agents" or "physics." The role of manganese is shown up with especial clearness, and many will be surprised to see how much evil has to be redeemed by the influence of manganese in counteracting the bad effect of sulphur and oxygen. With the new agents which take care of oxygen even better than manganese can, it is possible that manganese might be relegated to the side-lines if it were not for the necessity of remedying the effect of sulphur, especially in view of the ill effect of manganese in increasing brittleness and liability to corrosion.

TERMINAL SERVICE.*

By W. M. Prall,

Superintendent of Car Service of the Pennsylvania Lines West of Pittsburgh.

The first problem at the terminal is the organization of a system of records that will in no way delay the car in its movement, but will convey the necessary information to the end of a check, so that the agent can instruct for, and later establish delivery. The agent must be held to responsibility for the conveyance of all necessary information to the yard master and his subordinates, with one object in view—the continuation of service to the end of the fulfillment of the railroad's obligation for transportation.

In road service, there is a complete system of reporting. In terminal service the system of reporting is incomplete, and as a rule the reports are made to, or through the road official. It has been demonstrated that by the introduction of a proper record book at terminals, in which are entered each and every day every car received for local delivery, and every car received with the privilege of distribution, or reconsignment, or reshipment, with the proper checking and reporting, that if salaries are established to the end of the employment of intelligent car service clerks and delivery clerks, an ever-present supervision can be maintained over the movement of the car. And there is no reason why a system could not be established where every car in through service, handled in the terminal, and every car handled through divisional points, could be recorded and checked, so that any car delayed beyond 24 hours will be reported delayed, with an addi-

tional report of all cars delayed beyond 48 hours, to be made to the central offices.

A proper check of cars materially reduces the expense of the switching service. Engine delay amounting to 30 minutes a day justifies a sixty dollar clerk to make the necessary check and convey necessary information. As the delivery clerks can not be constantly supervised, it is necessary, to the end of conservation of switching expense, to employ intelligent clerks and pay them a proper salary.

During the last twenty years there has been a gradual improvement in the understanding of terminal necessities, and here and there throughout the country we find terminals in charge of a general agent, or in charge of a superintendent of terminals, they having authority over the entire terminal. But we do not find a uniform understanding of the possibilities of improved service through demurrage rules. The railroads fail to understand the benefits that can be derived in improved service by the constructive placement of cars. It is the pressure on the car already placed, to the end of that car's unloading, that results in continuous movement. The railroads are badly handicapped because consignees are protected by present laws, and by officials in many states, in their insistence that all the obligation for service is with the railroad. A car moves on a private siding just as well as it moves in the terminal or on the main line, and the car cannot move properly on the siding unless the siding is properly organized; unless the consignee has prepared his siding with roadways, runways, warehouses, etc., to unload the car within the time proper for its unloading. Consignees should not be protected in their demands for supplementary service that was not contemplated in the original contract; they should realize that unless a car can be immediately placed, there must be one or two additional switches, and that the general public bears the expense of those additional switches. A business that increases its output 20, 40, 50 or 100 per cent. without an increase in the facilities for loading and unloading, is adding a burden to service; a burden that should be accepted by themselves, and if accepted by themselves would result in benefits to themselves. The old idea that because of the volume of business being of importance to the railroad, the railroad should perform additional and unwarranted service, should be exploded.

It seems as if rebating has been eliminated, excepting in the shape of unwarranted and supplementary additional service; it should be as well eliminated in additional service as in repayment of moneys. The Interstate Commerce Commission, in its later rulings, has exhibited a knowledge of certain conditions surrounding terminal service that is most gratifying. Witness the decision in the Detroit reconsigning case. Witness the decision in the California case. Witness the decision which applied purely to the interchange of cars between railroads, in which a railroad is obliged to perform its service in accord with the contract, making deliveries to connecting lines even where the connecting line fails in an appreciation of the rights of ownership in the car, and notifying the railroads that they must formulate some rule or regulation to the end of re-taking their cars.

Many terminal engines are delayed from two to six hours because of the failure of the connecting line to so arrange that when the delivering line runs through the connection with a view to placement of cars on the tracks of the receiving line, there are no tracks on the receiving line on which the cars can be immediately placed.

A prolific source of car delay, is the method of commission men handling perishable freights, who assume the right to withhold cars from the market, always provided the car is held on a rising market, there being authentic cases of delays of 10, 20, 30, 40 and 50 days. If the shipper were relieved from responsibility excepting for the gathering, draying and loading, and if the consignee were held to responsibility for the immediate payment of freight charges, and in case of failure to pay that the railroad should be held to responsibility for the sale of the lading for whomever it might concern, the result would be a larger consumption of fruits and vegetables, to the benefit of the health of the general public, and it would conserve the interest of the shipper—because his consignments would be sold while they were still marketable.

In the early days of railroading, when the railroad transported a car from station A to station B, if the freight was not immediately unloaded from the car by the consignee, the railroad unloaded it on the ground and threw a tarpaulin over it and took the car for the service for which it was built. That was the old Drayage or Cartage law. The contract was clean-cut. The railroad was protected in confining itself to transportation. Later, for reasons best known to the railroad officers of 30 or 40 years ago, special privileges were granted to consignees, and among the special privileges it was conceded that the consignee could hold the car for his convenient unloading. In 1888, the conditions were so disastrous to everybody that the railroads, in fear and trembling, introduced demurrage.

A survey of the present situation is encouraging. There has been a gradual improvement in the understanding of the patrons of the railroads of their own necessities for service, together with a gradual understanding that the service to them individually is entirely dependent upon their organization.

The Interstate Commerce Commission is gradually attaining to an understanding of some of the terminal evils, and many of the present evils will be eradicated. The practice of reconsigning, distributing and billing of cars for a market are present necessities in order to properly conduct the business of the country, but the time allowances and the privileges should be in accord with the needs of business. The great difficulty in administration is in determining what should be allowed, and what is an unnecessary allowance. Supplementary service can never be performed at no expense. No conveyance of property rights can be made without an equivalent. And the courts have invariably maintained, in giving consideration to transportation obligations, that individual convenience is subservient to the public good.

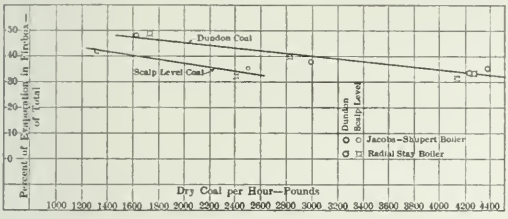
As the demurrage charge is in the nature of a penalty for breach of contract, it partakes of the nature of a police law, and, consequently, consideration should be given to mitigating circumstances under untoward conditions. In regard to the average rule, I have always maintained that it is a step backward. That is a rule that can be, and is used to effect unnecessary detention to certain specified cars, that detention being entirely within the control of the consignee or consignor. Under the average rule, car efficiency is not maintained, and cars are abused by certain patrons of the railroads in service, without compensation. The average rule is a special contract, and is in contravention of the decision of the Supreme Court of the United States, as rendered by said court in Opinion 215, in relation to the Carmack Amendment.

Accidents in England.—For the three months ending June 30, 1912, the accident record of the railways of the United Kingdom is in some important respects more satisfactory than that for the corresponding period of 1911. The number of fatalities to employees from accidents other than train accidents shows a diminution from 90 to 50. Especially noteworthy is the fact that there were no coupling fatalities, while the total number of switching fatalities declined from 23 to 4, and there was a decline from 31 to 11 in the number of fatalities to men working on the permanent way. On the other hand, 24—as against 15—were killed while walking, crossing or standing on the line, of whom 11 met their death while walking to or from work. As in the corresponding period, no employees were killed in accidents to trains, although 24, as against 18, received injuries. Four passengers were, however, killed in one train accident during the second quarter of 1912, compared with one passenger in the corresponding quarter of 1911. Comparing the number of accidents, it will be found that there were 13 against 15 collisions in which passenger trains were concerned, 14 freight train collisions, 6, as against 7 buffer-stop collisions, 16 against 23 passenger-train derailments, and 37 against 49 derailments of freight trains or light engines.

RESULTS OF COMPARATIVE FIREBOX TESTS.

Summary of the Report of Those Recently Conducted at Coatesville, Pa., with a Brief Reference to Methods Employed.

The complete report of the comparative tests of the Jacobs-Shupert and the radial stay boilers, which were made early last year, has been submitted to the Jacobs-Shupert United States Firebox Company, Coatesville, Pa., by Dr. W. F. M. Goss, dean of the College of Engineering, University of Illinois, under whose direction and supervision they were conducted. The program for the comparative tests provided for three series, designated as A, B and C. The object of series A was to determine the relative amount of heat absorbed by the fireboxes and the tubes of the two boilers under similar conditions of operation; series B consisted of evaporation tests of the two boilers; and series C was intended to determine their relative



Ratio of Evaporation in Fireboxes to Coal Burned per Hour.

strength under low water conditions. A report of the latter was given in the *Railway Age Gazette,* June 28, 1912, page 1595.

The two boilers, both of the extended wagon top type, were constructed under the supervision of Dr. Goss and were as nearly as possible identical. The following are the principal dimensions:

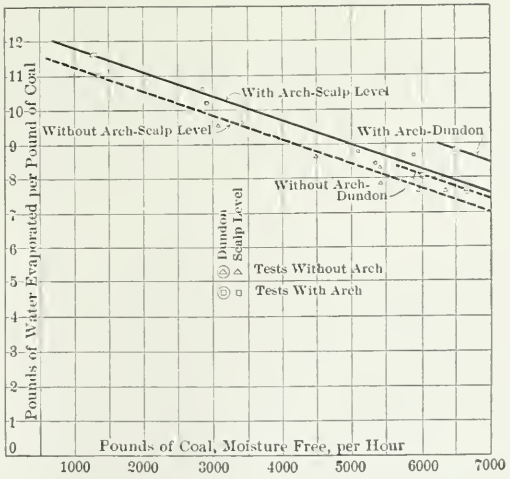
	Jacobs-Shupert.	Radial stay.
Diameter at front end, in.	70	70
Diameter at throat, in.	83⅞	83⅞
Tubes.		
Number	290	290
Length, ft. and in.	18—2	18—2
Diameter, in.	2¼	2¼
Firebox.		
Length, inside, ft. and in.	9—1⅝	9—1⅛
Width, inside, ft. and in.	6—4⅜	6—4¼
Depth, inside, ft. and in.	6—1⅛	6—2⅛
Grate area, sq. ft.	58.14	58.07
Heating Surface.		
Side and crown sheets, projected area, sq. ft.	146.2	146.6
Side and crown sheets, developed area, used in all computations, sq. ft.	168.0	146.6
Total firebox, sq. ft.	230.8	206.7
Tubes, sq. ft.	2,759.0	2,759.0
Total barrel, sq. ft.	2,777.6	2,777.6
Total boiler, sq. ft.	3,008.4	2,984.3

In series A both the Jacobs-Shupert and the radial stay boilers were divided into two compartments by an extension of the back tube sheet to the outside shell. These compartments were connected only through the medium of the steam piping, the arrangement of which was similar to that of two boilers connected to a common steam header. Both compartments received heat from the firebox, but each was fed from a separate supply of weighed water and its output of steam was dealt with as though it were a separate boiler. The location of the partition was such that the heat transmitted by the back tube sheet was delivered to the barrel portion of the boiler and the evaporation from this portion of the firebox was weighed in with that of the tubes. Regarding this Dr. Goss says: "The observed data give the actual weighings of water fed to each portion of the boiler, and all items involving water evaporated, are deduced from these values, being based upon the observed results referred to the actual surface which was effective in bringing about the result. The deduced values covering the firebox performance have been obtained by multiplying the evaporation actually obtained by the ratio of the total firebox surface to the firebox surface effective in producing vaporization in the firebox-end of this boiler. The small increment, which by this correction is added to the observed evaporation of the firebox, is in the deduced results, subtracted from the observed evaporation of the barrel. The effect of this correction is merely to credit to the firebox and debit to the barrel the heat transmitted by the back tubesheet. These statements are, of course, applicable to both boilers."

Trouble was experienced, while the boilers were heating up, by the firebox end beginning to make steam much sooner than the barrel end. This steam passed over to the barrel, where much of it condensed. It was finally necessary to supply means of circulation between the compartments while heating up, which was done by connecting two washout plug holes by a pipe. Valves were provided to stop the circulation after both parts of the boiler were in action. In considering the results of this series, given further on, it would be well to bear in mind that the boilers were not working under service conditions.

In series A nine tests were made using oil as fuel and twelve using coal. There was considerable difficulty experienced in firing the oil so as to prevent deposits of soot on the heating surface. On this account Dr. Goss states that the results cannot be accepted as constituting a basis of comparison which admits of a high degree of refinement and for this reason no attempt was made to elaborate, through a complete heat balance, the computations of the oil-fired tests.

In the tests using oil as fuel the boilers were so operated as to give an equivalent evaporation of from 20,000 to 29,000 lbs. of



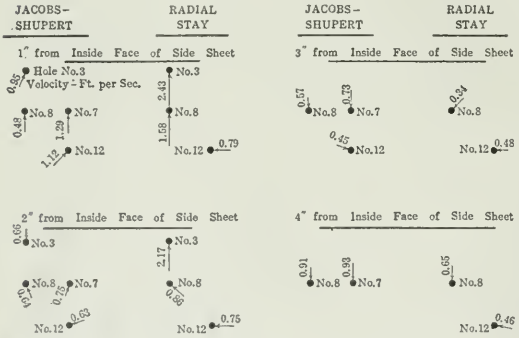
The Effect of the Brick Arch on Evaporative Efficiency.

water an hour, and the results indicated that each pound of oil produced an evaporation of 15.9 lbs. to 13.2 lbs. of water in the Jacobs-Shupert boiler, the amount diminishing as the rate of power increased. When 800 lbs. of oil were fired an hour, the tests showed 54 per cent. of the total evaporation as being due to the firebox heating surface; and with 2,200 lbs. of oil an hour, 40 per cent. of the total evaporation was from the firebox. When there was an equivalent evaporation of 40,000 lbs. of water an hour for the whole boiler, the evaporation per square foot of heating surface per hour was, for the barrel, 6.47 lbs.

and for the firebox 49.59 lbs. The ratio of heat absorbed per square foot of heating surface by the firebox, to that absorbed by the tube heating surface, was thus 7.6 to 1.

In the tests with coal, at low rates of power either boiler gave an equivalent evaporation per pound of coal of over 10 lbs. of water; and the evaporation was normally above 8 lbs. of water per lb. of coal for the entire series. This indicates a thermal efficiency from 8 to 10 per cent. less for coal than for oil. However, the brick arch was not used in this series. One of the diagrams shows the ratio of the total heat absorbed by the boiler to that absorbed by the firebox when coal was fired. Using Dundon (long flame) coal at a rate of 4,341 lbs. per hour, the equivalent evaporation of the Jacobs-Shupert boiler was 35,405 lbs., 11,982 lbs. being evaporated by the firebox and 23,423 lbs. by the tubes. The firebox developed 304 horse power, while the entire boiler developed 1,026 horse power. For the whole boiler, the average rate of equivalent evaporation per square foot of heating surface per hour was 11.77 lbs.; for the firebox alone 51.92 lbs. and for the barrel 8.43 lbs. The ratio of heat absorbed by the firebox to that absorbed by the tubes was as 6.15 to 1. The later tests with Dundon coal showed that when giving an equivalent evaporation of 20,000 lbs. of water an hour the Jacobs-Shupert boiler generated 8.3 lbs. of steam per pound of coal. Comparing this with 14.14, the weight of steam per pound of oil at the same rate, indicates that one pound of oil is equivalent to 1.7 lbs. of high grade bituminous coal.

Different fuels produced different results in the heat distribu-



Direction of Flow of Circulation and Velocity in Feet per Second.

tion, and Dr. Goss concludes that when giving an equivalent evaporation of 20,000 lbs. of water an hour, the proportion of the whole quantity of heat absorbed, which is taken up by the firebox of a Jacobs-Shupert boiler, is for oil 42 per cent., for long flame bituminous coal 42 per cent., and for short flame bituminous coal 35 per cent.

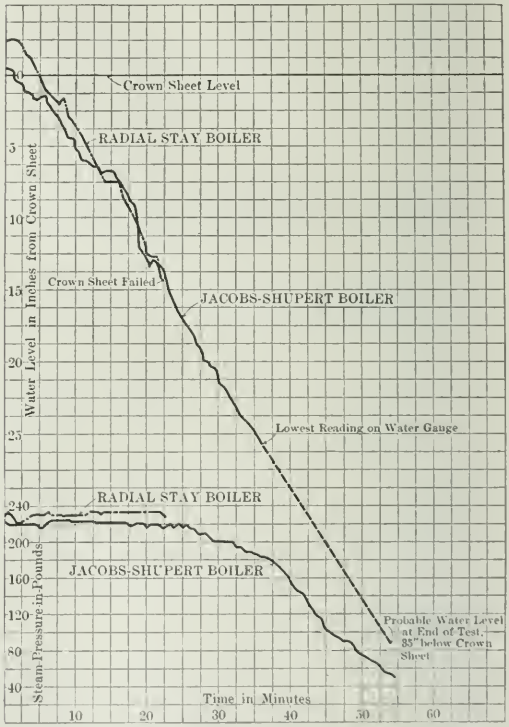
In retubing the boilers after the reconstruction of their fireboxes, preparatory to conducting the series B tests, the tubes were welded into the firebox tube sheet. This was done to prevent a tube sheet failure during the low water tests, series C.

Eleven tests were made on the two boilers in series B without a brick arch and eight with a brick arch. One test using Dundon coal was run on the Jacobs-Shupert boiler with the arch installed, the others being made with Scalp Level (short flame) coal. The diagram shows the equivalent evaporation with and without a brick arch.

Throughout the series the boiler efficiency was always highest when the least power was being developed. When burning 1,389 lbs. of dry coal an hour the efficiency of the Jacobs-Shupert boiler was 71.86 per cent., and excluding the grate, 79.75 per cent. When burning 6,314 lbs. of dry coal an hour, the efficiencies were 50.41 and 55.36 per cent. respectively. In the former case the boiler horse power was 443 and in the latter 1,393, while the equivalent evaporation per square foot of heating surface per hour was 5.08 and 15.98. The following table, which gives figures for the Jacobs-Shupert boiler, indicates the effect produced by increasing the rate of working of a boiler:

Pounds of coal fired per hour	1,389	3,419	5,930	6,314
Thermal units for each pound of coal:				
Absorbed by water in boiler	10,687	9,327	7,532	7,388
Lost by moisture in coal	48	34	37	33
Lost by moisture in air	49	53	114	54
Lost by hydrogen in coal	486	497	500	514
Lost by smokebox gases	1,979	2,731	3,992	4,675
Lost by incomplete combustion	78	...	...	...
Lost by cinders passing up stack	153	851	1,078	1,012
Lost by combustion in ash	1,187	679	291	185
Lost by radiation and unaccounted for	205	547	881	783
Total B. t. u. per pound of coal	14,872	14,719	14,425	14,654

The report states that the brick arch as a factor in boiler performance is always beneficial, its effect depending on the characteristics of the fuel. When the short flame coal was used, the use of an arch in either boiler increased the amount of water



Water Levels and Steam Pressures During the Low Water Tests.

evaporated per pound of coal 0.6 lb. Assuming either boiler to be fired with 6,500 lbs. of Scalp Level coal an hour, it would evaporate 7.35 lbs. of water per pound of coal without an arch and 7.95 lbs. with an arch, a gain of 8 per cent. in favor of the arch. With long flame coal the evaporation would be 7.7 lbs. of water per pound of coal without an arch and 8.7 lbs. with an arch, a gain of 12 per cent.

During the progress of the series A and B of tests, George L. Fowler conducted experiments on both boilers to determine the velocity and direction of flow, as well as the quality of the mass of the liquid at different points. For this purpose the water legs of the boilers were drilled with 15 holes. The principle of the operation was that of measuring the impact of the flow of the mass in the water leg on the mouth of a Pitot tube, by means of

the elevation of a liquid heavier than water in a U-tube. The proportions of contained water and steam were afterward determined by samples led off into a barrel calorimeter. The Pitot tubes were inserted in the firebox at the points where it was desired to make the measurements and could be moved through suitable stuffing boxes so that the opening in the tube could be placed in any desired position. The results of the investigation are shown in the diagram, the arrows indicating the direction of flow of the currents. Regarding the circulation tests, Dr. Goss says that in spite of the limitations which must be placed upon them, they are of great significance. Lack of time prevented these tests being carried as far as it was desired, but they indicated an almost complete absence of fore and aft movement of the water and that only enough water passes back to the water legs from the barrel to replace what the firebox evaporates.

In the low water tests, the water in the Jacobs-Shupert boiler dropped to the bottom of a special water-glass 25½ in. below the level of the crown sheet in 34 minutes after it had passed the crown sheet level. The test was ended 53 minutes after the water had fallen to the level of the crown sheet and when it was 40 in. below it, no failure having occurred. An inspection of the boiler showed all the effects of overheating except that the firebox was intact. In the case of the radial stay boiler, the crown sheet failed 17¾ minutes after the water passed the crown sheet level and when it was 14½ in. below it.

The principal conclusions drawn by Dr. Goss from the three series of tests are that the evaporative efficiency is the same for the two types of boiler; that in general their steaming capacity is the same but that the Jacobs-Shupert may be forced to higher power without danger of injury; and that the superior strength of the Jacobs-Shupert boiler under low water conditions permits it to endure overheating for long periods of time without failure, where the normal radial stay boiler quickly fails.

REGULATION OF RAILWAYS.*

By W. W. Finley,
President, Southern Railway.

Our railway system has been constructed without any cost to the public treasury, except as to some of the earlier lines and the land grant roads, as to which the ultimate public benefits in the settlement of the country which they made possible were far in excess of the cost. We think of the cost of the Panama canal as a large amount of money, but it is only about one-fortieth of the amount of private capital that is invested in the railway systems of the United States without taking account of the large amounts that have been wiped out by civil war, bankruptcies, and reorganizations, and the other large amounts of earnings that have been put into improvements and betterments and have not been capitalized. It is not detracting from the importance of the canal to point out that an estimate made by a distinguished authority of the annual requirements of the railways of the United States for additional capital expenditures to enable them to keep pace with the growing demands for their service are from two to three times the total cost of the canal; that a single railway company distinguished for conservative and able management has invested in its property earnings that it might have distributed to its stockholders in an amount approximately sufficient to have built the canal; that the operating expenses of the railways would pay for the construction of five Panama canals in a year and leave a sufficient margin to fortify them and build a few battleships for their defense, and that the taxes paid by the railways in three years, if all paid into the United States treasury, would more than reimburse it for the entire cost of the canal.

State and federal governments have enacted legislation and provided administrative and judicial tribunals for the correction of wrongs that may grow up in the business of transportation by rail. This is a proper and salutary exercise of the authority of government growing out of the nature of the business of a railway company in carrying persons and property over a privately-owned highway devoted to public purposes.

With this regulation by the government which has had the effect of eliminating abuses, and, with the power in the government to search out and correct any abuses still remaining or that may develop, I feel sure that there cannot be anything wrong in the proposition that conditions shall be made such as to permit the fullest development of the transportation service of the country. On account of the public interest in efficient railway service this is as important to the public as to the railways.

A FAIR CHARGE FOR EVERY SERVICE RENDERED.

The first requisite, in my opinion, to the maintenance of this condition is that those tribunals that have been established to regulate charges shall recognize the right of the railway to make a charge for each service that shall be reasonable as measured by that service having fair reference to its value. This is a very different matter from fixing charges for service so as to yield a predetermined rate of net income—a thing which a full knowledge of the problem will, I am sure, demonstrate to be uneconomic and impossible. That the application of this standard, in specific instances, may be difficult should not excuse failure to apply it. It is being applied with more or less exactness in the practical every-day fixing of charges by the railways and in the cases before the commission and the courts involving the reasonableness of specific charges. Capitalization and other conditions on different railways differ so widely that a strict enforcement of the principle of a predetermined rate of income, even if it were possible, must necessarily lead to discriminations, territorially and otherwise. If the aggregate of charges on the basis of their reasonableness as measured by the service performed is such as to leave little to the owners of the property after the payment of operating expenses and taxes, that is their misfortune. If it is such as to leave them a larger profit, that is their good fortune. Small net income for the owners of a railway, whether the result of poor location, inefficient management, or other cause, will not justify charges that are exorbitant or unreasonable as measured by the service performed. Neither will large net income, due to fortunate location, efficient management, or other cause, justify a reduction of charges that are reasonably low as measured by that standard.

OPERATING EXPENSES AND RATES.

Various elements enter into the reasonableness of a transportation charge. I am not now endeavoring to cover the whole subject as to the proper bases of a transportation charge. I shall mention one of them this evening because it is one which is dependent in no small measure upon public opinion. This is expense of operation. On superficial thought this might seem to be a matter with which the public has nothing to do, but it is coming to be more and more controlled directly and indirectly by the public. One of the most serious problems confronting railway management in the United States and entering into the cost of service is that of constantly increasing taxes imposed by public authority. The aggregate payments for the past fiscal year amounted to more than $120,000,000. The rate of taxation per mile has increased fully 150 per cent. since 1890, and each year sees it mounting ever higher. Then there are requirements under the exercise of public authority in other ways that tend to increase operating costs.

The largest single item of railway expenditure, and one in which the public is concerned as bearing on cost of service and the reasonableness of an adjustment of charges for railway service, is that of wages. Railway service, in many of its branches, is most exacting, requiring a high type of manhood. Without men of this kind the American railway system could never have become the efficient transportation agency that it is today. It is

*Abstract of an address delivered at a dinner given by the Chamber of Commerce, New Haven, Conn., January 23, 1913.

right that such men should be fairly paid, and American railway employees receive wages much higher than those paid to railway employees in any other country and generally higher than are paid in any other employments in the United States calling for similar measures of skill and reliability.

In the adjustment of questions as to rates of wages and conditions of employment it is inevitable that differences should be developed between the railway companies and their employees. Such differences concern not only the railways and their employees, but the public as well, for the reason that a strike or lockout which would interrupt, or seriously impair, the efficiency of railway service would cause great inconvenience if not actual suffering to many persons.

The public interest in controversies between the railways and their employees has already been recognized by Congress in the enactment of the so-called Erdman law, which applies to those classes of railway labor having to do with actual train operation. In a controversy involving any one or more of these classes either the employing company or the employees may apply to the presiding judge of the commerce court and the commissioner of labor for mediation. If mediation is accepted by the other side the mediators then endeavor to bring them together in an amicable agreement. Failing in this, arbitration may be resorted to if both sides agree. There is nothing compulsory about the Erdman law at any stage of the proceedings until a controversy has been finally and voluntarily submitted to arbitration. Yet it has been the means of the amicable adjustment of a large number of controversies which, but for the proceedings under it, might have resulted in strikes.

But since the Erdman law has been on the statute books cases have arisen in which it was not availed of and strikes have resulted. Although the settlements arrived at in the cases in which it has been invoked have not always been entirely satisfactory to both sides, they have always been in the public interest to the extent that they have kept traffic moving, and I believe that the time has now come when we should go a step farther and make it still more improbable that a strike or lockout shall affect the transportation service of the country. Among those who favor further action there are differences of opinion as to the form which it should take, but even now the experiment of special boards, not provided for by the Erdman act, is being tried, and I venture to suggest that this may point the way to a final solution that will safeguard the interest of employers, employees, and the public.

THE PUBLIC'S RIGHT TO ARBITRATION OF LABOR DISPUTES.

On account of the inconvenience, and, in some cases, hardship, that would result to the public from an interruption of railway service, I believe that, if any such interruption shall occur as a result of a difference between employers and employees, the public has a right to such full information as may serve as a basis for an intelligent opinion as to the merits of the controversy. This is most effectually accomplished by the Canadian Industrial Pursuits Investigation Law which provides that where a strike or lockout is threatened involving any agency of transportation or communication, or other public service utility, before such strike or lockout can legally take place the parties must refer their differences to a special board which exercises substantially the powers of a court in hearing a case. The first efforts of the board are to bring about a settlement by conciliation. Failing in this, it prepares and publishes a report setting forth what, in the board's opinion, ought or ought not to be done by the respective parties concerned. The essential difference between this Canadian law and the Erdman law is that resort to the Erdman law is altogether voluntary, but, under the Canadian law, while resort to it is compulsory, the finding of the board is not binding on either party. For effectiveness the Canadian law relies largely upon the force of enlightened public opinion. If, after publication of the finding of a board, a strike or lockout occurs, the public knows what it is all about and what the board has recommended should be done in the matter. It amounts in substance to the very reasonable provision that before the service of a public utility agency on which the public is dependent shall be interrupted by a strike or lockout the public shall be fully enlightened as to the merits of the controversy.

Each special board under the Canadian law consists of three members. One is named by each party to the controversy and they select the third, who acts as chairman, or, if they shall fail, within five days, to agree upon the third member, he is appointed by the minister of labor. The fault of a board thus constituted, in my opinion, is that, two of its members being partisans, its decisions are essentially one-man decisions and the questions presented are not considered as broadly as might be expected with a larger board. I venture to suggest, therefore, that the provisions of the Canadian law shall be adopted, except that, instead of three members, each special board shall consist of five members; that one be named by each party to the controversy; that these two jointly select two others, or, in the event of their failure to agree, that the two others be named by the commissioner of labor and the presiding judge of the commerce court, or, if there be no commerce court, the chairman of the Interstate Commerce Commission, and that the two last named shall select the fifth member, or, in the event of their failure to agree upon the fifth member, that he be appointed by the senior United States Circuit Judge in the territory affected. I believe the result would be broader consideration of the questions at issue and findings that would command, in fuller measure, the support of public opinion and the confidence of the parties in interest.

GOOD SERVICE THE PARAMOUNT NEED.

While the discussion of the relations between the public and the railways has been concentrated largely upon charges for transportation, the public has a vital interest in service as well as charges. In fact, if charges are not exorbitant or unreasonably high as measured by the service performed, the paramount interest of the public is in service.

It is the aim of the far-sighted railway manager to maintain a margin of carrying capacity over the normal demand on his lines in order that he may be able to handle any sudden increase in the volume of traffic. The difficulties that must be encountered in doing this can hardly be appreciated by those not engaged in railway work. James J. Hill, the highest authority on such matters in the United States, emphasizes the need of additional trackage and enlarged terminals, but large expenditures are required for their provision. Future growth of business is always problematical, and it requires a high degree of courage, in dull times when an existing railway plant is working far below its capacity, to enter upon projects for building additional main tracks or for enlarging terminals. It requires courage to contract for additional equipment when side-tracks are full of idle cars and roundhouses are crowded with cold locomotives. The railway manager may believe there is every reason to expect a large increase in business, but if his judgment shall be at fault he will have trackage in excess of his needs and will see his new cars and locomotives standing idle and depreciating without having had a chance to earn a dollar, while all of the time interest charges are accruing on the additional investment. Yet, so far as his resources will permit, this is the policy that the railway manager must carry out. He cannot wait until the crisis is upon him for the inauguration of constructive policies.

The same is true as to maintenance, and it is to the public interest that the railways shall not have to postpone repairs and catch up with maintenance work in times of heavy traffic. This is a matter that cannot be unduly neglected at any time, for there is probably no class of property subject to such rapid depreciation as a railway. Conditions of railway operation are such as to subject roadway and equipment to great wear, and as very little railway property is under shelter, it is subjected to constant depreciation from exposure even if it is standing idle, and a considerable proportion of expenditures for the

maintenance of both roadway and equipment must be made irrespective of the volume of traffic being moved.

There is probably no other form of industry that suffers so much in times of business depression as does a railway. When the business of a manufacturing plant falls off it can run on short time or stop running altogether. No matter, however, to what extent the business of a railway may fall off, there is a minimum of service that it must continue to perform and all of the time its plant is subject to just as much depreciation from exposure as though it were working at full capacity. I may say further that there is probably no other industry in which, from the nature of the business, such a large proportion of the plant must at all times be idle. This may be illustrated by the fact that it has been estimated that the average movement of freight cars in the United States is only twenty-five miles per day, yet while the car is actually under way its movement is at a very much higher rate than this. The reason for the low average rate is that it is figured on all of the freight car equipment of the railways of the United States and includes not only the cars that are in transit but surplus cars that are standing idle on side tracks at times when the demand of the country is not sufficient to employ them, the cars that are being held by shippers for loading and unloading and the cars that are in shops for repairs. Under the latter head alone, owing to the high rate of depreciation from use and exposure, an average of approximately 6 per cent. of the freight cars of the United States and about 10 per cent. of the locomotives will be found in the shops at any given time.

One of the strongest arguments against the policy of attempting so to regulate railway charges that they shall yield a predetermined rate of income rather than allowing them to be so adjusted as to be reasonable as measured by the service performed is that it may, by its arbitrary enforcement, tend greatly to hamper the railways in the provision of additional and improved facilities and in the proper maintenance of their present plant. One of the distinguishing features of American railway management as contrasted with that of other countries is that, so far as earnings would permit, the owners of American railway properties have, in many cases, abstained from taking to themselves the full amount of net income, but have turned greater or less proportions of it back into the property in the provision of improvements that have not been capitalized, in contrast with the prevailing custom in other countries of capitalizing all improvements. It is largely because of this that the average net capitalization of the railways of the United States is only approximately $60,000 per mile as compared with $314,000 per mile in England, $109,788 per mile in Germany, and $139,237 per mile in France. It is to the public interest that this policy be continued.

As railway operation must be continued in times of business depression, and as floods or other disasters may at times do enormous damage to railway property, the railways should be able, in times of prosperity, to accumulate a sufficient surplus to enable them to meet their requirements in lean years.

Even under the most favorable circumstances, however, the railways cannot return earnings to the property in amounts sufficient to enable them to meet the increasing demands for service. To a large extent additional carrying capacity will have to be provided through the investment of new capital. Ability to obtain new capital is dependent upon credit, and credit, in turn, is dependent, not on gross earnings, but on the proportion of gross earnings that can be saved as net income. It should be borne in mind that the natural tendency of capital is toward those investments promising the largest income in proportion to the safety of the principal.

PROSPERITY OF RAILWAYS DEPENDS ON THE PUBLIC.

Under the present system of governmental regulation in the United States the prosperity of the railways and their ability adequately to perform the transportation service of the country is dependent in very large measure upon the state of the public mind toward them. It is to the public interest no less than to that of the railways that, while laws for the prevention of abuses shall be enforced and, if necessary, amplified and strengthened, the attitude of the government should be such as to instill into the public mind confidence in the railways, for, under the present system of governmental regulation of the fundamental business of transportation there is attached to the government, as well as to railway management, responsibility for the success of a business so closely related to all the business activities of the country.

This thought was admirably expressed by that sound economist—President Hadley—when, in a recent address, he said: "We must lend a hand to the men who are getting things done. We shall deal with the problems of corporate regulation and with the abuses of corporate management more effectively if we are willing to appreciate efficient service."

If the railways are to have the character of support of which President Hadley has spoken, they must justify it. The obligation rests upon them to give the most efficient transportation service in their power without unjust discrimination, and at rates that are not unreasonable as measured by the service performed. Seeking exemption from unjust political attack, they should themselves abstain from political activities. There was a time when their support of policies deemed essential to the preservation of our civilization was urged upon them as a patriotic duty. I think we may all rejoice in the awakening of public conscience and the elevation of public standards which would condemn any return to those conditions.

But, in advocating abstention by the railways from such activities, I should not be understood as implying that they should surrender any of the fundamental political rights to which they are entitled in as full measure as any other business enterprise or individual citizen. These rights include the sacred right of petition—the right to be heard in argument and in protest before legislative bodies, the courts of the land, administrative tribunals, and before the bar of public opinion.

A PILOT SNOW PLOW.

By E. R. Lewis,

Assistant to General Manager, Duluth, South Shore & Atlantic, Duluth, Minn.

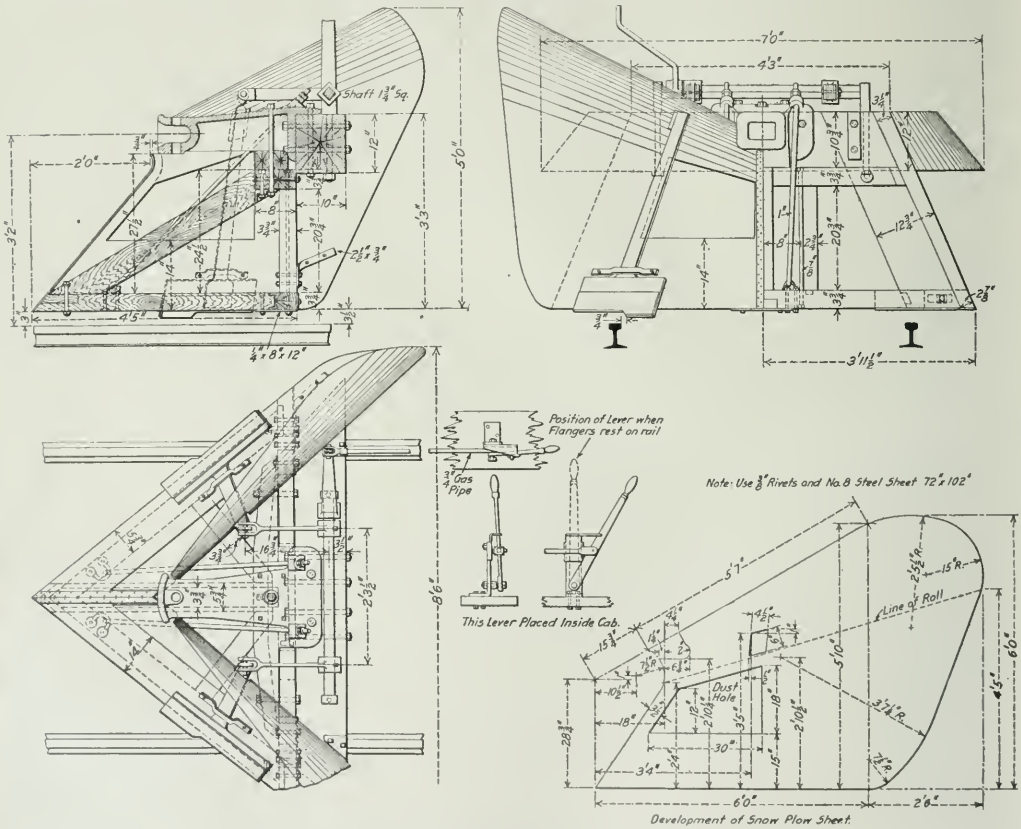
No locomotive, however powerful on a dry rail, can make satisfactory progress during severe blizzards in freezing weather, unless it is well supplied with snow handling attachments. It is by no means sufficient to provide engines, pushing snow plows and flangers, to run ahead of trains drawn by locomotives which have no such equipment. During exceptional winter storms, snow will drift in behind a snow plow and obstruct the track in a very few minutes after the plow has passed.

Every locomotive which is expected to make a trip in such weather should carry its own protection against drifting snow. The ideal equipment is the combined pilot plow and flanger, one style of which is shown in the accompanying illustration. These plows should be attached to the locomotives at the beginning of the season of severe winter storms, and removed only after danger of such weather is past. They will handle snow in drifts 6 to 10 ft. deep. The flangers are of course of service in cleaning snow from the rails and away from the flanges. By cutting loose from the train and flanging the track for a car length or two, the rail can be cleared of snow and ice so that the driving wheels will not slip or skid and the engine will gain sufficient headway to push through the drift. Care must of course be taken not to get so far from the train while flanging that the locomotive cannot recouple to the train, which would then freeze up.

The plow here described is believed to be built on the lines of maximum efficiency. The nose is set at an angle of 40 deg. from the vertical. The spread of the wings includes a total horizontal angle of 72 deg. 30 min. The rise and flare of the wings from nose to heel are such as to give the best results

in lifting and clearing snow from the tracks. A distinct advantage over most pilot plows is the position in which it is placed, close to the front of the locomotive. The pilot and pilot beam may be removed, and the snow plow with its beam put in place by 4 men in about 4 hours.

Locomotive pilot plows should be provided with dust doors, which when opened, allow dust from the ballast, which gathers under a plow on bare, dry track, to escape. The No. 8 steel sheets which form the plow armor are provided with square sliding doors of the same material, on each side of the nose, so fashioned as to cover or uncover a square space in the sheet a trifle smaller than the door, which works in grooves on the outside of the plow, and which may be fastened open or shut. The flangers are operated by a lever in the locomotive cab. The bottom leaves or shoes are of spring steel. If a flanger is broken, a spare shoe may be readily applied by means of four bolts without going into the repair shop. The pilot plow and flanger combined costs $150. The plow and flanger here described were designed and constructed under the supervision of J. J Conolly, superintendent of motive power and machinery, Duluth, South Shore & Atlantic, on which road it has been in use for more than 20 years with the most satisfactory results.



Combined Pilot Snow Plow and Flanger; Duluth, South Shore & Atlantic.

Fuel in Roumania.—In Roumania a few locomotives were converted into oil-burners as long ago as 1887. In 1911, out of a total of 595 locomotives, 499 used oil for fuel. About five-eighths of fuel used is petroleum, one-eighth is coal from Cardiff and Westphalia, more than a seventh, lignite; and one-tenth, wood.

ACCIDENT STATISTICS FOR 1910.

The annual statistical report of the Interstate Commerce Commission for the year 1910 contains no information concerning casualties on railroads, the carriers having been relieved from furnishing this in their annual reports, and the law providing this exemption, and transferring the accident records to another department, having failed to provide for beginning the new records immediately on the cessation of the old. Therefore, one whole year was left out of the annual records. This omission is not important except as concerns accidents to persons at highway crossings, to employees not on duty, and to trespassers, as other accidents had already been provided for in the records published in the quarterly bulletins.

The commission, however, issued a circular calling for a special report on the year 1910, and now publishes a statement showing the totals for that year, made up on the basis of the classification which had been used in the annual statistical report. The total number of persons killed on the railroads of the country in the year under review, ending June 30, 1910, was 9,682, and of injured 119,507. The number of passengers killed was 324; employees 3,382, and other persons 5,976; passengers injured, 12,451, employees 95,671, and other persons 11,385. At highway crossings 835 persons were killed and 1,932 injured. The total number of trespassers killed, all causes, was 4,864; and injured 5,348. These trespassers are included in the "other persons" mentioned above. The regular accident-bulletin statistics for the year ending June 30, 1910, were given in the *Railway Age Gazette* of November 11, 1910, page 925.

General News.

In the federal court at Boston, February 4, the Central Vermont and the New York, New Haven & Hartford were fined each $300 for violations of the safety appliance laws.

Alfred Knight Chittenden, forester of the United States Indian service, Department of the Interior, has been appointed assistant to the director of the engineering experiment station of the University of Illinois, and lecturer on timber and timber resources in the college of engineering.

Suit has been begun by the government in the federal court at Philadelphia against the Philadelphia & Reading for violation of the 28-hour law regulating the transportation of cattle. It is alleged that two carloads of cattle from Buffalo were kept in cars from 38 to 46 hours without food or water.

The Great Northern on January 29 opened its road over the Cascade mountains after a blockade which had lasted six days. The fall of snow has been the heaviest in many years. Many tons of dynamite were used in clearing away masses of fallen timber, rocks and earth which had been swept on to the roadway by avalanches.

The Chicago, Milwaukee & St. Paul has recently received from the builders seven gasoline-electric motor cars built by the General Electric Company, which are to be placed in service shortly for branch line service. Two of the cars will be used on the Puget Sound lines. Five of these cars each weigh 49 tons and are designed for a seating capacity of 80; two weigh 50 tons and have seats for 77 passengers.

A special train on the Pennsylvania lines used to carry cash each evening from the Stock Yards to the Union station in Chicago, was robbed early in the evening of January 31 by one man, who boarded the train as it was passing through the yards before entering the station, and forced the express messenger to open the safe for him. After taking the money and checks from the safe he jumped from the train and escaped pursuers.

Presidents Mellen, of the New Haven, and Chamberlin, of the Grand Trunk, together with A. W. Smithers, chairman of the Grand Trunk, were again indicted in New York City, January 30, for alleged violation of the anti-trust law in connection with the cessation of work on the Grand Trunk line to Providence last autumn. The indictments are substantially the same as those which were found a few weeks ago and which were invalidated on a technicality.

A contract has been signed by the Minneapolis, St. Paul & Sault Ste. Marie and the Baltimore & Ohio, whereby the Soo line will use the tracks of the Baltimore & Ohio Chicago Terminal into the Grand Central station as the entrance into the city of Chicago for its passenger trains. The change will not go into effect until about July, 1914. The Soo line is now using the tracks of the Illinois Central. The Grand Central station was formerly owned and used by the Wisconsin Central, which is now the Chicago division of the Minneapolis, St. Paul & Sault Ste. Marie.

The Pennsylvania Railroad reports the smallest loss from fire experienced by the company in thirty-four years. In 1908 the company's employees extinguished 274 fires out of a total of 1,397 which occurred on railroad property, and in 1912 454 out of a total of 905. The steady increase in the efficiency of the fire fighting brigade was further developed last year by special training of employees and equipping additional locomotives in yard service with pumps. Including the fires to which city fire departments were called, the total loss was only $219,892 from the 905 fires.

The frauds connected with forged bills of lading for cotton which made such a sensation in the southern states a couple of years ago, have again come into notice by the commencement of a suit in the United States Court at New York City by A. Hannay & Co., of Liverpool, against a New York bank, for losses on drafts drawn in connection with worthless bills of lading. The drafts had been discounted for Knight, Yancy & Company and Steele Miller & Company shortly before the failure of those firms. If this suit against the New York bank should succeed, it would open the way to the prosecution of similar suits for sums aggregating $4,500,000.

G. A. Ogline, superintendent of police of the Baltimore & Ohio, in his annual report, which has just been made, and in which he reports a total of 10,417 arrests made during the year, says that from his observation during travels over American railroads during the past year he believes that the trespassing evil is growing rapidly. During the year 289 persons were killed and 298 injured while trespassing on Baltimore & Ohio property. Mr. Ogline suggests that a good cure for vagrancy would be the maintenance of a stone pile. There is nothing which the tramp so dislikes as the labor of splitting stones.

The *Railroad Telegrapher*, the organ of the Order of Railroad Telegraphers, in its January issue reports that in the month of December the number of new members initiated into the order was one thousand nine hundred and twelve, the largest on record for a single month; and in the twelve months of the year one thousand nine hundred and twelve the total number of new members was 10,339. The total present number of members is not given. A list is given of the names of 58 railroads on which new and revised schedules of wages for telegraphers were made during the year 1912. The Grand Lodge gives prizes to members who secure new members; one bringing in twenty-five or more being offered a gold watch.

The Bangor & Aroostook has nearly or quite won its contest with the striking enginemen and firemen. It now has enough firemen for all trains and is short only twenty of its full complement of enginemen, though it is said that some of the enginemen have not yet fully learned the road. The leaders of the conductors' and trainmen's unions demanded last week a large increase in pay, but as yet they have not struck, and it is believed that probably the rank and file did not vote to sustain the leaders. It is said now that the track repair men, or some of them, are threatening to strike. The governor of the state of Maine sent to the legislature a message recommending arbitration or other measures to settle the strike, but both houses of the legislature laid the message on the table.

The Western Union and Postal Telegraph companies have filed with the New York Public Service Commission, Second district, new rates for money transfer service, effective March 1, 1913, as follows: Transfer premiums for $25 or less, 25 cents; over $25 and not exceeding $50, 35 cents; over $50 and not exceeding $75, 60 cents; over $75 and not exceeding $100, 85 cents; for each additional $100 or fraction thereof up to and including $3,000, 25 cents; for each additional $100 or fraction thereof over $3,000, 20 cents. In addition to the premium there will be a charge for telegraph service equal to the price of one fifteen word message from the office of deposit to the office of payment. The new rates greatly reduce the present charges which are as follows: Premium 25 cents for $25 or less, and 1 per cent. on all sums of more than $25 and not exceeding $1,000. For amounts over $1,000 1 per cent. for $1,000, and one-half of 1 per cent. for any excess over $1,000, fractional part of a dollar counted as a dollar, and in addition charge for telegraph service equal to twice the toll on a ten word message from the depositing office to the paying office.

The Purchasing Power of Money.

A leading financial paper says that the Atlantic Coast Line will use $40,500 from the proceeds of the sale of stock for the following purposes: Additional equipment, new construction, bridges, trestles, yards, terminals, shops, double track, creosote and rock crushing plants, block signals, telephone circuits and other additions and betterments.

Guilty on All Counts, But Unashamed.

The connection between the retail tobacco business and steel manufacturing and railroading may not be visible to the naked eye, but it is there, just the same. That is to say, it was there. Because the connection no longer exists a certain cigar dealer mourns the loss of $3,000 worth of business. In these uncertain times one can feel real badly over the loss of $3,000. But to explain: You see in the good old days sundry manufacturers of steel products were in the habit of making through their salesmen little Christmas gifts to the purchasing agents of railroads with which they did business, or hoped to do business. The cigars never did any one harm, because they were good

cigars. They merely helped to promote the entente cordiale between the salesman and the purchasing agent. The *Railway Age Gazette* heard about it and straightway became exercised over what it declared was a pernicious practice. The *Gazette* raised such a hullabaloo that presently the railroad men up at the top and the steel men in the same relative position concluded that perhaps the entente cordiale did not need any promoting, after all. So when Christmas came this time three or four steel representatives who had been making Christmas purchases aggregating $3,000 of the cigar dealer aforesaid did not buy so much as a package of cigarettes. It would have been bad enough if they had transferred their patronage elsewhere; but they did much worse; they simply kept their money in their pockets. No doubt the railroad men who have been having one on the steel salesmen will continue to smoke; but when one purchases one's own cigars one is likely to smoke less expensive cigars and fewer of them. Besides, their custom will be scattered, so that no one will reap any appreciable benefit. Shame on the *Railway Age Gazette.—United States Tobacco Journal.*

Railway Bills in the Legislatures.

Both houses of the Michigan legislature have passed a resolution providing for an investigation by a state commission of the financial and physical affairs of the Pere Marquette.

A bill has been introduced into the Minnesota legislature proposing an increase in the railroad gross earnings tax rate from five to six per cent. The last legislature increased the rate from four per cent to five.

A bill has been introduced in the Colorado senate, which would make trespassing on railroad tracks a misdemeanor punishable by fine, or imprisonment, or both. During the fiscal year 1912, out of 95 people killed on the railways of Colorado, 52 were trespassers.

Bills have been introduced into the Michigan legislature providing for a semi-monthly pay-day, requiring that all cabooses be built according to a standard plan, and providing for a ten-cent additional charge where fares are paid in cash on passenger trains. A full crew bill also has been presented.

A bill has been introduced in the legislature of New York at Albany, to empower the public service commissions to suspend railroad tariffs which propose increases of rates, in the same manner that such tariffs are suspended by the Interstate Commerce Commission. A similar bill was passed last year, but was vetoed by Governor Dix.

A full-crew bill has been introduced in the legislature of Colorado. Committees representing the brotherhoods of trainmen are endeavoring to have the bill made even more sweeping than are the laws on this subject now in force in other states; while arguments have been presented on behalf of the railway companies showing the unreasonable character of the bill.

A bill has been introduced into the Kansas senate requiring railways to pay their employees twice a month. At a hearing before the railroad committee recently, E. L. Copeland, secretary and treasurer of the Atchison, Topeka & Santa Fe, offered documentary evidence showing that if the bill were passed it would increase the expenses of the Santa Fe by about $24,000 a year.

A bill has been introduced in the Illinois legislature providing for the creation of two public utilities commissions, one for Chicago, and one for the state at large, to replace the present railroad and warehouse commission. The Chicago commission is to be appointed by the mayor, and the state commission by the governor. Each is to consist of five members at a salary of $10,000 each, yearly, with a secretary for each commission at a salary of $6,000.

Representative Hughes, of West Virginia, has introduced in Congress a bill providing that after January 1, 1915, all passenger, express and baggage cars used in interstate traffic shall be made of steel, with vestibuled platforms; the Interstate Commerce Commission to have authority, however, to extend the period of time within which any carrier shall comply with the law.

Representative Dent of Alabama has introduced in Congress, a bill making it unlawful five years after date for any common carrier to use any locomotive or car for passenger traffic not equipped with some safety device for the prevention of derailments resulting from broken flanges, broken wheels, etc. Mr. Dent evidently has in mind the virtues of somebody's patent for causing cars which have jumped the track to immediately jump back on the rails again.

Illustrated Lectures for Central of Georgia Employees.

The farmers are not the only beneficiaries of the traveling lecturer. The Central of Georgia has just started a lecture car for the benefit of its employees, and moving pictures constitute one of its main features. It is managed by the Educational Bureau of the road, in charge of D. C. Boy, assistant chief. The lecturers are E. H. Daniel, transportation inspector, and A. D. Prendergast, road foreman of engines. The lectures were begun at Albany, January 28, and they are in substance as follows:

First: "Fuel Economy, or Proper and Improper Locomotive Firing," by Mr. Prendergast. This lecture is illustrated with fuel tests, colored slides showing condition of fuel in fire box, and by moving pictures showing proper and improper methods of handling scoop-shovel, firing a pusher engine up hill, result of good and bad firing as seen from rear of train by the passenger, coaling engines, etc. A double-header is shown going up hill, the front engine being fired properly and the second engine fired improperly, as evidenced by the light smoke coming from the stack of the first engine, and the dense black smoke from the second engine. These moving pictures were taken on the Central of Georgia in and around Macon.

The second lecture, by Mr. Daniel, is on train rules. "Always Safety First" is the first and the last stereopticon slide shown. Following this many of the train rules are shown and explained. Pictures are shown illustrating the violation of rules and bad practice of trainmen, such as adjusting couplers, jumping on moving cars, etc.

The third lecture takes up loss and damage freight. There are several slides calling attention to the cost to the company of loss of and damage to freight. Following these are pictures showing loading and handling of freight at stations and in trains.

Opening of the New Grand Central Terminal, New York.

The new headhouse of the Grand Central Terminal, Forty-second street, New York City, was opened for business at midnight on Saturday, February 1, and all day on Sunday the station was crowded with sightseers. The concourse for the lower level was opened several weeks ago, and the principal rooms now opened are the main waiting-room, the men's and women's waiting-rooms adjacent, the upper concourse, and the restaurant. The concourse, ramps and tracks which will eventually serve for incoming trains and passengers are yet to be built, and the exterior of the station is not entirely finished; but in its main functions, the new station is now in service and the old "Grand Central Palace," in which was the temporary main waiting-room during the construction of the new bulding, has been vacated and the wreckers have already begun to tear it down. The hospital at the corner of Forty-second street and Lexington avenue, on which site the New York Central proposes to erect a hotel, is also being torn down.

Warren & Wetmore, the architects of the new station, gave a dinner in the restaurant of the station on Saturday evening to A. R. Whaley, and about 100 guests. Mr. Whaley, who has just resigned, has been general manager of the Terminal for several years past. About two thousand guests of the architects inspected the station Saturday afternoon and evening. Preparatory to opening, at midnight, the company had decorated the principal rooms with palms, and there was a band of music on hand; and when the doors were opened at 12 o'clock about three thousand persons, who had been waiting outside, rushed in.

The progress of the work on this station has been recorded from time to time in the *Railway Age Gazette*, the last article having been published on November 22 last, page 981. Photographs of the interior of the new station have not yet been taken.

Among the accounts of the opening published by the New York City papers, that of the *Evening Post*, which embraced a

large number of illustrations made from architects' drawings, is of interest historically by reason of several views which it shows, illustrating the New York terminals of the Harlem, the New Haven and the Hudson River railroads in early years. The *Evening Post* also prints a short article written by John N. Golding, the real estate agent who, in behalf of the New York Central, bought lands and buildings for the new terminal. From this we quote:

"Securing such a site as is embraced in the Grand Central Terminal necessitated buying two large hospitals, two large warehouses, orphan asylums, churches, rows of flats, house after house, vacant land, stables, express buildings, etc. In no instance was a property purchased from other than the original owner of record. This part it was my privilege to be engaged in accomplishing. No profits to speculators.

"The city of New York has every reason to be proud of the Grand Central Terminal and all that pertains to it. Each man from the president down had to do his share and do it well to make the undertaking go, and they did not fail.

"The gathering of the big financial men of the country, composing this board, was the primary authority. Trusting the operation to selected individuals in their line, the board controlled the adjustment of all legal difficulties, the rearranging of grades, new streets, exchanging of one part of a street for another part; conference after conference, public hearings, some pleasant and others a little unpleasant, everybody keeping his temper, all with a fixed purpose, and the undertaking was completed. Ideas advanced, turned over, looked into, followed, the brains of the whole system worked together.

"Property owners demanded that the streets be made from Lexington to Madison avenue; month after month conferences were held with representatives of the city, necessitating a great deal of thought on the part of the head of the legal department, Ira A. Place, and his associates; and the whole proposition was directed by the masterful mind of the railroad's late president, William H. Newman, who has made it a lifework, bringing about this wonderful result.

"With the 26-story Biltmore Hotel, the Yale Club, the Grand Central Palace, the Y. M. C. A.'s new building and stores and apartment houses, new hotels and other buildings now talked of, the tract from Forty-second to Fiftieth street, embraced in this terminal, will be the greatest business, club, amusement and apartment house center in the city. There are many wonders in this great city, and this terminal is one of them. But to my mind there is a greater wonder, and that is, *how they had the hardihood to do it.*"

Harriman Lines' Dissolution Plan.

Though the Harriman Lines' committees and the government have not yet reached a definite decision in regard to the plan for the dissolution of the Union Pacific-Southern Pacific system, it is believed that the plan is crystallizing rapidly and will probably be announced this week. It is expected that this plan will call for the sale of the Central Pacific to the Union Pacific for cash. It was the desire of both the railroads and the government that the Central Pacific should be paid for partly with Southern Pacific stock, but this is impossible because of a Kentucky statute prohibiting the Southern Pacific from purchasing its own stock. It is estimated that the price to be paid for the Central Pacific will be in the neighborhood of $100,000,000. The $126,000,000 Southern Pacific stock owned by the Union Pacific will probably be offered at about par to Union Pacific and Southern Pacific stockholders. The exact proportion to be offered to stockholders of the Union Pacific is not yet known. The offering of this Southern Pacific stock will be underwritten by a syndicate. This plan is merely the agreement expected to be reached between the directors of the two roads and the attorney general. The plan will then go to the circuit court of the Eighth district for final approval.

R. S. Lovett, chairman of the executive committee of the Union Pacific is quoted as saying, in part:

"The operating organizations of the Union Pacific and Southern Pacific in the West were separated a year ago last October, from the president down. The only joint offices and officials left after that reorganization and at the time of the decision of the Supreme Court in December were the directors, chairman of the executive committee, directors of maintenance and traffic and other officers in New York and the commercial and soliciting agents.

"When the attorney general's position respecting the disposition of the Central Pacific was made known, thereby showing a possible conflict of interest with respect to that property, the chairman and directors of the Union Pacific informed him that of course they could not further act for the Southern Pacific and immediately resigned from the Southern Pacific so that the latter board could be composed of directors not interested in the Union Pacific. This occurred on January 13."

Firemen's Wages.

Elisha Lee, chairman of the committee representing the eastern railroads, which committee expects to hold next Tuesday another conference with the representatives of the firemen, has issued during the past week a number of statements to the public. Commenting on the published statement of the leader of the firemen, relative to the delay in settling the case of the locomotive enginemen, he calls attention to the fact that the delay caused the enginemen no loss; for though the increase in pay which was voted was not announced until November 26, it was made to take effect on May 1. The men received back pay amounting to about $1,000,000. Mr. Lee says that the total annual increase in the pay rolls of the enginemen will be about $2,000,000, or approximately 5 per cent. In other statements he says:

"This strike vote of the firemen was taken in the face of the railroads' offer to submit all matters in controversy to an unbiased arbitration commission of five, seven or nine men. The firemen will endeavor to gain the support of public opinion. General chairmen are directed to make arrangements whereby publicity can be given to all matters in connection with this movement 'whenever it becomes evident that no settlement can be reached.'

"The railroad managers have learned with considerable surprise that the firemen are also polling the engineers who belong to the brotherhood. These same engineers have had their wages increased by the arbitration award recently announced and intended to continue until June 1.

"The attitude of the firemen's brotherhood towards the form of arbitration followed in the engineers' case may be gained from a letter addressed by President Carter to the railroads, in which he says:

"'It is noted that in your objections to the federal arbitration law that you believe its most fundamental defect is that the interests of the public are not guarded by it. Our committee instructs me to compliment the conference committee of managers upon their solicitude for the interests of the public. . . . We hold that an arbitration of a wage dispute should not be used for the purpose of molding public opinion as to the necessity of enacting laws to forbid railway employees engaging in strikes, or to secure legislation that will deprive workingmen of their constitutional rights, which seems to have been the purpose of the railroads' plan of arbitration. In any arbitration of wage matters social or legislative problems should not thus be injected. It is evident that the wish of certain prominent railroad officials has found expression in the report of this arbitration, under the railroads' plan, that national and state wage commissions be established, with power to enforce decrees. Advantage should not be taken of wage disputes to mold public sentiment concerning the proper returns upon capital invested by railroads or the necessity for increase in freight rates.' . . .

"The railroads still offer arbitration by a board representing the public. The railroads base their case upon the recent conclusions of the board appointed to adjudicate the claims of the engineers. That board, after examining the record of the operation of the Erdman act, stated that its results were 'accomplished by splitting differences, and the case may be adjusted without adequate investigation of the facts involved, in consequence of which the award may not rest upon a basis of equity. This method of splitting differences is very unsatisfactory, but it is an inevitable result of mediation or arbitration under the Erdman act. Feeling in advance that a mediation or arbitration will result in giving only a part of what they ask, the men make maximum demands, with the expectation that these demands will not be fully awarded. The railroad officers, appreciating

the tendency of mediators and arbitrators to split differences, make only minimum concessions or none at all.'

"The railroads have offered to grant concessions to the firemen. They have offered them what is tantamount to an increase of 5 per cent. in their total payroll. . . . The railroad managers are only too glad to pay their men high and increasing wages. It is only from a feeling that such increases as have been demanded are not justified by the conditions, that railroad managers are moved to resistance.

"The companies would regard a strike with dismay. Such an outcome of this situation must be prevented, in the public interest. If the public can insist that there be no strike and that there be arbitration properly guarding the interests of the public, the railroads and the employees, a most important result will have been achieved.

"The railroads have offered their men a minimum wage of $2.40 a day in passenger service. The present minimum is $1.75, though this minimum is paid on but few roads. In through freight service the railroads have offered a minimum of $2.75 per day. They have also offered increases of 10 and 15 cents per day on certain freight engines. All firemen working on freight engines now receive at least $2.45 a day. The Boston & Albany now pays $3 per day; the Baltimore & Ohio $2.75, $3 and $3.10; the Delaware, Lackawanna & Western, $2.90; the New York, New Haven & Hartford pays $2.60 and $2.80 per day; and the Pennsylvania Railroad and the New York Central pay $2.85 and $3. These are through freight rates.

"According to the recent arbitration commission in the engineers' case, the average wages of firemen in the district affected by the present strike vote are $2.88 per day. Ten years ago the average was about $2.05, so that the average wages of the firemen who are now threatening to strike have been increased more than 35 per cent. in the past ten years. Railroad managers are willing and eager to pay all classes of employees as high wages as conditions will permit. It is indeed recognized that the firemen at this moment deserve special consideration. But, it is obvious that the public must pay the bill in the end, and the question the public has to answer is: How long shall this process of increases be allowed to continue?

"Chief among the propositions which the men have voted on, and which the railroads already have offered to arbitrate, is a demand that there shall be two full-paid firemen on about 2,000 out of the 14,000 freight locomotives in the territory affected; that is, on all engines of more than 200,000 lbs. weight on the drivers. The railroads concede that there are cases deserving relief. On the Pennsylvania, for instance, where under the Pennsylvania state extra-crew law an additional brakeman is employed, he is required to assist the fireman in shoveling coal on a hard run. On other roads in some cases two firemen are employed for a full run. The railroads propose to the men to refer each case back to the local officers and men to settle; where it cannot be settled satisfactorily, to appoint a permanent committee of appeal for all the 54 railroads which shall have power to inquire into the case and settle it fairly.

"An arbitrary rule would unduly burden the railroads and would cause the companies to employ a large number of unnecessary firemen. But even this proposition the companies are prepared to leave to the judgment of a committee of citizens sufficiently large and representative, to consider and settle fairly the subject on behalf of the public, the railroads and the employees."

"The firemen have notified the managers that if the railroads do not grant two firemen on locomotives they will get the equivalent through federal legislation. At a conference on December 20, President Carter said 'if they could not get relief across the table they would have to get it at Washington. We are trying to get it across the table. If we don't get it here, you can depend upon it they will get it at Washington. I mean they will get the ten or twelve-hour day, and they will not get it through this organization, but they will get it through the individual members of Congress.' The railroads concede that the strain upon firemen has increased. All the railroads have given serious and sympathetic attention to this subject. Many factors besides weight enter into this question. An engine may be heavy, but the run very short. Many railroads are trying automatic stokers, so that all the fireman has to do is to stand by and see to it that the stoker works properly. But even on such engines the brotherhood demands two firemen."

Western Economic Society.

The Western Economic Society will present at its conference a thorough discussion of the modern ideals of organization, efficiency and scientific management. A number of prominent advocates of scientific management will present the fundamental features of their plans and an opportunity will then be given for discussions, questions and criticisms. The conference will be held on March 14 and 15, at Chicago.

Papers will be presented on such topics as the following: The Spirit of Scientific Management; Scientific Management from the Manufacturers' Point of View; Scientific Management versus System; Scientific Time Study and a Proper Task; Wage Systems and their Consequences; Planning Room and Functional Foremanship; the Importance of Standardization; Organization and Personnel; the Selection of Employees; Scientific Management in Commercial Enterprises; the Social Significance of Scientific Management; Scientific Management and the Laborer; Some Object Lessons in Scientific Management; and the Taylor Sysetm.

The following have accepted invitations to present papers on these subjects: Carl G. Barth, consulting engineer; Dr. K. M. Blackford; the M. Rumeley Co., La Porte, Ind.; M. L. Cooke, consulting engineer; Harrington Emerson, consulting engineer and author of the "Twelve Principles of Efficiency"; E. M. Feiker, the System Company; Hollis Godfrey, consulting engineer; H. K. Hathaway, vice-president of the Tabor Manufacturing Co., Philadelphia, Pa.; H. B. Kendall, the Plimpton Press, Norwood, Mass.; F. W. Taylor, founder of the Taylor system of scientific management; C. B. Thompson, in charge of work on industrial organization of Harvard Graduate School of Business Administration; S. E. Thompson, consulting engineer; Amasa Walker, Longmans, Green & Company; and William B. Wilson, chairman of the committee on labor of the United States House of Representatives. A number of papers will probably be presented by others. All sessions are open for general discussion. The officers of the company are as follows: President, Shailer Mathews; vice-presidents, Franklin MacVeagh and George E. Vincent; treasurer, Charles L. Hutchinson; and secretary, Leon C. Marshall, dean of the College of Commerce and Administration of the University of Chicago.

MEETINGS AND CONVENTIONS.

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Convention, May 6-9, St. Louis, Mo.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of General Passenger and Ticket Agents.—W. C. Hope, New York.

American Association of Freight Agents.—R. O. Wells, East St. Louis, Ill. Annual meeting, June 17-20, Buffalo, N. Y.

American Association of Railroad Superintendents.—E. H. Harman, St. Louis, Mo.; 3d Friday of March and September.

American Electric Railway Association.—H. C. Donecker, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Assoc.—George Keegan, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next meeting, May 21, New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Convention, October 21-23, 1913, Montreal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Convention, March 18-20, 1913, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, Old Colony building, Chicago. Convention, June 11-13, Atlantic City, N. J.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.; annual, June, 1913.

American Society of Civil Engineers.—C. W. Hunt, 220 W. 57th St., New York; 1st and 3d Wed., except June and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 13 Park Row, New York; 2d Tuesday of each month, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 20-22, 1914, New Orleans, La.

Association of American Railway Accounting Officers.—C. G. Phillips, 143 Dearborn St., Chicago. Annual meeting, May 28, Atlantic City, N. J.

Association of Railway Claim Agents.—J. R. McSherry, C. & E. I., Chicago. Next meeting, May, 1913, Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Semi-annual meeting, June, 1913, Atlantic City, N. J.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago; annual, May 20, 1913, St. Louis, Mo.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y. Annual meeting, October 8, Philadelphia, Pa.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—H. A. Neally, Joseph Dixon Crucible Co., Jersey City, N. J. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and Aug., Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 413 Dorchester St., Montreal, Que.; Thursday, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 North 50th Court, Chicago; 2d Monday in month, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Thurs. in Jan. and 2d Fri. in March, May, Sept., Nov., Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—L. S. Pomeroy, Old State Capitol building, St. Paul, Minn.; 2d Monday, except June, July, August and September, St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—E. R. Dasher, Box 704, Harrisburg, Pa.; 1st Monday after 2d Saturday, Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—E. K. Hiles, 803 Fulton building, Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va. Next convention, June 18, Bluff Point, N. Y.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—E. S. Koller, 226 W. Adams St., Chicago; Wed. preceding 3d Thurs., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick building, Chicago. Annual meeting, May, 1913, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 22-25, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Annual meeting, August 18, Richmond, Va.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—W. G. Wilson, Lehigh Valley, Easton, Pa.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Convention, May 26-29, 1913, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Old Colony building, Chicago. Convention, June 16-18, Atlantic City, N. J.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Annual meeting, September 9-12, Ottawa, Can.

NATIONAL RAILWAY APPLIANCES' ASSOC.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Meeting with Am. Ry. Eng. Assoc.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NORTHERN RAILROAD CLUB.—C. L. Kennedy, C., M. & St. P., Duluth, Minn.; 4th Saturday, Duluth.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Tuesday.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 2 Rector St., New York. Annual dinner, second week in December, 1913, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Assoc. Ry. Elec. Engrs.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo. Next meeting, August 12-15, Nashville, Tenn.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City, Southern, Kansas City, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Meetings, March 17, Chicago; June 10-11, New York; convention, October 14, Nashville, Tenn.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio. Annual convention, May 19-21, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOC.—J. D. Conway, 2135 Oliver bldg., Pittsburgh, Pa. Meetings with M. M. and M. C. B. Assocs.

RAILWAY TEL. AND TEL. APPLIANCE ASSOC.—W. E. Harkness, 284 Pearl St., New York. Meetings with Assoc. of Ry. Teleg. Sups.

RICHMOND RAILROAD CLUB.—F. O. Robinson, Richmond, Va.; 2d Monday except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Convention, September 8-12, 1913, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—P. W. Edmonds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—C. Nyquist, La Salle St. Station, Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Montgomery, Ala. Next meeting, April 17, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. G. Macomber, Woolson Spice Co., Toledo, Ohio; 1st Saturday, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meeting with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—Guy S. McCabe, La Salle Hotel, Chicago; meetings monthly, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 290 Broadway, New York; last Tuesday in month, except June, July and August, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie, Pittsburgh, Pa.; meetings monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7042 Stewart Ave., Chicago. Annual meeting, June 17, Los Angeles, Cal.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, L. S. & M. S., Detroit, Mich.; meetings monthly.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, August, 1913, Chicago.

UTAH SOCIETY OF ENGINEERS.—R. B. Ketchum, University of Utah, Salt Lake City, Utah; 3d Friday of each month, except July and August.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, Old Colony building, Chicago; 3d Tuesday of each month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock block, Chicago; 1st Monday in month, except July and August, Chicago.

Traffic News.

The Pittsburgh & Lake Erie and the Western Maryland have made a reduction of 15 cents a ton in the freight rate on coal destined to points beyond, by water, from the Pittsburgh district to Baltimore, and the reduction has been followed by a similar reduction over the Baltimore & Ohio. It is expected that the Pennsylvania will meet the new rates in the tariffs from the coal mines adjacent to its lines in western Pennsylvania.

At a meeting of the Western Passenger Association in Chicago, last week, summer tourist rates for this year were decided upon, and will be on approximately the same basis that has been in effect in previous years. From Chicago to Colorado common points the round trip fare will be $30, and to Utah points the round trip rate will be $43. Summer tourist tickets will be on sale from June 1 to September 30, with the return limit on October 31.

At a meeting of traffic officers of the New Orleans railway lines and agents of the steamship lines last week, an agreement was reached by which the steamship lines will pay demurrage charges on shipments of cotton and forest products exported through New Orleans on through bills of lading, after ten days' free time. It is understood that this agreement will end a controversy regarding the issuance of bills of lading which has been in progress for the past year.

INTERSTATE COMMERCE COMMISSION.

Reparation Awarded.

Dewey Brothers Company v. Louisville, Henderson & St. Louis et al. Opinion by the commission:

The rate of 21 cents per 100 lbs. for the transportation of distillers' dried grains in carloads from Stanley, Ky., to Akron, Ohio, was found to have been unreasonable to the extent that it exceeded 15 cents per 100 lbs. (25 I. C. C., 700.)

In re rates on empty beer packages returned.

Pabst Brewing Company v. Chicago, Milwaukee & St. Paul et al. Opinion by the commission:

In this case reparation was sought on certain shipments of empty beer packages on which the commission previously refused to grant reparation. The commission upheld its former decision, with the exception of that in the case of shipments from Hutchinson, Kan., to Milwaukee, Wis., made by the Pabst Brewing Company in 1908 and 1909. The commission found that rates of 29½ cents were applied on five of the shipments in question and 34½ cents on the remaining shipments. The commission found that these rates were unreasonable to the extent that they exceeded 24 cents per 100 lbs., with a minimum of 15,000 lbs. in refrigerator cars and 20,000 lbs. in ordinary box cars. As the present rate is now 22 cents per 100 lbs., no order as to a rate for the future was entered. (26 I. C. C., 4.)

Live Stock Rates.

American National Live Stock Association et al. v. Southern Pacific et al. Opinion by Chairman Prouty:

The commission established reasonable maximum rates for the transportation of live stock from stations in Arizona to Los Angeles and other California points. The rates were prescribed for 36 ft. cars; and to obtain rates for cars of different lengths 3 per cent. per foot should be added or subtracted. To those rates $5 per car should be added for a two-line haul for 500 miles or less; for branch-line hauls $2.50 per car should be added. The rate on stock cattle or on sheep for feeding should be 85 per cent. of the rate prescribed for fat sheep and cattle since in the case of stock cattle the carrier will get a second haul. Through routes were established from points on the Arizona Eastern, via the Southern Pacific, to Los Angeles and California feed lots. (26 I. C. C., 37.)

Rates on Manganese Ore Increased.

In re import rate on manganese ore. Opinion by the commission:

The cancellation of a tariff provision by the Central of New Jersey providing for application of the import rate on ground

manganese ore, ground at Elizabethport, N. J., was suspended. The commission found that the tariff provision in question enabled the complainant to deliver manganese ore to western markets at a considerably lower rate than its competitors, which were compelled to pay the regular rate. The commission therefore decided that the tariff provision was discriminatory in favor of the complainant and directed that the order of suspension be vacated. (25 I. C. C., 663.)

Rates on Porch Work Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of porch work from Beaumont and East Beaumont, Tex., to various interstate points. Opinion by Commissioner Meyer:

The commission suspended the tariffs of the defendant which proposed to cancel joint rates on porch work from Beaumont and East Beaumont, Tex., to various points east of the Mississippi river and to substitute combination rates which are from 8 to 12 cents higher than the present rates. At the hearing no one appeared for the complainant. The main argument for the defense was that the Texas & New Orleans did not receive a fair division of the present through rate. The witness for the defendant said that the rates on porch work should be at least three cents higher per 100 lbs. than the rates on lumber. The commission found that porch work took an arbitrary of three cents per 100 lbs. over lumber from producing points in several other states. The present rates on porch work from Beaumont and East Beaumont are only one cent per 100 lbs. lower than the rates on lumber from those points. The commission decided that the proposed advances are unreasonable, but that the defendants should establish from Beaumont and East Beaumont to eastern destinations to which joint rates on porch work now apply, joint rates which are not more than three cents per 100 lbs. higher than the current rates on lumber between those points. (26 I. C. C., 1.)

News Print Paper Rates Reduced.

In re investigation and suspension of advances in rates by carriers for the transportation of news print paper from Sault Ste. Marie, Ontario, to various points in the United States. Opinion by Commissioner Meyer.

The tariffs under suspension name rates on news print paper in carloads from Sault Ste. Marie, Ont., to points on the Missouri river and in central freight association territory. With two exceptions, the proposed rates are reductions under the current rates. The advances are only 1¼ cents and the reductions range from 1 to 13 cents. The complainant seeks to have the commission, in this proceeding, not only find that the proposed rates are unreasonable, but also to order the defendants to establish rates lower than those now proposed. The main argument of the complainants was based on a comparison with rates in other districts. The commission found that the complainant failed to show that the rates assailed were unreasonable or unjustly discriminatory; and that the defendants had justified the propriety of the rates proposed by them.

The formation of Sault Ste. Marie, Ontario, Sault Ste. Marie, Petoskey, and Cheboygan, Mich., into a single group for rate-making purposes, similar to groups established elsewhere, will largely obviate the difficulties and the seeming inconsistencies dwelt upon by the complainant with respect to the rates on news print paper from such points. (26 I. C. C., 13.)

Rates on Hay Increased.

In re investigation and suspension of advances in rates by carriers for the transportation of hay in carloads from points in Wisconsin to Chicago, Ill., and between other points. Opinion by Commissioner McChord:

The increases in the proposed rates on hay from points in the Northwest to Chicago range from 1½ cents to 5½ cents per 100 lbs. and average about two cents per 100 lbs. Under Western classification hay takes the class C rate, but to Chicago and other terminal markets commodity rates lower than class C have generally obtained. The advances in question bring the rate up to the class C basis in most instances. The commission found that it would have to determine upon the reasonableness of the proposed rate without reference to the classification. The defendant argued that one of the chief reasons for raising the rates on hay was the excessive terminal charges incident to delays in unloading hay. The commission decided that as some consignees were more delinquent than others, these terminal charges should not be included in the rate. It was shown that the proposed rates would yield more per car revenue than the rates on the same commodity in other districts. The commission found that the proposed rates were not unreasonable and they will be permitted to become effective. It was also contended by the complainant that the proposed rates were discriminatory, but as no evidence was introduced in support of this allegation, the commission made no decision in regard to it. (25 I. C. C., 680.)

Rates on Drain Tile and Sewer Pipe.

In re investigation and suspension of advances in rates by carriers for the transportation of drain tile and other articles from points in Central freight association territory to various destinations. Opinion by Commissioner Clements:

By the suspended tariffs the carriers proposed to advance their rates on drain tile and sewer pipe about 20 per cent. The purpose of this advance is to simplify the tariff by making one rate on all tile not classed as sewer pipe. The complainant contends that the cheaper grade of tile should continue to enjoy its lower rate as at present. The commission found that the proposed advances on drain tile were excessive and ordered the defendant to cancel them. The commission intimated that although the present advances are unreasonable, smaller advances might be permitted if it could be shown that they would simplify the tariff and also be reasonable.

In regard to sewer pipe, the testimony was with particular reference to the rate from Mecca, Ind., to Chicago, Ill., which the carriers proposed to advance from 6 to 8 cents per 100 lbs. The complainant contended that the rate of 12 cents per 100 lbs. from Akron, Ohio, to Chicago was not advanced, therefore it would not be fair to advance the rate from Mecca. The rate from Akron is on the basis of sixth class, and the proposed increased rate from Mecca is one cent less than sixth class. The commission found that the proposed increases in rates on sewer pipe were reasonable and as far as they are concerned the order of suspension will be vacated. (26 I. C. C., 88.)

STATE COMMISSIONS.

The Railroad Commission of Indiana has issued a code of rules, regulations and charges for the storage of freight, to go into effect February 15.

The Public Service Commission of Ohio has issued a code of demurrage regulations for freight cars and has directed all of the roads in the state to put them in force on April 1, next.

The Nevada railway commission has ordered the Southern Pacific to reduce its present local one-way passenger fares between all points on its standard gage main and branch lines in the state from 4 and 5 cents a mile to 3 cents a mile. The chairman of the commission dissented from the majority, stating that while he is favorable to the reduction on the main line, he is opposed to any reduction on the branches.

The New Mexico corporation commission has filed with the Interstate Commerce Commission a complaint attacking all the interstate rates from the Missouri river and Pacific coast points to New Mexico as unreasonable and discriminatory as compared with the rates to Texas and other points. The commission requests that hearings be held before the entire membership of the Interstate Commerce Commission.

The governor of New York has appointed Edward E. McCall, hitherto a justice of the Supreme Court, to the position of chairman of the Public Service Commission, First district (New York City), in place of William R. Wilcox, whose term has expired. Political influences and the interests of the democratic party seem to have been the controlling factors in this appointment. The governor on the same day, February 3, appointed Devoe P. Hodson, of Buffalo, to succeed John B. Olmsted, as a member of the Public Service Commission for the Second district.

REVENUES AND EXPENSES OF RAILWAYS.

Railway Officers.

Executive, Financial and Legal Officers.

George O. Lilley has been elected treasurer of the Louisiana Railway & Navigation Company, with headquarters at Shreveport, La.

Charles H. Morey, vice-president of the Manistee & Grand Rapids at Manistee, Mich., has been appointed receiver of that company.

R. Lancaster Williams, of Middendorf, Williams & Company, has been elected president of the Georgia & Florida, succeeding his brother John Skelton Williams, of Richmond, Va.

W. M. Baugh has been appointed auditor of the Liberty-White in charge of accounting and freight claim departments, with office at McComb City, Miss., succeeding L. B. Sedgwick, resigned.

F. P. Johnson, auditor of disbursements of the Missouri Pacific and the St. Louis, Iron Mountain & Southern at St. Louis, Mo., has been appointed assistant general auditor, and T. M. Niven succeeds Mr. Johnson.

W. E. Higgins, assistant to general manager of the Lackawanna & Wyoming Valley, at Scranton, Pa., has been appointed acting vice-president and general manager, succeeding Charles F. Conn, vice-president and general manager, resigned to accept service elsewhere.

The following appointments went into effect January 31 on the Southern Pacific: A. D. McDonald, auditor, with headquarters at San Francisco, Cal., was appointed deputy comptroller, succeeding C. B. Seger, resigned; and T. O. Edwards succeeds Mr. McDonald. Hugh Neill was appointed clerk and secretary, succeeding Alex. Millar, resigned. The resignation of William Rockefeller as director and member of the executive committee was accepted, but his place on the Board was not filled. A. D. McDonald, T. O. Edwards and Hugh Neill have been appointed to the same positions on the Southern Pacific of Mexico, as they will hold on the Southern Pacific.

W. H. Penfield, assistant chief engineer of the Chicago, Milwaukee & St. Paul, at Chicago, has been appointed assistant to Vice-President David L. Bush, at Chicago. Mr. Penfield was born in 1874 at Foxburg, Pa., and began railway work in a surveying party on the Buffalo, Rochester & Pittsburgh, in Clearfield County, Penn., and was later resident engineer of the same road to 1899. From August, 1899, to March, 1902, he was resident engineer and locating engineer on the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, and from March, 1902, to December, 1905, he was locating engineer on the Western Pacific in California. From December, 1905, to June, 1911, he was an engineer engaged in the construction of the Puget Sound extension of the Chicago, Milwaukee & St. Paul, with headquarters at Butte, Mont., and in June, 1911, was made assistant chief engineer of the Chicago, Milwaukee & St. Paul, with office at Chicago, which position he held at the time of his appointment on February 1, as assistant to vice-president of the same road as above noted.

Operating Officers.

C Ludolph, purchasing agent of the Texas & Pacific, has been appointed assistant to the general superintendent with headquarters at Dallas, Tex.

C B. Carpenter, chief clerk to the assistant general manager of the Denver & Rio Grande, has been appointed inspector of transportation, with headquarters at Denver, Colo., effective February 1.

H J Micksch has been appointed assistant superintendent of the Texas & New Orleans and the Galveston, Harrisburg & San Antonio, with headquarters at Jacksonville, Tex., in place of A L Kuykendall, resigned.

J McCraw has been appointed acting superintendent of the Southern division of the Central Vermont, with office at New London, Conn succeeding W. E. Costello, superintendent at New London, who has resigned.

W. E. Costello has been appointed superintendent of the First division of the Houston & Texas Central, with headquarters at Ennis, Tex., to succeed D. S. Gallagher, who has been granted indefinite leave of absence on account of ill health.

N. W. Jones, trainmaster of the Philadelphia & Reading at Tamaqua, Pa., has been appointed inspector of transportation of the Philadelphia & Reading and subsidiary companies, reporting to the vice-president and general manager, at Reading.

C. S. Wilkins, trainmaster of the Coal & Coke at Gassaway, W. Va., has been promoted to superintendent, succeeding to the duties of J. A. Emmart, assistant general manager at Gassaway, who has resigned to go into other business, and his former position has been abolished. J. W. Morrow, chief train despatcher, succeeds Mr. Wilkins, and J. C. Kinton succeeds Mr. Morrow.

R. M. Johnson has been appointed inspector of transportation of the Western Maryland, with headquarters at Baltimore, Md. H. W. Shank, trainmaster of the Third district, West Virginia division, has been transferred to Cumberland as trainmaster in charge of terminal operation. J. W. Griffey, trainmaster at Elkins, W. Va., of the Second district, West Virginia division, has been transferred to the Third district, succeeding Mr. Shank, and W. D. Peddicord, chief clerk to the superintendent at Cumberland, has been promoted to trainmaster, with headquarters at Elkins, succeeding Mr. Griffey.

H. E. Whittenberger, whose appointment as general superintendent of the Grand Trunk, with headquarters at Toronto, Ont., has been announced in these columns, was born on November 9, 1864, at Peru, Ind., and was educated in the common schools. He began railway work in 1885, with the Wabash as a brakeman and was later conductor in both freight and passenger service until February, 1898, when he went to the Grand Trunk as trainmaster at Stratford, Ont., and later was transferred to London. From May 15, 1902, to October, 1904, he was superintendent of the Denver & Rio Grande at Alamosa, Colo., and at Pueblo. He went to the Cincinnati, Hamilton & Dayton in November, 1904, as superintendent at Indianapolis, Ind., remaining in that position until his appointment on January 1, 1906, as superintendent of the Kansas City Southern, at Pittsburg, Kan. In October, 1907, he returned to the service of the Grand Trunk as superintendent, which position he held at the time of his recent appointment as general superintendent of the Ontario lines of the same road, as above noted.

H. E. Whittenberger.

P. C. Hart, general superintendent of the Chicago, Milwaukee & Puget Sound at Seattle, Wash., has been appointed general manager of the Chicago, Milwaukee & St. Paul lines East of the Missouri river, with headquarters at Chicago. J. T. Gillick, superintendent at Aberdeen, S. D., has been appointed assistant to general manager, with office at Chicago. G. E. Simpson, superintendent of transportation, has been appointed general supervisor of transportation, and G. L. Whipple, heretofore assistant superintendent of transportation, has been appointed superintendent of transportation, both with offices at Chicago, effective February 1.

C. G. Bowker, whose appointment as general superintendent of the Eastern lines of the Grand Trunk, with headquarters at Montreal, Que., has been announced in these columns, was born on April 21, 1871, at Medford, N. J., and was educated in the public schools of Philadelphia, Pa. He began railway work in May, 1888, with the Philadelphia & Reading as a telegraph operator and was subsequently agent and division operator on that road. From 1892 to 1900 he was first a telegraph operator and then train despatcher on the Lehigh Valley, and since that time has

held the positions of train despatcher, chief despatcher, trainmaster, assistant superintendent and superintendent on the Grand Trunk.

Frank E. Clarity, whose appointment as superintendent of transportation of the Denver & Rio Grande, has already been announced in these columns, was born September 10, 1877, at Sauk Centre, Minn. He was educated in the common schools of Minnesota and began railway work in September, 1894, as a car checker for the Great Northern at Superior, Wis. He remained with that road for eight years, filling various positions in the local freight office including that of local car accountant. He was then for two years car distributer for the Lake district and from November, 1904, to August, 1907, was assistant chief clerk and chief clerk to the general superintendent of transportation with headquarters at St. Paul, Minn. He was made traveling car agent on the latter date and in April, 1911, became chief clerk to the general superintendent of the Western district, with office at Seattle, Wash. He went to the Denver & Rio Grande in March, 1912, as inspector of transportation, which position he held until January 1 this year, when he was promoted to superintendent of transportation, with headquarters at Denver, Colo.

F. E. Clarity.

T. Cushing has been appointed trainmaster of the Third district of the Grand Trunk, with headquarters at Richmond, Que., succeeding R. P. Smallhorn, assigned to other duties; S. L. Trusler, passenger trainmaster at Toronto, has been appointed passenger trainmaster of the Ontario lines, with headquarters at Toronto; W. J. Piggott, trainmaster at Allandale, has been appointed trainmaster of the 11th and 14th districts, including Allandale yard, and W. J. Little, passenger trainmaster at Allandale, has been appointed trainmaster of the 12th district, both with offices at Allandale. The position of passenger trainmaster, Northern division, has been abolished. W. J. Hogan, master of transportation at Durand, Mich., has been appointed trainmaster of the P. O. & N. Railway and district 29 (exclusive of Detroit and Port Huron terminals), with headquarters at Pontiac, and H. W. Matthews, trainmaster at Battle Creek, has been appointed passenger trainmaster of the Western lines, including districts 25, 26, 27, 28, 29 and P. O. & N. Railway, with headquarters at Durand.

Benjamin McKeen, who recently became general manager of the Pennsylvania Lines West of Pittsburgh, with office at Pittsburgh, Pa., was born at Terre Haute, Ind., on January 23, 1864. He attended Worcester Polytechnic at Worcester, Mass., during 1881 and 1882, and was graduated from Rose Polytechnic Institute in 1885 as a mechanical engineer. He began railway work in September, 1885, as a draftsman in the office of superintendent of motive power and machinery of the Terre Haute & Indianapolis, now a part of the Vandalia Railroad, at Terre Haute. He held various minor positions in the motive power and engineering departments until January 1, 1887, when he was appointed engineer maintenance of way of the Terre Haute & Logansport, now also a part of the Vandalia Railroad. On August 1, 1892, he was transferred to the Peoria division in a similar capacity, and was promoted to superintendent of that division January 5, 1894. He was made superintendent of the main line division in June, 1901, and on April 1, 1902, became superintendent of the Chicago Terminal division of the Pennsylvania Lines West of Pittsburgh, with office at Chicago. In December of the following year he returned to the Vandalia as general manager, with headquarters at St. Louis, Mo., which position he held until his recent appointment as general manager of the Pennsylvania Lines West, as above noted.

H. F. Coyle, assistant superintendent of the Grand Trunk, Eastern lines at Bellevue, Ont., has been appointed superintendent of the Belleville division (districts 5, 6, 7, 8, 9 and 10) with headquarters at Belleville; J. J. Connolly, assistant superintendent at Montreal, Que., has been appointed superintendent of the Montreal division (districts 1, 2, 3 and 4) with headquarters at Montreal; R. W. Scott has been appointed superintendent of Montreal terminals, with headquarters at Montreal; L. Harold, assistant trainmaster at Hamilton, Ont., has been appointed superintendent of transportation of the Eastern lines, with headquarters at Montreal; C. S. Cunningham, superintendent Western lines at Detroit, Mich., having resigned, J. Caldwell has been appointed superintendent of the Detroit division; including Durand terminals, districts 27, 28, 29 and P., O. & N. Railway, with headquarters at Detroit; J. Ehrke, assistant superintendent at Battle Creek, has been appointed superintendent of the Chicago division, including districts 25 and 26, with headquarters at Battle Creek; O. F. Clark, trainmaster at Pontiac, has been appointed superintendent of transportation of Western lines, including districts 25, 26, 27, 28, 29 and P., O. & N. Railway, with direct supervision over all matters pertaining to transportation, and the office of master of transportation has been abolished.

E. W. Batchelder, whose appointment as assistant general manager of the Erie lines west of Buffalo, N. Y., and Salamanca, with headquarters at Cleveland, Ohio, has been announced in these columns, began railway work in 1870 as a telegraph operator on the La Crosse division of the Chicago, Milwaukee & St. Paul and from 1873 to 1879 was chief train despatcher of the Chicago division of the same road. He went to the Wabash in 1880 as train despatcher at Springfield, Ill., and later in the same year returned to the service of the Chicago, Milwaukee & St. Paul as chief despatcher and was then assistant superintendent on the River division. He left that company in 1889 to become chief clerk to the general superintendent of the Great Northern at St. Paul, Minn., and was later appointed assistant superintendent of the Fergus Falls division at St. Cloud, and then until 1895, was superintendent of the Montana division at Havre, Mont. He was out of railway work from 1895 until he went to the Erie, in June, 1903. The following December he was appointed superintendent of the Meadville division, and in November, 1912, was made assistant general superintendent at Marion, Ohio, which position he held at the time of his recent appointment as assistant general manager of the same road as above noted.

E. W. Batchelder.

Traffic Officers.

T. M. True has been appointed general freight and passenger agent of the Apalachicola Northern, with office at Port St. Joe, Fla., succeeding J. H. Hodges, resigned.

J. I. Campbell has been appointed commercial agent of the Chicago, Milwaukee & St. Paul, with office at St. Louis, Mo., succeeding H. G. Selby, resigned to accept service with another company.

C. N. McNulty, who recently resigned as soliciting freight agent of the Georgia, Southern & Florida, has been appointed freight soliciting agent of the Southern, with office at New York.

T. L. Jennings has been appointed commercial agent of the Chesapeake & Ohio and the Chesapeake & Ohio of Indiana, with office at Birmingham, Ala., succeeding F. W. Miller, commercial agent at Atlanta, Ga., resigned.

J. P. Rochelle has been appointed traveling freight agent of the Missouri, Oklahoma & Gulf, with headquarters at Dallas, Tex., in place of F. S. Sleight, who has been transferred to Houston, Tex., as commercial agent.

I. W. Dudley has been appointed commercial agent of the Toledo, St. Louis & Western, with headquarters at Seattle, Wash. J. H. Hogg has been appointed live stock agent, with headquarters at East St. Louis, Ill., in place of E. McGraw, resigned.

R. M. Case, chief clerk in the passenger department of the Lake Shore & Michigan Southern, has been appointed assistant general passenger agent of the Lake Shore & Michigan Southern and the Dunkirk, Allegheny Valley & Pittsburgh, with headquarters at Cleveland, Ohio.

The headquarters of A. N. Brown, general traffic manager of the El Paso & Southwestern System and the Morenci Southern Railway, have been transferred from Chicago to El Paso, Tex. The Chicago office will be continued with G. W. Feakins in charge as assistant to general traffic manager.

R. M. Brander has been appointed division freight agent of the Virginia general division of the Chesapeake & Ohio, with office at Richmond, Va., succeeding A. S. Cary, resigned, and C. C. Dearhart, Jr., has been appointed traveling freight agent of the Virginia general division, reporting to Mr. Brander.

George W. Vaux, Canadian passenger agent of the Union Pacific at Toronto, Ont., and formerly general passenger agent of the Grand Trunk, has been appointed general agent of the passenger department of the former road, with headquarters at Chicago. L. F. Barron, local freight agent of the Illinois Central, has been appointed general agent of the freight department of the Union Pacific, with office at Chicago.

In consequence of the recent order of the Supreme Court the Southern Pacific announces that effective February 1 all joint agencies in connection with the Union Pacific will be abolished. The following will represent the Southern Pacific exclusively: R. S. Stubbs, general eastern freight agent, New York; L. H. Nutting, general eastern passenger agent, New York; J. H. Glynn, New England agent; W. B. Johnson, district freight and passenger agent, Baltimore, Md.; F. T. Brooks, district freight and passenger agent, Buffalo, N. Y.; R. J. Smith, district freight and passenger agent, Philadelphia, Pa.; G. G. Herring, general agent, Pittsburgh, Pa.; O. P. Bartlett, general agent, Atlanta, Ga., and Birmingham, Ala.; C. M. Evans, general agent, Cincinnati, Ohio; George B. Hild, general agent, St. Louis, Mo.; E. A. Macon, general agent, Detroit, Mich.; A. G. Little, general agent, Kansas City, Mo.; William K. McAllister, general agent, Denver, Colo.; W. G. Neimyer, general agent, Chicago. On the Pacific coast and in Salt Lake City, Utah, there will be no changes in the representatives.

Engineering and Rolling Stock Officers.

C. T. McElvany has resigned as master mechanic of the Missouri, Kansas & Texas of Texas, at Dennison, Tex.

N. L. Smithan has been appointed assistant superintendent of motive power of the Missouri, Kansas & Texas of Texas, with office at Dennison, Tex.

R. Q. Prendergast has been appointed master mechanic of the Cincinnati, Hamilton & Dayton, with headquarters at Indianapolis, Ind., succeeding W. G. Rose, resigned.

H. E. Holt, division engineer of the Chicago, Milwaukee & St. Paul, at Spokane, Wash., has been appointed assistant chief engineer, with headquarters at Chicago, succeeding W. H. Penfield.

H. D. Jackson has been appointed general master mechanic of the Alabama, Tennessee & Northern and the Tombigbee Valley, with headquarters at Panola, Ala. He is also in charge of the shop at Calvert, Ala.

F. L. C. Bond, resident engineer of the Grand Trunk, at Montreal, Que., has been appointed division engineer of the Eastern lines, with headquarters at Montreal; G. Beckingham, general roadmaster at Montreal, has been appointed superintendent of track, with headquarters at Montreal; J. H. Johnston, resident engineer at Montreal, has been appointed superintendent of bridges and buildings, with headquarters at Montreal; C. S. Ogilvie has been appointed assistant engineer of the Belleville division, with headquarters at Belleville, Ont.; H. Ferguson, general roadmaster at Toronto, has been appointed superintendent of track, Ontario lines; G. A. Mitchell, resident engineer at Toronto, has been appointed superintendent of bridges and buildings, and E. G. Hewson, resident engineer at Toronto, has been appointed division engineer, all with headquarters at Toronto, Ont. The offices of general roadmaster, master of bridges and buildings and resident engineer have been abolished.

M. A. Long, architect of the Baltimore & Ohio, at Baltimore, Md., has been appointed assistant to chief engineer of the Baltimore & Ohio-Cincinnati, Hamilton & Dayton System, with headquarters at Baltimore. Mr. Long was born on October 25, 1875, near Middletown, Ohio, and received his education in the public schools at Dayton, Ohio, and at Middletown, later taking a course in architecture and railroad engineering at the Scranton Schools. He entered the service of the Baltimore & Ohio on June 5, 1899, as architect and assistant on engineering corps, and was promoted to architect on that road in 1904, which position he held at the time of his present appointment as assistant to chief engineer, as above noted. He is a member of the American Society of Civil Engineers, the American Institute of Architecture, and is vice-chairman of the building committee of the American Railway Engineering Association.

M. A. Long.

Purchasing Officers.

H. W. Morris has been appointed purchasing agent of the Wabash Pittsburgh Terminal and the West Side Belt Railroad Company, with headquarters at Rook, Pa.

The office of purchasing agent of the Texas & Pacific, heretofore held by C. Ludolph, has been abolished, and hereafter matters pertaining to the purchasing department will be handled through Vice-President Freeman's office at New Orleans, La.

F. W. Mahl, assistant to director of maintenance and operation of the Southern Pacific, has been appointed director of purchases, succeeding W. V. S. Thorne, resigned. Effective January 31, Mr. Mahl has been appointed to the same position also on the Southern Pacific of Mexico.

OBITUARY.

William R. Jones, formerly assistant superintendent of the Utica & Black River, now a part of the New York Central & Hudson River, died at Carthage, N. Y., on February 4, at the age of 69.

J. T. Mason Barnes, who died on January 28, at his home in Baltimore, Md., was secretary and treasurer of the Western Maryland from 1896 to 1902, and then was assistant secretary and treasurer. On October 16, 1912, he was retired on an annuity.

E. H. B. Cull, division freight agent of the Wabash, with headquarters at Detroit, Mich., died in that city on January 31, aged 49 years. Mr. Cull had been connected with the Wabash at Detroit for 30 years, having been made division freight agent five years ago.

Stephen S. Palmer, president of the St. Louis & Hannibal, the Green Bay & Western, the Ahnapee & Western, the Kewaunee, Green Bay & Western and the Iola & Northern railways, also a director in various banking, gas, electric, insurance and manufacturing companies, with headquarters at New York, died on January 28, at Redlands, Cal., at the age of 60.

Equipment and Supplies.

LOCOMOTIVE BUILDING.

The Pennsylvania Railroad has ordered 80 freight locomotives from the company's shops.

The Norfolk & Western has ordered 40 Mallet locomotives from the American Locomotive Company. These locomotives will be equipped with superheaters, will have 22 in. & 35 in. by 32 in. cylinders, 56 in. driving wheels and in working order will weigh 405,000 lbs.

The San Antonio, Uvalde & Gulf has ordered one consolidation locomotive from the American Locomotive Company. The dimension of the cylinders will be 20 in. by 24 in.; the diameter of the driving wheels will be 54 in., and the total weight in working order will be 144,000 lbs.

CAR BUILDING.

The Baltimore & Ohio has ordered 8 postal cars from the Pullman Company.

The Donora Southern has ordered 50 coal cars from the Standard Steel Car Company.

The Arms Palace Horse Car Company will build 12 cars in its own shops, the underframes and trucks to be furnished by the Bettendorf Axle Company.

The National Railways of Central America, owned by the United Fruit Company, New York, have ordered 20 freight cars from the Ralston Steel Car Company.

The Newburgh & South Shore has ordered 125 self-clearing ore cars from the Pressed Steel Car Company, and 50 general service cars from the Ralston Steel Car Company.

The Norfolk & Western has ordered 1,000 gondola cars and 250 hopper cars from the American Car & Foundry Company, and 1,000 box cars from the Pressed Steel Car Company.

The Louisville & Nashville, mentioned in the *Railway Age Gazette* of January 31, as being in the market for 500 gondola cars, has ordered that equipment from the Mt. Vernon Car & Manufacturing Company.

The Chicago, Rock Island & Pacific has ordered twenty 70-ft. coaches, eighteen 70-ft. chair cars, seven 60-ft. smoking cars, five 60-ft. three-compartment cars, and ten 60-ft. baggage cars from the Pullman Company; all of all-steel construction.

The Duluth & Iron Range, mentioned in the *Railway Age Gazette* of January 24, as having ordered 800 ore cars from the Standard Steel Car Company, ordered those cars from the Summers Steel Car Company. They will be built by the Standard Steel Car Company.

IRON AND STEEL.

The Western Maryland has ordered 8,400 tons of rails from the Carnegie Steel Company.

The Great Northern has ordered 20,000 tons of rails, divided equally between the Cambria Steel Company, the Bethlehem Steel Company, the Pennsylvania Steel Company, and the Lackawanna Steel Company.

SIGNALING.

The Railroad Commission of Indiana has ordered the Pere Marquette to install automatic block signals between Porter and the Michigan state line, 22 miles, by October 1, next. The same body has ordered the Pittsburgh, Cincinnati, Chicago & St. Louis to install automatic block signals between Richmond and Indianapolis, on 37 miles, and to take similar action in the case of all sections of the line where a single track is converted into double track.

Supply Trade News.

The Paxton-Mitchell Company has received orders for its metallic packing for the piston rods and valve stems on the 246 locomotives recently ordered by the Harriman Lines.

M. J. Madison, formerly assistant superintendent of the Morden Frog & Crossing Company, at Chicago, has been appointed superintendent of the plant of The Weir Frog Company at Cincinnati, Ohio.

The Milwaukee and West Allis properties of the Allis-Chalmers Company were sold by Commissioner Hazelton on February 3, to J. H. McClement of New York, chairman of the reorganization committee, for $2,250,000.

The Orenstein-Arthur Koppel Company, Pittsburgh, Pa., will move its general offices to Koppel, Pa., where its plant is now located. A two-story office building, 100 ft. x 160 ft., is now under construction at Koppel.

Frank N. Grigg, eastern representative of the Adams & Westlake Company, Chicago, for the past ten years, has resigned to become district manager of the Standard Heat & Ventilation Company, Inc., New York, with office at Washington, D. C.

Jordan D. Williams, Indianapolis, Ind., manufacturer and contractor for mastic rock asphalt floors, has received a contract from the Cleveland, Cincinnati, Chicago & St. Louis for about 30,000 sq. ft. of 1½ in. mastic rock floor for a freight house driveway.

S. P. McGough has been appointed general manager of the North American Railway Construction Company, engineers and contractors, with offices at Monadnock block, Chicago. A. S. Littlefield is president of the company; Emmet M. Fry, vice-president, and H. H. McDonald, secretary and treasurer.

A new company, under the name of Littlefield, Fry & McGough, has been incorporated with offices in the Monadnock block, Chicago, to make electric welded joints, as licensees of the Lorain Steel Company. The officers are Emmet M. Fry, president and general manager; S. P. McGough, vice-president, and Arthur S. Littlefield, secretary and treasurer.

M. E. Keig, who has been connected with the Atchison, Topeka & Santa Fe for several years, for the last five years in the purchasing department at Chicago, has accepted a position as secretary-treasurer of Harry Vissering & Co., with offices in the Great Northern building Chicago. Mr. Keig will also represent the Charles R. Long, Jr., Co., of Louisville, Ky.

The Isthmian Canal Commission will receive bids until April 1, 1913, for the purchase of supplies no longer needed. These supplies include steam shovels and parts; locomotives, dump and flat cars and parts; cranes, spreaders and parts; unloaders and parts; ballast plows; rock drills; concrete mixers and parts; injectors and parts; oil cups, lubricators and lubricator parts, etc Circular No. 758.

W. W. Lavarack has resigned his position as chief engineer of the Federal Signal Company, Albany, N. Y., to become general manager of the American Railway Signal Company, Cleveland, Ohio. Mr. Lavarack, after a number of years experience in the signal field with railroads and manufacturers in England, came to the United States in 1896 and entered the service of the Standard Railroad Signal Company, since which time he has been connected with the Pneumatic Signal Company and the Federal Signal Company, as mentioned above.

O. C. Mann, manager of the Mann-McCann Company, Chicago, writes to the *Railway Age Gazette* as follows:

"I note that the Isthmian Canal Commission is beginning to offer for sale the 21 Mann-McCann and Mann earth spreaders that we built for them and a lot of extras for the same. I think that it is no more than right that the bidders on this equipment should fully understand that these machines were built special, and that their extreme clearance will not allow them to be shipped or used on any railroad on this continent, and that the extras were designed for these particular machines and cannot be used on any other spreader."

The sales of the Western Electric Company, Chicago, during the year 1912 will be between 71 and 72 millions, which is slightly

more than in 1906, the previous largest year in the company's business. The increase has been in American sales outside of the Bell system, which have increased about 100 per cent. over 1906, and in European sales, which were the largest in the company's history. The results have been accomplished in the face of increased and increasing competition. The company is now selling to upwards of 30,000 customers in the United States alone. It is expected that the profits will be satisfactory considering the wider distribution and increased competition. The board of directors has established two additional vice-presidents in the company's organization, and has appointed to these newly-created positions Gerard Swope, general sales manager, and A. L. Salt, general purchasing agent.

John Hoffhine, for nine years assistant chemist of the Union Pacific at Omaha, has accepted an appointment with the American Brake Shoe & Foundry Company, with headquarters at 30 Church street, New York, effective on February 1. Mr. Hoffhine was born in Ohio 31 years ago. Immediately upon graduation from the Ohio State University in 1904 he entered the testing department of the Union Pacific at Omaha, where he soon advanced to the position of assistant chemist, with complete charge of the chemical and physical testing laboratories. He conducted exhaustive tests and analyses of the steel rails of the associated lines, and under the direction of W. R. McKeen, Jr., former superintendent of motive power and machinery, Mr. Hoffhine had charge of the material testing and research work in connection with the Harriman Lines standardization of passenger cars, freight cars and locomotives.

The Burden Sales Company, with general offices at 30 Church street, New York, and branch offices in Chicago, Atlanta, Ga., and St. Paul, Minn., has been organized by Gilbert H. Pearsall, president; H. H. Linton, vice-president; and Craig Graves, secretary and treasurer, to handle with the exception of horseshoes all the products of the Burden Iron Company, of Troy, N. Y., including Burden staybolt iron, Burden engine bolt iron, Burden rivets, etc. In connection with the general offices of the Burden Sales Company will be the eastern sales office of the Jacobs-Shupert United States Firebox Company, Coatesville, Pa., and the Oxweld Railroad Service Company, Chicago. Mr. Pearsall is also vice-president of the two latter companies, as was mentioned in the *Railway Age Gazette* of July 5, 1912, page 35, and August 30, 1912, page 407, respectively. He has recently resigned his position as secretary and manager of sales for Joseph T. Ryerson & Son, Chicago, with office in New York, as mentioned in last week's issue.

Samuel Thomas Park, heretofore superintendent of motive power of the Chicago & Eastern Illinois, at Danville, Ill., has been elected president of the Monarch Pneumatic Tool Company, with headquarters at St. Louis, Mo., succeeding William Miller, who has been made vice-president of the Pyle-National Electric Headlight Company, as previously noted in these columns. Mr Park was born March 31, 1868, and was educated at Elizabethtown College, Elizabethtown, Ky. He entered railway service in 1883, as clerk to the master mechanic of the Louisville & Nashville at East Nashville, Tenn., and laid the foundation of his career in the mechanical department of that road. From 1893 to 1900 he was a division foreman on the Louisville, New Albany & Chicago, and its successor, the Chicago, Indianapolis & Louisville, and was then for two years division master mechanic of the Santa Fe Pacific at Winslow, Ariz.; for one year division master mechanic of the Southern California at San Bernardino, Cal., and for two years master mechanic on the Illinois Central and Chicago & Eastern Illinois roads at Centralia and at Danville, Ill. On March 10, 1905, he was appointed acting superintendent of motive power of the latter road, and on June 8, 1905, was appointed superintendent of motive power, which position he held until he resigned, effective February 1, to become connected with the Monarch Pneumatic Tool Company

District Judge Hazel, in the United States district court, for the Southern district of New York, on January 27, handed down a decision in favor of the Union Tank Line in the litigation against the American Car & Foundry Company under the "Center Anchor" patent taken out by John W. Van Dyke. In accordance with this invention the middle of the tank of a tank car is secured to the underframe by rivets and the ends are held down between laterally retaining devices by means which allow the tank to expand longitudinally. The decision was in part as follows: "A reasonable construction of the claims will not permit restricting them merely to a tank body or plates riveted permanently to the underframe. . . . It is a fundamental rule that to constitute infringement it is unnecessary to use the entire device, and that if parts thereof are used in substantially the same way and in a similar contrivance it is infringement." The judge then found that the defendant had appropriated Van Dyke's method of center anchoring by riveting the casing to the shell, and though the method used differed slightly from that of the complainant, such difference was negligible, as the same result was achieved. It was also shown that the defendant's car is allowed free longitudinal expansion, thereby obtaining the precise results described in the claims in controversy. The judge decided that all the claims of the complainant were valid and were infringed by the defendant.

TRADE PUBLICATIONS.

Chicago & North Western.—The passenger department has issued an attractive booklet devoted to the outdoor winter sports at Lake Geneva, Wis.

Pneumatic Tools.—The Chicago Pneumatic Tool Company has issued bulletin No. 124, describing its pneumatic riveting, chipping, calking and stone hammers.

Electric Lighting.—The General Electric Company, Schenectady, N. Y., has issued an attractive illustrated booklet on G. E. Edison "Mazda" lamps for standard lighting service.

Pneumatic Hammers.—The Chicago Pneumatic Tool Company, Chicago, has devoted bulletin No. 124 to its pneumatic riveting, clipping, calking and stone hammers. In addition to descriptions this bulletin includes illustrations, diagrams and complete dimension tables.

Titanium Alloy.—The Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has published in a small folder specifications to govern the addition of Ferro Carbon-Titanium in the manufacture of both open hearth and Bessemer rails.

Boilers.—The Wm. H. Wood Locomotive Firebox & Tube Plate Company, Media, Pa., has published in a small pamphlet a very favorable report by John W. Harkom, a competent mechanical engineer, on three Wood boilers which had been in service for three years. The pamphlet includes also a study by the same author of the results of tests of Wood boilers by the New York Central & Hudson River.

Denver & Rio Grande.—A comprehensive review of the agricultural, mining, industrial and commercial conditions of Colorado, Utah and New Mexico, is contained in the annual review number of the Railroad Red Book just issued by the passenger department. The book contains a large number of contributed articles on the progress made during 1912 in irrigation, agriculture, mining and manufacture.

Wood Preserving.—The Barry Hardwood Creosoting Company, Kansas City, Mo., has issued an illustrated booklet containing a prospectus of the Barry hardwood creosoting process, which it is claimed will successfully treat hardwood with a preservative that will penetrate the center of the timber within eight or nine hours time. The appliance, while designed particularly for treating hardwood, can be converted by turning a valve for use with a softwood process.

Railway Service in the Balkan War.—According to a recent report from Beirut, the railway systems of the Hedsha Railway and of the French Company have been of the greatest possible assistance to the Turks in their military operations. But for these railways the Turkish authorities could not have got their troops together in so short a time and transported the reserves to the front. The military importance of the Baghdad and Anatolian railways has also been established for the first time. The latter railway was at once placed at the disposal of the military authorities, all passenger and freight traffic being stopped two days. On the other railways the ordinary traffic was not disturbed to any great extent.

Railway Construction.

Boston & Maine.—The Hampden Railroad, 15 miles long, between Springfield, Mass., and Bondville, which is to make a connection for the Boston & Maine by which it will have a route from Boston to Springfield parallel to the Boston & Albany and about the same length as the B. & A., is to be finished, according to announcements of the company, by the first of May. The Boston & Maine is to put in stronger bridges in place of those on the Central Massachusetts division so as to permit the running of heavier locomotives through from Boston to Springfield.

Canada & Gulf Terminal.—An officer writes, regarding the report that work is now under way on the extension from Matane, Que., east to Gaspe Basin, about 160 miles, that the surveys are all completed. It has not yet been decided when the work will be carried out. (April 19, p. 940.)

Canadian Pacific.—Sir Thomas G. Shaughnessy, president of this company, is quoted as saying that the new work on the western division for the present year includes the finishing up of some 300 miles of new line and building 500 miles additional. The plans include also the building of a tunnel five miles long in the Selkirk mountains.

El Paso & Southwestern.—An officer writes that there is no truth in the report that an extension is to be built south of Nacozari, Mexico, on the Nacozari Railroad. Surveys are only being made for the elimination of a few sharp curves on the present line.

Hampden Railroad.—See Boston & Maine.

Kentucky Southwestern Electric Railway Light & Power Company.—An officer writes that the company expects to begin work on a section of this line early this spring. The plans call for building from Henderson, Ky., southwest via Paducah, Mayfield and Murray to Hickman, in all about 210 miles. The work on the first section of 57 miles will be easy, and includes about 889,140 cu. yds. excavation work, and 135,550 cu. yds. of embankment The maximum grades will not exceed 1 per cent., and the maximum curvature 8 deg. There will be one steel bridge 600 ft. long, a 4,662-ft. trestle, also 11 small stations and 3 sub-stations. H. C. Rhodes, president, and W. A. Calhoun, chief engineer, Paducah. (January 31, p. 230.)

Mobile & Eastern Shore.—Under this name a company is being organized in Alabama, to build from Montrose Park, Ala., south to a point below Point Clear, about 20 miles. J. K. Glennon & Company, Mobile may be addressed.

Monongahela Valley Traction.—An officer writes regarding the building of extensions to Salem, W. Va., to Lumberport and to Annabell, that surveys have been made for the first two lines and that they will be built, if the company is able to secure the right of way. Bids for grading will probably be asked for about April 1. The lines are to be laid with 80-lb. rails and bracket overhead construction will be used. J. O. Watson, general manager, Fairmont, W. Va.

Northern Pacific.—According to press reports work has been started on an extension of the Clark's Fork branch from Bridger, Mont., south to Chance, about 20 miles.

Orange & Northeastern.—According to press reports a contract has been given M. Tansey for grading work on a section from Vinton, La., north. The company was organized last year in Texas, with headquarters at Orange, to build from White City, San Augustine county, Tex., east to a point on the Sabine river; also to build a 14-mile line from Orange, Tex., to Nibletts Bluff, La., in all 126 miles. E. Kennedy, president; H. White, assistant general manager, Orange. (September 6, p. 453.)

Pennsylvania Railroad.—An officer writes that contracts have been let for piercing the three tunnels on the Allegheny division as follows: For the tunnel at East Brady, Pa., to be 2,660 ft. long, and for the tunnel at Wood Hill to be 2,870 ft. long, to Arthur McMullen, New York; for the third tunnel at Kennerdell, to be 3,350 ft. long, to the John A. Kelly Company, Philadelphia, Pa. (January 31, p. 331.)

Quanah, Acme & Pacific.—Announcement has been made that this company which is building an extension from Paducah, Texas, west to Roaring Springs in Motley county, about 40 miles, will start work on the extension projected for some time across the Panhandle of Texas and through eastern New Mexico to Roswell, 300 miles, as soon as the line is finished to Roaring Springs. It is said that three routes are under consideration, one via Plainview, another via Lubbock and the third via Tahoka. The Q., A. & P. is being constructed largely by St. Louis capital. Sam Lazarus of St. Louis, Mo., is president and R. D. Yoakum, also of St. Louis, is third vice president of the road. (November 15, p. 973.)

Washington Electric.—According to press reports three important links in a chain of electric railways that will eventually connect Portland, Ore., with the principal cities on Puget Sound will be built this year at a cost of $2,000,000. A $10,000,000 mortgage has been filed in the state of Washington by the company to secure a 25-year 6 per cent bond issue, of which $2,000,000 will be issued for immediate development. The plans call for building lines as follows: From a connection with the line from Vancouver, Wash., at a point near Orchards, Wash., north to the Lewis river, 20 miles; from the present southern terminus of the line from Chehalis, to the Cowlitz river; from the northern terminus of the line from Centralia, to Olympia, 26 miles. In addition a new line is to be built from Vancouver east to Camas, but this will not form a part of the Portland-Tacoma line. When these improvements are completed there will remain a gap of about 50 miles between the Cowlitz and the Lewis rivers. A connecting line over this 50 miles will be built, also a connection between Olympia and Tacoma will be made to complete the through line between Portland and Puget Sound. H. C. Coffman is president, Chehalis, and A. Welch is general manager, Portland. (September 13, p. 491.)

Western Canada.—Incorporation has been asked for in Canada to build from Fort Churchill, on Hudson's Bay, south through Manitoba, south of the Churchill river and north of the Nelson river to a point at or near Sea Falls, on Nelson river, thence north of Lake Winnipeg and thence west via Prince Albert, Sask., to Calgary, Alb., with branch from a point near Manitoba Lake, Sask. Vincent, Seguin & Labelle, Ottawa, are solicitors for the applicants.

RAILWAY STRUCTURES.

Baltimore, Md.—An officer of the Pennsylvania Railroad writes that arrangements have been made to replace the present double track steel truss bridge 513 ft. long, with a four track reinforced concrete arch viaduct of three spans, to have a total length of 606 ft. on the Maryland division of the Philadelphia, Baltimore & Washington over Gwynn's Falls and the Western Maryland Tidewater Railroad in Baltimore. A contract for the work, which will require about 25,000 cu. yds. of concrete and 800,000 lbs. of steel bars for reinforcement, has been given to Charles McDermott, Pennsylvania building, Philadelphia, Pa.

Cleveland, Ohio.—The Baltimore & Ohio has announced plans for expenditures in Cleveland that will cost approximately $1,000,000, including two large freight houses, a large storage building, and additional yard and side track facilities.

Shreveport, La.—The Houston & Shreveport has let a contract for the construction of a new roundhouse to R. B. Shearer, of Lufkin, Tex.

Texas.—The Gulf, Colorado & Santa Fe has announced that $1,500,000 has been appropriated for improvements in Texas during this year as follows: Shops, engine houses and turntables, $260,000; siding and spur tracks, $230,000; water and fuel stations, $160,000; terminal yards, $140,000; station buildings and fixtures, $125,000; track fastenings and appurtenances, $115,000; increased weight of rail, $80,000; right of way and station grounds, $50,000; bridges, trestles and culverts, $50,000; additional main tracks, $40,000; block and other signal apparatus, $38,000; telegraph and telephone lines, $28,000; shop machinery and tools, $26,000; protection of banks and drainage, $25,000; dock and wharf properties, $21,000; fencing right of way, $20,000; ballasting, $20,000; improved frogs and switches, $5,000; interlocking plants, $1,500; miscellaneous additions and betterments, $39,000.

Railway Financial News.

Boston & Lowell.—Merrill, Oldham & Company offered on January 27, $1,000,000 4½ per cent. refunding bonds, due February 1, 1933, at a price yielding about 4.30 per cent.

Bruce Mines & Algoma.—This company will apply at the next session of the Ontario legislature for authority to change its name to the Lake Huron & Northern Ontario, and also to increase the authorized stock from $300,000 to $12,000,000. This road now runs from Bruce Mines, Ont., to Rock Lake Mines, 17 miles.

Chicago & North Western.—This company has called for payment at the Farmers Loan & Trust Company, New York, $107,000 5 and 6 per cent. sinking fund bonds of 1879 at 105 and accrued interest to February 1, 1913.

Chicago, Burlington & Quincy.—This company has called for payment at par and interest at the New England Trust Company, Boston, Mass., $109,200 Denver extension sinking fund 4 per cent. bonds, dated December 1, 1881-February 1, 1922.

Duluth, South Shore & Atlantic.—This company has sold to William A. Read & Co., New York, $310,000 4½ per cent. equipment notes, series 12, dated December 1, 1912, and due $31,000 semi-annually beginning June 1, 1917. These notes represent part cost of 400 ore cars, the total cost of which was $391,750, the balance paid in cash. These notes are guaranteed by the Canadian Pacific.

Green Bay & Western.—The directors have declared a distribution of 1¼ per cent. on the $7,000,000, class B, debentures, comparing with ½ of 1 per cent. paid in February, 1912, and 1911. The arrangement is that after 5 per cent. has been paid on both the stock and the series A debentures, the surplus is to be distributed pro rata to the holders of the B debentures.

Lake Huron & Northern Ontario.—See Bruce Mines & Algoma.

Minneapolis & St. Louis.—F. J. Lisman & Co., New York, are recommending the purchase of the new 6 per cent. secured notes at 98½ and interest, yielding 7½ per cent. These notes are dated February 1, 1913, and due February 1, 1914, but are redeemable at par and interest at 60 days' notice. Of this issue, $3,000,000 are authorized and outstanding.

This company has also sold to bankers $1,000,000 4 per cent. bonds to retire $1,000,000 5 per cent. notes which matured February 1. The bonds sold include a block of the refunding and extension 4 per cent. bonds, of which $75,000,000 were authorized under date of January 1, 1912.

New York, Ontario & Western.—The New York Public Service Commission, Second district, has authorized this company to issue $1,980,000 4 per cent. bonds to be sold at a price to be fixed hereafter. The proceeds are to be used for the payment of bills payable incurred for capital expenses to the amount of $1,571,564. The balance is to be spent on maintenance of way and equipment. This company is also authorized to issue $900,000 4½ per cent. equipment trust certificates, $30,000 of which are to mature semi-annually up to and including March 1, 1928. The proceeds are to be used for the purchase of 500 coal cars, 300 box cars, 100 flat cars, 50 stock cars and 50 refrigerator cars.

Norfolk & Western.—Stockholders of record February 17 will be permitted to subscribe before March 25, at 102½ for about $19,000,000 new 4½ per cent. convertible 25-year debenture bonds, dated September 1, 1913, up to 15 per cent. of their holdings. Subscriptions will be payable either in full on or before March 25, or 52½ per cent. on March 25, and 50 per cent. between September 2 and September 5. The bonds will be convertible any time after September 1, 1913, and before September 1, 1923. They are redeemable at 105 and interest any time after September 1, 1923.

Pittsburgh & Shawmut.—This company has sold to Rhoades & Company, New York, and the Guaranty Trust Company, New York, $200,000 5 per cent. equipment trust notes, dated November 1, 1912, maturing in 20 semi-annual instalments. The proceeds will be used to pay for 250 hopper cars.

Pittsburgh, McKeesport & Westmoreland.—Receiver James B. Secrist will by order of the court of common pleas of Allegheny county, Pa., offer the property at public sale at the court house in Pittsburgh on February 25, upset price $60,000. The purchaser will take the property subject to the lien of the mortgage of the Pittsburgh & Westmoreland Railway to the Union Trust Company of Pittsburgh, dated August 1, 1904, and also that of the Pittsburgh, McKeesport & Westmoreland to the Harrisburg Trust Company assigned to the Columbian Trust Company of New York, dated December 1, 1908, under which there are $437,000 bonds outstanding. The $50,500 receiver's certificates, the interest accrued thereon and the cost and expenses of the receivership will be paid out of the proceeds of the sale.

Quebec Central.—Holders of 7 per cent. income bonds and 3 per cent. second debenture stock are informed that the company has created £338,000 ($1,690,000) second mortgage debenture stock and £338,000 ($1,690,000) sterling 5 per cent. third mortgage bonds. Interest in both cases is payable in London on January 15 and July 15, and the principal is redeemable at the expiration of 50 years, the issues constituting a second or third mortgage respectively on the undertaking next after the 4 per cent. first mortgage debenture stock, secured by the rental payable by the Canadian Pacific, and principal and interest guaranteed by that company. Holders of existing 3 per cent. second debenture stock or 7 per cent. income bonds are required to surrender them on or before February 17 for exchange. The basis of exchange is as follows: The old 4 per cent. debenture stock remains undisturbed, but certificates must be presented for exchange into new certificates setting forth the terms of guarantee of principal and interest by the Canadian Pacific. The old 3 per cent. second debenture stock is replaced dollar for dollar by new 3½ per cent. second mortgage debenture stock, principal and interest guaranteed by the Canadian Pacific. The old 7 per cent. income bonds are replaced dollar for dollar by 5 per cent. third mortgage bonds, the principal and interest guaranteed by the Canadian Pacific; a bonus of 10 per cent. will be paid to holders on making the exchange. The old capital stock is converted into stock transferable in sums of $5 and multiples thereof with a dividend of 4 per cent. a year until July 15, 1916, and 5 per cent. thereafter guaranteed by the Canadian Pacific.

Scott City Northern.—The suit which was brought against this company, as mentioned in the *Railway Age Gazette* of January 24, has been dismissed, and W. H. Wagner, the unfriendly receiver, has been discharged.

Southern Pacific.—William Rockefeller has resigned as director and member of the executive committee of this company.

See item in regard to the Harriman Lines' dissolution plan in General News.

Toronto, Hamilton & Buffalo.—William A. Read & Co., New York, have sold at prices to yield 4¾ per cent. the entire new issue of $1,500,000 4½ per cent. equipment notes, series A, dated February 1, 1913, and maturing in 20 semi-annual payments of $75,000 each, August 1, 1913, to February 1, 1923.

Union Pacific.—See item in regard to the Harriman Lines' dissolution plan in General News.

Wabash Pittsburgh Terminal.—The Guaranty Trust Company, of New York, the Bankers Trust Company and Sutro Brothers & Company, of New York, are placing at par and interest the entire new issue of $973,000 6 per cent. receivers certificates dated February 1, 1913, and due February 1, 1914, but callable at par and interest.

Wabash Railroad.—Judge Sanborn, in the United States District Court at St. Louis, on January 30, on application of Pierce & Greer, of New York, representing the Equitable Trust Company of New York, trustee under the first refunding and extension mortgage, appointed a master to hear evidence and determine methods of foreclosure of the mortgage in the pending proceedings preparatory to the order of the sale thereunder.

The receivers on January 30 applied to the court in St. Louis for permission to extend for 6 months the company's obligation in respect to the Wheeling & Lake Erie defaulted notes due February 1, amounting on June 30, 1912, to $9,807,958.

*Illustrated.

MR. HUMPHREY, in a letter on another page commenting on an editorial concerning the relation of the railway supply man and the superintendent of motive power, which was published in our issue of November 1, 1912, brings out clearly and forcibly the important part which the representatives of the supply interests are playing in the development of railway equipment. No one can deny this, and the railway officer who does not realize and feel grateful for such assistance would be hard to find. It was not our intention to detract from the credit which is due to the supply man, but rather to direct attention to the necessity of conserving the time of the head of the motive power department to as great an extent as possible. The railways have been severely criticized in many cases for not giving the motive power superintendent as much authority and responsibility as it is felt that he should have in order to secure the best results. Has this not been due in many cases to the fact that he has allowed himself to be swamped with details and has not had the proper perspective which is so essential for an executive officer, particularly when the men and equipment under his direction are scattered over hundreds of miles of road, sometimes in several different states? To get this broad perspective he must have capable subordinates to whom the various details can be referred and on whose advice he will have to depend almost entirely in many instances. His most important function will be in selecting and developing these assistants. A time study of an average day for an average mechanical superintendent would develop some startling facts as to the amount of time which must be devoted to matters which in many cases could be investigated and followed up just as effectively by properly trained subordinates. It was not intended to suggest that the friendly relations and the spirit of co-operation which have existed between the supply men and the railway officers be cut off or weakened, but rather that the supply men be as considerate as possible of the time of the mechanical superintendents, and that the latter improve their organizations so that as many of the details of their work and as much responsibility as possible be shifted on subordinates.

ONE way the railways save money wastefully is by not spending enough for supervision. More detailed supervision of all phases of operation is needed on most roads to increase efficiency, both by improving service and reducing its cost. For example, in no other way can the accident record be so effectually dealt with. Supervision, as we conceive it, consists in constant efforts by competent officers to familiarize employees with the right ways to do things and constant checking to see that employees are doing things right. The root of most of the evil in the service of American railways is the failure of the managements to provide for the proper education and drilling of employees. Numerous investigations of accidents due to man failures disclose that the employees causing them have not been properly examined or instructed regarding the rules either when taken into the service or later. Accidents resulting from this are not the fault of the employees, but of the management. It is useless to say in reply that employees should familiarize themselves with the rules voluntarily. Supervision is the very essence of the function of management. Instruction, training, drilling must be precedent to knowledge and obedience on the part of employees; and the management that does not do them the best that is possible is deficient, in proportion as it falls short of this idea. It is very illogical for a railway management to blame or punish any shortcoming of any employee until it has first shown that the employee was selected with reasonable care, and has been instructed and drilled zealously and skilfully in the performance of the very duties which in the particular instance he has failed properly to perform. Deficiencies in supervision are not surprising when one notes the comparatively small number of men employed with official rank and authority. The total operating expenses of the railways of the United States in the fiscal year 1910, the last year for which there are complete statistics of the Interstate Commerce Commission, were $1,822,630,433. Of this $1,143,725,306 was paid out in wages and salaries. Of this latter sum only $37,448,770 was for official salaries and the total number of "General" and "other officers" was 14,868. In other words, only this many men were employed and only this sum spent to supervise the operation of 241,000 miles of railway, the work of 1,684,552 employees, and the expenditure of $1,822,000,000. Of course, this statement is only approximately accurate. There is supervision of employees by other employees—of trainmen by conductors, of track laborers by section foremen, etc. But it is roughly accurate to call the compensation of officers the wages of supervision. Could not the number of men of official rank and the amount paid to them in salaries be largely in-

creased with resulting benefits? Would not the results of the increased supervision much more than offset the increase in the total amount of official salaries?

THE CRISIS IN THE FIREMEN'S WAGE CONTROVERSY.

THE need for a better federal law for the arbitration of labor disputes on railways could not be more strikingly and conclusively demonstrated than it is by the crisis that has been reached in the controversy between the eastern railways and their firemen. Each side offers to arbitrate. Each refuses to arbitrate the way the other proposes. The firemen have taken a strike vote; and a strike may result. The interests of the public demand legislation forbidding a strike before arbitration, and prescribing a better means of arbitration than that now provided by the Erdman Act.

On the merits of the controversy the railways are clearly right. The firemen demand arbitration under the Erdman Act. The arbitration board would then be composed of one representative of the roads, one representative of labor and an umpire chosen by them or by Presiding Judge Knapp of the Commerce Court, and Commissioner of Labor Neill. The result would be determined entirely by the one man who was umpire. The issues involved are too important to be settled by any one man. Any man chosen would almost certainly have a slight bias one way or another and would decide largely according to his special bias. There ought to be at least three umpires, so that the disinterested members of the board would have a chance to confer and so that the slight bias of one in one way might be corrected by the slight bias of another in another way, and that varying talents, knowledge and experience might be brought to bear.

As an alternative to arbitration under the Erdman Act the roads have offered to make a settlement on the same basis on which the enginemen's controversy was settled. This would involve an increase in wages of about 5 per cent., and aggregating about $2,000,000 a year. The employees demand increases of 35 per cent., and aggregating $9,600,000 a year. If there is to be arbitration the railways favor a board similar to that which arbitrated the enginemen's controversy and which was composed of one representative of the railways, one representative of labor and five men chosen by the Chief Justice of the United States, the Presiding Judge of the Commerce Court and the Commissioner of Labor. Five umpires are still better than three.

The rights of the public are paramount, and that they would be better protected by an arbitration board such as that which settled the enginemen's controversy than by arbitration under the Erdman Act, seems self-evident. As the enginemen's board of arbitration said: "The fundamental defect of the Erdman Act is that the interests of the public are not guarded by it. Manifestly it is advantageous to both employers and employees to have the railroads get a sufficient income so that they will be able to meet the requests of the employees for increased compensation. Advances in rates cannot be made without the consent of the proper commissions. The railroads are not only subject to the commissions in rates, but are subject to them in regard to maintaining adequate service. The employees of the railroads are not subject to control through commissions."

Mr. Carter, the head of the firemen's brotherhood, has twitted the railway managers about the solicitude displayed by them for the interests of the public. It is significant that all of the expressions of solicitude for the interests of the public have come from the railway managers. Not one word has been uttered by Mr. Carter or any other representative of the firemen to indicate that they care a rap for the public. On the contrary, at one of the conferences between the firemen's committee and the managers, Mr. Carter said, "I speak the truth when I say that railroad employees are anxious that our little private troubles should not result in injury to both of us. This public that you are talking about sometimes had best not know our troubles." This statement is on a par with the announcement made by Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, when the enginemen's controversy was pending, that it was time the public should be taught a lesson.

When men are so anxious to avoid publicity regarding matters in which the public is vitally concerned they are evidently trying to conceal something that the public ought to know. The attitude assumed by the employees in this controversy, and the publicity that the railway managers have given to the facts regarding it, have been hardly second, as influences for educating public opinion regarding the railway labor situation, to the report made by the enginemen's arbitration board.

In the meantime, it is to be hoped that some means will be found of averting a strike. A strike would be a public calamity, and if it lasted long it very likely would be the last serious strike among railway train employees in the United States. This public from which Mr. Carter wants railways and their employees to keep the facts about their little private affairs would take hold of the situation in a way that would teach a lasting lesson to both sides. Mr. Carter talks about the constitutional liberty of railway employees. If any class in this country has a constitutional liberty to injure the public and abuses it, that liberty will soon be curtailed. Constitutions exist to protect the rights of the public, not to protect special classes in the right to injure the public.

HEAD-ON COLLISION BETWEEN MUCKRAKERS.

PEARSON'S is a magazine consecrated to the gentle art of muckraking. In its issue for February it prints two articles in which railway transportation in the United States is discussed. One is entitled "Revolution," and is by our old friend, the president of the Ananias Club, Charles Edward Russell. Mr. Russell discusses railway accidents. The other article is entitled "Our Imitation Parcels Post," and is by Ellis O. Jones. His special grievance is that the parcel post law provides for a zone system of rates instead of for a flat rate. The reader who wishes to learn just how good and how bad our railways are is commended to these two articles. We publish below in parallel columns some of the useful information that they give. The italics are ours:

MR. RUSSELL ON RAILWAY EFFICIENCY.	MR. JONES ON RAILWAY EFFICIENCY.
What is the trouble with the railroad system? Why, after about sixty years of scientific looting *it has broken down*; that is all. Why do we have all these frightful accidents on our railways? Same reason; that is all. *The old machine is physically unable to do the work.*	While transportation facilities in the meantime have everywhere become more and more highly developed and simplified; *while with improved methods and improved equipments and improved roadbeds*, the cost of carrying goods and people has decreased; while every indication and every consideration of public expediency has favored a lowering of our parcels post rate and an increase of our weight limit; nevertheless the interests have kept us from moving either hand or foot until this moment.

The foregoing illustrates the regard for facts shown by our muckraking friends. When they are discussing rates the economy and efficiency of our railways has so increased that they could operate for rates half as high as they get now. When they are discussing operation the efficiency with which it is conducted has degenerated until every person who gets on a train takes his life in his hands.

Mr. Russell shows great concern lest people think he is not telling the truth. He says that when statements such as his are made the "pen valets" of the railways jump up and shout "liar." Doubtless he has in mind the fact that several months ago the *Railway Age Gazette* reviewed another article on accidents written by him and proved him a falsifier on several counts. (*Railway Age Gazette*, December 8, 1911; January 19, 1912; March 8, 1912.) He said, for example, that an efficient automatic train stop device was in use on the New Zealand railways. We showed no such device was in use. He said he

had got certain information regarding block signaling on the railways of the United States from the Interstate Commerce Commission. We published a letter from Judson C. Clements, then chairman of the commission, saying that Mr Russell had not got the information from the commission, and furthermore that it was not correct. It is not surprising, therefore, that Mr. Russell fears somebody will question his veracity.

We might show that his article in *Pearson's* is an example of falsification by suppression. He has gone through the accident reports of the Interstate Commerce Commission and picked out those regarding accidents resulting from defects of railway plants, and ignores those regarding accidents due to man failures. He then concludes that practically all accidents are due to defects of the plants. The incorrectness of this conclusion is shown by the following statement in the annual report of the commission for 1912:

"The most disquieting and perplexing feature in the problem of accident prevention is the large proportion of train accidents caused by dereliction of duty by the employees involved. By far the greatest number of our serious train accidents are due to the failure of some responsible employee to perform an essential duty at a critical time. The seriousness of this problem is indicated by the fact that of the 81 accidents investigated up to September 1, 52, or more than 63 per cent. of the whole number, were caused by mistakes on the part of employees. These 52 accidents comprise 48 of the 49 collisions investigated, and 4 of the 31 derailments. They caused the death of 248 persons and the injury of 1,309 persons. Of the 48 collisions caused by errors of employees 33 occurred on roads operated under the train-order system and 15 occurred under the block system."

However, in this instance it is not necessary for the *Railway Age Gazette* to put Mr. Russell back in the Ananias Club. His coadjutor, Mr. Jones, has saved us the trouble.

AIR BRAKE HOSE.

INVESTIGATION of the troubles with air brake hose shows a general agreement that the present situation is serious, but it also shows a difference of opinion as to the causes and proper remedy. On the one hand are those who claim that so large a proportion of the failures are due to mishandling and mechanical injury that it does not pay to purchase a high grade hose. On the other side are those who claim that the failures due to poor material predominate and that a better grade of hose, even at a higher price, should be used. The specification under which air brake hose is now purchased by most roads was prepared and adopted by the M. C. B. Association in 1905—eight years ago—and except for a change in the label it is still in its original form. During this time there has been an enormous increase in the demand for rubber products, accompanied by an influx of high grade rubber and rubber substitutes, which, combined with the increased knowledge of the manufacturer as to the qualities of the substitutes and of changes in manufacture, has permitted the production of a hose which will meet the requirements of the M. C. B. specification when new, but by no means possesses the durability of the hose it was intended to insure.

A revised specification will probably be submitted to letter ballot following the next annual convention of the M. C. B. Association, and the question arises whether this specification should be revised so as to insure a hose which will better withstand mechanical injury, but that can be purchased without any considerable increase in the present average price, or whether it should insure a hose of much better quality which will not rapidly deteriorate after being put in service and that will probably require the payment of a considerably higher price. The answer to this question depends on accurate information as to the causes of air brake hose failures. If, as is shown by the records of a number of roads, mechanical injuries are the principal causes for removal, it will not pay to so revise the specification as to materially increase the cost. If on the other hand, porosity, bursting and cracks are the chief troubles, it will be the duty of the association to require the use of a better and more expensive hose.

There is no doubt but what the fittings, especially the nipple, the method commonly used for applying them and the practice of uncoupling cars without also uncoupling the hose, are responsible for a large proportion of the failures and that more careful attention tending to the correction of these features would do much to reduce the damage. Records maintained by a number of roads show these features to be responsible for upward of 50 per cent. of the removals, and it is these roads that hesitate in advising the purchase of a more expensive hose. On the other hand, however, a recent test, most carefully made and covering over 22,000 pieces of removed air brake hose, showed that about 82 per cent. were porous and that the porosity was not localized, but appeared at various points or throughout the whole tube. If these results represent the general condition, or anywhere near the general condition, all doubt as to the necessity of a better material is removed. Bursted hose is the cause of a considerable proportion of the removals, and while this may in some cases be indirectly the result of mishandling or other user's fault, it is generally believed to be due to poor material. The present average life of air brake hose will not exceed one year, and probably will be closer to ten months. The life of hose under former conditions and when a better quality of material was used, ran from two to three years. One railway company is seriously considering the issuing of instructions to its purchasing agent forbidding him to purchase any air brake hose for its locomotives or passenger cars which is quoted at less than 60 cents a foot. Investigation and experience have shown that satisfactory hose cannot be purchased under this price. Several other companies are purchasing hose to their own specification, which is more rigid than those of the M. C. B. Association, and are finding it possible to obtain a much more satisfactory hose, although in every case its cost is greater.

All of this would indicate that the new specification should be drawn so as to insure a better quality of material, a more carefully made product and the production of an air brake hose which so far as the quality of the material is concerned will have a probable life of over two years. This should be done irrespective of the price. Porosity in most cases is probably due to minute holes in the inner tube. The present specifications call for three hand made calenders forming the inner tube, but it is very doubtful if this requirement is followed to any great extent and most hose now in use has a single machine squirted inner tube. The suggestion that the center calender be made of different color would correct this difficulty and largely overcome the porosity if the hose is properly inspected. Such a requirement should be included in the specification. Even three hand made calenders, however, will not insure a satisfactory inner tube unless the quality of the material is better than that usually furnished. It has been suggested that a tensile strength requirement be inserted in the new specification, and this would probably go a long way toward insuring good material. Such a requirement should, however, also cover the outer covering and have maximum and minimum limits in both cases. In the same connection the stretching test should be so formulated as to also assist in preventing the introduction of rubber substitutes, or of undercured and low grade rubber.

In addition to insuring a good quality of material and workmanship in the hose itself, the association would do well to consider the fittings, and a standard nipple, properly designed, will greatly assist in reducing the number of condemned hose as a result of kinking. Experiments made with different forms of nipples have indicated that the present customary design may be greatly improved. In the same connection instructions as to the proper method of applying the fittings to the hose could be adopted as recommended practice. The usual way of forcing

the fittings in the hose by a powerful air cylinder is a great time saver, but often proves expensive in the end. Not infrequently the hose would be condemned before being applied to the car if it were possible to make an inspection of the inner tube.

Another feature that needs improvement is in applying the hose to the car. If the faces of the couplings are both in a true vertical plane they will pull apart with little damage to the hose, but if the nipple is turned too far the couplings will bind and a severe tension is put on a twisted hose.

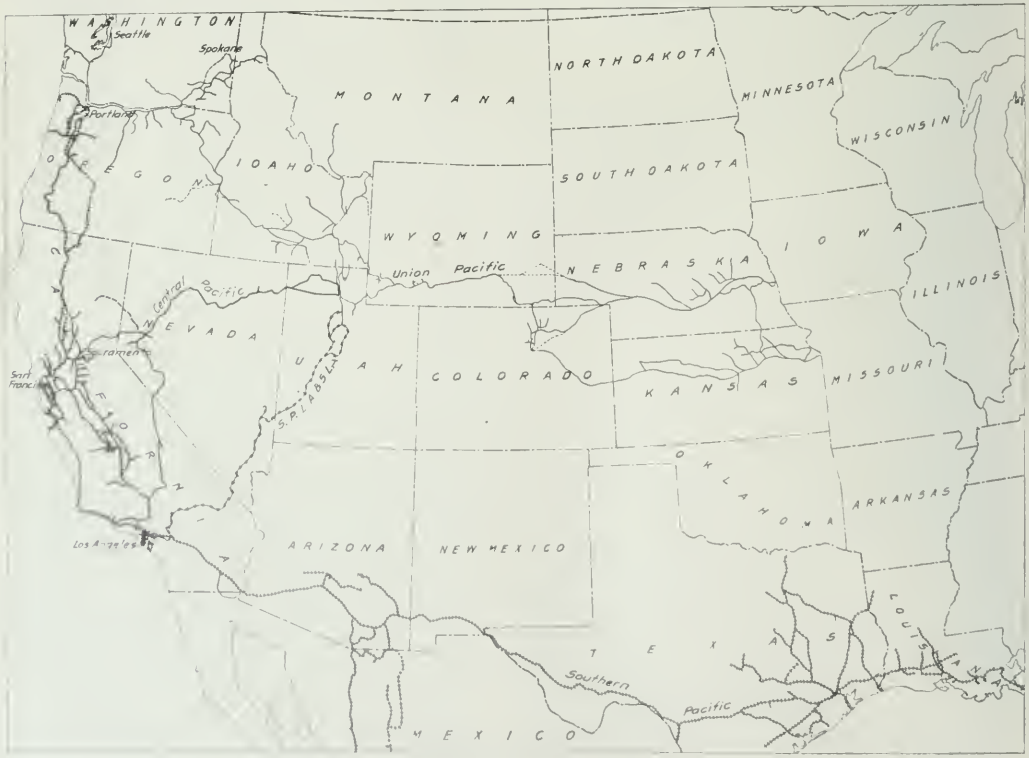
Taking everything into consideration it would seem possible to greatly reduce the hose failures, with their often expensive results, but that the original cost will be greater, although the net result will be profitable. It is the duty of the committee revising the specifications to make recommendations, leading to the maximum benefit with the minimum increased cost.

THE UNION PACIFIC-SOUTHERN PACIFIC DISSOLUTION.

WHEN the decision of the Supreme Court in the Union Pacific-Southern Pacific merger case was rendered it was quite generally criticised on the ground that it would have little tendency to further the ends sought by the government, viz., to increase competition. Many of these criticisms were based on a wrong premise. It was assumed that, as the case directly involved only the consolidation of the Union Pacific and Southern Pacific, which owned the Central Pacific, the effect would be merely to separate the Union Pacific system and the Southern Pacific, including the Central Pacific. The court indicated, however, that there would be no objection to the Union Pacific retaining the Central Pacific. This was made the basis of a contention by Attorney General Wickersham that the Union Pacific must retain the Central Pacific. Mr. Wickersham has won on this point. This changes the aspect of the entire matter.

The Union Pacific, with the possession of the Central Pacific, reaches San Francisco and gets into the heart of northern California. One of the Central Pacific's lines reaches as far south as Fresno. The Union Pacific also keeps its half interest in the San Pedro, Los Angeles & Salt Lake, which gives it a line from Salt Lake City to Los Angeles. It is announced that the Central Pacific will have a complete staff of general officers in San Francisco. The San Pedro, Los Angeles & Salt Lake has most of its general offices in Los Angeles. The Union Pacific also retains control of the Oregon Short Line and the Oregon-Washington Railroad & Navigation Co., by which it reaches points throughout the Northwest, including Portland, Tacoma, Seattle and Spokane. By means of a 99-year lease the Southern Pacific gets that portion of the Central Pacific lines which constitutes a part of its line from San Francisco to Portland. The Southern Pacific also has trackage rights over the Northern Pacific's line from Portland to Puget Sound, and steamship lines between Los Angeles, San Francisco and the north Pacific coast.

There seems to be no doubt that the dissolution of financial control of the two systems is complete. The consequence is that they become active competitors for business all along the Pacific coast. This competition does not seem likely to materially affect rates. Active competition in rates can hardly exist under the present laws regulating them. It does look as if there would result an increase in competition in service. The change in the situation in California is most marked. Formerly there were constant complaints that the Southern Pacific had a monopoly in California. With the Southern Pacific now covering the state with a network of lines; with the Santa Fe especially strong in



Segregation of Harriman Lines Under Dissolution Plan.

southern California and also reaching to San Francisco; with the Western Pacific reaching across the State to San Francisco; and with the Union Pacific by its controlled lines reaching Los Angeles and San Francisco and tapping some of the richest parts of the State, the complaint about monopoly can hardly any longer be made.

The struggle for business that will result between the Union Pacific lines and the Southern Pacific will be extremely interesting; and will not affect them alone. The Southern Pacific will strive to route as much California traffic southward and thence eastward over its lines to El Paso and New Orleans as practicable. In order to get its share of business to and from Chicago, it must have a strong connection to Chicago, and it must also strive to keep the territory it occupies from being invaded by still other lines. It seems likely to result that the Southern Pacific and Rock Island will draw more closely together. They already handle a good deal of traffic in connection with each other through the El Paso gateway. The El Paso & Southwestern has extended its line via El Paso to Tucson, and it is reported that it plans to go on to the Coast. The Southwestern connects with the Rock Island at Tucumcari, the Rock Island operating over tracks leased from it from Tucumcari to Santa Rosa, and the Southwestern handling through passenger trains from there to El Paso to the connection with the Southern Pacific. If the El Paso & Southwestern should extend to the Coast, the Rock Island, of course, could choose whether it would later work with the Southern Pacific or the Southwestern. In these circumstances, it would seem, as already indicated, that the Southern Pacific would be disposed to cultivate closer relations with the Rock Island. On the other hand, the Southern Pacific owns lines from El Paso to New Orleans and a steamship line from New Orleans to New York, whose interests it must protect. The Southern Pacific heretofore has delivered a good deal of business from California to the Union Pacific at Ogden. Naturally, it will strive in the future to take this business to El Paso at least, and to take as much of it as it can, while protecting its other interests, by way of its lines to New Orleans and its steamship lines to New York.
